It is especially noteworthy that this degree of security has been obtained without the elaborate machinery of a zonal defensive pact similar to the North Atlantic Treaty or the Southeast Asia Collective Defense Treaty. Turkey is of course a member of NATO and the Turkish-Iraqi alliance pledges Iraq to support Turkey, while the covenant of the Arab League pledges each of the Arab states to support Iraq. It can be said that in this manner the NATO-Turkish-Iraqi chain of agreements indirectly and illegitimately attaches the Arab League to NATO. This is as much as can be said, since neutralism and standoffishness are still conspicuous threads in the pattern of Arab policy.

Keeping the peace

Second, the threat of Western air power serves to keep the peace. Sustained petty wars of the ancient Bedouin pattern are almost unthinkable. The Italians in Somaliland, the Ethiopians with their American and British pilots, the new parliamentary government of the Sudan, the Saudi authorities, the young kingdom of Libya—any of these could inflict severe punishment on a marauding tribe with the use of a very small number of aircraft. If aircraft are supplemented by airborne forces this potential becomes greater, since the wells and fields of the marauders' home oases lie at the mercy of the ruler modern enough to possess aircraft. Behind the tactical power of the small local air forces there stands the immense reserve of the strategic air forces of the Western nations. The combination is such that serious war will occur in the Middle East only if it is permitted to occur.

USSR and Western air power

Third, the entire security of the Middle East depends upon the Soviet Union's not feeling free to cancel and overcome the air advantage at present enjoyed by the Western powers in the Middle East.

Upon what, in Soviet eyes, does Western air power in the Middle East depend?

"Massive retaliation" may be found to offer its best exemplar in this area. Soviet aircraft are incapable of driving Western aircraft from the Middle Eastern skies while at the same time protecting the Soviet Union against effective Western retaliation. The land routes to the Middle East are blocked by a vigorously anti-Communist Turkey in the West and by the inhospitable terrain of Iran in the East. The Middle East or any part of it will become another Korea or Vietnam only if Western statesmen give the leaders in Moscow and Peiping reason to believe that the West will put up with local victories or will endure local defeats without serious danger of reprisal.

AIR POWER AND PSYCHOLOGICAL WARFARE

The Turks do not need to be told that the Russians are their enemies. The Turks have endured a great deal at the hands of the old Russian Empire. They stood against the combined threat of Nazi-Soviet imperialism during the dark years, 1939–1941. They are not apt to yield to bluster now. The Turks have the additional advantage of being closely allied to large numbers of people in the Soviet Union and Sinkiang. They have constantly replenished factual reasons for mistrusting the purposes and the behavior of the Russians.

Except for Israel in Asia, which is Hebrew, and Ethiopia in Africa, which is Christian, the states of the Middle East are Muslim. The religious tenor of Islam is not sympathetic to the militant atheism of the materialist dialectic. The Muslims have some connection with their coreligionists in the USSR and on the Communist-controlled mainland of China. This works both ways. The Marxist states export some of their doctrine, especially that of the popular-front variety, with a sugar-coating of pious but fraudulent Islam, but at the same time the Muslim world has its own peepholes into the human suffering and religious sterility of the Iron Curtain world.[6] The piety of the Muslim world runs counter to the materialism of Soviet appeals, but at the same time recollections which the Arab world has of recent French and British colonialism are such as to make Western talk about liberty, independence, and progress a little thin.

The most vehement opinions entertained within the area are those pertaining to local problems. The West appears important only because of its recent colonialism and its alleged potential of an imperialist *revanche*. The Soviet menace is conceded by a few very farsighted people, but to most ordinary men it is almost on a par with the strategic threat which might some day be posed to humanity by aggressive inhabitants of the planet Mars. The strategic appeal of the West concerns far more practical matters. In co-operation with the Western world the Middle Eastern states can make themselves substantially rich.

Psychological climate of Middle East

One young American remarked to the present writer, during the course of a motor tour of Damascus:

> Syria and Lebanon had no more business being made French mandates after World War I than did Croatia or Serbia. These countries aren't behind the Balkans. They are just as modern as a lot of Europe and to my way of thinking they're much more pleasant to live in.

The psychological climate of this part of West Asia is very different from the real gloom and real tragedy surrounding much of South Asia, Southeast Asia, and East Asia. West Asia is entirely capable of modernization. The oil resources are capable of bringing in immense quantities of foreign currency. There is virtually no overpopulation in relation to the land, which is potentially irrigable—at least no overpopulation by Indian or Chinese standards. The problems of the area are real ones, but they

[6] The present observer has been impressed by the fact that Islam is far more vital in the Arab states than any religion has been in China. China's vulnerability to Communism can be found at least in part in the enervated atheism which characterized a broad majority of the Chinese people before 1949. The Arab world is far more like the West in possessing a religion which, though shocked by the intellectual and physical challenges of modernity, is still a vital force. Few Chinese or Vietnamese ever refer as seriously to religion as do the present-day Muslims of West Asia. It would be easy to make too much of this factor, since it can be pointed out that the Russians were before 1917 the most religious of all the great peoples of Europe.

are almost all of them soluble and there is every reason to believe that within the Western economic and political system the Middle Eastern states can offer an increasingly good life to their citizens in this lifetime, without waiting for another world or for future generations. The Middle Eastern states themselves show much of this buoyancy about their future. Soviet psychological warfare is not apt to make serious advances unless tactical blunders on the part of the West cause a recrudescence of anticolonial feeling or unless economic shocks cause severe local depressions.

The "when and if" of Soviet attack does not seem to lie in the short-range future. It may lie ten years ahead, perhaps more. Given effective Western cooperation, given the reappearance of Japan as a power in the world of air strategy, given the readiness of the American taxpayer to outbid the Soviet citizen in the purchase of that margin of aircraft needed for the reasonable safety of the free world, the Soviet world may never have enough aircraft to protect its home territories, attack Europe and the New World, and at the same time swarm into Persian, Arabian, and Turkish skies.

ROLE OF U. S.

A Spengler or a Toynbee might properly insist that there is nothing new under the sun, that every strategy is a repetition of similar strategy in the past. In the Middle East it is easy to believe this. The colonial rivalry of Germany, France, and Britain has led to the political disappearance of all three as effective military land powers in the Middle Eastern world. The Middle Eastern countries no longer provide the underpinning of an Ottoman Empire or the potential booty of European colonialism. The Middle Eastern states today play a role much more reminiscent of that of the minor Greek city-states in the latter part of the Peloponnesian War.

In order to avoid becoming the slaves of Sparta or of Athens the minor city-states had the choice of affiliating themselves with either against the other, of hoping that neutrality and innocence would shield them from the nakedness of power, of dreaming about creating third-force combinations big enough to resist destruction by the Peloponnesian War, or of changing sides rapidly enough to stay on the side of the victor.

In the realistic politics of the present, neither side enjoys a decisive advantage in strategic appeals. Russia is nearer in geographic distance, but farther away in strategic distance. The emigration of Syrians and Lebanese to the United States has provided close connections between America and the Levant. These connections have been further amplified by the recent expansion of the oil companies into the Arabian peninsula. The long-standing educational activities of the American colleges in the Eastern Mediterranean have yielded a great harvest of good will and sympathy between the United States and the Arab world.

The Russians have the strategic appeal of the old battle cries of anti-colonialism and anti-imperialism. The Americans and their Western allies suffer from the obloquy they inherit from colonialism and they will find that their obligations to ensure that no Middle Eastern state sinks into absolutism, terror, or corruption so abysmal as to invite Communism will present them over and over again with the two-edged problem which they have already met in Nanking, Seoul, and Hanoi. If the Western powers undertake corrective action in an insufferably depressed or oppressed area they will be challenged as intruders or meddlers; if they do not intervene to take corrective action against the worst manifestations of reaction or corruption, they will be proclaimed the allies of decay, poverty, and corruption. Policy makers in the West will have difficult decisions to make. The best way of forestalling future difficulties is perhaps to develop the greatest possible degree of candor and friendship with each of the Middle Eastern states.

America and Russia both suffer in Arab eyes from their hasty recognition of Israel and in Israeli eyes for the uncertainty of their support of the new state.

PROBABILITIES AND PROVISOS

What appears probable is that air power in the Middle East can hold its present status for years or decades, provided:

That the Western World remains economically viable enough to prevent catastrophic local depressions in the Middle East;

That the Western world suffers no overwhelming diplomatic or military defeats in other parts of the planet;

That the Western world adopts corrective action if any one of the Middle Eastern states begins to disintegrate into Communism or to fall under the sway of a pro-Moscow government;

That the Indian and neutralist world is unable to structure its leadership so sharply and so effectively as to present a workable "third bloc" of sovereign powers as a reality in world strategy.

Final decision in the Middle East, as elsewhere, must await the outcome of the contest between the two great poles of present-day human political aspiration. In the weapons field, and no less in the psychological field, there are endless advantages open to the Soviet bloc or to the free world through the use of creative imagination, new design, bold and intelligent application of novel methods to unparalleled strategic situations.

Until a happy future, somewhere beyond tomorrow, in which the Middle East once again exercises that power which the talent of its inhabitants and the richness of its territory have so often produced, it must be said that Middle Eastern air strategy will remain dominated or resolved by forces operating from the outside.

Paul M. A. Linebarger, Ph.D., Washington, D. C., is professor of Asiatic politics at the School of Advanced International Studies of the Johns Hopkins University in Washington, D. C., and visiting professor, Foreign Policy Research Institute, University of Pennsylvania. He visited the Middle East in 1922, 1945, 1950, and 1952, and made two field trips to Syria, Lebanon, Jordan, Egypt, Turkey, and Greece in 1954. His most recent books are (in collaboration with Chu Djang and Ardath W. Burks) Far Eastern Governments and Politics (1954) and Psychological Warfare (revised ed.; 1955).

Strategic Concepts for the Nuclear Age

By T. F. Walkowicz

THE world is entering an era of great danger. The United States and the Soviet Union will soon possess the capability to wound each other disastrously. Although the United States is currently ahead in some respects, both sides will possess this capability to an increasing degree, regardless of practicable defensive measures taken by either side to deflect and blunt a potential attack. This central fact has been known in general terms by responsible officials for some years. However, the enormous complexities of growing United States and USSR air-atomic power, obscured by limited intelligence on Soviet capabilities and intentions and compounded severalfold by sweeping technological advances in weapons and delivery systems, have made analysis of this problem most difficult.

Several factors of major importance can be perceived: Soviet *strategic* nuclear sufficiency, United States *military* nuclear sufficiency, and technological changes in air power. These factors, together with economic considerations, point clearly to the need for continuous reassessment of air strategy as the world moves into the nuclear age.

With the passage of time (and thus with a growing, frightful strategic nuclear bombing capability on both sides), it will become increasingly difficult for a President of the United States to give the order to initiate strategic bombing, if the enemy has *not yet* bombed our cities. Yet, we are too prone to take it for granted that the enemy will solve the problem for us, that is, start immediately by bombing our cities.

The nuclear armament race is dynamic, and we can only dimly perceive the future. Thus, national survival demands a flexible air strategy to meet changing conditions. United States Air Force strategy already leans toward destruction of Soviet forces in being in the event of war; for example, Strategic Air Command's first priority mission is now elimination of its Red counterpart. However, there is an apparent tendency to think too largely in terms of all-out nuclear war and destruction of the Soviet economy or "will to resist." There is needed an objective analysis of (and development of military means for) the possibility of reacting decisively but *with discrimination* in the event of future local wars, without undue risk of all-out war or mutual city-industry bombing.

Soviet Strategic Nuclear Sufficiency

The USSR is now or will soon be militarily capable of delivering a heavy atomic attack on the United States which could cause billions of dollars worth of damage, result in the loss of millions of American lives, and destroy or seriously diminish the ability of the United States to support a major war effort. Against this threat, our active air defenses today possess a total "kill" probability of about 30 per cent, that is, about 70 per cent of attacking Soviet bombers would get through our defenses. Projected increases in defensive strength will lower the number of Soviet bombers getting through to 50 per cent or more in the next few years.

Such kill probabilities, when applied against reliable estimates of the Soviet atomic bomb production, do not indicate any decrease in the number of bombs theoretically arriving on United States targets. Even the present estimated

Soviet stockpile, if accurately placed on United States targets, would be a catastrophic blow. The USAF "Sunday punch," the principal ingredient of a countereconomy air strategy, has so far been an effective deterrent to *major* acts of aggression on the part of the Soviets. Now, however, the Soviets are approaching a position of symmetry with this vitally important SAC capability. For the Soviets, this will be a period of strategic nuclear sufficiency.

U. S. Military Nuclear Sufficiency

The United States stockpile of fissile material is growing rapidly. Furthermore, important advances in bomb technology are being made. Simultaneously, the actual cost of employing nuclear weapons against military forces and strategic targets is decreasing rapidly in comparison with that of other means of destruction. Thus—as the result of large-scale production of fissile material, technological improvements in atomic weapons, and the trend indicating continued reduction in costs of fissile material—an era of United States nuclear *plenty*, that is, *military* sufficiency, is rapidly approaching.

True, we must not become complacent about the adequacy of United States fissile material production and supply. The amount of fissile material needed to carry out a countereconomy mission is finite and relatively small. By contrast, the various counterforce and air defense missions require that fissile material be used much like ammunition; therefore, large amounts must be produced to ensure that enough is available at the right time in the right place.

However, we do now have nuclear weapons to employ against military forces; furthermore, this situation is improving steadily with time, and we can and must stay ahead of the Soviets in this regard. Therefore, our military strategy can be based on a nuclear capability adequate for *all offensive* tasks, and also for *critical* defensive operations.

Technological Changes in Air Power

The qualitative and quantitative nature of the required air delivery capability, and its cost, are constantly being modified by technological changes in air power. The advent of jet aircraft and near-sonic combat speeds has worked to increase appreciably the size and cost of military aircraft. The attempt to achieve intercontinental range and reasonable independence of air bases on foreign soil has further accented this growth. Simultaneously, however, various techniques of range extension—some still in the early stages of development—are increasing the number of aircraft, with a wide range of sizes and performance, which will be able to contribute to the long-range bombing job. Other nuclear weapons will further increase the capabilities of this added number of potential weapon carriers. The day will soon arrive when *all our combat aircraft, including high-performance fighter types, will become bomber strike aircraft possessing devastating firepower.*

Similarly spectacular changes are in prospect in the field of air logistics. It is now possible to plan for factory-to-advance-base delivery of supplies, using aircraft operating over ranges of 3,500 miles at speeds between 300 and 400 knots. These aircraft will be able to operate, from present-day airfields, at direct costs of three to four cents per ton-mile. The flexibility of air transport, in turn, will greatly accelerate and facilitate changes in the present logistics system (methods of ordering, packaging, inventory keeping, and so forth), thus acting as a catalyst in reducing the tremendous cost inherent in the long, surface supply "pipeline" situation. The

entire cost of an air logistics system appears to be appreciably less than the savings in spare parts made possible by it. This future air logistics capability will greatly enhance the operational flexibility of air power, since the same aircraft can also serve as in-flight refueling tankers.

Range-extended tactical combat aircraft, supported by a world-wide air logistics system, make operationally possible and economically feasible the rapid deployment of *task forces* to fight "brush fires" or "limited wars" anywhere on the Soviet perimeter. These *task forces* need depend only on minimum overseas stockpiling (largely fuel and lubricants stored underground) and on overseas bases maintained on "austerity-tenant" standards.

Thus, air power is in the sweep of a technical revolution which will profoundly influence the character of its aircraft, greatly increase its operational flexibility and striking power, and keep its over-all costs within reasonable margins.

Economic Considerations

The challenge of Communism, coupled with the neutralization by air power of our historic ocean barriers, has placed unprecedented strains upon the American economy. We face the prospect of maintaining armed forces in being of great magnitude and expense, for an indefinite period of time. The unexpectedly early Soviet atomic explosion in 1949, followed by the Korean episode in 1950, brought a then existing military economy drive to an abrupt halt and greatly accelerated a laggard United States rearmament program. Soon thereafter, the inevitable inefficiency of hastily conceived military programs and the waste inherent in their rapid implementation became apparent, and led to great emphasis on improving the efficiency of our national defense effort and balancing the budget.

In the Soviet Union, a police-state system is used to suppress consumer demand below normal levels. For this reason, the USSR presumably can continue military spending at a relatively high level for an indefinite period of time. Here in the United States it appears that tax rates cannot be safely raised nor deficit financing indefinitely continued without seriously impinging on the traditional American way of life. The resulting pressures to reduce the cost of the defense establishment are enormous, and the new administration has moved strongly to cut the costs of previous military force programs.

Forces in Being vs. Post-D-Day Mobilization

The key factor in winning World Wars I and II was the United States mobilization base. Therefore, it is difficult to discard this concept in planning for victory in the third world war.

Yet, the outcome of a war in the nuclear age will almost surely be decided by forces in being rather than through post-D-day mobilization. The tremendous destructive power of nuclear weapons now makes it possible for *one airplane* to deliver in *a single instant* many times the explosive equivalent of the entire bombing effort of the Allied Air Forces in World War II.

Considerably fewer than a thousand nuclear weapons could render the Soviet economy impotent, and probably even fewer than that would do the same to the economy of the United States. The large-scale use of atomic weapons in countermilitary operations (two to three thousand) could reduce armies, air forces, navies, and their supporting logistic systems to relative insignificance.

Therefore, in a nuclear war, the combat potential of both sides may decline rapidly following D day, and the size of the mobilization base becomes practically irrelevant. The decisive phase of the war may have been fought almost before weapons still in factories on D day can be brought to bear on the enemy.

True, we dare not gamble that the first few months of any future war will be decisive. Thus, while concentrating on the war readiness of our forces in being, we must also place adequate emphasis on duplicating certain vital parts of the industrial mobilization base, and on dispersal of both industry and people. However, this is far different from the thinking reflected in the Vance Committee Report according to which the interests of the nation would be best served by substituting, to the greatest extent practicable, additional production facilities for stockpiles of military "end items."[1] Such thinking is not only obsolete, but extremely dangerous to the survival of the United States.

Producing the Forces in Being for Minimum Cost

Abandonment of the mobilization-base concept as the primary war-winning factor is an important first step toward minimizing the cost of a force in being. The present mobilization-base concept involves not only the building up of excessive productive capacity, but also the additional expense of using this capacity on a one-shift or less basis, that is, "maintaining living and breathing production lines."

Maximum emphasis must be placed on larger production runs and lower production costs in fewer producing units (that is, uneconomic spreading of orders must be avoided). However, the larger production runs must not be achieved wholly through reduced emphasis on development during production, but also in part through a reduction in the number of types of aircraft and equipment produced. Similarly, the stockpiling of selected, long lead-time, multipurpose machine tools is of great importance for the specific purpose of reducing development-to-production lead times.

Minimizing Vulnerability of the U. S. Economy and Air Power

At present, the over-all vulnerability of the United States to atomic attack presumably is greater than that of the USSR. The capacity of almost all of our important war and war-connected industries is two to three times larger than that of the Soviet Union. On the other hand, this bigger economic base is concentrated in fewer cities. Similarly, the offensive components of the Air Force, strategic and tactical, are extremely vulnerable to Soviet nuclear attack. Drastic measures must be taken for their protection, or the effects of the first Soviet strike on our capability to deliver nuclear weapons could be catastrophic.

The tactical air force and any SAC wings deployed in the European theater can be expected to suffer heavy damage in the initial enemy strike so long as they remain concentrated on relatively few airfields. Even SAC wings based in the United States are vulnerable. The concentration of practically all of our SAC force on a relatively few airfields in this country (while Congress drastically slashes air-base construction funds) increases their vulnerability and reduces the deterrent effect of United States offensive air power.

The physical vulnerability of the United States economy and its urban population can be slowly reduced through long-term dispersal programs,

[1] "Production Capacity—A Military Reserve," a Report to the Director of Defense Mobilization by the Advisory Committee on Production Equipment, January 1953.

and national, state, and local governments should develop master plans for the decentralized location of *new* urban and industrial construction arising from the demands of a growing United States economy. In this regard, the United States enjoys a marked advantage over the Soviets through possession of a superior communications network which makes long-term decentralization of *new construction* a practical plan.

Our economy and the United States people must be provided with an air defense system which would exact a heavy toll on the enemy, even though loss of life and property will be magnified manyfold by World War II standards, in the event of a Soviet attack. In view of this, we must now take urgent measures to minimize loss of life in the event of Soviet attack by providing an adequate warning system and by implementing a program of evacuating all major cities at the initiation of hostilities. Furthermore, the present emphasis on air defense must be maintained and increased as the situation requires.

Simultaneously, reliable intelligence on Soviet air-atomic strength must become the prime determinant in setting a proper balance between present United States offensive and defensive air power. This balance between air offensive and air defensive strength is the cold-blooded business of our survival. The situation profits little from reckless charges of disinterest in air defense hurled against military officials who have been fighting for years for resources to do the job adequately. Rather, the science-industry-military team must continue to work effectively together to construct a defensive system which leaves no margin for Soviet miscalculation as to our ability to survive and strike back, if attacked. In addition, many measures suggest themselves for minimizing the vulnerability of United States air power to Soviet attack.

U. S. vs. USSR IN A COUNTERECONOMY WAR

A future war, with unrestricted use of nuclear weapons in countereconomy strategic bombing campaigns, can end only in destruction of both sides. It would be folly to assume that symmetry in countereconomy bombing will not exist during the nuclear age, when the number of bombs required on target can be measured in hundreds. It is of little consequence that we have the nuclear stockpile capability of destroying Russia several times, if Russia simultaneously has the capability to destroy us just once. This she can have with a reasonable investment—an investment she is obviously making. Even worse, the countereconomy situation will become highly asymmetrical in favor of the Soviets (even when they still have a "limited" number of bombs and bombers) because they are subject to fewer political constraints in starting a war. Furthermore, should the Soviets develop a ballistic-missile-delivery capability before we do, countereconomy deterrent strength could shift heavily in their favor.

An exchange of blows resulting in millions of dead and devastation of a large portion of our industrial and urban complex would endanger our national objective of preserving democratic concepts and institutions. This basic inconsistency between national objectives and unrestrained countereconomy warfare under conditions of United States–Soviet Union *strategic nuclear symmetry* demands that we explore objectively any alternative war-winning strategies which minimize the prospects of an automatic exchange of countereconomy nuclear attacks.

There are two very good reasons why we should concern ourselves with broader air strategy than that based too rigidly on the decisiveness of the countereconomy campaign. First, with symmetrical United States–Soviet Union countereconomy capabilities, the "Sunday punch" is not likely to be decisive. Secondly, we should not rule out the possibility of a political decision staying the delivery of the "Sunday punch." Facing up to these possibilities, we must exploit fully all elements of air-atomic power to prevent even greater emphasis on the conventional ground orientation of our strategy. For the nation, this is a *must,* because we will lose any future war unless we counter Soviet superiority on the ground, and the only effective and economic way proposed for doing this so far is through air-atomic power.

Suggestions for employing air power in other than the classical strategic role have not always been seriously considered since World War II, and too often have been lightly turned aside by the cliché: "Oh, you want to return the battle to the battlefields." During the period of United States atomic monopoly many in the Air Force considered it rank heresy—and correctly so—to have the slightest doubt cast upon the validity of the classical tenets of Douhet and Mitchell. Therefore, it is small wonder that the dynamics of the nuclear age and the significance of the passing of our atomic monopoly have not been fully appreciated, and that old concepts of air power continue to be rigidly embraced. Much broader horizons are now open to United States air-atomic power, and through their exploitation the devastation of countereconomy nuclear war can, we may hope, be avoided.

NEED FOR MAINTAINING COUNTERECONOMY CAPABILITY

There can be no guarantee that the USSR will not attack the United States economy first. They will undoubtedly have the initiative, and it would be sheer folly to rely on any agreement with the Russians to refrain from bombing cities. Hence, there will be an overriding need for a United States strategic force with such unquestionable capability that the Soviets will have no room to speculate about the outcome of launching a surprise attack against the United States economy. This requires that we maintain a strategic force relatively invulnerable to enemy offensive or defensive air power. It also requires that we exploit fully alternative delivery capabilities for striking the Soviet economy.

The Soviets must never be tempted to strike SAC and the United States economy on the assumption that SAC is highly vulnerable and that if SAC is destroyed our total capability to retaliate will have been eliminated. In other words, SAC, Tactical Air Command, or in fact *all* offensive United States air power can and should be flexible enough to do a variety of jobs, including countereconomy strategic bombing. This is the only effective and practical way of standing down SUSAC, the Russian counterpart of our Strategic Air Command.

But what would happen if an attack on Western Europe should lead to a mutual countereconomy war which, however, would forestall a Soviet seizure of large territories? If Western Europe were occupied and its political and intellectual leadership purged by the Soviets, we would then be faced with the necessity of "liberating" and "governing" it in the World War II sense of the word. Clearly, this would be impossible in the event that countereconomy blows have been exchanged, since there would be no healthy American economy and some millions fewer people in the United States to use in mounting a new expeditionary force. Furthermore, in the face of an enemy atomic capability, Normandy-type invasions are doomed to failure. Thus,

although the United States would not necessarily have "lost" the war, we would be in no position to win it militarily. And with Western Europe lost to us, the long-term political and economic factors would strongly favor the Soviets.

These possibilities point up the indecisive nature of a countereconomy campaign against the Soviets, when they can do the same to us. Furthermore, there is always some risk that, faced with devastation in the event of a nuclear war, the Soviet leadership may prefer the risk of national suicide if countereconomy bombing were to leave *both* sides with their economies destroyed but the Soviets in control of Western Europe—a better prospect for the elite than certain defeat.

Political Implications of Soviet Nuclear Sufficiency

As the Soviets achieve *strategic* nuclear sufficiency, their large ground armies and tactical air forces could, in a conventional military sense—unless we counter them effectively—shift the world balance of power in favor of the Soviets. With devastating punishment aimed at the United States and North Atlantic Treaty Organization countries, the Soviets could be in a strong bargaining position to press for agreement to refrain from employing nuclear weapons. Furthermore, having the initiative, the Soviets might refrain from using nuclear weapons and simultaneously announce that city bombing would be resorted to only in retaliation. In the face of a known Soviet nuclear capability, it is highly unlikely that the NATO countries would, except in a dying gasp, initiate city bombing.

The possible courses of events outlined above would appear to favor the Soviets, with their large edge in conventional ground armies and tactical air forces. However, the reverse is possible if the United States takes full advantage of its large stockpile for mass employment of nuclear weapons by both tactical and strategic air forces against Soviet military forces in being and their direct supporting elements. A large and potentially decisive military advantage accrues to the United States in countermilitary force operations because of a larger nuclear stockpile; the probability of a greater variety of proven weapons and delivery systems; and a variety of proven delivery tactics and techniques. These advantages can and must be maintained for many years, and they can be militarily decisive during this period. This United States counterforce nuclear capability should enable us to overcome the Soviet advantage in numbers of conventional ground and tactical air forces.

Targets for Counterforce Operations

Combat forces, lines of communication, and supporting supplies constitute the principal targets for attack and destruction of counterforce operations. It should be clear that the use of nuclear weapons makes it difficult to distinguish between military and countereconomy targets. For example, major air bases are frequently located near cities; troops can be concentrated in cities; and submarine bases are associated with major seaports. Thus, even counterforce operations would inevitably lead to some destruction of cities. Furthermore, this situation presents especially difficult targeting problems when we contemplate using nuclear weapons against counterforce targets in Central Europe. Nevertheless, these targeting difficulties should not distract us from the basic objective of winning any war *primarily* through the destruction of enemy forces in being.

The targets of highest priority among offensive enemy combat forces are those

intended for the air delivery of nuclear weapons. The facts that combat aircraft spend some 90 per cent of their time on the ground, that they require servicing by highly skilled and trained personnel, and that they require certain fixed ground facilities render air installations particularly lucrative targets to attack by nuclear weapons. Furthermore, the fixed nature of air installations permits the targeting and planning for their attack prior to the opening of hostilities.

The destruction of the enemy's air force is the essential prelude to the large-scale attack of his ground forces. The Soviets habitually employed massive attack formations in World War II. The centralization of authority and distrust of the initiative of smaller unit commanders in the dictator society of the Soviets may influence them to continue reliance, at least *initially,* on massive ground attacks. Air forces armed with enough nuclear weapons can now destroy such ground forces—quickly and completely. After—or perhaps, even before—an anti-ground-force atomic capability has been demonstrated, dispersal in both frontage and depth will be used to reduce vulnerability, but this will introduce serious problems of control and great losses in *striking power.* Hunter-killer, air-ground tactics—utilizing small, highly mobile, airborne forces—can and must be devised to force isolated enemy ground units either to remain dispersed, immobile, and ineffectual, or to concentrate and present lucrative atomic targets of opportunity.

The Soviet submarine force will undoubtedly engage heavily in interdiction of our sea lines. Their employment for closing important allied seaports with atomic torpedoes and for launching guided missiles with nuclear war heads against targets in the continental United States is also a distinct possibility.

Like aircraft, submarines are difficult to locate, combat, and destroy when operating in their own medium. Also like aircraft, submarines require elaborate home bases, spend a large fraction of their time in these bases, and require highly trained and skilled personnel for their operation and maintenance. These submarine bases are tough targets, so that the fissile material requirements per target are quite high. This is counterbalanced by the fact that these targets are relatively few in number and their destruction rapidly reduces the number of enemy submarines on patrol.

The logistics and communications systems necessary to support and give mobility to ground forces present targets of high military value. The destruction of the enemy's skilled engineer troops through timely attack of bridge sites constitutes profitable employment of tactical air-atomic capability.

There is general agreement that atomic strikes against fuel-production facilities can have little effect in blunting the initial onslaught of a Soviet attack. They can have only a relatively long-term effect. However, the larger fuel-storage sites nearer the combat zone are important targets for initial atomic attack. Munitions and supplies are so readily dispersed and camouflaged and their vulnerability is so low that their attack with atomic weapons is of doubtful profit. However, destruction and abandonment of munitions and supplies coincident with nuclear attack of troop targets are likely to be a major bonus.

American Air Power Requirements

Based on what has been said so far, it is now possible to summarize American air power requirements. First of all, America must be strong in its own right and must be able to project some of *its* retaliatory power from well-defended bases on this continent. However, granted that an intercontinental strategic capability of some magnitude

is vital to this country's survival, it is no longer of itself sufficient to guarantee our long-term security. Furthermore, in the long term, air power based on America alone *can be* impaired by military and political vicissitudes in other parts of the world. After all, if we depended solely on a long-range striking air force, we would be leaving the whole Eastern Hemisphere open to eventual Soviet domination. The balance of world resources, including trained manpower, industry, and strategic materials, would then heavily favor the Soviets, and our eventual defeat would be merely a matter of time—unless we were to initiate a preventive war, which has been ruled out as a policy for the United States. Therefore, we must have *both* adequate long-range air power—with bases in the United States—to retain reasonable independence of action and to keep from being coerced economically by our allies, and adequate shorter-range air power—with bases on allied territory—to keep the Soviets from blackmailing our allies and eventually capturing a major fraction of the world's resources.

However, to be effective, NATO tactical air power must rest on secure bases. And the West European countries must provide the assurance that neither parliamentary debates (Communist members participating) nor Communist sabotage will inhibit allied tactical atomic air power at the moment the Soviets attack.

Lest these views be misunderstood, two points should be made clear: First, SAC's long-range offensive capability is vital to our survival. SAC's budget should, if anything, be increased. Second, powerful shorter-range (tactical) land- and sea-based air-atomic power, a supporting air-logistics system, and highly mobile ground units have become equally vital, and here the budgetary deficiency is even greater. The dangerous fiction that nuclear weapons drastically reduce requirements for aircraft should be dispelled, for it is the size of the enemy's air force—and not the type of bombs we shall both use—which must primarily determine the size of our air arm. Soviet combat aircraft now number appreciably more than those of the West; and our marginal and fleeting qualitative superiority (supported by an inadequate air research and development budget) is too slender a reed upon which to base the serious risk of being outnumbered in the air.

COUNTERFORCE STRATEGY

A counterforce strategy in the nuclear age stands in sharp contrast to present strategy influenced by World War II and the "age of atomic monopoly," emphasizing the United States mobilization base and the SAC countereconomy "Sunday punch"; also to the American Fortress strategy which places heavy emphasis on air defense; and to the completely unrealistic and impractical strategies based on various atomic disarmament proposals.

Of course, we should frankly recognize that the Soviets may choose *not* to fight a counterforce war. If this should be the case, nothing is lost by adopting the counterforce strategy ourselves. In the first place, SUSAC remains as the highest-priority target under both the present and the counterforce strategy. Secondly, the tactical atomic-delivery capability which we develop for counterforce purposes can also be used for strategic bombing. Furthermore, the counterforce strategy gives us clear gains in the cold war and local wars. Finally, there is always some chance that our counterforce strategy may cause the Soviets to refrain from attacking our economy massively at the outset.

Technological revolution has created a discontinuity in the normal evolution of strategy. We must attempt to establish a trend toward basic compatibility between national policies and strategic concepts, taking into account the rapidly changing nature of our military capabilities. Proper implementation of a counterforce strategy will enable us to *hold* vital areas of the free world. If we can *hold* Western Europe and other vital areas, we will rally free people to our side by removing the present fear of "liberation," *after* Soviet occupation and liquidation. The counterforce strategy offers some possibility of limiting wars, and hence a higher probability of preserving our way of life.

It clearly distinguishes between Soviet-controlled peoples and the Communist regimes. The United States professes no animosity toward Soviet-controlled peoples. Consistent with this, the counterforce strategy does not seek to win the war largely by destroying them.

The foreign policy of the United States government seeks to *reduce the capabilities* of the Soviet regime below the danger point, or to *alter its intentions* through creating situations which represent courses of action more acceptable to the Soviets and more in keeping with our objectives. This also is precisely what the counterforce strategy seeks to do in a military way—reduce Soviet capabilities (military forces and stocks) and create an acceptable alternative course of action for the Soviets (surrender on reasonable, stated terms or perish).

The counterforce strategy presents a badly needed opportunity for American leadership to associate itself with a higher purpose than the blind use of United States military might. Propagandawise, and diplomatically, this circumstance can be used to attract to American leadership moralists in this country and Europe, in still neutral Asia, and among the people behind the Iron Curtain, all of whom we have yet to attract by the quality and character of our leadership.

In the air age, United States mobile air-atomic strength can be the equivalent of nineteenth-century British naval power. It would make a kind of global Monroe Doctrine, countering Soviet military aggression against the free world, a political possibility. American troops, now stationed in forty-nine countries of the world, can be withdrawn to a major extent and stationed in this country, leaving a ring of dispersed and lightly manned standby bases around the Soviet periphery. The United States can recover from its present awkward position of overcommitment of available surface forces around the world. Local national forces in Europe and Asia can carry out their share of the containment of Soviet power, backed by the shield of United States air-atomic power, which is committed to destroy Communist-inspired forces of aggression and some of which is based in countries allied with the United States as solid evidence of our commitment.

T. F. Walkowicz, Sc.D., New York City, is an aeronautical engineer on the staff of Laurance S. Rockefeller and a member of the Institute of the Aeronautical Sciences. He served as junior engineer, matériel division, Wright Field, Ohio; chief, glider flight research unit, Air Forces, U. S. Army; consultant, airborne armies, Headquarters, Washington, D. C.; technical intelligence officer, Europe and Japan (1944–45, 1947); staff officer, air command and staff school, Air University. He was executive secretary, Scientific Advisory Board, U. S. Air Force; member of the Defense Management Committee on the Research and Development Board; member of the Weapons Systems Evaluation Group; and executive to the Special Assistant (Research and Development) to the Chief of Staff, U. S. Air Force (1949–52).

Dropping the Pilot

By Donald T. Perkins

DURING the past ten years, there has developed the widely held belief that the future defense of our country and its institutions must be based principally upon technological advances in the field of push-button warfare. This belief has been fostered by frequent public accounts of the omniscient and omnipotent properties of guided missiles, glowing with optimism but shrouding the details in mystery and mumbo jumbo. One sees the guided missile in its offensive role as the relentless and ineluctable dealer of death and destruction; and in its defensive role as the sure savior from all who will harm us, the universal protector that encloses us in safety as with a magical cloak. (The fact that these two capabilities are mutually contradictory is frequently overlooked.) The appeal to blind faith of this sort is dangerous, and in no way justified.

From one point of view, one may regard guided missiles as an advanced form of artillery. However, when thinking in terms of air power, a more natural viewpoint (and the one adopted here) is to regard guided missiles as delivery vehicles whose primary distinguishing characteristic is the absence of a human crew. One is reminded, perhaps, of Tenniel's famous *Punch* cartoon on the resignation of Bismarck, "Dropping the Pilot." It is certainly pertinent to inquire whether dropping the pilot is a good thing; or, more generally, under what circumstances it may be a good thing.

Naturally, it is not intended here to argue that the only feature which sets missiles apart from piloted aircraft is the absence of the pilot. Rather, it is intended to begin with this definitive feature, and attempt to determine in a rather general sort of way what are its implications in the design and operation of weapons systems, and how these considerations fit in with the concept of air warfare in the future. Before doing this, however, it is necessary to clear away some of the semantic debris which has collected around the subject of guided missiles.

The Party Line

Almost every public utterance concerning missile systems stresses the pinpoint, all-weather capability of these systems as their chief endearing quality. Perhaps such statements are sometimes intended merely as advertising material and, as such, should not be taken too seriously. But the almost ritualistic uniformity of these contentions leaves one with the impression that pinpoint accuracy and all-weather delivery are the prime articles of faith of the missile enthusiast. Nevertheless, an examination of the real factors that have a bearing on accuracy and all-weather capability does not reveal any startling advantages which missiles have over manned vehicles in these respects.

Bombing accuracy

The only source of operational experience with missiles to which we can point is that of the German V-1 and V-2 firings during World War II. Incidentally, these missiles constitute prototypes for a broad division of missiles into two varieties which will be called here "cruise-type" and "ballistic": the cruise-type missile is characterized by the use of aerodynamic lift surfaces and

dependence upon air as an oxidizer; the ballistic missile is characterized by the absence of these two properties. Of course, there are gradations in between, but it is adequate here to consider only the two extremes, as exemplified by the small, pulse-jet-powered, winged V-1 and the larger, rocket-powered, ballistic V-2. Whatever these missiles may have proved concerning the bold and ingenious character of German military development, they certainly failed to provide examples of pinpoint bombing accuracy. It was, in fact, their excessive inaccuracy which prevented them from affecting the course of the war to any great extent.

It must, of course, be recognized that the German V-1 and V-2 were extremely primitive, and more advanced techniques of guidance will yield much better accuracy. One must ask, however, whether such improved guidance techniques give missiles a comparative advantage over manned systems. Considering first cruise-type missiles, it seems fairly clear that the missile guidance problem is very nearly the same as the navigation and bombing problem of the manned system—except that certain techniques, such as visual bombing systems and pilotage, are not readily available to missiles. The crude, dead-reckoning guidance of the V-1 was forced upon this missile system by the absence of a pilot, at a time when much better guidance systems were available and in use by manned systems. Sufficient improvement of the V-1 guidance system could tend to bridge this gap, but could never serve to the comparative advantage of the missile, since such an improved inertial system would be equally available to manned systems. In other words, dropping the pilot cannot improve bombing accuracy and will probably make it worse.

The guidance problem for ballistic missiles is somewhat different, and certainly does not invite comparison with manned systems. However, it is clear that a high degree of accuracy is not easily to be achieved, and becomes progressively more difficult with increasing range.

All-weather capabilities

The all-weather capabilities of missiles likewise are open to question. Here again the ballistic missile presents different, but not necessarily trivial, problems. For example, the launching of ballistic missiles under conditions of strong and gusty surface winds appears to offer difficulties at least as serious as the take-off and landing of aircraft under the same circumstances. Freezing rain is admittedly a serious hazard to aviation—would all go well with a missile launching under these weather conditions? It is submitted that nobody really knows. In the case of cruise-type missiles, one can anticipate the same sort of difficulties with the weather elements as are experienced with manned systems. Weather minimums for landing are an obvious exception to this generality, but this is not a major problem for aircraft in wartime operations.

In general, it is apparent that the pinpoint, all-weather capabilities of missiles, as advertised, are based largely on the incapacity of these systems to derive any benefit from human contributions en route, based upon vision, interpretation, and judgment. This is perhaps an interesting negative property, but can hardly be regarded as a positive recommendation. The case for missiles must be based upon something firmer than this—and a firmer basis will be outlined in the following sections.

Characteristics of Design

Guided missiles are distinguished from aircraft systems by the absence of crew members. This has far-reaching implications in the philosophy of design.

There are sizable savings in weight and space made possible by dispensing with the need for proper environment for the crew. Also certain safety factors can be relaxed, and the entire vehicle can be designed on a more austere basis than would be possible with human occupants. Since the missiles are planned for one-time use, the landing gear can be eliminated, and requirements for the service life of components can be relaxed. These effects are all of some significance—but a much more important advantage of unmanned offensive systems lies in the range capability inherent in the one-way mission. This makes possible the use of relatively small and inexpensive missiles as delivery vehicles at ranges that would be almost prohibitive for much larger manned systems, required to make the return trip.

In the case of defensive missiles, the comparison between manned and unmanned systems is much more complex. But here also, and for somewhat the same reasons as in the offensive case, a really major advantage of the unmanned systems emerges—namely, the clear superiority in altitude capability.

The utilization of guided missiles for one-way missions has already been mentioned, and this has another unique and important benefit—it includes the use of ballistic missiles, which is well-nigh impossible on a manned basis. The advent of ballistic missiles as long-range delivery vehicles clearly opens up a new order of in-flight invulnerability, and the effect of this will be discussed in the next section.

CHARACTERISTICS OF OPERATION

In comparing missiles with aircraft in the offensive role, one should notice first that cruise-type missile delivery is subject to approximately the same degradation from enemy action as is aircraft delivery; on the other hand, the high-speed, high-angle trajectory of the ballistic missile reduces greatly its vulnerability to active defenses. The advantage of manned aircraft is that their relatively high procurement cost can be amortized over many sorties. Under some circumstances that can easily be visualized this is an important advantage, and one that weights the scales heavily in favor of manned systems. However, there are at least two circumstances in which this advantage cannot be realized: first, when the decisive phase of the war is of very short duration; and secondly, when the active defenses are highly effective against aircraft. In the first case, missile systems will be preferable to manned systems because of their lower procurement cost; in the second case, ballistic missiles will be preferable to aircraft and cruise-type missiles because of their lower vulnerability in flight.

Human values

The circumstance of highly effective defenses has another important implication for offensive operations. It is characteristic of missile systems that they may be operated efficiently (from an economic standpoint) at loss rates in excess of 50 per cent, on the inbound flight only. Human considerations exclude the possibility of planning for this type of operation with manned systems —when excessive loss rates actually occur, the operation is drastically modified or halted. Consequently, campaign costs for manned systems against strong defenses are relatively high, because of the requirement to maintain loss rates below acceptable human standards.

It is perhaps appropriate to point out that it has been assumed here that manned systems are operated according to standards of human value prevalent in this country and other Western democracies. The effect of drastically altering these standards was illustrated by the record of the kamikazes during the last war. Most of what has been said in favor of guided missiles applies equally well to manned suicide systems, and even to less drastic manned one-way missions. Presumably this general idea will find no application by ourselves, but there is no assurance that it will not be used by an enemy.

Base vulnerability and mobility

One should not attempt to assess the over-all worth of missile systems on the basis of in-flight performance alone. Considerations of base vulnerability and mobility of tactical units are equally important. It is of course not possible to discuss these issues in detail, but some of the salient features may be noted. First, although guided missiles are comparatively light (at least in empty weight) and are launched more or less vertically, there is a strong tendency to accumulate impedimenta on the ground. Secondly, the deployment and resupply of missile units is made more difficult by the fact that the missiles themselves must be transported, rather than ferrying under their own power. Finally, it should be said that in spite of these (and other) complications, guided missiles appear to offer an excellent potential for mobile and dispersed operation. However, in order to realize this potential, it is necessary to approach the problems of base operations and logistics from a fresh standpoint, rather than attempting to fit missiles into the existing structure.

Flexibility

Another aspect of operations that deserves some attention is the potential flexibility of weapons systems. Here guided missiles stand at a distinct disadvantage. The superiority of the human mind over machines in performing many functions (such as visual recognition, evaluation of complex situations, decision based upon information derived during flight, and so forth) is well known and need not be belabored. In some applications such as tactical support operations and area defense, the inflexibility of missile systems militates strongly against their exclusive use at the expense of manned systems. In other applications such as strategic bombardment and point defense, flexibility is not at such a high premium and may allow extensive replacement of manned by unmanned systems.

Reliability

Some consideration must also be given to the reliability of missile systems. It is inherent in the general nature of these systems that high reliability is difficult to achieve, especially under the stresses of combat operations. In some instances where safety of friendly troops and populations is at issue, low reliability may be a crippling drawback; in other instances, low reliability may be regarded simply as increasing somewhat the cost of operations, and this may be entirely acceptable. In any case, it must be recognized that it is a long step from a laboratory item to an operational system. When this recognition is coupled with a requirement for maintaining air forces continuously in a state of operational readiness, it engenders a fair degree of caution in the rejection of manned aircraft systems.

FUTURE OF AIR WARFARE

The previous discussion has set forth some of the salient characteristics of guided missiles and their operations. It is now pertinent to inquire to what extent these characteristics make guided

missiles suitable for the type of warfare that one can reasonably visualize in the future, especially as this warfare is affected by the impact of nuclear weapon technology. The vastly increased firepower afforded by atomic weapons has the immediate effect of giving the offense an inherent advantage over the defense. This is true because the delivery of relatively few, but powerful, weapons on appropriate targets can constitute a severe and tragic blow even to a great world power. It is not likely that this can be entirely prevented by defensive action; it cannot even be prevented by striking the first blow, if the enemy has exercised reasonable care in providing exceptional protection for his offensive striking forces. Under these circumstances, the classical concept of air superiority becomes somewhat inapplicable. The potentialities of missiles for this kind of warfare were illustrated in the last war, when the Germans launched many thousands of missiles against targets in England and on the Continent, during a period when the Allies held almost absolute air supremacy. One need only translate this into terms of nuclear weapons to gain some inkling of the unsavory character of future warfare.

In spite of the horror with which all reasonable men must view the possibility of another major war, the present world political situation dictates that we maintain a high state of military preparedness. It is inevitable that the keynote of this preparedness should be the preservation of a well-established and well-publicized capability for delivering devastation upon any potential enemy—for in this way, the initiation of general war may be deterred. The characteristics of guided missiles are such that they are well suited to this role. This is true not only from considerations of military economy, but also because of the psychological value of the threat of attack by guided missiles. It requires very little imagination to regard a missile poised on the launching site as being effectively a pistol pointed at the heart, and the psychological value of this should not be underestimated.

Manned aircraft systems

In addition to the strategic forces, defensive and tactical forces are also necessary. In order to support the national foreign policy, there must be air forces designed to engage in such forms of limited warfare and in such areas as may be dictated by the changing exigencies of world affairs. The success of military forces in such conflicts, as well as milder measures such as economic and psychological warfare, may well spell the difference between ultimate peace and ultimate total war. The high degree of mobility and flexibility required to meet this military obligation must severely restrict the application of guided missiles in this role. Likewise in air defense, a mixture of manned and unmanned systems is necessary. Within the foreseeable future then, a sizable proportion of the national air power will continue to be vested in manned aircraft systems.

CONCLUSION

Guided missile systems have been found to have several important inherent advantages over manned aircraft systems. Principal of these are the greater range capability for offensive systems, greater altitude capability for defensive systems, more economic utilization in the face of strong enemy defenses and in campaigns of short duration, and psychological superiority as a deterrent. These advantages are bought at a price of reduced accuracy at long ranges, lessened strategic mobility, general lack of flexibility, and lower reliability. It seems clear that the price paid is well justified by the advantages gained for the performance of a large portion of the air force mission. The fruition of guided missiles into operational systems will require tremendous efforts, not only in research and development but also in the introduction of new operational and logistics concepts. The transition from manned to unmanned systems will necessarily be rather gradual, but will constitute a very significant advance in air power.

Donald T. Perkins, Ph.D., Washington, D. C., is Chief of the Research and Analysis Division of the Office of the Assistant for Development Planning in Headquarters, United States Air Force. He has served as chief of the Operations Analysis Offices of the Allied Air Forces in Central Europe and the United States Air Forces in Europe, deputy director of Scientific Services for the Air Weather Service; Air Force major (Reserve) during World War II; instructor in mathematics at Harvard University; and instructor in mathematics at Yale University.

Aviation and International Co-operation

By Robert Strausz-Hupé

THE development of aviation has given rise, from its very start nearly half a century ago, to the most extravagant expectations of future achievements. The spokesmen of the new industry, who as a group were the most articulate and enthusiastic among publicists of industrial promotion, claimed nothing less than that aviation would revolutionize civilization and unify the globe. In retrospect, the apostles of aviation now appear to have been sober, if not overcautious, realists.

It is no longer possible to conceive of aviation as merely one among several means of transportation. The impact of aviation upon the entire economic, social, and political structure of civilization has shattered traditional concepts of space and time. True enough, the speed of modern surface transportation exceeds by impressive multiples preindustrial rates of locomotion. But the increase of surface speeds has been, over a period of about one hundred years, relatively gradual, and modern surface transportation still follows, except for minor deviations, trails that have been blazed by preindustrial civilizations. In the United States, for example, the average railroad passenger train attains an average speed of 39.1 miles per hour; domestic scheduled air transportation has increased its average speed to 200 miles per hour. In addition, air transportation has clipped an average of 20 per cent from rail and highway distances between major American cities. Since, in the United States, systems of surface transportation are highly efficient, the margin of time-space superiority enjoyed by air transportation is probably the smallest anywhere in the world. Internationally, that margin is much greater; in the so-called backward countries it has reached staggering proportions. Moreover, the rate of increase of air speeds steadily widens, absolutely and relatively, the gap between air and surface transportation. While, in the United States, rail speeds per hour increased between 1939 and 1953 from 37 miles to 39.1 miles (5.9 per cent), air speeds increased from 153.3 miles to 200.6 miles (30.9 per cent). If, during the first fifty years, aviation has reduced, in point of time, the globe to the area of the European continent, it is more than likely that, before the end of this century, the earth will have shrunk to the time-space dimensions of one of the larger American states.

Impressive as are these figures, they are far from reflecting fully the present potentialities of air transportation as an agent of international and cultural change. Were current air speeds and available commercial transportation facilities fully integrated into the world economy, the world would be too closely knit to accommodate isolated communities. The fact is that the potentialities of existing systems of air transportation are far from being fully exploited. Moreover, existing systems do not employ the latest, albeit fully tested, techniques that scientific research and industrial production have developed. The restrictions on the present capabilities of civilian aviation and on the expansion of these capabilities within the limits of available techniques are mainly political and military, rather than technical and economic.

Development of Civilian Aviation

The progress of commercial air transportation from its haphazard beginning in 1919, when the KLM company (Royal Dutch Airlines) opened for business, has been truly fabulous. However, it has been uneven. It has been largely confined to a few Western countries. In 1938, the world's airlines transported 2.5 million passengers and achieved a total of 1.1 billion passenger miles. In 1953, United States domestic and international scheduled services accounted for 18 billion passenger miles and 250 million ton miles (freight). The corresponding figures for Britain were 1.5 billion and 35 million, for France 1 billion and 40 million. United States and European domestic and international scheduled services flew, in 1953, more than three quarters of the passenger miles flown by all the world's services. The annual revenue of the world airlines exceeded 2 billion dollars. Of this total, the United States accounted for approximately two-thirds. Commercial aviation is still largely a Western monopoly, with the United States controlling the largest share. It can be deduced from available figures that the Soviet Union's scheduled lines account for about 8 per cent of the passenger miles flown the world over. The Soviet Union does not operate an international commercial air service. Given the vastness of the Soviet Union's territory, more than three times the size of that of the United States, and its 200 million population, the Soviet effort in the field of commercial aviation appears insignificant when compared with the Western and, specifically, the American achievement.

There are in the world about 120,000 private aircraft. Most are used for auxiliary services by the airlines, by business firms, by flying schools, and for crop dusting, fire fighting, and surveying. Although the number of aircraft registrations has been increasing steadily and rapidly, the number of "family aircraft" is still relatively small: about one plane per 5,000 Americans. Modest as is still the role of the private plane in American business and leisure activities, the United States leads the rest of the world: Americans own about 80 per cent of the world's private aircraft.

Airplanes and Economic Progress

The unevenness of the world-wide development of aviation reflects international disparities of technological development and standards of living as well as international political divisions. Yet aviation itself could be a potent means for accelerating technological advance, for improving economic conditions, and for building bridges of understanding and friendship between peoples.

The organization of international air transportation has brought together in continuous co-operation the business firms of many countries. The airplane opens up heretofore closed areas, not only for tourism but also for economic ventures, new investments, exploitation of additional resources, and settlement. Air transportation has been a major stimulus to economic development in many areas, especially the underdeveloped nations. In the long run, the most significant contribution of aviation to world commerce will be the opening up of hitherto inaccessible regions to the continuous expansion of trade as regards both markets and resources.

The airplane facilitates the rapid advance of backward countries because it introduces them to the highest forms of modern technology and places them in the position to leap across historical

technological cycles directly into the most advanced stage of transportation techniques. Central Africa, parts of Central and South America, and parts of the Middle East (notably the Arab peninsula) have entered upon important industrial developments without launching upon extensive, costly, and time-consuming programs of rail and highway construction. In each case, the establishment of the air transportation system has been the indispensable condition of economic progress. In many backward countries, the very appearance of the airplane, the establishment of airports and repair and maintenance shops, and the recruitment of ground maintenance personnel from native populations have triggered psychological chain reactions resulting in the accommodation, within a matter of years, of preindustrial and, in some instances, of neolithic civilizations to the ways of twentieth-century technology. Although the impact of aviation on old and venerable cultures may not have been everywhere an unmixed blessing, it lessened the social and emotional strains and stresses of modernization by shortening the process and by introducing the backward peoples to most efficient and labor-saving techniques.

Africa

Nowhere, perhaps, has aviation facilitated a more rapid advance from primitive civilization to the machine age than in Africa. From the camel and the donkey Africa moved more or less straight into air transport. It is unlikely, to say the least, that the great transcontinental railroads which, fifty years ago, stirred the imagination of such empire builders as Cecil Rhodes, will ever be built. In Africa, the plane appears to be the most practical means of hauling freight to and from the interior. Roads in Africa cost about $25,000 to $30,000 per mile, and approximately 75,000 miles of highways would have to be built in order to meet present and foreseeable transport requirements. Under these circumstances the airplane, which can move straight in before other forms of transportation are developed, is bound to effect so large a saving in time and money as to suggest the concentration of available resources upon the expansion of air transportation rather than upon the construction of roads and rail lines. This trend is bound to affect profoundly not only the economic geography of Africa but also its political structure: it supplies a compelling argument for the federation and consolidation of many territories whose boundaries were drawn under the conditions of colonial rivalry prevailing in the nineteenth century. Then, coastal points served as bases for expansion into the interior, mostly along the great rivers such as the Nile, the Congo, and the Niger. Air transport now renders the interior regions of the African continent, heretofore inaccessible to each other except by roundabout routes via coastal terminals, increasingly independent of sea and river ports, and tends to draw them together economically, irrespective of their political allegiance.

International trade and industry

In the long run, aviation holds the promise of making economic protectionism increasingly difficult and of freeing world trade of its many, largely archaic, restrictions. Perhaps this view reflects an excessive confidence in the power of economic logic to dispel the parochial preconceptions of nationalism. Yet it is possible to discern current trends that point unmistakably in the direction of "airborne" internationalism.

Aviation has liberated the traveler from the necessity of following traditional routes. A German, for example, traveling to Portugal can now reach his

destination without crossing France and Spain. Air travel does away with the tedious formalities of border crossings, including visas and customs inspections. Private flying will make the conventional guarding of frontiers very difficult. Intercourse between contiguous countries will grow ever more intimate —as, for example, by the establishment of helicopter bus service between Brussels, Rotterdam, Amsterdam, and Cologne. To put it differently, countries have acquired many additional neighbors, and their historical borders are losing their functional significance —except in the realm of pure politics.

Air transport itself is a fully developed international industry stimulating the exchange of industrial products and raw materials and the progressive development of international communications. Air travel led to the organization of international enterprises in two forms: that of the Scandinavian Airlines System in which three countries have joined on the basis of parity in one firm, and that of the Pan American complex in which one large mother firm allows national affiliates to develop local traffic and to participate in international flying. Furthermore, there is the whole complex of international air traffic agreements concerning transit, cabotage, air bases, signals and communications systems, and rescue operations. Air transport, by virtue of its own developmental requirements, stimulates the expansion of international trade and—last, but not least—the exchange of information.

Political checks

Air transportation, by virtue of low passenger and freight rates and development of new markets, contributes directly to the raising of standards of living everywhere. Although present flight equipment is out of date technologically, it is being replaced gradually, albeit with exasperating delays, by aircraft allowing for cheaper travel not only for passengers but also for cargo. Moreover, as equipment becomes diversified, the slow-haul traffic links on the ground will ultimately be abandoned in favor of air routes. Prominent among the new types of equipment are the turboprops, presently used by the British European Airways Corporation and Air France, long-range high-speed commercial jets, short-range craft, and the rapidly improving "family plane." Air transport has not only invaded the field of passenger travel and cargo carriage (except heavy bulk); it has also created what may be called novel and special transport situations as, for example, the shipment of highly perishable goods between continents and the automobile ferry across the English Channel. Flying is essentially a cheaper mode of transportation in the double sense that it costs less than competitive forms of surface transportation, provided the distance traveled is longer than one to two hundred miles, and that it saves a great deal of time and fatigue. Again, the obstacles to reduction in costs and thus to the integration of aviation economics into world economics, are political in nature, rather than technical.

Although a good case can be made for the contention that the progress of aviation has been fostered by international conflict, an equally good case can be advanced for the argument that threats of war and ideological dogmatism now delay the full exploitation of technical improvements that would accrue, in a milder political climate, to civil aviation. The cost of air travel has not come down to its technologically feasible level because in some countries military aviation "hogs" the best equipment and because in other countries, especially in Europe and Asia, the doc-

trinaire socialization of air transport has saddled the industry with bureaucratic rigidities, noncompetitive languor, and unprofitable schedules that cater to national vanity rather than to customers' demands.

Contributions

It is tempting to dwell on the spatial and quantitative aspects of aviation, for eye-filling statistics support aviation's proudest claims to record achievements. The more enduring and significant contribution of aviation to the welfare of mankind must be sought, however, in the service it renders to the alleviation of suffering, to the conciliation of conflict, and to the making of that cultural synthesis which alone can render tolerable psychologically the economic interdependence of growing populations and supply the ethical basis for the peaceful coexistence of diverse political systems.

Relief and rescue

Perhaps aviation's most signal contribution to the alleviation of human suffering has been in the nature of disaster relief and emergency rescue as, for example, the American-British air operations—evacuation and food drops—on the occasion of the North Sea tidal disaster in 1953, and the airlift of diverse International Red Cross missions assigned to flood, famine, earthquake, and epidemic areas. Hardly a month passes without airplane flights, from one or several nations, to some country ravaged by one of these scourges, with food, medical aid (including airborne hospitals), seed grain, insecticides, and technical personnel. Planes, flying the weather, spotting vessels in distress, and participating in actual rescue operations, perform nowadays routine services that have become an integral factor of surface navigation: aviation has raised not only the efficiency but also the safety of international shipping.

Diplomatic mobility

Air travel has made possible frequent and virtually instantaneous contacts between statesmen. It is only natural that public attention should focus on those international conflicts that defy solution, and that a crisis resolved quickly loses its news value. A study seeking to determine how many times, during the last ten years, airborne diplomacy has succeeded in composing serious difficulties would be not the least interesting and instructive study in the field of political science. The machinery of the United Nations, and especially of United Nations organizations created for the mediation of international conflicts, is geared, to an appreciable extent, to the speed of air travel. And in virtually all cases of international conflict the speed with which mediatory efforts can be brought to bear upon the situation is of the essence. In the case of mediation in the Kashmir dispute and in the case of the personal intervention of the UN's Secretary-General in Peiping on behalf of the American airmen held by Red China, air transport was, in view of the pressing nature of the issues and the hazards of surface travel, the one and only practical means of transportation. Mr. John Foster Dulles's celebrated ubiquity owes as much to the efficacy of air transport as to the courage and stamina of that highly mobile statesman.

Modern coalition diplomacy and the rapidity with which American military and economic assistance has been made available to America's allies are inconceivable without the ministrations of aviation. The quick succession of high-level diplomatic meetings, now in Washington, now in Manila, then at Berlin, Geneva, London, and Paris, and policy consultations on short notice, such as the increasingly frequent conferences of the Prime Ministers of the British Commonwealth, are characteristic features of the age of air travel. Negotiations and ratifications of treaties which, only fifteen years ago, would have required many months, are now consummated in a few weeks. The time budget of air travel is also of importance to a statesman who, were he to depend on other means of locomotion, must fear that he might lose control at home or who, like the President of the United States during sessions of Congress, must abide by constitutional provisions which limit the duration of his absence from the Capital.

The ease and speed of air travel may not have improved the quality of modern diplomacy; only the diplomats themselves can do that. But air travel has improved indeed the diplomat's chances of dealing effectively with emergencies: a "brush fire" crisis in a remote part of the world need not get out of hand because leaders of the so-called great powers are not able to consult personally and promptly or because teams of observers cannot supply in time firsthand information that precludes—or at least should preclude whenever all parties concerned are animated by a measure of good will—those factual misunderstandings which, in the past, have led to many quite unnecessary wars.

Cultural interchange

Air travel has made possible frequent contacts between scientists and scholars and the display in many places and in a short time of artistic productions. Whole symphony orchestras, operatic companies, and *corps de ballet* are now being flown from continent to continent; managers can schedule tours of a few weeks without interrupting the domestic season. Thanks to the airplane, many more people than ever before can partake of the best other countries have to offer in the field of music, dance, and drama.

Europe for the little man

More striking, however, than the new mobility of cultural productions is the new accessibility of individual national cultures. Air travel has wrought a revolution in the field of tourism that has begun to affect profoundly national attitudes and tastes. Air travel allows a time budget for trips that no other means of transportation can rival. The average traveler with a month's vacation is no longer restricted to travel in his local and national surroundings. This allows for a fuller understanding of other cultures and for the living experience, however brief, of diverse national ways of life. Overseas travel is no longer the privilege of leisure. In the America of a 350-billion-dollar national product, the problem of where to spend one's vacation is, for the average salaried employee and industrial worker, no longer a purely financial one; it is rather a problem of time, to wit, of how to compress the greatest amount of pleasure and recreation into the two to four weeks of the average vacation allowance. Scheduled overnight flights at low tourist rates have brought parts of Latin America and most of Europe within the range of large segments of America's working population. Admittedly, only a modest beginning has been made. Even the low tourist rates are still high enough to cause the average member of the middle- and lower-middle-income groups to think twice before venturing on a two weeks' spree in Paris. But there is no reason to assume that the practice of a Middle Western manufacturer who has launched a program of workers' flying visits to Europe in chartered planes will

remain for long a unique experiment in industrial relations. If past trends of air-travel economics are valid indications of future developments, then it is a foregone conclusion that, ten to twenty years hence, an annual vacation abroad will be well within the range of the average American worker's pocketbook and time budget.

World-Mindedness

The widening of the American political horizon and the very real growth of American world-mindedness are due to many causes, among which wartime experiences, the harsh lessons of the cold war, and the heavy burden of world power are probably the most potent ones. There can be no doubt, however, that air-mindedness and world-mindedness are kindred states of mind. International air travel is, by itself, education in international relations. The soaring airplane unfolds the map of the world; the mountain chains that separate nations and the great rivers that carry their trade, ships standing for blue-etched shores, and caravans moving across deserts compose vivid and comprehensive patterns of world geography—maps, so to speak, which are traced to the scale of nature. If it can be taken as axiomatic that any medium which conveys to man a sense of the interdependence of peoples and the arbitrariness of political boundaries serves the cause of peace, then the airplane deserves well of mankind.

PARADOX OF AVIATION

Like most things wrought by human ingenuity, the airplane carries the burden of a paradox. It ministers to the physical security and comfort and to the cultural aspirations of growing numbers of peoples everywhere; it owes its startling technical development largely to the international race for superiority in instruments of destruction. Air transportation could be one of the keys to unlock the bars to international understanding and co-operation—provided statesmen and nations are rational enough to put this rational device to proper and full use. It is one of the most flexible and economic devices for keeping abreast of the tremendous acceleration of such world-wide tendencies as the increase of international commodity exchanges and all peoples' increased dependence on world trade; the increase of populations and the increased demand for new opportunities of migration and settlement; the increased danger of "local" issues bursting into universal conflict and the increased need for coping with "local" conflagrations promptly; and the increased mixing of races and the increased urgency of creating a cultural framework that can encompass mass societies now uneasily jostling each other. Aviation is no panacea of international co-operation. At this stage of technical development, however, the proper use of aviation is an indispensable prerequisite of universal prosperity and peace.

Robert Strausz-Hupé, Ph.D., Philadelphia, Pennsylvania, is professor of political science in the University of Pennsylvania, director of the University's Foreign Policy Research Institute, and lecturer at the Air War College, Maxwell Air Force Base, Alabama. He is the author of Geopolitics (1942), Balance of Tomorrow (1944), Zone of Indifference (1952), and, with Stefan Possony, International Relations (1954).

Report of the Board of Directors to the Members of The American Academy of Political and Social Science for the Year 1954

MEETINGS

YOU will remember that for many years the general topics of our annual spring meetings have related to international affairs. We have received suggestions from members that we should depart from this convention and take up some important domestic subject. After several discussions, your Board decided this year to organize the meeting on April 1 and 2 around the general theme of "Internal Security and Civil Rights in the United States." We are now engaged in recruiting an able panel of participants, including journalists, professors, and governmental officials. It is entirely possible that we shall return to an international subject in 1956.

The family of Edmund J. James, first president of the Academy, and later successively president of Northwestern University and the University of Illinois, has contributed a generous sum to the Academy to enable us, in conjunction with the University of Pennsylvania, to hold a conference to commemorate the centenary of his birth. The substantive topic for the conference, to be held May 20 and 21, 1955, will be "Methods of Financing Higher Education in the United States," and the proceedings will be published as part of the September volume of THE ANNALS. Also, they will be separately bound and distributed widely among university boards of trustees, legislative finance committees, foundations, and other interested groups. High-level financial policy officers, including a number of presidents, from the leading colleges and universities of the middle-western and northeastern United States have accepted our invitation to attend.

It is also our intention to hold a series of seminars on subjects of national interest as soon as the finances of the Academy are able to support them. These will be conducted in much the same way as the James Conference.

PUBLICATIONS

It is our intention to reduce slightly the size of THE ANNALS, partly to trim expenses and partly to encourage our members to read it regularly and throughout. The Book Review section will continue its adequate coverage.

THE ANNALS during 1954 covered these topics:

January	*New Goals in Police Management*
March	*Bureaucracy and Democratic Government*
May	*Prisons in Transformation*
July	*America and a New Asia*
September	*America Through Foreign Eyes*
November	*The Future of the United Nations: Issues of Charter Revision*

Total sales of our publications, as distinguished from circulation among members, amounted to $10,697 for 1954, which compares unfavorably with $11,747 for 1953.

MEMBERSHIP

During 1954 the Academy admitted 3,478 new members, compared to 2,513 in 1953. But 3,490 died or withdrew. We tried to ascertain the reasons for the withdrawals, and 31 per cent of those who did not renew replied to our questionnaire. Their reasons were

varied but reflected no appreciable dissatisfaction with our publication or meetings. Since we believe that the optimum membership of the Academy should be a little larger than the present 15,384, we shall increase our efforts to interest qualified persons in affiliating.

FINANCES

Our report for 1953 revealed that there was a deficit in Academy financial operations for 1952 and 1953. We instituted a moderate rise in dues in the early part of 1954, and this, coupled with certain economies in operations, reduced the deficit at the end of 1954 to a third of that of the previous year. But there is still a deficit in operations for 1954 of $7,173. Despite this, it is not our present intention to increase the dues further, nor do we presently intend to make overtures for foundation support. We shall try another year of operations at the present rates before we make a decision on changes.

CHANGE OF OFFICERS

We have granted our President a leave of absence for one year, to enable him to serve as Secretary of Administration of the Commonwealth of Pennsylvania. We took this action following a request made by Governor Leader and President Harnwell of the University of Pennsylvania. During our President's absence, Dr. Sellin will serve as Acting President, as well as Editor.

Respectfully submitted,
THE BOARD OF DIRECTORS

Thorsten Sellin, *Acting President*
C. A. Kulp, *First Vice-President*
Charles J. Rhoads, *Treasurer*
Raymond T. Bowman, *Secretary*
Jerome J. Rothschild, *Counsel*

Otto T. Mallery, M. Albert Linton, Alfred H. Williams, Stephen B. Sweeney, Norman D. Palmer, James C. Charlesworth

January 24, 1955

REPORT OF AUDITORS

January 20, 1955

CHARLES J. RHOADS, ESQ., *Treasurer,*
American Academy of Political and Social Science,
Philadelphia, Pa.

Dear Sir:

We herewith report that we have audited the books and accounts of the *American Academy of Political and Social Science* for its Fiscal Year ended *December 31, 1954.*

We have prepared and submit herewith Statement of Receipts and Disbursements for the year ended December 31, 1954.

The Receipts from all sources were verified by a comparison of the entries for same appearing in the Treasurer's Cash Book with the records of bank deposits and were found to be in accord therewith.

The Disbursements, as shown by the Cash Book, were supported by the proper vouchers in the form of cancelled paid checks or receipts for moneys expended. These were examined by us and confirmed the correctness of the payments made.

As the result of our audit and examination, made in the manner above indicated, we certify that, in our opinion, the accompanying Statement sets forth the results of its operating activities for the period under review.

Yours respectfully,

(Signed) EDWARD P. MOXEY & CO.
Certified Public Accountants

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

ARNOLD J. TOYNBEE. *A Study of History.* Vols. VII–X. Pp. xxxii, 772; x, 732; viii, 759; viii, 422. London; New York; Toronto: Oxford University Press, 1954. $35.00.

The first six volumes of Toynbee's *Study of History* were published in 1934–39. Of the new (four) volumes completing this vast work, Volume VII gives a further analysis of the nature and role of the Universal States and the Universal Churches as the phases in the growth and decline of civilizations. Volume VIII deals with the Heroic Ages and the contacts of civilizations in space. Volume IX is devoted to a study of the contacts of civilizations in time, of the law and freedom in history, and of the prospects of the Western civilization. Volume X is made up of essays on eminent historians, on chronology, of acknowledgments, and index.

Since Toynbee's fully developed "philosophy of history" was given in the first six volumes, the reviewed volumes do not add much to his theoretical framework. Their novelty consists mainly: (a) of some new details concerning the Universal States, the Universal Churches, the Heroic Ages, and the interaction of civilizations in space and time; and (b) of the change of some of Toynbee's conclusions given in the first six volumes.

As to Toynbee's theory of history, it has its strong and weak points. In my previous criticism of his *Study of History* I have shown that Toynbee's framework is a variation of O. Spengler's scheme which, in its turn, is a variation of N. Danilevsky's theory of history published in 1863. All three theories make a fatal error in taking a vast dump of diverse social and cultural phenomena, not integrated together by meaningful or causal ties, for a real unified system called "Culture-Historical Type," "High Culture," or "Civilization." Not being integrated unities, such dumps of cultural and social phenomena cannot either be born or grow or disintegrate and die. For this reason, many of the conclusions of these authors concerning "the birth," "the growth," "the breakdown," "the disintegration," and "decline" of civilizations are built on a foggy foundation and crumble by themselves as soon as the fatal error is perceived.

The main changes in Toynbee's views concern two points. While in the previous volumes the Universal Religions were

viewed as "the bridges" between the great civilizations, in the new volumes the great civilizations are considered as the bridges between the great Religions. While before Toynbee interpreted all great civilizations as philosophically equivalent and contemporaneous, now he classifies them in chronological and evaluative order as the progressive steps for realization of the ever greater and higher religions. Since both interpretations are not so much a scientific description of the empirical relationship between civilizations and religions as much as the subjective evaluations of whether civilizations ought to be the means for the end-value of religions, or religions should be the means for the bigger and better civilizations, the significance of this shift in Toynbee's views lies beyond the sphere of science.

When we turn to Toynbee's empirical generalizations, many of these appear to be either platitudinal or onesided or fallacious. Thus he indefatigably repeats that "spiritual progress is subject to a 'law' proclaimed by Aeschylus" that we "learn through suffering," and that this "learning by suffering" is the only way to spiritual ennoblement of mankind. Stating so, he evidently forgets that suffering produces not only saints, but also criminals and "the worst of beasts"—human animals. He entirely overlooks the negative effects of suffering: suicide, mental and physical disease, agressiveness, criminality, brutalization, which "suffering-frustration" generates more frequently rather than spiritual ennoblement. Instead of the much more adequate "law of polarization" infrustration, suffering, and calamity, he thus gives us onesided pseudo law of the "learning through suffering" which does not stand an elementary empirical test. Another example. For corroboration of his preconceived theory that the "declining" civilizations go through the cycle of: "premonitory wars," a "general war," a "breathing space," "supplementary wars," and "general peace," he gives us five cycles of this kind for the period: 1494–1945. When, however, his data are checked by the number and duration of the wars, the size of the armies, the magnitude of war casualty for each of his cycles, several of his periods of "general peace" turn to be as belligerent as his periods of "general war," and *vice versa.* His theory of the cycles of war-peace is thus clearly contradicted by the relevant empirical data. Third example of Toynbee's empirical fallacies is given by his credulous acceptance of Jung's theory of the unconscious, by the identification of this unconscious with the divine element in man, and by Toynbee's classification of the great religions (Hinduism, Christianity, Islam, and Buddhism) as "introvert" or "extrovert." Contrary to Toynbee, the future of mankind would indeed be hopeless if its spiritual and creative progress were depending upon the unconscious biological drives and their instinctive-reflexological mechanisms given in all animal species. By definition the "unconscious" activity is automatic and fixed; it cannot think and cannot create because any thinking and creative activity are always conscious or supraconscious processes. Instead of investing his hopes for the future spiritual ennoblement of man into "the supraconscious"—which is the main source of all the great creative achievements of man—Toynbee expects the salvation from the least creative unconscious forces viewed by him as the divine element in man. As a fourth sample of Toynbee's empirical errors his diagnosis and forecasting of the future of the existing civilizations can be mentioned. According to his theory practically all civilizations, except the Western one, have been either dead for many centuries, or are in a hopeless mortal agony at the present time. This equally concerns the Hindu, the Chinese, the Russian, the Arabic, and all the other "fossilized" and disintegrated civilizations. The only hope for the future of mankind lies in the Western civilization which also is in a dangerous state.

If we take one by one of Toynbee's empirical generalizations, most of them will be found to be either onesided or fallacious. This is largely due to Toynbee's poor knowledge of a vast body of sociological, psychological, and anthropological studies in the fields of social and cultural mobility, migration, diffusion, and transformation; in the field of sociocultural rhythms and periodicities, social organization and disor-

ganization, cultural integration and disintegration, and so on. Despite vast literature quoted and referred to in Toynbee's volumes, they contain almost no references to hundreds of important studies by psychosocial scientists of the problems treated by Toynbee.

When Toynbee discusses such problems as "law and freedom in history," "the truth of science and the truth of religion," he rarely touches the fundamental points of this sort of problem. He rather goes around or dodges these points and delivers to us mainly the vague generalities and unclear conclusions often backed up only by numerous quotations from the Old and the New Testaments. His footnotes in these parts show again his limited knowledge of the most important philosophical and scientific works dealing with this sort of problem.

Viewed as a whole, these volumes represent an eclectic mixture of science of history, philosophy of history, ethics and politics, theology and religion.

Side by side with these shortcomings, the *Study of History* has many strong points. It contains a multitude of remarkable insights and excellent elaborations of several basic topics of historical and social sciences. It opens the new vistas on many dark problems of these sciences. Now and then it furnishes the fresh and strikingly fruitful interpretations of several historical and social processes. Even when Toynbee speaks as a prophet, religious thinker, philosopher, or moralist, his utterances deserve our full attention.

To sum up: in spite of an overabundance of misreadings of historical events and other shortcomings of Toynbee's *Study of History*, it is one of the significant works of the middle of the twentieth century in the field of historical and social science.

PITIRIM A. SOROKIN
Harvard University

LOUIS J. HALLE. *Civilization and Foreign Policy: An Inquiry for Americans.* Pp. xxviii, 277. New York: Harper and Brothers, 1955. $3.75.

Foreign policy by slogan is a familiar feature of the American scene. In recent months the concept of "massive retaliation," so popular a year ago, has yielded to "atomic stalemate" and "balance of terror." The vice of all such catch phrases is their tendency to conceal basic issues that cannot be resolved by clichés.

The present book represents a serious attempt to free the discussion of foreign policy from this tyranny of ignorance and oversimplification. The author has stated his premise clearly. "If we are to have an effective foreign policy we need to base it on a conceptual scheme that reveals and explains the world in terms that bear the test of practical application" (p. 52). The major portion of his book is devoted to the development of such a theory of foreign policy.

Mr. Halle has not written a manual or a handbook of formulas that can be factored into easy answers to complex international equations. Rather, he identifies the considerations that affect a nation's foreign policy and examines them in the light of existing conditions. American foreign policy must take into account the spirit of our institutions; the circumstances that made possible our early freedom from European political entanglements; the events that have removed these historic protections and projected us into international diplomacy; the alternatives now open to us: isolation, dominion, coalition.

After examining each of these alternatives Mr. Halle concludes that coalition offers the only reasonable policy of success so he proceeds to outline what he regards as the minimum essentials of a foreign policy to prevent our destruction in a hydrogen bomb world. These essentials include the maintenance of a nuclear offensive power to deter its use by an opponent; a defense against nuclear attack adequate to discourage an opponent from attempting to incapacitate us by a surprise attack; military forces capable of frustrating an attack of a more traditional nature in the event that nuclear power is not used by either side.

The book is meaty and thought provoking. In developing his argument he considers such diverse topics as the nature of political power, the validity of the balance of power concept, the growth and decay of cultures and civilizations; the conflict of nationalism and Communism in Soviet policy, the particularistic character of Chinese Communism and the problem this presents to Russia. Whether Mr. Halle has succeeded in constructing a theory of foreign policy may be open to question. That he has written one of the most informative and useful guides to this subject is certain.

LAWRENCE H. CHAMBERLAIN
Columbia University

ALFRED H. KELLY (Ed.). *American Foreign Policy and American Democracy.* Pp. 170. Detroit, Mich.: Wayne University Press, 1954. $3.50.

Of the five Franklin Memorial Lectures for 1952–53 that make up this volume Professor Quincy Wright's is the most stimulating. Entitled "American Foreign Policy and the Concept of International Law," it sets forth alternatives of American policy in terms of an irreconcilability between power politics and international order. At the end, however, after singeing the whiskers of those who advocate power politics, Dr. Wright justifies the respect which this reviewer and so many others hold for him by observing that we cannot expect enforcement of the international legal order "unless the balance of power is relatively stable." Power, having been thrown out the front door, is brought in again at the back.

The second lecture, on "Military and Strategic Aspects" of our policy, is by one of our ablest military thinkers, Colonel G. A. Lincoln. It deals more with psychological factors in international relations, however, than with military strategy. Perhaps this reflects the poverty of our traditional thought in this field (Mahan excepted). No American speaking on strategy has much to build on in the way of developed theory since the writings of that un-American and dated thinker, Clausewitz.

Professor Bossenbrook, in the next lecture on "The United States, the Soviet Union, and Western Nationalism," is so compendious and abstract that the reader must do some occasional stretching to maintain contact with reality.

Next, in "American Foreign Policy and its Critics," Professor Dexter Perkins takes issue with Messrs. Hans Morgenthau and George Kennan, but in such a pleasant fashion that he seems to be merely amusing himself by throwing pebbles in their direction.

Perhaps the most thoughtful of these lectures is the final one, on "American Foreign Policy and the Future of American Civilization." Here Professor Kelly offers an historian's opinion "that the ultimate solution to the cold war is that the dynamism of Western civilization and the inexorable march of time will ultimately make it irrelevant. If this seems a difficult idea to grasp, remember that for the historian, nothing is so certain as the proposition that the present, too, will die, that it will become part of the past, and that the men of other generations will have new problems. . . . We cannot know what these problems will be; we can only be fairly certain that they will not be those which cry out to us now."

LOUIS J. HALLE
University of Virginia

JACQUES FREYMOND. *De Roosevelt à Eisenhower: La politique étrangère américaine, 1945–1952.* Pp. 154. Geneva: Librairie E. Droz, 1953. No price.

Reflecting the lively concern with American policy recently evident in Europe, this volume traces the revolutionary change in American foreign policy from isolationism to its present active involvement throughout the world.

Volume VI in the useful series of studies in economic, political, and social history, the book is essentially an analytical history of the major events in the postwar period—suitable attention is given the Truman doctrine, the Marshall plan, the Berlin blockade, North Atlantic Treaty Organization, the Chinese Communist issue, the "great debates" in Congress, Korea, and economic policy.

Although based on solid documentation (the author has examined an impressive quantity of government documents—some, such as *Resources for Freedom*, neglected in our own literature), its chief interest to Americans will probably derive from the comments rather than from the descrip-

tive content. In so short a study, there is naturally little new of the latter.

Neither neutralist nor apologist, Freymond feels that on balance the United States has done a remarkable job of rising to the responsibilities of its new power position. He finds, however, three major sources of weakness. First there is the relative weakness of our diplomatic personnel. He traces this to inexperience and lack of historical tradition in great power diplomacy, but feels we will improve with time and experience. Second, there is danger of excessive concern with domestic issues: American opinion must learn to subordinate regional and special group interests to national interests when there is serious conflict on important foreign policy. Third, there is a subtle source of danger from the very strength of the United States, from its unprecedented relative power: "the exclusive search for the national interest or national security, legitimate though it may appear, is full of dangers for the United States. It may lead, more or less unintentionally, from a policy conceived as basically defensive to actions felt menacing by the very ones they are meant to protect. The weight carried by the United States in world affairs is such —and the weakness of her partners so great—that if she does not herself take care to erect barriers to her power she may well risk crushing the others."

He finds evidence that even this last lesson is being learned: that American publicists and policymakers include many alert to such dangers and striving to remedy them. This conclusion is typical of a thoughtful and balanced work.

OLIVER BENSON
Northwestern University

THOMAS I. COOK and MALCOLM MOOS. *Power Through Purpose: The Realism of Idealism as a Basis for Foreign Policy.* Pp. 216. Baltimore, Md.: Johns Hopkins Press, 1954. $4.00.

Apparently the object of this book is to demonstrate that Roosevelt's "Four Freedoms" can be made to work (although no mention is made of the "Four Freedoms," and although their author assumed that Soviet Communism was in agreement with them). *Power Through Purpose* should be read as power through *moral* purpose, the "mission" of America being to establish a moral empire which shall girdle the globe and gladden the "hearts of peoples liberated with our assistance" (p. 212). Since Communist tyranny is irreconcilable with this mission, "coexistence" presumably being impossible, we must first "contain" it and then "overthrow" it. Cook and Moos assume that American foreign policy can move logically and deliberately from one position to the other, that other nations in the "free world" will move willingly in the same direction, and that Soviet (and Chinese) Communism will fall back with the same measured logic and deliberation. Joshua will march seven times around the city, the people will shout "with a great shout," and the Communists, like the defenders of Jericho, will be utterly destroyed!

It is difficult for an historian to criticize this new dialectic for "God's American Israel" (Reinhold Niebuhr's very apt phrase for the American concept of destiny). The reviewer confesses to a little awe and even respectful admiration for such learned exuberance and devout confidence. Cook and Moos fancy themselves as intellectual knight errants embattled against the so-called "power politics" school of American diplomacy which has worked out a different dialectic. Over and over again they proclaim that theirs is the only true realism. To this student, who refuses to see history as dialectic, the antithesis is not so apparent. Everyone, it seems, is a "realist."

Cook and Moos have furnished some challenging intellectual fare. It is Woodrow Wilson (or perhaps Don Quixote) in modern dress. In spite of their aversion to "power politics," the authors bow occasionally in that direction. They could hardly escape doing so, and yet invoke history to the extent that they have done. Britain is lauded for her past success in avoiding "the inconveniences of unadaptative legal principles" (p. 85), and America is exhorted also "to avoid the statist way." This sounds suspiciously like an injunction to play the balance of power. All eight chapters of the book are interesting and stimulating, though some of the historical assumptions are certainly open to challenge, and though it is difficult to discover a recommended foreign policy that differs in specifics from that which has been propounded by the "realists." The United States is depicted historically as a "social nation" rather than a "political nation," that is, a nation dedicated to humanitarian ideals in contrast to a national state concerned only with its own interests. This in itself is a bit of American nationalism on the part of the authors, and a very considerable oversimplification of history.

RICHARD W. VAN ALSTYNE
University of Southern California

ARTHUR P. WHITAKER. *The Western Hemisphere Idea: Its Rise and Decline.* Pp. x, 194. Ithaca, N. Y.: Cornell University Press, 1954. $3.00.

Under a new title, this volume deals with an old theme, the Pan-American theme. It contains eight chapters with the following suggestive titles: "Meaning and Origin of the Western Hemisphere Idea"; "Political Expression of the Idea: The American System"; "Divided America"; "New Synthesis: Sarmiento and Blaine"; "Drago's Economic Corollary of the Monroe Doctrine"; "Whose Hemipshere?"; "The Hemisphere of Peace"; "Two Worlds, New Style: Reunion with Europe."

It is remarkable what a well-informed and gifted writer can accomplish by assembling familiar facts under a fresh title and a rigidly logical frame of reference. The result is a significant and most interesting book. The conclusion is that the United States is no longer primarily interested in its Latin-American neighbors, and that they are not likely ever again to occupy a special place in its esteem. The world crisis that began in 1914 has made them subordinate to Europe and the Orient in the policies of their big neighbor.

The only important topic that Professor Whitaker fails to consider is the wisdom of this shift in emphasis, which became quite evident during the 1940's and 1950's. A discussion of this topic would probably begin with a consideration of the fundamental objectives of the foreign policy of the United States, the objectives of security, and prosperity. Or perhaps it would start with the foundations of the platform of isolationism, the early advantages of isolationism, and the besieging forces that eventually impelled the government of the United States to abandon that platform: the drive for foreign markets and sea power; the search for investment opportunities abroad; devotion to democracy and peace in international relations; and the disturbance of the power-balance by the rise of Japan and Germany and the relative decline of Great Britain. An adequate examination of this topic would finally raise these fundamental questions: were the departures necessary and were they wise from the standpoint of national security and prosperity? An attempt to answer them would involve as much speculation as history, and the author chose to avoid the issue.

I grant him the right to delimit his subject, but I cannot help feeling that he should have included a final chapter setting forth the fact that Latin America is not being entirely neglected, nor is this region likely to be neglected in the future. Its resources and its strategic geographical position are too important to the United States. Latin America is included in programs of foreign investment, technical aid, and cultural relations; and if and when the power-balance is restored by means of regional alliances and an effective United Nations, the Western Hemisphere Idea may be resuscitated, or if this balance cannot be restored, Latin America may recover its primary place in the esteem of the United States as a significant part of fortress America.

On certain minor points, one might wish to argue with its author. Nowhere does he state clearly the limits of the isolationist policy, which never included any severe restraints upon foreign trade and investment. Nor was it as monolithic as he asserts down to the 1890's (p. 92), as might be suggested by the empolyment of the United States Navy to open the ports of Japan and Korea. But I shall refrain from dealing with trivialities.

J. FRED RIPPY
University of Chicago

JEAN-BAPTISTE DUROSELLE and others. *Les relations Germano-Soviétiques de 1933 à 1939.* (Cahiers de la Fondation Nationale des Sciences Politiques, No. 58.) Pp. 279. Paris: Librairie Armand Colin, 1954. No price.

The relations of Germany with Communist Russia after World War I have concerned scholars and others before, during, and after that time. John Maynard Keynes warned his readers in 1919 that the Versailles peace terms would force Russia and Germany together, into a co-operation of danger to the victor powers. Writing in jail a few years later, Hitler bitterly attacked the Weimar Republic for establishing close treaty relations with Communist Russia and underscored the warning he himself was to disregard, namely, that Germans should not have friendly relations with a country whose purpose was to destroy Germany. And ever since 1939 students of history have been trying to understand the two decades that followed Versailles in an effort to make sense out of the relations Russian Communism had with the Weimar democracy and Nazi totalitarianism. For the historian the problem is a peculiarly bewildering and paradoxical one. Accustomed to a European history wherein the enemy of one war becomes an ally during the next, they find it difficult to arrive at an intelligible explanation for a situation where time fails in its work of partitioning events into simple tandem arrangements capable of being understood and allows avowed enemies to maintain rather close and friendly relations while entertaining the greatest fear of each other's power and ideology.

In this excellent study Professor J.-B. Duroselle and Professor Jacques Grunewald describe the diplomatic and economic relations of Germany and Russia from Hitler's advent to power, Grunewald dealing with the period down to the conclusion of the anti-Comintern Pact and Duroselle with that thereafter, down to the time Molotov succeeded Litvinov. Since the foreign policy of Russia in this whole period was directed by Litvinov, Professor Raoul Girardet tries to analyze the enigmatic career and character of the Russian who believed in collective security and in co-operation with the Western powers. The most important chapter in the book is the last one, in which Professor Georges Castellan gives a convincing account of the relations of the Reichswehr with the Red Army. Here he shows how Germany used Russia after 1920 to promote her own war industries and to provide military training for Germans in defiance of the provisions of Versailles. He also goes into a detailed investigation of the purge trials of 1936–38 to show that a number of people executed for high treason and for collaboration with Russia's enemies were guilty of no more than co-operation with the German army in accordance with Stalin's own wishes.

This story of Russo-German relations would have been fully told for the period if there had been an additional chapter describing the espionage activities of Russian Communists in Germany.

HARRY R. RUDIN
Yale University

QUINCY WRIGHT and others. *Research for Peace.* Pp. xii, 296. Amsterdam: North-Holland Publishing Company, 1954. $3.50.

In 1951 the Institute for Social Research in Oslo, seeking to clarify "the possible relations between scientific research and positive action in the mediation and solution of human conflicts," announced a prize contest for the best essay on "the Relevance of Scientific Research to the Peaceful Solution of International Conflicts." It has now sponsored the publication of the three prize-winning papers, and one of its members reviews them and comments on ideas contained in some seventeen other essays submitted in the contest.

The chief significance of this initiative lies in its recognition of the importance of applying as far as possible the methods of science to the peaceful solution of problems arising in the relations of national states. As such it reflects the trend in recent years to reject the deductive method characteristic of most pacifist thought of the nineteenth century and seeks to utilize the inductive approach of the physical sciences for the solution of social problems.

However, for man scientifically to study man in his social relationships is admittedly a far more exacting task than for the astronomer to study the stars in their courses. Momentous new scientific discoveries leading to greater understanding and control of the forces of nature have not as yet been paralleled by a growing understanding and control of human nature. Nevertheless, one must hope that even in the field of international relations if scientifically tested generalizations concerning specific social institutions and beliefs point to their inadequacy or harmful character, a new perspective may develop with respect to them. Thus they may be abandoned, although human nature itself has not changed.

It is universally recognized, however, and for obvious reasons, that it is much easier for the so-called exact scientists to agree on what they are looking for and how to find it than for the social scientists. In particular "the fluidity and boundlessness" of the field of international relations, as one of the essayists characterizes it, was well illustrated in the contributions to this contest. The essayists were far from reaching a consensus on priorities for peace research, and in some instances they even questioned whether research into the causes and prevention of war is as important as concentration on the positive requirements of peace. Moreover, although most of the contestants seemed to accept the continued existence of sovereign and independent national states, and tailored their essays accordingly, a few were disinclined to postulate for the future the fundamentals of the present order.

Pondering the views of the foregoing essayists, and especially the warnings of our most respected scientists, one has the uneasy feeling that it may, indeed, be later than we think, and that research of a more fundamental nature may be indicated. For while the pacifists of the late nineteenth and early twentieth centuries could argue that eternal peace was demonstrably in man's *interest,* nuclear scientists today tell us that it is necessary for our *survival.* If so, no tinkering with the present international order will serve.

FRANK M. RUSSELL
Berkeley, California

J. F. C. FULLER. *A Military History of the Western World: From the Earliest Times to the Battle of Lepanto.* Pp. xiii, 602. New York: Funk and Wagnalls Company, 1954. $6.00.

This volume, the first of three which will constitute a military history of western peoples down to the present, is a reminder from the pen of one of England's leading military critics that war and not peace has been the characteristic state of international relations in the past; and that this together with the imminent threat of the outbreak of hostilities on a global scale today is adequate reason for a study of conditions which produce wars, the factors which determine their outcome, and the use or misuse of their success by victorious peoples. It is a sober, not a sensational narrative, and so all the more deserving of serious attention. Following an Introduction which gives a rapid survey of military developments from the fifteenth century B.C. to 490 B.C., twenty chapters are devoted to the analysis of as many campaigns culminating in decisive battles. These chapters are linked by nineteen short chronicles aimed at giving a politico-military background for the campaigns studied in detail. Quite properly, the author makes no distinction between battles on land and battles on sea, for in this period naval engagements followed the pattern of land fighting, and there was no real difference between the training and functions of a general and an admiral. One is glad to find both Marathon and Poitiers omitted from the list of decisive engagements, but will not so readily agree that Pydna was more significant in this respect than Cynocephalae and Magnesia. The analysis of military operations is lucid, in general convincing, and shows evidence of careful study of ancient and medieval sources. References to modern works indicate wide reading, but there is no bibliography and the footnotes do not reveal how completely the writer has mastered the

specialized literature of his subject. Naturally, specialists in military history will dispute details of battle plans and the like. For example, many will prefer the Kromayer-Veith disposition of the Greek fleet at Salamis to that adopted in the book. Professional historians will find more serious ground for challenging some of the many judgments pronounced on historical developments in the chronicles. What impresses most of all, however, is the evidence that the basic principles of warfare have not changed since the days of Salamis, and that politicians, military leaders, and indeed whole peoples have shown the greatest incapacity to profit by the experience of both their own and other countries either in the remote or the immediate past in the preparation for and conduct of wars or in the formulation of military policy.

A. E. R. BOAK

University of Michigan

AMELIA C. LEISS and RAYMOND DENNETT (Eds.). *European Peace Treaties After World War II.* Pp. xvi, 341. Boston, Mass.: World Peace Foundation, 1954. $4.75.

This very useful book is a supplement to the World Peace Foundation's series *Documents on American Foreign Relations.* Its second half contains the text of the peace treaties with Italy, Bulgaria, Hungary, Rumania, and Finland. The first half is given to a narrative report on the negotiations leading to these five documents. There is a general account of the diplomatic setting and procedure, followed by the story of the actual negotiation broken down by chief issues regarding each of the treaties. The story is told from the official documents and some of the memoirs of the protagonists without any attempt to analyze, evaluate or appraise. The positions of the negotiating powers and their modifications in the course of the conferences are clearly outlined. It is a reference book which the student of diplomatic history can hardly afford not to have on his shelf. And the general reader may, with its help, reflect on how far things have moved from the order that those peace treaties intended to establish, and how little of the diplomatic accomplishment of 1946 still stands today.

GERHART NIEMEYER

Yale University

UNITED STATES GOVERNMENT AND HISTORY

PAUL HORGAN. *Great River: The Rio Grande in North American History.* (Vol. I: *Indians and Spain;* Vol. II: *Mexico and the United States.*) Pp. xvi, 447; vii, 573. New York: Rinehart and Company, 1954. $10.00.

Mr. Horgan has written many books but none has been a greater achievement than this one. Years of meticulous research were spent in gathering material for the *Great River.* The author has lived for years in the arid area of the Rio Grande. At home in the Southwest, Mr. Horgan has written as a lover of the region.

Probably Mr. Horgan has had the most difficult assignment of all who have written of the rivers of America. He made his task a labor of love and has told a story that is unexcelled. His artistic skill is revealed in the vivid descriptions, whether he is writing about a pueblo dance or a river house. Typical of the author's talent for characterization are the pen portraits of Sam Houston and General Zachary Taylor.

The Rio Grande river has a twofold role in American history. It both divides and unites. It marks the boundary line between peoples of Spanish origin and folk of Anglo-Saxon derivation. It separates two vastly different cultures, two contrasting civilizations, yet these two peoples unitedly belong to the Rio Grande basin. They share the mountains from which enough water is squeezed to create the upper part of this great river. Throughout the long course of this meandering stream these different nationalistic groups share in the history of the Great River. All of this story may be gleaned from these pages, numbering almost a thousand. Although he is fair to the Anglo-Saxon, the writer is in love with the Spanish.

Each of these volumes is divided into two books. The Indian Rio Grande and the Spanish Rio Grande compose the first volume while the Mexican Rio Grande and the American Rio Grande constitute the second. The stream's history is told somewhat chronologically. The rich variety of content is seen in the chapter on the "Stuff of Life" in Book I, in "Hacienda and Village" in Book II, or in "Collective Prophecy" of Book IV. There are a total of eighty-four chapters in the two volumes supplemented by four appendices. Although both volumes contain maps and each volume has a list by chapters of the sources, the historian will regret that the literary artist in the role of a historian did not use the paraphernalia of the craft. In addition, the last volume has a general bibliography and an index. This is writing at its best and history in its most interesting form. The *Great River* may not receive the Pulitzer Prize but it will be a serious contender.

GEORGE C. OSBORN

University of Florida

EDGAR EUGENE ROBINSON. *The Roosevelt Leadership, 1933–1945.* Pp. 491. Philadelphia; New York: J. B. Lippincott Company, 1955. $6.00.

To appraise justly this stimulating book, one should note its origin. Chosen, under the terms of a substantial bequest, to write "a contemporary appraisement of the Roosevelt influence . . . without fear, favor or prejudice . . . ," the author (to use his own phrase) has written "the story of the influence" of Franklin Delano Roosevelt in one volume instead of several. The result is a vividly impressionistic, critical, yet fair, essay, with Yalta as its climax, about the impact of Roosevelt's personality on the nation and the world in his twelve years as President, and since.

The author has supplied a monumental bibliography, but he has omitted or inadequently rendered many relevant facts. He quotes, throughout, the opposing current partisan views of Hoover's and F.D.R.'s self-serving, often retroactively edited, "Public Papers and Addresses," leaving us to pick our way between them. He speaks of F.D.R.'s "tragedy" in being "overwhelmed by the inexorable forces of his time," somewhat as though his leadership had been that of a dedicated and martyred idealist. True, he moved greatly at a very few momentous junctures; but this resourceful, gay-spirited, zestful, and at times courageous, adventurer among expediencies, with his genuinely humane intentions and his dominant personal ambition, instinctively avoided lost causes and major risks after attaining power. In some problems, crucial for his nation or the world, such as labor, the currency, and neutrality, he withheld his strong leadership deliberately, or led wrongly for his own interest, until conditions, which could probably have been controlled earlier, had indeed become overwhelming. In some others, as throughout his dealings with Russia, from Stalin's immediate violation of the recognition agreement until after Yalta, his fatuous faith in his own judgment and in abilities which he did not possess, brought misfortune beyond remedy. The tragedy was his, as part only, of the ageless, generic one—mankind's progress being ever thwarted by self-bound man.

Was the bequest soundly understood or executed? Can one convincingly appraise a man's influence in a situation without giving its essential facts? The author says he attempted this for the sake of speed, in the belief that appraisals made today will be used by the lawmakers tomorrow—the historian's abidingly comforting illusion. One may wish that Professor Robinson, with his background of distinguished writings about the Roosevelt era, had developed a full-scale factual basis for his "appraisement"; yet, even with the handicap he embraced, he has made a real contribution to posterity's understanding of Roosevelt's leadership.

LOUIS B. WEHLE

New York, N. Y.

WILLIAM FRANK ZORNOW. *Lincoln and the Party Divided.* Pp. xi, 264. Norman: University of Oklahoma Press, 1954. $4.00.

In early 1864 the Republican Party, operating under the name of the Union Party, appeared to have excellent prospects of success in the Congressional and the Presidential elections of that year. But the

Republican Party had been from its victory in 1860 deeply divided between the radical wing, whom the author calls Unconditionals, and the more conservative majority. This radical group were convinced that Mr. Lincoln was unsuited to complete the task of winning the war and especially the business of reconstruction. He desired to treat the vanquished humanely. They would be merciless.

Professor Zornow passes before us in review the three outstanding candidates of the Unconditionals—Salmon P. Chase, Benjamin Butler, and John C. Fremont—and reveals the maneuvering of each to prevent Lincoln's nomination and gain it for himself. Lincoln's finesse, his unsurpassed skill in political maneuver, rendered his nomination inevitable. These and the president's hold on the mass of Republicans also made the scheming and manipulation of his opponents for the nomination ridiculous, indeed pitiful.

After Mr. Lincoln's nomination the bloody failures of Grant in Virginia to gain victory and Sherman's inability in his Georgia campaign to pin Johnston down in the summer of 1864 carried Northern morale to the lowest point of the war. The Unconditionals tried in vain to have Lincoln removed as the nominee of the so-called Union Party and to substitute a more vigorous radical leader. With the Union victories of late August and early September—the capture of Atlanta and Mobile Bay—the Unconditionals began falling in behind his candidacy, but with the firm resolve to destroy the President and his program as soon as the war ended.

The Democratic Party was also bitterly divided between the Copperhead faction—extreme state rights champions and opponents of the war as unnecessary to restore the Union—and the main body of conservative Democrats. The latter opposed Lincoln's war policies as unconstitutional and destructive of civil liberty; they would continue the war, however, to preserve the Union, but would not make emancipation a condition of union. The Democratic Party would, as a first step to reunion, call a convention of all the states, including the Confederacy, to attempt to work out a settlement. Despite the fact that McClellan, who stood for the preservation of the Union, was nominated for the presidency, the Republicans were able to brand the entire Democratic Party as traitors and Copperheads—which has a very modern sound. The author is of the opinion that the false issue of domestic treason rather than the flagrant military interference at the polls enabled the Republicans to win the election, even though by a very narrow popular margin. It was, though a narrow one, a "popular endorsement of Lincoln the man" but not "necessarily an endorsement of the program for which the man stood." By his great skill he had held the Unconditionals in the party and thereby cemented its unity. "In holding the party together he did much to assure the ultimate victory of the Unconditional program he had so long opposed." This fixed for twenty years the unbroken rule of radicalism followed by another sixteen years of power after the Cleveland interlude and the triumph of big business. This was not what Lincoln had striven for.

Mr. Zornow has written a scholarly and important book. He is realistic and penetrating in dealing with unpleasant facts.

FRANK L. OWSLEY
University of Alabama

ROBERT J. MORGAN. *A Whig Embattled: The Presidency Under John Tyler.* Pp. xiii, 199. Lincoln: University of Nebraska Press, 1954. $3.50.

There is no lack of historical scholarship concerning this period. The following three claims are made in justification of this new volume. It is the first study of a single presidency in all its aspects. It refutes the conventional picture of Tyler as a vain, ineffectual president by showing him as a courageous, articulate, but much misunderstood statesman. It brings a dramatic focus upon those perennial problems of authority and initiative which confront every President. The third point is most valid, and alone should be sufficient to justify purchase of a reasonably priced book.

Dr. Morgan analyzes in seven chapters: the effect of the precedent set when Tyler chose the title of "President" instead of accepting the suggested designation as "Vice-President, now exercising the duties of President"; Tyler's use of the veto; Cabinet crises, which, while producing a total of nineteen members to fill six offices in less than four years, nevertheless effectively thwarted a nascent swing toward parliamentary government in the United States, which had been engineered during the month of Harrison's administration through the technique of selecting a pliant President and filling his Cabinet with men subject to congressional influence; the prerogative; President Tyler's influence on foreign relations; Tyler's early efforts to conciliate the anti-Clay Whigs; and his failure to develop any effective, organized partisan support of his administration either from Whigs or from his own Democratic associates.

There is current significance in the description of Tyler's defense of the executive responsibility for conducting investigations, and his comparison of the relative functions and results of these inquiries and of those conducted by Congress. The President wrote, "the personal reputations of persons connected with the investigation may well be better protected when the work is done quietly . . ." by the executive department. Such inquiries must often be made in confidence lest "impertinence or malignity may seek . . . the means of incalculable and irremediable injury to innocent parties. . . ." During this debate, more than a century ago, there was no attempt to forbid wholly either executive or congressional investigations. There was an emphasis upon the dual responsibility, both executive and congressional, for preserving some degree of secrecy while preventing the covering up of "corruption and incompetence."

The author has shown skill in his choice of emphasis within a period already "thoroughly examined." No new sources have been available to him and, judged by the very adequate footnotes, over 95 per cent of his materials are from previously printed works. A score of items are cited from the Tyler manuscripts in the Library of Congress. There is an adequate selected bibliography, and an index which the University of Nebraska Press should have insisted on having in a more complete form.

CHARLES M. THOMAS
The Air University

LEONARD D. WHITE. *The Jacksonians: A Study of Administrative History, 1829–1861.* Pp. xii, 593. New York: The Macmillan Company, 1954. $8.00.

For altogether too many years, students of the American past ignored the administrative aspects of our government. In 1948, Mr. White, professor of Public Administration at the University of Chicago, published a volume titled *The Federalists.* This was followed, three years later, by *The Jeffersonians.* These two volumes provided, for the first time, a scholarly assessment of the changing and developing administration of our national government. With the publication of this present volume, continuing the study down to the outbreak of the war between the states, Professor White has provided a trilogy that traces the evolution of our system of government through its formative years.

A sampling of chapter titles will give some idea of the scope of this study: "The Presidency," "The President and the Administrative System," "The Struggle for Power," "The Control of Appointments," "The Treasury and Customs Administration," "Decline of the Post Office," "Theory and Practice of Rotation," "The Consequences of Rotation," "The Rise of Examinations," "The Personnel System," "Government and the Public Economy," "Democracy and Administration." Declaring that "the most important influence upon the administrative system during the years from Jackson to Lincoln" was the broadening of the franchise and the parallel growth of party machinery and democratic sentiment, the author follows the complexity of the governmental structure and concerns himself with the forces that were at work and the changes that were taking place. "In these years of turmoil and anxiety," he notes, "the administrative system described by President Tyler as 'the complex, but at the same time beautiful, machinery of our system of government,' went steadily on its way, carrying on the

business of the American people as best it could."

The reader of this volume will be struck by the author's solid scholarship, his breadth of understanding, his delightful organization and style, and the hard core of common sense that preserves the balance of the study. The chapters will add to the understanding of the scholar as well as of the layman. In the twenty-five-page chapter on "The Theory and Practice of Rotation," for example, one finds not only a clear explanation of the pressures that resulted in the "spoils system" of Jackson's time, but a more unusual description of the ebbs and flows of public sentiment and of the way in which the successive political leaders reacted to popular pressures. The author's narrative is liberally sprinkled with quotations from both manuscript and contemporary periodical sources. It is this wealth of unusual source material that may appeal most to the general reader.

No serious student of the first seventy years of our nation's history will ever wish to overlook these three volumes. To the student of politics, to the practical politician, to the good citizen who wishes to know how our government functions in actual practice, this study of our developing administrative history will long remain of the first importance.

RALPH ADAMS BROWN
State University Teachers College
Cortland, N. Y.

LAWRENCE HENRY GIPSON. *The Coming of the Revolution, 1763–1775.* Pp. xiv, 287. New York: Harper and Brothers. 1954. $5.00.

The Coming of the Revolution is the most recent volume in the New American Nation series edited by Professors Commager and Morris of Columbia. This book, let it be said at the outset, confirms the impression already made by Wallace Notestein's *The English People on the Eve of Colonization* and Arthur S. Link's *Woodrow Wilson and the Progressive Era:* that this venture will be, after all, a fit successor to the notable series of books produced a half-century ago under the guidance of Albert Bushnell Hart. Professor Gipson's magisterial narrative of the Revolutionary movement within the thirteen American colonies meets both the special needs of the editors and the high standards of the author—an achievement that is not, as we have learned from other books in other series, the easiest thing in the scholarly world to bring off successfully. Out of the massive rock of his knowledge and understanding of the British Empire in America, he has carved a gem of descriptive narration and reflective judgment. *The Coming of the Revolution* is "pure Gipson," that is to say, a book about early America that is documented with severity, written with clarity, and marked by a measured, one might almost say Franklinian, affection for the old Empire.

Were one to seek an argument with the author, it would not be with his final judgment on the causes of the Revolution —"it had its source fundamentally in the fact that America now embodied a mature and powerful English-speaking community with a mind of its own and a future that it considered peculiarly its own. British statesmen as a group were responsible for the breach, to the extent of their failure to realize that the old system of imperial control was no longer applicable to a society so highly cultivated, so extended, and so numerous"—but rather with the offhand manner in which he refutes all other and more restricted views of these causes and yet fails to make a strong and positive case for his own broad interpretation. It might even be argued that this book is a learned survey of the events and forces that did *not* lead to the American Revolution rather than of those that did. In the end, however, there is no mistaking Professor Gipson's opinion of the causes of the Revolution, an interpretation with which there are few historians now willing to disagree. The Revolution took place when and as it did because the American colonies in 1765 had achieved a society more open, an economy more fluid, a pattern of religion more tolerant, and a government more constitutional than anything Europeans would know for years or even generations to come. To tighten the bonds of empire on a people so free and mature, indeed so proudly conscious of their direct line of descent from the mother country, was to ask for and get a full-scale rebellion.

CLINTON ROSSITER
Cornell University

LINCOLN LORENZ. *The Admiral and the Empress: John Paul Jones and Catherine the Great.* Pp. 194. New York: Bookman Associates, 1954. $3.50.

This book treats what may be called the Russian episode of John Paul Jones's life, during which, having accepted a commission from Catherine II, he served in the Russian Navy, participated in the Second Russo-Turkish War (1787–92), became personally involved with his superiors, and finally took his inglorious departure from Russia.

The author, using material from his previously published biography of Jones and from other sources, has prepared a study of broader scope than that attempted by others—for example, Golder in his *John Paul Jones in Russia.*

Lorenz handles his subject with a passion that does credit to his heart and often gives life to his story, but it is a passion so flaming as to weaken credibility. John Paul Jones, we are told, was a wronged man. He was the only effective commander in the naval engagements against the Turks; therefore Potemkin was led, through jealousy, to mulct him of his laurels and his command. Catherine compounded the evil first by refusing Jones a hearing and then by being party to a charge of rape that was trumped up to justify the scurvy treatment he was receiving. All were against him: "Potemkin the barbarian, De Ligne the courtier, Alexiano the pirate, Mordwinoff the boor, Suvorof the madman, De Ribas the tool, Cobentzel the intriguer, and Nassau the ass in lion's skin—this rapacious pack . . . lurking and snarling at the heels of Jones" (p. 145).

Never, we are urged to believe, was so honorable and brave a man so badly treated. As the case is presented, one is convinced that Jones was unfairly treated, but not that he was as blameless and his opponents as blameworthy as the argument implies. Lorenz' excess of passion leads him to make statements that do not agree with the facts. His acceptance of Jones's version of the story as the unvarnished truth and his disregard of Russian sources weaken his case considerably.

The author, moreover, shows a tendency to inject the current cold war into his reading of eighteenth-century history, seeking to prove that Russia is, has been, and always will be a land of tricks and tyranny. Absence of maps, a paucity of dates, and a lack of documentation also detract from the book.

In short, the faults of this work are of such a nature that they can be only somewhat mitigated by the author's vivid writing or by the intrinsic appeal of a little-known period in the life of a hero.

SIDNEY HARCAVE
State University of New York

ANTHONY HARRIGAN (Ed.). *The Editor and the Republic, Papers and Addresses of William Watts Ball.* Pp. xxii, 209. Chapel Hill: The University of North Carolina Press, 1954. $5.00.

When William Watts Ball died in 1952 at the age of 83, South Carolina probably lost its outstanding newspaper editor of the present century. Ball served as editor of the Columbia *State* from 1913 to 1923, and the Charleston *News & Courier* from 1927 to 1951. He sandwiched a four-year stint as head of the journalism program at the University of South Carolina in between his two active editorships.

Mr. Harrigan, a strong admirer of Mr. Ball, has collected and edited in book form a series of documents prepared by Mr. Ball for presentation at meetings of a number of South Carolina organizations, particularly the state press association and the Kosmos Club, a Charleston group composed of business men and university professors. The seventeen papers were presented between 1911 and 1945.

Mr. Ball's interests, in terms of the subject matter of the collected papers, were cosmopolitan. He seemed equally at home in discussing "dangers" to freedom of the press, the "crisis" in Christianity, the "folly" of the 18th Amendment, Calhoun, the U. S. Constitution, the economic posi-

tion of the Negro, and research in newspaper history.

When Mr. Ball's papers are examined with an eye to uncovering a central philosophy, there emerges a picture of an editor possessed of a conservatism which, while possibly sincere, seems hopelessly out-of-date. Mr. Harrigan states quite frankly that his subject "was a believer in the verities of the old Republic as it was in the days before 1860 when corruption in government was not prevalent."

Mr. Ball was an intense believer in the use of land to solve the problems of the day. He agreed with Chesterton that we must increase the proportion of people living according to ancient simplicity and then added "land is abundant for every man who loves freedom." This message was strongly emphasized by Mr. Ball whenever he discussed the status of the South Carolina Negro.

Mr. Ball was a staunch advocate of states rights and some of his preachments recall the debates in Congress prior to the outbreak of the Civil War. In a 1930 paper entitled "The Constitution Is Nullified," he suggested that the states adopt a parliamentary form of government with a new federal constitution the eventual aim, and after the advent of the New Deal he broached the idea of withdrawing all southern representatives from the Senate and House as an act of passive resistance.

It was Mr. Ball's good fortune to work for newspaper owners whose ideas must have coincided with his to a remarkable degree because he boasts of the editorial freedom he enjoyed. However, in "Of Chiefs and Staffers," Mr. Ball utters a mild confession when he says "I have not followed every impulse or seized the newspaper of which I am a trustee for my employer to express convictions opposed to his."

Credit must be given Mr. Harrigan and his publisher for placing the name of Mr. Ball before a public broader than his South Carolina following. Existing general histories of journalism do not mention his name. Now that the bright light of the printed word has been thrown upon it, inevitable assessments will follow. The conclusion seems likely that many of these will not view the subject with the kindness and sympathy shown by Mr. Harrigan.

FREDERIC E. MERWIN
Rutgers University

FREDERICK SHAW. *The History of the New York City Legislature.* Pp. vi, 300. New York: Columbia University Press, 1954. $4.50.

The volume represents the most complete history we have yet had of a municipal legislature in the United States. As such, it is most useful for its painstaking and detailed analysis of the evolution of the New York City legislature from 1851 (when "with the bestowal of the first trolley franchise . . . the Board of Aldermen embarked on a career of spoliation"), through the story of the Proportional Representation-Reform Council of 1937–49, to the Council of the 1950's which, "given an able and public-spirited minority," could perhaps "play a useful, but highly limited role in the city government."

The author's perspective is predominantly that of the municipal reformers who for more than a hundred years have labored to improve the City's legislative institution, but he tells the story of their efforts and the results with considerable objectivity and with impressive evidence of industrious and thoroughgoing historical research. His fundamental discovery is a paradox: as the city legislature, responding to the tireless work of the reformers, has risen in the quality of its individual members and in its public reputation, it has steadily declined in power and function. Today the Council is neither corrupt nor important; its role in the government of the City is passive and almost wholly ritualistic.

The Board of Aldermen exercised its greatest powers during the years 1851–1888 when, as "an unbossed assemblage of conniving politicians," it made its own bargains with the franchise-seekers and exploited other opportunities for its members. It was Croker, beginning in 1888, who became the first party leader to boss rather than buy the aldermen. Thereafter, the legal powers of the Board were slowly whittled away by the reformers, while the party organization transformed the individual aldermen into work horses for the district leaders. When the municipal reformers, under the long reign of the La Guardia administration, were able to replace the Board of Aldermen with a Council elected by proportional representation, they chose first to improve the quality and representativeness of the membership of the body before they gave it any real power. There was pronounced success in this cautious first step, but the experiment while still in its first phase was interrupted by the repeal of PR in 1947. Thus the Council, as elected under the new system of single-member districts in 1949 and subsequently, has no significant function or power-role in the City goverment; the governing of the City is the task of the Board of Estimate, the Mayor, and the administrative agencies. The Council's assignment is to consent, not to decide.

The author relates this story in a dozen well organized chapters—some of them chronological, but most of them topical (for example, "The Alderman and his Bailiwick," "The Ideology of P.R.")—and a chapter of summary and conclusions. As a historian, he emphasizes the ebb and flow of standards of morality and public ethics in and around the municipal legislative institution. As a political scientist, he might with profit have pursued with equal zeal the baffling enigma: what is the function of a legislative body in the governance of a great city?

MILTON SYDNEY HEATH. *Constructive Liberalism: The Role of the State in Economic Development in Georgia to 1860.* Pp. xi, 448. Cambridge, Mass.: Harvard University Press, 1954. $7.50.

This fourth and last volume of a series on the relation of the states to economic development delivers the final coup de grâce to the formerly widespread notion that laissez-faire theory generally dominated state policies in the period from the Revolution to the Civil War. Previous studies of Massachusetts, Pennsylvania, and Missouri, prepared under the direction of the Social Science Research Council's Committee on Research in Economic History, all have led to similar conclusions. In no case did the widespread theory of a limited federal government have a corollary influence on the role of the states.

Professor Heath has produced in this volume an extensive economic history of Georgia prior to the Civil War. While attention is centered on the role of the state, that role is so great that it ramifies deeply into nearly every aspect of economic activity. Only in agriculture, it would seem, was there anything approaching laissez-faire—and even in that area the state's land policy and many of its promotional activities were of considerable import.

This volume differs from others in the series by reaching back into the colonial period. The author identifies five periods in which the currents of "constructive liberalism" were especially strong: under the colonial trustees, 1732–52; in the Revolutionary era, 1776–85; in the reaction against the Yazoo scandals, 1796–1819; in the railroad era, 1827–43; and in the administration of Governor Joseph E. Brown, beginning in 1857. The bulk of the book is devoted to the evolution of this program after the Revolution in the fields of land policy, banking, internal improvements, railways, corporations, educational and labor policies, and the role of the state as regulator of economic activity. While the device of the mixed public and private corporation was widely used, especially in banking and railroads, the state frequently resorted to state-owned enterprise in the promotion of economic development.

The book reflects thorough and painstaking research. Its well-documented findings demonstrate beyond question that virtually all political and economic groups in the state were willing to accept a large degree of state action in the economic field when they felt it contributed to the development of the state or to the advancement of their vital interests.

DEAN R. CRESAP. *Party Politics in the Golden State.* Pp. xi, 126. Los Angeles: Haynes Foundation, 1954. $2.50 cloth; $2.00 paper.

In his *Party Politics in the Golden State,* Dean R. Cresap undertakes to provide a "systematic discussion of party organization in California." He begins, appropriately, with the legal regulation of parties and moves on to describe party bodies at county and state levels. Then follow brief chapters on the role of party in the Legislature, relations with national politics, nominations, campaigns, and party leadership.

A useful purpose is served in bringing together scattered information concerning statutory rules governing the parties, and in providing a general description of party bodies. When it comes to probing into or interpreting what goes on behind closed doors, Mr. Cresap appears to lack the length of acquaintance and depth of penetration in California politics to make him a sure and mature observer.

The study demonstrates the difficulty of explaining California politics in terms of party. Group politics determines the pattern of California politics far more than does party politics.

His handling of the nominating process is made unsatisfactory by the timing of the appearance of the book: evidently the results of the 1954 primary, which indicated that the worst of cross-filing was over, were not available; Victoria Schuck's full-scale study of the device was not yet published; he missed the great increase in Democratic clubs and councils during 1953–54 and their transformation of the pre-primary endorsement situation.

Although the author sustains his main thesis that a more responsible party system would produce better government, the work is marred by a number of defects. Coverage is too much limited to the 1950–51 period when he did field work. Excessive reliance is placed on northern California newspapers, even for events in Los Angeles. Many names are misspelled: Kenny not Kenney, Tenney not Tenny, Werdel not Wardel, and others. The careers of father and son, Frank C. Jordan and Frank M. Jordan, are merged into one. Jack Tenney's opponent for Congress in 1952 was certainly not "a Warren Republican." In addition to the $1,250 reported in 1950 as received from the Republican Senatorial Campaign Committee, Richard Nixon later acknowledged that his committee received $5,000 from the Committee through Henry Grunewald, yet the author fails to record anything beyond the file at Sacramento.

The usefulness of the volume further is diminished by the lack of an index.

Los Angeles

EDWIN C. MCREYNOLDS. *Oklahoma: A History of the Sooner State.* Pp. xii, 461. Norman: University of Oklahoma Press, 1954. $4.95.

Professor McReynolds, a native Oklahoman, is well fitted by extensive personal acquaintance with the life and leaders of his state and by long teaching experience at the University of Oklahoma to undertake his stated task. He treats his subject in sober and conservative fashion. The first fifth of the book surveys the Spanish, French, and American explorations which passed more or less fleetingly through or near what is now the Sooner State between 1528 and 1832. Indian affairs, with much justification, receive twice this space. The remaining two-fifths is concerned with permanent white settlement, traced through a chronological sequence of state political administrations. There is a brief concluding chapter on Oklahoma culture.

The work follows closely the pattern set by Edward Everett Dale and Morris L. Wardell in their *History of Oklahoma,* published six years ago. Undoubtedly, it is a decided improvement over its precursor in format and illustration, though not in content. It brings the Oklahoma story smartly up to 1953; it is scrupulously accurate in details of workmanship; it makes a distinct effort to relate Oklahoma events to the major strands of national development. Nevertheless, there is so little here that is new either in factual material or in interpretation that one must ask why it was considered necessary to write the book at all.

It should be remembered that there are already eight scholarly histories of Oklahoma extant, three of them published within the last eight years. Professor McReynolds states his desire to give readers "a brief yet reasonably comprehensive account of the state's growth" (p. vii); the jacket declares that the author "has had no purpose other than the reader's full enjoyment of a unique and remarkable segment of U. S. history." On both counts, the book is disappointing. While sections on exploration and Indians are extensive, major themes in subsequent Oklahoma history are obscured by a forest of administrative and legal detail, or left out altogether. Thus, the development and role of the oil industry are scarcely mentioned, the cattle and wheat industries receive surprisingly brief treatment, and the ugly soil conservation problem is quite ignored. Often it seems that what is omitted contains greater reader interest, as well as more real significance, than what is discussed.

Admittedly, the writing of first-class state history is no easy task. Ever since nationalism triumphed over the doctrine of state supremacy not quite a century ago, historians who deal with state history have had to wrestle with a certain sense of inferiority. What to do? Should one seek aggressively to rehabilitate what is today generally regarded as a lost cause, or must he accept second-rate status with becoming meekness and deference? There are ways out of this dilemma. One of the most attractive is to build state history around socio-economic themes. When social history is generalized on a national basis, it tends to become platitudinous; but on the state and local level—seen from close up, as it were—it reveals great variety and vitality. As an exemplar, one may cite *Montana: High, Wide and Handsome,* by Joseph Kinsey Howard—a model closely paralleled by Angie Debo in *Oklahoma: Footloose and Fancy Free.*

A much more common approach is to side-step the issue altogether while distracting the reader with a deluge of local faces and facts, each of which represents a prospective buyer, as every small-town newspaperman knows. It is this technique which produced the justly condemned "mug book" state and county histories of the post-Civil War decades. Unfortunately, in spite of certain virtues, the volume here considered is much closer in spirit to that ancient form of state history than the present reviewer would prefer.

FREDERICK D. KERSHNER, JR.
University of Wisconsin

CLYDE E. JACOBS. *Law Writers and the Courts.* Pp. vii, 223. Berkeley: University of California Press, 1954. $3.50.

The publication in 1942 of Benjamin R. Twiss' *Lawyers and the Constitution* provided a fascinating and significant narrative of how lawyers and some publicists took laissez-faire to the Supreme Court of the United States, and Mr. Jacobs' volume, though not written with the verve and suave humor of Mr. Twiss's book, is in many respects a worthy companion to it. Mr. Jacobs instead of dealing with the arguments of leading practitioners confines his study to three influential publicists of the last third of the nineteenth century and their impact upon American constitutional law, state and federal. The three publicists whose influence is traced by citation or quotation in numerous state supreme court decisions and a smaller number of decisions of the Supreme Court of the United States are Thomas M. Cooley, Christopher G. Tiedeman, and John F. Dillon.

After a general introductory chapter in which he depicts the conflicts between conservative principles and democratic reforms Mr. Jacobs devotes two chapters to the origins, development, and application of freedom of contract as a substantive limitation on legislative power, two chapters to the rise and decline of the "public purpose" concept as a limitation on the taxing and spending powers, and a final chapter to an evaluation of the contributions of the three writers to laissez-faire and constitutional law. Of the three publicists considered the most important was Thomas M. Cooley not only because his *Constitutional Limitations* was the most frequently cited authority on due process of law from its publication in 1868 until about 1900, but also because he contributed mightily both to freedom of contract and the doctrine of public purpose; whereas Tiedeman's contributions were confined to freedom of contract and Dillon's to the concept of public purpose.

Following a brief biographical sketch and a general summary of the major ideas of each of the publicists the author proceeds to analyze the principal federal and state cases in which the ideas of the publicists played a part in the ultimate decision. In this respect, therefore, the volume is much more a general history of the judicial development of the doctrines of liberty of contract and public purpose than it is an analysis of the major writings of Cooley and his valiant cohorts who succeeded so wondrously in equating liberty with economic license. Although the state courts were the first to embrace the principle of freedom of contract, the Supreme Court of the United States was the last to abandon it. The concept of public purpose was avidly accepted by the state courts as a bar to the rising tide of paternalism, but was resisted in the federal courts where it met with only a limited acceptance and then like freedom of contract went into discard unhonored, unsung, and unmourned.

In a relatively short volume Mr. Jacobs has provided a valuable account of a very important phase of American constitutional history, particularly the development of substantive due process of law in the state courts. He has also added to the understanding of judicial decisions as a process of imitation and borrowing. The volume has a brief index, a table of cases, and a very useful bibliography. Unfortunately, the publishers have had recourse to the increasingly frequent and frustrating device of placing the footnotes at the end of the volume.

ROBERT J. HARRIS
Vanderbilt University

MAURICE J. GOLDBLOOM. *American Security and Freedom.* Pp. vii, 84. Boston: Beacon Press, 1954. $1.50.

This book states briefly the grounds for and the conclusions reached by Mr. Goldbloom on the appropriate relation of American security to the freedoms guaranteed in both federal and state constitutions. It concerns three areas where conflict in recent years has been most virulent—(1) federal, state, and local public and private employment; (2) general legislation respecting security; and (3) education. Mr. Goldbloom starts from the supposition that the United States is faced by a world totalitarian danger, Communism, against which it must plainly protect itself. But he means by "protect" the protection of civil liberties from destruction by Communism. Implicitly, he seems to mean that a totalitarian United States "protecting" itself against a totalitarian Communism would be devoid of any moral significance.

In the process of working out his recommendations, Mr. Goldbloom gives a history of civil liberties which seems to establish: (1) that legislatures—federal, state, and local—and the courts have imposed more and more restrictions upon civil liberties; and (2) the number of such restrictions has increased enormously since 1945. Mr. Goldbloom does not himself so generally estimate the history of civil liberties, but he does assess recent developments as seriously threatening the whole civil liberties structure. It is for this significant reason that he wrote the present work, and the *American Jewish Committee* supported the research on which it is based.

Mr. Goldbloom's conclusions may be summarized as follows. (1) The present security program, both in government and private industry, is a serious threat to all civil rights in the United States. It fails to provide objective standards for distinguishing between positions involving security risk and those which do not or between the various degrees of security risk. Even though he believes that no man ought to be legally guaranteed a job, he does not think a security program ought to endanger the livelihoods and reputations of dissidents, nonconformists, ex-Communists, or even Communists who do not occupy sensitive positions or engage in unlawful activities. (2) A security program need not grant all legal protections guaranteed criminals, but the maximum protection required ought to be guaranteed. (3) Nonsensitive positions ought to be removed from any security program. (4) Legislation should avoid punishing anyone for *beliefs*; punishment should be only for *acts*. Present legislation punishes persons for advocacy or belief, thus giving color to the Communist argument that social change is impossible without violence or the use of force. (5) No one who is a Communist should be permitted to teach at institutions below the college level. On the college level, judgment should be made purely on grounds of professional competence and teaching standards. (6) Illegal techniques such as wire tapping and unwarranted seizure should not be used in the investigation of Communists—largely because they are unsuccessful. (7) A federal committee of reputable men is needed concerned with safeguarding civil liberties.

A book so full of practical suggestions deserves full-size analysis. Unfortunately, we must limit ourselves to three observations: (1) the concept of "security" needs deeper clarification before its relation to civil liberties can be appropriately determined; (2) the statement "no man has a right to a job" is one that today, in particular, needs careful analysis; (3) the restrictions upon guaranteed freedoms and upon the conditions which serve to guarantee these freedoms also deserve more careful investigation: for example, freedom to teach as a facet of freedom on speech.

ECONOMICS AND INDUSTRY

JAMES W. PROTHRO. *Dollar Decade, Business Ideas in the 1920's.* Pp. x, 256. Baton Rouge: Louisiana State University Press, 1954. $4.75.

The author is at pains to justify his choice of principal officers of the National Association of Manufacturers and United States Chamber of Commerce to represent business notions on public questions in the burgeoning "New Economic Era." He was obliged to limit his spokesmen arbitrarily, but those he lit upon invite objections. Grant that the period was one of overconfidence, with pride unsuspicious to the fall, it is still true that the pronouncements of these gentlemen were extreme on the side of self-righteousness. The wide field of their colleagues' views doubtless contained some more boastful and untaught, but for consistent ebullience commend me to these super-trade association executives.

It is not only in the wisdom of hindsight that they appear as braggarts. To any but their immediate members—and, let us hope, to many of them—they were clowns. At the time, the deliverances of the typical ones were ludicrous by any standards of information and sense. This turns the book into wry comedy. Finding himself in such company, the author, without effort, lets the reader enjoy the contradiction of crying up business initiative while reposing faith in protective tariffs, or shrilling the rightful autonomy of the elite while calling for vigilante treatment of workers' unions. With such easy targets his shots lose their victory.

And yet, as Mr. Prothro reminds, these presumptuous fellows were put in their conspicuous posts and kept there. Maybe it is the dizzy prosperity years at which we are to laugh, and not at the persons who made presidential addresses. Others besides themselves thought happy days would last forever. The egotism, forgetting sectors of the economy chronically in trouble and certain premonitory dips in business activity, was uncomfortably national. The sorry spectacle of peoples humbled by World War I was matched by the height of self-esteem to which this country was raised. The "Dollar Decade" was an inevitable, though not a righteous feature of the whirligig of fortune. It had its redress when our heads were bloody and bowed both.

The lesson is for now and for the future. We may wipe off our smiles at the expense of the business grasshoppers who took no account of winter to come, and remember rather what they taught us. Perhaps it was that propaganda may not long pose as philosophy, that selfish dogma is reproved by the demands of democracy, and that America is but one in a family of nations. Since the business bigwigs of Mr. Prothro's review held forth thirty years ago, the professors have come to claim more of the public ear. Are we doing better, as the atomic age will estimate us?

BROADUS MITCHELL
Rutgers University

J. D. GLOVER. *The Attack on Big Business.* Pp. xvi, 375. Boston: Division of Research, Graduate School of Business Administration, Harvard University, 1954. $4.00.

Because ours is a civilization dominated by "big business," criticism of the latter, in the opinion of Professor Glover, is necessarily criticism of business enterprise in general, and also of the entire range of economic, political, and social institutions which have grown up along with it, as well as of the cultural and moral values which it embodies or sets at naught. "Industrial civilization *is* the civilization of 'big business.'" If the reader falls into the "category of 'men of business'" of any sort, "when it comes right down to it, the critics are talking about *you*, about all the things they associate with *you*, about *your* civilization" (pp. 206–207, italics in the original).

"Written primarily for use by thoughtful business leaders" (Foreword, p. vii) the book purports to be a summary of the attacks made on big business with the declared objective being "to understand, not to rebut." The summaries, however, are inadequate to the point of being pitiable distortions. The critics, ranging from the early days of the Robber Barons and the trust busters down through to the writers of the Temporary National Economics Committee monographs and the monumental reports of The Twentieth Century Fund, are found to be generally ignorant of the elementary facts of business and are obsessed with the need of building "a case" in general disregard of the facts. They are charged with believing that profits are the sole business motive (pp. 288, 317); with having an entirely mechanistic approach (p. 291); being occasionally downright simpletons (p. 292); being hopelessly biased and mentally incompetent (p. 296); being dominated by the stereotypes of "prescientific thinking" (p. 301); or with employing the Nazi technique of defamation, substituting "big business" for the Jews (p. 300), and so forth.

No proof is offered for the dictum that "big business" speaks for all business enterprise; that it can and must speak for trade unions, co-operatives, farmers' organizations, and the like—all of which are part of contemporary society—as well. No real summaries are given in any place of the masses of evidence in question, although in many instances the relevant data read by the critics here being excoriated runs into hundreds of volumes of detailed and (not infrequently) sworn testimony. Certain lengthy and painstaking reports, notably those of the LaFollette Committee and those relating to the National Recovery Administration, are passed over without mention.

In rebuttal—and most of the book is rebuttal despite disclaimers to the contrary—we are told that "big business has served us well." It does not need so much to reform its ways as to take "positive action" to clarify its position to itself and the public. This appears to sum in the injunction to big business leaders to resort to "*new*, different, broader, more responsible thinking" (p. 337) about themselves, and the manner in which they are discharging their duties and responsibilities to the general public. What the author has to say sounds very much like the medieval notion of "trusteeship." Would he have scholarship cease its critical role and become apologetics as well?

ROBERT A. BRADY
University of California
Berkeley

MARTIN V. MARSHALL. *Automatic Merchandising.* Pp. xi, 275. Boston: Division of Research, Graduate School of Business Administration, Harvard University, 1954. $3.50.

As the subtitle indicates, this little volume of 275 smaller than normal size pages is the result of "A Study of the Problems and Limitations of Vending." Obviously, it was not intended to present a case for or against this relatively new development of retailing defined by the author as "a method of selling goods which employs a vending machine to complete automatically a sales transaction upon the insertion of coins by the customer." It is this fairly objective treatment that especially recommends it to students of marketing.

In presenting the subject the author proceeded logically and systematically. A careful definition of terms in the first chapter is followed by a brief history of the development of vending from its origin through 1954, with major emphasis on its current status in volume, types of merchandise, and organizational structure comprised of the machine manufacturers, operators, location-owners, and merchandise suppliers. In the next four chapters is given a rather clear and comprehensive picture of the functioning and problems of *established* vending machine operators with respect to the machines, locations, servicing, and operating results. The five chapters that follow deal with problems of new applications, especially by department stores, with emphasis on the unsuccessful experiments by Hudson's within the store and by Filene's in outside locations at air and bus terminals. The concluding chapter summarizes the major limitations to vending and its potentialities.

As personal selling cost tended to increase without an offsetting increase in productivity and problems and difficulties connected therewith multiplied, retailers have attempted, especially since the end of World War II, to resolve the situation by reducing or eliminating personal selling wherever possible. One such attempt is to be found in the several versions of so-called simplified selling variously adopted. Another attempt is the experimentation with automatic vending.

From this volume it is revealed that automatic vending is a relatively high-cost method of retailing; that retail gross margins on goods vended must be substantially higher than on the same goods sold through alternative methods; that vending increases the number of middlemen because the retailing functions are divided between operators and location-owners, respectively; and that the problems incident to vending, especially those arising from the machine limitations, are often much greater than those intended to be solved by substituting it for personal selling. Vending is obviously best used where no alternative is feasible, as a supplementary device, or as a substitute in special situations as on trains. Except where especially applicable, however, a substitution of vending for personal selling may be a case where the cure is worse than the disease. The special merit of this book, therefore, is in dealing with the subject in its proper perspective.

THEODORE N. BECKMAN
Ohio State University

The Nation Looks at Its Resources: Report of the Mid-Century Conference on Resources for the Future, Washington, D. C., December 2, 3, 4, 1953. Pp. 418. Washington, D. C.: Resources for the Future, 1954. $5.00.

This is a remarkably readable report on a conference of outstanding importance in its field. The original incentive for holding the conference and funds to support it came from The Ford Foundation; the conference was planned and directed by Resources for the Future, Inc., a new organization with a long-range program of research and education in this field. Focused on problems presented by the mounting pressure on natural resources, the conference had three major aims: to arouse interest in resource problems, to further understanding among the various interested groups, and to provide leads for further work by the sponsoring organization.

Working papers were prepared to guide discussion in the general and sectional meetings, but these papers do not constitute the body of this report. Rather the problems raised and some of the general conclusions are combined as introductions to the main divisions of the report, which consist in the main of expertly selected quotations from the discussions. The editors have effectively winnowed the chaff of free discussion from the grain, and have seen to it that a goodly number of the sixteen hundred persons present express their views.

The major themes were these: the increasing demands on the nation's land base; the best uses of rural land; water problems, ranging from competing uses to allocation of costs; domestic nonfuel minerals; energy resources; world resources from the American viewpoint; problems in resource research; patterns of co-operation, from grass roots to international levels; and public lands and our degree of dependence on foreign resources. This report is convincing evidence that the conference will

abundantly fulfill the aims set for it. Yet some readers will be dissatisfied, no doubt, with the scope and balance of this survey of resource problems and their solutions. The discussions seem, for example, to have been overly optimsitic, and too much concerned with the technical and physical aspects. One looks in vain for general recognition that the crux of resource-management problems is frequently found in man himself rather than in nature; one notes a willingness to look to government for aid but not for controls of any sort; discovery, development, and more productive use of resources get ample attention, but resource renewal and maintenance receive relatively little; and ideals of good stewardship of natural resources are lost sight of, at times, in the urge to provide for greater and still greater production.

The volume rings with vigorous clashes of opinion. One finishes the report with a feeling of having sat in on a spirited conversation among informed, keenly interested men of diverse backgrounds, and with a sense of gratitude that an expertly prepared record of this lively give-and-take is available for study at one's leisure.

J. RUSSELL WHITAKER
Peabody College

CLARENCE B. RANDALL. *A Foreign Economic Policy for the United States.* Pp. vii, 83. Chicago, Ill.: University of Chicago Press, 1954. $1.95.

The author has stated vigorously and clearly the case for a more intelligent, soundly based, foreign economic policy for the United States. His business experience and his experience as Chairman of the President's Commission on Foreign Economic Policy have combined to give him an excellent grasp of the subject matter. His writing shows understanding of United States' needs, a perspective on the whole range of international economic problems facing the United States, and a sympathetic understanding of the problems confronting the other free world countries.

Mr. Randall's treatment of the subject is based on three principles: ". . . reliance upon private effort and intelligence called forth by proper incentives, the governing control of vigorous competition, and the registering of choices through the free market." He consistently and cogently applies these principles in testing the soundness of various aspects of our foreign economic policy.

Mr. Randall's style is clear and forceful. He pulls no punches. No matter how controversial the subject may be, he applies his principles with impartial vigor. He refers to our Buy-American policy as a concealed subsidy to companies already strong and prosperous; to our agricultural policy as madness; and he says our shipping policy should be direct and aboveboard rather than disguised.

His approach to the tariff issue might be criticized as overcautious in contrast to his basic convictions. He recognizes, however, that "the process is one of growth, not explosive change." He explains the need for an evolutionary approach to the problem as due to inadequate public understanding, and to the failure of the business community to place the national interest above self-interest.

The dominant plea in the book is for greater awareness of the critical importance of our foreign economic policy and the need for better public understanding of it. In his words: "the United States does bear an awesome responsibility even though she did not choose it, and the individual citizen can pay an awesome price if he and 160 million like him walk out on the problem and do not try to understand it."

Mr. Randall and his book illustrate the contribution that business statesmen can make to the formulation of sound national policies. His book and his example may well serve to stimulate the interest of other business leaders and result in other contributions from this source.

WILLIAM C. HAWKINS
Tufts College

ALBERT LAUTERBACH. *Man, Motives, and Money: Psychological Frontiers of Economics.* Pp. xiv, 366. Ithaca, N. Y.: Cornell University Press, 1954. $5.00.

Wesley Mitchell used to say that economics is a science of human behavior. Economists might therefore benefit by comparing their own lore with that of the psychologists. Albert Lauterbach has made a careful study of this borderline area. He sets out to answer three questions:

(1) To what extent does business behavior follow the rules of decision-making postulated by economists? (Answer. To a very limited extent.)

(2) Does economic instability prevent people from acting "economically"? (Answer. Often.)

(3) Does economic reform of any desirable kind presuppose a different type of human being from the one known in Western democracies? (Answer. No.)

These condensations of the author's questions and answers do slight justice to his careful qualifications and tentative conclusions, or to the course of reasoning by which he arrives at his judgments. Also they do not reveal the many interesting observations which he makes along the way.

Profit making, he asserts, is the chief incentive of small enterprises, but at least above a certain minimum it serves largely self assertion and the achievement of status, which can be found by other means as well. Large concerns need profit, too, but "desire for continuity, financial stability or expansion is more often influential than a striving for immediate and definite profit."

Current economic institutions are characterized by instability which interferes with the atmosphere of confidence required for full efficiency in production and distribution. Personal insecurity is favored by the incompatibility of religious and other prevalent moral codes with the experience of the individual in the economic world. "Whether an individual is basically conservative, reform-minded or indifferent depends on the degree of independence or conformity in relation to the prevailing ideology of his family life during childhood and to his cultural and group setting." It is the same human being who plays economic roles and non-economic ones. These and other observations will not be startling to thoughtful persons, but they are often too little regarded in the formal thinking of economists.

The book contains a useful appendix of supporting material, a full bibliography, and an index.

GEORGE SOULE
New York, N. Y.

The International Bank for Reconstruction and Development, 1946–1953. Pp. 273. Baltimore, Md.: Johns Hopkins Press for the International Bank for Reconstruction and Development, 1954. $4.00.

Two years ago the Senate Banking and Currency Committee set for itself the task of surveying the foreign economic and financial activities of the United States government. One of the fruits of the initiative was this report, initially prepared by the Staff of the Bank in response to the Committee's request for a general description of the Bank's activities. As a result, the specialist in international investment will find little in the book that is new. On the other hand, the superficial reader may find it difficult to extract from its pages the easy vignette he wants. But a broad band of readers between these extremes will find it rewarding reading.

The book is not a critical analysis of the Bank's operations; staff writers associated with an institution are in neither the position nor the state of mind to provide this sort of objectivity. Nevertheless, it does contain some fairly skillful explanations of the more contentious policies of the Bank. Some of the rationalizations are so adroitly introduced, in fact, that the reader may not be fully aware that alternative courses of action exist, let alone their justification.

The basic policy choice for the Bank, of course, is its approach to prospective borrowers. A continuous spectrum of alternative approaches exists, ranging from that of the most conservative institutional investor to that of a politically-oriented foreign aid administrator. The Bank has managed to avoid these extremes in the face of heavy pressures. Its major accomplishment lies in the fact that it has managed to develop a raison d'être over the eight years of its operating life which commands the respect not only of the bankers of Wall Street and Lombard Street, but also of the planners of Santiago and Addis Ababa. But one could wish for a more critical exposition of the rightness of

the Bank's approach as compared with the alternatives.

Here and there, the staff labors overly hard to develop its defenses against real or fancied Congressional critics. The staff is at pains to point out, for instance, that the Bank's ties to the United Nations' governing organs give the latter no shadow of control. Though the Bank is a specialized international agency within the meaning of the United Nations charter, it is free to go its independent way.

More than once, too, the staff feels obliged to stress the fact that the Bank is altogether free of any philosophical bent toward statism; that it is an adjunct of private competitive enterprise, not a rival with such enterprise. In the year 1955, these seem old ghosts, well laid; but in earlier years they were issues which might have weakened the Bank's position with the Congress.

The most provocative chapter of the book comes close to being its shortest—that dealing with the Bank's incipient program of technical assistance. Force of circumstance has obliged the Bank to turn more and more of its attention to broad development programming in individual countries, and to the training of the countries' personnel. These are fields in which the complementarity of the Bank's activities with those of private investors is easy to discern. They are activities which will inevitably grow and which may yet represent the Bank's most valuable contribution to the process of private international investment.

RAYMOND VERNON

Milburn, N. J.

SOCIOLOGY AND EDUCATION

LYMAN BRYSON. *The Drive Toward Reason: In the Service of a Free People.* Pp. viii, 148. New York: Harper and Brothers, 1954. $2.50.

Lyman Bryson's *The Drive Toward Reason* discusses the role of the educator, and of adult education, in particular, in our modern society. The challenge we face today is one of dealing with the problem of what Arthur M. Schlesinger, Sr. has called the broad base of the pyramid of culture—the common man in a democracy, emerging gradually, shaping himself, and being shaped, by the impact of mass media of communication, into a new creature whose final form is yet to be determined. Can this new man learn to enlarge the area wherein he can "use reason instead of trusting to the customs of the past"? If so, will the change prove beneficial to him, and to the civilization which is evolved in the process? Mr. Bryson's answer to these questions is a decisive affirmative.

Our technological progress has led to the material success which can give man the leisure necessary to make freedom a possibility. If this progress, in creating a greater awareness of our problems, has made this seem a more dangerous world in which to live, we must recognize, on the positive side, that a spiritual progress and intellectual growth such as man has never known are also within our nearer grasp. In order to justify our faith in the ability of man to build a better future, we must realistically appraise the past as well as the present, and courageously work for a better way of life.

Perhaps the first step in this appraisal, in regard to adult education, is an understanding recognition of the vulgarity of the taste of the common man. There is no justification for the theory that standards are being lowered. Heretofore the people had little leisure or opportunity to express their desires; in the instances where they did, there is no indication that their taste was higher than that of the common man of today. The intellectual elite, far from condemning derisively, must realize that the large mass of the people have now, as in the past, different standards and needs from those of the intelligentsia. What is encouraging in the modern scene is that we live in a mobile society, and one in which ideas are important and subject to change. Modern man, then, unlike the peasant, who lived in the rigidity of a stratified class order, can move quickly and learn to grow. Bryson believes that the educator can make this intellectual growth possible; the intelligent leader must

". . . meet each one where he is and offer him a hand he can grasp."

DOROTHY RUDY

Westboro, Mass.

JACOBUS TEN BROEK, EDWARD N. BARNHART, and FLOYD W. MATSON. *Prejudice, War, and the Constitution.* Pp. ix, 408. Berkeley and Los Angeles: University of California Press, 1954. $5.00.

Within a few months after the attack on Pearl Harbor our government, acting on the advice of military leaders, decided to remove from the West Coast all persons of Japanese ancestry. Ninety days after this decision was made more than 110,000 Japanese Americans—citizens and aliens treated alike—had been uprooted from their homes and placed under armed guard in detention camps. The majority remained in such camps throughout the war.

At the outset of the evacuation an interdisciplinary group of social scientists at the University of California began to study it. The book under review is the third major volume to appear by members of this group; and like the earlier volume, *The Spoilage* by Dorothy Swaine Thomas and Richard S. Nishimoto, 1946; and *The Salvage* by Dorothy Swaine Thomas with the assistance of Charles Kikuchi and James Sakoda, 1952, it is likely to stand as the definitive work in its area.

The book is divided into three complementary sections; each of which could stand alone as a monograph. Part I, Genesis, presents a detailed and well documented account of the development of anti-Orientalism in general and anti-Japanese prejudice in particular. The thesis of this section is that a century of anti-Orientalism produced "a rigidly stereotyped set of attitudes towards Orientals which centered on suspicion and distrust." The activation of this stereotype by the war crisis generated the public hostility necessary for the evacuation.

Part II, Exodus, contains a comprehensive history of the evacuation together with an acute analysis of the reasons for it. The balanced presentation impresses. The camps are pictured neither as Boy Scout jamborees nor as American Buchenwalds. The same balance is evidenced when the question of responsibility is considered. The theory that it was a military necessity is effectively disproved. So also are the theories popular with liberal circles and students of minority group relations that the evacuation was due primarily to the influence of selfish pressure groups and self-seeking politicians. The exaggerations and outright fabrications by many writers who hold to these views are neatly exposed. Folly not knavery is the judgment here.

In Part III, Leviticus, the constitutional issues are considered. Basic here is the wartime relationship of civilians with their rights to the military with its obligation to wage war successfully. At stake here are major values in American life, for only the most sanguine can feel sure that these issues are not likely to arise again perhaps for a different and larger group of citizens. Professor ten Broek (who is primarily responsible for this section—Matson and Barnhart for sections I and II respectively) with deftness, logic, and a careful assessment of both the legal and social factors involved concludes that the evacuation and detention was a flagrant and unwarranted breach of constitutional rights: a violation compounded by the Supreme Court's support. "In this way did the United States Supreme Court strike a blow at the liberties of us all."

At a time when many scholars seem reluctant to own to any values, it is refreshing to encounter a book which openly espouses a whole series of values. Acceptance of the value orientation is not necessary to appreciate the factual record and thoughtful analysis of a unique chapter in American history.

University of Connecticut

ANDREW F. HENRY and JAMES F. SHORT, JR. *Suicide and Homicide: Some Economic, Sociological, and Psychological Aspects of Aggression.* Pp. 214. Glencoe, Ill.: Free Press, 1954. $4.00.

This study of suicide and homicide is divided into three parts: 1) Aggression, Frustration, and the Business Cycle; 2) Some Sociological Determinants of the Choice Between Suicide and Homicide;

and 3) Some Psychological Determinants of the Choice Between Suicide and Homicide.

The authors consider suicide and homicide in general to be forms of aggression, the former turned inward, the latter outward. In closing Part One, they say: "We started out with the problem of internalization of parental demands and expectations and the associated inhibition of outward expression of aggression. And we are ending our discussion with the problem of projection. . . . Let us restate our sociological and psychological bases of legitimacy of other-oriented aggression. Internalization of harsh parental demands and discipline produces a high 'psychological probability' of suicide and a low 'psychological probability' of homicide. . . . The 'psychological' determination of the legitimacy of other-oriented aggression is a function of the degree to which childhood aggression threatens nurturance. Clearly this 'psychological' basis cannot in and of itself explain the persistent variations in the suicide and homicide rates at differing points in the social structure and the life cycle" (pp. 118–119).

As a way of accounting for "differences in rates of suicide and homicide at differing points in the social structure and the life cycle," the authors turn to the proposition that "legitimization of other-oriented aggression varies directly with the strength of external restraint over behavior of the adult" as a function of the "relational system and position in the status hierarchy."

The latter position is important because it saves the authors from too great a dependence upon the idea that degrees of external restraint upon the child which do or do not threaten nurturance are adequate to account for the inward or outward direction of aggressive responses.

It is possible that Henry and Short could profitably explore further the force exercised by cultural variations in patterns of response permitted by those who suffer from resentment. In the South, for example, the more favorably placed as well as those of lowly status are more given to crimes against persons than in non-Southern areas of the United States: a matter not of social structure but of codes of honor.

It is also difficult for some students to believe that all forms of suicide grow out of resentment against other persons turned inward. All suicides are the result of frustration, *but not necessarily of frustration by other persons.* Criminally aggressive responses in many instances may not be the result of frustration at all; may even be the mores of subcultural groups.

This capable and provocative treatment of suicide and homicide is a challenge to future research. It merits the attention of the serious student.

AUSTIN L. PORTERFIELD
Texas Christian University

CECIL G. SHEPS and EUGENE E. TAYLOR. *Needed Research in Health and Medical Care: A Bio-Social Approach.* Pp. ix, 216. Chapel Hill: The University of North Carolina Press, 1954. $5.00.

Needed Research in Health and Medical Care is based on a seminar on the same topic held at the University of North Carolina in September 1952. The three-day session of forty-seven scientists from various biological and social disciplines produced 600 pages of transcript. The authors have not, however, presented this in the undigested form made possible by modern recording techniques. They have organized the fruit of these discussions into a contribution to interdisciplinary research.

Much of the discussion consisted apparently in mutual absorption of concepts and attitudes, and otherwise learning to communicate with one another. Of the five chapters, the first deals generally with the purpose of bio-social research, and the last is a summary of conclusions. "The Fields of Bio-Social Research" (Chapter II) are delineated as major categories defined by disciplines rather than a conceptualization of the health field from an interdisciplinary viewpoint. It appears significant that one of the categories of research presented is social epidemiology, which is admittedly a redundant term, although considered necessary. Problems of the social organization of bio-social research appear to be paramount. "Problems in Methodology" (Chapter III) are considered broadly in terms of the utility of cross-sectional versus longitudinal studies, for instance, as practiced in various projects, rather than an abstract consideration of the utility of various logico-statistical procedures. "Special Organizational Problems" (Chapter IV) deals with financing, location (university or health facility), recruitment of researchers, and the research and societal roles of the social scientist and physician. There are appendices concerning the organization of the seminar, and three selected preseminar statements, which were invited to serve in lieu of formal presentations at the meeting.

The problems mentioned illustrate the various positions from which bio-social research is viewed and from which the book will be considered. For those actively working in such research, the book is heartening because of the number of projects presented demonstrating that the problems are surmountable and the approach valuable, although what might be more useful to those in the field is a further interchange of results and some development of theory. The book will be of major value to those contemplating bio-social research in health. While it does not go far beyond the social problems involved in establishing interdisciplinary research, it covers these thoroughly. By a frank presentation of the issues that must be faced, it should facilitate the necessary process of establishing rapport, and reduce the time required for discussions on projects. This would be a genuine aid to much needed research.

CHARLES A. METZNER
University of Michigan

HERBERT PARNES. *Research on Labor Mobility: An Appraisal of Research Findings in the United States.* (Bulletin No. 65.) Pp. xi, 205. New York: Social Science Research Council, 1954. $1.75.

Research on Labor Mobility merits an important place on the shelves of social scientists, particularly those who have not done special work or have not had special interest in the field. The Social Science Research Council and the author have performed a valuable service in pulling together in summary form the concepts, methods, and findings of those who over the past two decades have done research on labor mobility.

There are six chapters. In the first the author develops a "framework" into which he proposes to fit the numerous individual studies. He makes it clear that short-run flexibility of the labor supply in relation to the allocation of the human resource in the 1930's and 1940's is his focus, rather than other possible foci, such as workers' goals and their ability to attain them, or the degree of fluidity in the class structure of society, or the effects of movement on workers and their families.

The five other chapters deal with the main conceptual and methodological problems involved in labor mobility research; the extent and character of labor mobility; the chief determinants of labor allocation; and suggestions for further research in the field.

In respect to the concept of labor mobility, useful distinctions are made among workers' ability to move; their willingness to move; and their actual movement. Content is also given to seven different sorts of movement: inter-firm; inter-occupation; inter-industry; inter-area; from employed to unemployed status, and vice versa; and movement into and out of the labor force. The validity and reliability of the sources of data on these items—including employees' case histories, employers' personnel records, and social insurance records on number and duration of jobs, wage rates and earnings, labor turnover, and other items—are considered.

To many readers the summaries of research findings on patterns of labor mobility and on the conditions—motivational and institutional—that determine these patterns will be of major interest. So also will the discussion of these determinants in relation to the assumptions and conclusions of economic theory on wage differentials and labor-resource allocation.

The author finds significant gaps and weaknesses in the empirical data available from the summarized studies. In order to test the universality of the conclusions reached by mobility research thus far, he suggests: (1) parallel studies in diverse

labor market areas, among specific occupations, and under varying economic conditions; (2) periodic surveys of the same labor market under changing economic conditions; and (3) sampling investigations on a national scale. He emphasizes the need for greater refinement of concepts and methodology, and he calls for more appropriate empirical tests of hypotheses relating to the institutional determinants of mobility, including seniority clauses and private pension plans. (In our judgment, guaranteed annual wage plans, if they become a widespread reality, will provide an especially rich field for this sort of study.) He ends by stressing the need for limited investigations addressed to specific problems; thus, he questions that research designed for the study of motivational factors in labor market behavior would be equally appropriate for the study of institutional factors like unionism.

CARROLL R. DAUGHERTY
Northwestern University

WILLIAM HABER and others. *Manpower in the United States: Problems and Policies.* (Industrial Relations Research Association, Publication No. 11.) Pp. xi, 225. New York: Harper and Brothers, 1954. $3.00.

As the editors have pointed out in their succinct Introduction, "manpower policy in any formal sense dates roughly from World War I." When the wartime problems became eagerly relegated to near oblivion, the "imposition of national quota limitations on hitherto virtually unrestricted immigration," returned manpower problems to the nation's awareness. World War II and the partial return of a war economy with the "police action" in Korea, and the never-ending "cold war" have sharpened that awareness and made it constant.

In this short volume the editors have brought together essays by the following authors, well-known in the field and several of whom have collaborated: Daniel Bell, Rensis Libert and Stanley E. Seashore, Solomon Barkin, Glenn W. Miller, Louis Levine, Gladys L. Palmer and Ann A. Miller, Seymour L. Wolfbein, Helen Wood, Irving B. Kravis, Gertrude Bancroft, Donald J. Bogue, Charles A. Meyers, Eli Ginzberg and James K. Anderson, J. Douglas Brown, Peter Heale, and Frederick H. Harbison and Albert Rees. The book is composed of sixteen essays rich in a condensed handling of the manpower problems of the national crises of the past and of many of the statistically measurable trends in the industrial structure; and several have presented stimulating attempts to peep into the future structural changes and particularly into the future relations between technology and the human factor.

It is impossible because of space limitation to point out the specific contributions and aids to thought in the several essays, especially since not one of them is lacking in one or another of these qualities. It will, therefore, be far more revealing of the reviewer's own interest than of an objective weighing of relative merits when he states that he has been greatly impressed by Daniel Bell's "Work in the Life of an American" and by Solomón Barkin's "Job Redesign: A Technique for an Era of Full Employment." In the former, the author has passed in intriguing panorama the industrial age from the Industrial Revolution through scientific management to the automation of our own day, and in a way which ties together the inventive in the mechanical sense with the deeply human. Solomon Barkin has boldly posed the humanistic question as to why our inventive genius should not be given the novel directive of adapting our mechanisms to the worker and to do so in an integrated and comprehensive fashion over the full extent of our machinery-using industry.

SELIG PERLMAN
University of Wisconsin

PHILIP TAFT. *The Structure and Government of Labor Unions.* Pp. xix, 312. Cambridge, Mass.: Harvard University Press, 1954. $6.00.

Professor Taft's latest volume carries a rather broad title which attempts in this manner to give an appearance of unity to some very divergent material. If he had followed an older manner of titling, the result would have been something like: "Essays on the Structure and Government of Labor Unions, Some Diversions on the Problem of Communism in Unions, and Some Thoughts on the Past and Future of American Unions." A glance at the chapter headings will elucidate this point. They are, in order of appearance (but in abbreviated form): union radicalism, opposition in union elections, dues and officer salaries, the unlicensed seafaring unions, the auto and steel worker unions, the future of the teamster union, and the present state of American unions.

The second, third, and fourth chapters have been the subject of previous works by Professor Taft, but not in such detailed and exhaustive form. In the chapter on opposition in union elections there is an excellent and cogent case made against viewing with alarm the long service records of the incumbents of the top offices. But it is doubtful if unions are as different in this respect, as Professor Taft believes, from many other organizations both business and fraternal. What might have been brought out by a closer study of the careers of the top officers is that the international president of today is the vice-president of yesterday, the secretary of the day before, the international representative, district council president, local union president, business agent, and so on down perhaps to the sergeant-at-arms. The top is ordinarily reached only after a long slow climb during which, as the data on salaries shows, the climber was frequently poorly paid when regard is given to the hours of work and the weight of responsibility. The opposition must work its way up in the same manner, or connect with someone already well up—there is no easy road on this score in any organization.

The problem of union discipline has never been an easy one, and it is likely to become more difficult in the future. Here, Professor Taft working from the union records differs with Professor Summers whose sources were the court cases. While there is more moderation in the former's opinions, there is still the problem of correcting even the infrequent abuses. As the unions have grown to encompass so many whose initial and continuing connection with unionism is no more than a contract requirement of membership, concepts of individual advantage, and organizational benefit or collective benefit clash more often. In this picture the Taft-Hartley Act limits union discipline except for nonpayment of dues. As a practical matter, therefore, the arm of government is thrown around the shoulder of the rule violator. It would be interesting to know in how many cases the "disciplined" member has simply refused to pay his fine and gone his own way.

The chapter on the auto and steel worker unions and that on the teamster union fit in, in a general way, with the sections discussed above. Why two unions (auto and steel), born in the same period, developed so differently is of interest. Professor Taft attributes the centralization and political quiet of the steel workers to its organization "from the top down." Here mature organizers and men of prestige in the labor movement came in at the outset and supplied the money and shaped the organization. The auto workers, on the other hand, did most of their own organization work, financed themselves, and were mighty suspicious of "outsiders." The teamster union is seen as presently in a state of flux —personality and technology are pushing for a larger role for the international, but it is too early to say they have triumphed, for the locals may yet have the final word.

The chapters on radicalism and the unlicensed seafarers stand away from the other material. Little here relates to either government or structure in the formal sense.

On the over-all view then, what we have are three cross-section chapters on structure and government, three unions which are studied from the aspect of government and structure, and added chapters on radicalism in general and in the seafarers unions. The data and discussion on government and structure provide valuable material for study and thought and much insight on the "insides" of unionism. It is this insight which puts Professor Taft's work much above the current plethora of "quantification" and raises hope that the American "Industrial Democracy" will someday be written.

HERBERT J. LAHNE
Washington, D. C.

KATE H. MUELLER. *Educating Women for a Changing World.* Pp. ix, 302. Minneapolis: University of Minnesota Press, 1954. $4.75.

American women in the past three decades have been assuming expanding responsibilities in the public and the business affairs of the nation leading to a perception of new dimensions for their lives. These dimensions are related not only to the realm of what they are doing, but to a perspective of the individual in a rapidly changing scene.

Professor Mueller from a rich background of teaching and counselling women students discusses the multiple roles of women and the implications for their education. With insight and keen wit, she analyzes the strains and tensions with which women are confronted as they fulfill their primary responsibilities in homemaking, in supervising the family, and as they seek an individualistic type of self-expression. The author reviews the available data on sex differences. She raises pertinent questions as to whether the current tendency to maximize the likenesses of men and women at the expense of minimizing their differences is wise. She makes the point that there must be curriculum provisions which will allow for the many differences in the life patterns and the social roles of men and women.

Professor Mueller indicates that most of the planning for women's education is concerned with the social concept of *the* American Woman patterned after the upper or upper-middle-class woman, a woman who represents only about 15 per cent of our population. The author with great clarity discusses the undercurrents of conflict in the attitudes of men toward the recent freedom of women. But the crux of the matter to Professor Mueller lies in the fact that our rapidly changing society no longer allows women self-fulfillment within the home. The mental health and social adjustment of more than half of the population are thereby affected. Simultaneously also are the national economy, the problem of manpower, and community welfare programs.

In outlining proposals for the education of women, Dr. Mueller approaches these functionally: education for earning, mating, homemaking, citizenship, politics, leisure. Her recommendations merit careful attention. There is a strong tendency, however, towards emphasizing the utilitarian purpose of education, although Mrs. Mueller does recommend that women's education should be centered around the liberal arts to give perspective, depth, and flexibility. Dr. Mueller has developed an interesting, well written, controversial, and significant analysis of women's current position and educational needs.

ALTHEA K. HOTTEL
University of Pennsylvania

PHILOSOPHY AND RELIGION

BARBARA WARD. *Faith and Freedom.* Pp. ix, 308. New York: W. W. Norton and Company, 1954. $3.75.

The Western world, so we are sometimes told, is at a disadvantage in its dealings with the Communist East because of its lack of unity of doctrine and purpose. Though in certain respects this may be a very real disadvantage indeed, there is reason to rejoice in it rather than to lament it. It is a conspicuous weakness testifying to a hidden strength. Miss Ward, eloquent standard-bearer of Western civilization, is well aware of this paradox. She is deeply disturbed by a process of disintegration which threatens not only the unity but the very basis of our civilization, and she voices a grave warning: "the West will prove more vulnerable than any other society if it abandons the pursuit of visions and ideals for, more than any other community, it is the product not of geographical and racial forces but of the molding power of the spirit" (p. 263). But while summoning us to rally forces she does not indulge in a vain hankering after a unity of doctrine comparable to that of Marxist theory, and even the uncertainty about our fate, so different from the assuredness of Communist faith in the society of the future, she is willing to accept as "that unpredictability which belongs to the really creative activities of mankind" (p. 297).

The faith of the Western world is not to be circumscribed by the paragraphs of an ingenious system: its superabundant wealth is embodied in a more than millennial history. Accordingly Miss Ward's plea takes the form of a rapid historical survey, sketched with bold strokes and designed to throw into relief the basic ideas and tenets of Western culture conceived in the spirit of Christian humanism. As a historiographer she is a pupil of Toynbee's, and even the moral of her story is couched in terms borrowed from this master. She sees the human race rising above primitive and archaic society and a life under the sign of necessity to that consciousness of its dignity and freedom which is the noblest gift to man of civilized life and spiritual religion. And she sees the gain and promise of this development menaced by the oblivion to which modern man has consigned the very ideas to which he owes his emancipation. So he bids fair to relapse into a condition of unfreedom similar to his primitive condition but infinitely worse. We must "confront the fact that totalitarian government in its extremest forms has returned when the waning of religion left the altars of the soul empty and turned men back to the oldest gods of all —the idols of the tribe" (p. 265). In concluding the author holds out the saving hope of a renewal of the springs of faith and of a reunion of divided Christendom.

A worthy cause ably defended, the reader will feel. But he may also remember that Christ came to save souls rather than ailing civilizations, and that there is some danger for a Christian apologist in talking too much of civilizations; and for an analyst of civilizations to lean too heavily on theology.

HELMUT KUHN
Munich, Germany

W. MACNEILE DIXON. *The Human Situation: The Gifford Lectures Delivered in the University of Glasgow, 1935–1937.* Pp. 448. New York: St. Martin's Press, 1954. $3.50.

In *The Human Situation,* Dixon writes beautiful prose full of poetic symbolism and with much quoting of poetry. The structure of his thought is somewhat submerged beneath a torrent of language and many contradictory statements.

His central thought can be summarized in terms of Being and Becoming. Our conscious life is spent in a world of ceaseless change and struggle, pleasure and pain, triumph and defeat, hope and despair, life and death. But this conscious life is only a small part of the total self or soul. The body restricts consciousness to this stormy bit of flickering awareness in the sea of Becoming. The self or soul in its wholeness dwells in the realm of changeless perfection and this realm is called Being wherein all potenalities reside. The struggle and suffering of the world of Becoming are necessary to bring to consciousness in the sequence of time the infinite potentialities of Being.

The soul is eternal in the realm of changeless Being. At death it lapses into the realm of perfection and quietude and at birth comes forth again into the world of Becoming. Every individual, apparently, has many times been born into the world of Becoming and passed again into the realm of Being. This alternation of periods of unconscious rest in Being with periods of conscious struggle in Becoming is what our natures need, according to the author.

Fine art gives a glimpse of pure Being in its changeless perfection, and so also does the changeless past when viewed in retrospect.

God is incomprehensible. Therefore the wise man will hold that idea of God which best serves to give him the "strongest incentive to living, and rouses his highest powers" (p. 276). This incentive to living and this rousing of men to their highest powers seem to be the ruling concern of the author in all his writing of the book. The world is one vast miracle and mystery so that we cannot know what is true and false in matters of major concern. Consequently we should hold to be true those affirmations which seem to provide this incentive.

In the thought of this reviewer this is dangerous doctrine. With such reasoning the Nazis and Communists have as good ground for their beliefs as we for ours, if their faiths give them as much incentive

for living. Incentive for living according to Dixon is incentive to fight and struggle.

HENRY NELSON WIEMAN

Houston, Tex.

E. A. PARSONS. *The Alexandrian Library: Glory of the Hellenic World.* Pp. xii, 468. London: Clever-Hume Press; Houston, Tex.: Elsevier Press, 1952. $7.50.

This is the devoted work of an enthusiastic and wealthy friend and patron of the arts. It is a full-dress study of the famous library at Alexandria from the uncertain days of its first beginning by Demetrios of Phaleron, under the aegis of Ptolemy Soter, to its final destruction in the seventh century by the Arabs. Mr. Parsons has sought—and generally succeeded—to leave no possible phase of the story undescribed, no avenue unexplored. Every author, both ancient and modern, who has ever written anything on any related or contiguous theme is quoted or discussed. At times the result is somewhat akin to that nightmare of the teacher, the term paper, with its many: "Professor XYZ has weightily said: . . . ." But it is all done on the truly grand scale. All this does not tend to make the book conspicuously unified or nonrepetitious. Perhaps it does give it a taste of the encyclopaedic. There are a great number of lengthy asides. Some of them are of real interest and point, as the section detailing the other great libraries of antiquity. Others are of less consequence, as the lengthy but somewhat amateurish rehash of the Homeric Question. At any rate, the net result is a vast amount of material from which a mighty good book could be written. The whole work evidences clearly the hand of the zealous amateur rather than that of the trained professional scholar. The bibliography of twenty-nine pages is an amazing medley of pertinent and quite extraneous matter. In contrast the index —and a volume such as this needs a very full one—is totally inadequate, failing to list highly important matters in discussion in the preceding pages. A quite unsystematic way of citing authorities is to be found everywhere: Revelations II 13; 2 Mace. IV 33 are samples. The casual reference (p. 40) to Titus and the bronze cherubim he found in the Temple of *Solomon* or the remark on p. 183: "Jesus, as a child, was taught from manuscript rolls and verbal lessons of his native rabbins, the *Old Testament* from the Greek version, *The Septuagint*" will suggest that the reader will be wise to be on his guard if he is reading in a section outside his own domain. It would be ungracious to end on this sour note or to deny that in this labor of love—it must have cost a deal in time and money—much excellent material is to be gleaned. Certainly he has not erred by deliberately skimping on any part of the garment or its fringes.

MORTON S. ENSLIN

Moylan, Pa.

LIONEL KOCHAN. *Acton on History.* Pp. 184. London: André Deutsch; New York: British Book Centre, 1954. $3.00.

The Acton boom continues. Half-a-dozen studies on this enigmatic English nineteenth-century historian have appeared since the war. Mr. Lionel Kochan's brief and suggestive essay is one of the best of them. It is based, as are most of the recent crop of Acton studies, on the great mass of the historian's working notes now available in the library of Cambridge University. Mr. Kochan takes even more emphatically than did Miss Gertrude Himmelfarb (*Journal of Modern History,* December 1949) the position that where there is a conflict between Acton's published opinions on a given point and his opinions as reflected in these notes, it is the notes that are the more faithful reflection of his mind.

For Mr. Kochan, after distinguishing between the first period of Acton's life up to the Vatican Council of 1870, when he was a hopeful and articulate Catholic Liberal, and the second period, when after the defeat of the Liberals on the issue of Papal Infallibility, he retired to a life of contemplation and note-taking for the famous unwritten *History of Freedom,* goes on to make as a main point Acton's alienation from his age. Acton failed to publish not because he couldn't write—he had proved abundantly that he could—not because of any "perfectionism" masking some psychological block, nor for any of the many other reasons that have sometimes kept great scholars from publishing, but because, in a sense, he did not dare publish his real opinions. In fairness to Mr. Kochan's subtle analysis, it must be noted at once that he does not attribute to Acton any vulgar fear of public criticism, nor even of being simply misunderstood, but rather a very fundamental feeling that he would not be listened to, would not really get into the Victorian mind at all.

He had begun, Mr. Kochan finds, as a romantic historian with the characteristic romantic aim of reliving history, of identifying himself by an "inward vision" with the past. But he saw very early that this vision led to "historicism," to the doctrine that there are no standards by which to judge the historical process. Acton's inward vision was complemented—indeed opposed in an almost Hegelian dialectic—by the "external vision" of morality. The historian can and must judge, and his standards must be those of the moral absolutes, and especially the most basic of all absolutes: thou shalt not kill. The historian thus possesses the key that will resolve the horrible paradox of historicism. He can hold up to men the ideals so long, so constantly violated in the course of history, until someday men will see the error of their ways—and there will then be no more history. "The choice remains with man—'Knowledge of history means choice of ancestors.'"

Perhaps Mr. Kochan sharpens the conflicts within Acton's mind overmuch, but there can be no doubt that there is in Acton a very strong strain indeed of theological and metaphysical absolutism. The last quotation Mr. Kochan makes from the unpublished notes is revealing: "Liberalism essentially revolutionary. Facts must yield to ideas. Peaceably and patiently if possible. Violently, if not. . . ."

CRANE BRINTON

Harvard University

WILLIAM O. SHANAHAN. *German Protestants Face the Social Question:* Volume I: *The Conservative Phase, 1815–1871.* Pp. xii, 434. Notre Dame, Ind.: University of Notre Dame Press, 1954. $6.75.

German Protestants Face the Social Question is a volume in the International Studies of the Committee on International Relations of the University of Notre Dame, to be completed in a study, covering 1871–1933. The entire research gives promise of being a penetrating analysis of how German Protsetantism passed from quietism to approval of Hitler, with many valuable insights and judgments added, including: the spiritual separation of Germany from Western Europe was finally accomplished by the influence of its idealistic philosophy between 1770 and 1840 (p. 11); "Hegel, in attempting to reconcile faith with reason, completed his task with such formidable thoroughness as to dispense entirely with theology and to end by identifying . . . Christianity with a world process entrusted solely to the state" (p. 19); "*Protestantism . . . had the special qualities necessary for coexistence with an omnipotent state . . .*" (p. 20); "Pietism began as the German phase of that interconfessional and undogmatic religious movement which included Quakerism and Methodism, and even embraced such Catholic manifestations as Jansenism and quietism" (p. 25).

The author sees the revolution of 1848 as bringing the Catholic masses to political power in Germany (p. 193) with the loss of interest of the urban and industrial groups in the Protestant clergy with their slogan of "rights from above" and "revolution from below." There were "no *unbaptized* proletarians." The great moment of 1848 was when Wichern made his eloquent plea for a "Volkskirche" in reply to the Communist Manifesto, becoming the first European churchman to foresee a deadly battle between Christianity and Communism for the soul of the proletariat" (p. 214).

But no united church resulted and the national proved of greater significance than the social question. Yet Prussia was painfully to discover that self-respect, civil freedom, human reason, law, and education were not the solution of the social problem. Not even the formal separation of the civil and ecclesiastical administration would do. Christianity would solve the basic *sin* by the conversion of individuals; socialism,

the basic *evil* by universal economic remedies (p. 268).

Here are some conclusions: "conservatism can only succeed as a political principle when men have lost confidence in the future. . . . Prussian conservatism denied man's sovereignty over himself in insisting that he accept his fate in a traditional, authoritarian, and all-encompassing corporative regime . . . a dangerous illusion. . . . At a decisive moment, German Protestantism had cast its lot with the authoritarian and the agrarian traditions of European life, openly scorning the urban-industrial and liberal world that was coming into being. *German Protestants thereby risked the loss of the common man's allegiance,* for by committing itself to monarchical authority, Protestantism could not take the side of the people" (p. 301); "there was actually less factory and social legislation in Germany than in other nations" (p. 415); "the chief weakness [of the evangelical-social movement] was the neglect of practical measures" (p. 413).

University of Southern California

CHARLES C. COLE, JR. *The Social Ideas of the Northern Evangelists, 1826–1860.* Pp. vii, 268. New York: Columbia University Press, 1954. $4.25.

The great influence of the clergy on American patterns of thought during the Middle Period needs to be understood if the crusade which culminated in the Civil War is to be placed in its historical perspective. Not only in the rural areas of a country predominately agricultural, but in the cities as well, the clergy were a major group in the formation of public opinion. Large numbers of them, especially those representing the evangelical sects in the North, spearheaded reform movements such as temperance, anti-slavery, the reformation of delinquent females, and the observance of the Sabbath.

Mr. Cole has attempted to describe and analyze the social ideas of these evangelists in the context of their period. The result is a study which is not always in focus. The problem of selecting representative evangelists for study is a task with which the author appears to have had some difficulty. The inclusion of Francis Wayland among the evangelists raises the question of how far one may stretch a definition. In any case, it should be pointed out that Mr. Cole seems to be aware of the pitfalls that face historians in attempting to isolate for development a series of ideas among a group of individuals.

Although the secondary literature dealing with the subjects covered by Mr. Cole in his monograph is extensive, he shows a preference for the original sources. Many excellent books have been written on the revivals, the refom movements, the anti-slavery movement, and the various religious denominations. One wishes that the author had indicated that he had made full use of these works. In addition, the book tends to be sketchy when discussing the social ideas of the evangelists and concentrates on some reforms while almost ignoring equally important ones. For a book of 242 pages of text, it would appear that 95 pages of background material before entering into the basic subject matter of the book is excessive. Perhaps the strongest impression left on the reviewer is that Mr. Cole has not developed fully enough the possibilities of his theme.

In conclusion, it should be emphasized that the author has gathered together the views of an important body of men and shown their influence in shaping the history of their times. As Mr. Cole makes clear, the evangelists were period pieces for which a post-Civil War America found little use.

COMMONWEALTH OF NATIONS

THOMAS JONES. *A Diary with Letters, 1931–1950.* Pp. xiv, 582. London: Geoffrey Cumberlege, Oxford University Press, 1954. $4.80.

Educator, author, and civil servant, Thomas Jones was the confidential advisor to four successive Prime Ministers of Great Britain. He worked closely with Lloyd George, Bonar Law, Stanley Baldwin, and Ramsay MacDonald; rarely and much less closely with Neville Chamberlain and Winston Churchill. In 1916 he became a member of Lloyd George's War Cabinet Secretariat, and he continued to serve as a Cabinet Secretary until his retirement. When he retired from civil service in 1930 at the age of sixty, he began a new career, first as secretary and later as chairman of the Pilgrim Trust through which he administered funds to encourage fine arts and education. He travelled far, indeed, from the small Welsh mining town, where he was born in 1870, until he reached the high pinnacle of Cliveden where he enjoyed hospitality and friendship of Lord and Lady Astor and associated with the famous people who frequented their magnificent estate. Though he never regretted succumbing to the "plutocratic embrace" of Cliveden, he has continued to cherish "the hope of dying a reasonably poor man amidst the blessings of the Welfare State."

When Thomas Jones went to London to join the War Cabinet Secretariat, Sir Maurice Powicke urged him to help the historians of the future by keeping a diary. Jones began the diary at once and persisted in the strenuous discipline of daily record keeping until 1950, when he reached his eightieth birthday. The present volume is only one-sixth of his entire work; that portion which he wrote while in the Civil Service has been put on cold storage for his lifetime. When the whole diary is published, if the present part is indicative of the whole, it will establish the author as the twentieth century Greville.

Letters exchanged with many distinguished people of diverse interests interstice the diary. A substantial correspondence, relating to important questions of education, was carried on with Dr. Abraham Flexner, the first Director of the Institute of Advanced Study at Princeton, New Jersey. Many letters with Mrs. Shaw and other persons interested in literature throw light upon the character of George Bernard Shaw.

Taken together, the letters and the diary afford a box seat at the stage of history's stirring drama. From the vantage of No. 10 Downing Street, Cliveden, and Whitehall, one gains a clear sight of the dramatis personae of the early 1930's; and one can live again those dismal days of the economic depression, and see again the abdication of Edward VIII, and witness again the rise of Hitler and Mussolini while England slept. The author and other members of the "Cliveden set"—an epithet which he rejects—had a hand in shaping the policy of appeasement. This book reveals wonderfully the mentality of those who knew every Hitler move and yet could not bring themselves to rearm England adequately to resist him. By setting down these events fully and knowingly, Thomas Jones has undoubtedly helped the historians of the future to read the tragedy of his time.

R. G. COWHERD
Lehigh University

GEORGE HILTON JONES. *The Main Stream of Jacobitism.* Pp. x, 275. Cambridge, Mass.: Harvard University Press, 1954. $4.50.

James II was the Stuart king who succeeded to the thrones of England and Scotland on the death of his brother Charles II in 1685. A convinced and openly avowed Catholic, James attempted to Romanize the two countries over which he ruled. This course of action created a strong opposition party, which in 1688 invited the Dutch king, William, to invade Britain; and when William arrived in England James II sought safety in flight to France. Since the king had thus "abdicated," Parliament offered the vacant thrones of England and Scotland jointly to Dutch William and his wife Mary, James II's daughter. Thus the "Glorious Revolution" of 1688 was consummated.

Jacobitism is the name given to that movement which attempted to reinstate the Stuart House on the British throne. Its headquarters were at St. Germain, in France, where the exiled James II set up his court with the full approval of King Louis XIV. The Jacobite movement aimed at persuading certain Catholic governments of Europe, particularly that of France, to finance and equip an invasion of Britain, with which the native pro-Stuart faction in England and Scotland would co-operate. For most of the time Jacobitism did not get beyond the stage of intrigues—in which, among others, Winston Churchill's famous ancestor, the Duke of Marlborough, was

involved—and plots, for example, the 1696 plot to murder King William as he returned from a hunting trip. But after the accession to the British throne of King George I of Hanover in 1714, the Jacobites succeeded in mounting two small-scale invasions of Britain—in 1715 on behalf of James II's son, the so-called "Old Pretender," and in 1745 on behalf of Charles Edward, his grandson, the "Young Pretender." Both of these invasions, though they were joined by native insurgents, proved abortive; and after the 1745 rebellion, British Jacobitism was so thoroughly crushed, particularly in Scotland, that it survived only as a matter of nostalgic sentiment.

The present volume traces the story of Jacobitism from its beginnings in 1688 until the failure of the rebellion of 1745. Its author, Dr. George Hilton Jones, is familiar with the secondary works which deal with this movement. But he has also made a careful study of the abundant source material—both the manuscript sources, such as the voluminous Stuart Papers, and those which have been printed, like the Calendar of State Papers. And he has produced a clear, objective, and authoritative account of the Jacobite Movement.

NORMAN VICTOR HOPE
Princeton Theological Seminary

KENNETH GRANT CRAWFORD. *Canadian Municipal Government.* (Canadian Government Series, No. 6.) Pp. xii, 407. Toronto: University of Toronto Press, 1954. $7.50.

S. J. FRANKEL and R. C. PRATT. *Municipal Labour Relations in Canada.* Pp. v, 87. Montreal: Published jointly by The Canadian Federation of Mayors and Municipalities, and The Industrial Relations Centre, McGill University, 1954. $2.50.

Two new books on the subject of local government in Canada are another reminder of the revolutionary changes that have taken place in the Dominion since World War II. Canada is now the world's fourth largest industrial nation and its third largest trader. Her population has increased 22 per cent in ten years, and a country which was largely rural is now 57.3 per cent urban. That such rapid change is making unprecedented financial and administrative demands upon municipal authorities can well be imagined.

Professor K. Grant Crawford brings to his study of this subject wide practical experience in city government in Ontario. As Director of the Institute of Local Government at Queens University, Kingston, he is also keenly interested in training better municipal officers. His book, therefore, is a combination of textbook and guide, which can be equally useful to student, town clerk, or voter. Especially, it has the great merits of clarity and readability.

After an Introduction devoted to the general problems confronting Canadian municipalities, Professor Crawford points out the complications produced by the lack of uniformity in the local institutions of the ten Provinces. In Newfoundland, for instance, special financial enticements have had to be offered to the citizens to get them to organize any form of local government. The methods of election, organization, powers and activities of municipal councils, their committees and officers are therefore described in detail. Almost one half the book is devoted to the ubiquitous problem of financing municipal services. In Canada, as elsewhere, there is a growing tendency towards increased financial dependence of the municipalities upon the Provincial Governments, and a corresponding increase of supervision of local affairs by Provincial authorities. Professor Crawford ardently believes that "if a democratic form of government is to survive at the national level, it can only do so if it is built upon a foundation of local autonomy." Not the least valuable portion of his book is this discussion of the importance of local self-government as the grass roots of democracy. His proposed solutions to the vexed problem of provincial-municipal relations are both sane and practical. Indeed this book has much to say to the citizen of any industrial state.

In contrast with Professor Crawford's broad analysis, S. J. Frankel and R. C. Pratt of McGill University have concentrated on one of the many problems confronting municipal authorities in the new

Canada, namely municipal labor unions. Approximately 40,000 public employees are already organized into union in Canada, and there is every indication that the movement to negotiate with their employers by means of collective bargaining will continue to grow.

The authors point out that a number of problems which do not have to be met by the ordinary industrial union have to be faced by these municipal workers. As has often been said, "one of the difficulties of public business is that it is public." The authors outline, rather than discuss, the various methods, techniques, and weaknesses of collective bargaining in the public services in Canada. The laws of the ten Provinces are reviewed and certain changes proposed. Special attention is given to the difficult question of compulsory arbitration of disputes in which essential public services such as that of firemen are involved. Unfortunately, as the authors admit, "this slim volume is the result of what can only be termed a preliminary survey of a large problem." It is therefore incomplete, and to that extent an unsatisfactory study of a very important subject.

SLAVIC COUNTRIES

JOHN PLAMENATZ. *German Marxism and Russian Communism.* Pp. xxiii, 356. New York: Longmans, Green and Company, 1954. $4.25.

Despite the author's promise, the two parts of this work are not fully cemented together in a coherent whole which effectively illumines the relation of a theory and its development to the practice of a regime. The first part consists of an extraordinarily able examination of the teaching of Marx and Engels. Plamenatz, while emphasizing the creative importance of Marxist doctrine, as well as its overwhelming influence, does a beautiful job of revealing its philosophical and analytical defects, its unexamined assumptions, and the delusiveness, which was also on Marx' part self-delusion, of some of its major concepts and celebrated phrases. Likewise, Plamenatz, in my view correctly, has seen Lenin as a strategist and a theorist of strategy rather than as a creative philosopher, though he perhaps does less than full justice to Lenin as a thinker. He correctly sees, too, that, though Stalin was important as the manipulator and enforcer of the system, and in a sense was its popularizer, he has no genuine claim as a political and social thinker. Again, he is probably on sound ground when he insists that, had it been confined to the West alone, Marx' teaching, for all its intellectual weaknesses, would have proved a creative error. It was the perversion and misapplication of that error, joined to other, more sinister forces and doctrines in Russia, that constituted, and constitutes, the real evil.

Nevertheless, Plamenatz is equally right in stressing the value of new insights in Marx, especially his concept of ideology, and in emphasizing the nature of present Russian appeal to still agrarian and backward peoples. But I think he seriously exaggerates when he claims that it was Marx who taught us that the proper study of politics is not man, but institutions. If man and institutions are placed in opposition, the claim may be correct, but the teaching was disastrous. If Mr. Plamenatz means that man must be studied in the context of institutions, then any claim of basic originality on Marx' part is not warranted: witness a whole line of thinkers from Aristotle to Tocqueville.

Quite apart from these criticisms, however, the most serious defect of the book, each of whose parts has much fascination, wisdom, insight, and critical acumen, is that the very theoretical analysis of the first part is at a considerable distance from, and only loosely joined to, the often very fine institutional analysis of the second, with its emphasis on the relation of doctrines to practice, need, and purpose. The conjunction in the title states a connection; the actual work does not unite or unify the conjoined themes, whether by demonstrating interdependence or by making clear a deeper irreconcilability.

THOMAS I. COOK
Johns Hopkins University

W. W. KULSKI. *The Soviet Regime: Communism in Practice.* Pp. xiv, 807. Syracuse, N. Y.: Syracuse University Press, 1954. $8.00.

Arnold J. Toynbee has argued that Communism is a "Jewish-Christian heresy," engendered by the failure of the West to fulfill its professed ideals. The stock-in-trade of Communist propagandists consists precisely of ironic contrasts between aspirations and practices in the democracies. This device in turn has evoked reams of Western anti-Communist tracts, contrasting Soviet ideals with Soviet realities. Professor Kulski of the Maxwell School at Syracuse, and formerly a member of the Polish government-in-exile, here offers us the most informative single contribution to this body of literature. He hopes that his book "will find its way to the young generation whose age warrants a search for a better world. They should avoid the pitfall of believing that a better world is being built in the Soviet Union." His volume is no ordinary indictment but a meticulously documented analysis based on Soviet sources, which he has mastered thoroughly and used honestly.

The result is a belated refutation of the Webbs' *Soviet Communism* (where ideals in documents were taken at face value) and a priceless work of reference, offering the most complete treatment yet attempted of Party and State, Citizenship, Elections, "Freedom," Courts, Family, Youth, Workers and Trade Unions, Peasants and Kholkhozes, and post-Stalinist developments. The portrait, albeit less dramatic, is as black as that drawn by Igor Gouzenko in *The Fall of a Titan.* Kulski, unlike Isaac Deutscher and Harrison Salisbury, sees little prospect of any "mellowing" of Soviet society. His very subtitle denies the Marxist postulate that Communism is a "far-off, divine event" toward which Soviet socialism is painfully groping and assumes that the ugly realities of the past and present are permanent. The picture is not "objective," for the author's motto is: see no good, hear no good, speak no good of the Union of Soviet Socialist Republics. Yet this work is a factual compendium of vast scope and power which, for years to come, will prove invaluable to all students of the Soviet way of life. It is, indeed, the type of indictment which the Soviet oligarchs themselves would take seriously if they were as wise as they pretend to be. But this, for the present, is too much to hope.

FREDERICK L. SCHUMAN
Williams College

TIMOTHY SOSNOVY. *The Housing Problem in the Soviet Union.* Edited by David I. Goldstein. Foreword by Gregory Grossman. Pp. xviii, 300. New York: Research Program on the U.S.S.R., 1954. $4.25.

Next to a sufficiency of food, probably nothing is more essential to a decent life on the material plane than adequate housing. One of the most damning indictments of the "workers' state" which has succeeded to the power of the Tsar of All the Russias is the fact that, as all non-Communist students of the subject seems to be agreed, housing conditions in Russia are probably no better now, and perhaps even worse, than they were before the Revolution. Workers of the world, take note.

The present study by Dr. Sosnovy bears all the marks of a definitive study of this important subject. Based on a wealth of Soviet sources and statistics, it demonstrates irrefutably the steady deterioration of the urban housing fund which Soviet planners have allowed to occur through inadequate appropriations and maintenance. The natural result is that in 1950 an average of four persons lived in each room, with the actual figures varying sharply according to the social and economic status of the family. A private bathroom or kitchen is a rarity. As any one who has lived under such conditions can imagine, unsanitary conditions, quarrels, and fights are commonplace. And these are the conditions of the "free" section of the populace; those of the inmates of the forced labor camps are, of course, incomparably worse.

Projecting these discouraging trends into the future, we see no reason to think that, in view of the continuing and even increasing emphasis by the Soviet government on heavy industry and defense which the fall of Malenkov has rendered likely, the housing standards of the long-suffering Soviet people will do anything but decline further, or at best maintain their present unsatisfactory level.

It is no small achievement that this solid, even technical, study contrives to be not only comprehensible but interesting to the nonspecialist, or at least to this nonspecialist. This happy outcome is the result of careful organization and a thorough knowledge of the subject. In fact, Dr. Sosnovy's study could well serve as a model for other works of this kind.

HAROLD C. HINTON
Georgetown University

JOHANNES KAPS (Ed.). *The Tragedy of Silesia, 1945–1946: A Documentary Account with a Special Survey of the Archdiocese of Breslau.* Translated by Gladys H. Hartinger. Pp. 576. Munich: "Christ Unterwegs," 1952/53. No price.

Documents on the Expulsion of the Sudeten Germans. Compilation and Introduction by Wilhelm K. Turnwald. Translated by Gerda Johannsen. Pp. xxix, 308. Munich: Association for the Protection of Sudeten German Interests, 1953. No price.

For some years various academic and political groups in Germany have been studying the mass expulsions of Germans from Central and Eastern Europe after World War II. Several volumes containing eyewitness accounts have already been published by the Göttinger Arbeitskreis, the Arbeitsgemeinschaft zur Wahrung Sudetendeutscher Interessen, and the German federal ministry for expellees. The present two volumes are English translations respectively of *Die Tragödie Schlesiens 1945–46* (Munich, 1952/53) and *Dokumente zur Austreibung der Sudetendeutschen* (Munich, 1951). The merits and standards of the two works differ somewhat in accordance with the aims and purposes of the sponsoring organizations. The Silesia volume, compiled and published by a Catholic organization, is a collection of eyewitness reports by Silesian Catholics, many of them clergymen and members of religious orders. The accounts are the spontaneous, unpretentious, narrative statements by the participants in the events of that chaotic period. Thus they are not the product of systematic interviews, questionnaires, or opinion analysis. They stand on their own as forceful, moving human documents, classified merely according to region. They are remarkably free from expressions of self-pity and hatred although occasional passages, such as "Russian aggressor" (possibly an error in translation), "typically Polish (conditions)," and so forth reveal the naiveté of the narrator. On the other hand, both volumes include references to kindnesses shown to Germans by Russians, Poles, and Czechs. In this connection the reader is referred to a special compilation of such records of humanity published in 1950 by the Göttinger Arbeitskreis under the title, *Dokumente der Menschlichkeit,* which would serve as a counterdose to the almost unrelieved picture of brutalities described in the above two volumes. The *Documents on the Expulsion of the Sudeten Germans* edited by Wilhelm K. Turnwald and containing similarly arranged eyewitness accounts have more the character of a white book, not only because of the rather one-sided nature of the statements but also because of the editor's Preface. His aim is to show "the extensive participation of the Czech population in these misdeeds" (P. xxviii), and he demands the punishment of the guilty as "a condition for German-Czech co-existence." The documents in both volumes, however, tend to show that both in Czechoslovakia and Silesia it was the hastily organized "Revolutionary Guard" or militia, chiefly composed of young Communists and former inmates of Nazi concentration camps, that committed most of the inhuman acts described. The native Czechs and Poles often held aloof and condemned the behavior of these lawless elements. As some of the narrators in the Silesian volume appropriately pointed out, this behavior was partly the reaction to the treatment which these militia men had experienced in Nazi Germany as prisoners or slave laborers. The reader of these documents also craves to know something about the political background of the narrators and one cannot escape the feeling that what has been left unsaid is often more significant than what

has been printed. To insure maximum objectivity in future publications of this kind it might be advisable to set up an international board of editors. But in the final analysis one is forced to conclude that, no matter who committed the inhuman misdeeds described, or against whom they were directed, the fact that they could be committed at all constitutes a smashing indictment of our age and society. It brings to mind Zarathustra's statement, "Ye have made the way from worm to man, but much in you is yet worm." For while the individual testimony may be of doubtful value as a historical source, the sum of the thousands of statements already published and yet to appear eloquently corroborates the story of the Russian conquest, the takeover by the Poles and Czechs, and the expulsion measures.

CARL G. ANTHON
State University of Iowa

ALEX N. DRAGNICH. *Tito's Promised Land: Yugoslavia.* Pp. xii, 337. New Brunswick, N. J.: Rutgers University, 1954. $5.75.

American scholarship concerned with the contemporary interpretation of international relations is hardly ever interested in "what is," since the most popular approach is that which paints the current problem within the "black-white" framework. Thus, during World War II, Soviet Russia was extolled as a "true democracy," the historical United States-Russian relations were featured as always having been friendly, and Joseph Stalin was extolled as the best-meaning statesman in the world. Today, most articles and books tell us the "worst" about Russia and its rulers. A similar revisionism is now being written about Franco, whom we are treating in reverse; the former "bad boy" Franco is now being whitewashed. And we are just about due for a re-evaluation of Chiang Kai-Shek; President Syngman Rhee, whose "democratic" regime we saved; and the "dictator" Dr. Antonio de Oliveira Salazar of Portugal (whom we need nearly as much as Franco).

Dragnich's brilliant survey of the origins and evolution of Tito's regime belongs to the "black-white" school. It is a most devastating and effective demolishing job among those already undertaken by several other scholars whose leadership has now been assumed by this American-born Montenegran. Thoroughly documented and based on the impressions and interviews that Dragnich was able to gather during his stay in Yugoslavia as cultural attaché in the American Embassy in Belgrade, it presents facts which appear significant and important, telling the genesis of Tito's rule with clarity amounting to brutality. The handling of the theme is competent and comprehensive, and the arguments presented not without a certain eloquence arising from Dragnich's own keen feeling on the matter.

The reviewer cannot criticize Dragnich's workmanship on the basis of his documents or his personal impressions of Yugoslavia. But it is only fair to point out that the general impression left by Dragnich raised certain definite questions. It appears that from the very moment when Tito started to organize the Partisans he has been fighting everybody—Michailovich, nationalistic and political opponents, the Serbian as well as the Croat people (p. 29), and when starting on his career even arguing with Stalin (pp. 287 ff.). This might all be true, but how is it possible that Tito has survived and that his regime is still a going concern? What are the Yugoslav elements, besides the standard Communist techniques of domination, that have allowed Tito's survival among his people? And is not Yugoslavia the only country in the former Cominform allowing tourists and even advertising for them? In this respect, Dragnich offers us no answer whatsoever. In short, it is a very good academic yarn, despite the purplish tinge of the writing, with the Tito novel plot ingeniously treated and worked out. It is true that "in reality, of course, the Communist leaders' primary aim was to seize political power, a fact now readily admitted by them" (p. 22). But what other aim has any political movement ever had?

JOSEPH S. ROUCEK
University of Bridgeport

FREE EUROPE PRESS. The Research Staff. *Satellite Agriculture in Crisis: A Study of Land Policy in the Soviet Sphere.* Pp. 130. New York: Frederick A. Praeger, 1954. $2.50.

The productivity crisis in Soviet Agriculture and the 1953 "new agricultural course," designed to bring about greater farm output, have once more stimulated discussion regarding collectivized agriculture—including now the land policy in the entire Soviet sphere, coupled with its effects on Soviet power.

The authors present us with a concise study of the whys of the admitted shortcomings of the Soviet system of agriculture, especially in the satellite countries. There existed the concepts of revolution from above and by degrees which influenced every aspect of East European Communist policy. A bloody frontal assault on East European peasantry was to be avoided while gaining power. Collectivization was attempted in different fashions in each country. But peasantry expressed antagonism before the construction of the new society could be effected. This process is analyzed and supported with statistics for each country, including Yugoslavia.

The major turning point in the collectivization drive came when the mounting agricultural crisis in 1953 produced concessions: material incentives to peasant productivity, increased use of the open market, greater supply of consumers' goods, reduction of state delivery quotas, vigorous efforts to detach technicians from cities and send them to farms. These do *not* constitute fundamental policy changes. Yet they betray an inner anachronism: Soviet collectivization has been primarily designed to *redistribute* agricultural produce, rather than to *increase* it; to supply the urban group to which the Communists attached themselves, rather than to fill the needs of the peasantry or of the land; to effect industrialization in which the peasant would absorb the major shock. But the bedrock economic needs of an expanding industrial society call for ever increasing agricultural productivity, notoriously low on collective farms. Implicitly only free peasants will produce sufficiently and efficiently. Thus the authors contend that the present modus vivendi between the pleasantry and Communist regimes is a precarious and unstable truce of antagonistic social forces.

But they point also realistically to the changing character of Communism itself. The 1928 Stalinist elaboration of the intimate connection between Communist agricultural policy and the demands of construction of a totalitarian industrial economy may never be such a decisive issue for the satellite countries. The Communist "solution" to the land problem of Eastern Europe is no real solution at all; total collectivization may not be economically needed. In the meantime peasants and their traditions persist. One may expect very interesting developments which merit continued, closest scrutiny, like this study provides.

ERNEST F. WINTER

WESTERN CONTINENTAL EUROPE

PHILIP WILLIAMS. *Politics in Post-War France.* Pp. xiv, 500. New York: Longmans, Green, and Company, 1954. $7.00.

The author, lecturer in Modern History at Oxford University, faces the choice of following British academic practice of complete political detachment, or that of French writers who, despite state control of the universities, are "less concerned to avoid . . . taking sides." Conceding "there is much to be said for both approaches," but "nothing for professing one and practicing the other," he holds bias dangerous "only when concealed or unconscious." Finding it neither possible nor desirable to "avoid acquiring preferences and prejudices," he writes, "as supporter of the moderate wing of the Labour Party."

The book covers the years of the Fourth Republic, 1947–1953, on the background of the Third Republic, 1875–1947, the period with a constitution held to be fitting a monarchical as well as a republican regime.

Within four overhead parts—Background, Parties, Constitution, Political System—there are twenty-four specialized chapters: "Basis of French Politics"; "War and Aftermath, 1940–1947"; "Search for a Majority, 1947–1953";—"Communist

Party"; "Socialist Party"; *"Mouvement Républicain Populaire";* "Radical Party"; "Conservative Groups"; *"Rassemblement du Peuple Français";* "Minor Parties";—"Constitutional Problem"; "Presidency and Premiership"; "National Assembly"; "Assembly and Government"; "Committee System"; "Budget"; "Council of the Republic"; "Other Constitutional Organs";—"Electoral Laws"; "Pressure Groups"; "Parties and Elections"; "Parties and Government"; "Conclusion."

Behind sober titles of chapters, diagrams, maps, appendices, the author develops dynamic themes and scenes of a sophisticated, ruthless show—somber, comic, tragic, never dull; but sometimes highly detrimental to the commonweal and every Frenchman's vital concern. Stress is laid on the hectic parliamentary and governmental behavior pattern conditioned by a surging multitude of parties, large, small, and in between, whirling about in ever changing combinations motivated by agricultural, industrial, political, social, religious, and colonial involvements. The scenery inevitably bares the individual Frenchman's yearning for, or fear of, the strong man, real or imaginary.

While foreign critics may take a dim view of France's future—not so the author. French democracy, he admits, faces more immediate external and internal dangers than Britain and the United States. Despite "superficial contempt for politics" French voters go to the polls "in proportion . . . far higher than their counterparts in the United States." Instability is not as dangerous as it seems. Recurrent *"crises"* appear "reshuffles," bringing new blood, and permitting the old to change direction, thus providing "the means by which solutions are found to the more intractable problems of policy." For the peace of the West, may the author be proved correct!

JOHANNES MATTERN
Johns Hopkins University

VAL R. LORWIN. *The French Labor Movement.* Pp. xiii, 346. Cambridge, Mass.: Harvard University Press, 1954. $6.00.

This study of the French labor movement is presented by a careful student who has a fundamental belief in the value to modern society of organized labor. He has an abiding faith, it would seem, in the ability of free peoples to work out a way of life for themselves. He sees the slowness of the trek along the path to social stability in France as unfortunate, but necessary. And he puts the story of French industrial relations into its proper international place.

He does all of this as a social scientist with a research report to make, leaving his conclusions to find their place at the end of the study where the authority of the analysis will give them significance.

The student of industrial relations who wants to compare American labor movements with those in France with a view to seeing why the French workers have not mobilized their strength against Communism as have their American brothers will find this study rewarding. The fact that the pro-Communist *Confédération Générale du Travail* is the largest and best disciplined labor organization in France does not seem to mean that Communism has been gaining effective strength in that country. The CGT has split and united and split and united and split again on the Communist question; but even now it is not led by Communists alone and is not synonymous with the Communist party. Neither is the *Force Ouvrière* controlled by the Socialist Party, or the Catholic *Confédération Française des Travailleurs Chrétiens* by the Catholic *Mouvement Républicain Populaire.* This seems to be true despite the fact that the union movement has achieved more strength in France through legislation than through collective bargaining.

The author thinks that the CGT works against the recovery of a democratic France, and that the free unions have to maintain what is in fact a negative fight against the Communist CGT, the shortsightedness of the employers and the "immobilism" of the government. He says that the workers' hopes have been so often frustrated by wars on French soil, in the Far East, and Africa that they are not accompanied by the faith that collective action can win much permanent stability for labor. Working men have a weakened confidence in their nation's political and industrial leadership; which fact, when coupled with a long history of the dependence upon short-term, ill-financed, and ineffectual strikes as their principal means of action, leaves them passive.

Professor Lorwin gives a very satisfactory analysis of the structure and process of the labor movement in France with emphasis on the years since 1946. The efforts at collective bargaining, more unsuccessful than we have sometimes heard, the success in gaining social security, the organization of local plant unions, of industrial unions, and national federations all receive good treatment. He notes the rejection of the principle of compulsory arbitration in labor disputes and the substitution for it of compulsory conciliation. But there are shortcomings in any compulsory action in France, even in the practice of requisitioning of workers by the government as a means to break strikes.

The author's conclusion seems to be that the long tradition and special character of labor struggles in France are in themselves the chief blocks to the solution of current issues. He leaves it to the employers, to the government, and to the labor organizations to overcome their own past.

W. HENRY COOKE
Claremont Graduate School

LORD RUSSELL OF LIVERPOOL. *The Scourge of the Swastika.* Pp. xii, 259. New York: Philosophical Library, 1954. $4.50.

This "Short History of Nazi War Crimes" is a compact documentary of the unspeakable barbarity and depravity of which men are capable and which happened but a few years back in civilized Europe, where—on the lowest computation—12 million men, women, and children were done to death; not in battle, not in passion, but in the cold, calculated, deliberate attempt to destroy. The book is intended to "provide the ordinary reader with a truthful and accurate account," and the author, a distinguished member of the British bar, is well equipped to present it, for he served as a Deputy Judge Advocate General, British Army of the Rhine, at the war crime trials in the British zone of occupation.

This is a completely unemotional, almost irritatingly commentless presentation of the basic records of monstrous murder and cruelty that still stagger the imagination and depress all optimism in the decency of man. Lord Russell seems to carry no personal grudge against the Germans, but he does feel that we should not too eagerly nor too soon forget the hideous horror of Belsen, Buchenwald, and Dachau, where almost three million prisoners were butchered in Auschwitz alone, with 10,000 people vanishing in the gas chambers per day. As a matter of fact, so strong does he feel about it that he refused to drop publication of this book even if it did result in his enforced resignation last August as Assistant Judge Advocate General in London. Perhaps the many books of apologia in behalf of the Nazis, which have recently appeared, have further irked his conscience to make these records known. There are sixteen frightening photographs, superfluous and yet necessary perhaps for those who still believe otherwise. The Nazis kept punctilious records—and while the author had access to them, he was wise not to try to encompass the entire sordid chapter, but offer just enough to make it a most damaging entry into the ledger of contemporary civilization. And it will take more than the expediency of the day, verbose politesse, and a favorable trade balance to atone for this so hurriedly evaporated genocide.

BORIS ERICH NELSON
Hampton Institute

ALFRED GROSSER and others. *Administration et politique en Allemagne occidentale.* Pp. xxi, 247. Paris: Librairie Armand Colin, 1954. No price.

This is volume fifty-seven of the *Cahiers de la Fondation Nationale des Sciences Politiques* and the first publication of the German section of the *Centre d'Études des Relations Internationales,* organized in 1952 as part of the *Fondation.* It is a highly selective compendium. If the nine chapters, written by seven French and German contributors, have anything in common, it is the theme of federal-state and municipal relations under the Basic Law of 1949. Several chapters, however, stress functional and operational aspects of state or municipal administration with only casual reference to the federal framework

while others, particularly the one on Lower Saxony, are almost exclusively devoted to the discussion of local government.

For the American student of German affairs, this volume contains much that is useful and new. It provides an insight into the practical aspects and real consequences of federalism in the second Republic. It points up some of the problems and difficulties arising from the operation of a state system, that is partly brand new, components of which are but artificial creations, lacking a raison d'être in the all-German frame of things, and hence is partly unreal, ephemeral, and transitory.

Second, the chapter on Lower Saxony and to some extent the introductory chapter on the first session of the Bundestag give a vivid picture of politics in the Federal Republic. In particular, the chapter on Lower Saxony unravels for the American reader the intricacies of coalition politics at the state and federal levels. It also sheds new light on the problem of correlating the activities of a centrally directed party organization, such as that of the *Sozialdemokratische Partei Deutschlands,* with the conflicting and divergent requirements of local politics under a federal system. The example of Lower Saxony shows that the conflict between the party-liners and their comrades in high state offices can at times have rather amusing consequences.

Third, the American reader is provided with an insight into the juridical, structural, and functional problems of state and municipal administration in the new Germany. In the chapters dealing with state administrations, the treatment is rather sketchy and usually focussed on only one particular aspect or problem such as the role and function of the civil service. But in Part III, devoted to local self-government in a federal state, the coverage is more complete. Here are close-ups of Trier, Düsseldorf, Göttingen, and Heiligenhof (Holstein), discussions of the concept of *Selbstverwaltung,* its constitutional basis under the Basic Law, and a fairly exhaustive treatment of administrative, legal, and political problems encountered in these self-governing municipalities.

Appended is an annotated bibliography on the Basic Law, the constitutional aspects of unification, and federal-state relations.

W. W. ROSTOW and others. *The Prospect for Communist China.* Pp. xx, 379. New York: Published jointly by the Technology Press of Massachusetts Institute of Technology, and John Wiley and Sons, 1954. $5.00.

This superb book should be read by every one concerned with United States foreign policy or with Far Eastern affairs. Like its predecessor, *The Dynamics of Soviet Society,* it is the work of a team, it is the summary of a great deal of specialized material, it is analytic rather than interpretive, and it affords open American scholarship a glimpse into the workings of that formidable rival of traditional academic work, the new and mysterious world of classified scholarship.

Studies like this have been prepared for some years in the old Research and Analysis Branch of the Office of Strategic Services, in the Office of Intelligence Research of the State Department, and in many other federal agencies. The simplification and collectivization of scholarship by characteristically American methods of teamwork is a phenomenon affecting the line of every scholar and man of affairs in this country. It can be said that this volume and its Soviet-area counterpart would be important landmarks in the history of American scholarship, whatever the subject matter. The fact that each deals with an extraordinarily sensitive and crisis-fraught area of American foreign policy and strategic position makes the two books all the more important.

The China volume does a great deal to dispel the myth of "the Far Eastern expert." The authors of this volume have consulted Far Eastern experts very widely, all the way from people whom Senator McCarthy admires to others whom the Senator abhors. They have demonstrated that it is possible to reach intelligent conclusions concerning what is happening in China without going into the elaborate and often unnecessary masquerade of esoteric wisdom which has so often and lamentably been regarded as a minimum requirement for serious Far Eastern scholarship.

The presentation is a balanced and extremely sensible composite of the recent past and the immediate present. A first part provides an extremely succinct and fair-minded summary of what happened in China between 1840 and 1949. The second part describes the evolution of Communist policy in the five critical years of taking and consolidating power, 1949 to 1954. The four remaining parts deal respectively with the Chinese Communist Government and the people under its control, with Sino-Soviet relations, with the economic structure and current economic problems, and with the prospects for Communist China. Ideological problems are treated skimpily. The conclusions reached are as sensible and modest as the body of the book. The authors reach the final conclusion that the destiny of China "rests substantially with the peoples of the Free World and their governments" (p. 314).

It is important that men new to the China field should have been able to put together so much sheer fact and to cement their conclusions with an impressive bibliographical apparatus. For specialists to have done this would have been remarkable. For outsiders to come into the Far Eastern field and do it is nothing short of miraculous. A performance such as this means, at least in part, that the American people have the skills which they need to follow a world of moving targets.

Far Eastern experts will find minor points with which to argue. The general reader will be satisfied with a panorama of China under Communism and will hope that the kind of disciplined teamwork evidenced by the production of this volume will continue to serve the public as well as the sensitive or strategic agencies of the American Government.

PAUL M. A. LINEBARGER
School of Advanced International Studies of the Johns Hopkins University

E-TU ZEN SUN. *Chinese Railways and British Interests 1898–1911.* Pp. viii, 230. New York: King's Crown Press, Columbia University, 1954. $4.00.

This is a reliable and restrained account of railway projects and railway politics in China from the battle of concessions in 1898 to the Revolution of 1911 with special attention to British diplomacy and British finance. In contrast with the violent language of current discussion of such matters Mrs. Sun's account seems positively gentle. But the facts are set forth and the story cannot be called a cheerful one.

The development in China throughout the period was toward domestic financing and unification, but domestic financing failed and unification brought out opposition to the Manchu court and culminated in revolution.

The development on the British side was from independent contracts on the part of British corporations to co-operation with others and finally to the four-power consortium which entered into the Hukuang loan agreement of 1911. The culmination was in the sterile political manoeuvering of the Chinchow-Aigun proposal and the Knox neutralization plan.

Mrs. Sun summarizes in her concluding chapter the factors in the failure of more effective railway development in China before 1911. One of these was the growing international political tension, the cold war, of the period. The scene, observed from today, was one of Great Power irresponsibility and American immaturity. Another factor was the divided Manchu-Chinese government of China and the rising anti-Manchu temper of the Chinese.

Special attention may be directed to a double factor which is clearly set forth in this study, and which might have been more fully developed. It is the scarceness of capital in China and the efforts of the Chinese to mobilize what capital there was.

In western comments of the time the attempts to finance and build railways on the part of provincial groups tend to be set down as local agitation or to be given more dignity as rising Chinese nationalism.

Mrs. Sun uses the terms "gentry-merchant," "gentry capitalist," "the learned

and moneyed gentry" to describe these Chinese groups. That they did not have the means to finance extensive railway development is understandable, though it was not always understood by their own officials. What is more difficult to explain is the fact that they seem always to have been associated with the province and not to have thought of railways for the region or the country. Mrs. Sun points out that these gentry-merchants were wealthier and more numerous in some provinces than in others, that they were more independent of the officials in some provinces than in others. She has other things to say that should be pondered by those who sharply contrast gentry and merchant in traditional China. Gentry-capitalists *did* build the Shanghai-Hangchow railway which crossed a provincial boundary. If, in general, the gentry-merchants had not been so provincial, China might have mobilized more effectively what capital she had.

Mrs. Sun did well what she set out to do. When this has been said she should be urged to write more fully on the "learned and moneyed gentry" of the time.

CHARLES F. REMER
University of Michigan

WILLIAM W. LOCKWOOD. *The Economic Development of Japan, Growth and Structural Change, 1868–1938.* Pp. xiv, 603. Princeton, N. J.: Princeton University Press, 1954. $10.00.

Rarely is a reviewer asked to comment on a book like this, for which the scholarship has been so prodigious and the resulting interpretations so brilliant. Most of the sources from which information has been gathered are by Western economists, but key studies by Japanese scholars have also been used. Many of the developments described have been treated in English before, but never yet with this over-all thoroughness and with such perceptive correlations. Moreover, Dr. Lockwood has skillfully placed topical analyses in the useful context of Japanese experience as a pioneer modernizer in Asia—a precursive grappler with problems which now confront other Asian economies, including that of mainland China, ones in earlier stages of agricultural and industrial advancement.

Few may read this nearly 600-page text thoroughly, but it will serve many well for information and interpretations about topics of their special interest. For example, the reviewer was particularly interested in the light that is shed on Japanese social stratification and mobility in relation to political behavior; and he was well rewarded. The author's chief regret (as expressed in the Preface): "that the impersonal statistics which crowd its pages fail entirely to convey a sense of the human aspirations, the personal leadership, the toil and learning and sacrifice which built the Japanese economy" is, of course, inherent in this kind of treatment; still it is possible to sense his appreciation of these factors and his sensitivity to policies bearing on problems of socio-economic justice. His style is remarkably lucid for this kind of writing.

The first two chapters provide a concise economic history of Japan from the Restoration to World War I, and then on to 1936, latterly with more emphasis on changing economic structure after the great depression and the occupation of Manchuria. Chapter III describes major aspects of economic growth during the seven decades before Japan became deeply involved in an increasingly total war. At one point, Dr. Lockwood concludes that "the pressure of population was being gradually relieved by the growth of income and wealth per person. This process went forward steadily with only temporary setbacks, until war destroyed the civilian economy after 1938 and produced an 'overpopulation' crisis of first-rate magnitude." Chapter IV, under the general title: "Technology," includes a description of the structure of Japan's labor force. The *zaibatsu* and problems of competition *vs.* collusion are also treated here. Reasons are given for economic combinations and concentrations of power; their positive functions as well as dangers receive attention. The next chapter concerning economic capital includes sections on distribution of income, capital accumulation and investment, and lessons to be derived from Japanese experience in the channeling of capital.

Not until Chapters VI and VII does the author concentrate on Japan's foreign trade, and then (especially Pp. 307–310) he convincingly corrects the common overemphasis on the dependence of Japan's economy on foreign trade. As he explains, the industrial revolution in Japan, though stimulated by trade and technology from the West, was a pervasive development, relying (except for an important sector—about 25–35 per cent) on domestic markets. As compared to most other major industrial economies, however, this is a rather high proportion. The second of these two chapters treats the role of overseas trade in prewar Japanese economic development. The role of trade with China—exchanges with net balances usually in Japan's favor—is seen.

Next come two chapters describing domestic and international factors influencing changes in the structure of the Empire's economy. Chapter VIII treats changes in incomes and expenditures, gives international comparisons, and interprets the effects of Japanese specialization for international markets. Chapter IX on employment of resources includes a summary analysis of the structure of the Japanese labor force. The final chapter: "The State and Economic Enterprise," includes analyses of the structure and distribution of taxes, trade policies, features of Japan's tariff system, public policies regarding group interests, and a concluding summary.

ALLAN B. COLE
The Fletcher School of Law
and Diplomacy

DELMER BROWN. *Nationalism in Japan: An Introductory Historical Analysis.* Pp. viii, 336. Berkeley and Los Angeles: University of California Press, 1955. $5.00.

Professor Brown has written a well-documented, interesting, and scholarly book on Japanese nationalism, somewhat in the style of a text book. It is probably intended for use in a general course on nationalism and should be worthwhile for such a purpose, but it contains little if anything new to students of Japanese history.

The thesis presented is that nationalism is a type of group loyalty; that its growth in Japan was influenced by Japan's geographical separateness and the further elements of a common racial descent, language, religion, and government activated by social and political developments placing the members of the nation in a close interdependent relationship. These developments are associated with technological progress, economic expansion, political centralization, and cultural unification within the nation; and competition, rivalry, or danger from other nations. At the base of the present two-world struggle, the author tells us, is the incompatability of the open society with the closed society. In the former, where nationalism develops under conditions of long periods of unusual economic growth and freedom from foreign danger, it is less virulent and enjoys great political and social mobility; in the latter, where nationalism develops under foreign pressure with feelings of fear and hatred, the nation is not so realistic or rational in the appraisal of its own strength and that of other nations, and the established ruling groups usually remain in power.

For nine chapters, the author discusses succeeding periods of Japanese history with relation to the elements above-mentioned and endeavors to trace the growth of group consciousness, and the spread of nationalism from the ruling classes to the populace as a whole. For example, he points out that during the Bakufu period, internal political rivalries were as important as foreign pressure in bringing about the Restoration while, on the contrary, after 1936, nationalism was more engendered by a strong fear of foreign enemies and a powerful sense of mission to establish a new order in East Asia. However, being able subsequently to appraise the relative importance of each element in any given set of circumstances is not quite the same as being able to formulize the probable effect of each element in a new combination of them. Due to the sociological nature of the subject, predictions cannot be made with any degree of positiveness. Therefore, the study, while valuable as an historical narrative, provides no scientific or certain indication of the future direction that nationalism in Japan may take. The hope is expressed that it will not be

based on the fear motif which might possibly compel the Japanese to seek nationalist growth within the Communist orbit.

Certain observations of the author are open to question such as his statement that even after the collapse of Germany, the dropping of the atomic bomb on Hiroshima, and the declaration of war by Russia, *most* Japanese were determined to fight on to the final battle (cf. Butow's "Japan's Decision to Surrender") but on the whole, the book is accurate and an excellent addition to the literature on the Far East.

ALBERT E. KANE

Washington, D. C.

A. CURTIS WILGUS (Ed.). *The Caribbean: Its Economy.* Pp. xix, 286. Gainesville: University of Florida Press, 1954. $4.50.

This volume contains the papers presented at the fourth annual conference on the Caribbean held at the University of Florida in December 1953, sponsored by the School of Inter-American Studies. The contributions are grouped under five major headings: Resources and Production, Manufacturing and Investments, Transportation and Marketing, Labor and Industry, Culture and the Economy.

A unique—and rewarding—feature of the volume is the attention given to problems of private investment. A number of business representatives discuss the Caribbean area as an outlet for North American capital and trade. John M. Mitchell, manager of the export division of the Aluminum Company of America, stresses the importance of personal attitudes and suggests certain criteria for United States investments in foreign countries, the most important being that "the investment should be a project that will benefit the recipient country and its people" and that it "should be expected to earn only a reasonable return." Statements which I suspect have a more familiar ring to Latin Americans are made by Percy C. Magnus, President of Magnus, Mabee and Reynard, an export-import firm of New York City, and Frank K. Bell, Vice President of the Alcoa Steamship Company. Mr. Magnus suggests that not only expropriation but even the threat of seizure is enough to shut off the flow of venture capital. "The pen strokes affixed to the expropriation papers are a screeching siren signal heard throughout the world, warning capital not to invest in that country. Such acts can never be construed to be 'in the public welfare.'" Mr. Bell argues that the Caribbean should be considered "an American lake." (". . . it is a sad thing that about 50 per cent of the shipping in the Caribbean is under flags other than those of the Americas.") To achieve this goal, U. S. shipping should have "the kind of support America gives to most of her products—patronage and the necessary government assistance."

Víctor L. Urquidi, of the United Nations' Economic Commission for Latin America, in a thoughtful article on "Financing Investment in Mexico and Central America," suggests that the "new" Latin-American pattern of economic development—which focuses on the domestic market rather than on the exportation of primary products—necessarily calls for a substantial amount of public investment (especially for social overhead items) and the channeling of savings into private enterprise undertakings through official development corporations and banking institutions. His main conclusion is that the experience of Mexico and Central America shows that the methods of financing development in the economically more advanced countries cannot be copied or easily adapted by the lesser developed countries.

A comprehensive survey of mineral resources in the Caribbean countries is presented by Alan Probert of the U. S. Bureau of Mines. Professor Carl O. Sauer provides a sweeping review of agricultural, forestry, and fishery resources. He makes a strong case for the native *conuco* technique of planting and for the plantation system ("bigness is no more bad in sugar and bananas than it is in shoes or automobiles"). On the whole, however, agriculture—the mainstay of the Caribbean economies—receives amazingly little attention.

Possibly the most satisfying section in the book is the one on labor and welfare. Mary M. Cannon, of the Women's Bureau, U. S. Department of Labor, presents an understanding treatment of the relations between labor and government in the context of the special historical and cultural circumstances of the Latin-American countries. She explains how and why labor and government exist on terms of mutual suspicion, mutual support, and mutual dependence on lawyers "to tangle or untangle their problems." Ernest Schartz, of the Congress of Industrial Organizations, presents a comprehensive survey of labor organizations, covering each of the Caribbean countries. Clarence Senior offers a scholarly and well balanced treatment of housing problems and programs within the broad context of the demographic and economic factors which influence welfare in these countries. He stresses the implications for welfare of the continuing high birth rate and the sharply declining death rate. Housing, sanitation, and other welfare plans, he points out, will have a much better chance to succeed in raising levels of living if efforts are directed to the control of births. The remarkable progress which has been made by the Commonwealth of Puerto Rico, through its planned and integrated programs of development and welfare, is discussed in articles by Earl Parker Hanson and Felisa Rincón de Gautier. Puerto Rico stands out as the "Caribbean success story."

As if to underline the fact that man cannot live by bread alone, a section of the book is devoted to culture, including articles on Caribbean education, drama, music and poetry; Guatemalan arts and crafts, and archives.

In general, the volume leaves much to be said about the Caribbean economy; if the meat is a little spare, the *hors d'oeuvres* and the side dishes are quite tasty and the dessert at the end is a pleasant surprise.

HARVEY S. PERLOFF

University of Chicago

EARL PARKER HANSON. *Transformation: The Story of Modern Puerto Rico.* Pp. xxiii, 416. New York: Simon and Schuster, 1955. $5.00.

Chester Bowles says in his Introduction: "At a time when we Americans urgently need to burn deeply into our private consciences and public policies a sympathetic grasp of the hopes and strivings of the underdeveloped world, it is both fortunate and arresting that Puerto Rico can teach us so much."

"The Puerto Rican experiment in non-independent independence is totally unique."

"The accomplishments of Governor Luis Muñoz Marín are striking. He calls his administration 'a government of the poor for the poor.' 'Bread, Land, and Liberty,'" is the rallying call of his Popular Democratic Party and of awakening peoples everywhere in Asia, Africa, and South America."

These themes are vigorously expanded in a dramatic narrative by Earl Parker Hanson, geographer, explorer of the Amazon, first head of the United States Economic Mission to Liberia, formerly on the staff of the Mississippi Valley Committee, and of the predecessor to the present Puerto Rico Planning Board.

Contemporary history, cheerful for a change, strides through these colorful pages, with the reader hard put to keep up with the pace. The story is of the transformation of Puerto Rico from a colonial poor house, a blot on the coat of arms of Uncle Sam, to an outstanding democracy with economic achievements unparalleled by the Caribbean colonies of England and France.

"With the world in a turmoil over the twin problems of abolishing colonialism and raising living standards of billions of peoples, Puerto Rico, with Washington's full cooperation, has set an important example of the manner and manners in which these problems can be solved. Visitors who see what Puerto Rico has done and is doing go home again saying, 'This is America's answer to Communism. . . .'"

Morris Llewellyn Cooke, the social engineer and ex-administrator of the United States Rural Electrification Administration, says of *Transformation:* "It is one of the most useful and interesting treatises on government I have ever seen."

Hanson commends Tugwell, the last continental governor of Puerto Rico, for his leadership and courage in advancing the self-government of Puerto Rico. Some other United States governors are handled without gloves, but an appealing character

is created for Governor Muñoz Marín, the idealistic young reformer who, after years of apparent defeat, finally won the confidence of the most suspicious forgotten people of Puerto Rico and out of them created a political party committed to definite economic reforms now largely consumated.

This anecdote about him, among others, is revealing. Muñoz, being driven by politicians after his election, retreated to a resort for privacy, and gave orders that no one was to be admitted except members of his family and *any* Jíbaro (peasant) *who might want to see him.* A poor old Jíbaro promised the Virgin that if Muñoz was elected governor he would make a pilgrimage and kneel at the latter's feet. After the election the old man sold his last two chickens and journeyed to see the Governor. When he told the Governor that he was going to kneel before him the Governor said: "There is no reason why I should not kneel with you." Afterwards, someone suggested that the old man having sold his only chickens to journey to the Governor, therefore the Governor should give him the money to get back home. The Governor said: "When a man offers you his soul do you give him change?"

The plain people are repaying Muñoz' love and respect by increasing majorities at each election.

Under Muñoz's leadership since he became Governor in 1948 Puerto Rico has been opening a new factory once a week, has doubled its per capita income, has eliminated malaria, built new schools, roads, and hospitals. All of this has been done as part of the United States with the understanding aid of the Federal Government, but without management from the continent. Contemporary Puerto Rico is the brightest feather in Uncle Sam's hat, a feather which should be more conspicuously displayed.

This is the aim of *Transformation,* a story of the upsurgence of the human spirit under democratic opportunity.

The United States Information Service should reprint *Transformation* in a cheap edition in languages read by people in undeveloped countries who are deluged with Russian claims of its own perfect system and of the alleged degradating exploitation by capitalist America.

OTTO TOD MALLERY

Philadelphia, Pa.

CORRECTION

Professor Pieter Geyl has asked the editor to call attention to the fact that his review of Alfred Cobban's *Ambassadors and Secret Agents* in the January 1955 issue of THE ANNALS as printed contained an error. On page 173, column 2, lines 11–12, ". . . the Patriots . . . could not count on the support of France" should read, ". . . the Patriots . . . could count on the support of France."

LETTERS TO THE EDITOR

Dear Sir:

In his review of my book "Why Dictators?" (ANNALS, November 1954), Professor Odegard says that I "have not given an answer to the question the title poses," and that my book contains "not much in the way of theory or structure."

The answer to the question "why dictators?" is embodied in my basic theory which is outlined in the Introduction (pp. 1–6) and set forth in detail in the first sections of the first three parts.

In the Introduction I explain that the concept of dictatorship, because of its complex character, cannot be handled scientifically unless it is split up into a series of types, which then are sketched in a preliminary fashion. The Introduction also briefly indicates the place of these types in human history, and the fact that in spite of their intrinsic differences, they all exercise a function in the development of revolutions, typical of Western civilization.

Thus, while a single all-encompassing answer to the question "why dictators?" cannot be given, my book answers the question for each type. In doing so, it stresses the general principle that, while the often queer characters fit to enact the part of one or the other of these different types were as numerous as are bacteria, they could only become "socially virulent" when favored by the right circumstances, that is, by a revolution with an opening for the type in question.

On pp. 8–24 there is given the theory of the emerging of what I call the "classical" dictator type, meaning the middle-of-the-road man who comes to power through antiaristocratic uprisings of city folks and peasants, or peasant elements as whose leader he emerges. On pp. 24–66 historical material is then introduced for the purpose of testing my detailed theory on the rise of the "classical" dictator and of thereby also enhancing the general understanding of the individual cases concerned. This is followed (pp. 66–104) by a composite picture of the general characteristics of the "classical" dictator, comprising his ascent to power, the way he is financed, his political technique, and his relations to the leading social forces of his time.

In Parts II and III, the same procedure is followed with reference to the "ultra-revolutionary" type (that is, dictatorships caused by "revolutions from below") and the "counter and pseudorevolutionary" types (dictators who owe their rise to a co-operation with the classes on top). Both these parts start with my general theory of the emerging of these types (pp. 106–110, and 166–174, respectively) and then proceed to particulars. In the last part (No. IV) the general theoretical yardsticks shaped in the preceding parts are used for the analysis of present day dictatorships.

I am sending these lines to THE ANNALS in order to give your readers an adequate idea of my basic theory, the methods, and the structure of my book, and thus to enable them better to decide for themselves whether or not I have made my point. It might also be open to question whether my "canvas" is so full of sight-obscuring figures as Professor Odegard would lead one to believe. At least no other reviewer missed its symmetry and landscape.

My methods—based on Max Weber—can of course be used with reference to any social subject, but they might be found to offer a special interest when applied to a topic as important and timely as dictatorship.

FOREWORD

For more than one reason it is a pleasure to write this brief prefatory note to the July volume. This is the three hundredth volume of THE ANNALS, which began publication in 1890. It also marks a significant departure by the Academy from a practice which has been followed consistently since 1913—with one exception in 1920—of devoting its annual convention to questions of international relations. The papers contained in this volume were delivered at the Annual Meeting held on April 1 and 2 in Philadelphia. The topic, Internal Security and Civil Rights, shows the keen awareness of the Academy's program committee that this has become since the last war one of the most important public issues in the United States.

THORSTEN SELLIN

Address by the Honorable George M. Leader, Governor of Pennsylvania, at the Delegates' Luncheon, April 2, 1955

MR. President, Members of the Academy, Ladies and Gentlemen:

Ungenerous and vain as it may sound at the outset of my remarks, I want to say that the main feeling I have as I stand here before you is pride. Of course, I am pleased, too. But mostly I am proud, proud to be the governor of a state which is the home of an academy illustrious enough to attract such a distinguished group.

In addition, I am delighted that the American Academy has taken as the theme of its Fifty-ninth Annual Meeting the important subject of internal security and civil rights in the United States. As I looked into the history of your venerable society, I was struck with the number of names of men prominent in your activities who have distinguished themselves in the field of the social sciences. The work of men like Edmund J. James, S. N. Patten, S. M. Lindsay, L. S. Rowe, E. M. Patterson, J. H. Willits, and Thorsten Sellin—to mention only those who come more readily to mind—have bestowed upon your organization a tradition of sober and sound scholarship. In so doing they have resolutely refused to allow your organization to become the instrument of any special interest or propaganda activity. With so much hysteria in the country today on the subject of individual liberty and civil rights, it seems to me most appropriate that an organization with this solid reputation for dispassionate scholarship should address itself to a discussion of the sensitive subject of internal security and civil rights.

As many of you know, I am not a lawyer but a person trained in education, who turned to the poultry business and to the field of state government. Speaking as a layman in the field of your concern this week end, it has always seemed to me that civil rights are perhaps too much construed in the negative, as a protective device against invasion of individual freedom of action. As such, civil rights are traditionally associated with courts and lawyers and due process of law.

In the past twenty years, American society has suffered many trials, both in war and in economic depression. Regardless of the theories of some of our classical economists and sociologists, American society has become an organism, rather than an aggregation of individual persons. It seems to me, looking at this problem as a public servant, that since society has become so urbanized and so industrialized, and men have become so economically and socially interdependent, civil rights should assume more of the aspect of mutual obligations and should be a positive, vital, active concern of men in government and of the whole body of our citizens.

Certainly, men must continue to be protected as individuals as they go about their individual pursuits. But they must also be protected as members of groups, because in groups individuals lose their identity and are virtually helpless. There must be in government thoughtful people who are particularly sensitive to these issues—people who ponder them constantly and who have the courage to sustain their convictions.

It seems to me that scholars might well consider how the conventional tenets and procedures of civil rights can be integrated and articulated with the new social rights which are reflected in programs of public assistance, unemployment compensation, workmen's compensation, old age and survivors' insurance, and regulation of factory working conditions. I seem to remember from my studies in political science that when the Germans made their Weimar Constitution in 1919, they had a negative, that is, a conventional, bill of rights, and also a positive bill of rights, which emphasized the right to employment, the right to organize, and the right to live in a well-ordered community. This constitution anticipated the famous Third Freedom enunciated by Franklin D. Roosevelt in 1941—freedom from want. It is unfortunate that the mechanical parts of the Weimar Constitution were put together by inexperienced idealists and that they failed to work. But this failure of parliamentary and presidential machinery should not prejudice us against the great virtue of a positive bill of rights.

Let me see if I can illustrate by an analogy this rather vague concept of the implementation of traditional procedures in civil rights cases. The analogy must come from outside of the field of civil rights. Let us take the example of workmen's compensation. Before our system of benefits was established, an injured workman had his choice of accepting an ungenerous settlement offered by his employer or suing in the courts. Attorneys representing the employers were experts in delays, in appeals, in continuations, their tactic being to compel the hard-pressed worker, whose family was in want as long as his disability continued, to settle for less than his deserts. Justice delayed was justice denied. Now we have a Bureau of Workmen's Compensation, which does not sit in judgment on injury cases but is the worker's active friend and agent. The worker's ancient common-law remedy has been translated into a positive, automatic procedure, which keeps him out of court in almost 100 per cent of the cases and gives him immediate relief.

I certainly hope that minds more ingenious than mine can devise automatic and positive procedures to bring immediate relief to the victims of race prejudice, security hysteria, vicious investigations, censorship by majority stockholders, wire tapping, and related evils, just as we have modernized our methods of protecting those whose bodies are broken in our industrial operations.

You will understand that as Governor I am mainly concerned with getting good people into government. By good people I mean men and women to whom civil rights and human freedom are not dusty concerns of courts and lawyers and procedures. I mean thoughtful, courageous people who will be able to devise ways and means of deepening democracy among our citizens. I mean people like the distinguished Philadelphian who addressed you last night—the former Attorney General of the United States, Francis Biddle. I know a story about him which I think crystallizes my thoughts about the sort of person America needs.

He was, as he still is, one of the giants in maintaining civil rights. When he was Attorney General he was so much concerned with this subject that in Washington he was known to the inevitable group of jokesters as "Old Civil Rights Biddle." But this is an epithet of praise, not of derision. Shortly after Pearl Harbor President Roosevelt, in those dark and uncertain days, called an extraordinary Cabinet meeting. His Attorney General—Francis Biddle—was late in arriving, and Roosevelt, to

lighten the dismal atmosphere of the meeting, decided it would be appropriate to joke with him about civil rights. When the Attorney General arrived at the meeting—alone and conspicuous—the President addressed him by saying: "Francis, I am sorry you are late because during the first part of this meeting we decided that the situation is so grave that we will have to suspend civil liberties and rights for the duration of this emergency." General Biddle, whose great sense of humor never extended into the field of civil rights, blanched and said, "Mr. President, I think that is a terrible idea, and if you are serious I shall have to resign."

That is the kind of devoted public servant I should be grateful to find. Good men of this sort can bring imagination and courage to government. Government at its best assures good living to its citizens. Woodrow Wilson epitomized this thought when he stated: "Human freedom consists in perfect adjustments of human interests and human activities and human energies." These are the adjustments we all seek.

George M. Leader, Governor of the Commonwealth of Pennsylvania, was a state senator from 1950 and a justice of the peace. Earlier, he was chairman of the York County Democratic Committee. A graduate in education of the University of Pennsylvania, he took advanced work in the Wharton School of Finance and Commerce and in the Institute of Local and State Government of the University. He served in the Navy during World War II.

Science and Security

By M. Stanley Livingston

THE security system which has developed in this country is a social phenomenon of our times. It is a consequence of the severe political and social pressures associated with the emergence of this country as a world power and the rise of international Communism. The dramatic changes in the weapons requirements for defense, emphasized by the overwhelming destructiveness of atomic and hydrogen bombs, have forced the issue and added an element of insecurity. Our people grope for reassurance and grasp at straws, searching for some simple, understandable formula that will solve our problems and guarantee peace. Our leaders seem also to have been bewildered by the complexity and scope of their responsibilities, and all too often have slipped into the easier course of partisan recriminations. Demagogues have offered panaceas and scapegoats, which form unfortunately attractive alternatives to the continuing insecurity. In this atmosphere a few spies were exposed; investigations multiplied; newspaper headlines spread rumors of serious subversions; government orders were issued and punitive laws were passed. The security system, seeded by the need for military secrecy, flourished in this rank soil of uncertainty and suspicion and grew in a few years to tremendous proportions.

We now seem to have reached and passed a climax, and to have a breathing spell in which we can survey the situation and assess the consequences.

Scientists are members of one of the most "sensitive" of professions and have experienced some of the most severe frustrations and restrictions. For many years the Federation of American Scientists has served as a channel for bringing scientists' views to the attention of the public and of the appropriate government agencies. Study groups and committees of the Federation have gathered and published information about security regulations and procedures and have compiled individual case histories of those involved. My function in this symposium is to discuss the impact of the security program on science and scientists. Some of our problems are unique to those who work in or close to areas requiring security clearance, so such features may be rather heavily emphasized. However, in many respects the problems facing the scientist merge with those of the other professions, and I will also discuss these more general implications.

Our government security program is under attack on many fronts, by individuals and organizations representing a wide variety of professional and intellectual backgrounds. Although motives and purposes differ, a common basis for most of the criticism is concern over procedures which threaten our traditional liberties and the rights of the individual. Although this is a most important aspect of the growth of the security system, it is by no means the only one. A more basic question, which is frequently neglected, involves the philosophy and purpose of the security program. What is the security program intended to achieve? Can we agree on the meaning of the words we use in defining this purpose, such as security and loyalty, or can we define reasonable bounds for the areas in which secrecy is required? What kind of security procedures are best for this country? How can we make the most progress toward our acknowledged goal of world peace?

It is my hope that this conference will apply itself to the study of these more basic questions. If so, it may prove to be a significant step toward initiating a new and saner approach to the problems our country faces in the security field.

In this discussion I shall attempt to survey some of the more important aspects of the security problem as observed by the scientist, emphasizing those which bear most directly on the basic meaning and purpose of the security system. Criticisms of procedures cannot and should not be avoided in this survey, since they represent the factual evidence on which judgments must be based. The underlying purpose, however, is to illustrate the need for a fundamentally new approach to the philosophy of security.

Information Security

The security system originated in the need to protect vital military and state secrets. It involved compartmentalization of information, passes, guards, fences, and locked files. The basic concept was that existing military and technical information was so vitally important that it must be protected at all costs from loss by espionage or inadvertence. The military services are charged with the responsibility of protecting the country and of developing adequate weapons, forces, and tactics. Few would question the necessity or right of the military services to protect their essential secrets or their competence to judge the need for secrecy within strictly military areas.

With the growing complexity of military needs, however, this concept of the overriding importance of secrecy has been transferred bodily into many other areas of our national life. The area of responsibility of the military has become so broad as to include, for example, the possible genetic effects from radiation caused by H-bomb tests on generations yet unborn throughout the world. It is essential that we restudy the usefulness of the concept of secrecy at any cost in the present complex situation. The pertinent question is whether this emphasis on secrecy stultifies progress, resulting in an actual decrease in our national security.

There is reason to believe that secrecy has caused losses of strength disproportionate to the gains, even within the military system itself. Several examples have been cited from the past war to show that our military effectiveness was actually decreased by excessive use of secrecy. From my own experience as a civilian scientist within the Navy Department during the war I call to mind one example in which the use of a top-secret classification for a potent anti-submarine weapon so restricted and slowed its use in action in the field that it never made a "kill." Many other examples exist which illustrate the same point. To reverse the picture and bring it up to date, we can recall the published statement of Mr. J. G. Beckerley, formerly in the Security Division of the Atomic Energy Commission, to the effect that in his opinion the information gained by the Russians through espionage channels about our atomic-bomb project had a negligible effect on the development of atomic energy by the Soviet Union.

Scientific projects involving secret work now have a complex system of classification of information, in which the originator of the document makes the first decision, it is confirmed or changed by security officers, and eventually is acted on by a declassification board. The system works reasonably well within the policy framework in which it was conceived. But, in the view of many critics, because of this

basic policy it tends to overclassify too much information and is overslow to release material from classification. Failure to classify material carries severe legal and other penalties; on the other hand, there are no significant penalties for excessive security classification. My present purpose, however, is not to criticize the existing system or its proponents, but rather to suggest that a broader view of the significance of secrecy in the security program might change the underlying policy.

CHANGING MILITARY NEEDS

During the past war revolutionary new methods were introduced into weapons development. The scientific services (Office of Scientific Research and Development and others) were planned and organized to bring research scholars directly from their universities into the weapons program. Under the wise guidance of men like Drs. James Conant, K. T. Compton, and Vannevar Bush new organizational procedures were introduced, such as scientific advisory boards and relative freedom from detailed supervision or from irritating bureaucratic procedure. The result was amazingly successful. Scientists and engineers worked together with full freedom to explore all pertinent ideas, to invent new devices, and to discuss their problems freely with other experts. Money and technical assistance were plentiful. Speed was essential; time was telescoped. New ideas were frequently put into the laboratory for testing within a few days of their conception. A new and remarkably effective source of talent was injected into the age-old field of weapons development. There are few who will deny that these scientific weapons were instrumental in winning the war. One well-qualified analyst rates the three most important new weapons of the past war as radar, the influence fuse, and the atomic bomb. All of these and many more were developed either largely or in part in the OSRD laboratories.

Today we need such effectiveness and such progress even more, if we are to keep ahead in the rapidly changing race for superior weapons and systems of defense. Secrets represented by weapons in the field or even by plans in laboratory files become insignificant in comparison with the importance of new ideas and new concepts. This is true in all fields, not only the military. A significant new idea to prevent war is far more important than bigger bombs, at the present crisis. Peculiarly enough, some of the most valuable ideas in this field have been proposed by scientists. One example is Dr. J. Robert Oppenheimer's influence in developing the original Acheson-Lilienthal proposals for international control of atomic energy, which formed the basis of the Baruch proposal to the United Nations. To achieve this effectiveness, this fertility in ideas, we must modify our security system to encourage and foster original thinking. We need fewer controls and hampering safeguards and more freedom of discussion between experts in all fields. The prevailing requirements of compartmentalization and conformity are dangerous. Achievement, at a rate to keep well ahead of a possible enemy, becomes more important than secrecy.

In this race for technological superiority, the most effective new concepts appear frequently on the advancing front of research science. And these new ideas become available to scientists throughout the world in the normal course of development of the science. It is frequently true that new scientific concepts develop independently and simultaneously in several places. An example from my own professional field of particle accelerators is the simultaneous proposal of the principle of the synchrotron by E. M. McMillan at Berkeley, V. Veksler in the USSR, and M. L. Oliphant in Birmingham, England, each arrived at independently. Science speaks in all languages, and a new idea becomes available to all qualified thinkers in the field.

Progress and leadership in science depend primarily on the number and quality of trained minds. Since it has now become almost necessary to equate superiority in weapons with leadership in science, we find that our major resource and our greatest security comes from our intellectual potential. So the changing military needs expose a new priority in weapons development, in which imaginative thinking and minds trained for research become of primary importance.

PERSONNEL SECURITY

We need reliable people in positions of responsibility, and especially in secret work. We cannot tolerate disloyal or subversive employees. We do not want drug addicts, blabbermouths, or alcoholics in positions where loose talk or external pressures could result in disclosure of secret information. The responsibility for choosing reliable personnel has always been a major problem for the administrator or director of a project or agency. It is obvious that there must be some mechanism by which the administrator can obtain information about a prospective employee; this has normally been provided by the Federal Bureau of Investigation or the other intelligence services. The administrator also has the authority and responsibility for firing an employee if pertinent derogatory information is brought to his attention. This is a situation requiring judgment, and the test is whether the judgment is objective and fair.

Why, then, is there so much adverse publicity concerning personnel security procedures? We have all heard about cases where persons have lost their jobs through security actions; frequently these cases describe a sequence of decisions by administrators, security boards, and review boards, often reaching contradictory decisions on the same evidence. It is not my purpose to go into details to make this point. Many case histories have been described in published articles. An especially pertinent list is included in the April issue of the *Bulletin of Atomic Scientists*. The reason for these criticisms is that in the opinions of many observers the security decisions are not objective or fair. In far too many cases the rights of the individual have been badly mauled, and in some instances it is now clear that innocent persons have suffered unjustified and severe damage to their reputations and to their opportunity to work in their professional fields.

A government agency operates under Executive Order 10450, which puts the responsibility directly on the administrative head of the agency. This order specifies that security clearance is to be "clearly consistent with the national security," and requires that any questionable case is to be resolved in favor of the government. One consequence of this delegation of responsibility is that individual agency heads tend to lean over backwards to be cautious in security cases. Another consequence is that the same rigid standards for security clearance used within the most sensitive agencies are imposed on other government bureaus in which there is no classified or secret work. But the most controversial result is the considerable variation in procedures used in the several agencies. There is no general standard to provide an objective basis of judgment, and no criteria for determining the degree of risk suggested by an individual's background. Some agencies supply lists of charges to the suspected employee; others have

fired employees for security reasons while hiding behind some administrative formula such as a reduction-in-force order. Some allow hearings before action is taken; others use summary suspension on unevaluated derogatory information regardless of the damage to the laboratory program or to the individual. And in an uncomfortably large number of instances successive security boards or administrators have drawn contradictory conclusions from the same evidence.

It is an understatement to say that personnel security procedures are in bad shape. What is needed is, again, a critical restudy of the entire program, out of which will come some fair and sensible standards and criteria. However, this attempt to modify procedures will only be significant if it is based on a philosophy of security which gives a proper evaluation to the significance of procedures as such and allows security decisions to be based on an appraisal of the whole man, including the country's need for his services.

Cloak of Secrecy

Unfortunately, secrecy has been used as a cloak to veil the operations and decisions of security officers, although there must be many instances in which this is unnecessary. A particularly unfortunate example is the use of secrecy to prevent accused persons from being able to confront derogatory witnesses in security hearings, usually justified by the claim that calling such witnesses might expose secrets of the investigating agency. It is obvious that many of these witnesses (landladies, for example) could be called without harm to the agency. It is also probable that witnesses would be more careful to give only the truth in their derogatory testimony if they knew they would be called for confrontation. President Eisenhower has stated that the accused must have "the right to meet [his] accuser face to face." Yet few have been called in security cases heard to date.

Security Officials

Many security officers are enthusiasts who consider their actions to be of vital importance. It is possible to understand how some might take pride in turning up large numbers of suspects and long lists of derogatory charges. In many cases lists of charges show poor judgment and no attempt at evaluation. In the Fort Monmouth investigations a charge brought against one scientist was that he had attempted to transmit a reprint of his published work (available all over the world), on request, to a scientist in Czechoslovakia. Another charge was that an employee had been reported as attending a Communist-sponsored meeting; in the hearing it was demonstrated that the dates proved this event to have occurred when the employee was twelve to thirteen years old. It may be of interest to note that the civilian security official responsible for writing these charges rose to his position of responsibility from earlier jobs as a chauffeur and as a uniformed plant guard.

Consider the problem of an agency director when presented with such lists of charges against valuable employees. He may find it difficult or impossible to cancel out items on the list, even though they seem stupid or inconsequential, in view of the obvious authority and responsibility of the security officer. No adequate procedures seem to have been developed for evaluating charges before they are presented to the accused employee (with his right to publish them if necessary) or to the security review board.

We conclude that there are many new problems in the field of security which do not have the guidance of tradition or experience. The necessity for more competent training of security officers becomes obvious. Such training must surely include appropriate instruction in the long-range philosophy and purpose of the security program.

Creeping Security

Some of the more flagrant abuses of the security system have followed from the introduction of the techniques and practices of security into areas and agencies in which there is no secret work, and for which the standards of employment should obviously be different from those in the more sensitive areas. The pressures which have caused this "creeping security" have been largely political, and this feature will be discussed further in a following section. A more specific cause is the broad generality of Executive Order 10450, which makes no distinction between government departments and agencies. In retrospect it seems that this Executive Order was intended to dilute the problem of disloyalty and subversion by lumping it with the general problem of untrustworthiness and incompetence, in an effort to take the stigma out of security hearings. Unfortunately, this was not the result; rather, government officials and the people as a whole chose to attach the stigma of disloyalty to all the unfortunates who came under the general category of security risk.

Over thirty persons have been fired or have resigned under pressure from the Public Health Service, as a consequence of security investigation. In most cases the charges were of suspect associations or political nonconformity. Many of these individuals were competent and valuable workers, employed in completely open work where they could not possibly obtain or transmit vital secrets. It seems necessary to search for some other reason than concern over the national security to account for these actions.

Grants for basic research from the Department of Health, Education, and Welfare and the Atomic Energy Commission have been refused to universities because a member of the research-project staff was considered unclearable. The most publicized case is that of Professor Linus Pauling at California Institute of Technology, whose application for a renewal of his research grant in biochemistry was refused. It was later granted when two of his colleagues, of lesser scientific repute, resubmitted the application.

Security decisions have disrupted freedom of travel and scientific intercourse in fields of basic science where no question of secrecy is involved. Foreign scientists requesting visas to attend scientific meetings in this country have been required to submit detailed information about their past political associations and have experienced frustrating and expensive delays. Such treatment has caused hard feelings abroad and has denied our own scientists much valuable scientific consultation. Many informed critics argue that the effect of the visa security program has been a net loss to this country.

This is not the attitude of a strong and freedom-loving country; it displays a morbid, almost hysterical fear—of what? The history of our country shows a reliance on full, free expression of opinion, with confidence that in open discussion truth will prevail over error and that our democratic system of government will survive the challenge of any fascist ideology. We can only understand the prevailing extension of security practices into these traditionally open fields as the consequence of a distorted view of the importance of secrecy and of political conformity in our national life. The use of the security system to serve the purposes of those who

desire to enforce political conformity is a strange manifestation. This threat to our heritage of freedom of opinion should not go unchallenged.

PUBLIC REACTION

The reaction of the public to the prevailing suspicions, worries, and fears has been responsible to a large extent for the overextension of security and the abuses of fundamental liberties. It has been easy for demogogues to exploit these fears by magnifying the dangers of internal subversion and to personalize the public resentment in the form of attacks on nonconformist individuals and groups. The urge to find a scapegoat is a human urge and is all too easily fulfilled. So large segments of the people acclaim the demagogues who denounce lists of individuals as traitors or security risks and make headlines with broad charges of espionage and subversion; then they clamor for more charges and more convictions. The newspapers and other public journals must also take some responsibility for utilizing these charges in headlines, without making adequate effort to confirm them. One of the most hopeful signs at present is the growing skepticism of loose and unproven charges displayed by all reputable news editors. In this area, at least, we can hope that the tide has turned.

Security investigations carried on in this atmosphere have been far from objective and often actually unfair. Those conscientious citizens who make up our security boards are also influenced by public opinion. Their objectivity has not been helped by the occasional threat of investigation of security-board personnel, when their decisions have not been acceptable to some pressure group or demagogue. Furthermore, these people seldom have legal training and are not familiar with judicial tests for acceptability of evidence. Their standards have varied, in many cases reflecting the individual bias of members of the board. There are several examples where security-board decisions have obviously been influenced by newspaper headlines and the prevailing public attitude.

Adverse security decisions have often received wide publicity, although the detailed charges and answers are seldom known. Large segments of the public have accepted these decisions as equivalent to court convictions for subversion or disloyalty, even when in many cases the charges or decisions carried no imputation of disloyalty. Social censure on the victims of such decisions has at times exceeded that accorded convicted criminals. The wife of a discharged employee at Fort Monmouth was insulted by neighbors in a local grocery store. The child of an accused official of the State Department was refused service of an ice cream cone. Whispering campaigns and neighborhood gossip amplify the damage and in some cases even initiate security charges, as in the case of Chasanow and the Greenbelt housing project.

Almost all persons who have had their security clearance revoked have had great difficulty in obtaining jobs proportionate to their ability, even in nonsecret employment. Few industrial companies are willing to accept a person who has been the target of security investigation. In at least one instance a company refused to consider a man who had been charged but later reinstated with full security clearance, claiming that in a future investigation the charges might be revived and cause trouble for the company. We have developed a small but significant group of second-class citizens, unable to get suitable employment; some of these are capable scientists whose services are lost to our government.

Public opinion has a subtle effect. The desire to avoid any potentially questionable association has led many people to shun their former friends or colleagues, once the latter have become involved in an investigation. Accusation alone, if widely publicized, brings the same social stigma; complete clearance in a review seldom erases the stain. The security charge has become the modern equivalent of the "scarlet letter," a brand which can never be removed.

POLITICAL ASPECTS

Political appointees of a new administration need people in their organization whom they can trust to carry out the new policies. Each new administration attempts to clear out old party supporters and put in their own. Yet the number of openings for replacement are usually considered inadequate. Civil-service policies and practice have expanded to protect the tenure of more and more government employees. The need to open up new jobs becomes a tangible pressure on the new administrator. In this situation it is difficult for an administrator to be too critical of a security officer who presents a list of security risks, documented by lists of charges, especially if the cleanup has the sanction of a Presidential directive. Unfortunately for the individuals involved, a security-risk charge offers the administrator an easy way out of his dilemma, and it is understandable that the charges are not scrutinized with objectivity or thoroughness.

We should be naïve if we did not recognize that this type of pressure has inspired the removal of several valuable government servants on security grounds. The dismissal of John Paton Davies, Jr., from the State Department is an instance in point; another is the case of Wolf Ladejinsky in the Department of Agriculture, in which the implication has been confirmed by his immediate re-employment in another department. Several responsible analysts have concluded that this was the basic motive in the case of Dr. J. Robert Oppenheimer, who has made such valuable contributions to our atomic energy program.

There has also been an unfortunate citing of numbers of old administration employees dismissed on "security" grounds, in party political speeches, without adequate recognition of the probability that the public mood would translate these general charges as "disloyalty" or "subversive activity." Responsible members of both parties should feel shamed by this distortion and abuse of the security program.

LEGAL ASPECTS

Security investigations, lists of charges, suspensions, decisions of security boards and review boards, all are items of great public interest. Even administrative decisions on security are no longer hidden within the private channels of employment divisions, as formerly, but are frequently widely publicized. For example, when Dr. E. U. Condon had his clearance revoked by Secretary Charles S. Thomas of the Navy Department, following four earlier clearances by competent security boards, he resigned from the Corning Glass Works in protest and announced his reasons to the press. So, although such decisions are technically administrative matters they are no longer private; the public becomes informed and makes its judgments, as discussed earlier, in which these decisions are taken as equivalent to court actions. Unless the public can be persuaded to treat these decisions as normal administrative acts and to withhold its censure and penalties, the government must find a way to protect the rights and privileges of the individuals concerned.

The legal and judiciary systems were

designed to protect individual rights. The law grows as our conscience grows, and we develop new legal procedures and precedents to meet changing conditions. We cannot rely on the law or the courts to protect our basic liberties statically and indefinitely, but must expect judicial practice to evolve and change to meet the needs. The abuses of the security system present a challenge which must be answered by some new evolution of our judicial processes. What form this may take is not clear at present, but able minds are now being applied to this problem. The Fund for the Republic recently made a grant of $100,000 to the New York Bar Association to study the problems of security. It may be in this area that we can hope to see the first definite results of re-evaluation.

CONCLUSIONS

After this broad-ranging survey of many aspects of the security problem I shall be brief in my conclusions. The phenomena we have been discussing have occurred many times before in history, even in this country. As on earlier occasions, the initial public reaction causes blunders and carries us to extremes. But eventually a time comes, as now, when thoughtful people try to assess the dangers and search for a reasonable and fair solution. We can be thankful that we have in this country a small, but we hope sufficient, number of people who have become concerned with these threats to the traditional rights of the individual and to the true security of the country. We observe a rising wave of criticism and hope that this means that something will be done.

In my opinion the first step in solving these problems should be a thorough re-evaluation of the meaning and purpose of the security program in this country. It seems unlikely that this can be done within the existing government agencies, despite their obvious desire to revise procedures in order to reduce criticisms, since they act under laws, orders, and policies established by Congress and by the President. It also seems unlikely that the present administration could initiate any fundamental changes in the security policies, acting as it must in a partisan manner and under the controlling eye of Congress. It is possible that the Commission on Government Security proposed by Senators Humphrey and Stennis,[1] and now being discussed in hearings in Washington, may be able to make a valuable start in this direction.

What we need is a new philosophy of security, based on a careful study of all the facts involved, which will guide our government to a revised and improved security program, one which will truly protect the national security and also preserve basic American rights.

[1] Senate Joint Resolution 21.

Milton Stanley Livingston, Ph.D., Cambridge, Massachusetts, professor of physics at the Massachusetts Institute of Technology, is chairman of the Federation of American Scientists. He was associated with Professor Ernest O. Lawrence at the University of California in the development of the original cyclotron, and in 1947–48 was chairman of the accelerator project at Brookhaven National Laboratory, responsible for the design of the three-billion-volt cosmotron.

Freedom of Expression on the Air

By HAROLD E. FELLOWS

BEFORE dealing with the subject assigned to me, "Freedom of Expression on the Air," permit me to qualify myself as a witness. I speak neither as a political scientist nor as a social scientist, making no pretense to be either. What I shall try to do is to reflect the opinion of broadcasters about the subject at hand—the majority opinion, if you will, since there is no unanimity about certain aspects of this difficult problem even among broadcasters themselves.

This is an appropriate environment, perhaps even a sympathetic one, in which to make such observations as I shall offer. For here lived Benjamin Franklin, the sage who contributed so richly to the heritage of a free press in the United States and who also, with a kite and a key, revealed a phenomenon which one day would lead to the development of another great mass medium.

WITHOUT FREEDOM OF EXPRESSION

Let us assume at the outset, merely to establish a background for discussion, that freedom of expression were not permitted on the air under any circumstances. A ridiculous concept, of course, in light of the declarations and charters which assure freedom in our unique system; but a concept which, you and I know, might be looked upon with favor even in some quarters of this liberty-loving nation.

Were freedom of expression absolutely denied, the character of broadcasting would be in sharp contrast to that which exists today.

There would be no commentators. This, according to one's lights, might appear to be a blessing. Not infrequently we hear a citizen of determined political and economic persuasion say, "I dislike so-and-so personally, despair of his opinions, but I'm going to tune in on the scoundrel again tonight just to see what crazy theory he is now expounding." Psychiatrists may understand this urge toward self-induced torture in which the victim is powerless to do anything but mutter angrily at a vision on a screen or at the sound of a broadcast voice. I do not. At all events, let us assume "no commentators"—no well-known, coast-to-coast headliners, and none of the hundreds of others who broadcast locally in communities all over America.

In the total absence of freedom of expression, there would be no politicians on the air either. Office seekers would have to campaign without radio and television, resorting to the stump speech and assembly hall of another year. And officeholders would be barred from speaking on the air—for which among them could speak without expressing an opinion that would do violence to the prohibition against freedom of expression?

Naturally there would be no place for the pulpit, either. No faith or sect could be permitted to bespeak the virtues of its creed during such a blackout of opinion.

Surely we could not cover, by microphone or camera, the great political conventions, for these represent nothing but a cacophony of opinion, some good and some bad, but all born of conviction loudly proclaimed. It is very doubtful that a Presidential inaugural could be broadcast, and most certainly scientists,

scholars, and teachers would be forbidden.

Actually, in the strictest interpretation of the premise, if there were no freedom of expression whatever the air would be silent: for a drama of purest fiction can express a point of view, and even music may provoke thought.

But how long would such silence prevail? Not very long in this industry, for this industry—by necessity—is licensed by the federal government. Officeholders, the most innocent among them, would see quickly the usefulness of such a massive instrument of communication. Here, under proper control, the incumbent government could project its viewpoint without fear of contradiction, except in other media. Here would be the ready weapon of the unscrupulous man to perpetuate himself in office. Here would exist the pattern for dictatorships as, even today, we see it clearly in other nations.

LICENSING

Such speculation makes it apparent that broadcasting in a sense has supplanted the press of the nation as the first line of defense in the whole area of freedom of expression, for broadcasting is more vulnerable to attack through a licensing authority. During the thirty-odd years in which the medium has grown to its present stature, there have been many skirmishes between broadcasters and that licensing authority. Most of them have had to do with freedom of expression, basically; whether the broadcaster should be the arbiter of programing or the government; whether broadcasters should be permitted to editorialize; whether the broadcaster must be required to balance opinion by exposing all viewpoints on a given subject.

In other words, freedom of expression within this medium has been subject to greater restraints than have ever jeopardized the publishing industry since its final emergence from licensing authority. These restraints are likely to continue, whatever the identity of the party in power—for broadcasting will undoubtedly continue to be subject to licensing so long as its existence derives from the use of channels that require assignment.

WHAT MEASURE OF FREEDOM?

I believe we would agree that a broadcasting system which permitted of no freedom of expression whatever would be incongruously out of balance with our nation's concept of government by the governed. The air waves must remain free. What, then, shall be the measure of that freedom? Free, yes—but to what degree? A mechanic may give a different answer from a professor; a government career man a different answer from an editor; a political scientist a different answer from a lawyer. But all would agree, certainly, that there should be freedom in sufficient measure to neutralize any danger of usurpation.

As believing American citizens, they could give no other answer based upon logic—for this is not the freedom of the broadcaster we are considering, but the freedom of the people themselves. I am sure the implications of a free press and free speech as treated in the Bill of Rights are clear enough to readers of THE ANNALS, but it remains doubtful whether such comprehension extends to all of our citizenry.

The Constitution inveighs against the limitation of freedom of expression in the words which state that the right of free speech and a free press *shall not be abridged*. The Constitution's guarantee of these freedoms was not basically intended as a privilege for the publisher, but rather as a benefit and protection for the people at large whom the publisher serves.

It is true that the era of broadcasting had not dawned when those words were written, but they are clearly as applicable to broadcasting as to publishing. These two media perform like functions in unlike manners, one approaching the intelligence through the eye alone and the other approaching through both the ear and the eye. Both entertain. Both inform. Both are instruments of commerce. Both are diversely owned and of varying political and social persuasions. The very addition of the voice of radio and the picture of television gives balance to opinion, since they introduce new expressions of thought and opinion in the market place.

How free should broadcasting be? As free as the press. That is the answer—and no compromise upon it is consistent with a government which exists on the proposition that the governed shall be in control. For, as Chief Justice Earl Warren observed at the recent National Press Club inaugural dinner, speaking to both newspaper and radio and television correspondents who belong to that organization:

> May I say to you that this is a great breed—these newspaper people of America. They are the greatest friends that the public has—the greatest friends that people in office or out of office ever had. They are not public officials, but they are public servants. While they do not have a public position, they do have public responsibilities just as great as any man who holds public office and they discharge them with equal fidelity.

Freedom is not a piece of pie that can be cut into segments of assorted sizes and thus distributed. Each gets his equal share. Some are so ill-mannered, so disrespectful of its rewards, as to lose it altogether. As this applies to the individual, so does it apply to the medium. It is not difficult to stop reading a particular newspaper—or to stop dialing to a given radio or television station. Either action expresses your dissatisfaction with the product, and a sufficient rebellion will eliminate the producer.

The broadcaster thrives on the attention of the public and dreads inattention more than any other single thing. This is the true check, and the democratic one, against insolence of management or policy, as a person's vote is a check against insolence of office.

If such a premise is acceptable—that broadcasting should enjoy freedom no less than that of any other mass medium—what does the record show? Just how free is the medium in terms of its capacity to speak?

EDITORIALIZING ON THE AIR

The question must be considered in the context of regulations of the Federal Communications Commission, the licensing authority established by the Communications Act of 1934. But there must be weighed as well the activities of state and national legislative bodies, of the courts and certain professional organizations, with respect to the medium's freedom to report as well as to speak opinion.

Mayflower case

There was a time when the Commission said, in effect, that broadcasters should not editorialize on the air. The authority of the Commission to regulate such silence certainly is questionable, but this prohibition grew out of a Commission action on the hearing given a station for the renewal of license. The prohibition against editorializing, if it could be called such, was contained in dicta, as the lawyers say, and not spelled out in regulation. It could not have been spelled out, since the Communications Act specifically prohibits censorship.

The Commission, in this particular litigation—known popularly among broadcasters as the Mayflower case—held

that a station could not express a political opinion. The management of the facility, for example, could not go on the air and promote a specific bond issue or a particular candidate or cause without placing his license in jeopardy. Since radio and television licenses are subject to renewal every three years, it is obvious that this decision had the effect of stifling free comment by broadcasters.

Equal opportunity

Constant campaigning by the broadcast industry and thorough review by the Commission led to subsequent action, three years ago, which nullified the "raised eyebrow" caveat contained in the Mayflower decision. Now the Commission says, in effect: "You may editorialize but you must give equal opportunity for reply by those holding opposite points of view." Is even this freedom? I leave it to you who are political scientists to debate among yourselves. I can assure you that there has been much discussion of the subject among broadcasters. Some hold to the belief that the Commission, as the regulatory representative of the Congress and thus of the people, should demand such "equal opportunity." Most broadcasters believe that the rule of thumb should apply during political campaigns, but not all agree that it is meritorious otherwise. Whatever the virtue of either argument, it is true that such authoritarian advice does not apply in the printed media. No one tells a publisher, "You must give all points of view." The informed and experienced publisher makes every honest effort to do so, nonetheless, because he knows that prejudice begets enemies and enemies do not subscribe. We cannot proceed from the argument that broadcasters are less responsible than publishers, particularly in view of the fact that licensees are so thoroughly examined as to their personal, financial, and civic capacities before they are franchised.

At all events, you only occasionally hear a broadcaster—in the sense of a station manager, as compared to a publisher or editor—on the air with an opinion about a matter of controversy. I believe there may be a trend toward more and more such broadcasts, particularly in the smaller, well-knit communities. Perhaps this is good. There are over 2,600 radio stations and 400 television stations on the air. If editorial opinion by 1,800 daily newspapers is considered democracy in action, possibly the addition of 3,000 more viewpoints would be enlivening as well as enlightening.

I am separating this function, of course, from that of the commentator and analyst—as the editorials in a newspaper are separated from the observations of the columnist. The most successful broadcaster, at the network or station level, attempts to maintain a balance among commentators reflecting every possible opinion.

NEWS OR OPINION?

The arena of comment, whether by management or employee, is not to be confused, however, with another vital aspect of free expression on the air. "Freedom of expression" connotes not only the broadcast of interpretation of the news but the broadcast of the news itself. News improperly and unfairly presented can carry the effect of opinion. I like to illustrate the point by recalling the old town crier. He used to say: "It's three o'clock"—that is news —"and all's well"—that is opinion.

Broadcasters historically have been looked upon by some persons in public life with innate suspicion. One hardly believes that opprobrium was attached to the broadcaster himself but rather to the tools of his trade—the camera and the microphone. Politicians are likely to look upon these instruments of publicity with affectionate regard during campaign time, and once sworn in office to regard them with the waspishness of a thwarted spinster.

TELEVISION AND COURT TRIALS

Even now there are state statutes which absolutely forbid the use of microphones and television cameras in broadcasting public trials—although the precedent of the right to public trial is well established and accepted. The camera and microphone perform the function of making a trial more public than had been possible before their introduction into the craft of reporting. Broadcasters acknowledge that they must be used with wisdom and discretion and that their use should not impinge upon the issues or the individuals being tried. But to ban them capriciously, without thorough examination of the contribution they can make as against the inconvenience they may cause, is hardly the American way. Nor does it represent, in our opinion, a stride forward in the delicate domain of free expression.

The American Bar Association Canons of Ethics include one canon which condemns the use of cameras and microphones in courtrooms, although some farseeing and thoughtful jurists have overlooked this advice and broadcast proceedings with eminent success.

As to the annoyance which it is said might be caused by glaring lights and grinding cameras, a thorough exploration of modern day television techniques has never been undertaken. The truth is that a television camera is noiseless and that it can operate satisfactorily without artificial lights other than ordinary room illumination. In fact, a courtroom trial could be covered from beginning to end with a television camera lens peering through a wall aperture as a boy peeks through a knothole at a baseball game.

The basic consideration here is not the behavior of a camera, which could be considered exemplary as compared to that of some reporters who cover the courts, but the product of the camera's genius. How much of the truth should be told to how many? That, fundamentally, is the problem—and I am happy to report that even now the American Bar Association has organized a committee to re-examine this whole problem. One of the members of that committee is Edgar Kobak, chairman of the Freedom of Information Committee of the National Association of Radio and Television Broadcasters.

FREEDOM OF INFORMATION COMMITTEE

This NARTB committee, comparable to the one that exists among newspaper editors, is the watchdog of our industry in the field of freedom of expression. I should like to give in full the committee's statement of policy, which not only gives insight into the committee's objectives but reflects as well the nature of such dilemmas as do exist in this sensitive field among broadcasters:

> The Freedom of Information Committee is a standing committee of the National Association of Radio and Television Broadcasters. It is advisory to the Board of Directors and the management of NARTB.
>
> Its purpose is to propose policies and encourage actions which will promote freedom of expression, particularly as such basic freedom relates to the responsibilities of radio and television broadcasters in meeting their public interest responsibilities.
>
> It is the Committee's further responsibility to oppose vigorously any action, whatever the source, which limits the capacity of broadcasters to cover public pro-

ceedings by use of microphones or cameras or other electronic reportorial devices.

The Committee will develop positive programs of action to illustrate the right of radio and television to serve the public by such news coverage. The Committee will also confer with professional societies where ethical standards relating to treatment by radio and television in this area of news dissemination may exist, to the end that such standards shall not mitigate against these rights.

The Committee will encourage and advise broadcasters in the development of improved techniques for broadcast coverage of public events to avoid unnecessary and unreasonable interference with the orderly procedures of those events.

The Committee will develop a positive educational program to demonstrate the ability of radio and television broadcasters to accomplish their work through modern mechanical and electronic methods which may be adopted to meet all reasonable requirements of jurisprudence and the orderly conduct of public business.

The Committee shall give guidance to and coordinate the activities of freedom of information committees of State Broadcasting Associations which desire such assistance.

The Committee shall counsel the Association where questions of dignity, ethics, secrecy, the rights of privacy, and other sensitive matters require consideration.

And finally, the Committee shall continuously remind broadcasters, the public at large, governmental officials, and organizational leaders alike that freedom of information, and free access to such information, is a necessity for the proper functioning of a free press and a free broadcasting service; that the widest dissemination of news and other information by these and other media is vital to the development of an informed citizenry; and that eternal vigilance and cooperation in these matters by all is essential to preserve our liberties.

RADIO STANDARDS OF PRACTICE

That statement spells out the objectives of the National Association of Radio and Television Broadcasters and its members in the continuing search for freedom to inform. It is backed up by standards of practice which have been promulgated by these broadcasters themselves. In order that you may know of the broadcaster's sensitivity to his obligation to be fair, let me quote also—briefly—from the paragraph concerning editorializing contained in the "Radio Standards of Practice":

> Some stations exercise their rights to express opinions about matters of general public interest. Implicit in these efforts to provide leadership in matters of public consequence and to lend proper authority to the station's standing in the community it serves is an equal obligation to provide opportunity for divergent viewpoints.
>
> The reputation of a station for honesty and accuracy in editorializing depends upon willingness to expose its convictions to fair rebuttal.

This is not a command by government. This is an expression of the sum of experience of broadcasters—an ethic or canon, if you will, intended to guide and not to direct. Broadcasters believe that utmost freedom, based upon the principles of American enterprise, can be attained through such continuing self-appraisal.

General David Sarnoff, chairman of the Board of the Radio Corporation of America, recently has predicted the early development of a home television screen which will occupy no more than the area of a framed picture on the wall. There have been produced already radio sets that will fit in coat pockets and, with further use of the transistor, even smaller ones are yet to come. As radio now reaches nearly 98 per cent of the nation's people, so also will television attain such coverage. And in the case of radio, at least, news, information, and entertainment will not only reach us in the home but will find us wherever we are—for it will be as mobile as the package of cigarettes you carry in your pocket.

There should be no unreasonable restriction on a medium of such power and influence. Implicit in its existence, in its growing coverage, and in the free principles by which it may operate are the hopes of those who, nearly two hundred years ago, revolted in search of truth and peace and the pursuit of happiness.

In the battle against the insidious evils of silence and censorship, broadcasters have drawn their own battle lines; nor do I believe that they will waver in their obligation to the people to report fairly and comment freely.

Harold E. Fellows, Washington, D. C., is chairman of the Board and president of the National Association of Radio and Television Broadcasters. Prior to assuming the presidency of the NARTB in 1951 he was manager of New England operations for the Columbia Broadcasting System and general manager of Radio Station WEEI in Boston. In 1945 he assisted in the development of the "Radio Standards of Practice," ultimately adopted by the members of the National Association of Broadcasters. He is currently national chairman of the Commission on Mass Communications, National Conference of Christians and Jews.

Concentration of Economic Power and Protection of Freedom of Expression

By Adolf A. Berle, Jr.

PROTECTION of personality is rightly a major concern of mid-twentieth-century America. There are problems emerging which require the utmost thought and attention.

The problem is, of course, essentially philosophical. Unhappily America of 1955 apparently cannot discuss philosophy save with groans of agony and prophecies of decline. The writer cannot qualify as entrant in the debate in the usual manner. I do not see that our civilization is about to dissolve or that our structure has lost meaning. If I cannot go along with the glossy-print, cliché optimism of the public-relations trade, neither can I join the Jeremiahs.

Our philosophers have treated us to a fancy line of gloom. They are frequently epic in their sadness. Mr. Arnold Toynbee, in a massive *Study of History,* catastrophizes in several volumes. Mr. Walter Lippmann in a recently published best seller, *The Public Philosophy,* spends seven chapters expounding "the decline of the West." The late Russell Davenport in a book *The Dignity of Man,* financed by the Ford Foundation and scheduled for appearance this month, discusses the collapse of the American ideal for want of philosophy. An excellent poet, Chard Powers Smith, recently published a book entitled *The Yankees and God,* tracing four separate and distinct declines of America, in each case drawing his moral from the weakening of the New England Puritan ideal. There are others. The drama of their assorted catastrophies is epic. As the Golden Dustman in Dickens' *Our Mutual Friend* observed of his tutor, "Professionally they decline and fall, and as a friend they relapse into poetry." (Apparently anybody can decline and fall these days. All you need is a good witch-hazel fork with which to stroll through American history to discover the exact point at which a decline sets in. Being apparently the open season for decline points, you can pick your own.)

The odd fact is that our observers choose to regard as beginnings of decline those areas in which personality was, not most restrained, but most free. Toynbee fixes a decline point of the Roman Empire in the Antonine Age, when Stoic philosophy brought tolerance to perhaps the highest point in ancient history. Lippmann is more specific: his precise reason for asserting decline is that the aggregate of individuals we call mass public opinion has come to make politicians and governors into transmitting agents of a kind of neo-Jacobin mob action. One gathers Russell Davenport had somewhat the same fear. In each case the point appears to be that as personality is protected in its free expression, a common basis of action ceases to exist. There is no agreed set of philosophical premises. So Western governments cannot act with decision; Western intellectual life goes nowhere. Meanwhile outside forces not bothered with personality and having a system that imposes a single set of premises plow straight ahead. So democracy welters in impotent inaction while totalitarians, Nazi or Communist, take Rhinelands, Koreas, and Indochinas.

Against this background we have to tackle today's problem.

The Shift Towards Collectivism

Gloom aside, there is a problem here which demands careful attention. It overpasses even the technical maintenance of civil liberties which we must consider in a moment. Briefly it is the growing problem of maintaining a society, or at least a stratum of society, in which free-ranging thought and new ideas can go steadily forward, entering the causative streams of civilized life.

The problem is never wholly absent, but just now it is intensified, in my view, by a deep, hazardous, yet inescapable trend in the world generally and in the American world in particular. We are slowly (or perhaps, in historical perspective, rapidly) changing our civilization from one based on individual ownership, enterprise, and expression to one based on collective property, organized activities, and huge aggregates of systematized power. This is a world trend. We are dealing merely with an American expression of it.

This is not the time to discuss so vast a problem or trace so deep a change. The writer feels justified in making the statement after spending several years studying the institution known as the American stock corporation. It is now quite clear that the shift towards vast organization and away from individual enterprise and activity is not limited to the United States, nor is it even a product of capitalism. The Industrial Revolution probably is the prime cause; in any case that revolution seems to have only two groups of heirs competing for the task of producing under it: socialist or totalitarian commissariats which predominantly conduct economic activity in great parts of the world and great nonstatist corporations sometimes organized into cartels which predominantly conduct them elsewhere.

Simultaneous appearance of the two phenomena in the twentieth century is, one surmises, not coincidence. Great areas of today's economic life apparently have to be carried on by large organizations. Such organizations can either be governmental (as in more or less socialist England) or extragovernmental as in the United States. There is, obviously, a difference between great economic organization combined with political government (as in the case of the Soviet Union) and similar organization distinct from, different from, and perhaps opposed to political government. But whether or not the organization is combined with the power to govern, the two types of organization—these types tossed up by the twentieth-century revolution—have a good deal in common.

The intellectual minority

Their emergence prompted the British novelist, Mr. J. B. Priestley, who has in the course of his intellectual career critically examined socialism, Communism, and free enterprise alike, to write in the current issue of *The New Leader:* [1] "This is beginning to look like a society of Bossmen and Massmen with neither of them caring a rap about intellectuals"; the intellectuals he thinks are: "a dwindling minority, neither Massmen who do not know what they want until they are told, nor Bossmen who enjoy the bullying and the bouncing." His concern is that this minority—the musicians, artists, poets; the philosophers, pure scientific inquirers, and freethinkers generally—stand on a shrinking platform. The Bossmen are too busy settling immediate problems of power to think far ahead; the Massmen hope not to have to think at all. So, thinks Priestley, the economic phase of politics which had its beginning not very long ago may already be in sight of its own end.

[1] March 28, 1955.

American scientists are also feeling the pinch: an article by Eric Hodgins in the April 1955 issue of *Fortune* [2] quotes Dr. I. I. Rabi as saying that while the influences supporting American scientific research have done very well in applied science, they have somehow left out provision for the great, ranging, nonconformist minds. As a result, today the top 5 per cent of scientists in Europe are ahead of the top 5 per cent of scientists in the United States.

Now this is a moment in history in which (despite the violences of a now retreating McCarthyism and the propaganda cries of Communist party liners) actual freedom of expression is probably as well protected by law and institutions as it ever has been in history. Clearly something deeper is going on here than can be found in Supreme Court decisions, in occasional censorship statutes, or even in legislative investigations frightening the timid into self-imposed silence or conformity—or frightening institutional heads into demanding silence and conformity from their staffs.

Conformity—too little or too much?

The paradox is complete. Lippmann sees the decline of the West because there is not sufficient conformity to a public philosophy to permit strong and effective political action. Priestley sees in presently imposed conformity the impossibility of maintaining a strong and growing civilization, in which men can produce (for example) anything as dynamic and beautiful as the romantic movement. There is truth in both contentions. An economic phase has dominated politics for the first half of the twentieth century. It has produced some at least of the results which Priestley decries. Philosophically, at least in the West, there has been an increasing disparatenes[illegible] of thought—a kind of galloping agnosticism in all senses of that word. Probably this has produced some of the political phenomena which sadden Mr. Lippmann and incline Arnold Toynbee toward his Wagnerian gloom. Taken together, the two points of view pose a problem to which philosophy and political science alike must pay some attention.

Personality, we know, must be protected, for the principle of the thing. But what is the end to be achieved by its protection? As Hector asks in Cole Porter's musical comedy, *Golden Apple: "What* is the thing it's the principle of?"

Personality and the Universal

Protection of personality has been considered one of the finest flowers of Western civilization. Yet, interestingly enough, when we speak of it, we think at once not of personality as an end but rather of a collection of procedures designed to protect personality. We think of the Bill of Rights; of the writ of habeas corpus; of due process of law; of the Supreme Court of the United States and its ability to strike down legislative, executive, and possibly other kinds of acts which deny to men freedom of expression, freedom of religion, and freedom to think or to act in certain respects. One thing not commonly considered is why these procedures are important; why the personality should be protected at all.

It is dangerous for a teacher of law to enter the sacred groves of philosophy; and yet, for an academy of political science the philosopher is the essential premise giver. At some risk, I earnestly recommend that the time has come to restudy some of the thinking in this field. We might linger with the little volume written by Hegel for his students in 1821, translated in English under the name of *The Philosophy of Right*. For Hegel did state precisely this paradox.

Rights (such as the rights conferred by the American Constitution and similar documents), he recognized not as ends in themselves but merely as provisions or possibilities for individuals. "Personality" he considered as chiefly involving the "capacity to exercise rights." The imperative of right (Mr. Priestley's preoccupation) he expressed simply: "To be a person and respect others as persons." The state (Mr. Lippmann's preoccupation) he thought of as the actuality of concrete freedom. But he added:

> concrete freedom consists in this, that personal individuality and particular interests not only achieve their complete development and give explicit recognition for their right . . . but, for one thing, they also pass over of their own accord into the interest of the universal, and for another thing, they know and will the universal; they even recognize it as their own substantive mind; they take it as their end and aim and are active in its pursuit.

Apparently our paradox of today existed also in the period following the Napoleonic Wars.

Actually, I suggest that there is a dualism implicit alike in preserving personality and in achieving effective political organization. To be real, fecund, and dynamic, the individual must be himself, ranging with his own mind; like Prometheus, capable if need be of assaulting the gods. The scientific base of our technical progress has come from just such assaults, as have our artistic and spiritual achievements. Yet individual ranging thought must not only achieve a personality; it must overpass the limited ideal of expressing and realizing personality alone; it must be continually seeking correspondence with some conception of cosmic order which has universal quality. Granted that individuals can only approach cosmic order by infinitesimally minute advance; nevertheless the conception of it, and the intent to approach it, alone make free persons viable as social and political men. In other words, it alone affords men freedom instead of anarchy. It leads them to organize and maintain effective states—if need be, perhaps effective superstates. For this search and its realization, personality is kept free and must be protected.

In this analysis, Mr. Lippmann is right, and so also is Mr. Priestley.

Free-ranging Thought

The danger to personality inherent in American life is in my judgment great; but it is not the danger commonly described. We have had, we have now, and probably always will have, a continuing battle to preserve civil liberties. I do not think we will lose that battle. Brave souls like Roger Baldwin and Norman Thomas will continue to give their lives to this cause; we owe them a debt of gratitude. Great jurists like Oliver Wendell Holmes and Harlan Stone will continue to enrich the decisions of American law. Stout citizens in all parts of the country will fight perennially sprouting pressure groups who for reasons of their own wish to stifle free expression and impose their own forms of thought; and these stout citizens will, I think, continue to win victories.

But (reverting to Hegel) all they can do, and all that constitutions, bills of rights, statutes, and courts can do, is to preserve civil rights which are, in essence, permissions. They enable men to make choices and to express themselves. This is all.

The more dangerous threat to personality seems to me to lie in the piling up of forces influencing men not to make use of these permissions. These forces, because they are not clean cut, because they are not doctrinaire, be-

[2] "The Strange State of American Research," Vol. 51, pp. 112–115, 214–224.

cause they do not state demands, are perhaps more threatening even than the groups who wish to impose censorship or to brainwash their fellow citizens. They are the deadening forces which give every motive to an individual not to let his thought range, not to disagree, not to open unpleasant questions, not to shock or displease the group in which he moves. They add up to a sort of paralyzing miasma of opinion which seems to think men's lives and thoughts should come into the world without shock and leave it without velocity; and which expects men's intellectual work to come out like a ribbon, lie flat on the brush, and dissolve in suave foam and pleasant perfume.

Organizations and the controversial

Concentration of economic power has played an important part in developing this dampening cloud. The process was simple enough, and by no means immoral in inception. Briefly, we passed from the phase of individual and possessory property, like my great-grandfather's farm and forge on the banks of Lake Champlain, to the organization of economics in vast steel companies, great distributing organizations, and so forth. One hundred and thirty-five of these control roughly half the industry of the United States; and if production and a high standard of living justify organization, they have brilliantly fulfilled their function.

Now individual life does change quality under these circumstances. What happened was the replacing of hundreds of thousands of individual operations and enterprises by great pyramids of organization. Obviously life in an organization differs radically from life as an independent owner, possessor, or enterpriser. To attain high effectiveness in organizations men must, and should, get along with their fellows, at least in fulfilling purposes of the organization.

Somehow the idea spread that any expression of personality which is "controversial" spoils the perfection of this ideal "organization man." In industry, in banking, in the larger educational organizations, even in government, when a man comes up for appointment or promotion, the most damning thing which can be said of him is that he is "controversial." This merely means that somewhere, sometime, he had or expressed an idea or took a line with which some group disagreed. Any organized minority capable of making noise can, it seems, make any individual "controversial" by attacking him.

Privately we can all concede that a man who has never had ideas sufficiently important or well-defined to induce occasional disagreement is a man who either had no ideas at all or had not character enough to stand up for them. None the less, organizationally, when choice lies between a man who has fought out issues and taken sides and one who, apparently, never offended any substantial group, the latter is commonly chosen. There are noble exceptions: one thinks with pleasure of a conservative group of trustees like the Harvard Corporation selecting President Pusey as Harvard's president in the teeth of his controversy with Senator McCarthy. Unhappily, for a single case of that kind one can think of a dozen of the other. Only a few weeks ago the University of Washington canceled a lecture invitation extended to Dr. J. Robert Oppenheimer of the Institute for Advanced Study because he was "controversial." This was a case in which the situation was clear and overt, and the prompt expression of many men made it clear that the University of Washington, and not Dr. Oppenheimer, suffered from this bit of ineptitude. As a rule, as we all know, the "controversial" individual has been silently turned down in committee appointment, promotion, or recognition, and no one ever hears about it.

Universities and the nonconformist

We have rested a little overconfidently on the assumption that demand for conformity could never blanket certain strata of American life. We have liked to think, for example, that American universities would always be free ports of ideas in the future as in the main they have been in the past. But now the process of economic concentration is raising some problems even in this area. The great American corporations, rightly, have determined that a part of their revenues should be given for educational and philanthropic purposes. In the aggregate, the gifts made by a number of large American corporations are greater than the gifts made by the Rockefeller, Carnegie, and Ford Foundations combined. Already there is a grouping of these activities into a kind of advisory council so the gifts shall be (as no doubt they should be) co-ordinated. The movement represents one of the enlightened and generous phases of business concentration in American economics.

But . . . and but . . . and but. When a university chooses a president, when a college chooses a dean, when a law school chooses a new professor, and when the institution in question relies (as certain great institutions frankly do) on gifts from this source, would they really be likely to choose a man whose views, stated and defended, differed widely from the views of the group from which continued support is expected? This is not, you will note, the problem of academic freedom. Practically all universities, in the writer's judgment, will fight to the death to defend members of their faculties against outside attempts from politicians, donors, or anyone to control their teaching or honest thought. Nor does this involve the classic question of defense of the right of an institution to choose a "Communist" or a "totalitarian." Almost any academic institution will deny, and rightly, that an individual who is pledged to subordinate his thinking and his personality to an outside group has a right to a position premised on a paramount obligation to seek truth freely and to express only the individual's own conclusions.

The danger is more elusive. It is that a series of influences have been building up, tending increasingly to push out men whose habits of mind or whose honest research or whose artistic expression or whose speculations tend to conflict with the even tenor of current operations or are antagonistic to current business thought.

Many of us have had the happiest experience in university life. As a young man my own views about a corporation were obnoxious to some of the business world; and I owe an everlasting debt of gratitude to Columbia University and to the late Harlan Stone, then dean of the Columbia Law School, who in the face of it offered me membership in its faculty. All of us know, too, that occasionally individuals having received this noblest of gifts, the right to speak their own piece, have abused the permission. Yet one cannot avoid feeling and fearing a certain subtle change. Too often the heads of great universities are not picked for scholarship—they are picked as administrators. Not often do great foundations seek philosophers for their heads as did the Rockefeller Institute when it chose Simon Flexner. Too often the philosophy of the corporation which wants a "smooth-working" team gets into universities which ought to want, in Priestley's phrase, "a group of hundred-headed instrumentalities."

Conformity and the corporation

In commercial life, of course, the situation has become sufficiently familiar so that books are being written about it—pro and con. *Fortune,* a businessman's organ, expresses concern; overemphasis on conformity is coming to be a recognized danger.

This writer believes that personnel officers of corporations and appointments committees of foundations, universities, and other similar organizations should add a new rule to their book. Instead of ruling a man out because he has been "controversial," they ought to insist that every candidate presenting himself for a job should have under his belt at least one first-rate controversy in which he has borne himself well. If their candidate has not shown enough personality to do that at least once in his life, he is not a good enough man for a good job.

My own impression is that to maintain their leadership, and for the most practical as well as for the most idealistic of reasons, the great American corporations need a great deal more nonconformity than they are now getting. Corporations, like universities, in their limited sphere can derive enormous profit by creating within themselves free ports of ideas of all kinds within their general scope. This might upset the public-relations agencies by which the views of the corporate world are generally transmitted; but that, too, might not be altogether bad. Part of General Electric's present greatness lies in the fact that in past years its greatest scientific mind was Steinmetz; and he was a Socialist who used to run for office as a Socialist in times when socialism was bitterly unpopular. The point need not be labored. There is a great and growing sector of American life—and this sector includes the chief centers of economic power—in which it is of advantage to be or appear to be conformist and in which it is dangerous to a career to push thought beyond an accepted framework. The protection of personality here is probably of first importance, and we have to get about it.

WHAT COMMON BASIS?

But all this leaves Mr. Lippmann's point unanswered. He knows, as do we all, that a society must be not only free but effective; and effectiveness means the ability to focus thought, to achieve organization, and, when necessary, to act rapidly. Particularly this is true when outside forces threaten, and when emergencies must be forcefully met. Mr. Lippmann seeks a common basis of action in what he calls "natural law," and he means by this a body of agreement among rational men which can be invoked, which commands authority, which is sanctified with authority by tradition, and which is translatable into political or other relevant action.

I think Mr. Lippmann is right, though critics may disagree with some of his reasoning and regret his use of the phrase, "natural law." In the Western world there has commonly been such a body of authoritative thought. It is ingrained in our history. Historically such thought was commonly expressed in the great religious organizations. In medieval times, the Catholic Church set up the power spiritual over against the power temporal, thus mobilizing moral and philosophical conceptions influencing action in so large a part of the secular organization that it could partially guide or check the exercise of power. Indeed, the symbolism still persists in England where the "lords spiritual," or bishops, still sit at Westminster alongside the "lords temporal," the peers who today increasingly come from the ranks of business and less and less from among military and political chieftains.

The history of the American Colonies and the early history of the United States saw similar though less formal emergence of the power spiritual: Chard Powers Smith's book rightly makes it clear that the practising Protestantism of New England was the driving power which made its colonization of the Northwest the expansion of a civilization rather than the migration of a horde of self-seeking adventurers. In later account, one can hardly imagine that the state of Utah could possibly have developed as brilliantly as it has were it not for the binding quality of the Mormon Church. In America, for excellent reasons, we have steadily demanded that the power spiritual should never be united with the power temporal. But it is one thing to say that, and quite another to say that the power spiritual should not exist.

Has the mechanism broken down?

Mr. Russell Davenport insists that with the elimination of transcendentalism we have lost any means of achieving a spiritual or philosophical consensus. and Mr. Walter Lippmann is only mildly optimistic in his hope that rationalism can be brought to perform the same function.

Nevertheless, I suggest that the United States has a higher factor of agreement on the elements of philosophical principle than perhaps any similar bloc of 165 millions of people; and this in spite of the disparity of philosophical explanation, the difference in symbols or expression, and the fact that some make their philosophical synthesis by believing in an omnipresent God expressing himself through revelation while others do not recognize a deity at all. It takes more than hedonism, existentialism, or accident of coincidental private interest to make it possible for me to buy a newspaper on Fourteenth Street in New York, leaving an unguarded nickel on a street-corner stand while the proprietor has his coffee in a neighboring restaurant. It is not an accident that any stranger, however ignorant or uncouth, finds immediate help in getting from one point to another. It is not an irrelevant fact that almost every community instinctively organizes when a condition of want or misery becomes evident. We may not accept a common ecclesiastical base for what we do; but there is an amazing uniformity of action throughout the country. Factually, the civilization of the United States has absorbed and given common habit of thought and action to more diverse waves of population, in shorter time, than any civilization now in existence. It might even be possible (the experiment would be worth trying) to put down in a single book the standards of conduct which are observed almost without question from California to Maine. Part of these may simply be those habits which William James called "the fly-wheel of society." But it seems to me that quietly, without benefit of conscious thought, the American "personality" does what Hegel said: it steadily seeks norms of universality.

Extending the frontier of the accepted

The problem, analyzed, is most puzzling when the task is extension of this body of common mores which spring from a more or less agreed conception of life in the cosmos. We are quite accustomed to a conception which expresses itself by insistence that the poor should have access to hospitals and that if there is not a hospital handy the community ought to get together to raise some money and build one. But our common conception does not give a base for action (for example) when a country on our borders is suffering from malnutrition and bad economic conditions or when the problem is raised of defending a faraway country from the aggression of a tyrannical neighbor.

It is permissible now to revert to

Hegel's dualism. The developed personality, the nonconformist, the man perhaps at war with current thinking, is precisely the individual most needed when frontiers of accepted concepts have to be extended. In science we have learnt this is true: to extend our material capabilities an Einstein must assault Newtonian physics, as in earlier times a Galileo assaulted the premise of fixed stars. In music we understand it: a Rachmaninoff, a Debussy, even an Irving Berlin must break the boundaries hallowed by Beethoven and by Bach. In poetry and literature we expect it: the Thoreaus and Walt Whitmans pushed beyond perspectives of beauty posed by Shelley or Matthew Arnold. In politics we dimly discern at least that it has happened: Abraham Lincoln looms as an authentic American saint as well as an authentic American statesman, and I think the late Franklin D. Roosevelt had similar qualities. Properly speaking, authority is always conquered—never given—although the conquest-right is intellectual, philosophical, and spiritual.

OUT OF THIS CONFLICT

Enough has been said here to suggest, first, that there must be at all times a will towards common action, and, second, a continuous demanding that personality be protected in its power as well as its right to challenge old concepts and smash old frontiers. The will of the group organizes a viable society; the extension of personality achieves extension of the field of common action and changes in existing mores. From the two forces grinding against each other we have what is called the progress of civilization.

Authority, surprisingly enough, is the result of past conflicts between free personalities and accepted norms. As of today political and commercial life cries down the intellectuals and the "egg-heads" who emphasize personality. But, when faced with new or difficult problems, invariably the intellectual or the "egg-head" is called in to marshal data and devise solutions. On the American record to date, the continuous conflict has been useful in and of itself. The "egg-head" owes everything to his enemies; his enemies justify their existence by fulfilling the "egg-head's" dreams.

In statelier symbolism of earlier times, the power spiritual stood over against the power temporal, and from that combination of conflict and confluence, civilizations were born.

In brief, it is time that the intellectual world defend personality and resultant controversiality but know why the defense is essential. It is time that the conformist world recognize in the controversialist the guarantee of its fruitfulness and its growth. Each of us, demanding the right of free personality, must recognize that the permissions he demands have as their proper end contribution and addition to the body of common concepts and mores which alone makes organized society viable and which in turn makes freedom possible.

Adolf A. Berle, Jr., LL.D., New York City, is professor of corporation law in the Columbia Law School and partner in the law firm Berle, Berle, Agee & Land. He was Assistant Secretary of State from 1938 to 1944 and Ambassador to Brazil in 1945–46. He is the author of The Natural Selection of Political Forces (1950), The 20th Century Capitalist Revolution (1954), and other works.

Is Wire Tapping Justified?

By PATRICK MURPHY MALIN

THE Fourth Amendment to the federal Constitution reads: "The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized."

In 1928, in a dissenting opinion from within the minority of four in the Olmstead prohibition wire-tapping case, the late Justice Brandeis said: "The makers of our Constitution . . . conferred, as against the Government, the right to be let alone—the most comprehensive of the rights of man and the right most valued by civilized men." [1] He had not forgotten what often seem to be the most forgotten amendments, the Ninth and Tenth, which not only conclude the Bill of Rights but also succinctly declare the American faith in a free society with a limited government: "The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people" and "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people."

But in 1954, Attorney General Brownell posed this question: "How can we possibly preserve the safety and liberty of everyone in this Nation unless we pull Federal prosecuting attorneys out of their strait-jackets and permit them to use intercepted evidence in the trial of security cases?" [2]

In dealing with this problem, I shall first refer briefly to the extent and mechanics and legal status of wire tapping. Then I shall outline the arguments for and against legalized police wire tapping, and my conclusions.

EXTENT AND MECHANICS OF WIRE TAPPING

No one knows how much wire tapping there is—official and unofficial, legal and illegal. But occasional formal and informal revelations—of which the most recent widely publicized one is that of the privately organized New York City Anti-Crime Committee—indicate that each day there are many thousands of wire taps in operation throughout the country, most of all in the larger cities.

As for mechanics, it is apparently still true that there is only one way to tap a telephone secretly, and that is by having an expert cut into the wire itself some distance from the instrument. But there are already electronic devices which, despite difficulty of concealment and other imperfections, considerably facilitate the practice. And the phone tap need not now have a listener taking notes, but may be connected to an automatic wire recorder. A recording can be edited by deletion, rearrangement, or even addition of words or even syllables; and thus may increase the problem of false evidence to terrifying proportions. But I am dealing here,

[1] Olmstead v. United States, 277 U. S. 438, 478 (1928).

[2] "Statement by Honorable Herbert Brownell, Jr. . . . Prepared for Testimony before a Subcommittee of the [Senate] Judiciary Committee, April 20, 1954," p. 3.

not with that related problem, but with wire tapping itself, even if the evidence is accurate and fair.

LEGAL STATUS

Consideration of the legal status of wire tapping may begin with the 5 to 4 decision of the United States Supreme Court in the 1928 Olmstead case, which held that official federal wire tapping did not violate the Fourth Amendment, and that evidence so obtained could constitutionally be used in federal courts. In handing down that decision, the late Chief Justice Taft said: "The Amendment does not forbid what was done here. There was no searching. There was no seizure. The evidence was secured by the use of the sense of hearing and that only. There was no entry of the houses or offices of the defendants." [3] Literalism won, but by a slim margin, and not for long.

Opposition to that decision, as to prohibition enforcement practices generally, led Congress, when it passed the Communications Act of 1934, to provide in Section 605 that ". . . no person not being authorized by the sender shall intercept any communication and divulge or publish the existence, meaning, [etc.], of such intercepted communication to any person. . . ." [4]

That is still the law, and on its basis the United States Supreme Court has held that wire tapping—though not unconstitutional—is illegal and that evidence so obtained (or even evidence obtained upon clues discovered by wire tapping) is inadmissible in federal courts. The Supreme Court has also held that Section 605 extends to intrastate communications, and thus would seem to have made assurance doubly sure that even such wire tapping as is authorized by the laws of a half-dozen states is illegal. But it has not yet explicitly said so, and it has explicitly said that evidence obtained in violation of Section 605 is admissible in state courts —because Congress did not intend to enact a rule of evidence for such courts, which often admit evidence obtained in violation of even their respective state laws regarding wire tapping or other methods.

Moreover, though the Department of Justice in 1940 announced its complete abandonment of wire tapping, it almost at once reversed itself, and it continues to operate on the basis of a narrow interpretation of Section 605. From the time of the late Robert Jackson onward, it has argued that wire tapping is forbidden only if followed by divulgence and that sharing of wire-tap information among officials of a single government is not divulgence from one "person" to another "person"! (No wonder there has been only one federal prosecution of even unofficial wire tapping, and only a few state prosecutions.) With all the respect I can muster for such arguments, I must say that I find the Supreme Court more convincing in its interpretation: "We nevertheless face the fact that the plain words of Section 605 forbid anyone . . . to intercept a telephone message." [5]

VALUES AND RISKS

So much for extent and mechanics and legal status. Let me now outline the arguments for and against legalized police wire tapping, and my conclusions. In doing so, I hope it will be clear from the beginning that—though I am on balance strongly opposed to all wire tapping—I take that position, not in disregard of its risks, but in considered choice of those risks as against the risks involved in even a small amount of wire tapping. Also, I hope everyone will note that I have some excellent company—including the *Wall Street Journal,* which has said this in a recent editorial:

> We see no need for chipping away at the rights and privileges of people who are not Communists in order to catch Communists. Perhaps the latter can be more easily trapped through wiretapping; certainly it will make the job of our police easier. . . . The job of the police would be made easier also if they could go about arresting anyone they chose and if they could break down any door and if they could hold in prison a suspect as long as they wished. But restraints were placed on Government and on police so that these things could not happen.[6]

Put it another way: All life is a choice among values, and among risks; and a free society—to remain free—must take almost all of its risks on the side of freedom.

ARGUMENTS PRO

The arguments for legalized wire tapping may be conveniently grouped under three headings:

No-novelty argument

Attorney General Brownell points to the fact that the law already admits evidence obtained by an informer, an eavesdropper, or a policeman hidden in a closet; even evidence obtained by means of a transmitter concealed on an agent's person. And, he says, "There is little, if anything, to distinguish between these approved methods of obtaining and admitting evidence, and wiretaps which are not admissible." [7]

Great-need argument

Mr. Brownell points to the fact that criminals may go free if wire tapping is the only way to obtain evidence against them, and it is forbidden; this may jeopardize national security, as in the case of Judith Coplon. Next to national security, the most frequently emphasized area of need is the prevention and punishment of kidnaping; about it, Mr. J. Edgar Hoover, the director of the Federal Bureau of Investigation, says: "I dare say the most violent critic of the FBI would urge the use of wiretapping techniques if his child were kidnapped and held hostage." [8]

Little-danger argument

Even among persons who fully recognize the risks involved in wire tapping, there are those who believe that the actual danger of abuse is slight. They point out that our federal and state and local governments are kept reasonably trustworthy by a combination of the ballot and freedom of speech and the press. They also stress that police officials have not thus far been guilty of much abuse of power, and are unlikely to be so guilty in the predictable future.

ARGUMENTS CON

The arguments against legalized wire tapping may also be conveniently grouped under three headings:

Immense-difference-in-degree argument

Many opponents turn Mr. Brownell's argument against him by pointing out that even some other methods of obtaining and admitting evidence, now fully approved by the courts, are bad and should be eliminated; then, they point out, how much more should wire tapping be opposed. As Justice Hofstadter of the Supreme Court of New York County said on January 11 of this year:

[3] Olmstead v. United States, 277 U. S. 438, 464 (1928).

[4] 47 U. S. C. §605 (1952).

[5] Nardone v. United States, 302 U. S. 379, 382 (1937); the "first Nardone case." Also United States v. Coplon, 88 F. Supp. 921, 925 (S. D. N. Y. 1950).

[6] January 19, 1955.

[7] "Statement by . . . Brownell . . . ," p. 5.

[8] "Wiretapping: The Pros and Cons," *New York Times Magazine,* November 29, 1953, p. 32.

A tapped wire is the greatest invasion of privacy possible. . . . A telephone interception is a far more devastating measure than any search warrant. A search warrant is confined to a definite place and to specific items, or, at least, to items of a stated class or description. Those in possession of the searched premises know the search is going on and, when the officer has completed his search, whether successfully or not, he departs. Not so in the case of telephone interception. The interception order is obtained ex parte, and the person whose line is to be tapped is, of course, in ignorance of the fact. The tap is maintained continuously, day and night. Everything said over the line is heard, however foreign to the stated objective of the law-enforcement officers. The most intimate conversations, personal, social, professional, business, or even confidential, of an unlimited number of persons may be laid bare. In effect, the line of everyone who is called from or makes a call to the tapped line at any time is being tapped during the maintenance of the tap. When a line in a public telephone booth is tapped, as has on occasion been done, the conversations of people having no relation of any kind to the operator of the place in which the booth is situated or the person whose line is tapped are overheard.[9]

Thus, as Brandeis said in 1928, even "general warrants are but puny instruments of tyranny and oppression when compared with wire tapping."

Inadequate-result argument

Many opponents have pointed out that, even if there were known to be absolutely no wire tapping of any sort, the very nature of espionage and sabotage would cause spies and saboteurs to do practically all their work by personal presence and contact; and that the records of espionage and sabotage cases suggest, not only that little actual help has been gained from wire tapping in apprehension and conviction but also that other methods can be sufficiently effective. Remember that it was only one of the two Coplon cases in which the conviction was upset because the government's evidence derived from wire tapping; in the other case, there was a conviction on non-wire-tap evidence, and it was upset only because of a post-arrest wire tap on telephone conversations between the defendant and her lawyer.

As for kidnaping, even opponents of wire tapping acknowledge that the nature of the crime allows more scope for the use of the telephone, and therefore the possibility of greater help to be gained from wire tapping in apprehension and conviction. But they point out that, even if there were known to be absolutely no wire tapping of any sort, the mails would probably still be the chief means employed in attempts to extort ransom; and that, as would be true of police interception without consent of the mail received or dispatched by the distraught parents of a kidnaped child, the problem for a free society in the use of wire tapping is whether the gains would sufficiently overbalance the losses.

That is the very problem which a free society faces in regard to what I suspect is the fundamental reason why many of our law officers argue so strenuously for wire tapping: namely, to keep track generally of the doings of suspected criminals, to discover and develop leads in run-of-the-mill crimes. Here again it is pertinent to quote Justice Hofstadter:

> The application now made follows the general pattern of like applications heretofore made to me, which also, in the main, had as their objective the detection of gambling in some form. . . . Some years ago I instituted the requirement that . . . written reports of the results obtained from any interception ordered be thereafter submitted to me. . . . These showed some arrests and fewer convictions and then rarely, if ever, for a heinous offense. . . . It is melancholy to behold [our city] rife with violence, an admittedly lawless community, its inhabitants no longer safe by night or day, in their persons or their homes. To be redeemed as part of the great American community, its police department needs external aid, i.e., a larger force, with more pay for the men, and a renewed spirit from within . . . but not more wire-taps![10]

Overwhelming-danger argument

Many opponents start by pointing out that, given technological ingenuity and human nature, we should be in for bad trouble with unofficial and illegal wire tapping, even if the official and legal variety were completely removed from our society; and that official and legal wire tapping accentuates such trouble by stimulating technological development and by teaching more persons how to wire tap. Even now, according to Charles Grutzner of the *New York Times:*

> Federal wiretapping is nothing compared to that of local police and private investigators across the country. A former law enforcement officer told this writer a few days ago: "Detectives use wiretaps on maybe half of all the important police cases in New York, and many use wiretaps as a routine thing to pick up leads on bookmaking, prostitution and other crimes without bothering to get court orders or even to let their captains know they're tapping." Not all police, and certainly not all private investigators, limit their use of eavesdropped talks to those conversations they set out to hear. Blackmail and sale of business secrets, though incidental, have been found lucrative to crooked operators.[11]

Even if we could measurably solve the problem of unofficial and illegal wire tapping, say the opponents, we should be in for bad trouble with official and legal wire tapping. We may thank our lucky stars that the present head of the FBI is a man of integrity, and no alarmist; but some future head of that bureau might not be so scrupulous and intelligent. The way in which a policeman uses his gun can be pretty well checked on by the citizens who employ him and authorize him to use it in guarding public order; the way in which he uses wire tapping can scarcely be checked on at all. Nor is it only police wire tapping, and the enormous amplification of dossiers implied in it, which constitute an incalculably large threat to the private citizens of a free society. Wire-tapping surveillance has already been considerably employed, more or less legally, in public affairs—for example, by a Congressional committee and by a governor checking on a mayor.

This "dirty business," say the opponents in quotation from the late Justice Holmes, is—in quotation from the happily quite alive though retired Justice Roberts[12]—"inconsistent with ethical standards and destructive of personal liberty." It tends to corrode the morale and morality of a free society. Justice Hofstadter says: "As evil as an actual interception is the fear bred in the mind of the average citizen that he may at any time become the victim of one." Justice Brandeis said: "The makers of our Constitution undertook to secure conditions favorable to the pursuit of happiness. They recognized the significance of man's spiritual nature, of his feelings and of his intellect. They knew that only a part of the pain, pleasure and satisfactions of life are to be found in material things. They sought to protect Americans in their be-

[11] February 27, 1955.

[12] This paper was read before Mr. Owen J. Roberts death on May 17, 1955.—EDITOR'S NOTE.

liefs, their thoughts, their emotions and their sensations." Justice Frankfurter has warned us: "The contrast between morality professed by society and immorality practiced on its behalf makes for contempt of law." And J. Edgar Hoover said in 1940: "The discredit and suspicion of the law-enforcing branch, which arises from the occasional use of wiretapping, more than offsets the good which is likely to come of it."[13] I appeal from Paul drunk to Paul sober!

DESIDERATA

My conclusions are simple to state, however difficult to apply. I am, in considered choice among values and among risks, on balance strongly opposed to all wire tapping—by anyone, at any time, for any purpose. Like Senator Wayne Morse, I want the United States Supreme Court to reverse its 5 to 4 decision of 1928 at the earliest opportunity, and declare official federal wire tapping to be unconstitutional under the Bill of Rights. In the meantime, I want the Court or the Congress to make absolutely clear that all wire tapping is illegal, even when practiced by the Department of Justice or authorized by a state. I want prosecution of everyone who engages in it, or orders or allows it. I want the states to make wire-tap evidence inadmissible in court.

MINIMAL SAFEGUARDS

If those desires prove impossible of attainment, or are postponed, then I want the following minimal safeguards:

1. Wire tapping should be permitted only to federal officials, in cases involving treason, sabotage, espionage, or kidnaping. (In kidnaping cases, parents' wires should be tapped only with their prior consent.)

2. The authority to grant permission for wire tapping should be vested in one federal judge assigned by the Supreme Court for a ten-year period for each district.

3. Only the Attorney General should be allowed to apply directly to the judge for permission to tap a wire. All requests for permission should be channeled through him.

4. No wire tap should be authorized except upon sworn statement of fact demonstrating reasonable basis for belief of actual, as distinguished from potential, treason, sabotage, espionage, or kidnaping.

5. An application should include the names of the suspect and of the telephone subscriber, and the number of people who use the line.

6. Complete records of all applications and approvals should be kept.

7. Only recordings, sealed and preserved in a central place, should be used in evidence. If so employed, all recordings made in connection with an investigation should be made available to the defendant at government expense. Irrelevant material that might injure innocent outsiders should be excised, upon agreement between government and defendant. Recordings should be destroyed only on court order.

8. Taps should be authorized for a maximum of ninety days, with a ninety-day renewal permitted.

9. Strict penalties should be provided for any person tapping a wire illegally, and each year a federal grand jury should be convened to consider possible illegal tapping.

10. The present provisions of the law should remain in effect against any unauthorized tapping or disclosure of information obtained by tapping, whether authorized or unauthorized.

11. The press and public should be informed by monthly and annual reports of the number of taps sought for each type of case; the number granted; the number resulting in prosecution; and other pertinent data.

[13] Department of Justice release of March 15, 1940, quoted by Senator Wayne Morse, "Wiretapping Versus Freedom . . . ," *Congressional Record,* June 11, 1954, 7610.

INDEFEASIBLE RIGHT

But I am not satisfied with minimal safeguards; though not unmindful of the risks involved, I want all wire tapping abolished. I will bear my share of the risks involved in such abolition, as I have in the past—in peacetime and in wartime—borne some other risks for the American community and the American government, in token repayment of the vast debt I owe them and the immeasurable respect I have for them. I will gladly bear my share of those risks, not so much in terms of "the nicely calculated less and more" of reasons for and against as in the last analysis, because of commitment by faith to the defense and expansion of the grandest political achievement I know—the Anglo-Saxon principle of justice. In 1765, the elder Pitt said: "The poorest man may, in his cottage, bid defiance to all the force of the Crown." In 1885, the United States Supreme Court said:

> It is not the breaking of his doors, and the rummaging of his drawers, that constitute the essence of the offence [by the government against a man's privacies of life]; but it is the invasion of his indefeasible right of personal security, personal liberty, and private property.[14]

[14] Boyd v. United States, 116 U. S. 616, 630 (1885).

Patrick Murphy Malin, LL.D., New York City, has been executive director of the American Civil Liberties Union since 1950. He is a former member of the Faculty of Economics, Swarthmore College, and was vice director of the Intergovernmental Committee on Refugees, London (1943–47), price executive, Chemicals and Drugs Branch, Office of Price Administration (1942–43), and American director of the International Migration Service (1940–42).

Passport—Right or Privilege?

By Joseph A. Fanelli

PASSPORT—right or privilege? These are large words. Like the federal government's security standard one can get out of them about what one puts into them. So I attempt to define them, at least for the purposes of this discussion.

Let us first delimit the word "passport." Back in 1940, a story was current about the old man, a Jewish refugee from Hitler's Germany, who went to the counter of Cook's travel agency in Lisbon to buy transportation.

"Where do you want to go?" asked the polite clerk behind the counter.

"I do not know," said the old man. "This is not an easy question. I was lucky to escape from Germany. Here you have Salazar. In Italy and Spain, there are Mussolini and Franco. In Latin America, Trujillo, Batista, and Vargas are in power. And I hear that, in the United States, anti-Semitism is on the rise."

"Here," said the clerk, "is a map of the world. Go over to that desk and study it. When you have decided where you want to go, let me know and I'll sell you a ticket."

The old man studied the map of the world with care for some hours. At closing time, he returned the map to the clerk. "Please, sir," said the old fellow, "do you have anything else?"

The story shows the dreams of which humanity is capable even at the nadir. Had the old man wanted to visit and inspect some country as a possible future residence, he would have needed a passport to identify himself as a citizen of Germany, with a right to return and live in Germany. That he undoubtedly did not get from Hitler.

One function of a passport is to evidence the right of the holder, if abroad, to return and live in the country that issued it. At this hour, I am happy to report, a citizen of the United States can return to the United States from abroad at any time and in all circumstances, and he can get a passport for that purpose. Hence, it may be said that he has a right to that one particular use of a passport. But his passport rights, in that absolute sense, end there.

Restrictions

Under the law today, a citizen of the United States has no right in all circumstances to get a passport for the purpose of leaving the United States and visiting abroad. It is a federal criminal offense for a citizen to depart from the United States except in accordance with the passport regulations. Those regulations require a passport for all points outside the Western Hemisphere—Europe, the Middle East, the Far East, and so forth. Since the federal government regards passport issuance as a privilege to be extended or withheld from a citizen, there are a number of circumstances in which our Department of State will deny a passport. The result of a denial is to place the citizen in a sort of hemisphere jail. A citizen without a passport may travel to Canada, Mexico, and most Western Hemisphere countries. But the rest of the world is closed to him.

The State Department will deny a passport to a citizen under federal indictment or otherwise sought by outstanding compulsory federal legal process. I cannot quarrel with that. Nor would I quarrel with a denial of a passport to a citizen under a state criminal charge or sought by outstanding state legal process, although I should think that as a legal matter such action by our State Department would be invalid in the absence of more specific authority than the general discretion now conferred upon it.

But the State Department also denies passports to citizens who are merely under investigation for crime. The nature of investigators is to investigate at length, and in ever widening circles of involvement. In addition, we now have government officials who convict people of espionage by simply declaring them publicly to be spies. Given the present era when, in the words of the prophet Micah, "each hunts his brother with a net," denial of passports in the criminal area should be restricted to cases in which crime has been officially charged by indictment. A people who subscribe to the investigator's plea, "We know he is guilty but we cannot prove it," are already on the road to servitude. Anatole France puts this well in his classic *Penguin Island*. You will recall that the army officer assigned to investigate Pyrot reports to Greatauk that there is no evidence against Pyrot. "Let it be found," answered Greatauk. "Justice requires it. Have Pyrot arrested at once."

A second area in which passports are denied startled me when I learned of it. On the accusation of a wife against a husband of desertion and nonsupport, our State Department denies a passport to the husband until he settles his quarrel with his wife. Domestic relations in our state-federal system are the concern of the states and not of the federal government. And the State Department is ill-equipped either to judge family matters, or to force one party into settlement by the threat of withholding a passport badly needed for work abroad. I seriously doubt that this type of passport denial is valid in law.

The third area of passport denial is the controversial one today. Many citizens of the United States have applied for passports and received letters from their State Department rejecting their applications on the stated ground that granting of a passport "would be inimical to the best interests of the United States." No more and no less. They rushed to Washington to confer with the passport officials, only to learn from the highly agreeable officials that they would be glad to receive any evidence offered but could not divulge what was on their minds. In writing about this sort of thing, Kafka copies from life in the United States and not vice versa. In any event, it is a very frustrating experience. A couple of citizens, so treated, went to the courts. The courts held that the Department could not deny a passport to a citizen without first affording him a hearing.

Ineligible Communists Defined

As a result of these decisions, the State Department now publishes definitions of the Communist classes not eligible, in its view, for passports, and does advise a citizen fully and fairly of what is believed to be politically wrong with him. Let us see how this works out in practice.

The departmental regulations specify three classes to whom passports will be denied, except for direct return to the United States. The three classes are:

1. Current members of the Communist party, and recent members still under Communist discipline.

2. Persons who currently engage in activities which support the Communist movement, and do so as the result of Communist control.

3. Persons who are going abroad to engage in activities which will advance

the Communist movement and have that purpose in mind.

In sum, the three classes consist of persons who are currently Communist party members or currently under Communist discipline or currently working in support of a Communist party activity. America has traveled far from the principles of Jefferson. Many Americans, it may be, most Americans, would today agree that such persons should not get passports. However, few Americans would agree with the kind of inquiry that appears necessary to sift out the three proscribed classes.

INQUIRIES

In ferreting out the three classes, the Department is largely engaged in having citizens of the United States explain casual incidents in their lives that took place many years ago. The following types of State Department inquiry are derived from actual cases:

1. "It is alleged that when you were in college in the 1920's, you supported a Communist-dominated strike." The 1920's were a long time ago.

2. "In the 1930's, you were a member of the American League for Peace and Democracy, which the Attorney General has listed as subversive." That organization, as some of you may know, attracted many loyal Americans who were anti-Fascist and pro-Loyalist-Spain.

3. "In the 1930's, you were a member of the Los Angeles Anti-Nazi League, which was listed by the California Tenney committee." The Tenney committee, considered unreliable in respectable quarters, also listed the American Civil Liberties Union as subversive. It is an odd thing that the federal government has the Attorney General authoritatively, albeit invalidly, list the organizations considered subversive, but then inquires about any organization on anyone's list of subversive organizations.

4. "In the early 1940's, you subscribed to the magazine called *In Fact*." I am old-fashioned, and I shall never understand why my reading material is any business of the government's.

5. "In the 1940's you attended a dinner of the American Committee for the Settlement of Jews in Birobigan, Inc." If Patrick Henry were alive today, I suppose he would say: "As for myself, I shall dine with whom I please."

6. "In the 1930's, you knew and associated with J. Worthington Pump and Mary Coldangels [the names are fictitious], who are alleged to be Communists. Please explain your acquaintance with them, and what you knew of their views." Let this be a warning that your present friendships are subject to federal government inquiry, even if you do not work for the government.

7. "You have denied under oath any Communist membership or connection since 1941, but we cannot grant a passport until you inform us whether you were a Communist party member prior to 1941, and if so, who your Communist associates were." Another invasion of the Fifth Amendment privilege.

And all this in pursuit of current Communists.

When the Department's inquiries are directed to the events of recent years, they can still be troublesome to lovers of our traditions of liberty. "You want to go abroad," says the State Department to a passport applicant, "to write articles on the operations of the Marshall Plan for the Left-Wing press. Will your writings be constructive?" A very plain example of advance censorship in violation of the First Amendment.

Here is another one. The Department holds up a passport for a lawyer and seeks explanations, because, and solely because, the lawyer had been counsel for two passport applicants in connection with their passport difficulties—an attempted intimidation of counsel and a burden upon the citizen's right to counsel.

THEORY OF RELEVANCE

The theory of relevance has its broadest application in the field of belief and association. I do not say that the Department's inquiries are irrelevant. When you are trying to find out whether a man is really a Communist—that is, what he really thinks and what his motivations are—everything in his life is relevant: what he reads; what his religion is; who his friends are; and even what music, drama, and art he likes. This, I think, is true in logic. It certainly is inevitably true in practice, in the passport field, and in the closely related field of the government's security and loyalty programs.

Given the broad theory of logical relevance, the Passport Division of the State Department handles its inquiries with courtesy, fairness, and efficiency. For all I know, its inquiries may have resulted in some impediment and prejudice to the Communist party. And, I think, those who are not really Communists and Communist sympathizers today are usually cleared by the State Department and eventually get their passports.

But in the process the damage that is done to our free ways of life is immense. I pass over delays in urgent trips abroad, and the expense of seeking to clear oneself with the State Department. The injury to the fabric of American life goes much deeper. Who, when questioned about an innocent organizational membership or contribution in the past, will not tend to eschew organizational activity in the future? Yet, in a nation as large as ours, democratic processes can hardly continue without the association of Americans with organizations for a myriad of purposes. Who, when questioned about a past acquaintanceship, will not review his present friends and future acquaintances from the point of view of their orthodoxy? So confidence and trust among Americans lessen, and life dries up at its very roots. And who, when questioned about a view opposed to current foreign policy, will not try in the future to keep his unorthodox views to himself? And so the gray pall of orthodoxy gradually settles down upon the home of the brave.

The main fault lies not with our administrators in the State Department. Since we have the proscribed classes and the broad theory of relevance necessarily applicable to civil administrative proceedings of this nature, the maiming of our lives and body politic must result.

TRANSFER OF INQUIRY TO CRIMINAL COURTS

If my fellow Americans must insist on denial of passports to current Communists, I would suggest that the area of inquiry be transferred to the criminal courts. Let the passport application contain an oath that the applicant is not a Communist or Communist sympathizer. If the oath be subscribed, let the passport issue. If the oath be found false by those who investigate crime, let the applicant be indicted and tried for perjury. This procedure would reduce the damage; for the theory of relevance applicable in our criminal law is extremely narrow. You cannot in a criminal court introduce the friendships and associations of the thirties in proof of present-day Communist membership and sympathy.

UNCONDITIONAL RIGHT

But personally I would stand on the issuance of passports as a matter of absolute right to any citizen of the United States not wanted by outstanding legal process. Only forty years ago,

passports were not needed for travel. Today, a citizen of a small country has more freedom of movement than a citizen of the greatest nation on earth. Our criminal laws against espionage, sabotage, and so forth must and should be enforced. But in that pursuit the addition of passport denials is but a scatter-shot way of fighting Communist crime. And I worry about the trend. The trouble is that you cannot find the Communist unless you invade the lives of all applicants. In Washington today, a board is sitting to determine the political qualifications of an applicant for renewal of a license to deal in second-hand pianos. These things, of course, are not new. The rights of every American stand or fall, now, as in the past, upon the treatment afforded to the most hated citizen. I would make passports a right for every citizen not sought by legal process, a right—absolute and unconditional—and not a privilege which entails governmental invasion of life, family, religion, and thought. In any event, that is, in my opinion, the kind of liberty that befits an American.

Joseph A. Fanelli, LL.B., Washington, D. C., is a member of the law firm of Fanelli and Freehill, and has been engaged since 1944 in private practice, specializing in cases on immigration, nationality, and civil liberties. He was previously attorney, Office of the Solicitor General; Acting General Counsel, Railroad Retirement Board; chairman, United States Board of Immigration Appeals; special assistant to the Attorney General and to the Secretary of the Interior; and first assistant to the Assistant Attorney General, Claims Division, Department of Justice.

Religious Freedom—a Good Security Risk?

By PHILIP E. JACOB

FREEDOM of religious belief and practice has been accepted as so integral a part of the American political and social heritage that to challenge its "loyalty status" appears heretical. Are we not the proud spiritual descendants of Pilgrims and Huguenots? A Congress dominated by an overwhelming orthodox Protestant majority pays its respects on appropriate occasions to papal authority, Jewish law, Quaker individualism, and Mormon revelation. We generally believe with Justice Douglas that the legacy of Madison and Jefferson as expressed in their Virginia "Bill for Establishing Religious Freedom" has become part of the American ideal; that, as he summarizes it:

> The community will tolerate every religion.
>
> The state will establish, favor, or support no religion.
>
> Each man's religion is his own affair.
>
> Religious freedom and sanctity of rights of conscience go hand in hand.[1]

SUPREME COURT OPINION

Indeed, this marriage of national unity to religious diversity is confirmed by our highest judicial authorities. Speaking for the Supreme Court in the second of the historic flag-salute cases, Justice Jackson found that " if there is any fixed star in our constitutional constellation it is that no official, high or petty, can prescribe what shall be orthodox in politics, nationalism, religion, or other matters of opinion or force citizens to confess by word or act their faith therein." [2] If there should be question as to the relative claims of individual right and the authority of government, the Supreme Court majority has actually recognized a "preferred position" for the religious freedom, together with the other "First Amendment" freedoms. Not that they would admit an absolute freedom, even in regard to religious belief or practice, but that government, they insist, must not allow its sense of responsibility for public convenience and even the security of society a free hand at the expense of private conviction. To do so might well jeopardize rather than preserve the essential security of the national community. "Those who begin coercive elimination of dissent soon find themselves exterminating dissenters," to quote again from Justice Jackson as he took a second look at the implications of compelling a Jehovah's Witness child to salute the flag in school. "Compulsory unification of opinion," he goes on to say, "achieves only the unanimity of the graveyard." [3]

NEED FOR REAPPRAISAL

So we have the word of our courts and the testimony of our political credo that religious freedom can be cleared as a security risk. But is this enough? Time and circumstance—are they not different from the days of Madison's "Great Remonstrance" against the establishment of a "safe" state-approved religion in Virginia? At a time of exceptional crisis in the war for men's

[1] William O. Douglas, *An Almanac of Liberty* (Garden City, N. Y.: Doubleday & Company, 1954), p. 210.

[2] West Virginia State Board of Education v. Barnette, 319 U. S. 624 (1943).

[3] *Ibid.*

minds can we really count on individual religious freedom to buttress or at least not to impair the political and ideological foundations of our national commitments? Is not the political reliability of some persons' religious beliefs and practices open to question and, if so, should we not restrain those found to operate against the national interest regardless of religious considerations? Is it not time that we took a fresh look at this so-called preferred right of religious freedom, to see whether it is actually as "safe" as we blandly have thought?

If we conduct a security investigation of religious freedom, not only within the immediate American context but in the broader perspective of what is happening in other countries, we can detect four main tension points between state and church, government and religious believer: first, the opposition of religious persons and organizations to the established political order; second, the rejection of public duties on the grounds of religious belief; third, the challenge of religious proselytizing to public peace and morals; fourth, the enlistment of religion in the nation's service and the promotion of national interests.

RELIGIOUS CRITICISM OF THE STATE

First, and most dramatic, is the insistence of religious believer or organization on a political mission, a role of critic or opponent of government conduct which is considered morally wrong. How far can the government tolerate attacks on itself from behind the sanctuary of religious freedom?

House Committee on Un-American Activities

The House Committee on Un-American Activities, while denying any intent to "investigate religion," has proceeded on the premise that "a member of the Communist Party enjoys no immunity from investigation, regardless of his rank or calling" and that an individual member of the clergy identified as a member of the Communist Party (or as in the case of Bishop Oxnam, identified as associated with front organizations) shall be subject to the same security checks as anyone else. Said Representative Donald Jackson, defending the committee's activities in this regard:

> I feel no greater service can be rendered to God and man alike than to find out what men, if any, would place the thorny crown of the Kremlin upon the brow of the Prince of Peace. . . . A churchman who serves the Communist Party compounds his treason. . . . The man of God who treats with the conspirators betrays those things which are of transcendent importance—his oath, his moral obligations and his Creator. . . . Their responsibilities as citizens are no less than those imposed on other Americans in meeting the godless aggression confronting our people.[4]

In a public warning, the committee charged that Communists are trying to corrupt religion in the United States, that as a result there are clergymen and other church members who are Communists or play the Communist game as fellow travelers and that Communist propaganda is sneaked into church publications, sermons, and organizations. The committee viewed Communism as a "real" danger inside our churches, quoting J. Edgar Hoover as confessing "to a real apprehension, as long as Communists are able to secure ministers of the gospel to promote their evil work and espouse a cause that is alien to the religion of Christ and Judaism."[5]

[4] *Congressional Record,* Vol. 99, part 2, p. 2024 (Eighty-third Congress, first session, March 17, 1953).

[5] See House Committee on Un-American Activities, "100 Things You Should Know About Communism," released August 15, 1949.

Regardless of the accuracy or inaccuracy of the charge of subversive activity in a particular case, or the fairness of the procedures followed to determine such activity, the issue raised here seems to me fundamental. Unless a religious person is willing to abdicate all claim to moral responsibility for the political conduct of his country, he is bound to come, sooner or later, into conflict with what some others consider vital to the country's security—and hence to be viewed by them as a political threat. A Bishop Oxnam, no less than the churchmen whose sharper criticisms of American political and economic ways he disavowed, is suspect because he dared to protest, as a religious duty, the methods of security investigation adopted by a congressional committee.[6]

Soviet satellites

The same problem, though different in degree, has confronted religious leaders and their political counterparts in the Soviet satellites. To Cardinal Mindszenty, refusal to acquiesce in the Hungarian nationalization of church schools was a religious imperative and his letter condemning the government for abrogating fundamental freedoms was a pastoral duty. But to the Communist regime, the Cardinal was guilty of political offenses proscribed by law, and in particular—mark the phraseology—"of conspiring to overthrow the democratic regime in Hungary."[7] Again disregarding the question of whether particular charges were or were not true, a point of critical tension was reached because the government felt the security of its tenure imperiled by the thrust of a powerful religious opposition. To this challenge, the Communist political leadership gave a response identical to that of the House Un-American Activities Committee: "Being a Cardinal does not entitle a Hungarian citizen to commit treason and espionage."[8] "Freedom of religion does not imply that Church dignitaries should be exempt from the jurisdiction of the courts of their respective countries and that they could not be tried for criminal offenses, whether of a political or any other nature."[9] In other words, religious freedom is unexceptionable as a principle, but its exercise shall not be permitted to jeopardize the established legal and political order, whatever form it may take; and the proper limits of religious freedom shall be determined by political authority.

Communist and American attitudes compared

There is of course an important practical difference between the two situations—quite aside from the quality of the respective judicial processes involved. We in America start with the presumption of the political *inoffensiveness* of the religious critic and a profound suspicion of governmental interference with religious institutions and practices. The brashness of Representative Jackson's remarks and elaborate self-justification by Representative Velde, the committee's chairman, actually covered a quick tactical retreat from their venture into an investigation of religious subversiveness. But the Communist regimes presume a very real

[7] Andrei Gromyko (USSR) before the 201st plenary meeting of the United Nations General Assembly, April 29, 1949.

[8] Juliusz Katz-Suchy (Poland) before the General Committee of the United Nations General Assembly, Third Session, Part II, April 5, 1949.

[9] Joza Vilfan (Yugoslavia) before the 202d plenary meeting of the United Nations General Assembly, April 30, 1949.

threat to their security in the opposition of organized religion, and indeed they might, if the churches steadfastly proclaim their rejection of totalitarian secular authority. With the security threat strong and imminent, the government is prone to move in upon the area of religious freedom more swiftly and drastically. The relative lack of tension at this point between religious expression and internal security in the United States should be attributed, therefore, not so much to general acceptance of a more liberal *principle* of religious freedom as to a kind of harmony of interests between religion and politics. Whether this is a reassuring state of affairs will be considered later.

PUBLIC DUTIES VS. CONSCIENCE

The second tension point between religious freedom and internal security arises from the resistance dictated by religious belief to demands of the state for the performance of public duties considered essential to its welfare or survival. How far may government properly go in compelling individuals to perform obligations of citizenship which conflict with their beliefs or conscience? This is the point at which American law and politics have wrestled most intensively with the implications of religious freedom.

Area of freedom

The trend in the last decade has veered strongly in the direction of an expanding area of personal freedom. The Supreme Court, we have seen, struck down the compulsory flag salute and pledge of allegiance to the United States as an invasion of "the sphere of the intellect and spirit which it is the purpose of the First Amendment to our Constitution to reserve from all official control."

In addition there have been important advances in legislative and judicial recognition of conscientious objection to military service. No longer is citizenship denied to one who will not promise to bear arms. The Supreme Court, and the Congress by tacit consent, have apparently come to accept the former minority view of Chief Justice Charles Evans Hughes that "even in time of war one may truly support and defend our institutions though he stops short of using weapons of war." [10]

Furthermore, a person called to military service despite his claim to be a conscientious objector under the Selective Service Act may secure judicial review of his classification, a right he did not have in World War II. Among many grounds now accepted by the courts for throwing out inductions ordered by the Selective Service System are: (1) Mere disbelief by draft board or hearing officers. (2) Arbitrary or capricious ruling of hearing officers in regard to the validity of the C.O.'s claim. For instance, in one case a hearing officer threw out a claim by a Catholic to be a conscientious objector on the ground that in his judgment no Catholic could be a conscientious objector. That was held by the courts to be an arbitrary and capricious judgment on the part of the hearing officer. (3) Inferences from the registrant's attitude in regard to self-defense. (4) Indications of prejudice or discrimination on the part of the draft boards or hearing officers.

In a set of recent judicial decisions the right of Jehovah's Witnesses to be classified as conscientious objectors has been clearly established. "The test," declared Justice Clark for the majority, "is not whether the registrant is opposed to all war, but whether he is opposed, on religious grounds, to participation in war." Selective Service officials had denied conscientious-objector status on the ground that the Jehovah's Witness admitted he would fight in a theocratic war ordered by Jehovah to defend "kingdom interests," fellow members of the sect, and "our property"; though he would not engage in "the carnal warfare of this world" nor bear "carnal" weapons. Justice Clark noted, however, that the history of the sect recorded no divine command to war since biblical times and that "their theology does not appear to contemplate one in the future." This would seem to settle one of the main issues which landed some four thousand J.W.'s in jail during World War II.[11]

[10] See United States v. MacIntosh, 283 U. S. 605 (1931); Girouard v. United States, 328 U. S. 61 (1946); *In re* Wiebe, 82 Fed. Supp. 130 (1949); Cohnstaedt v. United States, 339 U. S. 901 (1950).

Limits of freedom

But there are limits beyond which we still will not go in allowing the individual to dissociate himself from the obligations of citizenship, and at some points we seem to be increasing the imperatives of political allegiance. Conscience is still considered a privilege, not a constitutional right, and this leaves to legislative discretion the area of exemption from the performance of public duties to be granted. The courts continue to sustain the decision of Congress to limit the type of conscience to be recognized. The nonreligious or unorthodox religious objector has only prison as an alternative to the armed forces even though he is willing to do civilian work or serve as a noncombatant. The absolutist objector, even if religious, also faces prison. This difficulty has been compounded by the fact that Selective Service and the Department of Justice have prosecuted these men again after they have completed prison sentences. Thirteen objectors have been convicted a second time. One of these served eighteen months in the payless civilian work of World War II, one prison sentence in World War II, and two prison sentences under the 1948 law.

A further limitation prohibits the counseling of conscientious objectors, when the intent or effect of such counseling is to cause them to refuse to register or otherwise disobey the law. The Department of Justice has secured the conviction of at least three persons for such action: a father who advised his son not to register, a stepfather whose advice was not followed by his son, and in the third case, a professor who counseled with a student who had already refused to register before meeting the professor. Conviction in the latter case was sustained by the United States Supreme Court in a 4 to 4 vote.[12]

The conscientious objector who lands in prison because of his beliefs may find a further penalty awaiting him when he asks for parole. The United States Board of Parole has recently ruled that they will not allow a so-called conscience clause in a parole argument. While pledging not to violate most laws, some objectors want explicitly to reserve the right to oppose the draft law, or they may state, for instance, that "in matters of obedience to laws, my associations with others, and other situations in which this principle might apply, my conduct will be governed, insofar as is possible within me, by my conscience—that is, my conception of God's laws as revealed by His Son, Jesus Christ—rather than by man's dictates and standards, when a conflict

[12] Gara v. United States, 178 F.2d 38 (1949); decision affirmed *per curiam* by the Supreme Court, 340 U. S. 857 (1951).

arises between these two." Be this candor or hairsplitting, individual parole boards found no real cause for alarm over releasing such men. But the national board now rules that only an unqualified commitment to be law-abiding, regardless of religious reservations, is compatible with the national security.[13]

Loyalty oaths

There is also the question of loyalty oaths. States requiring such oaths have fired from public employment those whose scruples of conscience would not permit them to demonstrate their loyalty in this manner. Faced with the choice of losing their jobs or maintaining personal integrity, scores of conscientious civil servants, nurses and doctors in public institutions, and teachers in Pennsylvania, Maryland, and elsewhere have done the latter.

The point of view of those who defend the necessity of these security limitations upon conscience is well summed up by Justice Frankfurter, in his dissent from the final decision in the flag-salute cases:

> That which to the majority may seem essential for the welfare of the state may offend the consciences of a minority. But so long as no inroads are made upon the actual exercise of religion by the minority, to deny the political power of the majority to enact laws concerned with civil matters simply because they offend the consciences of a minority really means that the consciences of the minority are more sacred and more enshrined in the Constitution than the consciences of a majority.[14]

Universal Military Training

So far, we have been concerned primarily with those public duties that are demanded of a few and the objections that have been raised on behalf of a few. But there is a current issue in which the opposition of religion to the performance of public duties is cast upon a much more general basis, the issue of Universal Military Training. The principal source of opposition now and in the past to Universal Military Training legislation is the concern of religious groups over the moral effects they foresee from the inculcation of militarism as a way of life. Regardless of their personal stand on participation in war, leading churchmen in the great denominations have insisted that there is a real danger of moral injury in any permanent universal subjection of youth to military training and indoctrination. The general moral health of the nation demands, they insist, the development of qualities of *self*-discipline, not imposed discipline, and respect for family and human values. It is these things which it is not the purpose or the effect of military training or discipline at an early age to produce. The character-formative years should be preserved, feel these religious organizations and leaders, from the impact of a public duty which in its nature presumes a destructive human mission.

At this point, we can see in its full import the conflict which can arise between the conception of public duty demanded by the security-minded and the moral reservations of religion.

PROSELYTIZING

The third main tension point which appears in the security file on religious freedom is the disturbance caused by religious proselytizing to public order and what one might call the "moral" security of the state. Thanks again largely to the determined zeal of Jehovah's Witnesses, the United States has had to reconsider during the last

[13] Central Committee for Conscientious Objectors, Philadelphia, Pa., "Memorandum to the United States Board of Parole," [1955].

[14] *Op. cit. supra* (note 2).

ten years whether the exercise of religious faith can be tolerated if it jars accepted community standards and invades the personal privacy of the general citizenry. The Supreme Court has laid down on this issue an almost consistent line of decisions warning public authorities to keep hands off the religious evangelist, no matter how extreme his views or how displeasing to the community at large. We are told, in effect, that it is the responsibility of government to provide security *for* the proselytizer, not *from* him. He should be permitted to preach in public parks, to roam the streets with a sound truck, to ring doorbells and offer his literature to the residents of private homes or public housing, and to parade through the town. What he says or writes is his business, though he maligns the cherished beliefs of his listeners and infuriates them almost to the point of riot.[15]

Inroads on privacy and public order

The implications of all this for local peace and order did indeed cause concern to some of the Justices, especially to a former Attorney General such as Justice Jackson, who shuddered at the practical effect of a perpetual open season for proselytizing if all sects should exercise the rights conceded to the Jehovah's Witnesses. It was not unreasonable, he felt, for a city to protect the dignity of its residents against fanatics or to exercise control over a loudspeaker which could make life unbearable. Others questioned how far the proselytizer could properly carry his "intrusion into cherished privacy." But the prevailing (though small) majority steadily rejected any prior restraints on religious expression which might conceivably be used to discriminate against a queer or unpopular faith. Because of the closeness of recent decisions on this issue, however, freedom to proselyte may have reached its limit for the time being in the United States. The security-minded seem about ready to contain any further inroads on the public order—though just what further challenges there could be beyond those that have been brought is a little hard to imagine.

Security and an established church

While this issue seems so clearly settled on our domestic scene, freedom to proselyte is far from an established right in countries where the security of the public order is considered inseparable from loyalty to an established church. And because the religious affiliations of most Americans are to world-wide communions, the issue is precipitated into the international arena. In our relations with Italy and Colombia, for instance, we are obliged to decide whether to defend our concept of religious freedom as a universal right or to concede that other countries may insist on religious conformity and uniformity as an essential condition of their security. For it is on this basis—the inescapable dependence of the nation's security upon maintaining the integrity of the established religion—that these other governments have justified the arrest and intimidation of ministers, prohibition of religious announcements and signs, and similar denials of legal and civil rights to religious minorities.

Colombia

"Colombian democracy is based on the precepts of Catholicism," declared the

[15] See, for instance, Cantwell v. Connecticut, 310 U. S. 296 (1940); Murdock v. Pennsylvania, 319 U. S. 105 (1943); Tucker v. Texas, 326 U. S. 517 (1946); Marsh v. Alabama, 326 U. S. 501 (1946); Saia v. New York, 334 U. S. 558 (1948); Niemotko v. Maryland, 340 U. S. 268 (1951); Kunz v. New York, 340 U. S. 290 (1951); Fowler v. Rhode Island, 345 U. S. 67 (1953).

Minister of the Interior. Hence in the interest of the nation and its security "neither ministers, pastors nor plain Protestant faithful can perform any religious activity in public or use means or propaganda outside the premises where worshipping is done." [16] Needless to say, American Protestant leaders vehemently protested that such an attitude "contravenes the principles of religious liberty maintained by most governments outside the territories under Communist rule and currently supported by the most authoritative religious voices, Roman Catholic, Protestant, and Eastern Orthodox."

Italy

Meanwhile in Italy, an important decision by the Council of State indicates that the tide may be turning in the direction of the broader view of religious liberty, even in the church-states (where government is committed to the support of a particular church.) The Ministry of the Interior was ordered to grant juridical recognition to the Pentecostal sect and to other non-Catholic denominations. This will permit public services, tax exemption, and, in effect, legal rights equal to those enjoyed by the Roman Catholic Church. And a shift in Catholic outlook itself may be indicated in the statement of the Pope, concerning "International Community and Religious Tolerance," to the effect that a formula of religious and moral toleration may in some circumstances be justified for the Catholic jurist, statesman, and sovereign Catholic state in the interests of a higher and moral general good of the community of nations. I think this is an extremely significant statement which may spell the end for Christian countries of the sharp conflict over religious proselytizing.

[16] *New York Times*, January 29, 1954, p. 5.

Security and unity

The basic issue still remains, however: May not national security depend fundamentally upon national unity, and if the basic unifying element in the nation is an established church, will not the proselytizing activities of competitive faiths undermine, confuse, and divide? If so, must other countries sacrifice their *religiously* based security for the principle we consider just, the freedom to proselytize? Are we prepared to go just as far in sacrificing our *politically* based security whenever it comes up against a claim of freedom to oppose public policy or refuse public duty on religious grounds?

RELIGION AS HANDMAID OF THE STATE

This leads to the fourth and final tension point between religious freedom and national security—the positive role which religion is so generally expected to play in the strengthening of the nation. Though we shun a state-established or state-supported religion in any form, we continually assert our national respect for and dependence on religion. We appeal to religion to build the internal defenses of our country, form good citizens, support our national policies, and even wage ideological warfare. A Quaker is the religious director of the United States Information Agency and supervises the infusion of religion into the Voice of America. A Methodist bishop declares under oath that the churches deserve more credit than any other force for combating Communism. We look to religion to save—and to serve—the nation.

But how can this attitude of mutual respect and the practice of mutual support between the political and the religious communities result in an issue of religious freedom? The security of the nation would seem aided rather than threatened by such an exercise of religious faith. Yet what happens to the vitality and integrity of religion when it is linked in partnership with national political goals? Does religion unconsciously lose its own sense of mission in the national mission? Is not this the danger which we sense when the Eastern European regimes profess their support for a *nationalized* church which in turn is expected to accept and support the prevailing order? Does not freedom of religion quietly erode as it is exercised, even voluntarily, in direct support of the security interests of the state?

Perhaps the very absence of outward tension and conflict in the United States between the imperatives of religion and the demands of political security is a subtle symptom that real religion—the burning sense in the individual of a higher duty compelling his steadfast dedication to service beyond the call of state or government—has evaporated, and that what passes under the name of religion is no more than a satellite of our national polity. Candidly, do we conceive our national policies in moral and religious insights; or do we *use* the symbols and slogans of religion to justify to ourselves and others policies determined by quite other considerations? What actually calls the tune in our national conduct—fear for our own personal and national security or the fundamental moral standards of mankind?

I do not mean to suggest that there can or should be no close and meaningful relationship between the religious and the political worlds, or that the present role of religion in the United States is completely subservient to the politically determined line of national interest. I do question how long a state of peaceful coexistence between religious freedom and national security can continue unless one or the other becomes unimportant to the general community.

GOOD RELIGION A BAD SECURITY RISK

Good religion is a *bad* security risk in the modern state, whether it be Communist dictatorship, national democracy, or church-state.

Good religion is a bad security risk because it dares to condemn and resist, with all the force at its command, the actions of government which it holds to be wrong.

Good religion is a bad security risk because it rejects the authority of government to make the ultimate decision on what public duties the individual may properly be expected to perform, reserving that authority to the mandate of the church or the individual conscience.

Good religion is a bad security risk because it insists on the right to win the allegiance of all mankind, even if in so doing it disturbs the public peace or offends conventional moral standards.

Good religion is a bad security risk because it fails the state as an ideological or political weapon—and in my judgment it is right for religion so to fail the state.

CRUCIAL CHOICE

If this contention is sound, then we are faced with a crucial choice, reminiscent of the medieval choice of church *or* state. Should we accept the demand that individual believer or organized church work within an area defined by the state as compatible with its own security? What if this area should be labeled "strictly nonpolitical," as in the Communist states; or "strictly no proselytizing," as in the church-states? Or what if the state demands public duties offensive to individual conscience or ecclesiastical judgment; or conversely cor-

dially invites the close co-operation of religion in the advancement of its policies?

Should we not rather, in the fundamental interest of ourselves as human beings, declare that there are some things more important than national security and that the *state* may not overstep limits defined by religious belief and conscience? Whether such belief leads to outright rejection of political policy and nationally prescribed duties or merely to independent pursuit and practice of one's faith, there can be no more important act of political statesmanship today, it seems to me, than to recognize that a human society will be no stronger than the integrity of the individual faith of the persons who compose it.

Philip E. Jacob, Ph.D., Philadelphia, is professor of political science in the University of Pennsylvania and director of its College Collateral Courses and Summer School. He was formerly secretary of the Civilian Public Service Section of the American Friends Service Committee. He is coauthor (with Mulford A. Sibley) of Conscription of Conscience (1952), which was given the Franklin D. Roosevelt Award in September 1953, and was special editor of the November 1954 issue of THE ANNALS *on The Future of the United Nations: Issues of Charter Revision.*

Subversives in Government

By FRANCIS BIDDLE

IN the opinion of many American "liberals"—if I may be excused for using a word which is now, as it has so often been for the past two hundred years, in disrepute—Americans for a dozen years or so have been suffering from a curious sort of disease. That it is hard to define makes it no less discernible. That it seemed to many social psychologists to evidence immaturity, growing pains, the unstable state of adolescence, a sort of spiritual jitters, was at first a comforting diagnosis, until they began to realize that we were not growing up. The jitters did not stop, they increased. The fears spread. It was all very well to explain them in psychological and historical terms, to say that with the loss of our cherished isolation we found ourselves suddenly standing stripped of our comfortable assumptions in a tight world of conflicting nations, a new world heretofore hidden from our sheltered vision, of which we had suddenly become the center. We had, in a sense for the first time, bitten into the knowledge of evil which was part of the daily diet of the Old World. We were afraid—but of what? Not so much of Russia, apparently, as of ourselves. Was it true, as Senator McCarthy had said in 1951, that "the crimson clique in the government had engineered the Communist victory in China"? Were Americans betraying Americans? Was there a clear and present danger of revolution in our country?

Generalities are dangerous. Motives are mysterious and conflicting. Yet some conclusions must be reached before we can take the next steps. We must try to see our direction, steadily at least, if it is impossible to see it whole. So let us say, to start, that in *some* fields, among *certain* people in our country, since 1938 (to take as a convenient date the year when the House Committee on Un-American Activities was organized), there has been conviction that the government of the United States is "infiltrated," as the expression goes, with Communists; that in certain states the fear took the form of believing that young Americans were being taught Communism on campuses of colleges supported by their parents and the public generally; that in many universities, as Dean Millicent C. McIntosh of Barnard said, pupils had begun to believe that anything identified with peace, freedom of speech, or negotiations to resolve differences was identified with Communism, and were "becoming afraid to advocate the humanitarian point of view because it has been associated with Communism." Terror of Communism was at the base of it all. But the terror has turned backward and inward. It was no longer terror of a foe that could be seen and met, objective and measurable, but of the inner treachery of the mind, the worm of treason feeding in our own breasts—a cankerous growth, deep and dark. Were we doubtful of our institutions as we had begun to doubt them when the false heroes of fascism and nazism for a short while had shone with a spurious glow of accomplishment, and efficiency and good roads seemed tempting in the light of the slow, careless, and so often corrupted steps that dogged the progress of a democracy which no longer met the needs of a changing world? Most of us did not care. Between in-

difference and fear some balance of sanity had been lost.

It was not that there was nothing to fear internally, but the form that the fear took. The Hiss conviction, the ring of espionage that the Rosenberg cases revealed, the confessed presence of American Communists within the government, the activity of Communists in the moving picture industries, the far more serious leadership of Communists in certain labor unions, particularly in the CIO—these were serious and sometimes dangerous realities that had to be disposed of. Most of them dated from war days, when on the war front the Russian Communists were putting up such a magnificent fight against the Nazi invasion; it was hard for most Americans to foresee the threat of Russian imperialism and infiltration which was so soon to look over the shoulder of victory. By 1947 when Czechoslovakia fell the Russian outlook was stripped of its pretenses to all who were not too obstinate to think. And soon information about Russian concentration camps was added to the picture.

And by 1947, there are grounds to believe, the problem of espionage and subversion *within* the United States had largely passed. The American Communist party was a closely knit criminal conspiracy, but it had never in any true sense of the word been a political party, never had elected a governor or Congressman (the only fellow-traveling Congressman was defeated after a few terms), no member of a state legislature, no mayor. When Eugene Victor Debs ran for President on the Socialist ticket in 1920—he was a candidate five times—he received more than a million votes. By April 1953, the membership of the Communist party had shrunk, according to the Federal Bureau of Investigation, to a little under twenty-five thousand. And by then Communists had been cleared out of the labor unions in which ten and even five years before they had been exerting a dominant leadership. They had been a security problem in those industries which would, in case of war, be mobilized for war production: the threat was the threat of sabotage. That danger is largely in the past. Yet as the threat subsided the fear and accompanying hysteria increased.

Official Hysteria

Let me give you one of the most recent examples of the hysteria, commented on by George F. Kennan in a letter to the *New York Times* of March 6 of this year. This is an instance of official hysteria, far more deplorable than public hysteria, out of which the public nervousness presently grows, and far less excusable.

Mr. Kennan points to the report of the *Times* Moscow correspondent that the Soviet government had ordered the Reverend Georges Bissonnette, a Roman Catholic priest stationed in Moscow, to leave the Soviet Union, and says that there can be no doubt that the action was taken in retaliation for the decision of our government not to permit Metropolitan Boris of the Russian Orthodox Church to live any longer in the United States. Was this action, Mr. Kennan asks, an example of American policy being distorted by persons responsible for internal-security considerations and not conscious of any other aspects of the national interest? This is a distinct loss in other respects, he suggests, to deprive the members of the little American colony in Moscow of the comfort and strength which Father Bissonnette had afforded it.

Mr. Kennan comments on another government action of like nature—the recently reported attempt of the United States postal authorities to prevent delivery of copies of *Pravda* and *Izvestia* to persons in this country "not authorized to receive them"—an ominous phrase. Mr. Kennan says that he has followed *Pravda* and *Izvestia* for some twenty-seven years and that reading them could not fail to sharpen the understanding of "those features of Soviet life and thought that are most unacceptable to American feeling and tradition." He concludes by asking whether

> . . . there are really people in our Government who believe that our own political philosophy is so unconvincing, our attachment to it so weak, our youth so bewildered and gullible—and the outlook of our adversaries, on the other hand, so forceful, so logical and so persuasive—that we must shield our people physically from every confrontation with Communist thought.

American Decencies

But I sense a change, in these last few months, in the attitude of the public, even if not in that of their government. It is slight. There is no reason to suppose that it will persist if the cold war becomes hotter. To describe the change, I would suggest that more people talk more rationally. They begin to ask questions. They are confused and some of them shocked to hear that we need more engineers, more physicists, more scientists to challenge the Russian advance in science, and that to meet the crisis the Atomic Energy Commission closes off Robert Oppenheimer, pre-eminent as an atomic scientist—a leader and superb organizer in his field—shuts him away from usefulness, at the same time pronouncing him loyal and discreet. The public would not listen when a few voices were raised to warn against professional informers—they must be used, but with care and caution—to warn against Elizabeth Terrill Bentley, J. B. Matthews, and Ben Gitlow; Whittaker Chambers, Professor Budenz, and Karl Baarslag; and Joseph Zack Kornfeder.

And now Harvey Matusow has stepped forward to testify.

I suppose the average man—if there is such a being—the average man felt a flush of anger and shame when Senator McCarthy attacked the Army; we all had a stake in the Army. At the Gridiron Dinner in Washington last autumn, I am told, the President, who is liked by the press, was greeted with the friendliest of cordiality. But when Senator Arthur Watkins walked in—a quiet man, rather shy, no hero to himself, and until then, no hero to others—the whole room rose and clapped and cheered, and would hardly let him sit down. He had kept his head high and stood up against the sheer brutality of a bully, he would not be cowed or hushed, he was not ashamed of American decencies. That was all—but it was refreshing.

I may have appeared to you to have wandered from the path I had undertaken to follow, the problem of subversives in the government. But without some feeling of the tangled emotions that are involved, and of how far we have thrown aside those American decencies, one cannot appreciate this long-endured nightmare. One must feel as well as think. Talk to any physical scientist and you will learn what it is doing to science. Talk to an educator and you will learn what it is doing to education. Talk to a lawyer who has represented a government employee in a security case—I have talked with many—and you will discover what the government programs (under President Truman the loyalty program, under President Eisenhower the security program) are doing to human beings who have chosen or would like to choose government as a career. Talk to any career man in the Foreign Service and you will discover what all this vast, amateur, and childish, yet brutal and stupid, mechanism for our protection

has done—irreparably, perhaps—to that service. Talk to John Carter Vincent.

SUBVERSION—MEANING WHAT?

Subvert—what is the primary meaning of the word? To overturn, to upset, to overthrow—like the American Revolution, or those who valiantly protested against the Eighteenth Amendment by buying, and drinking, hard liquor. We are not concerned, however, with the primary meaning, but with the actual meaning given the word by government officials dealing with employees or men working on government contracts charged—or suspected—of being "subversive." I suggest that the word is impossible to define in a way that would prove useful, and that attempts at loose definitions as well as use of the word without definition are dangerous and harmful. If it is narrowly defined—an attempt to overthrow the government by violent or unconstitutional means—it is useless as a tool. Government clerks, and even career men, just are not engaged in that attempt. If they are, they should be indicted and tried and sent to prison.

Do you remember the definition which a special committee set up by the House of Representatives in 1943 to investigate and report on the fitness of thirty-nine federal employees accused by Congressman Martin Dies of being fellow travelers—do you remember the definition which this committee, manfully struggling to be accurate, and inclusive, produced? "Subversive activity," the committee concluded, "derives from conduct intentionally destructive of or inimical to the government of the United States—that which seeks to undermine its institutions, or to distort its functions, or to impede its projects, or to lessen its efforts. . . ."[1] Ambiguous words, these. They might well be construed to include reciprocal trade agreements, federal health programs, or even criticism of the recent increase in salaries of government officials.

[1] Robert E. Cushman, "The Purge of Federal Employees Accused of Disloyalty," *Public Administration Review*, Vol. 3 (Autumn 1943), p. 299.

SUBVERSIVE ORGANIZATIONS

Let me give you another example which shows the serious consequences to which the use of the word *subversive* may lead. In 1941 Congress appropriated one hundred thousand dollars to be used by the Federal Bureau of Investigation to investigate government employees "who were members of subversive organizations or advocated the overthrow of the federal government." What did Congress mean by "subversive organizations"? I was Attorney General at the time, and I was deluged with that question from the heads of government departments and agencies. It was my duty to advise them. Accordingly, I ruled that Communist and Bundist organizations came under the language. But that did not touch the "front" organizations. No one knew much about them. Therefore the departments were furnished with such information as the FBI had been able to collect about those organizations which might be construed as coming under this indeterminate formula. There were no formal determinations. The information was confidential. The departments were told that membership created no clear presumption or basis of discharge. Half a dozen years later, membership had become a ground for dismissal, and the organizations had been outlawed under President Truman's loyalty program—illegally, as the Supreme Court finally decided.

As Eleanor Bontecou points out in her admirable book, *The Federal Loyalty-Security Program*, the only safe course for a government employee is not to join anything, unless he wishes to follow the sage advice of one loyalty board official and join only the Methodist Church. When Martin Dies, then chairman of the House Un-American Activities Committee, finally cleared Fredric March, the actor, and his wife, Florence Eldridge, he admonished them that it would be safer "never to participate in anything in the future without consulting the American Legion or our local Chamber of Commerce." The wisest and most sympathetic critic of American democracy, Alexis de Tocqueville, foresaw this result.

> When some kinds of associations [he wrote] are prohibited and others allowed, it is difficult to distinguish the former from the latter beforehand. In this state of doubt men abstain from it altogether and a sort of public opinion passes current that tends to cause any association whatsoever to be regarded as a bold and almost illicit enterprise.[2]

In the broader field of the public domain, the use of this mechanical proscription, the listing of "subversive" organizations, has already done infinite harm. Mr. Justice Black in an opinion of the United States Supreme Court called the lists "officially prepared and proclaimed Government blacklists [which] possess almost every quality of bills of attainder."[3] It is enough that a professor's name appear on the mailing list of one of the organizations, or that he have been a member for a brief time even if a dozen years ago the organization ceased to exist, for him to be pilloried on the university campus by some ardent state investigating committee, or subpoenaed to appear before a United States Senate committee convinced that the purpose of a congressional investigation is to accuse and to convict. Punishment in most cases can safely be left in the hands of the employer.

Fear of Russia, fear of revolution, fear of change, fear of subversion. Texas shields its electorate from the perils of the mind by proscribing associations "whose principles include any thought or purpose of setting aside representative government." Until the law was declared unconstitutional, Illinois excluded from the ballot groups "associated, directly or indirectly, with un-American principles." Pennsylvania in 1941 prohibited subversive organizations from nominating candidates for public office, denied state employment to subversive individuals, and later excluded them from welfare and public assistance, excepting, with a show of liberal mercy, pensions for the blind.

[3] Joint Anti-Fascist Refugee Committee v. McGrath, 341 U. S. 123 (1951).

PHASES OF LOYALTY-SECURITY PROGRAM

We have now had three phases of the loyalty-security program. The first period lasted from 1942 to 1946. An Interdepartmental Committee, appointed by the Attorney General, advised government agencies on methods followed by the FBI in its investigations, suggested procedures for examining employees and reaching decisions, and distributed the reports I have referred to on "front" organizations. Most of the departments set up review boards and followed the procedures recommended. In 1943, President Roosevelt appointed a new committee to take the place of the one organized by the Attorney General, similar to it in scope and procedure. Both committees consisted of high ranking government officials. The work of the committees was advisory. Administration remained—as indeed it must—in the departments and agencies. On the whole the program was satisfactory—quiet, rational, and

gradually developing principles of practice and standards which, more and more, the agencies began to apply.

Truman administration

The second stage began with the inauguration of the loyalty program by President Truman in 1947, and lasted until it was abolished by his successor six years later, when the present security program was substituted. There can be little doubt that President Truman attempted to meet congressional (and doubtless public) pressure for more extreme measures. Under the program the departments still had ultimate responsibility for deciding, but the Loyalty Review Board's decisions, although technically advisory, were actually determinative. The program dealt only with *loyalty*, not security, risks. The FBI made the investigations. Each department had its own loyalty board. Certain shadowy paper rights were given the employee, who sometimes got a fair hearing, sometimes did not. On the whole the Loyalty Review Board, at least while it was headed by Seth W. Richardson, did its best to prevent injustice, a supervision which afforded some protection. But under the order and regulations, charges were only as specific "as security considerations" would permit; the employee could introduce only such evidence as the Board deemed proper; could cross-examine witnesses—but not informants; had no right to subpoena witnesses; and appeared before a board in his own department which in fact was acting also as a prosecutor. There were two records, one which went to the employee and to the court if, as in the famous Bailey case, an appeal was taken. The other, the *real* record on which the action hinged, and on which the Matusows were designated simply by an *X*, anonymous shadows never under oath and never appearing before either board—on that record, which could not be reviewed, the case was decided, and determined, as Judge Edgerton said in his dissent in the Bailey case, on the "unsworn reports in the secret files to the effect that unsworn statements of a general sort, purporting to connect [Miss Bailey] . . . with Communism, had been made by unnamed persons," not on knowledge but on belief.[4]

The standard—so read the President's order—was that there were "reasonable grounds . . . for belief that the person involved [was] . . . disloyal to the Government of the United States." In 1951, when a new chairman had taken Mr. Richardson's place, President Truman, reluctantly, I believe, changed the grounds for dismissal from reasonable proof to a finding "that, on all the evidence, there [was] a reasonable doubt as to the loyalty of the person involved." The burden of proof had thus shifted. The employee now had to remove any doubt which a lying or malicious accusation might have raised and which he in most cases had no way of meeting. The operation of the program did much to increase the emphasis on conformity.

And to what end? No spies were caught. After three years of operation, Mr. Richardson testified before a Senate subcommittee that the vast, complicated, expensive, and time-consuming project had not produced "one single case" of espionage or turned up any evidence "directing toward espionage." No indictment was filed against any individual who had been discharged or refused employment—in 1950, 246 in all. Were they Communists? Had they once joined the party? Were they in sensitive positions? We had spent approximately $21,500,000 by then, and we might have been entitled to know. But when President Truman appointed a Commission on Internal Security and Individual Rights "to make a thorough study of the problem," Congress blocked the move by refusing to pass a law exempting the members, many of them businessmen and lawyers, from the federal statutes that prohibit a federal officer or employee from engaging in business with the government. The Nimitz Commission never functioned. The public is still in ignorance of what went on, and of what was turned up.

[4] Bailey v. Richardson, 182 F.2d 46 (App. D. C. 1950).

"In the interests of national security"

President Eisenhower scrapped the loyalty program in 1953, under an executive order setting up the security program, in which loyalty is not mentioned. If during the investigation there develops "information indicating that the employment . . . *may not be clearly consistent with the interests of the national security*" (my italics), the head of the department must terminate the employment when he determines that it is "advisable in the interests of national security." We find the same impact and emphasis of proof in both programs—"reasonable doubt," "clearly consistent." The approach is the same, the intention that the employee shall justify his sufferance; he has no right—only a privilege—to be employed, as the order recites.

PRESENT SECURITY PROGRAM

That improvement is needed in the present system is indicated by Mr. Brownell's recent letter (March 4, 1955) to President Eisenhower, suggesting that certain procedural changes be adopted by the department heads, such as a personal interview with the employee before the filing of charges and the suspension which immediately and automatically follows. At present it takes six or eight months before a decision is reached. A very large number of employees, who like the rest of us have to eat and whose salaries are cut off on suspension, resign and seek private employment. And those who remain are subject to further investigation, whenever an administration changes or a new set of rules is devised. Mr. Brownell thinks government witnesses should testify and be cross-examined by the employee, "so long as the production of such witnesses would not jeopardize the national security." This vague criterion is in substance the same as that used under the loyalty program. You can cross-examine a witness if the government will let you. In practice the evidence of informers is still unsworn, anonymous, and of course not subject to cross-examination.

But the ultimate success or failure of the system lies in the quality of the men who sit in judgment. Comparatively few employees were discharged under the Truman administration, a relatively large number under that of President Eisenhower. Do these numbers suggest that the former method was more humane and exercised better judgment, or that the latter was more vigilant in its patriotic search for security? We do not know until we know more about the treatment of the individuals who were discharged. Security is a relative thing, and always must be under any system. And there has been, as former Senator Harry P. Cain, now a member of the Subversive Activities Control Board, states, an "unwarranted emphasis on security."

Informers

Just how could production of an informer prejudice national security? There are three types of informer. An FBI undercover agent's usefulness, in certain fields at least, would be at an end if he were put on the stand and his name and activities made public. Whether he should be called, however, is hardly a problem of national security,

but rather, I suggest, one of administrative convenience and efficiency. The second anonymous witness is the professional informer like Matusow, who makes his living from informing. He is generally known, he has testified many times before, he but adds to the list, and it is difficult to conceive that national security would be imperiled if he were forced to back up his secret charges by taking the stand. The third type of anonymous witness is the individual who in confidence, often reluctantly, tells the investigative officer what he knows, or thinks, or has heard about the employee. He may be a neighbor, the employee's janitor, or his divorced wife. His evidence, usually based on or greatly influenced by rumor, opinion, or even not infrequently personal vindictiveness, is peculiarly subject to inaccuracy or untruthfulness. It is not apparent why his anonymity should be protected. If it be said that a man will not reveal to an investigator what he really knows or thinks about a government employee if he faces the possibility of being put on the stand to back up what he believes, it may be conceded that this makes the investigative job more arduous. But again, such a consideration, honestly weighed, does not affect national security. It may be very important; but is it more important than the individual's right, and the state's duty, to get at the truth under the well-tried, thoroughly established, and American technique of cross-examination?

There is something extraordinarily repellent about many of these cases, when you take a close look at them. I know of a recent case where a man was discharged because the board believed him to be a homosexual—or that perhaps he was one. The action was based on the opinion of an acquaintance—nothing more. The informant's name was not divulged, but the employee guessed who it was and tried to get him to take the stand. He would not, and there was no way of forcing him to face cross-examination. The government should not be allowed to use that sort of testimony. "Why don't you resign?" an employee was asked at a recent hearing. But he refused, and was reinstated. Again we do not know how many Matusows have lurked in the files, how often informers have been shielded, and under what circumstances.

Association with subversive groups

Although the ultimate standard of decision is in broad terms, and probably should be, certain information, the order suggests, should be developed. As in the former order, association is used—"affiliation or sympathetic association with" any subversive group; and although the Attorney General's list has not officially been used since the listing was held illegal by the Supreme Court, there can be little doubt that if the employee belongs to a group which has been outlawed, this evidence would come under the order and would not improbably be conclusive.

But we do not know. Perhaps my assumptions about informers are mistaken. The reports of the Civil Service Commission, the last one on January 3, 1955, do not give us any basis for making an intelligent appraisal of whether or not these sweeping programs are accomplishing anything. I am not referring to the number of employees dismissed for felonies, misdemeanors, or sex perversion. Presumably these dismissals have always been made, although until the last two years they were not reported in the alluring categories now adopted by the Civil Service Commission. What is important to know is the number of employees who were discharged because, according to the Commission's language, their "files contained information indicating, in varying degrees, subversive activities, subversive associations, or membership in subversive organizations," and the actual grounds of their discharge under this language. Surely employees are discharged not merely because their files contain charges, but because the government believes the charges may be true. Yet it would appear that no real effort is being made to find out, apparently on the theory that if a charge is made sufficient doubt exists. How many were Communists? How many fellow travelers? What organizations? When were they members, and how long, and how long ago—five years ago, ten, fifteen? Have they resigned since then, or was the association terminated without formal resignation? Was it merely some fugitive and half-interested relation when the employee was in college? What are the facts?

Security, I believe, is a better category than disloyalty—"disloyal to the Government of the United States," as President Truman's order put it, without further attempt to suggest what loyalty—or disloyalty—was. Evidently the word was open to misinterpretation, for we find the Loyalty Review Board solemnly announcing that advocacy of change in the form of government or economic system of the United States was not disloyalty. But loyalty cannot be put into words to apply like a measuring stick. No rigid standard can be set up, and, as was to be expected, the test of loyalty varied according to the temperament of the individual who was judging. "Association" tended to become the only objective test of the program. And the ground of association, unless recent and active, throws little light on the standard of loyalty.

Atomic Energy Commission

Few complaints have been heard about clearance in the Atomic Energy Commission. For this there are probably three reasons: the members of its review board have been men of unusual balance and ability; the system is fair; and the standards are dictated by common sense. The original chairman was Justice Owen J. Roberts, of Philadelphia. He was succeeded by Charles Fahy, former Solicitor General of the United States. who retired from private practice when he was appointed to the federal Court of Appeals for the District of Columbia. His successor is Ganson Purcell, a former chairman of the Security and Exchange Commission and a distinguished member of the District bar. All employees and applicants are entitled to a hearing before the board. Informers are called before the board and are not infrequently submitted to cross-examination. The standard, in the words of the Atomic Energy Act, is *"whether the common defense or security will be endangered by granting security clearance."* In the words of the Commission the decision is "an over-all, common-sense judgment, made after consideration of all the relevant information." Politics have never played any part in the organization or operation of the system.

BRITISH SYSTEM

There are two theories about the way to handle the problem of subversives in government. One is to give the reviewing officer or board a very broad discretion, without definitions or minutely spelled-out standards, which, as has been seen, are difficult to state and often mislead rather than control. Such an approach is typical of the British method. It is an *ad hoc* program aimed at eliminating the possibility of sabotage and espionage, under which Communists are transferred out of sensitive positions and to some extent out of sensitive areas. There are few procedural protections, cases are informally handled, sources of information are not revealed. There is an Advisory Board

of three former civil servants, men of standing. The system seems to have worked satisfactorily and fairly. A decision that a particular employee is unfit to fill a specified position carries no moral stigma.

CURRENT NEEDS

But basically the success of the system springs from the British sense of ministerial responsibility. It may be doubtful whether as a program it could be applied to this country, where that habit of political responsibility has not been developed. There can be little question that procedural protections should not be omitted in the United States, but strengthened. The use of a permanent review board is a feature of the Truman program which should be reinstated. The "association" technique should be greatly restricted. As Miss Bontecou says in the conclusion of her study: "The crucial question . . . is not that of membership but of the relationship between the Communists in the group and the person investigated." [5]

The policy and top administration should be in the hands of individuals of standing in their community, not connected with the government and therefore free from political pressure, a pressure which usually takes the form of waving the bloody shirt of Communism over battlefields where the foe has long been conquered in order to show the voters that under no circumstances is the government ever tough enough. On March 10 of this year the Washington *Star* reported: "High Department officials feel that there has been no let-up in the Communists' attempt to infiltrate the Government, labor unions and key industrial plants. They feel . . . that the activities of the Reds have been intensified." Such *feelings* have been reported regularly every year or two for the past ten years, particularly when the loyalty program of whatever administration happens to be in power is being questioned.

Former Senator Cain has made a clear and forceful analysis of the present situation. Speaking to the National Civil Liberties Clearing House on March 18, he said:

> We have grown somehow to consider legal justice to be one thing and administrative justice to be a different sort of thing. Until justice is understood to be indivisible, this Republic of ours will be mired in troubles.[6]

Citizens, he continued, have become bewildered by the contradictions between stated purposes and administrative results of the security program. Political considerations have been the major source of our diminishing confidence in authority since World War II. Twenty million Americans, he estimated, are affected directly or indirectly by security programs. Why should employees be suspended until their status is determined? Surely the national safety would not be imperiled by their retention, *with salary*.

But all this talk is in the field of speculation. My convictions—or yours—will carry little weight if the public has no knowledge of conditions as they are, not as they are said to be by Senators McCarthy and Jenner, and Martin Dies, by Mr. Brownell, by the professional experts, the ex-Communists, and the chairman of the Americanization Committee of the American Legion. Perhaps now there is a chance for the facts to come through. The Fund for the Republic is underwriting an investigation by the bar of the City of New York, and Senator Humphrey's subcommittee on government administration is engaged in a similar enterprise. The press of the country is generally alive to what is going on and will, I am convinced, welcome these efforts and give wide publicity to the result. But investigations and reports, a momentary flash of indignation, are soon forgotten in the flow of our restless indifference. The peril of this nation, as Charles Evans Hughes once said, is not in any foe, but in the people, who are "its power, its peril, and its hope."

[6] Press release, March 18, 1955.

Francis Biddle, LL.B., LL.D., Washington, D. C., is former Attorney General of the United States (1941–45); Solicitor General of the United States (1940); Judge, U. S. Court of Appeals, Third Circuit; deputy chairman, Federal Reserve Bank; chairman of the National Labor Relations Board; and member of the Permanent Court of Arbitration. In 1942 he received the Four Freedoms award and in 1954 was decorated by the Italian government with the Order of Merit. He is the author of The Fear of Freedom (1951), Mr. Justice Holmes (1942), and other works.

Controlling Subversive Groups

By Ernest van den Haag

THE right to forbid incitement to revolution is inherent in the lawful authority which all governments claim. Democratic principle grants this lawful authority to governments which issue from the freely expressed wishes of the majority. In a democracy, therefore, incitement to revolution is unlawful and contrary as well to the substantive principles on which the law rests. Revolution would necessarily defy the wishes of the majority and thus not only the governmental principle of legitimacy but also the democratic principle of popular consent. Because opponents are free to urge the ouster of the government and if they grow into a majority to replace it by a peaceful vote, democratic governments cannot stay in power when opposed by a majority. Hence only groups despairing of persuasion and resolved to conquer power in spite of the wishes of the majority need urge violence. But in a democratic system, governments have the duty to safeguard the effective franchise of both the majority and the minority. Thus, while other governments may have the authority, democratic governments also have the obligation to ban incitement to revolution.

Perhaps the majority is only lukewarm, and democracy though fulfilling their wishes does not satisfy their wants. Santayana is probably right on this. But what government does? At least democracy does not allow the government to decide what the citizens want, by disregarding the wishes they express or forestalling expression. God reads our hearts' desire better than we do. But it is unlikely that governments will. And they might misread their desires into our muted hearts.

That much is settled doctrine. However, only advocacy of violence is barred. At present organized attempts to persuade citizens to bring antidemocratic groups to power by the ballot are lawful. Yet I believe that the pursuit of subversive aims even by peaceful means should be outlawed. The logic of democratic principles leaves no place in our system for parties which propose to abolish democracy even by a peaceful vote.

Even though the facts have sadly disproved his optimism, ritualists will go on quoting Jefferson to the effect that enemies of our system should be left "undisturbed as monuments of the safety with which error of opinion may be tolerated where reason is left free to combat it." Yet in John Stuart Mill's words:

> It is a piece of idle sentimentality that truth merely as truth has an inherent power denied error. . . . Men are not more zealous for truth than they often are for error, and a sufficient application of legal or even of social penalties will generally succeed in stopping the propaganda of either.

Where there are no "penalties" truth may not be suppressed. But there is nothing to bear out Jefferson that it will win. And one would have to share Jefferson's natural-law metaphysics—which strike me as absurd—to share his confidence that the "right" values will always prevail.

Perhaps you think that I am tilting against windmills nevertheless. Antidemocratic groups, you may say, could never hope to sway us peacefully. But Hitler came to power largely by persuasion. And we rightly worried about the outcome of some peaceful postwar

votes in Italy and France. We are not certain that Communism might not win free elections in some parts of Asia now. I submit, then, that the voters of no nation are naturally immune to antidemocratic persuasion—particularly if they suffer from national misfortunes.

Peaceful Antidemocratic Persuasion?

But is there such a thing as peaceful antidemocratic persuasion? As a matter of fact, Communists at least never come to power without using or threatening violence. They argue that they are only readying themselves for the violence they anticipate from the opponents they hope to defeat at the polls.[1] No doubt Communists intend to use violence aggressively while pretending defense. This is indeed logical. Those who feel entitled to stay in power without the consent of the majority surely must be willing to get power by the same violence by which they are prepared to keep it. But, as long as they are weak, Communist groups might well find it expedient not to advocate violence. And their intent to do so in the future does not count legally unless it is manifested in words or other acts which they might well become cautious enough to omit. Hence, the advocacy of violence should remain a sufficient ground for illegality, but not an indispensable ground. Otherwise we cannot forbid antidemocratic organization until it grows strong enough to bid for violence. We might then be too late.

Political violence can be renounced, moreover, only so long as political freedom is exchanged for it. Even if Communists were peaceful, democrats could not peacefully accept defeat by them. Defeat at the polls is acceptable as long as the losers have the implicit assurance of the victors that the game will go on. They can try again; there is always another election. But if Communists were to win, the losers would not be allowed to play again. The rules would be rigged so as to keep the Communists in power regardless of popular wishes, which democrats would no longer be allowed to affect.

Before considering these practical matters further let me show that democratic principles permit us to define and outlaw subversive activities without confining ourselves to advocacy of violence.

Freedom Is Inalienable

However important its nonpolitical effects, as a political system democracy is but the right of citizens to compete freely for a limited governmental power and to award it freely to one of the competing parties. This right is perennial and inalienable. To make it truly inalienable, the power of governments in a democratic system is so restricted that they cannot impair the ability of the citizens to oust them by a peaceful vote. Liberties required for this—freedom of speech, association, and voting—are therefore protected constitutionally and safeguarded by checks and balances.

The fathers of our Constitution were successful in protecting us against a government that might keep itself in power by taking away our rights. Less

[1] Stalin himself, in describing the overthrow of the short-lived democratic government of Russia, implied that this is argued only to deceive the gullible: ". . . the revolution attempted to carry out every, or almost every step of its attack under the appearance of defense. There is no doubt that the refusal to permit the transfer of troops was a serious aggressive act of the revolution; nevertheless this attack was undertaken under the slogan of the defense of Petrograd against a possible attack of the external enemy. There is no doubt that the formation of the revolutionary committee was a still more serious attack against the Provisional Government; nevertheless it was carried out under the slogan of the defense of the Petrograd Soviets against possible attacks of the counterrevolution.—*Errors of Trotskyism* (London, 1925).

attention was paid to the possibility that some citizens might *give away* their democratic birthright and invite others to do so, as large groups abroad have done. Yet if our right to choose the government freely is *inalienable,* then we are not entitled to *give* the right away any more than the government is entitled to *take* it away. We cannot then elect a government that does not recognize the right of the people to oust it peacefully or that denies the necessary civil liberties. Nor, if freedom is to be inalienable, can invitations to alienate it be recognized as a legitimate part of the democratic process.

Voluntary and involuntary servitude

Here I can imagine someone muttering that, basing my argument on the word "inalienable," I have made freedom compulsory: citizens are not to vote on it and no organization may tempt them to get rid of freedom. But the alternative—which would permit the use of our political freedom to abolish it—while seeming to pledge more freedom, actually would ensure less.[2] Laws that do not allow men to deliver themselves voluntarily as slaves guarantee more freedom than laws that allow them to be enticed into slavery. Therefore once we abolished involuntary servitude, we also refused to recognize any right to voluntary slavery or to enticement into it.

But there is more: by installing a government which is to be the irremovable and total master of their fate, those voting to become *voluntary* political slaves would necessarily compel some of their fellows into *involuntary* servitude. They would not only irreversibly mortgage their own future; they would also deprive of political freedom those who want to keep it. Now even if you should feel that your freedom is so absolute that you have a right to alienate it, with what right could you dispose of the freedom of others? You may be entitled to suicide, but not to homicide. Yet unless the decision to abolish political liberty is unanimous, the suicide necessarily would become homicide. Some would be deprived of their birthright—political liberty, which is but another name for democracy—against their wishes.

Democratic heritage

Nor is this all. Any vote by which we abdicate our right to future free election also robs our children of their heritage of freedom. To allow citizens to vote against democracy is to allow them to sell their children into slavery.

We are the beneficiaries of freedoms won in the past. We possess but we do not own this precious heritage. We have a right to use it but not to give it away or to destroy it. We are trustees, not owners; and we cannot give away what is not ours. As custodians of the democratic heritage, we have no more right to use our possession of democracy to give it up and deprive our children of it than any occupant of the White House has to sell it or to give it away.

Our heritage permits us forever to elect and to replace governments as we see fit. Our fiduciary duty requires us to keep this sacred trust intact for our children, to protect it against those who want to rob us of it by violence, as well as against those who want to seduce us to give it away. It is not ours to give. Hence, we have no business voting it away and no one has any business trying to corrupt us into doing so. We ought not to permit advocacy of the ballot to extinguish democracy any more than we can allow advocacy of resort to violence. For the end, the surrender of power to a group which would not recognize the right of our children to oust it, is vicious in itself regardless of the means used. And the means are tainted by the vice of the illicit end. To advocate violence to overthrow a democratic government is to propose illegal means for an illegal end. To advocate a vote to overthrow democracy is to advocate an illegal end to be achieved by means that lose their legitimate character to the extent to which they are used for that end.

[2] Compare John Stuart Mill, "The principle of freedom cannot require that he should be free not to be free. It is not freedom to be allowed to alienate his freedom." Ralph Gilbert Ross in his penetrating and far-reaching "Democracy and Politics" (*Ethics,* January 1954) expresses similar ideas.

RISKS OF INTERDICTING SUBVERSIVE PROPAGANDA

But would it not be unwise to bar invitations to abolish democracy by a vote? Prohibitions, however well justified in principle, might not have the wanted effects or might produce injurious ones. Prudence enjoins us to make laws only when desirable effects seem likely to preponderate. What then can we hope to accomplish here and what evils are likely to attend the interdiction of organized subversive propaganda? Let me consider first the harmful possibilities which have hypnotized many nervous though well-meaning friends of democracy.

It is earnestly feared that free speech would be destroyed if invitations to destroy free speech—to surrender democracy—were disallowed. But could a law to preserve democratic freedom not be so drafted and interpreted that it does not defeat its purpose? Is it actually impossible to separate freedom of speech, which is to be protected, from organized propaganda against it, which is to be barred? We discuss and study quite freely many things now for which the law does not allow organized propaganda. We are free to discuss and study all crimes though none can be advocated. Why should our judiciary be unable, then, to apply a prohibition of propaganda against democracy without invading studies and free discussions of democratic and antidemocratic systems and ideas? Many of our institutions such as the universities and even the courts themselves rest on the conviction that expression of opinion, logical analysis, and fact finding can be separated from organized propaganda. If there were no difference between criminology and propaganda for crime, political science and advocacy of political systems, or if judges and teachers could not discern those differences, how could universities, how could any institution, offer courses and conduct discussions dealing with the numberless perversions of the human mind?

Actually we have always drawn a line between propaganda and discussion. The courts have always distinguished literary, scholarly, or conversational discussion, even personal advocacy, from organized propaganda and organized advocacy of illegal acts. Of course, we cannot forbid a man to think as a Communist or even to persuade his friends to Communist views. However, the courts have already held that he is not allowed to associate with others to prepare for or to advocate violence. We can as well forbid *organized* propaganda to abolish democracy by vote and the organization of groups and parties devoted thereto. The courts even decide whether a man alienates from another the affections of a woman—without noticeably impairing free discussion between the sexes. Surely then the courts can, without impairing freedom, decide whether an organized group, in concert, deliberately alienates the affections of the citizens from democracy.

The meaning of "antidemocratic" is hardly open to doubt. For instance, propaganda for socialism is not antidemocratic as long as the changes are to be accomplished through a free vote

and as long as the Socialist government does not propose to eliminate that free vote in the future. Nor would propaganda to change the manner of voting or restrict the franchise (for instance by increasing the voting age to twenty-three or by denying the vote to women) be antidemocratic. (An age or sex group is not a political group. However, income or occupational groups could probably not be disenfranchised without impairing democracy.) On the other hand, agitation to bar a democratic political group from voting, directly or indirectly, or to restrict freedom of political speech, other than antidemocratic propaganda, would become illegal.

The legal prohibition of subversive organization is far from unprecendented in democracies. I have not heard any liberals object to the German law prohibiting the organization of a Nazi party or to the Italian law prohibiting the organization of a Fascist party.[3] I do not know how effective these laws are. But nobody has contended that they interfere with freedom of discussion in these countries, nor have they impaired democracy there. Why should a law prohibiting both Communist *and* Nazi activities be more harmful? Because it would be more consistent? Or because it would guard against present and future as well as past dangers?

[3] Some liberals who at home ceaselessly assured us that such laws are incompatible with democracy promoted them abroad. Though freedom from consistency was never listed among our war aims, they must have won it.

Many liberals also supported the Nuremberg procedures by which branches of the Nazi storm troopers became criminal associations *ex post*, and men were found guilty of crime for acts which, however loathsome, were not illegal when committed. Granted the depravity of these acts, does it justify retroactive law fashioned by the victors and applied to the vanquished?

Some courageous and clearheaded liberals (and conservatives) objected. But most, undoubtedly, supported these "trials." Willing to punish Nazi activities as criminal retroactively, they insist that it would not be "due process" to outlaw Communist activities *ex ante* and to punish those who violate the prohibition after it has become law. Scarcely would the fathers of our Constitution recognize as legitimate offspring these products of miscegenation between vacillating lovers of liberty and errant social workers.

After Communism, liberalism?

Some liberals sincerely fear that if Communist propaganda were prohibited, their own activities might come next. Actually liberalism is as far removed from Communism as one political philosophy can be removed from another. Yet they fear that people might not distinguish. The psychology of that fear has a dreary fascination. A political psychoanalyst might translate the anguished lament of some liberal patient's subconscious about as follows:

> Half the fun of being a liberal was going out on dates with Communists. Of course, I didn't go all the way. Only debauched people, who *went* all the way—and came back—see anything obscene or dangerous in my flirtations. People who say I should discriminate just don't realize that I'd have no one left to be unafraid and broadminded with.

Or the patient's subconscious, being notoriously inconsistent, might splutter:

> I never could tell fellow liberals from fellow travelers and Communists. If I couldn't, it proves that no one else can. It is impossible, therefore, to distinguish Communists from liberals. They're out to get me!

Is this a correct psychological interpretation? It might hold for some and not for others. But we must restore the liberal subconscious to the fretfully waiting psychoanalyst, from whom we borrowed it.

The political effects of the liberal anxiety are not open to doubt. No greater disservice could be rendered the liberal cause than to suggest that liberalism is so hazy a matter that it is difficult to distinguish from Communism. Liberals who pretend that liberalism is nebulous, for the sake of denying that their mind was, who insist that the world is a dark place instead of admitting that they kept their eyes closed—such liberals either endow the world with their own confusion or deliberately sacrifice liberalism to their belief in their own infallibility. The original mistakes were venial, even engaging. For the perversely obdurate clinging to them I find no excuse. The worst enemy of liberalism could not damage that splendid and humanitarian cause as much. Compare the attitude I have described with that of the labor unions, which at one time also were blind to the danger of Communism, the very unions which, according to some liberals, are the "real target" of anti-Communist legislation. They opened their eyes, corrected their mistakes, and saw that it is possible to keep freedom in and Communism out. Indeed, one cannot have both.

Abuse of laws

Some of us dread that laws against antidemocratic propaganda might be abused to punish persons with unpopular ideas who either are not antidemocratic or do not engage in propaganda. Laws, indeed, can be abused. We have executed innocent men for homicide. Shall we then have none? Laws to bar subversive activities need not be less clear nor the court proceedings less careful than in homicide cases. The evil to be remedied, the danger to society, seem no less, while the chance of abuse is not intrinsically greater.

Public hysteria

Perhaps your fears fasten on the word "intrinsically." Yes, you might say, but what about popular hysteria and pressure? I am not proposing to have the law drawn or applied by Senators Humphrey and McCarthy. I am discussing a competently drawn law, applied by the judiciary. Nothing would reduce hysteria more than such a law. For hysteria, and hysterical fear of hysteria, come when people feel that the right laws are not on the books or are not applied.

McCarthy rode a wave of popular discontent. Some "liberals" who are certain that Communism in faraway China was caused by popular discontent do not like to think that McCarthy's quondam popularity was. Yet McCarthy, unlike the Chinese Communists, had no arms except his own unscrupulousness and the feeling of many people that the government could not tell a Communist from a liberal. The anxiety he so recklessly exploited was generated when people realized the dire threat to our institutions while ritualistic liberals simply denied it and hid their failure to take preventive measures by calling Communists red herrings or witches. They pretended or believed that Communists are like liberals. And they became hysterical when McCarthy pretended or believed that liberals are like Communists.[4]

[4] In *The Fear of Freedom* (Garden City, N. Y.: Doubleday & Company, 1951), Mr. Francis Biddle wrote: ". . . I do not believe that their attempt [that of Communist government employees] to spread Marxian dialectic among the balance [of government employees] constitutes a serious threat to the government of the U. S. . . ." (p. 241). If we still had an Attorney General who believed that Communist employees are engaged in spreading "Marxian dialectic," it would indeed be "a serious threat to the government of the U. S." The trained incapacity of leading liberals to understand that Communists are engaged in a business very different from "spreading Marxian dialectics" explains McCarthy more than any other single factor, though, of course, it does not justify him.

BENEFITS OF PROSCRIPTION

If subversive organizations were prohibited even the most confused might learn to distinguish between the study of dialectics and membership in a group organized for the abolition of democracy. The law would serve as a beacon. And the clear statement and application of democratic principles would also abate hysteria. Finally, we would set an example abroad and help dispel genuine misunderstandings of our domestic policies, which have arisen mainly because we were vague and inconsistent.

Proscription of organized subversive propaganda would yield other benefits still. We are not free of blame for the fate of the Rosenbergs, of Greenglass, of Alger Hiss, of Whittaker Chambers. These victims of Communism, with many others, were lured into their final criminal activity by Russian agents. If we are to have law, responsibility must be personal. I am not trying to exonerate these people. But society did little to warn them. The United States government for the most part treated Communists as a group playfully engaged in Marxian dialectics. Are we not in duty bound to do our utmost to prevent Russian agents from enticing misguided persons into their nets? Must we not erect warning signs and rails shielding the incautious? Society must control Communist groups just as it must control rings of dope peddlers. And such controls need not interfere with the study or discussion of the opiates pushed by either group. If we do not make a reasonable effort to prevent crime we jeopardize our moral right to punish those we did not try to keep from being lured into it.

Significance of party membership

I need not take much time to show the gravity of the evil which confronts us. A few quotations suffice. The antidemocratic aim of Communism was stated admirably by William Z. Foster, chairman of the American Communist party: a dictatorship in which "all the capitalist parties—Republican, Democratic, Progressive, Socialist—will be liquidated, the Communist party functioning alone." [5] It is a universal Communist aim, already achieved wherever the Communists are in power. The facts are too plain to need rehearsing. The means to be used were stated quite plainly by Lenin when he told a delegation of foreign workers that when it serves the interests of the movement, they must resort to "any ruse, cunning, unlawful method, evasion and concealment of truth." [6]

The sad facts recorded by our courts prove that Lenin's advice was not taken to be a counsel of perfection. The commitment of American party members to live up to Communist precepts was stated lucidly by their chairman: "Care should be taken to select only those individuals who show by practical work that they definitely understand . . . and especially display a thorough readiness to accept party discipline." [7] The record shows that party members were sedulous. They could not otherwise remain in the party, as the following dialogue before the congressional Committee on Un-American Activities indicates:

MR. MATTHEWS: A member must carry out all decisions of the party or be expelled from the party?

MR. BROWDER: Yes, that is correct.

MR. STARNES: A party member does not have any latitude or discretion in the matter—he has to carry out orders?

MR. BROWDER: The party member has to carry out orders.[8]

Clear and present danger

Still, you might think that Communists are few and therefore the danger recondite. This is an odd idea. If there are only a few people engaged in dishonest activities, should we not control them? Should we wait until there are more? Yet dishonesty is less infectious and less dangerous than Communism. For the Communists here are but one of the long arms of the Moscow octopus. It is a mistake to judge the peril from the size of one tentacle. Trials here, in Canada, and in England have left no doubt of the usefulness of these very few Communists to their Russian masters, whose main target now is the United States. Of course not all American Communists are spies. In the first place, they do not all have access to secrets and, in the second place, some are more useful as decoys and as more or less conscious spy procurers. All the more reason to eliminate organizations which are breeding grounds for spies. We close houses of prostitution even if the defense shows that the chambermaids engaged only in limited tasks.

Some of you, though satisfied that the danger is clear, may still wonder whether it is "present." The interpretation of the majority of the Supreme Court in the Dennis case [9] was that Mr. Justice Holmes's "present" did no more than reiterate his "clear." [10] The court rejected as absurd the contention that preparation for the overthrow of the government must have been likely to succeed if the danger is to be "present." For obviously the government could then act only when it might well be too late. The court also avoided interpreting "present" to mean "imminent," though I suspect that Holmes might well have had in mind the proximity of the danger. If so, I should agree with Mr. Justice Jackson's concurring opinion in the Dennis case: We should abandon the Holmes formula. If you are trying to kill your wife by feeding her poison it does not matter whether it is to be effective in an hour or in a year. How near death you brought her, or how fast, might influence the size of the penalty but is irrelevant to the criminality of the action. What matters is only that your attempt involved a *clear* danger. There can be no doubt that Communist activities do.

[9] 1951.

[10] In the Schenck case (1919).

GOVERNMENT EMPLOYEES

If the government need not tolerate subversive activities it surely need not keep subversive employees. Only questions of procedure can arise here.[11]

Some insist that the government, before dismissing an employee, must furnish proof of wrongdoing and act as a trial court would. I see no merit in this contention. Dismissal from government service is not punishment, even though it might involve a loss, just as dismissal from private employment might. An employee need not be guilty of anything to be discharged and surely not of any legally incriminating thing, nor need anything be proved. Nobody has a right to government employment. Mr. Justice Holmes pointed that out when sitting on the Massachusetts bench. Civil service regulations only

[11] A comprehensive and lucid discussion of the whole subject of subversion may be found in Sidney Hook's *Heresy Yes—Conspiracy No* (New York: John Day Company, 1953). I have learned a great deal from it, though, of course, Professor Hook is responsible only for what he taught. And I know that he does not share my views on many of the topics here discussed.

specify privileges which can be withdrawn. They exist not so much for the benefit of employees as to guard the government against hiring of incompetents and capricious firings not motivated by public interest. Except for the judiciary, the government retains the right to judge the fitness of its employees and to fire on grounds it deems relevant at least as much as a private enterprise. Surely the government has more reason to insist that its employees be loyal and competent.

No one, of course, believes that the government has always acted wisely in this matter. No doubt in trying to rid itself of undesirable, inept, disloyal, or doubtful personnel, the government lost the services of some loyal and competent persons. Perhaps matters will improve once a clear line is drawn between subversive activities and democratic rights. Those who complain should remember that we are confronted with an urgent, immense, and important task for which nothing in our history has prepared us. We can all fill books with anecdotes about foolish investigators. I reserve my respect for those who sincerely try to help the government to do better.[12]

PROFESSORS

What I have said about government employment [13] requires modification for professors vested with academic freedom in forming and professing their views. Academic freedom imposes an obligation to keep the independence it protects. Yet some think it is a license to surrender it! They became members of the Communist party and thus committed to "at all times take a position on every question that is in line with the policies of the party." [14] A professor who thus commits himself gives up his academic freedom and therefore forfeits his office. He has no more right to it than a monk has to his place in the monastery if he gets married. The university need not prove that he really consummated the marriage and fulfilled his pledge to "skillfully inject Marxism-Leninism . . . at the least risk of exposure." [15] For this would be irrelevant. The commitment itself is incompatible with academic freedom and is a sufficient ground for dismissal not, of course, because the professor associates with Communists but because he is committed to them and associated with them for the accomplishment of the objectionable common purpose. Ignorance of the true nature of his commitment might prove his innocence of Communism but it would also prove him guilty of irresponsibility, culpable neglect, or stupidity. A certain measure of these vices must be tolerated if we are not to decimate our ranks. But ignorance of the nature of such major commitments goes too far for one who is to dispel ignorance and teach responsible behavior.

Fifth Amendment

Finally, what about those merely suspected of not being true to their commitment to academic freedom? I think we must investigate such charges as carefully as we might investigate charges of incompetence or immorality. It is the professor's duty to co-operate with constituted authorities in this investigation. He has the same right as any other citizen not to incriminate himself by his own testimony. No court may take the use of this right as a confession of guilt. On the other hand, any citizen may draw inferences from the exercise of the constitutional privilege. The Fifth Amendment never was intended to offer immunity against nonjudicial inferences. Surely universities or school boards would be remiss in their duty if they kept a teacher who refused to tell whether he habitually corrupted his charges. He has a right to refuse. And the school board has a duty to fire him if he does.

A professor's status cannot rest merely on the inability of authorities to prove any past wrongdoing. That is enough to keep him out of jail. But to keep himself in office he must co-operate in reasonable inquiries into his continued fitness and his freedom from commitments contrary to his profession. A man unwilling to profess such freedom from bondage cannot be a professor. And his fear of incriminating himself would surely interfere with his teaching.[16]

Undeniably, the zeal of persons outside the academic world was often misguided. But so was the inertia of the faculties and their exclusive devotion to alibis for it. This smug inaction is largely responsible for the outside pressure we so volubly decry. Behind it, probably, is the confusion of liberty with its surrender and the cloudy liberalism I have already described. The best we can say for educators here is that they have not added much to it.[17] They share in our common vices without claiming more than their due portion. Only because they are more articulate do they seem to be ahead.

[12] Though the government has a right to fire on suspicion of incompetence, disloyalty, alcoholism, or what not, it ought to *label* bottles only when it is quite sure of the contents.

[13] The judiciary is, of course, in a very special noncontroversial position.

[14] Resolution of the Ninth Convention of the Communist party, U.S.A., 1936.

[15] *The Communist,* May 1937.

[16] One who without such a fear invokes the Fifth Amendment perjures himself. (Witnesses, of course, cannot stand mute for fear of being accused of false testimony in the proceedings in which they are testifying. Otherwise no witness ever would have to testify.)

[17] A case in point is the refusal of some professors at the University of California to swear an anti-Communist oath which the trustees foolishly wanted to impose. (Foolishly, because it would be of no use; misleadingly, too, because it gives the impression of solving a problem which the oath—rendered or refused—would leave unchanged.) They won in the courts because the California constitution enjoins that no oath be demanded as a condition of public employment, other than that of fealty to the Constitution. But I cannot see why the professors should have minded the oath. They were not Communists and said so. Because they were singled out? I should think such selection merely recognizes the importance of the teaching profession. Perhaps they had reasons of a more local nature than I cannot see from here. But the defense usually made of their action leads me to admire their courage more than their wisdom.

Ernest van den Haag, Ph.D., New York City, is an adjunct associate professor of social philosophy in New York University and a lecturer at the New School for Social Research. He was formerly on the faculty of Hofstra and Queens Colleges and the College of the City of New York; economist, the Econometric Institute; and propaganda analyst control editor, Office of War Information. He is the author of Education as an Industry (1955) and a forthcoming work on Contemporary Society.

The Meaning and Significance of Academic Freedom

By Robert M. Hutchins

THE arguments for academic freedom are the same as those for freedom of speech, and they rest on the same foundation. Here are the familiar words of John Stuart Mill:

> If all mankind minus one were of one opinion, and only one person were of the contrary opinion, mankind would be no more justified in silencing that one person, than he, if he had the power, would be justified in silencing mankind. . . . the peculiar evil of silencing the expression of an opinion is, that it is robbing the human race; posterity as well as the existing generation; those who dissent from the opinion, still more than those who hold it. If the opinion is right, they are deprived of the opportunity of exchanging error for truth: if wrong, they lose, what is almost as great a benefit, the clearer perception and livelier impression of truth, produced by its collision with error.[1]

Man is a learning animal. The state is an association the primary aim of which is the virtue and intelligence of the people. Men learn by discussion, through the clash of opinion. The best and most progressive society is that in which expression is freest. Mill said, "There ought to exist the fullest liberty of professing and discussing, as a matter of ethical conviction, any doctrine, however immoral it may be considered." The civilization we seek is the civilization of the dialogue, the civilization of the logos.

In such a society the intelligent man and the good citizen are identical. The educational system does not aim at indoctrination in accepted values but at the improvement of society through the production of the intelligent man and the good citizen. Education necessarily involves the critical examination of conflicting points of view; it cannot flourish in the absence of free inquiry and discussion.

In a democracy what the public needs to know about the teachers in the educational system is that they are competent. The competent teacher knows the subject he is teaching and how to communicate it to his pupils. Unlike the teacher in a totalitarian state, he is not supposed to purvey the prevailing dogma. He is supposed to encourage his students to use their own intelligence and to reach their own conclusions.

The definition of competence does not shift with every wind of prejudice, religious, political, racial, or economic. If competence had been the issue at Brown University during the free silver controversy, the President would not have been asked to resign because of his premature distaste for the Gold Standard. The modern note was struck there. What was requested of the President was "not a renunciation of his views, but a forbearance to promulgate them." And the reason was that these views were "injurious to the pecuniary interests of the University." On the other hand, the standard of competence did protect a professor at the University of Chicago who was a leading critic of Samuel Insull and the other local oligarchs of the time. He was doubtless injurious to the pecuniary interests of the university, but he and it lived through it, and he is today the senior Senator from Illinois.

Wrong Questions

We have been stifling education in this country because we have been asking the wrong questions. If you are asking the right questions, you ask about a subject of discussion whether it is important. You do not forbid students to discuss a subject, like the entry of Red China into the United Nations, on the ground that it is too important. The right question about a subject of research and the methods of investigation is whether competent scholars believe that the subject should be investigated and that this is the way to investigate it. You do not permit the Post Office Department to protect the Johns Hopkins School of Advanced International Studies from *Izvestia* and *Pravda*. The right question about a textbook is whether competent people think it can make a contribution to education. You do not ask whether incompetent people are going to be offended by passages taken out of context. The right question about a research man on unclassified work is whether he is competent to do it. You do not act like the United States Public Health Service and weaken the country by withdrawing contracts from research workers on unstated grounds that can only be grounds of loyalty.

As I have said, the right question about a teacher is whether he is competent. If we had been asking about competence we should have had quite a different atmosphere in the case of teachers who were Communists or ex-Communists, who refused to testify about themselves, or who declined to discuss the political affiliations of others. We have been so busy being sophisticated anti-Communists, detecting the shifts and devices of Communist infiltration, that we have failed to observe that our educational responsibility is to have a good educational system. We do not discharge that responsibility by invading civil liberties, reducing the number of qualified teachers available, eliminating good textbooks, and intimidating the teaching staff. The standard of competence means that there must be some relation between the charges against a teacher and the quality of his teaching. The standard of competence would have protected us against teachers following a party line or conducting propaganda. If a teacher sought to indoctrinate his pupils, which is the only circumstance under which he could be dangerous as a teacher, he would be incompetent, and should be removed as such. The standard of competence would have saved us from the excesses of the silly season, such as the refusal of the University of Washington to let Professor Oppenheimer lecture there on physics, and from the consequences of concentrating on the negative task of preventing one particular unpopular variety of infiltration. If we had used the standard of competence we should have been free to fix our minds on the positive responsibility of building an educational system, and with half the energy we have put into being scared to death we might have built a great one.

Since our guilty conscience tells us that there ought to be some connection between what a man does and the punishment visited upon him, we often try to pretend that this is the rule we are following. The Attorney General of the United States, speaking in New York three weeks ago, said that schools should not be sanctuaries or proving grounds "for subversives shaping the minds of innocent children."

This picture of subversives shaping the minds of innocent children has nothing to do with the case. The teachers who have lost their jobs in the campaign against subversives have not been

charged with doing anything to the minds of any children. The case of Goldie Watson here in Philadelphia is typical: testimony about the good she had done the minds of the children in her classes was rejected as impertinent. The only evidence allowed was as to whether she had declined to answer questions about her political affiliations. She had, and she was fired. The same procedure seems to be followed everywhere, even at Harvard. When a professor there is called on the carpet, the issue is whether he is a member of something or other, or whether he has lied or refused to answer questions about such membership. The matter of his competence in his field or what he has done to the innocent minds of the Harvard students is never referred to.

FEAR OF IDEAS

We are getting so afraid of ideas that we are afraid of people who associate with people who are said to have ideas, even if they themselves have not expressed them. The State Curriculum Commission of California is now studying investigators' reports on the authors of twenty-three textbooks. Dr. C. C. Trillingham, Los Angeles County Superintendent of Schools and a member of the commission, said, "If an author is aligned with the Communists, we don't want his textbook, even if there is no Red propaganda in it."

We regard what a man says as irrelevant in determining whether we will listen to him. What a man does in his job is irrelevant in determining whether he should continue in it. This amounts to a decision that people whose ideas or whose associates' ideas we regard as dangerous cannot be permitted to earn a living or to make a contribution in any capacity to the well-being of the community. The Supreme Court of California has just taken this logical next step: it has held, in effect, that a Communist can have no contractual rights that the rest of us are bound to respect.

Not long ago at a dinner of the senior members of the faculty of the University of Birmingham in England, I sat across the table from a professor who is a member of the executive committee of the Communist party of Great Britain. The British appear to be getting value out of a scholar whom none of the great American universities could appoint.

FIFTH AMENDMENT

One of the more important advances in law and government effected by the struggles of our ancestors is that proclaimed by the Fifth Amendment. Why should the government demand that a man convict himself out of his own mouth instead of requiring the prosecution to make the effort to establish the charges that it has brought against him? All the Fifth Amendment means is: prove it. Injury is added to insult if there is no pretence that the questions asked must be relevant or proper. In some public school systems refusal to answer any questions by the Board of Education or any other public body is insubordination; insubordination justifies dismissal.

Surely the issue is whether the questions are legitimate. It cannot be insubordination to refuse to answer illegitimate questions. We have gone very far under the influence of one of the rollicking dicta of Mr. Justice Holmes, that there is no constitutional right to be a policeman; but not so far that public employment can be denied on a ground that has nothing to do with the duties to be performed. If the President were to refuse to employ bald-headed men in the federal establishment, the Supreme Court would find, I believe, that the bald had been deprived of their constitutional rights.

IS IT TOO LATE?

You may say that the issue I am discussing is academic in every sense: there is no use now in talking about the right of Communists, ex-Communists, or persons who decline to answer questions about their political affiliations to teach in the United States. Milton Mayer in his forthcoming book, *They Thought They Were Free,* tells the story of the way history passed Martin Niemoeller by. When the Nazis attacked the Communists, he was a little uneasy, but he was not a Communist, and he did nothing. When they attacked the Socialists, he was uneasy, but he was not a Socialist, and he did nothing. They went after the schools, the press, and the Jews, but he was not directly affected, and he did nothing. Then they attacked the Church. Pastor Niemoeller was a churchman. He tried to do something, but it was too late.

I hope it is not too late to point out where our preoccupation with public relations and our failure of courage and intelligence may take us. The *New York Times* on March 17 and the New York *Herald Tribune* on March 19 published editorials on the question whether teachers who decline to testify about others should be dismissed. The significant thing about the editorials is this: they both, perhaps unconsciously, extend the limits of the prevailing boycott. The *Times* condemns "adherence to Communist doctrine," thus adding theoretical Marxists to those automatically disqualified. The *Herald Tribune* comes out against Communists "or any other brands of subversives," thus opening vast new unmapped areas of investigation, recrimination, and confusion.

REECE COMMITTEE

These two newspapers bitterly attacked the Reece committee, appointed in the House to investigate foundations; but they appear to have succumbed to its influence, which is another evidence that if you say something outrageous authoritatively, loudly, and often enough you will eventually find yourself quoted in the most respectable places. The Reece committee includes among the subversives almost anybody who differs with the two members of the committee who constitute the majority. Zechariah Chafee, Jr., said at the University of Oregon last October, "The word 'subversive' has no precise definition in American law. It is as vague as 'heretical' was in the medieval trials which sent men to the stake." Leading the list of Reece committee subversives are those who do not share its philosophical prejudices. The committee condemned a philosophical doctrine, empiricism, and those who hold it as the fountainhead of the subversive tendencies now engulfing the country. If a philosophical position can be treasonable, particularly one as harmless as a preference for fact over theory, and if two politicians can make it treasonable, freedom of thought, discussion, and teaching may not be with us long.

By repetition the Reece committee is obtaining unconscious acceptance of another proposition, which, coupled with the proposition that politicians may declare a doctrine and its adherents subversive, still further imperils freedom of teaching and inquiry. This is the proposition that tax-exempt money is public money and that a tax-exempt institution is therefore subject to a special variety of public surveillance. An extension of this proposition is found in the California statute requiring all claimants of tax exemption to take a nondisloyalty oath. If carried to the logical limits hinted at in the Reece Report, this notion of the public control of private, tax-exempt corporations could deprive the independent educational in-

stitutions of this country of their autonomy, that characteristic which has given them their value in the development of the American educational system.

Tax exemption is conferred for the purpose of facilitating the performance of a public task by a private agency. A corporation that carries on education and research to that extent relieves the taxpayers of their obligation to finance such work in state-supported institutions. Tax exemption imposes no duty on colleges and universities except that of conducting teaching and research according to their best judgment of what good teaching and research are. It does not impose the duty of making sure that the teaching and research conform to the views of the majority of a legislative committee.

CALIFORNIA SENATE COMMITTEE ON UN-AMERICAN ACTIVITIES

Consider what those views might be. Richard E. Combs, Chief Counsel for the California Senate Committee on Un-American Activities, testified two years ago before a subcommittee of the United States Senate. He gave an account of how Communists reorient courses of instruction. He thought it worth while to report that the name of a course at a California university had been changed from public speaking to speech, and the books had been changed from Robert Louis Stevenson, Masefield, and Kipling to John Stuart Mill. The subversive nature of these changes may not be clear to you, but it was clear to Mr. Combs and, from all that appears, to the California committee that employs him and the committee of the United States Senate before which he testified. The appraisal of courses of study or of the performance of teachers is a professional job, not to be undertaken by the naïve and unskilled.

Consider the role of the California Senate Committee on Un-American Activities in the administration of California institutions of higher learning. The committee claims that a chain of security officers on campuses has been welded by its efforts. If its claims are correct—and they have been disputed —professors and students at eleven institutions are being continuously spied upon for the benefit of a legislative committee. The committee has an arrangement whereby it passes on the qualifications of members and prospective members of the faculties from the standpoint of their Americanism. The reason for this is said to be that the colleges and universities are not competent to assess the Americanism of their teachers, and the committee is. According to the committee at least a hundred members of these faculties have been forced to resign and at least one hundred prospective members have failed of appointment because of the committee's work. It is too bad that the committee has not disclosed the information that led to the interdiction of its victims. One shudders to think that it may have been enough to have been heard quoting John Stuart Mill.

BEHIND ACADEMIC FREEDOM

But the issue of legal control is not basic. Academic freedom comes and goes because of some conviction about the purpose of education on the part of those who make the decisions in society. The Kaiser gave professors freedom of research because he believed that this was one way to make Germany strong and prosperous. This freedom did not extend to professors who wanted to engage actively in politics on the wrong side, the side of the Social Democratic party. The Kaiser did not set a high value on independent criticism.

In a democratic community the question is what do the people think education is and what do they think it is for? I once asked a former Minister of Education of the Netherlands what would have happened if he had exercised his undoubted legal authority and appointed professors of whom the faculties of the Dutch universities did not approve. He said, "My government would have fallen." He meant that the people of Holland would not tolerate political interference with the universities: they understood the universities well enough to recognize interference when they saw it and felt strongly enough about it to make their wishes effective.

The public officers and businessmen who are the trustees of the provincial universities in the United Kingdom have legal control over them, but would never think of exercising it in any matter affecting education and research. They limit themselves to business. The taxpayers now meet more than half the cost of Oxford and Cambridge, but no Englishman supposes that this entitles the government to exert any influence in their academic affairs.

If the people believe that independent thought and criticism are essential to the progress of society, if they think that universities are centers of such criticism and that the rest of the educational system is intended primarily to prepare the citizen to think for himself, then academic freedom will not be a problem, it will be a fact. Under these circumstances teachers would not be second-class citizens, subject to limitations of expression and behavior that show the public thinks the teacher of today is the nursemaid of yesterday. A teacher would be appointed because he was capable of independent thought and criticism and because he could help the rising generation learn to think for itself. He would be removed only if those who appointed him proved to be mistaken in these matters. The proof of their error would have to be made to persons who could understand the issue —an out-of-hand administrative removal approved by a board of laymen without participation by academic experts is a denial of academic freedom.

ACADEMIC RESPONSIBILITY

The people of this country think that education is a perfectly splendid thing and have not the faintest idea of what it is about. The reason that they are in this condition is that educators have had no time and little inclination to explain. After all, the great desideratum of American education in the last thirty-five years has been money. If you want money, you do not talk about independent thought and criticism; you do not engage in it too obtrusively; you may even suppress it if it becomes too flagrant. To get money you must be popular. "He thinks too much" is a classical reference to an unpopular man. Or as a great industrialist once remarked to a friend of mine, "You are either a Communist or a thinker."

I have no doubt that much of the trouble of recent years about academic freedom has been the result of the cold war and our panic about it. As Professor Chafee has said, "Freedom of speech belongs to a people which is free from fear." But the basic issue is public understanding. If public understanding had been serious and complete, the cold war could not have thrown us off our balance.

I do not deny that many eloquent statements of the purpose of American education have been made. They cannot offset the impression created by the official propaganda of educational institutions, by their fatuous efforts to please everybody, and by their emphasis on the nonintellectual and even anti-intellectual activities associated with education in this country. Freedom of teaching

and research will not survive unless the people understand why it should. They will not understand if there is no relation between the freedom that is claimed and the purpose it is supposed to serve. If the teacher of today is the nursemaid of yesterday, he does not need academic freedom—at least the nursemaid never did.

Academic freedom is indispensable to the high calling of the academic profession. If the profession is true to the calling, it will deserve the freedom, and it will get it.

Robert M. Hutchins, LL.B., LL.D., Pasadena, California, is president of the Fund for the Republic. He was formerly chancellor of the University of Chicago (1945–51), after having been its president from 1929 to 1945; acting dean and dean of the Yale Law School (1927–29); and secretary of Yale University (1923–27). Among other works, he is the author of Education for Freedom (1943), Morals, Religion, and Higher Education (1950), The Democratic Dilemma (1951), and The Great Conversation (1951).

The Dismissal of Fifth Amendment Professors

By HAROLD TAYLOR

I SHOULD like to speak about the dismissal of professors in general before dealing with Fifth Amendment professors in particular. A Fifth Amendment professor is simply a professor with a special problem, and he has to be considered first of all as a professor. Dismissing professors is a serious and complicated affair, not to be carried on by the unenlightened. The complications run not just into matters of tenure rules and academic policies, but into psychological and social effects on the people not dismissed, on people outside the universities who read about dismissals and make up their minds about intellectuals and universities on the basis of what they read, on students who learn to take their attitudes to politics, to education, and to life by seeing what happens to dismissed and nondismissed professors.

There are other complications. For example, there is the nonreappointment of instructors and assistant professors, which may be another name for dismissal. There is the simple, straightforward nonpromotion. But the most complicated of all is the nonappointment of teachers. In some cases nonappointment may be the equivalent of immediate dismissal just before hiring; it might be called the doctrine of premature dismissal. The doctrine is applied in the case of professors who have been attacked, called before committees, threatened, publicized; who have expressed a liberal viewpoint; or who have otherwise become politically vulnerable.

As we all know, there are very few valid reasons for dismissing professors —incompetence, dishonesty, physical or mental incapacity, conviction of a felony involving moral turpitude (which is a name for personal habits which are disgusting and incurable and which are at the same time publicly known). To allow other reasons than these would be to put the professor at the mercy of the whims of individuals and of groups, both inside and outside the university. In consequence, once a man has received tenure, the tenure rules and the academic policies of the university community are usually strong enough to sustain him in his post indefinitely, no matter what level of achievement he may subsequently reach as a teacher or as a thinker.

There is no reason to change these rules of tenure or the academic policy of universities in the case of professors who invoke the Fifth Amendment before a committee of Congress. The man who in every respect has shown himself to be worthy of his post over a long period of time does not suddenly become a different person because of his refusal to answer political questions in public.

EDUCATIONAL RIGHTS AND RESPONSIBILITIES

When the teacher says in public that an answer to questions about political affiliation or association with the Communist party might tend to incriminate him, he certainly does arouse fears and indignation among members of boards of trustees and educators, negative comment in the general public, and anxiety among faculty members and students. But the criteria by which his continued membership in a university faculty must be judged are his worth as a scholar and a teacher, and his integrity and honesty as a member of the academic commu-

nity. Inferences and judgments made by those who are unfamiliar with his personal, intellectual, and moral qualities, and who know him only through his public refusal to talk about his political affiliations and opinions, are not relevant to a determination of his fitness to teach. There has been a predominant tendency on the part of university administrators and board members to desert the regular procedures of determining fitness to teach just when they need most to be applied—that is, when a man is under fire by a congressional committee. The tendency was given official status by the Association of American Universities not long ago in their statement entitled "The Rights and Responsibilities of Universities and Their Faculties." It turned out that the universities had most of the rights and the faculties most of the responsibilities. The statement reads in part:

> Legislative bodies from time to time may scrutinize [the universities'] benefits and privileges. It is clearly the duty of universities and their members to cooperate in official inquiries directed to those ends. When the powers of legislative inquiry are abused, the remedy does not lie in noncooperation or defiance; it is to be sought through the normal channels of informed public opinion.

Any witness who has been out where the winds of publicity blow would take little heart from the admonition to spend the rest of his life in jeopardy and his money in legal fees, as he is blown down the "normal channels of public opinion," informed or uninformed. No faculty member in his right mind could take much comfort from the admonition to co-operate with a committee whose stated intention is to show that he is part of what the committee refers to as the "Soviet conspiracy," and "the rule of Moscow over its adherents in the education world."

What would give him more comfort and would speak more in the name of justice would be a statement to the effect that as a respected member of a university faculty in the exercise of his lawful right to refuse testimony against himself before a congressional committee, he is entitled to the support and protection of his university until such time as the evidence produced in a body of his peers should prove that he is no longer worthy of the respect of his institution or a post among its members. To demand co-operation with a congressional committee, or to say as the Association of American Colleges said, "We welcome investigations . . . ," is to say that educators have abdicated their own responsibility for judgment of scholarship and truth and that they should welcome malice, ill intent, and political trickery into a community where mutual trust, respect, and honor are the true modes of life.

Politics and Education

Before dealing with cases of professors who have invoked the Fifth Amendment, I should like to go back a little to the prior issue of the relation between politics and education. Presumably, a government which wished to remain in office permanently without regard to the wishes of the people would be wise to make certain that all teachers in schools, colleges, and universities followed a political line set for them by the government. Conversely, a government which wished to remain in office by democratic means would count on the schools and universities to develop political ideas and views freely and to teach their students to be politically independent. It would therefore wish the universities to run their own affairs within the framework of the Constitution and the charters of their institutions.

The political intention of the congressional committees has not been to foster democratic political values, nor to help education in the conduct of its own affairs. The congressional investigation of college professors is not and has not been an effort to gather knowledge to aid the country's educational system by legislation. It has been in the nature of a prosecution of teachers for political opinion and past affiliation. It has been an effort to control the politics of the American intellectual, using publicity and the country's anxiety about Communism as the chief instruments, and it has been an effort to impose a political orthodoxy by men seeking political power. Unless the congressional investigations of college teachers are known by their true name it is impossible to understand the situation of the college teachers who appear before the investigating committees, whether they plead the First Amendment or the Fifth Amendment or tell everything the committees want to know.

Antecedents of McCarthy and Jenner Committees

The beginning of the recent series of investigations of college teachers lies with the Special Committee on Un-American Activities under Martin Dies, which proved so successful in attracting national publicity that imitators have been springing up ever since. The most immediate antecedents of the educational work of the McCarthy, Velde, and Jenner committees were the small pilot studies done by the Tenney and Canwell committees in California and in Washington. In 1948 when the University of Washington, under the impact of the Canwell committee, dismissed Professors Butterworth and Phillips because they admitted membership in the Communist party and not because there was anything wrong with their scholarship, their honesty, or their performance as teachers, the way was opened for the dismissal of professors in general and for the decline of scholarship at the University of Washington. At the University of Washington there is a direct line from the dismissals of 1948 to the banning of Robert Oppenheimer in 1955. Once political criteria are introduced as a primary cause for retention or dismissal of university professors, academic freedom has abandoned its first line of defense and must keep retreating to various unprepared positions, no one of which can be held for long under sustained attack.

Early Confusions

When the series of investigations of education and teachers by the McCarthy, Jenner, and Velde committees began two and one-half years ago, the biggest difficulty which professors and college officials faced was the fact that there were no precedents, and no one was very clear about what to do to protect the witness, to defend academic freedom, and to protect the reputation of the universities. The boards of trustees, university presidents, and deans were keenly aware of the damage which could be done to their institutions by national publicity which implied that Communists were teaching on their faculties. The degree of political, moral, and personal confusion which the investigations actually caused at the outset has to have been experienced to be believed. In the confusion many educators, teachers, and citizens lost their heads, reacted with fear and anxiety, and became committed to false positions before giving themselves a chance to make up their minds.

The strategy of the committee counsels, who were the genuine investigators and planners—with the chairmen acting as symbols of a democratic government protecting itself against the conspiracy of a foreign power—was designed to produce this confusion. The counsels, with the aid of research staffs, collected

leaks from the Federal Bureau of Investigation, newspaper reports, letterheads, catalogues of the Jefferson School of Social Science, back files from the Tenney committee in California, American Legion reports, statements from professional informers, stories from newspapermen, lists of membership in organizations on the Attorney General's list, names contributed by friendly witnesses, and information interchanged from the files of other committees. The names were then sorted by institution, and at a given moment all those from a given university whose names were in hand would be subpoenaed with a few days' notice, leaving little or no time for the witness to prepare himself with a lawyer or to decide how he would handle his own case if he felt he did not need legal advice. Those subpoenaed were then called to private sessions, asked questions about membership in the Communist party, past or present, about their political opinions, their writing, their immigration status where this applied, and the opinions and affiliations of their faculty colleagues. Those who stated that they were not and had not been members of the Communist party were often dismissed, although at any time remarks made in private session could be released to the public. Those who admitted former membership and provided names of others were either dismissed, or if they wished a public hearing were provided with one. Those who invoked the Fifth Amendment and those who refused to give names were scheduled for a public hearing at the earliest moment. The executive sessions were, in effect, screening devices for the location of teachers whose plea of the Fifth Amendment or whose political views and affiliations might evoke wide public interest.

In the beginning, very few lawyers knew very much about the Fifth Amendment itself, and those who did were not clear as to whether the law that worked in the courts was one that would work in the same way with congressional committees. Since no cases based on the use of the Fifth Amendment before congressional committees had been tested in law, everybody was making new law by speculation. There were lawyers who advised witnesses to say Fifth Amendment to almost every question asked, on the grounds that otherwise the committee chairman could claim that you had "opened the question," and "waived your privilege." This would mean that you then had to answer everything anyone asked, or be cited for contempt or trapped into perjury. Other lawyers would advise the witness to answer every question except one about actual membership in the Communist party. Then there were the lawyers who argued that unless the witness actually were in the Communist party, he had no right to use the privilege. Among the *aficionados* of the university freedom circles, the merits of taking the full Fifth, the partial Fifth, the straight First, and the No Answer Gambit were debated endlessly. Various moral attributes were assigned to each position, with the straight First Amendment, with no answer on political associates, most often coming first; an unfriendly Fifth with an unco-operative attitude and partial disclosure was second; and friendly co-operation with naming of associates a very bad last.

Since those early days, we have the good fortune to have at hand the work of Erwin Griswold and Telford Taylor on the Fifth Amendment and a recently published book by Alan Barth on investigations in general, with definitive pieces by Clark Byse and various scholars in jurisprudence. But when the investigations first began, there were so many differing views as to how best to protect oneself as a university professor that it is no wonder that university

presidents having to deal with alumni, many different kinds of faculty, boards of trustees, students, the government, and the entire American public should have been uncertain and confused as to where the right course of action lay.

FIRST FIFTH AMENDMENT DISMISSAL

In this situation, it is to be regretted that the first case of a Fifth Amendment dismissal should have resulted in a surrender to the political forces at work. This was the Rutgers University case, in which two members of the faculty were dismissed because they invoked the Fifth Amendment in refusing to testify before a congressional committee. A faculty committee, appointed by the President of the university, considered the cases and recommended to the President and the Board of Trustees that the two men be retained in the faculty. The President and the Board of Trustees set a deadline by which the men should either co-operate with the congressional committee or be dismissed. The men refused to comply and were dismissed. Because it was the first time that a congressional committee had secured the dismissal of faculty members it was a decision of very great importance, and it set a precedent that other universities, some of which were already predisposed toward such a solution, were willing to follow. The principle was very clear: if the men were to be judged through regular procedures as to their worth as teachers and as members of the Rutgers faculty, they should remain at Rutgers. If they were to be judged by the public, the Board of Trustees, and the President as men obligated to answer questions of a congressional investigating committee, they should be dismissed. For whatever reason, the university authorities failed to accept the judgment of those best qualified to pass on the merits of the defendants, and two good men were removed from their teaching posts for having exercised their rights as citizens. This is to me a betrayal of the responsibility of the university.

DR. NOVIKOFF AND THE UNIVERSITY OF VERMONT

A second case is equally dramatic, and may serve to demonstrate the futility of allowing political investigations to determine who should or should not teach. It is the case of Alex Benjamin Novikoff, biochemist at the University of Vermont. Dr. Novikoff was called suddenly by subpoena at a time when he was ill in bed, to a private, then a public, hearing of the Senate Subcommittee on Internal Security whose chairman at that time was Senator William Jenner. He appeared before the committee in both hearings without a lawyer, having decided that he would talk freely with the committee about everything connected with his political past except a time when he was a member of the Communist party. On that point, he invoked the privilege of the Fifth Amendment. He did so, according to his remarks later on to a trustee-faculty committee at the University of Vermont, because he did not want to implicate himself or his friends in further questioning about activities of a political kind in which he was involved eight years previously. Whether or not he should have done so was a decision of his own, since Dr. Novikoff took no lawyer and made up his own mind as to how he should proceed.

The trustee-faculty committee which reviewed his case reported that Dr. Novikoff is "an excellent teacher and scientist, and of great value to the Medical School." The committee commented on his honesty, candor, and willingness to co-operate and stated that there was no indication that while he had been at the University of Vermont Dr. Novikoff had been a member of the

Communist party or "directly or indirectly, or by implication taught Communist philosophy to any student therein"; and that

> . . . his failure to answer to the congressional committee was his method of protection against what seemed to him inquisitorial methods . . . ; that while he may have been in error because of confusion about the rights which the Amendment confers upon a person, and while legally, as well as technically, his position may not be wholly defensible, nevertheless he was convinced in his own mind of his moral rights in the matter.

The committee then voted five to one to retain Dr. Novikoff in the faculty. The President declined to accept the recommendation and, refusing the advice of his trustee-faculty committee, recommended to the Board of Trustees of the University of Vermont that Dr. Novikoff be dismissed, solely because he had invoked the Fifth Amendment. The Board of Trustees accepted the President's recommendation. The result was that the University of Vermont lost a good teacher, a good member of the community, and a good worker in the field of cancer research because the President of the university was not prepared to accept the considered judgment of Dr. Novikoff's colleagues and of a duly appointed committee of the faculty and trustees. The case was settled by a moral dogma that all teachers have an obligation to disclose publicly any information a congressional committee may ask. There are many more cases to which this dogma has been applied.

POPULAR OPINION

The statement which comes closest to representing popular opinion about the use of the Fifth Amendment by professors is that of William T. Gossett, Vice-President and General Counsel of the Ford Motor Company, a man who, as a lawyer and a businessman, has shown interest and concern in civil rights and public issues. Mr. Gossett says this:

> It seems to me, therefore, that if a teacher refuses under the Fifth Amendment to answer questions put to him by a congressional committee as to membership in the Communist party, the institution would be justified in taking appropriate action to protect itself from any adverse inference that might be drawn by the community from the teacher's action. This would include the dismissal of the teacher, unless he can prove to the satisfaction of the institution that he is not a member of the party, and that if he ever has been, he has disavowed and repudiated its principles.[1]

This is a persuasive argument, since it is clear that the man who refuses to be candid with his own colleagues about activities which may be classified by the courts as illegal, and are certainly regarded by the public as subversive, may confuse his supporters, even within his own institution. But the argument does not quite meet the real situation. There have been in the past, and presumably are in the present, sincere Marxists who may have repudiated the Communist party but not Communist principles. There may be other faculty members whose lawyers have advised them not to speak to any formal faculty or trustee committee about political activities no matter how innocent or sincere, on the grounds that the record could be subpoenaed by an investigating committee and the witness' privilege not to testify against himself might thus be removed by his very candor with his colleagues. There is also the fact that, in the absence of evidence that membership in any political party by a teacher has involved espionage, illegal activity, or subversion, questions about political activities even by the teacher's colleagues are not the primary ones to be raised about his faculty membership.

[1] From an address delivered at Washington and Lee University, Lexington, Virginia, April 16, 1954.

The real situation is one in which the individual faculty member finds himself, regardless of his legal position. The latter may well be a technical matter connected with the particular lawyer he has retained to advise him. The teacher may be a man who on principle joined the Communist party and on principle left it, and on principle does not wish to identify associates or to involve himself further in political controversy. It cannot be determined by the fact that a member of a university faculty pleads the Fifth Amendment that he is a member of the Communist party or that he is a bad teacher. Even if the faculty member has had no connection at all with the Communist party or with organizations associated with it, he is damaged simply by being called before a congressional committee.

HARVARD AND PROFESSOR FURRY

The case of Professor Wendell Furry of Harvard University has in it all the diverse elements of political, moral, social, legal, and personal content which mark the situation of a witness before a congressional committee. It may serve as the prime example of the Fifth Amendment professor at bay. As a matter of fact, Professor Furry's case demonstrates the situation of the First Amendment professor as well. His is the case of a man who ultimately relied on no legal sanction for his position but on the single moral point that he would not involve his former associates in a situation similar to his by giving their names.

When Professor Furry was first called before the Committee on Un-American Activities of the House of Representatives on February 26, 1953, he invoked the Fifth Amendment as to his present or past membership in the Communist party. He chose his own lawyer. At that time, two committees, one of the Harvard Law School, one of the Harvard faculty, had differing views as to what position a man in his situation should take. These were informed committees, who reached differing conclusions using the same set of facts. Professor Furry not only chose his own lawyer but acted as his own press representative, and gave statements to the press about some aspects of his Communist party membership which he at first refused to give to the Committee on Un-American Activities and gave later at a second hearing before that committee.

The Harvard Corporation, on its part, invoked the principle that each case should be decided on its own merits, and after conducting its own hearings, using the regular academic procedures, decided to support Professor Furry's membership in the faculty with certain reservations about his public conduct and his past political activities.

In the meantime, Senator McCarthy took up the case in his Senate investigating committee, with a great many advance declarations about Harvard Fifth Amendment Communists, only to find to his chagrin that Professor Furry was now willing, for the sake of his allegiance to Harvard University and his colleagues, to waive his privilege under the Fifth Amendment, to answer all questions about his own political activities, and to face the possibility of contempt charges. These were subsequently pressed.

The most moving account of the process by which Harvard University and Professor Furry came to an understanding of each other is that set down by Edwin C. Kemble, professor of physics at Harvard University, in a statement published in the *Harvard Alumni Bulletin* of March 1954.

Professor Kemble says of his colleague, Professor Furry:

Professor Furry is an able physicist and teacher. Ever since he entered the department twenty years ago he has been known to his colleagues as a cooperative, high-minded person, free of self-seeking and exceptionally conscientious. In spite of the occurrences of the past year we continue to believe that he is a man of basic integrity and loyalty to our country.

After a short description of Professor Furry's own explanation of his political past, Professor Kemble says of Professor Furry's account: "This story seems to those who know Professor Furry an altogether believable one. It fits with all we know about the man and about his former associates." Then he describes the operation of the McCarthy committee and Professor Furry's conduct before it, and comments:

These considerations do not prove that Professor Furry's course is right, or in the best interests of himself or Harvard University. It does mean, however, that his decision was one of those difficult ones that every man must make for himself. In the opinion of the writer it is worthy of respect.

Although not everyone agreed with the wisdom of Professor Furry's course of action, it was also considered worthy of respect by the Harvard faculty and by the large body of American scientists.

I should like to conclude my remarks with Professor Kemble's own concluding statement about the case of his fellow scientist:

If the universities are to continue to serve the nation in the future as in the past, it is essential that they stand firm on the ground of their traditional procedures. Happy indeed is the institution like Harvard whose tradition of freedom is long and deep-rooted. We are bound to no state legislature and we are free from the enslavement of government contracts. We have a high reputation and an enlightened alumni. By maintaining our own position we can help those less favorably situated. The scholars and scientists of our sister institutions inquire anxiously, "Will Harvard stand firm?" They do not want Professor Furry to resign, for they realize that just because his case is a difficult one, it is a fine case to cite before their own boards of regents.

The Harvard Corporation is bravely sticking to the rules. The Faculty is proud of the fact that there has been no surrender.

LOYALTIES OF THE FREE MIND

This is the voice of the scholar, speaking of his work and of his tradition. It expresses simply and honestly the truth that the life of the free mind and the growth of knowledge can only exist where there are men and women of patience, generosity of heart, and good faith who will protect one of their number in a time of stress. If we have learned no more than this from the travail of the scholar in these recent years, it may well be that this is enough to give us, in the continuing stress of the present, the courage and strength we all need to do our best work.

Harold Taylor, Ph.D., Bronxville, New York, has been president of Sarah Lawrence College since 1945. He taught philosophy at the University of Wisconsin from 1939 to 1945, during the war serving also for a time as research associate in psychology in the Office of Scientific Research and Development. He is a member of the Board of Directors of the American Labor Education Service and a trustee of the Kosciuszko Foundation. He is the author of On Education and Freedom (1954), editor and coauthor of Essays in Teaching (1950), and a contributor to philosophical and educational journals.

Security Through Book Burning

By CHARLES G. BOLTE

I LOOKED for a text from the American humorists, because they so often illuminate our follies better than the sobersided do, and because if we laughed more often at the pygmies who are trying to take us prisoner, instead of treating and entreating them so earnestly, we might the better blow them away. I found two texts.

Mark Twain, of course, first:

It is by the goodness of God that in our country we have those three unspeakably precious things: freedom of speech, freedom of conscience, and the prudence never to practice either of them.

Then Walt Kelly, whose "Pogo" recently featured an exchange between a blameless owl and an inquisitorial badger, the latter supported by two junketeering crows:

BADGER: I won't *threaten* you, Mr. Owl. But here is a book that says: Owls migrate north about April first. . . . You got a day to pack.

OWL: Why, *you* jes' writ *that* you' own-self. . . . Where is Captain Wimby's Bird Atlas?

BADGER: *Dis*credited. It didn't agree with *our* observations. . . . Did it, men?

FIRST CROW: No sir, it's out of date.

SECOND CROW: *And* on fire.

BADGER: There's nothing quite so lovely as a brightly burning book.

CLASHING SYMBOLS

My theory is that we had all better be a little less prudential in exercising our precious freedom of speech and freedom of conscience, if we want to keep them. Like other rights, they grow weak when not used. This makes life too easy for those who enjoy the sight of brightly burning books.

The title assigned me is "Security Through Book Burning." A dear old lady I know asked a while ago, "What is all this bother about book burning? Why, I always dispose of my old books that way. How else does anyone get rid of books he doesn't want any more?" Well, ours is an age of symbols. The shortage of shelf space bothers us all, I hope. We shall simply have to get used to sending books we can no longer keep to the veterans' hospitals and the Merchant Marine Library. Offensive books can be buried. But burning is out.

This is now pretty generally realized. The Boy Scouts in Portsmouth, Rhode Island, decided to celebrate Lincoln's Birthday this year by burning "objectionable" books on the grounds of Fort Butts, a shrine of the Revolution. They ended by withholding the torch and consigning the offensive matter to the town dump instead, when the announcement of their proposed celebration received what the sponsors mildly called "adverse publicity."

This outcome supports my theory that we need to exercise our freedoms, and bellow and laugh more often and more loudly at those who have forgotten what country they are living in. Nobody denies a man's, or a Boy Scout's, right to junk a piece of printing which he decides, after reading it, that he does not like. But form counts for a lot. In any society, ideas without procedure are a mess; in our society, which has staked everything on the principle of government by laws not men, a breakdown in method means an unholy mess, and points to the end of our society as we have known it. Book burning is a symbol which denies the

validity of the symbols of Lincoln, the Revolution, or, one would have thought, the Boy Scouts.

However, American history can be read as a long succession of clashing symbols (spell it either way). We no sooner resolve one tension in our dark continent than we generate another. There are always enough of us sure enough that we are right to guarantee constant prayers to God to make our neighbors see the right as we have given Him to see it. "I'll make that fellow feel brotherly love if I have to kill him" is an old story with us.

The drive to achieve security through book burning has consequently never lacked supporters, nor is it likely to. A royal governor of Virginia wrote in 1671:

> I thank God there are no free schools nor printing, and I hope we shall not have any these hundred years; for learning has brought disobedience, and heresy, and sects into the world.

Holmes

Two and a half centuries later the Supreme Court was still dealing with the problems caused by this view of the world. Holmes, with distaste but with understanding, wrote:

> Persecution for the expression of opinion seems to me perfectly logical. If you have no doubt of your premises or your power and want a certain result with all your heart you naturally express your wishes in law and sweep away all opposition. To allow opposition by speech seems to indicate that you think the speech impotent, as when a may says that he has squared the circle, or that you do not care wholeheartedly for the result, or that you doubt either your power or your premises.[1]

I ration myself to one paragraph only of Holmes—this would not be a paper on my subject without at least that much—but I know you will all remember that it is the next paragraph which goes on to say that "time has upset many fighting faiths," that "the ultimate good desired is better reached by free trade in ideas," and that "the best test of truth is the power of the thought to get itself accepted in the competition of the market."

Holmes's was a dissenting opinion; it is not always clear that the majority of the country is with him even now. This need not shake our belief in the validity of his conclusion, since we have Thoreau's word for it that any man more right than his neighbors is a majority of one already. It only means that we need to be diligent in challenging the power and questioning the premises of all those, in or out of office, who want a certain result with all their hearts, even if it means destroying what is in ours.

Lenin

A year after Holmes's dissent in the Abrams case, Lenin set forth the Communist view:

> Why should freedom of speech and freedom of the press be allowed? Why should a government which is doing what it believes to be right allow itself to be criticized? It would not allow opposition by lethal weapons. Ideas are much more fatal things than guns. Why should any man be allowed to buy a printing press and disseminate pernicious opinions calculated to embarrass the government?

This quotation, to be found in Alan Barth's new book, *Government by Investigation*,[2] which I commend to you all, is offered free of charge to those who still want proof that any American who favors book burning is guilty of Communism by association.

If we could be sure that we were

[1] Abrams v. United States, 250 U. S. 616, 624 (1919).

[2] (New York: The Viking Press, 1955), p. 183.

right, that the complex of our national policies and accepted truths added up to the truth for all time, then I suppose we could find security through book burning. Lenin was surely right in this, that "ideas are much more fatal things than guns" (if we can admit that there are degrees of fatality). Ideas *are* dangerous; and in a perfectly regulated world, new ones would not be admitted, to turn over the existing order.

But it is not in the cards for us to have this kind of certainty, this faith *à la russe*. We shall need to make do with what we have: a tough-minded faith, which accepts a pluralistic society, moving through trial, unafraid of error, receptive to new ideas.

Embarrassing the government is an old American tradition. For my part, surveying the press of national problems, I sense an absolute need for fresh thought. I am not persuaded that every one of our national policies is beyond all doubt the wisest for us in our present time and place and situation. I fear more harm from everybody thinking alike than from some people thinking otherwise. The nation needs more men who march to a different drummer, not fewer. We can dare to disagree even with decisions of the Supreme Court. After all, four of nine justices often do.

Safeguarding the Republic

The saddest thing about our censors is the evidence they give that they mistrust their neighbors and doubt the validity of American ideas. Is our own cause really so frail that we must be safeguarded from reading attacks on it? Is a textbook by a politically unpopular writer really going to turn the kids from little Republicans into little Comrades?

Are United Nations documents in the San Antonio library really going to undermine the Texas constitution? Are *Pravda* and *Izvestia* really going to provide ammunition for scholars to blow up bridges with? Is the Communist Manifesto in the Boston Public Library really going to supplant the Mayflower Compact in the affections of the next Massachusetts generation? Did it really safeguard the Republic when a security check was run on a private citizen who had written a pamphlet advocating more ground forces, before the pamphlet was circulated in the Pentagon?

Apparently so, in the view of the aroused citizens who have been attacking textbooks all over the country, the patriotic Texans who cried out against the United Nations documents, the Post Office officials who denied the mails to *Pravda* and *Izvestia* except to "authorized" addressees, the Bostonians—including two of five trustees of the library—who favored the removal of Communist literature from the stacks, and the officers who ran the security check on the professor before using his arguments on their side.

TEXTBOOKS FOR BOOK BURNERS

This kind of activity does, I believe, deserve that ugly epithet "un-American." Who are these un-American characters, seeking to tell us what we may not read and judging a book by its author's history instead of by reading the book? Some of them are dangerous pyromaniacs, who feel with the badger that there's nothing quite so lovely as a brightly burning book. Mostly, though, they are honest and worthy, if temporarily frightened, souls, who have just forgotten their history, and what America is all about. They perhaps need to be reminded, as Murray Kempton said a while ago, that the Bill of Rights was written by a revolutionary to protect bad literature and undesirable people.

Let us, therefore, not denounce their ignorance or condemn their motives: let us seek to improve their understanding.

Lead them gently to the Constitution; introduce them to Socrates, Milton, Voltaire, Jefferson, Mill, Holmes, and Hand; show them the passage beginning "Don't join the book burners" from Eisenhower's Dartmouth Commencement speech; remind them that, although the Devil can quote Scripture and make a profit at it, these are still the American scriptures, and must be lived by if we are to remain Americans. The price of our liberty is the free grant of it to those we suspect may be seeking to destroy it.

THE NEED TO KNOW

Aside from the Constitution and the American scriptures—what might be called the needs of the American psyche—there is the obvious pragmatic reason for this. The need to know is not less intense in this generation than it was in the last. A knowledge of Communism is obviously essential to any American who wants to be able to combat it effectively. A university president, challenged by an alumnus that they were teaching Communism in the college, is said to have replied, "Yes, and we teach cancer in the medical school." Yet the Post Office now intercepts mail from the Iron Curtain countries and destroys periodicals addressed to subscribers here, excepting only those institutions and individuals "authorized" by the Post Office Department. (Imagine being authorized by the Post Office Department.) It would be in the national interest if the Post Office, instead of suppressing *Pravda* and *Izvestia,* were to carry them free, and perhaps even make their reading compulsory (although this, on second thought, would be an infringement of that equally valuable freedom, the freedom not to read).

At a deeper level than this is the need for new thought about our own society and our conduct in the world. Salvation tomorrow may lie in the unpopular today. In the words of the Freedom to Read Statement issued a couple of years ago by the librarians and publishers, "No society of free men can flourish which draws up lists of writers to whom it will not listen, whatever they may have to say."

Yet this kind of listing, or blacklisting, is now widespread, especially in the field of textbooks. Texas requires authors of textbooks to declare that they are not and never have been members of the Communist party, and are not and have not for ten years been members of any organization on the Attorney General's list. Other communities, denied such helpful and clear-cut legislation, have had to content themselves with informal lists or the dropping of works whose writers are locally unpopular.

One thing about lists: it saves people the trouble of reading the books.

Melville puts a footnote on a fresh thought at the end of *Billy Budd:* "An irruption of heretic thought hard to suppress." I suspect most of us have been suppressing our heretical thoughts lately. It is precisely here, I believe, that there lies a danger far more grave than the circulation of the most insidiously concealed Communist doctrines. If thoughts heretical of the current official orthodoxy are suppressed, where are the new and saving ideas to come from?

PRUDENT AFTERMATH

There is not, in fact, much official suppression of political ideas in the country today. The crisis of that particular folly seems to have been at least temporarily passed two years ago, when those two young men made everyone laugh at their antic raid on our overseas libraries. Freedom of expression stands high in our courts. Most libraries and schools have withstood the open assaults on their collections and texts from the local vigilantes and the would-be brainwashers.

But these battles leave their scars. Our present danger, I say, is here: that the school superintendent, having fought off an American Legion raid on his textbooks, may limit his selections afterwards to books by writers who never joined anything; that the librarian, having maintained her right to have pamphlets of the United Nations Educational, Scientific and Cultural Organization on the shelves, may not exercise that right on the next lot; that the publisher, having weathered the storm over a book by a writer who gave ten dollars to Spanish War relief in 1938, may decide his next book does not fit into the list; that the scholar, having observed the drawing and quartering of his colleague for a dispassionate study of recent Chinese history, may defer his own book on contemporary problems of the Far East and start revising his monograph on court customs of the Ming Dynasty; that the book-review editor, having received the document from the United States Atomic Energy Commission attacking the Alsops' book on the Oppenheimer case, may not review the book at all.

I do not say that any of these things have happened; although I am told that only three newspapers in the country have reviewed *We Accuse,* there were other factors involved in this case. I say only that it would be in human nature for things like this to happen. I do not believe that we are, as a nation, terrified; but I think some of us have got pretty cautious. If we have, so much the worse for us, and so much the worse for our country, which needs depth of insight, and boldness in speaking out, just as much today as it ever did.

Books—all kinds of books, expressing all kinds of views—are not a luxury but a necessity. They contribute to the strength of America. The best of them challenge our convictions and our settled ways of thought and make us learn not only what we believe but why we believe it. They cannot serve their most important social function if caution and prudence, even without censorship and suppression, serve to limit the range of ideas and of expression. Censorship, one student of the subject remarked recently, is like the common cold: it is a mild irritant, always with us, and there is nothing much to be done about it. If this is so, those who believe in free expression will at least avoid having the self-induced, or psychosomatic, sniffles when there are no germs about.

CENSORSHIP ON MORAL GROUNDS

They will also, if they are wise, take steps to combat the germs wherever they appear. At the moment, the chief censorship activity in this country is directed against publications not on political but on moral grounds. This seems, but is in fact not, remote from our topic. The local ordinance that is drawn to prevent the sale of horror and crime comics to children can be stretched to suppress *The Brothers Karamazov,* or the newspaper that gives the details of the latest love-nest killing. Aware of the latter possibility, but apparently unconcerned by the former, some legislative bodies have put language in their bills specifically exempting newspaper accounts of crime; a curious provision, considering that the First Amendment was drawn to protect not so much newspapers as books and pamphlets, and considering further that children are apparently affected more by what they believe to be the truth than by what they know to be fiction. The current morals laws do extend, either explicitly or implicitly, to magazines and books.

More serious than these laws, most of them of dubious constitutionality, is

the current rash of extralegal censorship by citizens' groups. The technique here is to use lists of "objectionable" publications—often the list compiled monthly by the National Organization of Decent Literature, a Catholic lay group—to purge the neighborhood newsstands and drugstores. Dealers are asked to "cooperate" with the citizens' groups by withdrawing from sale the books and magazines on the lists. The consequence of nonco-operation is nontrade. Most dealers go along.

The seamless web

These drives are avowedly aimed at protecting the morals of the young. However, some cities have banned the works of Freud and other writers on psychoanalysis. Begin with morals, and suppression on doctrinal or political grounds soon becomes too tempting. No one will contest the right of a church to prescribe what its followers shall read. But is it also to prescribe what its nonfollowers shall read? And shall adults be limited to what is thought suitable for adolescents?

Everybody understands that you can demand the protection of due process of law for a man accused of murder without condoning murder. But it is not always easy to make it clear that you can insist on due process for books accused of obscenity without harboring any sympathy for obscenity. Despite the risk of misunderstanding and consequent denunciation, I am suggesting that those who believe in free expression must take this position. A breakdown in due process for the publication we abhor makes it that much more likely that there will follow a breakdown in due process for the publication we esteem. There is no such thing as a little censorship. This is one web that really is seamless. The citizens who boycott the dealer for selling crime comics or William Faulkner may be around next week to demand the removal of *The Age of Jackson* because they do not like Americans for Democratic Action or of *American Diplomacy* because they do not trust State Department officials even when they have resigned.

Law enforcement and censorship

The distinction that needs to be made, I think, is between law enforcement and censorship. The police department fobs off its duty when it sets up a citizens' committee to advise it on what books are "objectionable." It moves away from law and into taste. The principle is the same for politics as for morals. Support of rigorous enforcement of the laws, and opposition to extralegal efforts, is the way to guard ourselves against those so sure they are right that they are prepared to take the law into their own hands. If a book is unlawful, this is to be established in a court. If it is not unlawful, it is improper for the state or for any group within the state to attempt to suppress by coercion what cannot be suppressed by law.

The observance of due process, so central to our society, is being overlooked today in the quite natural revulsion against the horrors of some of the comics and the quite natural concern about exposing the young to books their parents do not want them to read. People who would cry out against any effort to censor on political grounds are silent about the censorship of morals because it is difficult to develop much enthusiasm for anyone's right to publish some of the things that have lately been displayed. The danger here is that precedents will be established and that censorship will spread. This is not fanciful. A congressional committee set up to investigate "pornography" issued a report in which one book was criticized because the author appeared to advocate polygamy; another because the author did not seem to have the properly respectful attitude toward law-enforcement officers; another because the "author is obviously trying to cash in on the Scottsboro pro-Negro agitation which was Communist-inspired."

New York City Bar Association

The Committee on the Bill of Rights of the Association of the Bar of the City of New York recently considered the suppression of books on political or moral grounds and concluded that, as a result of private censorship actions:

> . . . one group *within the community* is compelling the balance of the community to conform to its standards of what it thinks should or should not be read. The censorship thus exercised, since it is that of a private group, is without the benefit of the procedural safeguards established by law as necessary to insure the proper application of the proscriptive standard. . . .
>
> The wrong is basically public not private. What is involved is the infringement of a keystone of a democratic society: the preserving of a political system which permits the greatest possible freedom in the exchange of ideas.

The committee proposed a remedy:

> Legislation penalizing organized private action which interferes, as described above, with the distribution of reading material would cure this danger. Legislation such as this would compel private groups which wish to prohibit the distribution, or the maintenance on a library shelf, of a particular book or magazine to invoke action under the applicable local ordinance.

The Bar Association accepted this report last month and approved unanimously a resolution by which it

> . . . deplores and condemns the attempts of any individual or group, private or public, to interfere in any manner with the publication, circulation, or reading of any published matter, other than by means of regular applicable statutory procedures and standards; this resolution does not purport to limit the expression of views by any individual or group concerning any published matter.

THE RIGHT TO DECIDE

Our freedoms are involved: our right to decide for ourselves what we shall read. For us, there can be no security through book burning: only the rigid crust of conformity, and the end of that great conversation about who we are, what we are doing, and where we are going that is the essence of our national life. Let us see to it that the conversation continues.

Charles G. Bolte, New York City, has been executive secretary of the American Book Publishers Council since 1952 and is a member of the Board of Directors of the American Civil Liberties Union. He was formerly a member of the United States Mission to the United Nations (1949–52), organizer and chairman of the American Veterans Committee (1944–47), special writer for the Office of War Information, and newspaper writer. He is the author of The New Veteran (1945).

The Operation of Personnel Security Programs

By Ralph S. Brown, Jr.

THE federal government operates five distinct security programs, along with some minor loyalty programs and tests we shall not be able to discuss at all. The important ones cover:

1. Civilian government employees. This is the one we hear most about. It affects 2,400,000 people.

2. The armed forces—a million more numerous than the civilian employees.

3. Defense Department contractors and their employees requiring access to classified material (Confidential, Secret, etc.).

4. Atomic Energy Commission contractors in similar circumstances.

5. Sailors and water-front workers, under the supervision of the Coast Guard.

These last three programs directly affect some 3,000,000 people who are not government employees at all. The consequences of being held a security risk vary. If you are a government employee or a career military man, you will probably be dismissed. But if you were drafted, you will probably be kept in service at the lowest rank; you may get an unfavorable discharge. If you are a maritime worker, you probably have to find another occupation altogether. If you have been working on a defense contract, your employer may find other work for you, or he may fire you.

There are also differences in the operation of the various programs. But the basic pattern is the same; and since I do not have time to develop the differences here, I shall address myself chiefly to the program we know most about, the one for civilian employees under Executive Order 10450. I shall describe the main stages in a case, giving special attention to the role of a new and powerful figure in government, the security officer.

Investigation

A distinctive characteristic of federal programs is their routine resort to investigation—a laborious and expensive process—and their correspondingly slight reliance on oaths and other declarations by the employee or his superiors. Of course the employee supplies a detailed personal history when he first applies for a position; but the information that the employee supplies is used chiefly as a starting point for investigation.

Name check

The first step is a "national-agency name check," which means an examination chiefly of the files of the Federal Bureau of Investigation, the Civil Service Commission, the military intelligence branches, and the House Committee on Un-American Activities. The purpose of this file check is to see if any "derogatory information" turns up. What is "derogatory information"? Anything, it may be said, that bears directly or indirectly on the ultimate question to be resolved: Is the employment consistent with the national security? And what has a bearing on this standard? This question raises intricate problems of relevance. It is fair to say that these problems are not faced at the name-check stage. The process seems to be increasingly mechanical, with some safeguards against mistakes in identity. Affiliations with suspect organizations, associations with suspect persons, reports of behavior, expression, and opinions that have been filed because they suggest sympathy with Communism, all are extracted. As the files grow more voluminous, and the kinds of information that are considered grow more extensive, the chances increase that derogatory information will be found. These untested data of themselves may lead to the rejection of a mere aspirant for employment, but routinely their discovery leads to a "full field investigation." Even without the appearance of adverse material in the file check, the present program requires a full field investigation for every sensitive position, a category that has been generously defined. For example, all State Department employment is considered sensitive.

"FBI report"

In such an investigation, "Friends, neighbors, fellow students, fellow employees, teachers and colleagues, even one's grocer or one's hairdresser may be interviewed."[1] Another round of file checking must also occur, for as the names of more of the employee's associates come to be known, it is considered necessary to establish whether there is derogatory information about *them*. The result of all this industry is a report popularly known as an "FBI report," though the FBI is not responsible for all the investigative reports that are assembled.

The composition of these reports is one of the most controversial aspects of the process. The FBI, the agency chiefly concerned, stoutly maintains that it is not an evaluating agency; it simply collects facts, opinions, and rumors—whatever people tell its agents—and reduces the mass to some degree of coherency. It is the job of the recipients to assess significance.

[1] Eleanor Bontecou, *The Federal Loyalty-Security Program* (Ithaca, N. Y.: Cornell University Press, 1953), p. 83.

Four factors militate against this picture of detached, impersonal transmission of information. First is the imperfection of the interviewer, which of course varies with the capacity and predilections of each individual. Investigators take only sketchy notes, if any, during an interview; there are many instances of interviewees who claim to have been misrepresented. Second is the fallibility inherent when the "raw" files are edited to produce the finished report. Third (related to both the foregoing stages) is an almost unavoidable stress on unfavorable information. Though FBI reports are said to include whatever favorable material has been elicited, the primary object of the investigation, after all, is to discover if there is evidence of disloyalty or of security risk.

The fourth factor involves a policy that overshadows the entire process, the concealment of the identity of many of the FBI's sources. This is not the point at which to discuss the justification and ramifications of this policy. It is unquestioned that concealment of the source is widely practiced, whether the source is an undercover agent whom it would be hazardous to expose, a wire tap that is sub rosa, or simply a casual informant who does not wish his role to be known. The FBI protects them all and does undertake an evaluation of the reliability of the informant. If it did not, the anonymous information could be given scarcely any independent weight. So the report will state whether the unidentified informant is believed to be of known reliability, of probable reliability, or of unknown reliability. It certainly makes a great difference whether the source of a report that the employee is a Communist is labeled reliable or unreliable by the FBI. These judgments must also have some degree of fallibility.

"How Good is an FBI Report?" Alan

Barth asked in a magazine article. Not very, he concluded, on the basis of the scraps of information available to the public. Officials who have used the reports have expressed to me a remarkable variety of over-all opinions about their value. My point here is that under the best of circumstances they are imperfect.

EVALUATION AND DISPOSITION OF FBI REPORTS BY SECURITY OFFICERS

Some of the concern over the failings of investigative reports might be allayed if it could be said that the reports are used cautiously and skeptically. The judgments that are introduced into the reports may not be so important as the judgments that other people derive from them. These other people, in the first instance, are the security officers of the employing agency.

The security officer is not a familiar species of civil servant. The nature of his duties leads him to shun the limelight; public figures like Scott McLeod of the State Department are exceptional. Probably the one element of personal history common to all ranking security officers is that (so I have been told) their own records must be "lily-white." In security jargon, this means entirely devoid of derogatory information.

The immediate fruit of the security investigation is a decision by security officers as to what action is warranted. The following courses are open:

1. To appraise the derogatory information as insubstantial, and do nothing. Doing nothing requires a modest degree of bureaucratic fortitude, since the employee's retention may later be criticized and that criticism deflected onto the security officer. The terms of the Eisenhower and related security programs appear to discourage this course by requiring an affirmative finding that keeping the employee is consistent with the national security.

2. At the other extreme, a possible choice is to disqualify the employee or prospective employee on the strength of the FBI report, without inquiring any further. Security officers can and do summarily reject applicants; only the Atomic Energy Commission habitually gives a person applying for employment an opportunity for a hearing, though the Air Force may do so. The general practice means that an aspirant for federal employment may be rebuffed without any opportunity to overcome the appearance of derogatory information.

3. A third technique permits the employee to thresh out his problems with the security staff, under varying degrees of informality. It has been said that this common-sense approach has been neglected, that much technically derogatory information can easily be explained away, and that the subject of the investigation is uniquely qualified to make the explanations. There is, as usual, another side of the coin. Direct contact between security officer and employee permits pressure, either subtle or crude, to be brought on the employee to resign. The employee may also be informally urged to "co-operate" with the security staff by submitting to prolonged questioning, lie detector tests, or other indignities from which an impersonal procedure shields him.

4. A more common step is the submission of the derogatory information (in edited form) to the employee for written comment. These interrogatories are often effective in clearing up mistakes and misconstructions derived from the investigative reports. About one-third of all the cases decided by the old loyalty boards went in favor of the employee at this stage without further proceedings.

STANDARDS AND CHARGES

It is only when the employee begins to participate in the process of evaluation, by responding to interrogatories or defending himself in a hearing, that the effective standards of the program begin to emerge dimly—from the charges that are made and from the questions that are asked at hearings. We have of course no systematic collection of these materials; the government normally keeps them private, for the protection of the employee and of others who may figure in them.

Association and affiliation

The overwhelming preponderance of charges in both loyalty and security cases relate to associations with alleged Communists and affiliation with alleged Communist organizations. Charges that relate to more serious criteria—for example, attempts at espionage—are rarely encountered. Indeed, taking espionage as the offense most feared from government employees, we find no responsible claims that the loyalty-security programs have caught a single known spy. One does not encounter many charges having anything to do with treason, espionage, sabotage, compromise of classified information, or performance of duties so as to serve the interests of a foreign power. We therefore have little basis for saying what information would be disqualifying if it touched on these areas. The offenses themselves, if satisfactorily established, would without question warrant dismissal.

In the main stream of charges, those relating to questionable associations and affiliations, we can distinguish two polar situations. The first is a history that leads to a reasonable conclusion of present party membership or of Communist sympathies practically indistinguishable from membership. Here dismissal would presently be obligatory. At the other extreme is a single episode in the relatively remote past, which can be excused. In between, the prima facie case created by a longer list of charges can also be overcome. The employee has often, as is apparent from the number of clearances after hearing, been able to show that the association was in fact innocent or misguided, and that his present outlook and maturity dispel any doubts about his loyalty or reliability in security matters. But the employee, in the revealing phrase, has to clear himself. In addition to making whatever denials, qualifications, or explanations he can with respect to the specific charges, it seems fair to conclude that the process of clearing oneself —whatever the charges—has come to impose at least these burdens on the employee.

Conditions of clearance

1. He must persuade the hearing board and the reviewing authorities that he shares prevailing anti-Communist sentiments. It is not enough to disprove Communist sympathies. How anti-Communist must the civil servant appear to be? The answer varies with the times and with the judges.

2. He must forswear the associations and affiliations that got him into trouble. This obligation has reached the point where employees have felt obliged to cut off any connection with blood relatives.

3. He must exhibit a willing disposition to acquiesce in the demands of the security system. The Atomic Energy Commission made this requirement clear in the Oppenheimer case. The necessity for assent apparently extends to the very process from which the employee is trying to extricate himself, for employees are sometimes asked in hearings whether they think the security program is fairly administered.

These three conditions for clearance are nowhere, so far as I know, explicitly laid down. They are my own conclusions from the materials available.

In developing these conclusions about the effective standards of the programs

we have run somewhat ahead of our step-by-step description of the process, the main steps in which are investigation, evaluation, charges, hearing, and review. Let us return briefly to the matter of charges.

Communist sympathies

Closely related to Communist affiliations and associations are charges of Communist sympathies as expressed in conversation or writings, or as inferred from one's reading or other intellectual interests. In the seventy-five case histories analyzed by Miss Bontecou, charges with respect to sympathetic expressions occurred in fourteen cases; with respect to reading Communist literature, in ten.[2] The number of such charges, however, understates the significance of opinions and attitudes in the resolution of a case. Whether or not there are direct charges about the employee's beliefs, he will doubtless volunteer his political creed if he understands what is needed for clearance. If he does not, the hearing board will correct the omission in its questioning.

Reliability risks and pressure risks

The present security standard opens the door to two families of charges that do not imply Communist leanings on the part of the employee. These I call "reliability risks," and "pressure risks." Summarily, reliability risks are traits of character or personal history that could also disqualify an employee on grounds of general suitability; for example, dishonesty, criminality, or mental disorder. A reliability risk that comes closer to the special requirements of security is negligence or obtuseness in security matters; for example, losing papers. "Pressure risks" are associations or facts that are thought to expose the employee to coercion or blackmail. Russian control of close relatives is the classic example of liability to coercion; homosexuality, of liability to blackmail, and this vice is also said to have some relation to general trustworthiness.

These special security standards are not part of the main stream of cases. Even under a security program, the emphasis is still on Communist associations and affiliations.

Nature of charges

We now turn from substance to form. Do the charges, as drafted, adequately inform the employee of the derogatory information he has to meet? The trend has been away from vague charges like "You have shown sympathy with the Communist Party aims and ideology," [3] toward some specification of place, time, and content of the alleged exhibitions of sympathy. This trend is repeatedly checked, however, by the policy against revealing sources of information.

It should be said that there appear to be few cases in which knowledge of the source of accusations is absolutely crucial to the employee's cause; but there are many in which he is hindered by his inability, in the words of the Sixth Amendment, "to be confronted with the witnesses against him."

Our last observation about charges combines form and substance. The multitude of charges based on associations—"You knew A," "You joined X" —require some characterization of A and X. Here the jargon of security flourishes. A may be described as "a known Communist," when he is in fact nothing of the sort. But the files contain some informant's statement that he knew A as a Communist, so down goes A as "a known Communist." Sometimes boards take these thumbnail descriptions as gospel, so that the employee can only dissociate himself as best he can from unclean A; usually he will be permitted the laborious task of rehabilitating A (who will nevertheless turn up in other cases as "A, a known Communist").

The framing of charges that turn out to be preposterous or trivial imports more than the loose use of words or the uncritical acceptance of the investigative work product. It is another clue, I believe, to the effective standards of the programs. The whole is the sum of its parts; none of the parts can be taken lightly. Take the sort of charge we see in the case of Abraham Chasanow, a Navy employee who, after taking his cause to the public, was finally vindicated. One charge against him was that of association with P, "described as an individual having Communist tendencies, and it is of record that his wife signed Communist nominating petitions during 1939." Note first that this charge involves a technique that we may call "remote association": "You associated with P, who associated with Q, who . . ." No direct connection between the employee and Q is charged. Second, P is "described as . . . having Communist tendencies." Described by whom? What does this mean anyway? It may be a cautious description of P's political orientation; it may simply mean that he has leanings toward his wife, who, it is stated, signed "Communist nominating petitions in 1939." Third, consider the relevance of signing nominating petitions in 1939. If the employee had done so, it would have some bearing on his politics in 1939. He might have signed as a Communist; he might have signed as a non-Communist who thought that the Communist position should be put to the test of the polls. What is charged here is that P's wife, not even an acquaintance of the employee, signed the petitions.

That such tidbits are unearthed is a tribute to the mechanical perfection of the FBI files. Their inclusion in a set of charges, however, is the result of human judgment. The association with P, in the Chasanow case, it should be added, was at board meetings of a community organization. The inclusion of this casual relationship, and the further injection of the remote history of P's wife, were elements in a tentative decision that Chasanow was a poor security risk. They help us to sense the security officers' idea of a security risk.

Charges of this sort have appeared with increasing frequency under the Eisenhower security program.

HEARINGS

The primary purpose of hearings is to give the board a good look at the employee. He is usually the principal witness—sometimes the only one. If he brings on witnesses, their chief function is to corroborate the employee's portrait of himself. He cannot compel the production of unfriendly witnesses. If he knows who they might be, he can ask to have them invited to attend; but they may decline the invitation. The government infrequently produces witnesses in support of the charges. It does not need to; it can stand on the investigative report, which the hearing board sees though the employee does not.

In presenting himself for examination the employee of course hopes to strengthen the affirmative case that, if well-advised, he has already advanced in writing. He is anti-Communist, prospectively (if not retrospectively) free of bad associations, and obeisant to the security system. In making these claims, he invites challenges to explain his beliefs and attitudes. Questions from the board and its counsel are likely to be more sweeping than anything provoked by the charges. Whether or not the employee wants to put his political philosophy to the test, there seems to be little effort to confine hearings to narrow issues. Posers like this result,

[2] Bontecou, *op cit.*, p. 109.

[3] *Ibid.*

from an AEC hearing of a biologist: "Q. Do you think it would be possible for a person to be a deeply religious person and also to be a 'dyed-in-the-wool' Communist? A. Gee, there you got me. I really don't know."

REVIEW AND CO-ORDINATION

The old loyalty program afforded an employee who lost out at the hearing level an appeal to the Loyalty Review Board. This was a group of about twenty-five private citizens, mostly lawyers and educators of considerable standing, who sat usually in panels of three.

The principle of departmental responsibility, though subordinated in the loyalty program, has always dominated the security programs. The military departments especially have insisted that, since the Secretary is responsible for the integrity of his department, his word should be final. The Departments of the Army, Navy, and Air Force do have appeals boards in Washington which make recommendations to the Secretary on all hearing-board decisions. This means that the employee has his case considered by a central board, which serves the further purpose of co-ordinating the activities of far-flung hearing boards. The Eisenhower program has, however, no interdepartmental review or co-ordinating agency comparable to the Loyalty Review Board.

I have no basis for estimating the extent to which, in the absence of a central review board, the various agencies are relatively tough or easy with their employees. A single standard of loyalty, if it could be made manifest, was presumably desired throughout the executive branch. But in a security program, the risk depends (or should depend) on the sensitivity of the job, so that only agencies or jobs of similar sensitivity could be compared in any event.

An increase in the number of stages through which a case must pass before final decision, whatever equities it may introduce, certainly introduces opportunities for delay. One of the most persistent criticisms of both the loyalty and the security program has been directed to the way the proceedings are often dragged out. From chronologies supplied to me by employees and their attorneys, it appears that intervals of a year, eighteen months, or even two years are not uncommon between the initiation of charges and the final decision. If the employee is at work all this time, the chief cost is in efficiency and peace of mind. But suspension without pay has been the routine first step in the security programs. Faced with the gamble that a long period of suspension may end well in clearance and an award of back pay, or may, on the other hand, end in dismissal, the employee must often feel constrained to abandon his defense and resign.

There is one other hazard. The appearance of new derogatory information reopens a case. A transfer to an agency that considers its standards more exacting than those of the prior place of employment reopens a case. A change in the security personnel or in the agency head or in congressional pressures may reopen a case. It is reported that John S. Service had been cleared seven times by the Department loyalty-security board before the Loyalty Review Board ordered his dismissal.

POWERS OF SECURITY OFFICERS

We have been talking about charges and hearings and review. We must remember that there are three features of the program which undercut whatever advantages these give the employee. In the following situations, the security officer's verdict is decisive:

1. Denial of hearings to applicants and probationary employees.

2. Routine suspension without pay of any employee against whom charges are brought.

3. Denial of access to classified material, without charges or hearing. This is a device that has not been mentioned before. It puts the employee in a sort of limbo if his normal occupation requires the use of confidential information. He is kept on the payroll, but the work that is found for him is probably unimportant. His incentive and his opportunities for advancement are both curtailed. It is a form of pressure that has been increasingly used.

With the security officers intervening at every stage of the proceeding, it is not surprising to hear that most stages can be bypassed if they exert even modest pressure. It is reported that in the State Department, where the new administration thought drastic action was necessary and put Mr. Scott McLeod in charge of effecting it, there was a practice of advising employees informally that charges would be brought against them in forty-eight hours, but that they were free to resign in the interim. There is no way of knowing how many resignations have occurred out of alarm or under pressure, or of estimating whether the people concerned could have met the standards of the programs at any particular time. We know that security officers do exert informal pressures and that some people resign without exercising the rights that the program gives them. Some observers whom I have talked to take this to be the main thrust of the program, behind the façade of regulations, hearings, and so forth. I think this position is exaggerated; but it would be an unrealistic picture that did not give considerable prominence to behind-the-scenes activities.

The influence of the new bureaucracy of security officers is probably evident in another trend that we have already noted. That is the growing "mechanization" of the program. You put a name in the investigative machinery. Along the way it may pick up derogatory information, mechanically defined. If there are two or three derogatory items on the processed product, it is stamped "security risk" and discarded. By comparison, a process that emphasizes hearings before persons who are not professional worriers about security is more likely to bring out the offsetting factors in the case.

We should, however, be skeptical of concluding that we have found the first cause of arbitrary decisions in the habits of security officers. They may simply be the faithful executors of a dominant public policy. That policy, which in turn has a multiple origin in our fears and alarms about security, boils down to a cautious phrase: Take no chances.

Whether this is a sensible policy is beyond the scope of these remarks. I have attempted only to explain briefly how these complex programs operate.

Ralph S. Brown, Jr., LL.B., New Haven, Connecticut, is professor of law in the Yale Law School, member of the New York Bar and the American Bar Association, chairman of the New Haven Civil Liberties Council, and member of the Board of Directors of the American Civil Liberties Union. He is at present engaged in a study of loyalty and security programs and their effect on employment, supported by the Louis S. Weiss Fund, Inc.

Due Process in Security Dismissals

By Eleanor Bontecou

I WAS given as a topic "Due Process in Security Dismissals." Instead, for reasons that I shall make plain, I am going to discuss a slightly broader subject; namely, procedure as defined by Judge Curtis Bok when he spoke last year at the national book award ceremonies. "Procedure," he said, "is not only due process, but the proper relation between ends and means." He added that "unless people have an instinct for procedure, their conception of basic human rights is a waste of effort."

Due Process Defined

In so far as due process represents "the deep-rooted demands of fair play" it is a broad and untechnical concept. But it still is a matter of law. On the whole, that law finds its specific expression in the Fifth and Sixth Amendments to the Constitution, in the Administrative Procedure Act, and in court decisions.

The requirements of the Fifth and Sixth Amendments are familiar. They are part of our custom and our tradition and our law. They provide that there shall be no double jeopardy; that no man shall be compelled to be a witness against himself; that an accused must be informed of the nature of the accusations against him, be confronted with the adverse witnesses, and have the right to counsel. The Administrative Procedure Act requires that in administrative tribunals even a man seeking benefits shall have the right to notice, hearing, counsel, full disclosure of evidence, and the right to cross-examine witnesses against him. He must be heard by an impartial tribunal in which the function of prosecutor and judge are separated and all presumptions shall be in his favor.

The constitutional requirements apply only to criminal prosecutions. Security proceedings, though certainly punitive in the nontechnical sense, are not criminal. The boards always say that they are not prosecutions but inquiries. The Administrative Procedure Act specifically excludes from its purview matters relating to personnel administration. So far, the courts have not developed standards of fair hearing in security dismissals. It seems, therefore, that as of today there is no due process of law in security cases. In the Peters case that is now before the courts the government is contending that there never can be. In these cases, they say, the President is the law.[1]

Rules for Conduct of Security Cases

The President has issued rules for the conduct of security cases. They permit double, treble, and quadruple jeopardy. In fact, an employee cannot be sure that he is out of jeopardy until he has left the government, and perhaps not even then—as Val Lorwin discovered. The accused is given only an imperfect right of disclosure of evidence, since it may be concealed in the interest of security. His right to a hearing, as that word is now understood in our law, is also imperfect. He is denied the right to be confronted with the adverse witnesses and may not even know their

[1] At the argument of this case before the Supreme Court the government abandoned this position.

identity. The separation of prosecutor and judge is partial only. The employee who in a security case invoked his constitutional right not to be a witness against himself would court immediate dismissal. The rule of the game is that all the presumptions are against him. In view of the extent to which security cases have been made a political issue the requirement of an impartial jury or tribunal cannot always be met. The pressure in particular cases may be too heavy. The only right now commonly looked upon as an essential part of due process that is unreservedly granted to an employee in a security case is the right to counsel. It would seem therefore that if I stuck close to my text I would have very little to talk about. I am glad to find an acceptable substitute in Judge Bok's concept of procedure, for there is plenty of procedure in these cases. Sometimes many days and several thousand pages of it.

Thurman Arnold, incidentally, takes the position that if we cannot have due process we had better let the procedure go.

Those who seek in the security cases to achieve a proper relation between ends and means are gravely handicapped by certain obstacles in their path. They are trying to do what Chief Justice Brian as long ago as the fifteenth century said was impossible for the Devil himself; what Gordon Gray called "searching a man's soul without violating his civil rights." Under the rules, they must find a way to reach fair decisions when relevant facts are concealed from them as well as from the accused person who is before them. Many of them have had no experience in the curious hybrid proceedings of security, which are neither interrogations nor adversary proceedings but smack of both. There now seems to be no common agreement as to the ends they seek, no generally accepted definition of the concepts "national security" and "security risk."

The Government's Position

In its brief in the Peters case the government takes the position that in the security program it is doing the very best it can. It says "The program has been carried out in the fullest possible conformity with the basic Anglo-American traditions of individual liberty" and claims that the government has provided "the maximum hearing process consistent with the paramount objective of the program."

The government says further that it cannot give a man the right to face his accusers in these cases because it cannot produce witnesses without disclosing "necessary sources of delicate information" and "extremely delicate and confidential techniques." It then contends that it meets the demands of basic fairness in the circumstances in that it provides that decision shall be made by "Boards carefully selected," who engage in "the most careful examination and sifting of all available material," and make their decisions on the basis of "information satisfactorily evaluated."

I think it will be useful to examine these contentions. For though the government is speaking of the loyalty program, what it says applies equally to the security program. It is quite true that these two programs were devised as a kind of preventive counterintelligence operation. I think that the government expected through them to uncover Communist agents in its ranks, as well as to prevent further infiltration. As a matter of fact, it has not worked out that way. Apparently, the Communist agents had been separated from the government before the program began to function—or else they have not been uncovered. Seth Richardson testified at the end of his service as chairman of the Loyalty Review Board that they

had not found "a single syllable of evidence to show that any employee was involved in espionage."

As Miss Perkins put it, almost no big fish have been caught in the net, although hundreds of little ones have. This being so, we may well ask whether techniques designed to catch barracuda really apply to fishing for minnows.

VARIATIONS IN PRACTICE

An examination of the record of many loyalty cases suggests that the government's contention that it has provided "the maximum hearing process consistent with the objectives of the program" is not correct. I say this because a few boards have gone much farther in the observance of Anglo-American traditions of individual liberty than they were required to by the rules laid down. Before a hearing began, they informed the accused fully as to the derogatory information in their files. They gave him the names of the nonconfidential witnesses against him and tried very hard to bring the adverse witnesses into the hearings. Some of them traveled to various cities to make this possible. There was never any suggestion that the government was hurt by these practices, but neither were they made obligatory for all boards. Today some agencies try to bring in witnesses; others do not.

SOURCES OF INFORMATION

The most serious departure from the tradition of due process in the security program is the refusal to inform the accused fully as to the information against him or to give him the right to face his accusers. What are the "delicate sources of information" and the "delicate techniques" that the government says would be destroyed if this were done? They certainly include the following: the genuine undercover agent, the paid informant, the casual informant who seeks to have his identity concealed, the files of investigative agencies other than the Federal Bureau of Investigation, including the local police and such records as telephone taps, dictaphone tapes, and letters extracted from the trash or perhaps turned over to investigators by employees turned informer. Symbols in the report indicate the character of the various sources but these symbols are not explained to the boards.

UNDERCOVER AGENTS

The undercover agent is certainly an important instrument of counterintelligence and probably a reliable informant. It is true that once his identity is disclosed his usefulness is over. We cannot expect an investigative agency to consent to that disclosure and so far as this class of informants is concerned the government's argument is valid. It is probably true, however, that in the great majority of cases the undercover agent plays no part. Ernest Angell, who was chairman of the Loyalty Review Board in New York, said that this was the case in his jurisdiction, and Shippen Lewis reported the same thing in the Philadelphia region. Undercover agents, moreover, are bound to turn in information about things they hear, as well as things that they know. It is also possible that they may misinterpret the things that they know. This seems to have been the case when Mrs. Markward, who certainly is a reliable and conscientious informant, testified that Mrs. Annie Lee Moss was on her list for the District of Columbia. The name definitely was there, and apparently it referred to the Annie Lee Moss in question. But it must have got there through some hocus-pocus of which Mrs. Markward knew nothing. When she and Annie Lee Moss finally faced each other they both agreed that they had never seen each other.

EX-COMMUNIST WITNESSES

The paid informer and the professional anti-Communist witness present a different problem. Most of the ex-Communists fall in this class, and Whittaker Chambers himself has described the inherent weakness in the testimony of even the most reliable members of this group. When questioned by the McCarran committee several years after he had first been brought into the open, he said that he could no longer be sure in many cases whether he was speaking of his own knowledge or whether he was simply repeating things that he had been told after he had left the party. Not many of these witnesses are capable of this kind of self-analysis.

The bizarre case of Harvey Matusow, who now says he lied 245 times when he testified against alleged Communists, highlights the extreme possibility of false witness in such cases. There are other examples of unreliability. Paul Crouch has been under investigation by the Department of Justice for alleged false statements. George Hewitt was indicted for perjury because of his testimony before the Canwell committee in Washington State. In the case against Ralph Bunche in the United Nations, Manning Johnson—a regular witness in deportation cases—discovered that he had been basing certain testimony on false premises and did not really know what he was talking about. Certainly at best these informers are not wholly disinterested witnesses. In deportation cases they were required to appear and face the accused. The whole question of their anonymity in security cases would bear looking into. Once they have appeared in the open as informers, no matter whether before the courts, in administrative proceedings, or in Congress, they certainly should not be permitted to wear the cloak of anonymity simply because they request it.

ORDINARY CITIZENS

The ordinary citizen who requests anonymity is probably the most prolific of informers in security cases. Much that he has to say is a matter of opinion. Sometimes it reflects malice, ignorance, or bigotry. But this is not always evident on the face of the record. It is one of the unshakable tenets of all the investigative agencies that if these people are obliged to stand by their statements openly the sources of information will dry up.

Again, chairmen of loyalty and security boards have felt that careful analysis of the bulk of the cases would show that the information actually obtained from this group of people is not worth the price that is paid for it. Just what can happen in such cases is dramatically illustrated in two cases recently made public—that of Abraham Chasanow and that of Val Lorwin.

CHASANOW OF GREENBELT

Mr. Chasanow is one of the most respected citizens of Greenbelt—a little Maryland town that began as a low-cost housing project. It was put down in the middle of nowhere and in order to provide for their daily needs for groceries, gasoline, and so forth, its citizens organized a co-operative that now runs all the Greenbelt business enterprises. As a result, some of the people that came to live at Greenbelt did so because they were evangelical believers in the co-operative movement. Others accepted it simply as a practical solution to their problems. The custom grew up of referring to the first group as the radical co-operators. When Congress decided that all the federal housing projects must be turned over to private ownership, the Greenbelt citizens organized to buy their own homes, and Mr.

Chasanow acted as attorney for the housing association they formed for this purpose. Eventually, this was turned into a co-operative because better financing terms could be obtained.

But there were some hot arguments for and against co-operative ownership. A group of the residents who had always lived on subsidized rentals bitterly opposed the idea of purchase and concluded that those who supported the co-operative were subversive, since by their activities they were hurting the economic interests of their opponents. The opposition group reported its suspicions to their Congressman, investigation was started, and apparently a rather bulky file was developed for Mr. Chasanow, whose name appeared as attorney on the eviction notices which were sent out to some of the recalcitrant tenants.

When the new administration took over, charges were filed against him under the security program. Apparently, according to the file, several of the town officials had given unfavorable information about him but were willing to appear at his hearing. They did so, and proved to be his strong supporters. They had described the shades of opinion in the co-operative controversy, and their testimony had been twisted to mean that anyone who worked for the co-operative group had associated with a Communist group. This distortion occurred in at least three instances. There was nothing in the file to indicate such misreporting to the board. The final outcome, after much delay, was a clearance and a public apology to Mr. Chasanow. Unless his accusers had appeared in person this would never have happened.

VAL LORWIN

The Lorwin case is perhaps an even more dramatic illustration of the ill effects of concealment of identity of accusers. Val Lorwin when he came to Washington in 1935 joined the Socialist party and soon became a very active anti-Communist. He fought to oust the Communists from their control of the United Federal Workers of America (UFWA) and some other organizations. Later he rendered valuable service to the Office of Strategic Services and to the State Department by his ability to distinguish the Communist elements in the foreign labor movement and in the resistance movement in France. He evolved policies that were useful in spiking the guns of those who opposed the Marshall Plan in Europe and in gaining the support of the American unions for that plan.

When the loyalty program began he received an interrogatory from the State Department based largely on his necessary association with some of the Communists who had been in UFWA. He was quickly cleared. He was on leave from the State Department and in Paris working on a study of the French labor movement when he received a letter of charges from the State Department and was ordered home at once for a hearing. He was charged with having admitted Communist membership in 1935, having held a Communist meeting in his house, and having displayed his party card. He was told that this information had been given to the FBI by a thoroughly reliable witness who was willing to appear before the State Department board, but not in Lorwin's presence.

After going over some fifty names of people whom he knew in 1935, he and his wife decided that there was only one who could have been at a meeting at his house at that time and have so misunderstood the situation. He planned his defense on the theory that this person, who hated equally Socialists and Communists, was the informant, but he was never sure about this.

In the course of the hearing, he discovered that according to the file there were two other confidential informants who alleged that he had been a Communist, and he was asked how he could explain this—obviously it bothered the State Department loyalty board.

After this first hearing, he was cleared on grounds of loyalty but was labeled a security risk, apparently because of the doubt raised by unknown informers. He asked for a rehearing and presented detailed, conclusive evidence of twenty-five years of anti-Communist activity. After a long delay he was cleared on both scores.

He then resigned from the government and went to a teaching position at the University of Chicago. After he had been there about four months, there was an announcement on the radio that Lorwin had been indicted in Washington for making false statements as to his Communist record. Now that the case was in the courts, he had the right to see the documentary evidence against him. It turned out that he was right in his conjecture as to the identity of the principal informant. Suddenly his case took a dramatic turn. The head of the Criminal Division appeared in court and asked to have the indictment dismissed. He explained that the Grand Jury had been told that the testimony of the principal informant would be corroborated by two undercover FBI agents. Actually, there were no such persons, although according to the file they appeared to exist. The FBI had been asked to reinterview these supposed informants. It then turned out that one was only repeating something he had heard and the other stated that he had been falsely reported. None of this appeared on the face of the file. The prosecutor, who had obtained the indictment in spite of this report of the FBI, said that he did it because he thought it would be better to get it by hook or by crook than to have to explain to a Senate committee why he had failed to get it.

QUESTIONING INFORMANTS

There is absolutely no way of knowing in how many cases the supposed informants are equally unreliable or have had their information wrongly reported. My examination of a number of transcripts of loyalty and security cases suggests that it is an appreciable number—say about 8 per cent.

In view of the booby traps presented by the files, I think we must conclude that in any critical case the information cannot be satisfactorily evaluated unless the board itself can question the informants and in many cases not unless the accused can cross-examine him—at least by submitting questions to the board for the board to put to the witness.

FIRST EVALUATION BY FBI

There is another obstacle to satisfactory evaluation by the boards. In the case of the undercover agent and the paid informer, Mr. Hoover admits that the FBI itself makes the first evaluation. The board gets a predigested report of their testimony. The Bureau summarizes the material in its files and deletes anything that it thinks might reveal the source of the information and the manner in which it has been obtained. It does not say whether the information has come from an undercover agent, a paid informant, or a telephone tap, whether it amounts to first-hand information or hearsay. The Bureau evaluates further by describing the source as a reliable informant, someone who has given reliable information, and so forth, but unless questioned further says no more. The pitfalls of this system are illustrated by the Lorwin case. Imperfect evaluation is the result.

TECHNIQUES OF INQUIRY

Techniques of inquiry are very important. Curiously, very little attention seems to have been given to this problem. When the boards say that they are concerned with an inquiry and not a prosecution, some of them do not seem to understand the meaning of the words they use. Too often the techniques are those of prosecutions. The employee and perhaps his witnesses are subjected to rigorous cross-examination—sometimes of the bullying variety that is intended to confuse a jury as well as to break down the witness. He has no countervailing privilege, and we discover that when cross-examination is one-sided it tends to defeat its own purpose. The truth is obscured rather than made plain.

Many boards adopt the practice of questioning an employee on matters as to which they have full information in their files. This soon becomes evident and the employee feels that they are trying to trap him into making false statements. If he becomes wary and tries to qualify his answers—which often relate to matters that occurred many years ago—he may be accused of evasion and ordered to say "Yes" or "No." He may then act like an undergraduate taking a true-false examination and guess—perhaps guess wrong. The result is an angry, frightened, or confused employee from whom the boards will not get the full story that they need in order to judge him. Those who use the techniques described seem to lack the instinct for procedure, and, as Judge Bok points out, their concern for human rights is a waste of effort.

LACK OF WELL-DEFINED CRITERIA

It is hard to see how basic fairness can be achieved until we develop well-defined standards that apply equally in all cases. There is a special difficulty in security cases in achieving this objective, since the degree of sensitivity of the work that is to be done must always be taken into account. There can, I think, be common agreement as to definition of terms, and this does not yet seem to have been achieved in the security program. In the days of the loyalty program the term "security risk" was reserved for persons who held sensitive positions. The questions to be asked were whether the employee was loyal and whether he was able to keep secrets. In the Oppenheimer case these criteria were definitely rejected by the hearing board, and apparently by all but one of the commissioners. But there was no agreement on any other definition. The Wolf Ladejinsky case seems to make it clear that no such definition exists. Ladejinsky is a Russian-born American citizen who came to this country when he was eighteen years old. He has served the federal government since 1935. During the occupation of Japan he worked on General MacArthur's staff and there put through a land reform that was said to have done more than any one thing to prevent the Communists from making headway in Japan. When the treaty with Japan was signed, he became our first agricultural attaché in Tokyo, serving under the State Department, and was cleared for security by the redoubtable Scott McLeod. Then jurisdiction over agricultural attachés was transferred to the Department of Agriculture. The duties of the attaché were not changed, but Ladejinsky found himself ousted from the position and labeled a security risk. This happened, it developed, largely because of a curious letter written by a White Russian who hated Jews. The State Department refused to accept the Agriculture label and kept Ladejinsky on its rolls. Recently the Foreign Operations Administration hired him to continue his good work in land reform in the sensitive areas of Southeast Asia. The White House then said, in substance, that everyone was right about him. Until the ends of the program are more precisely, more realistically, defined, either by Presidential order or by some central review body, I do not think that we can hope that basic fairness or a just relation between means and ends can be achieved.

Eleanor Bontecou, J.D., Ph.D., Arlington, Virginia, is the author of The Federal Loyalty-Security Program (1953). She was formerly assistant director of research of the Cornell Research in Civil Liberties; dean of Bryn Mawr College; professor in the Graduate School of Social Service Administration, University of Chicago; attorney, Civil Rights and Research Sections, Criminal Division, Department of Justice; and attorney-advisor, War Crimes Branch, Civil Affairs Division, War Department. She is a member of the bar of New York State and has practiced law in New York City.

Morale in the Federal Civil Service

By Marie Jahoda

THE nationwide debate on the security measures has over the last several years frequently focused on the issue, What is the net effect of these programs? Some people maintain that the effect is disastrous; others say that there is hardly any harmful effect.

Let me first give you two arguments supporting the latter view.

If we take the official statements on the number of people dismissed from government service for security reasons —and I realize that there are some peculiarly difficult arithmetical problems to solve in counting such persons— there is general consensus that only a very small fraction of federal employees in government service has been directly affected by security measures. Thus, some people argue, the number of those who may have suffered innocently from security procedures is so small as to be socially insignificant.

Those who use this argument are also often inclined to point to the absence of a general hysteria in the population at large, as evidence that the security measures have done no harm to the country. In the light of a recent study,[1] the factual point of this argument appears to be correct. Only a minute fraction of the public—at best 2 per cent—expresses any concern with civil liberties or Communism. People worry about many things, but certainly not about the consequences of the security measures.

On the face of it, such facts might suggest that some of us get unduly excited about the social climate of the country.

However, there are weightier arguments in favor of a less complacent conclusion. Indeed, I want to suggest that one of the consequences of the security program is that it has affected not only the people who have lost their jobs— some innocent individuals, some who should not work for the government in difficult times—but that *the morale of the entire civil service has probably been undermined,* even though only a minute fraction of government workers has been directly and personally affected by the programs.

What is the evidence for this statement? At this point I am afraid I have to apologize because my evidence is not up to date. More than three years ago we made a study in Washington, D. C., among federal employees of professional rank to try to discover the impact of security measures on their morale.[2] This was an exploratory study resulting in ideas and suggestions rather than in exact quantitative statements. The only justification for presenting this material to you is that nobody else has apparently been in a position to appraise the psychological effects of the security measures on the civil service since then.

The study concentrated on those federal employees about whom no derogatory information emerged from the universal routine investigation conducted for every federal employee. We have distinguished three major areas in which

[2] Marie Jahoda and Stuart W. Cook, "Security Measures and Freedom of Thought," *Yale Law Journal,* Vol. 61 (March 1952), pp. 295–333.

psychological effects of security measures can be noted. These three areas are: the generally accepted code of the behavior for a government employee; the level of suspicion and confidence in personal relations; and the emergence of new marginal groups in society.

Do's and Don't's

Let me briefly describe to you what we found in these three areas. In every bureaucracy, and particularly in a governmental bureaucracy, there are certain regulations and prescriptions about the do's and don't's appropriate for a position. No society could function without such generally accepted rules. But the code of behavior described to us by federal employees had undergone a change in terms of being more concrete and more narrow than it had been before. No longer was appropriate behavior defined in terms of general principles such as discretion, decorum, or responsibility. Rather federal employees said: You should not discuss the admission of Red China to the U.N.; you should not advocate interracial equality; you should not mix with people unless you know them very well; if you want to read the *Nation* you should not take it to the office; if you bring it to the office, you should explain in considerable detail why you have it with you; you should take certain books off your private bookshelves; and so forth. The very concreteness of this code seemed to encourage excessive conformity.

Personal Relations

Let me go on to the second area, suspicion and confidence in personal relations. At work and in social contacts outside the job, suspicion seemed to have replaced confidence. The interviewers themselves were occasionally suspected of being agents of the Federal Bureau of Investigation or Communists. But more important from the point of view of efficiency within governmental departments, confidence in colleagues and supervisors seemed to be on the decline. We asked people, for example, whom they would expect to come to their support if they themselves were involved in a security investigation. Many answered, "Nobody, and certainly not my colleagues." The respondents themselves often said they would not offer any help in such a situation, in part because they felt that others could not be trusted, in part because they felt that the demonstration of trust in such a situation might have dangerous consequences.

Marginal Groups

The third area apparently affected by the security situation is the position of certain groups within the larger community. Some groups which previously had been fully accepted now became frequently the target of suspicion. The most outstanding example of the effect of the security measures in this area was the changing position of participants in voluntary organizations. Anybody who was active in an organization concerned with social reform or the spread of ideas was said to be a target for suspicion.

In our democracy certain groups have always had a marginal status: Negroes, for instance, and the Jews, and various other groups. While the position of such traditionally marginal groups is improving in many ways, new groups are becoming marginal in response to the climate of suspicion.

Climate of Conformity

If the impact of the security measures in these three areas is as strong as the exploratory study led one to believe, the

efficiency of government service is undoubtedly diminished. It should be noted that such effects go beyond the officially proclaimed purposes of the security procedures; they are largely unanticipated by-products of measures intended to safeguard internal security. How can we understand the reasons for such widespread effects in areas not relevant to internal security and among people not directly exposed to special investigations?

In summary fashion the two preceding articles in this issue have implied these reasons. Federal employees felt the need to react in an overcautious way because the procedures of the security program were vague, unpredictable, and not based on clear criteria of innocence or guilt.

Let me try to make this clear. The punishment inherent in a security investigation is meted out long before it has been established whether a punishable act has been committed. Salaries are suspended. Reputations are attacked. Job opportunities outside the civil service are undercut by the publicity of security investigations. A fine (in terms of having to hire a lawyer) is imposed. Everything that the clearance procedures intend to do for suspected individuals is undone already in the process of investigation.

Since government employees not themselves involved in special investigations watched what was going on around them, they became convinced that establishing one's innocence was of no avail. Avoiding the process of investigation, even if it meant final clearance, became the important thing.

This is one reason for the exaggerated effect of the security procedures on the morale of civil servants. There were others too. At that time in Washington many federal employees *unwittingly* intensified the climate of conformism, whatever their own attitude toward the security measures. The results of the security program were the content of innumerable discussions. Everybody was concerned with it, and everybody spread stories about it. Some people for example said with apparent approval: "Nobody who reads Marx can stay in government service." Others expressed their disapproval in spreading the same story by saying: "Isn't it terrible that people lose their jobs, if they read Marx?" The net effect of either statement was to make others believe that it was dangerous to read Marx.

Out of the Past

Another reason for their overcautious behavior was the fact that employees were judged not in terms of their current activities but in terms of activities in which they had engaged years ago. In 1939 an organization may have been generally respected; fifteen years later this organization is regarded as suspect. Those who belonged to it in the past are put in a situation of helplessness. What they had done in the past, supported by the climate of the thirties, they cannot undo now; it may nevertheless confront them at this moment as a current accusation.

This time factor is indeed a very serious point also in another respect. I understand that at one time or another there were something like 700,000 people in the Communist party of this country. If we assume that about 200,000 people have died, it leaves about half a million persons with this black mark on their record, even though they may have been members only for a few months many years ago. It is indeed understandable that such persons overdo their caution and conformism; for having rejected the mistakes in their past is no help in their predicament.

Intensifying and Mitigating Factors

I should like to add one word about factors which increased and factors which diminished these effects.

We talked to government employees from about fifteen different departments, including departments on sensitive and on nonsensitive work. However, the degree of sensitivity of the task bore no relation to the degree of effect. Even in the most sensitive agencies some employees seemed to be very little affected by the climate of fear and conformity. In other agencies where work was not related to security problems we found the most widespread fear and suspicion. Apparently the general atmosphere at work, apart from security implications, had much to do with how employees reacted to the security measures. One relatively high-placed government official told us that he had to write out a report explaining what the reason was if he was five minutes late in the morning. He clearly implied that this did not make for an ideal working situation. His conformism and fear were of the highest order. In other government departments, where human and working relations were more satisfactory, the impact of the security measures on the climate of thought was not quite so extreme.

Perhaps the most powerful factor affecting the morale of the civil service was the explicit attitude a supervisor at work took with regard to security policy. In cases where superiors had discussed with the people under them what the situation was and said that they would try to help and stand by them, much less harmful effect could be noted than where this was not the case.

This, then, is a brief summary of an exploratory study. Its most telling lesson has, unfortunately, not yet been implemented: if we want to appraise the security program, more comprehensive and definitive studies on the impact of current procedures should be available. There can be little doubt that the security program did not intend the consequences I have briefly sketched. Solid evidence that they nevertheless occur may be the best way of bringing about their radical revision.

Marie Jahoda, Ph.D., New York City, has been since 1949 professor of psychology at New York University and associate research director of the university's Research Center for Human Relations. She was formerly research associate at Columbia University, member of the Scientific Department of the American Jewish Committee, and fellow in social psychology at Cambridge University.

The Constitutional Privilege Against Self-Incrimination

By Telford Taylor

THE preceding article by President Taylor of Sarah Lawrence College covers very fully and clearly the question of the impact of the Fifth Amendment in the academic world. University presidents and professors, however, need not feel lonely in this field, for in my own profession there is now a strong movement in some quarters to disbar all lawyers who plead the Fifth Amendment. Indeed in the State of Florida it has already been held that a lawyer who pleads the Fifth Amendment should be disbarred. I am pleased to say that in California, whether because of greater common sense or of jealous rivalry with Florida, they have come to the other conclusion and have held that this is not in itself grounds for disbarment.

But this problem as to what is going to happen to somebody who pleads the Fifth Amendment is not by any means restricted to the learned professions. A few days ago I saw in the newspapers that a secondhand piano dealer in the District of Columbia who had pleaded the Fifth Amendment before a meeting of the House Un-American Activities Committee had been denied a renewal of his license to deal in secondhand merchandise.

Things are no better in New York State. Recently the State Senate unanimously passed a bill which would authorize all employers to discharge all employees who plead the Fifth Amendment—an authorization not restricted to defense work or government work or any other especially sensitive areas.

You can see, then, that when we are talking about the Fifth Amendment it is no abstract or dry legal question that we are discussing. This is an intensely human problem which is now having a broad impact on American life.

Since that is the nature of this question, I do not propose to deliver myself of a sort of law school type of lecture, carefully analyzing all the fine legal points that could be brought up about the use of the Fifth Amendment. What I want to try to do is to illuminate how we ought to view the Fifth Amendment in the context of the theme of internal security and civil rights.

Before we can do that, before we can approach this question of what inferences we may draw from the use of the Fifth Amendment, we have to have some common ground, some common understanding of what the nature and purpose of this amendment is. Of course, when I say Fifth Amendment I mean that part of it which contains the privilege against self-incrimination, the actual words being, ". . . nor shall any person . . . be compelled in any criminal case to be a witness against himself. . . ."

For the Innocent or the Guilty?

It is a misunderstanding about the basic purpose of this provision of the Constitution that lies at the root of a great deal of the angry confusion now prevalent in the public mind. Indeed we encounter violent disagreement at the very threshold of the question when we ask for whose benefit this provision is intended: Is it for the benefit of the innocent or for the benefit of the guilty?

The old British judges who first called this privilege into being said it was for the benefit of the innocent, and Elmer Davis also in one of his recent books speaks of it as being for the benefit of

the innocent. But Judge Arnold's partner, Mr. Abe Fortas, has written an article saying that the guilty are the ones who are really entitled to the benefits of the Fifth Amendment. Certainly that is closer to the point of view of most of our congressional committees today. These committees have a nice little formula. They call a witness to the stand. If he pleads the privilege against self-incrimination when asked whether he is or has ever been a Communist, then the chairman says, "Well, you see, that shows that you must be a Communist because if you were not a Communist then you would answer 'No' and it would not incriminate you. Therefore the only implication that the Committee can draw from your pleading the privilege is that a truthful answer would be 'Yes'; and we don't deny that you are entitled to plead this privilege, but we do say that we therefore conclude that you are indeed a Communist."

If the privilege is for the benefit of the innocent, why do they need it? Or if the privilege is for the benefit of the guilty, why do they deserve it? What is the point of letting them utilize this privilege if they are indeed guilty? This leaves us in a dilemma, for if the innocent do not need it and the guilty do not deserve it, what is it doing in the Constitution at all?

A Page of History

I think that this dilemma yields quite readily to a moment of history. Justice Holmes is the author of the probably too frequently quoted aphorism that "a page of history is worth a volume of logic." Here is a case where about one page of history will, I hope, pretty well clear up the question.

English origins

The origins of this privilege against self-accusation are well known. They go back to the thirteenth century and the document we call the Magna Charta. In origin this concept was simply that a man could not be required to be his own first accuser. At that time the methods of trial were rigorous and arduous indeed. They did not have juries and lawyers to examine and cross-examine; they had trial by battle and trial by ordeal, of fire or water. If you were accused of a crime, it was more than likely that you would be asked to walk barefoot over red-hot plowshares. Nobody found this any fun, and it put people at the mercy of some vengeful bailiff or legal functionary who might invite one to stand trial at his own sweet will. In order, then, to protect people against that kind of thing, it became pretty well settled that nobody could make you stand trial unless there was already some evidence against you. In church law, too, torture was frequently used in heresy trials; we have the coldly comforting principle laid down by Pope Gregory IX that torture shall never be resorted to until some evidence has been introduced.

For several centuries the principle that you could not be your own first accuser persisted in the law, but it did not go further than that. If there was some evidence to start the ball rolling you could be called upon to take the stand and say whether you were guilty or innocent and to testify further.

The privilege in its present form of an absolute protection against being called to testify came about in the seventeenth and eighteenth centuries in England, when there was a great development of criminal law and procedure. A whole parcel of principles were evolved at that time to protect the individual in various ways. Protections against political and religious persecutions and provisions to ensure fair trial, as we know them today, grew up during that period. This privilege against

being required to testify against yourself is one of that whole parcel of legal concepts that sprang into being during those years. It is a part of the historical establishment of a balance, a balance between the power of the state and the rights of the individual, which I suppose more than anything else is the essence of modern democracy.

In the United States

The privilege grew up, then, and passed across the ocean, and we find it in our own colonial law well before the establishment of this government. It was written into the federal Constitution and into most of the early state constitutions, and indeed it is now found in every state constitution except two, those of New Jersey and Iowa. But even these two apostate states recognize it as a matter of common law.

Balance between state and individual

Now let us acknowledge immediately that although this privilege is well established in constitutions, its wisdom is not universally acclaimed. For instance, the great philosopher Jeremy Bentham said it was a very unscientific sort of rule, that if you were really going to try to determine whether a man was guilty or innocent you ought to be allowed to make him testify. There is no need to rehash all the arguments pro and con on that point, because these arguments, I think, overlook the basic principle, namely, that this privilege, like those other privileges that I have mentioned, is part of the balance between the state and the individual.

Law enforcement

After all, the process of law enforcement is not the only thing in life, and indeed law as a science is not a science merely of finding out who is guilty or who is innocent. It is also a matter of establishing a system of justice that does not disrupt everything else in life. I suppose that Orwell's *Nineteen Eighty-Four* seemed so horrible to us because everything in life was geared to law enforcement. We could probably avoid a good deal of crime if every telephone were tapped and every room had a microphone in it, but there would be a lot less life. We could avoid a lot of fires and explosions if we had no heat in our buildings and no power in our trains, but we should have a lot less life too if we did that. We pay that small price—tolerance of some undetected crime—in return for the social atmosphere and the political freedom that we want to preserve. And that is one purpose of this privilege.

FOR BENEFIT OF THE ACCUSED

Now, after this short historical excursion, let us come back to the main question: Is this rule for the benefit of the innocent or the guilty? I think once we get that out of the way, the rest will be relatively clear sailing. It may help us if we look at the other guarantees of freedom that are in our Bill of Rights, because this privilege is in there along with many others: jury trial, right of counsel, and a lot of other things. Are those rules for the benefit of the innocent or the guilty? Immediately the question sounds rather silly.

I suppose in the ultimate sense all these legal rules are to protect the innocent and apprehend the guilty, because that is the ultimate purpose of law; but this does not mean that these rules come into play only when it is known in advance that the person is innocent, because if we knew that in advance there would be no reason to have trials or rules at all. This, I think, guides us to the answer. These are rules for the benefit of the *accused* before it is known whether he is innocent or guilty. It makes no sense to speak of them as being for the innocent or for the guilty: they are both. They are for the benefit of the accused and they are part of the very process of deciding whether or not he is guilty—what you might call prophylactic rules, part of the judicial process.

To use a homely illustration: If any of you are worried about your weight, I hope you do not blame it on the scales. The scales tell you whether you are heavy or light. Just so, this principle and others are the principles that we apply in determining whether a charge is true and whether a person is guilty or innocent. It follows that pleading the privilege does not establish guilt. It is one of the things that is applied in the process before we arrive at the answer.

Perhaps you will say that all this is fine in legal theory, but let us talk common sense. Why does an innocent man really need this privilege? Does it not raise the inference of his probable guilt if he uses it? Why does he not stand up like a man and say what the facts are?

I think on this point we now have to recall that whether you are guilty or innocent is not a philosophical absolute; it is what the jury decides. And what the jury decides might be right or might be wrong. They decide it on the basis of the evidence before them. If you yourself under accusation are the source of evidence which arouses suspicion, which might establish guilt, then you have put yourself in a worse position before the jury.

TWO EXAMPLES

Examples are readily come by. I should like to give an abstract one very briefly and a concrete one at a little more length. If you are accused of murder, the question of motive is important and the question of your proximity to the crime is important. It may be that you yourself are the only possible source of evidence as to where you were or as to your having a motive, and if you yourself took the stand and said where you were and what your motive might have been, then to establish your innocence you might have to go forward and show that in fact somebody else did it or that you had killed in self-defense. One of these things might be true, but it might be difficult for you to prove it and to make the jury believe it, and so you would really have imperiled yourself by giving that testimony to establish the evidentiary basis which then called upon you to come forward in defense.

Let us now get away from abstractions and use a concrete case which brings us right back to the academic pastures. This is an actual case that occurred at Cornell University sixty years ago, when the habits of Freshmen and Sophomores with respect to hazing were somewhat more violent than they are today, I hope.

At all events, at Cornell University in 1894 the freshman class gave its annual banquet. The Freshmen, of course, were an object of scorn to the Sophomores, and it had always been part of the game for the Sophomores to upset this banquet. In this particular year they took some rather drastic steps. They had all been taking chemistry, so they put two large jugs underneath the banquet hall where the banquet was to be held, bored holes through the floor of the hall, ran tubes up, and then created a lot of chlorine gas in these jugs. The chlorine gas went up the tubes and into the banquet hall, and very effectively disrupted the freshman banquet. But it did a good deal more than that. It made nearly all the Freshmen very sick indeed. Further, it most unfortunately killed the cook in the kitchen.

The result of this prank having been homicide, the grand jury was called into the situation to look into who was responsible for this chlorine gas affair.

They called a student (another Taylor) before the grand jury. He was not even the chief suspect. He was not the person who was thought to be responsible, but he was the roommate of the boy who was the chief suspect. He was a Sophomore, and he had been studying chemistry, and he admitted under examination that he knew how to make chlorine gas. At that point he pleaded the Fifth Amendment, because they went on to try to question him about where the jugs were bought, how much was paid for them, who bought the jugs, and all that kind of thing. At that point he said No, he would testify no further, and pleaded his privilege against self-incrimination.

As I have said, he was not the chief suspect. So it is a case of an innocent person finding himself in a situation where he needed to plead the Fifth Amendment, and the Court of Appeals in the State of New York in a very excellent and full opinion noted that even though he was innocent, things had reached a point where it was reasonable and proper for him to plead the Fifth Amendment, because otherwise his testimony might have built up such a circumstantial case against himself that although innocent he would have had grave trouble in meeting it. The court said at the end:

> It is quite conceivable that a person may be placed in such circumstances connected with the commission of a criminal offense that if required to disclose other facts within his knowledge he might, though innocent, be looked upon as the guilty party and convicted.

This case is as good an illustration as I know to bring out the necessity that an innocent person may in some circumstances have to plead this privilege.

CONGRESSIONAL INVESTIGATIONS

Everything I have gone through so far has been, one would have thought, familiar to lawyers for a long time and taken for granted. Now to bring the question a little closer to our theme: What application does all this have to congressional investigations and to security problems?

There never has been much question but that the privilege against self-accusation may be invoked by a witness in a congressional investigation. Indeed, the first time it happened, so far as I know, was right here in Philadelphia, and the person who did it bore a very distinguished Philadelphia name; to wit, Biddle. Nicholas Biddle, president of the second United States Bank, was the first person to invoke the privilege in response to a demand from a congressional investigation. The second one—poetic justice—was Andrew Jackson, upon whom a demand was made a few years later for information about the spoils system.

Then, finally, the third example, so far as I know, and a rather amusingly contemporaneous one, was President Ulysses S. Grant. He was fond of taking long vacations, and the last two years of his second term of office he took the entire summer off and came up to Long Branch, New Jersey, right near Fort Monmouth. Having spent the entire summer there, he then went back to the capital and was confronted with a resolution from the House of Representatives asking him for a list of every executive act he had performed at a distance from the White House. (I hope Governor Leader is taking due note of this little problem.) Of course, the purpose of this demand was to emphasize the absentee character of his administration. Grant replied by saying he could see no legitimate legislative purpose for it and therefore it must be, he thought, for purposes of impeachment. That being so, he begged to inform the House of Representatives that there is a constitutional provision which protects

everyone in the land, from the President to the humblest citizen, against being made a witness against himself. He declined to give the information.

I suppose that our present-day friends would call President Grant a Fifth Amendment loafer, but nobody at that time said anything like that. It was taken for granted as a perfectly respectable thing to do.

THE CRIMINAL ACT

We next have to examine what criminal act is involved when a person is called before a congressional committee and asked whether he is or has ever been a Communist; or, rather, what the possible crime is, what the hazard of prosecution that he may be confronting.

Since 1940 we have put on the books a succession of laws that create this hazard. In 1940 we put the Smith Act on the books, making it a crime to conspire to overthrow the government or to conspire to advocate its overthrow or to be a member of a group that advocates the overthrow, knowing that it does so. These clauses are pretty broad, and it has now been fairly well established that a responsible membership in the Communist party is indictable under the Smith Act. Ten years later the Internal Security Act of 1950 was passed, in which Congress declared:

> It shall be unlawful for any person knowingly to combine, conspire, or agree with any other person to perform any act which would substantially contribute to the establishment within the United States of a totalitarian dictatorship, . . . the direction and control of which is to be vested in, or exercised by or under the domination or control of any foreign government, foreign organization, or foreign individual: *Provided, however,* That this subsection shall not apply to the proposal of a constitutional amendment.

A lot of us may have very different ideas about what sort of conduct tends to establish a totalitarian government in this country. I can think of a number of people that I might have on my list. You can see how broad your vulnerability to prosecution may be under that law.

Who is a Communist?

As if that were not enough, at the closing session of Congress last year there was enacted the Communist Control Act of 1954, which has added various new penalties and also has set up fourteen criteria by which Communists can be detected. All these fourteen things are things that you can submit to the jury as evidence of the fact that you are a Communist.

One of these criteria, for example, reads: "Anyone who has indicated by word, action, conduct, writing, or in any other way a willingness to carry out in any manner and to any degree the plans, desires, objectives or purposes of the Communist Party." If you think back to all the points of view that have been prevalent in this country since the middle thirties—economic reforms and the depression, the Spanish Civil War, the united front against nazism, the alliance with Russia in World War II, various peace movements since World War II, German rearmament, racial discrimination—all these are matters and issues upon which there have been many parallelisms between Communism and anti-Communism or non-Communists. Indeed, I cannot think of anyone who has played a responsible part in public life and taken a position on political issues who is not now in a position to plead the privilege. I certainly think our President is. He wears the Order of Suvorov. He has been allied with Communist

governments in a number of very important ventures, and successful ones. I can think of many other high officials of the present administration who could be vulnerable under those provisions.

What we have done by these laws, in other words, is to broaden the field of criminal vulnerability on charges of Communism or subversion to a point where a very wide variety of associations or past actions may be evidence of Communism and may go to the jury on that basis.

SOME CONCLUSIONS

If that is so, it seems to me we can now come to three conclusions. In the first place, a person may have reason to plead the Fifth Amendment when asked about Communism even though he may not be or may never have been a Communist. Second, pleading the privilege does not establish or support the conclusion that the person is guilty or, in fact, a Communist. Third, this expression which has become so prevalent and so popular—Fifth Amendment Communist—is a gross perversion of law and logic and is a subversion of the Constitution itself. Congressional investigating committees that have popularized the phrase and have tried to make out that they have exposed as a Communist everyone who has ever pleaded the privilege are indulging in an entirely meretricious occupation.

Public office

Where has this argument taken us? Are we then to entrust the secrets of the Central Intelligence Agency to Fifth Amendment pleaders, or atomic secrets? Certainly not. But for quite a different reason. It is not because if they plead the Fifth Amendment they are guilty. It is because if you undertake public office, if you undertake to discharge public responsibilities requiring access to national secrets of that kind, you have duties that go far beyond those of the ordinary individual in the witness box. You have a duty of full disclosure about yourself and your political past, and if you do not choose to make that full disclosure, for whatever reasons—and whether you are, in fact, innocent or guilty—it is only part of wisdom to say that you shall not be put in that kind of position of trust until you have made full disclosure and the situation can be gauged openly.

A common example is the policeman who is accused of bribery or corruption and declines to answer. We do not want policemen on the force who do that. The New York State constitution, I might say, draws just that distinction between the ordinary person in private life and the public official. The public official is liable to dismissal if he pleads the Fifth Amendment.

Illegitimate pleaders

One other thing. By no means does it follow from what I have been saying that every private person called before a congressional committee should plead the Fifth Amendment when asked about Communism. Quite the contrary. Most people have no basis for so doing; they have a duty to co-operate with congressional investigations. I think many people who have been pleading it have been doing so for unwarranted and insufficient reasons—to avoid discomfiture, out of fear, out of some illusion that they are challenging the power of the committee by doing so, though, of course, they are not.

None of these reasons is satisfactory, and I would add that anyone who pleads the Fifth Amendment without the most solid legal and practical necessity for doing so is simply playing into the hands of those extremists who are trying to make the Fifth Amendment synonymous with guilt and subversion.

Fair practice

But there will always remain a few cases where the person does have to plead it. How are we to treat them? The question brings us to the final point. There are people who want to fire all teachers or to disbar all lawyers who invoke the Fifth Amendment. And some go much farther. I have already mentioned the secondhand piano dealer in Washington. I do not know what the upshot was, but anyhow that is a matter that lies in Judge Arnold's judicial circuit. Perhaps he can find out. He is going to deal with another aspect of this matter, due process in congressional investigations. I do not want to trespass on his territory, but I cannot resist leaving with you one little item.

As you may know, the House of Representatives recently adopted some rules of fair practice and in the course of the debate Congressman Doyle in all seriousness stated:

> I am quite sure that my several years that I have spent on the House Committee on Un-American Activities have fully convinced me that we need basic House rules below which House committees cannot go.

NEW YORK NADIR

I want to end, therefore, with one example below which we cannot go, and that is the proposed New York statute I have mentioned. This statute—fortunately, however, it is not a statute yet; it is only a bill—this bill provides that any employer may discharge or refuse to hire any employee who pleads the Fifth Amendment at a hearing involving subversion.

It is a very revolutionary proposal. It manifests, I think, all the vices and all the misconceptions that I have tried to cover in the course of my remarks. As you can see, it has at its root the conception that equates pleading the Fifth Amendment with guilt, as one and the same thing, and then proceeds to punish everybody who pleads the Fifth Amendment by making them subject to discharge from employment in any capacity whatsoever.

It is not only bad law; it is a most astoundingly Draconic penalty for something which is not even an offense at law. It is likewise, I think, clearly unconstitutional, because what it amounts to is an effort to wipe out the Fifth Amendment by indirect means—not by trying to repeal it but by making its use so hazardous and so damaging that nobody can afford to use it.

This very point came up in the Supreme Court of Illinois: the court very definitely said that to make it impossible to use a privilege because the consequences are so disastrous in fact wipes the privilege off the books entirely.

Finally, what this bill says, in effect, is that the Fifth Amendment pleader cannot enforce a labor contract. It denies him access to the usual processes of law to enforce a contract and thereby it approaches what was known in times long past as outlawry. We have all read about the legendary outlaw Robin Hood; it was in his time that outlawry was most popular. It has not been part of American law for centuries; it is obsolete in England. The current New York bill really does come close to denying anyone who pleads the Fifth Amendment the benefit of legal protection, and one might just as well frankly call it outlawry.

The bill passed the New York State Senate unanimously and without debate. How much attention did it attract? A couple of inches in the *New York Times*. Every day thereafter the *New York Times* published a list of major bills introduced in the Legislature. It has never been listed. There has not been an editorial about it in either the *Times* or the *Herald Tribune*.

Fortunately, however, the little gem was noticed. Steps have been taken and the bill, according to my last information, was successfully blocked in the Assembly. But it could easily have been overlooked.

It seems to me that the fact that a bill like this could pass the upper house of the New York State Legislature unanimously and without debate is an ominous sign of a confused and fear-ridden legislature. The great vice of this kind of thing is that it tries to punish people outside the law. It is, in effect, punishment by legislative enactment after inquisition, and in many ways it resembles very closely the people's courts that we saw under both the Nazis and the Communists, to enforce what they called healthy standards of public outlook. I am old-fashioned enough to think that such a bill is really un-American, that we have tried and established ways of determining whether a person is guilty of a crime and whether he should be punished, and that legislation of that sort cannot possibly safeguard security.

To return in conclusion now to the theme of internal security and civil rights: it is bad security because what it really does is to destroy by the security mechanism itself the very thing that we are trying to safeguard—the freedom under law that is the essence of democracy.

Brigadier General Telford Taylor, LL.B., New York City, member of the law firm of Landis, Taylor & Scoll, was formerly administrator, Small Defense Plants Administration (1951–52); United States chief of counsel for war crimes, Office of Military Government (1946–49); military intelligence officer, European Theater of Operations (1943–45); and general counsel, Federal Communications Division (1940–42). He is the author of Sword and Swastika (1952) and the recently published Grand Inquest: The Story of Congressional Investigations.

Due Process in Trials

By THURMAN ARNOLD

MY subject is the role of an American fair trial by due process in providing stability and a sense of security in our society. I am first going to explain what the ideal means to us, how it is a necessary part of the emotional background of a proper relation between an individual and his government even for those who have never been inside a courtroom, how it gives sanctity and dignity to civilized government. I am then going to speak about the tendency, particularly strong in times when men fear and distrust dissenting ideas, to degrade the process of fair trial by maintaining its trappings and façade while at the same time abandoning its fundamental requirements. And finally, I am going to talk about what has happened to that ideal in recent years, how it is being used as a cloak for the prosecution of heresy, and what the social results of this degradation are.

EFFICIENCY AND THE PHILOSOPHY OF JUSTICE

A trial by due process is a cumbersome and inefficient way of investigating facts. It is not and cannot be objective. No scientist would attempt to discover the truth by confining his research to the advocacy of two partisans each presenting an extreme view. A realistic investigation has no exclusionary rules. It does not limit itself to any single written record. It carefully avoids pomp and ceremony aimed at impressing the public with the dignity and importance of the participants. It escapes from the tyranny of precedents instead of eagerly embracing them as judicial procedure does. Real investigation of facts refuses to give finality to any conclusion. There are, therefore, those who claim that the American trial is based on a sporting theory of justice and who insist on realistic short cuts in our cumbersome trial procedure. Little do such people realize that this is the first step on the road to a police state.

Too much efficiency in government, too much disregard of ceremony, eat out the cement which binds human institutions together. Government cannot be the product of any consistent theory. Like the human personality it must contain in balance all sorts of conflicting ideals. And over them all, keeping each contradictory social attitude in its proper place, there must be spread the philosophy of justice. That philosophy can never be defined. To put it in words only creates the confusion which is always found in learned treatises on jurisprudence. The only way that it can become real and make itself felt is by the ceremony of a trial by due process of law. Justice Holmes once said that law was not a brooding omnipresence in the sky. He was wrong. It is and must be a brooding omnipresence in the sky.

The ideal that every man is entitled to a fair and impartial trial is the cornerstone of civilized government. Before this ideal every consideration of efficiency in government administration must give way. This is because the significance of the ideal of a fair public trial in our culture is tremendous. It includes the humanitarian conviction that the underdog is always entitled to a chance. The American trial is our only public ceremony which symbolizes the idea that the rights of the individual

are superior to the convenience or even the security of the sovereign.

Only an infinitesimal proportion of our citizens ever become participants in a public trial. Nevertheless, the existence of this institution gives the man of affairs a sense of security both from attacks from his fellows and intermeddling by the government. For most people it is the criminal trial that overshadows all other symbols as the dramatization that this is a government of law and not of men. It represents the dignity of the state as the enforcer of law and at the same time the dignity of the individual even though he be an avowed opponent of the state, a dissenter or radical, or even a hardened criminal. So important is the public trial to the whole ideological structure of any government that the adoption of more efficient and speedy ways of punishing individuals is a sure sign of instability and insecurity.

DRAMATIZATION OF SPIRITUAL VALUES

Let me illustrate the importance of the American trial in dramatizing the spiritual values which hold the nation together by our treatment of the defense of insanity in a criminal case. It is an important spiritual value to us that we do not punish the sick for the consequences of their illness. That idea used to be expressed in terms of right and wrong. An insane man could escape conviction if his insanity was of such character that he did not know this moral difference. Recently in the District of Columbia the rule was changed by the Court of Appeals. The science of psychiatry no longer recognized the old test. Expert psychiatrists could not testify in these terms. The Court of Appeals adopted a test which is equally indefinite but more in line with modern ideas of mental illness. The rule was laid down that a man is not guilty where his conduct was the product of mental disease.

The decision created a storm of comment among adherents of the old and proponents of the new. It was headline material and the topic of leading editorials. Much of the discussion was on the question whether more or fewer criminals would escape under the new rule. Actually I am convinced that it will not make the slightest difference. The essential question at the base of both rules is whether the jury can be induced to blame the defendant or say that it is not his fault. The real difference between those who favored and those who opposed the new rule lay in the moral values which each side wanted the criminal trial to express.

These are spiritual rather than practical values. From a practical point of view it may well be asked why dangerous people like the boys in Brooklyn who killed for mere cruelty should be kept alive at the expense of the state and given hospital care because a jury could be induced to believe that these seemingly rational people were insane. Nor is there any reason to believe that the decision of the jury on insanity can be anything other than guesswork, or that psychiatrists cannot be found half of whom will insist that the man be kept alive while the other half insists that he be executed.

I am using the illustration of the criminal defense of insanity not for the purpose of discussing whether the new rule is an advance over the old rule, but rather as an illustration of how a trial represents to countless people who have never seen a courtroom the moral values which they so deeply hold. The controversy between the proponents of the old rule and the new is the ever-present controversy in American life between those who believe in a secular religion represented roughly by the psychiatrist and those who prefer an expression of moral values in terms of a higher faith. The importance of the illustration here is the extent to which the American trial represents to the people who read about it in the newspapers the spiritual values of a nation.

If we abandon this dramatic process which portrays our most important moral ideals, if we treat criminals from a practical standpoint, we shall have lost immeasurably. We shall have fallen below the standards of a humanitarian, civilized society.

More important than the minor issue of insanity in the role of the trial as dramatization of the relationship between free individuals and their sovereign are the procedural safeguards which are the protection of the accused in a trial by due process. Here the state puts itself under a real handicap in its pursuit of criminals by dramatizing the moral principles which it professes to follow. Through the institution of the trial the state says to its citizens, "I am fair, I am just. I give to each man due process of law. In protecting the state from its enemies I am respecting the inalienable rights and dignity of the individual at the same time." Only in the drama of a trial can the people of a nation find symbolized the heaven of justice which lies beyond the insecurity, cruelty, and irrationality of the everyday world. If a government destroys or damages that heaven of justice it does irreparable harm to the structure of society.

There are two essential elements of a fair trial. The first is that the accused be confronted with the witnesses against him and have an opportunity to examine them. The second is that he be tried for something he has done and not for his opinions, his associations, his character, or even his loyalty to his government in the absence of an overt criminal act.

In the absence of either of these elements no government has a moral right to impose any imprisonment, any fine, or even any serious stigma or disgrace on any of its citizens. Any civilized society which does so will pay a heavy penalty indeed in impairment of its moral leadership at home and abroad. And no alleged claim that disgrace or stigma can be imposed by the state without a fair trial in these two senses can ever be justified on the ground that it promotes national security.

CHARACTER TRIALS

Times of world revolution and cold war are times when ideals are fanatically held and fears of opposing ideals are intense. In such times the temptation to depart from these two ideals of a fair trial becomes severe indeed. Men are no longer content to penalize accused persons for their acts alone. They want to impose a stigma and disgrace on those whose character, opinions, associations, and beliefs they regard as dangerous. They demand that such men be branded as quasi-traitors. Merely discharging such persons from the government in an informal manner without imposing this brand is not enough. And so the first essential element of a fair trial goes out the window and character trials begin.

Take the strange case of Dr. Oppenheimer. There was no reason in the interests of national security for the American government to present this spectacle to the civilized world. If there was one secret which should have been zealously guarded in the Oppenheimer case it was the fact that Dr. Oppenheimer was no longer to be trusted. It was obvious to a sensible person that such a disclosure would destroy the morale of scientific research. No scientist could be sure that his character might not be publicly destroyed in a mock trial in which the issue was not whether he had disclosed secrets but only his general worthiness to serve his government. It was equally obvious that

the disclosure would split the American people on the question of whose character really was superior, that of Oppenheimer himself or the members of the commission. And finally, the disclosure was bound to throw a cloud over our atomic research from the beginning.

Why then was Oppenheimer not permitted to go in peace on the simple and unarguable formula, "I do not like you, Dr. Fell"? What induced the government so to violate the ideal that no man should be tried for his character, his opinions, or his associations?

The reason may be found that only by trial procedure can the acts of the government be given both finality and sanctity, because the public trial is such an important symbol that those who conduct it become elevated above public criticism. Political attacks on a judge because of unpopular decisions cannot be made. This is because though people know there are mistakes in the judicial process the institution as a whole is fundamental to our society and must not be made the subject of attack. A dismissal which had the appearance of an executive act would not have shielded the executive from criticism. Dress it up in the mantle of an impartial trial and the executive feels secure. And so throughout history character trials are instituted in times of fear of dissenting ideas in the hope that the trappings of judicial procedure will give them respect and authority. Thus it was that Hitler tried to use the Reichstag trials to give an appearance of law and order to his regime. The Russian purge trials are a similar attempt to give the appearance of law and order to political assassinations.

Corrupting power

The degradation of the ideal of a fair trial involved in a judicial determination of the character of the accused always boomerangs on the person who attempts to use it. There are many reasons. No man should be permitted to pronounce official judgment on the character of his fellows. The power to make such judgments and impose disgrace as a result of them is the most utterly corrupting power in the world. Loyalty, depending as it does today on the views and associations of a lifetime, permits the tribunal to condemn by using hindsight on historical events. We passed through a period of hatred of Russia prior to the Hitler invasion, of enthusiasm for Russia's war effort during the war, of acceptance of Russian participation in the United Nations and the Nuremberg trials, and of the present hatred for Russia during the cold war. Yet a loyalty hearing involves a judgment of the views of the accused and his associations during all these periods, and such a judgment is impossible. The loyalty hearing has destroyed the morale of our scientists and has hurt American moral leadership in the world by damaging, misusing, and distorting our greatest tradition—the tradition that no government is entitled to impose the penalty of disgrace of any kind by trial of a man's opinions, beliefs, and associations.

This is the lesson of the Inquisition. It is the lesson of the Star Chamber. And yet thoughtful men today are saying that a fair procedure can be devised to fit a loyalty hearing. It is as impossible to do this as it was to devise a fair procedure for the trial of Joan of Arc.

Joan of Arc's trial

No court ever more sincerely attempted to make its procedure fair than the court which tried Joan. It did not put her to the torture as was customary at that time. It allowed her to state her case fully. It used no secret testimony. It gave her an appeal to the University of Paris, and even the defense of insanity was carefully considered. The record was published.

There is no doubt that Joan by the standards of our present loyalty program was a security risk and a subversive. As such there were plenty of ways of disposing of her other than by a public trial of her character. Why were these ways not used? It was for the same reason that Oppenheimer was tried. It was for the purpose of giving dignity and sanctity to the disposal of Joan. Thus her enemies thought they could achieve the kind of protection that a Supreme Court decision gives today. And no doubt those who tried Oppenheimer reasoned in the same way.

Their trouble was that they did not realize that to try a man's character or his opinions flies in the face of due process itself. Neither good procedure nor unbiased judges can give sanctity to a character trial. It was for this reason that both Joan's trial and Oppenheimer's trial blew up in the faces of those who instituted them and damaged the moral leadership of the governments who permitted them.

SECRET EVIDENCE

Nothing deteriorates so rapidly as the quality of character trials once they are started. The original loyalty order of President Truman seemed to give government employees every reasonable protection. In that order the standard for finding of disloyalty was that reasonable grounds for belief in the bad character of the accused must be "on all the evidence." But it soon appeared that the word "evidence" as used in the President's order was to take on a new meaning alien to every American tradition. The President's commission and then the court held that the word "evidence" in a loyalty case could include secret reports from informers not known to the board, vouched for only by a government police agency, and never disclosed to the accused. And thus the second element of an American fair trial went out the window—the requirement that no man shall be convicted on a secret police report containing information from informers who are not produced at the trial.

The Attorney General of the United States is now urging that such procedures are necessary in order to make the loyalty program protect national security. The findings of unworthy character may be based upon secret police reports containing derogatory information from informants unknown to the accused. The drastic nature of the domestic crisis imagined by the Attorney General is illustrated by the fact that he will not disclose even to the board which sits in trial on the government employee the identity of the secret informer on whose judgment their findings must be based. Thus the board's judgment is not its own. Operator X-22 was certified by the secret police to be reliable. The board never gets a chance to see him. Nor does the board see even the agent of the Federal Bureau of Investigation who certified as to the reliability of the informer. The employee's career may thus be ruined by the unexamined opinion of an unknown FBI agent.

This procedure was first sanctioned as part of the loyalty program of President Truman in the Dorothy Bailey case. Dorothy Bailey was charged with disloyalty. A hearing was had and voluminous evidence introduced. She had never held any job which could by any stretch of the imagination be called secret or sensitive. She wrote printed programs to help employment services in various states to train personnel. These were public documents and could be found in public libraries. Never in her life had she had access to secret in-

formation. She was charged with having had some undefined relationship with the Communist party. No details were given, no places, no dates. Against this shotgun charge she was forced to review her whole life, and she did.

The sole evidence against her consisted of information which was part of a secret FBI report which she never saw. She was not permitted to know who the informers were. Neither was the loyalty board which heard her case. The chairman said at the hearing, "I haven't the slightest knowledge as to who they were. . . ." Yet on this evidence she was convicted of probable disloyalty, a conviction which ended her career. Never since has she been able to obtain work commensurate with her ability or in her chosen field. She took her case to the United States District Court. Her counsel argued that the word "evidence" in the President's order could not be degraded to include a secret dossier supplied by informers whom the board did not know and which had never been disclosed to the accused.

The lower court held against her. The Court of Appeals affirmed, one judge dissenting. The Supreme Court split 4 to 4, thus affirming the Court of Appeals because it could not find a majority to reverse.

The procedure thus sanctioned is the same procedure, conviction on a secret dossier, that aroused the indignation of the civilized world in the Dreyfus case. It is the same procedure that President Truman's own tribunal, sitting in the trial of the Nazi judges at Nuremberg, condemned when they said that reliance upon secret Gestapo reports was "the final degradation of the judiciary."

Since the Dorothy Bailey case, decided in 1951, this kind of procedure has spread through every government department. It has its undoubted conveniences from the point of view of the prosecution. Oppenheimer's character was tried on evidence which was disclosed to him. Had he been convicted on secret evidence no one would ever have known the kind of case he had in his favor. The country might not have been split into two violently opposing opinions. The impression would have been given that there was something so serious against Oppenheimer that no conscientious official could avoid branding him as a risk to national security.

ARE SUBVERSIVE IDEAS OUR GREAT DANGER?

But once we admit that the real danger to America is the impact of subversive ideas on our government and citizens, McCarthyism has won its case. If we must hold trials on political beliefs and associations to maintain our institutions, our Constitution no longer meets our problems. Certainly Russia, if it adopted the fair trial, would see the security of its present government impaired. That is what the Attorney General says will happen in America if we grant fair trials in loyalty cases. Can it be that we actually believe this is true also in America?

Of course no American really believes this. We have just become confused by the noise. My own proposed treatment would be similar to that with which a friend of mine once subdued a dragon he was leading down the garden path at the end of a short clothesline. Suddenly the dragon got out of control, knocking down the shrubbery and flower pots with his tail and creating general havoc. My friend turned to him and said sternly, "Either you be a good dragon and walk down this path in an orderly way or I will take a couple of aspirins and there won't be any dragon any more."

The utilization of secret evidence has created the necessity of recruiting an army of spies, gossips, and investigators for the delicate matter of the character of federal employees. Their judgment of what opinions these employees should have held at the various stages of our relationship with Russia can spell disgrace and the ruin of a federal official's career. And further, this procedure has spread through every department of the government down to the rank of janitor. It is used in agencies which have no conceivable connection with national security. Assuming that some typist in the Labor Department could conceivably be a danger these character trials have become a worse danger.

No one disputes the importance of the FBI's collecting information and keeping it secret. On the other hand, no one can justify the use of that secret information to ruin the career of an individual by branding him as a quasi-traitor without producing the witnesses against him. There are plenty of other ways to protect the security of this country against persons who may be suspect. An Army officer cannot have his commission taken away from him on secret evidence. He has a right to court-martial in which the evidence is disclosed. The easy remedy if a court-martial is not held is to remove him to a less sensitive post. But the Attorney General is saying that a janitor in an agency which has no secrets may be removed and stigmatized without due process.

How can we account for the deterioration of our ideal of fair trial that has occurred in our loyalty hearings? Are people like McCarthy to blame? My answer is No. McCarthy simply took over the procedure which had been instituted by well-meaning idealists anxious to pursue wicked people and to take their property without the cumbersome safeguards of due process of law. This idea was prevalent among many New Deal thinkers, who tried to devise systems by which judicial review of administrative decisions could be avoided. They lost, and the administrative commissions are the better for it.

AMERICAN JUSTICE IN GERMANY

The degradation of a fair trial got its greatest impetus through our justified hatred of the Nazis. One essential element of a fair trial is an impartial tribunal. Yet it was the United States which instituted, in collaboration with Soviet Russia, the Nuremberg trials where criminals were judged by their enemies. No doubt they deserved what they got. But this is not the test of a fair trial. A trial by due process is a procedure which protects the worst possible offenders.

Some find it difficult to become indignant about the principal Nuremberg trials. But few Americans know what happened after the famous cases, when President Truman sent a horde of minor judges to Germany to serve as military tribunals. They picked from the millions who no doubt deserved punishment a selected few who were indicted. Hundreds of innocent men were incarcerated. Inevitably this hit-or-miss procedure punished many innocent Germans and permitted influential Nazis who deserved punishment to escape.

I was called to Germany to represent Baron von Weizsaecker who had been Hitler's Under Secretary of State and later Ambassador to the Vatican. He had been one of those who attempted to plot against Hitler. On his behalf Lord Halifax intervened, Sumner Welles, the Bishop of Norway, and an emissary from the Pope. He was nevertheless convicted. Part of the testimony against him was given by a German named Gaus, who had been Ribbentrop's secretary. He was told that unless he testified against Weizsaecker he would be turned over to the Russians; the person responsible was the American prosecutor in the case, a man unknown here but famous in Germany. The doc-

ument reporting that story was discovered by the defense, and was spread over Germany by a committee of German bishops as an example of American justice. This was and still is regarded by Germans as an example of how the Americans tried the Germans.

There were other procedures in which the military tribunals appointed by President Truman degraded our traditions of a fair trial. In one proceeding involving about twenty defendants there were sixty-five German lawyers. They were allowed only one telephone. Their witnesses had to be summoned by notifying the American government. Witnesses called by the defense were frequently arrested and interrogated in secret. When the defense desired to interrogate them they could do so only in the presence of counsel for the prosecution.

We spent about forty million dollars teaching the Germans how American justice worked. At that point Congress got tired and refused to vote further funds. Whereupon the American tribunals got in a hurry and decided to take depositions at the same time trial was going on. German defense lawyers protested they could not be in both places at once; their protests were overruled. On a lower level there was the denazification process. In these proceedings my liberal friends attempted to classify Germans in four categories—major offenders, minor offenders, offenders, and followers. The higher grades got imprisonment. The lower grades, including schoolteachers, were forbidden to pursue any other occupation than manual labor. The lower grades were tried not for what they had done during the war but for what they thought during the war. Neighbors were encouraged to bring in gossip. These were character trials of the worst sort.

POETIC JUSTICE AND REAL JUSTICE

Liberals who supported this kind of procedure in Germany are now complaining about it at home. The lesson they should learn is that he who degrades the American ideals of fair trial should not be surprised if the procedures he approved contrary to that great ideal are taken over by his enemies and used to destroy him. There is a certain poetic justice in the fact that President Truman, who instituted the proceedings which convicted Dorothy Bailey on secret evidence, should find himself branded by the Attorney General of the United States on the basis of equally secret papers. The trouble is I do not like poetic justice. I believe that nothing but real justice dramatized by our institution of due process will give America back the moral leadership which this sort of proceeding has so greatly impaired.

Thurman Arnold, LL.B., LL.D., Washington, D. C., is a member of the law firm of Arnold, Fortas & Porter. He was formerly Associate Justice of the United States Court of Appeals for the District of Columbia (1943–45), Assistant Attorney General of the United States, in charge of the antitrust division of the Department of Justice (1938–43), professor of law at Yale University (1931–38), and dean of the College of Law, West Virginia University (1927–30). He is the author of The Symbols of Government (1935), The Folklore of Capitalism (1937), Democracy and Free Enterprise (1942), and other works.

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

QUINCY WRIGHT. *The Study of International Relations.* Pp. xii, 642. New York: Appleton-Century-Crofts, 1955. $6.75.

This wide-ranging volume stems from an advanced course which Professor Wright has given at Chicago since 1947 to assist "integration of the field of international relations"—"today a discipline in process of formation." How far this provocative treatise will itself consolidate that integration and discipline remains to be seen. But there is no doubt it will be a key reference which will for a long time be examined by serious students and practitioners. (Its leisurely length, inevitable in an effort to state the assumptions and major conclusions of each of the sixteen disciplines considered relevant to the subject, may deter some persons likely to benefit from these mature thoughts of an experienced scholar.)

The book is divided into five parts: The Meaning of International Relations, Objectives in the Study of International Relations, Practical and Theoretical Analyses of International Relations, and *Toward* [my italics] a Unified Discipline of International Relations.

Some of the flavor is conveyed in the opening sentences to Chapter XXX, "Conceptions of International Relations." "International relations, as a discipline contributing to the understanding, prediction, evaluation, and control of the relations among states and of the conditions of the world community, is at the same time a history, a science, a philosophy, and an art." (Whether the journals in each of these fields will review this book is another matter.) "The effort to unify the study of international relations resembles the effort to unify all knowledge."

For the most general synthesis, Wright favors the concept of the world "as field" though he believes the concept of the world as plan, as spiritual community, as equilibrium, or as organization, has each been useful in certain situations (pp. 531, 567). He also adds that the discipline "may prove more useful for research than for either general education or practical action" (p. 582).

In answer to the contention that the foreign relations of each state is unique, he explains that "the thesis is accepted in this book, as it has been in general practice, that general disciplines exist in the field of international relations. These disciplines [e.g., international law, international economics, and so forth] have proved useful to statesmen and citizens of all countries and their synthesis is at least conceivable" (p. 7, 8). He adds that useful as the discipline of

international *politics* is in the present situation of the world it "is of little value for long range prediction and control" (p. 145).

One of Wright's hopes is expressed thus: "The relativism, pragmatism, adaptability, and moderation observable in the healthy organism, in the well-adjusted personality, and in the stable culture, is needed in the world community. . . . It should be the function of a discipline of international relations to analyze the entities, processes, forces and relations in the international field, and to seek means for so regulating and balancing them that the opportunity for individuals and groups to achieve their values may be maximized" (p. 59).

There is much intellectual history in this book.

RICHARD H. HEINDEL
University of Buffalo

W. D. PULESTON. *The Influence of Force in Foreign Relations.* Pp. xii, 254. New York: D. Van Nostrand Company, 1955. $4.50.

Contemporary United States foreign policy has emphasized military, economic, and moral considerations in its formulation. The thinking of the moralists has been adequately developed by international lawyers and exposed by Hans J. Morgenthau. Various economic approaches may be as sophisticated as Keynes and Viner or as naive as Humphrey and Wilson. But the military mind has been neglected until recently. Little yet has been forthcoming from the large scale research financed by Carnegie, Rockefeller, and the Twentieth Century Fund. Captain Puleston's latest book, therefore, is all the more welcome as an excellent illustration of a military analysis of foreign policy.

The author, a retired naval captain (Annapolis, 1902), cannot be accused of forsaking his church—the United States Navy, nor his god—Admiral Mahan. As a technician he tends to emphasize the role of the specialist over that of the generalist; his scope therefore can be characterized as narrow rather than broad. Perhaps typical of the military mind, Puleston stresses the short run (expedient and efficient) as against the long run (political and psychological). Likewise he emphasizes the material aspects of power, and tends to neglect the importance of the psychological aspects (both morale and allies). Like navy writers in general (including an unmasked Hanson Baldwin) he appreciates potential power and depreciates an overstated air-force evaluation of the immediate destructiveness of H-bombs. Withal, Captain Puleston would disagree that the atom bomb created a technological revolution in warfare; he uses the history of preatomic wars for predictive purposes.

The book's eight chapters include an Introduction which sketches the contributions of Clausewitz and Mahan; a chapter on the relative role of the land, air, and sea forces (emphasizing the latter); a consideration of the joint responsibility of civil and military leadership, taking particular exception to the thought that wars are too important to be fought by generals; a case study of the diplomatic rivalry between the United States and Japan in which he stresses power more than pride (United States immigration policy) as a motivating factor for the Japanese policy; the impact of the H-bomb in which defensive mechanisms are emphasized on the one hand, and a modified preventive war policy on the other ("we should strike only if the enemy did not cease preparing to attack us by a certain time!"); an unflattering analysis of the leadership in Britain and the United States as compared to Russia in World War II; and an assessment of all the futile efforts to eliminate force from the first Hague Conference in 1899 through the United Nations.

While this reader disagrees with the author's approach, as well as his conclusions, it must be admitted that Puleston gives a pungent criticism of idealistic thinking. It may be that the flaws in this militaristic realism are all too apparent and for that reason the author does not quite earn the title of "Devil's advocate."

Nevertheless, the book deserves to be required reading for all students of foreign policy—particularly in connection with Sapin and Snyder's *The Role of the Military in American Foreign Policy.*

MARTIN B. TRAVIS, JR.
Stanford University

JULIUS STONE. *Legal Controls of International Conflict: A Treatise on the Dynamics of Disputes-and-War-Law.* Pp. iv, 851. New York: Rinehart and Company, 1954. $12.00.

This improtant book is about half devoted to problems concerning the nature of international law, the settlement of international disputes, the prevention of aggression, the punishment of war crimes, and other issues involving the interpretation of recent treaties such as the League of Nations Covenant, the Kellogg-Briand Pact, the Nuremberg Charter, and the United Nations Charter. The other half sets forth the traditional law of war and neutrality. The author's main conclusions on the law are dealt with in the main text of the book, leaving to thirty-four "discourses," following many of the chapters, arguments in a practical spirit on the more controversial issues.

This procedure gives the reader the benefit of jural analysis and practical criticism without confusion of the two.

Recent international law had been marked by a divergence between the norms to which states have committed themselves in treaties and actual international practice. The gaps may be closed by restrictive interpretation of these commitments to harmonize them with practice, or by a more effective utilization of international organization to conform practice to the norms. In view of the indifferent success of efforts of the United Nations and other agencies to follow the latter alternative during the "cold war," Stone adopts the first alternative and interprets broad commitments to prevent aggression, punish international crimes, and protect human rights restrictively by reference to what international machinery can be expected to accomplish in the light of its relatively inoperable procedures and the continued dominance of extreme nationalistic sentiments. He notes particularly that the United Nations, though equipped with ample powers to stop aggression, is unable to exercise these powers because of the veto and the failure of the members to make agreements committing forces to United Nations service. As a result the states have substituted, by the Uniting for Peace Resolution of 1950, procedures which he interprets as similar to those of the system worked out by the League of Nations, leaving responsibility to act against aggression to the members individually, and utilizing the international agencies, in this case the General Assembly, not to compel but to co-ordinate their efforts. As a result he considers it probable that clear pronouncements distinguishing the aggressor and the defender in future hostilities will frequently not be made and consequently war in the traditional sense, in which the belligerents are considered equal, will occur and should be regulated. The law of war and neutrality will therefore continue to be important. He does not discuss, although he alludes to, the problem of the applicability of portions of the law of war even in case hostilities have the formal character of policing action against agression.

The tone of the book is not optimistic but its keen analysis, clear insight into the nature of the society of nations, and careful exposition of the realities of procedure, not to mention the voluminous references to jural materials, makes it an outstanding contribution to international law. The author, now Challis Professor of International Law and Jurisprudence at the University of Sydney, is well known for his important contributions in the field of jurisprudence and international organization. The present book will be widely used for reference to which it is well adapted since about a third of each page is devoted to footnotes, and over a hundred pages at the end include lists of case citations and of treaty citations, a name index, and a subject index.

QUINCY WRIGHT
University of Chicago

HAROLD NICOLSON. *The Evolution of Diplomatic Method.* Pp. 93. New York: The Macmillan Company, 1954. $2.25.

In this luminous essay, Sir Harold Nicolson analyzes diplomatic methods from ancient times to the present. Under his polished microscope pass the methods of the Greeks and Romans in ancient times, of the Italians in the fifteenth and sixteenth centuries, of the French in the seventeenth–nineteenth centuries, and of the luckless Americans in the twentieth.

To the French perfection of the art of diplomacy, Sir Harold justly pays tribute. This perfection brought a centralization and certainty to diplomatic methods which they had lacked before and which they have never enjoyed since. American practice, on the other hand, invites Sir Harold's criticism. He feels it has brought a good deal of confusion to the art. We have no centralization of diplomatic authority; and our "belief" that it is "possible to apply to the conduct of *external* affairs, the ideas and practices which, in the conduct of *internal* affairs, had for generations been regarded as the essentials of liberal democracy" has opened a veritable Pandora's box. Finally, "although the Americans in recent years have been in process of creating an admirable service of professional diplomatists, these experts do not yet possess the necessary influence with their own government or public."

To some of this one can say "amen," but there will be many to feel that Sir Harold makes too much of Wilsonian ideas or even of American peculiarities. He attempts to explain too much of the present evolutionary stage of diplomacy in such terms. Other factors have been more basic, such as the spread of education throughout the world; inventions in communications, giving rise to a widespread press, wire services, instantaneous printing, radio, and television; along with a variety of economic and social phenomena including what Ortega y Gasset calls "the fact of agglomeration." One might add also the emergence of the USSR as a world power and, for modern times anyway, the somewhat unique problems which it has introduced in the normal intercourse of nations. All of these things explain why the masses have advanced from the background of the international stage and jostled others—including the diplomats—from the footlights. This would have occurred whether Woodrow Wilson or America had existed.

Sir Harold believes that diplomacy should be left to the diplomatists. But what is diplomacy today? Decisions as to the conduct of foreign affairs now affect the whole political, economic, and social life of the peoples of the world. It is inconceivable that peoples will permit such decisions to be made without the fullest discussion, in which they themselves participate.

Is it less inconceivable that many will question whether the implementation of these varied decisions can be left to professional diplomatic services? The answer obviously will lie in the composition and management of these services. Many skills, many talents, many experiences are involved in the conduct of international relations these days. The cultural and economic life of the world is rich and vast. To deal effectively with it, as well as with political questions, requires something more than the diplomatic methods and services of Louis XIV.

Sir Harold has done well to remind the twentieth century that it still has a good way to go before it can claim to have acquired a polished mastery of diplomatic methods under modern conditions. The sooner it approximates that mastery the easier we shall all be—including those of us engaged in the service of diplomacy.

R. SMITH SIMPSON
Lourenco Marques
Mozambique

ARTHUR W. MACMAHON (Ed.). *Federalism: Mature and Emergent.* Pp. xi, 557. Garden City, N. Y.: Doubleday and Company, 1955. $7.50.

Federalism: Mature and Emergent is a symposium-type publication, but one which fortunately avoids most of the shortcomings which too frequently plague publications of this kind. The book is, in fact, the edited report of a carefully planned and well-conducted symposium. Twenty-three (including the editor) recognized scholars prepared chapters on selected aspects of the general topic. The chapters were circulated in advance among sixty-odd persons who attended a three-day conference "for a quiet meeting of minds." Thereafter each essay was revised by the original author. A stenographic record of the conference was available to the editor. This masterful planning and close coordination of efforts are obvious throughout the book. Much of the unity, continuity, and perspective may be attributed, however, to the skillful editing and the series of analytical and interpretive chapters (four of twenty-six) contributed by Professor Macmahon. The study is presented in four parts: Part I, Federalism: Its Nature and Role; Part II, Basic Controls in a Maturing System (The Political Process, the Courts and the Law, and Legislative and Executive Responsibilities in Managing a Federal System); Part III, Functional Channels of Relationship (Illustrative Studies of Functional Fields, and Over-all Aspects of Functional Relationships); Part IV, Supranational Union in Western Europe (The Economic Background and Functional Developments and The Project of a Political Community).

The purpose and direction of the study may be read from the organizational pattern. The primary objective is a re-examination and re-evaluation of federalism in its legal, political, and functional aspects to determine its political usefulness in the rebuilding of a war-shattered world. Although several of the chapters are directed to an examination of historical aspects and theoretical concepts, the principal areas explored are those from which practical applications of the federal principle can be evaluated. The specimens examined are drawn mostly but not exclusively from North American experiences. The evaluations follow largely the traditional pattern: federalism may be a hybrid, even unstable system, yet on the whole it has served a useful purpose in providing political stability among diverse elements, in preserving a functional balance of interests, and in discouraging concentrations of power—both political and economic. There are, however, dissenters.

Professor Franz L. Neumann in a short but caustic chapter is sharply critical of the advantages usually accredited to federalism.

Neumann's doubts concerning the inherent qualities of federalism are not widely shared, but doubts of the general applicability of the principle are raised by those who examined the possibility of its extension to some geographical areas—say Western Europe. Professor Kenneth C. Wheare asserts almost unequivocally "that no successful federation has been formed from states that have existed as independent nations for a considerable period of time." Among the other essays are several which explore "emergent federalism" in the European community. In the concluding chapter, Professor Carl J. Friedrich sounds a warning and injects an optimistic note in suggesting European unity along federal lines, provided the architects of that unity will cleanse their thinking of static concepts and regard federalism as a "process" rather than a "form."

The symposium was one of a series of five conferences sponsored by Columbia University during 1954 as a part of the Bicentennial celebration. Many of the chapters are well documented. In some cases the notes, collected at the end of each chapter, carry explanatory excerpts from the stenographic record. There is an adequate index. The book also carries brief biographies of the conference participants. All in all, this is a significant contribution to the literature of federalism.

HAROLD M. DORR
University of Michigan

MERLE CURTI and KENDALL BIRR. *Prelude to Point Four: American Technical Missions Overseas 1838–1938.* Pp. xi, 284. Madison: The University of Wisconsin Press, 1954. $5.00.

The period 1838 to 1938 is a necessary "prelude" to contemporary technical missions overseas—"necessary," no doubt, as seed ground for today's complex activities and as "briefing" for the thousands of persons involved in this kind of work.

By numerous case studies, with broad sweep and fascinating details of this underworked field of American transitional history, ten chapters cover such topics as "Missions to Japan," "Cuban Experiments," "Missions Multiply" (the era of 1912–29), "Public Health and Education," and, courageously, "The Meaning of the Missions." One may see how Americans carry and modify their assumptions (usually middle-class) when operating abroad, for example, the American influence working toward

centralization on one hand and decentralization on the other, in various spheres.

American attitudes to these technical missions have varied. The nitrogen survey of Chile and the survey of the Amazon River basin (1923), "official American ventures designed to serve the needs of the American economy, with incidental benefits to the underdeveloped areas . . . carried further the evolution of the overseas technical mission" (p. 143).

Some of the generalizations which flow, in temperate spirit, from this history may be noted here to incite complete reading.

"Perhaps the most important period in the life of any mission was its origin" (p. 204). And "no problem was as serious as that of proper administration" (p. 212). The missions varied widely in scope, subject matter, and objectives. American motives were not always clear-cut. "There seems to have been no close correlation between the scope of these missions and their success" (p. 208). However, "The limited objective type with a pragmatic approach can sometimes be of considerable use and certainly involves less risk of failure with all that this might mean for relations between the two countries involved. On the other hand, the comprehensive program is probably the only type that offers any hope of really solving the fundamental problems underlying the world's ill."

The American expert, whose attitude toward his foreign colleagues was of crucial importance, was generally well paid. "The information and skills brought by the Americans generally proved reasonably adequate," especially in the natural sciences, but "the usefulness of American knowledge in the realm of the social sciences and social policy seemed somewhat more dubious" (p. 211). Perhaps this is improving.

Finally, "There were few missions that were clearly successful, few that were total failures. . . . What is clear is that technical aid abroad is no simple or sure method of improving international relations" (pp. 216, 218).

American historiography is enriched because Professor Curti himself, and in the encouragement of his students, has added the American impact abroad to his purview. Possibly in due time, material such as is in this fruitful collaboration will get into our textbooks. A more constant evaluation and recognition of overseas services by our citizens may do much to improve such service. These missions, obviously, are not the total of American influence in, or cross-cultural relationships with, any one country or period, but they are an important segment carefully treated in this work.

RICHARD H. HEINDEL
The University of Buffalo

UNITED STATES GOVERNMENT AND HISTORY

WILLIAM ANDERSON. *The Nation and the States, Rivals or Partners?* Pp. xvi, 263. Minneapolis: University of Minnesota Press, 1955. $3.75.

A member of the President's Commission of Intergovernmental Relations, Professor Anderson, in this volume, gives evidence of the moderation that mature study is likely to bring to any problem. In general he defends the extensions of federal power that have taken place and doubts that weakening the national government will strengthen the state governments. The problem is not one of conflict between two elements, the federal government against the states, but rather one of allocating functions among three—national, state, and local. The decision as to which is to exercise control in any instance depends upon time and circumstances. This approach is the one that the country has been following, and Professor Anderson believes that, on the whole, results have been good.

The author's interpretation of the effect of the Tenth Amendment converts it into something of an anti-states-rights guarantee. Adopting from the preamble the view that the Constitution was the creation of the people rather than of the states, he argues that the Tenth Amendment consequently is the product of the whole people, and in incorporating this reservation of rights in the Constitution the states accepted the view that their "reserved" rights were in fact only a grant from the nation. This view he believes is borne out by the fact that some three-fourths of the states have subsequently been admitted to the Union and could not have had any prior inherent powers. Congress may be the best defender of states-rights, as is witnessed by its action after the Southeastern Underwriters insurance decision, and the off-shore oil decisions.

On the practical side, he opposes any new constitutional limits on the federal taxing power, believes it is not feasible to separate arbitrarily the subjects of federal and state taxation, opposes the earmarking of taxes for specific purposes, except for some pension and retirement trust funds, and believes it is not feasible normally for the federal government to collect taxes for the states. Some of the opposition by governors to federal grants-in-aid he ascribes to the fact that federal contacts upon these grants may be with subordinates of the governor or with legislative committees, thus by-passing the official head of the state.

In sum, Professor Anderson believes that we are doing very well under our present allocation of powers and has no proposals for drastic constitutional changes.

SAMUEL J. ELDERSVELD and ALBERT A. APPLEGATE. *Michigan's Recounts for Governor, 1950 and 1952: A Systematic Analysis of Election Error.* Pp. viii, 178. Ann Arbor: University of Michigan Press, 1954. No price.

The unusual occurrence of recounts in successive gubernatorial elections (1950 and 1952) presented a fruitful opportunity to study the administration of elections in Michigan. In both recounts, G. Mennen Williams, the Democratic candidate, emerged as winner. In the 1950 race, Williams' original plurality was 1,154 votes in a total poll of 1,879,382. Before the recount was completed, the Republican candidate conceded when the Williams' plurality reached 4,010 votes. The Republican candidate withdrew from the 1952 recount when Williams' original plurality of 8,618 had grown to 10,760. In each case, the recount procedures were invoked only in specific precincts, the Republicans challenging the returns from preponderant Democratic districts and the Democrats from those overwhelmingly Republican.

The authors found that 2 per cent of the total 1950 vote was affected by error of some type. The incidence of error was fairly general, running in 86 per cent of the precincts recounted. Three of every four errors resulted from negligence or incompetence of election officials. Only one-fourth of all errors could be attributed to the voters. Official errors included failure to initial ballots, improper initialing, inaccurate counting, and carelessness in protecting the security of the ballot boxes. The most frequent voter error was in using a check mark rather than a cross. Violations of ballot security alone involved more than 123,000 votes. Many boxes were not sealed, some were not locked, and others did not contain the official pollbook as required by law.

The investigators discovered that the ratio of election-officials' errors was highest in rural counties which were preponderantly Republican, and that there was a distinctly partisan flavor to these mistakes. This partisanship showed itself in several phases —in the long count for the majority party, in the short count for the minority party, and in decisions involving invalidation of individual ballots.

Most of the irregularities in the two elections sprang from the incompetence of the election officials. So long as they are recruited through patronage and so long as elections are administered at the local level, there will be inconsistencies, errors in election-law interpretation, and pure and unadulterated partisanship. It should be remembered that politics is much more casual in a rural neighborhood than in legislative halls. What are constitutions and laws among people who speak to each other almost every day? If there is a weakness in this excellent monograph, it is that the authors have not attributed sufficient importance to the persistent informality in American politics. The study

contains a map and sixty tables of quantitative data.

University of Oklahoma

D. W. BROGAN. *Politics in America.* Pp. 467. New York: Harper and Brothers, 1955. $5.00.

Commentaries on our political institutions and processes by competent observers from abroad have contributed much to the better understanding of ourselves. Such observers are less likely to get lost in details. Consequently, they may have clearer perspectives of the whole. The monumental works of DeTocqueville and Bryce are not alone in this respect. Harold Laski and others have also made significant contributions. It is always good to have Professor Brogan's analyses. He is professor of political science at the University of Cambridge; moreover, he is no casual observer of American politics. He comes here often and gets about extensively. There is a standing joke around Cambridge that he should apply for a Fulbright assignment and spend a year at Cambridge.

From previous publications in newspapers and periodicals, it is apparent that Brogan knows every nook and cranny of our nation; it is also apparent that he knows American politics. However, this study is not intended to be anything particularly comprehensive. On the contrary, as the title indicates, he has undertaken mainly to decipher politics rather than to describe institutions and processes. Moreover, he has limited himself pretty largely to the national level and has not undertaken to do much with the state and local levels.

Professor Brogan does have a chapter, it is true, on "Machines and Bosses" but it is decidedly not the best chapter in the book. It is largely historical and seems to be a bit out of date. An up-to-date chapter on pressure politics would have been better. There are also chapters on the "Party System," "Morality and Politics," "The National Conventions and the Campaign." These are often entertaining and sometimes enlightening. His best chapter is one on "Congress and the President." Here is where the competent student of both the British and American systems is able to make some really intelligent and informative observations. A chapter on "Politics and the Courts" is also well done.

To American readers the factual material in Professor Brogan's work will seem to be largely common knowledge. Nevertheless, Americans will find the book well worth reading and exceptionally readable. The style is lively and Professor Brogan has an unusual flair for facetious remarks, amusing anecdotes, and interesting incidents. The pages of his book are filled with these.

There are a few minor errors. Warren G. Harding in 1920 was scarcely a dark horse at all, much less "the only really dark horse" (p. 212). What about Garfield? Harding was an active candidate for the nomination and had substantial support from the first ballot. Garfield was not a candidate at all and had almost no support until the thirty-fourth ballot. Someone should also explain to Professor Brogan that the "open primary" and "cross-filing" are *not* the same thing (p. 89). Moreover his statement that the delegates to the national nominating conventions are "largely poor men and women" (p. 210) is not entirely accurate. At least it is not supported by our study of the delegates from Ohio in 1952.

On the whole, the errors of fact or judgment are indeed minor ones and relatively insignificant. One is more impressed by the accuracy of his information, by the keenness of his wit, and by the brilliance of his observations.

Ohio State University

LEROY C. FERGUSON and RALPH H. SMUCKLER. *Politics in the Press.* Pp. 100. East Lansing, Mich.: Michigan State College, 1954. No price.

This is not a general discussion of how the American newspaper reflects the political scene. It is, rather, a meticulous research analysis of the contents of a selected sample of Connecticut and Wisconsin newspapers in a six-week period preceding the elections of 1952. Further refinement limits the study to the senatorial campaigns. The book is not for the general reader, but for specialists, particularly those interested in techniques of newspaper analysis and their application to a quantitative study of the political process. The volume "is the first basic research publication of the Governmental Research Bureau" of Michigan State College. It is premised on the assumption that such detailed, basic research is the essential initial step in an understanding of politics and in constructive political action.

The authors are commendably cautious in stating the limitations of their work. They are likewise explicit in describing the rather elaborate methods they have employed. Their conclusions are presented with great restraint, and they admittedly resist the temptation to speculate as to their implications. This is a scholar's book for scholars.

Certain major findings of more general interest do emerge from the data. The study reveals that policy issues figured in the appeals to the voters much less than appeals based on personalities or generalized issues such as Communism. It shows that there were few instances in which opposing candidates focused on the same issues, and even candidates of the same party were not consistent. Party identification of candidates was not stressed, rather their individuality and independence. Newspapers tended, the data indicate, to reflect editorial policy in their news coverage. Headlines reflected partisanship more than total news coverage.

Interesting as these limited conclusions may be, the main contribution of the book is in methodology and in the related suggestions for further study.

MALCOLM M. WILLEY
University of Minnesota

HUSBAND E. KIMMEL. *Admiral Kimmel's Story.* Pp. xvi, 207. Chicago: Henry Regnery Company, 1955. $3.75.

In February 1941 President Roosevelt suddenly relieved Admiral J. O. Richardson as Commander in Chief, United States Pacific Fleet and appointed Kimmel in his place. Shortly after the attack on Pearl Harbor he as summarily relieved Kimmel and then appointed the Roberts Commission to ascertain any "derelictions of duty or errors of judgment" leading to that military debacle. The Commission formally exonerated the Secretaries of State, War, and Navy Departments; the Chief of Staff of the Army; and the Chief of Naval Operations; and inferentially acquitted the President from any blame by placing complete responsibility for the disastrous defeat upon Admiral Kimmel and his Army colleague General Short.

Kimmel's *Story* told in terse language is as dramatic as any Greek tragedy. Unexpectedly summoned to command our most powerful fleet he diligently prepared it for its assigned tasks in the event of war, simultaneously striving to insure its security in case of a Japanese surprise attack. Unjustly sacrificed with Short to shield the shortcomings of the President and High Command in Washington, who as Stimson has revealed sought to entice Japan into striking the first blow where it would do little injury, he patriotically remained silent, only regretting that he had not foreseen "what happened on December 7." Lay readers will find the *Story* an absorbing tale of the triumph and tragedy of an American Admiral; professional readers will be better prepared for high command by comparing this account with the conclusions of the Roberts Commission, the Army Board, and the Navy Court of Inquiry.

The Army Board held that General Marshall had withheld vital information from General Short, the Navy Court charged Stark with depriving "Kimmel of a clear picture of the existing situation"; it cleared Kimmel of the accusation made by the Roberts Commission of failing to co-operate with Short. Most important it approved his measures for preparing the fleet for war, while taking all feasible means of insuring its security during a surprise attack.

Stark and Admiral Turner admit that they did not supply vital information to Kimmel because they both *thought* he was receiving it from other sources. The Naval Court concluded it was a matter of conjecture what further action Kimmel would

have taken had he been furnished with the information available in the Navy Department; in chapter IV, Kimmel relates the additional measures he is confident he would have taken *if* he had been properly informed; he had proved his ability to increase the efficiency of the fleet, in all probability he could have reduced our losses and inflicted heavier losses on the enemy if these measures had been taken. Kimmel's modesty, his long sufferance in silence, and his proven abilities make his many civilian and military admirers regret that he relied too confidently on Stark's assurance of providing him with all available information during the critical period preceding the Japanese attack. He had many means of communications; radio, cable, even a telephone were available; he could get a message to Stark almost instantly; he could get an officer courier there by plane in a day. He should have regularly demanded information as the crisis obviously approached.

There is a still bigger lesson for commissioned officers of the Navy; because our torpedoes could not operate in shallow harbors we assumed the Japanese could not; with one exception, Admiral Turner, no officer of the High Command in the Pacific Fleet or Washington claimed to expect an air attack on Pearl Harbor. By almost elementary security measures the Japanese High Command completely concealed their intention to attack the Pacific Fleet.

HAROLD L. ICKES. *Secret Diary.* Vol. III: *The Lowering Clouds.* Pp. 695. New York: Simon and Schuster, 1954. $6.00.

The Lowering Clouds covers the period from September 1939 to December 1941, approximately twenty-six months, and is the third volume of the most illuminating diary thus far published of the New Deal Era. Certainly others high in the councils of the nation in this period kept diaries but none will surpass the Secretary of Interior's ability to preserve for posterity the bitter, often petty, feuds which went on backstage. Nor will anyone outstrip this curmudgeon in easy frankness, in obvious sincerity, and in uncanny ability to turn a phrase.

Of those few whom Ickes admired he wrote in glowing terms. Robert Jackson, for example, "was too much of a gentleman" to have "dead political cats wrapped around his neck." The author had great respect for his "Chief" but at times the official relations between Roosevelt and Ickes were indeed strained. On one such occasion the author confided to his diary that the President was "being so damned onery."

Ickes denounced bitterly those whom he disliked or mistrusted. Chairman Doughton of the Ways and Means Committee was "an old fuzzy-wuzzy" whose mental capacity was "not only well below par, it has become atrophied." No one grated on Ickes' sense of activity or interfered with his policies as did the slow-moving Secretary of State, Cordell Hull. Ickes labelled Hull as "a false alarm," denounced his colleague's inertia and in desperation wrote "Goddam the Department of State."

One of the first to propose that F.D.R. run for a third term, Ickes played a significant role in preparing the way for the President's third nomination. When Garner turned against the President, Ickes urged dropping him from all cabinet meetings and withholding from the Garners all invitations to White House social affairs. As evidence accumulated that Farley was using National Democratic Headquarters and party money to gain the nomination for himself, Ickes prodded Roosevelt to dismiss the Postmaster General. Ambitious to be the President's running mate in 1940, Ickes could see why he was defeated, but he could not visualize why Wallace was selected. Ickes early realized Willkie's possible nomination and his potential strength as an opponent. He called Willkie an American fascist and declared that if elected the Republican nominee would create a corporate state in the United States.

Repeatedly Ickes urged curbing the selling of scrap iron and petroleum to Japan and the strengthening of our defensive fortifications in the Pacific. Moreover, he was convinced that we would eventually enter the European war and opposed permitting Hitler to control our entrance by providing the incident for which the President was apparently waiting.

This volume, as the two preceding volumes of the diary, will be widely read and will be referred to constantly as one of the best day-to-day personal records of the age of the New Deal.

DONALD G. MORGAN. *Justice William Johnson, The First Dissenter.* Pp. xv, 326. Columbia: University of South Carolina Press, 1954. $6.50.

If the greatness of a man's career is to be measured by the applicability of his concepts and actions to a future age, Justice William Johnson must rank high among leaders of the early national period. A controversial figure, called by John Quincy Adams "a restless, turbulent, hot-headed, politician caballing judge," and characterized by Professor Morgan as "proud, aloof, and impulsive," Johnson, whose ideas seem surprisingly topical today, had gone without an adequate biography since his death in 1834.

In a sense this is easy to understand. Foreshadowed in his day by Marshall and Story, later biographers of these men handled him as a pawn with which to show their figures' greatness, overplaying the partial misconception that Jefferson's first Republican appointee became, under Marshall's tutelage, an extreme nationalist and opponent of the man who appointed him. Further, Johnson, a slaveowner, who regarded slavery as a necessary evil, was an outspoken foe of nullification in his home state of South Carolina and hence had little appeal either to extreme Northerners or Southerners. As a critic of complete laissez faire, who rejected absolute freedom of contract, his ideas were also antipathetic to postwar generations endowed with the unassailable sanctity of private property.

The balance on Johnson has been redressed admirably by Professor Morgan. Working without personal papers, he has revived an important figure and in the process has thrown valuable light on both Marshall and Jefferson. He acknowledges that Johnson was often influenced by Marshall as evidenced by his acceptance of Marshall's McCulloch ruling, and his concurring opinion in *Gibbons* v. *Ogden,* where he went further than the Chief Justice in proclaiming the breadth of national authority under the commerce clause. He is careful to make clear, however, that in a number of important areas the two men differed sharply. Johnson's sympathy toward vested rights did not prevent him from frequently supporting state regulation, and influenced, especially in his later career by Thomas Jefferson, he took a sharply distinct view on the role of judges and their fallibility, the power and superceding authority of legislatures, and the value of the individual in society. Further, his contributions in molding court procedure and defining the jurisdiction of Federal courts rank with those of Marshall in establishing important legal precedents.

Professor Morgan avoids the tendency in judicial biography toward either excessive legalism or oversimplification. With the forthcoming studies of Stone and Harlan, the steadily growing literature on our Supreme Court justices should begin to assume respectable proportions.

PAUL L. MURPHY
Ohio State University

JOHN CHALMERS VINSON. *The Parchment Peace: The United States Senate and the Washington Conference, 1921–1922.* Pp. xi, 259. Athens: University of Georgia Press, 1955. $4.50.

While competent scholars, notably C. Leonard Hoag and Harold and Margaret Sprout, have studied the movement culminating in the Washington Conference of 1921–22, Dr. Vinson is the first to concentrate upon the activities of the Senate in the struggle for disarmament and security. Briefly, his theme is the differences between the Senate and the Executive and the eventual triumph of isolationist Senatorial principles in the Four Power Treaty, which sharply limited American commitments in the Pacific. This is an in-

teresting story and one well worth telling.

Dr. Vinson's search for materials has been broad and imaginative. He has examined many manuscript sources not used by the Sprouts in their broader treatment, which appeared while Dr. Vinson was working on the present study as a doctoral dissertation. While this wide research did not result in startling new revelations, it does somewhat broaden our picture and goes far to confirm that the major outlines of this subject are now established. On only one substantive point of importance does Vinson seem open to challenge; he virtually ignores the part played by Arthur Meighen of Canada in the Commonwealth decision to seek abrogation of the Japanese alliance and wrongly mentions instead W. R. Hughes of Australia.

The verdicts which Dr. Vinson passes are interesting and often provocative. Some may feel that his critical—even sarcastic—treatment of the Senate and its sincerity is overdone. Others may feel that a deeper analysis of party factions and motivation is required; there is here, for example, no indication that it was the staunchest Wilsonians, those who stuck with their chief in the vote of March 1920, who provided the bulk of the voices against the Four Power Treaty. More fundamentally, while recognizing that the Senate, like the people, was "chiefly concerned in defeating, as easily as possible, two old enemies, war and taxes," readers may challenge Dr. Vinson's further assertion that the Washington treaties reflected untrammeled Senatorial isolationism and were therefore unrealistic, unwise, and basically hypocritical. In short, was the Washington system a "Parchment Peace" or (to borrow the Sprouts' title) a move "Toward a New Order of Sea Power"? Was it the structure itself, or the failure to develop and execute it, that was responsible for later tragedy?

Dr. Vinson's book is a concise and admirably written study. As such, it is a positive contribution to the literature on the Washington Conference.

BRADFORD PERKINS
University of California
Los Angeles

ROBERT K. MURRAY. *Red Scare: A Study in National Hysteria, 1919–1920.* Pp. xii, 337. Minneapolis: University of Minnesota Press, 1955. $4.75.

Mr. Murray, assistant professor of history at the Pennsylvania State University, has written an absorbing account, as far as it goes, of one of the most important episodes in recent American history—the Red scare that convulsed the American government and people during 1919 and 1920 and survived in various violent manifestations into the 1920's. Altogether, it is an astounding story of the way in which fear of a largely mythical Bolshevik danger stimulated wholesale federal, state, and private assaults against civil liberty and free thought and expression. Mr. Murray analyzes the whole phenomenon with considerable precision and understanding.

Having said this, however, the reviewer must also say that the book has certain defects that should not be ignored. To begin with—and the following observation obviously reflects the reviewer's personal judgment—Mr. Murray was so impressed by certain similarities between the Red scare of 1919–20 and the one that followed World War II and so determined to expose the folly and disastrous consequences of unreasoned fear that he often wrote more like a prophet than a scholar. He frankly tells us in his Preface that his approach to history is "mainly moral" and that he makes "no pretense of having completely achieved historical detachment." This reviewer does not object to morality; nor would he argue that it is possible to achieve complete historical detachment. It is all a matter of degree, and there is a difference between a "moral" approach and a didacticism that becomes in this book at times a little wearing.

The second and by far the gravest defect of this study, however, stems not from the author's point of view, to which he has a clear right, but from the way in which he limited his research in the main to published sources. He simply overlooked, or concluded that it was not worthwhile to work through, the great manuscript collections bearing on his subject—the Wilson Papers, the Justice Department Papers in the National Archives, the Papers of Colonel House, and the Oswald Garrison Villard Papers, to mention only a few of them.

The result of the author's failure to research widely enough is a book that records the events of the Red scare competently but lacks depth and such understanding as the scholar can obtain only from private sources, and in its coverage does not go much beyond the work of Zechariah Chafee, Jr., Frederick L. Paxson, Frederick Lewis Allen, Mark Sullivan, and other men who have written on the same subject.

ARTHUR S. LINK
Institute for Advanced Study

NEWBOLD MORRIS in collaboration with ANA LEE THOMAS. *Let the Chips Fall: My Battle Against Corruption.* Pp. xiii, 308. New York: Appleton-Century-Crofts, 1955. $4.00.

This autobiography of an important New York City reformer and political leader, prepared in collaboration with a professional writer, centers upon the era of the La Guardia administration in which Newbold Morris had a leading part. The story traces his career from his youth as a member of one of New York City's patrician families, through Groton, Yale, the Yale Law School, into his father's law firm, and his father's place on the Republican party committee in the upper East Side "surtax" district, then into the Board of Alderman, and then city-wide election as president of the City Council. His 1945 and 1949 candidacies for mayor, and his brief experience as a special investigator for President Truman in 1952, are largely anticlimactical. Of special interest is a chapter on the New York City Center of Music and Drama, which may well prove to be Newbold Morris' most enduring contribution to the life of his city.

The approach and tone of the volume are indicated by its subtitle: *My Battles Against Corruption.* From this reform perspective the story is told with sincerity and integrity, and with impressive faith in the reformers' diagnosis and remedies for governmental shortcomings.

But it must be noted with regret that the autobiography does not probe very deeply nor produce new insights into the political and governmental life of New York City. The volume suffers from its dependence upon secondary materials and twice-told stories, and from its lack of new and intimate information. There is surprisingly little of the kind of significant firsthand information and the revelation of personality which marked, for example, the autobiographies of Theodore Roosevelt and Robert M. LaFollette. This failure may be illustrated by the fact that the two central figures in the author's political life—Kenneth Simpson, the Republican leader who first sponsored Morris, and Fiorello La Guardia, who gave him greater prominence—do not emerge from Morris' account with any new dimensions; instead, they remain stock figures in a conventional reform drama. There is, too, an absence of reflective detachment and self-criticism, demonstrated most clearly perhaps by the failure of the narrator to see any contradiction between his long battle for individual rights and dignities, and his plan to subject all federal employees in 1952 to a questionnaire and a prospective inquisition which was an affront to their self-respect.

WALLACE S. SAYRE
Columbia University

CARL CARMER. *The Susquehanna.* Pp. 493. New York: Rinehart and Company, 1955. $5.00.

When, in 1937, the late Constance Lindsay Skinner planned the *Rivers of America* series, she was inaugurating not only a series but a trend. Since then we have had series devoted to mountains, trails, lakes, regions, and cities. The appetite of the American reading public for books dealing with folk history seems never to be satiated. In this original series alone we now have, counting the present volume, forty-eight books. The present author, whose earlier volume on the Hudson was widely acclaimed, is now general editor of the series.

Flowing out of Otsego Lake, in south-central New York, the Susquehanna drifts

lazily through New York and Pennsylvania and briefly through Maryland until it enters Chesapeake Bay. Its course roughly approximates that of the Greek *sigma*. Never important as a means of transportation, with the possible exception of the ark and raft era of the early lumbering days, the Susquehanna becomes important and colorful chiefly in terms of the people who have lived along its banks. Mr. Carmer tells the story of the river in twenty-three chapters, of which the first twenty-two occupy roughly two-thirds of the volume.

These twenty-two chapters contain many unusual and colorful tales. Beginning with John Smith in 1608, Carmer writes of the strange doings of Lord Talbot, and of the romantic story of the French nobles who founded the Gallic city of Azilum. Here are thundering good tales of the Revolutionary era, of Tory and of Whig. The activities of the Molly Maguires and the Pinkertons, the massacre at Wyoming, the struggles over conflicting land claims, the rumors that turned to panic when it appeared that the Confederacy had successfully invaded (and colonized?) the peaceful Susquehanna valley—all of these are good reading, good folk-history in the tradition of the series. The final chapter, a third of the volume, follows the river down stream, recounting story and myth as the river flows along. In many ways this is the most interesting part of the volume.

No one can doubt that Mr. Carmer is an excellent writer. His volume about the Hudson River is one of the best in this series; his *Stars Fell on Alabama* and *Listen for a Lonesome Drum* entitle him to his high place among American folklorists. Yet this is, in spite of interesting sections, a disappointing volume. The early pages contain much forced writing, a seeming attempt at scholarly and thorough presentation that results only, it seems to this reviewer, in clumsy and dull passages. There is a single and unsatisfactory map. Yet there are sections, the last chapter in general and the description of Coopertown in particular, that are fascinating. Mr. Carmer can certainly write superbly; it is unfortunate that he has not chosen to do so throughout this volume. If not the worst in the series, this is far from the best.

RALPH ADAMS BROWN
State University of New York
Cortland

SAUL K. PADOVER (Ed.). *The Washington Papers: Basic Selections from the Public and Private Papers of George Washington.* Pp. 430. New York: Harper and Brothers, 1955. $5.00.

The character of this volume and the editor's purpose in producing it are clearly indicated in the concluding lines of the Introduction. "Here are Washington's speeches and addresses, his essential diaries, many of his more important letters and comments. The editor has tried to eliminate the irrelevant but to omit nothing that is of importance for an understanding of the essential Washington. Here we see him in his capacity as surveyor and planter, as general and patriot, as President and Statesman, as family man and friend. The editor's aim has been to produce a one-volume treasury of Washington, to show him in his fullness and many-sidedness." The Introduction contains an excellent character sketch and Parson Weems' classic of the cherry tree which Dr. Padover calls the "most famous Weemsy."

The papers are arranged topically and there is a minimum of editing; characters are rarely identified; seldom is background material furnished; and extracts of letters are usually given without regard to context. One may question whether a different plan of organization, which would have presented complete letters in chronological sequence connected by brief explanatory notes, would not have resulted in a work of more interest to the general reader. Washington's cumbersome eighteenth-century style does not contribute to the general readability of the volume.

The papers show that Washington was proud of the new nation which he had helped to bring into existence and that he had optimistic expectations of its economic and political future. His trials in the Revolution as well as the weaknesses of the Confederation had impressed upon him the need for a strong central administration; he was pleased with the success of the government under the Constitution of 1787. He was a strong advocate of a national university where the mingling of potential leaders from all parts of the country would lessen the danger of sectionalism; such an institution, he thought, would cause fewer young Americans to go abroad for study and exposure to political ideas unfriendly to republicanism. He was, in his way, deeply religious. He was interested in improving farming methods and was a correspondent of Arthur Young, the famous agricultural reformer. He had a high and affentionate regard for Lafayette. His strong sense of family loyalty and responsibility is attested by the sound advice and substantial aid that he frequently gave relatives and by the bequests of his will.

We are indebted to the editor for making available in a convenient volume this representative collection of Washington Papers.

CECIL JOHNSON
University of North Carolina

ECONOMICS AND INDUSTRY

A. D. H. KAPLAN. *Big Enterprise in a Competitive System.* Pp. xii, 269. Washington, D. C.: The Brookings Institution, 1954. $4.00.

Are the presence and growth of big business compatible with the survival of the competitive system of American capitalism? This is the fundamental issue explored by Dr. Kaplan in the interesting volume under review. After a careful and extensive study of the *structure* and *performance* of big business, the author concludes that big business has been functioning in a highly dynamic, market determining economy; and that all the available evidence indicates it will probably continue to do so. A high degree of vigorous competitive activity has been retained. The giant corporations operate in a competitive environment where the development of alternative products, the use of new substitute materials, and a constantly shifting product-mix are responsible for continuous adjustment to consumer choice patterns. Even in the area of pricing, while increasing stability of prices for short periods is evident, the secular reductions in the prices of such products as rayon, dyestuffs, tires, gasoline, and the new "wonder drugs" show a strong downward pressure. The fear of Berle and Means in 1932 that the projected growth rates of 200 giant corporations would, by 1950, result in their control of half the total national wealth, has not been realized; and the small firm has continued to play an important role in our economy.

Dr. Kaplan begins his book (Chapter I) with one of the finest short reviews I have ever read of the growth of American public opinion and public policy towards monopoly and big business. An astonishing amount of specific detail and stimulating interpretation has been compressed into fifty-two pages. This historic survey is followed by an interesting chapter on the "rationale" of competitive enterprise—concepts of free competition, free enterprise, free markets, imperfect competition, and oligopoly. Against this broad background a series of chapters develop in detail the growth of big business in relation to industrial concentration, financial concentration, price competition, the drives of competition, and the size and integration of firms. An excellent summary chapter concludes the volume. All data is presented effectively, but the study is not intended as a source book for data on the American economy.

There have been many books written since the 1920's calling attention to the dangers inherent in the rise of big business and concentration in industry. Dr. Kaplan, while clearly aware of these dangers, gives a lucid analytical picture of the other side of the issue. He emphasizes the necessity for a more realistic and workable concept of competition. The classical concept developed in an era of small business and relatively simple industrial technology is not a very satisfactory tool for the study of the modern dynamic economy, constantly reoriented by innovations in methods and basic materials used. Dr. Kaplan has given us a stimulating volume.

The reviewer intends to make considerable use of this work and believes others will find its study equally rewarding.

W. W. HEWETT
University of Cincinnati

SAMUEL LUBELL. *The Revolution in World Trade and American Economic Policy.* Pp. xvi, 143. New York: Harper and Brothers, 1955. $2.50.

The Revolution in World Trade and American Economic Policy is written in protest against the deceptive illusion, "oversold" to the American public, "that the world's economic problems can be remedied simply by lowering United States tariffs and lifting the trade restrictions of other nations." With vigorous and lucid analysis the author reviews the major forces behind the economic revolution currently reshaping the world, urges the substitution of leadership through mutual understanding among the allied free nations for leadership by example, and outlines a series of proposals designed to assure an integrated foreign economic program.

A series of four chapters, based on both firsthand observation and careful study, deal with the nature of the economic forces at work in the major world areas and deserve a wide reader audience. Here the author analyzes: (1) Asia's dollar problem which stems less from an inability to sell what she produces than from a desire to import so much more than ever before; (2) Britain's real battle, the difficulties of which involve not her economic relationship to the United States or the dollar area, but rather her concentration of exporting and investment energies for the achievement of a favored position within the sterling trade bloc; (3) Western Europe's diversion of resources not for reintegration into the world economy, but for the integration of the resources and markets of dependent areas with those of the home countries; and (4) the pressing by the Soviets of a deceptive trade policy designed to split the free-world allies by exploiting the tensions and rivalries among them. Thus we see emerging a world trade pattern consisting of a number of trade blocs each in partial conflict with the other.

In the sections of the book dealing with solutions, the author is more certain in the statement of objectives than in the outline of methods. Having been declared an illusory means for closing the "dollar gap," the lowering of United States tariffs appears to be ruled out entirely. Included in the aims are many which are implicit in existing foreign policy. The difficulty of freeing "major currencies" appears in bold relief throughout the author's own analysis and the desirability of convertibility can hardly be dissociated from the whole complex of other proposed measures. On the proposed expanded program of foreign investment to stimulate the growth of underdeveloped countries, one might also wish that the author had been more explicit and detailed. The suggested plan of understanding among the allied free nations for limiting trade with the Iron Curtain countries runs counter to a well reasoned opinion which permits no simple solution. These unanswered questions, however, simply add to the unique significance of a book which deserves the attention of student and policy maker alike.

AMOS E. TAYLOR
Washington, D. C.

SIGMUND DIAMOND. *The Reputation of the American Businessman.* Pp. 209. Cambridge, Mass.: Harvard University Press, 1955. $4.00.

The author of this book set himself a two-fold task. One was to analyze the conceptions held by various groups in the United States at particular times regarding the significance of the entrepreneur and the ingredients of entrepreneurial success. The other was to examine the changing conception of the entrepreneur's significance in America over time. Subject to the limitations of determining the exact nature of public opinion, a problem explicitly recognized by the author, the book succeeds admirably in meeting these objectives.

No one will quarrel with the choice of Stephen Girard, John Jacob Astor, Cornelius Vanderbilt, J. Pierpont Morgan, John D. Rockefeller, and Henry Ford as subjects for the sort of analysis proposed. The careers of these men were well spaced over the 116 years that separated the death of Girard from the demise of Ford. While they achieved success in somewhat different fields, each was an outstanding, if not the outstanding, businessman of his generation.

For somewhat obvious reasons the author has drawn heavily on statements made at the time of the death of each of these men. He disclaims the use of any "sophisticated notions of sampling" in gathering his data. But an extensive coverage of available sources, and the great care in securing a cross section of opinion, leave little to be criticized in respect to methodology.

The findings of the study can be briefly summarized. In the early nineteenth century the entrepreneur in America was described as a man with certain personal qualities that made for success; qualities that would have made for success at any time, in any place, under any circumstances. His nonbusiness acts were private and not "deemed suitable for discussion or even relevant to an understanding of the man" (p. 178). The destination, not the source of his wealth or the methods used in acquiring it, largely determined whether public reaction was favorable or unfavorable.

By the end of the century the standards for judging the significance of the American businessman had shifted. The roles he had in common with the rest of his countrymen were now considered relevant in explaining his status. "The individualism of the entrepreneur, which once meant his personal uniqueness, now means his conformity with qualities possessed by all" (p. 181). "Business enterprise itself, not its by-product in the form of philanthropy, becomes the basis for the twentieth century evaluation of the businessman" (p. 179). Moreover, it was argued that without the economic system—capitalism or free enterprise—entrepreneurial success would be impossible.

This shift in the symbolism of the businessman, the author believes, was in response to growing attacks on the entrepreneur and the economic system. The fact that the defense or rationalization has been quite successful indicates the continued vitality of the functions performed by the entrepreneur in America. "For only as a symbol takes on new meanings relevant to new social conditions may it live" (p. 182).

Because of the fresh and original treatment of a somewhat familiar subject this reviewer fully agrees with the statement on the book's dust jacket, "Businessmen, their public relations counselors, journalists, and the general public will be as interested in this book as will the historians."

Northwestern University

IRVING BERNSTEIN. *Arbitration of Wages.* Pp. xiii, 125. Berkeley and Los Angeles: University of California Press, 1954. $3.50.

Basically the author has drawn his material as well as his conclusions from an analysis of all of the reported arbitration decisions, in which at least one of the issues involved was wages, reported in the Bureau of National Affairs "Labor Arbitration Reports," Volumes I-XIV, covering the period 1945–50. In addition he has skillfully woven into the text pertinent observations by other writers in the field. He cautions the reader in the Preface that his work is not intended to be the arbitrator's "handy guide" because his source of material is limited to the principles that have been determined by arbitrators in a limited number of cases, that is, 209. Moreover, he recognizes wisely that there is no final word in an area as fluid as wage arbitration.

The author concludes that to understand wage arbitration one must take account of three basic considerations. The first is that the arbitrator's judgment replaces that of the parties in framing the wage fraction of the collective agreement and at the same time serves as a substitute for work stoppage. In consequence, he must behave as the parties would have if they had not

needed him, in order to make his award acceptable. Secondly, when the parties elect to submit the wage issue to arbitration each has concluded that it can gain its own vision of the wage no more effectively by any other device. Thirdly, that since the criteria of wage determination are something less than definitive their shortcomings are as hazardous to the arbitrator as they are to the parties. In consequence, "his problem is not to lay out a yardstick and measure off an amount, but, rather, to balance contesting standards in an exercise in responsible judgment."

The author's analysis reveals that the criteria of wage determination are given sharply differing weights by the parties and arbitrators in the cases studied. He concludes, however, that the order of weight given to the most frequently used wage criteria by arbitrators appears to be: comparisons, normally intra-industry and less often inter-industry; cost of living; and financial condition of the employer. Other wage criteria that are rarely utilized by arbitrators include differential features of work, regularity of employment, money value of fringe items, substandard wages, productivity, and hours of work.

The book is exceptionally well-written, well-documented, and contains a wealth of material that can be extremely useful to employers, unions, arbitrators, and students who have any concern with the complex problems involved in the arbitration of wage matters.

THE EDITORS OF FORTUNE. *The Changing American Market.* Pp. 304. Garden City, N. Y.: Hanover House, 1955. $4.50.

This book presents with some revisions a series of twelve articles that appeared in *Fortune* between August 1953 and 1954. The editors hope that it will prove to be "an exciting new kind of travelogue for everyone interested in America as well as a statistical source book for the trained student of the United States economy" (p. 7).

Lay readers who like to have facts about changing consumption in quantitative terms will find much of interest. Market analysts who want a broad survey of many types of consumer markets will find the book a mine of information. Information from many sources has been brought together and interpreted. Many charts are included in the text; tables have been relegated to the appendix out of the way of the readers gathering impressions, but available for those wishing to make a closer appraisal. Many of the charts suffer, however, from being condensed from the format of *Fortune* magazine to that of the book.

The book is full of optimism about the future, exemplified in such chapter titles as "The Rich Middle Income Class," "The Lush New Suburban Market," "The Fabulous Market for Food." Consumption levels have been high and are to be higher in the future even though marked increases in population are in prospect. The authors are nevertheless very candid about the probable decrease in the demand for some types of consumer goods, the kind of competition traditional lines are likely to encounter from new products that the technology develops, and the shifts in demand occurring because of the greater equality of the incomes.

The travelogue is one of many short stops rather than a few long visits. A few readers as they hurry along may sense certain paradoxes in the facts and the interpretations. What meaning should be attached to low income families in 1947 spending 90 per cent of their income for food? (p. 280). Does income going to food or to any other consumer goods signify tendencies if income was underreported or if it was an abnormally low year for the families concerned? Such families were probably spending during the year of the survey $150 for every $100 income reported. Much is said about the increase in "discretionary" income that has occurred with the recent rise in real income. The recent rise in income has been spectacular. It seems important to bear in mind, however, that American consumers have been experiencing a rise in real income for several decades, the thirties bringing a break in a long run trend. It has been shown over and over again that comforts and conveniences rather quickly become an established part of a consumption pattern.

SOCIOLOGY AND EDUCATION

GABRIEL A. ALMOND. *The Appeals of Communism.* Pp. xix, 415. Princeton, N. J.: Princeton University Press, 1954. $6.00.

Dr. Almond and his colleagues have applied the methods of social science research in a brilliant study of the Communist movement.

The scholars who designed the research which has led to *The Appeals of Communism* hypothesized that not only would the Communist recruits differ from their fellow men in significant ways, they would also take on to some extent at least the character of the societies in which they operated. Thus, the research concerned itself with both the small deviational party movements of the United States and England, and with the mass working class parties of France and Italy. The differences between the two types of movements, as revealed in the analysis by country, lead to some of the book's most stimulating conclusions.

The authors employed a number of research tools in reaching their conclusions. From a painstaking content analysis of selected Communist publications they were able to establish models of the movement at various levels of ideological indoctrination. Through this process they were able to lay the ground work for a set of hypotheses about the reliability of different types of Communist party members, and the conditions which are likely to put their loyalties under strain.

Next they interviewed in immense detail a sample of 221 "former Communists, which included Frenchmen, Italians, Englishmen, and Americans; workers and middle class; those who had joined in the period before the Popular Front and those who joined after; and those who had served in the various echelons of the party, the high, the low, and the rank and file."

And finally, a group of American psychoanalysts who had had Communists as patients provided thirty-five clinical case histories for study.

While the authors make no claim to statistical validity for the resultant findings, they are understandably proud of the fact that they are based on the largest and most carefully selected body of empirical data so far collected on these aspects of the Communist problem.

The methodological approach which led to simultaneous research into the parties in all four countries gives new and revealing evidence of the vast differences in susceptibility of the four populations. More important, it suggests methods for coping with the threat in each nation.

On this latter point the authors find the British and American Communist parties "standing in the sharpest contrast to those of France and Italy. . . . They do not touch the real fiber of the British and American societies. Communists may infiltrate other movements such as trade unions, or 'capture key points' by . . . placing agents in sensitive jobs, but there is no mass susceptibility to Communism in Britain and the United States."

On the other hand, "The continued attraction of Communism for intellectuals in countries such as France and Italy may be attributed to the deep and apparently chronic social crises characteristic of those countries which confront the intellectuals with problems of decision which are more complex and exacting than those which confront their colleagues in England and the United States."

While acknowledging the need to alert the public to the nature and threat of Communism in the United States, the authors find much to criticize in recent U. S. policy. Congressional investigating committees which have violated the "humane and libertarian tradition of the West" have been one of Communism's biggest assets.

In France and Italy, Dr. Almond and his colleagues find the Communist parties holding the countries in a state of virtual political siege. Only by aiding in the de-

velopment of a "militant left" will the West hold the front in these two areas.

"For obvious reasons, this is not a campaign for the United States government to undertake. To inspire confidence the main leadership must come from the peoples of these countries themselves. However, such a movement can be sparked, and financed, and advised by the powerful free trade union movements of the United States, England, and the European continent."

These challenging ideas reflect only a small part of the solid research and solid thinking which have gone into this meaty report.

ELMO C. WILSON

F. STUART CHAPIN, JR., and others. *In the Shadow of a Defense Plant: A Study of Urbanization in Rural South Carolina.* Pp. xvi, 260. Chapel Hill: Institute for Research in Social Science, University of North Carolina, 1954. $2.50.

THE INSTITUTE FOR URBAN STUDIES, University of Pennsylvania, with the cooperation of the Bureau of Urban Research, Princeton University. *Accelerated Urban Growth in a Metropolitan Fringe Area: A Study of Urbanization, Suburbanization and the Impact of the U. S. Steel Plant in Lower Bucks County, Pennsylvania.* Vol. I, *Summary Report,* Vol. II, *Project Report.* Pp. ix, 63, xx; xxv, 262. Vol. I, $2.00; Vol. II, $4.00; Two vols., $5.00.

World War II's boom towns fascinated students of urbanization. Despite the difficulties of research in wartime, teams of social scientists were deployed as participant-observers in Willow Run (Carr and Stermer), Seneca, Illinois (Havighurst and Morgan), Hampton Roads (Marsh and others), Charlestown, Indiana (Field and Stoner), and elsewhere. They reported the dismal failure of rural local government to respond to the needs for new public services, lack of co-ordination in the actions of state and federal agencies, social conflicts between the old settlers and the new in-migrants, and disruption of community life. But, of course, this was wartime: what could one expect?

On November 28, 1950, The Atomic Energy Commission announced that about 315 square miles of land along the Savannah River would be evacuated to become the site of the world's largest industrial plant, bringing into a predominantly rural area a construction force of 36,000 and a permanent labor force of over 6,000.

In the summer of 1950, it became apparent that an unidentified agency was about to undertake a major development in lower Bucks County, Pennsylvania, announced by the United States Steel Corporation on December 27, 1950 as the world's largest integrated steel works. Here was no mass evacuation; 3,800 acres of truck farms were acquired in an area already in the throes of suburbanization lying between the expanding centers of Philadelphia and Trenton.

Alert urbanists at universities in the two regions obtained the support of the now defunct Division of Research of the United States Housing and Home Finance Agency to send well balanced teams of sociologists, planners, political scientists, social workers and land economists into the areas to watch what would happen over the next two years. The stated purpose of research was the development of guides for urbanization in metropolitan areas affected by the building of large industrial plants.

The guides appear in these able and interesting reports. The South Carolina report sets forth "Lessons for the Future," for the relocation of the displaced families and for rapid urbanization of open areas. Alas, the lessons of the extensive Tennessee Valley Authority relocation experience (in reservoir clearances) were written plain for AEC to see; but, in the words of the report, in the name of security for the nation, there resulted unwarranted threats to individual security of the displaced families. Our principles of compensation were and are totally inadequate. The Bucks County report lists sixteen pages of "Guides to Urbanization": a check list of steps that must be taken to provide for orderly growth and the provision of needed services.

Yet the reports of the 1951–53 experiences read frighteningly like the wartime reports. No use blaming a school board in Bucks County for not building schools fast enough. As the authors say, no school board in the United States is geared to complete a new school every ninety days—to meet the rate of population growth in Levittown! Most distressingly, it almost seems that the basic decisions on plant location have to be made in ways that militate against planned and orderly absorption of the shock. United States Steel had to act secretly until it had assembled its 3,800 acres—or rampant speculation would have driven land costs out of sight. Still, as the Pennsylvania-Princeton team points out, if there had been a county planning board in Bucks County, if there had been more logical boundaries to the units of local government, if . . ., if . . ., the trauma would have caused less human pain. The prescription for a cure is well presented. How can these studies in pathology lay the basis for preventive hygiene in the next areas where the shock of industrialization will fall?

CHARLES S. ASCHER

Brooklyn College

ROBERT MOORE FISHER (Ed.). *The Metropolis in Modern Life.* (Columbia University Bicentennial Conference Series.) Pp. xiii, 401. Garden City, N. Y.: Doubleday and Company, 1955. $6.00.

These writings grew out of the first conference, under the chairmanship of economist Ernest M. Fisher, held in 1954 in connection with the bicentennial celebration of Columbia University. Consisting of sixteen principal papers and nineteen commentaries, they have been well ordered and edited by Robert Moore Fisher, who has contributed an Introduction to each of the eight parts of the volume.

The general question to which the conference was addressed was how to enhance the advantages and to minimize the disadvantages of the modern metropolis. It seemed to be generally agreed that the metropolis provides a richer and fuller kind of living than is possible anywhere else—due to the greater diversity, specialization, efficiency, social mobility, and other characteristics of the large city—and that these advantages outweigh the disadvantages of congestion, noise, crime and immorality, anonymity, political and social apathy, and similar conditions which exist in greater degree in the metropolis than in small communities. While the conference was concerned with understanding the metropolis rather than with solutions of metropolitan problems, it assumed that the latter could be lessened through the application of science, technology, and planning.

The volume begins with "the dynamic role of the city in social development" and proceeds to discuss the political, economic, and legal influences and effects of metropolitan concentrations and the adaptations occurring in response to new and changing conditions—the strongest section in this reviewer's opinion. The influence of science and technology on the metropolis is next considered in a general way, followed by a more specific discussion of the impact of the metropolis on the professions, in which the main theme is the trends in increasing specialization and in interprofessional cooperation. The last two sections are addressed to the effects of the metropolis upon spiritual life (which doesn't say very much) and the search for the ideal city (which has some interesting commentaries).

In view of the origin and nature of this volume, a comment on the personnel may be in order. Of the sixteen principal contributors, five came from Great Britain and two from France; the remaining nine from various parts of the United States. Of the nineteen commentators, one was from abroad (Denmark), the others hold positions in this country. The disciplines and fields of activity represented range from archeology to theology, with law, the social sciences, and city planning in numerical prominence. Besides professors, who are the most numerous, the group included university administrators; directors of foundations and institutes; and a few business executives and others from the world of affairs. Though symposia always present certain inherent problems, the output here seems hardly commensurate with this array of talent. The reader who is a specialist in a given field will not be greatly enlightened by the section of the volume con-

cerned with his specialty, but he may profit by perusing the essays in other fields.

MAURICE R. DAVIE

Yale University

RUPERT B. VANCE and NICHOLAS J. DEMERATH (Eds.). *The Urban South.* Pp. xii, 307. Chapel Hill: University of North Carolina Press, 1955. $5.00.

The growth of southern cities and the impact of urbanization on social life in the South are the themes developed in this symposium published under the auspices of the University of North Carolina. The volume is the latest of a long series of regional studies of the South.

Part I consists of chapters by Heberle, T. Lynn Smith, Thompson, Hitt, and Dinkel on the growth of cities, occupational and economic changes, migration, and demography. In Part II, Organizational Aspects of Southern Cities, there are two chapters on ecology (Vance and Sara Smith, Demerath and Gilmore), a chapter on social stratification (Kaufman), and one on crime (Porterfield). Part III, labeled Urbanism, Change, and Tradition, includes chapters on race relations (Bullock), southern politics (Ewing and Titus), community organization (Hunter), city planning (Chapin), and "Possum Trot" (Nixon).

Anyone who has experienced the agonizing frustrations of planning and editing a symposium (as has the reviewer) is probably disposed to view with kindly tolerance the efforts of others to achieve effective academic co-operation. Most undertakings of this type lack uniformity in the quality of contributions, and this book is no exception. Furthermore, there is a flavor of warmed-over potatoes in T. L. Smith's chapter, which was reprinted from his textbook, and in Heberle's chapter, a slight revision of an article written several years ago.

Some of the chapters are based on fresh research data, or at least unpublished data concerning southern cities. Particularly impressive are those dealing with occupational shifts and economic changes, metropolitan dominance and integration, urban ecology, and race relations. Some interesting data and interpretations concerning the impact of urbanism on southern politics are also provided. Kaufman's chapter on social classes falls below his usual standard, probably because he had limited concrete data upon which to base his discussion of an extremely complex phenomenon. Likewise, Hunter's discussion of community organization is so highly generalized that there is really nothing new in it; hence a contrast to his extremely valuable monograph on power and community structure. Chapin might well have been more concrete in his discussion of city planning in the South.

A spirit of optimism pervades most of the writings. The South is on the march. It is recovering from its feeling of inferiority and is now prepared to take its proper place in the national picture. It is no longer the problem area of the nation. The growth of cities is symbolic of progress and a harbinger of the new order of things. "Possum Trot is dead." Not much is said about the unlovely aspects of the South, things that have made this region "reputedly one of the more backward areas." Even racial discrimination is handled so discretely that bigoted Southerners could hardly object to the treatment.

One is tempted to raise the unorthodox question as to when interest in regionalism tends to become provincialism, or at least when it fosters provincialism. To state the matter differently, do we need regional studies of the "urban Middle West," the "urban Pacific Coast," or "urban New England"? There seems to be some risk that preoccupation with regionalism may lead to a kind of cultural myopia so that the position of regional phenomena in the larger national and international setting is obscured. One of the weaknesses of American sociology in general is its geographic and cultural provincialism because of its focus on things American almost to the complete exclusion of things elsewhere. American sociologists are beginning to peer over their national boundaries to have a look at other societies and forms of social organization, although lagging behind the anthropologists in this respect. Regional sociologists likewise should keep an eye on the larger society so that things may be viewed in their proper historical and cultural setting. At present there is a need for studies of urbanization in world perspective. *The Urban South* should be seen as one of the elements of this world-wide trend.

Sociological studies in the South have been largely slanted to rural society. Now that the South is going urban in a big way, it may be hoped that this volume will encourage sociologists of that region to expand their researches to take into account the great changes accompanying the shift to a city-dominated area.

NOEL P. GIST

University of Missouri

O. A. OESER and S. B. HAMMOND (Eds.). *Social Structure and Personality in a City.* (Studies of Social Behaviour, Vol. I.) Pp. xxii, 344. $4.50.

Social Structure and Personality in a Rural Community. (Studies of Social Behaviour, Vol. II.) Pp. xiii, 279. New York: The Macmillan Company, 1954. $3.75.

Numerous studies have appeared which describe the world-wide shift of population from rural to urban areas and its broad economic and political consequences. Detailed explorations of the consequences of this shift in terms of changing social contexts for the emergence of individual personalities are a good deal less numerous. These volumes, based upon research largely supported by UNESCO, are a useful addition to the latter type of study. They present a collection of working papers on rural and urban personality structures in Australia by a group of University of Melbourne social psychologists. The emphasis is upon ideological differences in personality make-up rather than upon a complete over-all picture of Australian life. That is to say, the orientation is a selective socio-psychological one, not an exhaustive anthropological one.

In undertaking the study the authors have avoided the pitfalls of exploring too broad a field. They recognize the unwieldy nature of any such unit of analysis as "the Australian individual." Rather, they limit their focus to two phases or age segments within an individual life span: children aged ten to twelve years and their parents. They address themselves to the question of how the personality structures of these selected groups are influenced by the Australian mode of life and whether, within this mode of life, there are significant rural-urban differences.

Individual personality structure is defined as a system of values, needs, and modes of response; the differences in patterns of social expectations and pressures which condition this personality structure are explored in sample rural and urban communities. Individuals within the sample were interviewed to assess the extent and character of their participation in family, school, and other community groups. The data from those interviews are subjected to various techniques of small group analysis. There emerges first a contrast between urban and rural families in terms of group activities. For both rural parents and children, the family household is the focus of a larger proportion of day-to-day activities than is the case for urban family groups. This in itself is no new discovery, but the authors define this contrast in meaningful empirical terms. For example, they have constructed indices for the assessment of tensions associated with the intra-family activities for both parents and children.

Farm youths, with heavier household participation scores than the urban youths, show lower degrees of tension associated with these activities. This, in addition to the fact that the over-all tension score for urban families is greater than that for rural households. By pursuing still further the factors associated with this contrast, the authors conclude that the basic orientations of the children are functionally related to the place of the family within the larger social organization. Urban children find themselves oriented more directly towards their peers, even though the family represents their "strongest emotional ties and contributes much more to meeting their basic needs." Adult urban existence makes stronger demands in the direction of getting on with others largely in secondary contacts rather than in the direction of family solidarity. Children brought up

within this framework of expectations are being conditioned for the individualistic life they will lead as urban adults.

Farm children, in contrast, are prepared for adult expectations in precisely the opposite manner. Rural family solidarity increases the child's foreknowledge of the manner in which he will be expected to behave as an adult. This period serves as a sort of apprenticeship, or as the authors phrase it "anticipatory socialization—a preparation for participation in adult life as a farmer or as a farmer's wife."

There is a great deal of useful information to be had from these studies, but one might wish for more editorial cohesion than is here displayed. The volumes are the work of a staff of researchers and difference in style and focus is frequently apparent.

THOMAS O. WILKINSON
University of Massachusetts

CHARLES ABRAMS. *Forbidden Neighbors: A Study of Prejudice in Housing.* Pp. xi, 404. New York: Harper and Brothers, 1955. $5.00.

"*Apartheid* in America" would be an appropriate title for this vivid description of residential segregation of racial, religious, and nationality groups.

Charles Abrams is a lawyer, author, university lecturer, journalist and, presently, New York State rent administrator. The book is interesting, readable—and disturbing.

Forbidden Neighbors is the most comprehensive treatment available of housing segregation and discrimination as practiced against Americans of Chinese, Japanese, Puerto Rican, Mexican, and Negro descent. The chapters on the roles of realtors, financial institutions, property owners' associations, and government agencies reveal plainly the discrepancy between the American creed and the American deed. The accounts of mob violence in Chicago and Miami are shocking. Abrams' review of promising experiments with interracial housing, and his recommendations for education and action show that something is being done and much more can be done.

Abrams weakens his case by attributing evil motives to the public and private elements in the power structure of the housing industry. These people are no more prejudiced than are the people who buy houses in the Levittowns and thousands of other all-white suburban communities. Questions about property values puzzle banks and insurance companies that are responsible for investing other people's money. Abrams breaks down the problem and shows that there are many possible responses to the movement of Negroes into a white area. But because enough research has not been done, he cannot state what actually happens to property values under various conditions.

Abrams shows how prejudice makes housing the chief commodity in America not available on the same terms to whites and Negroes. Residential segregation makes for school segregation. It contributes to physical separation in recreation and worship and, above all, to separation in our thinking and feeling.

This is wrong, and we need to find ways to spur more Americans to work on this complex problem. The cessation of building during depression and war, our growing population, the urban migration, the rising level of incomes, and the competition for the limited supply of housing aggravate urban racial tensions. Most important, social controls with respect to numerical proportions are lacking in the field of private housing. In employment, management can integrate on a gradual basis. In housing, the white group feels unable to extend a neighborly hand because of its fears of being inundated. It is significant that in interracial public housing and cooperative housing, quotas are usually set on the number of Negroes. As long as so many whites feel the way they do about colored people, exhortation is no answer to the question of numbers.

Abrams has broken new ground in the crusade for equal opportunity and equal treatment of all Americans. The number of people working for integration is increasing. Abrams' book will enlighten and strengthen them.

FRANK S. LOESCHER
Philadelphia, Pa.

MICHAEL M. DAVIS. *Medical Care for Tomorrow.* Pp. x, 497. New York: Harper and Brothers, 1955. $6.50.

Among the many recent publications on the sociology and economics of medicine, Dr. Davis' book stands out as the most comprehensive, the most scholarly, the most courageous, and the one most likely to rekindle the flames of controversy over national health insurance. The first three parts, dealing with basic elements in medical services, evolution in organizations, and evolution in economics, present a detailed description and an incisive analysis of the many and varied forces that have shaped the policies followed by society in its efforts to adapt medicine and the related sciences to social needs and uses. Acknowledging progress, Dr. Davis nevertheless is forced to conclude that the present balance is too uncertain to be durable. He believes the time has come to envision goals desirable alike for medicine and for society and to work toward their achievement. After studying the present situation through a microscope Dr. Davis takes a telescope to scan the horizon, and what he sees there is recorded in the final part of the book. Dr. Davis is convinced that the demand for comprehensive medical care will be persistent and growing in intensity, that the American people can afford to spend on medical care all they need (p. 322), and that the long-range interests of medicine and the interests of the public are against the fee-for-service method of remunerating physicians (p. 337). He is fully aware of the fact that the problem of organizing payment for comprehensive medical care is interrelated with others, such as creation of a service organization providing for the necessary profesional personnel and physical facilities and for attainment of teamwork through group practice and regional organization of hospitals. He realizes the importance of educational processes, especially the need for changing the climate of opinion in professional schools. "The basic issue . . . is not the survival of individualism, but *the maintenance of individuality within organization*" (p. 428).

Without a "broad and frontal attack on the economic problem of medical care, that is, the methods of paying for it," the author expects but "slight and spotty progress in developing widespread group-practice units, regional organization, adequate supply and distribution of needed professional personnel" (p. 395). Discussing the chief alternatives in developing group payment, Dr. Davis is certain "that we shall have neither all insurance nor all taxation, but some of both" (p. 430). He favors national health insurance, proceeding by stages, and makes a strong plea for "*expedited* gradualism, expedited and directed by those who view medicine not merely as a healing, or even a preventive agent but as one of the chief creative and reconstructive forces which physical, chemical, biological, psychological, and social sciences are now marshaling for mankind" (p. 433).

FRANZ GOLDMANN
Harvard School of Public Health

JOSEPH FLETCHER. *Morals and Medicine.* Pp. xvii, 243. Princeton, N. J.: Princeton University Press, 1954. $4.50.

This is a study of the "ethics of medical care," as distinct from "medical ethics" in the ordinary meaning of the latter term. The author, who is professor of Christian ethics at the Episcopal Theological School in Cambridge, Massachusetts, states that little systematic writing on his subject has been produced in Protestant or Jewish circles. He also finds the treatment of such genuinely ethical questions as appear in professional codes to be ambiguous or evasive. These codes, moreover, focus on the rights and actions of physicians, whereas the author is concerned with the rights of patients. There is, on the other hand, a large and pertinent Catholic literature, to which the present study is offered as "counterpoint."

The author's views are founded on an extensive knowledge of the sources—both historical and contemporary. They are also based on the belief that choice and responsibility are "the very heart of ethics." Patients, like all men, are moral or immoral to the extent that they are free. They therefore have a right to be treated as free beings; that is, as persons rather

than as cases. They are entitled, for example, to be told the truth about diagnosis and prognosis so that they may make their own plans and decisions. The only exception to this relates to the care of those who are psychotic or emotionally disturbed.

Dr. Fletcher deplores, in this connection, the tendency among physicians to treat diseases rather than persons—an impersonal approach which he ascribes to specialization and a resulting indifference to human values. It may be added, however, that this attitude derived originally from the nineteenth-century emphasis upon a localized, specific pathology, which logically focused attention on diseases as such. The situation is being modified today, quite apart from its moral aspects, by a partial return to a generalized pathloogy of "the whole man."

Science, Dr. Fletcher declares, has extended man's freedom by widening the choices available in medical matters; while theology has usually limited freedom by rejecting each new alternative in turn. Chief among these alternatives are those relating to life and death; and Dr. Fletcher therefore poses in succession the controversial issues of contraception, artificial insemination, sterilization, and euthanasia. He examines Catholic opposition to each of these procedures and ascribes it to a particular concept of "natural law." This concept, it is held, has come to identify what is right with what ordinarily occurs in nature—rather than with moral values in themselves. Dr. Fletcher rejects this "materialistic and animistic doctrine," and concludes that free choice in each of these issues raises man about brutish or fatalistic attitudes to a level of personal integrity.

The argument throughout is primarily moral in tone, but the humane advantages of the proposed practices—individual and social—are also noted. The appeal is to reason rather than to dogma, and no attempts are made to shock the reader or to arouse feeling against those who think otherwise. The study impresses the reviewer as an unusually clear, timely, and courageous one.

Johns Hopkins University

HAROLD A. BONER. *Hungry Generations: The Nineteenth Century Case Against Malthusianism.* Pp. viii, 234. New York: King's Crown Press, 1955. $3.75.

Hungry Generations is a survey of the literature touching on the Malthusian controversy from Godwin to Wells. Through the writings of editors, publicists, economists, novelists and poets, the author traces the rise and decline of the authority of Malthus' ideas. Authors receiving most attention include Carlyle, Dickens, Disraeli, Godwin, Kingsley, J. S. Mill, and Southey; but many others are included. This is not a scientific treatise, but literary criticism. Its thesis seems to be that the ideas of Malthus were utterly false, were accepted because of their utility to the ruling class, but finally were exposed as full of glaring fallacies by the literary critics. The survey conveniently stops short of the revival of Malthusianism following World War I.

The "Malthusian controversy" was marked by much heat, hair splitting, and logomachy with much neglect of facts or even scorn of them. This war of words is here interestingly traced with acuteness and general impartiality though leaving the basic issues where they were. Hence it is a work of scholarly futility. The basic fault lies in the narrow interpretation of Malthusianism. While no systematic statement is anywhere made, the author adheres rather consistently to the following: Malthus held that poverty is inevitable and incurable, and that the poor are themselves responsible because of their inherent imprudence in breeding; hence, a Socialist-Communist utopia is unattainable; moreover, poor relief should be abolished because it undermines prudence, subtracts from the well-being of the prudent, and harms the imprudent by spreading poverty over larger numbers; this suffering of the poor is part of the mysterious designs of Providence.

This may come close to the views of the first edition of the *Essay,* but since Malthus was fully aware of criticisms of his ideas and made substantial alterations in the second edition, it is not possible to hold him to such a harsh interpretation. The proof is found in this survey, for it classes among those who undermined what the author considers "Malthusianism" numerous persons who considered themselves Malthusians and were so considered by their contemporaries; in some cases they are dubbed even by our author as "Malthusians with a difference." These include such names as Place, the Mills, Ricardo, Senior, and others.

What Malthus persisted in from first to last was his central contention that poverty is inevitable *unless* the poor restrict their multiplication. He did not contend that all the poor were hopelessly imprudent; he was one of the first to suggest that a higher standard of living encouraged prudence. To contend that he held that nothing could be done to alleviate poverty is to set up something of a bogeyman. His central contention was admitted by nearly all his opponents. It is clearly a truth of first-rate social significance as the workers of the West have at long last learned, and as the hungry generations of the Orient are now beginning to understand.

Finally, it may well be doubted whether or not the often fierce contentions of the critics had much to do with the decline of Malthus' authority. If that were true, how would one account for his present revival? Far more important were the great technological advances, the vast increase in trade, the abundant food from America, and the obvious improvement in the conditions of the working class. Far from "the Malthusian minority" dwindling "into its present obscurity" (p. 174), it now stretches around the globe and finds in Malthus one of the major prophets of all time.

FRANK H. HANKINS
Smith College

RALPH LINTON. *The Tree of Culture.* Pp. xiv, 692, xvi. New York: Alfred A. Knopf, 1955. $5.75.

This posthumously published book is based in part on lectures delivered by Linton as Sterling Professor at Yale. The final processing of the volume was done by Mrs. Linton who states in the Preface that the title refers, not to familiar evolutionary tree, but to the banyan "whose branches cross and fuse and send down adventitious aerial roots which turn into supporting trunks. Although the banyan tree spreads and grows until it becomes a miniature jungle, it remains a single plant and its various branches are traceable to the parent trunk. So cultural evolution, in spite of diffusion and borrowing and divergent development, can be traced to prehistoric origins."

This statement sets clearly the mood and scope of the volume. It is the mixture of geographically defined culture areas, of scientific conceptualization, and of historical specificity that characterizes much of anthropological thought in the last fifty years. It is, in other words, a mature anthropologist's view of world cultures. Historical reconstruction as well as actual history, archaeology, and ethnography are blended in synoptic sketches of six major culture areas: Southeast Asia including Oceania; Southwest Asia including the Semitic cultural florescence, and Neolithic Europe; the Mediterranean complex including Islam; Africa in its prehistoric, Egyptian and indigenous contemporary civilization; the Orient meaning India, China and Japan; and finally the New World of both tribal and high cultures. The scope is frankly as pretentious as anthropology and world history. It belongs with Kroeber's *Anthropology* although its presentation is less scholarly, and its topical coverage is less complete. To the reviewer the richest aspects of the book are Part II: Evolutionary Processes and Part III: Basic Inventions. These 150 pages are not only masterly in their selective condensation, but are by that very fact creatively elucidating.

This is not a thought-provoking volume for the professional, but rather suggests itself as a text for a course on world ethnography. Also, the non-anthropologist who wants a lucid survey of how the professional organizes cultural data in historico-geographic terms will have here an instructive, poised, and knowledgeable presentation. He will also find the necessary maps, illustrations, and index as well as a carefully selected guide to further reading.

This is a good book, but it does not rank

with Professor Linton's distinguished contributions to the ethnology of three major world areas nor with some of his more creative volumes such as *The Study of Man* and *The Cultural Background of Personality*.

CORA DU BOIS

Cambridge, Mass.

W. F. OGBURN and M. F. NIMKOFF. *Technology and the Changing Family*. Pp. v, 329. Boston; New York: Houghton Mifflin Company, 1955. $3.75.

The well-known veteran team of Ogburn and Nimkoff has produced a readable, well-organized book which is accurately described by its title. The conceptual framework of the book is distinctively sociological and, as might be expected, centers about technology as a prime mover having impact on family functions. Many ideas are familiar, but writings of Shakespeare seem full of "quotations." It should not be forgotten that Ogburn was the pioneer who originated, some thirty years ago, many concepts now taken for granted by younger sociologists.

Rather than tracing the social consequences of a single invention, the authors devote themselves to a scientific analysis of the causes of family change. They ask questions about causes and seek to answer them by organizing empirical evidence, largely statistical, and by shrewd deduction and extrapolation when evidence is inadequate.

In Part I the authors are guided in their selection of important changes in the family by opinions of experts, in spite of some diversity of "expert opinion." The second chapter contains a lucid explanation of causes and criteria of relative importance in causation. Special stress is laid on clusters of converging causes which may include ideologies as well as inventions.

The eight selected family changes analyzed in the nine chapters of Part II are indicated by the titles, "From Economics to Romance," "Starting Earlier," "Toward a Smaller Family," "Shrinking Functions," "More Working Wives," "Away from Authority," "Accent on the Child," "More Disruption," and "How and Why the Family has Changed." Only one who has worked with Federal statistics can appreciate the labor expended by the authors who do not just copy available tables, but rather seek out pertinent documented material, reorganize it to bear on questions, and finally subject it to sophisticated interpretation in terms of the causation concept. The final analysis stresses the family as a whole with respect to causation clusters, such as urbanism, birth control, and ideologies. The authors reject biological constants as causes of variables and show an inclination to trace back the web of causation to science and technology.

The final section of the book consists of two brilliant and stimulating chapters on the future of the family as affected by technology and scientific discoveries. Imagination, insight, and wide knowledge of recent developments here are combined with respect for facts and reluctance to pass value judgments.

The book should be required reading for those who regard family sociology as preachy advice to persons wanting simple answers to not very thoughtful questions.

CLIFFORD KIRKPATRICK

Indiana University

FRANK LORIMER and others. *Culture and Human Fertility*. Pp. 514. Paris: UNESCO, 1954. (Distributed by Columbia University Press, New York.) $4.50.

This work was produced under the auspices of the International Union for the Scientific Study of Population, and was financially supported by UNESCO. Its purpose, in the words of Professor Lorimer, is that of "an examination of cultural conditions affecting fertility in different non-industrial societies in the context of their social organization and cultural values—especially with respect to the organization of the family and kinship relations. . . ." The work is avowedly tentative and exploratory.

The first half of the volume is devoted to a generalizing essay by Lorimer based on a wide range of secondary sources. This is followed by a series of culturally specific research reports including a demographic field study in Ashanti by Meyer Fortes; an analysis of Brazilian birth rate statistics by G. Mortara; a report on fertility in Buganda and Buhaya by Audrey I. Richards and Priscilla Reining, and a brief paper on the relation of social conditions to fertility in the Gold Coast by K. A. Busia. Thus, with the exception of Mortara's Brazilian analysis the field researches all bear upon African populations.

The fact that Lorimer discusses his conclusions in terms of hypotheses suggests the exploratory character of his work. Moving from a consideration of procreative capacity and natality levels, Lorimer treats the relations of kinship systems to fertility, developing hypotheses associating corporate kinship structures with high fertility. Fertility-related values and mores are discussed in a wide range of societies living under differing environmental, cultural, and technological conditions. His concluding chapter is on the cultural conditions of the demographic transition in Europe, colonial America, and other regions.

Stimulating as is this survey, it would have gained greater coherence had it been oriented to an explicit sociological conceptual framework. The probability that Lorimer's generalizations will stand considerable qualifying is, however, scarcely a handicap for they pose many fruitful lines of research in the field. Many of the structural and dynamic social and cultural factors to be given account in such research are suggested.

Except for Mortara's essentially statistical analysis, each of the research studies represents an integration of ethnologic and survey techniques. Meyer Fortes' report is not only substantively important, it is a fine demonstration of the power in integrated ethnologic and survey type methods. The Richards-Reining study suggests the importance of comparative research within a generally similar cultural milieu. A signal importance of the volume is its manifestation of collaboration among demographers and ethnologists and the cross fertilization in research methods.

BRYCE RYAN

Wayne University

NATIONAL MANPOWER COUNCIL. *A Policy for Skilled Manpower*. Pp. xxv, 299. New York: Columbia University Press, 1954. $4.50.

This is the fourth report of the National Manpower Commission, which was set up under a Ford Foundation grant in 1951. The Council consists of sixteen representatives from education, industry, and labor.

The present volume is divided into two parts. The first part presents the recommendation of the Council, headed by Mr. James D. Zellerbach. It suggests means to strengthen the nation's resources of skilled workers and technicians. The second part consists of about nine-tenths of the volume and presents the facts and underlying issues upon which the recommendations were made. It was prepared by the Council's research staff under the directorship of Professor Eli Ginzberg of Columbia.

The study is concerned with the inadequacy of skilled manpower in our labor force. In case of a national emergency shortages in skilled manpower might be critical. The volume discusses in detail several factors that have combined to reduce the reservoir of our skilled and technical manpower.

Our vocational schools have proved to be deficient in training skilled workers and technicians. These schools have succeeded in attracting the least intelligent students and their training is frequently limited to preparing their students to the performing of single tasks rather than rounded skills.

Possibly the most serious obstacle to the development of skilled workers in adequate numbers, according to the study, has been the decline in wage differentials between skilled and unskilled labor. The narrowing differentials have apparently robbed young workers of the incentive to learn skills. The wage rates of apprentices are considerably lower than those of unskilled workers, and the wage advantages that accrue from learning a skill do not appear to be large enough to warrant the temporary sacrifice of income entailed by entering apprenticeship.

A Policy for Skilled Manpower suggests some means by which the government at the national as well as state and local levels can aid in strengthening our skilled manpower resources. The measures in-

clude: the establishment of an effective military reserve system; radical changes in our immigration restrictions, which would favor in practice skilled workers and technicians regardless of national quotas; more vigorous government-supported apprenticeship programs; and an educational campaign aimed at the elimination of discrimination against minority groups, which would broaden the base from which skilled workers might be drawn.

The study does not attempt to set up yardsticks for measuring the desirable and needed strength for skilled manpower. The heavy reliance upon government as an active agency for increasing the numbers of skilled workers and technicians might be objectionable to some. The stress laid upon the supposed impact the declining wage differentials between skilled and unskilled workers have upon the drop in the number of skilled workers needs further examination.

Nevertheless, the National Manpower Commission has performed a vital service. It has called the nation's attention to a serious weakness in our national security. The facts concerning the deficiencies in our manpower utilization are presented concisely and lucidly. The program suggested by the Commission and its staff deserves the serious attention of all those engaged in shaping our manpower policies and resources.

SAR A. LEVITAN
Library of Congress

JOHN SPENCER. *Crime and the Services.* Pp. xii, 306. London: Routledge, and Kegan Paul, 1954. $6.00.

Crime and the Services can claim the credit for having introduced finer shades into the broad simplification of "war." There is an essential difference between barrack-square and battlefield, home service and oversea service, the serviceman who had been wounded, was prisoner of war or had worked as waiter at the Officer's mess at the Isle of Wight, had been in the army, the navy or the airforce, not to speak of the distinction between peace and war. The term used by the writer covers all the activities and experiences of the man who has been put into uniform. Spencer rejects the tradition of the "brutal and licentious soldiery." He is inclined to find criminogenic influences of service life rather in the breakup of the family, the interruption of working life, and contrasts in the standard of living. At the same time, the writer is quite aware of other precipitating factors: the effects of the all-male community (involving drinking, promiscuity, gambling, and so forth), the changed attitudes toward property, the training in the school of aggressiveness, destructiveness, and physical subduing. The brutal type is given every opportunity of lawfully, even meritoriously expressing his atavistic impulses. The author does not think that Commando training will set free brutish instincts. I do not quite agree. I have known rapists in the United States who gave the excuse that they just had performed a "raid," as they had been taught in battle courses, where overwhelming is practised and all technical details are picked up. The author, himself, mentions the case of a man who had been given Commando training in blowing safes with a minimum of noise. He was sentenced in 1951 for safe blowing at home.

He touches upon a crucial issue. Since half of the military crimes consists of desertion, and since living underground demands a chain of criminal activities would an amnesty, perhaps not justified in itself, cut short this unavoidably "appended" delinquency, and thereby be sound criminal policy? I have referred to only few of the problems involved which may be of general interest—John Spencer has written a book which, I hope, will be as provocative to the services as it is to the criminologist.

HANS VON HENTIG
Bonn, Germany

PHILOSOPHY AND RELIGION

REBECCA WEST. *A Train of Powder.* Pp. 310. New York: Viking Press, 1955. $3.75.

This latest book by Cicily Isabel Fairfield, known throughout the world as Rebecca West, makes it clear once more that she is one of the really great reporters of the twentieth century. This extraordinarily gifted, brilliant, and cultivated English woman has helped raise the profession of journalism to an art; in her hands reporting becomes literature. She works like a scientist, patiently amassing the particularities and facts, and, at the same time, possesses the rare ability to step back from her subject and regard it in perspective. The result is first-rate reading for lovers of good writing, as well as magnificent, three-dimensional raw material for the historian.

A Train of Powder consists of six reportorial essays, of which three concern Germany since 1946. "Opera in Greenville" describes the trial of thirty-one men (of whom twenty-eight were taxi drivers) in Greenville, S. C. for the brutal lynching of Willie Earle, a 24-year-old Negro who had killed a cab driver. The final two essays recount two notable British trials: that of Brian Donald Hume, an English "spiv" who was accused of neatly dissecting the body of a black marketeer and from a rented plane throwing the pieces over the North Sea; and William Martin Marshall, a young English telegrapher in the Foreign Office, who was duped into becoming a Soviet spy.

Far from being disconnected essays, these reports have a significant common denominator. Miss West is deeply concerned with the problem of legal authority, the motives of those who defy it, the study of socio-psychic cause and effect, and the nature of trials. With subtle skill she moves from cases of treason to cases of individual and group violence, always seeking for the over-all pattern of defiance of the law and its relationship to human reason and the social order. She is intrigued by the combination of fantasy and reality that leads to violence in our lawless times ("Most trials result from a collision between a fantasy and reality" [p. 284]). She presents the reader with an illuminating account of human behavior and also convinces him that no individual human behavior is without links to the whole situation of mankind.

The three essays on Germany are important for the professional historian. Included is Miss West's classic treatment of the mighty drama of the Nuremberg trials of 1946 with their symbolic meaning for our time. There are also two essays concerning the state of affairs in Germany in 1949 and 1954—effects of the Allied occupation, the amazing industrial revival, and the nature of Soviet totalitarianism. In these reports the author effectively demolishes the arguments of revisionist historians that the Germans really understand Anglo-Saxon ideas of justice and parliamentarianism. The titles: "Greenhouse with Cyclamens, I, II, and III" refer to a theme skilfully expressed again and again as in a symphony. In a greenhouse at Nuremberg, Miss West observed a one-legged man who grew enormous cyclamens with the help of a child of twelve. "He terrified because his absorption in industry left a vacuum in his mind which sooner or later would be filled" (p. 248). To the author this symbol of beaver-like activity describes a people desperately seeking to forget its past and sublimate its guilt feelings by a highly neurotic concern with work, work, and more work.

Miss West's style is a thing of beauty and a joy for 310 pages. She writes with a mixture of common sense, wit, and satire. She has a poetic flair for the striking figure of speech. Above all, she possesses insight and intuition as her sensitive mind probes into the psychological background of criminal situations. Her discursiveness, marked by seeming digressions from the matter at hand, is patently planned and carefully designed to fill out the canvas of her art and provide it with a proper frame. Considering her excellent craftsmanship, one need not take too much issue with Miss West for sending her readers to the dictionary (in the first chapter there are: ambience, cantrip, stravaig, commination, epicene, cunctative, palimpsest, fecundated, and quiddity). Nevertheless, this is, in more simple words, a fascinating book—a certain best-seller.

LOUIS L. SNYDER
City College of New York

JOSEPH H. BRADY. *Confusion Twice Confounded: The First Amendment and the Supreme Court.* Pp. 192. South Or-

ange, N. J.: Seton Hall University Press, 1954. $3.00.

Confusion Twice Confounded treats only the ten opening words of the First Amendment, "Congress shall make no law respecting an establishment of religion." The "Confusion Twice Confounded" is found in two decisions of the Supreme Court of the United States: *Everson* v. *Board of Education of Ewing Township,* 330 U. S. 1, the parochial school bus fare case, and *McCollum* v. *Board of Education,* 333 U. S. 203, the "released time" for religious classes case. The author's position is that although the decision of the Court was right in the Everson case, the discussion in the majority opinion showed that the Court had a completely mistaken view of the history and purpose of the constitutional provision, which mistaken view was soon thereafter embodied in the *McCollum* decision, which was wrong.

The author's view is that all that was intended by the constitutional provision was that Congress should not, by law, create an established church or an established religion for the nation; that the provision had nothing to do with the matter of nondiscriminatory support or encouragement of religion in general.

An obvious criticism of the book is that there is substantially nothing new in it. The book, *Religion and Education Under the Constitution,* by J. M. O'Neill, published in 1949, expresses the same attitude toward the subject and uses the same historical and other factual information. The O'Neill book even anticipates the current one in its indignant, intemperate, and disrespectful attitude toward the Justices of the Supreme Court. The essays in the symposium on Religion and the State, in Volume XIV, No. 1, of *Law and Contemporary Problems,* especially Judge Fahy's essay on Religion, Education, and the Supreme Court, cover much the same ground.

The historical and factual data given by the author are marshaled with skill and acumen and are quite convincing. A strong case is made that Jefferson, by his "wall of separation between church and state" observation, had no such idea, for his own State of Virginia, as that which emerged from the *McCollum* opinion. And Madison's subsequent conduct seems to show that he had no such idea for the Federal Government, to which the First Amendment was directly applicable.

Those who defend the *McCollum* decision and the *Everson* dicta do not say much about the historical facts. They urge that the law as laid down by the Supreme Court is a wise law for current times, and that it is not important that it goes farther than the constitutional fathers may have intended. Whether the text "Congress shall make no law respecting an establishment of religion" is that kind of a flexible text, like "due process of law" or "commerce among the several states," the meaning of which may vary from time to time, is highly debatable.

J. WARREN MADDEN
The United States Court of Claims

JAMES STREET FULTON. *Science and Man's Hope.* Pp. 179. New York: Bookman Associates for the Rice Institute, 1954. $3.25.

This book seeks to present an inclusive moral ideal ("man's hope"), and to determine the source and character of moral knowledge. The view proposed is that the human good is realized in the "moving creativity of life," the ideal culmination of "constructive decision" consisting in an alert sensitivity to every reality according to its kind. It is also argued that although moral knowledge is "rational," such knowledge stems from an "inward" insight and is radically different from conclusions obtainable by the methods of empirical science. According to Dr. Fulton, who is professor of philosophy at the Rice Institute, science is incapable of supplying normative moral principles. For science cannot define the ideals of life, even if science can discover some of the instrumentalities for achieving human blessedness, and even if the life of science is itself a splendid illustration of human effort "to become fully alive by becoming alert to the full reach of the processes which sustain our existence."

Dr. Fulton writes with passionate eloquence and conviction, and he exhibits a fine sensitivity to certain aspects of the phenomena of moral experience. His appraisal of the habits of mind essential for the pursuit of science is appreciative and perceptive, and his comments on a variety of historically influential doctrines on the relations of science and moral knowledge are frequently acute. Moreover, although he thinks there are limitations in scientific reason in respect to moral knowledge, he also refuses to follow current philosophies of irrationalism which renounce the use of intelligence in any form as a guide to moral living.

Dr. Fulton's presentation of his central theses is nevertheless not convincing. At crucial points his writing has an inspirational rather than an analytic quality, and he never squarely states how the *validity* of moral "insight" is to be established. In particular, despite his professed allegiance to "reason" as a guide, he nowhere explains how, granting the 'inward" source of moral *perceptions,* the adequacy of moral *judgments* is rationally adjudicated, especially when such judgments are mutually conflicting; and he simply ignores the relevance of empirical knowledge for the *evaluation* of moral claims. In any event, his account of the inclusive moral ideal is fatally vague; and while his description of certain aspects of moral life and scientific endeavor is sometimes to the point, his conception of moral and scientific experience strikes the present reviewer as a feverishly romantic one, only rarely faithful to the facts of moral deliberation and scientific inquiry.

ERNEST NAGEL
Columbia University

The Social Sciences in Historical Study: A Report of the Committee for Historiography. (Bulletin No. 64.) Pp. x, 181. New York: Social Science Research Council, 1954. $2.25 cloth, $1.75 paper.

If this second report of the Committee on Historiography is representative of the present opinions of American historians, then the changes in attitude towards the objective potentialities of the historical method since the early twentieth century have spiraled. Historians have moved from a concept of their discipline closely analogous to that in the natural sciences, through a relativist and skeptical phase, to the affirmative and optimistic view of the "social science historian" as revealed in this work.

The first chapter, written by Mrs. Jeannette Nichols, surveys the reception given to the report of the earlier committee in Bulletin 54; the last chapter is an adaptation of the provocative article by Thomas Cochran, published in July 1948, on "The 'Presidential Synthesis' in American History." The five chapters in between constitute the body of this new report, mainly the work of Cochran, Hugh Brockunier, Hugh Aitken, Shepard Clough, and Bert Loewenberg. It is a successful co-operative venture in summarizing the present status of the social sciences and their applicability to history, and in analyzing the concept of change and the methods of the historian. Frequently the footnotes provide an excellent select bibliography. Among the intellectually attractive features of this report are the committee's preference in historical reconstruction for the conscious employment of theory, for the restricting of hypotheses to testable proportions, and its awareness of the possibilities of a "cumulative analysis" in history comparable to that in science.

I am disposed to criticism, not on fundamental grounds, but on points of emphasis. It seems to me that the members of the committee are overly deferential to the scientific standing of the social sciences, confine themselves too much to techniques available only to the historian writing of recent times, develop insufficiently the fact that the historian has found his own way, and that he is still concerned with narrative, and with his relations to the humanities. The relevance of philosophy to history is briefly recognized, but there is no suggestion that if the methods of any other discipline have been adapted to the historian's uses it is probably, more than the social sciences, those of a much older discipline—that of the detective and juridical processes.

The weight of such criticisms, however,

is reduced by the whole tone of the volume —by the writers' recognition of the problem-raising and question-asking character of the historical enterprise. This is a rewarding book for any reader willing to devote time to its careful perusal.

WILLSON H. COATES
University of Rochester

COMMONWEALTH OF NATIONS

P. A. REYNOLDS. *British Foreign Policy in the Inter-War Years.* Pp. xi, 182. New York: Longmans, Green, and Company, 1954. $2.25.

British Foreign Policy in the Inter-War Years by P. A. Reynolds is wholly unpretentious. It was designed as a textbook and conforms to the better tradition of such writing. The style is lucid and uncluttered; the sentences are explicit, and statements are made without hedging. The author is given to recapitulations and summaries at frequent intervals, as one does in a good textbook. In the front there is a chronology for ready reference or for memorization. At the end a bibliography carries some critical comment; nearly all the books mentioned are in English, a few in French (mostly memoirs), and none in any other language. The volume makes no pretense at originality of interpretation or point of view and is itself heavily dependent upon secondary works. There is virtually no reliance upon documents, except on those which have been published by the British or American government or by Chatham House.

The account takes for its major premise the decline in the position of the United Kingdom after World War I—economically, politically, and strategically. This decline is attributed to the loss of Great Britain's industrial pre-eminence, the weakening of its political position as a consequence of the enhanced status of the Dominions within the Commonwealth, and the growth of nationalism and anti-colonialism in the colonies. The strategic position of Britain had been undermined by the development of new weapons, the shrinkage of the globe. The author emphasizes that despite its changed status the basic objectives of Britain's foreign policy—command of the seas and a balance of power in Europe—remained unchanged; they were indeed intensified. But command of the seas had to be shared with the United States, and the effort to produce a balance in Europe led to sharp differences in policy between Britain and France. "The most disastrous feature of British policy in the inter-war years was the rigidity with which an understandable policy of caution towards widely conceived collective security in the 'twenties was pursued and intensified in the 'thirties . . . to the point of surrender of one of her traditional aims—the prevention of mastery of the Continent by a single power." The disappearance of the United States from the tripartite guarantee among France, Britain, and the United States led to Britain's abandonment of this guarantee; the lack of an Anglo-French alliance dominated French policy and, in a sense, dominated world politics between the two wars. Lack of cohesion among those three opened the way for Hitler and the Japanese jingoes.

The book is admirably adapted to the audience for which it was intended, and for the general reader who wants a clear, brief survey.

HENRY M. WRISTON
Brown University

GEORGE HARRIS HEALEY (Ed.). *The Letters of Daniel Defoe.* Pp. xxii, 506. Oxford: The Clarendon Press, 1955. (Distributed by the Oxford University Press, New York.) $6.75.

These 251 letters of Daniel Defoe represent all of the known extant letters of that prolific writer. Most of the letters have already been published either in the Historical Manuscripts Commission's *Report on the Manuscripts of His Grace the Duke of Portland,* or elsewhere. Notwithstanding, Professor Healey has done a real service in bringing all of the letters together and in providing clean and well-edited texts of them. Defoe was the author of 235 letters, while the additional sixteen were addressed to him.

The great bulk of the correspondence concerns Defoe's relationship with his benefactor Robert Harley, Speaker of the House and later Lord Treasurer and Earl of Oxford. From 1703, when Harley saved Defoe from prison, up to the death of Queen Anne in 1714, Defoe wrote Harley long accounts depicting conditions in England and Scotland. Defoe described his unique position as Harley's man thus: "Methinks I look Very Simply when to my Self I reflect how I am your Messenger without an Errand, your Ambassador without Instructions, your Servant without Orders" (p. 131). In his own mind he carried out Harley's tasks well: "In my Mannagemt here I am a perfect Emissary. I act the old part of Cardinal Richlieu. I have my spyes and my Pensioners In Every Place" (p. 211).

Political scientists will read with profit and pleasure Defoe's ideas on the prime ministership as it had developed historically, his thoughts on naval affairs and naval administration, his penetrating judgments and descriptions of the violent party warfare that was so prevalent in eighteenth-century political life, his stand on freedom of the press and of conscience, and his insights into the duties of a British secretary of state and into the operation of the British electoral system. For the historian, the letters will be complementary to Defoe's *History of the Union* and an invaluable source for Dissenter attitudes toward the leading issues of the day. His observations on foreign affairs are expressed to better purpose in the *Review* or in his pamphlets. Economists will discover his economic digressions, especially his project for advancing Scottish trade and for founding a colony in Chili, to be both interesting and enlightening. Literature students will find the notes and letters most valuable in their quest to fathom the doings and the character of the author of the *True Born Englishman* and *Robinson Crusoe.*

The editorial effort expended by Professor Healey has made the book highly usable. The text is lucid and the index full. A bibliography would perhaps have added to the value of the work. This is of course a minor criticism. Professor Healey's edition of *The Letters of Daniel Defoe* henceforth will be consulted by all students interested in Queen Anne's England.

Coe College

J. D. B. MILLER. *Australian Government and Politics: An Introductory Survey.* Pp. 240. London: Gerald Duckworth and Company, 1954. 15 *s.*

Australia's rise in national unity and international prestige has been beset with many difficulties, as the volume by J. D. B. Miller, assistant lecturer in international relations at the London School of Economics, amply demonstrates. The reviewer spent eight months in Australia in 1953 as a Fulbright professor. To the visitor, and perhaps to a certain extent to the citizen, Australian political life presents a bewildering variety of institutions: three tiers of government and a multitude of statutory bodies. There are thirteen Houses of Parliament and 680 Members of Parliament to govern nine million people. Sometimes these facts are quoted to prove that Australia is over-governed. But part of the reason for the elaborate framework of government "lies in the inhospitable nature of the country," Mr. Miller argues, "in the remoteness of one center of population from another, and the sparseness of population between the main centers; the political expression of this has been the demand of the faraway areas for special representation in their local parliaments, equal representation in the Senate, and a place at the Premiers' Conference."

There are three Australian political parties which have been significant in any of the parliaments—Labor, Liberal, and Country—and only one outside parliaments—the Communist Party. One feature which all of the parties display and which distinguishes them from British political parties is that they are organized primarily at the state level, and only secondarily at the national level. Each party, in fact, "has reproduced the Federal pattern on which the present governmental system is based, in that each began as a series of independent State organizations which created a na-

tional organization in order to operate effectively in the Federal parliament. In no case does the central organization have anything like the power possessed by the central organizations of the British parties." Another characteristic of the three Australian political parties is that each is supported by easily identifiable organizations of people whose economic and vocational interests have induced them to band together for action to their common advantage: such as trade unions, associations of manufacturers and traders, and farmers' and graziers' unions, which exercise constant influence over party policy.

Isolated from other countries and sparsely populated by a single European racial group conscious of a high standard of living, Australia for more than a century developed a high standard of living and an organized system of political institutions which, in many ways, are unique in the world. Over the years, this system tended to concentrate on economic problems: land, employment, irrigation, taxation, industrial disputes, transport, marketing, water supply, and social services; to disregard theories in face of a discussion of concrete proposals; to distrust political leadership, except in times of crisis; and to exhibit a willingness to experiment in forms of government, but with a strong bias to group loyalty.

The first war led Australia to membership in the League of Nations, and to the inception of independent external policy. However, she continued to accept British leadership during the 1920's and 1930's, being content with consultation on major matters. In the second conflict, Australia's exposed position in the Pacific involved her in diplomatic activity and military cooperation on her own account, especially with the United States.

Since World War II, Australia has been plagued with the problems emanating from a booming economy, heavy immigration, inflation, and industrial unrest. The position of the Australian Communist party and the enlarged influence of Communism in Europe and Asia have been subjects of constant argument. Religious issues, too, have appeared in national politics for the first time since the 1920's, creating deep differences of opinion within the Labor party. In 1949, 1951, and 1954 a Liberal party coalition under Mr. R. G. Menzies was given charge of the Government. Mr. Miller emphasizes, however, that "the Federal Government is now the custodian of the economic health and external security of Australia, in a world where these two conditions are influenced primarily by forces outside Australia's control."

The relations of Australia with other Commonwealth countries since the last war have been largely economic, although they have also involved a friendly reception to the new Asian Dominions and an attempt, through the Colombo Plan, to show that Australian goodwill to these nations is practical. Economic problems within the Commonwealth have continued to be dominated by serious problems within the sterling area. In the 1950's the international economic problem for Australia is still in essence what it was in the 1930's, namely, the problem of heavy dependence upon exports of a few primary products whose prices depend on world markets.

SLAVIC COUNTRIES

GEORGE B. DE HUSZAR and Associates. *Soviet Power and Policy.* Pp. x, 598. New York: Thomas Y. Crowell, 1955. $8.75 Trade; $6.50 Text.

George B. de Huszar has brought together some fourteen different specialists writing on various aspects of the nature of Soviet power. In the editor's words, "since no one person can discuss with authority the several phases of Soviet power and the Kremlin's policy of expansion, this volume is a cooperative venture in which each aspect of Soviet power and expansion is discussed by a specialist."

The first chapter entitled "The Success of Kremlin Policy" by de Huszar begins with the sweeping generalization, "Soviet Russia was the only real victor of World War II." This kind of writing, justified as it may seem for text book purposes, which is essentially what this work is, characterizes so much of the book. In the last ten years, Soviet studies in the United States have burgeoned so fast that a large number of excellent monographs and specialized works on different aspects of the Soviet Union have been published. To summarize these monographs and works and incorporate their distillate is no small task for a panel of specialists. Except for the provocative *USSR a Concise Handbook* edited by Ernest J. Simmons and published in 1946 and the very informative issue of THE ANNALS on *The Soviet Union Since World War II* edited by Philip E. Mosely and published in 1949, and notwithstanding the excellent collection of papers in *The Threat of Soviet Imperialism,* edited by C. Grove Haines and published in 1954, there has not been until de Huszar's book as extensive a compendium of political, economic, and foreign policy articles on the USSR.

The main value of the book is that it is a handbook of current data concerning the USSR. Material on land, population, economic development, transportation, foreign trade, political and administrative structure, ideology, Communist party organization, the system of controls, armed forces, and foreign policy are all discussed. The latter part of the book is concerned with Soviet expansion in Eurasia, preceded by a discussion of the strategy and tactics of Soviet expansion, written by the editor. Separate chapters are written on Western Europe, Eastern Europe, the Near and Middle East, and Northeastern Asia. The book is concluded with a chapter by de Huszar on the geopolitical position of the USSR and Soviet position toward the United States.

Since so many different writers contribute to this volume on so many different topics, there is an unavoidable unevenness in the style and contents of the volume. Some of the articles are filled with masses of data such as in the economic and transportation chapters while those on politics, administration, and controls are characterized more with broad analysis than with detailed description of facts. If the reader will go through these six hundred pages of information on the USSR, he will receive a very extensive exposure in one volume to the basic information on the USSR, critically presented.

WILLIAM B. BALLIS
University of Washington

HANS KOHN (Ed.). *The Mind of Modern Russia: Historical and Political Thought of Russia's Great Age.* Pp. xii, 298. New Brunswick, N. J.: Rutgers University Press, 1955. $5.50.

Not long ago I was talking of small and inconsequential matters with a Russian when suddenly he broke off the conversation to put the question, despairingly and as it seemed to me with childish naiveté, "Why, oh why is it the Poles hate us Russians so?"

In Professor Kohn's useful and compact compilation we can find a rather good answer to the question. Although not stated in so many words, the answer is there by implication, not only as to why there is ill feeling between the Russians and their immediate neighbors on the west, who happen to be the Poles, but between themselves and the West generally.

The volume is not, as might be imagined from its title, a study or exposé of "the mind of modern Russia" at all, but a gathering together of writings by various Russians of the nineteenth and twentieth centuries on the single theme of "Russia and the West." Always the question asked by my friend, though here not in reference to the Poles, is just beneath the surface. "Why," we hear Danilevsky phrasing it in his important study of *Russia and Europe* (1869), "why doesn't Europe love Russia?"

If all those speaking in this compilation for the mind of modern Russia were of the Chaadayev-Herzen-Soloviev stripe, Europe would love Russia perhaps better even than she loves herself. All these were harmonizers, who saw in Europe not only the evil which we all know exists, but the noble and the exalted as well, and in their own country the same, the bad along with the

good. And these three recognized the deep need of each for the other. But, despite Herzen's statement to the effect that "a citizen of North America" is almost the only non-Russian in the world capable of understanding the Russian people, it is hard to see how the North American can ever really *understand* (in the sense of *sympathize* with, as is meant here) a race, the majority of whose spokesmen from Pogodin down through the Slavophils and ending with Stalin, find a warlike spirit only in the West, and in Russia only gentleness, goodness, and light. How, in another connection, can a North American even "understand" a race which does not believe in a political opposition party?

Why Professor Kohn lugged in Mickiewicz's involved and diffuse lament from the *Books of the Polish Nation* it is hard to see, but Havlíček's contribution is of great value, and perhaps the best answer we have to the question of which we have spoken. This is why the West does not love Russia: because a noble and potentially fruitful idea, that of Slav reciprocity, whenever it appears, is invariably turned to evil and betrayed by being transformed into an instrument of Russian imperialism. It is the same with other schemes of cooperation.

There are many strident voices speaking in Professor Kohn's volume. From knowing Russians personally, and finding them to be people of warm, rich natures, good and bad as ourselves, we hope the strident voices are not the true echoes of "the mind of modern Russia." Yet we fear that if these are what the Russian people are listening to, and that if they listen to these long enough, understanding between them and ourselves will grow ever less and less. And so we close the book with a shudder. No light has been shed. Only darkness.

ARTHUR PRUDDEN COLEMAN
Alliance College

MARSHALL MACDUFFIE. *The Red Carpet: 10,000 Miles Through Russia on a Visa from Khrushchev.* Pp. xiv, 330. New York: W. W. Norton and Company, 1955. $4.50.

It is refreshing to read this volume so full of direct unadulterated observations and so free of any preconceived judgments. Marshall MacDuffie came to Russia not to look for evidence for or against any theory, but with the desire simply to see as much as possible. And he succeeded to see much more than most foreign travelers. Of course, he did not see all he wanted. However, he was wise enough not to be deceived by what he did not see. He writes in the last chapter of his book: "I saw no signs of unrest among the Soviet people—but then I saw chiefly the surface of life in Russia. I'm not kidding myself. If there had been rebellion brewing all around me, I doubt that I could have seen it." And he adds: "I was denied a chance to visit Soviet prisons and slave-labor camps. But I didn't have to see oppression to know it was there; the testimony of those who have suffered from it is indisputable." To register exactly what he saw and not to deny what he did not see—this approach of Mr. MacDuffie is the most sound for one who was able to see only the surface and was conscious of it. And it is the surest guarantee that Mr. MacDuffie has been no superficial observer.

In 1946 Mr. MacDuffie spent several months in Russia, mostly in Byelorussia and the Ukraine as Chief of the United Nations Relief and Rehabilitation Administration mission. He saw devastated areas of the country just arising from the depths of their misery. In the fall of 1953 he saw a part of the same areas already fully reconstructed. Comparisons with past impressions were unavoidable. The change, of course, was tremendous. But it did not make the author uncritically enthusiastic for the achievements of the regime and blind to the dark sides of the picture—as far as they could be seen on the surface, he was able to observe. Speaking about Russian homes he was invited or allowed to visit, Mr. MacDuffie makes the following remark: "experts who have analyzed my experience believe . . . that the guides who escorted me had general permission to take me into some flats and knew perfectly well that those they were showing me were in an acceptable show-place area. If this speculation is true, the show places I saw reflect badly upon what was unrevealed." What this remark reflects is the cautious attitude of Mr. MacDuffie, which prevails with a few exceptions in his book.

It is finally worth mentioning that the reader will find in the book many very valuable data about such topics as, for instance, prices on free "Kolkhoz" markets or wages and salaries in various state enterprises—all noted by the author on the spot.

GEORGE DENICKE
Washington, D. C.

DONALD R. HODGMAN. *Soviet Industrial Production, 1928–1951.* Pp. 241. Cambridge, Mass.: Harvard University Press, 1954. $5.00.

Since this book is entirely specialized and quite unsuited for laymen, it is reviewed as such. Professor Hodgman sets out to compile an index of Soviet industrial production from the individual published series of physical outputs, using Soviet weights. As far as is humanly possible, he has succeeded. He puts his index through all the correct tests. How does it compare with the official index year by year? If the latter shows more inflationary bias in one year than another can this be rationally explained, say by some statistical reorganization? How and why does his index differ from those of other foreign scholars? What does it imply for labor productivity? Is it compatible with the movement of mineral consumption and freight transportation? All these questions the author ought to have, and has, asked and answered. His work is very satisfying: honest, complete, and competent.

Criticism, then, can only be of the niggling kind. To a reader of S. Schwarz's *Labor in the Soviet Union*, it is barely credible that fewer hours were worked in 1932 and 1937 than in 1928 or 1950 (p. 116). Secondly, it is not mentioned or allowed for that the output of new coal mines received new 1926–27 prices, not those applicable to the same quality coal from old mines (p. 62). Thirdly, the use of forced labor in industry—mostly excluded from official statistics—is neglected in the estimation of the growth of productivity. To be sure it is impossible to estimate, but it certainly rates a mention.

On the theoretical side, it is perhaps worth saying that there is *some* defence for including new goods in a production index with inflated weights, as the Soviet authorities did until 1950. The resulting upward bias over more ordinarily calculated indices, especially in a period of rapid industrialization when there will be many new goods, is not purely bogus. This is for a reason that, curiously enough, Soviet ingenuity has never urged in excuse: a new good is better that the old one for which it is a substitute, yet costs the same or less (or it would not be introduced). Therefore, to weight it by its cost, or by a price fixed on the basis of its cost (as opposed to a perfectly competitive price) is to weight it too low relatively to the old substitute, if that is similarly weighted. Therefore, all cost of living indices have an upward, and all production indices a downward, bias compared with an ideal index based on social utility weights; wherever technical progress has taken place. Arbitrarily, unconsciously and very badly, the Soviet official index does make an allowance for this.

The weights are Soviet wave-costs in current rubles for 1934. This middling date is certainly better than 1926–27, but it cannot be accepted either that Soviet relative wages are "rational" in the welfare economics sense or that wage-costs alone are anything like suitable weights. The proportion of wages to net value added differs very much from product to product. But space forbids that these objections be elaborated here.

Finally, there is not enough guesswork. The author is too choosy about weights. He neglects, for instance, a perfectly good lumber output series on the ground that he does not know what weight to give it (p. 57). But since lumber output employed very many men and increased much less than average, it is very important to include it, even if only with a guessed weight. Moreover it is impossible to see why the data given in the footnote (p.

180) do not directly provide something better than a guess.

P. J. D. WILES

Oxford University
England

HENRYK PASZKIEWICZ. *The Origin of Russia.* Pp. xii, 556. New York: Philosophical Library, 1954. $10.00.

This impressive study covers the period of the ninth through the fourteenth century of Eastern Europe. It is an important era during which the destiny of Russian statehood was shaped. The entire work consists of four parts, beginning with a discussion of the term "Rus" and of Eastern Slavdom, ending with the ascendancy of Moscow. It is followed by a most extensive bibliographical list—forty-nine pages of neatly packed references—and should be invaluable to the student of history laboring in this field. Two maps, five genealogical tables, and a most extensive index enhance the value of this work further. The entire book is carefully and profusely supported by lengthy quotations and references to numerous and various sources.

The subject of Russia's origin has long been a controversial one. It has been discussed at great length on many occasions by various scholars. Professor Paszkiewicz approaches the subject from a different angle—the ethical aspects and the prevailing form of political life. The dawn of Slavdom centered within the region of two great rivers, the Volga and the Dnieper. The ethnic groups that came to play a decisive part in this early period of history vary: the Scandinavians, the Finnish tribes mingled with the Byzantines, Tartar, and Slavic peoples. All of them leave significant imprints upon the later course of Russian national development. The author's sources are the twelfth century Nestor Chronicle, the *Tale of the Raid of Igor* (*Provest vremennykh let*), and many others.

The main thesis of Professor Paszkiewicz undoubtedly will be challenged by many scholars who hold other views. The link between ascending Moscow and "Asia" is a thesis that is never tired of and is particularly common among Polish writers. It emerges perennially and is especially prone to crop up in time of strenuous relations between the two neighboring states, Poland and Russia. What is further interesting to note is this: the Soviet historian, M. Pokrovsky, has never been held in too high esteem by historians of the Paszkiewicz school. When, however, Pokrovsky's writings seem to support their thesis of the Muscovite state as a "prison of nations" Pokrovsky is faithfully quoted.

Academic freedom is a precious possession and the right of every writer to be his own historian is characteristic of democratic society. If, however, some of the highly hypothetic theories assume the form of political dogmas that might seriously affect world policies, it is necessary to call for alertness. Highly hypothetical theories can quite easily turn into false instruments of national policy with sorrowful consequences for all concerned.

ANATOLE G. MAZOUR

Stanford University

WESTERN CONTINENTAL EUROPE

RAYMOND FUSILIER. *Le Parti Socialiste Suédois: Son organisation.* Pp. 372. Paris: Les Éditions Ouvrières, 1954. 900 *fr.*

The choice lies between a modus vivendi reached by toleration and compromise in a free society or authoritarian suppression of all views but one. In Sweden both principle and the even balance of forces prevent the authoritarian solution. The Swedes are inclined to be practical rather than doctrinaire, whether they are socialist, liberal, or conservative. Their ability to live with divergences and to make progress through co-operation is a phenomenon that perhaps appeals especially to a Frenchman.

Dr. Fusilier has produced a lucid and thorough analysis of one of Europe's most effective political parties. The work is descriptive and comparative and deals primarily with the organization of the party; it is not a study of causation or of issues. It contains, nevertheless, an excellent survey of the rise of the Social Democratic party since its founding in 1889. Socialism is a foreign importation which took root in Sweden and grew like a strong indigenous pine. The steady accretion of strength is traced to 1917, when the socialists first took part in the administration, and on to 1954, a period in which the party has held sole or partial responsibility for twenty-eight of the thirty-seven years. If the author has a thesis, it is that "political parties strongly organized are not an obstacle but rather the prerequisite of an efficient democracy" (p. 309).

The author uses English and American literature in political science, but his real contribution comes from his study of the literature and archives of the Social Democratic party itself. He marshals statistical data for such purposes as charting the party strength in different parts of the country, studies of the median age and occupational background of members of the *Riksdag*, and analyses of the support given the party by the several social classes. He reveals that although it is a working class party, it receives one quarter of its support from the middle social group. This fact, plus its actual achievements and its repeated coalitions with the farmers' party, indicates the moderation in which it exercises political power. The discipline of the unions helps to develop the political consciousness of the workers and of their wives; 80 per cent of them now go to the polls (though this still is less than the 86 per cent of Social Group II and the 93 per cent record of Social Group I). The tie-in between unions and party is not compulsory, but it is close: two-thirds of the socialists are "collective members" through unions, and only one-third are individual members. Here is a penetrating political study.

FRANKLIN D. SCOTT

Northwestern University

Germany Reports. Pp. 367. Germany: Press and Information Office of the German Federal Government (original publication date, 1953). No date for English translation. $3.00.

Germany Reports is a well-documented account of developments in Western Germany from May 1945 through September 1953. Issued by the Press and Information Office of the Federal Republic of Germany as an official account of its accomplishments and objectives, it is based upon information compiled by appropriate governmental departments and contains thirty-two chapters, eighty-one charts, eighty-four statistical tables, and forty-six full-page photographs. It deals with virtually every phase of German life.

The book opens with a chapter which summarizes Germany's major geographic features: economy and raw materials, history, area, and population. This is followed by chapters dealing with foreign policy developments, Germany's relationship with other governments, problems involving the continuity of the Reich, state and local government, the Berlin situation, regeneration of the law, the internal safeguarding of a democratic state, public opinion, war victims and war losses, refugees, budgets and finance, housing, various other economic and fiscal matters, transport, Marshall Plan aid, education, religion, youth, cultural life, and literature.

Most of these chapters are concisely handled and the information is often largely statistical or, at least, well documented by the latest statistical information.

Although, at first glance, *Germany Reports* appears to be merely an official activities report, it is much more than that. To the German people, it is a frank appeal by the Adenauer Government for patience and support. To the foreign reader, it is intended as an assurance of lofty motives and objectives. More than that, it is an expression of the determination of the German people to take their place in the family of nations.

Throughout the book, no opportunity is lost to stress the ultimate objective of a reunified Germany, the great destruction of its economy and the tremendous problems which face the West German Government in achieving its goals. Throughout, no punches are pulled and a spade is called a spade. Thus, in his Preface, Dr. Adenauer states quite frankly that the col-

lapse of the National Socialist dictatorship freed innumerable human beings throughout the world and in Germany from a nightmare and left in its wake unimaginable devastation. "The very basis of sustenance seemed destroyed and the millions of dead and crippled made even the biological survival of the German people doubtful. But what weighed equally heavily was that Germany had lost the confidence of the world."

Continuing, he does not hesitate to take full credit on behalf of the German people for the country's miraculous comeback, at the same time paying some tribute to the effect of foreign aid. Thus, he states, "In looking back over the few years that have passed . . . the change that has come over Germany appears almost impossible to grasp. Through the perseverance and diligence of the whole German people, through the efforts of the communes, the counties and the *laender,* and through the painstakingly (sic) planning and daring policy of the Federal Government, reconstruction in all sectors has been achieved to an extent nobody would have believed possible in 1945. Foreign aid produced blissful effects on the economy and food supply."

He concludes by stating that the day of the collapse of the Nazi dictatorship "will also be recorded by history as the day when the division of Germany began, through which a source of disquietude has been created in the heart of Europe. The obliteration of the unnatural boundary between West and Central Germany will be the primary concern of every German Government. Reunification can only be achieved by peaceful means. Until this is accomplished the whole German people will have no peace and no economic means of livelihood nor will the people of the Soviet occupation zone attain freedom from want and liberty of thought."

With equal frankness, Dr. Felix von Eckardt, Chief of the Press and Information Office, in a Foreword which purports to state the purposes of the book, asserts that it is merely a record of the sequence of events since the collapse of the Reich in May 1945. He continues, however, with the statement that "the government wishes to assure the German people that their political leadership has neglected nothing during the past to build up their social, state and economic life again, and that its efforts will be successful in the future as well. . . . To foreign countries who regard this rapid reascent of Germany with understandable doubts and often with concern, the Federal Government desires to offer, through the dispassionate reporting of facts, the possibility of checking and experiencing the successive stages of this path in order to arouse understanding for the German people and their unique position."

Space does not permit the quotation of a large number of pithy remarks and characterizations relative to the Saar problem, political reconstruction, denazification, and, above all, Soviet Russia.

Germany Reports is a valuable collection of historical fact, reliable statistics, interesting narrative, and what may be termed "justifiable pride." It is the latest and most complete factual picture of the situation in Western Germany. Students of the subject will find it most useful. Persons merely seeking information will find a substantial amount. Care should be taken, however, to assess the characterizations which occasionally take on the flavor of a chamber of commerce report.

ELI E. NOBLEMAN
Washington, D. C.

GEORGE G. WINDELL. *The Catholics and German Unity, 1866–1871.* Pp. xii, 312. Minneapolis: University of Minnesota Press, 1954. $5.00.

Here we have a closely written, detailed account of the role of Catholicism in the politics of building the German Empire from the Austro-Prussian War, 1866, to the proclamation of the empire five years later. This book is well worth the reading. The author writes with such historical evenhandedness that he conceals his own confessional preferences. His treatment is competent; his style, though not lively, is neither pedestrian nor unclear. His lengthy bibliography, predominantly of German titles, shows how full a book may be produced without recourse to archives. The usefulness of his extensive index would have been greater had all individuals (many of whom are obscure) been identified. The chart showing the informative religious census of 1871 would be more satisfactory had it broken the heterogeneous Prussia of the 1860's into regions, for Prussia, like Texas, is something special. To have described church-state arrangements in Germany would have helped most readers.

George Windell's account is so single-mindedly political that it neglects such spiritual-intellectual forces as liberalism, materialism, ultra-Montanism, secularism, and amorality. Only in chapter VII, "Bismarck and the Church, 1866–1870," do we find much of the *zeitgeist* as we trace the interactions among the Vatican Council; German political and religious dogmas; and German, French, and Italian foreign policy. Resistance to unification expressed not only particularism but also resistance to secularism, Lutheranism, and militarism. It was more than Rome versus Wittenberg.

The great gain from reading this book is a sharp realization, supported by details, that Catholic politics per se were vigorous, powerful, and organized. Windell shows conclusively that the *Zentrumpartei* reaches back to the days following Sadowa, and that Bismarck's policies and tactics were affected by the necessity of countering Catholic forces to an extent seldom suggested in standard accounts. Bismarck was not the sole actor on the stage. Finally, as Windell points out at great length, Catholic parties broke unity party strength in Bavaria, ousted Prince Hohenlobe from the Bavarian chancellorship, and came within two votes of preventing Bavaria's entry in the empire. In these years the *Kulturkampf* was seeded. Unfortunately for him, Bismarck's realism was such that he was slow to grant that religious beliefs, which to him were lacking in realism, could be important to others. We should hope for a comparable study of Lutheranism and German unity to complement this useful work.

GARLAND DOWNUM
Arizona State College

EUGENE N. ANDERSON. *The Social and Political Conflict in Prussia, 1858–1864.* (University of Nebraska Studies, New Series, No. 12.) Pp. x, 445. Lincoln: University of Nebraska, 1954. $5.00.

Students of nineteenth-century Prussian history will be indebted to Professor Anderson's painstaking and carefully documented study of the six years bridging the abdication of the demented Frederick William IV and the entrenchment of the Bismarck government. The value of the book is enhanced by the author's success in interpreting political developments in their social setting. Prussia's political awakening is pictured against the backdrop of an expanding economy and rapid industrialization.

Professor Anderson writes sympathetically about Prussian liberalism and the Prussian Liberal party. In its composition and conduct, the Liberal party reflected the desire of the majority of the Prussian people to eliminate the last vestiges of eighteenth-century mercantilism and to break the shackles of Hohenzollern Junkerdom—as represented by the small but powerful Conservative party.

The first part of the book deals with Prussian society with reference to castes and privileges, police state features, militarism, and the political and economic forces striving for the unification of Germany. Judiciously using a wealth of contemporary sources, the author demonstrates how political and economic reform issues affected the roots of Prussian society. The question remains unanswered as to the extent of agreement between the elements in the Liberal party who strove for unification for purely patriotic and nationalist reasons, and those who regarded unification as an advantage to industry and commerce. The struggle over army reform is well described. We see here how a resurgent military caste—relatively dormant since 1815—clashes with a vocal middle class. A vivid characterization is given of Roon, the stalwart War Minister, the tenacious reactionary who, in 1861, persuaded William I to appoint Bismarck Prime Minister.

The second part of the book examines the structure and strength of contemporary Prussian political organizations, emphasizing Prussian "grass roots" party machinery and the electoral and voting systems. The

author's talent for introducing pertinent details sometimes leads one to think that he might have been an eyewitness. His sympathy for the Liberal party and its courageous struggle for reform against the host of Hohenzollern reactionary forces is convincing. The question is left open, however, if the progressive program of the Liberal party for electoral reform and political equality was genuine, in view of their surrender to Bismarck when he too espoused German unification. This surrender was at its worst a sign that the Liberal party was insincere in championing a progressive program. At best it was a demonstration of weakness. The party thus showed that only the tenuous cord of the unification issue held together its divergent groups.

Excessive and long quotations impair somewhat the refreshing flow of the narrative. Direct translations are often stylistically awkward and idiomatically inaccurate. Examples of these weaknesses are the use of "under-officer" instead of "noncommissioned" officer (pp. 107, 237), "unselfconscious" (p. 285), and "handworker" which is used throughout the book. The book has no index. However, these flaws and the numerous typographical errors do not seriously detract from the value of the study.

OTHER COUNTRIES

ARTHUR P. WHITAKER. *The United States and Argentina.* Pp. xv, 272. Cambridge, Mass.: Harvard University Press, 1954. $4.75.

The United States and Argentina is the fourteenth volume in "The American Foreign Policy Library," initiated by Sumner Welles and now edited by Donald C. McKay. It is the fourth of those volumes dealing with Latin America; relatively little of the panorama of the twenty republics now remains to be covered.

It seems to be a general directive for the authors of the series that they set the stage for consideration of the problems of *The United States and*—whatever the country or countries in a given volume happens to be. This makes for confusing and seemingly contradictory titles for the volumes individually and for the series as a whole. Thus, in Professor Whitaker's excellent volume on Argentina the "United States and" part is limited to two chapters and parts of one other; it is hence, at least quantitatively, a minor portion of the whole volume.

Granted that restrictive premise, little of a critical nature can be said about the volume under review. Much that is superlative would have to be included in any detailed review of the book. It is written in Professor Whitaker's customarily brilliant style and with his broad grasp of the intricate interrelationship of factors and problems as they affect the country with which he is dealing.

In the initial chapter he sets the stage in terms of land and people. Four following chapters trace the relations with the United States and the domestic developments in the pre-Perón period. Four more deal with the Perón era and a concluding one seeks to look into the future. An excellent brief bibliographical essay is added.

A few unimportant points of fact might be questioned but will not be at this point. This reviewer must respectfully protest, however, against identifying Juan Manuel Blanes as an Argentine painter even "by adoption." Blanes in residence, inspiration, and allegiance was Uruguayan; as his eminent biographer Salterain y Herrera says of him, *"Vive con los ojos puestos en la patria,"* and the *patria* was definitely Uruguay.

This book complements well Blanksten's *Perón's Argentina.* The two remain easily the best books of recent years dealing with this strong and puzzling country of South America.

CHARLES ROBEQUAIN. *Malaya, Indonesia, Borneo, and the Philippines.* Translated by E. D. Laborde. Pp. xi, 456. London; New York; Toronto: Longmans, Green, and Company, 1954. $6.00.

Bandung, the name of a mountain city in Java, suddenly has become a household word. Remotest corners of the Orient have emerged from story-book land into the realm of our immediate concerns. It is opportune that there should appear at this particular moment a significant book on the fundamental, geological, economic, and cultural structure of a substantial portion of Southeast Asia which the author calls *Le Monde Malais.* It is to be hoped that it will reach a greater audience than its rather forbidding scientific outline may invite.

The author, a professor of colonial geography at the Sorbonne, has reported the results of his scholarly research in Malaya, Sumatra, Java, the Celebes, Borneo, Eastern Indonesia, and the Philippines. These areas, from the evidences of geological formations and ethnic relationships, seem to be a unit in the Asiatic world, each part bearing a closer similarity to the others than to the remainder of the Far East. Statistical details involving land structures, climate, vegetation and fauna, anthropology, and movements of population are not permitted to grow boresome through the generous use of pictures and a deft literary touch, which has lost very little in the excellent translation from the French by E. D. Laborde.

It is a temptation to oversimplify the remedy for the ills of Asia in terms of education for backward people. Education is a two-edged sword which should also cut in the direction of those who are striving to understand and help their less enlightened brethren. This book on advanced geography should contribute invaluably to the equipment of those who are charged with the responsibility of cementing friendly relationships between the Western and Eastern worlds.

Above all, the lessons of this book should answer the occasional contention that there is a power vacuum in the Malayan world into which various political influences may be sucked. The history of colonialism and the current displays of individual nationalism should form a strong argument in the negative. Moreover, a geological background of common antiquity with the rest of the world: ancient customs, deep-rooted religious beliefs which have compromised with rather than yielded to outside influences, local customs responding to the impulses of nature, all form as living and breathing a part of the universe in the Malayan world as any to be found elsewhere. The people are counterparts of other populations. In such a place, dealings with local groups must be on a man-to-man basis and not on the level of patronage. As the author points out, the native "should be regarded as a human being and should be treated as such."

ERNEST SCHEIN

Washington, D. C.

MARIUS B. JANSEN. *The Japanese and Sun Yat-sen.* Pp. viii, 274. Cambridge, Mass.: Harvard University Press, 1954. $4.00.

The West has never fully been able to understand how the Japanese were able to deceive the nations of Asia into believing, even for a moment, her Greater East Asia Co-Prosperity Sphere propaganda. For Japanese policy, which appeared so transparently expansionist to the West, looked entirely different to an Asia in the throes of resentment against Western imperialism.

Thus the idea of uniting all of Asia under Japanese leadership in order to combat Western imperialism did not appear such a farfetched idea to Asians, as we have learned to our dismay over and over again —from the Aguinaldo rebellion of the 1890's to the Japanese New Order of World War II. Japan, as the only Asian nation to meet the West on its own grounds, held a great fascination for an Asia suffering under the complex humiliations of colonialism. As Sun Yat-sen once said, "the day when the unequal treaties were abolished by Japan was a day of regeneration for all Asiatic peoples."

On the Japanese side, Pan-Asianism has always been the point of intersection of diverse political views. It was shared by reactionaries and expansionists who saw a united Asia under Japanese rule, and by liberals who saw a united, free, and

democratic Asia brought to independence through Japan's benevolent example and guidance. Thus it was that Sun Yat-sen, the very symbol of Chinese nationalism, was able to draw inspiration and help from Japan, Chinese nationalism's greatest enemy.

The problem always was, as Sun Yat-sen and others learned through bitter experience, whether Japan would rule or lead. For Japanese ultranationalists, the dividing line was never entirely clear. Japan wanted a nationalist sentiment strong enough to drive out the Western imperialists, but not strong enough to defy Japanese rule. It was this confusion that ultimately compromised the good will that Japan had to its credit in every country of Asia.

Dr. Jansen has given us an extremely valuable understanding of the process whereby the attraction of Japan for Dr. Sun was gradually replaced by an inevitable, if reluctant, hostility. As long as Japan could make use of the radical nationalists to weaken Western power, to hamper the unification of China, and to further her own economic and political advancement, it was willing to help. But when Chinese nationalist aspirations seemed to conflict with Japan's aims, then they were junked. In the same way, Japanese political sentiment itself was split. For the "liberals," Pan-Asianism was more than a mere expedient: it represented a genuine, if somewhat confused, ideal. But for the ultranationalists, Pan-Asianism meant only an Asia united under the Japanese Empire. Dr. Sun learned eventually to deal with the reality of Japanese expansionism, but he always reserved the hope that Japan would return to her role of "leader," not "ruler" of Asia.

Dr. Jansen's book lies in that extremely difficult area of study—requiring as it does command of both Japanese and Chinese language sources—between Japanology and Sinology. It promises well for what we may expect from this field in the future.

HERBERT PASSIN
Ohio State University

GAMAL ABDUL NASSER. *Egypt's Liberation: The Philosophy of the Revolution.* Pp. 119. Washington, D. C.: Public Affairs Press, 1955. $2.00.

In this slender volume Premier Gamal Abdul Nasser traces his own political evolution and outlines the future tasks of Egypt in the Arab world and the global community. A young student in 1935, he took part in demonstrations clamoring for a constitution and the end of British rule in the Land of the Nile. He called upon leading Egyptian statesmen to prevail upon them to help unite Egypt. The National Front was formed as a result.

During World War II, seven years later, he grew bitter against the British imposing their way upon the young king and his determination waxed to see his country gain full independence. The time appeared to be propitious during the Palestine campaign in 1948, when Egypt seized arms to vanquish the Israelis. Instead of that Egypt was defeated.

Nasser, a young army officer, helped to create the Free Officers' organization which ousted King Farouk on the historic July 23, 1952. This appeared to be the right time to realize the national ambitions.

The vanguard had done its work and now it was the masses' turn to close ranks and turn against the enemies of the country. Instead of that hordes of politicians descended upon the leaders of the movement, each of them complaining against the other and offering mass executions as the remedy of the country's ills. Nasser and his associates were deluged with petitions for personal favors. Nobody said "we," everybody said "I." This was an orgy of egotism.

Yet, Egypt needs great force and will power, as Premier Nasser sees it, to play a historic part. He sees his country destined for a majestic role. First, it has to seize leadership in the Arab world, linked together with bonds of a historic heritage, and which is to be cemented into a common destiny. Then Egypt must remember that she is an African country and cannot remain indifferent to the fate of the "Dark Continent" again besieged by self-seeking "white people." Egypt must assume leadership in Africa.

Finally, Egypt must also play a large role in the Islamic world. That part must be large because of Egypt's special status among the Arabs, since she occupies the most strategic location in a very vulnerable area. The area's importance is enhanced because it produces a fabulous oil wealth at a fraction of the cost of production in the Americas. For all these reasons, Premier Nasser sees Egypt's task as the removal of the obtacles in the way of Arab unity.

This is a strange and in some ways disturbing little book. In the Introduction, Miss Dorothy Thompson presents Nasser as a man of stature in the Arab world. Such a man is, no doubt, badly needed. However, this book provides no indication of Nasser's greatness. On the contrary, in some ways he appears to be very petty. He writes no word about the role of former President Mohammed Naguib who, not long ago, was Egypt's most representative man. Then, the role Nasser foresees for his country looks very much like a new type of imperialism in the Arab, African, and Islamic worlds, the Egyptian version of the white man's burden. While he packs the book full of patriotism, he breathes barely a word about his nation's tremendous economic and social problems. What, for instance, should be done about land reform? And what a contradiction there is between his vision of Egypt's cosmic role and the morbid worship of the sacred "I" he pans. Also, the "statistics" of the Premier are evidently inspirational. He credits Pakistan, for instance, with a population of nearly 100 million Muslims while, in reality, the total population of the country amounts to only 75 million and of these more than 10 million are Hindus. The impression Premier Nasser makes is not improved by his jejune nationalistic nostalgia of another age, reveling in words, removed from reality.

EMIL LENGYEL
New York University

BARNET LITVINOFF. *Ben-Gurion of Israel.* Pp. xii, 273. New York: Frederick A. Praeger, 1954. $4.00.

Ben-Gurion of Israel is one of those rare books that hold more for the reader than their title would lead him to expect. This biography of the first Prime Minister of Israel, primarily the story of his life, is at the same time a most incisive, critical, and dispassionate analysis of the forces, personalities, and events that helped shape the present, in many respects unique, phase of Jewish history.

Evidently, it is the very character and stature of the man who is the subject of this life-sized portrait that invites such treatment. Ben-Gurion's part in the sequence of historic events that led to the establishment of the State of Israel is not so lofty as that of Theodor Herzl, who turned Zionism into a movement of political consequence, nor as that of Chaim Weizman, who won public recognition for its chief goal, the National Home in Palestine; but it is possibly more decisive. These statesmen of Zionism used their talents to gain diplomatic victories for their people. Ben-Gurion devoted his to translate these victories into political reality. He was, when necessary, an agitator, but he was always an organizer of the Zionist youth in the little Eastern European townlet where he was born, as David Green, in 1886; of the workers in Palestine, where he immigrated in 1906; of the military struggle against the Arab forces in 1948; and of the government and administration of the new state in his "hour of triumph." In tracing his long and, more often than not, stormy career of a party politician, his biographer can hardly avoid touching upon all the intricacies of Zionist politics, sometimes bordering on the miraculous, and too often on the profane. That he does so candidly, with a perfect mastery of the relevant and the revealing material, makes Mr. Litvinoff's book a source of invaluable information for the student of recent Jewish history.

With all his virtues and shortcomings Ben-Gurion, as this biographer convincingly demonstrates, has done more than any other single individual to bring about the establishment of the State of Israel. Concluding his study of both the man and the state, Mr. Litvinoff retains his sympathetic, but detached objectivity. He shows Ben-Gurion, the party leader, at his worst —at the time when he was "ready to bar-

gain away hallowed principles for a truce with Revisionism" (p. 111); and at his best—in his determined stand during the riots caused by the acceptance of reparations from Germany, in 1952 (p. 235). Neither does the careful chronicler try to gloss over the dangers that beset the new state. "Today" we read, "the balance of power in the Middle East is heavily loaded against Israel. She disposes of an excellent army, well-trained, intelligent, and prepared to defend the state and the cause identified with it. It is nevertheless difficult to see what this will avail against a synchronized attack, launched by air, sea and land, of nations sharing the humiliation of a combined defeat, better led than previously, and far less arrogant" (p. 235). In other words, the outcome of the militant and militaristic politics may prove to be far less final than they would appear to be in the light and glory of their present success. It can only be hoped that some fortunate turn of events will prevent the destruction of what these politics so spectacularly helped to create.

HENRIK F. INFIELD
Group Farming Research Institute,
Poughkeepsie, N. Y.

JOHN F. CADY. *The Roots of French Imperialism in Eastern Asia.* Pp. xii, 322. Ithaca, N. Y.: Cornell University Press, 1954. $5.00.

Eastern Asia of the nineteenth century still offers the historian a fertile field for research. John F. Cady has demonstrated this by his detailed study of the bases of French imperialism in this area during the three decades from 1830 to 1860. This book is important, not only for what it reveals of French policy and the motivations for French expansionism, but also for its excellent synthesis of the diplomacy of the European powers with respect to both European and Asian questions.

Professor Cady concludes that "the taproot of French imperialism in the Far East from first to last was national pride—pride of culture, reputation, prestige and influence" (p. 294). The conclusion is documented in detail in this book which was begun before World War II, but remained unfinished because the war prevented the author's completion of his archival research. Although access was not obtained to the archives of the French Ministry of Marine and Colonies, it is probable that this material would only have served to provide more detail rather than modify the author's analysis and conclusions.

For the student of Eastern Asia, Professor Cady's study is indispensable mainly because through it he will be able to grasp the principal elements in the very tangled relationships of the European powers and the United States in the period when Western policies towards China and the countries of Southeast Asia were being formed. The careful analysis of French support of their missionary efforts in the area involved shows that such support was not always consistent and was frequently the result of factors in France and in Europe that had nothing to do with Asia. The role of French missionaries in bringing pressure on the government in Paris to provide them protection and even to engage in territorial adventures is carefully set forth.

New light is thrown on the position and policies of successive French governments and their representatives with respect to China and the Chinese treaty ports in particular. The role of the French in the first treaties with China and in the subsequent treaty settlements is made clear by this book and should serve to correct misstatements by other authors who have not done the detailed research in the relevant archives. Throughout, the importance of the prestige of France and the high value which French representatives placed upon the export of French culture is clearly shown. It is hoped that the author may continue his research to cover subsequent decades of the nineteenth century or, at least, that his book will stimulate further research in the important last two decades of that century by other scholars, for France's role in Asian international relations needs to be understood.

WILLIAM C. JOHNSTONE, JR.
School of Advanced International Studies

WENDELL PHILLIPS. *Qataban and Sheba: Exploring the Ancient Kingdoms on the Biblical Spice Routes of Arabia.* Pp. xvi, 362. New York: Harcourt, Brace and Company, 1955. $5.00.

Qataban and Sheba is the story of trips of exploration into Southern Arabia in 1950 and 1951 under the leadership of Dr. Wendell Phillips, President of the American Foundation for the Study of Man. The initial exploration was undertaken at Beihan el Qasab, in the ancient kingdom of Qataban, whose life span seems to have encompassed some eight centuries up to the beginning of the Christian era. The frankincense route traversed this region, close to what is today to the southeast corner of the Kingdom of Yemen. The drought, sand and native bullets, the author asserts, had defied the work of explorers. With his superior equipment and enterprising spirit he hoped to unearth evidences of pre-Christian cultures. The photographs he produces show that the work of his expedition was not in vain.

The second expedition was undertaken in the ancient Kingdom of Saba and the work was concentrated in Marib, reputed capital of the Bible's Queen of Sheba. The photographic evidence of results is again impressive. The great moon temple was exposed to view.

Marib is within the boundaries of jealously guarded Yemen which none but the personal invitation of its King can open. The royal favor shone on Dr. Phillips and his party at first, but then their time of troubles began. Among other nefarious acts, the explorers were accused of spying and in the end they barely escaped with their lives. Undaunted, the explorers moved into the Dhofar province of Oman, frankincense capital of the ancient world, where they unearthed such treasures as a bronze bull representing the moon god and bronze female dancers imported from India.

The book is written in a rushing narrative in which hairbreadth escapes and near miracles play important roles. Speaking of a British colonial officer, Dr. Phillips tells the story of how he escaped death when a would-be assassin's knife plunged into his chest. "Miraculously, the blade entered near one side of the heart and pushed it aside instead of piercing it."

Dr. Phillips describes a microfilm project on Mount Sinai in which he had a hand as one that "made available the largest and most important body of research material ever revealed in a single operation," and about which hundreds of books will no doubt be written. He describes Professor William F. Albright, archeologist of the first trip, as the "author of over eight hundred books and articles on the Bible and the Middle East." As all the world knows, the accomplishments of Professor Albright need no such gilding.

The publishers describe Dr. Phillips as "America's foremost Arabian explorer." Whatever else he is, he is also a brilliant salesman. When describing the vehicles his caravan was using, he never omits to make specific mention of the manufacturer and the brand of tire. He also names the brands of the typewriters, refrigerators, and nonalcoholic cold drinks he presented to native Kings and commons.

He tells us that the scholarly caravan included two very beautiful girls on its expeditions. The first one was a ravishing blonde while the second one was a "raven-haired beauty," both of them fetchingly photographed. In view of this and also because of the front-page news excitement caused by the caravan's escape from Yemen it would be surprising if this book, highly praised, among others, by Lowell Thomas, would escape the sharp eyes of Hollywood talent scouts.

WAINGER, BERTRAND M. *The American Adventure.* Pp. v, 727. New York; Toronto; London: McGraw-Hill Book Company, 1955. $4.20.

ERRATUM

In Volume 296 (November 1954) of THE ANNALS, *The Future of the United Nations: Issues of Charter Revision,* page 20, column 2, line 1, *for* the same civilization, later the con- *read* aid of the victim; and that, finally, the. The sentence as corrected then reads: The first condition is that in case of unqualified aggression by a state the Security Council be unanimous in recognizing the aggression and in designating it as such, and unanimous in calling upon the Member States to come to the aid of the victim; and that, finally, the Member States have both the determination and the military capacity to coerce the aggressor and punish him.

FOREWORD

This issue of THE ANNALS was planned primarily in relation to the conference on Methods of Financing Higher Education sponsored by the American Academy of Political and Social Science and the University of Pennsylvania. The conference was convened to commemorate the hundredth anniversary of the birth of Edmund J. James, the first president of the Academy, and was held on May 21 and 22 in Philadelphia.

The editor was informed of the general character of the conference and was requested to select topics and authors to make possible an issue which would present as comprehensive a picture of higher education as possible within the limitations of the space available. Since it was necessary to plan the balance of the issue and to have the articles completed by the time the conference was held, it was impossible to correlate the two parts of this issue other than by informing each writer of the theme of the conference and of the other articles.

This inability to plan the issue as a whole is not as serious as it might appear. All discussions of higher education are now influenced by the one overriding fact of the increase in the number of persons of college age who are just now beginning to arrive on the campus. That these numbers will increase beyond those of any prior period, including even the peak of veteran demand, is now acknowledged by the most skeptical. The basic problem facing higher education is what shall be done to meet this demand.

At this point there is wide divergence of views among educators. Some assert that the demand for higher education should be met by greater selectivity, ignoring the ever increasing numbers who would thus be barred from a college education. At the other extreme are those who believe that democracy and our rapidly changing needs for college-trained personnel make it the first responsibility of the college to provide opportunity for a college education to all whose further education is in the national interest and who have the intellectual ability to profit from it.

These differences in assessing the basic function of higher education in our democracy result in different answers to many of the problems now facing our colleges and universities. It is well, then, that there are different points of view expressed in this issue. It is hoped that bringing them together in this way will provide an opportunity to appraise each, to find the extent to which the various viewpoints can be reconciled in relation to the total problem, although not for each institution, and to take such steps as may be necessary to attack realistically this new problem of youth and of our nation.

The first three articles present the over-all picture. The others were selected to treat the more specific areas of administrative organization, state and regional planning, the role of the federal government, campus issues, the curriculum, accreditation, scholarship and academic freedom, and the international responsibilities of higher education. The conference report covers the problems of financing our colleges and universities.

Each contributor was left entirely free to express his own opinions in his own way. It is hoped that the issue as a whole will make a contribution to each insti-

tution of higher education by assisting its administrative staff and faculty in working out the role their institution will play in the expanding demands already being made upon our colleges and universities. It is hoped that the volume will also interest some of the many individuals outside the immediate field of higher education whose understanding support is essential if higher education is to meet the challenge of the years ahead.

FRANCIS J. BROWN

A Long-Range View of Higher Education

By FRANCIS J. BROWN

AT fifty-one minutes and fifty-one seconds past 7:00 A.M. (Eastern Standard Time) on May 27, 1955, the huge population meter in the Department of Commerce Building in Washington, D. C., turned to 165,000,000! This was the population of the United States at that moment and a new person has since been added each twelve seconds. A baby is born somewhere in our nation every eight seconds; a person dies every twenty-one seconds; an immigrant arrives every two minutes and an emigrant departs every twenty-four minutes. These facts have significance for our colleges and universities, since the eighteen years to 1973 will come all too soon.

But if we look back eighteen years the facts take on even more significance. After a period of actual decline in the number of births in the United States, the curve changed direction in 1936.

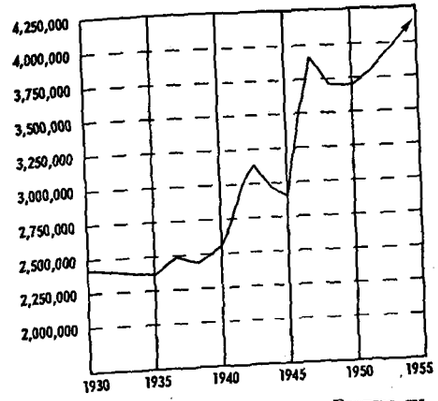

FIGURE 1. ANNUAL NUMBER OF BIRTHS IN CONTINENTAL UNITED STATES, 1930–1954

(*Statistical Abstract of the United States*, with supplemental data from the Bureau of Vital Statistics)

While there were fluctuations, as shown in Figure 1, the trend for the future is clear and there appears no reason to suppose it will again reverse. There were 130,000 more babies born in 1954 than in 1953 and the first six months of 1955 indicate that this increase will at least be equaled. The proportion of unmarried adults is declining, young people are marrying at an earlier age, and now for the first time in four decades, the average size of the family is increasing.

But this is only a part of the picture. Three other factors are also important: decrease in mortality, motivation, and mobility.

LOWER MORTALITY

It has been said that in the advances of medicine, the first quarter of this century will be known as the "age of the child" and the second as the "era of geriatrics." While it is true that most of the great advances in the prevention and cure of infant and childhood diseases were made prior to 1925, and that much effort since then has been expended on adult causes of death, the percentage of mortality among infants and young people will continue to grow smaller. Thus the increase in the number of persons of college age will be greater than the past increase in relation to the number of births eighteen years earlier.

But the changes in the upper end of the age scale in Figure 2 also have significance for higher education. The increase in the number of persons over sixty-five is now at the rate of 400,000 a year and is increasing annually. This has a twofold bearing on the problems

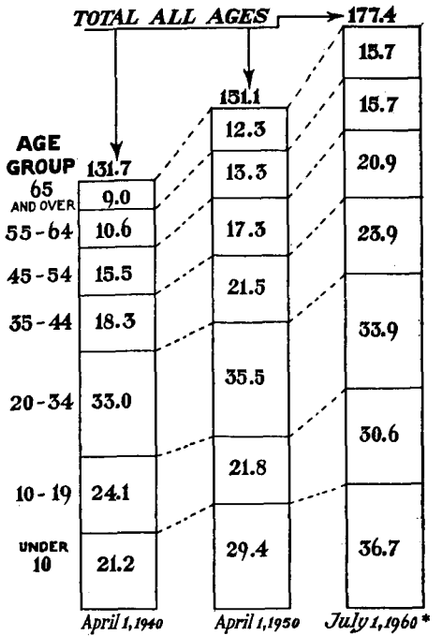

FIGURE 2. POPULATION GROWTH BY AGE GROUP, 1940–1960

(United States Department of Labor, Bureau of Vital Statistics)

* Projected; assumes continuation of 1950–53 birth levels.

of higher education: first, there will be a continuing number of persons who become dependent; and second, it is a challenge to our educational system to re-educate some for other employment and to enrich the lives of all in the autumn of their years.

The demand for maximum education is clearly indicated in the over-all data. Those between eighteen and thirty-five will actually be fewer in number in 1960 than in 1950, yet they will be in the productive age and required to support a vast increase in dependents at both ends of the age span.[1]

[1] For a more detailed analysis see Francis J. Brown, *Educational Sociology,* Revised Edition (New York: Prentice-Hall, Inc., 1954), Chap. 8.

MOTIVATION

The second major factor which will determine college enrollment is that of motivation. If the technical requirement of eligibility through procuring a high school diploma is an index of motivation then it becomes important to note that in 1900, only twenty out of each one hundred young people entered high school and ten graduated. In 1951, eighty-six out of each hundred entered our secondary schools and in June of 1955 fifty-six graduated. This proportion is continually increasing, and some predict that by 1960, ninety-five of each hundred will enter high school and seventy-five will receive a high school diploma in 1964. But predictions are not necessary to bring into clear focus the vastly greater numbers of young people who have met at least minimum requirements for entrance to college.

There have been many attempts to measure motivation to attend college; again a backward glance indicates a consistent trend. In 1900 only four of each one hundred young people entered our colleges and universities and but two graduated. In 1951, twenty-six entered and last June thirteen received their first earned degree.

Frank H. Bowles, Director of the College Entrance Examination Board, in an address, "Facing the Increasing Demands of Higher Education," delivered at the 1955 meeting of the New Jersey Association of Colleges and Universities, summarized the facts in this way:

> In the forty-year period 1870–1910 population increased by 130 per cent, while college graduations increased by 260 per cent, followed by another forty-year period during which population increased by only 65 per cent while college graduations (excluding allowance for veterans) increased by a whopping 660 per cent.

Dr. Samuel Brownell, Commissioner of Education, in an address to the Higher Education Group of Washington, D. C., on June 7, 1955, stated that in the fall of 1955 there will be thirty-one out of each one hundred persons of college age who will enter our institutions of higher education.

The most significant fact in the Office of Education data on enrollment in the fall of 1954 was that while the number of eighteen-year-olds increased less than 1 per cent, the number of persons in college for the first time increased approximately 10 per cent. Of course there were other factors than motivation in this striking contrast, but it would appear that the trend of the past fifty and more years is accelerating and that the maximum prediction of 30 per cent of the age group who will apply for admission is already demonstrated to be too conservative! [2]

MOBILITY

Over-all figures, although interesting and significant nationally, are not a reliable guide to planning on the part of each institution or of a state or region. Mobility must also be taken into account. Bureau of the Census figures show that if each family that changed its place of residence was a different family instead of some moving several times, every family would be in a different home each five years and in a different state or region each fifteen years.

Were the in-migration of a state counterbalanced by equal out-migration, mobility would not be a significant factor in calculating the college age population. But this is not the case. Dr. J. F. Wellemeyer, Staff Adviser on Personnel Studies, American Council of Learned Societies, in an unpublished study compared the number of college-age youth based on a projection of birth data with the actual number as given in the 1950 census. The wide variation is shown by the two states at the opposite extremes. The census data for North Dakota is only 73 per cent of the estimated figure based on projection of births. For California the census figure is 185 per cent of the projection figure. Other states showing a number less by 10 per cent or more are Arkansas, Kansas, Kentucky, Mississippi, Montana, Nebraska, Oklahoma, Pennsylvania, South Dakota, and West Virginia. Those showing a plus of 25 per cent or more are Arizona, Florida, Maryland, Nevada, Oregon, Texas, and Washington. The major factor producing this differential is family migration.

Student migration adds a further variable, but this factor has more bearing on the demands upon specific institutions than upon state-wide student population. It must, however, be taken into account in meeting the expanding demands for higher education.

[2] *The Impending Tidal Wave of Students.* Prepared by Ronald B. Thompson, Ohio State University, for the American Association of Collegiate Registrars and Admissions Officers.

FUTURE COLLEGE ENROLLMENTS

Many predictions of college enrollments have been made reflecting the basic educational philosophy of the proponent or the degree of his optimism. But for the nation as a whole the number of persons who will be of college age each autumn is a *projection* not a *prediction.* They are here with us as infants, children, and adolescents. There will be 2,300,000 eighteen-year-olds in 1955; 2,800,000 in 1960; 3,700,000 in 1970; and 4,000,000 in 1975!

As indicated in the Foreword, the question is what proportion of these will be admitted to our institutions of higher education. The answer will need to be given by each institution in the light of

its own purpose. But the answer for the nation as a whole will depend primarily upon the educational values of three groups: trustees, administrators, and staff of our colleges and universities; youth and their parents; and the general public. To a considerable degree, the first reflects the personal point of view of the individuals responsible for the policies of each institution; the second is based upon both personal values and the increasing demands of our changing cultural patterns; and the third, perhaps more accurately than either of the others, reflects national needs for manpower at the level of a college education.

The first presents a confused and confusing picture for the nation as a whole, although many institutions are seeking to formulate a clear policy. In the recent report of the Carnegie Corporation, President John W. Gardner states:

> We send great numbers of our youth on to college each year without any clear notion as to what they will get out of it, but simply in pursuance of a vague notion that "college is an opportunity that should not be denied them." This makes no sense at all.

Conversely, there are many leaders in higher education who, with equal conviction, believe that the rapidly changing world in which we live demands that higher education expand to provide educational opportunity for all able students. They point to the expanding demands of our economy for persons with a college education, to the need for a deeper understanding of human values in our relationships with others both in day-to-day living and in our national and international affairs, and to the necessity for developing in an even larger number of our youth the cultural, moral, and spiritual values essential both for the individual and for a democratic society.

The educational values of youth and their parents seem clear. Whatever may be the motivation, a larger proportion, as pointed out above, is knocking at the doors of our institutions. By June 1, 1955, almost all institutions report a significant increase in the number of freshman applicants over even a year ago; many have already reached the number they can accommodate. Constantly rising costs to the student as described by one of the conference speakers seem as yet to be no deterrent to the desire to go to college or the value which young people and their parents place upon it.

Probably the most important question for the future is the educational values of the general public, since its attitude is immediately reflected in the financial support essential to meet expanding demands. Thus far, though with some exceptions, state legislatures, private and foundation donors, church organizations, and alumni have made it possible for institutions to expand in proportion to the demand. But if the vast increase envisaged for the future is to be possible, greater attention even than now must be given to enlisting public concern for the needs of our colleges and universities. This development of public concern will not be easy, since our expanding population also makes its demands for more elementary and secondary schools; new facilities for medical and health care for all, but especially for the very young and the aging; recreational facilities and social welfare services; vast networks of highways; extension of public utilities. Higher education must compete with these and many more. Some of the ways in which it is seeking to compete are described later in this issue and need not be pointed out here.

Competition in an expanding economy is more than fiscal. It is equally important, as Dr. Trytten points out in his article, in the field of manpower. Much more needs to be done than is done at present to encourage able young people to seek college teaching as a career. At the other end of the age span, more thought should be given to the continuing employment of the increasing number of faculty members who are still intellectually alert and physically strong at the traditional retirement age.

APPRAISALS AND RE-EVALUATIONS

Institutions of all types resist change. This is both their strength and their weakness. Through such resistance they perpetuate basic values which would otherwise be lost to society. Conversely, they may hold to traditional structure and procedures when a courageous re-evaluation is essential in the light of the changes in the total social structure.

The veteran's impact upon our institutions of higher education was an emergency situation involving only temporary adjustments. The present and future demands will be continuous and of a positively accelerating character. Institutions must find the middle ground between preservation of the basic values which have made our colleges and universities so vital a force in American life and planning for such changes as are essential if they are to continue to render maximum service.

This re-evaluation will involve many changes. Will the universities of the next decade sharply decrease their number of freshmen and sophomores and become primarily upper-level, graduate, and professional institutions, with the junior colleges accepting a major responsibility for the education of young people during their first two years of college? This is, in effect, what is happening in California and in a number of institutions in other states. Should it be accelerated by much more deliberate planning?

Should the whole concept of degrees based upon credit hours and time be reappraised? Surely enough is now known about measuring achievement to warrant careful experimentation on a national scale with the awarding of degrees on other bases than timeserving. If the time factor is retained, would it not be possible, as Dr. Arthur S. Adams suggested in a recent address at the University of Virginia, to give every student a feeling of success by setting variable goals of one, two, and three years of college, with proper recognition of such achievement, as well as the four-year course for the A.B. or B.S. degree? Again, something of the kind has already occurred in the establishment of the one-year terminal programs and the two-year Associate in Arts degree and in the long-existing three-year hospital training programs for registered nurses. But little has been done to make a realistic appraisal of what may be accomplished in a broad range of academic fields in one, two, three, and four years, or to provide academic respectability to students who because of limited ability or interest complete less than the full college course. They now are failures both in their own eyes and in those of the academic community.

There are many other areas requiring reappraisal. Should the large institutions continue to establish residence off-campus centers or should there be a resurgence of the establishment of new urban or private institutions, especially to provide instruction at the community college level? Is it desirable for independent and church-related colleges to seek to retain their present percentage ratio of enrollment or should they seek only to retain their present numerical and academic importance and anticipate that the major share of the expansion will be absorbed by public in-

stitutions?[3] How may the relatively new media of television, both educational and commercial, be more effectively used to meet the impending demands upon higher education? With the rising costs of higher education, what further steps should be taken to provide scholarships and thus keep economic status from becoming a primary factor in who goes to college?

No Piecemeal Approach

These are but a few of the questions which need to be asked by higher education and for which more comprehensive answers are needed than are now available. Other questions are raised in the succeeding articles. It will not be enough to seek answers on a piecemeal basis. The whole field of higher education needs to be reviewed by a carefully planned and continuing program of research and experimentation. Such a program should enlist the cooperation of all higher education. Certainly if our colleges and universities are to resolve the problems they are now facing and will face with increasing magnitude in the years ahead it is imperative that each institution conceive itself an integral part of the total system of higher education. Of course it must retain its autonomy, which has been one of the great strengths of American institutions. But autonomy should not result in an attitude of vested interest on the part of any institution or any group or type of institution.

Higher education has adapted itself to meet the needs of two world wars, an extended depression period and the postwar veteran enrollment. In the spirit of service and with increasingly co-operative planning it will make such further adaptations as are proved essential to resolve the problems which lie ahead.

Francis J. Brown, Ph.D., Litt.D., H.L.D., is staff associate and director of the Leaders Program of the American Council on Education, where he has been employed since 1940, and visiting professor at Johns Hopkins Unviersity, educational consultant at the American University, and national president of the undergraduate educational fraternity Kappa Phi Kappa. Prior to his association with the Council he served for ten years as associate professor and professor of educational sociology at New York University and for seven years as a faculty member in education at the University of Rochester. During leaves from the Council he planned and conducted the International Conference of Universities at Utrecht, Holland, in 1948, and was secretary of the Education Committee of the Joint Army-Navy Committee on Welfare and Recreation and executive secretary of the President's Commission on Higher Education. He is author of Sociology of Childhood (1940), Educational Opportunities for Veterans (1946), and Educational Sociology (revised edition, 1954), editor of Our Racial and National Minorities (1937) and One America (1945), and special editor of two prior issues of THE ANNALS*—Refugees (May 1939) and Organizing for Total War (March 1942).*

The Purpose of Learning

By GORDON KEITH CHALMERS *

ANY who propose radical redirection of American education must face the risk of destroying something precious to our country. We never had it so good. Neither did the world. The very boyishness of American education and its naïve fascination with engineering won the war. Dr. Salk and the colleagues to whom he so generously accorded their share of credit were most of them products of American schools and colleges. Not only this. So are the millions of parents who, unlike their ancestors of the early days of smallpox vaccine, soberly accept and act on the advice of competent scientists. Let any who propose radically to change American mass education reflect on the intellectually and spiritually depressed populations of countries committed to the education of leaders only.

But we should not forget that the good is the chief enemy of the best. Our world responsibilities imply that, for America, good education will not now be good enough; that to maintain our self-respect as Americans and to offer brave men the world over the example and support in the fight for freedom which if provided can come only from us we must overcome our enemy the good in order to approach, at least, the best in our educational system.

American education is friendly, relaxed, sentimental, humanitarian, imprecise, and amiable as a spaniel puppy. It assumes that kindliness and gentle curiosity will always be met by a neighborly smile. The pleasant thing about America for the three-quarters of a century following Reconstruction is that within our borders this has largely proved true. We have been rich enough and secure enough to indulge for three generations in flattery. Religious leaders have flattered people into church by offering easy "peace of mind." Business has flattered people into buying Cadillacs because they owe it to themselves. Politicians have flattered the electorate until there is now a divinity that doth hedge a voter.

The near disaster to which this orgy of spiritual self-indulgence has brought us is outlined in Mr. Walter Lippmann's distinguished book, ***Essays in the Public Philosophy,*** in which he recounts the great emotional blunders which we have committed because of our unwillingness as a people to discipline ourselves. The book has been misread by political commentators who assume that because it discusses world politics it is merely a political book. It is about *paideia*, about the education of mind, feeling, and will in America, largely in school but also in the talk, dispute, and worship out of school which make us what we are. Unconditional surrender of Germany, its consequent destruction, and the necessity within ten years to rebuild its army are a result of such American emotionalism. Failure to see realities in the Far East must be put down to the same cause. And this is not merely the natural emotionalism of children. It is a kind of prepared emotionalism for which there is a concerted and organized philosophy directing schools and universities.

The fact, for example, that the most vocal of the learned editors, ministers, scholars, publishers, and writers who

* An address delivered at the seventieth annual meeting of the Ohio Historical Society, April 30, 1955.

made it their business in the twenties and thirties to tell us what was really happening and what should be expected in Russia almost universally were wrong is surely no accident. What these publicists failed to state was not the theories but the facts, facts which they traveled to Russia and saw with their eyes but refused to see with their minds. The error, perhaps the most colossal error in all history on the part of a highly literate nation provided with hecatombs of libraries and printing presses, stemmed from this same relaxed, friendly, sentimental, and humanitarian education—not simply in the schools and universities but in most articulated American thought. The cost of that error has not yet been revealed to us, but we have known since the start of the Korean War that the cost will be great.

REFORMIST PRINCIPLES OF 1910

The good American education which we have, so good, for example, that it is slowly and without bloodshed accomplishing desegregation in the whole country, is officially operating on principles developed to meet conditions of 1910. These principles are called a philosophy, but they are really a reform. Rather than an affirmation of the nature of man, of human experience, and of the great purposes of American life, they are essentially a comment and criticism of the social abuses of the late nineteenth century. They are footnotes to a chapter of American history, and they belong historically beside the social criticism of Ibsen, Bernard Shaw, Lincoln Steffens, the muckrakers, and Upton Sinclair. The world they attacked was the world of "Meet Me in St. Louis." The success of the social reformers from 1910 to the present merits the highest praise. We no longer have the twelve-hour day or child labor; women have the vote; medical services are now generally available to the poor; unemployment and impoverished old age are less dreaded than they were. Most school-age young people are now in school.

But what should we do with them, now that they are there? This is a question for philosophy, not for mere reform or commentary. Comment is the vine on the wall; we and the world now need no fragile vine, but a rampart.

The reforms of education developed from 1910 to 1920 which still constitute the official "philosophy" of American education are dated all through, and they should be displaced by fresh, affirmative, and workable statements of the aims of learning in all its parts: ethical, scientific, literary, human, social. No mere qualification or revision or emendation or patching up or reinterpretation of those old slogans will do, for those reforms concerned the internal social and economic problems of an expanding nation which was becoming ever more urbanized and industrialized. On the intellectual side they confronted nineteenth-century scholarship, which was largely antiquarian, desiccated, snobbish, and unconcerned either for the new science or the new society. On the spiritual side the reforms faced fundamentalism and the literal spirit of little authoritarians. The world of 1955 is different. It is characterized by a splendid and ever more powerful natural and physical science, religion so liberalized that we and our countrymen are in imminent danger of plunging into a new set of absolute dogmas and doctrine, and a wholly new dimension of American concern: world power and politics. Then the British guaranteed the freedom of the seas; today the Russians threaten to order the lives of more and more of the world's inhabitants. We loved in those days to twist the lion's tail. Today we reckon with world Communism, a political dogma so potent in its evil that our worries about the British and German Empires now seem mere mosquito bites. In intellectual and spiritual terms we have been challenged with ideas, not mere military power—a new experience for us; and the scare which the ideas of Communism have thrown into us is not honorable. As a nation we have always been ready, or knew we soon could get ready, to face armaments. Having gone to school in institutions which are boyish, relaxed, imprecise, and sentimental, we are now acting like boys in the face of intellectualized evil.

For the model-A ideas of 1910 we now need not a new tire here and a sparkplug there, but a wholly new machine. It would be surprising if reformist principles leveled at domestic Victorian injustices *could* prove adequate to America faced with wholly new conditions abroad; and *they do not*. What passes for educational "philosophy" in our country is inadequate to the second half of the twentieth century for two basic reasons: its account of man is sentimental and so is its account of democracy.

NATURALISTIC ACCOUNT OF MAN

That historically important reformer's book, John Dewey's *Democracy and Education* (1916), assumed a naturalistic account of man. "Since growth is the characteristic of life," wrote Professor Dewey, "education is all one with growing; it has no end beyond itself."[1] Growing here is organic growing, and Professor Dewey used the metaphor of a growing organism without reference to standards of good or right, leaving grave uncertainty whether the growth stimulated by education would, for example, be partial, one-sided, bad, or good. This is still the official assumption of the official aim of learning in American schools. The account of man is clear: that he is naturally good, being liable to evil only if affected by bad social arrangements, that he is a child of nature, and that the child in his innocence should provide the central preoccupation of all *paideia*.

But the American Constitution, said Harry Gideonse, was written on an opposite assumption.

> It was written on the basis of a realistic conception of the nature of man, wholly aware of the fact that man is potentially good—that's why we trusted ourselves with free government institutions—but also deeply aware of the fact that man who is potentially good is also potentially a beast! *Therefore* we should not trust the government we set up with unqualified power. *Therefore,* we established governmental institutions that separated power and dispersed control. The reason we separated power and dispersed control is that we did not trust man with unqualified power, power that was not dispersed. You see, we had a realistic theory of the nature of man. We saw him not just as mind, but we saw him as *potentially* evil; we saw even the potentially angelic element in man as, under the trust of complete power, most vulnerable indeed to the temptations and the lusts for power that bring out the bestial. This is perhaps the crucial weakness of modern liberalism—its illusion about the nature of man, its illusion that the evil in man is all due to unfavorable circumstances for which he is personally not responsible.
>
> . . . . . .
>
> If you look at the nature of man realistically, and that includes a full allowance for his emotional potentialities for good as well as for evil, you run straight into the major intellectual and moral bellyache that is brought about by the wishful thinking of modern liberalism.[2]

[1] John Dewey, *Democracy and Education: an Introduction to the Philosophy of Education* (New York, 1916; twenty-sixth printing, 1953), p. 62.

[2] Harry D. Gideonse, "Reason and Emotion in American Discussion of Education," *Proceedings 1954 National Convention American Association for Health, Physical Education and Recreation,* p. 19.

(I believe that President Gideonse considers himself a liberal, as I consider myself, and I think he would agree that the great task of thinking people is now to restore liberalism to ethical realities.)

DEMOCRACY AS AN IDEAL

The account of man implicit in the 1910 reforms of American education is sentimental. The second basic weakness of these reforms lies in their account of democracy. John Dewey, to refer again to the chief of the great social reformers of the first quarter of our century, was concerned rather with society than with government. He referred to democracy as an ideal. "A democracy is more than a form of government," he said in *Democracy and Education;* "it is primarily a mode of associated living, of conjoint communicated experience." [3] It consists, he said, of shared common interest and reliance on the recognition of mutual interests as a factor in social control. The widening of the area of shared concern, he said, was "caused by the development of modern manufacture and commerce, travel, migration, and intercommunication which flowed from command of science over natural energy." From this view of democracy as primarily a social characteristic, there follows a conclusion which many of John Dewey's followers are reluctant to admit: that one of the chief heroes of social democracy is the late Henry Ford.

The John Dewey reforms were part and parcel of a populist movement in American political thinking which espoused election of senators, initiative, referendum and recall, social reform by means of federal law, notably the Prohibition Amendment and the Wagner Act, substitution of security for freedom, the packing of the Supreme Court, aggrandizement of power by the executive, and all the changes of political structure suggested by Vice-President Wallace under the slogan, Century of the Common Man. The tendency toward tyranny and the denial of liberty of all movements of mass democracy is suggested by the fact that it was by means of the direct primary, introduced into Wisconsin by the elder La Follette, that Senator McCarthy came to power. However, in spite of this and similar misfortunes, after the self-correction of the American constitutional republic and the revisions of the reforms executed in the direction of extreme democracy, I think it likely that history will conclude that the net result of these social reforms has been good. We appear now to have better-regulated banks than we had, and we hope we have a better-regulated stock market. We evidently have a more responsible labor movement and a considerably chastened and vastly more responsible industrial management than in 1910.

When, however, we consider whether the slogans, tracts, and party lines which produced the reforms can now do service as the educational philosophy of the second half of the twentieth century, we must observe the single, naïve, and uncritical direction of the naturalist, instrumentalist, egalitarian principles whose bones are now dry and brittle. Those dry bones cannot possibly live. Those dated and limited ideas cannot possibly affirm the purpose of learning for the second half of the century.

CONSTITUTIONALISM

Our liberties are not secured primarily by democracy. They are secured by constitutionalism. As Mr. Lippmann says, they antedate by two hundred years the modern mass elections. "Without constitutional government," he says, "there is no freedom."

> Large mass electorates [says Mr. Lippmann] are something quite new, much newer than the ideals, the ideas, the institutions and the usages of the liberal state. Political orators often assume that the mass of the people voted their own liberties. But the fact is that they acquired the vote after they had acquired their liberties and, in fact, largely because not being able to vote was felt by free men to be incompatible with their equal dignity. The Bill of Rights (1689) is more than two centuries older than universal suffrage in Great Britain. The enfranchised people did not establish the rule that all powers are under the law, that laws must be made, amended and administered by due process, that a legitimate government must have the consent of the governed.
>
> I dwell upon this point because it throws light upon the fact, so disconcerting an experience in this century, that the enfranchised masses have not, surprisingly enough, been those who have most stanchly defended the institution of freedom.[4]

For half a century the official leaders of American educational thought have promoted with religious zeal the reformist idea that the chief and all-encompassing concern of education should be with the natural-rights half of the tradition of the American government; that is, with the expansive principle expressed by the Declaration of Independence. Jacksonianism and the more sentimental teachings of Jefferson have smothered concern for the other half, the half best represented by the great decisions of the Supreme Court under John Marshall, by *The Federalist* papers and the work of Hamilton and John Adams, the restrictive half represented in the division of powers defined in the Constitution. The party political implications of this one-sided reformist concern need not bother us here, where our subject is a viable philosophy of education for the second half of the twentieth century. Surely it would be dangerous to correct the extreme of the half century of the Common Man with a half century of aristocrats. But we must soberly consider the genius of our liberties, the government constructed to secure them, and the ethical principles from which they stem, if we are to talk realities in a world now half mobilized for the destruction of all liberty.

DEMOCRATIC GAINS

Before considering the relation of the idea of American democracy to the purpose of education, I must add one more compliment to the reformers who have expanded the opportunity of schooling to nearly all American youth, including the definite prospect of common schooling for Negro students in nonsegregated schools. The American Ambassador to Germany, Dr. James B. Conant, when president of Harvard, reiterated the John Dewey slogans concerning a fluid society, stressing the importance of easy movement of young people upwards in social position and into the callings which used to be reserved for the gentry. This doctrine for forty years has supported the expansion of the opportunity to go to school and college. It is an old American doctrine, present in the frontier colleges and frontier society in many parts of our country from the first clearing of the forests. Dr. Conant ably employed it to alert the nation to the need for university and college scholarships supported both by the government and by private individuals and groups. To no small degree we have him to thank for pointing the way to the science scholarships of the National Science Foundation and the more recent establishment by such great corporations as the Ford Motor Company, General Motors, Union Carbide and Carbon, and Procter and Gamble, to name but a few, of free scholarships for sons and daughters of employees and for young people of whatever parentage who prove

[3] Dewey, *op. cit. supra* (note 1), p. 101.

[4] Walter Lippmann, *Essays in the Public Philosophy* (Boston, 1955), p. 40.

their need and their potential for college work.

If the radical reform of the official purpose of American education should entail reduction of these important democratic gains in American society we should view them with the greatest suspicion and even fear. But the needed reforms run no such risks.

The basic assumptions of the 1910 reforms of educational philosophy involved an inadequate notion of democracy because they considered democracy an ideal, not a working principle, because they considered the social aspects of democracy to the neglect of the governmental, and because the implications for government treated the expansive, egalitarian, unchecked, and populist elements of American government to the neglect of the ethical and constitutional ones.

UNDERSTANDING OF JUSTICE

When we Americans witnessed the rampage of tyranny in Germany, Italy, Japan, and Russia, it gradually dawned on us that the center of freedom is the courts, or, as Mr. Lippmann has said, that constitutionalism preceded mass enfranchisement and stands at the center of political liberty. In a time in world history when the great organized forces both of intellect and of military power are mobilized against the universality of law and due process, it is clear that the central intellectual task of lovers of freedom is the understanding and exposition of these things. Such understanding is the more difficult half of the intellectual problem of free government. It is easy to preach natural rights, social security, the absolute power of the electorate, majority rule. America is now popularly thought to be nothing but majority rule. It is, of course, no such thing, for that is the definition of tyranny. America is the rule of the majority tempered by justice.

Here is posed the educational problem which has been throughout the ages the most difficult of all—the understanding of justice, which for Americans and all free peoples entails the even more difficult idea, liberty. That this understanding has a discipline, a series of set problems, indeed a series of set books, has been denied by the official philosophy of education for forty years. The popular idea of liberty in the schools is absence of restraint, to such an extent that W. C. Brownell said that the loud liberals who prate about their liberty are not truly emancipated but merely unbuttoned. Robert Frost says that to be free is to be loose in harness. When in 1945 the justly famous Harvard Report, *General Education in a Free Society,* proposed an ethical and humanistic view of the great political and social problems of our time, it contained a statement so radically at odds with the conventional understanding of liberty in the schools and many universities that the statement, so far as I have observed, was ignored—perhaps because it was not understood. Far from treating liberalism as a matter of eliminating more and more barriers, the report states that freedom is submission: "Freedom is submission to the best and fullest truth that can be known; yet is also recognition that truth is not fully known."[5] Education in liberalism can never result from following youthful whims, for it "has a pattern of its own."[6] There are some things, says the report, of which the liberal is not free to be ignorant.

The necessaries to the study of political liberty express themselves largely in the ethical and political principles underlying the key decisions of the great

[5] Harvard University Committee on the Objectives of General Education in a Free Society, *General Education in a Free Society* (Cambridge, Mass., 1945), p. 105.

[6] *Ibid.*, p. 57.

courts of law and underlying the historic constitutions and contracts by which rights of men have been prescribed. These necessaries give character to the American Republic and to a degree must be understood by millions of citizens if this constitutional democracy is to survive. To study the human experience which shows forth these principles and to state the realities of human nature expressed in them requires abandonment of talk about dreams, visions, and ideals—all very well for patriotic calendars or for advertisements but hopelessly inadequate to the warfare of liberty confronted with tyranny. Such study of man, of history, and of political principle must lie at the center of common education for the second half of this century. Its purpose is so different from the humanitarian purposes of the 1910 reformers, and the world in which we must live now is so different from the antimacassar world which they set out to change, that we must now develop and affirm a new philosophy of education by which the learning of our children and grandchildren will be put into focus.

DUAL NATURE OF MAN

I have described the problem of the purpose of learning in political terms because it has been by means of political events of the past decade that we have come as a nation to see the ethical bases of American life. The foundation rock of all learning is the ethos, the accepted standard of right and respect, and this can be understood only in the light of a realistic account of man and his nature. As Dr. Gideonse said, we are dual in our nature, not single. That is the radical proposition of the Christian doctrine of man and lies at the root of all the delicate and complex problems of the current dispute concerning Church, State, and School. A positive, modern, ethically realistic, and thoroughly American purpose of education in the public schools must be based clearly on the classic understanding of the dual nature of man, which characterizes not only Christianity but Greek tragedy, Roman law, and historic Hebrew and ancient Indian thought. Establish the philosophy of education in this fashion and you will have taken a major step toward resolution of the legal and social problem posed by religion and the public schools.

The nature of man and of the conception of democracy being so poorly and sentimentally analyzed in the official philosophy of education, the ethical weaknesses of the presiding purpose of the school system show up not only in the realm of political theory but in all the major departments of American thought and life. There is time to mention but two of these, and I shall name the central ones: the humanities and science.

THE HUMANITIES

Since the job of stating the purpose of education entails a realistic account of the nature of man, one would expect that he could walk over to the humanities departments of learning and there find principles readily applicable to our present need. Alas! The humanities have been gnawed by the same worm which has eaten the vitals of social reform. They share with educationists the Jean Jacques Rousseau illusions about the noble savage, the glories of sensation, and the single nature of man. The humanities have gone aesthetic. Like the educationists, many literary scholars and writers love noble savages and the beautiful soul of the innocent child. They are concerned with fantasies, not reality. Ethical problems, many a learned literary scholar will tell you, are merely quantitative problems of society. Fifteen years ago the writers

chiefly considered by literary America to be moral were the Communist poets and novelists who thought it sinful to fail to reveal in their earnest writings the party line. It was fashionable for most other writers to pretend that right and wrong do not exist. Happily, a revival of concern for the great central content of literature has begun among writers, and critics have acknowledged the mighty moral stature of such poets as Robert Frost and such dramatists as Thornton Wilder. The Book of Job is enjoying a fresh reading, and the literati are less afraid than they were to think of mankind finding out salvation under wrath. A few university scholars like Douglas Bush have always revealed the central position in world literature occupied by Right Reason and have never denied, as the eighteenth-century sentimentalists did, the war in the cave, that is the eternal warfare in the human breast between what makes us rise and what condemns us to fall.

Oddly enough, the movies have probably done as much constructively in this particular as any one group, for with all their grotesque absurdities and sugary never-never land, they now and then tell a genuine story. When we reflect that the best that mankind has ever had, to show us liberty, humility, and love, we have had by way of stories and by no other way, we surely owe a debt to any storyteller who truly tells a tale.

There is alive among American scholars and teachers of the humanities a firm, old, and central tradition of the great ethical import of all literary study. It was voiced by Mr. Churchill in his warning to the learned world:

> Scientists should never underrate the deep-seated qualities of human nature and how, repressed in one direction, they will certainly break out in another. The *genus homo*—if I may display my Latin—is a tough creature who has traveled here by a very long road. His nature has been shaped and his virtues ingrained by many millions of years of struggle, fear, and pain, and his spirit has, from the earliest dawn of history, shown itself upon occasion capable of mounting to the sublime, far above material conditions or mortal terrors. He still remains as Pope described him 200 years ago:
>
> Placed on this isthmus of a middle state,
> A being darkly wise and rudely great;
> . . . . . .
> Created half to rise, and half to fall—;
> Great Lord of all things, yet a prey to all—;
> Sole judge of truth, in endless error hurl'd;
> The glory, Jest, and riddle of the world![7]

Man the riddle, the jest and glory, provides the foundation study of all liberties, since these are established directly on unquestioning faith in the dignity and preciousness of each individual person.

The riddle arises from man's dual nature. If we argue that liberty cannot be known without some understanding of why each individual is precious and must be respected, we oblige ourselves to put the study of man and his nature at the center of education. To do this requires a treatment of reading, literature, language, and history wholly different from our present instruction in these subjects. The study will be guided by a rough rule of thumb usefully if too sharply stated by Emerson as follows:

> There are two laws discrete
> Not reconciled,—
> Law for man, and law for thing;
> The last builds town and fleet,
> But it runs wild,
> And doth the man unking.

A far cry indeed from Professor Dewey's naturalistic statement, "Education is all one with growing; it has no end beyond itself"!

[7] Winston Churchill, *New York Times*, April 1, 1949, p. 10.

To understand American liberties requires some familiarity with the law for man. If the law for man *is* the center of studies, the child must begin to read literature not as an aesthetic picnic of the sensations but for what it is, the contest within men's own hearts. If he is to do this, his teachers must respect language and the word. History describes society, true; but if man and his nature is to be the foundation study of liberty, history must first be presented as one of the humanities—that is, as a central study in the quest to find out what manner of creature we men and women are.

SCIENCE

The plight of science is a very different story. Science is better off than our understanding of man or man in groups (the humanities or social science). Its dangers lie in predatoriness, in the belief that it is the proper subject of strategy by organized teams of researchers, and the idea that unlike poetry it can dispense with the imagination. The public affection for science is a wholesome thing. True, we are short of scientists. But I am inclined to think that if we recall the whole concentrated strength of schooling to its ethical center and treat language with the respect it deserves we shall find genuine scientific work also respected early in a child's development. If we do this we shall not continue to distract potentially fine scientific minds into the trivia of the minor mechanics of commerce.

TEACHING THE TEACHERS

Where shall we find the new philosophy of education so desperately demanded by our country and the times and so needed by the thousands of able and dedicated teachers who now do a heroic job in spite of obstacles? How many excellent teachers of the sciences, humanities, and social sciences turn in a performance a hundred times better and more realistic than the official philosophy which presides over them! The danger lies in the fact that the official philosophy influences the training of new teachers, with its talk about adjustment to life and a dozen sentimental slogans. That fine historian and maligned critic of educational philosophy and practice, Arthur Bestor, has pointed the way. To hear the catcalls, you would think he had recommended a St. Bartholomew's massacre of grandmothers. But all he has proposed is that the great masters of education in historical thinking, that is, the historians, be considered among the chief educators of the land, and the same for the masters of thinking in chemistry, mathematics, literature, biology, and so forth. There is excellent common sense in this proposal, and in making it Dr. Bestor is well aware of the serious dereliction from duty on the part of almost all American scholars and scientists of great stature and genuine leadership. It is our neglect, now fifty years old, of our personal and direct responsibility for thinking about all education, from primary school through the doctor's degree, and our neglect of the job of guiding the training of teachers and of teaching them ourselves.

If historians, literary scholars, and mathematicians in impressive numbers now begin to do their duty, a longish period of study awaits them to familiarize themselves with the social and political realities of American schools today. Their usefulness is not likely to be great in technical and managerial matters, but the principles which govern our private and public lives have been the object of their study and reflection for a lifetime, and it is here that they

can be truly useful, for these principles must now stand at the center of the philosophy of education for America.

THE STUDY OF LIBERTY HAS A PATTERN OF ITS OWN

As Mr. Lippmann has said, there are many learned and thoughtful men and women in our country who have never doubted the existence and availability to our present need of the Public Philosophy of civility. This philosophy sometimes referred to as Right Reason or, in the pre-eighteenth-century sense, as Natural Law, can be revived and renewed. Its revival and renewal is at once an intellectual, spiritual, and moral enterprise. All three aspects of its revival involve American education, and the purpose toward which our whole establishment of schools and universities could and should be directed is just this revival, rediscovery, and renewal.

The American educational system is still operating under its 1910 slogan: opportunity. The philosophy of opportunity has produced important changes in the management of education, but it has permitted great deterioration of its content into egotism and materialism, which are the basis of flattery, and into the fatalism which inevitably follows. The *purpose of learning* is to learn how to find out what is important to think about and to think about it in appropriate terms. In our country the last decade has taught us again that the central concern of thought should be liberty and justice. It will be the business of school to teach the human experience which makes this conclusion possible and to equip the young with the grammar and arithmetic of these subjects so that they may understand them with some precision. The words and the center of the new purpose of learning should be the ancient words *liberty* and *justice,* words which stem not from the era of the Marseillaise and the French Revolution, which led swiftly to the orgy of the guillotine. The justice and liberty which Americans understand has little to do with fraternity and equality, deriving as they do from Roman law. For the half century of threat of tyranny, Americans, whose strength and courage must encourage and strengthen the free world, must find a philosophy of education worthy of our greatness as a nation and our great mission in history. For Americans, the central purpose of such learning is *liberty,* the study of which, as the Harvard Report affirms, "has a pattern of its own."

Gordon Keith Chalmers, Ph.D., LL.D., Litt.D., L.H.D., Gambier, Ohio, has been president of Kenyon College since 1937. He was president of Rockford College (1934–37) and instructor and subsequently assistant professor of English at Mount Holyoke College (1929–33). He has been vice-president of the Franco-American Audio-Visual Distribution Center since 1948, director of the College English Association since 1950, after having been its president in 1949–50, and chairman of the school and college study of admission with advanced standing since 1951 and of the Problems and Policies Committee of the American Council on Education since 1953. He was a member of the national committee on Fulbright awards in 1951. President Chalmers is author of The Republic and the Person: a Discussion of Necessities in Modern American Education (1952) and of articles on education and on seventeenth-century literature and thought.

Meeting Manpower Needs

By M. H. TRYTTEN

HIGHER education especially, but perhaps all education, may be looked at from two points of view. One of these envisions the educational process as a means whereby individual students may be aided toward self-realization and self-improvement, so that they may enjoy the fullest and most useful lives. Their probable contributions to the community and the state, while not overlooked, are not the primary foci. From another point of view the educational system is seen as the means of producing all the doctors, dentists, scientists, professors, lawyers, economists, all the learned, professional, and other vocational types the nation needs; if these needs are not met the system is not functioning properly. The needs of each student, while not forgotten, are not a primary concern.

Probably neither point of view should take absolute precedence over the other. Nor is it impossible to serve both ends simultaneously. Yet there are many whose personal predilections move them strongly to one pole or the other of this duality. Unquestionably, historically, most Americans have tended strongly toward the former point of view.

EMPHASIS ON NEEDS OF SOCIETY

Recently, however, the dramatic demands of defense and the needs of the community have begun strongly to direct attention to the second view of education. It seems clear that attention may have to be focused increasingly on meeting the needs of our society and its security. It can only be hoped that this will not mean that the best interests of the individual student will be forgotten or ignored or even submerged in the interests of a more general purpose. Yet the needs of our nation, its welfare and its defense, the needs of our highly organized society and the needs of its people for personal services in a complex world, will of necessity come in for more and more attention. Perhaps the result will be gross influences which will increasingly affect individual choices of careers.

Even more will the public attitude toward the support of education change in the future. In the past the motivation in the support of education has been perhaps more in the interest of providing opportunity to individuals than any conscious attempt to supply the nation's demands for specialists. It is evident now, in the consideration of the needs of education in the public press, in the halls of Congress, in the directorates of industrial organizations and elsewhere, that the latter point of view is in the ascendancy. Industries, faced with shortages in trained personnel, are questioning whether they should not support education and in so doing are most concerned about the adequacy of the flow of trained personnel from our schools.

This changed point of view is a phenomenon mainly of the past decade, and to a large extent is due to the strain put upon our manpower resources by the needs of a great war of a highly technical nature. The result has been to focus great interest on the quantitative aspects of the problem. If specialized knowledge has become so important to the functioning of our economy and its defense, it is important to know how many of each type is too few or enough or too many. And this in a

loosely regulated economy, largely free of rigid standardizing restrictions in its training institutions and in its employment processes, is a moot issue.

ADEQUACY OF SUPPLY

The question of adequacy of supply in any given field is one of great difficulty. It is probable that we shall never see our society so stable and so unchanging that we can predict the future demand for any given profession or specialty with even rough approximation over a period of time. This is one of the antitheses which are inherent in the situation—it takes about twelve years, from beginning high school to emerging from graduate or professional school, to train a scientist, a medical doctor, an economist, and many other types of specialists. Yet to predict twelve years in the future what the demand for any particular specialty may be is virtually impossible in a highly fluid society.

That this is true is clear after a moment's reflection. Had the most experienced chemists or engineers been asked to predict, say in 1915 or 1925 or 1935, what the demand in their fields would be in twenty years from the date of prediction, the estimate would invariably have been far too small. Certainly no physicist in 1935 could have guessed the number of persons working in nuclear science in 1955. The same can be said with varying degrees of predictability of all fields of specialization.

This does not mean that the future is a hopeless enigma. In retrospect one can now see some pattern to the changes wrought in our society and their effect on the employment of specially trained persons. Not always can one extrapolate into the future with assurance. But neither do the rivers of time jump their banks or change their courses with great capriciousness.

It is commonplace now to say that our civilization has changed more in the past half century than in many previous centuries. And yet this is probably the most significant fact in present-day history. While it is customary to say that this change is due to the effects of modern science, it is probably more correct to state that it is due to the accumulation and application of systematized knowledge in all fields that contribute to man's ability to understand and to control his environment and to live cooperatively with his fellow men. The best measure of the future demand in all the areas of specialization arises from an understanding of the present and the past.

POPULATION AND TECHNOLOGY

The dynamics producing the present-day world are, among others, the growth of populations and the rise of technology. They have gone hand in hand, each dependent on the other. And here technology is used to connote also the whole area of technical knowledge, including the modern advanced knowledge in social and economic organization, human relations, health protection, legal and other procedures in control of the complex human environment of today, and many other areas of knowledge.

That the population dynamic will continue seems predictable. The world's population has doubled in a century and bids fair to double again in seven or eight decades. The rise of technical knowledge has steadily accelerated over recent decades. For the vast major part of our scientific information one need not go back more than ten or twelve generations to the time of Galileo and Newton. For the major part of our applied sciences, and our industries based on them, one need only go back to the past two or three generations. It is in these latter days that specialized knowledge has become indispensable in almost all activities of the nation.

Among those industries based on modern scientific technology, the pattern of events has been fairly common to all. While the degree of scientific knowledge involved in industrial processes varied from industry to industry when they were founded, the practice in all cases has been to apply more and more scientific knowledge to all processes. This has been due to the increasing availability of such knowledge, the press of competition, the increasingly rigid requirements resulting from new technological developments, and so forth. The net result has been a steady increase in the number of specialists needed by industrial and governmental activities in research and production, and also an increase in the level of education required among them.

Thus in each industry the percentage of persons with advanced training, such as engineers and scientists, has steadily increased through the last fifty to a hundred years. But it is also true that the number of industries using such personnel has steadily increased as the demands of modern industry have forced more and more types of industries to embrace in their activities an enhanced technology. Thus there has been not only a need for a greater percentage of scientists and engineers in the personnel of each industry but also a horizontal spread of such employees into more and more types of industries. The result is graphically portrayed in Table 1.

OTHER GROWING COMPLEXITIES

It must not be thought, however, that the rapid development of technology is the sole or even the most important development leading to a need for increased specialized training. Together with the growth of technology and not necessarily resulting from it has been the growth of our economic and social institutions, our transport and communications network, our governmental structures, and all the vast complex of our highly integrated lives. These all present new demands for more and more highly trained people.

As an example one may cite the fact that the newly developing nuclear engineering activities of the nation could probably absorb thirty to forty thousand scientists, if they were available, to meet needs which would exist if the manpower resources existed. But they will also absorb management personnel, legal talent, personnel specialists, and a number of other types.

As another example, the development of these great new activities has a profound effect on our way of living. Whole new communities arise. Problems of social, economic, and human re-

TABLE 1—INCREASE IN POPULATION AND IN TYPES OF EMPLOYMENT, 1870–1950*

	1870	1910	1950
Population (in thousands)	39,818	91,972	151,179
Labor force (in thousands)	12,925	37,371	60,429
Labor force per thousand (population)	325	406	400
Number of professional persons in the civilian labor force in thousands	342	1,634	5,111
Professional persons per thousand population	9	18	34
Employment in science and technology in thousands	12	186	1,019
Employment in science and technology as a per cent of all professional persons	3.5	11.4	20.0

* National Science Foundation, unpublished "Fact Book on Scientific Manpower."

lations arise, creating the need for many persons with special training. The dramatic road program recently proposed by President Eisenhower is an example of auxiliary requirements arising out of a new technological development—in this case, automotive transportation. While such a program would undoubtedly demand 250,000 man years of engineering directly, it would also create many other demands in many fields and for a very long time.

SPECIFIC DEMANDS

It would be possible to present a few sample statistics to predict specific demand levels in selected fields, and this has in fact been done in *America's Resources of Specialized Talent*.[1] Such predictions, however, could be only tentative and would probably shortly be meaningless. The important fact is that demands have been increasingly great in a wide variety of fields and will probably continue to increase faster than we expect.

More generally, however, certain indications may be noted. In these remarks *America's Resources of Specialized Talent* is followed. In the physical sciences the rapid rise in research expenditures and in capital outlay by technological industries indicates increasing demand. Federal expenditures for research tripled between 1930 and 1940, then jumped from 67 million to 2,200 million dollars between 1940 and 1953. Similarly, in industry a sharp increase occurred between 1940 and 1954. Recent studies by the National Science Foundation[2] indicate severe shortages in scientific manpower in large essential industries. At present no indications of supply overtaking demand are visible.

In such fields as psychology and the social sciences, because of the great dispersal of graduates into a wide spread of fields of activity, demand at the level of the bachelor's degree is without sharp meaning. At higher levels of specialization, however, there is every prospect for a rapid increase of personnel, especially at the level of the doctorate. Industry and government have shown accelerating demands owing to the many new complexities of their activities. This is particularly true of economics and psychology.

The demand for engineers has been highly publicized and needs no comment beyond the observation that it remains high.

In applied biology, such as home economics and agriculture, because of the increased call for teachers and the needs of a rapidly rising population, demand seems likely at least to match supply.

In the health fields, including nursing, the relation between supply and demand is intimately related to the development of social institutions and public policy. In view of the rise of public consciousness of health needs, implemented by political action, it seems probable that demand will exceed supply for an indefinite period.

Of all remaining fields two more may be singled out because of the large numbers involved. In business and commerce the tendency for persons to seek added specifically relevant training and for employers to seek out trained personnel has been a notable development. In 1943 there were only 175,000 living graduates of collegiate schools of business. By 1953 there were 580,000. This rapid increase in the number of trained persons has not yet shown any signs of oversupplying the demands of business or commerce.

In the field of teaching at both pre-college and college levels the demand is so far ahead of supply, when due attention to quality is given, that it is idle to quote statistics or evoke other authority. Reports by the National Education Association[3] have adequately documented the great need for teachers. From the point of view of employment opportunities, this field is wide and open.

[1] Dael Wolfle (Harper & Brothers, 1954), p. 77.

[2] Alan Waterman, "A National Survey of Scientific Research and Development," National Science Foundation Release, June 6, 1955.

MOBILITY IN PROFESSION

Two points may be added. American college graduates have always displayed a remarkable mobility from one field of activity to another. A surprisingly large percentage of engineers, for example, do not follow engineering as a career. Wolfle[4] shows that less than two-thirds of all engineering graduates prior to 1953 were in engineering in 1953. Only 21 per cent of physical science graduates prior to 1953 were in the physical sciences professionally in 1953. The rest were in engineering (7 per cent), business and commerce (10 per cent), education (21 per cent), administration (5 per cent), advanced study (12 per cent), and scattered other occupations. Other fields show wider diversities.

This is important in that it indicates a flexibility in our system which is most desirable in itself and also a safeguard against the ill effects which would result from overproduction in a specialty if graduates were less adaptable to other tasks and opportunities.

QUALITY THE MAJOR PROBLEM

As one looks to the future, there seems to be every likelihood that our technical problems will increase, as will our problems of human organization and relationships. Personal services of all kinds will unquestionably be in rapidly increasing demand as we become a more integrated and articulated society and people consequently become more dependent on others.

Our major problem in the future as in the past will be one of quality more than quantity. We increasingly need able people and people with more training. Consequently, we should be more concerned about a failure to find, motivate, and train enough able people. There will never be too many able people.

M. H. Trytten, Ph.D., LL.D., Washington, D. C., has been director of the Office of Scientific Personnel, National Research Council, since 1944 and assistant professor of physics at the University of Pittsburgh since 1928. He has been chairman of the Advisory Committee on Scientific Personnel, United States Civil Service Commission, since 1945, secretary of the Committee on International Exchange of Persons since 1948, and a member of the Commission on Human Resources since 1949.

Changing Patterns of Administrative Organization in Higher Education

By John Dale Russell

UNTIL the last quarter of the nineteenth century the pattern of internal administrative organization in the institutions of higher education in the United States was simple. The enrollment of almost every institution was small by today's standards. The curriculum was standardized and consisted almost exclusively of required subjects, with limited substitutions allowed in the "classical" course for students taking the "modern" or "scientific" course. The "faculty" consisted of a president and rarely more than three or four other professors. Such a situation did not require an administrative organization, and the president was the only official with executive responsibilities.

Development of Administrative Organization

Research [1] on the history of the development of administrative offices in the colleges and universities of the United States indicates that the first of the modern array of institutional administrative officers to be differentiated, after the presidency, was that of librarian. The office of librarian began to appear rather regularly by the beginning of the last quarter of the nineteenth century. The listings indicate clearly that some member of the faculty was in practically every instance assigned this responsibility. Compared to the complex administrative job of operating a modern university library, the duties of the early college librarian were simple. He carried the key to the room where the books were kept and saw to it that this room was tightly locked except during the few periods of the week when students were permitted to use the books.

Registrar

With the coming of the elective system in the last quarter of the nineteenth century, academic bookkeeping became a necessary chore. Prior to the elective system, in the days of the fixed curriculum, the number of years a student had been in attendance indicated accurately the stage of his academic progress. But the elective system changed all this. Colleges found it necessary, in order to determine the progress of a student toward graduation, to have records of courses taken and completed. Someone had to be appointed to look after these records. The title that was commonly given this officer was "registrar." Officials by that title continue even today to be key members of the administrative organization in the colleges and universities of the United States.

Deans

The registrar's office soon developed as a strategic center for institutional planning, for here were the records and the data on which an alert official could base sound conclusions about institutional development and academic policies. Out of the registrar's office, with its primary function of record keeping, there developed the function of academic leadership. For this office the title of "dean" came to be used. At first the combination title of "dean and registrar" was frequently used, but gradually the record-keeping function came to be somewhat divorced from the function of academic leadership as set up in the office of the college dean.

Only a few pioneering institutions had developed coeducation by the end of the second third of the nineteenth century. Immediately following the close of the Civil War, however, large numbers of institutions, particularly those under state control, became coeducational. The acceptance of women students brought certain problems and responsibilities which the existing institutional staffs were unprepared to handle. It became the custom to appoint an additional staff member to take care of these responsibilities. This official in the earlier days was given some such title as "lady preceptress" or "lady principal," but later the title "dean of women" came to be generally accepted.

It is curious that recognition for the need for similar service to men students did not come generally until after the beginning of the twentieth century. Many institutions even today have never used the title "dean of men" for a member of the administrative staff. Following the close of World War I, however, there was a very large expansion of the noninstructional service to students. The recognition of the responsibility of the institution for something other than classroom teaching of students has led to a large-scale development of what is commonly known as student personnel services. The officials who provide this service appear under a wide variety of titles.

Business office

Problems of business management and finance in institutions of higher education began to be increasingly important near the end of the nineteenth century. Enrollments were increasing, and income from student fees was increasing correspondingly. The faculties were getting larger and the burden of caring for payrolls required something more than the casual attention of an officer such as the president. The physical plant was no longer a single building, in which students had their dormitory rooms as well as their classrooms and laboratories. Instead, a large campus with a whole series of buildings was becoming the common pattern, and the care and maintenance of the physical plant required supervision. Privately controlled institutions were beginning to accumulate endowment, the management of which called for ability not customarily found in the college institutional staff of those days. These and other circumstances required the setting up of the business office with a full-time staff member in charge.

Director of public relations

Perhaps the latest member to be received into the institutional administrative family is the director of public relations. The development of this service has come almost entirely since the end of World War I. Although the development came late, it has been rapid. Today practically every institution of any consequence has one or more staff members to whom are especially assigned responsibilities for publicity and public relations.

Faculty Origins of Administrators

From a review of the evolution of administrative offices in colleges and universities in the United States three or four generalizations may be drawn. The first of these generalizations is that, in the main, administrative offices and officers have had their origins in the teaching staff. In some quarters today a

[1] Earl J. McGrath, "The Evolution of Administrative Offices in Institutions of Higher Education in the United States." Doctor's Dissertation, Department of Education, University of Chicago, 1936.

sharp dichotomy is drawn between college administrators and faculty members, as if the two were entirely different subspecies of *genus homo*. But the history of the development of administrative officers shows clearly that administrators for the most part are simply faculty people upon whom have been laid certain nonteaching responsibilities. The transition to administrative status may, it is true, change behavior patterns, but probably the basic intellectual anatomy of the individual remains much the same whether he is in administrative work or in teaching. Particularly in the areas of academic administration it is rare to find a dean or department head who has not previously been a member of a teaching and research faculty.

The principal exception to this generalization, that administrative officers have been developed from the faculty, is in the field of business management. Even in this area it is becoming increasingly common to find as business manager someone who was formerly a professor of business administration or accounting. It is even more common to find the chief business officer and possibly some of his subordinate staff members, whatever their origins, given assignments to teach a class or two in some subject in which they have competence.

The office of the dean of women also had its origin outside the faculty. But as women with scholarly attainments began to be added to institutional faculties, these female faculty members have become the principal source of recruitment for the office of dean of women.

The two administrative positions that have probably become the most highly professionalized, the librarianship and the registrarship, have moved somewhat away from their origins in the faculty. It is still the common practice, however, to give such officers faculty status even though they may often have no responsibilities for class teaching.

The presidency is the one office that is frequently filled by someone who does not trace his career through beginnings in a college or university faculty. The church-related colleges have long chosen their presidents from the ministry about as often as from academic life. Independent universities and state universities have sometimes chosen great military leaders or industrialists or statesmen (sometimes politicians). State teachers colleges often choose as president someone who has followed a career in public school administration.

Despite the exceptions that have been noted, the generalization still holds that for the most part the administrative offices and officers in colleges and universities in this country have their origin in the faculties of the higher institutions.

INCREASE IN SIZE OF ADMINISTRATIVE STAFF

The second generalization is one that is rather obvious to anyone who is at all familiar with institutional administrative organization over the past thirty or forty years. An enormous increase has occurred in the number of administrative officers in practically every college and university. The increase in the size of the administrative staff tends to be approximately parallel to or possibly somewhat less than increases in the number of students enrolled and the number of members on the faculty.

INCREASE IN ADMINISTRATIVE OFFICES

The third generalization is that, as an institution takes on a new function (or begins to recognize a function that has gradually been developed), a new administrative office is almost always added to supervise that function. For example, if the institution begins to offer extension courses, it must have a director of extension. If a new professional school is added, or developed out of a former liberal arts department, then someone must be employed as dean of the new unit. If the courses in speech and dramatics and journalism are separated from the parent department of English, new department headships must be created for each of the new departments. If the college begins to provide health services for its students, a director of student health soon appears in the listing of administrative officers in the institution's annual catalogue. If the institution formally recognizes the responsibility to help students to find positions after they graduate, a placement office with a director in charge is almost certain to be set up. The first half of the twentieth century has been a period in which large numbers of new functions have been added or recognized in institutions of higher learning in the United States. This situation, along with the increases in student enrollment and faculty members, accounts for the large increases that have occurred in the number of administrative officers in the typical college or university in the United States.

VARIABLE NOMENCLATURE

The fourth generalization is that the nomenclature used for administrative titles has not been standardized. Likewise there has been no standardization of functions of administration officers with a given title. The writer occasionally gets a letter from a worried inquirer who, after stating that he or she has just been appointed as registrar (or dean, or director of student personnel services, or what not), asks to have a list of the duties of this position. Sometimes the inquiry raises a question about institutional officials with different titles both of whom claim responsibility for a certain function: Will the referee or umpire please decide to whose office this function belongs? The only answer that can be given to such inquiries is that there is no authority anywhere in the United States to say definitely what the title of an administrative officer should be or what functions one with a given title should perform.

In its "divine right" of local autonomy, each institution decides for itself what titles it will bestow upon its administrative officers and what duties it will assign each of them. As a result, a given official, such as the one in charge of the business affairs of a college or university, may appear in the listing of administrative officers in different institutions under any one of sixty or more different titles. Research studies have been made of the duties of officials, such as the dean or the registrar, in institutions of higher education. Such studies, if based upon data from a sufficient number of institutions, nearly always show that the composite list of duties for any given officer includes practically every administrative duty that is to be performed anywhere in an educational institution. The condition results in large part from the tendency to assign duties in terms of individual capabilities rather than in terms of some predetermined list of functions appropriate to a given title.

It is true there are modal titles for at least the major areas of administrative responsibilities, and modal practice can be shown with respect to the officers to which given functions are assigned. But the whole situation of administrative titles and duties of administrative officers appears very chaotic, especially to one unfamiliar with the practice in institutions of higher education in the United States. It is sometimes difficult to explain to an educator from another country why we prefer such confusion to the alternative of having some bureaucrat in a federal ministry of educa-

tion in Washington issue authoritative lists of administrative titles, with definite assignments of functions and responsibilities that must be associated with that title in every institution in the country. The only answer that can be given is that in this country we cherish greatly the autonomy of each institution of higher education. Lack of uniformity in administrative titles and patterns of organization is preferable, we think, to the loss of autonomy that would inevitably result if some central authority were given power to issue definitive pronouncements on such matters.

SPAN OF CONTROL

The second and third generalizations listed above have stressed the growth in administrative staff members in the colleges and universities in the United States. As institutions expanded their administrative staffs, particularly when the occasion for such expansion was the addition of a new function, the tendency was to make the new official responsible directly to the president. When a new function is added, particularly if the operation has not yet become routinized, there is nearly always the feeling that it must be watched closely by the highest level of administrative authority. Once such a supervisory relationship is established with the highest level of administrative authority, the later subordination of the operation under some official of lesser status becomes increasingly difficult as time goes on.

Over a period of years the addition of many new functions thus tends to result in a condition technically known as an overexpanded span of control; that is, too many subordinate officials are responsible to the highest level of administrative authority. In the University of Chicago survey in the early 1930's, for example, it was found that some seventy officials (some of them committees) were supposed to be responsible directly and only to the president of the university. Such a condition inevitably means either that many functions are without any adequate supervision or that the overworked president is swamped with a mass of detail, to the neglect of the larger aspects of institutional policy and development.

According to sound theory of administration concerning span of control, a complex organization such as a modern university should have no more than eight and preferably as few as four major administrative officers reporting directly to the highest administrative authority, the president. Recent efforts at reorganization in colleges and universities in the United States have been in line with this principle. A rather definite organizational pattern has emerged, by which four major areas of administrative function are recognized. These four areas are the academic program, student personnel services, business and financial management, and public relations. The current tendency is to group all administrative functions under these four major areas and to put each in charge of a high-level officer, frequently with the title of vice-president and always with that status. This results in an institutional administrative organization with four officers directly responsible to the president: (1) the academic vice-president; (2) the director of student personnel services; (3) the vice-president for business affairs; and (4) the director of public relations.

COMPLICATIONS OF TRANSITION

In large numbers of institutions the transition to the pattern outlined above is incomplete. For example, a vice-president for the academic program and a vice-president for business management may have been appointed, but the student personnel services and the public relations may not yet have been placed under co-ordinating officers. In the smaller universities and colleges the president himself often holds the additional portfolio of vice-president for public relations. In some of the smaller institutions the vice-president for academic affairs serves also as the vice-president for student personnel services.

Many institutions have found it easier to make the transition to the ideal organization by taking one step at a time than by a wholesale reorganization all at one time. Personalities have to be considered in making any reorganization. The personnel situation that facilitates reorganization does not come about at one time in all the areas affected by the four major groupings.

Most institutions that have put into effect a reorganization along the lines suggested above have found a certain amount of resistance, especially among the older members of the administrative staff. Thus a dean of women, who has long enjoyed direct access to the president's office on all problems affecting her administrative responsibilities, may resent the introduction of a dean of students or vice-president of student personnel services to whom she is required to report in the future instead of to the president. Similarly a registrar, who may also have a long history as one of the major administrative officers of the institution, feels that he is being kicked downstairs when he is told that hereafter decisions affecting his responsibilities will be made by a vice-president rather than by the president. A librarian, long accustomed to go directly to the president to beg his funds for books and staff, feels frustrated when the reorganization places him under an academic vice-president. Consideration for the feelings of valued members of the administrative staff, with long records of faithful and effective service, has caused many institutions to delay the inauguration of a desirable plan of administrative reorganization until retirements or resignations make the transition less painful.

FRINGE AREAS

Although the pattern described above reduces to four the number of administrative officers reporting directly to the president, in practice it usually develops that some fringe areas do not fit into the theoretical pattern. Sometimes the president himself believes he must retain direct contact with certain important functions that might, in theory, be subordinated under one of the four major areas. Thus in a college or university that depends for a substantial portion of its income upon gifts or endowment earnings the president usually wants to retain direct touch with the officer who heads the solicitation for funds, although in theory this officer may well be a subordinate of the vice-president in charge of public relations. Such a situation may result, in effect, in creating a fifth vice-president.

In institutions that have much of a program of intercollegiate athletics, the president nearly always has to retain direct contact with the official or committee in charge of this important activity. It will be observed that the athletic program has certain aspects which would classify it within the area of academic administration. It has certain other aspects that are clearly a part of the student personnel service. The important financial problems that are involved in intercollegiate athletics necessitate some contact with the area of business management. And finally no one would deny that a tremendous public relations problem is involved, particularly if anything like "big time" athletics is maintained. Possibly it is this lack of sharp definition of the administrative area to which intercollegiate athletics should be assigned that has led many institutions to set this func-

tion up as a direct responsibility of the president. The gravity of the criticism that descends upon an institution when its athletic program is unsatisfactory may lead the institutional authorities to believe that only the highest executive level can finally be responsible for such an important operation.

Some time ago the writer had an interesting conference with a promising scholar who, some eight months previously, had been inaugurated as president of one of the medium-sized state universities. Upon being questioned as to what he had accomplished during the eight months he had been in office, the president replied unhesitatingly that his only achievement had been to hire a new football coach. Soon after taking office he found it necessary to find a satisfactory replacement for a popular figure who had resigned to take a better-paying position, after bringing fame to himself and the university by a series of winning teams. Subsequent reports on the sports pages indicate that the president spent his first eight months wisely. And he is still president.

As a result of the separation of certain fringe areas, the typical pattern of administrative organization now generally includes three or four major administrative units besides the four areas of academic administration, student personnel services, business management, and public relations.

REORGANIZATIONS AT LOWER LEVELS

At the next lower level of administration within each of the four major areas, there has also been some tendency toward reorganization and regrouping. This is particularly evident in academic administration. The rapid growth of subject matter available for teaching, the tremendous expansion of research interests, and the increasing number of widely diversified occupations and professions into which graduates from colleges and universities may go have resulted in a large increase in the number of specialized schools and departments within the academic program. Thus the university vice-president in charge of academic affairs, with a dozen or more deans of schools and colleges responsible to him, may also come to have a span of control far too large for effective management.

Grouping of professional schools

Some institutions have grouped certain of their professional schools under an officer one echelon higher than the dean of the school itself. Thus all the professional schools related to health may be grouped under a single administrative officer to whom the dean of the medical school, the dean of the dental school, the dean of the school of nursing, and so forth, may be responsible. Accrediting associations in certain professional fields have resisted this arrangement and have stoutly insisted that their dean shall always be responsible directly to the highest level of administrative authority in the institution.

Departmental organization

The tremendous expansion in subject matter has particularly affected the departmental organization of the colleges of liberal arts in the larger institutions. Departments have multiplied by a sort of process of mitosis until today it is common to find twenty-five or thirty or even more departments and department heads in a college or university. Here obviously also the dean of the college of liberal arts is likely to have a greatly overexpanded span of control. One device that has been used for correcting this situation has been the introduction of a divisional organization whereby related departments, such as the social sciences, the physical sciences, the biological sciences, and the humanities, may each be grouped under a single administrative officer for the respective divisions. The divisional organization has been introduced both for administrative convenience and to facilitate better integration of the curriculum. In many institutions where the divisional organization has been introduced it exists only on paper, and the institution actually does not operate either administratively or in relation to the curriculum on a true divisional basis.

In a large university even a single department may become so large, in terms of the faculty members and diversified services, that some administrative subdivision is necessary below the level of department head. Thus within a department of English there may be a grouping of all the work in freshmen English composition under a director of that subject. Similarly there may be more or less official recognition of faculty members who head up such areas as world literature, American literature, English literature, and other broad areas of specialization within the department.

STAFF OF THE PRESIDENT'S OFFICE

At the other end of the administrative ladder the office of chief executive itself has grown into something more than a president with a stenographer or secretary. (Even the provision of a secretary for the president is a comparatively recent innovation.) Most institutions of any considerable size now have a staff associated with the office of the president. These staff officers may bear such titles as assistant to the president, secretary of the university, provost, director of institutional studies, consultant—or others in wide variety. Such additions are necessary to relieve the president himself of what becomes an intolerable burden of detail, even though the maximum use has been made of delegation of authority to subordinate officers in the line of command.

As long as the functionaries attached to the president's office retain purely a staff status, the administrative organization is not thereby complicated. But there is a great tendency to begin to assign small but expanding administrative functions to these persons in staff positions in the chief executive's office. When this is done, considerable confusion is likely to result in the organizational pattern. After a time, if such practices are followed, the whole administrative organization must be restudied, and the result is another reorganization in the interest of efficient management.

THE FACULTY AND INSTITUTIONAL CONTROL

Space is lacking in this article for the discussion of other areas of internal administrative organization in which changing patterns seem to be emerging. One is tempted, for example, to refer to the question of the place of the faculty in the control of the institution. Long-time trends seem to be away from the strong man, dictator-type of executive control, in which the college or university is viewed as "but the lengthened shadow of one man." The trend seems to be toward a much wider sharing with the faculty of responsibility for policy decisions. Certain groups have insisted that the interest of democratic administration can be served only if faculty members hold positions as members of the controlling board of trustees or regents. There seems to be no tendency, however, for institutions to follow such a suggestion. A few institutions have created faculty committees that are advisory to their boards of trustees or have created joint faculty-trustee committees for the study of problems, but even this arrangement is by no means the common practice. Although faculty members generally do not hold membership on the boards of trustees of their institu-

tions, in actual practice in most institutions the faculty as a group either has full control or at least an important voice in all matters that are vital to the academic program. This whole problem of the relationship of the faculty to institutional control cannot be discussed here in detail and is cited merely as one illustration of the numerous problems of a similar sort in which changing and developing patterns of administrative organization are found in the colleges and universities of this country.

CHANGING INSTITUTIONAL TYPES

The discussion in this article has dealt almost exclusively with the changing patterns in the internal administrative organization of institutions of higher education. There are many phases of organization and administration, other than those related to the executive control within the individual institution, that cannot be discussed here for lack of space. Two or three developments outside the area of internal administrative organization will be mentioned briefly.

Evolution of the normal school

New institutional forms in higher education have appeared in considerable variety during the past fifty or sixty years in the United States. An interesting case is the evolution of the normal school, which was originally an institution not recognized as being of college grade. Gradually its entrance requirements were raised to include high school graduation. A four-year college-level curriculum was then developed, leading to the bachelor's degree. At this stage the institution usually became officially known as a "teachers college." Currently in large numbers of these institutions the word "teachers" has been dropped from the title. State colleges that have grown up on the foundations of the old normal schools now commonly maintain multipurpose curriculums and seek to serve a wide variety of educational needs in their region or state. Some of these institutions now bear the title of "university."

The community college

Another interesting development of a new institutional form in higher education is the community college. The term "junior college" is losing favor. The trend seems to be toward an institution tied very closely to the local public school system and serving broadly the educational needs of the community, not only for college-credit courses, but for advanced vocational training and for a broadly conceived offering of noncredit courses for adults.

SUPRAINSTITUTIONAL CONTROLS

The growth of suprainstitutional controls has been an interesting phenomenon during the past half century. One such control is the accrediting agency, which is discussed in another article in this volume. Currently much thought is being given to the place of agencies of state government in the control of higher education. Alarm has been expressed at the tendency to infringe upon the traditional autonomy of state-controlled colleges and universities by the assignment of certain control functions to noneducational agencies in the state government.

INDICATIONS OF FUTURE CHANGE

The great expansion in the variety of services rendered in institutions of higher education during the past half century in the United States and the general increase that has taken place in the size of student bodies and teaching staffs have been the basic causes of marked modifications in the pattern of administrative organization of these institutions. Certainly the end of such developments has not yet been reached. With the prospect of almost incredible enrollment increases in the next fifteen or twenty years, and the great probability that the variety of services rendered and functions performed will also continue to expand, it may be confidently expected that still further modifications will be made in the pattern of administrative organization in the country's institutions of higher education.

John Dale Russell, Ph.D., Santa Fe, New Mexico, is chancellor and executive secretary of the Board of Educational Finance, State of New Mexico. He has served on the faculties of the departments of education at Indiana University, Ball State Teachers College, the University of Kentucky, and the University of Chicago. At the University of Chicago he was also dean of students and associate dean of the Division of Social Sciences. From 1946 to 1952 he was director (later associate commissioner) of the Division of Higher Education, U. S. Office of Education. He is author or coauthor of College Organization and Administration (1929), Efficiency in College Management (1931), The Liberal Arts College (1933), The Evaluation of Higher Institutions (1935), Vocational Education (1938), The American Educational System (1940), The Finance of Higher Education (1944; revised edition 1954), and other books and articles.

Recent Developments in State and Regional Planning of Higher Education*

By A. J. Brumbaugh and Redding S. Sugg, Jr.

PLANNING at state and regional levels has developed in higher education as rising enrollment and diversification of programs have made competition among colleges and universities uneconomical. Pressure of numbers long since brought about state-wide co-ordination of elementary and secondary education. Only since the 1920's, however, has this pressure reached higher education and begun to produce a similar effect; and it is chiefly since World War II that the scope of planning has passed state boundaries. The chief problem posed by mass college enrollment—a phenomenon which the statisticians project with virtual certainty indefinitely into the future—is how to achieve high quality and sensitivity of program in the face of quantitative expansion. Graduate education in particular, with its multiplying specializations, small enrollment units, and comparatively great unit costs, demands new dimensions for planning. One response to this is interstate or regional study and action supplementing individual state efforts.

Comprehensive studies of higher education aimed at the rationalization of institutions into state-wide systems which can be efficiently managed have increased since World War II. They typically focus on recommendations for co-ordination of state programs of higher education, recognizing the complementary role of private colleges and universities, and on particular modifications and developments at existing and potential institutions. The more complete studies provide information, not only about the activities of colleges and universities, but also about the states' resources for higher education, their needs, and their enrollment prospects. In every instance co-ordination to greater or lesser degree is recommended, despite a general concern for institutional identity.

The theory of co-ordination or of what might be called system making in higher education has evolved from experience. During the past quarter-century nineteen states brought their colleges and universities into systems of one kind or another. It has become possible to categorize systems. The most complete co-ordination is provided by systems which feature a central board of control that delegates executive functions to an officer, usually titled chancellor, to whom the heads of the several state institutions report. The Oregon system is an example. Other systems, Mississippi's for instance, have the heads of institutions reporting to a central board that employs an executive officer, usually titled secretary, to whom less responsibility is delegated than to chancellors. A third type of system includes a board and chancellor, but retains in addition local institutional governing boards to which the presidents are responsible for the internal operations of their schools. Oklahoma's system is of this kind. A fourth type, also featuring board and chancellor, is limited in function; the New Mexico system, for example, is limited to the co-ordination of financial functions. As other states undertake studies and move toward co-ordination of higher education, the tendency is to choose and modify these models on the basis of particular situations.

* Editor's note. No reference is made in this article to the voluntary state associations of colleges and universities. Many are primarily concerned with financial support, and their activities were included in the conference program. Those not primarily concerned with fund raising vary widely in scope and function; their most frequent activity is an annual conference.

Minnesota and Louisiana

Both the basic similarity of goals and the local differences of emphasis may be observed in state-wide studies recently completed, currently under way, or planned. It may be illuminating to look first at the studies in Minnesota and Louisiana, as examples of states where no co-ordinated system existed at the time of the investigations. These states are not strictly comparable, since the Minnesota studies began in 1945 and culminated in 1950 with the publication of a substantial volume, whereas Louisiana has only just adopted the plan for a comprehensive survey. Nevertheless the Minnesota study and the plans for the Louisiana one give an idea of the motivations and the scope of the work regarded as prerequisite to soundly based recommendations on the co-ordination of higher education.

In 1947 the state commissioner of education was directed by the Minnesota legislature to appoint a commission representing all phases of higher education in the state, "for the purposes of studying higher education." The resulting book, which incorporates two earlier publications, was meant to help Minnesota face the rapidly growing demand for college education and to formulate a "clear pattern" for planning. It is an editorial integration of sections by several hands, all Minnesotans. The study begins with a discussion of the social and economic background of the entire educational system and proceeds to an account of what happened to two recent classes of high school graduates, regarded as the "student potential" for higher education. The junior colleges, liberal arts colleges, teachers colleges, and the state university get a section apiece, and the volume concludes with essays on the future of higher education.

The Minnesota study, though elaborately conceived and plainly motivated by a felt need for co-ordination of the work of the colleges and the university, reveals perhaps more clearly than other recent studies an ambivalence toward centralization. Instead of coming out for a board and an executive and recommending an unequivocal organizational chart, the study ends with a listing of "long-term objectives" which might be expected of a co-ordinated program. According to the concluding section:

> It is clearly evident that the progress of higher education toward its long-range objectives will depend on the efforts that individual institutions make. . . . There is great need for better co-ordination, although voluntary co-operation will be the keystone of co-ordination. Autocratic organization or unified state control would destroy the freedom that is the heart of education in a democracy . . . no formal program of institutional co-operation could be adequately developed without considerable further study. . . .[1]

Louisiana, on the other hand, includes both managerial and educational efficiency as the objective of the comprehensive study which the legislature has authorized the Commission on Higher Education to undertake. Like many other states, Louisiana faces increasing enrollment, problems in recruiting and retaining faculties, and rising operational costs without, at present, any co-

[1] Minnesota Commission on Higher Education, *Higher Education in Minnesota* (Minneapolis, 1950), p. 406.

ordinated plan of action. The study is frankly designed to produce such a plan.

The Louisiana study will be based on nine assumptions briefly set forth in the plan, which has appeared as a brochure graphically laid out to engage public as well as professional support. The nine assumptions may be taken to constitute as complete a theory of co-ordinated planning and administration of higher education as any of the recent studies has offered. They are as follows:

1. Higher education should contribute to the development of the state's cultural and economic resources.

2. Public and private institutions should provide both practical and liberal education appropriate to the state's needs.

3. Plans should be made "to achieve maximum efficiency and highest quality for dollars spent," maintaining a proper relation between expenditures for higher education and for other government functions within the financial capacity of the state.

4. Private institutions should continue to play an important role "which will be recognized in determining the magnitude of the responsibility of public instruction."

5. Full account should be taken of facilities available in the region of which the state is a part and at non-educational installations.

6. The proposed study should recommend an administrative organization and allocation of functions among the state institutions.

7. Professional and lay leaders should join in identifying the state's needs for higher education and in planning to meet them.

8. Long-range plans for higher education, running as far ahead as twenty years and including priorities for action, should be prepared.

9. The proposed study should be the beginning of a continuing study process which will keep higher education sensitive to needs growing out of the socio-economic life of the state.[2]

ARIZONA

The study of higher education in Arizona completed under the direction of Ernest V. Hollis in 1954 contributes an equally succinct list of the problems with which legislatures have difficulty in the absence of aid from a state-wide, co-ordinating, screening, and planning body. The justifications of such a central authority as the Louisiana assumptions imply are here in effect summed up. Arizona is of further interest as an example of a state which has established central machinery without getting it into satisfactory operation. The Board of Regents of the University and State Colleges authorized the study because of ". . . the conscious lack of adequate educational leadership, committed to a co-ordinated state-wide program of higher education." The entire study is based on the assumption that the Board will employ a full-time executive officer and a staff with sufficient status and resources to help the legislature make decisions in the following areas:

1. Where the programs of two or more institutions involve undesirable and expensive duplication of services.

2. Where the programs of all the institutions omit important recognized needs of the state for higher education.

3. Where institutional policies may vary unjustifiably on such matters as faculty salaries, student admission requirements, student fees, or the quality of instruction.

4. Where significant differences exist in the effectiveness with which the several colleges and universities organize, present and defend their respective budget requests.

5. Where the combined requests of institutions for operating funds or new facilities exceed the total funds the legislature is able or willing to devote to higher education.

6. Where the legislature is put under specific pressures to add an entirely new program at an existing institution, or even to change the basic purpose and scope of an institution.

7. Where the legislature is confronted with unwholesome competition among the State-controlled colleges and their friends.[3]

FLORIDA

Florida's situation is similar to Arizona's in that the Board of Control for Florida Institutions of Higher Learning, although exercising certain co-ordinating functions, is felt to be inadequately staffed and insufficiently authorized to handle prospective expansion. The Council for the Study of Higher Education in Florida, appointed by the Board of Control at the direction of the legislature last year, has published an initial report recommending plans for co-ordinating the government of higher education and for relating private and public education. As in Arizona, the key recommendation is that the central board be made by statute a policy-making body, delegating executive and administrative functions to a professional staff headed by a chancellor. A final report, the details of which will depend in part on the action which the legislature takes with respect to strengthening the central board, will be issued in March 1956. This publication will propose an allocation of functions among the several state institutions and describe the nature of the educational programs required to meet the needs of the state.

Noting that Florida must expect a tripling of its 1953–54 college enrollment of 36,013 by 1970, the Council's initial report stresses the need for deliberate effort to attain quality of program in times of quantitative expansion. It suggests that private colleges and universities be encouraged to maintain high quality programs and to expand their enrollments consistent with their purposes and resources. It further recommends the expansion of the existing public institutions and an ambitious program to supplement them by establishing public community colleges in strategic population centers. The Council believes the state can accommodate the first contingents of the rising enrollments at the existing institutions and in the proposed community colleges. It foresees, however, a need for additional four-year state colleges, which should be planned now but opened only when it is clear that maximum use is being made of the existing institutions and community colleges.

The emphasis on community colleges is of special interest. The Council recommends that a Community College Commission be established at once to begin the development of a community college system and to exercise sole responsibility for co-ordinating it. As the Council conceives them, the community colleges would provide terminal, two-year programs with a strong vocational cast, would identify able students who can be aided to continue their formal education, and would offer adult education programs. The community colleges would help avoid congestion at the state universities and proposed state colleges, and they would be comparatively economical, both for the state and for their students, most of whom could live at home.

OTHER STUDIES

In Mississippi, which has one of the older co-ordinated systems of higher

education, the organization of the Board of Trustees of Institutions of Higher Learning is regarded by some educational administrators as ideal in many respects. All the state institutions are under the Board, whose members serve overlapping twelve-year terms relatively free of temporary political influences. The study of higher education in the state directed by John E. Brewton and published in December 1954 is "a practical, workable guide to the planning of a long-range program." It rather carries forward work well under way than recommends radical administrative reorganization. It recommends, however, the addition of a Director of Planning and Research to the Board's staff and the maintenance of a continuing assessment of the system leading to a more exclusive concentration on policy making.

A number of other states, notably California, New York, North Carolina, and Texas, have recently completed studies of a scope comparable to those already mentioned. Still other states are engaged in more limited studies, and several states are including surveys of higher education in preparation for the White House Conference. They do not present striking variations on the ones we have discussed.

REGIONALISM: THE NEW ELEMENT

The newest element in the state studies of higher education is a growing consciousness of regional action as an alternative to be considered in planning. The Florida, Louisiana, and Mississippi studies specifically take into account the program of the Southern Regional Education Board. The more recent program of the Western Interstate Commission for Higher Education is referred to in the Arizona study. Thus the state studies are beginning to occur, not in isolation or in simple imitation of earlier ones, but in a larger context which allows great flexibility and unprecedented option in the development of plans for state systems of higher education.

The Florida study includes among the assumptions which it has adopted as the basis of its work one stating that "full account will be taken of regional facilities and of non-institutional facilities and resources within the State, in determining the expansions that will be required to meet the needs of Florida." The Council also assumes that "Florida will assume its share of responsibility in the fields of regional, national and international education."[4] Especially with respect to graduate and professional programs, the Council feels that because the field is so large there is no valid reason for uneconomical duplication in the development of new programs among Florida institutions. According to the report

> A further means of effecting economies and at the same time achieving high quality in graduate work is to make maximum use of all the facilities in the State and region . . . [which involves] taking full advantage of the arrangements for inter-institutional and inter-state cooperation.[5]

Similarly, the Mississippi study recommends that assessment of needs in the region as well as the state be the first consideration guiding the central board in establishing new policies and procedures for graduate study and research. The state is advised to undertake advanced programs for training only those professional and technical personnel who "cannot be prepared more economically and effectively through the Southern Regional [Education] Compact or through grants-in-aid to graduate students who study in specialized fields outside the state."[6] The plan for the Louisiana study is equally cognizant of the regional context.

[5] *Ibid.*, p. 9.

INTERSTATE COMPACTS

A total of forty-five states and two territories have shown interest, to varying degrees, in co-operative planning, sharing of facilities, specializing within complementary patterns, and avoiding unnecessary duplication in advanced education. Through these approaches the states can supplement their individual efforts to discharge the frequently overwhelming task of developing the full range of advanced instruction and research at their universities. Twenty-four of the states and one territory have entered into statutory regional compacts for mutual planning and development, particularly of graduate and technical education.

Fifteen of these states have given legislative approval to the Southern Regional Education Compact of 1949, while nine states and one territory have ratified the Western Interstate Compact for Higher Education of 1953. The Southern Regional Education Compact involves the area stretching from Delaware on the north to Texas and Oklahoma on the southwest; the Western Interstate Compact includes Alaska and Washington, Oregon, Idaho, Montana, Wyoming, Utah, Colorado, Arizona, and New Mexico. California, Nevada, and Hawaii are also expected to participate. Meanwhile a New England Compact on Higher Education has been approved by the Massachusetts legislature and is under consideration in Connecticut, New Hampshire, Vermont, Maine, and Rhode Island. In addition, twelve midwestern states are scheduled to confer in July on the desirability of interstate co-operation to develop veterinary medical education and perhaps also medical and dental education.

In resorting to the interstate compact, educational and political leaders are demonstrating the flexibility of one of the oldest of American public administration devices. It provides expanded opportunity for state initiative within the federal system. During recent decades such compacts have been used in river sanitation, forest-fire control, criminal probation and the control of juvenile delinquency, and water and oil rights; undoubtedly the educational compacts are the most ambitious, for their application is limited only by the scope of education itself.

EFFECTS OF REGIONAL CO-OPERATION

What does regional co-operation in higher education do for the states? In general, it enlarges the geographical, and hence the fiscal and administrative, area for planning. Individual states which would experience frustration or mediocre results in attempting all things can concentrate their resources on given fields within patterns which assure the citizen of each co-operating state of access to the full range of offerings. In so doing they find it advantageous to maintain an inventory of their needs and resources as the basis for reciprocal arrangements with other states. As individual state studies of higher education are beginning to take regional facilities into account, the Southern Regional Education Board is encouraging the states in its area to initiate continuing studies.

At its 1954 meeting the Board's director, Dr. John E. Ivey, Jr., noted that projected enrollment increases will make careful planning necessary if the states are to provide for them without jeopardizing the quality of their programs. He also stated that the problem is so great that "the resources of the region must be used to maximum efficiency"

[6] John E. Brewton *et al.*, *Higher Education in Mississippi: Digest of the Survey Report* (Jackson, Miss., 1954), p. 36.

and pointed out that "research into the basic problems of educational programs is extremely limited." Each of the participating states has been urged to "undertake a long-range study of its total needs for elementary, secondary, and college programs and explore the most efficient educational, financial, and organizational procedures for meeting projected needs, including the more effective use of the regional education compact." The Board provides assistance to such projects on request, and Dr. Ivey has further suggested a joint effort of the states to develop educational research.

In addition to consultation the Southern Regional Education Board has contributed two important aids to state planning of higher education. In 1954 it published *Future School and College Enrollments in the Southern Region,* which includes enrollment projections to 1970 for each of the states in the compact and which will be revised periodically. This year the Board published a detailed tabulation of *Doctoral Programs Offered by Southern Universities,* which it also intends to revise from time to time. This bulletin was designed to provide colleges and universities with information to be used in student counseling. It also helps to publicize the doctoral programs and aids the institutions which offer them to plan their work in relation to that of their neighbors in the region.

At its own annual meeting, at the annual Legislative Work Conference which it conducts, and in upwards of twenty-five academic fields, the Southern Regional Education Board not only fosters intrastate as well as interstate planning but also disseminates and interprets the results of research and planning to a growing variety of groups. The Board includes the governors of the participating states and three other persons appointed by each. College presidents, legislators, and prominent citizens are typical members. The Legislative Work Conference is attended by delegations of legislators appointed by the governors. It has devoted itself to reviewing regional education programs, to passing judgment on the desirability of new ones, and to general questions of educational policy.

SOUTHERN REGIONAL PROGRAMS

Within academic fields, the Southern Regional Education Board has worked only through existing institutions without attempting to establish new ones. The oldest activities are the contract programs in medicine, veterinary medicine, dentistry, and social work. States which lack schools in these fields contract through the Board for quotas of places at institutions which have such schools, agreeing to pay the institutions $1,500 a year per student in medicine and dentistry, $1,000 a year per student in veterinary medicine, and $750 a year per student in social work. The institutions use this money only for operational expenses—to raise professors' salaries and otherwise improve the schools beyond what would ordinarily have been possible. The gain to the students is primarily access to a school. No scholarships are provided, although out-of-state fees are waived. At present over 1,042 students and about $1,365,000 a year are involved. It has been conservatively estimated that it would cost about $64,000,000 to build new schools in the compact states providing the same facilities and about $9,000,000 a year per state to operate them.

An equally important type of program is carried on under Memoranda of Agreement which commit the participating institutions and the Board to co-operate in planning and developing advanced scientific and educational programs. The memoranda, which bear the signatures of the heads of the participating institutions and the Board director, establish Regional Committees in various academic fields. The committees usually consist of the deans of the schools concerned and a representative of the Board. Such groups now guide regional programs in city planning, forestry, research library development, the marine sciences, nursing, and the petroleum sciences.

Achievements under the memoranda include the establishment of a uniform preforestry curriculum, the launching of co-operatively planned master's programs in nursing at six universities with the aid of grants from the W. K. Kellogg Foundation and the Commonwealth Fund, and the initiation of regional graduate summer sessions in statistics and the petroleum sciences, as well as joint efforts in several fields to recruit students, raise funds, and co-ordinate research.

An even more inclusive kind of regional educational activity is in prospect as the result of the resolution of the 1954 Southern Governors' Conference which requested the Board to establish a Southern Regional Council on Mental Health Training and Research. The council, which was organized July 11–12, 1955, is advisory to the Board and will be supported by special appropriations at the rate of $8,000 annually from states which elect to participate.

Sixteen states took part in the surveys which resulted in the proposal that the council be set up. So far it appears that at least eight or ten states will support the council. In March the National Institute of Mental Health granted $73,600 to the Southern Regional Education Board to supplement support from the states during the next two years—appropriations from some of the interested states must wait for legislative action in 1956. The Southern Regional Education Board will employ a staff and assist the states in developing interstate planning and collaboration to advance training and research in psychiatry, clinical psychology, psychiatric nursing, and psychiatric social work. This spring the National Institute of Mental Health also allocated funds to the Western Interstate Commission for Higher Education to help finance preliminary surveys which it is expected will lead to a similar program in the Far West.

WESTERN DEVELOPMENTS

Like the Southern Regional Education Board, the Western Interstate Commission for Higher Education gets its basic support from legislative appropriations. Membership of the Commission is predominantly educational; unlike the Southern group the Commission does not include the governors. The Western Interstate Compact specified that the Commission's first efforts should be to arrange contracts on the Southern model in dentistry, medicine, veterinary medicine, and public health. Currently there are 101 contract students in medicine, veterinary medicine, and dentistry, with 250 prospects for 1955–56. The Commission is co-operating with the United States Public Health Service and the W. K. Kellogg Foundation in a regional survey of dental manpower. It has recently received a grant from the National Institute of Mental Health to conduct a regional survey of mental health training and research. With its initial obligations in the health fields well in hand, the Commission is preparing regional programs in marine biology, nursing, educational television, journalism, and social work.

CONCLUSION

It is to be observed that the motivations and patterns of the state studies and planning carry over into regional

action, which so far centers on graduate and professional education. As the primary impetus of the state studies is the prospect of doubled and tripled college and university enrollment and the patent need for economical use of resources in accommodating it, so in regional planning is the necessity of economy paramount. But in regional planning perhaps more clearly than in that limited to particular states the concern for the maintenance and improvement of the quality of advanced education is manifest. The quality of advanced programs, which has been associated with highly individualized instruction, is in danger from the effects of an unprecedented quantity of students. As regional action tending to foster the study of basic principles of education and educational administration continues to develop, it is likely to be increasingly devoted to the problem of quality in mass higher education. The Southern and Western regional programs, and such others as may come into operation, should be watched not only for particular achievements in academic fields, but also for the development of a broad conception of what constitutes excellence. The traditional tendency to associate quality only with accomplishment in areas calling for verbal and abstract intellectual aptitudes may come into serious question as the educational structure accommodates large numbers of persons with other aptitudes requiring other standards of value.

A. J. Brumbaugh, Ph.D., LL.D., L.H.D., Tallahassee, Florida, is director of the Council for the Study of Higher Education in Florida. He was a member of the education faculty of the University of Chicago from 1927 to 1944, as professor from 1936, and also served there in various deanships in the College of Arts, Literature and Science and in the University. He was vice-president of the American Council on Education (1944–50) and president of Shimer College (1950–54). He has been a member of numerous educational commissions.

Redding S. Sugg, Jr., Ph.D., Atlanta, Georgia, is a staff associate of the Southern Regional Education Board. He has edited a weekly newspaper and taught English at the Georgia Institute of Technology, the University of Texas, and the Atlanta Division of the University of Georgia. He was a Fulbright scholar in Paris in 1951–52.

Higher Education and the Federal Government

By J. L. MORRILL

RELATIONSHIPS of higher education with the federal government have become a major preoccupation in the American college and university world. They enter significantly into financing and policy. Historically this has been true of the land-grant colleges and universities from their beginnings, but within the past fifteen years federal involvements have spread into the whole academic-administrative realm.

World War II gave overwhelming impetus to this trend. The federal government found the colleges and universities indispensable for training specialized military personnel and for scientific research and development. Since the war federal involvement in higher education has widened and intensified.

Educational benefits for World War II veterans (and now for veterans of the Korean conflict) brought federal relationships to almost every campus. The government declared draft deferment of better-than-average students while they pursue college work to be in the national interest. The Reserve Officers' Training Corps (ROTC)—Army, Navy, and Air Force—has been expanded far beyond its earlier principal affiliation with the land-grant colleges, and is now definitely regarded, at long range, as the major source of officers for the active military forces.

Federal support of research, initiated by the Hatch Act many decades ago in agriculture, is now pouring into the universities in an amount exceeding $150,000,000 annually in medicine and health, in the natural and biological sciences, and for defense purposes which include not only "weapon research" but the most basic investigations in nuclear and atomic fields. The government has moved into long-range loans for campus housing, into world-wide support of educational exchange, including the reorganization and rehabilitation of higher education abroad, into the specialized training of civilians and military personnel as well as veterans—all these with highly complex and diversified contract and fiscal relationships.

This changing pattern is significant, indeed. No cliché about "creeping socialism" is a sufficient explanation. Higher education has become an instrument of national policy in ways never intended by the founders of the Republic or the founders of early American colleges and universities themselves.

The expanding needs of a diverse and specialized social order which, surprisingly, not only science but also scholarship has been found uniquely useful in meeting, are a major factor in the situation. And the idea that public money should be spent or loaned exclusively through public agencies has been considerably revised, not only in higher education but also in many other types of operation. The privately supported institutions, like private business, have been a party to this revision.

The whole notion, indeed, of organized education as a social function—public and private—has assumed new political overtones. This is understandable in the fears and tensions of this divided world. The spiritual and economic crisis of Communism with its educational implications, for example, becomes in practical terms a political crisis. Even in a democracy as contrasted with a totalitarian state—indeed especially in a democracy dependent

upon public opinion as the basis of decision—education becomes a force of political consequence. Both the federal government and state governments become concerned with education in new ways. They are more and more inclined to take a hand in it.

EDUCATIONAL COMPLAISANCE

It should not be assumed that the increasing involvement of the federal government with higher education has taken place despite strenuous objections of the institutions, both public and private, directly concerned. Quite the contrary. American colleges and universities of all types have welcomed arrangements to train military personnel, contracts and grants for research, deferment policies on behalf of their students, support of veterans and foreign students, and other federal programs combining tangible benefits with the satisfaction of operating in the national interest. There have been some voices raised in protest, but the number of institutions declining to participate has been small indeed.

DANGER SIGNALS

And yet, certain dangers in this situation have become apparent in recent years and have caused considerable concern. For example, the ROTC, originally a plan by which the Army assisted colleges and universities with their own programs of military training, has now become so integral a part of the officer-procurement plans of all the armed forces that control has, in effect, passed to the Pentagon. The obnoxious "loyalty oath," instituted last year by the Army and the Air Force for freshmen, was one symptom of the change. The Army directive was based on the assumption, stated by the Department of Defense, that these students were in some respect members of the armed forces, even though many of them were enrolled by compulsion under state laws declaring military training to be merely academic instruction.

The Department of Defense also asserted the right, in contracts for correspondence courses offered colleges and universities in 1953, to relieve an employee of the institution from further responsibilities under the contract for "security" reasons without presenting evidence or the opportunity for self-defense. The same right has been asserted by more than one federal agency in connection with research contracts, even when no classified information is involved. This principle, if applied generally, could carry over into every kind of contractual relationship between the federal government and the colleges and universities—into ROTC instruction, the agricultural extension service, vocational education, even veterans' education, and could consequently affect nearly every faculty member in the United States. Whatever the motive, the procedure is clearly an invasion of the institutional autonomy without which there is no protection against political control.

In another sphere, the financial benefits from some of the federal research programs are now recognized as illusory, especially in institutions where concentrations of contracts and grants have stimulated large-scale operations. Since a number of federal agencies pay only a part of the cost of research projects they sponsor, the effect has been, in some instances, to impel the institution to use its own resources in ways that have resulted in unbalanced over-all research programs, diversion of funds from faculty salaries and other essential purposes, and partial neglect of the teaching function.

In the larger context the issues, pro and con, of government support and government control are not so simple as many suppose. They are empirical; and indigenous to the times and to the nation or state in which they arise.

We can jump to conclusions too quickly. The syllogism—to mix aphorisms—that the hand which controls the purse strings will rock the cradle is not necessarily true. On the other hand, the axiom of eternal vigilance as the price of freedom is true, beyond doubt or debate.

LESSON OF THE LAND-GRANT COLLEGES

The group of colleges and universities with probably the longest experience of federal relationships is the federally aided land-grant college group. Generally speaking, that experience has been a sound and satisfactory one, as I can testify from some twenty years of administrative responsibility in three land-grant universities. That it has been generally satisfactory is accounted for by two things—the fact that the relationship is a co-operative one between the states and the federal government, with the final decision on the methods and policies of co-operation reserved to the institutions and the state legislatures; and the fact that the land-grant colleges, individually and in concert through their strongly organized and competently staffed association, have steadily, militantly, and successfully resisted the undoubted although only occasional tendency of the federal government to intervene and to control.

Most of these problems have arisen, for the land-grant colleges, in the federal appropriation and administration of funds for agricultural extension and research, to which the states also contribute millions of support. Today for both publicly and privately supported institutions the horizon of federal relationships has expanded far beyond the land-grant agricultural area. There is, long range, the same possibility and prospect of a reasonable relationship if buttressed by the eternal vigilance of those involved.

There is evidence of this fact from the later developments in several of the examples cited earlier. The Department of Defense has recently withdrawn the objectionable loyalty oath and substituted a brief affirmative declaration that satisfies most of the critics. The objectionable clause in contracts for correspondence courses under the United States Armed Forces Institute Program has been eliminated. At the request of the White House, the National Research Council has agreed to study the security problem in government-sponsored research and to make recommendations for elimination of abuses. Congress has likewise interested itself in the problem. And a number of federal agencies sponsoring research are considering, under the leadership of the National Science Foundation, changes in their financial contract formulas.

All of these results have come, in large part, from the efforts of higher education itself, working through such agencies as the Association of American Colleges, the Association of Land-Grant Colleges and Universities, the Association of American Universities, the National Catholic Educational Association, the Association for Higher Education of the National Education Association, and the American Council on Education. Higher education need by no means be a helpless pawn in the hands of the government, provided that it is alert and united.

EDUCATIONAL INTERDEPENDENCE

For the eggs of education are in one basket. Educational institutions stand or fall together at every level—the schools, the colleges and universities—in the American scene and scheme. It is proverbial—and democratic—that educational institutions differ in their philosophies of education, in the special objectives to which they are variously committed. As the British observer Denis Brogan has written, the glory of

free societies is that "they produce a great many people of all kinds because they let them produce themselves." Education, surely, must be the proving ground of that principle.

But it is shortsighted to consider the great issues involved in federal relationships in the small terms of a divisive competition of interest between the publicly supported and the independently supported colleges and universities of the country. It is folly to confuse currently popular propaganda with common sense by attributing to the privately supported institutions primarily the virtues of "private enterprise." It is similar folly to attribute to the publicly supported institutions any exclusive concern and responsibility for the "public interest." All depend upon each other. Nationally, the distinguishing merit and success of American higher education in the whole Western world are not nearly so much its competitive as its complementary character—the balanced diversity of institutions differently motivated, controlled, administered, and supported.

QUESTIONS FOR THE FUTURE

Assuming that higher education will continue to be an instrument of national policy and that the institutions of higher learning and the organizations that speak for them will stand together on critical issues, the central questions for the future are these: Will the American public still sustain the traditional aims of "the advancement of learning and the search for truth"? Will it resist the prejudices of anti-intellectualism? Will it stand steadfast against political intervention, protecting the independence and autonomy of our institutions?

The totalitarian view we know from experience in our own time: the indoctrination of youth, the coercion for conformity, the anesthesis of intellectual freedom.

Historically our own outlook has been otherwise. Education has been the buttress of that enlightenment needful to democratic success, the free mind regarded as indispensable to American advancement. To be sure there was no mention of education, as I remember it, in the Declaration of Independence or the Constitution. No national university such as James Madison urged has ever been established.

But we remember the historic mandate of the Ordinance of 1787, and Washington's Farewell Address in which he admonished his fellow citizens of the struggling new republic to "promote, then, as an object of primary importance, institutions for the general diffusion of knowledge." We remember Jefferson's lifelong preoccupation with the University of Virginia; John Quincy Adams' plea for the public support of "scientific research and inquiry" towards, as he phrased it, "the improvement of agriculture, commerce and manufacture, the cultivation and encouragement of the mechanic and elegant arts, the advancement of literature, and the progress of the sciences, ornamental and profound."

Are those convictions still the American view of education—of higher education especially—as an instrument of national policy? Within the expanding realm of federal relationships, can public understanding be somehow mobilized and relied upon to circumscribe the actions of Congress and the executive agencies?

Clearly our institutions of higher learning are challenged to make themselves more strongly felt for what they really are amid the confused and competing pressures which too often crystallize in practical political decisions. Immediately useful today, their larger usefulness in the time to come must somehow be publicly perceived and protected.

In our always evolving democracy, new problems constantly emerge. Integral to the American social order—more so, perhaps, than in any other nation—have been the establishment and unparalleled development of colleges and universities. Their increasing governmental relationships are an instance of inevitable logic, it would seem. They pose the problem of sound adjustment, to which the resources of institutional diversity are one safeguarding answer. Beyond these are the ancient integrity of the academic tradition in the whole Western world, and the genius of our democracy to make wise and needful adaptations.

J. L. Morrill, LL.D., L.H.D., Minneapolis, Minnesota, has been president of the University of Minnesota since 1945. He serves currently as chairman of the American Council on Education Committee on Relationships of Higher Education to the Federal Government and president of the Association of American Universities. Before going to Minnesota he was president of the University of Wyoming (1942–45) and vice-president of the Ohio State University (1932–41). He has also served as president of the Association of Land-Grant Colleges and Universities (1947–48), chairman of the American Council on Education (1950–51), and chairman of the United States Advisory Commission on Educational Exchange (1951–54).

Campus Issues and Problems

By Harry J. Carman

THE issues and problems confronting every institution of higher learning are numerous and vexing—more so on some campuses than on others. Within the limits of this brief article it is quite impossible to do justice even to the more important of those issues which have not been treated elsewhere in this volume, much less to all of them. Consequently, we shall confine ourselves to those which are of major concern to every person interested in higher education. These are institutional objectives; admission of students; faculty recruitment, tenure, teaching load, opportunity for intellectual and spiritual growth, standards and values; library facilities; housing; counseling; student government and student participation in academic policy.

Institutional Objectives

In his celebrated "House Divided Against Itself" speech of 1858 Lincoln said: "If we could first know where we are and whither we are tending, we could better judge what to do and how to do it." This famous epigram admirably summarizes the matter of educational goals or objectives. Too many of our institutions of learning flounder along like a rudderless ship without a sense of direction or ultimate goal. If the teacher is to be effective he needs to have clear objectives and to relate these to the objectives of the institution in which he teaches. This is possible, however, only if the institution has itself clarified its corporate objectives, its basic philosophy of education, and its conception of the proper role of its several departments and courses. A visit to many colleges in which teaching is inferior convinces one that no single factor has contributed more to this failure than a general aimlessness of purpose on the entire campus. One searches in vain for some relation between the purpose of this or that specific course and the stated functions of the college. Sometimes the college has failed entirely to attempt to formulate its objectives; often the printed formula is trite and unilluminating. In these colleges a teacher could hardly be blamed for not relating his own courses helpfully to the over-all college program. A statement of goals or purpose can help the college to give a maximum account of itself. Often even a statement of partial or intermediate objectives is helpful. And because we live in a world that is changing so rapidly it is especially important that objectives be reconsidered from time to time. Administrative machinery—it need not be complex—should be established whereby new members of the staff may become familiar with the objectives of the college. Members of department staffs should be encouraged to remember that they are part of the college and that their courses and instruction should conform with the objectives of the institution. Were this done, courses which do not so contribute could and should be eliminated.

It is important, too, that the students have knowledge of the objectives of the college, of its several departments, and of individual courses. The student selecting a college or professional school would be well advised to ascertain the objective of the institution. He should want to know about its program and whether it affords him opportunity to

obtain a balanced, well-rounded education. The extent to which there is student-faculty-administrative co-operation should be of prime concern to him. In this connection he should be strongly attracted to the institution where student opinion and suggestions about the curriculum and other activities of the institution affect the educational atmosphere and reputation of the place. He should be interested in knowing whether a spirit of teamwork or authoritarianism prevails. He should try to ascertain whether he will have the opportunity and responsibility for a goodly share of his own education, a responsibility which will contribute to his intellectual maturity, personal enrichment, and social usefulness. Lastly, he should want to know whether the institution is concerned with the problems of moral and ethical values.

Increasing Competition for Admission

Not only should the student be interested in selecting his college or professional school but in these days of ever increasing college population our institutions of higher learning should be no less concerned about whom they admit. With the swelling number of those seeking admission it seems evident that no one should be admitted who is not qualified in terms of character and competence. Because of keen student competition for admission our colleges and professional schools will increasingly cease to admit marginal students or at least those who are bad risks. Increasingly, too, they will weed out the loafers and playboys whose places can easily be filled by those who will make better use of the educational opportunity. In other words, requirements for admission will be more exacting and, once admitted, standards of performance will be higher. Only in those institutions to which for financial or other reasons more students are admitted than they have staff or physical facilities to accommodate are standards of performance likely to be jeopardized.

In the future as at present, the majority of our colleges, in all probability, will seek a student body national and even international in character. Experience has already demonstrated that where a student body is drawn from a variety of economic, social, religious, and racial groups, thus representing a wide range of personalities, interests, and achievements, a much healthier educational climate prevails. Students with a diversity of background contribute much more to their own education than those who come from a more restricted area where this diversity is lacking.

It seems likely, too, that the requirements for admission will be further broadened in the years ahead. Increasingly many colleges are convinced that scholastic records, however satisfactory, do not cover all the qualifications which a candidate for admission should possess. Substantial weight is, therefore, being given to such personal qualities as willingness to work, social adaptability, community spirit, honesty, breadth of interests, and promise of social usefulness. Increasingly, the common denominator for all who are admitted is likely to be good character, demonstrated scholastic ability, and an inclination to make effective use of the opportunities which the institution offers.

Faculty

No institution of learning is any better than its instructional staff.[1] The quality of education which it makes available to its students depends in large measure upon the character and

[1] For a more extended treatment of this topic see Aura Edward Severinghaus, Harry J. Carman, and William E. Cadbury, Jr., *Preparation for Medicine in the Liberal Arts College* (New York: McGraw-Hill Book Company, 1953), Chap. IX.

competence, the vision and conviction of its faculty. It is absolutely essential, therefore, that the institution attract, hold, and develop as many able and devoted teachers as possible. We realize that all the teachers in the land—and especially at a time when there is a teacher shortage—cannot be equally able. The firmament is not filled with first magnitude stars. We are sure, however, that many more young men and women with a capacity for first-rate teaching who are now going into other professions or vocations might be attracted into teaching. And we are also convinced that far more can and should be done than is being done at present by college administrations to select their faculties wisely and to promote their maximum growth and effectiveness as teachers.

The problem of teacher recruitment and replacement is becoming more acute with each passing year. College enrollments, as already noted, are increasing. The other professions are offering higher education more and more competition for the services of our ablest citizens. Teachers are continually being lured away from the college campus and potentially first-rate teachers from their proper calling. In addition, normal vacancies must be filled every year and we need to replace inferior with superior teachers. In short, we need far more college teachers of outstanding ability than we now have. How can these teachers be found?

Faculty recruitment

First of all, a nationwide effort must be made to present the challenges and rewards of teaching more persuasively to the young men and women of each college generation when they are deciding upon their life work. The Woodrow Wilson Fellowships for one year of graduate study, conceived of as a sampling experience without initial vocational commitment, are a fine step in this direction. This program, initiated by Princeton University and now administered by the Association of American Universities, has already sent many of our ablest college graduates to graduate school and some of them are now happily embarked upon a career of teaching. The proposals of Dean Frank R. Kille of Carleton College to bring home to our thoughtful and able college seniors the joys of teaching and scholarship and the tremendous potential contributions of higher education to our larger democratic cause merit enthusiastic support.

Meanwhile, all the colleges, the best as well as the poorest, can select their teachers much more wisely. It would be interesting to know how many liberal arts teachers in this country acquired a teaching post entirely on the basis of correspondence, the president, dean, or departmental head relying wholly upon the recommendation of the major professor, who in turn has never seen the candidate teach and has no real proof that he will be a successful teacher. Reliance is placed on the usual criteria: Does the candidate have a Ph.D. degree? From what institution was the degree obtained? How much has the candidate published? What is his reputation among scholars in his field? These are important considerations but they are not enough. Such procedure is, at best, fraught with risks. How can a college administrator ascertain with any exactness on the basis of an exchange of letters such important qualifications as intelligence, personality, temperament; ideology, outlook, and the like? With few exceptions our graduate schools have proceeded on the assumption that knowledge of the subject and ability to do research in a chosen field of interest are sufficient. As a rule those who are recommended for college teaching are recommended on the basis of scholarship only. Often those who write the recommendations have never seen the candidate teach and have no proof that he will be a successful teacher.

How much more sensible for the president, dean, or departmental head to visit the candidate's institution and to talk with him and his associates. Even better, the candidate could be invited to visit the campus of the institution which has him under consideration. He might even be invited to give a lecture or attend a seminar or a conference. By recourse to devices such as these opportunity would be afforded for "sizing up" the candidate for the post which the institution wishes to fill. Fortunately, there is growing evidence that our colleges are endeavoring to mend their ways in this matter of selection.

No less important, our institutions of higher learning should realize that they can also create on their campuses working conditions and an atmosphere more conducive to the intellectual growth and pedagogical efficiency of their faculties. They can do so, however, only if they have (1) a clear understanding of the qualities which make a fine teacher; (2) a well-defined educational goal; (3) a willingness to assess their present faculties with imagination and candor; and (4) a determination to take whatever steps may be feasible to remedy defects and make advances. Let us look briefly at these four prerequisites for the improvement of college teaching.

Qualities of the able teacher

What are the characteristics of an able teacher? He must have, first of all, mastery of his subject matter, a sincere belief in its importance, and a strong desire to extend the frontiers of present knowledge through study and research. The three-year postgraduate discipline leading to the Ph.D. degree is today the normal and most effective way of laying a foundation for that scholarly inquiry which, if the teacher is to grow intellectually and not stagnate, must continue throughout his teaching career. Such unflagging scholarship, if it is focused upon important problems in his field, need not make him a less effective teacher. On the contrary, he will have something worth saying in the classroom year after year only if he continues to nourish himself intellectually and spiritually in significant study and research. Herein lies one of the weaknesses of many college teachers. Taking the point of view that they are "teachers and not researchers," they fail to add to their intellectual stature by additional study, research, and meditation.

Such scholarship and such teaching involve the power to apprehend significance, to go beyond mere facts to interpretations and conclusions of real human import. The able teacher is a person of intellectual and spiritual stature who has studied with imaginative comprehension the basic elements of our own culture in the context, so far as possible, of other cultures. He is a person who in his own thinking and judging exemplifies emotional maturity and the ability to face man's perennial problems with integrity, wisdom, and fortitude.

An able teacher is also a skilled craftsman in the art of teaching. He knows how to impart his own insights to others, how to fire them with his own enthusiasm, and, above all, how to help his students to do their own thinking, to make up their own minds on controversial issues, and to participate in their own education.

Such pedagogical skill, in turn, will be put to good account only by one who is profoundly interested in his students. It must be the teacher's dominant concern to know his students and to open up new vistas to them and to help them to develop the capacity to use their

factual knowledge and their isolated evaluations in the growth of wisdom. He must be eager to help them to formulate for themselves a valid and workable philosophy of life. He must be anxious to strengthen their faith in themselves and in the possibility of a world of diminishing fear and increasing hope. He must be able to see his own subject so steadily in the context of reality, truth, and human values that he will never forget its significance for them as unique persons and for all human beings everywhere.

The ideal teacher will have an attractive personality, a happy disposition, a sense of humor, high moral integrity, and spiritual humility. He will be the kind of person whom his students will regard with affection and respect as "a grand human being," well qualified to be their guide, philosopher, and friend. His intellectual attainments—his insight, his sensitivity, and his perspective—will direct and motivate his decisions and actions and will thus reflect a total personality of cultural and spiritual depth.

The able teacher will have an understanding of the psychology of adolescence and youth. At the college level his students are in the late adolescent or postadolescent period of life when many of them are striving for complete social, intellectual, and emotional emancipation. He will understand that there are variations in the rates of growth and attainment of maturity, and that these variations are influenced by psychological, social, economic, and geographic factors. He will know something of the tumult of adolescent emotional experience so that he can deal with his students warmly and yet with objective understanding.

The alert teacher will also feel a sense of responsibility to the institution with which he is associated. He will know its history and its educational objectives. By "knowing" we mean something more than reading the formal statement of aims which usually appears in catalogues and other college bulletins. In the better colleges educational aims do not emanate *ex cathedra* from the office of the president or the dean; they are developed gradually and co-operatively by the entire college community. Administrative officials can and sometimes do play an important role in such matters, but in a healthy academic community common objectives are formulated primarily by those who teach and those who are taught. Such institutional objectives are often more clearly revealed by the actual practices of the faculty than by official statements written for publication, helpful as the latter may be. Corporate objectives are best clarified when faculty and students have a voice in discussions of over-all policy, of new programs, and of new experiments in teaching, and in checking upon student progress. Teacher and students thus become conscious of what the educational objectives are and should be.

The teacher in the community

Finally, the able teacher is community-minded. He participates in campus and community life, and the wise administrator encourages him to do so, allowing him time for this purpose as well as for his family. The essentials of democratic living, as the late President Day of Cornell University pointed out shortly before his death, find expression in a variety of ways. Participation by all citizens is an essential of enduring democratic government. Especially is this true of the local community, where problems assume more concrete form and possible solutions are more readily understandable. Even in the larger community of city, nation, and world, the college teacher can in numerous ways help formulate and execute policies and programs which are of far-reaching consequence.

Earmarks of failure

Many teachers approach very closely the ideal just outlined, but there is a distressingly large number of second- and third-raters even among the young and supposedly vigorous members of the instructional staff of many colleges. There is not only variation in teaching performance as a whole but also variation within a single institution and frequently within a single department. Sometimes the gap between educational intent and actual achievement is wide and discouraging. Here we can do little more than list the more important causes for the widespread failure in college teaching today.

1. Preoccupation with research at the expense of teaching. In many colleges faculty members give the impression that teaching is and should be of secondary interest. Some look upon teaching as a means of financing research. They draw their salaries for teaching but devote no more time to it than is absolutely necessary. Many colleges emphasize research almost exclusively in granting tenure and in making advances in rank and salary and are largely indifferent to miserable teaching. Undergraduates, especially in colleges which are parts of large universities, are often neglected.

2. Sheer pedagogical incompetence. This means human wastage that should never take place in any classroom of any educational institution, much less in a college. Visiting college classrooms one frequently witnesses neutral, humdrum, pedestrian, and uninspired teaching. Many teachers seem to be almost incapable of dedicated commitment to the search for truth, of human fellowship, of sensitivity to and concern for the creation of a more perfect society. Some boast of their scholarship but fail to see that it is not in scholarship but *through* scholarship that the minds and souls of youth are served.

3. Exhibitionism and timidity. Mental dexterity and wit may entertain but they should never be thought of as substitutes for the nourishing intellectual diet which the student needs. Dull teaching bores the student; exhibitionism ultimately disgusts him.

The teacher without conviction and without courage to face controversial issues is also a weakling, especially if he hides behind the cloak of being "objective." College students need to learn how to wrestle with social, economic, moral, and political issues. They should not be allowed to avoid important issues merely because they are controversial. The college teacher who, by his example, encourages such avoidance, severely limits his usefulness. The college campus should be a training ground for young men and women who are learning how to use controversy for enlightened action. The able teacher knows that the college should be a free market for ideas—a citadel for those who are interested in the search for and dissemination of truth, most of all, on matters of great human importance. By the same token, it should never be regarded as a place for inculcating and spreading insidious propaganda.

4. Lack of self-criticism. The ablest teachers are those who are most self-critical. Every teacher should take inventory of himself from time to time. He should do so in order to discover whether he is becoming a slave to a self-satisfying though inefficient and meaningless routine; whether he is ceasing to be curious, questioning, and contemplative; whether he is living in a little devitalized world of his own; whether he is losing perspective and ceasing to grow intellectually and spiritually; whether, above all, he is doing the best possible educational job for his

students. Is he making use of all available techniques to interest and stimulate his students, to evoke their curiosity, and to encourage self-reliance on their part; or does he put his students to sleep by listless, droning lectures which do not go beyond material available in the assigned text?

5. Inadequate use of helpful facilities. Many teachers do not adequately inform themselves concerning the rich possibilities of the use of audio-visual materials as instructional aids. Moreover, too few of them are aware of the wide variety of evaluation devices which if employed wisely would improve the validity and reliability of their examinations. Many do not realize the full potentialities of the learning process.

Behind poor teaching

The causes for these failures in effective college teaching are as numerous as are the failures themselves. Some of the more obvious contributing factors may be noted. Gravely inadequate budgets make it impossible for colleges to appoint the ablest teachers and to hold them in competition with other institutions and the nonacademic world, and frequently necessitate overcrowded classrooms and the serious overburdening of the teaching staff. They also explain many inadequacies in physical facilities. The poverty of the institution may also preclude or jeopardize an enlightened policy of faculty leaves, faculty reimbursement for attendance at conferences, and faculty retirements.

Poor administrative practice is another leading cause of poor teaching: conformity to established ways, inbreeding, unwise methods of selection of faculty personnel, lack of educational goals, inadequate evaluation of teaching, failure to stimulate teachers to do a more effective task. To these serious administrative shortcomings should be added the activities of pressure groups both off and on the campus which often tend to undermine the teacher's sense of security and consequently his morale.

Tenure

Faculty morale would also be strengthened by adoption of a wise policy of tenure. Tenure provisions at present range all the way from the complete absence of any definite rules to acceptance of the tenure policy advocated by the American Association of University Professors. Some administrators continue to insist that members of the instructional staff should serve at the pleasure of the trustees. A much larger number believe that annual appointments should apply only to those below the rank of assistant professor. Most members of the teaching staff favor the early application of permanent tenure. Thus the municipally supported colleges of the City of New York have permanent tenure after three years of continuous teaching service. Many administrators oppose granting tenure on so short a period on the ground that two or three years is too short a time in which to make a wise decision as to whether a person should have tenure or not. Those who take this position advocate a period of from five to seven years before granting permanent tenure. Increasingly, our better colleges are adopting the policy that any instructor who is not to be promoted should not be retained beyond a four- or five-year period.

Aids to morale

Nothing is more conducive to good teaching than good faculty morale, and nothing will undermine college teaching more rapidly and more devastatingly than bad morale. As all teachers and college administrators know, morale is very elusive and intangible, hard to maintain and harder to repair. It is affected by many factors—by administrative leadership, by the presence or absence of corporate responsibility in the faculty, by the prevailing attitude of the alumni, and by traditional attitudes of the undergraduate body. It is, in subtle ways, a product of all these factors and, in turn, the most powerful single determinant of good or bad teaching.

Were we to single out one academic procedure more likely than anything else to improve faculty morale and to maintain it at a high level, even when salaries are low and teaching schedules are heavy, it would be a forthright policy of regular sabbatical leaves and additional fellowship grants for study, writing, and travel. It is, we believe, absolutely imperative that the able and ambitious teacher be given the opportunity every so often to refresh himself intellectually and spiritually in order to re-create himself as a person, a thinker, and a guide of youth. Summer vacations help; without them, many teachers would sink into complete exhaustion and sterility. But they never suffice as periods of refreshment and renewal. The Fund for the Advancement of Education was fully aware of this fact when it established its Faculty Fellowship program, which has been of inestimable value as a morale builder, as have also the Visiting Internships program of the Carnegie Foundation for the Advancement of Teaching.

The Conference on Improving the Effectiveness of College Faculties, at its meeting in Chicago in December 1950, listed ten factors which can contribute significantly to faculty morale and to better college teaching. Here is the list: [2]

[2] Conference on Improving the Effectiveness of College Faculties. Sponsored by the American Council on Education and the United States Office of Education, Chicago, December 1950. See "Summary Reports and Suggestions."

1. An atmosphere of freedom of thought, inquiry, and expresssion conducive to creative productivity.
2. Extensive faculty participation in the planning and management of the affairs of the institution and its community.
3. An understanding of realms of responsibilities of all members of the professional family—the governing board, administration, the instructional staff, and special services personnel.
4. Generous recognition for faculty services, promoting a sense of belonging to an important group and a feeling of satisfaction for work accomplished.
5. Policies of promotion, tenure, and retirement that will reduce the fear and frustration arising from economic and social insecurity and help to maintain academic mobility.
6. Opportunities for responsible student participation in those aspects of the educational program in which students might be expected to make a definite contribution.
7. Maintenance of a free flow of information, ideas, and suggestions within the institution and between the institution and outside agencies.
8. Active promotion of studies dealing with teaching and other important issues that relate to teacher effectiveness.
9. The distribution of committee work so as to avoid overburdening any individual or interfering with effective teaching.
10. Sufficient clerical and technical service to permit individual faculty members, including preprofessional advisers, to make the most effective use of their time, energy, and professional talent.

Were the colleges of the United States to be rated on the basis of their teaching effectiveness, we would place at the top of the scale those colleges in which the conditions here listed prevail in the highest degree.

LIBRARY AND LIBRARIANS

The university or college library and its librarians are closely related to instruction, especially in these days when greater emphasis is being placed upon the responsibility of the student for his

own education. Instead of being the recipient of predigested summaries presented in the form of lectures, the student, under guidance, addresses himself to problems whose solution is to be found in the library and the laboratory. Consequently, the library facilities should be adequate in terms of space, lighting, and accessibility of materials. Instead of being a mere repository for books, the library should be organized for use rather than conservation of its contents.

Similarly, a librarian should no longer be regarded as the mere "keeper" of the books—a kind of supernumerary, an academic castoff. The librarian should be thought of as a valuable member of the instructional staff and an important part of the total educational system. Wise is the administrator who entertains the point of view that the college librarian should be broadly educated and have a place on the curriculum committee, that college librarians should no longer be "handmaidens of the learned world" but part of it. In this matter all of us would profit by reading Dr. Jesse H. Shera's admirable address delivered at the Eastern Conference of Librarians last November.[3]

Accrediting agencies and even some of our learned societies, as for example Phi Beta Kappa, have long been concerned about the number of volumes in the library. The concern should rather be, in the opinion of a growing number of educators, not with mere numbers but with titles and quality. The primary need is for a good working library. Space now cluttered with materials valuable, perhaps, to the bibliophile and the university specialist might well be given to more needed products of recent scholarship.

[3] *The Role of the College Librarian—A Reappraisal,* 40th Conference of Eastern College Librarians, Columbia University, November 27, 1954. Published by the Association of College and Reference Libraries, Chicago; Monograph No. 13.

HOUSING

The last three issues that I wish to mention briefly—housing, guidance, and student government—are interrelated.

Many college educators have long been aware that it was highly desirable for all students to live on the campus, since those who reside at home and commute a considerable distance must forgo many campus activities and experiences contributing to a rounded college life. Two factors have prevented complete realization of this ideal, namely, the economic status of the student and the lack of housing facilities of the college, both stemming from want of adequate finances. To overcome in part the drawback of nonresidence, many colleges have established student centers where it is hoped the nonresident students will enjoy certain contacts they might not otherwise have. Where new student housing is feasible there is considerable tendency to provide smaller units housing from forty to sixty rather than to build large dormitories housing sometimes hundreds of students. The smaller unit appears to be more advantageous educationally.

Any discussion of college student housing should take into account fraternities and sororities. On some campuses these organizations house a large proportion of the student body. In a broad sense their purpose is educational as well as residential and social. In organization they bring into intimate relationship the undergraduate, the alumnus, the men and women of kindred spirit from other colleges and regions. Their impact upon the life of the colleges where they exist is important and sometimes far-reaching, but there is currently considerable difference of opinion as to the character of their total contribution to their members and to the college. Consequently, the Commission on Student Personnel of the American Council on Education, established in 1952, proposes that a study be made of the characteristics and potentialities of fraternities and sororities with a view to assisting administrators, teachers, and the fraternal organizations themselves to appraise or evaluate the significance of the fraternity in higher education generally and in specific campus situations.

It should also be noted here that several colleges have addressed themselves to the problem of adequate housing for members of the faculty. Assistance in the form of loans for building or purchase and the building or acquisition of properties by the college for rental to faculty are the principal efforts that have been made by the colleges to relieve this often difficult problem.

STUDENT GUIDANCE AND COUNSELING

The impending increase in college student population not only makes the problem of housing imperative but highlights the whole problem of student guidance and counseling.

To date two schools of opinion on this question have prevailed. One school holds that student guidance and counseling are highly technical skills and, therefore, require trained specialists who have talent and competence for this work. To these specialists, this school of thought insists, should be entrusted entire responsibility for these important and exacting duties.

The second school entertains an opposite view. It believes that the guidance and counseling of students should rest with the members of the teaching faculty and that professional specialists should be kept to a minimum. Those who align themselves with this school, though admitting that all classroom teachers are not equally gifted for the discharge of these particular functions, nevertheless maintain that it is educationally unsound to compartmentalize teaching and guidance.

For the benefit of both of these schools four observations may be made:

1. All education should be student centered. Every activity should be focused on and around the student: objective, policies relating to admission, curriculum planning, guidance, instruction, housing, cocurricular activities, health, recreation, self-government, discipline, publications, financial assistance, evaluation of performance—all these and others should revolve around those being taught.

2. The main function of the school or college should be the stimulation of growth and development of the individual student—physically, intellectually, spiritually. We should help him to discover himself—his likes and dislikes, his strengths and weaknesses, his talents and aptitudes. We should broaden his perspectives, deepen his sense of aesthetic and spiritual values, and make him more aware of his responsibilities to himself and to others with whom he comes in contact, whether in home, school, neighborhood, or larger community.

3. This stimulation of growth can best be effected by the able teacher,

4. Whether a member of the teaching faculty or of a guidance personnel staff, it is of the utmost importance that the counselor have a sense of belonging to the college community and display cooperation and teamwork with everyone in the community, including students. Failure to co-operate opens the door to snobbery, high-hattedness, artificial divisiveness, and community retrogression. Fortunately, an increasing number of colleges are realizing that teamwork is imperative; and it must always be borne in mind that the primary objec-

tive is each student's understanding of himself, of his human needs both within and outside the classroom, and of his relation to the institution of which he is a part.[4]

STUDENT GOVERNMENT

Everyone agrees on the importance of student self-government. On the other hand, in many colleges student self-government is almost entirely wanting or primitive in character. Although there is wide agreement that the students should participate in the affairs of the college community, there is apparently no one best pattern of student self-government. Tradition, faculty, and student interest and attitude and environmental needs are highly determining factors. In Washington and Lee, Princeton, and other institutions where students work seriously at self-government it has functioned efficiently for many years and has come to be regarded as a traditional part of the permanent machinery of the institution. But if emphasis is placed chiefly on who gets elected to the student governing board, and the board subsequently is inactive or has trivial duties until the next election, student self-government is not well thought of by either students or faculty. There are a number of colleges in which a somewhat authoritarian atmosphere prevails either in the administration or the faculty or both, with little or no opportunity for student self-government.

Members of student self-government bodies are usually chosen directly or indirectly by vote of the student body; sometimes class officers, particularly the class presidents, are members of the student governing group. (Incidentally, in institutions which have fraternities the elections to the governing boards as well as to other posts are frequently keenly contested.) In a few colleges governing bodies are composed jointly of students, faculty, and administration. At Ohio Wesleyan, for example, where a high degree of democratic control prevails, students and faculty work together in this manner. Social discipline is shared by the students and the deans of men and women. Academic discipline is likewise handled jointly by the office of the dean and students. At Earlham College the governing body of the college community is the Senate, composed of twenty-two students, five faculty members, and the academic dean. On one occasion the president of the college appeared before this body for violation of one of the rules of the college.

The authority enjoyed by student governing boards varies greatly. In some institutions it is limited to control over minor social matters; in others it extends to all social matters; in still others, the students share authority with faculty and administration in some academic matters. In a few instances, these student self-governing groups may extend their influence even to matters of curriculum. At Columbia College the student governing board has a committee composed entirely of students, known as the "Committee on Academic Affairs." This committee concerns itself primarily with questions of curriculum changes and improvement in instruction. From time to time it is invited to report on questions of curriculum change and teaching quality to the Committee on Instruction of the College and to sit in on staff deliberations. Notable improvements in the effectiveness of the college have been initiated by this student committee. Reed and Haverford are other examples of colleges where students have a voice in educational as well as other matters. Many educators hold that faculty and administration are too paternalistic in attitude toward college students and that, with advice and guidance, responsibility commensurate with demonstrated capacity should be placed upon the students to an increased degree.

Personally, I am strongly of the opinion that inasmuch as the college should exist for the benefit of the students, the student should participate fully in shaping its policies and decisions. Such participation, after all, constitutes a part of his total education.

[4] See E. O. Williamson, *New Frontiers in Counselling College Students*. Pasadena, Calif.: Western Personnel Institute, 1955.

Harry J. Carman, Ph.D., L.H.D., LL.D., Lit.D., D.P.S., New York City, formerly dean of Columbia College and until recently Moore Professor of History at Columbia University, is presently devoting part of his time to work as a college consultant. He is a member of the Board of Higher Education of the City of New York (1938–) and of the Board of Trustees of Bard, Earlham, Morehouse, and Rollins Colleges, Atlanta University, Parsons School of Design, and the Free Europe University in Exile; until recently he was a member of the Board of Trustees of the Institute of International Education, which he still serves in an honorary capacity. He was for many years (1940–52) president of the New York Adult Education Council. Since 1943 he has been a member of the New York State Board of Mediation. He is author or coauthor of several volumes in the field of American history and of the report entitled Preparation for Medical Education in the Liberal Arts College (1953).

The Flowering Curricula of American Higher Education

By Harold W. Stoke

If one wishes an impression of the volume and variety of activities of American higher education, one can get it from an inspection of curricula more quickly than by any other means. Even a review of budgets and enrollments will not convey it so well. And if the curriculum describes most accurately what American institutions of higher education are doing, one must use the plural form, for our colleges and universities are not confined to anything which could be described as a single curriculum.

The most important, as it is the most obvious, observation to be made about the curricula of American higher education is their enormous size and complexity. The "branches of learning" would long since have become an impenetrable jungle were they not traversed by some discernible lines of organization, and if the growth had not been brought about by deliberate cultivation. Both the volume and the complexity of curricula in higher education must be explored if one is to get a sense of what the colleges and universities are doing. Perhaps college catalogues are as good a mirror as any other in which to see what has been taking place. Catalogues are much larger than they were twenty years ago, for almost nothing has been dropped out of college curricula and much has been added—new schools, new divisions, new departments, and new courses. And the increase in volume of activity has also been accompanied by an increase in complexity of organizations, requirements, and interrelationships. Catalogues of most institutions have become handbooks of reference for the expert rather than guides for the uninitiated.

The growth of curricula in American colleges and universities falls into three fairly identifiable patterns—the expansion of established fields, the development and addition of new ones, and the formation of new combinations and groupings. The process by which these patterns emerge appears to be continuous and inevitable so long as there are change and vitality in the colleges and universities and in the society which they serve. Each of these methods by which the curricula of higher education grow deserves some consideration.

Expansion of Established Fields

The expansion of curricula by the growth of established fields may be illustrated as well by biology as by any other. The parent fields of botany and zoology, which dominated biological curricula a generation ago, have subdivided into something more than fifty divisions which lay claim to identifiable places in the curricula of the colleges of arts and sciences, medicine, agriculture, and pharmacy. Only the broad classification "life sciences" could possibly comprehend them all, and with recent developments in scientific analysis, which blur the distinctions between organic and inorganic matter, even this characterization has begun to lose its usefulness. Here are a few of the emergent biological interests which have demanded and obtained separate recognition in organized curricula: bacteriology, biochemistry, biophysics, cytology, embryology, entomology, genetics, immunology, microbiology, parasitology, plant

physiology, radiology, toxicology; the host of others covers the range of the alphabet. Some of these subdivisions originate in techniques rather than in content but they nevertheless now present separable aspects of biological study. Nor do these subjects merely represent accumulations of biological knowledge; they reflect changes in scientific interests and purpose, shifts in the methods of study, and changes in the uses to which biological knowledge is put. The early preoccupation of botany and zoology with problems of taxonomy has now been overshadowed with current interests in such fields and subjects as heredity, ecology, physiology, the structure of the cell, nutrition, and resistance to disease. Until the curricula of biology are measured not only in volume but in terms of these new complexities, it is not possible to understand what has taken place in the teaching and research of this old and established field of study.

What has taken place in the development of biological curricula is reflected in virtually all other established fields. In the social studies and the humanities, knowledge has also been expanding, less perhaps from the mounting accumulation of facts and data which characterizes the natural sciences, than by the continuing necessity for replacing old ideas with new ones, for interpreting accumulated data, and for giving attention to new interests, values, and problems. Ideas, events, and discoveries alter the content of curricula. For example, war exerts a powerful influence upon the study of every field of knowledge, but its effects upon history, the social studies, and the humanities are particularly immediate and profound. War can bring about the rise of the study of one language and literature and the decline of another; history may get itself rewritten; new war-forced problems of organization compel the attention of economics, political science, and sociology. The two wars which American education has endured within a generation have left profound effects upon the curricula.

War is only one of the compelling forces constantly shaping curricula. Every aspect of a changing society—depression, prosperity, propaganda, education, invention, population growth, religion—has its impact upon higher education and its preoccupations. The curricula of the social studies are inclined to take their color from the passing scene, to reflect the current interest and preoccupations of society. This is particularly true in sociology, economics, and political science, but even the student of history is more and more tempted to measure the importance of his subject by its illumination of the present. As the current scene changes, the curricula of the social studies in particular and even of the humanities will tend to reflect it. The tendency may be illustrated in sociology. Here a score of specializations have grown up —social statistics, the study of group behavior, the family, population problems, race relations, rural sociology, urban sociology, public opinion, communications, penology, and social psychology. Even these do not exhaust the broad areas in which the sociologist may concentrate. And as each of these fields expands it makes its demands upon others for skills and training in such fields as statistics and other techniques of investigation, psychology, anthropology, and education, thus setting in motion other pressures toward curriculum expansion.

New Fields

In addition to the proliferation of established fields, the curricula of higher education have grown by the addition of entirely new fields which have never be-

fore existed. These come about through such forces as discovery and invention, political change, the demands of emerging occupations, and changing ideas. A major scientific "breakthrough," for example, can not only affect the instruction of many different established fields; it can introduce entirely new dimensions into curricula. The development of nuclear physics is a case in point. Almost every field of science has been directly affected by developments in atomic energy; almost every other area has had to take it into account. Quite naturally there have followed new courses of study, not only in physics, but in biology, medicine, chemistry, and engineering, courses which are leading to the invention of new and separate degrees such as those in atomic engineering and radiobiology.

Other inventions and discoveries, new occupations and activities, exert similar, if not equal, influences on curricula. Aviation and television inevitably make their educational demands. Consider the names of recognized professions and occupations which today must be accommodated in curricula of higher education but which were scarcely known to our vocabulary twenty-five years ago: radio announcers, television engineers, social workers, psychiatrists, automation engineers, social science analysts, and scores of others. As the list grows, the pressure for curricula to supply the raw materials of their education will likewise grow.

NEW COMBINATIONS

Finally, curricula in higher education grow by a process of combination, which finds established fields regrouped to serve purposes or ends which cannot be served by any single one of them alone. History, literature, political science, economics, and others, for example, may be combined as the study of American civilization. In such a case knowledge from older fields is organized from a fresh point of view, but for all practical purposes something new has been added. This is the origin of such area studies as Latin-American studies, Near Eastern or Oriental studies, and a variety of others. New focal points may give rise to the establishment of such organizations as institutes of labor studies, institutes on population trends, wherever a point of interest emerges which is sufficiently strong to justify a new and useful combination of studies. New schools may make possible new combinations of studies as schools of social work have brought together such diverse interests as sociology, psychiatry, and child psychology. It is quite likely that the "special interest" form of additions to curricula will become increasingly numerous and useful.

INCREASING COMPLEXITY

Enough has been said to indicate the nature of the growth of curricula in higher education in volume, but its development in complexity needs some further elaboration. Here again biology is a good illustration. Where once biology was a descriptive science devoted to the observation of nature, largely as it appeared to the naked eye, its study has now undergone an almost complete transformation. This has happened through developing, borrowing, and applying tools of analysis which in many respects it possesses in common with chemistry, physics, and mathematics. "Method" has become for the scientist a field of study apart from "content," equipping him with a kit of techniques which enable him to move more easily from one field to another but which also impose upon him new and heavy requirements of study before he can be really successful in any. The well-trained biologist today must have more than a smattering of chemistry; he must know something of physics and mathematics. He must know the analysis of organic matter, he must have some knowledge of complicated photographic and microscopic processes, and statistical operations must be no mystery. Hence, to curricula in biology, much is essential which must be borrowed from other subjects.

This increasing complexity is by no means limited to the sciences; it is true of almost every field. Art, for example, has been affected by studies as diverse as psychology and optics. Speech has incorporated both physiology and physics into its subject matter. Statistics has imposed itself as virtually a requirement in every social study; and psychology, while borrowing more from neighbors than perhaps any other field, has returned its borrowings just as generously. Anyone who wishes to understand what has been happening to curricula in higher education must understand that they have grown not merely in size; they have been transformed in content.

GROWTH OF RESEARCH

While the growth of curricula in higher education is an awesome phenomenon and might profitably be reported in detail, it is less the immediate purpose here to describe it than to understand and to interpret it. What accounts for the exuberance of such growth and what are some of its educational effects?

It has been pointed out that curricula grow primarily by the expansion of knowledge and by the necessity to make our knowledge serve new purposes. A number of factors of varying significance contribute to this process. One of the most important of these is the growth of research as a preoccupation of higher education. Of course the teacher or scholar has always regarded it his responsibility to add to the sum total of knowledge, but never before has there been anything like the devotion of time, energy, and money which is now being given to research. Research activities in our colleges and universities have reached almost feverish proportions, with marked effect upon curricula development. To be a "productive" scholar has become an essential part of the academic pattern of success, and one of the most efficient ways of accomplishing this is to make teaching and research coincide as nearly as possible. Consequently a faculty preoccupied with research tends to add courses and seminars to curricula which represent research interests perhaps more than they represent instructional necessities. Graduate students are frequently encouraged to share with the faculty in co-operative research as early as their training will allow, and the curricula grow by the addition of these highly specialized activities.

To the normal interests of the faculties in research, there has been added recently the terrific pressure of research to be done under contract or grants for the federal government or for industry. Such research has proved exciting, sometimes because of its intrinsic nature, sometimes because of the financial assistance it has provided either to faculty members directly or to institutions. The sheer volume of research activity, together with the development of a broader range of subject matter now regarded as proper for investigation, has had great effects upon the development of curricula.

PASSION FOR TEACHING

A second factor contributing to curricula growth is the passion of American higher education for teaching. While there is always some grumbling about heavy teaching loads, the fact remains that the average college teacher

looks upon "working up" a new course as an intellectual challenge. It is almost as if our colleges held the view that whatever is known must be taught and that any omission from the curriculum is consequently a dereliction of duty. When this point of view of faculties and of institutions is coupled with the conditioning of students by the time they reach college that nothing can be learned except in a course, the result is a powerful stimulant to the addition of new courses.

PREPARATORY SCHOOLING

Another factor which has added to the size of curricula is the accommodation which higher education has been compelled to make to the changing pattern of college preparation. The high schools have become far more than college preparatory schools (there are those who charge that they have, in fact, ceased to be such), and this has forced upon the colleges and universities the necessity for providing a larger amount of beginning work, especially in mathematics, sciences, and languages. Students now entering college bring with them a greater variety of preparation in quantity and quality than ever before and to accommodate this variety of preparation higher education has been compelled to develop not only more elementary work but more advanced courses which recognize diversity of backgrounds. Chemistry, for example, must provide beginning courses for those who have not had chemistry in high school as well as for those who have, and the number and shape of advanced courses are also likely to be affected by that fact.

COMPETITION

Another pressure for the expansion of curricula is institutional competition. "Keeping up with the Joneses," educationally speaking, is by no means wholly bad. In fact, it may be quite the contrary, but it does have the effect of adding new segments to curricula. The competition for the best students and staff, in which all institutions are engaged, can frequently turn on the opportunities offered for the expression of individual interests—a wide variety of studies for the student, of fields of instruction and research for the faculty member. Hence, every institution attempts to provide, within the means at its disposal, as great a number of such opportunities as possible. The establishment of an "institute" by one institution is promptly followed by the establishment of similar institutes by others. Even the addition of a piece of specialized equipment, an electron microscope or a synchrotron, or the acquisition of a specialized library may lead to new courses, seminars, or research enterprises. Institutional prestige and esteem are, in part, established by such evidences of vigor and originality revealed in new enterprises and curricula, and there are few institutions which do not find it wise to try to keep up with the parade.

OUTSIDE PRESSURES

Finally, there is a whole set of pressures originating outside the campus which tend to widen the curricula of higher education. Among these are the growth of adult education, advanced training for specialized professional groups, services to the armed forces, both in research and training, and services to industry. All of these have been impressive developments of the past few years. Indeed, they have added new dimensions to the whole of higher education. The passion for "upgrading" in teaching and in government service has attached itself largely to the colleges and universities, while the professional schools of medicine, business, law, and engineering have been called upon to devise ways—short courses, institutes, conferences—which would make available to the practicing professions the latest in educational developments.

"EDUCATION" FOR THE UNDERGRADUATE

One cannot possibly explore in brief compass all of the ramifications of the tremendous expansion of curricula in the colleges and universities, but there are some questions resulting from the expansion which are insistent. One of these is the question as to how from all this welter of proffered knowledge the undergraduate is to get an "education." This question, of course, assumes that there is something "central" to a college education and that the colleges and the students should undertake to find it. With the expansion of curricula, with the limitations of time facing the student, with the increasing specialization in all fields and the resulting fractionation of courses, the identification of something "central" in an education is becoming increasingly difficult. There is a growing skepticism as to the view that everything in the curriculum is born free and equal in educational value for students or faculty and a growing conviction that it is time a new conception of educational management should be developed as an offset to the sovereignty of the "free elective" system. The general education movement has its origin in this problem.

INSTITUTIONAL RESOURCES

A second consequence of the continuous expansion of curricula is the tax which it places upon the resources of an institution in money and in personnel. The quality of the educational result is likely to suffer by the very effort to do too much, and the attempt to include all manner of activities in the curricula of higher education is to blunt the sense of discrimination as to what has prior claims upon its resources. There appears to be a strong tendency to regard all activities carried on in the name of higher education as equal in their claims for attention, merely because they are all associated in the same institution. The overexpansion of curricula can result in the inclusion of the trivial with the important, and can also create the danger that there will be no distinction made between them. The overtaxing of the staff and finances of higher education by undertaking too many new things or things which might better not be undertaken at all can reduce educational effectiveness in everything.

IMPROBABILITY OF CONTROL

If one assumes that the growth of curricula should be controlled and directed, the question naturally arises as to whether it can be. Possibilities for control will arise from two major sources. The first of these is a philosophy of education and the second, the institutional resources of money and personnel. However, the current philosophy of American higher education will place few restraints upon the expansion of curricula, and there is little to be expected from this source. Our institutions of higher education are governed by a spirit of service which extends to almost every type of activity in which educational institutions can be useful. Indeed, the very variety of these activities threatens to transform colleges and universities from educational institutions, in the traditional sense of the phrase, into general public-service institutions. Our prevailing educational philosophy actually encourages rather than represses curricula expansion.

If limitations are to be made, they will then arise chiefly from limitations of budget and personnel, but even these are only temporarily effective. It is true that most institutions are constantly faced with limits of money and

staff, but when this is the case, such being the philosophy of service which characterizes American higher education, it becomes the duty of administrators in charge to secure the resources of money and staff in order to provide the "services" which the institution, presumably, should perform. To ask American colleges and universities to limit their curricula is to ask them to govern themselves by a different philosophy from that which prevails, and virtually to become institutions different in character from what they now are. So long as American colleges and universities serve the variety of purposes they now serve, they will continue eagerly to add to their ever growing curricula.

Harold W. Stoke, Ph.D., Seattle, Washington, is dean of the Graduate School of the University of Washington. He has served as professor of political science at the Universities of Nebraska and Wisconsin and was, for brief periods, engaged in government service in the Tennessee Valley Authority and in the Bureau of the Budget. He served as president of the University of New Hampshire from 1944 to 1947 and as president of Louisiana State University from 1947 to 1951. He is the author of a number of books and articles in political science and has contributed to numerous educational publications.

Dr. Stoke will become dean of the Graduate School of Arts and Sciences of New York University in the autumn of 1955.

The Accreditation Problem

By FRED O. PINKHAM

IN its simplest mechanical form, accrediting[1] is the process of setting standards for educational institutions, judging the institutions in light of those standards, and publishing a list of the institutions and programs which are judged to comply satisfactorily with the criteria.

Accrediting serves many masters, and its nature varies a little with the motives of the members of the group employing it. There are voluntary collegiate organizations, such as the six Regional Accrediting Associations, that are made up of virtually all nonprofit institutions in their respective areas. There are organizations of specialized schools, such as the American Association of Collegiate Schools of Business. There are organizations of specialists in some form of institutional management, such as Collegiate Registrars and Extension Directors. There are organizations of professional practitioners, such as the American Bar Association. There are combined councils and committees of educators and practitioners, as in the Engineers' Council for Professional Development, and there are dozens of quasi but none the less real accrediting bodies, such as the American Association of University Women, the magazine *Good Housekeeping*, honor societies, and church councils. In all, over one hundred agencies participate in some form of accreditation of colleges and universities. For some agencies, accrediting is the sole function. A few conduct accrediting as but one function among many organizational activities, while other groups merge accrediting with other services to such a degree that it is impossible to discover where accrediting ends and other services begin.

[1] There is no outstanding single reference in this field. Most of the significant records are in the form of minutes or verbatim records of meetings. The best library and reference source on the subject is located in the National Commission on Accrediting, George Washington University, Washington 6, D. C.

BEGINNINGS OF ACCREDITING

At the close of the nineteenth century, higher education in America was still an opportunity limited to the few, but its value as a steppingstone to bigger and better things was widely recognized. Since there were virtually no controls over higher institutions from "outside" forces, quality and content differed widely from college to college. The federal government, philanthropy, foreign countries, professional organizations, and the institutions themselves soon, and all about the same time, felt the need to identify the better colleges and universities.

As early as 1870 the United States Bureau of Education published a list of all colleges and universities authorized by the states to grant degrees. Thirty-five years later the Carnegie Foundation for the Advancement of Teaching, which has since sponsored research leading to the establishment of several accrediting programs, issued a list of educational institutions which had met certain quantitative criteria. As American students flocked to European universities, requests came to America for a "guide" to colleges and universities in this country which would enable foreign institutions to assess the educational records presented to them by visiting students.

As knowledge became more organized and specialized, and as the services of

the professions were more and more recognized and demanded, the need for supervision of practice and control of training increased immensely. Quack practitioners and fraudulent or low-standard schools were "fleecing" the public and misguiding well-meaning students. In the interest of public safety, and for the protection of honest practitioners, the professions, led by the American Medical Association, began "to clean house." Accrediting was their most effective tool.

As the American population became more mobile, it became increasingly important for students to be able to transfer from one institution to another. Colleges and universities which were banding into national and regional organizations for the purposes of mutual aid and protection were given further impetus to accredit by the difficulties inherent in exchange of students between institutions. For these associations of institutions, membership meant accreditation.

Thus accrediting came into the American scene as a natural development out of the needs of the times. It is important to note three significant factors about the birth of accrediting: (1) It was established voluntarily, not by government order; (2) the same process was begun from two sources simultaneously—by professions from without and by institutions from within higher education; and (3) accrediting by both types of organizations was the outgrowth of genuine and sincere efforts to answer serious problems of the times.

BENEFITS FROM ACCREDITING

The benefits to be derived from accrediting vary with the type of agency. Professional organizations speak more of professional benefits to graduates. Associations of institutions speak more of institutional improvements. The key benefits cited by accrediting agencies are:

1. Assurance and recognition that the institution meets or exceeds minimum standards, thus facilitating exchange of students, selection of institutions, and prediction of capabilities of graduates.
2. Institutional self-evaluation; exchange of ideas and information and other items of mutual concern.
3. Direct assistance to the institution by experts from the national office of the accrediting agency.
4. Privileges to graduates in the profession.

EDUCATORS' OBJECTIONS

That accrediting was effective cannot be denied. The history of the medical profession in America stands as undisputable proof. However, from the start, educators whose institutions were undergoing accreditation saw the undesirable by-products of the system. A simple process became a scheme by which a national organization, in the name of protecting and serving the public, restricted its membership and limited its recognition to institutions complying with prescribed standards. On-the-spot inspections were made, and a list of the approved institutions was given national distribution. Thus a select group of institutions which maintained programs and conducted procedures outlined by the agency was identified. Institutions offering something less than or different from prescribed requirements or otherwise judged unqualified were labeled inferior by implication, and the public was encouraged to avoid them and their graduates. Effective penalties—pressures which prevented graduates from receiving such benefits as license to practice, employment, advancement, and membership in professional societies—were invoked against those institutions not "voluntarily" complying with the standards or

inviting inspection. Used in this way, accrediting became a powerful device for protecting and promoting a selected group. Further, since the standards applied were the same for all institutions, the threat of overstandardization loomed in the minds of those educators who knew how essential diversity is in American democracy.

Once the precedent for control of colleges by "outside" groups had been established, and once those groups had learned the effectiveness of accrediting in eliminating competition, and in bringing about professional unity, control, public recognition, and special privilege, accrediting became the order of the day for all major professional organizations.

Association protests

Immediately, educators raised their voices in a chorus of criticism and alarm. They spoke out against the "evil tide" of accrediting. In 1924 the National Association of State Universities set up a special committee to formalize and publicize the sentiment of its members against accrediting. The charge given the committee, as quoted from unpublished minutes of the Association, states:

> The National Association of State Universities has viewed with increasing concern the rapid increase in the number and variety of organizations which have undertaken to standardize procedures and policies in one or another branch of higher education. Not only does it feel that actions in matters vitally affecting the policies of state institutions have too often been taken by such organizations without sufficient provision for consultation with the institutions concerned, but it is further of the opinion that the movement toward standardization in higher education in America, while it has accomplished great good, is assuming such a character as seriously to limit both local initiative and that freedom of experimentation which is necessary for educational advance.

Other institutional agencies expressed their concern over the same situation, and, one by one, joined forces with the NASU. By 1949 the Association of Land-Grant Colleges, the Association of Urban Universities, the Association of American Universities, and the Association of American Colleges had formed a joint committee to control the impact of accrediting upon higher education.

Chief complaints

Chief among the educators' complaints were these: [2]

There are too many accrediting agencies. Practically every organization formed to promote a specialized interest in higher education has turned to accrediting as the basis for its operation. When asked to name the agencies which brought this process to their campuses, college presidents listed over two hundred organizations. There were as many as six agencies seeking to set standards and to accredit the same specialized segment of higher education.

Understandably, an "outside" agency is primarily concerned with only one particular segment of an institution. Typically, little concern is shown for the institution as a whole. Little attempt is made to view the segment in the perspective of the total institution. Thus, there may be found as many as a dozen groups arriving on the campus of a complex institution on a dozen different occasions, each making demands for special consideration with little regard for the objectives or stability of the institution as a whole.

Most of the professional accrediting agencies manage to back their demands with state licensing laws, grants of

[2] National Commission on Accrediting, Unpublished Report, George Washington University, Washington 6, D. C.

money, blacklisting, discriminatory hiring practices, and other inducements, including prejudicial treatment of alumni. These are the things which put teeth into accrediting, and all of them are beyond the control of the individual college. Thus it is that local autonomy and freedom to experiment and to be different, the most vital essentials in our democratic system of education, are being usurped by unseen pressures which institutions themselves are often forced to support through annual fees and dues.

In their attempts to control a certain portion of higher education, namely, that part which provides the immediate training of their potential members, organizations draw up criteria or standards which deal with curricula, staff, facilities, administration, textbooks, and so forth. These standards include matters of administration which properly should remain within the authority and responsibility of the constituted governing body of the institution. Items such as salary, hiring practices, faculty code, grading systems, and retirement plans rightly belong within the province of local faculty and staff—not within that of national special field organizations. Division of authority and responsibility tears administration apart and threatens the very existence of good institutions. Further, arbitrary application of fixed national standards to institutions serving different constituencies and purposes works against the basic tenets of the democratic ideal.

In the flood of questionnaires which precede accreditation, the same information is sought by each accrediting agency. But each agency requires its data in a different form and order. Some large universities keep a man occupied full time in collecting, arranging, and rearranging data for accrediting agencies. Much of the material which must be provided bears little demonstrable relationship to the real quality of education being provided by the faculty of an institution. There is a place for quantitative information. However, important as such details are, the real worth of an educational institution will not be found in the cubic feet of space per student, the number of picture slides, the salary of secretaries, the purity of drinking water, or fireproofing of file cabinets.

In the effort to raise standards, professional organizations frequently concentrate upon minimum standards and minimum requirements. Their time and energies are drawn to the institution which is trying to reach the minimum level. This has two unhappy consequences: (1) it tends to standardize educational programs, and (2) it fails to provide stimulation and assistance to all institutions. That is, accrediting tends to become a police function, an inspection rather than a consultation. It becomes a mechanical process of checking to see that all institutions maintain the minimum standards rather than a constructive process of helping all institutions to improve beyond their current level of achievement.

Accrediting forces institutions to adopt objectives derived nationally by national organizations. Evaluation of an institution is usually made in terms of what a specialized national agency says the college ought to do rather than in terms of what the institution itself purports to do. Institutions are gradually being shaped by national codes. Individuality, diversity, and local autonomy —the very sources of strength in higher education in America—are being lost through accrediting designed to promote national professional groups. All educators want to help the professions to improve, but higher education must not be sold out in the process.

With ever increasing specialization and standardization in the scientific world, increasing demands are made for

larger portions of curriculum time to be devoted to professional-technical training. These demands are backed through accrediting by strong national accrediting organizations. General or liberal education, quite properly, is not supported by agencies which can coerce colleges into offering specific courses and sequences. Thus, the flanks of general education are vulnerable to attack by professional studies hungry for more curriculum space. It must be said that there is a growing desire for more general education on the part of many professional people. But in trying to fix the point of balance between technical and general education, accrediting is too often used to add weight only on the technical side.

Accrediting costs too much. Although several agencies make no direct charges to institutions for their services, enough do to make the cost burdensome. The returns to the institution from accrediting do not warrant the cost involved. Moreover, legalists do not agree that state tax dollars or private donations should be used to support national agencies over which the contributing institutions have no control and in the budgeting of whose funds they often have no voice.

In spite of the objections raised by educators, these conditions persisted. Accrediting had proven too useful to be abandoned.

PARADOX AND AMBIVALENCE

Accrediting is inextricably ingrained in higher education. Its growth has been undisciplined for half a century, and it has found its way much deeper into the heart of American education than most people realize. As in other branches of society, there has been a trend in the professions toward increasing centralization of administration and control, toward systemization of license, and toward standardization of preparation. How much the nation's progress has been the cause of this centralization and standardization, how much the result, or how much has been achieved in spite of this general trend is difficult to discern. Higher education, in any case, has had its part in this trend of the times.

It is not that the professions do not understand the educator's point of view. The situation is not a simple case of the lion and the lamb. The true difficulty lies within the American custom of looking to "voluntary" agencies for advice about purchasing, and within the nature of accrediting itself. Just as Americans look for the Duncan Hines, AAA (American Automobile Association), Underwriters, Good Housekeeping, Consumers' Research, and other seals of approval, so they look for seals of approval for colleges. Just as businessmen know that such seals attract customers, so colleges and university administrators know that accreditation attracts students. Thus, educators are faced with a paradoxical and ambivalent situation.

The university president may show real concern over the inroads upon his administrative powers made by powerful professional agencies but, at the same time, point with pride to the fact that his institution is fully accredited by all appropriate professional organizations.

The college dean may express alarm over the degree to which a professional organization is imposing a standardized curriculum upon his school and, at the same time, point with pride to the backing he received from the same organization in his efforts to secure much needed financial allotments from his institution's budget committee.

The faculty member may be disturbed by minute curricular requirements imposed by a certain professional agency but, at the same time, happily

accept an increase in salary demanded of his institution's administration by the same agency.

The graduate of a nonaccredited institution becomes irate when he finds himself deprived of certain privileges given to graduates of accredited institutions if he "knows" that his training is superior to that of a fellow worker who graduated from an accredited institution.

Transfer students show despair when they find that a fully accredited institution will not accept at full value the credits earned at another institution which is also fully accredited by the same accrediting agencies.

It is possible to find evidence to support almost any claim, for or against accrediting. Although accrediting has accomplished much, it has left greater problems in its wake. Although it may mean a great deal on a national scale, for the individual student it may mean nothing. What he gets out of his college experience may be controlled by factors wholly unrelated to the accredited status of the institution he is attending.

National Commission on Accrediting

In spite of these conditions, the voices of educators were without effect until the formation of the National Commission on Accrediting.

The Commission has seven constituent associations in its membership. These are the Association of American Colleges, Association of American Universities, Association of Land-Grant Colleges and Universities, Association of Urban Universities, National Association of State Universities, Association of Teacher Education Institutions, and American Association of Junior Colleges. The six Regional Associations are not members of the Commission. No accrediting body is a member of the Commission, and membership in the Commission has no direct bearing upon the accredited status of an institution.

Each of these seven constituent associations has elected six members to sit on the executive body of the Commission. Each association replaces two of its six representatives each year as part of a rotating membership plan.

To broaden the base for study and service and to provide a means for financial support, institutional membership in the Commission is extended to institutions holding membership in any one of the constituent associations. There are now approximately one thousand institutional members in the Commission, making it the largest organization representing institutions of higher education in the country.

The National Commission on Accrediting should not be confused with the National Committee of Regional Accrediting Associations. The latter group came into being prior to the Commission as a result of earlier studies of accrediting problems by the American Council on Education. The NCRAA is a committee composed of two representatives from each Regional Association. There are no other national committees or associations of the Commission's type representing institutions of higher education for the purpose of solving accrediting problems.

The Commission's declaration

The preamble of the constitution of the Commission is an important declaration in higher education. It states that the strength of higher education in America derives in large part from the unique and diversified contributions of individual colleges and universities. It claims that this strength can be maintained and extended only if institutions are free to set their own objectives and to experiment in the ways and means of education. It holds that institutions of higher learning must be free to exercise both responsibility and authority in administering their programs. Believing these things, and seeing them threatened by accrediting as it now operates, the colleges created the Commission and gave it the mandate to study the accrediting situation and to devise a plan which will preserve and strengthen what good there may be in accrediting while eliminating the evil or destructive features.

The Commission met with all of the important accrediting agencies and conducted many studies in the field. It soon became clear to all who saw the record that some form of control and co-ordination was needed if accrediting was going to help rather than hinder higher education.

Statement of principles

Following a careful study of all facets of the situation, the Commission issued the following statement of principles: [3]

1. Historically, accrediting has contributed much good to higher education and, properly handled, it can and should continue to be a constructive force for improvement in higher education.

2. If accrediting is to be of most worth, it must be made to serve and strengthen the best interests of all higher education. No one program within an institution should be promoted at the expense of institutional stability and in spite of institutional objectives. No one educational field should be promoted nationally through accrediting at the expense of other equally legitimate educational programs.

3. Colleges and universities should be the responsible and supervising authority for evaluation of higher educational institutions.

4. Channels through which the counsel and suggestions of the professions and employers of graduates can continually reach the institutions should be maintained.

5. Accreditation costs and the number of visitations should be reduced. For accrediting purposes, not more than one organization should represent a field of training.

6. Improvement of higher education in all its parts is best achieved when based upon thorough self-evaluation prior to examination by outside specialists.

7. Institution-wide aims and responsibilities should be given primary concern, and evaluations should be concerned with the institution as a whole as well as with its various segments.

8. Evaluation of an institution should be based upon the aims and objectives of the institution and should emphasize qualitative as well as quantitative features.

9. Accrediting should not be limited to an inspection of a segment of an institution with a view to imposing upon and measuring that segment in terms of national, arbitrarily applied standards. Accrediting should be, rather, an educational enterprise, the major aim of which is to stimulate institutional growth and development through self-evaluation and expert assistance primarily conditioned by what the institution is trying to do.

[3] National Commission on Accrediting, Mimeographed Report, 1953. George Washington University, Washington 6, D. C.

The Commission's plan

The Commission's plan is primarily a scheme for bringing together the various parties concerned in order that policies and procedures can be developed in the best interests of all. Recognizing the need for administrative control, but not wanting centralization under a federal agency, the Commission turned to the six voluntary Regional Accrediting Associations. Although the Regionals were known to be relatively "weak" compared to the tightly controlled professional agencies, and although they varied greatly in their readiness to handle an expanded role in accrediting, the Commission believed they offered more potential in administrative organization and philosophy than any other available group. Through the National Commit-

tee of Regional Accrediting Associations, the Commission asked the Regionals if they would be willing to accept the responsibility for supervising all accrediting in their respective areas. The responsibility was accepted and a set of guiding principles drawn up.

The national professional organizations, representing the various fields in which institutions of higher learning maintain educational programs, have been asked to join with the Regional Associations in developing standards and criteria, in eliminating duplication, and in evaluating institutions. Under this plan, each institution is to be evaluated as a whole institution, but each part is to receive the benefits of traditional "segmental" evaluation (experts in legal education evaluate the law school, experts in medical education assess the medical program, et cetera). That is, the evaluators, representing the various professional agencies concerned, act as a team studying each part in its relation to other parts and in the perspective of the whole institution. Under the direction of the Regional Association, duplication of effort in evaluation is removed and institution-wide policies, procedures, and objectives are given proper concern. Professional agencies issue their own lists and the Regional Associations publish their lists of institutions approved on an institution-wide basis.

Recent Changes

During the last three years certain changes have taken place, primarily as a result of the Commission's work.

Attention has been called to the chaotic accrediting situation, and people are now alert to it and are thinking about it. Practically every educational and professional organization is putting forth effort to understand the problem and to do what it can to help. At the suggestion of the Commission, a faculty committee to receive, study, and advise on accrediting problems has been set up in nearly every college and university in the country. These committees are proving very helpful in promulgating an understanding of the problems and remedies in accrediting which involve faculties, and in bringing various faculties together to discuss institutional problems and to look at their own particular fields of learning in the perspective of all higher learning.

Institutions have renewed their interests in Regional Associations and are taking measures to strengthen the Regionals as service organizations of immediate use to them.

The increased responsibilities for the Regional Associations require many basic constitutional and procedural changes. The necessary legislation is being or has been enacted in each Regional. With the assistance of the National Commission on Accrediting and the National Committee of Regional Accrediting Associations, a set of fourteen guiding principles for the establishment of comprehensive evaluation procedure has been adopted.

To date, written working agreements have been made between one or more Regional and twenty-two major accrediting agencies representing over seventy-five professional organizations and 1,441 institutions. Generally, the co-operative arrangements provide for joint study and planning, combined evaluation visits, and exchange of confidential information. In some instances, questionnaires have been drastically reduced and combined into one simplified single document. The working conferences between the Regional Associations and professional agencies are having a quiet but profound effect upon accrediting philosophies, policies, and practices.

Several experimental institution-wide team evaluations have been conducted. Techniques are improving with each undertaking. Where these have occurred, institutional, Regional, and professional personnel who participated acclaim the values received. They state that the new type of accrediting offers much more than was possible under traditional accrediting.

Many organizations wishing to enter the accrediting picture for the first time have been deterred. In order that for accrediting purposes a single unified voice might represent a single field to higher education, numerous organizations which were formerly competitors have joined in the formation of single representative councils or committees.

At present, the whole field of accrediting is in a state of change. Regional and professional organizations are experimenting in joint activities. Differences among parties of apparently incompatible points of view concerning the control of accrediting are gradually being set aside in genuine efforts to collect facts, explore proposed solutions, and bring about improved practice wherever possible.

As a "force" stimulating the reconsideration of educational philosophies, devices, and systems designed to control higher education through accrediting, the Commission has identified and explored many basic issues and problems attending upon all areas of higher education. In the study, planning, and carrying out of a co-operative evaluation of higher education, a wide variety of viewpoints and experience has been brought together and machinery for co-operative democratic action set in motion. These contacts continue to bring into sharp focus the nature of competing motives, philosophies, and techniques. Perhaps the greatest benefit thus far obtained from all the negotiations and joint visits stems from the exchange of ideas and sharing of experience in all fields of higher education. Whether in local faculty meetings or in national conferences, the give and take among thinking people has done much to improve accrediting and higher education.

The National Commission on Accrediting has made its mark, but its task is by no means finished. Very basic problems remain untouched and unsolved.

Basic Issues

Essentially, accrediting is an evaluative process. It presupposes certain objectives and criteria in terms of which higher education is assessed and toward which it is guided or coerced. By its very nature, accrediting rests upon the preconceived notions and assumptions of the accreditors.

There being no clear-cut definition of higher education, it falls to the accreditors to set the limits and point the way. Thus, one group may view a university as an arrangement for expediting administration of autonomous faculties, while another group may view a university as an institution which has purposes and values greater than those of its parts. Most professional agencies operate from the first premise. Associations of institutions, such as the Regional Accrediting Associations, operate from the second. Should each department and professional school be evaluated *in vacuo* in terms of its own objectives? Or should the whole institution be evaluated in terms of the broader aims and functions of the institution as a whole? Both? Suppose the department is backed by a powerful national agency which can bring pressure upon the institution sufficient to warp the entire budget and program in its favor? This is often the case. When the two conflict, which shall take precedence?

Who is going to define and lead higher education? Unless educators come to the front in the accrediting struggle, higher education may be torn apart by shortsighted specialists.

To what extent should a group of people banded in promotion of a common social good (medicine, law, dentistry, teacher education) be allowed to give direction and movement to that good through various forms of pressure upon society? Where does healthy persuasion end and coercion begin? Where does social interest end and self-interest begin? The first important act of the newly formed accrediting agency in teacher education, the National Council for Accreditation of Teacher Education, was to sign an agreement with the National Council of Chief State School Officers. This agreement calls for recognition by all states of certified teachers graduated from institutions which have been accredited by the NCATE. This is a move in the direction of placing control of all teacher education under one national accrediting agency. The implications of the move are immediately clear to the student of democracy. Yet why should it not be allowed in teacher education when national control is already a fact in medicine, law, veterinary medicine, dentistry, and other fields? Each year more state legislatures under pressure from professional agencies are passing regulations requiring graduation from professionally accredited schools as prerequisite for license to practice.

Control through accrediting by "outside" groups tightens about higher education in much the same way that the rise in cost of living squeezes the value out of the dollar. If higher institutions in America are going to remain free wellsprings of intellectual leadership, the basic issues and alarming conditions underlying accrediting must be resolved.

The Association of American Universities stated last year in instructions to its representatives on the National Commission on Accrediting that higher education in the United States has reached a degree of organization and maturity entitling it to a much freer hand in exercising self-direction and self-discipline.[4] This declaration reflects the thinking of present-day educational leaders. But it is clear that the desired freedom will be achieved only under dynamic, wise, patient, and inspired leadership. Our American democracy is not yet sure just how free and autonomous its "free" institutions shall be. It will be up to the educators to develop a plan of self-discipline which will replace the accrediting controls by "outside" groups.

No other country in the world has a similar system of voluntary accreditation. Although the federal Office of Education comes closer to a policy role in education each day, few thinking educators want government control of colleges and universities. Has the day come for higher education to take a stand for freedom? Can it bear the responsibilities that go with freedom? Is not the accrediting problem the crucial problem of higher education? Is it not the process of defining democracy itself? From whence shall come our leadership?

Fred O. Pinkham, Ed.D., Ripon, Wisconsin, is president of Ripon College. He was formerly assistant to the president of George Washington University in Washington, D. C., and for five years executive secretary of the National Commission on Accrediting. His addresses and articles have appeared in publications of national, regional, and state educational and professional organizations.

Academic Freedom: A Decade of Challenge and Clarification

By HARRY D. GIDEONSE

THERE is," says Sidney Hook, "more sloppy rhetoric poured out per page about academic freedom both by those who believe they are supporting, and those intent on criticizing it, than on any other theme with the possible exception of democracy."[1] Another generation has discovered for itself that freedom is not inherited as a youth acquires property rights in a house from his parents. Freedom can only be inherited in the sense that every succeeding generation has the opportunity to hammer out for itself, on the anvil of its own experience, the framework of unavoidably interwoven rights and responsibilities within which freedom in the sense of self-expression and freedom in the sense of self-control can be for such a generation a working faith.

ORTHODOX CASES OF ACADEMIC FREEDOM

In recent years we have, of course, had our normal quota of orthodox academic-freedom issues, cases in which a teacher is dismissed because he addresses a Wallace-for-President meeting, or in which a trustee interested in dairy farming argues that a campus supporter of the removal of fiscal handicaps for oleomargarine is unfit to serve a state university. There have not been more issues of this type than in any other decade if the reports of the American Association of University Professors are a trustworthy guide, and even a valiant and responsible spirit of professional self-policing could hardly be expected to eliminate these altogether in our sprawling system of higher education with its decentralized and varied controls. Our preoccupation with the issues—false and real—of Communism in education has even tended to promote underemphasis, in recent years, of a few startling abuses of academic freedom of the vulgar variety.

One of the many merits of Russell Kirk's "essay in definition," entitled *Academic Freedom,* lies in the balanced discussion of the two "most shocking" cases of the violation of academic freedom in recent years, that is to say the effort to impose the views of professional "educators" upon the rest of the faculty by President Minard W. Stout of the University of Nevada in the so-called Richardson case in 1953, and Chancellor Hutchins' removal on less than a day's notice—in the fall of 1950—of Mr. W. T. Couch as director of the University of Chicago Press.[2] The feeble and belated intervention of the American Association of University Professors in these cases may itself have been due to the Association's preoccupation with the issues presented by membership, past or present, in the Communist party. It is not without interest that the national officers of the organization did not take a hand in the Nevada case until it appeared that some members of the Board of Regents might attempt, without any foundation whatsoever, to insinuate that there was

[2] Russell Kirk, *Academic Freedom* (Chicago: Henry Regnery Company, 1955); cf. Chap. II (on President Stout) and Chap. III (on Chancellor Hutchins).

a "Communist" or "fellow traveler" angle to the case.

There is nothing new about the "orthodox" cases of academic freedom in recent years. Arthur O. Lovejoy's authoritative article on academic freedom in the *Encyclopaedia of the Social Sciences* and an able summarizing article on "Academic Freedom" in THE ANNALS of November 1938 [3] by Henry W. Tyler and Edward P. Cheyney can still be cited as the best sources for historical and philosophical documentation, with appropriate stress upon the valuable and creative role of the American Association of University Professors in the formative years.

NEW ISSUES

The new issues in academic freedom arising from membership in the Communist party came to the fore in the late thirties in New York City, and they received their earliest formulation in connection with the Rapp-Coudert investigation of public education in New York City from 1940 to 1943.[4] To the country as a whole these remained "special New York City" issues until the University of Washington dismissed several professors in 1949 on the ground that they were guilty *as members of the Communist party* of violating the principles of academic freedom and therefore of "conduct unbecoming a teacher." [5] The classical formulations of the principles of academic freedom by the American Association of University Professors contemplated no such development. Neither the 1925 nor the 1940 "statement of principles" [6] foresaw a hazard to academic freedom in the ideological commitments of the teachers themselves. They speak of the university or the college as the party that "may not place any restraint upon the teacher's freedom of investigation" or "impose any limitation upon the teacher's freedom in the exposition of his own subject in the classroom or in addresses and publications outside the college."

It is true that the 1940 "statement of principles" postulates that the "common good" of institutions of higher learning depends "upon the free search for truth and its free exposition," and recent experience has demonstrated with tragic emphasis that political organizations as well as the federal government itself may place more effective restraints or limitations upon the teacher's freedom of investigation or his freedom of exposition than were ever contemplated by colleges or universities themselves.

The struggle for academic freedom takes a new form as the intellectual, ideological, and cultural landscape changes. The essence of the tradition must be restated and redefined by every generation in the light of current facts, current challenges, and current abuses. Those who live in an atmosphere that is comparatively static will abide by the received verbal formulations. Those who live in a climate of opinion deeply affected by new developments—such as, say, in the modern scene, a university with a real experience with Communist infiltration or a large number of teachers in the physical sciences affected by federal security regulations—will find little help in a parrotlike repetition of the old words and phrases. If they are to be a living chart—and not an empty verbal shell covering an alien content—

[3] Vol. 200, pp. 102–18.

their meaning must be defined anew in the light of developing experience. In such a period of restatement and redefinition, it is inevitable that there will be an interval of confusion and even chaos arising from the differences in thought and emotion evoked by old and new verbal symbols, and only a process of sharing and analyzing the new experience will contribute to a basic clarification of the issues involved.[7]

CURRENT DEFINITIONS

After six years the initial storm of confused and essentially uninformed comment and discussion has settled down to a professional agreement that covers a remarkably wide area. In recent years authors who are as far apart in their basic philosophical views as Sidney Hook and Russell Kirk have arrived at a reasoned view of freedom under professional responsibilities in the face of the new challenge of totalitarian discipline of scholars that is in all essentials in agreement with the statement on "The Rights and Responsibilities of Universities and Their Faculties" unanimously adopted by the Association of American Universities in 1953.

Sidney Hook

It may serve a useful purpose to compare the definitions of academic freedom which have been formulated in the light of the new experience. Sidney Hook, who deserves a great deal of credit for the tenacity of purpose and the clarity of mind with which he has sought to make the general public as well as the academic profession understand the full meaning of the experience to which New York City was exposed earlier and more intensively than the country as a whole, develops the thesis that it is our moral obligation in a free society to tolerate dissent, no matter how heretical, and not to tolerate conspiracy, no matter how it may be camouflaged. He offers the following definition:

> What is academic freedom? Academic freedom is a specific kind of freedom. It is the freedom of professionally qualified persons to inquire, discover, publish and teach the truth as they see it in the field of their competence, without any control or authority except the control or authority of the rational methods by which truth is established. Insofar as it acknowledges intellectual discipline or restraint from a community, it is only from the community of qualified scholars which accepts the authority of rational inquiry.
>
> Like every other freedom, academic freedom, although it has an intrinsic value, is not absolute. It must be judged by its consequences on a whole cluster of other freedoms (values). The *justification* of academic freedom must therefore lie in its fruits.[8]

Russell Kirk

Russell Kirk, who offers a sympathetic and reasoned criticism of Hook's definition, accepts the definition of W. T. Couch that "academic freedom is the principle designed to protect the teacher from hazards that tend to prevent him from meeting his *obligations in the pursuit of truth*," [9] and then suggests that it should be anchored in a commitment, made in a spirit of dedication, not of suspicion,

> . . . to adhere to the Truth, according to the light that is given to the teacher; a promise to conserve the wisdom of our ancestors and to extend the empire of knowledge as best a teacher can; a promise to guide and

[7] For a detailed examination of the issues as they presented themselves after the University of Washington decision, cf. Harry D. Gideonse, "Changing Issues in Academic Freedom in the United States Today," *Proceedings of the American Philosophical Society*, Vol. 94, No. 2 (1950), pp. 91–104.

[8] Sidney Hook, *op. cit. supra* (note 1), p. 154.

awaken the student, but not to indoctrinate; a promise to abide by the principles of social order, as expressed in the country's constitution; and a promise always to put freedom of the mind above material advantage and the passions of the hour. What the Hippocratic oath is to the physician, such an oath ought to be to the teacher, and more; and no further oath ought to be required by any authority.[10]

Association of American Universities

Some of the key paragraphs of the unanimous statement of the Association of American Universities reflect both the consensus of professional opinion—unchallenged by any responsible governmental authority—and the nature of some of the problems inside and outside of the profession itself. After a statement of the "unique" role of the modern American university, the defining paragraphs read as follows:

A university must . . . be hospitable to an infinite variety of skills and viewpoints, relying upon open competition among them as the surest safeguard of truth. Its whole spirit requires investigation, criticism and presentation of ideas in an atmosphere of freedom and mutual confidence. This is the real meaning of "academic" freedom. It is essential to the achievement of its ends that the faculty of a university be guaranteed this freedom by its governing board, and that the reasons for the guarantee be understood by the public. To enjoin uniformity of outlook upon a university faculty would put a stop to learning at the source. To censor individual faculty members would put a stop to learning at its outlet. . . .

Timidity must not lead the scholar to stand silent when he ought to speak, particularly in the field of his competence. In matters of conscience and when he has truth to proclaim the scholar has no obligation to be silent in the face of popular disapproval. Some of the great passages in the history of truth have involved the open challenge of popular prejudice in times of tension such as those in which we live. . . .

Appointment to a university position and retention after appointment require not only professional competence but involve the affirmative obligation of being diligent and loyal in citizenship. Above all, a scholar must have integrity and independence. This renders impossible adherence to such a regime as that of Russia and its satellites. No person who accepts or advocates such principles and methods has any place in a university. Since present membership in the Communist party requires the acceptance of these principles and methods, such membership extinguishes the right to a university position. . . .

"Academic freedom" is not a shield for those who break the law. Universities must cooperate fully with law-enforcement officers whose duty requires them to prosecute those charged with offenses. Under a well-established American principle, their innocence is to be assumed until they have been convicted, under due process, in a court of proper jurisdiction.

Unless a faculty member violates a law, however, his discipline or discharge is a university responsibility and should not be assumed by political authority. Discipline on the basis of irresponsible accusations or suspicion can never be condoned. It is as damaging to the public welfare as it is to academic integrity. The university is competent to establish a tribunal to determine the facts and fairly judge the nature and degree of any trespass upon academic integrity, as well as to determine the penalty such trespass merits.[11]

Hazards of political discipline

The stress in all these definitions on key words such as "truth," "conscience," and the "discipline of the community of scholars" springs from the new awareness of the hazard to free scholarship that may be inherent in the acceptance by individual teachers of political discipline in matters of learning

[10] *Ibid.*, p. 153.

[11] These paragraphs are excerpts from the full statement as quoted in the *New York Times*, March 31, 1953.

and academic organization. Thus the national clarification of standards and values arrived at a conclusion which matched the decision of the New School for Social Research in New York City in its adoption of a bylaw many years ago stating that "no member of the faculty may be a member of any political party or group which presumes to dictate in matters of science or scientific opinion."[12] This is a reflection of a new tough-minded liberalism which refuses to permit the destruction of free institutions by their totalitarian abuse, and it is morally rooted in the acceptance of the ideal of the search for truth as the evidence and your conscience may teach you to see it, not as a political party or ideological discipline may force you to twist it.

COMMUNIST PARTY MEMBERSHIP

The significance of the new formulation of academic freedom is its insistence that fitness to teach must be decided primarily on intellectual and educational rather than on political grounds, and that membership in the Communist party is relevant because of its educational and intellectual, rather than its political, implications. There is no issue concerning teaching about Communism or about Communist ideas—every student in a free society should be exposed to their study and their criticism—and it is least of all a matter of fear of meeting such ideas in open discussion, since actual experience with members of the party who are members of a faculty reveals a deliberate and disciplined policy of concealing their identity and of teaching "at the least risk of exposure." The rejection of members of the Communist party as members of the teaching profession is not a matter of ideas but a question of professional *conduct*.

When the nature of the Communist party is understood—and even the carefully nurtured ignorance of some of our more extreme libertarians begins to yield to the wealth of evidence concerning the party's insistence that all members must "at *all* times take a position on *every* question that is in line with the policies of the party," that they must "display a thorough readiness to accept party discipline," and that inactive or "bad" members are expelled because they do not have "any latitude or discretion in the matter"—it becomes plain as a pikestaff that membership in the Communist party is *prima facie* evidence of *professional unfitness* to teach. Sidney Hook has summarized a large amount of the relevant evidence from party documents, official hearings, espionage cases, and so forth.[13] It has taken sev-

[12] The effort to confuse the issue by comparing the disciplinary relation of the Communist party with its members to that of the Roman Catholic Church with its communicants is adequately analyzed by Sidney Hook (*op. cit. supra* [note 1], pp. 219–20). It is also discussed with great cogency in Ernest van den Haag's paper, "Academic Freedom and Its Defense," published in *Strengthening Education at All Levels*, Report of the Eighteenth Educational Conference sponsored by the Educational Records Bureau and the American Council on Education, Washington, D. C., 1954.

[13] Hook, *op. cit. supra* (note 1), Chaps. I, III, IX. The argument that professional competence should be based upon evidence "from the classroom" is, of course, an invitation to initiate the type of educational policing that is itself—and rightly so—the subject of the most acute "liberal" attack. Teachers who perjure themselves or who engage in scurrilous and anonymous libel of their colleagues are unfit for membership in the teaching profession, irrespective of their performance in the classroom or as practitioners of their scholarly specialty. In any case, Communists who attempt to conceal their membership in accordance with party instructions are likely to use the classroom to "spot" likely candidates for recruiting purposes who are then "solicited" later (and outside the classroom) by student leaders. Also, faculty members have other-than-classroom contacts with students, in guidance and in service on faculty committees. Cf. Hook, *op. cit.*, pp. 186 ff.

eral years for the evidence to convince some of our liberals, who are frequently more hostile to anti-Communists than they are to Communists, but it is now quite generally agreed that "membership" in the Communist party is not in any significant sense similar to membership in any other legal party.

To be a registered Republican or Democratic voter—which is presumably the meaning of "membership" in such a case—does not imply the assumption of iron discipline in executing the party leaders' orders even in intellectual matters as politically remote as biology, the history of philosophy, or the theory of music, whereas "membership" in the Communist party really means that the individual becomes the *agent* of the party—this is the phrase Lenin always used to describe "members"—in every field in which it is seeking instruments to achieve its power purpose. While excesses may have occurred under the doctrine of "guilt by association," it is misleading to speak of party membership in these terms, since this would be true of membership in the free society's sense of the term, whereas membership in the Stalinist sense means a dedicated commitment to accept the discipline of the group, *which is active co-operation and not association.*

There is no warrant, either, for the confusion of past and present membership in the Communist party, since the academic agencies have been as insistent upon the protection of the rights of teachers who proved the bona fide termination of their membership as have the senatorial investigators. Justice Douglas, in his dissent from the United States Supreme Court's decision declaring the New York State Feinberg Law constitutional, spoke of "the threat" of the New York City procedure as raising "havoc with academic freedom" because "youthful indiscretions" and "misguided enthusiasms" would "become the ghosts of a harrowing present." The law—and the procedures—make it very clear, however, that Justice Douglas' fears have no closer relation to the facts than his views as to the real nature of the Communist party.

CONFUSIONS

There has been a good deal of distressing evidence of abuse of intellectual freedom in the years of clarifying discussion and experience that have led up to the present emergence of a new consensus. In the exaltation of rights and the minimizing of responsibilities which have been so characteristic of free society in recent generations, it is possible for a distinguished professor of sociology in one of our major universities to tell the *New York Times* that "freedom is either unqualified or it does not exist"; it is possible for a distinguished professor of history to say that after a decade of incessant snooping only "two real live Communists" have been found in American colleges and universities, although evidence available to any newspaper reader would have told him of over a hundred such cases in his own city; and—to cite only one further example from a wealth of similar evidence of professional irresponsibility—it is possible for four distinguished academic personalities to sign a letter to the *New York Times* in which they speak of "faceless informers" who are used to convict New York City teachers of perjury although the record conclusively shows that no teacher has been convicted of perjury without an open trial in which the witnesses against him were subject to public cross-examination, and in which there was always the opportunity for an appeal to the State Commissioner.

Meanwhile, Robert M. Hutchins—and others of comparable standing could be cited—tells the world that "everywhere in the United States" university professors are "silenced by the general atmosphere of repression," [14] and that the "entire teaching profession of the United States is now intimidated." [15] In lectures to Swedish and Canadian universities he made similar statements about the position of "intellectuals in America." [16] Although these statements correspond as little with the facts as his description of John Dewey's influence, they lend credibility to the views of Bertrand Russell, who tells his audiences that American professors of economics are considered "subversive" if they "know" what the doctrines of Communism are, or that if the Federal Bureau of Investigation in its "perpetual snooping" should hear a teacher quote with approval some remark by Jefferson, he "would probably lose [his] job" and find himself "behind bars." [17]

To an American reader, it is of course clear that Mr. Hutchins and Mr. Russell were acquainted with selective samples of the American teaching profession, and Sidney Hook's comment is surely relevant that:

> . . . the facts are that no professor who was in the habit of speaking up five years ago has been silenced, many who were silent five years ago are speaking up, while those who were silent five, ten, fifteen years ago and are still silent cannot be regarded as victims of a reign of terror. It is not necessary to picture the situation as ideal—or to deny the episodic outbreaks of intolerance towards professors with unpopular views (when was the U. S. free of them?) to recognize Mr. Hutchins' statement as a fantastic exaggeration, and no more accurate in its description of the situation than a characterization of the state of academic freedom at the University of Chicago under Mr. Hutchins would be if it were based only on Mr. Hutchins' outrageous dismissal of Mr. Couch.[18]

Assorted nonsense

Every year the annual crop of assorted nonsense about "dangerous thoughts" and "radicalism" which is produced as an inevitable by-product of a free society by folks with whom "liberals" do not agree frightens those who are easily intimidated and makes it easy to confuse the distinction between real and imaginary threats. Cultural vigilantes occasionally make fools of themselves by insisting that Robin Hood is a "subversive" book—the fact that they failed to convince the Indiana school authorities of the validity of their claim is not usually mentioned—or ignorant politicians sometimes make themselves ridiculous by describing the Tennessee Valley Authority or unemployment insurance as "Communistic," or a group in Congress, which needs to be reminded of the vital distinction between conservatism and reactionary radicalism, apparently assumes in an "investigation" of the foundations—without, however, securing the support of the House as a whole—that it might be an appropriate function of Congress to decide whether an empirical or a philosophical approach is more rewarding—or even patriotic—in scientific research.[19]

Ethical questions

None of this irresponsible conduct on the part of nominal conservatives disproves the fact, however, that there is such a thing as a real Communist conspiracy, with all of its unpleasant links

[18] *Ibid.,* p. 61.

[19] Cf. Harry D. Gideonse, "A Congressional Committee's Investigation of the Foundations," *Journal of Higher Education,* Vol. 25, No. 9 (December 1954), pp. 457–63.

to conspiratorial conduct, to anonymous and scurrilous libel of colleagues, to perjury and even occasionally to espionage and murder. The fact that spurious patriots exploit the public concern about real professional abuses, as defined by any reputable academic body, by casting doubts upon the members of scores of more or less innocent "front" organizations which were deliberately designed to enroll the idealistic and the gullible does not explain away the indisputable fact that perjury is intolerable in a teacher, irrespective of his or her political associations. It is not morally edifying to hear a plea for the avoidance of relevant testimony by a college professor on high grounds of "conscience" when the preceding day's testimony clearly *and admittedly* included evidence of perjury by the same individual at an earlier session. These only *appear* to be political issues. They are in fact *ethical* questions that strike straight at the core of the viability of a free society.[20]

It may seem to be a pity that so much energy has been spent in recent years on the clarification of elementary values in academic and in free society. In a larger sense, however, the rethinking of the philosophical foundations and the moral prerequisites of free society may be strategically more vital than the development of our foreign policy or the perfection of our armament.

Standing citadels

In recent years the most glaring weaknesses in the tradition of academic freedom have not appeared as a result of the arguments of its enemies but have been revealed in the philosophical and historical illiteracy of some of its advocates. The record at the University of California, the University of Chicago, and Harvard University makes it clear that our enemies may be sufficiently strong to win an occasional battle but they do not win the war. In New York City's municipal colleges academic freedom is as real as it is anywhere else in the country or in the world, in spite of a determined effort to make it appear otherwise by some misguided "liberals" and fellow travelers. Harvard University is a citadel of strength in the defense of intellectual freedom in spite of Senator McCarthy's envenomed attacks, and Mr. Hutchins' prophecy that donors would "hesitate to give money to the university" has been emphatically disproved by the munificent gifts Harvard received immediately after the most vicious phase of the campaign of attack.

Congressional investigations

The best-known congressional representatives of the idea that there should be no rules inhibiting a congressional investigation have encountered a firm check in public opinion as well as in the restraints imposed by their legislative colleagues. If we examined the report of the subcommittee of the United States Senate Committee on the Judiciary which has handled most of the cases related to education, we would find a statement of rules and objectives that is in line with the best democratic and professional tradition, including the provisions of the statement of the Association of American Universities. The detailed cases described in this committee's report of July 17, 1953, under the title, *Subversive Influence in the Educational Process,* indicate a form of unprofessional conduct which would be so defined by any reputable academic authority, and in any case the committee has left the final judgment concerning such evidence to the discretion of the appropriate educational agencies and authorities.[21]

Philosophical and political illiteracy

The philosophical and political illiteracy of a defense of freedom which is anchored in a plea, by a founder of the American Association of University Professors, that scholars act "as agents of the people," and that their responsibility "is ***not to the truth***" but "to the people who need the truth," [22] or the argument by a leading sociologist that "freedom is either unqualified or it does not exist," [23] points to a weakness in the prevailing theory of a free society which promises to be far more dangerous than any of the attacks by outsiders that we have experienced thus far. Such views are a characteristic by-product of a rising secular religion of democracy, in which it becomes possible for intelligent men to teach that "there is nothing wrong with democracy that more democracy will not cure." These men do not understand that they are thereby denying the basis in political principle of the Bill of Rights, and that they are incidentally undermining the philosophic basis of the distinction between the so-called "people's democracies" of the Soviet type and our own variety, which is anchored in the limitations imposed upon what Jefferson called "majoritarian despotism" by the Bill of Rights.

This situation is perhaps an unavoidable outcome of a century of scholarship in which students of jurisprudence have glorified "positive" law in continual efforts to prove that the very idea of natural law was a hoax, in which sociologists have spent their energy demonstrating that the very idea of community—and its related values and moral standards—is ideological in character, and in which psychologists have treated "conscience" as if it could be illuminated by conditioning experiments with rats and—of course—dogs. Academic life has been crowded with scholars who have spent their lives eagerly sawing off the branches upon which they themselves—or their colleagues—were sitting.

Freedom is anchored in the relative autonomy of the associational liberties, the significance of which Tocqueville and Burke understood so well, and this is, of course, the reason for our renewed interest in their views. When scholars accept the status of "agents of the people," the door has been opened to all forms of populist, majoritarian, or totalitarian control. The philosophical vacuousness of certain types of contemporary philosophy and social science may constitute a greater hazard to free society than any of the conspiratorial activities of the more easily recognized enemies to which we are devoting so much of our attention.

FREEDOM AND RESPONSIBLE CHOICE

Freedom is not the absence of restraint or the right to do "as you please." It is the presence of responsible choice. It is anchored in a capacity for self-control. Freedom emerges historically—as academic freedom developed in the medieval universities *because* they *shared* the values of medieval religion—when internal checks can be substituted for external constraint, and, conversely, freedom is endangered when

[20] For typical evidence of legalistic straining at a gnat, and simultaneous willingness to swallow a camel of the appropriate ideological family, see Sidney Hook's discussion of the sworn evidence in the Rapp-Coudert investigation as it is explained away in Dean L. H. Chamberlain's volume, *Loyalty and Legislative Action,* published in 1951 in the Cornell University series (Hook, *op. cit supra* [note 1], pp. 186–201).

[21] For details, cf. Harry D. Gideonse, "Are Congressional Investigations Helpful?" *The Educational Record,* Vol. 35, No. 2 (April 1954), pp. 104–7.

[22] Professor Alexander Meiklejohn as quoted in Russell Kirk, *op. cit. supra* (note 2), pp. 31–34. See also Sidney Hook, *op. cit. supra* (note 1), pp. 233–38.

[23] Professor Robert S. Lynd of Columbia University as quoted in the *New York Times,* April 8, 1953.

a free society's shared values are no longer sufficiently vigorous to preserve the moral cohesion on which the discipline of free men rests.

We must somehow restore the quest for the sources of responsibility to a strategic place in our intellectual activities. Free society and its opposite cannot be distinguished by the absence of authority in the one case and its presence in the other. It is, rather, a question of inner checks in the first case and external control in the other. This is not merely a question of intellectual understanding; it is essentially a matter of moral commitment. Just as Tocqueville taught that "despotism may govern without faith but liberty cannot," we must learn to see that a free society is not an "open" society but, on the contrary, a society strictly committed to a distinctive set of beliefs which are widely regarded as obsolete in the free world today, and perhaps most commonly among scholars.

We must—as Michael Polanyi has phrased it in a seminal and groping book—

> . . . learn once more to hold beliefs, our own beliefs. The task is formidable, for we have been taught for centuries to hold as a belief only the residue which no doubt can conceivably assail. There is no such residue left today, and that is why the ability to believe with open eyes must once more be systematically reacquired.[24]

It was the fall of liberty in Europe—or the threat of its loss—that aroused a new consciousness of the basic beliefs on which these liberties rest. But "the beliefs remain nevertheless logically prior to these liberties" and "the coherence of science must be regarded as an expression of the common rootedness of scientists in the same spiritual reality." To Polanyi, "the principal belief underlying a free society is that man is amenable to reason and susceptible to the claims of his conscience."[25] Free men can never be nihilists. Free men are always—in the moral sense—committed men. The problem of freedom lies in the understanding of the nature of their essential commitment.

There is a jungle of philosophic and semantic confusion crying for systematic cultivation here. The quest for total "objectivity" is so deeply rooted in the best of our Western tradition that it will call for a major reorientation to recognize its relationship to the moral insecurity and normlessness that are the intellectual breeding ground of totalitarianism. There is nothing novel about the cultural pattern, however, to anyone who is aware of the Jewish, the Christian, and the Greek sources of our culture. Aristotle knew that anomic libertarianism was an immediate predecessor of despotic government, which conceals the symptoms of normlessness by imposing an iron framework to prevent disintegration.

The problems of academic freedom are in this sense merely a special example of the larger problem of restoring the vitality of free society in general. Ranging all the way from the quest for a philosophical foundation for our foreign policy on a world scale to the need for an indigenous restatement of the theory of general education on the local campus level, we can only escape the confusion of a congeries of conflicting material and power motives by a recognition of the need for clarifying the order of our priorities in the moral or philosophical field. To refresh the

sources of responsibility is the primary challenge to free society in its struggle with domestic obscurantism as well as with its totalitarian adversaries in world politics. In this emphasis we are merely returning to the theme of John Dewey's remarks in 1915 as the first president of the American Association of University Professors, in which he described issues of academic freedom as not more than "an incident of the activities of the association *in developing professional standards,* standards which will be quite as scrupulous regarding *the obligations imposed by freedom* as jealous for freedom itself."[26]

Harry D. Gideonse, LL.D., Brooklyn, New York, has been president of Brooklyn College since 1939. Previously he was professor of economics and chairman of the Economics Department of Barnard College (1938–39), associate professor of economics and director of social science courses in the College, University of Chicago (1930–38), assistant professor of economics, Rutgers University (1928–30), and director of international student work in Geneva, Switzerland (1926–28). He is president of Freedom House and of its Willkie Memorial Building and a member of the Board of Directors and past president of the Woodrow Wilson Foundation. He has been interested in the use of radio for education, as one of the originators of the University of Chicago Round Table Program (NBC) and a frequent participant in the People's Platform and Invitation to Learning (CBS). President Gideonse is the author, among other works, of The Higher Learning in a Democracy (1937) and joint author of United States Foreign Policy—Its Organization and Control (1952).

The Role of the University in International Relations

By Howard E. Wilson

THE role of the American college or university in international relations is neither simple nor static; within this century institutions of higher education have become as complexly and pervasively involved in world affairs as has the nation itself, and their adjustment to the involvement is a continuing and uncharted process. The involvement arises in part because all such social institutions as universities are intimately subject to the developments and needs and trends of the general society, in part because the personnel of universities—both students and faculties—are peculiarly affected by manpower requirements and priorities essential to the national security, and in part because the intellectual and aesthetic substance—the arts and sciences—with which modern universities deal is now consciously employed in the conduct of world affairs in a degree and on a scale hitherto unknown.

Entire University Involved

The university's concern with world affairs is not limited to specialist preoccupation with a particular subject field. In a sense, the university's interest in world affairs is more a reaction to outside events and pressures than to internal academic developments, although there have been notable, internal, scholarly developments resulting in the evolution in recent decades of international relations as a special field of learning. If one looks realistically at the activities characteristic of the university's work on world affairs, he looks at every aspect of the institution.

The university is a center of research bearing on foreign policy, cultural interrelations, and international action. It trains specialists in international relations, in the study of world areas, and in the international ramifications of established disciplines and professional fields. It has responsibility for widening the horizons of the great body of its students, both by formal instruction and by informal influences. It is caught up in the very center of farflung programs for the interchange of persons across national boundary lines. It has a role in adult education about foreign policy and world affairs, particularly important as adult education in these years "comes of age" in America. The university becomes heavily involved in relations with government in all these matters—financing research, admitting foreign students, arranging for faculty leave of absence for government work training for the Foreign Service, and so forth—and it is developing widening patterns of international relations of its own under the impact of such agencies as the United Nations Educational, Scientific and Cultural Organization, the World Health Organization, the International Association of Universities, and the contract programs of the Foreign Operations Administration.

Recognizing the range of these academic involvements in international relations, the Carnegie Endowment for International Peace developed a program in 1950 focused on cross-sectional analysis and appraisal of the role of colleges and universities in international relations. After exploratory surveys had been made in eight co-operating institutions, a "handbook" [1] was prepared

[1] Howard E. Wilson, *Universities and World Affairs* (New York: Carnegie Endowment for International Peace, 1951), pp. 88.

for the use of faculties which might be interested in assessing the role and the operations of their own institutions under the gathering impact of the nation's heavy involvement in world affairs. Since that time, seventy colleges and universities, widely distributed and representative of the range of American institutions, have completed self-surveys and appraisals of their activities and resources bearing on world affairs. Much of the material presented in this discussion is based upon these institutional self-analyses.[2]

Research on International Relations

In the ordinary functioning of universities a great deal of research is being carried on which has relevance to the serious study and the responsible conduct of international relations. This research is carried on by individual scholars, by academic departments, by research bureaus; it frequently involves the co-operation of foundations or of government; it is often related to the programs and needs of intergovernmental agencies such as the Economic and Social Council of the United Nations. It is increasingly interdisciplinary and interuniversity in character. In its research role the university is a focal center for the accumulation and interpretation of data, for the development of conceptual insights, and for the structure of research designs and methods in international relations—the essential elements in organizing a new and specialized field of systematic study.

[2] The surveys have been issued in mimeographed form by the Carnegie Endowment for the use of co-operating institutions. From them and related studies will be issued a series of topical volumes dealing with selected aspects of the work of universities in this field. The volumes will be published during 1955 and 1956 for the Carnegie Endowment by the American Council on Education.

Two aspects of the university's role in research deserve specific mention. International relations is obviously rooted in studies of a historical, political, and economic nature. The research materials classified within these disciplines are relatively easily brought together and interrelated. But other research areas have not so readily been brought into focus—materials from psychology, cultural anthropology, demography, sociology, for example. Yet as the study of international relations proceeds, the pertinence of these fields seems to be clearer. A task in the research work of universities which is in the category of unfinished business is the focusing and co-ordinating of these scattered materials on world affairs.

Another task in research operations is that of finding the best means by which research data can flow into the forum of public action, the actual conduct of world affairs. Research studies published in book form for library use by scholars and students is a traditional operation, and an essential one for universities. Additional channels for utilization of research data may be necessary. Some of these may be found in research asked for by agencies of government and paid for by governmental contract—an application to the social sciences of the research contract arrangements now common in the natural sciences. The problems in respect to such contracts are the obvious ones of "applied versus pure" research, of the danger of an unbalanced research program, of the nature of governmental controls over academic work, and of the timing and scheduling of research in terms of the need for it.

But even without specific governmental aid or stimulation, much research now carried on in academic communities could be made more useful and be more used by government agencies. The director of one university institute in in-

ternational relations feels that the best contributions of his staff have been made in the form of specific studies placed in manuscript form upon the desks of public officials specifically responsible for dealing with the topics studied. The work of the Department of State in establishing a liaison office for accumulating bibliographical material on current research, while promising in its beginnings, has currently suffered from economic stringencies. The creation of machinery by which research data can be accumulated and funneled into action—and without making research simply a tool for politics—is a matter of continuing importance.

TRAINING OF SPECIALISTS

The university is, of course, the primary center for training specialists in international relations for the public service, for certain industrial and professional posts, and for research and teaching. The number of institutions giving advanced degrees in this field is increasing, but analysis of the programs offered indicates that most of them are focused on training for academic rather than public careers. Lack of adequate articulation between training programs and job requirements is a problem of basic importance.

In this connection, it should be observed that most posts in public and business life involving the actual conduct of international affairs require specialization in such fields as law, economics, agriculture, engineering, commerce, education, and medicine. The task of training these specialists with a view to the application of their work in international situations is one which relatively few institutions have been able to attack successfully. Certain graduate schools of business, public health, and agriculture have perhaps been most successful, but even so the current interest in orientation problems for American civil servants and industrial or educative posts abroad is an evidence of inadequacy in the university preparation of most specialists.

In the education of area specialists the universities have been more active in recent years, though the co-ordination of area-study programs with programs devoted specifically to international relations leaves much to be desired. It should be noted, too, that the duplication of area-study offerings—as, for example, in the Latin-American field in universities in the southern part of the United States and in Asiatic studies in the institutions of the West Coast—is probably excessive and, in the long run, uneconomical. There has not been sufficient national planning or co-ordination for the developing area-study centers.

With all the shortcomings which might be pointed out, it is nevertheless to be emphasized that the universities of the United States have been extraordinarily sensitive to the need for specialized personnel in international relations. The development of institutes, bureaus, departments, centers, and program concentrations under the impact of phenomenally rising American interest in world affairs during recent decades is an extraordinary chapter in the history of higher education. It is significant that a specialized discipline in international relations has been evolving during this urgent period in which the United States has been forced from isolation to participation in world affairs. The role of the university in training needed specialists is not being ignored; its achievement is in a pioneering stage, characterized both by problems and by substantial promise for the future.

INTERNATIONAL RELATIONS IN LIBERAL EDUCATION

The formal curricular contribution to the thinking of the great majority of students about world affairs is most commonly made along two lines—first, in the foundation courses in social sciences and humanities in which an interpretation of human experience is undertaken and, second, in vocational or professional programs which stress the international relations of a given field. There is no standard curriculum for American institutions as a whole, and the variety of courses that go under the label of liberal education is enormous and unpredictable, but there is assuredly an influence on orientation toward world affairs arising from the general college experience. Reports on college graduates indicate that, on the average, they are more interested in and more informed about international relations than are nongraduates. In this orientation of American leaders toward concepts and values and judgments underlying participation of educated men and women in the development of foreign policy and international relations, the colleges and universities have an important role to play.

Within the general program of courses offered as parts of liberal education, a good many standard offerings have been greatly modified in recent decades under the impact of world affairs. The whole program of language instruction, for example, seems now in a stage of extensive readjustment. Standard courses in world history have been widened to include the background of Asiatic history —or have been renamed more accurately as courses in the history of Western civilization. Programs in literature now deal with writings from cultures formerly outside the academic literary ken. And the development of courses in Asiatic studies, Latin-American studies, Russian studies, and the like in recent years has been phenomenal.

The number of colleges and universities offering undergraduate courses in international relations as a part of the general program in liberal arts is now legion.[8] There has been a steady shift from concept of these courses as introductory and preprofessional in character toward the concept of "terminal" courses as aspects of liberal education for the general student. In the general education program of San Francisco State College, for example, this development has progressed to the point where one semester of a four-semester sequence in social science required of all freshmen and sophomores is devoted to the study of international relations. While most of the undergraduate courses in international relations are organized within the framework of political science or economics, a number—apparently increasing—are organized in the philosophy and religion departments or in connection with anthropology and geography.

However, it is unfortunately true that these courses expressly devoted to world affairs, however organized and scheduled, are ordinarily taken by relatively few students. The college graduate who has taken a course in international relations is the exception rather than the rule. It is also true that the adjustments and developments in courses generally devoted to the liberal arts have taken place unevenly, and influence students in somewhat unpredictable fashion and degree. While in general it is possible to say that college graduates think more about and think more deeply about international relations than do nongraduates, the curricular reasons why this is so on any large scale are by no means obvious. The changed outlook on the world of college graduates may be as much due to nonformal, off-campus influences as to the courses of study to which they are exposed.

[8] See Grayson Kirk, *The Study of International Relations in American Colleges and Universities*. New York: Council on Foreign Relations, 1947.

INFORMAL EDUCATION

In considering the possibilities of collegiate education about world affairs for all students the informal influences of the college as a way of life are of more importance than most college people assume. Each institution, large or small, urban or rural, public or private, has a somewhat distinctive body of traditions and pattern of mores which influence in high degree the intellectual as well as emotional development of "members of the college." The extracurricular life as well as the curricular—or the merging of the two which is indicated in the term "cocurricular"—must be considered in determining the program of higher education about world affairs. College life is a form of inculturation for prospective leaders of the national society, and college life may condition the point of view toward matters international for very large numbers of students.

College seniors report that they think they received particularly substantial contributions to their understanding of world affairs from a number of out-of-class sources within the college community, including lectures they have heard, discussions in which they have engaged, and informal contacts they have had with foreign students and with faculty members having experience in some form of international work. It is customary in many institutions to bring to the campus periodically as lecturers leaders experienced in the actual conduct of international affairs. Too frequently these all-campus lectures are planned on a catch-as-catch-can basis and are poorly attended. A few institutions have begun to experiment with carefully developed sequences of lectures, at which attendance is expected if not required of students and in which an examination is given at the end of the series "to lift the lectures to the status of a course." Such lectures, planned systematically as complementary to basic course programs in institutions, may reach all students in smaller colleges or fairly large cross sections in the larger institutions. In a sense they may be the obverse of the large lecture class broken periodically into sections, in that they may be occasional focal points bringing together students from a variety of classes. Informal series of lectures, planned as a part of the institution's program of general education, seem to be highly important in reaching large numbers of students.

In terms of discussions, the means by which the power of the "bull session" can be harnessed for education about world affairs is no inconsequential matter. The programs of many College Unions, which have moved toward emphasis on informal educational activities from the romantic emphasis on social recreation of the 1920's, can be systematically planned to contribute toward this end. The housing arrangements for students, the discussion groups and forums scheduled by religious centers in the collegiate community, the semi-seminars in which selected students meet with faculty members—all of these may be molded into a college life which contributes substantially to understanding of other cultures, of the development of foreign policy, and of the conduct of international relations.

Among the out-of-class experiences for students in this field should be listed some of the activities of the student government association and some of the organized clubs and associations of the campus. Many of the structural arrangements by which students participate in college government make careful provision for activities devoted to international matters. Among these are campus philanthropic drives, the reception of foreign students, the organization of special campus events on such occasions as United Nations Day, and the

scheduling of lectures and forums on international topics. A member of the cabinet of the student president of the University of Florida, for example, is the Secretary of International Relations who has responsibility for stimulating and co-ordinating activities in this field. The National Student Association is particularly active in stimulating campus interest in world affairs and in managing a growing travel program of its own which involves extensive relations with student organizations in other countries. While many student clubs are concerned in one way or another with activities bearing on international matters, a few are devoted entirely to work in this field. Among these are the International Relations Clubs, which have had a continuous existence in American colleges of more than forty years. Now organized as an Association of International Relations Clubs and closely affiliated with the Foreign Policy Association, the clubs number in their membership at least twenty thousand students. And on many campuses the clubs assume some responsibility for developing a program of interest and value to the entire college community.

FOREIGN STUDENTS AND PROFESSORS

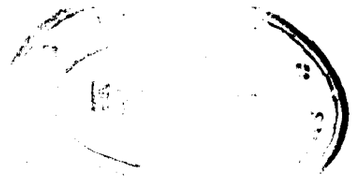
The number of foreign students and foreign professors and research workers on American campuses has increased substantially in recent decades. We have now reached the point where systematic research analyzing the effect of an American sojourn on the academic visitors is beginning to take form. Many institutions make elaborate arrangements for receiving and counseling foreign students. Governmental and nongovernmental agencies have developed programs for handling exchangees in this country with tact and skill. But the effect on the visited as well as the effect on the visitors may be a significant chapter in American education—and that is a field in which virtually no research has been done. The role of college life in educating students is rooted in the character of the membership of the college; association with students from other lands is itself an education, as is readily attested by students and faculty who have analyzed this situation. The role of the college or university as a meeting place for persons representing diverse cultures and nations is a significant role in education about world affairs.

UNIVERSITY AS A CENTER FOR ADULT EDUCATION IN WORLD AFFAIRS

The university in America inevitably has a role in adult education, which seems likely to loom larger as adult education itself becomes more important to our society. In numbers of institutions, the relations with alumni have become increasingly educational—as, for example, the lectures and forums at the meetings of the Associated Harvard Clubs or the special institutes for alumni organized in key cities by Stanford University. In one sense alumni are an adult captive audience for institutions of education. The founding of university presses in an earlier day has now led to university radio and television stations and, even more frequently, university sponsorship of round tables, news summaries, and other educational broadcasts. The extension divisions of universities have grown enormously. The power of the university in shaping public opinion through direct contact with adult citizens as well as by education of the younger citizens is not to be minimized. And, in this role, the distribution of information and ideas about world affairs plays a prominent part.

University policy in respect to adult education, for the most part, is not clearly formulated. Perhaps the most common policy is that of approving the activities of professors as individuals in

adult education about world affairs—so long as the professor does not arouse too much controversy. Encouragement of faculty members to become active in the field is not so common, and the policies involving their doing so are not reduced to written precision as widely as is desirable. In this area academic freedom, academic responsibility, and public relations are all involved. So also is the need of the public for reliable sources of information and counsel on questions of foreign policy having great portent for all of society.



CONCLUSION

The role of the university in respect to world affairs, then, is not simple or easily fulfilled. It involves the entirety of an institution; it is focused on research which advances man's knowledge of other countries and of the relations among countries; it is equally focused on the training of young persons—most of them as leaders in civic and vocational fields on which world affairs have direct bearing, some of them as responsible public officials, some of them as specialists in the further development of international relations as a field of systematic study. It leads, too, to the function of the university as a counselor to society, a voice in the formation of public opinion. In all these capacities, the institution faces complex problems both of policy and of operation. But unless all of them can be realized, the nation's participation in world affairs will be severely handicapped.

Howard E. Wilson, Ed.D., Washington, D. C., is executive secretary of the Educational Policies Commission, which is jointly sponsored by the National Education Association and the American Association of School Administrators, and also consultant for the Carnegie Endowment for International Peace, with responsibility for completing the Endowment's current program in the field of higher education. Dr. Wilson was for seventeen years on the faculty of the Harvard Graduate School of Education. He has been chairman of committees on international relations of the National Education Association and the American Council on Education, served in London and Paris as deputy executive secretary of the UNESCO Preparatory Commission (1946) and subsequently for two terms on the United States National Commission for UNESCO, and represented this country at UNESCO conferences in Mexico (1947) and Havana (1950). He is author of Universities and World Affairs (1951) and coauthor of Learning the Ways of Democracy (1941).

METHODS OF FINANCING HIGHER EDUCATION

The following papers and addresses were prepared for a conference on the above topic held in Philadelphia on May 20–21, 1955, under the joint auspices of the University of Pennsylvania and the American Academy of Political and Social Science to commemorate the centenary of the birth on May 21, 1855, of Edmund Janes James, first president of the Academy (1889–1901), first editor of THE ANNALS (1890–1895), and professor of public finance and administration in the Wharton School of Finance and Economy of the University of Pennsylvania and professor of political and social science in the Department of Philosophy (graduate faculty) of the University (1883–1896).

This conference was made possible by a grant from Mr. and Mrs. George E. Frazer, Winnetka, Illinois, daughter and son-in-law of President James.

PROGRAM

Friday, May 20, 1955

LUNCHEON

Welcome by Roy F. Nichols, Vice-Provost and Dean, Graduate School, University of Pennsylvania, and Thorsten Sellin, Acting President, The American Academy of Political and Social Science

FIRST SESSION, 2 P.M. GOVERNMENTAL SUPPORT OF HIGHER EDUCATION

Chairman: Robert T. McCracken, Chairman, Board of Trustees, University of Pennsylvania

PUBLIC UNIVERSITIES: *Discussion Leader,* John A. Perkins, President, University of Delaware

PRIVATE UNIVERSITIES: *Discussion Leader,* Carter Davidson, President, Union College

RECEPTION AND DINNER

SECOND SESSION, 8 P.M. GIFT SUPPORT

Chairman: M. Albert Linton, member of Board of Directors of The Academy and Associate Trustee, University of Pennsylvania

ALUMNI SUPPORT: *Discussion Leader,* Ernest T. Stewart, Jr., Executive Secretary, The American Alumni Council

CORPORATION SUPPORT: *Discussion Leader,* Wilson Compton, President, Council for Financial Aid to Education

Saturday, May 21, 1955

THIRD SESSION, 9:30 A.M. PAYMENTS BY STUDENTS

Chairman: Alfred H. Williams, member of Board of Directors of The Academy and Trustee, University of Pennsylvania

TRENDS IN TUITION CHARGES AND FEES: *Discussion Leader,* Herbert S. Conrad, Office of Education, United States Department of Health, Education, and Welfare

HOW MUCH—AND HOW—SHOULD STUDENTS PAY? *Discussion Leader,* John F. Meck, Treasurer and Vice-President, Dartmouth College

LUNCHEON

FOURTH SESSION, 2 P.M. OPERATING COSTS AND UNIVERSITY MANAGEMENT

Chairman: Roy F. Nichols, Vice-Provost and Dean, Graduate School, University of Pennsylvania

STANDARDS OF SERVICE: *Discussion Leader,* Harry L. Wells, Vice-President Emeritus and Former Business Manager, Northwestern University

METHODS OF EFFECTING ECONOMIES: *Discussion Leader,* Richard M. Paget, Cresap, McCormick & Paget, Management Consultants

COMMEMORATIVE DINNER

Thorsten Sellin, Acting President of The Academy, presiding

THE CAREER OF EDMUND J. JAMES: Ernest Minor Patterson, President Emeritus of The Academy

FIFTH SESSION, 8 P.M.

Chairman: James C. Charlesworth, President of The Academy

PROSPECTS FOR STRONG AND STABLE FINANCING: Henry M. Wriston, President, Brown University

A REVIEW OF RECENT DEVELOPMENTS: John H. Millett, President, Miami University

PARTICIPATING INSTITUTIONS AND THEIR REPRESENTATIVES

AMERICAN UNIVERSITY—Hurst R. Anderson, President
ASSOCIATION OF AMERICAN COLLEGES—W. Terry Wickham, President, Heidelberg College
BOSTON COLLEGE—Thomas Fleming, S.J., Executive Assistant
BOSTON UNIVERSITY—Quentin Leisher, Director of Office of Planning and Development
BROWN UNIVERSITY—Thomas B. Appleget, Vice-President
BRYN MAWR COLLEGE—Charles J. Rhoads, President of the Board of Trustees
CARNEGIE INSTITUTE OF TECHNOLOGY—Walter J. Blenko, Chairman of the Executive Committee of the Board of Trustees
CINCINNATI, UNIVERSITY OF—Ralph C. Bursiek, Dean of University Administration
COLUMBIA UNIVERSITY—W. Emerson Gentzler, Associate Provost
COMMISSION ON INTITUTIONS OF HIGHER EDUCATION, Middle States Association of Colleges and Secondary Schools—George A. Brakeley, Vice-President Emeritus, Princeton University
CORNELL UNIVERSITY—Paul L. McKeegan, Controller
COUNCIL FOR FINANCIAL AID TO EDUCATION—Wilson Compton, President
DARTMOUTH COLLEGE—John F. Meck, Vice-President and Treasurer
DELAWARE, UNIVERSITY OF—John A. Perkins, President
SAMUEL S. FELS FUND—Frederick P. Gruenberg, Treasurer
FORDHAM UNIVERSITY—Kevin O'Brien, S.J., Investment Administrator
GEORGETOWN UNIVERSITY—Charles J. Foley, S.J., Director of University Development
HARVARD UNIVERSITY—James R. Reynolds, Assistant to the President, and Lewis Gard Wiggins, Comptroller
HAVERFORD COLLEGE—William Morris Maier, Treasurer
HOWARD UNIVERSITY—Mordecai W. Johnson, President
ILLINOIS, UNIVERSITY OF—Robert W. Mayer, Chairman, University Senate Budget Committee
INDIANA UNIVERSITY—J. A. Franklin, Vice-President and Treasurer
JOHNS HOPKINS UNIVERSITY—J. Douglas Colman, Vice-President
LINCOLN UNIVERSITY—Austin H. Scott, Business Manager
MARYLAND, UNIVERSITY OF—C. L. Benton, Director of Finance and Business
MASSACHUSETTS INSTITUTE OF TECHNOLOGY—Joseph J. Snyder, Vice-President and Treasurer
A. W. MELLON EDUCATIONAL AND CHARITABLE TRUST—Philip S. Broughton, Assistant to the President
MICHIGAN STATE COLLEGE—Merrill R. Pierson, Assistant Comptroller
MIDDLEBURY COLLEGE—Samuel S. Stratton, President
NEW HAMPSHIRE, UNIVERSITY OF—Jere Chase, Office of University Development
NEW YORK UNIVERSITY—Gerald P. Burns, Development Office
NORTHWESTERN UNIVERSITY—William S. Kerr, Vice-President and Business Manager
NOTRE DAME, UNIVERSITY OF—John J. Cavanaugh, C.S.C., Director of Notre Dame Foundation
OHIO STATE UNIVERSITY—Jacob B. Taylor, Vice-President and Business Manager
PENNSYLVANIA, UNIVERSITY OF—Chester E. Tucker, Vice-President for Development and Public Relations
PENNSYLVANIA STATE UNIVERSITY—Kenneth R. Erfft, Associate Comptroller, and C. S. Wyand, Executive Assistant to President
PITTSBURGH, UNIVERSITY OF—G. S. Rupp, Comptroller
PURDUE UNIVERSITY—Lytle J. Freehafer, Business Manager and Assistant Treasurer
RUTGERS UNIVERSITY—Mason W. Gross, Provost
ALFRED P. SLOAN FOUNDATION—Arnold J. Zurcher, Executive Director
SWARTHMORE COLLEGE—Edward K. Cratsley, Vice-President in Charge of Financial Operation and Control
SYRACUSE UNIVERSITY—Hugh C. Gregg, Vice-President and Treasurer
TEMPLE UNIVERSITY—Millard E. Gladfelter, Provost and Chairman of the Budget Committee
VERMONT, UNIVERSITY OF—Robert H. Kroepsch, Dean of Administration
VIRGINIA, UNIVERSITY OF—Vincent Shea, Comptroller
WAYNE UNIVERSITY—Olin E. Thomas, Vice-President for Business and Finance
WEST VIRGINIA UNIVERSITY—Irvin Stewart, President
WESTERN RESERVE UNIVERSITY—John F. White, Vice-President in Charge of University Development
WISCONSIN, UNIVERSITY OF—William H. Young, Professor of Political Science and Special Budget Assistant to the President
YALE UNIVERSITY—Charles M. O'Hearn, Assistant to the President

The Career of Edmund Janes James

By ERNEST MINOR PATTERSON

EDMUND J. James was born in Jacksonville, Illinois, on May 21, 1855. From 1883 to 1896 he was professor of public finance and administration in the Wharton School of Finance and Economy of the University of Pennsylvania and professor of political and social science in the University's "Department of Philosophy," as its graduate work was then designated. During this period Dr. James organized the American Academy of Political and Social Science, serving as its first president from 1889 to 1901, acting *in absentia* from 1896. He was editor of THE ANNALS from 1890 through 1895, and one of the associate editors thereafter through 1898. He went from Philadelphia to the University of Chicago, was president of Northwestern University from 1902 to 1904 and of the University of Illinois from 1904 until his retirement in 1920. On June 17, 1925, he died in Covina, California.

Any appraisal of Dr. James should be made with a realization of his background. His father was a Virginian, and most of his life was spent in the Middle West. He studied at Harvard University (1874–75) and at the University of Halle for the next two years, receiving there the degrees of M.A. and Ph.D. He was in Philadelphia, as we have seen, from 1883 to early in 1896.

During the early years of his life the Civil War was fought, and the subsequent years were the turbulent ones of the Reconstruction period. The last quarter of the nineteenth century was a time of rapid industrial development —the growth of railways, the introduction of the telephone and the use of electricity, the increasing power of organized labor.

Such changes as these were, of course, accompanied by demands for changes also in economic and political organization and by demands for reform. A greater concentration of labor in industrial centers helped make more effective the organization of the American Federation of Labor, led for many years by Samuel Gompers; the growth of population and the development of the West increased the value of natural resources and aided Henry George with his advocacy of the Single Tax; the decline in prices from 1873 to 1896 meant a larger audience for William Jennings Bryan with his protests against "the cross of gold" and his advocacy of the "free coinage of silver." To some at least Edith Wharton erred in characterizing the eighties as "The Age of Innocence," and the "Gay Nineties" was equally a misnomer.

DR. JAMES AND THE WHARTON SCHOOL

In what ways these great changes influenced the thinking of Dr. James on particular issues only those closely associated with him can say, but his general outlook is clear. From his years in the Middle West, interrupted only briefly (1874–77), he came to the University of Pennsylvania in 1883 with a strong conviction that collegiate education should be modified to provide academic training for young men planning business careers.

His own statement about the "Wharton School of Finance and Economy" in an address before the American

Bankers' Association on September 3, 1890, clearly expresses his views:

> It was these considerations then that determined Mr. Wharton to establish this school. First: the belief that the business classes of our country need a higher training as much or more than any other classes; second, the view that the commercial or business college, however valuable its curriculum, is by its very nature unable to give this higher training; third, that the American college, however real and valuable its higher training, does not in its present form furnish a kind of higher training which appeals to the business sentiment of the community, as is shown by the fact of the small number of youths looking to business careers who enter college.

Because of his outstanding competence he was sent to Europe by the American Bankers' Association and in 1892 submitted a report to its Committee on Schools of Finance and Economy. In this report he gave a careful presentation on higher commercial education in Vienna, Prague, Paris, Leipzig, Antwerp, and Venice and in England.

But Philadelphia was not the Middle West. Most Philadelphia leaders, including the trustees of the University and many members of its faculty, were conservative. Collegiate training with emphasis on economics and political science and with courses in accounting, banking, and business law was not readily accepted. Hostility was common and the leaders of this new movement had to face a strong opposition. In addition to Dr. James mention may be made here of Robert. Ellis Thompson and Simon N. Patten.

Dr. Thompson was dismissed in 1892 and Dr. James in 1896. Dr. Patten remained until his formal retirement in 1917 but he was continually the object of criticism. In his *History of the University of Pennsylvania,* which appeared in 1940, Dr. Edward Potts Cheyney observed:

> The departure of both [James and Thompson] was a serious and unnecessary loss to the University; it has not had too many men of their stature, and neither need have gone if greater reasonableness had been exerted.

THE AMERICAN ACADEMY

Dr. James by no means limited his activities to formal undergraduate training. He was a leader in organizing the American Economic Association and served for a time as vice-president and as its president in 1910; he was elected to membership in the American Philosophical Society when only twenty-eight years of age; his leadership in connection with the American Academy of Political and Social Science has already been mentioned.

The American Academy undertook a broader field of work than the American Economic Association and the other societies whose members are primarily specialists in their respective fields and accustomed to a technical terminology and an advanced presentation not easily grasped by the layman. The general public in a democratic society must frequently express itself at the polls and otherwise. Thoughtful presentations at "the college level," to be read by the general business and professional public and representing all leading points of view, were being sought, and the American Academy in its sixty-five years has endeavored to meet that demand. Probably the only closely comparable organization is the Academy of Political Science in New York City, associated with Columbia University.

Starting and operating the American Academy was no easy task. The minutes of the business meetings of those early years reflect the many difficulties —financial and otherwise—that had to be faced and overcome. The struggle was and is a hard and continuing one. Perhaps record should be made of the fact that the American Academy is not a part of the University of Pennsylvania. It has its own Articles of Incorporation and operates independently. Many of its directors, however, are members of the faculty of the University; others are Philadelphians outstanding in business and the professions.

Although Dr. James left Philadelphia in 1896, he continued as president of the Academy until 1901. He was succeeded for a short time by Dr. Samuel McCune Lindsay, who was followed by the late Dr. Leo S. Rowe, who also served *in absentia* from 1917 to 1930. Under different leaders and with political, social, and economic life constantly changing, the Academy of today is of course different in detail from that of sixty years ago. It is a tribute to Dr. James, however, that its basic approach is the same as it was under his guidance.

The conference on Methods of Financing Higher Education is a tribute to him, and the papers there given would have inspired him. The one defect is the absence of Dr. James himself. Had he been present the rest of us would have gained.

THE WHARTON SCHOOL TODAY

First we should like to have seen him in Dietrich Hall, the building now occupied by the Wharton School of Finance and Commerce. Presumably he would be impressed by the size and by the conveniences of the building, but more important would have been his reactions if told that there are now over 2,000 students in attendance, or about 5,000 if there are included those in the Evening School of Accounts and Finance, in the Extension Schools, and in the Graduate Division of Business and Public Administration, all part of the Wharton School.

He would have been welcomed by the faculty and its administrators and by the leaders of the University. The Wharton School has the largest enrollment of the numerous schools of the University. Until 1912 it was not on a par with the other schools but was a part of the College with a director in charge. Since that time it has been under a succession of deans and has multiplied many times the courses offered.

This writer taught for forty years in the Wharton School but in the quiet of retirement is no longer familiar with the many issues now under discussion. But if Edmund James were present his proposals would be most valuable. Probably there would be opposition to him and criticism of him, as was the case years ago. But his ideas about organization and curriculum, even though they were not accepted in full, would be a valuable guide to those who now have the responsibilities for decision and action.

THE AMERICAN ACADEMY—1889 AND 1955

Second, we should like to have shown him the American Academy. Today that organization has a membership between 15,000 and 16,000 scattered all over the world. In addition to sending THE ANNALS to its members, the Academy sells thousands of copies each year to individuals and to organizations. Of one issue only a short time ago 19,000 copies were printed. Today the Academy owns its own quarters not far from the University of Pennsylvania and has a considerable staff of permament employees.

But for the Academy too the world is different from 1889. Communication has changed fantastically in techniques and timing. Some of us can remember the ridicule we heaped on "Darius Green and his flying machine," but today

transportation in the air is commonplace. At a meeting of the Academy a few years ago this writer heard President Beneš of Czechoslovakia addressing us by radio from Prague. As we listened, an engineer present quietly observed that if we were close to the amplifier at the front of the hall we would hear the voice of President Beneš before he could be heard by those who were in the same room with him in the palace in Prague.

In this altered world our traditional habits of thought are undergoing an upheaval, and it is not easy to make the adjustments called for in a rapidly changing society. An enormous number of organizations is today endeavoring to reach the general public. Some are objective in their approach, but many are attempting to influence public thought in ways that will be to the advantage of the groups they represent. Emotions are tense and criticisms are bitter. *Non sequitur*'s are more abundant than ever and the *argumentum ad hominem* is a commonplace. Objective presentations of social issues are increasingly difficult. In many ways the task of the Academy is greater than in the past. Costs are much higher and balancing the budget is far from easy. What Dr. James would propose we cannot know, but we do know that the leaders of the Academy today would welcome his counsel if he were here to give it.

FINANCING HIGHER EDUCATION

A third contribution Dr. James could have made in May 1955 is to the subject of the conference on the financing of higher education. This paper has been limited primarily to his contributions to the Wharton School and to the Academy. But from 1902 to 1920 he served as a university president—first of a private and then of a state institution. He would doubtless have been impressed by the magnitude of the financial problems of higher education today, but with his vigorous mind and with his experience as an administrator his contributions would have been great.

We pay tribute to the services of Dr. James and wish we still had his advice and his guidance.

Ernest Minor Patterson, Ph.D., LL.D., Philadelphia, Pennsylvania, is president emeritus of the Academy, having served as its president from 1930 to 1953. He taught in the Wharton School of Finance and Commerce, University of Pennsylvania, from 1910 to 1950, and was chairman of the Department of Economics from 1919 to 1932 and of the Graduate Group Committee in Economics from 1919 to 1936. He was vice-president of the American Economics Association (1936), secretary of the American Philosophical Society (1943–48), and an official arbitrator of the American Arbitration Association. He has lectured widely in this country and abroad, and was visiting professor at the Institut universitaire des hautes études internationales, Geneva (1929) and lecturer at the Académie de droit international, The Hague (1931). He is the author of numerous articles and books in the field of economics, including An Introduction to World Economics (1947), and was special editor of many issues of THE ANNALS *during his presidency of the Academy.*

Government Support of Public Universities and Colleges

By JOHN A. PERKINS *

IT is my assignment to consider governmental financial support of public universities and colleges in the United States. To make a sharp distinction between public and private institutions of higher learning, especially on the basis of their means of support, is illusory. American colleges and universities do not lend themselves to such clear-cut classification. Court decision surprisingly declared the University of Maine to be private, although it was "chartered by the state and fostered by it." Harvard, now considered to be the prototype of the private university, was dependent upon public funds from the Massachusetts General Court for its establishment and early maintenance. The first state university, North Carolina, was given considerable impetus by a munificent private gift, and many state universities have come to have sizable endowments. Some public colleges, as do private ones, campaign for funds annually and for special projects sporadically. Private institutions such as Cornell have certain of their schools or colleges heavily subsidized by public money, and such states as Pennsylvania and Maryland regularly appropriate to institutions strictly private in character. Recently federal and state funds for student housing have been made available to private as well as public institutions.

"It takes money to make the mare go." Whether public or private, universities have not found additional dollars needed to do their task adequately. They will, in the future, be even harder pressed for funds, owing to what President Harold W. Dodds of Princeton has so aptly called the coming "Bull Market" in higher education. This tremendous need for funds plus a backlog of financial problems, coupled with the existing tax system and the increasing tendency of wealth in the United States to distribute itself over a large number of people rather than to gravitate to the few, may easily make all our higher education increasingly dependent upon appropriations, tax exemptions, governmental loans, governmental scholarships, and other forms of public largess.[1] Hence, institutions of higher learning, howsoever traditionally classified and supported, are not in a position to be, nor are they apt to be, very selective about the sources of their income. A real danger, to be discussed later, is that both private and public institutions may become so desperate in their scramble for money that some of each genus may be pressed to sacrifice vital elements of independence. The magnitude of the

* In the preparation of this statement, I have had the valuable help of my administrative assistant, Mr. Daniel W. Wood.

[1] The impending situation in enrollments in higher education and the likelihood that government money will be of greater importance seem predictable on the basis of what happened in the 1930's with respect to welfare activities. Before the poverty and distress of the Great Depression became overwhelming, welfare was supported in large measure by private philanthropy. The development of the social service state and the cold war have left us with a heavy tax burden upon wealth, whether accumulated or currently earned. This may make available for higher education even less private help, as has been true in late years in welfare campaigns of the Red Feather–Community Chest variety.

financial problem confronting higher education behooves us all as educators to have as a background some understanding of public higher education and of governmental support of it.

ENROLLMENT CRISIS

While the proportions of the enrollment crisis are generally known, its immediacy and certain aspects of it warrant emphasis. In each of the last three years, college and university enrollments have increased; in 1954, by 10 per cent. The present college generation was born in the low-birth-rate era of the 1930's. These larger enrollments simply represent the increasing percentage of youth going on to college and in no way reflect the increased birth rate since 1940 that brought this country the biggest baby crop ever, 4.1 million in 1954. When children born in the last sixteen years come to college, they will create a problem that cannot be solved by temporary overcrowding such as was done to accommodate the GI's in the 1940's. By 1970 it is predicted that college enrollments for the country as a whole will be up more than 70 per cent, with approximately five million students seeking some alma mater.

Will private institutions expand?

For the great percentage, that alma mater may, of necessity, be a public one governmentally supported. This conclusion is reached after a look at the statistics and after reading statements by leaders of private higher education. For approximately thirty years college students were divided evenly between public and private institutions. In 1953, however, 52 per cent were in public colleges and universities; in 1954, 55.8 per cent. Also, in 1954, 65 per cent of all new students were enrolled in public institutions. Officers of private institutions frequently indicate they have no funds to accommodate greatly increased enrollments. To do so on present resources would jeopardize their traditional quality. Only Chancellor Henry T. Heald of New York University seems to have made an optimistic public statement about potentialities for growth in endowments. Should the added funds be forthcoming, a few private institutions may be willing to expand considerably.

Adherence to present size is defended on other than financial considerations. Officials of the small college imply it is the last hope of quality education and of a truly liberal education. Another implication is that the forthcoming greater enrollments are owing to a willingness on the part of some colleges to lower their standards. Apparently the same percentage of youth born during the recent high-birth-rate period are not expected to be as capable of benefiting from college as those of earlier generations.

BACKGROUND OF PUBLIC HIGHER EDUCATION

Such positions recall some of the reasons public higher education came into being. The first state universities—North Carolina, Virginia, and Michigan—the land-grant colleges after 1862, and the early municipal universities were all the result of new philosophical tenets which rejected, at least in part, the existing tendency to transfer decadent classical scholasticism to American higher education. These tenets still evoke little enthusiasm from those who hold to the tradition that Dr. Benjamin Fine has characterized as "aristocratic and classical." The philosophy that inspired the founders of our public institutions of higher learning is expressed by Thomas Jefferson: "If a nation expects to be ignorant and free in a state of civilization, it expects what never was and never will be." That education must be broadly disseminated for the general welfare of the state, a premise advanced by Diderot, Condorcet, and other men of the French Enlightenment, found ready acceptance among such republicans as Jefferson, Benjamin Franklin, and George Washington. Our public higher education also has ideological roots in romanticism, which stresses the dignity of man and his infinite worth. This meant full educational opportunity not for everyone but for everyone with the desire and mental ability, whatever his station in life or vocational aim. Higher education was no longer limited to those entering the learned professions. It was opened to those entering the newer vocations, many of which have come to be called "sciences."

Senator Justin S. Morrill, finding the states all too slow in developing opportunities for higher education, brought into being, with President Lincoln's help, laws giving the states grants-in-aid if they would broaden the scope of higher education. This father of the land-grant college system thus explained the whole matter:

> The land-grant colleges were founded on the idea that a higher and broader education should be placed in every state. . . . The design was to open the door to a liberal education for this large class of people [those from the lower and middle classes choosing industrial vocations] at a cheaper cost from being close at hand and to tempt them by offering not only sound literary instruction but something more applicable to the productive employments of life.

The higher education that has so proliferated from this philosophy is largely dependent upon state government for funds. Aside from the Service academies, there are few federal institutions, and only a handful of the four-year colleges are supported by municipalities. Today, institutions which are both land-grant and state universities receive their support from the following sources: state governments, 42.7 per cent; federal government, 13.2 per cent; student fees, 28.5 per cent; endowment and other, 15.6 per cent. Other types of publicly supported institutions such as separate state universities, teachers colleges, liberal arts colleges, and junior colleges receive a higher proportion of their income (as high as 70.4 per cent) from the states. This is particularly true of teachers colleges and junior colleges where student fees are minimal.

EXTENT OF FEDERAL SUPPORT

So far as the education of students is concerned, the federal government's support of public higher education is now relatively small. The Morrill Act of 1862 provided a college in each state with a land endowment of 30,000 acres for each representative and senator. This endowment was to provide for the operating expense of these institutions. State governments were to provide only the buildings and grounds.[2] These colleges were unable to operate on the income thus provided and eventually were given operating appropriations by the commonwealths. Such appropriations have grown steadily, amounting in 1950 to approximately one-half billion dollars. The federal government upon only three occasions authorized an increase in the annual grants to constitute "further endowment" for these colleges for resident instruction: the Second Morrill Act in 1890, the so-called Nelson Amendment in 1908, and the Bankhead-Jones Act in 1935. The total federal money for instructional purposes given to the land-grant colleges from these acts amounted to approximately seven million dollars in 1951–52, only 3.43

[2] House Report (2697, 51st Congress, 1st session, p. 6) states: "The theory of this provision evidently was that the states should furnish the material required for the proposed institutions, while the funds contributed by the United States was intended to make adequate provision for the actual cost of the instruction."

per cent of total expenditures for instruction. This is but a pittance in view of the intention of the original Morrill Act and its affirming amendment.

The federal government has been much more generous in providing money for auxiliary activities within the responsibility of the land-grant institutions, especially for co-operative extension services and agricultural experiment stations. These substantial subventions (close to fifty million annually) are often mistakenly thought to contribute directly to the instruction of students. They most certainly do not. They may even divert limited state appropriations from instruction to these activities supported on a "matching basis." [3]

STATE EXPENDITURES

Because of the extensive development of the grant-in-aid system in many other fields of governmental activity, influence of the federal government upon the fiscal well-being of public higher education of all types has been largely negative. State expenditures for higher education dropped from roughly 10 per cent of all state expenditures in 1915 to only 4 per cent in 1949. This was accompanied by a rise in the percentage of state expenditures on welfare and health programs and highway construction, all of which were greatly stimulated by federal matching grants. Thus, state services supported by federal grants-in-aid gained ground, while public higher education, which enjoyed no substantial federal grants for instruction, fell behind.

[3] The full implications of this point can readily be appreciated by educators in public and private institutions alike. A similar effect is created within the university budgets by another bonanza of the federal government, the research grant which does not carry adequate provision for overhead.

Further, the national government's expenditures, hence its taxes, have increased so rapidly, owing first to the depression and more recently to hot and cold wars, that state taxation, upon which publicly supported higher education ultimately and primarily depends, has not been able to keep pace with state needs. In 1929, federal taxes absorbed 11.4 per cent of the national income; in 1953, 27.4 per cent. In 1929, state governments took 2.3 per cent of the national income. This percentage rose to an all time high of 4.5 in 1937 as the states increased taxes to match federal grants, but this larger state income went to functions other than higher education. Since World War II a tax-conscious public, heavily burdened with federal taxes, has kept state taxes nearer 3 per cent than 4 per cent of the national income. Meanwhile, public higher education has had to share these limited state resources with other activities primarily dependent upon the state and with other governmental services heretofore completely supported by local taxation. Money subvened to local governments by state governments more than doubled in the last fifteen years. Thus, public higher education has been ground between the upper millstone of federal fiscal policy and the nether millstone of state aid to local governments.

PLIGHT OF PUBLIC HIGHER EDUCATION

It is especially important that there be a greater understanding of public universities at this time. The newly formed federations of independent colleges such as the Empire State Foundation of Independent Liberal Arts Colleges and the penchant of the Council for Financial Aid to Education and at least one great foundation to aid only the private institution may somewhat distort the picture of public higher education.

The financial plight of public higher education is about as serious as that of private higher education. Unfortunately, private colleges, in pleading for the alleviation of their fiscal plight, have made it appear that institutions publicly supported are "in the clover." Realistic appraisal of the situation indicates quite the opposite.

Faculty salaries

While the general working population has enjoyed an increase in real income of over 40 per cent since 1940, teachers in state universities and colleges have suffered a 5 per cent decrease in their real income. The top salaries paid in higher education today, as has always been true, are in the large private institutions, *not* the state universities. The better private liberal arts colleges often pay their faculties better for comparable work than do state institutions. It is misleading to compare salaries of professors in state universities having many professional schools with those in private liberal arts colleges. To compare the atrociously low salaries of a marginal private institution with the pay scales of the University of Michigan is unfair unless at the same time salaries of Salisbury State Teachers College are compared with those of Harvard. To hold and attract quality faculty, private institutions can, if need and daring are commensurate, improve salaries even if it means showing a deficit. Half of the private colleges purport to have such deficits. The state institution must operate within its budget, however inadequate, even at the risk of losing key personnel or hiring people unqualified academically or personally. To ignore a budgetary balance in the public institution is to break the law and invite possible prosecution.[4]

[4] Many states are themselves operating in an unsound fiscal manner with annual operating expenses running in excess of incomes. Between 1946 and 1952, the combined state indebtedness climbed from $17 per capita to $45.

Where appropriations go

Simply to divide the state appropriation of a public institution by the number of students enrolled conveys an illusion of prosperity which does not exist. The state university or college may be compelled by charter to offer so many programs that it cannot operate at a reasonable cost per student. A considerable part of the appropriation may go to agricultural extension and research, the support of geological surveys, and other public services, some tangential and some quite unrelated to undergraduate instruction. Moreover, state institutions usually have more than their share of the costly specialized and graduate curricula such as engineering, medicine, veterinary medicine, home economics, and laboratory sciences. Many state colleges are not permitted to collect tuition and sometimes when they are such fees must be turned over to the state treasury.

Capital needs

Moneys for capital needs of public institutions are as deficient as operating funds. The fact that most institutions have not sufficient space indicates that building construction has not even kept pace with present needs.[5] Since the war, higher education has been expected to house not only the teaching function but a considerable part of the nation's research activity as well. Research has undoubtedly stimulated col-

[5] The President's Commission on Higher Education reported that postwar crowding had resulted in an average of 110 square feet of space per student. The prewar average was 155 square feet and the U. S. Office of Education recommends over 180 square feet per student. Engineering and other laboratory curricula require over 200 square feet per student if adequate facilities are to be provided.

lege teaching, especially where graduate instruction is concerned. But government and other contractors have been reluctant to provide adequate operating overhead and have "sponged" on already limited instructional space with no thought of adding to it. It is not fantastic to suggest that higher education in the next fifteen years will need as much new plant as was built in the previous three hundred years of its history. To summarize the public institution's plight: state-financed higher education already has accepted more students than it can adequately accommodate in either dormitories or classrooms and has added more staff than it can properly compensate.

STATE TAX DIFFICULTIES

The uninitiated might think the answer to future enrollments and adequate financing thereof is simply to raise state revenues and appropriate the money to higher education. Of course it is. What are the difficulties? The chances of raising taxes and securing them for the support of post-high-school education are not good. The reasons are:

First, in spite of the expressed desire to cut federal expenditures, a balanced budget is no longer confidently predicted in Washington. We can expect no great relief from the federal tax burden to make it easier for the states to increase their taxation.

Second, the tax systems developed by the states are in general of the regressive variety and commonly employ direct rather than indirect levies. These features make the taxpayer even more resistant than usual to those "hateful exactions of government" known as taxes.

Third, most taxes are already being imposed at two or three levels of government.[6] This overlapping has been furthered of late by the propensity of states to increase the taxing authority of local jurisdictions.

Fourth, many states are precluded by their constitutions from fully exploiting certain tax sources. During the depression state constitutions were amended to restrict the use of the property tax. Strict court interpretation of so-called uniformity clauses in tax articles have proscribed the use of graduated income taxation in such states as Florida, Illinois, and Michigan.

Finally, special interest groups, dissatisfied with legislative appropriations usually tightly controlled by finance committees, have secured, sometimes by constitutional amendments, the dedication of certain lucrative taxes to their vested interest. This unsound fiscal practice has been justified on the basis of relating the tax collected to the corresponding expenditure, for example, gas taxes for highway construction. Thus, the so-called general funds of many states have been substantially reduced. Legislatures, if they would, are not able to budget for state services on the basis of proportionate need.

STATE GOVERNMENTAL WEAKNESSES

More fundamental than these tax difficulties are some basic weaknesses common to many state governments. These sometimes work against responsible development and execution of public policy even when the need is recognized. Legislatures often overrepresent territory and underrepresent people; therefore, policies desired by the majority often do not prevail. Governors are misnomered chief executives: actually, they commonly share executive leadership with other officials who may thwart the governor's policies but are not themselves held closely accountable by the people. Constitutionally, responsible state leadership is scattered, so that it is easy to ignore pressing problems and difficult to solve them. Under the American governmental system, it is in the state that we find the power centers of the political parties. As a result, state policies and administrations may be occasionally abused if to do so gains advantage for a political party in the ever approaching national elections which determine the grand prize—the Presidency.

[6] The 1954 report of the Committee on Intergovernmental Relations on Overlapping Taxes in the United States explains that 80 per cent of the taxes in the ten major tax categories are collected at two or more levels of government.

PRESSURE GROUPS

Political considerations being uppermost, executive leadership being poorly defined, and legislatures so often being unrepresentative, pressure groups, sometimes more powerful than the state in which they are located, can dominate. Such special interests may thwart an intelligently conceived policy, educational or other, designed for the public good. Corporations, through their lobbyists, sometimes sit on the state tax lid and unwittingly upon public higher education. At the same time, they are so concerned about the general well-being of higher education that in their own interest they make gifts to both private and state institutions.[7] To a certain extent, higher education has commanded unusual respect among politicians. On the other hand, as pressure groups have become more significant and the political maelstrom more turbulent, higher education, which has never developed a parent-teachers' association or similar champion, has had difficulty in securing adequate appropriations.

[7] Private higher education, to its great credit and financial gain, has discovered that corporate wealth obtains the same altruistic satisfaction from philanthropic giving as does the individual who pridefully displays the Red Feather in his lapel for community giving but who invariably gnashes his teeth when confronted with taxes rising from the legitimate costs of the state performing the same or equally vital community services.

PUBLIC SENTIMENT

People in the United States, whatever their political affiliation or economic interest, feel kindly toward higher education. It is within the reach of every man's child. It keeps the country truly a land of opportunity. A few tax facts, however, indicate that this feeling is not accurately reflected in state support of higher education. In 1953, higher education in Idaho and North Dakota was not well enough financed for colleges in these states to be cited as exemplary. Yet these two states reduced their taxes substantially. Delaware barely ranks in the top third of the states in the order of support to higher education, although it has the highest average individual income and the lowest combined state and local tax burden of any of the forty-eight states.

MORE AID FROM FEDERAL GOVERNMENT?

What are the possibilities of the federal government's financing public higher education? From past performance, not great. The federal government is trying to bring its budget into balance rather than add to its expenditures. No feasible plan has even been evolved to aid either students or institutions. Private colleges having indirectly benefited from federal aid to the GI might now oppose a federal aid plan unless they are included. Federal payments to all higher education, when approximately 80 per cent of the private institutions are church related, raise difficulties about the separation of church and state. Without pausing to speculate on the inevitable intricate secular controversy, one is able to predict that the federal budget balancers will use this

issue as a means of escaping still another expenditure burden.

The issue could be avoided, of course, by aiding the student directly. Two points come to mind in this approach. First, the federal government has been willing to aid *veterans*—not students. Second, in aiding veterans who are fee-paying students, the financial dilemma of higher education is not solved. Possibly it is complicated even further. Students, it has been argued, have a tendency to gravitate to those colleges and universities with minimal fees. The United Kingdom has demonstrated the feasibility of a limited program of national scholarships. Scholarships there have been a boon to the student—not the colleges. All British universities have had to receive additional help from Parliament through the University Grants Committee.[8]

NEED OF INDEPENDENCE

This administrative device may nevertheless recommend itself to higher education in the United States. It suggests a way of mitigating the threat to academic freedom implicit in appropriations direct to institutions. In receiving public money, especially federal funds, colleges and their need for autonomy encounter basic theories upon which representative government developed. The power to tax calls for representation. Expenditures from the public purse must be justified and accounted for to the satisfaction of the legally constituted governmental powers that be. These powers, especially when constituting one national government, may not tolerate the freedom that higher education must have if it is to make its inimitable contribution. So far, many state governments, prompted by the competitive situation among themselves and their institutions and between public education and private higher education, have permitted their universities considerable autonomy. Some state constitutions make the university an independent entity. In other states, corporate charters have given public institutions self-government. No such independence is likely to develop vis-à-vis the national government.

As the cost of higher education has risen, even a few of the states have lost sight of its need for autonomy. They have vested in nonacademic agencies certain fiscal controls over higher education. Colleges and universities have been increasingly subjected to control by centralized state purchasing and accounting and by uniform state personnel policies. In a few instances, controls over state printing have required state authorization of scholarly publications. Pre-audit of expenditures enabled a Governor of Florida to block effectively the Board of Control's choice for the university presidency. He threatened to withhold his signature from the salary check of the chosen appointee. Those properly concerned for academic freedom should be much more alarmed over these developments than they are.

To be worth while, learning and the institutions which foster it must be free and uninhibited. For this reason, Americans have been loath to place their schools at any level in a situation in which they might be subjected, either directly or indirectly, to the whims of those who might pervert them to selfish or political ends. It would be tragic to jeopardize higher education purely out of zeal to finance greater educational opportunity. If faced with the choice, we might better have less educational opportunity and maintain freedom. Colgate W. Darden, Jr., President of the University of Virginia, and a former Governor of that commonwealth, in discussing the relationship between higher education and the state said:

> . . . publicly supported educational institutions should not be administered as other branches of the state government because educational activities are quite different from other state operations. While teamwork and close coordination are required [with other state agencies], they are more apt to lead to mediocrity than to progress in educational institutions.[9]

STATE PLANNING

Fortunately, educators are a sanguine lot. Where are the signs of hope?

In the past few years two-thirds of the state governments have had commissions, patterned after the first Hoover Commission, studying their need for governmental reform.

Several states have so far recognized fiscal problems in the offing that they have made studies and reported on the probable pattern of their taxes and expenditures.[10]

All commonwealths are holding conferences to determine the magnitude of the educational job ahead on all levels and the finances which will be needed. These will culminate in the White House Conference on Education in the autumn of 1955.

A few states are taking other appropriate steps more especially related to the future well-being of higher education. Florida, Illinois, and California have pointed the way. In Florida, the Board of Control of Higher Education has employed a competent professional staff to embark on a planning and development program to relate that state's collegiate needs during the next twenty-five years to the industrial, natural, and cultural resources of the state. Illinois and California have initiated state-wide studies on birth rates, anticipated growth in higher education, and the needs resulting from them. The Governor of Michigan has convened the presidents of the publicly supported institutions of higher education there and asked them to develop a comprehensive plan to meet the impact of enrollment increases in the next fifteen years.

INTELLIGENT ECONOMIES

The public money now appropriated for higher education may be made to go even further. To accomplish this, sentiment, vested interest, local pride, and prejudices will need to be put aside for fiscal considerations. Some states have altogether too many state colleges and even with greatly increased enrollments they are not organized to educate their youth properly at a reasonable cost per student. In some states identical but inferior educational programs are offered by several public institutions. Some state-supported educational programs are competing for students among themselves and with well-established programs in private institutions. When students are divided among too many institutions, none of them, be they public or private, can operate at an optimum cost. Meanwhile, other specializations needed by students in a geographical area are ignored altogether.

Some states have committed themselves by law to certain educational programs when there are not enough students or funds to warrant them. Only poor-quality education or high-cost education can result. For example,

[8] A plan before Congress would permit substantial income tax reduction for parents of all college students. Such tax reduction has never been urged as a form of federal aid to colleges and universities, but inasmuch as it would permit them to raise fees, it would, in effect, amount to aid.

[9] See "Summary of Prepared Addresses," 32nd Annual Meeting, Association of Governing Boards, November 15–19, 1954.

[10] The most significant is the Temporary Commission on Fiscal Affairs of State Government of the State of New York, headed by Frederick L. Bird, Director of Municipal Research for Dun and Bradstreet, Inc., which issued its report in January of this year.

experts have estimated that a population of two million is needed to give adequate public support to a medical school. Five states with less than this minimal population are struggling to support accredited medical schools. An expensive-to-operate technical school may be supported by a state long after the state is surfeited, for example, with mining engineers and its minerals depleted. Such programs might well be consolidated with others in engineering to make at least one pre-eminent school of engineering in the state. Low-fee institutions to provide teachers for commonwealths have not altered their fee structure but they have enlarged their programs to become liberal arts colleges and even graduate schools. Half of the degrees they award do not lead to a teaching certificate.

Within each college and university efficient management must be given greater consideration. Respect for academic freedom does not give teaching personnel the right to determine the hour of day at which they will teach, the number of students to be assigned to each class, the number and variety of courses offered, or the number of hours per week to be taught. Management consultant services along with understanding on the part of faculty and administration of the crisis that confronts higher education should stimulate determination to make some internal savings.

POTENTIAL REVENUES

Another hope stems from the apparent ability of the states to support higher education. There is a lack of correlation between tax-paying ability and tax effort. This indicates there are potential revenues to be had for colleges and universities in many commonwealths. Half of the *top* ten states in terms of per capita income are among the *lowest* ten in per capita revenue collected. Nor is there any correlation between the per capita income in the states and the per capita expenditure for higher education. Of the top ten states in terms of per capita income—generally accepted as a satisfactory measure of ability to support governmental services—only California is found in the top ten in terms of support of higher education. If higher education is to face its future with confidence, tax collections must more nearly approximate the ability to pay and the percentage of state expenditures that higher education enjoyed in the 1920's must be regained.

Some additional revenues may be collected even though tax rates are not increased and tax payments in terms of ability are not measurably improved. The President's Council of Economic Advisers estimates a gross national product by 1970 in excess of 500 billion, a gain of 35 per cent. While attainment of this goal may be a boon to higher education, the economy is in turn dependent upon higher education if this growth is to be achieved. Thomas B. McCabe, former chairman of the Board of Governors of the Federal Reserve System, suggests that to reach this goal individual productivity will have to be increased 40 to 50 per cent. This will not be done simply by people working harder and in greater numbers. It will be achieved only by better methods and by fundamental and applied research which are the fruits of trained minds in a free society.

VENTURE CAPITAL

The people of the United States must realize that funds for higher education represent the true "venture capital" of the nation. Higher education, whether public or private, must no longer suffer from financial malnutrition. Too much depends upon its well-being. Our problem today is not a lack of sufficient potential resources for higher education. Rather, it is a lack of appreciation of the unique role higher education plays in the nation's future. When this is understood, the funds will be available.

John Alanson Perkins, Ph.D., Newark, Delaware, has been president of the University of Delaware since 1950. He was previously controller, Department of Administration (1948–49), and budget director (1946–48) of the State of Michigan, assistant professor of political science and secretary of the Institute of Public Administration, University of Michigan, assistant director, International City Managers Association (1945), assistant professor of government, University of Rochester (1943–45), teaching fellow and instructor in political science, University of Michigan (1939–43), and secretary to Senator Arthur H. Vandenburg (1936–37). He is currently a trustee of the Winterthur Museum and a member of the Executive Board of the United Nations Educational, Scientific and Cultural Organization.

DISCUSSION *

In the discussion there was apparent agreement that the division between public and private institutions was artificial, that tax exemption was a form of governmental subsidy shared by privately controlled institutions, and that in many states direct grants-in-aid or contracted services were common among universities and colleges usually referred to as private.

The extraction of funds from state legislatures is increasingly difficult. Tax sources available to states are diminishing under the competition of federal and local cesses. Political problems harass the university official representing the cause of higher education in the state legislatures. In some states, the composition of the legislature is not such as would favor the colleges and universities even though the public as a whole might be more generous. It was pointed out that there is no special pressure group equivalent to the parent-teacher associations interested in promoting general funds for higher education. The few pressure groups available are seeking funds for specialized schools and training programs within the universities.

The question of state interference in the internal affairs of the university was raised, and the conference concluded that except for a few extreme cases, state support has not implied state control in the educational aspects of the school. However, the number of expensive subsidiary services which the school is required to provide vastly complicates the administrative and budgetary problems of state universities. It was felt that there was little chance of introducing an ideal type of state aid such as is exemplified by the British educational grants system, which gives funds for general educational purposes without political control.

* The papers were distributed and were read by the conference participants prior to each of the scheduled sessions. Discussion from the floor was entertained by each of the authors.

This summary of the discussion and all summaries on later pages have been prepared by Dr. Richard D. Lambert, Assistant Editor of THE ANNALS.

Government Support of Private Colleges and Universities

By Carter Davidson

As we look into the history of government support of higher education, we discover that the line between public and private higher education has not always been very strictly drawn. For example, Harvard, Yale, and many other colonial colleges were supported by colonial grants in the early days. Even after the Revolution and the establishment of the Constitution of the United States, the various states made appropriations to colleges which are now considered completely independent. For example, in New York State both Columbia and Union received appropriations from the state legislature during the early years of the nineteenth century. The distinction was sharpened considerably in the year 1816, when the state of New Hampshire tried to make Dartmouth College the state university. This was resisted by the Trustees, and under the leadership of Daniel Webster was successfully fought through the Supreme Court of the United States, resulting in the famous 1819 decision.

Land-Grant Program

A few years later, when the public-lands problem began to grow large upon the horizon, the states felt that one of the best ways of using the public lands was to support higher education; therefore the land-grant program was put into effect. Although grants of land were occasionally made to colleges with private charters, most of these land grants were made to public institutions. In place of the land grant, many private colleges were given complete tax exemption on any land that they might hold within the state. These old "tax-exempt charters" have become very valuable in later years. In 1862, after many years of legislative activity, Senator Morrill of Vermont managed to get through Congress the famous Morrill Act, decreeing that 30,000 acres of the public lands, then largely in the West, be given to each state for each member of Congress from that state, for the establishment of public "land-grant colleges" within all the states of the Union. Apparently the original idea was that these land grants were to serve as endowment, but many of the lands were sold off before they increased greatly in value, and the proceeds were put into buildings and the establishing of the institutions.

Cornell University, which considers itself a combination of a private institution and a state college, has profited most from the land-grant endowment. In addition to Cornell, the Massachusetts Institute of Technology, the University of Vermont, and Rutgers University, all of which were considered private universities, were included under the land-grant provisions. It is interesting to note that within recent years both Rutgers University and the University of Vermont have been formally taken over in toto by the State of New Jersey and the State of Vermont respectively as their state universities. In at least two cases out of four, therefore, the granting of federal governmental support through the land grant has led eventually to the taking over of the institution by the state. All

other land grants were made to state universities or to establish new "state colleges" throughout the nation. These were supplemented by grants from the federal government in 1887 for the establishment of agricultural experiment stations, and appropriations beginning in 1890 for annual support of the program, particularly in agriculture.

Reserve Officers' Training Corps

Aid from the federal government to higher education has been definitely "programmatic"; through the Morrill Act, aid has been given for the development of agricultural and mechanical education, with the later addition of home economics. In 1918, in the emergency of World War I, the federal government established a Student Army Training Corps, which lasted only a few months, but was then reorganized as the Reserve Officers' Training Corps, on the campuses of both public and private institutions. It was required, however, that all land-grant colleges should have the ROTC. Previous to World War I the federal government had, of course, supported the United States Naval Academy at Annapolis and the United States Military Academy at West Point, and had given encouragement to military schools in the individual states. The purpose of the Reserve Officers' Training program, however, was not to help the colleges financially, but to provide trained manpower for the armed forces. It was usually necessary for the colleges to supply the buildings and secretarial assistance for the ROTC programs, though the government paid the salaries of the faculty members who were sent in from the armed forces personnel. The ROTC arrangements have worked fairly satisfactorily for thirty-seven years, since World War II in an expanded form.

National Youth Administration

Seeking to solve the problems of unemployed youth during the depths of the depression, the federal government established in 1934 the National Youth Administration, which continued for nine years to pay modest wages to boys and girls attending colleges and universities, as well as to some attending high school, for part-time work which they did in connection with their college duties. During the nine years that this program was in operation 620,000 students received aid amounting to more than $93,000,000. The colleges provided the supervision of the work without extra compensation, a very satisfactory arrangement, although it may have given some faculty members a habit of relying upon student assistance. I served for several years as an NYA co-ordinator on a college campus, and I must say that it helped many students to go to college who would otherwise have been unable to attend.

Effects of Prewar Federal Aid

As we look back over these activities of the government before World War II, we see certain patterns emerging. Perhaps as a result of the land-grant program, the federal government now has a practical monopoly over all agricultural education. Could it be said that as a result the farmers trained in these land-grant colleges are more amenable to federal assistance in the total agricultural program than they would have been if their education had not been supported by the federal government? ROTC programs on our campuses have certainly modified the curricula at many colleges, and at times the granting or withholding of an ROTC unit has been used as a club to force colleges into changing their require-

ments or even increasing their enrollments. The NYA program was discontinued in 1943 because World War II did away with the unemployment problem among American youth.

STATE AID

There have been interesting experiments in the various states of the Union to give state aid to the independent colleges. Before 1942 and the outbreak of World War II, the chief state aid to private higher education was the privilege of tax exemption, though in some states, such as New York and Minnesota, there was a modest program of state scholarships which could be used at either the private or public institutions. In New York State the state government established "contract colleges" of forestry at Syracuse University and of ceramics at Alfred University, in addition to the contract colleges at Cornell. More recently this formula has been modified by the establishment of the State University of New York, which includes all these contract units. Some are, however, still operated in cooperation with the independent colleges. Pennsylvania, in addition to supporting Pennsylvania State University and a number of teachers colleges, has been making annual appropriations to the University of Pittsburgh, the University of Pennsylvania, and Temple University, particularly for medical education. Virginia made appropriations to the College of William and Mary for teacher education, and now lists that institution as one of its state teachers colleges. California has located tax-supported junior colleges on the campuses of independent senior colleges, as at Stockton.

FEDERAL PROGRAMS SINCE WORLD WAR II

These and other experiments were pushed into the background when World War II descended upon us. Under the stimulus of the defense program, the federal government began to pour billions of dollars into educational and research programs; they were, however, still programmatic in nature. For example, in the year 1950 there were nineteen federal departments which were carrying on educational programs; namely, the Departments of State, the Army, the Navy, the Air Force, Justice, Commerce, the Treasury, Agriculture, and the Interior, and the United States Maritime Commission, the Federal Works Agency, the Veterans Administration, the Federal Security Agency, the Tennessee Valley Authority, the Housing and Home Finance Agency, the National Advisory Committee for Aeronautics, the Atomic Energy Commission, the War Assets Administration, and the Institute of Inter-American Affairs. It should be emphasized once again that these programs were established, not in order to give financial aid to the educational institutions, but in order to provide services to the departments of the federal government concerned.

Veterans Administration educational program

Of all these programs the largest in number of individuals affected and in its total cost was, of course, the Veterans Administration program of education for those who had been in the armed services. Through Public Law 16 those veterans who had been in any way incapacitated by military service were given an opportunity to rehabilitate and prepare themselves for useful occupations. The stated purpose of Public Law 346 was to enable the veteran to make up for the time lost in military service, upon the assumption that his education had been interrupted by the war. Although it is true that the great increase in student enrollment threw a heavy burden upon all institutions, it was at the same time an unprecedented opportunity for service and for growth for many institutions which desired to expand. The formula of paying tuition fees plus a maintenance allowance enabled the independent colleges to charge fairly high tuition fees without severe handicap to the veterans.

The program had many good points, including freedom of choice of the institution attended, but it would be willful blindness on our part if we indicated that there were no difficulties involved. Dozens of meetings were held between representatives of the Veterans Administration and of the colleges and universities to try to iron out misunderstandings on a variety of questions, such as the equitable definition of a "change of course," the out-of-state tuition charges made by state institutions, the delays in payments, the suitability of certain courses for college credit, and the restrictions placed upon colleges because of the flagrant abuses by "fly-by-night" institutions below the college level.

Out of some of these difficulties came the regulations of Public Law 550, for the education of veterans of the Korean conflict, which made all payments direct to the veteran so that he would himself control the tuition charge and maintenance allowance. Some private colleges have insisted that the form of Public Law 550 has forced many veterans to attend public rather than private institutions to make their allowance cover the cost. To this the government can answer that P. L. 550 is "programmatic," intended to help the veteran, not the college.

Training of federal employees

Since World War II the federal government has continued to use private universities and colleges for in-service training of federal employees, including a large number of those in the armed services who are sent there while on active duty for training in particular fields. During the year 1950, there were more than 60,000 such federal employees receiving training in American colleges. In selecting these institutions, the federal government seems not to discriminate against the private institution.

Contract research

In the area of contract research, the war stimulated government grants for this purpose, and they have grown rather than decreased since the end of hostilities. In addition to the major installations such as Los Alamos and the Argonne Laboratories, for which the government has contracted with the University of California and the University of Chicago respectively, the Department of Defense and the Atomic Energy Commission are spending over $100,000,000 a year on research projects, and the majority of these are in private rather than in public institutions. The United States Public Health Service is spending over $11,000,000 a year, most of this in the private medical colleges. The National Science Foundation, which eventually may spend $15,000,000 and whose program may become a permanent part of our national picture, has also made grants without discrimination to private institutions and to individuals studying in private institutions. As a result, over two hundred institutions are carrying on research on contract from the federal government for over $132,000,000 a year, this amount constituting more than 70 per cent of all the research being carried on in these institutions.

The question might well be raised as to whether such a large amount coming from the federal government on the basis of annual appropriations does not make the colleges and universities heavily dependent upon the ups and

downs of the federal budget. The institutions are also handicapped in the employment of personnel for these research projects, since tenure as members of the faculty cannot be granted to these men and women, yet they may be on the university staff for a long period of years, so that a moral obligation is established. The Public Health Service has also made grants for teaching, particularly in the fields of cancer, cardiovascular diseases, and psychiatry, which have done much to improve the teaching in the medical schools, but which have made the medical school budgets heavily dependent upon this support. Withdrawal of such grants would create a crisis in the budgets of most of the medical schools of the country. Although the private colleges are inclined to complain about the uncertainty of federal grants for research, they are the first to admit that without these grants the amount of research going on on our college campuses would be greatly reduced, and progress, particularly in scientific fields, would be slowed down immeasurably.

Surplus supplies

Toward the end of the war the armed forces discovered that they had vast amounts of supplies which were in surplus, and they began offering these, either as gifts or at a great discount in price, to the colleges and universities. The various offices of distribution in the country seemed to have different policies for distribution, and as a result some institutions profited greatly while others were left out entirely. Eventually these discrepancies were alleviated, and today the distribution seems to be a fairly equitable one throughout the land. Many colleges have equipped their shops and laboratories with such surplus equipment, and there are still billions of dollars worth of it awaiting distribution. It is to be hoped that the federal government will exercise wisdom in this distribution, to see to it that not merely the squeaky wheels are greased but that those institutions which can make the best use of the materials and are in greatest need of such help are adequately supplied.

Housing

When the veterans in their millions descended upon the campuses in 1946, housing was such a severe problem that the federal government had to step in and erect many temporary dwellings as dormitories for single students and apartments for married veterans. Through the Public Works Administration there were also a number of classroom buildings erected for the use of the veterans. Most of these were temporary structures, and many have now been demolished or are approaching demolition. Others will probably remain on our campuses for many years to come.

To take care of the problems of permanent housing, Congress passed a bill in 1950 authorizing the Housing and Home Finance Agency to lend up to a maximum of $300,000,000 to the colleges and universities of the country for the erection of dormitories on a long-term loan basis at a very low rate of interest. To date about half this amount has actually been taken up by the colleges, and the rest will undoubtedly be used as it is released by the federal authorities. This aid has gone to private institutions in the main, because the public colleges can issue their own tax-exempt bonds at a rate of interest lower than that provided by the federal government.

Income tax deduction

Congress has given further help to private education by increasing the percentage which can be deducted from personal income, in reports to the government for tax purposes, by those individuals who wish to contribute to charity. As yet the results of this increase in percentage have not been clearly visible. Modifications have also been made in the dependency regulations for federal income tax to enable the student who is in college to work in the summer and during term time and still be considered a dependent of his family.

EMERGENT QUESTIONS

As we look back over the happenings of the last fifteen years in the United States, we must ask ourselves several very basic questions about the effect of federal policy upon our private institutions. Is the gradual shifting of our total college enrollment away from the private institutions to the public institutions due to the aid being given by the federal government to tax-supported land-grant institutions? Does the fact that twelve private universities, the California Institute of Technology, the University of Chicago, Columbia University, Cornell University, Harvard University, the Illinois Institute of Technology, Johns Hopkins University, the Massachusetts Institute of Technology, the University of Pennsylvania, Princeton University, the University of Rochester, and Stanford University, plus five state institutions, the University of California, the University of Illinois, Iowa State College, the University of Michigan, and the University of Minnesota, received almost 90 per cent of all the money given in contract research indicate that the federal government is interested in encouraging the larger institutions at the expense of the smaller, the universities at the expense of the undergraduate colleges, or could it be argued that the programs of use to the federal government can be carried out only in the larger and more fully developed professional and graduate schools? Is it fair to say that the federal government seems to be interested only in vocational and professional educational services rather than in the liberal arts? Is the heavy stress on the sciences and engineering justified in view of the major social problems with which our civilization is faced? Can the government reduce its stress upon applied science and give more attention to basic scientific research?

PROPOSALS FOR FUTURE FEDERAL AID

These questions and others like them lead us to a consideration of various proposals which have been made for future federal aid to private education. Public Law 346 and 550 veterans will soon disappear from our campuses. What will be the pattern of the future?

What concerns are national?

As we look to the future we ask ourselves, "What concerns in the educational area are not national in nature?" If we accept the argument that since there was no mention of education in the federal Constitution all educational matters should be left on the local level, then the programs previously described, such as the land-grant college program, are hard to justify. Our past experience would suggest that the federal government should not grant aid to education except to carry out a program which is distinctly federal in nature and of direct assistance to the federal government, such as contract research and the rehabilitation of war veterans. There is a strong feeling that if we do not stick to this principle of programmatic aid there will be no limit to the invasion of local autonomy by federal activities. To avoid this possibility, some have suggested that the federal aid should not be given to individuals or to institutions but to states, who would then distribute it to individuals and institutions. Although this

may seem to avoid federal interference, is it not really a subterfuge? Does this not merely multiply the problems by forty-eight or more, as local conditions and prejudices enter into the picture? Would a state-administered veterans-aid bill have been better or worse than what we have experienced? Will the issue of the separation of church and state, which is already rearing its head in New Jersey and elsewhere, make it impossible for state authorities to grant aid to denominational colleges?

Is medical education, which has often been pointed out as an area of federal concern, really a special case? True, there is a United States Public Health Service, but if the principle of making medical education a national concern is accepted, could not the same case be built up for teacher education or engineering or business administration or social work or political science? Is federal aid to medical education merely a back door to the nationalization and socialization of all medical services? The mere fact that medical education is in a more desperate financial condition than some other forms of education hardly seems justification for calling in the federal-emergency pulmotor.

State need as a basis

Does the argument really hold water that since some of our states are unable to take care of their educational needs alone the federal government must step in? In any given year it might be shown that Mississippi and Arkansas are having a harder time than New York or California to see a high percentage of their young people through high school and into college, but are these differences so permanent in nature that they must be treated by federal surgery? It has been argued that changes in the economy during the last ten years have revised the picture of the needy areas very markedly. It is also argued that the less wealthy states could take care of their educational needs more satisfactorily if they would revise their tax structure in the direction followed by some of the more wealthy states.

Pressure toward federal scholarship program

Ever since the publication in 1947 of the six-volume report of the President's Commission on Higher Education, entitled *Higher Education for American Democracy*, the major pressure for federal aid to higher education has been in the direction of a federal scholarship program to increase the percentage of young people of college age in attendance at our American institutions. The President's Commission argued that 49 per cent of the age group seventeen through twenty-one have the intellectual ability to finish the junior college level of education, and 32 per cent have the ability to finish the four years of college or specialized professional education. The achievement of these percentages would bring about an immediate doubling of the number of students in college, and as our population increases would step the figure up even higher. The President's Commission felt that the chief deterrent to entering college for this age group was financial and that therefore the only means by which the percentage could be increased would be a system of scholarships. It believed that scholarships from private sources would be inadequate to meet the need, and that therefore the federal government would be the only possible source from which such scholarships could come. This report stirred up great debate among educational leaders, but no action has as yet been taken by Congress, because Public Law 346 kept our colleges more than filled to the end of 1950, and in that year, just as the discussion of a federal scholarship program was growing warm, the Korean conflict broke out, which has kept the federal government in the student-aid business ever since. Now that Public Law 550 is going to come to an end the agitation has begun again that we should use these two great veteran scholarship programs as models upon which to build a citizen's scholarship plan. There is no doubt whatever that many colleges are in favor of a federal scholarship program. A survey made by the National Education Association in 1949 reported that 83 per cent of the private colleges and 80 per cent of the public colleges approved of the program.

How great is the need?

Let us ask ourselves some pertinent questions. Do a very large number of able and interested students now actually remain away from our college campuses because of their financial inability? Frankly, this is rather hard to believe in a period of high levels of family income, unprecedented savings in banks and government bonds, opportunities for summer employment and for part-time employment during the college year, millions of dollars in unused college loan funds, and the recent heavy growth of scholarships sponsored by private corporations and foundations. It was estimated by the Commission on Financing Higher Education that in 1949–50 124,000 undergraduate students were receiving over $27,000,000 in scholarships. A study reported in the April 1955 number of the *Educational Record* by Mr. John N. Schlagel indicates that in twenty-five selected colleges and universities during the year 1952–53 there had been an increase of more than a 100 per cent in the scholarships over a four-year period. We can infer, then, that there is certainly more than $50,000,000 in scholarships being distributed through the colleges themselves to students during the current year. In addition, there have been millions of dollars set up by corporations, such as the Ford Motor Company, Union Carbide, and General Motors, to supplement the college scholarships. The legislature of New York State has just doubled the number of state scholarships of $350 a year awarded each May to graduating seniors. This year 3,388 new scholarships will be awarded, plus 300 special scholarships for nurses.

Do we have clear proof that such philanthropy is going to be insufficient to meet the need for student aid in the years ahead? Is it not true that many of the students who stay away from college do so not for lack of money but for lack of motivation? If we assume that the average cost of attending a college in this country for a year is $1,200, does it not seem reasonable to expect that the family or relatives or friends should put up one-fourth of this amount? One-fourth could come from the student's savings or summer earnings, one-fourth from earnings during the college year, and the final fourth from either a scholarship or a loan. Although it may be pleasant for a student to go to college without any responsibilities other than study and enjoyment of extracurricular activities, there has been abundant proof that a limited work load of not more than fifteen hours a week can be carried without damage to either the academic record or the participation in student affairs. Although a student might hesitate to go heavily in debt in order to start college, there is good reason why, as he approaches graduation and employment, he should be willing to finance his college education at least in part on loan funds. These loan funds are usually set up so that the rate of interest is very low indeed and often does not become effective until a year or two after the student has been graduated.

Is not the proper way to help more

students through college to give the aid to students who really need it rather than to those whose parents want the prestige of a prize scholarship award or whose families feel they need a new automobile or television set more than they need a college education, or to athletes who think that the world owes them a free education? Would it not be better to work out an integrated program of aid for students who wish to go to college by which they will use family and personal savings during their first year to get started and then will gradually move over into the field of work and loans to finish the job? The Commission on Financing Higher Education felt that if all our present resources were sufficiently utilized, there would be very few able and properly motivated students who could not attend college, and for these very few other states of the Union might very well follow the pattern set by New York State.

Federal scholarships—proposals and objections

In the 1950 Congress, Senator Thomas and Representative Barden introduced a bill for a federal scholarship program. Similar bills have been introduced into succeeding Congresses with some modifications in the direction of defense-related aid. The Thomas-Barden bill prohibited federal control of the educational institutions to which the students went and placed the administration of the program in the hands of the Commissioner of Education, with the aid of an advisory council of twelve members. No discrimination was to be allowed on the basis of race, color, or creed, but awards were to be made on scholastic merit and stipends were to be granted only if financial need could be established. An appropriation of $15,000,000 per year per class would allow 75,000 students to be assisted with an average of $800 a year in outright scholarships, which could be supplemented by loans up to $2,400 in a four-year period, to be repaid within ten years after graduation.

This bill and others since have been attacked on the basis that they open an avenue for political favoritism toward groups in society or toward favorite institutions. It has also been argued that any system of scholarship tests would obviously militate against those students who had attended the poorer secondary schools and might result in injury to minority groups. Others have felt that subsistence allowance should be separated from tuition allowance, so that the student would have more freedom of choice of the institutions he might attend. In order to avoid the dangers of state politics, President Milton Eisenhower, of Pennsylvania State University, has advocated the prorating of these scholarships among colleges and universities on the basis of their enrollment, leaving the award and administration of the scholarships up to the institutions. This would be following the pattern used by the National Youth Administration during the depression. Others have advocated that the NYA work grant is a good pattern to follow, but the fear of federal control of the colleges still lies at the bottom of much of the opposition. The report of the President's Commission stated as follows:

> Sound public policy demands that the state be able to review and control educational policies in any institution receiving public funds. The acceptance of public funds and thereby public control by private institutions would tend to destroy the competitive advantages and free inquiry which they have established and which are so important in providing certain safeguards to freedom.[1]

[1] United States, President's Commission on Higher Education, *Higher Education for American Democracy* (Washington, D. C., 1947), Vol. V, p. 58.

British grants to universities

Some friends of federal scholarships have wondered whether we might not learn a lesson from the British, who through the University Grants Committee have been making national grants direct to the British universities over a considerable period of years. Today the British universities are largely dependent upon these grants. A study made by President Dodds and others for the Commission on Financing Higher Education reported, however, that although this program had worked well for the British universities, it was not one for export to the United States, where the number of institutions was so much greater and local political pressures were much more common.

CHANGE IN DIRECTION IMPROBABLE

In conclusion, it would be fair to say that a change in federal policy in the direction of outright grants to private educational institutions for support of the liberal arts rather than the practical sciences and of scholarship grants to students on the basis of academic ability and need rather than on the basis of service to the armed forces or other federal agency would mark a severe break with the past. At the present moment such a change does not seem likely to come about.

Carter Davidson, Ph.D., LL.D., Litt.D., L.H.D., D.Sc., Schenectady, New York, has been president of Union College (Schenectady) and chancellor of Union University (Albany) since 1946. He was president of Knox College from 1936 to 1946, after ten years of college English teaching. President Davidson was chairman of the Board of the Empire State Foundation of Independent Liberal Arts Colleges, president of the New York State Association of Colleges and Universities, and member of the Committee on Relations between the Federal Government and Higher Education and of the Board of Trustees of the Carnegie Foundation for the Advancement of Teaching. He was a member of the Commission on Financing Higher Education (1949–52). He is coauthor of Poetry: Its Appreciation and Enjoyment (1934) and Colleges for Freedom (1947).

DISCUSSION

The conference was concerned about a growing tendency in local governmental bodies to whittle away at the areas of tax exemption open to institutions of higher education. Although some of the participants felt that the private institutions were not exploiting to the fullest extent their power to acquire tax-exempt real estate, others urged caution and tact in the use of this device. Pointing out that the purchase of tax-free real estate was a hidden form of subsidy without governmental control and at the discretion of the institution, they argued that the public frequently objected strenuously to the acquisition of new properties under the tax-exempt clause and that educational institutions are usually defeated in long, expensive legal battles. In some municipalities, laws have been passed to bar further removal of property from the tax list by requiring a local vote to exempt real estate purchases by educational institutions. As a result, the private colleges have at present mixed holdings of taxable and tax-exempt properties. Nevertheless, it was felt that endowments of real estate taken over tax free are a fruitful means of combating growing deficits.

The conference raised a number of detailed objections to state and particularly to federal programs purportedly in aid of higher education. The federal government, it was alleged, is interested only in specific services and programs such as ROTC, agricultural extension, and contract research

rather than in general education. Under the "general welfare" clause in the Constitution the way was legally open for more general support. The discussion leader enumerated a series of difficulties experienced by colleges in dealing with federal government programs. Nineteen different federal agencies conduct separate programs in the colleges, and each is eager to have its program isolated from those of other governmental departments. They further insist on taking a direct hand in the educational administration of these programs and require short-run and highly visible evidence of success. Of all the programs, the NYA drew the most praise, inasmuch as the funds were given directly to the colleges to dispense in student aid. Some objected that NYA was a made-work program and did little to assist the colleges themselves.

There was a strong feeling among some members of the group that government aid, in particular federal aid, was not only unsought by the privately controlled schools but was potentially damaging. Scholarship aid to individual students, unless it is accompanied by supplemental grants to the institution, covers only a fraction of the expenses of educating the student, and the school has to bear the rest of the financial burden.

Opinion was divided on the desirability of the proposed federal scholarship scheme. It was argued that present resources were adequate and that the resulting governmental bureaucracy required to select and administer the scholarships would spend three dollars for a task the private institutions could do for one dollar. Moreover, the tendency of control to follow funds appeared inescapable. Others felt that there was no other way to handle the forthcoming "Bull Market" in higher education.

Opinion was also divided on the contribution that contract research is making to financing higher education. It was felt to be particularly useful where graduate students were numerically high in ratio to the total student body, for contract research is a form of subsidy for graduate training. Otherwise, it frequently does not adequately cover operating expenses. The emphasis in contract research is heavily on the technological and applied sciences rather than on basic research. There are variations among the different contracting agencies. The Office of Naval Research in particular is more likely to finance basic research than most other governmental divisions. However, so long as the governmental agency itself carries a practitioner's label, on occasion it was free to sponsor essential liberal arts and humanistic studies.

Opinion was uniformly favorable to the proposed legislation granting tax deductions to families who were supporting college students.

It had been anticipated that the change of the GI Bill provisions under Public Law 550 would operate to induce veterans to select public colleges and universities where tuitions are considerably lower than in private institutions of equal status. In the case of four-year colleges, surveys do not bear this out, although a long-term trend in the direction of state schools has continued.

The discussion leader listed several other questions which were of interest, but could not be debated in the time available:

1. Would there be any improvement in programs if federal government programs for higher education were handled by the states?

2. Is there any justification for the heavy emphasis on financing medical education to the exclusion of others?

3. How justifiable is the expenditure of federal funds to support higher education in the so-called "needy states"?

4. Why do not state institutions increase tuition charges to lower the general tax burden and equalize the competition between public and private colleges?

Alumni Support and Annual Giving

By ERNEST T. STEWART, JR.

IN its efforts to further the cause of the annual alumni fund, the American Alumni Council may well have done a disservice to itself and to our college and university alumni. For in reporting the steadily rising total of gifts to such funds, we have conveyed the impression that these amounts represent the sum total of alumni support. Lost sight of are the millions of dollars which alumni bequeath or give outright each year to colleges and universities for new buildings, increased endowment, or other capital purposes. Only as we recognize that these gifts too represent alumni support do we gain the proper perspective on this major element of educational philanthropy.

For every dollar contributed by alumni through the annual funds, at least two alumni dollars reach the institutions directly or through other channels. Such are the findings of the latest American Alumni Council Fund Survey, which, for the first time, has made a determined effort to uncover and publicize the figures for total alumni support. Though some of the 352 institutions reporting did not have adequate records to provide a complete figure, most could give the desired totals and others agreed to report in the future. So it is that two-dollar totals are receiving equal billing this year: $21,619,035 as the amount contributed in 1954 by 791,008 alumni (20.3 per cent of those solicited) to their annual funds, and $62,902,852 as the total of alumni support to these institutions. (About one-fourth of the degree-granting colleges and universities are included in the report.) It may well be true that the beneficiaries of higher education are not yet fully facing their financial responsibilities. Nevertheless, the figures are gradually being made available that ensure fairer evaluation of the share of educational philanthropy represented by alumni support.

Though the American Alumni Council takes pride in its yearly survey, it faces real difficulties in reconciling individual reports. Some colleges use the alumni fund as the receiving agency for all current gifts from whatever type of donor, be it parent, friend, church, or corporation. Some assign to the fund all alumni contributions of whatever type, including bequests and capital gifts. The diversity that characterizes our system of higher education applies equally to the fund-raising approaches and bookkeeping systems in use on the various campuses. In general usage, however, the terms "alumni fund" and "annual giving" are synonymous; each is defined as a plan under which substantially all of an institution's alumni are solicited for contributions every year, in whatever amount the individual chooses to give and usually for unrestricted purposes or for operating expenses. Since these are for the most part recurring gifts, the funds live up to their description as "living endowment." In his forthcoming book on *How to Raise Money for Higher Education*, John A. Pollard cites the $21,619,035 figure of the 1954 survey and observes:

> If this annual giving were capitalized at 5 per cent, it would represent roughly $430,000,000, or about one fourth of the aggregate endowments now possessed by all of America's colleges and universities.

1954 SURVEY

In this 1954 survey, the reporting institutions were listed by types of institutions. Here are the statistical highlights of the eight groups.

The 140 private coeducational institutions reporting received $7,846,280 from 18 per cent of the alumni solicited. An additional $9,629,514 contributed by graduates and former students was not credited to their funds, bringing the total of alumni giving to $17,475,795.

The 62 private men's institutions were close behind in fund gifts, with $7,676,568 from 36 per cent of the alumni. Total alumni giving, however, was far larger, reaching $29,520,350.

The 51 private women's colleges reported $2,403,568 from 35.4 per cent and $5,939,921 all told.

Though only 7.2 per cent of their alumni responded to the appeals, the 37 state universities and land-grant colleges barely trailed the women's institutions in both categories, with $2,177,106 and $5,895,249.

The other four groups, in order of their dollar totals in alumni fund contributions, were: 27 secondary schools with $735,487; 10 Canadian universities with $430,413; 14 other tax-supported institutions with $265,749; and 11 junior colleges with $83,864.

In the matter of individual performances, private universities in the East once again tended to dominate the so-called honor rolls based on the Fund Survey. By combining the totals of its various graduate schools with the College results, Harvard emerged on top in the category of alumni gifts to the fund with $1,233,448. Yale continued over the million dollar mark in second place, followed by Notre Dame, Columbia, Princeton, Dartmouth, Vassar, Wellesley, Cornell, and Stanford in that order. Harvard, with 30,402 alumni contributors, also led that honor roll, with Yale once again in second place. Ohio State, Princeton, Dartmouth, Pennsylvania, Cornell, New York University, Smith, and California followed. Princeton edged Dartmouth for honors in percentage of alumni participation, with 67.9 per cent to Dartmouth's 67.7 per cent. Other colleges up among the leaders were Mount Holyoke, Regis, Amherst, Connecticut, Jefferson Medical, and Worcester Polytechnic Institution. Because of a large bequest from George Davison, Wesleyan with $7,030,291 led all others in total alumni giving during the year. Harvard, Cornell, Yale, Smith, Princeton, Union, Dartmouth, Rutgers, and Massachusetts Institute of Technology shared the remaining places on the honor roll.

LANDMARKS IN ALUMNI GIVING

Even though the major share of alumni support still comes through other channels, the growth of alumni funds and of the annual-giving concept has been encouragingly steady. Seventeen years ago, when the annual survey began, only eighty-six funds were known to exist; these reported a total of $2,815,130 in annual gifts. As for the future, most observers probably agree with Dr. Wilson Compton of the Council for Financial Aid to Education, who believes that alumni fund giving will, by 1970, exceed $100,000,000 annually as it "becomes more general, more systematic, and more dependable as a major continuing form of support of higher education."

The organization of the first alumni association, at Williams College, dates back to 1821, and beginnings of many other features of this distinctly American contribution to education are found in the records of the next half century. Yet in times of financial difficulty it was the trustees and not the graduate groups who were counted on to make up the deficits. Just before the turn of the century, however, a few imaginative and resourceful leaders at Yale University found the key that was to open the door to alumni support. James E. Armstrong of Notre Dame puts it this way: "College presidents wrote all the chapters of the old testament of fund raising in the first 250 years of financing higher education in this country. Then Yale discovered the alumni."

It was as early as 1870 that a Yale professor, William Graham Sumner, put forth the novel argument that college graduates felt under obligation to their alma mater for their education and might be willing to do something about it. In elaborating his views, he wrote:

> Many can never pay the debt; a few can become munificent benefactors. There is a very large number, however, between these two, who can, and would cheerfully, give according to their ability in order that the college might hold the same relative position to future generations which it held to their own. The sense of gratitude, the sense of responsibility, the enlightened interest in the cause of education, which are felt by these men, constitute a source which has never yet been tried, but which would yield richly.

Twenty years later Yale alumni decided to put this theory to the test. In a pamphlet mailed to all Yale men in 1890, a group of leaders reported the establishment of the Alumni University Fund Association in the following terms:

> A widespread sentiment has existed for some time among Yale graduates in favor of some systematic endeavor to increase the resources of the University. While opinions may have differed somewhat as to terms, the fundamental idea common to all plans suggested has been to seek contributions from the largest possible number of alumni, to be continued yearly at the will of the givers and to be devoted preferably to University uses as distinguished from special uses of any departments.
>
> The special feature of this effort to benefit our University, in which it differs from all previous efforts, is that it not only furnishes an opportunity to accumulate principal, the income of which can be used as it is needed, but especially invites annual contributions which, continued from year to year as the majority of them are likely to be, will themselves form the income of what may be fairly deemed a permanent endowment and an income which can be immediately applied to current needs.

Thus was born annual alumni giving, heralded by some today as "the very rock on which all other giving must rest."* Its virtues were slow to gain recognition, however, and it was fifteen years before Yale reached the $104,500 goal it had originally set and nearly twenty-five years before similar fund operations were set up on other campuses—at Brown, Union, Illinois, Cornell, Dartmouth, and Wesleyan. And even today, sixty-five years after that pioneering step, less than a third of our colleges and universities appear to have made a serious effort to establish and operate an alumni fund.

After 1890, the next important date in recording the development of alumni support is 1904–5, when the Harvard alumni responded to a challenge from President Eliot to increase endowment funds for faculty salaries and allowances, and raised $2,400,000 in one year. About two thousand contributed in response to personal interviews and to letters and circulars sent to all graduates. It was the most successful capital fund effort that had yet been organized for an educational institution and was the first to go over the million dollar mark. A year later another bench mark was laid when Harvard's Class of 1881 made a twenty-fifth anniversary or reunion gift of $113,777 to the University, the income to be used for unrestricted purposes. Soon after that Princeton's Committee of Fifty, organ-

ized to secure pledges for current expenses and endowment for Woodrow Wilson's Preceptorial System, collected $4,079,693. And in 1914–15 the alumni of the University of Michigan organized and successfully carried out a campaign to raise a million dollars for a student union building. With alumni committees set up to work throughout the country, it was the most highly organized campaign up to that time and served as a model for many that were to follow.

THE CAPITAL FUND DRIVE

The years immediately after World War I proved to be the heyday of the intensive capital campaigns, mostly for permanent endowment. Basic techniques had been perfected for such campaigns as a result of the drives initiated by the Young Men's Christian Association and developed during the war. Conditional gifts from the General Education Board stimulated the efforts. Professional fund-raising organizations came in to work with alumni and administration in directing the operations. Most of the campaigns succeeded, and by 1926 sixty-eight of them had raised 149 million dollars for higher education. Yet even before the outburst was curbed by the depression, resentments were beginning to arise. Alumni were growing tired of paying the same old debt over and over again. It soon became clear that there was a limit to the number of intensive campaigns that could be conducted among any one group of alumni or friends. The constant pressure, the vigorous salesmanship, the inspirational meetings, and other trappings eventually produced a reaction of bad feeling against high-powered efforts. One such effort a decade seemed to be about the absolute limit.

President Seymour of Yale used to tell a story illustrating the point about two nice old ladies who visited a silver fox farm and took a tour with the owner as their guide. Near the end of the visit one lady asked him how many pelts they were able to get from each silver fox. "Lady," he replied, "we find that if you skin them more than once a year, they get very, very nervous." And so it was with alumni.

Gradually alumni and educational leaders began to see the virtues of annual giving as a method of raising funds on a continuous basis to meet the urgent needs of the institutions without alienating the alumni. They came to realize that they were trying to meet a continuing need with an intermittent technique. Urgency was its basis, and a constant state of emergency becomes commonplace. So it was that many discovered the annual alumni fund and, as a supplement to it, the development program concerned with all forms of giving and all types of givers.

This is not to say that the capital fund drive has gone out of the picture. As the needs for new buildings, new programs, and endowed projects kept bearing down on hard-pressed colleges, many saw no recourse but to launch intensive campaigns. In the process, budding alumni funds were knocked off like sitting ducks. As a result, all too frequently in the past, friction has developed between the alumni officers and the professionals brought in for the drives. Those on the scene have resented the red-carpet treatment accorded to the outsiders: the generous budget, the large staff, the unlimited services of the president, the full cooperation of administration and trustees —in short, all the support, actual and moral, that they had sought in vain in their efforts to make a significant operation out of the annual fund. In addition, there was resentment that the campaign organizers were capitalizing on long years of alumni cultivation without acknowledging the debt. And at the end, those at home were faced with the prospect of picking up the pieces and trying to regain momentum for the alumni fund and the long-term selling job it does on a comparatively low-pressure basis.

RELATION OF ANNUAL GIVING AND CAPITAL GIFTS

Fortunately, such friction has lessened in recent years. The parties concerned seem to be developing a better mutual understanding of the need for diversified fund-raising programs. And new techniques are being developed to join the alumni fund to the capital gifts effort. One of the "joining" techniques calls for a certain percentage of alumni gifts to capital to be credited to the annual fund; another has the alumni fund picking out a specific capital project, such as a dormitory, within the over-all program for development. It is significant to note, however, that a growing number of institutions have decided to limit capital solicitation to the relatively small group of alumni who are in a position to make substantial gifts. An analysis of most campaigns shows that 10 per cent to 15 per cent of the givers usually account for about three-fourths of the dollar total in a major effort. Is it not more logical, then, to limit capital gifts solicitation pretty much to that group and seek the annual support of the rest for the annual fund? Yale has made that decision and states the case frankly to its alumni. In the words of the chairman of Yale's Committee on Endowment and Gifts:

> The alumni fund is being granted absolute priority in the quest for additional support for Yale. We want every Yale man to contribute. . . . Second, and wholly distinct, is the University's appeal for capital gifts. . . . We recognize that there are those among us who, quite aside from making a thoughtful, proportionate annual gift to the alumni fund, are in a position to make substantial capital gifts to special needs of Yale. No alumnus will be encouraged to contribute to Yale's endowment program if such a gift would preclude his annual and thoughtful support of the alumni fund. We who have the responsibility of bringing new capital support to Yale understand that the alumni fund comes first in Yale's plans. It is the hope of all of us that the fund will rank high on the annual list of all Yale almuni giving.

Even though there is often the need of some sort of special campaign to excite the imagination of alumni and friends and provide the opportunity to seek special gifts, complete disruption of a successful alumni fund will probably be avoided by most colleges in the future. Many presidents now seem to agree with their colleague who recently wrote: "As time goes on, I am impressed with the fact that the steady growth of an alumni fund is more important to the college than a periodic capital gifts drive."

INGREDIENTS OF THE SUCCESSFUL FUND

What then are the characteristics of a successful alumni fund? What are some of the benefits it brings to the institution? Why is it that more and more frequently it is being assigned priority over any other kind of fund raising?

A recent leaflet put out by the Council for Financial Aid to Education lists these common denominators of successful operations: "Active and effective leadership, informed and enthusiastic volunteer solicitors, a timely and convincing base in behalf of alumni contributions, a goal related to the giving potential of the alumni, and competent staff and promotional procedures." In addition, the blessing of the board of trustees of the institution concerned and the strong encouragement of the president are important.

Too often college officials, enchanted

with the results of alumni fund raising but woefully ignorant of the theories, have launched solicitation without developing other facets of an institutional alumni program. The shock when it came was rude, for you cannot raise funds in a vacuum. You cannot expect to get anything from your alumni without giving something to your alumni. Alumni service is a two-way street. In the words of Loren L. Hickerson of Iowa, current president of the American Alumni Council:

> Alumni loyalty and support must be earned, positively and actively, as a permanent part of the college program. In a realistic sense, the function of the alumni fund raiser is that of systematically and sensitively collecting the dividends of what the college itself has earned over the past years. If he is effective and if the program he heads is effective, then the nature and extent of the return is a fair measure of how well the institution has done its job.

This particular presentation will not attempt to analyze the various features of the student experience and the general alumni program that help to produce solid alumni support. It will not go into the matter of records, addresses, class and club organization, undergraduate cultivation, continuing educational opportunities, informative and interesting publications, and all the other features of a good alumni program today. Instead, it urges acceptance of the word of all experts in the profession that such a program is the foundation on which dependable alumni support must always rest. The dangers of a fixation on fund raising to the exclusion of all else have been stated by no other expert so picturesquely as by Mr. Armstrong of Notre Dame, who writes:

> The alumnus who once resented being considered an alcoholic cheering unit will not be flattered by his newly threatened identity as an institutional blank check. Single track fund raising will lead you to an ultimate dead end. . . . But if we make our Wall Street office just a branch of the Main Office and just a part of our major operation, we can not only live, but live happily ever after. . . . When the intellectual banners are unfurled, when the athletic colors continue to warm alumni hearts, and as the personal friendships between student, faculty and administration grow by increasing contact and sharing, then financial support will come as naturally and as surely and as adequately as quo involves quid.

Institutional support of alumni program

A great many of the imperative basic services to alumni, it is significant to note, are now being provided only because the institution has agreed to foot the bill. Throughout the country the trend is running strongly away from dues and from the concept of an independent, self-supporting alumni association. Interdependence is now the watchword. In exchange for alumni support through the annual fund, the alert college is now underwriting all expenses of the alumni program and granting full privileges of membership in the association, including the alumni magazine, to all graduates and former students. The amount of the subsidy may seem heavy for a while. Yet almost invariably that phenomenon occurs which has been an inspiration to so many: the gap between the total subsidy and the funds received quickly narrows and soon the alumni fund becomes a source of substantial, dependable funds second to none.

Why then are so many alumni funds continuing to operate in low gear? Sometimes it is the alumni association that is shortsighted on the potentials of an expanded but subsidized program; sometimes it is the president and administration; sometimes it is the board of trustees controlling the purse strings. One of the most discouraging letters ever received at our office came from an able alumni executive announcing his resignation and offering the following explanation:

> The association is beginning to achieve some stature at last. Our fund drive this year was more successful than ever before. Sumptuous new quarters are planned for us. Yet the governing board shows no sign of doing the things that they should be doing. Their attitude is that if we raise the money, then they will subsidize us. You know that it works the other way, and so do I. There is a limit to what one can do on an extremely small budget. We have reached that limit. Having reached what I consider maximum potential on the money available to me, there seems to be no point in sitting around.

Though nothing could be done in this particular case, the only answer for the conservatives and skeptics seems to lie in keeping constant reminders in front of them of what others are accomplishing. Some maintain that what has worked for others will not work for them because "our school" doesn't have a long history of loyal and devoted alumni interest and support. Mr. Hickerson characterizes this as "the weakest kind of rationalization," and argues:

> "Our school" never will have that kind of history unless we set out to build it, in our own places and at our own levels, through the only investments which will do this or any other great job—brains and money.

STATE UNIVERSITIES

One of the major developments of recent years in the growth of alumni support is the rapid strides that tax-supported universities have made to set up successful annual funds and to operate with great effectiveness in areas once thought of as the province of the private institutions. No legislature ever provides all that is needed, even though appropriations will always be looked to for primary support. As one president has noted, "There is every reason to believe that genuine greatness will be realized only as private benefactions also begin to play their part." Spurring developments in this area has been the record of the Development Fund of the Ohio State University Association, which in its first fifteen years has received 167,968 gifts totaling over $4,000,000. Today it records annually over 20,000 alumni contributors—more than those ordering football tickets during a season—and has 3,000 volunteers at work soliciting throughout the country. Much of the money raised has gone into scholarships, fellowships, and similar programs. Much has been raised as "venture capital" needed for research in the development of the first electron microscope, a new magnetic cooling system, cobalt-60 needles for cancer treatment, a radio telescope, and other advancements in nuclear science. Though Ohio State pioneered in this area, it no longer stands alone. Michigan, Minnesota, Iowa State, and others are moving rapidly in alumni fund raising and may yet take over the lead.

BEQUESTS

One of the important by-products of annual giving is its service as a feeder line. For once an alumnus forms the habit of annual giving, he is far more likely to consider his college for a bequest. The Sterling bequest to Yale and the Murphy bequest to Northwestern are usually cited as exemplary of this relationship. But Ohio State provides a more recent example in the late Ralph D. Merson, an active alumnus and the largest individual contributor to the Development Fund from the start. When his will was filed, it was learned that he had left the bulk of his large estate, exceeding $7,000,000, to Ohio State University.

CORPORATION SUPPORT

The recent emergence of business and industry as a source of financial support for education has had a mixed effect on alumni giving. Certain colleges who were on the verge of making a real effort to enlist the aid of their graduates seem to have been diverted by the prospects of corporate gifts. Why bother with the alumni, some reasoned, when the corporate giants will come to our rescue with generous checks? Some alumni may have acquired similar ideas in feeling that they were soon to be relieved of the necessity of providing support. These were negative reactions, which fortunately seem to be on the wane. On the positive side, the prospects of gifts from business and industry, particularly through such devices as the General Electric Corporate Alumnus Program, may eventually prove to be one of the most effective spurs to alumni support ever devised. For administrators and alumni alike are beginning to realize that an institution which has not demonstrated alumni support cannot make an effective case for help from business and industry. It must be ready with affirmative answers to the questions that are now inevitably asked: What are the alumni doing to help? Do those who enjoyed the benefits of what the college has to offer believe in it and give it their enthusiastic support?

Much has been done to convey this idea to the alumni in seeking their help. One college president notes that "gifts from outside the family depend largely —sometimes wholly—on the degree of alumni support." Another urges alumni to be aware that theirs is the first responsibility, since "there can be little incentive for others to help if the beneficiaries themselves are not actively interested." But the one quotation which continues to be used by dozens of funds with greatest effectiveness is a statement made nearly forty years ago by President Eliot of Harvard, who said:

> It is, of course, largely by the extent of the support accorded to a college by its own graduates that the world judges of the right of that college to seek cooperation of others in planning for the future. An institution that cannot rally to its financial assistance the men who have taken its degrees and whose diploma is their passport into the world is in a poor position to ask assistance from others. It is not merely what the alumni give; it is the fact that they *do* give that is of supreme importance.

SETTING UP AN ANNUAL GIVING FUND

As a device for covering quickly some of the current developments and issues in the field of alumni support, we might assume briefly the task of an able and informed administrative officer who has been handed the assignment of setting up a comprehensive fund operation for Alfalfa College. Fortunately, a good general alumni program and magazine have paved the way for the steps he plans to take and he has the backing of his president. He has no illusions that the task will be easy. The Commission on Financing Higher Education concluded that "one of the peculiarities of private philanthropy is that effort is required to obtain it." He feels this may well prove to be the understatement of the year.

He starts by accepting the verdict of his new colleagues that "the full development of alumni potential in annual solicitation is the cornerstone for all other efforts." He is determined that his fund will be more than a vehicle of alumni affection, that it can and should be big business. But many decisions must be made. First, what should its title be? If he calls it the Alfalfa Alumni Fund, will he be able to get parents, friends, and other groups to join with alumni in using it as the medium for their annual gifts? Should he plan on separate programs to be set up later with such names as Alfalfa Parents Fund and Corporate Friends of Alfalfa? Would one over-all Alfalfa Annual Fund or Annual Giving Fund or Living Endowment Fund be better? Should it be the channel for all alumni philanthropy, including large capital gifts? Does it offer sufficient motivation for the potential large giver?

What about organization? Who should be on the advisory board? If there is merit in the argument that the fiction of independence should be maintained, so that alumni believe they are responding directly to the appeals of fellow alumni rather than to their alma mater, should the fund be set up technically as an organization outside the Alfalfa administration? What about objectives? Should funds be raised for unrestricted purposes or should there be multiple objectives that will appeal to all tastes? Would scholarships and faculty salaries have the greatest appeal? Does the average alumnus prefer to give for buildings or other brick and mortar so that he can look at the finished product, beat his chest with pride, and say: "I helped build that, and there's my name on the plaque to prove it"? What about specific participation and dollar goals? Should he follow the lead of Tulane, which never makes its goals public for fear of hurting the morale of alumni if they are not achieved; or of Barnard, where they are deliberately set low to raise all spirits by going over the top; or of Princeton, where the sights are set high—a million dollars from 70 per cent of the alumni—and a confident "wait until next year" spirit develops as the charts steadily creep up toward those figures?

Should he run his fund for a full calendar year or concentrate his efforts on a shorter campaign? What about the theme of his general mailings? Should they invariably be straightforward and serious, or are a little humor and even an occasional gimmick called for? Should a system of class agents be the basis of his solicitation effort, or has personal solicitation proven so effective that it alone is the answer? Can the two systems be combined? Should personal solicitors be used only to approach special gifts prospects in advance or used as a cleanup detail? How extensive an organization can the main office service until the program is running in high gear? What about special alumni reunion gifts, for the fund or for capital purposes? How best to keep in front of alumni the tax features of such forms of giving as stock certificates, life insurance, and annuities? What about parent solicitation? Can he emulate the record of Carleton College, which pioneered in this endeavor and now receives about $60,000 annually in gifts from the families of current students and graduates of recent years? What about bequests? Should he limit himself to keeping lawyers well supplied with data and publishing frequently suggested testamentary forms? Or should be try to set up a counterpart to Dartmouth's Estate Planning Program, where alumni in all classes out twenty-five years or more are encouraged tactfully and effectively to provide bequest funds for Dartmouth, and where at least 20 per cent of the members of thirty-eight classes are known to have drawn wills leaving the College sums that range from $200 to $250,000?

Personal solicitation

One of his most important decisions may prove to be the one on personal solicitation, generally regarded now as the most promising new technique for effective alumni fund solicitation. Central mailings from the campus continue to be important, as are the letters from class agents. Yet increasing evidence

is developing that there is no substitute for a personal visit from one alumnus to another and that regional committees are worth all the time and effort they entail. The job of setting up a personal solicitation program is akin to that of establishing branch offices for a national sales organization. Normally, it is wise to start slowly, establishing regional committees in the areas of major alumni concentration first and then gradually expanding into a more ambitious, nationwide program. No solicitor probably should be asked to visit too many prospects—some put the maximum at ten—and a constant effort to reduce the number assigned to each worker is all to the good. In fact the real goal, as one enthusiast describes it, is to lower the ratio every year until the point is reached where every alumnus solicits personally only his own gift. For the task of raising money for his alma mater usually does more to capture and maintain the interest of the average alumnus than any other program. He comes to know more about his college; he takes a positive interest in its well-being; he is honored to be asked to work for it.

PERCENTAGE OF PARTICIPATION

Some alumni funds are concentrating now on increasing the percentage of participation with only a secondary concern for the amount that is raised. Primarily, they want to develop the habit of giving among alumni, and they are taking to heart Dr. Eliot's view that "it is not merely what the alumni give; it is the fact that they do give that is of supreme importance." Personal solicitation can do a major job here. Whether used as a cleanup or as the heart of the fund effort, personal calls can pick up many of those who do not respond to a mail appeal, even from a classmate or a good friend. It is particularly effective with that frustrating group known in the trade as "LYBUNTS," those who gave last year but not this. Most of these and many of the others not responding to mail fully intend to make a contribution but somehow let it slip by—unless a personal solicitor drops around to pick it up. As for raising the level of giving, nearly all philanthropic agencies have come to believe that a personal visit and a verbal explanation —ideally supplementing good literature on the subject—will almost invariably produce a larger gift than a mail appeal. In moving in this direction in recent years, alumni fund raisers are only following the trail blazed by their own capital campaigns and by such agencies as the Red Cross and community chests.

VARIED APPROACHES

As the annual fund movement begins to come of age, much thought is going into the question of how best to approach these millions of alumni to enlist their support for education in a measure closer to their true giving potential. More and more able people are being assigned to this important task; the necessary budgets and staffs are being provided; new techniques are being developed all the time. And success is being achieved on additional campuses with each passing year. But are we really getting over to these graduates and former students the need for assuming a lifetime financial obligation to their alma maters? Are we really convincing them that the old school tie must become a strong bond of obligation as well as a symbol of sentiment?

The approaches continue to be varied. Some cling to the "roll call concept," asking alumni to report in every year as a matter of habit. Some keep reminding alumni of the hidden subsidies in their education, and by overemphasizing the obligation argument lose sight of La Rochefoucauld's advice: "Do a favor, make an enemy; let him do you a favor and make a friend." Some use

the crisis technique: Give or the college will close down or, worse yet, the federal government will take over. Some put major emphasis on sentiment, secure in the belief that nostalgia has always been and always will be a potent weapon with alumni. Some rely on gimmicks, on clever devices, realizing that the average person is besieged with solicitations and something eye-catching is needed to make him respond to any appeal.

Accentuate the positive

Yet clear evidence is developing that the strongest case can be made for those appeals which "accentuate the positive" and "eliminate the negative." As Princeton's George J. Cooke points out, "the sooner we can disassociate ourselves from the idea of alms taking and put the operation on a positive basis, rather than negative, the better off we will be." Harvard's David McCord describes the virtues of this approach in enlisting the alumni volunteers:

> We do not go to our class agent with a plea, we go to him with a challenge. Today he does not face the distasteful task of dunning his classmates; he faces the rewarding opportunity of enlisting their support in free education in a free land.

A valuable new asset of alumni fund raisers these days in their efforts to increase the extent of alumni support is the phrase, "thoughtful and proportionate giving," and an affirmative presentation created by Harold J. Seymour, one of the country's top fund consultants, for the Yale Alumni Fund. It is a check sheet for thoughtful and proportionate giving outlining the four main philanthropic areas: (I) religion, (II) education, (III) community services, (IV) world services. Accompanying the sheet is this suggestion, presented after consultation with officers of various community services and with churchmen of all faiths. "Anyone with a balanced interest in all four areas," it reads, "could start with an arbitrary yardstick of 30-30-30-10 per cent for Areas, I, II, III and IV respectively—modifying these proportions to suit individual loyalties and interests." How is it working? It is too early to tell. Yale's Charles Watson points out:

> Like everything else we try, it will take time to educate our alumni on it thoroughly. But as a vehicle, this formula will in later years certainly be recognized as an important step forward to increased thoughtful and proportionate giving to the Yale Alumni Fund.

Yet one point should perhaps be made, parenthetically, in behalf of negative appeals. On at least two occasions alumni have been asked ***not*** to support an institution unless the administration complied with certain demands. One came from William F. Buckley in his book *God and Man at Yale,* which demanded that alumni withhold their support until the University took action on his evidence of socialistic and atheistic teaching. The outcome of this negative effort—the Yale Alumni Fund went over the million dollar mark for the first time. More recently, Mrs. Aloise Buckley Heath, writing on the letterhead of the Organization for Discrimination in Giving, urged many of her fellow alumnae of Smith College to exercise such discrimination until certain members of the faculty were dismissed. The result —an outpouring of letters, checks, and other expressions of solid alumnae support comparable to nothing before in the history of the College.

Traditional wails

Even as shifts are made from a low-pressure fund operation to a really professional effort, some of the trappings of the former logically remain. One is the occasional appeal to sentiment combined with the positive, forward-looking

approach. A second is the continued goal of cheerful giving—the result of creating in the alumnus an honest desire to make his annual contribution willingly as his means, his time, and his heart permit. And the third is a change of pace, an art that is just as important in alumni relations as in baseball. Unless very well handled, appeals at reunions and at class and club meetings continue to be taboo. And interspersed with any written fund appeals must be good alumni magazines and other interesting and informative mailings. One fund raiser is so concerned about his postal budget that he refuses to let a single mailing go out to alumni—even a Christmas card—without a fund reminder and some kind of pledge card or return envelope. Most recognize the virtue of the change of pace in forestalling the traditional alumni wail, "The only time I ever hear from my college is when they are asking me for money."

There is a second traditional wail: "My college always seems to need money." There is only one answer to this, and it must be impressed upon alumni. If it is a good college, it will always need money. By their very nature, educational institutions are, or should be, insatiable. As has been pointed out to a group of presidents: "Any person will tell you, however reluctant he is about passing the hat, that the fully endowed church has lost its vitality. This is equally true of the educational parishes over which you preside." Just as the alumni fund movement was getting started, the pioneers at Yale anticipated this complaint and wrote:

> There are perhaps some who object that Yale always wants funds. But is not this the proof of her progress in life? When she ceases to have wants, when she has not at least a dozen purposes for which she would gladly use money, she will no longer be worthy of her past history or of our present devotion.

JOINT EFFORTS

Over the years alumni fund raisers have worked closely together, primarily through the American Alumni Council, in furthering this important movement. There has always been much to learn and a constant influx of new ideas and new techniques to analyze and absorb. Since each was dealing with his own alumni body, there was essentially no competition and no possible reason to hold back on the good ideas that each was developing. In addition, they all had and still have a tremendous stake in spreading the alumni fund movement to every institution in the country. As one veteran, Allen Hawley of Pomona College, noted nearly ten years ago:

> The reason is simple and fundamental. It will help me to raise more funds from my constituency. As all graduates from all institutions become more aware of the problems of education, it will become easier for each one of us to raise more money from greater numbers of his own alumni. . . . What I want to see is a feeling that it is the accepted thing for alumni everywhere, regardless of the type of college or university from which they graduated, to help support their respective institutions.

Some fund raisers have gone on from there to advocate one big national alumni fund effort, with a few even suggesting a single collection agency like the United Negro College Fund. Most, however, are thinking of the community chest type of organization in advocating national publicity and promotion for the separate campaigns. The virtues and the needs of education must be sold, to alumni specifically and to the public in general, and they argue that no one college can accomplish this alone. They are grateful for the fine efforts of the Council for Financial Aid to Education and other existing organizations. Yet they feel that some new agency must be set up, or the American Alumni Council vastly expanded, to do this job.

NO SUBSTITUTE FOR ENDOWMENTS?

As a lengthy postscript to a presentation that already runs long, I want to advance a personal belief: the real future of alumni support lies in selling the concept of alumni giving less to the alumni than to our leading educators. I have in mind those who continue to hold fast to the view that there is no substitute for endowment—for the tangible invested assets—as a guarantee of an institution's future financial stability. They are the ones who stand in the way of the potential development of annual giving by failing to accept it as a full-fledged partner of endowment in twentieth-century educational financing. They appear not to recognize it as "living endowment," a system which enables a great many generous and interested persons to do with small contributions what a few big gifts would do in the form of endowment; or as a means of giving the interest on a capital gift rather than the capital gift itself.

Much has been written of the demise of the big giver, the wealthy philanthropist whose gifts once formed the bulk of support for American education. The reports of his death, like those of Mark Twain's, may well be exaggerated. But even if the day of the large individual giver is not over, the day of multiple gifts which together make a large total has definitely arrived. It was a day heralded as early as 1870 by that same farsighted Professor Sumner of Yale:

> When we get tired of waiting for the rich man's thousands, we can begin to take the poor man's dollars. We have examples enough before us of success in business which has been won by seeing that there was more money to be made out of the pennies of the million than out of the dollars of the upper ten thousand. . . . If every graduate who could afford it should give the college ten dollars, and others should give more in proportion . . . we should reach results which we can never attain by waiting for the tardy generosity of a few men of extraordinary wealth.

For nearly three centuries, endowment, along with income from student fees, has been viewed as the most dependable financial resource of virtually every privately conducted college or university. The depression years brought abrupt changes. Endowment is still important, particularly to the six private universities and the sixteen liberal arts colleges that receive about half of the one hundred million dollars of income from the two billions in endowment held by educational institutions today. But it has not proved itself a particularly salable commodity for gifts —except for bequests—since 1929.

Only gradually are college presidents being weaned away from their enchantment with endowment funds. Such views as Alfred P. Sloan's are beginning to give them pause. Speaking at a meeting of the Council for Financial Aid to Education in July of 1954, Mr. Sloan said:

> Let's cut out gifts to endowment. . . . I do not believe that relying on endowments is making the most effective use of your money. You need capital now—not only money for expansion and development but money to take care of the deficits that you are facing. I feel that you will be better off to get as much money as you can now, use it up in ten years, and then trust to your competence and your efforts and the work of those who are helping you to carry the institution along at the end of the ten-year period. This is the point of view of one who is tremendously interested in higher education and who is earnestly seeking ways and means to make it more effective.

In a particular situation—that of providing increased scholarships for the Graduate School of Business of Columbia University through annual giving—Mr. Sloan's views were echoed recently by Dean Courtney C. Brown:

> As we have thought of this matter, we have gradually come around to the view that that is the proper way to handle student assistance. Endowment funds are all right if they are in hand, but they can tie up a very large amount of money for the amount of current assistance that can be made available. More and more colleges and universities are coming to the realization that the substitution of continuity of giving must take the place of endowment income in these days of smaller personal fortunes and lower returns on investment. We are going to look to the alumni to be our principal support in this effort.

Continuity and a broad base

It is this same Dean Brown who has made one of the most effective arguments yet advanced in behalf of the alumni fund by stressing its continuity and the fact that the base of its support is broad. "An annual alumni drive, if properly organized," he believes, "can be relied upon with some confidence because it has many small sources. It is not dependent on one big source that might from year to year show a high degree of variability."

Because of this stability, it is significant to note that at more and more colleges the annual alumni fund is coming to be looked on as a "budgeted asset." At Dartmouth, for example, the trustees in setting the budget for the academic year estimate the College's needs and then request the Alumni Fund to furnish a certain amount of the revenue. The surplus—and recently there has always been a surplus—goes to the College's scholarship program.

WHICH ROAD?

The whole movement of alumni fund raising has reached an important juncture. One road leads to new emphasis on annual fund raising, a spur to increased effort greater than any ever provided in the past, including the imaginative Corporate Alumnus Program. A second leads to a subordination of alumni fund raising to a search for millions of dollars in capital funds. The decision as to which road will be taken is not left to those who direct annual giving operations. It is one that is to be made by the officers, directors, and advisory committee of the Ford Foundation and such other foundations and philanthropic agencies as are energized to similar action by the Foundation's $50,000,000 offer of conditional grants to help raise faculty salaries.

Though the Ford program will be limited to a group of private colleges and universities, it promises beneficial results throughout the field of higher education out of all proportion even to the initially large size of the grant itself. As the *New York Times* noted editorially, it constitutes "an extraordinarily timely, effective and wise way of improving the whole structure of American education." Though the detailed plans have not yet been announced, it is known that the grants which go to the institutions are to be used as endowment, with the income earmarked for undergraduate faculty compensation. To qualify for a grant, each institution will be asked to match it with funds from other sources in various matching ratios—one, two, or three dollars for each dollar offered. Each must demonstrate its capacity to raise funds, by virtue of the Foundation grant, that it would not otherwise raise.

Here is the decision affecting the future of alumni fund raising that lies with the Ford Foundation officials. Will their insistence on matching dollars virtually force colleges to launch intensive capital campaigns for the several hundred million dollars that will be needed? Or will they give the colleges the chance to turn to their alumni with a significant new challenge—to raise the level of annual alumni giving by $40,000, or $80,000, or $120,000, with faculty salaries as the objective, and demonstrate that this new figure is a floor and not a ceiling? Despite the evidence of the stability and continuity of alumni funds, such a decision may seem like a gamble. Yet if this Foundation action is to have "a cumulative effect charged with a high potential," is not some measure of vision and courage required?

Inspiring examples

There are inspiring examples.

In 1948, at a time when Princeton's Annual Giving had settled on a $250,000 plateau, the Board of Trustees made a dramatic announcement. A badly needed increase in salaries had been voted for all members of the faculty, to be paid for out of funds which Princeton did not have. Would the alumni come to the rescue? Would they that year double their annual giving to provide the additional $250,000 that was needed? Would they ensure—in a sense "endow"—the funds for the future by keeping Annual Giving at a minimum figure of $500,000 in the future? The response was so enthusiastic there was little doubt about the outcome. The $500,000 goal was surpassed, and the curve, after one slight dip, has continued to climb. Today Princeton's Annual Giving has passed the $900,000 mark and is nearing a record-breaking 70 per cent in alumni participation.

In a recent report by the head of the Vassar Alumnae Fund, Mrs. Helen Couch described the dilemma Vassar faced in 1949: to go all out to secure an additional $10,000,000 in endowment or to accelerate alumnae giving to the level of $350,000 annually—"roughly the equivalent of the $10,000,000 which we then would never have to raise." She noted that the suggestion was greeted with apprehension:

> Instead of capital funds in the bank producing a safe yearly income, the only securities would be the intangibles of continuing loyalty, affection and concern on the part of her alumnae for Vassar College. It was on these intangibles as security that we decided to gamble. Actually, as has since been abundantly proved, there never was a gamble.

In 1954, the Vassar Alumnae Fund recorded $520,386, and Vassar received a total of $744,868 in alumnae gifts.

In that same year, when the Yale Alumni Fund was bringing in a half million dollars a year, its Board of Directors made a decision of great significance. Within two years (that is, by 1951 when Yale would begin to mark her 250th Anniversary), the Fund would aim for the million dollar level in annual giving. Once it was achieved, the objective would be to maintain it as a permanent plane of giving. The schedule was met, and the University continues to receive this annual income that is the financial equivalent of $12,500,000 of invested endowment and an expression of confidence in the Yale of today that money cannot buy.

READJUSTMENTS

If these and other examples influence the decisions that are being made on implementing the Ford Foundation program, a new day in alumni fund raising could be dawning. There would be some necessary readjustments, of course. Some funds now operating completely independently of the college might have to surrender sovereignty in the interests of close co-ordination and efficiency.

Some would have to abandon their low-pressure concepts. Many would have to change their objectives, with the so-called unrestricted funds as the major casualties. Yet in most cases the changes may work to the fund's advantage. A dollar for faculty salaries and a dollar for unrestricted purposes are of equal value. And the experience of many alumni funds indicates that an appeal in behalf of the faculty and the cause of better teaching has a strong pull for most alumni. Recently a public opinion research organization polled five hundred leading citizens in Chicago for a local university. The results showed that a majority of those who make gifts to higher education prefer to see the money used for faculty salaries.

"We won't be able to do what we should for the teacher," one observer recently noted, "until we can show that the alumni are strongly behind the program. No other leadership group has one tenth their power." What better way to rally alumni strongly behind this cause, I submit, than to turn over to them the opportunity to match the grants and share in this move "to strengthen American education at its base—the quality of its teaching"?

Ernest T. Stewart, Jr., Washington, D. C., has been executive secretary of the American Alumni Council since 1951. He was previously editor of the Princeton Alumni Weekly, following four years' service in the United States Navy as an air combat intelligence officer.

DISCUSSION

The discussion was concerned with the programs and problems which develop when a university seeks extensive and continuing alumni support. Several formulas were suggested whereby the administrator could gauge the amount of alumni support he could reasonably anticipate. One suggestion was that 1 per cent of the annual income of each alumnus is a fair standard. Another suggestion claimed for education 30 per cent of all charity gifts made by an individual alumnus. An earlier scheme which called for a dollar for every year since the alumnus graduated was considered too limiting for large gifts and not persuasive enough for small gifts. Dartmouth's scheme of advertising a giving curve with a peak in the middle age group seemed a more flexible device. It was generally agreed that to win the support of 70 per cent of the alumni in any fund drive is a reasonable goal.

The raising of the level of alumni support is not without problems. At least 10 per cent of an increase in income must be expended to obtain the increment. The university should take over and finance an alumni magazine and must sponsor other alumni functions. The magazines should not be direct vehicles for solicitation. Another set of problems arises out of the relationship between annual giving campaigns and sporadic capital fund drives. The speaker urged that the two be of equal standing, but kept separate and carefully co-ordinated so that one does not interfere with the other. The practice at Yale University where no one is encouraged to give to the capital fund if it will diminish his support of the annual fund was mentioned with approval. Middlebury College has compromised by allocating one half of all that is received to each of the uses—capital and current expenditures.

Both the high- and the low-pressure fund-raising techniques were discussed. It was remarked that professional solicitation agencies generally please neither the campus nor the alumni. Roll call alumni drives which seek to enlist the support, however small, of every member of the alumni are useful at the outset. Thereafter, low-pressure techniques which establish the habit of giving are preferred. Appeals based upon the obligation of the alumni to the school soon lose their effectiveness. The University of Notre Dame has introduced a novel system wherein token gifts of five cents each are solicited from the current student body to encourage a donation tradition for future alumni. Personal solicitation is used at different schools for different purposes. Sometimes it follows repeated central mailings to exert final pressure on the remnants, sometimes it is restricted to "big givers," and sometimes it is spread through all organized alumni groups. Class agents are an especially useful device. It was pointed out that the alumni respond best to appeals for funds earmarked for faculty salary increases.

The general increase in alumni financial gifts to tax-supported institutions was remarked, and a question was raised as to whether the state governments would decrease their budgetary allocations accordingly. It was reported that Ohio State University's experience was to the contrary, that increased state appropriations have followed increased alumni giving.

Corporation Support

By Wilson Compton

Financial aid by business corporations to the colleges and universities is sound business policy. It is an opportunity for them, as well as a responsibility. It is not a charity but an investment in their own future. Its basic legality has been settled by the courts. It should be handled separately from their ordinary contributions and donations. It should be based on policy determined at their highest levels of authority; and should be regarded as a continuing function of their business management. Business concerns should accept a reasonable share of financial aid to higher education but not exclusive support. They should pick the institutions with care and then keep "hands off" their internal affairs.

THIS sounds arrogant, does it not? It would be if it represented an outsider "preaching" to business concerns and undertaking to tell them what they should do. But it is not that. This is the voice of fifty of America's principal industrial leaders, including the heads of many of the largest corporations, talking among themselves only a month ago about the problems, the importance, and the opportunities of corporate support of higher education in this country. These gentlemen from coast to coast, representing some of the most respected corporations in America, were meeting in a two-day conference at Arden House, the seat of the American Assembly, under the auspices of the Graduate School of Business of Columbia University and the Council for Financial Aid to Education. They were meeting for purposes not unlike the purposes of this notable conference, to explore the widening range of common interests and mutual needs of industry and higher education in this country.

Interdependence of Business and Higher Education

What happens to American education will eventually happen to America. Businessmen know that. There are now in the United States more than eight million college graduates. In all of its enterprises our country is becoming more and more dependent on college-educated men and women. This always has been true of the so-called "learned professions." But during the past half century, and especially since World War I, it has gradually become true in business and industry, in political life, increasingly in agriculture, and now even in labor. College graduates constitute about 10 per cent of our adult population. But they head three-fourths of our biggest industrial and commercial enterprises. During this century they have provided nearly three-fourths of our national leaders; all but two of our Presidents; nearly one-half of the members of the Congress; three-fourths of our Cabinet officers; and four-fifths of our judges. Nearly seven-eighths of our oncoming business executives nowadays have college or university origins.

We often think and speak glowingly of our twentieth-century industrial revolution, which is still under way. Less often do we think or speak of our twentieth-century revolution in higher education. It is, to be sure, less visible, less spectacular, less dramatic. Yet it is more significant and more revolutionary than the revolution in industry itself! If higher education were today to be subtracted from American industry there would soon be no industry from which to subtract it. At the same time business corporations, small and large—hundreds and thousands of them—are providing the opportunities for livelihood to two-thirds of our population, and gradually more and more of the earnings and savings of the American people are in the custody and at the disposal of American business corporations.

This is not a prelude to a dissertation on sociology or political economy. It is merely a recognition of the scope and the magnitude of the interest of higher education in what happens to business and of the interest of business in what happens to higher education. Both are interested in productivity. Both are interested in freedom. Both understand that freedom, private enterprise, and public education are segments of the same circle.

Technology and Liberal Education

Some weeks ago the head of one of the most respected industrial concerns in America was speaking to the Johnstown Chamber of Commerce. He was talking about "automation." This is a new and fashionable word for one of the oldest facts of industry—mechanization—the substitution of machines for men, the lifting of labor from the backs of men and women, a process which has been going on for centuries, accelerated in recent years by man's increasing inventive genius and his increasing mastery of the mysteries of nature. Machines make more jobs, he said. "As mechanization has increased the output and the purchasing power of people, it has multiplied enormously their demand for services . . . more doctors and dentists, more engineers and scientists, and more clergymen and preachers." "Had technological progress stopped in 1908," he added, "it would cost $65,000 to build a contemporary auto car at today's wages." This was the voice of modern technology.

Some weeks before, the same gentleman in behalf of the great enterprise which he headed had announced in these words a broad financial aid-to-education program:

> We are aware that a large number of the private liberal arts colleges in the United States are today operating at a deficit. It is quite apparent that these colleges and universities operating without tax support urgently need capital and general operating funds to provide for growing student bodies, to strengthen independent undergraduate education, and to improve the incentives now offered for the highest quality of free and independent teaching.

Then in announcing grants of unrestricted funds to nearly 250 colleges and universities (this year increased to 450) he added:

> If such support should become general, high standard liberal arts colleges everywhere will benefit, and free educational institutions will remain free.

This was the voice of liberal education.

The speaker was Benjamin F. Fairless, chairman of the Board of the United States Steel Corporation and of the United States Steel Foundation, son of a coal miner in Ohio, schooled in a small liberal arts college, a civil engineer, and one of the most articulate spokesman in America of what Adolf Berle in his latest book calls its "twentieth-century capitalism." There are also many other business leaders today in whom the voice of technology and the voice of liberal education are being combined. There is, among American businessmen generally, a growing recognition that freedom is indivisible; that, as was said long ago, "the safety of the nation is in the education of her youth"; and that training without education is

of as little significance to business progress as is education without training. This is not to abandon technology but to fortify, broaden, and humanize the technology which is at the core of our twentieth-century industrial revolution.

CORPORATE CITIZENSHIP

Many of you will recall a few years ago the mixture of cheers and jeers which greeted the first public suggestions that businessmen should regard financial aid to colleges and universities as an appropriate interest of business corporations, as an opportunity for "corporate citizenship," even as an "obligation" to their stockholders, customers, and employees. I was then the president of one of the state universities. My immediate concern was with a state legislature. It had been making good provision for the institution for which I was responsible. So I was not directly concerned, except that the increasing prospect of financial support from industry added to the possibilities of improving the quality of our educational enterprise and of gradually lifting its level of excellence.

But as a graduate of a church-related liberal arts college, believing earnestly in the value of such institutions to American society, I had always been interested in the maintenance also of our private universities and colleges. So the idea of "corporate aid to education" then advanced by eminent businessmen like Frank W. Abrams, chairman of the Standard Oil Company of New Jersey and trustee of Syracuse University; Alfred P. Sloan, Jr., chairman of General Motors Corporation and member of the Massachusetts Institute of Technology; and Irving S. Olds, chairman of United States Steel Corporation and long-time member of the Yale Corporation, was interesting and encouraging. It seemed logical and sensible and important. Some corporation executives, however, regarded the idea as "preposterous" and said so. Some said, "It is illegal." Some even called it "socialistic."

That was hardly five years ago. What do we see now? Well, if the idea was "preposterous" thousands at least now approve and accept it, hundreds are practicing it, and hundreds of others are diligently considering it; and their numbers among business concerns both large and small are continually increasing. If it was "illegal" the courts evidently have not known it. And if it was "socialistic" it evidently was of a kind with strong appeal to many of America's most conservative business leaders.

Financial aid to higher education if it is "conservative" is conservative at least of one of America's greatest "glory roads." If it is "liberal" it is liberal at least in the sense that it contributes to what the dictionary calls "independence of opinion, not servile, befitting or worthy of a free man." No business leader needs to be told what "independence of opinion" has meant in American industry and in American life. More and more are businessmen aware of the extent to which this country owes its progress, its strength, and its moral force in a shaky world to its public education, and fundamentally to its universities and colleges; and more and more are they aware nowadays of the extent to which the maintenance of a climate encouraging to "independence of opinion" is dependent on public education which never will be stronger or safer than the colleges and universities from which it springs.

Out of this background of developing opinion originated the Council for Financial Aid to Education, a unique adventure into the future of American higher education. It was founded not by educators but by businessmen. It is financed not by the colleges and universities but by some of the most respected foundations: the Fund for the Advancement of Education, the Alfred P. Sloan Foundation, the Carnegie Corporation of New York, and the General Education Board. The Council itself neither solicits nor accepts nor disburses funds for the support of education. Its aim is to promote wider public interest in, and wider financial support for, American higher education. Its objectives of course are of great importance to our colleges and universities. They are of equal concern to American business.

The interest of business corporations in what is happening to the colleges and universities may be a novel idea. But it is reasonable and sensible, is likely to be continuing, and, in the long run, it may be a decisive factor in determining the future structure of American higher education. At present voluntary financial support by corporations, most of it now to private institutions, is between 6 and 8 per cent of their revenue. The total is between 75 million and 90 million dollars annually.

Last year the Council secured a great deal of information from several hundred leading national corporations regarding the nature and extent of their financial support of higher education, and from most of the colleges and universities regarding their financial status and financial needs.

TRENDS IN CORPORATE GIVING

These surveys show some interesting facts. Predominantly the corporations now aiding higher education prefer to furnish funds for current operations rather than for capital purposes, student aid, or special services such as research, product testing, work-study projects. The composite ratios of preferences expressed are:

Operating funds	1.00
Capital funds	.49
Student aid	.46
Special services	.43

This shows a marked change from the former more general preference for research grants and other special services; also a growing awareness of the financial dilemma of higher education.

Among the companies not now financially supporting higher education but "willing to consider" doing so the corresponding ratios are:

Operating funds	1.00
Capital funds	.55
Student aid	.75
Special services	.79

Among companies now aiding higher education those giving some financial support to various classifications of higher institutions are:

To technical schools	73%
To private universities	72%
To liberal arts colleges	71%
To other professional schools	52%
To state universities	37%
To junior colleges	15%

Among the companies not now aiding higher education but "willing to consider" such support the comparable percentages are:

To technical schools	73%
To private universities	67%
To liberal arts colleges	65%
To other professional schools	60%
To state universities	26%
To junior colleges	28%

Of the reporting companies giving any financial support to higher education 63 per cent were giving to the United Negro College Fund; 49 per cent to the National Fund for Medical Education; and 41 per cent to the state Associations of Liberal Arts Colleges. Of those "willing to consider" doing so the comparable percentages were 50 per cent, 47 per cent, and 45 per cent. Fewer than one-third of the companies were "willing to consider" giving to a national pool fund or "Bank of Philanthropy" even if one were established to operate on a national scale to seek, re-

ceive, and disburse corporation grants in aid of higher education.

At present geographical considerations have a dominant part in determining the selection of beneficiaries of corporate financial aid. Three-fourths of the selections now are based evidently on location of plants or employment or markets as the predominant criteria of company interest; or in some instances on the principal sources of the donor company's college-educated personnel. In one-sixth of the cases the selection of beneficiary is being determined by the "best judgment" of the responsible officers without geographical or other fixed criteria. The proportion of these is increasing. Last year the proportion of total contributions by these leading national corporations designated for education, as distinguished from other purposes for which tax-exempt contributions are admissible, was evidently about one-fourth as compared to the estimated one-sixth four years ago. These trends in corporate giving are constructive and encouraging.

FACULTY SALARIES

But the interest of corporations goes much farther than these simple figures would seem to imply. For example, there is growing recognition that many colleges and universities in the "red" and hundreds of them technically in the "black" are being financed in substantial part by "borrowing" from their faculties by paying appallingly low teaching salaries. One of the leading publishing concerns in America recently published an article entitled "Our Colleges and Universities Are Living on Borrowed Time—Time Borrowed from Underpaid Faculty Members." It showed in terms not of dollars only but of purchasing power the contrast between the course of faculty salaries during the past fifteen years and the earnings of other callings and professions:

Lawyers	plus 10%
Physicians	plus 80%
Industrial workers	plus 48%
Faculty members	minus 5%

The reports to the Council for Financial Aid to Education show great differences even in the average faculty salaries of the groups of American colleges and universities. Between 1939 and 1954 general prices of goods and services were almost doubled. During the same period average faculty salaries were increased in approximately these proportions:

In state (or municipal) colleges (113)	96%
In state (or municipal) universities (54)	88%
In professional or technical schools (26)	82%
In church-related (non-Catholic) colleges (125)	77%
In Catholic colleges (84)	76%
In Catholic universities (21)	74%
In nondenominational liberal arts colleges (184)	71%
In church-related (non-Catholic) universities (26)	65%
In private universities (66)	57%

These are the salary figures which are recording the gradual drift of best minds "from campus to commerce," the increasing difficulty of recruiting qualified college teachers, and the ominous prospects of greater shortages during the next fifteen years.

STUDENT AID

The reporting colleges during 1953 spent nearly $50,000,000 in student aid. Of this amount nearly 60 per cent came out of the general operating funds so urgently needed for improvement in faculty salaries and for other purposes. The same colleges showed total operating deficits for the year of nearly $25,000,000, equal in the aggregate to half the amount which they had paid out in student aid.

ENDOWMENTS AND CAPITAL FUNDS

The same colleges and universities in 1954 had total endowments of

$2,538,180,000 and stated that in the next ten years at "rock bottom" they needed additional endowments totaling $3,175,456,533 and additional capital funds for buildings and equipment during the same period of $2,533,799,922. These additional endowment funds in the view of the colleges and universities are needed primarily for two purposes: (1) improvement in faculty compensation and (2) financial aid to students. These needs are shared alike by tax-supported institutions and institutions independent of the state.

These needs of the colleges and universities are of great concern to business corporations. They know that whatever the extent of their brick and mortar the colleges and universities will never be any better than their faculties. And as long as 40 per cent of our most talented youth do not go to college because of lack of financial means, they know that America is forfeiting much of its ablest potential manpower. This is important unfinished business of both American higher education and American business.

ESTIMATES FOR THE FUTURE

How much of a part will American business corporations take in fortifying the financial support of our colleges and universities? A minority part, I hope and believe, but perhaps a decisive part. So I am venturing some formidable estimates which may perhaps put in better perspective the problems, opportunities, and prospects of financial support of our higher education. These you may well take with caution. They are personal opinions. They may be based on wide observation. But they are not official views of the Council for Financial Aid to Education.

1. The present bona fide combined operating deficits of the private colleges and universities now are less than twenty-five million dollars annually and are steadily being reduced.

2. Average college faculty salaries will be increased by at least 25 per cent or college teaching as a learned profession will continue to wither.

3. At present rates the widening gap in private colleges and universities between student tuition and educational expense per student by 1970 will have reached nearly 500 million dollars. This gap will be filled in part by increasing the scale of student charges, supplemented by scholarship and loan funds. But most of it will be filled by voluntary financial aid.

4. College education in both private and state-supported higher institutions will be made more nearly self-supporting through higher student tuition and fees. Reasonable income-tax credits for college tuition payments is a sensible and appropriate form of public financial assistance to higher education. Eventually it will be adopted as a part of the Internal Revenue Code.

5. American higher education, not including its auxiliary activities and miscellaneous services, now a two billion dollar a year enterprise, within a short generation will be at least a five billion dollar a year enterprise. In the meantime, capital outlay for new physical facilities will exceed ten billion dollars.

6. Alumni giving to colleges and universities will gradually become general practice. In time college students generally will understand and respect the obligation inherent in their acceptance of opportunity for college education *at less than cost*. As alumni they will accept the implied responsibility to help others as they themselves have been helped. Eventually alumni funds will cover at least half of the gap between tuition and cost.

7. Unless federal and state tax laws are fundamentally changed (an unlikely event) endowment funds as a ma-

jor source of *new* financial support to expanding higher education will gradually dwindle. In their place will be more corporate and individual foundations, larger short-term grants, and fewer commitments of capital funds. Endowment funds will continue to come largely from estates and bequests. There will be fewer sources of such funds and more foundations. Educational finance will gradually change. Many of the sources and conditions of financial support will be different. More and more of the burden of providing facilities for higher education will fall on the institutions of the state, hence on tax funds. But ample funds will continue to be available to assure the maintenance in vigor of higher education financed and directed independent of the state.

8. The participation of business corporations in financial support of American higher education, through capital grants, through current funds for various purposes, and through student aid, will have reached by 1970 a half billion dollars annually. Business is one of the chief beneficiaries of a diversified competitive system of higher education, is increasingly dependent on it, has increasing means of aiding it financially, and will not let it wither for lack of financial support.

Wilson Compton, Ph.D., LL.B., LL.D., L.H.D., New York City, is president of the Council for Financial Aid to Education, Inc. Previously he was president of State College of Washington and the State Experiment Station (1944–51), professor of economics, George Washington University (1934–41), secretary and general manager, National Lumber Manufacturers Association (1918–44), economist, Federal Trade Commission (1916–18), assistant professor of economics and political science, Dartmouth College (1915–16). He was a member of the Advisory Committees of the Forest Products Division, Department of Commerce (1929–45) and of the U. S. Timber Conservation Board (1930–45); vice-president and manager, American Forest Products Industries, Inc. (1932–44) and founder and president, Timber Engineering Company (1933–44), and he has been honorary director of these companies since 1945. He was a member of the U. S. Education Mission to Japan (1946) and a delegate to the Fourth General Assembly of the United Nations. He was administrator, International Information Administration, Department of State, and chairman of the Psychological Operations Co-ordinating Board (1952–53).

DISCUSSION

To court a share in the corporation funds currently being made available to universities, institutions must muffle talk about budgetary deficits and be prepared to answer searching questions about the efficiency of their management and organization. The great growth in corporation giving has produced a large variety of plans under which funds are distributed. There is some tendency to seek new schemes which will bear the corporation's name and bring credit and publicity as a partial reward for the gift. For most corporations, support of higher education is a new type of enterprise, and they have neither the personnel nor the past experience on which to draw. It is hoped that the selection and planning will be done at the top management level. There is a danger that corporation programs will be formulated entirely by personnel departments and that those departments will tend to dole out scholarships as fringe benefits for employees.

The reluctance on the part of business firms to choose specific recipients has led to the formation of consolidated funds. These fund pools distribute gifts on a proportional formula to all institutions within a given area such as a state or county, or to selected institutions within a given category such as liberal arts colleges or Negro institutions. To the businessman, this has the advantage of absolving him from the selection process and giving him an outside organization of professionals who are responsible for proper administration. It has disadvantages from the educational point of view in that it tends to support the marginal schools which may be low in instructional level; moreover, the fund-pool system does not provide the risk capital best spent upon encouraging the leaders. As yet it is impossible to determine whether the trend is generally toward the consolidated fund system of disbursement.

A discussion of the decline in the part played by large private gifts in financing higher education revealed that while there may have been no quantitative decline, nevertheless in comparison with other sources of support the large individual donor is losing in importance. Few new fortunes are being made and the charities of old ones are frequently channeled through intermediary foundations. The funds are administered by the foundation personnel rather than by the college trustees.

Trends in Tuition Charges and Fees

By Herbert S. Conrad and Ernest V. Hollis

TUITION charges and fees are of special interest to a conference on Methods of Financing Higher Education, since these charges and fees are the one major source of income that can be controlled directly by the college or university itself. This paper will attempt to present such facts as are available with regard to trends in the following areas: (1) undergraduate tuition rates; (2) the relation between such tuition rates and students' ability to pay; (3) the total amount received from tuition and fees; and (4) the relation between receipts from tuition and fees on the one hand, and various expenditures by institutions of higher education on the other. In so far as available data permit, the facts will be presented separately for publicly and for privately controlled institutions of higher education; and separately for the different curricular-organizational types of institution (universities, liberal arts colleges, and so forth). Attention will also be given to differential tuition rates for in-state versus out-of-state students in publicly controlled institutions of higher education.

The main sources of data employed are: college catalogues; the United States Office of Education's Biennial Survey of Education; unpublished recent data from the Office of Education; and the "Annual Survey of Business Management Statistics" by the Central Association of College and University Business Officers, conducted for 1954–55 by W. Robert Bokelman. Supplementary sources include an article on "Size Distribution of Income since the Mid-Thirties" by Selma Goldsmith and others in the February 1954 issue of *The Review of Economics and Statistics* and conventional economic-statistics sources such as the periodical, *Economic Indicators,* and the *Statistical Abstract of the United States.*

The period covered extends from 1939–40 to 1954–55 in the case of tuition rates compiled by the Office of Education, and from 1947–48 to 1954–55 in the case of data from the study by Bokelman. With respect to the total amount received from tuition and fees, the period covered is 1929–30 to 1951–52 (the last year for which nationwide systematic data are available).

Tuition Rates

Data from catalogues

Tuition per student. A study (unpublished) has been made of tuition and required fees for a number of fairly large institutions—namely, 196 institutions each with a total college-grade enrollment of 2,000 or more in the fall of 1953.[1] Only those institutions were included for which catalogues were available in the Library of the Department of Health, Education, and Welfare for *each* of the academic years, 1939–40, 1949–50, and 1954–55. The purpose of this study was to obtain, with minimum effort, data covering a maximum number of students.

[1] None of the institutions had a full-time resident undergraduate enrollment of less than 1,000 in November, 1953. The 196 institutions—120 publicly controlled, and 76 privately—account for about 55 per cent of resident undergraduate enrollment in the United States (about 65 per cent of such enrollment in publicly controlled institutions and 45 per cent in privately controlled), and for a larger percentage of graduate enrollment.

The average tuition rate per student in the 196 institutions, and average rates for students in subgroups of the 196 institutions, are given in Table 1.[2] Examination of the table shows a steady, long-time increase in tuition rates. In the fifteen-year period from 1939–40 to 1954–55, the increase in the 120 publicly controlled institutions was from $70 to $132—a rise of $62, or 89 per cent; the increase in the 76 privately controlled institutions was from $328 to $599—a rise of $271, or 83 per cent. In broad terms the rise has been about the same, percentagewise, in the publicly and the privately controlled institutions; but has been much larger, dollarwise, in the privately controlled institutions.

Details for the different curricular-organizational types of institutions are included in Table 1. These do not seem to require special comment, other than the caution that the number of institutions in certain of the subgroups is small, and the results for these subgroups correspondingly subject to sampling error.

Tuition per institution. Data similar to the figures in Table 1, calculated on a per institution basis, are given in Table 2. The findings in this table are not, in general, very significantly different from those in Table 1.

[2] For the academic years 1939–40 and 1949–50, the resident undergraduate enrollment at the end of the academic year was employed for weighting the tuition rate in each institution; for the academic year 1954–55, resident undergraduate enrollment as of November 1954 was employed, since enrollment data for the full academic year were not yet available at the time of the study (May 1955).

TABLE 1—Tuition Rate per Student in 196 Higher Educational Institutions, by Type of Control and by Curricular-Organizational Classification, 1939–40, 1949–50, and 1954–55

(*Catalogue study*)

Type of Control and Curricular-Organizational Classification	No. of Institutions	Tuition Rate per Student			Amount of Increase			Percentage Increase		
		1939–40	1949–50	1954–55	1940 to 1950	1940 to 1955	1950 to 1955	1940 to 1950	1940 to 1955	1950 to 1955
All institutions	196	$165	$249	$305	$84	$140	$56	51	85	22
Publicly controlled	120	70	109	132	39	62	23	56	89	21

Liberal arts colleges	14	285	439	542	154	257	103	54	90	23
Technological schools	5	420	626	751	206	331	125	49	79	20

Data gathered by Mrs. M. G. Fullam, S. C. Craigie, C. G. Lind, and Mrs. D. Holladay under the direction of Mrs. Mabel C. Rice.

Question immediately arises as to the representativeness of the 196 institutions from which the results described above were obtained. Some empirical evidence on this point is available by comparison of the tuition rates for 1954–55 in Table 1 (based on the 196 institutions) with the tuition rates for 1954–55 in Table 3 (based on 1,526 institutions, which is nearly 80 per cent of the total number of higher educational institutions). The comparison yields some reassurance but also points to some discrepancies. Data based exclusively on rather large institutions cannot be depended upon to reveal accurately the facts for smaller institutions, even though one may conjecture that the smaller institutions tend eventually, if not immediately, to follow the tuition pattern set by the larger institutions. As already mentioned, the 196 institutions for which data are presented in Tables 1 and 2 include about 55 per cent of the resident undergraduate enrollment of the country, and a larger proportion of the graduate enrollment. The results in Tables 1 and 2, then, may be said to apply to a majority of the college-grade students in the nation.

Data from Office of Education questionnaire

For the years 1953–54 and 1954–55, additional data are available from a questionnaire sent to all institutions of higher education, requesting the approximate charge in tuition and required fees for the academic year, with reference to the "typical undergraduate, non-veteran, in-state, full-time student." At the time this is written, returns are available from 1,526 of approximately 1,950 institutions of higher education for the academic year 1954–55; for the same institutions, returns are also available for the academic year 1953–54. The results are given in Table 3. As shown in the last two columns of this table, the increase in tuition rate from 1953–54 to 1954–55 was identical dollarwise in the publicly and the privately controlled institutions ($13), but larger percentagewise in the publicly controlled institutions than in the privately controlled (10.9 per cent versus 2.6 per cent).

Table 3 also contains data for the separate curricular-organizational subgroups of higher education: universities, liberal arts colleges, and so forth. Space is lacking for comment on the data for these separate subgroups.

Data from questionnaire study by W. R. Bokelman

Under the sponsorship of the Central Association of College and University Business Officers, W. R. Bokelman,[3] serving as chairman of a study committee, received 330 usable questionnaire returns from higher educational institutions in all parts of the United States. As in the case of the 196 institutions included in the Office of Education catalogue study, the institutions in the Bokelman study are fairly large; the average enrollment in the 330 institutions was 2,366.

The data supplied by Bokelman provide a comparison of tuition rates for the academic years 1947–48 and 1954–55 (see Table 4). According to Table 4, the percentage rise of tuition rates from 1947–48 to 1954–55 has been virtually identical in publicly controlled and privately controlled institutions: namely, 38 and 37 per cent, respec-

[3] Dr. Bokelman is now specialist for College Business Administration in the Office of Education, Department of Health, Education, and Welfare.

TABLE 3—TUITION RATE PER STUDENT IN 1,526 HIGHER EDUCATIONAL INSTITUTIONS, BY TYPE OF CONTROL AND BY CURRICULAR-ORGANIZATIONAL CLASSIFICATION, 1953–54 AND 1954–55

(*Questionnaire study—U. S. Office of Education*)

TYPE OF CONTROL AND CURRICULAR-ORGANIZATIONAL CLASSIFICATION	NO. OF INSTITUTIONS	TUITION RATE PER STUDENT		INCREASE, 1954 TO 1955	
		1953–54	1954–55	Amount	Per cent
Publicly controlled	530	$119	$132	$13	10.9
Universities	70	153	173	20	13.1

Liberal arts colleges with enrollment of less than 500	60	178	245	67	38

[a] The tuition rates in this table are per semester or quarter.

[b] Calculated from average tuition expressed in dollars and cents, instead of rounded dollars as in the present table.

tively. In dollar amounts, the rise for publicly controlled institutions was $21 and for privately controlled, $69.

Bokelman also inquired as to *anticipated* increases in tuition from 1954–55 to 1955–56. The results are shown in Table 5. The percentage rise anticipated by publicly controlled institutions is on the average 4.6 and by privately controlled institutions is 1.9 (see last column of the table). Bokelman does not convert his percentage data on anticipated increases into dollar amounts; but if we apply the percentages to the average tuition rates in Table 4 ($77 and $257, for public and private, respectively), the calculated dollar amounts are $3.54 and $4.88, respectively. Because of the subjectivity of "anticipated" increases, it would doubtless be preferable to think of these figures as roughly $3.50 and $5.00, respectively.

ABILITY TO PAY

The figures in Tables 1–4 reflect the significant increases in tuition rates in recent years, and Table 5 indicates that, on the average, this rise will continue in the immediate future. Question arises as to the relation between increases in tuition rates and the ability of students to pay such increases.

Changes in the ability of students to pay tuition and required fees will depend, of course, on changes in income. Such changes, it is recognized, are not uniform from state to state, nor from urban to rural communities, nor from industry to industry within urban places.

Lack of detailed, specific data, however, compels us to deal with income on a national basis. We shall be concerned, in general, with income after taxes, since that is the only kind of income available for the payment of tuition and required fees.

Table 6 presents data on (*a*) increases in tuition rates (as reported in Tables 1–4) and (*b*) changes in disposable income. It can be quickly seen in Table 6 (bottom quarter of the table) that between 1939–40 and 1949–50, per capita disposable income rose 136.5 per cent, whereas tuition rates rose in the neighborhood of only 50 per cent (56 per cent for publicly controlled institutions, and 43 per cent for privately controlled). In recent years, however, tuition rates (both in publicly controlled and privately controlled institutions) have been rising at a more rapid rate than has per capita disposable income. This fact is likely to create some resistance to further tuition rises.

Since college students are probably drawn mainly from the upper two-fifths of the population with respect to income, it is pertinent to inquire whether disposable personal income in the top and the second fifth has risen as rapidly as the national average. The answer (Table 7) is that disposable personal

1949–50	1,310	109[c]	468[c]	756	39	140	136.5	56.0	43.0

[a] *Figures on per capita disposable income are based on data in Economic Indicators* (April 1955 and earlier issues), published by the U. S. Government Printing Office. The figure for 1954–55 is an estimate based on data for the last half of calendar year 1954 and the preliminary estimate for the first quarter of calendar year 1955.

[b] Based on a questionnaire study by the Office of Education. See Table 3.

[c] Based on a catalogue study by the Office of Education. See Table 1.

[d] Based on a questionnaire study by W. R. Bokelman. Figures give tuition per institution, on a semester or quarter basis. Other figures in these columns give tuition per student, on an academic-year basis. See Table 4.

[e] Based on unrounded tuition rates for 1954–55 and 1947–48.

Data gathered by Mrs. M. G. Fullam, S. C. Craigie, C. G. Lind, and Mrs. D. Holladay under the direction of Mrs. Mabel C. Rice.

[a] Column 4 minus column 3.

[b] Column 5 minus column 3.

[c] Column 5 minus column 4.

[d] Column 6 divided by column 3, times 100. The first entry in this column is to be read: The *increase* in the difference between average in-state and out-of-state tuition rate from 1939–40 to 1949–50 (*viz.*, $80, column 6) was 121 per cent of the average difference existing in the school year 1939–40 (*viz.*, $66, column 3).

[e] Column 7 divided by column 3, times 100. The first entry in this column is to be read: The *increase* in the difference between average in-state and out-of-state tuition rate from 1939–40 to 1954–55 (*viz.*, $105, column 7) was 159 per cent of the average difference existing in the school year 1939–40 (*viz.*, $66, column 3).

[f] Column 8 divided by column 4, times 100. The first entry in this column is to be read: The *increase* in the difference between average in-state and out-of-state tuition rate from 1949–50 to 1954–55 (*viz.*, $25, column 8) was 17 per cent of the average difference existing in the school year 1949–50 (*viz.*, $146, column 4).

income has risen just about as rapidly as the national average in the second fifth of income level, but *less* rapidly in the top fifth. It seems beyond question that the top fifth sends a larger proportion of its children to institutions of higher education than any other income group. This again is a factor which may be expected to create some resistance to further tuition rises.

It will have been noted that the presentation above has been phrased in terms of current dollars (rather than dollars of stable purchasing power). This is appropriate, since all tuition rates have also been expressed in terms of current dollars.

STATE RESIDENCE AND TUITION

It is well known that the differential between tuition rates for in-state and out-of-state students attending publicly

controlled institutions of higher education has been rising. In 1939–40 this differential averaged $66 per institution per academic year, according to an unpublished study based on the catalogues of 120 publicly controlled institutions by the Office of Education (Table 8). A decade later, by 1949–50, the differential had risen to $146; and by 1954–55, it had risen to $171. The rise in the last five years, however, has been at a considerably less

[a] Normal schools are classified with junior colleges for 1949–50 on.

rapid rate than in the decade from 1940 to 1950.

Data from the Bokelman study also point to a rising differential between tuition rates for in-state versus out-of-state students (Table 9); in Bokelman's data, however (based on 108 publicly controlled institutions), the rise is less rapid than in the data from the study by the Office of Education. According to Bokelman, a further substantial rise in the differential tuition rate is planned by several institutions (Table 10). Over-all, the increase in 1955–56 (for all publicly controlled institutions in Bokelman's sample) is expected to average 6.2 per cent.

RECEIPTS FROM TUITION AND FEES

Table 11 presents data on receipts from tuition and fees, from 1929–30 to 1951–52, the last year for which systematic, nationwide data are currently available. In general, the big jump in receipts came after 1945–46, with the arrival of the large World War II veteran enrollment (a dash line after this year has been drawn in Tables 11–13 to

[a] Educational and general expenditures plus expenditures for plant expansion. Expenditures for auxiliary enterprises (such as dormitories and dining halls) and "noneducational expenditures" (such as annuities and scholarships) are not included.

[b] Normal schools are classified with junior colleges from 1949–50 on.

TABLE 14—CHANGES IN TUITION RATES AND FACULTY SALARIES, FROM 1947–48 TO 1954–55

CLASS OF INSTITUTION	AVERAGE INCREASE IN TUITION RATE FROM 1947–48 TO 1954–55 (per cent)	AVERAGE INCREASE IN FACULTY SALARIES, 1947–48 TO 1954–55 (per cent)
State universities with enrollment of 5,000 or more	30.3	33.0
State universities with enrollment of less than 5,000	37.4	34.7
State teachers colleges	34.9	36.6
State liberal arts colleges	41.7	34.7
Municipal universities and liberal arts colleges	58.3	35.3
Private universities	34.3	30.3
Private liberal arts colleges with enrollment of more than 500	37.3	32.4
Private liberal arts colleges with enrollment of less than 500	37.7	32.2

emphasize this fact). Between 1945–46 and 1947–48, the receipts from tuition and fees in publicly controlled universities, colleges, and professional schools rose from $60 million to over $190 million, and in privately controlled, from about $185 million to nearly $400 million. The rise in publicly controlled junior colleges, after 1945–46, was especially pronounced, but the subsequent recession has also been more pronounced in this group.

There has been some complaint that, with a decline in other sources of income, receipts from tuition and fees have become a disproportionately large fraction of educational and general income. It has seemed to us that perhaps more significant conceptually than the relation between tuition and total income is the relation between receipts from tuition and fees and *expenditures* (or, still better, *needs*, if a good measure of needs were available). Table 12 shows the relation between receipts from tuition and fees and "educational and general expenditures (except expenditures for separately budgeted research)." The complaint regarding the rise in the prominence of tuition and fees does not seem justified, at least through the school year 1951–52. The percentage of educational and general expenditures accounted for by receipts from tuition and fees has, in fact, been declining in the two bienniums of our data since 1947–48. In the school year 1951–52, the percentage was generally close to its value in 1939–40—or lower. Of course, the situation may have changed between 1951–52 and the present; and in some individual institutions the trend will not conform with the national average.

Table 13 presents the relation between receipts from tuition and fees and an approximation of *total* expenditures. Here, too, the complaint that tuition and fees account for a rising proportion of expenditures seems unfounded, for institutions of higher education as a whole.

If one examines the top and bottom line of each tier of figures in Tables 12 and 13, one gains an impression that the different types of institution are drawing more closely together in the proportion of expenditures represented by tuition and fees. The privately controlled junior colleges and teachers colleges still stand out as meeting a comparatively large fraction of their expenditures from receipts from tuition and fees.

The statistics in Tables 11–13 may seem "dry." The set of figures (from Bokelman) in Table 14, on changes in tuition rates and changes in faculty salaries, may suggest the human values implicit in the financial statistics of higher education.

CONCLUSIONS

1. In studies of tuition rates of institutions of higher education, it is desirable to distinguish between tuition rate per student and tuition rate per institution (when dealing with a group of institutions). It is suggested that the tuition rate for the "typical undergraduate, nonveteran, in-state, full-time student" be generally adopted as a kind of "standard" figure—to be supplemented, as needed, by tuition rates for graduate students, for extension students, for students in selected professional schools, and so forth. As another methodological suggestion, it is recommended that changes in "ability to pay" tuition and required fees be measured in terms of "disposable personal income." If the purpose is to compare disposable income with tuition rates, no correction is needed for changes in purchasing power of the dollar.

2. In the fifteen years from 1939–40 to 1954–55, tuition rates per student, in a group of 120 publicly controlled institutions, rose from an average of $70 to $132—a rise of $62, or 89 per cent. The comparable rise for students in a group of 76 privately controlled institutions was from $328 to $599—a rise of $271, or 83 per cent. Other data, from questionnaire studies by the Office of Education and by W. R. Bokelman, show that, in the main, the rises in tuition rates in publicly and in privately controlled institutions have been roughly the same on a percentage basis but much larger in the privately controlled institutions on a dollar basis. According to Bokelman's data, the trend toward higher tuition rates will continue at least into the next academic year.

3. During the decade from 1939–40 to 1949–50, per capita disposable income rose from $554 to $1,310—a rise of over 136 per cent. Tuition and fees in this period rose only about 50 per cent. In recent years, the rise in tuition rate has been appreciably more rapid than the rise in per capita disposable income, especially for those in the top fifth of income. This may be expected to create some resistance to further tuition rises.

4. The differential between in-state and out-of-state tuition rates increased rapidly in the decade from 1939–40 to 1949–50, and more slowly from 1949–50 to the present (1954–55). Further significant increases in the next academic year are anticipated in some institutions.

5. Total receipts from tuition and fees rose sharply after 1945–46, with the arrival of World War II veterans on the campus. In general, however, receipts from tuition and fees have dropped in the two bienniums since 1947–48. The complaint that receipts from tuition and fees constitute a rising proportion of income and expenditures (owing to a drop in income from other sources) does not seem to be borne out by the data through 1951–52.

The "rising tide" of enrollment and associated receipts from tuition and fees should help to solve some financial problems of higher education. The "rising tide," however, will not swell for several years; and in any event, other solutions beyond increased receipts from tuition and fees may quite possibly be necessary.

DEFINITIONS

Tuition rate

The phrase "tuition rate" is intended to refer to tuition and required fees

charged to the typical undergraduate, nonveteran, in-state, full-time student in an institution of higher education. The following types of charge are excluded or ignored in the present limited study: tuition for graduate work; tuition for summer sessions, extension courses, adult education, short courses, and so forth; one-time and special fees not charged all undergraduates (such as matriculation fees for freshmen, late-registration fees, laboratory fees charged only to students in certain courses); voluntary fees for student activities, intercollegiate activities, and so forth; and charges for room and board. The restriction of the term "tuition rate" to "tuition and required fees for undergraduate, nonveteran, in-state, full-time students" provides a significant concept which is broadly applicable on a reasonably comparable basis to all [4] institutions of higher education. Except for charges for room and board—which, as living costs, clearly do not belong in the same category as the tuition rate—none of the excluded miscellany of fees is of major importance as a source of income for higher education as a whole. In a few institutions, tuition for graduate work is a considerable item; but graduate students (both full-time and part-time together) constitute only about 10 per cent of all resident college-grade students; [5] and of course a larger proportion of graduate education is subsidized by fellowships and other means than is the case with undergraduate education.

[4] The only exception is the quite rare instance where student services may take the place of all or part of tuition and required fees. Even in these cases, good accounting practice would credit the imputed value of such services to the tuition account.

[5] See Herbert S. Conrad and William A. Jaracz, *Resident, Extension, and Adult Education Enrollment in Institutions of Higher Education: November 1953*, Office of Education Circular No. 414. Washington: D. C.: U. S. Government Printing Office, 1954.

The report by Bokelman does not define "tuition," but the meaning of this word in his report is probably similar to the usage described for "tuition rate" in the preceding paragraph.

In data reported from studies by the Office of Education, "tuition rate" refers to the tuition rate for the academic year (two semesters or three quarters). In the Bokelman data, the figures for "tuition" apparently refer to the rate per semester or quarter. Either set of data, it should be noted, is equally suited to reveal *trends* (for example, the percentage rise in tuition rate from one year to another).

Tuition rate per student and per institution

An important conceptual distinction should be noted between tuition rate per institution and tuition rate per student. The first simply averages the tuition charges made by institutions, with each institution (whether large or small) given equal weight. The second weights the tuition charge in each institution by the enrollment in the institution. To illustrate: Suppose that institution A, with 9,900 students, charges tuition at the rate of $100 per student; and institution B, with 100 students, charges tuition at the rate of $900 per student. Then, for this group of two institutions, the tuition per institution is simply $\frac{\$100 + 900}{2} = \$500$. The tuition per student is

$$\frac{(9{,}900 \times \$100 + (100 \times \$900)}{10{,}000} = \$108.$$

The difference between $500 and $108 is, of course, significant.

In general we have been more concerned with tuition per student than with tuition per institution, since a change affecting, say, 9,900 students may usually be considered more important than one which affects only 100 students. It should be added, however, that in actual practice the two types of tuition rate for a given group of institutions will usually not be very far apart, if the number of institutions involved is at least moderately large (say 50 or more; see Tables 1 and 2), and especially if differences in size of institutions in the group are limited. The Bokelman data refer to tuition per institution; but Bokelman generally takes precautions to avoid unlimited range of size of institutions in a given classification, so that the likelihood of a large discrepancy between tuition per student and tuition per institution in his data is rather slight.

Receipts from tuition and fees

The term "tuition rate" is to be sharply distinguished from the accounting term "receipts from tuition and fees." The phrase "receipts from tuition and fees," as used in the present paper, refers to receipts from *all* tuition and fees which, in conventional college accounting, fall in the category of "educational and general income." (Fees or charges collected in connection with auxiliary enterprises, such as dormitories and dining halls, are not included.)

Expenditures

Receipts from tuition and fees are compared, in this paper (Tables 12, 13), with two types of expenditure. The first of these is "educational and general expenditures (except expenditures for separately budgeted research)." The second is an approximation of total expenditures, obtained by adding expenditures for plant expansion to educational and general expenditures. "Educational and general expenditures" include expenditures for (*a*) general administration and general expense, (*b*) instruction and departmental research, (*c*) libraries, (*d*) organized activities related to educational departments, (*e*) operation and maintenance of the physical plant, (*f*) extension and public service, and (*g*) separately budgeted research. "Expenditures for plant expansion" relate to purchases of land, the construction or purchase or remodeling of buildings, improvements other than buildings, furniture and equipment, and construction inventories.[6]

The reason for separating educational and general expenditures from total expenditures is that receipts from tuition and fees are generally expected to contribute to expenditures in the "educational and general" category, while gifts or appropriations are expected to take care of requirements for expansion of the academic plant. The reason for making use of a figure in which separately budgeted research is removed from "educational and general expenditures" is that full support for such research is generally obtained from non-student sources (federal funds, grants from foundations, gifts from corporations, and so forth). Finally, the reason for making use of total expenditures (or an approximation thereof) is that there is some legitimate interest in a single figure which embodies, so to speak, the over-all expenditure problems of higher education.

Ability to pay

Students' ability to pay tuition and fees has been inferred, in general, from national data on per capita disposable

[6] Institutions of higher education differ to some extent in their definitions of the various expenditure items and in their accounting practices. But there is sufficient uniformity to permit an appraisal of basic national trends or changes.

income (income after taxes). Special attention should be given to the upper two-fifths of the population in income level, since it is from this group, it is believed, that the majority of college students are drawn.

Herbert S. Conrad, Ph.D., Washington, D. C., has been chief of Research and Statistical Standards, Office of Education, Department of Health, Education, and Welfare, since 1948. He was statistician and research associate, Institute of Child Welfare, University of California (1928–43) and assistant professor of education (1933–38) and associate professor of psychology (1938–43) in the University; research psychologist (1943–45) and technical consultant (1945–48), College Entrance Examination Board; chief, Examination Analysis and Statistical Unit, United States Civil Service Commission (1945); and expert consultant to the Secretary of War (1947). He has been editor of Psychological Monographs: General and Applied since 1948, served as chairman of the Council of Editors of the American Psychological Association in 1952, and is on the editorial board of Psychometrika and the Journal of Psychology and a contributing editor of Journal of Experimental Education.

Ernest V. Hollis, Ph.D., Litt.D., LL.D., L.H.D., Washington, D. C., is chief of College Administration, Office of Education, since 1944, after serving as co-ordinator of the Commission on Teacher Education, American Council on Education (1940–44). Prior to these dates he had been professor, dean, and president of colleges. He is author, among other works, of Philanthropic Foundations and Higher Education (1938), Toward Improving Ph.D. Programs (1945), College and University Building Needs (1948), and Social Work Education in the United States (1951).

DISCUSSION

The discussion took the form of replies from the floor to a series of provocative questions and propositions drawn from the paper. First the speaker pointed out that even within the same geographic area, attendance at colleges and universities did not vary inversely with the cost of tuition. On the contrary, in Milwaukee for instance, precisely the opposite is true: the high tuition schools have the highest enrollment. From the floor several explanations of this seeming paradox were offered, and the Milwaukee situation elaborated in greater detail. It was concluded that the motivations involved in the selection of a college or university were highly complex, and that tuition was only one and frequently not the most important factor in the decision.

The speaker pointed out that there had been an increase of 136.5 per cent in expendable per capita income during the decade 1940–50, but in the same period tuitions in publicly supported schools had risen by only 56 per cent and in private schools by only 43 per cent. In the face of mounting deficits, why were not tuition increases proportionately as great as increases in the available income? A number of extenuating circumstances were mentioned for the apparent underpricing of higher education. During the war, government units were placed on many campuses and under the original contracts, tuition rises were severely restricted. At the same time, the coeducational colleges and universities were competing with the women's colleges for a single source of students. High tuitions would have endangered their competitive strength. After the war the influx of veterans and the Veterans Administration ceiling on tuition prevented radical increases. Some discussants quarreled with the implications of the statistics presented, holding that the percentage increase in expendable income was not nearly so great among the middle-class groups, and it was from this class that recruits for the college population were drawn. It was pointed out that the cost of living had gone up approximately 90 per cent since 1940 and that tuitions had increased by about the same proportion. It was also remarked that the proportion of the annual budget drawing upon tuition income had not appreciably changed. The consensus was that tuitions had in fact been raised close to the feasible limit.

Next, attention was directed to the growing disparity between the tuitions charged by public and by privately supported institutions, and within the public institutions themselves the growing differentiation between in-state student and out-of-state student tuitions. Although it is true that the low tuitions charged by state colleges and universities tend to depress tuition charges at the private institutions, the public colleges fill a gap in education left by the ever more expensive private universities. It was alleged that even in the present years of low ebb in numbers of students graduating from high schools, the annual 5 per cent increase in enrollment has been maintained and is directly traceable to the public universities and colleges. Not only did the in-state, out-of-state student differentiation appear to be here to stay, but most state legislatures were under considerable pressure to increase the disparity even further.

How Much—and How—Should Students Pay for Higher Education?*

By John F. Meck

THE question "How Much—and How—Should Students Pay for Higher Education?" is of vital importance in the context of 1955 and of the years which lie ahead. Factors of major significance are the impending increase by as much as 100 per cent in the numbers seeking college education by 1970, the relatively favorable economic conditions which make it possible for more parents to bear a larger portion of their children's education expenses, the significant growth in scholarship and other sources of financial aid (especially the marked uptrend in corporate and similar scholarship programs), and the likelihood that Congress in the near future may look favorably on providing some measure of tax relief for educational expenses.

Cost of Higher Education

At the outset of this "How Much" phase of the discussion, it is desirable to define clearly the type of costs which students should pay. Broadly speaking, the costs of higher education are principally educational expense (instruction, libraries, administration, plant operation, and organized research) and the expenses incurred in operating the auxiliary activities (dormitories, dining halls, intercollegiate athletics, and related enterprises). A third element in the total cost of higher education is that of providing scholarship assistance for students unable to pay their full share of the foregoing costs.

The total current operating expenditures for higher education in the United States today exceed 2.5 billion dollars per year,[1] three-fourths of which represents educational expense and nearly one-fourth of which is auxiliary activities expense.[2] Auxiliary activities have been segregated traditionally because they are expected to be virtually self-supporting in that the direct charges to students and other patrons ordinarily defray at least the current operating costs. The dormitory resident is expected to pay rent and the dining hall customer is expected to pay for the food he consumes and the services he enjoys, in the same way that he (or his parents) would be expected to meet such expenses should he not live and eat in college facilities.[3] On the other hand, as campus living accommodations are developed as an integral part of the educational program, serving to encourage the intellectual purposes of the institution by making the social life of the academic community a part of the educational life, a portion of the cost of operating certain of the auxiliary activities may justifiably be considered an element of educational cost.

* For a more complete analysis of the subject than is possible in this paper, reference should be made to publications of the Commission on Financing Higher Education, 1952–53, and to the studies of the General Education Board before World War II.

[3] *Ibid.*, p. 101.

Inherent in a discussion of how much students should pay is the further question of whether sources other than student fees can and should be developed to meet a larger share of the costs of higher education. Some of these other possible sources are being considered at other sessions of this conference. For purposes of this discussion, it can safely be assumed that student payments, particularly for most private institutions, will continue to be the basic source of financial support.

Educational Costs and Student Payments

In terms of income to meet educational costs as previously defined, student fees are the largest single source of operating revenue for private institutions, and they are an increasingly significant source for public institutions.[4] The Commission on Financing Higher Education found that, as of 1950, private institutions as a group and public institutions as a group obtained about 68 per cent and 30 per cent [5] respectively of their educational income from student charges.

Despite this high percentage, virtually no student or his parents pay (at least during the period he is enrolled) the full cost of his education. Historically this cost has been met from a combination of sources in addition to student charges, including mainly endowment income, state and federal grants, and private benefactions. At least two factors have forced both public and private institutions over the past decade to place increasing dependence upon meeting a growing percentage of their educational costs from student charges: (1) the higher cost of education due to decreased purchasing power of the dollar and development of more expensive and specialized curricula; (2) the failure of endowment income and state support to keep pace with expanding enrollments.

[4] Richard H. Ostheimer, *Student Charges and Financing Higher Education* (New York: Columbia University Press, 1953), p. 27. (In 1950 student charges yielded one-fourth of educational income of public institutions and three-fifths of that of private institutions.)

[5] John D. Millett, *op. cit. supra* (note 2), p. 304.

The Relevant Considerations

At this point it is to be assumed that student charges are a logical and indispensable source of financing the educational costs of higher education. "How much," or perhaps "How much more," of such costs should be financed in this manner is affected by three major considerations: [6] (1) the effect on enrollment and on quality of students; (2) the effect on the individual student; and (3) the effect from the standpoint of the interests of society as a whole.

Effect on enrollment and quality of students

The Commission on Financing Higher Education, in a staff study, has estimated that a 25 per cent increase in student charges might be expected to result in a decrease of only 5 per cent in student enrollment.[7] In other words, the demand for higher education is relatively "inelastic," although many factors other than price influence actual enrollments. In the opinion of the Commission, student fees could have been increased as much as 100 per cent in the period 1940–52—the actual rise was only about 75 per cent—without any substantial adverse effect on enrollment.[8] As 1970 with its prospective larger number of students seeking higher education draws nearer, the likelihood of further increases in student charges having an adverse effect on enrollment diminishes further.

[6] Millett, *ibid.*, Chap. 22.

[7] Ostheimer, *op. cit. supra* (note 4), p. 101.

[8] Millett, *op. cit.*, p. 386.

On the other hand, excessive reliance on student fees as a source of income presents the danger that educational standards and objectives may be compromised in order to maintain a profitable volume of enrollment. Admission standards at some institutions conceivably might have to be lowered in order to take in a sufficient number of students able to pay the fee, and the type of courses offered may tend to be determined primarily on the basis of their "sales appeal."

Effect on the individual student

From the standpoint of the student, the costs of higher education, including room, board, and other similar expenses, as well as the charges for educational services, are highly relevant in a very personal sense. A further indirect but nonetheless real cost to the student and his family is that resulting from forgoing the student's earning power while he is in college.

At the same time, higher education costs are relatively less today than prior to World War II. Increases in student charges have not kept pace either with the rise in per capita income or with the rise in cost of living.[9] Furthermore, the cost of a college education has generally been well worth the student's investment in terms of subsequent increased earning power and in the future should become even more so. Indeed, it has been estimated that a college graduate will have a lifetime income $100,000 in excess of that of a noncollege graduate. Too frequently students overlook this aspect when charges are increased.

Several factors are present today which should tend to relieve further the student's burden of meeting increased charges or which brighten the prospect for such relief in the future. The first is the general economic well-being of the country. The changes in American society since World War II have increased the number of families who are able to finance college educations for their children. The same economic well-being has served to enhance substantially the ability of a student to earn a portion of his educational costs through remunerative employment opportunities during the academic year and especially during summer vacations.

A second factor in easing the student's burden is the sharp increase in scholarship and other financial aid programs. From the standpoint of the student, as distinguished from that of the institution, opportunities for financial aid have tended to increase at least in proportion to increases in student charges and in some instances at an even faster rate. Particularly noteworthy has been the rapid growth in corporate scholarship programs during the last three years, which, through a variety of plans including competitive or open scholarships and "in-company" scholarships, are opening up an entirely new resource of financial aid for college and university students.

A third factor is the possibility of some measure of relief from the federal income tax for taxpayers who incur heavy expenses for their children's education. One proposal, which is receiving widespread support from colleges and universities and, also, from organizations such as the American Council on Education and the Association of American Colleges, is a plan whereby a taxpayer would be entitled to a credit against his federal income tax for up to 30 per cent of the tuition or other similar charges for educational services for his child. This would be subject to a maximum credit of $450. Under this proposal, a taxpayer with a gross income of $10,000 per year, who has four dependents (including himself) and who takes the standard deduction, would pay a tax of $1,372 at the 1954 rates. If he had one child at a college where the tuition was $800, he would be entitled to reduce his tax by $240, making it $1,132.

Tax relief along the foregoing lines would afford substantial help to students and their parents, especially those of moderate means who too often have just enough income or other resources to disqualify them for scholarship aid under the programs of most institutions. The highly qualified child with little or no financial resources is often better able today to finance his college education by virtue of the scholarship assistance available to him than an equally qualified child from a family of moderate means.

Interests of society

The objectives of higher education, from a financial standpoint, are twofold. The one is providing the highest quality education possible to meet society's present needs for developing leadership and professional talent. The other is to provide as equal an opportunity as possible for each individual, regardless of social, economic, and religious background, to receive a college or university education.[10] Reconciliation of these two objectives means that since both the individual student and society in general benefit from the cost of his higher education, both should contribute toward financing that cost. The student should do so through payment of student charges and subsequent gifts, while society should do so through public appropriations and private contributions in order to keep the ever increasing cost of education within reach of as many as possible who have the interest and capacity to benefit from higher education.

POSSIBILITIES OF FURTHER INCREASING STUDENT CHARGES

In the light of the factors considered above, it can be concluded at this point that student charges should continue to be the principal source of educational income for private institutions and a significant source of income for public institutions. In both cases student charges should continue as a minimum to meet the same proportion of educational costs as prior to World War II. The question then becomes whether student charges should not begin to bear a higher proportion of educational costs than they are now bearing.

One basis which has been advanced for increasing student charges is a system of differential fees based on actual costs of varying programs. As a result the programs involving lower faculty-student ratios and more expensive laboratory facilities would involve higher charges to students enrolled in such programs. If the foregoing situation is coupled with a field of study in which the assurance of future income is good and in which a demand exists for trained men, as in the case of the medical school student, there is probably some justification for higher student charges. On the other hand, to establish student fees solely on the basis of cost of the particular program might affect society's interests adversely. Such a policy could have a tendency, on the one hand, to lead some students to pursue lower cost programs for reasons of "price" and, on the other, to encourage other students to go into higher cost programs because of higher future earnings possibilities. Also, using the medical school example again, high student charges, without offsetting financial aid programs, could result in students from low income and even medium income categories being excluded from certain careers. These consequences could be highly undesir-

[9] Ostheimer, *op. cit. supra* (note 4), pp. 133, 190–91.

[10] Millett, *op. cit. supra* (note 2), p. 394.

able for society generally as well as for individual students.

A different basis for increasing revenue from student charges is founded on the thesis that students should pay the full cost of their education. As is well known, Mr. Trevor Arnett in 1940, after years of study in the field, reached the conclusion that private institutions should "make their fees commensurate with the cost of providing the education, excluding interest and depreciation on plant investment." [11] Under this plan all students would be charged for educational services on the basis of cost, with those able to pay in full being required to do so, and those unable to pay the full charge being given financial assistance. The recent uptrend in scholarship and other financial aid programs noted above has tended to reawaken interest in this idea. Further support for charging closer to the full cost may be derived from the current movement among a number of institutions to agree upon common standards for determining the existence and extent of a scholarship applicant's financial need.[12] Such a system might well result in some redistribution of established scholarship funds by eliminating grants to students not justified on a financial need test, and thereby make existing scholarship funds go further.

A partial step toward the goal of making student charges commensurate with educational costs has been given serious consideration by some private institutions. This step is based on two principles, first, that a number of families who are financially able to do so sincerely wish to pay for the cost of their children's education and, second, that no qualified student should be denied an opportunity for higher education because of lack of financial resources. Proceeding on these principles, the plan calls for fixing the tuition charge as close to the full cost of educational services provided as is possible, granting a "general" scholarship for students requesting it without any proof of financial need and granting an additional "specific" scholarship for students who establish financial need in the usual manner. For example, in the case of an institution with a tuition charge of $800 and a cost per student of $1,500, the new tuition charge would be fixed at $1,500 and be applicable to all students. Any student, however, would have the privilege of electing a general scholarship of, say, $500, merely on the basis of a statement by him and his parents that the $1,500 charge is a burden. A student who needed additional financial aid would apply for a specific scholarship by an application in the usual form, which would include proof of his financial need.

This plan has not been and may never be tested in practice because it would be feasible only where competing colleges and universities adopted it simultaneously. Objections to the plan have been made on the ground that parents able to pay full cost would prefer to do so by paying the normal tuition and making a tax-deductible gift for the difference between such tuition and the actual cost. Pending tax proposals to give relief to taxpayers for educational expenses might tend to weaken this objection to the plan.

RATIO BETWEEN CHARGES AND COSTS

The foregoing discussion indicates that student charges in general must continue to meet a substantial portion of educational costs. Furthermore, in the light of possible inability to augment institutional revenues from other sources, it seems entirely feasible for student charges to be further increased without any undue adverse effect on enrollment, the individual student, or society as a whole. This would be especially true if the present trend toward larger resources in scholarship and other financial aid continues. Each individual institution, however, will have its own special problems in terms of the sources from which it draws its students, its other sources of income, and policies of its competitors.

SPREADING OF DUE DATES OF STUDENT CHARGES

The second question is *how* a student can meet his share of the cost of his education. Despite the factors referred to above, which tend to afford relief to students in financing their educations, in individual cases tuition and other charges still remain a serious obstacle to the obtaining of a college or university education.

The practice at a number of institutions has been for student charges, including not only those for tuition and other educational services, but also for room, board, health service, and the like, to be payable in a lump sum either prior to or shortly after the beginning of each semester. A larger number follow this practice on tuition and like charges, but spread due dates for board and room charges over the academic year. At virtually all such institutions extensions are obtainable in individual cases on the basis of proof of hardship. Still others, and the number has been increasing since World War II, have spread due dates for all types of student charges over the academic year, thereby considerably easing the difficulties of students in making payments when due.

The spreading of charges by institutions, however, is not the only means by which parents may ease the burden of meeting their children's educational expenses. Since an individual's college education, like the purchase of a house, represents a long term and, indeed, a lifetime investment, it is natural that various efforts to "amortize" the high short-term educational costs over a longer period have developed. Various forms of endowment insurance are available for those parents able and willing to save for their children's education in advance of the actual payment dates. Other plans go even further, such as that of one private organization which, since 1938, has extended monthly financing at a fee of 4 per cent of total charges. Under this plan the organization pays the student charges as they come due during the academic year and the parent reimburses the organization, plus the 4 per cent fee, in equal monthly payments spread over the same academic year. Hence, this plan is essentially a "pay-as-you-go" plan and not a deferred payment plan.

There is also in operation at least one plan of tuition insurance which, through a life insurance feature, provides for full payment of the student's charges from the date of his acceptance throughout his college course regardless of the parent's death or permanent disability.

Except for student loan funds at institutions which have such funds available, there does not appear to be in operation any regular and readily available plan whereby payments for a student's college education can be stretched out beyond graduation.

FINANCIAL AID PROGRAMS

Virtually all institutions today have some form of financial aid programs, including scholarships, loans, and student employment.

Financial aid in the form of scholar-

[11] Trevor Arnett, *Recent Trends in Higher Education in the U. S.* (New York: General Education Board, 1940), p. 33.

[12] A central agency known as the College Scholarship Service has been established in this field by ninety-five colleges and universities. At least fifty additional institutions have expressed interest in participating. This organization receives and evaluates financial information from scholarship applicants.

ships, as discussed earlier, has grown substantially since World War II. Undoubtedly, the necessity of filling the gap created by the winding up of the veterans program contributed to this growth in scholarship programs. Another significant factor is the growing competition for the outstanding student who has intellectual as well as physical qualifications, and who gives promise of assuming a position of leadership in later life. At the same time this latter development has, in some degree at least, tended to lead to financial assistance in cases where it cannot be justified on the basis of financial need. The development of common standards for determining need, which was referred to earlier, would help eliminate such abuses and in effect make existing scholarship funds go further.

One danger spot in scholarship programs based primarily on financial need is that probably only the outstanding needy student is being helped. The good but not outstanding student must be given more consideration as colleges and universities, foundations and corporations, move ahead with their scholarship programs.

Loans are a second form of financial assistance to students in meeting the costs of higher education. Certain institutions, particularly the technical schools and others offering primarily professional training, have been highly successful in operating financial aid programs which rely almost entirely on loans. In other institutions, however, such as liberal arts colleges, loans may not have been adequately utilized as a means of helping students finance a college education. Even at these institutions, it does not seem inappropriate to expect a student to "bet" on himself to a reasonable extent. If properly administered with low interest rates and flexibility in scheduling due dates to take graduate work and other like factors into account, it is believed that loan programs can be an effective way of helping to enable students to "amortize" the high short-term costs of their education. Indeed, the view has been expressed that the size of an institution's loan program is a good index of the "efficiency" of its over-all financial aid program.

The practice of working one's way through college has its roots deep in American tradition. Most institutions today have special student employment offices to assign jobs to students or assist students in finding work both within and outside the institution. Here again much is being, and more can be, done.

Relative roles of scholarships, loans, and employment

The relative roles scholarships, loans, and employment should play in enabling students to finance their higher education is a complete topic in itself. As one educator has pointed out, each method alone has its merits and its disadvantages.[18] Scholarships are an important means of preserving equality in educational opportunity and of making a college education possible for a gifted but needy student. Awards, however, which are excessive in terms of family resources deny opportunities to other deserving candidates. Loans, in turn, in reasonable amounts may not only help finance a student's education but also may serve to inculcate a sense of responsibility in the student borrower. Too large a debt burden, however, may actually weaken the borrower's sense of an obligation to repay. Employment likewise, if reasonable in its extent, can be significant in helping a student, but if it involves a sacrifice by the student in terms of academic accomplishment or extracurricular activities or both, such employment can become a detriment rather than a help.

[18] "Report of the President for the Year 1951," *Swarthmore College Bulletin*, vol. 49, No. 2, pp. 7–16. This discussion by Dr. John W. Nason is stimulating and valuable.

MEANS OF MEETING PAYMENTS

The student (or his parents) has essentially three means of meeting the higher student charges with which he is faced:

1. To prepare for meeting them well in advance of his actual entrance through savings or some form of endowment insurance, or to assure payment after his acceptance under a plan of tuition-payment insurance;

2. To pay as he goes by use of accumulated savings and earnings from part-time and summer employment (monthly payment plans can ease the burden to the student to some extent);

3. To postpone payment by securing loans scheduled for repayment after graduation or scholarships which he may subsequently be able to "repay" in the form of gifts or bequests.

Whatever method, or combination of methods, the student chooses to make his payments, it is probable that the growth in sources of financial aid and opportunities for remunerative employment during and after graduation will, as time goes on, tend to keep students in an economic position relatively as good as, if not better than, before World War II. It does not appear that higher student charges would create greater economic barriers to a qualified student desiring to obtain a college education than has heretofore been the case. At the same time there is a real need for colleges and universities, foundations and corporations, to develop aggressively further means by which students can finance their college education. This is particularly important as the student population sharply increases, so that the needy student of good but not outstanding qualifications is not denied the educational opportunities available to the student able to pay his way but of no better, and often inferior, qualifications.

John Foster Meck, LL.B., Hanover, New Hampshire, is treasurer and vice-president of Dartmouth College. He practiced law in New York and Washington; was assistant and associate professor of law (1937–41) and assistant dean at the Yale Law School (1939–41); chief counsel, Bureau of Naval Personnel (1945–46); and executive secretary, staff director Foreign Affairs Committee, Hoover Commission (1948–49). He is a contributor of articles on legal and public administration subjects in law reviews and other publications.

DISCUSSSION

The proper question about tuitions is not how much, but how much more. At present tuitions cover only a small proportion of the costs of educating a student; the problem of closing the gap between cost and tuition is a complex one. Every rise in tuition must be accompanied by additional university scholarships so that needy students will not be deprived of a full education. About 24 per cent of Dartmouth College students are now enjoying scholarships. Corporate programs are taking some of the drain off university scholarships. They are especially welcome when they are accompanied by general funds to cover the full cost of education in addition to tuition. The proposed federal scholarship system would have the same effect.

The most promising legislation under consideration is a bill allowing tax deductions to families sending children to college. Such a bill, if passed, would enable the schools to raise tuition closer to the total cost. Several schemes now being consid-

ered are intended to raise the tuition rates to cover full costs. Some parents want and can afford to pay full costs. Under these schemes, the tuition rate would be set high, and to cushion the blow, general scholarships would be available for the asking for students who could not afford full costs. Another alternative is to encourage the parents to make up the difference in tax-deductible gifts to the college.

In general most colleges have encountered little resistance to tuition increases and no loss of student attendance. Several colleges and universities are devising plans for distributing the costs to the student beyond the actual years he spends in college. A preliminary step is to amortize the tuition bill over a full year so that installments can be paid periodically rather than in one or two lump sums during the year. Some universities are requiring that the student borrow up to a stated limit from loan funds before scholarship money is available to him. These loans are of low interest or interest free and are not due until after his graduation. It has been proposed to set up a central organization to pay tuitions for students, and in turn the parents will spread the payments over a number of years in the manner of insurance policies. Another plan starts needy freshmen at full scholarships, and in successive years gradually converts more and more of the amount into a loan. Some of the corporations, notably General Electric, are encouraging the six months of school alternated with six months of work plan. The last two years of education under this plan will be fully subsidized full-time work. One drawback to all of the amortization plans is that it immediately makes inroads into alumni annual giving funds.

Standards of Service in University Management

By HARRY L. WELLS

THE background experience of your discussion leader—equally divided between industrial and educational business management—requires a frank preamble for this particular discussion. I cannot excuse educational administrators for their failure to establish more adequate and realistic standards for measuring the effectiveness of the services they are rendering. Even more critical am I of the carelessness in the simple rudiments of accounting for the stewardship of the tax and gift dollars upon which education survives. Time is too short to belabor my conviction, but you are entitled to know that I have it.

Other fields of human endeavor have faced appraising assignments just as difficult as education and have evolved amazingly accurate measuring units to guide them in increasing their effectiveness. The potential and nature of the function, the relative position of an individual institution within the field, the efficiency of manpower, and the utilization of space and equipment are no more baffling in education than in any other major business. Cost standards for even minute operations are possible and in many instances are available. They await only the willingness to use them. As we face the greatest demand for increased facilities and staff that educators have ever encountered we find ourselves not only without standards but without convictions. For a group which has as its main objective preparing leaders to have been found so handicapped at this time warrants a full measure of chagrin and should fire us with a determination to do something about it. This conference is timely and from it, we all hope, will come constructive advance.

OVER-ALL STANDARDS

We shall hope that in these discussions we may draw a boundary within which to develop some standards and convictions and then suggest specific approaches to certain of our major areas. Before we consider standards for measuring specific services rendered we need to examine the over-all function and pattern of education and agree upon some standards for the total operation. As a background, therefore, the following observations are proposed for your consideration:

Expanded junior college program

1. At the risk of duplicating some of the discussions of earlier sessions of this conference it seems essential to consider a standard for weighing the over-all demand for higher education which will confront us in the next ten years. We are living in a country where freedom is taken for granted and the right to "try anything" has common acceptance. Through compulsory school attendance laws, we insist that every boy and girl must "try" high school. We have accepted a pattern for higher education which will provide facilities for every high school graduate who wants to try college. This poses a very interesting survival problem for private education. If the load ahead of us is absorbed by tax-supported institutions, the position of private education will be significantly dwarfed.

An over-all standard for measuring

the potential must deal with the fact that all high school graduates may insist upon trying higher education in some form, even though the greater percentage can never travel the difficult road of profound scholarship. This is an age of minute specialization, and most young people will insist upon training for at least limited specialties. Stating such a concept of the potential is the beginning of standards for measuring it. We have data sufficient to throw light upon the percentage of those trying college who prove equal to carrying on in the more advanced educational programs. The remainder should therefore fall into shorter programs directed toward less exacting fields. The dividing line is, of course, not fixed and shifts in each direction must remain possible. We must set a workable standard which can be applied and refined by experience.

It is not pertinent to this discussion, except in so far as it limits or magnifies the problem, to call attention to the great need at the completion of high school for the kindly and sympathetic guidance needed to siphon off many youngsters who will be further ahead if they go into a job rather than waste a year or two in discovering their academic limitations.

From the records of college enrollments and performance it would seem that approximately 35 per cent of all who try college education complete the four-year course. There are many factors other than ability which influence this percentage but it remains a fairly reliable guide.

If we were to provide facilities in four-year colleges for only 35 per cent of all those who want to try college, our existing four-year institutions could meet the entire requirements projected during the next ten years. What would happen to the 65 per cent who will try college but who will fail to finish? They are now attending junior colleges and other short-course programs or are being flunked out of state universities which have, because of political pressure, been denied the selection in admissions which prevails in private schools. This, it seems to me, points very clearly to an expanded junior college program similar to the California plan in order to relieve the four-year colleges of this wasteful expense and to protect the youngsters from this brutal junior college within the state universities where the only diploma is failure. I submit that we need conviction upon this problem and a rough standard such as suggested to determine the direction of the expansion program required to meet the increasing enrollments.

Junior colleges should be community institutions without housing requirements for students. Naturally the programs for such schools will have to combine subjects of the four-year-college level with specialized courses of a limited kind which can be adequately covered in a two-year period. The California experience furnishes ample guidance for such a development.

A strong majority conviction on the part of educators on this area of our task is the most pressing assignment before us.

Balance of private and public support

2. Now let me call your attention to a situation which has been overlooked and needs speedy consideration. I refer to a sound appraisal as to the balance between private and publicly supported education at the four-year university and college level. Forty years ago private education provided 70 per cent of these facilities and public support carried 30 per cent. Today the situation is reversed and public support provides approximately 60 per cent and private gifts 40 per cent of the facilities. If the great demands ahead of us are

provided by new or enlarged state universities in four-year programs, privately supported education may well drop to a 15 per cent position. There is ample evidence that this would be a tragedy at the college and university level from which pioneer research and new knowledge must emanate. The most tangible proof of the imperativeness of private support for these risk ventures in research is the growth of endowment funds and private gift solicitation now being promoted by state schools. Educators from both state and private schools should jointly evolve a workable standard for this relationship. If they face it, courageously, I predict it will result in a standard favoring the predominance of private education either through privately supported schools or in privately supported programs within the state schools. Here again a statement of the problem is the beginning of standards. First, the right of selection on the four-year university level should be an accepted standard for both state and private schools. Secondly, the pattern for meeting the enrollments which we foresee should include largely an expansion of community junior colleges to relieve the four-year state universities from the wasteful and brutal practices of flunking 40 to 70 per cent of their freshman classes. For this conviction, time is of the essence if we are to avoid breaking out in a rash of expanded four-year programs.

Tax support and tax exemption

3. To implement what has been suggested to this point in our discussion we must venture into a very touchy field, one clouded by lack of understanding on the part of citizens and looked upon with skepticism on the part of politicians. Tax support and tax exemption are two forms of taxes granted for the purpose of carrying on services which the government insists should be performed. In the case of education, the government's position is that the service will be performed even if the entire load must be tax supported. Recognizing the value of the private way of accomplishing their objective, federal authorities have been very liberal in providing tax exemption on gifts designated for educational purposes. In fact, under the present provisions of the income tax laws more than ample funds have been made available to carry the entire educational program on a privately supported basis. Nevertheless, our lawmakers still fail to recognize that all private support should be subjected to the same standards as those applied to tax support. If taxes to meet all or part of a student's tuition in a state school are a deductible expense, then private support to the same extent by a parent or donor is equally a legitimate deduction. Education is an either-or choice. If the job is not supported privately it will be added to the tax load. All that is needed to prove the right to a common standard of treatment for private gifts and tax support is to call attention to what happens if you shift the load from private to tax-supported institutions. We should have integrated the alternatives of this dilemma long ago in a common standard of treatment. May I add parenthetically that the representatives of state schools recognized and supported this viewpoint long before private school administrators discovered their competitive handicaps?

Voluntary giving is cheaper

4. It is essential for the completion of the line of reasoning being followed to examine one more basic fact. It has been contended in this statement that gift support of education is simply a form of taxation, voluntary rather than enforced. Further, it is clear that if the program is not provided on the

voluntary basis, it will be added to the citizen's tax load. It is not generally understood that voluntary giving in actual experience follows the same pattern as the tax contributions. That is, the people and corporations who pay large taxes are also the large donors to education. The problem therefore is—which way does the man or corporation prefer to make the payment? The blind spot in this choice is due to the failure to understand that direct giving by each taxpayer is by large odds the cheaper way to accomplish the goal. This is not a criticism of the state schools; it is simply recognizing the mathematical accretion of overhead and handling charges which builds up in relation to the number of links in the chain connecting the taxpayer and the ultimate use of his money. This standard of conviction endorses wholeheartedly the program of greater private support for both state and private schools. An honest attempt to understand this fact will lead, in my opinion, to a new conviction as to the direction our efforts and endorsement should take.

You will recognize that the standards being discussed here up to this point are not units of measure but rather standards of conviction and direction which shape the pattern for all standards within the field of education.

FORD FOUNDATION COST STUDY

With the consciousness that our overall function needs integration we can now look at the basis for standards within our educational institutions. Fortunately there is now in progress a cost study supported by a grant from the Ford Foundation. It is unwise to attempt here to prejudge their findings or recommendations. It may help us, however, in our co-operation in these studies if we discuss the areas in which the survey must reach conclusions.

Observations on standards

Permit me to state a few observations about standards garnered from business and educational experience.

Standards are worthless in any atmosphere where top administrators do not believe in them. A determination to use standards sets the boundary for their effectiveness.

Standards do not need to be perfect to be of inestimable value. They are improved only by use, and approach accuracy in no other way.

Standards at any level of accuracy are but flags which indicate the direction of services and alert management for action. Rigid and inflexible standards will break under their own sluggishness.

Historically, educational progress has been subject to expediency and accident rather than to constructive development. Political pressures and donors' interests have been very effective.

Because standards have not prevailed in education, departmental jealousies, bad traditions, and seniority and tenure rights have delayed progress in this field. "Sacred cows," to use the accusation expressed in the last few weeks by a college president, are still handicapping educational progress.

California and Big Ten Conference Committee summary

The most satisfying summary of the cost and standard problem with which I am familiar was written by a committee known as the California and Big Ten Conference Committee. It was part of the statement to the Ford Foundation asking for a grant to carry on the cost study referred to above. The conclusions reached may be summarized as follows:

The common units of comparison, such as clock hour, credit hour, and per student, would not be meaningful, helpful, or useful on a university-wide basis in institutions of higher education of the magnitude and complexity involved. Such units on an all-university basis, which would merely reflect the differences in organization, program, and policy that we know exist, would be of doubtful and limited value for comparative and internal administrative purposes and could be harmful in the hands of people unfamiliar or unsympathetic with higher education.

The prospect of useful and comparable costs and data would be enhanced if the proposed study were undertaken in terms of the *elements* of total costs in such areas of university functioning as administration and general instruction and physical plant. These elements of cost in the several areas, using appropriate units of measurement as indicated in the detailed reports, can be compared in the several institutions with, we believe, a reasonable degree of reliability. These elements of cost could also perhaps be assembled in the several institutions to provide clock-hour or credit-hour costs by departments, by colleges, and by curricula. At this stage in the study this assembling is not contemplated or recommended, for it is our present judgment that the unproved and arbitrary bases involved in a distribution of administration, physical plant, and other indirect costs to the instructional program would make the resultant figures of very doubtful value for comparative purposes. We are entirely agreed that the assembly of these elements of cost into institutional clock-hour or credit-hour costs would be of no value for comparative purposes.

Scope of cost study

The presently proposed scope of study does not embrace extension, auxiliary, or research activities, which, of course, loom large in many of our institutions. However, it should be noted that subsequent studies of these activities will be necessary, for inherent in the proposed study is the allocation to these activities of an appropriate share of administration, physical plant, and other indirect costs.

Purpose and techniques

Throughout our discussions it has been clear that in addition to providing valuable internal guides, the study should be designed to advance understanding and confidence in the soundness of our operations in the minds of governing board members, legislators, donors, and the public generally. There is unanimous opinion, however, that general publication of all costs and data assembled should not be an objective of the study. Such publication, in the absence of detailed recitals of the differences between our institutions, could be more harmful than helpful. Each institution should determine the use of its own costs and data and, in our judgment, should have access on a confidential basis to the costs and data of other participating institutions.

This study, if undertaken, will develop procedures and techniques which should be of long-time interest and help to higher education.

It has always simplified my thinking in problems of this nature if the issues are approached in the sequence in which they would occur if we were building a completely new institution. The following comments follow that pattern.

ADMINISTRATIVE EXPENSE

The minute we make the decision to start a new college we are faced with administrative expenses. Whatever outlays are involved in directing the overall program fall into this classification. The first problem for the cost study is to secure a meeting of minds as to

which items are general administrative expense and therefore are to be spread over every segment of the college budget, and which pertain to one or a few segments and therefore belong to the departmental budgets. The next assignment is to attempt to reconcile nomenclature so that terms mean the same thing wherever used. Once these classifications are agreed upon, the determination of the amount of general administrative expenses is a simple bookkeeping routine.

The basis upon which it will be applied for cost accounting purposes to each segment is more complicated. One rather widely used method is to allocate general administrative expense in the percentage that the actual costs of a segment bears to the total costs of the college—in other words, a uniform percentage for every segment. The cost study may reach some other basis. The only pertinent factor for the present discussion is that this area of accounting has been under adequate control for a long time, even though we have not been consistent as to the items included in this classification or in the nomenclature used. Therefore any attempt at comparisons between institutions, or even between departments within an institution, is misleading. We may very well discover in the cost surveys that standards for comparative purposes between institutions are meaningless, and actually dangerous, and yet for control purposes within an institution, very accurate and valuable. It is impossible to make either items or nomenclature conform to the variables of geography, climate, class of schools, and many other situations which exist in individual schools. We must not permit our hope that standards can be determined for comparative purposes between institutions to discourage their use for control and guidance within an institution.

Over the years, experience has indicated that the percentage of general administrative expense ranges from 7 to 10 per cent of the total cost of operating a college or university, a variation due largely to institutional variables. The goal should always be toward comparable figures and a lower percentage, for the drift to top-heavy administration is an easy one.

PLANT EXPENSE

Plant expense encompasses the outlays for maintenance of land and maintenance and depreciation of buildings and equipment. Greater progress with costs and standards has been made in this area than in any other phase of educational accounting practice, largely because we can apply the experience of industry to educational plant situations. Nevertheless there has been wide difference of opinion as to what unit of measure should be accepted as a standard. In the case of land and buildings, "cost per square foot used" has the widest acceptance, although it has been weighted for height of ceiling, weather conditions, and other variables. Many standards have been used and are available for application in this field. Perhaps the cost study will win acceptance for a particular standard.

The amount of land and building area needed for our new college, even if standards of measure are accepted, is faced immediately with a "herd of sacred cows." Size of classes, hours of use of buildings, teaching loads, and rearrangement of class schedules—all must be realistic and flexible if wastes are to be avoided. Top management must accept the responsibility for resolving these difficult prejudices and traditions. The solutions will pay great dividends in efficiency and in lessening personnel tensions resulting from inequities in teaching loads.

As to equipment costs and standards, I think the cost study under way will discover that this problem centers in a rental concept. If each piece of equipment were rented from an outside firm, the accounting and costing would be simple. It is possible to apply the same thinking to an internal plan where all equipment belongs to the college and is rented to the departments. Costing on this basis is simple, but standards to determine needs and use are not workable. Experience with the rental basis has proved very effective in encouraging the release by departments of unused equipment, particularly if released funds are available for other departmental purposes. This incentive is perhaps the most effective standard available. I recall one instance where its application immediately released a large number of typewriters which obviously did not warrant a rental charge.

INSTRUCTION AND RESEARCH

This is the field in which the cost study will be most difficult, because the problem can be stated in all gradations from a simple base to an impossible confusion. The confusion arises in my opinion because we have failed to place the variables in their proper relationship. Too often we try to make variable hours produce the same mental load. This, of course, is an attempt to evaluate the mental capacity of Professor X and Professor Y and weight them by a variation of hours of work expected. Certainly industry has faced this identical problem, and the hours were fixed so that the variables occur in the amount of services rendered and the commensurate compensations established. The argument of the educators to which I have listened over the years paints a picture of the long hours of preparation and research required of teachers. The successful businessmen I have known have spent just as many extracurricular hours keeping abreast of their field and preparing for their job as have been spent by the college professors I have known. The cost study will, in my opinion, be forced in the direction of a more consistent pattern of fixed hours of teaching load if space and equipment are to be efficiently used and if students are to receive a consistent quality of instruction. The better minds cannot be released from reasonable hours in their main task of teaching. The problems of higher salaries, additional plant needs, and gift and tax support all rest upon an intelligent measuring of this basic phase of the college program. Legislators and donors are becoming more critical of mounting requests for support without evidence that it is needed. The Ford Foundation Cost Study sprang from this very criticism.

Administrative expenses and plant expenses can be adjusted to any single all-university cost standard which might be agreed upon. If a single measure is found, however, it will in the opinion of all accountants with whom I have worked be established in the instructional section of the budget. Whatever we are doing in our college program has its base in teaching. Therefore the common unit, if available, will arise in the teacher-student relationship.

We seem to be doing one of two things: either (1) furnishing teacher "contact hours" for students, or (2) providing "student credit" hours for graduation. Either of these units may become a single unit of measure to which we can apply all other standards. If the cost studies can reach an agreement on one or the other, and if college administrators will faithfully use it, we may make a real contribution toward a sound expansion of facilities to meet the projected increase in enrollment.

PAST WORK ON COST-STANDARD NEEDS

There has been a tremendous amount of energy expended by business manage-

ment in education on the cost-standard needs. Many books and hundreds of speeches and articles are recorded in the records of conferences and institutes. Not, however, until the last few years has a demand emanated from educators that something must be done about it. The cost study referred to offers a hope that something will at last be accomplished.

In view of the cost and standard study no attempt is made in this discussion to offer specific standards or the voluminous bibliography which is available on this topic. *The Manual on College and University Business Administration* just published by the American Council on Education, Dr. John Dale Russell's *The Finance of Higher Education* published by the University of Chicago Press (revised edition 1954), and other literature in the possession of the American Council on Education will furnish ample information for anyone desiring to make further studies.

May I repeat in closing that this is a timely conference and those who conceived it deserve praise and our thanks. The topic of financing higher education is urgent and calls for speedy consideration; the conference will have added a new conviction toward a solution.

Harry L. Wells, LL.D., Evanston, Illinois, is now vice-president emeritus of Northwestern University, after active service as its business manager (1934–54) and vice-president (1937–54). Prior to his connection with the University he was vice-president and general manager, Bauer & Black Division, Kendall Company (1929–34) and operating executive of Hart, Schaffner & Marx (1917–29). He is a director of Hart, Schaffner & Marx and of the Washington National Insurance Company, a trustee and director of the Chicago & North Western Railway, and a trustee of Lawrence College.

DISCUSSION

The speaker outlined the general features of educational reorganization which he considered necessary to meet the increasing demand for higher education. The bulk of the increase should be met by two-year nonresidential junior colleges supported by the states. A much smaller percentage of future students should enter four-year colleges and universities. A much more rigorous screening of applicants would serve to reduce the high "wastage" whereby only 35 per cent of the entrants today actually finish a full degree course. This situation has turned the state universities and colleges into "brutal junior colleges." Several possible explanations of the high mortality rate were offered, and it was asked how many of the 65 per cent losses left college because they did not have the ability to finish. If lack of ability is the primary factor, then the curricula of junior colleges must be set up at a much lower level of difficulty than are present freshman and sophomore courses. If on the other hand the factors inducing the high percentage of withdrawals were other than ability, then perhaps the junior colleges should be shorter and more specialized versions of the four-year curricula in the major colleges and universities. In either event, a formula must be developed which would bar all but the most capable of the junior college trainees from transferring to four-year colleges. Some progress has already been made in creating municipal junior colleges in Michigan and California.

In internal organization of the educational institutions a system of cost accounting must be developed to produce more rational and less expensive operation. It was pointed out that in any large organization there are a series of privileges and perquisites accumulated by the personnel, such as tenure, shorter hours, seniority, departmental prerogatives, which are inevitably opposed to the organizational requirements for constant audit and rearrangement of duties on the basis of optimum efficiency. The speaker maintained and the conference agreed that in the academic world a series of highly inefficient practices had been elevated to the status of "sacred cow," and that the density of the sacred cow population was seriously hampering the efficient management of educational institutions. Several areas were mentioned where the least utilitarian standards are those most admired by academicians, such as low-teaching load, small class sizes, and the greater the seniority the less the load. The speaker urged that particularly where the charity dollar is concerned, some mass bovicides are in order. It was agreed that the problem of setting standards of output per man was a difficult one, encumbered by questions of quality versus quantity of instruction and problems of interuniversity comparisons.

Operating Costs and University Management: Methods to Effect Economies

By Richard M. Paget

At the risk of oversimplification, it seems to me that the major problems facing higher education in this country today lie primarily in two areas. The first is in the social, economic, and political atmosphere of the times and is concerned with the need to maintain true freedom to pursue educational objectives. The second is the area of responsibility for seeing that the total resources—human, physical, and financial—of our educational institutions are fully and effectively used to attain these objectives. Problems in this category can be described as pertaining to management and administration.

Among the basic aims of all colleges and universities worthy of the name are to search for and impart truth, to train minds, and to develop values. The principal resources needed to realize these goals are good teachers and sound, fundamental research. Physical plant, equipment, and service functions of various kinds, while important, are secondary factors in the over-all situation.

Although the fundamental objectives of free universities have remained essentially the same through the ages, the conditions and processes involved in attaining them have undergone significant changes in recent years. We live at a time when universities and colleges are being subjected to many kinds of pressures which threaten true academic freedom. While I recognize the gravity of this possible corruption of truth and learning, it is not within the province of this paper to discuss all the implications of this category of problems affecting higher education. It is of the utmost importance, however, to recognize that the best thought, the energies, and the resources of our educational institutions should be directed to the attainment of the objectives which are their reasons for being.

Management a Positive Function

The area of management is important because good management and administration are one way of assuring that the energies of our colleges and universities can be directed to where they are most needed; that is, to maintaining freedom and to the search for truth. Weak or unskilled management disperses resources and diverts energies from these vital purposes.

Management in higher education is a positive function. It is the intelligent and effective exercise of the responsibility to direct and use the human, physical, and financial strengths of the institution for the realization of its objectives. Management provides the supports and the services necessary to carry on teaching and research programs. It is the function of management to participate in the selection and development of personnel and to provide physical facilities and money. It also is the function of management to provide those services which make it possible to house and to feed students and to operate the auxiliary enterprises in which the college or university is interested. Management is responsible for handling funds and investments. All of these functions are essential to the operation of our colleges and universities.

There can be no assurance, however, that these functions always will be performed in a manner that is best suited to the welfare of our educational institutions. Where there is bad management there is likely to be faulty organization, waste, and energies diverted from fundamental goals. The problems resulting from weak administration should be identified, analyzed, and corrected just as they should be in any business or industrial organization. Good management, on the other hand, will provide an organizational structure that meets program requirements, and will use resources effectively to further the institution's policies and purposes.

Deficits and donors

Good management and administration are important for still another reason. Soundly administered colleges and universities attract financial support. Many of the problems confronting nonprofit organizations today result from the economic conditions of our time—inflation, high operating costs, and high income and estate taxes. Colleges and universities are finding funds more difficult to obtain than they did some years ago, and are seeking to reduce expenditures for certain supporting services and operations so that more money will be available for faculty salaries, professional development, and research. There was a time when educational institutions were not unduly concerned by annual deficits. Usually, donors could be found who would make up the necessary amounts.

Today, nonprofit organizations cannot afford the luxury of deficit operations. Although substantial private funds still are available to assist educational institutions, donors now have a greater interest in granting funds to well-organized and soundly managed institutions than had many of their predecessors. The colleges and universities whose objectives are not clear, whose programing is not sound, whose organization is loose, whose facilities are not effectively or fully used, whose staffing patterns are not geared to need, and whose costs are poorly controlled are not likely to fare well at the hands of individual, foundation, or corporate givers, or at the hands of legislatures.

Effecting Economies

Thus far, I have tried to emphasize the thought that management and administration should be constructive functions. The subject assigned me for discussion—"Operating Costs and University Management: Methods to Effect Economies"—may imply an overemphasis of the negative aspects of administration. This topic also may suggest a detailed consideration of specific tools or methods to be used to make savings. It would be unfortunate if we dwelt only on techniques and on the negative when the need to comprehend the positive aspects of management is so great.

Effecting economies is essentially a negative thing. Even poor management can sometimes make savings, although this may be done in a way which impairs the attainment of objectives. In contrast, good management, by positive action, seeks to reduce or to eliminate conditions which are wasteful or unproductive. Such action is the expression of the constructive character of management.

With regard to methods or techniques to be used to effect savings, I doubt that there is a single answer or formula which produces desired results in all cases. A direct application of identical methods to all institutions would not work. Colleges and universities differ in many ways. They vary in size; they organize differently to carry out their objectives; some operate extensive auxiliary enterprises while others engage

only in a limited activity in this sphere; some are coeducational while others are not; state-supported institutions have problems peculiar to themselves while privately supported colleges and universities have still other problems. These are some of the obvious differences among our educational institutions.

Further, educational institutions are not unlike individuals. They often emphasize different values. Some individuals may forgo an expensive automobile in order to build up a library of classical music. Similarly, some educational institutions may decide that a high level of maintenance is not as important as having more funds available for instructional purposes.

A blind approach to the problem of effecting savings is neither desirable nor possible. As in business, there probably is not a college or university budget that could not be reduced in some respect. But if in blindly reducing budgets we destroy values or impair objectives, we may find ourselves in the classical position of the surgeon who reports the operation successful despite the death of the patient.

I should like to deal briefly with five important aspects of management and administration in which there are opportunities for constructive action. The five areas are as follows: the functions of the governing body in policy guidance and control; the organization for administration; the organization for controls over administration; the organization for the continuous review of costs; and the creation of an atmosphere conducive to change. Generally speaking, these are areas in which, if we find management weaknesses, it is almost certain that monetary savings can be made. These also are areas in which there are tremendous opportunities for constructive, positive action by sound management.

THE GOVERNING BODY—POLICY GUIDANCE AND CONTROL

The role played by the governing bodies of colleges and universities is one of the most significant elements affecting the type of administration which prevails. Where there is misunderstanding concerning the function of these bodies unfortunate situations often result.

Size and composition of the board

Governing boards vary in size from five to a hundred members in the almost 1,900 institutions of higher learning. Board members are chosen in several different ways: some are popularly elected, some are chosen by legislatures, some are appointed, some are selected by alumni organizations, some boards are self-perpetuating. Board members may or may not have specific knowledge of educational problems. However, the governing bodies of our colleges and universities generally are composed of public-spirited and culturally minded citizens who usually give their time without compensation.

A policy-making body

It is the primary function of boards of trustees to establish objectives and determine policies, and to see that the policies adopted are carried out. A distinction must be made between policy making and administration. The board should not be an administrative body but should accept the fact that its principal contribution to the institution is in the area of policy determination. Where the functioning of the board has not been thought through clearly, the governing body often gets into strange fields, such as involving itself in details of curriculum matters and approving purchases of items even in small amounts. The boards of some colleges and universities, for example, concern themselves in great detail with the appointment of almost all new personnel, including wage employees. Consideration of matters such as this takes the time of the board and yet does not result in effective policy control, since the board members cannot possibly pass on the qualifications of all the employees.

The governing body which involves itself in the details of administration stultifies its own usefulness in the area in which it should make its major contribution, and frustrates and hampers internal administration. In these circumstances, the president of the college or university will function in an atmosphere of uncertainty, and his initiative in administration will give way to a state of paralysis.

On the other hand, there are rare occasions where the circumstances are reversed and where the president of the institution has sought to perform the policy-making functions of the board as well as his own functions in the sphere of administration. In such instances, there usually is not a close working relationship between the president and the board. In fact, efforts are made to withhold information from the board. This type of relationship, with confusion of responsibilities, is unsound. It is harmful in the long run, for when the strong leader departs, indecision and management confusion enter.

Sound management is based upon clearly defined roles for the governing body and the president. The governing board, by concentrating its efforts in the area of major policy, can gain sufficient control to enable it to meet its responsibilities. To refer again to the illustration given above of the board which sought to control personnel policy by approving the appointment of all new employees: governing bodies interested primarily in policy formation would have proceeded in a different manner. Boards in some educational institutions have asked that positions be classified, have adopted minimum standards for selection for each grade, have approved salary ranges for each grade, and have then fixed organizational responsibility for carrying out these approved policies in the field of personnel. In this manner, such boards have gained effective control over the entire personnel process and also have a bench mark against which they can measure the success with which it is administered.

The principle involved here should be applied to other important aspects of administration. This type of relationship between the governing body and internal administration contributes to good management, reduces the likelihood of providing opportunities for unsound administration, and thereby limits the opportunities for the development of uneconomical and wasteful situations. Where responsibilities have been thought through clearly, the functions and scope of the governing body and each part of the institution are defined, the future of the major organizational units is outlined, and the means of financing and operating them are approved. Thus, new programs which do not have board approval are not added, and splinter programs which later cannot be financed are not begun. In these circumstances, the funds available to the institution are more likely to be used for its determined primary purposes, and competing activities are kept to a minimum.

Committee system

The effective governing bodies usually carry on much of their work through active committees, the type and number of which vary considerably among boards. Some governing bodies establish committees in accordance with major functional activities, such as instruction and curriculum, buildings and grounds,

finance, athletics, and alumni and public relations. Others have established committees which correspond, generally, to the major units of the college or university, such as a committee for each of the professional schools, the graduate school, and the undergraduate college, in addition to committees for various functional activities. Many boards, especially the larger ones, find an executive committee to be an effective tool of management.

An effective committee system provides additional links between the governing body and the institution. Active committees are channels of information which keep the governing body informed of needs in the policy area. A wise board will make sure that it is well informed and will draw upon the president and the faculty for advice in establishing objectives and policies.

The governing bodies of our colleges and universities require skillful staff assistance. The members of these bodies often have full-time responsibilities elsewhere. They usually meet infrequently and are not in continuous touch with the affairs of the institution on whose boards they serve. In a sense, the president and other key officers of a college or university are, in part, staff officers to the board. However, it is the secretary to the board who is in a position to provide full-time staff service. The secretary should be very much more than a keeper of minutes and records. Among other responsibilities, he should see that the vertical channel of communications is working properly, that there is follow-up on action taken by the board, and that materials for board consideration are adequately prepared in a manner that will make it possible for board members to handle items of business expeditiously.

There should be a flow of concise reports to the board, of such a nature that its members can determine if policies are followed and with what degree of success. The board and the president should determine the type of reporting required to accomplish this purpose.

In summary, I should like to point out that a strong, active board, whose relationships with internal administration have been clearly defined, is an asset because of the contribution it can make to good management. When it comes to determining what credit should be given to strong boards for effecting economies in operations, it is difficult to assess the situation precisely. It usually is impossible to trace specific economies to a properly functioning governing body. It can safely be said, however, that in the college or university in which there is good top management, errors are less likely to be made and therefore the opportunities for effecting monetary savings are not so likely to be present.

Organization for Administration

A second area in which positive action can make for effective management is in the organization for administration of the college or university. A sound organizational structure is basic to effective and economical operations.

It appears to be a historical fact that some educational institutions have developed over the years with little consideration of the manner in which they have organized themselves to carry out their work. Sound principles of organization often are not followed. Lines of authority generally are far from clear, responsibilities may not be defined, the scope of authority of various officers often is not precise, and frequently needed functions have not been specifically assigned to anyone. These failures to follow good standards of organization have resulted in duplicated effort, in frustrated personnel, and in deficiencies in essential services.

Many of our colleges and universities have not been so alert to the importance of sound organization as American business has been. This may be because the importance of organization has not been recognized so generally among educational administrators as it is among business executives, or it may be because the proper organizational structure sometimes requires a larger expenditure of funds for administration. Even when there is a desire to correct organizational weaknesses, it is extremely difficult for those inside the organization to make these changes effectively. Motives often are suspected, weight of authority is questioned, and, in many instances, comparative knowledge of organizational principles and practices is limited.

The role of the president in a college or university is a difficult and a complex one. He has a dual role to fill. First of all, the president is expected to provide leadership and, in a sense, to personify the institution. He is responsible for its academic programs, including research, instruction, and educational objectives. Secondly, he is an administrator who is responsible for seeing that funds, personnel, facilities, and services are provided to support these programs. He must watch income and expense closely; he must raise funds; he must see that facilities are properly maintained; he must see that supporting services are adequately provided; and he is responsible for sound, internal organization and operations.

These are responsibilities which are too great for one man to discharge effectively. His task is lightened in the institution whose organization for internal management is soundly conceived, and where able lieutenants are available to assist him.

The colleges and universities that are soundly organized have grouped related functions as nearly as possible into homogeneous organizational units, in order to avoid jurisdictional problems and to eliminate duplication of effort. Officers responsible to the president have been put in charge of these functional areas and have been given clear delegations of authority. Their responsibilities have been determined, as have the functions of their subordinates. Such an organizational structure is designed for effective administration to support educational objectives, and the investment to obtain it is well worth while.

Sound organization makes savings a possibility, as the illustration which follows indicates. In a state-supported college, economies of more than $200,000 per year were identified as the result of rearranging major functions, eliminating duplication which came to light during the course of the organizational study, and fixing responsibilities more clearly. This institution believed it had been financially starved for more than a generation; and it is significant to note also that it had been struggling with the problem of how to increase faculty salaries. The savings referred to permit an average increase in salary to each member of the faculty of over $1,000. If, as here, the savings obtained from good organization and economies in the business and service areas are used whenever possible to strengthen the faculty, constructive measures will have been taken to further the primary objectives of the college.

Organization for Control over Administration

A third area in which management can take positive steps to improve administration is in establishing adequate internal controls. Sound controls are necessary to determine compliance with policy and to assure effective performance. Controls have been standard practice in industrial enterprises for many years, and our colleges and uni-

versities are gradually coming to accept their value. Controls probably will be more widely accepted when educational institutions learn that effective controls make it possible to detect costly operations which incur deficits and to identify waste so that corrective action may be taken.

There are many areas in university administration which can be subjected to internal operating controls. For example, in one university the registrar's function had been a decentralized operation for a number of years. When this operation was subjected to cost measurements on a unit basis, it was found to compare unfavorably with unit costs in well-run institutions of a similar character. Some consolidation of the registration and student-records functions was made; savings in salaries for personal services and at the same time more satisfactory operation resulted.

To take another illustration, it was found at a certain university that a disproportionately high percentage of the budget was being used for maintenance and repair. The head of the buildings and grounds department was given assistance in establishing standards of maintenance and a maintenance schedule to carry out those standards. Production levels then were established on a unit basis for certain of the personnel: principally painters, carpenters, and custodians. Performance then was watched carefully. Under this system it was disclosed that the buildings and grounds department was overstaffed, and in the first year the services of ten men were dispensed with at an approximate savings of $30,000. The head of that department is of the opinion that further savings are possible.

The area of food service for students readily lends itself to controls. Many colleges and universities now have broken down their food-service costs into cost for raw food, labor and other preparation and service costs, and total cost per meal. They now keep accurate meal counts to assist them in determining unit costs. They have introduced portion control. In some cases the costs for student feeding have been reduced and the quality of the food has been improved as the result of supervision of this type.

In a college where there had been no agreement as to priorities in the construction of new buildings, the program for the construction of new classroom facilities is now based primarily upon data derived from controls over space utilization. In this particular college, the enrollment figures have been projected for several years ahead. Each year a detailed study is made of the utilization of present classroom and laboratory space. The enrollment and space-use data are checked annually to note any change in trend, to test for accuracy, and to determine demand. When space utilization reaches a predetermined point in terms of present and anticipated enrollment, it is planned to begin the construction of new classroom facilities. It is hoped in this way to have the appropriate facility available at the time it is needed. In contrast to this approach is a situation at another college where several millions of dollars in new buildings are being provided for a program for which demand has steadily declined in recent years, and where enrollment has fallen off sharply. In that same institution, the facilities are inadequate in certain other areas where there has been a marked increase in demand during the postwar years.

Control in the academic area

It undoubtedly would be agreed generally that operating controls are desirable in the areas just referred to. There is not a similar general acceptance, however, of the idea that controls should be applied to instructional costs or to academic programs. It seems clear that the factors involved in matters of curriculum are so different from business or industrial operations that it would be a grave mistake to determine their value exclusively in terms of dollars and cents. Some institutions do exercise a close control over the budgets of instructional departments by applying measurement in terms of student enrollment, credit hours taught, and the percentage of fees for which its enrollees are responsible. Such measurements are imperfect and have many disadvantages, because they do not take other factors, such as cultural objectives, into consideration. Certainly, decisions as to instructional programs should not be based upon cost measurements alone.

However, with certain qualifications, there may be some validity to cost studies in the academic area. Even in our teaching and research programs we have a tendency to fall into bad habits. We may build facilities we do not really need; we may not spend wisely for equipment; we may add new majors; or we may multiply the number of courses offered when there appears to be little justification for so doing. These things result in higher operating expenditures. Cost studies in the academic area may be necessary and valuable, therefore, if they are not the sole measurement relied upon as a basis for reaching decisions, but are accepted only as one of the factors to be taken into consideration in making judgments. This is an area of management control, however, which requires additional study and improvement in techniques.

CONTINUOUS REVIEW OF COSTS

A fourth area in which management can take positive action to strengthen administration and thereby avoid waste or effect economies is in providing an organization which makes it possible to review costs and performance. It is not common practice among even many of the larger educational institutions to assign responsibility for the continuous study of the costs of operating the college or university. There still are institutions where budgeting is thought of as a function of one of the fiscal officers for a few weeks each year, and where it is believed that a good budget job has been done if at the end of the year total income and expenditures approximate the original plan.

Year-round budget activity

In well-managed institutions, the budget function is a year-round activity. The budget is the expression of the policies and objectives of the college or university in terms of a financial plan. The budget process, therefore, should take into account long-term plans as well as annual operating needs. One of the purposes of good budget planning is to see that the financial resources of the educational institution are concentrated in the areas that further its major objectives. Conversely, funds should not be diverted needlessly to activities that are inconsistent with those objectives.

From an organizational standpoint, the responsibility for budget making, for budget execution, and for the review of costs should be fixed in an officer who reports to the president. In larger institutions, segments of the budgetary and cost responsibility should be delegated to designated officers in the major functional areas. There may be further delegations within these areas to various supervisory levels or to various activities. These officers all have the responsibility for reviewing performance, for studying costs, and for gathering data that are relevant to the budget process. The annual budget then is not a "crisis" operation but be-

comes a point in time when the financial plan of the institution is prepared.

The absence of a fixed responsibility for the budget and for continuous review of costs contributes to weak management and to waste. For example, in one small institution there were sixty-six mimeographing machines and five automatic addressing machines. This represented approximately a 50 per cent overinvestment in equipment; yet some offices in the institution still did not have the services of these machines available to them. There had been no review of expenditures for this equipment in terms of over-all need. In a larger institution, there were 163 major machine tools located in thirteen different machine shops, all serving the research activities of the university. By combining some of the equipment and personnel, it was possible to reduce the requirements for equipment and to effect a saving in personnel which amounted to over $25,000 per year. Neither of these educational institutions had a full-time budget officer, with the result that costs had been excessive for personnel and equipment without providing satisfactory service. A competent budget officer, reviewing requests for equipment and personal services, and reviewing costs, could have prevented such waste.

Good management recognizes that the budget is one of its most useful tools to control operations and to evaluate accomplishment. Modern management cannot be successful without the benefit of periodic financial reports derived from the budget. In form, the budget should make it possible to determine with ease the expenditures and income for the major areas of activity of the college or university. A budget, in turn, should be supported by a chart of accounts, which readily lends itself to the preparation of periodic financial reports pointing out variances from anticipated performance. Such an arrangement also facilitates budget making.

Procedural simplification

Another means for continuous study of costs not commonly found in educational institutions is through the recognition of the procedures and methods function. Certainly, the larger institutions could well afford full-time staff assistance in this area. Such a staff position might be used to study methods, review and develop procedures, design and control forms, determine the means of reproduction of printed matter, study means of effecting work simplification, and prepare procedures manuals. Continuous work in these areas often leads to savings. For example, in one university the cost of the supply of forms used in the president's office was reduced $1,100 by combining a large number of forms into one. It was not possible to calculate the additional savings resulting from the reduced time needed to handle one form instead of several by the many offices which processed this material from the president's office. Further, the requirements for filing space were considerably reduced.

There are many other areas in which procedural simplifications might strengthen management as well as produce savings. Included in these areas are the processing of work orders, of purchase orders, and of records and procedures relating to personnel.

Combined methods for economies

The more substantial and the more dramatic savings made through sound management result from a combination of good organization, effective operating controls, and a continuous review of costs. In one large university, which is now well on the road to becoming an excellently managed institution, ways to effect economies of several hundred thousand dollars were pointed out. Some months later, the university reported that savings on an annual basis of approximately a half million dollars already had been effected. The principal savings in this particular university involved the buildings and grounds activities, the accounting processes, the registration procedures, the consolidation of library facilities, printing and duplicating activities, and other business services. Once the management of that institution was properly equipped, it proceeded to take necessary action to recoup funds which could be used for the major educational objectives of the university.

CREATING AN ATMOSPHERE CONDUCIVE TO CHANGE

A fifth area in which strong management can contribute to sound administration is to assist in creating an atmosphere conducive to change. In spite of the spirit of inquiry which characterizes the academic atmosphere of educational institutions, many are traditionally resistant to change in management techniques and concepts. This resistance appears to be a natural human trait and is found in almost all organizations. American industry, however, generally seems to be aware that management and administration are not static and that there is a hazard in maintaining the status quo. Many firms have discovered that it is unreasonable to expect employees to make suggestions to improve operations unless they are convinced that top management is sincerely interested in bringing about changes and improvements. Progressive industrial leaders have adopted sound suggestions made by their employees. This atmosphere has focused the attention of substantial numbers of personnel on the need for a continuing identification of opportunities to improve administration. Only rarely have colleges and universities shown similar ingenuity in their appoach to administration.

In our educational institutions there should be a more widespread understanding of what management is and what it contributes. It is important to remember that teaching, research, and management are part of a whole. Management assembles, organizes, and maintains the resources to be used to achieve the fundamental objectives of the college or university. As we have seen, it is vital to make the flow of resources which support major goals as large as possible. In order to find the maximum amount of funds for this purpose, operating costs must be controlled and opportunities to effect economies should be seized.

To state it another way, management may be regarded as a means of testing whether the college or university is using its resources effectively. It is the responsibility of management to see that the educational impact of the institution is the maximum possible within the limits of its available resources.

Top management should demonstrate that it is alert to the needs for dynamic and better administration by a continuous review of management problems and by improving the efforts to solve them. With a better understanding of the purposes of management and administration, college and university personnel should be encouraged to participate in efforts to strengthen and improve them.

To assist the persons in the institutions of higher education who are sincerely interested in strengthening administration and in conserving resources, I should like to call to their attention twenty areas included among those in which we have found the most

frequent opportunities to effect savings. These areas are as follows:

Admissions office
Athletics
Bookstores
Buildings and grounds operations
Business machine operations
Business office
Equipment and farm machinery operations
Food services
Health services
Libraries
Mail and messenger services
Motor pools
Official publications
Printing and duplicating
Purchasing
Registration and records
Stenographic services
Student housing
Student placement, guidance, and testing
University press

Each of these areas or activities does not always offer the possibility of savings. Furthermore, the opportunities for savings and the extent to which economies may be made are dependent, in part, on the amount of money budgeted for each of these activities. These are areas, however, in which objective and systematic analysis has been rewarding.

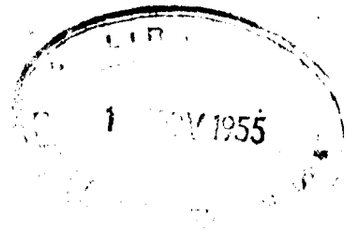
CONCLUSION

Two generations ago even the greatest universities in our country were small in size and simple to manage. The community of scholars was self-governing, with little need for a formal organization to provide specialized services to assist in the attainment of educational objectives.

Today, even the smaller institutions of higher education are relatively complicated organizations with many complex services and problems. The larger universities now approach the complexity of our giants of industry. The value of the physical plant, the size of operating budgets, and the amounts of endowment and investments often run into millions of dollars. With the prospect that the enrollment of students may double in the next fifteen years, the continued growth of our colleges and universities during this period will make past growth in any similar period seem insignificant. It is reasonable to assume, therefore, that the problems of management in our colleges and universities will become more rather than less complex.

Already there have been signs of a growing recognition that sound administration is essential. Possibly the financial stringency of recent years has contributed to this development in American colleges and universities. It is a healthy condition when there is greater awareness that money spent for any purpose should be evaluated in terms of the contribution that expenditure makes to the over-all objectives of the institution. The spread of this awareness means that the importance of management is being more generally recognized. In short, good management and sound administration are coming of age in the field of higher education.

Richard M. Paget, New York City, is a partner in the management consulting firm of Cresap, McCormick and Paget. He served as management engineer of the Navy Department during World War II and in the decade prior to the war was in private practice. For nine years, he and his firm have been working with the special management problems of educational and other nonprofit organizations. He is a director of the Atlas Powder Company and The Kemper-Thomas Company and a trustee of the Parsons School of Design.



DISCUSSION

The speaker maintained that the budget should be a continuing process and not a yearly spasm. Predicted costs should be constantly contrasted with actual expenditures. A contrary suggestion was made that the budget might well be confined to a limited period since it was inherently a frustrating process. In a large university the lower levels are always trying to make the segmental budgets larger. The problem is to motivate the lower echelons to demand less than they would require to fulfill their most imaginative aspirations. The discussion leader suggested that a proper balance might be achieved by strengthening budgetary control in the hands of a central comptroller and by making individuals in the lower echelons responsible for segmental budgets. In order to allow scope for maximum savings, such faculty-made expenses as office space and telephone costs should be directly chargeable to departmental budgets. Machinery and equipment can be rented to individual departments to reduce excessive immobilization.

One very real danger was the tendency of administrative costs and overhead to far outdistance instructional costs. At Wisconsin, for instance, about one-third of the cost dollar goes into instruction. There are many reasons for this. Educational institutions, in particular land-grant and state-supported institutions, have been required to take on numerous subsidiary services such as agricultural extension and experimentation stations, research programs, military training—which are high in overhead compared to more traditional liberal arts subjects. Also growing student enrollments have forced the centralization of many functions, such as student counseling, which used to be part of the faculty's responsibility. Expansion of alumni and fund-raising activities has also swelled the central overhead. One of the most futile of current administrative expenditures arises out of the large volume of admissions on scholarship applications. Many of them are duplicates of applications submitted to several other colleges. In spite of the understandable need for increased administrative services, the danger of overloading the budget with administrative costs is a serious one and must be continuously controlled.

The most difficult problem, of course, is the evaluation of the instructional program, for it is here in most colleges that the bulk of the expenditures occurs. There is no easy standard for measuring instructional efficiency, but several methods of promoting efficiency were mentioned. The Harvard visiting committee and Board of Overseers system was suggested as a possible model. The speaker pointed out that management counselors called in to survey university operations were not the proper ones to examine the educational program. Curriculum review boards, however, might well combine academicians with lay specialists in applied fields. In addition to providing useful advice, such boards could function as liaisons between the institution and influential sections of the public.

At the close of the session the chairman made three brief comments. Creative activity thrives best in a little chaos. Sacred cows sometimes give good milk. Filet mignon costs more than hamburger.

How to Finance Higher Education in the Future

By Henry M. Wriston

I REGRET not having been able to attend all the meetings of this important symposium, but the Charter of Brown University contains a provision that the President shall not occupy the same bed two nights in succession. While this may be a matter of custom and habit in other institutions, it is law in mine. I have, however, had the opportunity to read the papers of the other participants and have been impressed with the learning and insight they have brought to the various phases of the subject before us.

They seem to be in general agreement that the children who are going to make us trouble are already born and, though the United States has not ratified the Genocide Convention, there is no available legitimate way to cut down the number. We must, therefore, face the grim problem of educating them. If the percentage of the age group who go to college continues to increase at the rate it has during the last fifty years, the pressure will be enormous and will require marked readjustments on the part of institutions of higher education.

The prospect of such a situation invites alarm, and symptoms of acute anxiety are not missing among those most deeply concerned. It has been postulated as obvious that, in the limited time available, it will not be possible to double the present facilities, which have required over three centuries for their accumulation.

I regret that none of the speakers seems to me to have attacked this problem with such boldness and imagination, with such reach and grasp, as to give us what we need, namely an integral solution. No less a solution is tolerable in our epoch. They have made suggestions here and there, all of which are valuable in themselves, but they fall short of the sweeping and radical change that is necessary.

One idea which has been proposed elsewhere as the key to a solution is rapidly to increase the number of students admitted while enlarging the staff of instruction to a much lesser degree. This would involve a sharp alteration in student-faculty ratio. Important agencies now propose to seek techniques and instrumentalities to facilitate this change. They hope to make it an advance toward educational perfection, rather than a retreat.

Lecture and Textbook

I should like to make a comprehensive proposal for the attainment of this worthy goal. To that end I begin by observing as settled fact that the dominant mode of college instruction today is the lecture with a supplementary textbook assignment. So far as the latter half of that combination is concerned, my proposal would have the effect of reducing the number of different textbooks used, but it would increase the size of the editions. This would produce economies, for the larger each printing the lower the cost. It would also eliminate some (but not all) frightfully bad textbooks.

Lecturing is a different matter and our habits must be more drastically revised. Current practices are shockingly wasteful as well as woefully inefficient. A great lecturer today has, at best, a

very limited audience. Some lecture halls have loud-speakers, and the class can be somewhat expanded. But there are only a few universities with auditoriums large enough to make any real impact on the problem before us by that simple method. As yet nothing has been done to meet this issue with wired television. However, if an article in the current issue of *Time* is accurate, this oversight is to be corrected in the new Air Force Academy soon to be constructed in Colorado Springs.

The inefficiency of the lecture system as now practiced is even more serious than the costly waste. Different professors vary enormously in their grasp of subject matter as well as in the effectiveness of their presentation. Why not have the leading men, really first-class scholars, put their lectures on film with sound track? If a great man's voice is not pleasing, but his appearance is satisfactory, the sound can be dubbed in by an announcer borrowed from radio or television; wisdom that is mellifluous clearly has an advantage over the dry cackle of a savant too long accustomed to captive audiences.

Such films with sound effects would be available to every college and university in the nation. By this process every student in every institution everywhere would "see" and "hear" not a second-rater, but the very best man in each field. At last the ideal that Charles William Eliot set for Harvard more than half a century ago would be realized, not only there but everywhere else: "the best of everything and everything of the best." The student would still maintain about as close and human a contact with his teacher as he now does in typically large lecture classes.

Some of you, with a regrettable tendency to levity, may try to make sport of this proposal by suggesting that the material be piped directly to a television screen in the student's room, so that he can learn in bed, thus fulfilling the cynical comment of a sophomore who, after hearing a dull lecture, said, "I should have stood in bed." But we know, or seem to, that learning is a gregarious process, that students absorb more in a crowd. There is another reason why a dormitory-room television set would be inadequate if this innovation is to be really effective. The professor, being a great man, should be projected on a big screen as more than life size. He ought not to *look* smaller than Jane Russell, let us say. There is a fitness in these things, which we will overlook at our peril.

Attendance could be taken by automation—a modern word which should quickly find a niche in modern education. Each student's thumbprint would be on file. As he entered the lecture he would merely thumb a piece of wax; the fresh impression would be electronically compared with his master print. Thus no substitute would gain learning at another student's expense. Once in the room he could not leave without setting off an appropriate alarm.

Examination System

Present examination practices are another evidence of waste and inefficiency. We all know from experience that most examinations are incompetently written by people who are scholars in the subject but are not skilled in how to examine students in it. Every study of examinations has shown that grading is, to a considerable extent, visceral, and that the grades assigned are almost quixotic. It is clear that there is need for both greater economy and higher efficiency.

My proposal is that examinations be set nationally, prepared at a central bureau by experts in devising objective tests. They might not know much about the subject, but they would know how to find out how little the student

knew about it. The long drudgery of reading papers would be ended, for all tests would be scored electronically. Thus a junior taking Advanced Microtome Technique 316 could learn in due course that his national standing was 16,952nd out of 22,124. By knowing his relative position in the national scale he might be challenged. At least he could not say that the grading was unfair.

It may be objected that without essays as a requirement, students would not learn to write well. Who will make the assertion that they now do? Indeed, it is a fact beyond challenge that in most large lecture courses no essay of any considerable length is now required. The objection, therefore, may be instantly dismissed as without merit.

ACCREDITATION

This national lecture and national examination process, applied to all fields of instruction, would quickly solve one of the stickiest and costliest of our present difficulties—accreditation. One of the largest and fastest of available electronic brains would assemble all the test results in every subject for every university, college, and junior college. By simple calculations—simple, that is, to the calculator—the relative over-all position of every institution within its class would be accurately determined. An established cutoff point would automatically determine which institutions should be accredited and which should remain in outer darkness.

The same process could also be applied subject by subject; this would reveal unerringly which institutions should be accredited in chemistry or in engineering—or any other field. The criterion would be the only valid one—the achievement of the students, not the number of books in the library or the number of square feet in the laboratories or the number of Ph.D.'s on the faculty or any other irrelevant fact. The new procedure would be a guarantee that the graduates of one institution knew something and that graduates of another institution knew less. This has long been regarded as the basis on which institutions should be accredited, if only the data were available.

The proposed accreditation technique, furthermore, would relieve institutions with satisfactory scores from being visited from time to time by inspection teams in numbers reminiscent of the descent of the locusts. The amount of time and money saved would be great, and the gain in reliability even greater.

STUDENT COUNSELING

Skeptics among you will demand to know how student counseling could be carried on under such a regime. This is another point where economy and efficiency could go hand in hand. No one can deny that the present system is time-consuming and therefore wasteful. We know that under current practices the same student problem presented to two different counselors produces widely variant suggestions. Obviously, if they are different, one suggestion must be wrong; there cannot be two different correct answers; that carries relatively a step too far. Unhappily we cannot be sure that either of the two answers is right. A third or a fourth counselor might well come up with still different curricular proposals. This confusion of counsel is not only expensive and inefficient, it is grossly unfair to the student. He is entitled to know that the curriculum prescribed for him is really suited to his "felt need."

There are several manufacturers capable of designing a machine to end these costly confusions. Let each student set down his objectives in life; he could do this by check marks upon a properly constructed form. Those could readily be coded to the machine; out

would come the precise curriculum perfectly adapted to meet his objectives. His studies would be tailored exactly to his "felt need." Similar objectives would get similar results—no fumbling, no guesswork. There would be a vast psychological gain as well as perfect vocational efficiency. The student would be in instant emotional harmony with the prescribed program because he knows that these machines do not make mistakes; they have inexhaustible memories and infallible logic.

CURRICULUM PROBLEMS

This method would put an end to one of the most expensive of all present procedures—the infinite number of course changes recorded in the first two or three weeks of the college year—a process that makes for confusion and inefficiency. It would also make unnecessary one of our most wasteful practices, curriculum committees; their members engage in endless departmental logrolling under the very thin pretext of intellectual review and discussion of courses of study.

One final, and I believe clinching, argument for my broad reform remains. Today a student in a small college may be deprived of some course for which he has a "felt need" because the college cannot have a faculty large enough to cover every conceivable subject. I met such a one on the train between Portland and Seattle: a young lady had been forced to leave Stanford University because it did not offer a complete major in microbiology, and she did not want to mess up the precisions of her knowledge in that field with what she regarded as macrobiology.

Under the proposed plan, if the curriculum calculator said a student should have a course in psychoceramic indices, the college could readily rent that course reel from the central pool. Even if he were the one student interested in identifying crackpots the cost to the college need not be prohibitive. It is true that he might have to watch the professor on a small screen; that would be his only loss. If the normal class rhythm had conditioned his mind to learn only at the well-known alternate day interval between lectures, he could go to the same spot three times a week, register his thumbprint, and throw the switch.

Is there anything wrong with this proposal, save lack of imagination on my part in suggesting new electronic marvels for education by automation, which might be adopted as our new national project?

IS THE LECTURE-TEXTBOOK TECHNIQUE EDUCATION?

Granted the lecture-textbook assumption upon which it is based, I cannot puncture it successfully—it is like some modern tires, tubeless and filled with goo. It can be rejected only by attacking the major premise—that the lecture-textbook technique is the proper universal standard. I would go further and doubt that the dominant current practice is even education in the best sense of that word. It *tends*—I do not want to overstate the case—it *tends* to induce passivity in the student. He tends to learn by adsorption; material clings to the surface of his mind. He is not drawn out; his response is not vocal; he gains no power of expression, save possibly by imitation. And, if he imitates a good many university lecturers, he will lose by the process.

I do not go so far as to say that lecturing should be banished. In the right context, as when the professor and student are well known to each other, and with the right follow-up, a lecture often provides inspiration to intellectual action. But in a large class where the human equation is reduced to the vanishing point, the lecture is merely informative. Moreover, it is information

delivered by an inefficient means, at a pace too slow for some, too rapid for others. The same material could be read and understood by many students much more swiftly; bright minds would not be held back. Slower minds could proceed at their own proper pace.

What is the relevance of these satiric observations to the problem before us? It is that, if we are to draw out the student and cultivate within him a critical mind, one sensitive to values and even to nuances in value, there is no substitute for the direct contact between the student and the teacher. Moreover, the more intimate the contact, the more effective it will be. The student-faculty ratio is already too high and should be reduced. The student should use materials far more worthy of his attention and intellectually challenging than any textbook. It is not too much to say that the better the materials, the better the instruction.

Since it is the student who is to be educated, the more he participates in the process, the less inert he is, the less receptive in the passive sense of the word, the better. Today we have too many students who are overinstructed and undereducated. Many proposals now being brought forward will make that situation worse instead of better.

Economies in Instruction

This brings me to my central thesis—admittedly a hard gospel: you cannot economize in instruction. The effort to spread instructors thinner and thinner is just that; it means that the educative process loses impact. Consequently we must train more teachers in many disciplines; we must not reduce the rigor of their training. We need not only more teachers, but better ones. The idea of a cheaper and easier degree than the Ph.D. has been around for thirty years. It would assuredly produce poorer teachers, and where tried it has had that result. We must see to it that there is not less but more competition in the teaching field, so that the inefficient, the ineffective, the unlearned will have difficulty in finding employment—indeed, they should fail of employment.

There is, of course, another thing to be said: We can and should throw more of the burden of learning upon the students. Spoon-feeding has gone far—much too far—in American higher education. Because the students have not had college preparation as such—interpreted in the most formal sense—in the high schools and private preparatory schools, there is a tendency to underestimate their knowledge. Even more serious, there is a strong tendency to underestimate their capacity to acquire knowledge.

It is forty-three years since I did my first teaching. In all those years I have never seen standards raised too high. Of course, false standards can be raised too high in some stilted fashion so that a student may fail to know a full thousand dates in a history course or may lack some precise knowledge such as the complete conjugation of one of the least used and most obscure irregular French verbs. But when it comes to being able to seize an idea, work it over, digest it, and make it his own, the student has only to be stimulated enough and he will astonish us.

I have heard it argued and have even seen it "proved" (indeed there is a sizable volume to confirm it) that students can learn more science by demonstration lectures than by work in laboratories. That particular experiment was a typical instance of economic determinism. The object was not really to find out what the student learned; the "research" sought to validate what the officers of the institution felt its finances required to be proved. There is no question that by shaping a certain kind of examination a student may appear to learn more by a poorer method than by some other better one. This is particularly true when the "other" instruction is in overcrowded laboratories, supervised by graduate students with no instructional experience or interest, who go through the motions in order to gain money for their survival.

If the colleges are not interested in stuffing the students in order to measure by examinations their retention of the stuffing, if, in short, they seek to stimulate the students' intellectual and moral growth, nearly all the economy devices in instruction are bound to be revealed as efforts to shortchange the students for supposed economic rather than sound educational reasons.

Economies in Living Arrangements

I am making no plea for wastefulness in instruction nor am I defending inefficiency in the business operation of institutions. You can "save money" in the dormitories and dining rooms, however, at the cost of deteriorating the environment within which the student lives and works. If you are interested only in his having a cot on which to sleep and food to sustain life, if you have no concern for the cultural future of America or for the urbanity which should go with learning, there are striking "economies" available.

You can save space and time and money by running a kind of automat and by stowing the students in triple-tiered bunks. There are an almost infinite number of devices to impoverish their surroundings in the name of thrift. But it is nonsense to insist that the American economy is built upon a rising standard of living and then adopt devices designed deliberately to lower the standard of student living; they inculcate habits which are inconsistent with our stated ideal.

Past Financial Difficulties

Having said so much, how do I suggest that the bills be paid? The first step is to make every institution worthy of support. This requirement comes even ahead of efficiency. Let every college determine its objectives and then hew to that line. This has been hard to do during the last twenty-five years because nearly all institutions, the rich and the poor alike, are ultimately dependent on student fees for that final margin which balances expenditures and income. Student fees may be a principal source or a lesser source; they constitute nonetheless the difference between a balanced budget and one out of balance.

The depression accentuated this situation. Then inflation, which decreased the value of old endowments and retarded the growth of new, reinforced the same trend. Many colleges, therefore, began to debase their currency; they would announce themselves as liberal arts colleges but infiltrate the curriculum with vocational and semivocational subjects. In short, they spread vocational bait to bring enough students to pay enough fees to help balance the budget. Some of our most scandalous educational sophistries were used to make the changes appear to have educational rather than fiscal bases.

Unique Opportunity

The present moment and the years just ahead offer a supremely good opportunity—a unique opportunity—to make profession and practice square with each other. There is to be a surplus of students; that is a fixed point in our calculations. A college can get all the students it can serve and still be completely honest in its program and its professions. The liberal arts can be made the real as well as the ostensible objective, and whatever deviates from

that ideal can be dropped without an adverse effect upon the budget through decline in student fees. This is the first time in a quarter century when that could be said with complete assurance.

There is a second reason why many an institution can henceforth follow this sound practice. There not only has come a sharp change in the market for college graduates; there has arisen a new desire upon the part of industry to employ liberal arts graduates. Anyone who has followed this subject closely will realize that in the last five years there has been a marked shift in emphasis. Business is now reaching out for those whose training is broader, more deeply infused with the ideas and the ideals which come from a sound liberal arts program. Moreover, the professional schools, and particularly the medical schools, are no longer discriminating against the arts graduate. A recent review of experience showed that those who did not take a premed undergraduate concentration not only were admitted to medical schools, but their achievement there, as indicated by grades, was as good as—or even better than—those who specialized earlier.

There is also a third reason why this reform can now be undertaken better than at any recent time. When the Commission on Financing Higher Education was working upon its studies and drafting its report, it had to consider whether corporate gifts would flow to the liberal arts colleges or whether they would continue in the future, as they had in the limited giving of the past, to serve primarily as a subsidy for technological and scientific training. In this respect the last three years have seen a tremendous shift in interest.

This year corporations are contributing roughly a hundred million dollars. That is more than a third of the way toward the goal which the Commission on Financing Higher Education set. It is a more rapid approach to a stated objective than anyone could have dared to predict three years ago. Even more striking than the amount of this giving is the marked emphasis upon support of the liberal arts.

Here then are three reasons for the simplification and purification of the programs of literally hundreds of institutions. First, they will not lose in student attendance and, therefore, in student fees. Second, they will not be put in an adverse position in marketing their graduates. Third, they will not suffer discrimination against them on the part of corporations making donations to higher education. It is, I repeat, a unique opportunity for great qualitative advance in their programs, which can be attained without disastrous fiscal results. All the reasons that have heretofore been used as excuses for debasing their coinage have recently disappeared. If they do not now reform, it is because they have lost faith in their own professions. If they have deteriorated in sincerity they do not deserve support.

CHURCH-RELATED COLLEGES

It may be remarked that historically many of the colleges were church related. It is commonplace knowledge that under the stress of what was regarded as fiscal necessity some fled from those relationships. As their programs became more commercialized and less concerned with values, church support declined or was entirely withdrawn. These trends, also, can be reversed; indeed they have been in certain instances. If institutions with religious and even churchly traditions will cease to be ashamed of them and develop their programs in the spirit of the liberal arts, church sources of revenue will revive and become a more valuable resource than ever before.

FIRST OBLIGATION OF THE COLLEGES

The first obligation, therefore, of the college, as distinguished from the university, is to purify its program, to develop the intimacy of teachers with students to a degree which will reverse the decline in contact that has marked the last thirty years. It may not be possible to re-establish social relationships upon the basis which was said once to exist (though I never experienced it). But it will be possible to re-establish intellectual contacts and to give the student both more incentive and more leeway to educate himself than have been stressed since the onset of the depression.

I am not suggesting that the small colleges should not grow; I am only emphasizing the fact that growth is their secondary obligation, that their primary duty is to advance the quality of their work through better teaching, simplified and more coherent curricula, and sharper selection among the vast hordes of students who are going to be seeking admission. None of these steps will have an adverse effect upon their fiscal position in the new atmosphere within which they will work. As a matter of fact the pressure of student population will facilitate an increase in tuition and improve finances.

UNIVERSITY CURRICULA

As for the larger institutions, none of them (not even Harvard with all its resources) can hope, as President Eliot suggested, to do everything and everything at its best. There has been far too much effort to keep up with the Joneses, far too little manifestation of self-confidence in shaping programs within a reasonable scope and leaving different functions to others. Probably no nation in the world has heard so much about cooperation among institutions of higher learning or has done so little. When one thinks, for example, of the library problem, one of the costliest and most complex of the difficulties facing universities, it is both astounding and disheartening to see the disparity between proposals for co-operation and the realities. What is true in that particular field applies to many more.

The undergraduate curricula of universities have been expanded into fields quite inappropriate to undergraduate instruction, and undergraduate specialization has been carried much further than educational considerations could possibly justify. No one with any experience would pretend that the pattern of undergraduate elections reflects real intellectual interests or even sound vocational preparation. Time of class meetings during the day, whether a given course involves Saturday sessions, and a host of other irrelevancies and trivialities often have more weight in determining individual programs than sound educational objectives.

The overexpansion of offerings has advanced costs beyond all reason, and immense savings could come from reform. In every institution there is the spectacle simultaneously of enormous lecture courses at the undergraduate level and inefficiently small, costly, advanced undergraduate courses with far too few students to justify the expense. In one institution with which I have some familiarity there are lecture courses with over four hundred registrants; yet 40 per cent of all courses are too small for efficiency. This reveals a maldistribution of faculty time and effort not conducive to the best educational results. Simplification of the curriculum and a redistribution of teaching assignments would produce much better results for both faculty and students with no added cost. Furthermore, sensible class schedules would save the costs of construction and maintenance of aca-

demic buildings that are not really needed.

WORTHY OF SUPPORT

Standards raised at all levels, curricula purged of excess and of irrelevance, teaching stressed and improved, undergraduate environment made an integral part of the educative process—all these will have the effect of stimulating alumni pride and evoking alumni support. Most institutions are only at the threshold of alumni giving. It can be enlarged by skillful promotion and improved technique, but both those tricks of the trade will be more effective if they are in a position to exploit an honestly reformed educational program.

What applies to alumni giving applies also to public support, which can be greatly increased, and to assistance from the foundations. It was about fifty years ago that Andrew Carnegie set out to improve the salaries and retirement allowances of professors. The dramatic announcement of a fifty million dollar gift by the Ford Foundation is symptomatic of renewed appreciation of the centrality of this problem.

The country is fully able to support all the education its youth can absorb. The wealth of the nation is advancing; its productivity is going forward by leaps and bounds. In the reduction of the amount taken from their territory by federal income taxes alone the states have had taxable resources made available to them to supply enough money to finance any necessary expansion of their programs of higher education.

In summary, it is time to stop viewing with alarm, to reverse the recent pessimistic attitude, and to demonstrate that educational institutions are worthy of the support which is available if only we will fully justify it.

Henry M. Wriston, Ph.D., LL.D., Litt.D., L.H.D., Providence, Rhode Island, has been president of Brown University since 1937. After eleven years of teaching history in Wesleyan University (1914–25), he was president of Lawrence College (1925–37) and director of the Institute of Paper Chemistry, Appleton, Wisconsin (1929–37). President Wriston is a trustee of Northwestern Mutual Life Insurance Company and of the Carnegie Foundation for the Advancement of Teaching; until 1954 he was also trustee of the Carnegie Endowment for International Peace. He was public governor of the New York Stock Exchange (1950–52), president of the Association of American Colleges (1935–36) and the Association of American Universities (1948–50), and a member of the executive committee of the American Council on Education (1941–44). He is author, among other works, of The Nature of a Liberal College (1937) and The Strategy of Peace (1944).

Recent Developments in Financing Higher Education

By JOHN D. MILLETT

IN its report issued in November 1952, the Commission on Financing Higher Education summarized the financial difficulties of higher education as fivefold: (1) inflation, (2) the expansion of educational services, (3) fluctuating student enrollments, (4) need for enlarged and modernized physical facilities, and (5) uncertain sources of income.[1]

Certainly, in the three years which have intervened since the presentation of that report, no miraculous solution to these difficulties has appeared. Nonetheless, the years have brought some changes, and even some improvements, in the financial circumstances of our colleges and universities. These are worth examining in turn.

INFLATION

It would require an economic soothsayer to claim that our postwar inflation has run its full course and that our economy may now look forward to an era of steady growth with some degree of price stability. Yet the fact remains that the price index has remained fairly steady in the past three years. Our institutions of higher education have had a breathing spell in which to catch up with the consequences of seven years of rapid price change in which the purchasing power of the dollar was reduced to almost exactly half.

Three years have not been long enough, however, to repair all the damage. We must remember how far our colleges and universities fell back. In the one item of faculty salaries, as an illustration, the nationwide advertisement of McGraw-Hill, which appeared in March 1955, pointed out that in terms of dollars of constant purchasing power faculty salaries in 1954 were 5 per cent less than in 1940. This is an average. Some colleges and universities have succeeded in doubling their salary scales in the past ten years. Few have done any better than that. Others have not done that well. And a doubling simply means that faculty salaries have stood still. In this period some professions have substantially increased their compensation in real terms. The average remuneration of industrial workers has risen nearly 50 per cent.

To what extent should our college and university faculties share in the general advance of our economy which has occurred in the past fifteen years? There is no single, so-called objective guide for answering this question. Educational administrators are nevertheless well aware of several factors which may help to provide an answer. First of all, the highly trained, specialized personnel from which faculty members must be drawn is in short supply. This shortage promises to become more acute over the next few years. Furthermore, the competition from business, from the practicing professions, and from the federal government for highly educated personnel is such that university needs are suffering. University professors do not engage in teaching solely because

[1] Commission on Financing Higher Education, *The Nature and Needs of Higher Education* (New York: Columbia University Press, 1952), p. 59. A private agency, the Commission was sponsored by the Association of American Universities and financed by grants from the Rockefeller Foundation and the Carnegie Corporation of New York.

of the monetary remuneration involved. But we cannot expect our top young talent to choose an academic career as opposed to other opportunities to make use of their abilities if a major economic sacrifice to themselves and their families is to be exacted for such a decision.

Faculty salaries may be in the process of catching up with inflation. They have not caught up with the demand for highly specialized abilities in our society as a whole.

Another victim of inflation in our college and university administration has not fared even so well as faculty salaries. The maintenance of buildings and the replacement of equipment have definitely and even dangerously fallen behind at almost all institutions of higher education. Wages of maintenance employees have risen with the general trend in industrial wages. The prices for materials and equipment purchased by a college or university are the same as those paid by all consumers. With income lagging and with costs rising, administrators have had no choice except to cut back on maintenance activities. It is safe to say that scarcely a college or university in the country has had an adequate maintenance program in the past ten years. To the accumulated deferred maintenance of war years has now been added that of another ten years resulting from inflationary pressures. The capital plant of higher education has been steadily deteriorating, and there is little evidence to suggest any substantial change in this situation in the past three years.

If price stability has been in large part realized in the past few years, our colleges and universities have not yet caught up with their needs. The breathing period has been helpful. It has by no means brought an answer to all the problems which inflation created or aggravated.

EXPANSION OF EDUCATIONAL SERVICES

The greatest single change in the educational activity of our colleges and universities to occur in this generation was the sudden demand for a large expansion in scientific research. World War II first made it apparent that industry and government had dire need for stepped-up technological development. Much of our technology in turn depended upon the advancement of fundamental knowledge. As a result, our great universities in particular were asked to organize and expand their research efforts on a scale never before attempted.

Since 1945 this demand has continued almost unabated. Higher education is still working overtime in the field of scientific research. By and large, especially since 1952, government agencies have now accepted the general proposition that reimbursement of research costs incurred by a university must extend to indirect as well as direct elements of expenditure. A few years ago some government agencies argued that they had only a minor obligation to help universities in meeting the overhead costs of sponsored research. Now it is fairly generally understood that the volume of sponsored research in our universities created serious financial burdens. These are now being met by more adequate government underwriting of research activities. The problem has been by no means entirely solved, but the situation appears to be improved.

Apart from research, our colleges and universities have been subjected only to the more or less normal pressures to expand their services. The number of four-year medical schools has grown from seventy-two to seventy-six in the past three years. The enrollment capacity of all these schools has also been increased. Yet the adequate financial support of medical education has not yet by any means been forthcoming. A nationwide demand for more doctors must still be accompanied by greater financial assistance to medical education.

Our colleges and universities have been under a great deal of pressure also to educate more public-school teachers, more engineers, and more scientists. Two of these are costly fields of service, and more should certainly be spent on the proper preparation of our school-teachers.

If, then, no new demand comparable to the tremendous impact of augmented scientific research has been thrust upon higher education in recent years, nevertheless more and even improved programs of certain particular educational efforts have been expected. The educational services demanded by our society show no indication of contraction. The exact reverse is the case. And these expectations continue to complicate the financial administration of our colleges and universities.

FLUCTUATING STUDENT ENROLLMENTS

When the report of the Commission on Financing Higher Education was released, our colleges and universities had experienced two successive years of declining student enrollment. In terms of the customary autumn count, our colleges and universities had seen their student bodies reduced from 1,400,000 in 1940 to some 700,000 in 1943, only to swell after the war to a peak of 2,450,000 in 1949. This number then fell back to about 2,100,000 in 1951. Immediate future trends were uncertain.

Interestingly enough, with the veterans about to disappear, with the war in Korea still being waged, and with the total college-age population at a record low, college enrollment gained somewhat in the autumn of 1952. It continued this upward trend in 1953 and 1954. It appeared evident that the proportion of eighteen-year-olds in the population who were graduating from high school was increasing somewhat, and the proportion of high school graduates going to college was also larger. Furthermore, in 1954 there was a larger influx of Korean veterans than had been expected. Moreover, with a state of at least semipeace prevailing in the world, the manpower demands of our armed forces could be relaxed. The expected crisis in meeting military manpower requirements did not materialize.

Yet these changing circumstances in the past three years have not meant a sudden return to prosperity for our colleges and universities. Almost all institutions were greatly extended in order to accommodate the peak enrollment of 1949. As the numbers subsided, many colleges began to study an "ideal" size in terms of available facilities, educational objectives, and financial well-being. Often they projected a desired size somewhat smaller than the enrollment of 1951. They made plans to accommodate some such load in the general expectation that the whole decade of the 1950's would see higher education at a postwar ebb.

Before facilities and programs caught up with the first bulge, a second expansion began. Moreover, the probable duration and magnitude of this new growth were almost entirely unpredictable. To make matters even worse, the American Association of Collegiate Registrars in 1953 published a little volume warning colleges and universities what they should reasonably expect in the decade of the 1960's. The birth statistics of the 1940's indicated that by 1965 there would be 50 per cent more young people of college age in the United States than in 1952 and that by 1970 the number would be 70 per cent greater.

There was little satisfaction for America's colleges and universities in either the sudden change of direction or the sharp warning of greater loads ahead. Rather there was a good deal of confusion and some dismay. Just how large a proportion of our youth should higher education embrace in any event? Was higher education getting more students rather than better students? These and other questions had no commonly accepted answers. Moreover, although rising enrollment meant more income from student fees, this was by no means ample by itself to answer all financial needs.

The plain fact is that fluctuating enrollments are still with higher education, but the fluctuation now appears to be all in one direction—upward. Higher education must now clearly undertake to find the financial resources for a steadily, even rapidly, expanding student body.

PHYSICAL FACILITIES

Although most colleges and universities have been able to make some improvements in their physical plant in the past three years, they are still far behind their needs. The available plant in 1949 was not adequate for that enrollment. The downward trend, lasting only two years, provided no period for real improvement in the situation. An upward swing now for three years has simply aggravated the situation.

Enrollment in higher education increased during the depression years of the 1930's. Few colleges and universities received much in the way of enlarged plant resources in these years, except in those states where state universities were enabled to take advantage of the federal government's public works program. The war virtually halted all construction. At the end of the war, construction controls remained for a time, while rising building costs made it more difficult to meet plant requirements.

Only the intervention of the federal government saved the day. War surplus buildings, mostly from army camps, were made available; the government even helped in moving the buildings. In this way colleges and universities met the enrollment bulge. Today those temporary buildings are dilapidated, inadequate, and unsightly. They are still being used on many campuses all over the country.

Now colleges and universities face increasing enrollments before they have been able to meet present-day needs. Moreover, so much attention has been given to difficulties in meeting current operating costs that plant requirements have often been neglected. In the past three years this situation has been more generally understood and corrective action begun. A good many capital-giving campaigns have been launched, legislatures in many states have provided funds to state-supported institutions, and private borrowing has helped immensely in financing residence halls.

Yet the sad fact remains that most of our institutions of higher education are not yet ready to face the needs of the future. To be sure, conditions have improved. They have not improved nearly enough.

UNCERTAIN SOURCES OF FINANCING

The last three or four years have seen some substantial improvement in the financial support of higher education. No one pretends that that support has yet become embarrassingly generous. There is still much to do. But at least the situation today does seem better than it was at the beginning of the 1950's.

The outstanding development has been the great expansion of corporation support of higher education. For 1950 the staff study for the Commission on

Financing Higher Education estimated that perhaps as much as forty million dollars was contributed to colleges and universities by private corporations. If anything this figure was too high. In the current year it is estimated that corporations will be giving about a hundred million dollars to higher education.[2] This means an increase of more than 150 per cent in the past five years.

The creation of the Council for Financial Aid to Education, Inc., has undoubtedly helped in building support for the idea of corporation giving to higher education. Improved solicitation devices have also been beneficial. The colleges have done a better job in presenting their needs. Changes in the federal income tax law have encouraged corporation philanthropy. The New Jersey test case has helped to clarify the law. All in all, real advance has been made in this area of financial support.

Alumni giving continues to increase. The latest report of the American Alumni Council indicates that in the year ending June 1954 organized college alumni funds obtained nearly twenty-one million dollars in contributions. This is a long way from the approximately three million dollars which was the extent of alumni giving before 1940. Yet here too much more is still to be done. The average effectiveness of alumni solicitation is still only 20 per cent. Less than a dozen institutions succeeded in obtaining contributions from more than 50 per cent of their alumni solicited. The average gift is still only $27.

Reluctantly, colleges and universities have for the most part increased their student charges to fairly high levels. In a number of Eastern institutions tuition charges per year in 1955–56 will be $1,000, compared with $400 in 1940. In many midwestern colleges and universities, tuition will range from $600 to $800 a year, compared with $250 to $350 before World War II.

A larger number of families enjoying improved income status, and greatly expanded support of scholarship funds, mean that these increases have not decreased the opportunity to go to college. On the one hand, our private institutions have augmented their income. On the other hand, many families have also realized that higher education entails substantial economic sacrifice.

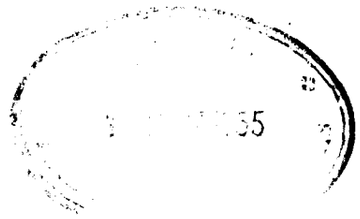
State institutions too have been increasing their fees little by little, and no doubt will continue to do so as their income needs expand. To the extent that state legislatures do not provide the necessary support, state institutions have the difficult alternative of raising their charges in order to maintain their quality.

Another major development has been the increased interest on the part of foundations in providing capital funds to colleges and universities, and in diminishing the overwhelming preoccupation with support of research. The outstanding illustration has been the Ford Foundation's action in creating a fifty million dollar fund to be distributed on a matching basis to private institutions for the endowment support of faculty salaries. Surely similar action by others will follow in the next few years.

The interest in support of higher education by the federal government appears to have subsided in the last three or four years. Financial assistance to those who have served in the armed forces and then go to college is likely to become a continuing program, at least as long as we have selective service, and would seem to be desirable. Federal support of research appears now to be fairly well accepted. If more of this support could be provided for basic

[2] A. H. Raskin, "The Corporation and the Campus," *New York Times Magazine*, April 17, 1955.

research, our educational institutions would be happier. Time-honored assistance to agricultural research, extension, and education may be expected to continue.

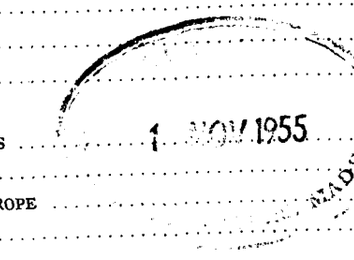


But no interest at all has been aroused in the suggestion for general subvention by the federal government of state higher education, and there seems to be little demand for a national scholarship program. This situation should create cause for general thanksgiving, since general federal support could only lead to undesirable intervention in educational affairs.

CONCLUSION

In general, our colleges and universities have survived a trying period without major disaster. They still have crucial current financial needs. They face an immense challenge in the next fifteen years.

The capacity of American society to protect and improve the status of higher education should not be despaired of, and the inclination to do so will surely not falter in an age when higher education is indispensable to national survival.



John D. Millett, Ph.D., LL.D., Oxford, Ohio, is president of Miami University. He was formerly a member of the staff of the Social Science Research Council (1939–41) and of the National Resources Planning Board (1941–42), assistant to the executive director of the Hoover Commission on Organization of the Executive Branch of the Government (1948–49), executive director of the Commission on Financing Higher Education (1949–52), associate professor and professor of public administration, Columbia University (1945–53). He is author of The Process and Organization of Government Planning (1947), Financing Higher Education in the United States (1953), and other works.

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

EUROPEAN YEARBOOK. (Vol. I.) Pp. xxv, 584. The Hague: Martinus Nijhoff N. V., 1955. (Published under the auspices of the Council of Europe.) Guilders 28.50.

Scholars and laymen interested in European affairs or in the broader subject of regional organization will be delighted to know that this volume is but the first of an annual issue to be published under the auspices of the Council of Europe. The editors, Dr. B. Landheer and Dr. A. H. Robertson, have compiled the book under the supervision of an editorial committee, a group of five men acting in an unofficial and nonpolitical capacity and not authorized to express opinions on any aspect of international affairs. The various articles, documents, and bibliography have to do with European regional developments from 1948 to December 31, 1953; the second volume, scheduled to be off the press late in 1955, will cover the year 1954.

The editors explain that the necessity of dealing in one volume with a period of six years compelled them to omit documents and information which they would have liked to include; they plan to take up the Central Commission for the Navigation on the Rhine, the Benelux Customs Union, and the Customs Cooperation Council in Volume II. United Nations agencies operating in the European area are omitted for the reason that information about them is already available.

The first 187 pages of the book present ten articles dealing with selected phases of European co-operation. Three of them, written by Minister of State, E. N. Van Kleffens of the Netherlands, former Prime Minister Robert Schuman of France, and Professor Basilio Cialdea of the University of Rome, respectively, discuss the basic problem of European unity. Three articles on the Organization for European Economic Cooperation (O.E.E.C.), one on the Council of Europe, one on the Coal and Steel Community, and one on the European Convention on the Rights of Man are also included, each of which was written by a man officially connected with his subject. The final article by Mr. C. W. Jenks of the International Labor Office takes up the relation of European integration to world organization. Some of the articles are in English and some in French; each is followed by a brief summary in the second language.

The "Documentary Section" of the book

consists of the basic documents, in both English and French, of eight organizations, together with explanatory material; the Brussels Treaty Organization; the O.E.E.C.; the Council of Europe; the Coal and Steel Community; the Northern Council; the Conference of Ministers of Transport; the Organization for Nuclear Research; and the Conference on the Organization of Agricultural Markets. The third and final section of the *Yearbook* provides a well-selected bibliography on the many phases of European integration.

NORMAN HILL
University of Washington

FOSTER RHEA DULLES. *America's Rise to World Power, 1898–1954.* Pp. xx, 314. New York: Harper and Brothers, 1955. $5.00.

Professor Dulles, author of several books, has, in *America's Rise to World Power,* made his contribution to the New American Nation Series. This series, which will contain forty volumes when completed, gives promise of becoming one of the major collaborative works of the mid-century.

In this volume the author has dealt with the leading personalities and their contributions to the development of our foreign policy since 1898. Influenced certainly by Alfred T. Mahan, Theodore Roosevelt, and Henry Cabot Lodge the initial step toward world power was taken. Despite these jingoists, business leaders hesitated, but popular magazines accepted more articles on imperialism. With our easy war against Spain, the imperialists were elated. Mark Hanna's conversion to colonialism marked the altered opinion of business. The revolt of the Filipinos revealed the liabilities of our new foreign policy.

The writer's hero, if he has one in this book, is Theodore Roosevelt, who for eight years pursued an aggressive foreign policy. He doubled the size of the navy, took Panama, added a corollary to the Monroe Doctrine, maintained the Open Door Policy, acquiesced in Japan's taking Korea, established the Treaty of Portsmouth, and bested the Kaiser at Algeciras.

Taft, less aggressive, dedicated himself to promoting arbitration treaties and pushing "dollar" diplomacy. Wilson is correctly revealed as having planted his foreign policy in the soil of moralistic idealism which, when cultivated by himself and Bryan, bore fruits of trust and faith. With numerous problems pressing at home Wilson, the precedent-maker, attended the Paris Peace Conference. The President got the League of Nations in the treaties dictated at the Conference. When the opposition defeated the treaty in the Senate, Wilson prophetically declared that rejection of collective security meant another global war.

Professor Dulles summarizes our position in 1919 as the stabilizer of world power, the foremost creditor nation, the earth's financial capital, the greatest economic imperialist, and the giant of the Western hemisphere. Due to these achievements, there was a need for alteration in our foreign policy, but the author laments the fact that mid-Western provincialism triumphed over internationalism.

Throughout the 1920's and until the 1930's the American ideal of peace through disarmament was not realized. We suffered disillusionment in the mirage of neutrality. With the outbreak of hostilities in 1939 our actions revealed our sympathy for the Allies. In 1941 Congress enacted the Lend-Lease Law as Franklin Delano Roosevelt prepared his Arsenal of Democracy speech. The challenge was met in the popular way. Our entrance into the war was forced in the Pacific not in the Atlantic.

During World War II meetings were held to seek solutions for postwar problems. A second attempt at collective security was made in the United Nations. Perhaps the most fundamental change in America in this century was in the general acceptance of world leadership and the United Nations in 1945.

In this book only the barest mention is made of any phase of our history except foreign affairs. There is no attempt to treat economic phases of our international relations. The book is limited to the treatment of the political evolution of the world's foremost Democracy from continentalism to world leadership. Our basic problem, national security, is always easily seen in the background.

GEORGE C. OSBORN
University of Florida

H. BRADFORD WESTERFIELD. *Foreign Policy and Party Politics: Pearl Harbor to Korea.* Pp. x, 448. New Haven, Conn.: Yale University Press, 1955. $6.00.

This is a problem study—how to achieve democratic control of American foreign policy. The author believes that generally democracy is served best through the regular party process which allows the electorate to choose between alternative programs. In foreign affairs, however, he fears that strong partisanship might endanger the international position of the United States which must appear to the world as united, dependable, yet flexible. He therefore considers two alternatives to partisanship—bipartisanship and extrapartisanship. Bipartisanship, as commonly understood, involves some measure of consultation among the leaders of both parties to the end of dampening opposition both in Congress and in the elections. Extrapartisanship places the initiative for policy-making with the President who, while mobilizing the support of his own party, seeks to prevent counteraction by consulting influential members of the opposition party.

The author concludes that extrapartisanship is the preferable solution in foreign policy. He arrives at this conclusion by a three-way approach. First, statistical analysis of roll calls relating to foreign affairs between 1943 and 1950 shows a consistent pattern of voting in Congress; a Coastal-Interior split in the Republican party, a North-South cleavage in the Democratic party which makes partisan policy too uncertain either under present alignment or any realignment in the foreseeable future. Secondly, examining the congressional organization for foreign affairs, he finds it loose and disjointed, but in this very weakness and dissidence he sees a presidential opportunity to utilize extrapartisanship. Thirdly, he traces the record of the parties from Pearl Harbor to Korea: the impact of war, organizing the United Nations, "getting along with Russia," "getting tough with Russia," European recovery, the China problem, foreign policy issues in the elections of 1944 and 1948; a history of rising harmony and bipartisanship in the war years; growing discord and increasing partisanship in the postwar peace.

Mr. Westerfield's text is relentlessly factual; the evidence carefully collected; the interpretation highly reasonable. Much of the groundwork was done while he was serving as a Congressional interne for the American Political Science Association. It is too bad that out of this personal experience he was not prepared to put into his writing some of that "human interest," or individual motivation which is the *elan* of politics. This is not to say, however, that he disregards the key roles of such persons as Marshall, Dewey, Vandenberg, Taber, Connally, Wallace, Dulles, Acheson, Pepper, Fulbright, and many others in the making of foreign policy. His is an impersonal and thoughtful appraisal, a scholarly and dispassionate analysis, a constructive contribution to the study of foreign policy controls.

MARIAN D. IRISH
Florida State University

JULIUS W. PRATT. *A History of United States Foreign Policy.* Pp. xxiv, 808. New York: Prentice-Hall, 1955. $6.95.

This new and comprehensive textbook on the history of American foreign policy is scholarly, well organized, and clearly written. Following a generally conventional chronological pattern, that begins with the diplomacy of the revolution and concludes with a very full treatment of developments in the mid-twentieth century, it nevertheless incorporates one valuable innovation. Before swinging into his fast-moving narrative, Professor Pratt has three chapters that successively take up "the aims of foreign policy," "the tools of diplomacy," and "the tools of force."

In his narration of the more controversial features of recent policy, the author is fair and objective. His technique is to give a straightforward factual account, and then to append a brief section which explicitly defines the controversy and suggests his own interpretation of events. After discussing the defeat of the League of Nations, for example, he gives us a brief section entitled "Who Was to Blame," and then on World War II developments, provides a "Note on Pearl Harbor" and "Criticism of Yalta."

In spite of the good things that may be said about this book, it is still in some

respects rather disappointing. The time would appear to be at hand for a more complete rewriting and fresh evaluation of the history of American foreign policy than Professor Pratt has chosen to undertake. His emphasis, as in other comparable texts, is primarily on diplomacy rather than on the forces that have more basically accounted for the evolution of American foreign policy. There is less discussion than one might have desired on such phenomena, if they may be so called, as isolationism, imperialism, and internationalism. The great transformation that has taken place in the American approach to foreign affairs during the past half century consequently tends to be obscured in the detail of more specific developments. Perhaps the pressure to make a textbook complete makes it all but impossible to avoid this submergence of the general in the particular, but there still remains the question of how much the student will really learn of the basic conflicts in the evolution of our foreign policy by this approach.

It is true that Professor Pratt assigns nearly half of his book to the period since the Spanish-American War and has no less than five chapters on the very recent postwar years. This is a distinct gain in throwing his account as a whole into better perspective. One is still left, however, with the feeling that the story is merely brought up to date rather than newly appraised from the vantage point of the momentous happenings which have marked the final shift from a traditional isolationism to responsible internationalism.

FOSTER RHEA DULLES
Ohio State University

JOHN M. CABOT. *Toward Our Common American Destiny*. Pp. xvii, 214. Medford, Mass.: Fletcher School of Law and Diplomacy, n.d. $3.50.

The seventeen papers here reprinted fall between October 9, 1952, and February 23, 1954. Thirteen were originally presented in the United States and four in Latin America. They vary in length from two pages to twenty-two; all are concerned with the theme of inter-American ties and dependence, with differing emphasis on politics, economics, and culture.

John Moors Cabot is a career diplomat who has spent seventeen of his twenty-eight years in the Foreign Service on assignments relating to Latin America. He speaks of that area as his "chosen field," and of his departure from it in early 1954 with "deep personal regret." He said of his leaving that "my very going may paradoxically advance the cause for which I have always earnestly worked: our continental solidarity; friendship and understanding between the American republics." Supposedly, "these writings constitute . . . an official statement of American policy toward Latin America as set forth during the first year of President Eisenhower's Administration."

Cabot declares his first allegiance to the national interest of the United States, but he feels that the pursuit of that interest leads Toward Our Common American Destiny. The common interests of the American republics, plus the fact of Latin America's development at a pace "so rapid that it must in a short span strongly affect the balance of world economics and military power," point the course of United States policy. That policy calls for North American stimulation and assistance in the promotion of the Latin American economies. But government grants have a limited usefulness and the great burden must fall upon private capital, domestic and foreign. The new partnership implies a renunciation of the tactics of intervention and imperialism. All such earlier meddling was foredoomed to failure: democracy must grow from within; it cannot be imposed from without. The most effective encouragement must take the form of respect for national dignity, of mutual esteem and tolerance, of technical assistance, and of enlarged trade and investments. Foreign business interests have been guilty of abuses, but the limits on foreign investments in Latin America have been for the most part imposed by the panaceas of irresponsible governments in the southern republics themselves. Let us each put his own house in order, and let us take counsel together when problems affect us all. Let us remain loyal to our great regional organization and our many inter-American agreements. Finally, let us stand together against the threat of international Communism. We have a "rendezvous with destiny." Such is the liberal and good neighborly creed of Eisenhower's erstwhile Assistant Secretary of State for Inter-American Affairs, now curiously Ambassador to Sweden.

HOWARD C. PERKINS
University of Pennsylvania

GOVE HAMBIDGE. *The Story of FAO*. Pp. xii, 303. Toronto; New York; London: D. Van Nostrand Company, 1955. $6.50.

"Most people at present are farmers, and most farmers are . . . badly off. . . . This is one of the things drastically wrong with the world . . ." (p. 30). The reduction in the proportion of people in the world directly dependent upon agriculture for their livelihood, and the growth of the productive potential and the level of living of those remaining—these might well be considered measures of the success of current world development efforts. And many persons would agree that the prospects for peace and economic advance throughout the world will improve essentially as these objectives begin to be achieved.

Such emphasis on the size and economic well-being of the world's farm populations does not mean that the tasks are primarily agricultural, or indeed primarily economic and demographic. Rather, the economic problems lie at least as much in the field of industry, transport, and other service activities. Cultural and political development are intimately interrelated with the demographic and economic. Mr. Hambidge makes clear that Food and Agriculture Organization, the "food and agriculture" of its name notwithstanding, must deal with the whole complex. In fact, I suspect Mr. Hambidge is somewhat over-impressed with the role of industrial growth, at least for the near future. On the other hand, the book might have been more explicit on the problems of planning in an admittedly over-all approach: food and agriculture programs in a country's total investment budget, for example, or in the total expenditure for technical assistance by the United Nations and all its specialized agencies.

The Story of FAO is the story of the origins, objectives, growth, and accomplishments of the oldest postwar specialized agency of the United Nations. FAO had to deal with the age-old problem of hungry people against the backdrop of postwar economic crises and political strife. It had to do something about hunger and agriculture's dislocation and backwardness while the world was evolving a pattern of international-national relationships. In particular, it had "to try on for size" various ideas for appropriate international programs, ranging from the responsibility for a major operation like that of a World Food Board to primarily research and advisory activities. Mr. Hambidge's book is therefore more than the story of FAO; it it a candid analysis of some major postwar problems as seen by a person trying to deal with them on an international basis.

No reader will fail to be impressed with Mr. Hambidge's craftsmanship. In a relatively brief study, he presents a scholarly treatment of the big issues. But he also tells the day-to-day story of FAO, of its technicians, frequently by name and nationality, and of their work, by country and region. The book is thus a happy combination of a convenient basic reference on FAO activity and of a valuable analysis of its major problems. A high standard has been set for the writers of The Story of IBRD, WHO, and others!

Massahusetts Institute of Technology

UNITED STATES GOVERNMENT AND HISTORY

LEWIS MAYERS. *The American Legal System*. Pp. ix, 589. New York: Harper and Brothers, 1955. $6.50.

This is a comprehensive study of the institutions that administer justice in the United States. Its purpose is to present an integrated exposition of the instrumentalities of American law. The author has served as counsel to a New York State joint legislative commission and as research consultant to the New York State Law Revision Commission. He is now professor of law at City College in New York. His book reflects not only the fruit of his experiences in the codification and

revision of the law, but also the result of extended class room testing, since in mimeographed form it has long been used as a text in the author's classes at City College.

The author describes the structure, personnel, and operations of the American legal institutions: civil, criminal, administrative, military, and arbitral. The allocation of coverage reflects the rapid change in the administration of law that has been going on in this country during the past quarter century. Before the advent of the New Deal and the cold war, a study of American legal institutions would have been devoted almost exclusively to the judicial system. Professor Mayer, on the other hand, devotes almost one-third of his book to an examination of nonjudicial tribunals —administrative bodies, military courts, and arbitration boards. In view of the multiplication of administrative bodies as an incident of the welfare state, the advent of peace-time conscription and possibly universal military service, and the ever increasing extension of commercial and industrial arbitration, Professor Mayer's allocation of treatment appears justifiable. Nevertheless, this results in what the reviewer believes to be an inadequate treatment of some important aspects of the judicial machinery.

For example, the rule-making power of the courts deserves more than a cursory paragraph. Chief Justice Vanderbilt in New Jersey has completely revised and modernized an outmoded civil procedure by the exercise of this power; and in New York, summary judgment procedure, exclusively a product of the rule-making power, disposes with conclusive finality of thousands of cases without according the litigants an opportunity to testify and present their witnesses in open court. Again, the revolutionary creation of a Federal common law by *Swift* v. *Tyson* and its counter-revolutionary abolition a century later by *Erie Railroad* v. *Tompkins* is discussed with such conciseness that it is probably largely unintelligible to the author's major audience—the college or university student with little or no legal background.

This, however, is a minor criticism (as is the rather strange omission from an otherwise adequate bibliography of such readable classics as Hughes' *Supreme Court,* Holmes' *The Common Law,* and Pounds' *The Spirit of the Common Law*). All in all this is a splendid work, comprehensive, accurate, and well written. What is particularly gratifying is that the author does not hesitate to express value judgments, with most of which this reviewer would agree. Gratifying too is the author's perceptive appreciation of the social factors that mold legal institutions; although this reviewer would suggest that the author fails to recognize the necessary role of the civil jury as a corrective to the archaic notion that compensation for automobile and other nonindustrial accidents must depend upon one party's fault and the other's complete lack of guilt.

While this book appears to have been intended primarily for classroom use in advanced political science, pre-law, and first year law courses, it would be a pity if it did not receive much wider distribution and acceptance. This reviewer would heartily recommend it to every citizen seeking an integrated and comprehensive exposition of the American legal system.

LEO PFEFFER
American Jewish Congress

LYNTON K. CALDWELL. *The Government and Administration of New York.* Pp. xviii, 506. New York: Thomas Y. Crowell Company, 1954. $5.95.

This volume in the *American Commonwealth Series* is the first to deal with the government and administration of one of the most populous, urbanized, and complex states. The task of mere formal description is accordingly a formidable one, but the author has accomplished this in competent fashion. The total state government of the Empire State has never previously had such a thorough and well organized exposition.

The author divides his treatment into three main parts: the frame of government, the administrative system, and the public services. In part one, he devotes a chapter to each of the following nine topics: the Empire State (a brief survey of its land, economy, people, and politics), the state constitution, the political parties,

the legislature, the executive, the courts, local government, the City of New York, and the state and the Union. In part two, attention is given in five chapters on the administrative system to: organization and management, public revenues, financial administration, personnel administration, and forms of administrative action. In part three, eight chapters are used to appraise the government and administration of law enforcement, education, health, social services, public works and housing, agriculture and natural resources, labor, business enterprise, while a final chapter considers public service and citizen participation. A highly useful statistical appendix and a select bibliography complete the volume.

"The purpose of this book," the author notes in his Preface, "is to inform rather than to interpret." The emphasis is, accordingly, upon the factual exposition of the more formal aspects of the government and administration of the Empire State. The reader is given a clear blueprint of its machinery of government but no comparable understanding of the motors which propel the machine forward or backward, of the political fuels which provide power to these motors, nor of the men and the forces competing for the driver's seat. The "politics" of the Empire State are for the most part left unexplored. This more crucial half of the story of the government and administration of New York State ought to be a tempting subject for a second useful volume.

WALLACE S. SAYRE
Columbia University

BERNARD BELLUSH. *Franklin D. Roosevelt as Governor of New York.* Pp. xiii, 338. New York: Columbia University Press, 1955. $5.00.

Doctor Bellush has done an excellent service in writing this book, for it fills a long-felt want in picturing accurately Franklin D. Roosevelt's background before he came into national prominence as President and author of the so-called New Deal. It is a matter of interest that Dr. Bellush does not hesitate to say that "the seeds of the New Deal were first planted by . . . Governor Alfred E. Smith. It blossomed forth, however, under the affirmative and competent guidance of a Harvard product, a pragmatist who had devoted his entire political career to becoming President of the United States. Roosevelt carried on the work initiated by the Happy Warrior" (p. 284).

Dr. Bellush writes from the stand point of an admirer of Roosevelt, and, it appears, is definitely a convinced New Dealer. However, he does not let his work descend into the field of propaganda. And he does not hesitate to criticize Roosevelt on several counts. Thus, "during the conflict between "Smith" and "Walker-Curry" Democrats, Roosevelt maintained a policy of benevolent neutrality. Opposed to the philosophy and practices of the Walker-Curry elements, Roosevelt nevertheless granted patronage for deserving New Yorkers through Tammany Hall. Although he had led the fight against Tammany while State Senator and Assistant Secretary of the Navy, Roosevelt was now more practical minded. In fact, as a result of a contribution to the 1929 building fund of Tammany Hall, Roosevelt automatically became a member of Tammany after writing, "I am very glad to send you a check . . . and I regret that I cannot make it larger" (pp. 153–4). Dr. Bellush also says, "both the Republicans and Roosevelt must be indicted for having failed, in 1930, to comprehend the implications of continued neglect of stricter regulation of thrift accounts in commercial banks" (p. 113).

The author's admiration for Roosevelt is both pardonable and proper, for to write this type of biographical history, one should be at least in sympathy with the subject, if he is to produce a good and adequate piece of work. Also, Dr. Bellush has used original and new sources for his study, and the book is likely to stand for years as the authority for this period of Roosevelt's life. There are, also, adequate footnotes and index.

WILLIAM STARR MYERS
Princeton, N. J.

MARSHALL W. FISHWICK. *American Heroes: Myths and Reality.* Pp. viii, 242. Washington, D. C.: Public Affairs Press, 1954. $3.75.

Those who work in any one of the disciplines included in the relatively new academic area of American studies are conscious—and at times puzzled—by the growing interest in the realm of abstraction called, variously, the "image," the "myth," the "stereotype," or the "symbol." The terms seem to have crept in *via* the field of American literature, and have in common a vagueness of definition and of usage that confuses rather than illuminates the subject under examination. The old contrast between myth and reality is lost, "image" and "myth" become just the accepted body of ideas concerning a man or an event—true or not—and the "symbol" may easily be something of which the writer of the work examined was possibly totally unaware.

It is a pleasure to read this clear straightforward account of the method of creation of a hero in which the lawmakers are carefully scrutinized and the differences between fact and fiction, as well as the factual basis for a burgeoning fiction, are carefully set down. The ease with which history becomes saga and the quickness with which fact can be embroidered by contemporary admirers of a folk hero are carefully illustrated. The methods used by Professor Fishwick are the same for statesmen like Washington and Lee and for Daniel Boone and Billy the Kid. The growth of the myth—or development of myth—from a small amount of fact by skillful creators of folk heroes seems to be the same for figures of real historic stature as for tawdry charlatans or folk villains. A close examination of the evidence in each case can either enlarge the "hero" or diminish him. The minute study given the life of Washington by Douglas Southall Freeman has produced a man greater in every way than the myths-embroidered father of his country created in early accounts of his life. Recent biographies of Captain John Smith seem to have rescued him from his long condemnation as liar and braggart, and certainly the hero makers of Daniel Boone had much more to go on than those who worked so industriously on Davy Crockett.

The "folk heroes" Professor Fishwick has chosen might not be the ones to appear on a list made up by another historian. The inclusion of Mickey Mouse, for example, may seem strange; and the presence of Henry Ford instead of his creation, called "Tin Lizzie" many years ago, seems unjustifiable. Because of the diversity of figures selected, it is difficult to form any conclusion as to the author's criteria as to what constitutes a "hero," and what proportion of myth and reality are mingled in his creation. The end result, however, is clear and the process apparent.

The hero-making process and the creation of folklore are subjects of interest to all the fields covered by the general area of American studies. But it is obvious that they are not limited to that area. Both heroes and folklore know no national limits, and there is no evidence that Americans "hero worship" more than other people or that the growth of legend differs radically elsewhere. In any case, the effort to recapture reality from myth and to re-create an approximation of the real man who played a very real part in the events of his day is admirable, and Professor Fishwick has selected a wide variety of "heroes" for such examination.

ALICE F. TYLER
University of Minnesota

ELISHA P. DOUGLASS. *Rebels and Democrats: The Struggle for Equal Political Rights and Majority Rule During the American Revolution.* Pp. xiv, 368. Chapel Hill: The University of North Carolina Press, 1955. $5.00.

Some of those Americans who supported the movement of the 1760's and '70's that culminated in the Declaration of Independence were quite willing, once British rule had been overthrown, to allow the political order to continue much as it had been before. Indeed, to this group, the principal purpose of the movement was to free America from British rule. Other Americans, however, looked beyond this limited objective. To them, independence was but a necessary first step toward an overhauling of the colonial political system along equalitarian lines. Plural office-holding, suffrage restrictions, and inequitable representation were among the illiberal features of the system which they wished to see pass with the authority of the British crown. The struggle between these two groups, the one wishing to preserve the old order largely intact, the other wishing to establish an order that more nearly recognized the dignity and worth of the individual man, constituted an internal revolution in the colonies of great moment. To some extent, notably in the Carolinas, New York, and Pennsylvania, this phase of the revolution was a continuation of movements that had started without reference to the Stamp Act and other Parliamentary measures that precipitated the revolution proper.

It is to the political phase of this internal revolution that Mr. Douglass addresses himself, stressing especially the constitutional developments in North Carolina, Pennsylvania, and Massachusetts, but giving some attention to similar developments in Georgia, South Carolina, Maryland, New York, and New Hampshire also. A chapter is likewise devoted to Jefferson's constitutional plans for Virginia. While nowhere was the equalitarian movement a complete success, it did temper and restrain the conservative forces that gained the ascendancy during the revolution and helped produce state constitutions that alleviated some of the grosser political abuses of the colonial period. The liberal progress thus made provided a foundation for further reform during the early national period.

In developing his theme, Mr. Douglass has made good use of monographic literature dealing with political and constitutional change during the revolutionary era, and to the findings of earlier writers he has added others resulting from his own researches in manuscripts, newspapers, and printed documentary sources. This reviewer knows of no other work that brings together in a single volume so much that is significant in the political history of our revolutionary period. The book is well written and well documented, and is an example of sound historical workmanship.

JENNINGS B. SANDERS
Kensington, Md.

JOHN WILLIAM WARD. *Andrew Jackson: Symbol for an Age.* Pp. xii, 274. New York: Oxford University Press, 1955. $4.75.

How to grasp the essence, the true inwardness of a people in a given age? Mr. Ward believes that one way is to understand the mental icons it erects, the irrational but meaningful constructs of its imagination. Whatever may be the historical truth about Andrew Jackson the man, there can be no doubt that the symbol of Andrew Jackson possessed and dominated the minds of Americans in the 1820's and '30's. Basically, Mr. Ward submits, the symbol was a constellation of three ideas—Nature, Providence, and Will. Historians of ideas have made us familiar with the genealogy of these concepts. Mr. Ward shows us how they provided, to use his own violent metaphor, "the ideational skeleton of the ideal Andrew Jackson."

To his contemporaries the Hero of New Orleans appeared as one of Nature's noblemen, a simple cultivator of the soil, equally removed from crude savagery and from decadent civilization. The filiation with the eighteenth-century stereotype of the American yeoman farmer (so ably delineated by Mr. Ward's acknowledged master, Henry Nash Smith, in *Virgin Land*) is obvious. Less obvious, but persuasive, is the connection Mr. Ward establishes between the natural intuitive genius that contemporaries ascribed to Jackson and the "Reason" of the transcendentalists. But the Jackson of the myth was also the instrument by which Providence wrought America's destiny. Here, in the image of Old Hickory as "God's right-hand man," Mr. Ward finds the age's unblushing justification for its expansionism, its unhypocritical sense of a duty to "extend the area of freedom." But this simple man of the soil, this charismatic leader (the embodiment, as it were, of Nature and Nature's God) was also—and quite inconsistently—a prime mover himself, a self-reliant "man of iron," the personification of Will, the inner-directed master of his own soul and of outward events. In this facet of the Jacksonian image Mr. Ward sees reflected

the American cult of success, of the self-made man.

Mr. Ward's sources are newspaper articles, Fourth-of-July orations, funeral sermons, stump speeches, popular ballads, campaign songs, and political cartoons. Skilfully, appreciatively, he exploits their color and humor; subtly, perceptively he analyzes them, with an eye always to their bearing on his main theme—what the image of Jackson reveals about the people who fashioned it. The result is a clear and valuable insight into the mind of America in an era miscalled the Age of Jackson. "The age was not his," Mr. Ward insists—and his book amply demonstrates; "he was the age's."

FREDERICK B. TOLLES
Swarthmore College

THOMAS JEFFERSON. *The Papers of Thomas Jefferson.* Vol. X: *22 June to 31 December 1786.* Edited by Julian P. Boyd. Pp. xxx, 654. Princeton, N. J.: Princeton University Press, 1954. $10.00.

The test of a series such as this lies in its capacity to sustain interest. The scale of the work may be gauged from the fact that the newest volume—nearly 700 pages long—covers only the second half of a single year, 1786. Definitely, however, this gigantic enterprise of scholarship and publishing justifies itself. This is due to two considerations. One is the loftiness of the subject that arises both from the quality of Jefferson's mind and from the importance of the matters contained in his papers. The other is the impeccable standard of the editorial work and the commentaries and notes that accompany the text.

For Jefferson and Adams the principal diplomatic problem of this period, as judged by the quantity and detail of the correspondence, had to do with the piratical powers on the Barbary Coast. An interesting exchange of views takes place between the two Ministers, in which they discuss the pros and cons of buying off the North African Muslims or building a navy to attack them and thus protect American commerce. A contemporary parallel may be observed in the point that the United States was concerned then as now to secure the release of Americans who were held as prisoners.

To build a navy of sufficient power called for plenty of money. But in this essential commodity the government of the United States was then deficient. Weakness at home spelled weakness abroad. The letters that flow to Jefferson from Madison, Monroe, Jay, and others are eloquent in their exposure of the political and fiscal weaknesses of the Articles of Confederation. The disturbances in Massachusetts are discussed. Also, there appear the first gleams of hope—for a meeting is to be held in Philadelphia in 1787.

The other sides to Jefferson's intellect and personality are equally well revealed in this tenth volume. The scholar is honored by the conferment of degrees. The scientist discourses on physics, botany, zoology, anthropology—to name but a few. The father supervises his daughter; the uncle advises a nephew. Moreover, the man of affairs is for a moment captivated by a charming, but married, lady to whom are sent some notable letters full of romantic implications.

LESLIE LIPSON
University of California
Berkeley

CHARLES ALBRO BARKER. *Henry George.* Pp. xvii, 696. New York: Oxford University Press, 1955. $9.50.

"No other book of the industrial age dedicated to social reconstruction and conceived within the Western tradition of Christianity and democracy commanded so much attention as did *Progress and Poverty,*" by Henry George (p. viii), says the author. Marx's *Das Kapital* is partly comparable, he admits, and I would add *Uncle Tom's Cabin.* The intellectual influence of Henry George (1839–97) has been largely forgotten, but it was world-wide in its day. He influenced such people as Leo Tolstoy in Russia, Philip Wicksteed, Joseph Chamberlain, and George Bernard Shaw, and many Fabian Socialists in England, Hamlin Garland, Brand Whitlock, Tom Loftin Johnson, and several of Woodrow Wilson's cabinet and close advisors (Tumulty, House) in America, and leading figures in Australia, Ireland and Scotland.

Professor Barker has written his biography from the substantial Henry George collection in New York, from George material in many university libraries, and from files of west coast newspapers with which George was associated. The result is a scholarly work chronologically presented. The author delves deeply into every important phase of George's life. Professor Barker is thoroughly familiar with the economic history of George's time and with the developments then taking place in economic theory. And he writes well, makes reasonable judgments, and does not hesitate to criticize Henry George although it is clear that he admires him. Henry George was a journalist by profession, and a Jeffersonian Democrat in his politics. He would be catalogued today as a "liberal" or "do-gooder." Although he worked with socialists and influenced them, George was basically a capitalist with strong sympathies for the laboring man. He gave up his job on numerous occasions, with real financial distress the consequence, rather than compromise his own convictions. Slight in build, red-bearded, outwardly calm, he was a very persuasive speaker and writer.

During his lifetime Henry George wrote eight books, ran unsuccessfully twice for mayor of New York, and travelled widely, especially to England. His greatest book, *Progress and Poverty,* came at about the midpoint of his adult life. It was an economic plea, with religious overtones, for government ownership of land. George was incensed that in the 1870's a small number of Californians owned so much of the land there (p. 191). He regarded getting rich from a rise in land values as the worst kind of robbery. George's idea of freeing people from paying economic toll to landlords came soon after the freeing of negro slaves, and thus had more respectability than it might otherwise have had. The idea had a surprisingly great appeal. Incidentally, he did not develop the "Single Tax," that is, tax on economic rent, until ten years later (1888–90). The socialists incorrectly thought that George was one of them, but generally he balked at nationalizing industry and always at outlawing interest. In addition to nationalizing land, he wanted to promote free trade, and to reduce corruption in government. The Australian secret ballot was his device for doing the last. Professor Barker has written the first really definitive biography of a man who was a great force for reform and human rights in his day.

It may be doubted that George and his ideas would have been as influential in another age, say in the eighteenth century when land and resources were plentiful, or in the mid-twentieth century when the problem of human needs is being cared for by our generous supply of capital. He preached more equal enjoyment of land in an age when growing population was causing land values to rise rapidly.

WALLACE STEGNER. *Beyond the Hundredth Meridian: John Wesley Powell and the Second Opening of the West.* Pp. xxiii, 438. Boston, Mass.: Houghton Mifflin Company, 1954. $6.00.

John Wesley Powell's most obvious claim to fame is for his descents of the Colorado and its canyons. As performed in 1869 and 1871 this was hard and perilous work and, in proportion, high adventure. The first reports on these exploits attracted great interest. Fraudulent claims that others had preceded Powell in running the river opened a controversy that led to still more publicity. It is only a slight exaggeration to say that Powell went to the Colorado unknown and returned famous.

No biographer could resist dwelling on the canyon voyages. Stegner narrates them not just as an adventure, but as an experience that added greatly to Powell's knowledge and understanding. It was there, for example, that he saw the proof that the course of the river was older than many of its mountains, and that as they are gradually uplifted, the river had been able to cut its channel through. Stegner records the voyages magnificently, with a sureness of touch that reflects an extraordinary familiarity with the river and the plateau province through which its course is threaded. Another quarter of his book describes the subsequent surveying of this region as managed and directed by Powell.

A special feature is the analysis of the work of artists Moran, Holmes, and Hillers in depicting this exposed geology, and samples of their best work are included as illustrations.

For Powell's youth, his struggle for an education, his teaching, his Civil War experience, his early naturalizing and collecting, there is far more adequate coverage in William Culp Darrah's *Powell of the Colorado* (1951). Darrah also recognized that the most important part of Powell's career was post-Colorado. Stegner agrees, and argues the point even more vigorously. Descending on Washington, Powell devoted the rest of his life to mustering science, and especially government-supported science, to inventory the natural resources of the nation. The great Southwest, which he had probed, offered many tantalizing questions, for example, in physiography, geology, and ethnology. But the same could be said about the West in general—hence Stegner's title; and the systematic application of scientific study to this larger area was "the second opening of the West" to which the subtitle refers. In this work Powell sometimes took to the field, but mostly he was the planner, the administrator, the procurer of appropriations, the politician for science. As such he was the prime mover in the establishment of the Geological Survey and the Bureau of American Ethnology. He was responsible for the stress on gathering data for the topographic sheets that were intended to blanket the nation. He had much to do also with engaging the federal government in forestry and reclamation and moving toward a system of land law more suited to the arid area.

Powell's later career could be studied on the level of political technique—how he marshalled the community of scientists, how he angled for executive support, how he got Congress to pass the necessary enabling acts and appropriations. Stegner includes such information, but in his treatment the drama of these final decades is seen in the struggle to gain and to solidify government support for a program of scientific fact finding, and on this basis to achieve a wiser national policy on use of resources.

JOHN W. CAUGHEY

CAROLINE KATZENSTEIN. *Lifting the Curtain.* Pp. 376. Philadelphia, Pa.: Dorrance and Company, 1955. $4.00.

Lifting the Curtain reviews the campaign for woman suffrage stressing the climactic years from 1910 to 1920, the decade that ended the forty-two years struggle which began when the Susan B. Anthony Amendment was first introduced into the Congress in 1878.

The book is impressive, vivid, most readable, and well documented factually. It is a socio-political history describing also methods and techniques used in a campaign which stirred the nation. Both men and women participated. Dudley Field Malone, Collector of the Port of New York, dramatically resigned because of intransigent President Wilson who withheld his support until the very last moment.

The author, a national leader in the movement herself, presents her account in two parts. The first focuses, in the main, on the struggle in the states and ends with the defeat of Pennsylvania's state amendment in 1915. The second half stresses federal legislation and ends with the victorious passage of the nineteenth amendment to the Constitution in 1920.

But the victory was not easy. There were constant demonstrations in Washington, deputations to the President, picketing of the White House and the capitol. Pickets carrying lettered banners addressed to President Wilson were unchallenged for more than five months. Then suddenly the District authorities changed tactics but, despite police warnings of arrests, picketing continued. The women were now beaten by the police and by mobs, thrown into Occoquan Workhouse, a filthy, verminous, rat-infested jail. The women smuggled out of Occoquan the moldy and wormy bread which was their diet and sent it to Dr. Harvey W. Wiley, renowned government food expert. Commented Dr. Wiley drily, "a diet of worms won one revolution, and I expect it will win another."

Alice Paul, chairman of the National Woman's party, was mentally examined for commitment to St. Elizabeth Hospital. Dr. William A. White, famous psychiatrist and head of the institution, talked with her at length about suffrage and found her perfectly normal.

The leaders who won the political war were not only intrepid and able but, as the book's illustrations show, many were very beautiful and appealingly feminine.

The appendices are of value as political science documents on: the famous Seneca Falls Convention of 1848; the 19th Amendment to the United States Constitution adopted in 1920; and the proposed Lucretia Mott National Amendment to give women equal rights with men.

Caroline Katzenstein not only reviews American political history, but also tells in excellent fashion a worthwhile story.

LEON T. STERN
Philadelphia, Pa.

ECONOMICS AND INDUSTRY

NORMAN S. BUCHANAN and HOWARD S. ELLIS. *Approaches to Economic Development.* Pp. xiv, 494. New York: Twentieth Century Fund, 1955. $5.00.

This is unquestionably the best general book on the problems of economic development that has appeared to date. For the student and the general reader unfamiliar with the field it summarizes in a sensible way the major considerations, both economic and noneconomic, which must enter into any analysis of the development problem. It contains a large number of relevant tables and the footnotes constitute a useful selected bibliography of the literature.

Nonetheless this reviewer comes away from it with the same sense of disappointment and frustration one gets from most of the literature in this field. Everyone who works on either the theory or the practice of development comes to recognize the truth and importance of a host of common sense observations of a qualitative sort. There is a problem of mobilizing capital which can be tackled in a variety of familiar ways: external economies play a major role, population growth will affect the outcome, the social and cultural context is important, education and the acquisition of administrative skills are a prerequisite to growth, entrepreneurship and an innovative spirit must appear, and so forth. But to go beyond a catalogue of the relevant variables to a quantitative understanding of their magnitudes and their complex interaction requires the formulation of an analytic framework much more rigorous than anything which has yet appeared.

It is perhaps churlish to complain that authors who have done such a good job of organizing and summarizing the state of current thinking on development have not gone further and contributed to the intellectual breakthrough which is so badly needed. The first hundred and twenty pages of this book cover the principal factors affecting development The next section, about equally long, attempts to draw the available lessons from the history of development in England, Western Europe, Japan, and the USSR (a notable omission is a systematic look at United States development). The final section examines a series of policy problems both for the underdeveloped areas themselves and for the United States and other developed countries concerned to promote development abroad.

The policy conclusions will be more controversial than the outline of the problem. The authors support labor-intensive investment, urge a heavy concentration on agricultural development, and defend the gradualist as against the massive dose approach. On financial policy they are much more worried about inflation than about underutilization of resources, and they believe much more in the possibilities and beneficent effects for development of a classical international free trading system than would this reviewer.

But on these as on all points their position is so balanced and sensible that it is not easy to disagree with it sharply. The real question this book leaves one with is

whether balanced and sensible common sense advice is likely to be of much help in answering the tough questions facing the policy makers at home and abroad on development questions.

Massachusetts Institute of Technology

ARTHUR SMITHIES and others. *Economics and the Public Policy: Brookings Lectures, 1954.* Pp. vii, 157. Washington, D. C.: The Brookings Institution, 1955. $2.00.

ROBERT A. SOLO (Ed.). *Economics and the Public Interest.* Pp. 318. New Brunswick, N. J.: Rutgers University Press, 1955. $5.75.

These two volumes, being multi-authored, are likely to get less attention than they deserve. Six distinguished economists were invited by the Brookings Institution to discuss the various aspects of public policy as it is concerned with economics.

Arthur Smithies discussed "Economic Welfare and Policy"; Joseph J. Spengler discussed "From Theory to Public Policy"; Frank H. Knight entitled his lecture "Economic Objectives in a Changing World"; John Jewkes carried the subject further in "The Economist and Economic Change"; Jacob Viner addressed himself to "International Trade Theory and Its Present Day Relevance"; Lionel Robbins discussed "Freedom and Order."

Robert D. Calkins provided the Preface. Each essay is timely and relevant. Economists would be well advised to examine the several essays as possible supplements for a number of different intermediate and advanced courses. All are high-grade. Both theoretical problems and questions of application are dealt with. The prestige of economists is evaluated by Jewkes. The book lacks an index.

The second volume, in honor of Eugene E. Agger, long connected with Rutgers University, was written by twenty authors. There is something useful in the book for almost any economics course. The volume is divided into four parts: (I) The Method and Purpose of Economics; (II) Economics in the Empirical Analysis of Modern Society; (III) Economic Policy and Social Control; and (IV) Economic Growth and Development.

Arthur F. Burns, once connected with Rutgers University, contributes a short eulogy to Professor Agger. Well known economists contributed to the volume: Milton Friedman, Harry Gideonse, Geoffrey H. Moore, and others.

The essays are of unequaled length and quality. One of them entitled "Rain-Making and Monetary Policy," by Anatol Murad, is a somewhat intemperate diatribe against changing monetary policy as a tool in economic stability. It appears to be an endorsement of direct over-all control and planning to replace the free market. With the "rediscovery" of monetary policy in the last decade by ministers of finance in much of the world, this essay reflects a cultural lag of some sort.

On the other side, the essay by Professor Friedman on "The Role of Government in Education" develops a new way of financing and improving general education. Recognizing the public interest in universal education, Friedman suggests that the state give each child, through his parents, a specific sum to be used solely to pay for his general education. The parents would be free to spend this sum at a school of their own choice provided it met certain standards laid down by the appropriate governmental unit. Such schools would be conducted under a variety of auspices including enterprises operated for profit, nonprofit institutions, religious bodies, and some even by governmental units. A wealth of experimentation would follow. This essay is in the best tradition of the philosophy of freedom and the dispersal of power which has come to be associated with Chicago University.

Geoffrey Moore addressed himself to "The Diffusion of Business Cycles." He brings to bear some of the more recent research on the measuring and timing of turning points. This is a useful addition to our knowledge. The same can be said for a number of the other essays.

This volume, too, ought to be in every college and university library. Most of the essays are written in intelligent layman's language and should receive considerable general reading.

EMERSON P. SCHMIDT
Chamber of Commerce of the
United States

H. D. HENDERSON. *The Inter-War Years and Other Papers.* Edited by Henry Clay. Pp. xxvii, 445. New York: Oxford University Press, 1955. $6.75.

This is a collection of some of the best writings of Hubert D. Henderson (1890–1952), edited by the late Henry Clay. The materials were selected to bring out the fine reasoning of the author on many phases of contemporary life. Henderson was editor of *The Nation* from 1923 to 1930; Joint Secretary of the Economic Advisory Council from 1930 to 1934; advisor to the Treasury from 1939 to 1945; and Drummond Professor of Political Economy at Oxford from 1945 to 1950. These varied experiences gave him a close insight into national problems, the inner workings of government, and the shaping of economic and political policies. Henderson left no major work, but his contributions to periodicals and official memoranda were both important and distinguished.

Each of the five parts of the book presents selections which highlight the particular work or service in which he was engaged. Part I has ten of his editorials which appeared in *The Nation.* They deal with monetary policy, tariffs, employment, economic trends, and issues which plagued Britain at that time. The essays are short but pointed and appear to be of greatest interest to an English economic or political historian.

Part II consists of thirteen longer articles which were memoranda written when Henderson was Secretary to the Economic Advisory Council, 1930–34. They deal mainly with the pressing contemporary issues and were not written for publication. These four years contributed heavily in shaping his economic views which were published later.

Part III presents three essays done while he held a research fellowship at All Souls College, 1934–39. Of the three essays the one of greatest interest is entitled, "Mr. Keynes's Theories," which was a review of his friend's, Keynes's, *General Theory.* The reader will be amply rewarded to have a look at this essay. He was extremely critical of Keynes, who, he said, had "invited the world to throw upon the scrap-heap a large part of the orthodox economic theory in which I still believe" (p. 161). He seems to have regarded it his duty to disagree completely with the Keynes theses, or, as he says, confine himself to a "purely destructive task" (p. 177). Nor did he accept the views of Keynes on policy.

Part IV consists of six memoranda prepared between 1940 and 1945 while serving in the Treasury. These were the war years, and the views expressed in the essays reflect war-induced issues of employment and postwar commercial policies. The greatest postwar problem, he believed, was international economic relations. He violently opposed a return of economic laissez-faire, which he thought would be disastrous. He was very critical of policies, as we can now see, but at the time only those in government circles knew his views.

Part V, entitled Post-War, 1945–1951, presents eight essays which were either given before a learned society or published in a learned journal. They reflect his uninhibited views when serving in the Drummond Chair at Oxford. In many respects these essays are the best of the collection. They reveal Henderson at his best as an economist. This book will prove to be an historical document of importance. It is a fine tribute to a great twentieth-century economist and to a skillful editor.

J. F. BELL
University of Illinois

MORTON S. BARATZ. *The Union and the Coal Industry.* Pp. xvii, 170. New Haven, Conn.: Yale University Press; London: Geoffrey Cumberlege, Oxford University Press, 1955. $3.75.

Economic historians, labor economists, and government commissions have found the American coal industry and the vigorous United Mine Workers interesting and fruitful objects of investigation. The pres-

ent study is a further effort to discover and appraise the forces that determine the varying fortunes of the industry.

The inquiry is concerned primarily with the impact of an aggressive union, the UMW, upon a severely competitive industry. The analysis covers the structure and behavior of coal industry, the characteristics and importance of the Appalachian region, significant developments in the industry during the period 1890–1950, the policy objectives of the UMW, political aspects of the union-management relations, the effect of the union upon the wage level, the relation of the union to interregional competition, union policy and interfuel competition, and the general consequences of union policy and action. Statistical data are skillfully used in support of the analysis, and there is a carefully selected bibliography.

In the intense interrregional competition involving the mines of the Appalachian area north and south of the Ohio River, freight rates and wage levels are the principal weapons. In this competitive struggle for markets, the UMW has entered not only to obtain higher wages and stability of employment, but improved physical conditions of work and numerous "fringe" benefits, especially adequate pensions.

Cold realism obviously has motivated UMW leadership in the formulation and application of union policies. Recognizing the relation of excess production to prices and employment and of wages to accelerated mechanization and labor displacement, the union has philosophically accepted reduction in the number of miners, elimination of marginal producers, and conscious adjustment of the labor supply to demand. The objectives always have been higher wages and stabilized employment.

The analysis reveals that despite the comparative effectiveness in attaining its main objectives, the union is subject to economic forces and realities, such as the nature of the demand for the product, the possibility of fuel substitution, the structure of the market, and the ease of entrance into the industry.

The whole study is an excellent example of scholarly, objective investigation; it will prove extremely revealing to the economist and the lay reader with a special interest in the coal industry.

University of California
Riverside

GRACE HEILMAN STIMSON. *The Rise of the Labor Movement in Los Angeles.* Pp. xvii, 529. Berkeley and Los Angeles: University of California Press, 1955. $6.00.

This book tells a detailed factual story and presses a thesis. Its many new facts should be accepted with thanks for mountainous research surmounted; the thesis needs further investigation.

Dr. Stimson, Research Associate, Institute of Industrial Relations, University of California, Los Angeles, aided by research assistants and Haynes Foundation funds, has produced a documented account of Typographical Union Local 174 and labor relations in the Los Angeles printing trades to 1912, having gained access to the minutes of the typographers. Little correspondence is cited. Work in Central Labor Council minutes, 1909–12, and strenuous research in newspapers deserve high praise.

The author's indefatigable pursuit of her subject, trade unionism *vs.* businessmen in Los Angeles, 1875 to 1912, produced significant economic and political history. Yet her orientation makes it doubtful if the book will greatly further the Institute's objective of creating "a better understanding of the problems in the relationships between labor and management," for the worries and motives of entrepreneurs are little discussed. Inability or unwillingness to raise wages, to consent to a closed shop, and to agree to union demands whenever presented are attributed to blind anti-unionism. The book dwells on the battles between the unions and Harrison Gray Otis of the Los Angeles *Times,* with Otis a stereotype of evil, unworthy of any biographical treatment. (See *Dictionary of American Biography.*) Despite some academically qualified conclusions in final paragraphs, Otis is portrayed as the creator of reaction in Los Angeles, not as a powerfully persuasive swimmer on its surface. Little stressed

are retarded industrialization, geographical and psychological isolation, population mobility and conservatism, climate, and "the easy life" (p. 428). Radicalism and socialism in the local labor movement are tacitly acknowledged, but discounted as reasons for slow growth and anti-union sentiment in strongly Republican Los Angeles. In picturing unions as "almost helpless" against "such an array of wealth and influence" as business associations mesmerized by a newspaper, the author seems to postulate pro-union sympathy elsewhere in the nation which clearly did not exist in those years.

The fifty overly sympathetic pages given the McNamara case, interestingly written from the Burns, Darrow, vainglorious Steffens memoirs, and the local press, sent this reviewer back to the multicolumned New York *Times* coverage of the bombing of the Los Angeles *Times* and the trial of those who engineered eighty-six other bombings. An unromantic treatment of this clash between a handful of violent men and American society is needed.

Equally desirable, whatever has been said above, are more books like this one, which raises city and county history to a stature it deserves—but seldom attains—at the hands of those unwilling or unable to research and write on historical subjects of a highly controversial nature.

VAUGHN DAVIS BORNET
Menlo Park, California

HERMAN MILES SOMERS and ANNE RAMSAY SOMERS. *Workmen's Compensation.* Pp. xv, 341. New York: John Wiley and Sons, 1954. $6.50.

The jacket blurb says this is a definitive book. A publisher's judgment is subject to a normal discount of at least fifty per cent but in this instance it may be accepted at face value. As an up-to-date statement on the earliest social insurance venture in the United States, it is at once compact and comprehensive. No important phase of workmen's compensation is neglected, from the history of the transition from common law liability to the most modern developments in rehabilitation. Coverage, the benefit structure, insurance arrangements, administration and litigation, safety and occupational health—each is surveyed with painstaking care and the facts marshalled in a concise account which sacrifices neither essentials nor readability. More important, the facts are subjected to a critical appraisal which utilizes the values of a social philosophy infused with the moral concern out of which workmen's compensation was conceived originally.

The book is aimed at a diverse readership: the various groups professionally concerned with occupational disability, the beginning student, and the interested layman. It is a tribute to the authors' skill that they succeed in hitting such a heterogeneous target. The book is written simply and engagingly enough to be useful as an introductory text yet its insights are sufficiently penetrating and fresh that an attorney or insurance specialist with long years of practical experience in workmen's compensation will find its pages rewarding.

Not the least of the merits of this study is its adequate recognition of the transcendent but neglected importance of rehabilitation. To provide monetary compensation and medical care to a man who has lost the sight of both eyes is minimal, and an accomplishment of which we need not be too proud if he remains a functionless member of society with his self regard permanently impaired. In the authors' own formulation, "what we cannot or do not prevent, we may be able to repair or rebuild."

Nowhere within so short a compass is there to be found a more trenchant or challenging analysis of the dimensions of the problem, the public and private programs in operation, and the economics and bureaucratics of rehabilitation. This analysis leads to the conclusion that a new concept of medical care in occupational disability is essential, a concept of "total medical care" which requires the doctor to reassess his traditional role and find his place as one co-operative element in a total complex of specialists co-ordinated toward the single objective of restoration.

In only one respect would I change the emphasis in the concluding chapter—"Workmen's Compensation at the Crossroads"—wherein the authors assess with

considerable discernment the current issues in this field. Although it is implicit on many pages, what seems to me to be the overriding issue in workmen's compensation is not drawn with the sharpness it deserves. That issue is whether or not workmen's compensation is to be engulfed in its own legal and common law system, thereby returning the problem of industrial accident and disease to the disastrous conditions from which the social invention of administrative law and procedure was supposed to have rescued it.

JOHN PERRY HORLACHER
University of Pennsylvania

SOCIOLOGY AND EDUCATION

SAMUEL STOUFFER. *Communism, Conformity, and Civil Liberties: A Cross-Section of the Nation Speaks Its Mind.* Pp. 278. Garden City, N. Y.: Doubleday and Company, 1955. $4.00.

Throughout the period of the 83rd Congress public figures in this country behaved as though they thought the American public was in a white heat over the presence in government, industry, and the schools of Communists, ex-Communists, and people called Communists. The clamor created by certain highly vocal politicians, newspapers, and commentators was apparently taken as evidence of widespread public demand for summary treatment of these nonconformists. Few private citizens and even fewer public officials were willing to speak out against it.

We now know from Professor Stouffer's detailed study that this presumed public outrage was in large part an "empty phantom," a great façade with only a small minority of angry people behind it. We have all been party to a mass expression of a phenomenon psychologists call "pluralistic ignorance." Misled by the headlines in the mass media each of us assumed that other people were running a high fever regarding domestic Communists. If we did not share this position we tended to keep quiet about it, thereby permitting those around us in their turn to make a false assumption about our opinions. Thus a vast fiction was created because none of us really knew where the others stood.

Professor Stouffer's volume is, however, far more than merely a documentation of the relatively low level of public excitement over the Communist issue. It is by far the most intensive study available of public tolerance of political nonconformity. It is based on interviews taken with a national sample of 5,000 adults and with a special sample of 1,500 "leaders" selected in communities of 10,000 to 150,000 population. This latter sample makes possible a comparison of leadership and rank and file, an important type of social analysis which is very uncommon in survey studies.

Not everyone who examines the data presented in this book will find them reassuring. Although the author gives a relatively optimistic interpretation of the findings, based largely on his belief that the increasing educational level of the population will be reflected in greater respect for civil liberties, the reader may well take a much darker view. While the number of people who are greatly disturbed about presumed subversion is relatively small, the proportion of the population who say they are prepared to deny the right to teach, to speak, and even to work to various kinds of nonconformists is appallingly high. Even though one discounts some of this intolerance as sheer verbalization which is not likely to be carried into action, it is still apparent that public understanding of the concepts of civil liberty is limited indeed.

Professor Stouffer's book ought to be read by a very wide audience. He has brought us a wealth of information on a vitally important issue and he has written it so that it can be read. He and the Fund for the Republic whose grant made the study possible deserve a vote of appreciation.

ANGUS CAMPBELL
University of Michigan

EDMUND DAVID CRONON. *Black Moses: The Story of Marcus Garvey and the Universal Negro Improvement Association.* Pp. xvii, 278. Madison: University of Wisconsin Press, 1955. $5.00.

Marcus Garvey, "a short, stocky, largely self-educated but supremely confident black man," was born in the little town of St. Ann's Bay on the island of Jamaica, August 17, 1887, and died in London on June 10, 1940. He has been described as the most colorful Negro leader that has yet attempted to improve the lives and conditions of the American Negro. Arriving in the United States at the age of twenty-eight, he organized the most ambitious enterprise to establish a Negro nation in Africa. That the enterprise failed in no way dims the grandeur of his dream or the remarkable organizing ability of Marcus Garvey. His venture in shipping, which would carry Negroes back to Africa and connect the new state with the world commercially, may today seem fantastic, but in the 1920's, with sufficient and honest support, it had real possibilities. Disasters were almost inevitable in view of the lack of experience and the inability to obtain funds or credit. Stock was sold in the enterprise when no capital assets existed. Garvey was hounded by creditors, insurance companies, and jeers from his own people. Huge sums were wasted on unseaworthy vessels that failed to move or, having moved, had their boilers blow up in the high seas, or rust and corrode in Caribbean ports, as Garvey tried desperately to stave off creditors or raise funds to repair the Black Star vessels. The Universal Negro Improvement Association, as Garvey called the movement, encountered numerous intraorganizational difficulties and the Pan African movement came to an inglorious end when Garvey was indicted, convicted, and sentenced to the Federal Penitentiary for using the mails to defraud. The Negro press applauded the verdict against Garvey, referring to him as a "self-convicted criminal" and "a gigantic blunderer." The government regarded him as a "dangerous alien." Despite the opposition, Garvey received widespread support from Negroes, who poured hundreds of thousands of dollars into the enterprise. No accurate estimate can be made of the membership. Garvey claimed 11,000,000, with 3,000 branches throughout the world. Other estimates ranged from 80,000 down to 9,000. Whatever the number, it is safe to say no Negro had ever roused the racial consciousness to such an intensity as did Garvey. One might liken Garvey to a Savonarola exhorting his people to act for their own salvation before it was too late, only to see his own people turn away with calculated indifference as his enemies prepared his funeral pyre.

Mr. Cronon, a member of the History Department at Yale, has done a competent job in running down the details of Garvey's life and hopes. He tells the story of a great and courageous leader quietly and sympathetically. He evaluates Garvey's contribution to Negro life in these words: "The creation of a powerful feeling of race pride is perhaps Garvey's greatest and most lasting contribution to the American race scene" (p. 201). Why did the movement fail? Mr. Cronon gives the most sensible and acceptable reason: "Garveyism failed largely because it was unable to come up with a suitable alternative to the unsatisfactory conditions of American life as they affect the Negro. Escape, either emotional or physical, was neither a realistic nor a lasting answer" (p. 224).

J. P. SHALLOO
University of Pennsylvania

HENRIK F. INFIELD. *Utopia and Experiment: Essays in the Sociology of Cooperation.* Pp. 319. New York: Frederick A. Praeger, 1955. $3.50.

The first part of this book describes and compares various types of modern cooperatives, including the Kibbutzim of Israel, co-operative farms in Saskatchewan, the pre-Communist Chinese Industrial Cooperatives, and others. Because it consists of essays written and published over a period of time, there is considerable repitition and the organization is queer. Thus in Chapter VII, entitled "Pains of Growth in Israel," the reader suddenly encounters an historical sketch of Robert Owen and the Rochdale Weavers. Moreover, some of the material is out of date. For example, the brief item on the multipurpose co-operative at Nilokheri north of New Delhi in India contains no inkling of the difficulties that co-operative has had in recent years.

The descriptions betray a strong bias in favor of the co-operative idea. Thus, a section on the Hutterite colonies in South Dakota includes the following statement: "It was gratifying to see the more articulate of these future farmers take such a definite stand in favor of cooperation as a way of living." Only rarely does the author appear to recognize the degree to which this type of community must buck the social tides of the day. At one point, he does state the dilemma succinctly: "To avoid the pitfalls of isolation, a community must keep in step with the world around it; to preserve its identity, it must know how to shield itself against adverse influences. In short, it must succeed in being at the same time a world within itself and a part of the world as a whole."

The second part of the book describes the use of various tests designed to measure the degree of success in a given co-operative community and also indicates the lines along which an improvement in the community might take place. Of particular interest are a "sociometric test" to indicate the attitudes of individuals in a small community toward each other, and a "co-operative potential test" to reveal the relative interest of the community members in the satisfaction of individual needs versus social needs.

The discussion makes clear that the restricted co-operative community can be to the sociologist what a primitive tribe is to the anthropologist and offers real opportunities for the development of sociological techniques generally. Accordingly, these chapters are of interest to the student of human behavior, whether or not he is a member of what might be called "the co-operative persuasion."

JONATHAN B. BINGHAM

Albany, N. Y.

ROBERT J. HAVIGHURST and BERNICE L. NEUGARTEN. *American Indian and White Children: A Socio-Psychological Investigation.* Pp. xiii, 335. Chicago: University of Chicago Press, 1955. $5.00.

In 1941 began the Indian Administration Research Project, an investigation into the relationships existing between American Indian personality, education, and administration. A final report by Laura Thompson, *Personality and Government,* appeared in 1951. Several tribal studies made as part of the project have also been published. Now comes a report of information produced by five psychological techniques used to study the moral and emotional development of Indian children. The techniques are the Emotional Response Test; Moral Ideology Test, including questions concerning the source of rules; a test for animism and belief in immanent justice, and an attempt to get at a world view through free drawings. Children six to eighteen years old belonging to the Hopi, Zuni, Zia, Navaho, Papago, and Sioux tribes responded. A sample of several hundred Midwest white children provide a sort of baseline control group for most measures. The reliability of the various techniques is also discussed, while an appendix takes up responses to some of the techniques made by New Zealand white children.

One limitation with tests that inquire about sources of happiness, fear, or other emotions, or that ask about good and bad deeds, is that one cannot be certain that the respondents' answers correspond to customary behavior. Such instruments are nevertheless useful for getting at the ideals of a culture, and if one happens to be interested in belief systems then the approach is a sound one. For example, one of the most interesting chapters deals with beliefs about rules of the game. Malinowski and other anthropologists have stated that magic declines with technological control. If magic is defined as a tendency toward absolutist thinking (as has been suggested by Godfrey and Monica Wilson), then we discover that children in all Indian tribes are indeed not equally magical, but that magicality is not inversely correlated with the degree of white contact. Zuni children stand highest in the belief that rules of a game cannot readily be changed at the will of the players, followed by Papago, Sioux, Zia, Hopi, and Shiprock Navaho. Isolated Mountain Navaho children, however, are unanimous in saying that rules of *native* games cannot be changed, because they come from "the holy people."

For any social scientist interested in comparative data intelligently discussed with reference to cultural background, this book provides a great richness. Most of the techniques are simple to administer and many sections constitute a useful manual for field workers and analysts.

JOHN J. HONIGMANN

University of North Carolina

Six Approaches to Psychotherapy. Pp. v, 402. New York: Dryden Press, 1955. $3.75.

Six approaches to psychotherapy currently used most frequently are described in this book by experienced practitioners such as Frederick Thorne, who discusses directive and collective personality counseling; Nicholas Hobbs, clients centered and non-directive psychotherapy; and J. L. Moreno, psychodrama.

There is a summary by Daniel Sheer in which the attempt has been made to integrate the material thus expounded on the preceding 340 pages. The last chapter, comprising forty-five pages, is a serious attempt at organizing the *disjecta membra* of psychotherapy. In the first section of the summary it is pointed out, on the basis of experimental research mainly done by F. A. Fiedler, that the differences between expert and nonexpert therapists, in one and the same branch of psychotherapy, are more outspoken than those among expert therapists of the various branches. Expert therapists of all approaches agreed more consistently with one another than with nonexperts of their schools. This finding is also apt to emphasize the importance of expertness in medicine in general and to shed some light on the vital problem of opposing expert opinions.

In the division on theory and techniques it is shown how Slavson bases his theory of group mechanisms on individual psychoanalytic principles, such as: transference, catharsis and so on; in other words, he considers group psychotherapy as basically individual psychotherapy under specific conditions. Similar basic orientations prevail for the psychoanalytic, the directive, and the nondirective approaches. "The therapeutic objectives, theory, and techniques of any single approach are highly inter-related." The practitioner of the nondirective approach is not inclined to start with diagnostic considerations; he is in favor of an indication 100 per cent. The other schools have gradually seen the light of clinical method and, therefore, limit their indications of one specific method. On the other hand, the evaluation of success has been lacking in the other schools, while in the nondirective approach one has tried to measure the achievements more exactly.

As for common orientation the program for the future is outlined as follows: the therapist-variable and the basis of aberrant learning. The facilitation of aberrant learning will have to be evaluated in experimental investigations. "There is simply no substantial and clinical data available today upon which to base definite comparisons."

W. G. ELIASBERG

New York, N. Y.

WILMA DONAHUE (Ed.). *Housing the Aging.* Pp. 280. Ann Arbor: University of Michigan Press, 1954. $3.75.

Interest in housing facilities designed to meet the needs of older people has developed considerably over the past two or three years. Much of the underlying awareness was precipitated by the Fifth Annual University of Michigan Conference on Aging which is reported in this book.

Part I reviews the characteristics of the older population and their present living arrangements and includes a summary by Dr. Donahue of the expressed housing desires of older people, themselves. Part II considers matters of community location, dwelling design, and experience in a limited number of communities.

The third section of the book examines the housing needs of the infirm and long-term ill. With these people, of course, housing and medical care become inextricably interrelated and the capacity of the individual to pay reaches its most acute level.

There is uniform recognition among the authors of this section that more older people means more who will need prolonged medical care and special living arrangements. All urge the point, however,

that complete breakdown can be avoided for most, and that rehabilitation together with suitable institutional programs and home services can maintain the majority of frail older people in functional status in the community. Thoughtful community planning is urged in order to obtain fluidity and efficiency among the services offered and availability for older persons at all income levels.

Financing housing for older persons is the subject of Part IV. The six papers reflect the recency of recognition of special housing needs of older persons and the persistence of fixed attitudes, but they also present a good deal of honest soul-searching for new procedures. Knottiest problem is, of course, the low incomes of older people, pointing, according to several of the contributors, to greater government participation in both individual and congregate facilities.

The final section, Part V, deals with housing standards, community services to enable more older people to remain in their own homes instead of seeking institutional care, and organizing the community for action. This section includes, also, a thirty-page description of housing developments designed expressly for older people. Though incomplete now, it remains the nearest thing there is to a national inventory of such facilities.

One must come to the conclusion that housing an aging population is a complex matter beset with difficult problems. These are reasons for finding solutions, however, as the Conference was designed to suggest, rather than to avoid the issue.

CLARK TIBBITTS
U. S. Department of Health, Education, and Welfare

HELEN D. GREEN. *Social Work Practice in Community Organization.* Pp. 253. New York: Whiteside, and William Morrow and Company, 1954. $4.00.

In this clearly written and well-organized posthumously published text, Helen Green points out that *Community Organization* is a field of social work practice largely identified with community chests and councils, as well as with state and national welfare co-ordinating agencies, such as the Child Welfare League of America or the National Conference of Social Work. It has increasingly widened its jurisdiction to include any "social work process directed toward intergroup relations" in a variety of new settings, such as neighborhood councils. It covers application of primarily three types of action:

> The *social intergroup work* process, which involves the co-ordination of groups, first to understand each other and develop mutually satisfactory relationships, and second to work towards social goals selected and accepted by the groups involved.
> The *administrative* process, by which objectives of an organization are determined and plans are made and executed for the achievement of these objectives.
> The *educational and promotional* process, where the primary focus is on the achievement of an objective selected and set forth by specific groups.

Virtually two-thirds of the book is devoted to three summarized process records of social intergroup work in a neighborhood council, a young adult council, and a teenage group council. They illustrate problems of applying the social work point of view, which differs from that of other community workers, as political leaders and public relations experts, in that the focus "is not on 'doing for' or on controlling, but on helping or enabling people" (p. 81).

Miss Green believes that practice should be based on knowledge from all the behavioral sciences, particularly sociology, anthropology, psychology, and psychiatry, but does not attempt to show how this goal can be accomplished. Her case histories are more descriptive than analytical, and are not presented to provide a basis for formulating generalizations which could be applied to the field as a whole. These limitations of the book for use in didactic teaching reflect the fact stressed by W. I. Newstetter in his excellent foreword: "The development of social intergroup work as a professional social work practice has only begun and this book is an initial attempt at definition. It is the documenting of our ideas as we put them into practice" (p. 12).

JOSEPH W. EATON
Western Reserve University

JEAN R. PEARMAN and ALBERT H. BURROWS. *Social Services in the School.* Pp. x, 218. Washington, D. C.: Public Affairs Press, 1955. $3.75.

The basic premise of this important contribution to the non-academic services of the school is that any factor which reduces the freedom of the child to learn reduces his learning. These factors are physical, psychological, emotional or social. The social worker is concerned with each of these, and his work is consequently a vital contribution to the educative process.

Although the authors present the history, basic philosophy, and legal bases of social work, the entire volume may best be described as a "handbook." Utilizing the case method to a considerable degree, it includes specific and concrete recommendations regarding: administrative organization, special tools and techniques including suggestions for interviewing and recording most desirable working conditions, and proposals for more effective school-community relations.

Special chapters are devoted to specific areas of social work including: the troubled child, juvenile delinquency, the problems of sex, and alcoholism and drug addiction. The content of the chapter on delinquency is illustrative of the content of much of the volume. It begins with an analysis of the conflicting educational philosophy of Thorndike and Dewey and its bearing upon the development of social work in the schools. Delinquency is carefully defined both from the sociological and legal points of view, and a great deal of relevant and significant statistical data are presented. The section dealing with causes of delinquency reviews the literature and carefully analyzes the controversy between those who believe that the tendency to delinquency is inherited, and those who assert it is solely or primarily the result of environment. The steps toward the reduction of juvenile delinquency include: emotional insight by the teacher into the behavior of the child; a better understanding of home and community background; character education; religious teaching; and a recognition of the important role of social work services.

The volume concludes with an excellent chapter on child-guidance clinics and a general review of the developments and further needs for school social work. "Training in the pertinent disciplines in order that every teacher may acquire an understanding of the emotional needs of the individual, the symptoms and dynamics of common emotional and behavior difficulties, and the resources needed to help with serious problems is a *sine qua non* of modern education."

The only negative comment on the volume is that the authors might wisely have used more case material of children of school age in place of the adult cases which are given.

FRANCIS J. BROWN
American Council on Education

ROBIN M. WILLIAMS, JR. and MARGARET W. RYAN (Eds.). *Schools in Transition: Community Experiences in Desegregation.* Pp. xiii, 272. Chapel Hill: The University of North Carolina Press, 1954. $3.00.

This is the second publication of what has become known as the Ashmore Project of the Ford Foundation's Fund for the Advancement of Education. The first publication was *The Negro and the Schools* by Harry S. Ashmore, and while this initial publication utilized some materials from the field studies made by research teams in twenty-four communities which had recently desegregated their schools, it was left to the volume under review to present the detailed community case studies.

This book reports the experiences of twenty-four communities in six states (Arizona, Illinois, Indiana, New Jersey, New Mexico, and Ohio) which had moved in recent years from racially segregated toward racially integrated public schools. Part I deals with the general problem of desegregation, with particular attention to the role of law in determining patterns of racial separation and integration in American school systems. Part II treats selected communities in states having "mandatory"

laws which permitted either segregation or integration. Part IV briefly summarizes a few main findings and suggests some conclusions that may have applicability beyond the communities which were studied.

While upon first examination the individual studies appear to present a wide variety of experiences, the following common principles are among those suggested:

1) A recurrent theme in all the communities studied is the essential role played by the school officials; where they were in a real sense community leaders, potential disturbances seldom developed. Wavering and fearful school administrators were unable to control either the school situation or community reaction to it (p. 48).

2) Those communities having open channels of communication between white and Negro leaders seemed to have made the transition from segregation to desegregation with relative ease (pp. 237 and 241).

3) In none of the communities studied does the piecemeal approach to desegregation appear to have worked as harmoniously as a complete change under a careful plan of action. Of the administrative practices developed, well-defined districts and clear-cut transfer rules seemed most effective for desegregation and for operating efficiency (pp. 152 and 172).

4) The success of public school desegregation is only loosely correlated with the apparent racial attitudes or prejudices of the population. Successful public school desegregation has been carried out in places where supposedly the prevailing attitudes favored segregation (p. 241).

5) The studies show that in the actual situation of faculty integration, where it has been tried, professional standards soon take precedence over previous racial attitudes (p. 245).

6) The experience now at hand shows that where desegregation has been tried, the typical outcome has been its eventual acceptance (p. 248).

The book has some limitations which should be noted, although they do not vitiate its general value. One limitation appears to be generally a failure to relate the desegregation process to the social structure of the community. This is reflected in the relative absence of treatment for most communities of the moral or religious influences and the political climate as they affected the nature of the transition. Also, while some objective social facts are given for most communities, these are seldom related to the desegregation process by the authors.

This book is valuable as a record of the experiences of communities in approaching the problems and opportunities inherent in one of the great challenges of our times in the area of democratic human relations, but there is still need for more intensive studies of the desegregation process and its relationship to the social structure of individual communities.

PRESTON VALIEN

Fisk University

PHILOSOPHY AND RELIGION

CLINTON ROSSITER. *Conservatism in America.* Pp. 327, xii. New York: Alfred A. Knopf, 1955. $4.00.

LOUIS HARTZ. *The Liberal Tradition in America.* Pp. lx, 329. New York: Harcourt, Brace & Company, 1955. $4.75.

Even so short a time ago as fifteen years, "conservative" was an ugly word to apply to a fellow citizen—closer to slander, certainly, than "radical." But it is beginning to look as if we are all conservatives now. The disputes shift verbal ground. Now we argue over claims to "real" or "true" conservatism.

Professor Rossiter is attached to the ideological screening unit of the conservative army that is commanded in the field by General and President Eisenhower. This army occupies a narrow front, according to Professor Rossiter's chart, and has got to maintain a tireless watch to keep its flanks untangled. Its Left almost merges with the Liberal divisions that stretch on toward radicalism and revolutionary radicalism. To the Right lie entrenched the black cohorts of standpattism, reaction and revolutionary reaction. The Rossiter tactic, in keeping with the Eisenhower strategy, is to seek alliance with liberalism against the menace of the extremes.

Conservatism in America is the more convincing the more distant it remains from political and social fact. There is an adequate statement of the traditional doctrine of conservatism, with a good summary of its expression in several of the Founding Fathers and their pre-Civil War successors. But as Professor Rossiter closes in toward the present, he becomes more and more troubled by the gulf between the abstract conservatism which he champions and our actual conservative forces, which he rejects with horror. At all costs he must strip Senator McCarthy of every conservative insignia. And not only McCarthy. The norms of the Rossiter conservatism are "dailies like the *New York Times,* periodicals like *Fortune,* and columnists like Lippmann." By those criteria he must also shove the Hoovers, Knowlands, and Brickers into the outer darkness of the lunatic fringe. "The commands of common sense call upon conservatives to associate with moderate liberals in 'the vital center.'" Thus, if I may adapt the Stalinist thesis of social-facism, Professors Rossiter and Schlesinger, Jr., turn out to be not opposites but twins.

Somehow it can't be that simple. Dr. Rossiter himself recognizes that an American conservatism must come to terms with American business, that "most new conservatives will be businessmen or professionals in allied fields. Indeed, a conservative movement that fails to enlist the conservative businessmen can have little influence on the future of the Republic." Agreed. But at the same time Dr. Rossiter is not willing to admit into his restricted quarters the kind of rough-and-ready conservatives that American businessmen usually turn out to be.

Professor Hartz would explain the difficulty by arguing that there cannot be a genuine conservatism in the United States. His new book, *The Liberal Tradition in America,* is a set of elaborate variations on a theme by de Tocqueville: "The great advantage of the American is that he has arrived at a state of democracy without having to endure a democratic revolution; and that he is born free without having to become so."

Feudalism never existed in America. Therefore, there is no historical basis for a true Burkean conservatism, which rests on a traditional aristocracy. Nor can there even be a healthy Whig (bourgeois) conservatism, because this sort of conservatism must have a feudalism to struggle against. Finally, there cannot even be a valid Left, at least not a radical or socialist Left, because a Left presupposes a Right, and there is no Right. What remains is a bare and unique "liberal community." All doctrines and political movements outside of the liberal boundaries are aberrations, "frauds," and "betrayals."

The author's development of his thesis, though rather tricky and doctrinaire, is intellectually interesting—or could be if it were not for some lamentable qualities of his style. The patronizing tone he uses toward all American writing of the pre-Hartz era on politics, from Adams and Jefferson to Wilson and Beard, is almost too much to be borne. The phrase "of course" (averaging about two and one half per page) appears, on conservative estimate, 750 times, closely followed by "needless to say," and "it is not accidental." The slapdash way in which he applies psychiatric jargon to political events suggests a basic flaw in historical understanding as well as a crudity with words.

JAMES BURNHAM

Kent, Conn.

Science and Freedom: Proceedings of a Conference Convened by Congress for Cultural Freedom, and Held in Hamburg on July 23rd–26th, 1953. Pp. 295. Boston, Mass.: Beacon Press, 1955. $4.50.

Some hundred scholars and scientists from nineteen different countries met in Hamburg to combat the assaults on the freedom of science which have become so serious since World War II. As Michael Polanyi states in the Preface: "It was our task to consolidate a small sector of the intellectual front advancing on this historical line toward the reconquest of freedom. This task presented three aspects. First, we were concerned to reveal to the whole world the cruel suppression of intellectual freedom under totalitarianism. Second, we tried to examine those faults which

exist in the organization of scientific activities in free countries and to explore the possibilities of reform and improvement in this field. And finally, we attempted to clarify the philosophic foundations to the idea of freedom and science."

A total of six sessions was held where formal papers were read. The presentation of papers was followed by a general discussion. Indeed, much of the interest in the published proceedings is found in the reports of these informal remarks and arguments. The sessions covered such topics as the organization of science, science and the state, science and its method, science in chains, and science for the citizen. A general session, in which the whole subject was unified and reviewed, brought the meetings to a close, and a fraternal message was sent to the scientists behind the Iron Curtain.

While many of the facts and principles, which emerged from the Congress, were well known to the scientists, the eloquence and clarity of the presentations made the reading of them a real pleasure. After all, the speakers were all leaders in their fields. But the chief value of *Science and Freedom* is educational, and our intelligentsia desperately need this type of education. It is true, of course, that the belief that science should be free and that scientists should be allowed to investigate what interests them is more fashionable today than it was in the nineteen thirties and forties. Recent events have not been too kind to those who wished to advance the "socialization of science." The attempt to plan science so that it would conform to a party line and not conflict with a state supported philosophy has had such disastrous sequelae that even the Communists themselves are now seeking a way out of their dilemma.

CONWAY ZIRKLE
University of Pennsylvania

A. CAMPBELL GARNETT. *Religion and the Moral Life.* Pp. viii, 223. New York: Ronald Press Company, 1955. $3.50.

When a man has already written books on the philosophy of religion and on moral value, he may be expected to speak with authority in a volume on the relation of the two. This Garnett does. Even his critics must grant that he knows the literature well and refers to it as one whose thought sweeps beyond particular books.

Basically, morality comprises duties whose validity holds regardless of one's theology or metaphysics, says Garnett (p. 26). But motivation needs the impetus of a power, not ourselves, if it is to make for righteousness in a Christian sense. One may see the good but not do it. Religion adds the inspiration to achieve what is seen to be good.

Probably Chapter V is the heart of the book. Under title of "The Faith of Theism," Garnett gives a clear and persuasive delineation of how conscience, which first makes cowards of us all, takes on the role of a friend that lures us beyond our natural powers (pp. 117–18). The sequence of events must be love, hope, then faith, rather than the reverse as St. Paul and Aquinas would have us believe. The insights of moral conscience give reason, when critically scrutinized, to believe that the universe is on the side of values.

Readers of other philosophic persuasions may find that Garnett has said too little about the place of physical nature in personal theism and about the relation of finite persons to God. Evil makes trouble in many philosophical systems, and Garnett should have told us more about what to do with it. Traditional philosophic rationalism leaves us with contradictions (pp. 154–57) between the love and discipline of God. But what is better? Presumably the "agape" of Jesus' teaching leads to a faith that there is an answer to evil (cf. p. 168). But we would be grateful if Garnett would spell this answer out.

While there is little color in Garnett's style, it is lucid, balanced, and simple. We get down to business on the first page and stay there throughout. This book is good reading for the nontechnical philosopher as well as the more initiated. The very thesis that there is more to religion than morality will make this book important to many.

LOUIS W. NORRIS
MacMurray College

DAVID P. EDGELL. *William Ellery Channing: An Intellectual Portrait.* Pp. xv, 264. Boston, Mass.: Beacon Press, 1955. $4.00.

Channing died in 1842. He has been much commented upon. His collected works come to six volumes and have called for twenty-two editions. France, Italy, Hungary, Sweden have paid attention to his significance. In 1903, Chadwick published his last biography. The twentieth century passed him by except in occassional review articles. Edgell felt that the full significance of Channing had been missed, and so he has sought to recover the real Channing as he lived and wrought by an examination of new materials and a sober revaluation of old, by the use of up-to-date methods, by a critical study of the interpretation of Channing's contemporaries, and by a fresh approach to the journals of Emerson and of Alcott. He has succeeded very well in his twofold objective: to appreciate Channing as a man of his times, and to master his thought as a "synthesizer of intellectual and ethical theories."

Fortunately, the volume is equipped with an extensive bibliography, very accurate notes, and above all with an eleven-page index making reference to desired passages very simple.

He apparently approved of progress in education, did not confound cramming with increasing competency to interpret life. But strangely, he was so bound by class distinctions as to disapprove of universal taxation for universal education. For to deprive the wealthy of their holdings without their consent was morally wrong. It must be voluntary giving, benevolence, a gratuity! Education of the lower classes must include manual labor lest they take too easy a view of life. "There is no need of costly institutions for universal education." Believe it or not, Channing regarded the depression of 1837 as resulting from too much education!

"Whether Channing's acceptance of labor was the result of a subconscious Calvinist identification of worldly prosperity with a state of grace, or whether it sprang out of an agrarian conviction that work on the land was the only socially profitable source of income, we cannot know; we can, however, be sure that it was a cardinal point of Channing's social thought" (p. 198).

Channing preached a sermon on "The Ministry for the Poor" in 1835. Two quotations follow:

"That some of the indigent among us die of scanty food, is undoubtedly true; but vastly more in the community die from eating too much, than from eating too little; vastly more from excess, than starvation. . . ."

"Our daughters are oftener brought to the grave by their rich attire, than our beggars by their nakedness. So the poor are often overworked, but they suffer less than many among the rich who have no work to do, no interesting object to fill up life, to satisfy the infinite cravings of man for action. . ." (p. 161).

Here is evidence as the author admits that Channing "never completely transcended his class background."

Theodore Parker's sermon on "The Transient and the Permanent" then stirred as much criticism as Channing's own Baltimore Sermon had in 1819. They are both fundamental documents of Unitarianism today. Parker was accused of being tainted with "egomittism," self-sent Messiah. Channing was disappointed too, granting Parker freedom of speech but sorry he had said it. Then he feared that Parker didn't believe in miracles, but "without miracles, Jesus becomes a mere fable," never appreciating that the validity of truth is not dependent upon miracle (p. 148).

Yet Emerson's remark is worth recalling: "In our wantonness we often flout Dr. Channing, and say he is getting old; but as soon as he is ill we remember he is our Bishop, and we have not done with him yet."

CONRAD HENRY MOEHLMAN
University of Southern California

COMMONWEALTH OF NATIONS

R. T. MCKENZIE. *British Political Parties: The Distribution of Power Within the Conservative and Labour Parties.* Pp. xv, 625. New York: St. Martin's Press, 1955. $7.50.

The party system constitutes an aspect of political life in Britain which until recently had been neglected by scholars. Mr. McKenzie's study of the two major parties is the most substantial work in this area to be published since Ostrogorski's classic book *Democracy and the Organization of Political Parties* first appeared in English translation more than half a century ago. Mr. McKenzie is not concerned, as was Professor Duverger in his recently published study, to provide a general theory of political parties. His aim has been to examine what he calls "the distribution of power" within the Conservative and Labor parties. The Liberal party has been relegated to a two-page appendix, a harsh but no doubt inevitable act in view of the declining role of that party in British life during the past third of a century.

To the casual observer, the striking difference between the British Conservative and Labor parties relates to the leadership. The leader of the Conservative party appears, on the surface, to be an autocrat who dictates policy and selects his own subordinates without interference. In the Labor party, by contrast, it is supposed that policy is made and the leaders chosen by the democratically-elected Annual Conference. Anyone who has been active in British politics knows that this difference is more apparent than real, and this is the conclusion to which Mr. McKenzie comes after a careful study of the facts. "In reality the distribution of power within the two parties is overwhelmingly similar" (p. 582).

Moreover, Mr. McKenzie is a detached observer—though his detachment is admirable and his observation acute. He draws attention to certain "sources of concern" in the functioning of British parties. He believes, for example, that both parties should be more willing than they are to encourage the honest expression of dissent within their own ranks.

Mr. McKenzie has written a first-rate book. His style is effective because he knows what he wants to say. This is one of the half dozen most valuable books on British politics to have appeared in the past decade.

SYDNEY D. BAILEY

New York, N. Y.

LORD BEVERIDGE. *Power and Influence.* Pp. xi, 448. New York: Beechhurst Press, 1955. $5.00.

Lord Beveridge takes up the story of his life in 1901 just after he had finished four years at Oxford and when he had reached the age of twenty-two. Following the example of his father, who had gained distinction as a judge in India, he began the study of law. But he soon forsook this when it began to appear that the career of a barrister meant "a sale of the next twenty or twenty-five years of my life for the chance of doing something with the remainder" (p. 13). After turning from law, he became the subwarden of Tonybee Hall, a settlement in the slums of London which had been designed to acquaint the privileged classes of the West End with the appalling poverty of the East End. In this position he acquired the knowledge and experience which opened the doors of power and influence. He soon left the work at Tonybee Hall and became a special writer for the *Morning Post* on subjects relating to unemployment and social insurance. His informed and persuasive articles for the *Post* brought him to the attention of Winston Churchill, then the president of the Board of Trade, who appointed him in 1908 to the Board "as an expert inventor of schemes" and in the next year made him Director of Labor Exchanges. As a civil servant, Beveridge continued to promote the causes of labor exchanges and unemployment insurance until the emergency of World War I moved him into the Munitions Ministry and later into the Food Ministry.

Shortly after the end of the war, Sidney and Beatrice Webb, who had originally recommended Beveridge to Churchill, persuaded him to become the director of the London School of Economics. He accepted their offer because he wished to be a writer of books, rather than government reports, and spent the next eighteen years of his life in remaking the London School and in relocating London University on its present Bloomsbury site. Though he successfully enlarged the facilities of both the School of Economics and the University, he failed in his major endeavor to place economics on a scientific basis. Because of this disappointment, he eagerly accepted an invitation to return to Oxford where he was given a chance to try his hand at transforming the social studies into a science; but before he had gone far on this new quest, war descended upon Oxford, disrupting his scholarship and drawing him again into the whirl of government service.

During World War II, Beveridge served the government as a roving critic of men and measures so effectively that he became "an uncomfortable companion to departmental colleagues and their chiefs" (p. 295). He expressed such strong preference for Lloyd George's type of war cabinet that he quickly alienated both Bevin and Churchill, the dominant personalities of the wartime coalition. Though cut off from vital administrative work, he was appointed chairman of an inter-departmental committee on social insurance, and its report, under his signature, brought him national popularity and international fame. Because of his dramatic crusade for social insurance, and his distinguished leadership at London University, Lord Beveridge's autobiography, *Power and Influence,* which so admirably illustrates how things are done in a democracy, will be compelling reading for civil servants, educators, and social reformers in many countries.

R. G. COWHERD

Lehigh University

LEICESTER WEBB. *Communism and Democracy in Australia: A Survey of the 1951 Referendum.* Pp. 214. New York: Frederick A. Praeger, 1955. $5.00.

In this book Leicester Webb, head of the Political Science Department of the Australian National University, presents as detailed an analysis of what happened in the Australian constitutional referendum of September 22, 1951 as could be managed with the research facilities currently available to him. The purpose of the referendum was to obtain for the Government the power necessary to put on the law books fairly comprehensive anti-Communist legislation. The Government had sought such legislation from parliament earlier, had, after rather amazing political gyrations on the part of the opposition, obtained it, and then had seen it declared unconstitutional by the High Court. The Government again suffered defeat in the referendum and was thereafter forced to confine its anti-Communist legislation within the existing constitutional limitations.

While the title of the book focuses the attention on Communism, and while the whole episode in all its ramifications circles around the Communist question, readers who take the book up expecting a systematic exposition of the place of Communism in Australian life, will be somewhat disappointed. Rather the book should be read as an exceptionally vivid illustration of what can happen, under democracy, when the question of how to handle the Communists is put to all the voters in a referendum. Indeed, students of referenda can derive great profit from the book regardless of whether the Communist question particularly interests them or not.

As a study in politics the book is at once dramatic, replete with fierce personal conflict between the major leaders, R. G. Menzies and H. V. Evatt, and gaudily colored throughout. As the referendum had a prehistory which was strange and wonderful, so the Communist question has had postreferendum history hardly less remarkable. This book provides very important light on the genesis of the war within the Australian Labor party, a war which may well keep the party out of power for a decade. Mr. Webb's book is an interim battle report. It is a fine job, indispensable to an understanding of politics in Australia today.

Katonah, N. Y.

G. B. PYRAH. *Imperial Policy and South Africa, 1902–10.* Pp. xvi, 272. New York: Oxford University Press, 1955. $5.60.

This serious and scholarly study fills gaps in the worldwide story of Britain's imperial development. South Africa is taken as the illustration, because of its importance during and after the war there. British policies studied for that country stress the peace settlement in 1902 and the concession of self-government to the Transvaal and Orange Free State in 1907. South Africa was to follow Canada and

Australia and form itself into a federation, the union of 1910 anticlimaxing a great phase of British imperialism.

By studying the policies of the Liberal party in particular the author is seeking to discover links between Gladstonian imperial policy and the emergence of the Commonwealth idea in 1917. The problem here was how to combine British sovereignty with local autonomy for the Afrikaners. The essay opens with an analysis of the general lines of Liberal pronouncements from 1899 to 1911. Succeeding chapters include Unionist views also and show how far the announced theories of both parties were put into practice.

The Liberals proved themselves throughout to be more acutely aware than the Unionists of the force of colonial nationalism. They confined themselves to political problems conunected with imperial unity, the Unionists to economic considerations. Liberals and Unionists differed in policies concerning the methods which ought to be followed to strengthen imperial ties. Obviously neither party could advocate imperial disintegration. Whereas both parties denied political rights for the non-European majority, the author inquires into the problem of whether the Liberals were conscious of any obligations of trusteeship toward the native, colored, and Indian populations of South Africa.

The Liberals condemned but supported the war in South Africa and afterwards worked for a reconciliation with the Dutch. Campbell-Bannerman, as leader of the party (returned to power in 1906), had the responsibility for the constitutional settlement whereby responsible government came to the ex-Boer republics. Winston Churchill, who became Lord Elgin's Undersecretary in the Colonial Office, had a part to play in reversing the policy of Chamberlain and Lyttleton. The British were singularly fortunate in having a man such as Botha with whom to deal.

Resolute Sir Alfred Milner, the high commissioner during and immediately after the South African war, might be expected to be the villain of the piece. Instead, the author presents favorably his economic and social policies. There is no condemnation of Milner, no tracing of the heated debates of 1906 wherein he narrowly escaped a direct vote of censure in Parliament for the bringing in for the gold mines of the thousands of Chinese laborers whom the Liberals repatriated.

SLAVIC COUNTRIES

HERBERT S. DINERSTEIN. *Communism and the Russian Peasant;* LEON GOURÉ and HERBERT S. DINERSTEIN. *Moscow in Crisis: Two Studies in Soviet Controls.* Pp. xviii, 254. Glencoe, Ill.: Free Press, 1955. $4.50.

Soviet Russia is held up by Communists and sympathizers as a model economic system, but paradoxically Soviet attitude makes it impossible for others to emulate it. No one can follow a model if he is not allowed to see how it is put together and how it works. The general practical results are bound to become known sooner or later, but not the reasons for success or failure. Mr. Dinerstein's study throws much light precisely on the working of the agrarian sector, and while he can add nothing new to the facts and figures revealed with such startling frankness two years ago in the speeches of Malenkov and Khrushchev, he adds light and shadows to the picture by filling it in from the human side. Mr. Dinerstein, who is responsible for the first section, has used original sources and also interviews with undisclosed Russian visitors and refugees to such good effect that everyone can now see why a collectivized system cannot work in a sector in which human labor, individual effort, and care is the first condition for good production.

Much of the attention of those responsible for agriculture, both at the center and locally, had therefore to be continually devoted to incentives and rewards. Their efforts at times had actually the paradoxical result that in the past heavier burdens were laid upon the more efficient *kolkhozes* than upon the lazy ones. It is not surprising to discover that the system also bred a multitude of officials and agencies, and that these in turn called for elaborate arrangements for verifying their activities and results. As an essay in popular attitudes towards government and official policy, the first study would seem to suggest that neither is solidly established on the land. It is just as well, therefore, to have the corrective of the second essay, the joint work of Mr. Dinerstein and Mr. Gouré—an intensive examination of conditions and attitudes when the Germans were outside Moscow—with its firm conclusion that "at the height of the crisis the majority of the population of Moscow did not rebel against their rulers" and, what is more, "had no intention of doing so."

Both these summaries of contemporary evidence were well worth putting together and the work has evidently been done with great care. One adds, therefore, with some regret that the brief historical Introduction does not reach the same standard and in some respects is actually misleading. To say that during the nineteenth century those who wanted westernization were inevitably driven towards revolution is to overlook that the most numerous and relentless revolutionaries were Slavophiles. In view of the failure which Mr. Dinerstein's essay describes, it is also misleading to say that except in the immediate postrevolutionary period there was no heart-searching within the party as to the soundness of Soviet policy; what then was the meaning of the whole Trotskyite "heresy," of the fearful trials and purges of the thirties, and indeed of the far-reaching changes in persons and policy since Stalin's death? On a point of detail, but an important one, it is inaccurate that the *mir* was essentially to be found only on lands owned by the Crown or by monasteries; and as regards Siberia, where it is said to have been weak, it is a remarkable fact that the peasants who migrated to Siberia, legally or mostly illegally, generally organized themselves into a *mir* even where land was not scarce, just as they did after the Bolshevik revolution on land they took over from private landlords. That egalitarian and communal tradition had strong roots among the peasants, and yet it has not proved a steppingstone to agrarian collectivism.

LEONARD SCHAPIRO. *The Origin of the Communist Autocracy: Political Opposition in the Soviet State, First Phase, 1917–1922.* Pp. xvii, 397. Cambridge, Mass.: Harvard University Press, 1955. $7.00.

The peculiar persuasiveness of power and success makes many contemporary historians vulnerable to the official and widely spread versions of the victorious. But the truths of the defeated, which are always a significant part of the over-all historical truth and a key to its meaning, have to be sought in obscure pamphlets, scattered leaflets, stifled and muted cries. It is these truths of the defeated that Leonard Schapiro's remarkable study brings back into the picture of the Russian revolutions of 1917 and the subsequent rise of Communist autocracy and totalitarianism.

Mr. Schapiro's style is quiet and dispassionate. His skill in exhuming what has been buried under successive layers of defeat, dispersion, calumny and oblivion is such that the documentation speaks for itself and affords the reader the pleasure of keeping several jumps ahead of the author in deriving his own conclusions.

The organization of the work is quite simple. Part I deals with the democratic February Revolution of 1917, and the fatal weaknesses of the Provisional Government arising from its dogmatic adherence to total democracy in time of war and siege; and its superstition that the enemy of democracy was to be found only on the Right.

Part II surveys the fate of each of the opposition parties after the Bolsheviks have overthrown the Provisional Government and seized power. First we watch the Left Social Revolutionaries prepare their own undoing by accepting minority dictatorship and permitting their little group to obscure the fact that it is really a one-party dictatorship. Then we watch the downfall of the Social Revolutionary party,

which had behind it the overwhelming majority of the people but perished because it thought that it could substitute "nobility" and "service to the popular will" for a program of using its majority to take power. Next we follow the fortunes of the Menshevik Social Democrats, handicapped by their dogmatic acceptance of the Bolshevik "revolution" and of the Soviet "legality" which the Communist ruling party no longer respected. The Mensheviks "perished without firing a shot," yet the state propaganda machine branded them as "counter-revolutionists and White-Guardists," and only recently Professor Carr's history has retailed the official version that they were outlawed because they were unwilling to accept "Soviet legality."

Part III surveys the fate of each of the Communist groups which accepted party dictatorship yet fancied they could keep democracy alive inside a dictatorial, minority party. These prepared their own undoing; the police they had sanctioned and even urged on against all other groups and parties finally entered the Communist party to exterminate the heretics who insisted on taking seriously the original ideals and programs of Communism which had been used to win power.

Only in Part IV does Mr. Schapiro suggest his own conclusions. But it is the triumph of his method of presentation that these almost seem superfluous, for the facts and documents themselves have already presented with the rigor of a syllogism the conclusion that this outlawing of all other parties and of inner party democracy in the minority ruling party is the obverse of the rise of the Communist autocracy and of Communist totalitarianism. From this inner connection between obverse and reverse of a unitary historical process comes the lengthy dual title of the book.

BERTRAM D. WOLFE

DONALD W. TREADGOLD. *Lenin and his Rivals: The Struggle for Russia's Future, 1898–1906.* Pp. 291. New York: Frederick A. Praeger, 1955. $5.00.

This is a book on the growth and development of political parties in Russia. Whereas in most countries parties arose only after a parliament had been established, in Russia parties came into being before the establishment of the Duma in 1905–06. The parties according to the author arose out of the efforts of the intelligentsia "to set the people free" from the autocracy of the Tsars. They had their origin in Herzen's exhortation to go "to the people" and spread the gospel of political enlightenment. The leaders of the movement were filled with concepts of political parties taken directly from the West. Objectives were "framed in purely western terms like 'constitution,' 'legislative assembly,' 'universal suffrage,' and the 'freedoms,' concepts with whose embodiment Russia was almost wholly unacquainted" (p. 57).

The transition of Populism, which is equated with peasant socialism, into the Social Revolutionary movement led by Chernov is given in detail. Chapters are then devoted to the formation of the Social Democratic party and how this split into the Menshevik and Bolshevik wings. The Liberal party under Miliukov was also plagued by division. The differences between these various groups in regard to theory and tactics are not always easily discernible. The one thing which all the groups had in common was opposition to the government. It was the cement which, to use the terminology of a later period, led to the first Popular Front in 1905. But even at this time Lenin, who considered the Tsar defeated, had come to center his attention on the Liberals as his chief enemies. The Kadets were the first to discover that it was not possible to cooperate with the Bolsheviks.

To be definite and precise on indefinite things is not proper, and the origins of political parties are never clear cut. Nevertheless, even within these limitations the author does not seem to achieve an over-all picture. This book is for the specialist, and it is easy to get lost in the detail. All too often men as well as minor events in Russian affairs, which will not be known to the general reader, are mentioned without explanation. The author, for example, repeatedly refers to a "Four-Tail Constituent Assembly" and "Four-Tail Suffrage," but does not explain until page 131 that this stands for universal, equal, secret, and direct suffrage. Tsar Nichloas II by the way took office in November 1894 rather than in January 1895 (p. 20). Footnotes are grouped in the back of the book, but there is no separate bibliography. An appendix gives a list of the principal conferences of various political organizations.

Bowdoin College

JOHN A. ARMSTRONG. *Ukrainian Nationalism, 1939–1945.* Pp. xi, 322. New York: Columbia University Press, 1955. $5.00.

The idea of nationalism has had its day, and today we may be witnessing its doom, for it is being mangled and mutilated by the cosmopolitan-minded intelligentsia partly because the idea eloquently elaborated by Mazzini is often misunderstood and misinterpreted. One hardly hears Mazzini mentioned in this connection; instead, we usually have the idea coupled with racialism, chauvinism, fascism and nazism. Recently the nationalism engendered and nursed by small nationality groups has been studied. Mr. Armstrong's book, issued for the Russian Institute of Columbia University, is such a study.

The author traces the origin of nationalism among the Ukrainians and finds that the idea struck root rather late. Only in World War I it took definite shape in the minds of certain leaders, but they were at odds both as to the goals of Ukrainian nationalism and their realization. That was one reason why the short-lived independent Ukraine (1918–20) had the support of only one nationalist faction. After 1920 the country was sovietized and nationalism should have disappeared. During the interwar years, however, it was nursed and kept very much alive, thanks to the inhuman policies of the Kremlin. At the outbreak of the last war nationalist leaders, both in the Soviet Union and those in the West, hoped to realize their long cherished dream. Until the outbreak of Nazi-Soviet hostilities they paid heavily in the Soviet Ukraine for the ideas they held. Thereafter they hoped to see the day of Ukraine's liberation. All nationalist groups were willing to help the Germans to free their compatriots from the Soviet yoke, but Nazi leaders were not ready to have the Ukrainians fight with the Germans side by side; this was against the Nazi creed. Worse was to follow when some 2,000,000 Ukrainians were conscripted in labor force for work in Germany and in the West. This caused bitter resentment, but poor Ukrainians were not in position to defy German authorities. In 1943 when Germans were losing ground in the Ukraine many nationalist leaders were caught in the Soviet net. Those able to flee with the retreating German forces still looked forward to the eventual liberation of the Ukraine. Some had put great faith in the Atlantic Charter. As late as January of 1945 there were several hundred thousand Ukrainians fighting against the Red army, but as the war drew to its close, a part of this force surrendered to the Western powers, and, as they were not subject to the Soviet Union, we did not commit the error of turning them over to Soviet authorities.

The author states that the "Ukrainian nationalism is but one thread in the immense tapestry of the Second World War." He could have added that it is a red, bloody thread, which is well described in minute details and fully, if somewhat cumbersomely, documented.

A. O. SARKISSIAN
Library of Congress

JOZEF LETTRICH. *History of Modern Slovakia.* Pp. 329. New York: Frederick A. Praeger, 1955. $5.00.

This is a succinct, clear and well-documented political history of a small nation which occupies a strategic position between the Polish plain to the north and the Hungarian plain to the south. The author is a Slovak lawyer who was chairman of the Slovak Democratic party which was opposed equally to the Communists and to the separatists, the latter favoring a separate Slovak state. In the first postwar elections in 1946 the Slovak Democratic party gained 62 per cent of the votes cast in the province.

Students of power politics will be interested in the first place, in Mr. Lettrich's account of the struggle between the Slovak Democrats and the Communists which

shows on a small scale the tactics used by the latter, and the role played by their fellow-travelers. These tactics finally lead to the coup d'état of February 1948 when Czechoslovakia became a Soviet satrapy. Despite the majority support enjoyed by the democrats, the Communists surpassed them by their aggressive and well-planned line of action as well as by the fact that they held effective power. As Mr. Lettrich points out, the Communists in Slovakia controlled the army, the police, the partisans, and the armed workers' militia "from the instant the first Soviet troops had entered Czechoslovak territory." The democratic front's weakness was also due to the heterogeneity of its component elements, and as a consequence, due to the Communist Putsch, the Democratic party ceased to exist (p. 260). In spite of this, Dr. Lettrich advocates, at the end of his book, the necessity of the reconstruction of Czechoslovakia on the basis of equality of the partners Czechs, Slovaks and Ruthenians, thus excluding both the system of centralization and the separatist chimera of a Central-European federation.

Three chapters in Mr. Lettrich's book deal with the last hundred years of Slovak history. The first deals with the despotic Magyar régime, lasting until 1918, which oppressed the Slovaks from a political, cultural, and economic standpoint. The latter was reflected in a large emigration, directed particularly to the United States. The remarkable development of Slovakia achieved in all fields, during the first Czechoslovak Republic (1918 to 1938), is summed up in Mr. Lettrich's evaluation: "The twenty years of the Czechoslovak Republic were the finest in Slovak history."

The period since 1938 is the main topic of the book. Mr. Lettrich describes the turbulent development of the Slovak People's party which under the leadership of Jozef Tiso finally led to the separation of Slovakia from the already mutilated Republic and the establishment of a puppet Slovak state, cast in the opprobrious Hitler mold. There is also an interesting description of the unsuccessful Slovak uprising of 1944.

This background largely explains the division of the Slovaks into three camps—democrats, separatists and Communists—which will constitute one of the main obstacles to a reconstruction of Slovakia should Communist tyranny come to an end. This, according to Mr. Lettrich, should take place within the framework of a Czechoslovak Republic, based on the principle of equality of the three people that inhabit it—Czechs, Slovaks and Ruthenians. He is equally opposed to a centralistic régime in the hands of the Czechs and to the revised aspirations of the separatists, according to which there would be an "independent" Slovakia which would be member of a supposed Central European federation. According to Mr. Lettrich the separatists in demanding the destruction of the viable Czechoslovak entity are going counter to European development which moves from the existing small, medium, and large states towards an ultimate European union.

WESTERN CONTINENTAL EUROPE

GEORGE W. F. HALLGARTEN. *Hitler, Reichswehr und Industrie: Zur Geschichte der Jahre 1918–1935.* Pp. 139. Frankfurt am Main, Germany: Europäische Verlagsanstalt, 1955. D.M. 7.50 cloth; 4.80 paper.

This monograph is an historical study of Hitler's relations with the German army and industry from 1918 to 1935. The first part is concerned with Hugo Stinnes, General von Seeckt, and Hitler. It is based upon documents from Seeckt's papers, formerly in the army archives at Potsdam, and documents from the general records of the American Department of State, now in the National Archives, Washington. The second part of this study, Hitler and the German Heavy Industry, is largely a translation of an article which Dr. Hallgarten published in an American journal in 1952. A number of American and German documents supplement the text, and the author's scholarly footnotes enable the reader to note the sources for every important statement of fact.

This study throws new light on the French invasion of the Ruhr, Hitler's plan for a march on Berlin, and General von Seeckt's dream of establishing a reactionary dictatorship in the autumn of 1923. Especially valuable are the author's conclusions concerning this complex of intrigues, negotiations, and quarreling factions. It may be noted that the author has not used the frank revelations which Seeckt made when he visited the United States nor certain sources that would have indicated reserves of strength, which the Weimar Republic had available in the crises of 1923.

The author observes that the end of Hitler Germany and the rise of new international conflicts after 1945 have revived many of the basic questions of 1923. Again we are confronted with the problem of creating a democratic German army, a viable democracy for a united Germany, and a party system which can co-operate with the Western democracies. Dr. Hallgarten has doubts about the present plan for rearmament, which is perhaps the most crucial issue of the German Republic. Moreover he notes that the German heavy industry is far stronger now than it was in 1923. The steel kings, the coal barons, and the various other manufacturers are again in control of a vast industrial empire, which has recovered its former place in the world market. Will it support or undermine a democratic republic?

The second part of this book is a brilliant study of Hitler's relations with the German heavy industry and especially of the financial support which many industrial leaders gave to Hitler and his movement. The principal supporters were the directors of the great banks, Hjalmar Schacht, the group of industrialists in the United Steelworks, and the directors of the chemical industry. "Although Hitler was strongly supported from the funds of the industrialists," concludes Dr. Hallgarten, "one cannot say that they had 'made' his movement."

RALPH H. LUTZ

Stanford University

JOHN L. STIPP (Ed.). *Devil's Diary: The Record of Nazi Conspiracy and Aggression.* Pp. xv, 236. Yellow Springs, O.: Antioch Press, 1955. $3.75.

The reality of Communist imperialism has forced the free nations to include Germany into the North Atlantic Treaty Organization and other defensive arrangements. If ten years ago anyone had dared to predict that by 1955 Germany would become one of the main bulwarks against the flood of aggressive expansion, his political foresight and sanity would have been seriously questioned. Yet the Soviet Union managed to bring about this fundamental change of events by a series of reckless aggressions and threats of aggression. As a result, German military strength is not only tolerated by the Western Powers which vanquished her in World War II, but the Germans are asked to rearm as fast as possible and as intensively as possible. It would be grossly unfair to see in this *volte-face* of Western policy any Machiavellian scheming or, much less, profascist sympathy; not Eisenhower and Churchill, but Stalin and Molotov are the authors of German rearmament.

Yet the danger of accepting the practical necessity of German rearmament in the present world crisis lies in forgetting all too soon and all too completely what the German people did, and stood for, only a short ten or fifteen years ago. Professor Stipp has therefore performed a valuable service in editing, at this time, the *Devil's Diary: The Record of Nazi Conspiracy and Aggression.* The book is a collection of key excerpts from the monumental collection published by the United States Government after World War II under the title *Nazi Conspiracy and Aggression,* and containing the basic evidence used against the German war criminals at the Nuremberg trials. However, as the average size of these volumes (nine in all, with additional supplements) runs over a thousand pages, only specialists have so far been able to comb through the mass of material. Professor Stipp's slim volume of slightly over 200 pages is not meant to be a *Reader's Digest* version of the many thousands of pages on which it is based, and the scholar will have to go back to the multi-volume original edition of the United States Government. Yet even the

short excerpts supplied in the present anthology are quite sufficient to indicate the character of German policy prior to, and during, World War II. The book opens with the famous "Hossbach Notes," which show—in Hitler's own testimony—how, in 1937, Germany planned a war of conquest while publicly professing peaceful intentions. With typical German *Gründlichkeit* all steps of conquest were laid out well in advance. In the subsequent chapters Professor Stipp shows—always in the words of the Germans themselves—how they planned the annexation of Austria, the Sudeten crisis, the disintegration and colonization of Czechoslovakia, the invasion of Poland, the attack against Denmark and Norway, the violation of Holland and Belgium, the frustrated plans against England, and, finally, the most fatal decision of Germany's war lords, the invasion of Russia. What makes the record so gruesome is that it is based enitrely on German documents and statements of German leaders. Any commentary would merely weaken the effect.

Since the translation of the German documents was done at top speed, it is regrettable that Professor Stipp decided not to change obvious lapses of elegance or accuracy. Thus, *Parteibewegung* (p. 43) is rendered as "Movement Party," which is both wrong and slightly confusing. However, these are minor blemishes in an otherwise useful book.

WILLIAM EBENSTEIN
Princeton University

MILTON MAYER. *They Thought They Were Free: The Germans, 1933–45.* Pp. xii, 346. Chicago, Ill.: University of Chicago Press, 1955. $4.75.

When Milton Mayer, a writer from Chicago, paid his first, brief, and only visit to postwar Germany, he gathered the material for the larger part of his book. In a Hessian town at whose University he lectured as an American guest professor he had many talks with ten man who once were members of the Nazi party. "As an American, an American of German descent, a Jew, a newspaperman," Mr. Mayer writes, he wanted to find out "what the Nazi had been and how he got that way." Happily, Mr. Mayer differs from the many American intellectuals who—despite their proud claims of familiarity with social psychology, and despite their even prouder claims of freedom from prejudice—seemed to deal with the subject of Germany in a passionately prejudiced way. Mr. Mayer's description of his talks with ten ex-Nazis and of their views, actions, lives before, under, and after Hitler has the ring of authenticity. From these talks, at least one facet of totalitarian reality does emerge.

Yet sources of misunderstanding remain in Mr. Mayer's report. They are based on the size of his sample and the choice of his cross-section. Both are rather arbitrary and, as anyone conversant with German political and social geography would suspect, rather untypical. To consider his ten men in a particular Hessian university town (pop. 42,000), as "the Nazis," seems about as valid a generalization as to present the views and actions of ten men in, say, "Middletown, Mississippi" as those of "the Democrats" of this country, if not of "the Americans."

In a short second part, called The Germans, the author sketches some observations and generalizations of "German national behavior." With pleasant facility, yesterday's Germany is compared with, and explained as, the new boy in the neighborhood—insecure, therefore given to bullying, painfully conscious of his own shortcomings and weakness. The parallels Mr. Mayer draws between Germans and "the Jews" are thought-provoking, as are quite a few of his other—not necessarily provable or valid—random remarks.

Unfortunately, Mr. Mayer in the third and topical part of his book turns from an amateur anthropologist in the field taking notes about a strange people, and from a writer of stimulating aperçu, into a political pundit. In a discourse on present-day American and German policies, he warns against West German rearmament in defense against Communism and against America's support of West Germany. Apparently, his bitter denunciations are mainly based on a few newspaper clippings (with the political character and reliability of the quoted sources often badly mistaken,

such as when he introduces the very liberal *Frankfurter Zeitung* as a "very conservative" newspaper, the violently anti-Adenauer *Frankfurter Rundschau* a "pro-West" newspaper, and so on), and on a few general impressions which, though they were correct when he gathered them in 1952, have ceased being true today (particularly with regard to economic conditions, to a certain nostalgia for the "good old times" of Hitler, to the general political temper). Recovery which then still seemed a surface mirage has in the meantime proved to be a reality. Readers, I hope, will come to distrust Mr. Mayer's evidence (much of which is factually wrong) after reading his statement "The newest wrinkle in psychoanalytic lingo is 'charismatic leader.'" From an error of that kind if it would seem that Mr. Mayer, while he explains German society, has never ventured into the field of German sociology, nor in that of German political history in which the "charismatic leader" has been a byword since Max Weber.

The same personal bias which leads Mr. Mayer to rather valuable observations on yesterday's Nazis misleads him into rather erroneous views of the present. A convinced, doctrinaire pacifist, Mr. Mayer rebelled against the stereotypes circulated in and after the war about "the Nazis" and "the Germans," and tried to come closer to the truth. Still a convinced doctrinaire pacifist today, he rebels against the present-time Western defense organization and its German link, which he tries to denounce. What emerges from his protest is only a parochial editorial lacking familiarity with foreign facts.

NORBERT MUHLEN
New York, N. Y.

RICHARD K. ULLMANN and SIR STEPHEN KING-HALL. *German Parliaments: A Study of the Development of Representative Institutions in Germany.* Pp. iv, 162. New York: Frederick A. Praeger, 1954. $4.00.

This is an important book primarily because it fills a gap in the literature on German political institutions. It offers extensive proof that contrary to widespread belief, Germans have had some forms of representative institutions at least as long as their Anglo-Saxon cousins, and that, therefore, it would be incorrect to say that the conception of representative government is foreign to German thought. To be sure, the authors attach a rather broad interpretation to the term "representative government is foreign to German thought. To be sure, the authors attach a rather broad interpretation to the term "representative," including in their account distinctly unrepresentative parliamentary bodies of earlier German history and excluding some of the lesser, but no less interesting parliaments that existed from time to time in certain principalities and dukedoms. Nevertheless, the book calls to mind that if democracy in Germany has an unsatisfactory record of performance, this was not because German representative institutions lacked historical antecedents.

The line of German, and for that matter British, parliamentary institutions is traced back to the "oak-woods of Germany," the Teutonic assemblies of freemen in earliest German history. Throughout the succeeding periods, the era of feudal and then imperial estates, there are evidences of the practice of representative government. The trend culminates in the ill-fated liberal revolution of the 1840's. Beginning with that tragedy, the line of representative institutions then moves in cycles, emphatic and pronounced for a period, then obliterated by counter-revolutionary pressures, reappearing again only to run once more into a reactionary cataclysm. The story is brought up to date with the discussion of the parliamentary institutions in the two competing republics of present-day Germany. One might add, largely because the authors do not with sufficient emphasis, that the so-called German Democratic Republic of East Germany is as unrepresentative as some of the diets in Germany's feudal past.

When it comes to pointing up some of the reasons why German representative institutions failed to acquire the solidity and permanence of a House of Commons, the authors are not consistently convincing or complete in their coverage. Perhaps, they should not have ventured that far into the controversial waters of political behavior

analysis. Their contribution would not have been less welcome had they restricted themselves to a purely historical account of the structural and procedural aspects of German representative institutions.

HENRY L. BRETTON
University of Michigan

BRIAN CHAPMAN. *The Prefect and Provincial France.* Pp. 246. London: George Allen and Unwin (distributed by the Macmillan Company, New York), 1955. $4.25.

Mr. Chapman, with two books on French local government published in quick succession, is well on the way to becoming the world's leading authority on the subject. His earlier volume, somewhat broader in scope than the present one, filled such a vacuum that it was promptly translated into French. This second work likewise has no real competitor in any language.

Nonspecialists are likely to feel that an entire book devoted to the prefectoral corps offers more information than they want or need. The serious student of French government, on the other hand, will find this study of real value. So many aspects of local life are linked in some fashion with the prefecture that a clear understanding of the prefects' unique role is essential. Mr. Chapman has pulled together a great deal of detailed information, which he presents in sober, lucid fashion. If anything is lacking, perhaps it is the human element. Occasionally, Mr. Chapman does enliven his analysis with brief examples of the problems faced by the prefects in their multifold relations with the politicians, the ministry of interior, the mayors and local councils, and the general public. The more frequent use of such case studies might have leavened the mass of administrative detail.

Mr. Chapman is, on the whole, a defender of the prefects against their many critics. He contends that the corps has done its job well—better, indeed, than the politicians, whose "freedom to be irresponsible is often due to the Prefects' efficiency." He approves the government's recent decrees which broaden the prefects' powers at the expense of the central administration in Paris. On the other hand, he is skeptical about the transfer of more local authority to elective bodies or officials, in the Anglo-Saxon tradition. A decade ago, pressure for more local self-government was great enough to get the principle of decentralization written into the new constitution; but Mr. Chapman believes that this article will remain a dead letter. Indeed, he argues that "a strong and active Prefectoral Corps is the best way of retaining . . . the virility of local government," since any reduction in the prefects' power would probably strengthen the ministries in Paris rather than the local governmental units.

A few minor errors detract little from this thorough and judicious study. It should remain for a good many years the standard work on the subject.

GORDON WRIGHT
University of Oregon

J. M. THOMPSON. *Louis Napoleon and the Second Empire.* Pp. 342. New York: Noonday Press, 1955. $4.50.

"Machiavelli himself . . . would have had nothing but praise for the Second of December." Such was the enthusiastic judgment of the Empress Eugénie on the *coup* by which Louis Napoleon gained the mastery of France. But later historians have been less positive; they have found it difficult to assess not merely this particular incident but, in fact, the entire Second Empire and its enigmatic Man of Destiny. Was Louis' regime merely an illegal despotism by a second-rate imitator and was its destruction in 1870 simply the working of inevitable justice, or were there solid achievements and noble ideals, and was the whole fabric destroyed by forces which not even a Man of Destiny could control?

J. M. Thompson, the British historian of the French Revolution and the First Empire, is the latest scholar to attempt a portrait of Louis Napoleon—"a fascinating but puzzling character." His study is more a biography of the man than a history of the times, and it is better on politics and diplomacy than on economics. Aside from the addition of many details based upon his intensive use of English source materials, Thompson does not—and doubtless

did not intend to—reach any striking new interpretations. Nor does he present many final judgments although he does demonstrate, once again, that the problem of the Second Empire is too complex for easy answers or facile generalizations.

Napoleon III emerges as an idealist who believed in both repression and progress, a dictator whose rule suffered from his own lethargy and later ill health, a fatalist who trusted in his "star" but who was often guilty of star gazing, a conspirator who relied too heavily on bad friends, a Hamlet who was too weak to accomplish the deeds he knew were necessary. But, like virtually every modern biographer of the Emperor, Thompson is compassionate in his estimate. Louis Napoleon was not merely a despot. "At the back of all his twists and turns . . . . he held close in his mind and warm in his heart the will to be great and the wish to do good." Because of his basic integrity of mind and generosity of purpose, "he must be judged, if at all, by the ends he tried to win more than by the means he took to win them."

Thompson's unique contribution is that he comes to the Second Empire after years of studying the First. It is all too tempting for the twentieth-century historian to see 1848 as a great watershed in European history and, hence, to rely on recent analogies—to compare Louis Napoleon to Mussolini and his draining marshes, to Hitler and his rigging of plebiscites, and to Wilson and his faith in nationalities. Thompson, however, rightfully emphasizes Louis' indebtedness to and dependence upon the example of the first Napoleon. "This was a life ruled from first to last by a great name," he writes. "Louis' political aims never strayed far from what he had learnt from meditating on the career of Napoleon." Thus, to cite but one example, because Louis erroneously interpreted the *acte additionel* of the Hundred Days, his own Liberal Empire was "a misinterpretation of the First Empire in the light of 1815" and, hence, a failure. Because Thompson's book is oriented toward the early nineteenth century and not toward the twentieth, it is, therefore, one of the most significant of recent studies of Louis Napoleon and his empire.

ELI F. HECKSCHER. *An Economic History of Sweden.* Translated by Göran Ohlin. Pp. xii, 308. Cambridge, Mass.: Harvard University Press, 1954. $5.00.

Professor Heckscher, perhaps the greatest of economic historians, has been known chiefly for his studies of mercantilism and the Continental System. Yet the work that absorbed him most, and which his death in 1952 prevented him from completing in its multi-volume form, was the economic history of his native Sweden. In 1941 he published a one-volume abridgement; this *Svenskt Arbete och Liv* has now been excellently translated for an English-reading audience.

Some of Sweden's uniqueness is salutary for such a study: Sweden has the earliest and most complete statistical records of any country; population figures began in 1721 and became especially thorough in 1749. This was the work of the clergy, who may have paid little heed to the social gospel, but who pioneered in social statistics. Such records, plus the financial accounts of government and private estates, make possible enlightening comparisons such as that of food budgets and caloric consumption in the sixteenth century and the twentieth century, and of harvests, prices, and foreign trade.

The book treats well the peculiar aspects of Swedish development—the minting of the huge and heavy sheets of copper money, the alienation of crown lands to the nobility and the sudden reversion with its accompanying effect of restoring freedom to the peasants, the Swedish application of mercantilism with a special emphasis on private enterprise, and so forth. Until after 1870 Sweden was relatively backward economically; she has become one of the most prosperous nations. This transformation gives her story special interest.

Heckscher's breadth of knowledge concerning the economic history of Europe

and the United States gives force to his generalizations and period characterizations; even more important is his acquaintance with economic theory, for he was a man thoroughly qualified in each of the fields which his discipline straddled. He used economic theory to give meaning to history, and he used historical method to give validity to theory. For him historic fact was essential, especially "secular statistical time series." Richness of material and the insight of the author combine therefore to give this study both historical significance and an immediate relation to universals. Heckscher had a genius for putting his finger on the vital issue and for finding the relevant evidence. The book has been given added value by a final chapter on the period since 1914 by his son, Professor Gunnar Heckscher, and by a forty-page evaluation of Heckscher's total work by Alexander Gerschenkron.

GIOVANNI SCHEPIS. *I Sistemi elettorali: Teoria-Tecnica-Legislazioni positive.* Pp. lxiii, 249, 356*. Empoli, Italy: Editrice Caparrini, 1955. 4000 *lire.*

FRANCESCO COMPAGNA and VITTORIO DE CAPRARIIS: *Geografia delle elezioni italiane dal 1946 al 1953.* (*Il Mulino.*) Pp. 71. Bologna, Italy: S.p.A. Poligrafici "Il Resto del Carlino," 1954. 300 *lire.*

Professor Schepis, who teaches statistics at the University of Rome and is, at the same time, connected with the Italian Ministry of the Interior as a specialist in electoral systems, has set himself the goal of presenting a factual exposition of the various systems of voting which compete for attention in the democratic world. The first section of his carefully written volume deals with the "theory and technique of electoral systems." It does not limit itself to the major forms of the majority system and of proportional representation, but treats, in detail, the deviations from the major principles of each, as well as systems which aim at being a mixture of both. These systems are important ingredients of recent discussions, and of recent legislation, in Continental Europe, not to mention the continued application of the single-nontransferable vote in Japan.

The second section presents the major features of electoral legislation in all major, and most of the minor, countries of the world. Professor Schepis approaches this task with a keen appreciation for the actual effects of a particular system, always probing below the surface. Thus, he rightly characterizes the German electoral systems of 1949 and 1953 as "preponderantly proportional," concessions to the majority principle which they contain being too small to justify the assertion, made so frequently, that these laws constitute a half and half combination of the two major systems.

These advantages make Professor Schepis' volume an excellent up-to-date handbook of electoral legislation. The question is whether he might not have gone beyond this in order to present, on the model of the two volumes published by Karl Braunias in 1932 (the usefulness of which is attested by the fact that they had to be reprinted recently, although they were out of date in regard to many details), evaluation of the actual implications of the various electoral systems. Braunias applied this principle also to his country by country treatment of actual legislation. That method makes possible, in the first place, critical analysis of the terms used which, in this field, is all important, because accepting the terminology of consistent supporters of one electoral system or the other means accepting their major conclusions. In the second place, Braunias was able to discuss the political dynamics of the countries with which he was dealing, which made their successive steps in electoral legislation more intelligible. It is possible that Professor Schepis, aiming at worldwide coverage, rather than at a treatment of Europe alone, did not follow Braunias' approach because it would have meant exceeding the space available to him. Still, one wonders whether a cooperative international effort should not be made to supplement what Professor Schepis has done along the lines of an up-to-date, worldwide, and consistently systematic Braunias.

Geografia delle elezioni italiane dal 1946 al 1953, the slim booklet by Compagna and De Caprariis sets itself the goal of promoting "knowledge of the political realities" of Italy. The authors' analysis of changes in the electoral strength of the various Italian parties in the postwar period is scrupulously objective. They present much valuable detail, particularly so far as the difference between, on the one hand, the Center and North of Italy, and, on the other, the South and the Islands is concerned. Their most important contribution to the discussion is this analysis of developments in the areas most affected by land reform. They reach the conclusion that this reform has not been a political failure; that, in fact, it has managed to slow down the growth of Communist and left-wing socialist votes in the region concerned as a whole, and has actually been followed by a reduction of that vote in some of the communities most affected by the reform (pp. 52–4). In the concluding paragraphs (pp. 68–9) they step, in their own opinion, beyond the bounds of strict objectivity in order to express regret over the concentration of political strength in Italy on the Communist-Socialist bloc and the Christian Democrat party, but they could have reached somewhat similar conclusions on the basis of an exposition of the logical requirements of a party system adapted to the functional needs of the democratic system rather than to preponderantly ideological factors.

GIUSEPPE UGO PAPI (Ed.). *Teoria e politica dello sviluppo economico.* Pp. 567. Milano, Italy: Antonino Giuffrè, 1954. 3,000 lire.

This large volume, edited by Professor Giuseppe Ugo Papi of the Law School of the University of Rome, is a symposium on the theme of economic development in its twofold aspects of theory and practice. The basic query deals with the deviations from pure theory when theory is applied in practice in the very complex world of our time.

The study of this process has been stimulated and even determined by the concern of the United Nations over the economy of backward countries, and the aid that the United States has generously and providently offered them.

Each article is preceded by a summary in Italian, English, and French, a symptom of the international mindedness that has developed in our day after the tragedy of World War II. The ratio between good and evil does not change in the historical process whereby humanity walks towards its always new destiny.

The first three essays deal with the theoretical aspect of the problem of economic development. A second section of this well-planned symposium deals with the various factors that are at work in the field of economic development of backward countries.

Special attention has been given to Southern Italy which, as is generally known, is industrially behind the rest of the country and especially of the northern sector where industry and commerce are highly developed. The United States is intensely interested in Southern Italy, and large capitals from our country have been invested there in the hope of stimulating the industrialization of the region, and thus achieving a higher level of economic well-being in which the deadly microbe of Communism will not develop.

One of the positive characteristics of this book is the theoretical background on which economic development has been studied. Special chapters have been dedicated to concepts of economic life from the classical thinkers (Adam Smith and the physiocrats) to Marx, Schumpeter, and contemporary thinkers.

A broad vision of international cooperation is presented in the book. There rings in it a note of tempered optimism, through the consideration of the new consciousness of co-operation that has arisen in our time, be it in the mist of political considerations.

OTHER COUNTRIES

A. ARTHUR SCHILLER. *The Formation of Federal Indonesia, 1945–1949.* Pp. x,

472. The Hague: W. Van Hoeve, 1955. 15 *Guilders*.

Professor Schiller, already an authority on the customary law (*hukum adat*) of Indonesia, planned to visit Holland and Indonesia in the spring of 1949 in order to study developments in the law during the Japanese occupation and the postwar period. Even before leaving Holland, it was becoming evident that the available materials were too scanty to make such a study successful and this was confirmed after his arrival in Indonesia.

Professor Schiller found, however, that there was a great deal of interest in the nature and structure of the future state of Indonesia and that the moment was ripe "to undertake the study of a state in the process of its establishment." The final steps were being taken which would culminate on December 27, 1949, in the establishment of Republik Indonesia Serikat, the federal Republic of the United States of Indonesia. A unique opportunity was indeed presented to trace the development of the federal idea and of its progress toward fruition in the years since 1945.

History records that the resulting federal state was of very short duration. Coming into existence with some twenty federated units, the number was reduced by merger to four within as many months, and the whole experiment collapsed with the creation of the unitary state of Republik Indonesia on August 17, 1950. History may decide also that federalism did not reflect the wishes of the people and had little correspondence to the realities of the existing situation.

All this does not detract, however, from the genuine value of Professor Schiller's work. He has analyzed with painstaking industry a tremendous mass of documentary material and has assembled his conclusions methodically and with meticulous care. In the result he has been able to present a study of central and local governments, of the distribution of powers, and of the administration of justice which will be of major interest to students of Indonesian history and political development for a long time to come. Parliamentary elections are to be held in Indonesia in September, and plans are being made for a constituent assembly which will be charged with the drafting of a Constitution to replace the provisional document signed in August, 1950. The influence of the federal period on the structure of Indonesian government, already far from inconsiderable, may prove yet to be of even more significance.

RUPERT EMERSON, and others. *Representative Government in Southeast Asia.* Pp. vii, 197. Cambridge, Mass.: Harvard University Press, 1955. (Issued under the auspices of the Institute of Pacific Relations.) $3.50.

Professor Emerson's discussion of representative government in Southeast Asia is informative, judicious, and timely. He is less concerned with governmental forms than with the ability of citizens of high or low degree to make their voices heard on public affairs and to regard their governments as neither remote nor alien, but rather as a living process in which all can participate on equal terms. He examines the situation in terms of conditions prevailing locally. In separate chapters, Willard Elsbree covers the Philippines, and Virginia Thompson local government.

Democratic institutions on the Western pattern are alien to the traditions of Southeast Asia. Even at the village level, where considerable self-government once prevailed, political vitality stemmed not from any atomized individualism, which equated all men's votes, but rather from a highly structured social order now sadly in decay. The governing policies of the prewar colonial regimes afforded little training in representative government save for a beginning made in the Philippines, and Burma's brief experiment with self-rule. Japanese conquest aborted all European plans and stimulated nationalism rather than democracy.

Professor Emerson stresses the encouraging postwar vogue among nationalist elite groups in support of constitutional forms. He explains it in terms of prewar struggles for greater democratic privileges which were regarded as touchstones of political progress and independence. He suggests that if current democratic tendencies represent nothing more than the inertia behind such long-deferred hopes, the vogue will inevitably disappear. But if democratic aspirations possess sufficient vitality to arouse among the people an appreciation of their worth, and if governmental leaders are willing to risk the fate of their pet development schemes and their personal roles by staging free elections, then democracy can survive and grow. The prospects are exciting but not encouraging; short-cut totalitarian methods provide tempting alternatives.

Each country is examined in detail. The Philippines are making progress despite serious political problems, while Thailand is retreating in the direction of a military dictatorship. Burma's U Nu is committed to the principle of popular sovereignty, and his *Pyidawtha* self-help program has encouraging possibilities. Although Indonesia is challenged by political instability and separatist tendencies, President Sukarno, like Nu, is a staunch advocate of the democratic creed. The politically bankrupt Bao Dai regime in Vietnam cannot even enlist nationalism to stem the Communist tide much less develop a democratic governmental structure. Malaya is trying to be born as a state outside the matrix of nationhood.

The authors are undogmatic and designate many topics calling for more detailed study, but they are abreast of present knowledge and deserve a wide hearing.

JOHN F. CADY
Ohio University

VIRGINIA THOMPSON and RICHARD ADLOFF. *Minority Problems in Southeast Asia.* Pp. viii, 295. Stanford, Calif.: Stanford University Press, 1955. $4.00.

The events of World War II and its aftermath in Southeast Asia inevitably conspired to rouse into active turbulence all the issues concerning minority groups and peoples which could lie largely dormant and concealed in the calmer prewar period. The Japanese occupation, the return of the white man, the independence of India and Pakistan, the Communist take over in China, and, perhaps most significant of all, the flowering of passionate nationalisms, all worked to sharpen the distinctions and multiply the tensions which must unhappily play so great a role in the future of this part of the world.

It is to these events and problems that Virginia Thompson and Richard Adloff have addressed themselves in the latest of their contributions to the literature of Southeast Asia. With only occasional reference to the remoter past, they have concentrated on the developments of the last couple of decades and have brought their study as far up to date as the last minute news reports would allow. Although they have necessarily done some picking and choosing among the minorities with which they deal, on the whole they have given a broad interpretation to their theme and include much valuable material and comment on the contemporary state of affairs —as, for example, in relation to the activities and attitudes of India and China and the politics of Southeast Asian countries— which a narrower reading of their task might have excluded.

Nearly half the book is taken up by the first two chapters which deal respectively with the Chinese and Indians, both in general in the region and on a country by country basis. Here, as in their conclusion, the authors draw a sharp distinction between the Indians, whose numbers and economic importance have declined in Southeast Asia since the war, and the Chinese who, despite severe immigration restrictions, have forged ahead on both these scores as well as in political significance. The contrast is heightened by Nehru's conciliatory policies as compared with the more aggressive pressures of the Chinese Communists who have, the authors assert, organized the machinery for dealing with their overseas brethren on a far bigger and more efficient scale than did the Kuomintang.

If the over-all outlines of the Chinese and Indian story are reasonably familiar, newer ground is broken in the chapter called "Buddhists vs. Buddhists," which delves into the frequently obscure recent history of Cambodia, Laos, and adjoining areas which only rarely catch the head-

lines. This chapter also has a useful bringing together of materials concerning the alleged plans of Communist China to penetrate southward, particularly through the utilization of a new and loose concept of the Thai people which offers the possibility of a large-scale reconstruction of much of mainland Southeast Asia.

Among other minorities which are dealt with are Eurasians and Christians. As is all too often the case, it is to be regretted that there is no map.

RUPERT EMERSON
Harvard University

ALLEN S. WHITING. *Soviet Policies in China, 1917–1924.* Pp. x, 349. New York: Columbia University Press, 1954. $5.50.

Mr. Whiting's scholarly contribution to the Studies of the Russian Institute of Columbia University is an important guide through the complex relations that developed between the Soviet Union and China in the period between the October Revolution (1917) and the conclusion of the basic treaty establishing diplomatic relations and settling other contentious issues (1924). As its title suggests, the study is developed from the point of view of Soviet policy and interest with respect to China, and the principal sources of information are Russian-language materials.

Although he handles his facts most scrupulously, Mr. Whiting correctly emphasizes that "it is not the facts but the way in which men view them that conditions policy." Consequently, in searching for an understanding of the motivations of Soviet policy in the early years, Mr. Whiting points out that "far from being monolithic, the Soviet structure of the early twenties presents a fascinating picture of clash and conflict, rooted both in theoretical differences and in political intrigue" (p. 9). His interpretations of theoretical questions and his appreciation of complex political forces and motivations show that Mr. Whiting has fully mastered his subject; and his book is skilfully and sensitively written.

The shift in Soviet policy from doctrinaire rejection of the Tsarist heritage to a calculated defense of some of the imperialistic spoils of Tsarist policy is reflected in the repudiation, in 1920, of Karakhan's pledge of the previous year to return the Chinese Eastern Railway "without compensation of any kind" (July 25, 1919). Mr. Whiting sees in this repudiation an early example of the tendency of Soviet leaders to give higher priority to defense of the interests of the "Socialist fatherland" than to the advancement of world revolution. Much of his story concerns the efforts of the new Soviet leaders to develop imperialistic aspirations at China's expense, especially after 1921; and Mr. Whiting helps to demolish some of the myths that have developed around the notion of Soviet disinterestedness. He draws the conclusion, well established by the documentation, "that Soviet intentions in 1917 and Soviet pledges in 1919 proved inoperative once Russian power became established in the Far East" (p. 251).

Los Angeles

MICHAEL LINDSAY. *China and the Cold War: A Study in International Politics.* Pp. xv, 286. Melbourne, Australia: Melbourne University Press; New York: Cambridge University Press, 1955. $3.75.

This rare, thoughtful book will come close to making conservatives and Leftists in the United States agree on the developments which have taken place in the last six years on mainland China. The book is closely reasoned and is based on the author's firsthand experience of Chinese life, almost unparalleled among our American China experts. Lord Lindsay was—and to some degree, still is,—a sympathizer with the Chinese Communists, but he is an honorable and a rational man first and foremost; his sympathies are therefore transparent and candid; his arguments are addressed to the timeless best in the Western mind; he explains China with a love for the Chinese and, more importantly, with a respect for the intelligence and reasonableness of the human brain.

It can even be said that Michael Lindsay is an odd bird, one of those uncommon Englishmen who range far places and then speak their heartfelt version of the truth, despite the noble threat of death or the subtler, nastier threat of unpopularity. Lindsay knows that he is talking to Americans and to Britons, so that his book amounts to an explanation of the Communist system in mainland China, written by a man who has been the friend of Mao Tse-tung and who knows both China and Communism well enough to explain the tremendous price which the Chinese are paying for Communist rule.

What is the price? Totalitarianism.

The Chinese have fallen victim to an Orwellian *1894* already. Lindsay says, "The only hopeful feature of the situation is the possibility that a high proportion of the Communists are more irrational than fanatical—that for possibly a majority of Communists the drive for power is not an ultimate objective but the result of irrational behavior produced by a faith in Marx-Leninism" (p. 142).

In order to explain Chinese Communism, Lindsay had to explain the lodgment which this movement had in his own sympathies. His chapter, "An Analysis of Communism," is a rebuttal not only of the Chinese version but of Marxism-Leninism (pp. 66–99). It makes this the only birthday present which an American Right-wing millionaire could give his son one week after the son joined the Communist party. Lindsay comes close to making words hold to their meanings, despite the distortions of our "cold war period."

The fifteen chapters are much more a series of brilliant essays than a presentation of mere fact. It is possible to get good compendia of facts on China, thanks to W. W. Rostow and a few others. First-class thinking on China, combined with first-hand comment, makes this book first-rate reading for anyone who wishes to review China and Communism from the ground up.

The Korean War, the nature of Communism in general, Chinese Communism in particular, the chances of peace, a modest and rather British program for peace, the Communist "peace" campaign, and comments on the psychology of modern politics make up this brilliant and unusual book. Few American readers will agree with everything in this volume; all the intelligent readers will enjoy it thoroughly.

PAUL M. A. LINEBARGER
School of Advanced International Studies
of the Johns Hopkins University
Washington, D. C.

SSŬ-YU TENG and JOHN K. FAIRBANK, with E-TU ZEN SUN, CHAOYING FANG, and others. *China's Response to the West: A Documentary Survey, 1839–1923.* Pp. ix, 296. Cambridge, Mass.: Harvard University Press, 1954. $6.75.

For those who are interested in intellectual history this book is a brilliant combination of commentary and documents on nearly a century of Chinese thought. It is the first attempt to give a connected and illustrated account of a subject which has been far too long neglected. In doing so the authors have drawn upon most of the best scholarship in America, but they have themselves woven the contributions of others into a meaningful pattern.

The two main authors of this book, John K. Fairbank and Teng Ssŭ-yu, have selected for translation some sixty-five documents which they have spread over twenty-eight chapters. These documents are designed to bring out the main lines of thought of China's traditional and modern leaders in their efforts to understand and to adapt themselves to the West. The book covers a period which begins with the Opium War and ends with the entente between the Nationalist party and the Soviet Union in 1923. Communist China is beyond the scope of the volume but the authors rightly claim that "modern China, including the communist rise to power there, can be understood only against the background of its contact with the West." The first two chapters, which contain an excellent discussion of the main elements in the Chinese intellectual tradition, bring the reader up to date for the opening documents which deal with the recognition of China's need to know the West.

Short but highly useful introductions precede the other main sections of the book—the documents illustrating the desire for western technology, the efforts at self-

strengthening, the reform movement of the end of the century, reform and revolution (1901–12), and the ideological ferment (1912–23).

China was for long the center of the Far Eastern world and resisted change longer than any other part of it. When the old moral order collapsed it collapsed entirely. The reader of this book will see the process of change through Chinese eyes and Chinese social and political institutions. He can hardly fail to realize that it is as difficult as it is important for the members of one society to understand those of another.

GEORGE E. TAYLOR

University of Washington

MOHAMMED NAGUIB. *Egypt's Destiny.* Pp. 256. Garden City, N. Y.: Doubleday and Company, 1955. $4.00.

Egypt's former President reveals more than his views on his country's destiny in this thoughtful book. He provides an "inside" view of the 1952 coup, which ousted King Faruk and established the régime of the Council of the Revolution, gives a detailed account of the work of the new rulers, and sets forth his own views on the causes leading to the conflict that resulted in his being deprived of his posts as Prime Minister and President.

General Naguib concurs with the opinion that the weakness of the royal regime was displayed for all the world to see in the Palestine war of 1948, after the establishment of the State of Israel. Knowing about the weakness of his country under the incompetent and utterly corrupt royal regime, Naguib did not wish Egypt embroiled in open warfare. He recommended Egyptian guerrilla operations in support of what he calls the Palestinian-Arab resistance movement. However, Farouk and his court *camarilla* decided on war. They made fabulous profits on buying inferior arms abroad and selling them to the government at high prices.

The King was mistaken in his belief that in Egypt the monarch was above the law of common decency. Officers who saw what was going on were paving the way for a coup. General Naguib was sympathetic with the aims of the young officers' group which needed him because of his more mature age and high reputation.

Faruk was so immersed in his dissolute ways that he had no inkling of what was going on in the young officers' quarters. Then, when the movement reached the boiling point, he hoped that the British would save him on the ground that a revolution might jeopardize foreign lives. Whatever Downing Street may have had in mind at first, it did not fall in line with Faruk's hopes. There is a strong hint in Naguib's book that the American Ambassador in Egypt, Jefferson Caffery, played a significant role in the revolutionary days. The Ambassador seems to have been in close touch with the British and he was also interested in saving Faruk's life. Only a few hours were available to the King to leave for exile, long enough for him to have more than 200 pieces of precious baggage collected.

Rid of the King, the council acted with dispatch. Two items headed its list of the most urgent tasks: the Suez Canal and land reform. The British were made to evacuate Suez and thus terminated a long period of foreign rule in the land of the Nile. The agrarian reform was urgent as an earnest of the government's intention to solve the peasants' problems. Because of the shortage of available land, however, not too many of the *fellahin* will be able to obtain land, Naguib states.

The conflict within the revolutionary council is described by the General as due mainly to disagreements on tactics rather than questions of broad policy. Abdul Nasser, who is at present Egypt's strong man, "believed, with all the bravado of a man of thirty-six, that he could afford to alienate every segment of Egyptian public opinion, if necessary to achieve our goals." On the other hand, Naguib wanted to keep the bridges open to the other side.

A comparison of this book with Nasser's slender volume, *Egypt's Liberation,* published simultaneously in this country, is rewarding. While Naguib has his biases, he does give the impression of a mature, even though not a strong, person. Nasser, on the other hand, appears to be more a philosophizing secondary school student than a statesman. The juxtaposition of these personal testimonies prompts at least one reader to wonder whether Egypt can be well served by the post-Naguib regime.

EMIL LENGYEL

New York University

EMANUEL RACKMAN. *Israel's Emerging Constitution, 1948–51.* Pp. xvi, 196. New York: Columbia University Press, 1955. $3.00.

Israel's Emerging Constitution, 1948–51 —written by one who has been trained in law, political science, and rabbinical studies —is the first comprehensive study of the constitutional developments in the State of Israel. It serves the useful purpose of providing, in summary fashion, the essential facts respecting the legal situation in Palestine before the establishment of the State of Israel; the complex, and in many ways obnoxious, partisan and ideological differences among the citizens of the new state; the reasons for the failure to adopt a written constitution, despite the United Nations General Assembly resolution of November 29, 1947; the constitutional principles that seem to have emerged through legislation and other official actions since the organization of the Constituent Assembly early in 1949; and the problems relating to the role of religion.

Dr. Rackman finds that the religious issue is the principal cause for postponement of the drafting of a written constitution; for the extreme orthodox say there is no need of a constitution, since the Torah must serve as the law of the land, and the other religious groups "are neither united nor even notably respectful of each other's point of view." The religious differences are reflected in the rife partisanship that divides the voters into many parties. The author's conclusion is that most of the faults found with Israel's unwritten, emerging, makeshift constitution "are due to the multiplicity of political parties, the mutual hostility and suspicion of the parties, and the perpetual domination of the parties by their leaders." Many things in the book confirm the judgment of Macaulay that where factions predominate, a politician considers, not the whole people, but only his own section of it, and the rest are to him strangers or enemies.

The author writes with commendable restraint, and succeeds in giving a factual statement of the important events and issues. He grinds no partisan axe, though he must have been often tempted to take a position and to speak out hotly on one side or the other of a vexed issue. His book fills a real need.

MILTON R. KONVITZ

Cornell University

CYRIL S. BELSHAW. *Changing Melanesia: Social Economics of Culture Contact.* Pp. x, 197. Melbourne, England: Oxford University Press, 1954. $2.30.

Cyril Belshaw is both an economist and anthropologist by training. He has also served as a government administrator in the Solomon Islands. He has, therefore, an excellent background for the task undertaken in this book: an examination of economic change in Melanesian society as a result of European contact. The result is a valuable contribution.

For one thing, Belshaw presents us with an excellent review and analysis of the nature and effects of European contact on Melanesian life from the time of initial exploration in the Pacific on down through World War II. In doing so he is especially concerned with resulting changes in the wants of native Melanesians, in their relationship to their natural resources, and also in their capital equipment, incentives to labor, property organization, methods of production and distribution, and systems of exchange. He concludes that native economic life has changed less than might be supposed, and far more in the area of wants than in the structure of economic relationships.

Secondly, Belshaw outlines a tentative theory of socio-economic change, pointing up major problems for future study. He offers a useful framework within which to evaluate specific instances of such change. Indeed, he manages to combine economic and social anthropological concepts in a way which this reviewer finds very satisfying. Anthropologists can learn how economic theory can be applied with great force to problems of acculturation. Economists can learn how their concepts properly apply to so-called primitive societies

and discover implications for the future development of economic theory.

The book closes with some suggestions regarding the practical implications of Belshaw's theory for administration. In this regard, his discussion of efficiency (pp. 150–52) is an important contribution. He distinguishes between four not necessarily compatible types of efficiency: *technical,* which is the "relation between physical output and physical input alone"; *financial,* "which resolves into the ability to make a monetary profit"; *social,* which is the degree to which people are able to achieve the values which they happen in fact to hold; and *welfare,* "the degree to which, or the cost at which, the society achieves not its own existing ends, but its own ends plus a minimum standard of living defined by the welfare worker." Inasmuch as administrative programs are normally concerned with increasing what may be regarded as the efficiency of some aspect of local life, it is obviously important for administrators to keep clearly in mind just what kind of efficiency they are concerned with and how it relates to improvement in social efficiency as here defined.

While anthropologists, economists, and administrators will all find this an informative and readable little book, its usefulness suffers for the lack of a detailed analysis of change in any one society. This deficiency is remedied if one reads it in conjunction with Belshaw's short monograph *In Search of Wealth* (Memoir No. 80 of the American Anthropological Association, 1955).

Belshaw succeeds in approaching the subject of culture-contact in Melanesia without being carried away emotionally by its more sordid aspects. It is refreshing to find the effects on native life of sandalwooders, missionaries, blackbirders, and traders the subject of cool appraisal and dispassionate discussion.

WARD H. GOODENOUGH

C. GROVE HAINES (Ed.). *Africa Today.* Pp. xvi, 510. Baltimore, Md.: Johns Hopkins Press, 1955. $6.00.

The wrapper advertizes this book as "up-to-date, comprehensive, authoritative." It may be redundant to say that Africa is a continent of diversity for "continent" connotes not only enormity of size, but variability of peoples and habitat. However, it is this diversity which is the stumbling block to a survey of the area, for no individual can know all regions intimately. There are two ways of meeting this problem; an individual author may strive to extend his understanding or a group of experts may be assembled to pool their knowledge in a single volume. On a journalistic level the first approach is possible, but on a social science level, the second approach is almost mandatory. *Africa Today* illustrates the difficulties of the second approach. It is mainly a problem of integration.

"Up-to-date" generally means inclusive of recent developments, but in Africa there are many things that are as yet unknown, so that it sometimes means to know the points on which the experts still have inadequate information. In the first sense the book generally fulfills its promise and the second is referred to by M. Henry and discussed by Miss Ady, in regard to her own specialty of economics, in what seems to me—a noneconomist—an excellent article.

"Comprehensive" likewise can have alternate meanings. Is the book intended to be comprehensive in regard to areas or topics? In the latter respect it is quite comprehensive, but in the former respect it is not completely so. Munger explicitly limits himself to "sub-Saharan" Africa and most of the other contributors do so implicitly, but Robinson's exhaustive article on French Africa includes the North. Only the Belgian Congo and the Union of South Africa have an article devoted exclusively to each; all other areas being considered either as parts of regional or administrative groupings or by implication under the various topics. As usual, the Portuguese, Spanish, and independent areas are the most neglected. The aspects that are considered are the historical, military, ethnological, political, religious, educational, commercial, and industrial.

The differences between these fields of specialization are so great that any comparison of articles would be largely personal and invidious, representing attitudes toward the different fields. However, it must be recognized that the caliber is uneven. The forty contributors comprise a large proportion of the American experts on Africa plus a sprinkling of overseas *conoscenti* (but there are a few whose reasons for being included are not clear). There is a courageous and laudable mixing of "practical" and "academic" people. Each article is followed by a commentary which is an excellent device that might have been used in several ways. Cross-discipline stimulation could have been provided by this means, but was apparently not sought, nor was it used to provide the assessment in social science terms of the other contributions; one might have expected, for instance, to have a sociologist comment on the missionary's account rather than a recapitulation of the same by another missionary. Sir Philip Mitchell's article also goes crying for comment.

The appearance of this book is another milestone in the growing interest of Americans in Africa and is certainly to be welcomed; its shortcomings are due to the immensity of the subject matter, and the former neglect in this country of African affairs.

EARL GRANT HARRISON

1899-1955

On July 28, 1955, Earl Grant Harrison, member of the Board of Directors of the American Academy of Political and Social Science, was stricken suddenly by a heart attack.

Mr. Harrison had a distinguished career as a public servant and as a private citizen. He was director of alien registration, United States Department of Justice (1940–41); special assistant to the Attorney General of the United States (1941–42), and United States Commissioner of Immigration and Naturalization (1942–44). Later, he served as the United States Representative on the Intergovernment Committee on Refugees (1945–46) and as vice-chairman of the President's Commission on Immigration and Naturalization (1952).

In his home city, Philadelphia, he served his community in many ways. From 1936 to 1943 he was president of the Public Charities Association of Pennsylvania, and since 1939 he had been vice-chairman and then chairman of the Philadelphia Award Trustees. At the University of Pennsylvania, where he received the degree of bachelor of arts in 1920 and of bachelor of laws in 1923, he served at various times as instructor, professor, and dean of its Law School, as a vice-president of the University, and as a member of its Board of Trustees. Since 1948 he had been a partner of one of the city's most prominent law firms.

Mr. Harrison was an administrator of extraordinary ability, he freely gave of his time and effort to many worthy causes, and his friendship was treasured by all who were privileged to enjoy it. By his death the Academy has lost a warm friend and wise counselor.

FOREWORD

Public education has experienced a striking development in recent years. The increase in the number of children has necessitated large expansion. Development in other ways has been even more significant. Increasingly, as the problems of society have mounted, public education has been required to assume more responsibility for the growth of children and youth through an almost limitless variety of learning experiences. It is society's most consciously conceived instrument to strengthen the individual and to improve community life.

The problems of modern society—the unmet needs and tensions—have also demanded the provision and rapid expansion of other public services. Public interest in land use, housing, public health, social welfare, youth services, and other public services has increased sharply. In many of these areas there has been an awakening in recent decades comparable to that experienced in public education a century ago. Many of these developments have large significance for the development of children and youth.

It has been said that each child attends two schools: his home and his school. Perhaps it should be said that each attends at least three schools: his home, his school, and his community.

With the increase in the number of agencies concerned with children and youth, and with the growing size and complexity of schools, school systems, and other services, the problem of the co-ordination of effort emerges. It demands new approaches. The more adequate provision for the growth of children and youth is a major challenge to our society. It cannot be met by any one agency alone.

But how shall co-ordination be effected? Is there a danger that it may result in conflict and reduction in the exercise of initiative? How can various agencies come to understand the role which each can play most effectively? Can an agency serve its primary purpose as well (or better) while co-operating with another public service? Are changes in governmental policy, structure, and organization needed? Is the problem largely one of developing understanding among various professional staffs? What is the level of public opinion and action? Can the "conflict" among services be reduced or eliminated, to the desired enrichment of all through co-ordination? In the long run will the administrative "independence" which our society has granted to public education give it greater strength? In an increasingly complex society is such independence more necessary or less so? Should the agency which co-ordinates also administer?

To these questions, which concern men of many nations, this issue is addressed.

THEODORE L. RELLER

Changing Scenes—Changing Issues

By THEODORE L. RELLER

FOR more than a century, the people of the United States have been studying and experimenting with a variety of arrangements pertaining to the relations of public schools and other governmental departments and services. Practices have varied widely over the years and among communities at any given time. On the one hand, education has been seen as an integral part of local government. In New England, for example, the Education Committee was a committee of the town responsible to the town either through the town meeting or a town governing body. Under these circumstances, education was considered in relation to other town services and seen as one of the services without notably exceptional features. In fact, the construction and maintenance of buildings, the levying of taxes, the development and approval of the budget, were in many instances not the responsibility of the Education Committee but rather of the governing board of the town. This resulted in costly conflicts and delays. As the educational program developed, it became so large in many towns that the Education Committee was granted greater responsibilities and a greater measure of independence of action in regard to all matters pertaining to education. Education became the largest of the responsibilities of the town. At about the same time, there was a growing recognition of the importance of education in the society, with emphasis upon the desirability of having it set up in such a way that it would be in the direct control of the people, with little or no responsibility to other local governmental bodies.

Thus there developed the Board of Education with large responsibilities and powers conferred upon it by statute. In its "best" form, this Board of Education had no direct relationship to the city government or to any other local governmental body. It levied taxes, employed personnel, secured land, and constructed buildings, and under either direct or implied statutory powers did anything necessary to maintain schools. In many communities, education has never had this measure of independence. But educators have generally sought it while political scientists have tended to question its soundness. Various studies conducted in this field have not offered a conclusive answer to the issue. In the meantime, changes have been occurring in society as well as in education and in other public services, and it is therefore believed that the present is a most opportune time to re-examine the problem in at least some of its many phases.

At the present time, established administrative structure and the informal arrangements existing between agencies and their staffs vary widely from state to state. Mere fiscal dependence or independence of schools, for example, does not necessarily tell much of the story regarding the extent to which there is co-ordination of effort on the part of educational and other public service agencies. The problem of co-ordination to be considered here is, therefore, deeper than—though not unrelated to—such matters as established governmental structure and finance. It certainly involves, also, public opinion and the views of the professional groups involved.

PREMISES

This issue of THE ANNALS was not planned to cover all phases of this exceedingly large and complex problem. It concerns itself with: (1) education at the elementary and secondary levels; (2) governmental services directly related to individual and community development, such as health, welfare, libraries, land use and housing, and delinquency control; and (3) services provided rather than details of program and methods of any of the agencies involved. It does not explore directly or in detail such important problems as the relation of public educational services and the military; fiscal dependence or independence and related financial matters; the curriculum as it facilitates community development; the exact arrangements between the city or other local government bodies and the board responsible for education. The volume is fundamentally pointed toward the problem in the United States. Although it gives attention also to other societies, it does so primarily in an effort to find new, different, or additional possible approaches to a solution of the problem. It involves the viewpoint of educators but especially looks at the problem from the point of view of those who are students of or leaders in other areas. It aims to describe briefly better practices, to isolate and explain problems and issues, and to evaluate in broad terms. It does all of these things in an effort to stimulate further thinking and study concerning the problems of co-ordination and to point to potentially promising future developments.

In developing this series of papers a few general assumptions have been made, as follows: (1) The co-ordination or perhaps even the integration of the efforts of those responsible for public services which impinge directly upon the development of children and youth should contribute to the effectiveness of these services. (2) Each agency, organization, or service involved has certain responsibilities and competencies, some of which may not relate directly to children and education. (3) The co-ordination or integration which is achieved should not interfere with the discharge of the various responsibilities of the respective agencies but rather should facilitate meeting them. (4) Significant improvement can be effected in the working relationships of those public agencies in our communities which have a responsibility for the development of children and youth.

EARLY FORCES STIMULATING SEPARATISM

In order to understand the situation existing today it is necessary to look briefly at some of the forces or factors which influenced the developments that occurred through a century. Among the more important of these are the following:

Public education developed earlier and more vigorously than most of the related services. The great awakening in regard to public education occurred in the first half of the nineteenth century. This was almost a century earlier than the public awakening concerning such matters as land use, housing, and public health.

Public education was considered imperative if the new republic with a strong democratic faith was to carry forward. The early leaders of the nation emphasized the relationship between an educated people and a free government conducted by the people. The importance attached to education is shown also by the attitude of the federal government in the development of the great public domain—the land in the West. The policy which was established prior to the adoption of the Constitution and which persisted was to

set aside large acreages for the establishment and the endowment of public schools.

There was a strong desire to have the schools close to the people and not too readily responsive to those in positions of influence and power in government. The significance of education for the development of the state was not underestimated; rather, popular control was intended to ensure an educational program which would provide a basis for a more perfect union rather than for the enhancement of the power of any one group, including public officials. It was an early attempt to find an answer to such questions as: In whose interest shall the schools be operated? May schools be used to contribute to the improvement of the society and its government or are they the instruments of those who govern or of government? Probably partly as a result of European backgrounds but perhaps even more as a result of the independence men found in America, especially as they moved west, the people were desirous of keeping the schools directly responsive to them. The remoteness and relative security of our new continent also made it unnecessary for education to be a direct instrumentality of the state—and, of course, much less so of those governing. The "climate" encouraged belief in the perfectibility of man and of society, and education was among the leading instruments utilized in the pursuit of this faith.

Local government was believed to be "corrupt," and many people wished to remove the schools from this corruption. The last half of the nineteenth century was a period in which corruption was rampant in the governments of many American cities. "Boss" rule was widespread, and the only direct escape from it appeared to be the removal of vital services, such as education, from the control of city government. The elimination of corruption was seen as a task which would involve many years—years during which education should be carried on apart from local government.

Education came to be regarded legally as a function of the states. This was less true, formerly, of social welfare, health, recreation, libraries, and some other matters, which were viewed more generally as the responsibility of local government, since they were considered services less vital than education to the continued existence of the state. The legal concept that education was a function of the state supported those who were anxious to eliminate local governmental control of education because of corruption: it was argued that the state should establish separate and independent local Boards of Education to provide and maintain the educational service. Conceivably the local government could have served the state in the educational field—though this arrangement would probably have been more involved because of the many other powers of the local government. The creation of the local Board of Education ensured direct action within limits prescribed by the state.

LATER DEVELOPMENTS

In the early years of the twentieth century, the clear and complete separation of education from all general local government control was widely accepted in the educational world as a satisfactory solution to the question under consideration. Though separation in administrative structure did not deny the desirability of co-ordination of effort between the educational system and other agencies, there can be little doubt that it did not encourage co-ordination. Yet almost as this solution was coming to be accepted in theory, and increasingly also in practice, a series of new forces appeared to disturb some of

those who believed they had "found" an answer. Among the forces which challenged the pattern that had been developing were the following:

The society was characterized by increasing urbanization, growing complexity, and more governmental action. Urbanization and industrialization brought new and difficult problems. The interrelationships between various social and economic policies and practices became clearer. Governmental action was demanded and provided on an ever increasing front. Relatively, education may have commanded considerably less of the thought devoted to public-service issues than at an earlier date. It became increasingly doubtful whether any service could stand alone effectively in such a complex and interrelated society.

Schools came to be more concerned with their potential impact upon society. They gave more attention to the conditions under which people lived, and to the problems of individuals and of the society. One important test of the effectiveness of the school became the contribution which it made to the improvement of community living. Thus schools directed more attention toward problems of government, concerned as it was with housing, health, delinquency, employment. This movement or expression of interest raised the question as to whether schools should not work more closely with other governmental agencies concerned with the same problems. It was clear that the activities of schools were inevitably closely intertwined with those of other agencies.

The society was confronted with problems pertaining to children and youth with which no one agency could cope effectively. Juvenile delinquency, the result of a vast complex of factors, was obviously a challenge to the whole society and to many of its institutions. No agency alone could hope to prevent or eliminate it. The schools inevitably had a large role to play—as had other public services.

Expansion of social services

A number of the social services expanded in the first half of the twentieth century somewhat as education had in the nineteenth. Social welfare, health, land use and housing, were no longer solely or largely consigned to private action. They received public consideration. Programs of action by government at various levels were developed. While education continued to expand in the twentieth century, the "awakening" about it had occurred in the nineteenth. In the twentieth century a public awakening regarding other aspects of living led to public action—and correspondingly to an increasing "competition" for the tax dollar among the social services, and between the social services and the demands of preparedness resulting from international tensions.

Professionalization

With the expansion of the social services and in the light of the study of problems of local government, various governmental services were professionalized and greatly improved. The city manager contributed to the strengthening of local government as the city superintendent of schools had strengthened educational administration a half century or more earlier. Highly trained professional workers made their appearance in library service, social welfare, public health, and juvenile court service. Although schools and school people may well have hesitated to co-ordinate efforts with the earlier untrained "political" officeholders, this hesitation was now much less well founded. This is not to argue that all is well regarding the position of professional personnel in education or other service fields. It is, however, to recognize that the wide gap in professional standards of appointment and service was narrowing; in some cases even disappearing. The statements of the American Library Association on the need to defend freedom to read and to learn, the need to fight the book burners posing as superpatriots, might well have made educators proud to have been in their ranks. Professional development in a number of groups raised the question whether each could not achieve its purposes and responsibilities more significantly if it were working co-operatively with and supported by others who had common purposes and common problems. Too frequently various groups with common goals were unaware of each other's efforts and so could not strengthen one another in their common struggles as they should have. Professionalization tended to raise walls between groups.

How independent?

There was growing recognition of the fact that although formal organization was important, informal organization could be equally so, and that one type of organization had relatively little significance without the other. Thus it was clear that while schools were independent they were not nearly so independent as had been imagined. To preserve their independence, they sometimes avoided controversial or dangerous areas which they should have been considering. Their independence may thus have reduced their influence upon community living. Perhaps they were too far removed from the maelstrom of public debate for their own best development. Certainly many groups without legal control over the school system exercised large control over what was taught and how. Under the impact of congressional investigating committees, for example, some teachers avoided consideration of even such matters as the Bill of Rights, yet these committees have no formal organizational relationship to the schools. Here, then, was a difficult question. Was independence, though much less real than apparent on the surface, to be preferred to less formal independence and more public struggle regarding the place, character, and role of education in a democracy? Obviously not all had been gained through independence that had been hoped for. But did any other answer promise as much?

Difficulties of co-ordination

The principles of administration which were widely accepted led to difficulties in co-ordination of effort. Line and staff organization was generally accepted. The school administrator, as a result, saw the health and library service for the school child as his direct responsibility. The public health officer saw all aspects of public health, including school health if related to his department, as his direct responsibility. Thus, to have the lines of authority straight it appeared necessary to keep school health separate from public health—or worse, probably, to keep matters of school health, if under the public health officer, separate from health education. An organization that would fix responsibility upon the proper party, that would include the various interested parties, and that would not result in long delays in decision making was not to be formed readily. Was there a type of organization which could bring together essential resources in an effective service? Or was it necessary to continue to have a public library service and a school library service co-ordinated informally if at all?

Religious groups entered the field of education more than they entered other public service areas and sought limited

aid for their schools (or for the students in them) from noneducational services. The problem of achieving close co-operation among various publicly provided services was much complicated by this situation, for public schools were generally provided under laws specifying that the funds for them should not be used to aid private schools of any type, while funds for public health and social welfare, on the other hand, were allocated to these purposes and could be offered through private and parochial schools as well as through public schools. In some communities the city health department provided health services in the parochial schools while the public school health services were provided by the Board of Education. The co-ordination of these two health services, if effected, would have to be effected with care to avoid spending public education funds for private schools. Thus, the "aid follows the child" theory—or the desire to provide health services wherever needed—complicated the establishment of a co-ordinated or integrated school and public health service program.

State and local governments

The concept that education is a function of the state, and thus different from other public services, was held to less rigidly, and more attention was given to the partnership idea. Legally education remained a state function. In practice, however, probably as a reaction to the trend toward centralization which characterized many aspects of life, the view was held that the local education authority should be more a partner of the state and less a mere instrument of it. This development encouraged more local initiative and raised the question as to the manner in which the local partner could best play its role. It opened for consideration again the co-ordination of services at the local level. At the same time, state departments of education were attempting to develop programs in co-operation with a number of other state departments, such as highways, health, conservation, and libraries. Additionally, other services than education came to be more generally recognized as services for which the state had large responsibility.

Wider participation needed

Problems confronting the public schools and attacks made upon them awakened citizens to the need of having many more concerned and informed individuals give attention to public education. Merely to provide buildings and teachers for the greatly increased numbers of children and youth was an enormous problem. Even more difficult of solution were questions of curriculum arising from confusions in society itself on social and political issues, domestic and international. Under the challenge of Communism some wished to abandon traditionally democratic rights and procedures. In some instances groups sincerely trying to improve the schools were infiltrated by the insincere.

Many recognized that a promising reply to malicious and deliberate attack was the development of more fundamental understanding through wider participation in the planning of school programs and policies. This desire to include more people in educational planning raised again the question as to whether the independence of the schools facilitated the attainment of understanding and co-operation. Was it better to maintain the organization that had developed over the years and to provide by other means, such as citizens' committees, for the participation of more people? Or should the organization be examined with a view to developing a broader base and wider co-

operative action? Or were there other answers? Was it contradictory to be independent and separate and then to seek co-ordination of effort? Had the various other public services concerned with the development of children and youth played the role in the advancement of education that might properly have been expected of them? Or were they too often on the sidelines? If so, why?

FROM THIS EVIDENCE

These are some of the problems and issues which were the genesis of this issue of THE ANNALS. Answers to them are not to be found easily. Present forms of organization have developed through long years of experimentation and struggle. Are they adequate today? Do they need strengthening? Are there new roads worth exploration? In the chapters which follow, much evidence will be offered on present problems and the results of various attempted solutions. From this base, it is hoped, provision for the development of children and youth may be more effectively made—more soundly conceived and planned and more realistically financed. The values of a democratic society offer no alternative.

Theodore L. Reller, Ph.D., Berkeley, California, is professor of education at the University of California. He was for many years on the staff of the University of Pennsylvania. Among his writings are The Development of the City Superintendent of Schools in the United States (1935); Community Planning for Youth (1938); as coauthor, The Administration of American Education; and numerous articles in professional journals. He has served as consultant to or on the staff of commissions studying education in several states and in many cities.

The City Planning Process: A Framework for Community Education

By Francis Violich

THE city planning process is essentially a local governmental function which serves the purpose of co-ordinating and guiding the separate decisions which are made daily concerning the use of land in our urban areas. Its objective is physical growth in an orderly and functional arrangement reflecting the best interests and basic social-economic needs of the citizenry. Its principal instrument is the general or master plan, the community's own statement of a policy of development for the following decades.

Land as the Basis for All Community Activities

The very existence of this service and its rapid development during the last twenty to thirty years are based on a concept which should be clarified at the outset: that land is a basis for all community activities and that the way in which urban land is used has a direct effect upon the way a particular social group functions. The physical relationship between lands used for various purposes can limit or encourage most forms of human enterprise. Education is one of these activities, and it can be directly affected for better or worse through such physical factors as location of the facility in relation to users, the amount of land set aside, and the timing of construction in relation to other community needs. Without the land itself, and with any of these conditions lacking, the ability of the educational plant to serve human needs is impaired. Viewed in this light, city planning is essentially community planning. No other governmental service has this especial assignment.

Independent Decisions on Land Use

The basic problem behind providing land for needed community purposes in the proper physical relationship is essentially one of co-ordinating numerous independent decisions. We know how relatively simple it is to plan a home, or a school, or a church, where ownership is under one authority and where conditions are controlled by a unified group responsible for all policy questions. In planning a city, or even a small town, we have a far more complex situation. Each day many hundreds of decisions regarding physical change of the city have to be made by a wide variety of owners of land—private individuals and firms, semipublic organizations, government at various levels. Private owners of land, for example, decide to open and close shops and stores and to build whole new shopping centers; building firms decide that homes will be built in a certain area and initiate the subdivision of land; investment companies are at work deciding on the location of new industries and the provision of related utilities, railroads, and the like. Semipublic owners of land are likewise constantly in the process of making decisions regarding the location of churches, institutions, and similar community facilities for which they are responsible. In the public realm, city, county, state, and federal officials are daily considering what land to buy, what school, community center, recreation building, library, hospital, and the like to build. These officials are responsible for perhaps the most essential decisions, for they must decide on the routes for streets, highways, transit lines, and other lines of communication which serve to link the physical facilities built by private interests.

Key groups

Here are some of the key groups who are responsible for providing the physical components of our urban areas and whose daily decisions must be brought into a reasonable whole through the city planning process.

Private	*Semipublic*
Home builders	Church groups
Merchants	Institutions
Industrialists	Welfare agencies
Business firms	Hospitals
Banks	Improvement associations
Realtors	

Public	
Recreation and park departments	Schools
Public works	Fire departments
Public welfare agencies	Police departments
Public health departments	Traffic departments
Libraries	Housing, redevelopment, and renewal agencies

In any given community many more such groups could be added to the list. It is through the innumerable independent actions taken by these varied groups that our cities grow and are formed. As Miss Bauer points out in the article on "Housing Policy and the Educational System," this accumulative process is accentuated by the trend toward large-scale, long-term development fixing patterns of land use for all time with fewer but more significant decisions, and making advance planning by public bodies more imperative than ever before.

Growth of City Planning

City planning authority and techniques have developed steadily—and within the last five years rapidly—as a means of co-ordinating these many decisions which result in physical changes within and on the fringes of our existing cities. Most large cities now accept city planning as a function of municipal government, working under authorization by state enabling legislation in force in most states in the Union. These state planning acts were based on a Standard Enabling Act prepared by the United States Department of Commerce in 1928. The act [1] under which California operates, passed originally in 1929 and amended several times since, is one of the best in the country. This act permits cities to set up planning commissions and requires counties to do so; it provides the conditions under which city and county planning commissions may operate; it requires the preparation and adoption of comprehensive, long-term general or master plans; and establishes the general framework within which local planning may be done.

Municipal charters also provide enabling legislation and often establish more detailed or specific provisions related to the process of city planning. County planning is carried on in many states as an extension of county government, with authority only over the unincorporated areas. At the metropolitan regional level a few urban centers in the United States, such as New York, Detroit, and Los Angeles, have official or unofficial planning agencies. These, however, are generally inadequate, owing to the lack of a unified governmental base. At the federal level, legislation related to housing, redevelopment,

[1] Contained in State of California, Printing Division, Documents Section, *Laws Relating to Planning*. Sacramento (Calif.), 1953.

and public works recognizes local city planning processes and, in some cases, actually requires the existence of a planning program or master plan as a prerequisite for loans or grants.

Budgets for city planning in most large cities in the United States have been greatly increased over those of ten years ago. San Francisco, for example, which was spending some $50,000 per year in 1940 is now providing $150,000 for a well-staffed city planning department. Contra Costa County has increased its planning budget from about $60,000 to $175,000 per year during the past five years. The number of staff persons and consultant services has increased proportionately. The profession of city planning, which was established during the second decade of this century with the founding of the American Institute of Planners, has grown in size and strengthened itself in terms of city planning knowledge and experience. The Institute, which had about five hundred members just after World War II, now has a membership of about a thousand. California, long active in city planning, had some thirty-five members in this professional organization in the 1930's, about seventy-five in the early 1940's, and today has approximately three hundred members.

City Planning Procedures

These indications of the growth of the city planning profession suggest the increasing recognition of planning as a co-ordinating force in dealing with problems concerning the use of urban land. In this country the planning process is designed to reflect traditional democratic procedures in making important decisions affecting the public welfare. For this reason the work of a local city planning agency is basically advisory to the elected officials who hold final authority. A citizen commission is appointed by the city council, board of supervisors, or mayor for the purpose of advising them, and the commission is provided with a professional staff which offers technical study and formulates conclusions to serve as a basis for the lay commission's recommendations. Public hearings are required by law. Although this concept slows down the co-ordinating process considerably when urban growth is going on at a rapid pace and decisions have to be made in a hurry, the end result has many social advantages when it works. Obviously political factors may intrude.

The master plan

Assuming good local government and observance of democratic procedures, basic policy in this country is brought together by the city planning commission in the form of a general or master plan which shows the community's concept of the direction in which it should grow. The plan must look far into the future, yet relate to current needs; it must be based on study of the various alternatives which might be followed; and it must be broad, comprehensive, and flexible in order to meet all potential needs as they may develop. Specifically, the general plan would indicate a general pattern of land for residential, commercial, industrial, public, and other purposes, the network of circulation routes of various kinds, and the related terminals for them. The plan would provide a general range of population densities for the various residential areas and indicate limits for each area. In this way a total holding capacity for each portion of the community and for the city as a whole is established. The plan provides no specific program or schedule for the provision of facilities or the timing of development of particular areas, but rather presents the picture of the community as it might best develop—a large design the details of which can be developed little by little.

Since the general or master plan is to become an expression of public policy, it is essential that before the plan is finally adopted the wants and interests of the community be obtained and citizen participation secured through citizen advisory committees, public discussion prior to and during preparation of the plan, and the official public hearings required by law. In the past, adoption of the plan by the planning commission has been considered sufficient; more recent thinking, however, concludes that if the plan is not adopted by the legislative body it does not really become official community policy. In the City of Berkeley, for example, the first comprehensive master plan, completed in 1954, was adopted by the City Council in 1955.

Effectuating the Plan

Since the master plan is considered policy and not law, its effectuation must be brought about through various specific means. One of these is legislation in the form of zoning ordinances regulating in precise terms the uses to which private land may be put and the conditions under which it may be built upon, and subdivision ordinances which control the quality of land development for residential purposes as to lot and street pattern. Another means is the requirement that all public improvements, including acquisition and sale of land by any city department, be referred to the planning commission for its recommendation as to conformity with the general or master plan. This so-called "referral process" permits the legislative body to approve capital improvements only after having first received a recommendation from the planning agency. The plan is further effectuated through the urban development, public housing, and slum clearance programs described in the following article. Perhaps the most important factor in making the general or master plan a creative force in shaping the physical aspect of the city is public participation itself and the understanding it engenders. This fact is recognized in most planning legislation, which usually requires consultation with the public, calls for public hearings, and urges or makes mandatory public education programs related to the general or master plan.

The Long View

This brief review of the city planning process indicates the opportunity at hand to set forth community objectives as to the use of land, to determine the location and extent of such uses, and therefore to bring into focus community activities themselves. City planning has in this sense been playing a far more creative role in the last ten years than it did in the earlier periods, when the emphasis lay in making separate decisions on zoning and subdivision development without taking the long view of community needs as a whole. With this kind of planning proved inadequate, contemporary city planning has become a dynamic process.

Schools in the City Plan—Current Theory

Against this background of city planning practice, let us look at the way in which school planning fits into the picture. Most city planners base location of schools on the so-called neighborhood theory. This concept, put forth during the early thirties by Clarence Perry[2] and others, calls for the shap-

[2] *The Neighborhood Unit Plan: Its Spread and Acceptance.* Compiled by James Dahir. New York: Russell Sage Foundation, 1947.

ing of residential areas so that an elementary school is located at the center of each subarea, which in turn is planned to hold sufficient population to support the elementary school. The size of the subarea is based on a walking distance to school of not more than one-half mile, approximately. This measure provides also a convenient guide in determining land-use patterns, spacing of major and secondary arteries, and location of related neighborhood facilities such as recreation centers and shopping facilities.

Opponents of this theory have argued that from a social point of view such precise functional planning of areas can lead to a too neat and inflexible patterning of residents according to income and race. Even worse, the pattern would be reflected in the elementary school itself.

As an outgrowth of the neighborhood theory, planners have developed the concept of the "community," made up of a series of neighborhoods, served by a single high school or junior high school, and bounded by such primary barriers as freeways, major arteries, railroads, or geographic elements. While the neighborhood idea is based on walking distances, the community concept is based on travel by public transportation or car; location of the junior high school or high school central to a cluster of neighborhoods means that such "community-wide" travel can be done without passing through other neighborhood areas. This arrangement provides a framework for locating major traffic ways, transit routes, and related community facilities and, in fact, offers some of the advantages to be obtained from the self-contained small town with a population of some twenty-five to forty thousand. It may be argued that this "community" concept broadens the neighborhood idea and offers a basis for greater heterogeneity of population types. Certainly the school is a key element in each system.

Facilities of higher education such as colleges and universities and adult education facilities serving the city as a whole or possibly even the region would, according to this general theory of planning, be located in places between or central to communities; here also will be found other major institutions which serve the whole urban area, the central commercial sections, and the major public facilities and civic buildings.

These concepts provide a convenient general procedure to follow in integrating schools into the residential pattern. Population densities can be predetermined and held in place through zoning, total holding capacity calculated, and sufficient land for the needs of the population set aside in advance of development. Related community and neighborhood facilities can be located to form "focal points" of social activities, and street patterns can be laid out to foster their use and accessibility and to discourage through traffic foreign to local needs.

OBSTACLES TO GOOD SCHOOL PLANNING

This straightforward, theoretical method of planning schools in relation to the city as a whole is less simple in application, owing to a number of obstacles to good planning. We shall attempt in this section to consider some of them, and to point out problems which are not being solved and which are blocking proper co-ordination. In the solution of these problems the assistance and close co-operation of educational administrators are essential.

Schools must be paid for

One fundamental problem is related to the economic base of the community and its ability to pay for needed school facilities. Too often members of school boards and particularly citizens at large fail to see the relation between planning of education facilities and land-use planning for commerce and industry in terms of the quality and quantity of these uses for taxing purposes. A typical situation is one to be found in many of the newer residential suburbs in California, where the residents want good new schools but do not want any intrusion of industry or "heavy" commerce. They fail to realize that industry and commerce, properly located and set up with proper restrictions, can provide an employment and tax base by which first-class schools can be financed. In Davis, California, an essentially agricultural university town of some ten thousand population, older residents have opposed setting aside land for industry because of their desire to maintain the semirural environment. Newer residents, particularly those with growing families, are convinced that a large area should be set aside for industry and appropriate types of industry brought in, because they know that this industrial development will lead to better schools and better education.

On the other hand, a similar problem often exists in reverse, when major industrialists or downtown commercial interests oppose bond issues for schools on the basis that thrift is good public policy. These groups overlook the significant fact that if school standards fall the attractiveness of the community as a place in which to live and raise families diminishes, and that population which serves as a stable labor force and as a market for the products and services of business may go elsewhere in pursuit of a more favorable total living environment.

In both these examples relating to economic results of land-use planning, co-ordination between all phases of the development of the physical environment, the essence of the city planning process, is the key to community welfare.

Too many of a kind

Unbalanced population makeup is another important obstacle to proper co-ordination. For example, in Santa Cruz, California, a bond issue for schools failed to pass even though an almost desperate need for school-plant development existed and one school had to be closed as a hazard. The reason for the failure was the large number of older persons in the community who were retired on limited pensions and who had no interest in paying for schools. Whenever the population is composed too much of one kind or another, problems are likely to arise. In many California communities where zoning and subdivision controls set a pattern of similar lot size and dwelling units, the net result in terms of population composition is uniformity. A similar pattern of age groups prevails throughout the community, placing a major load on the school for children of a particular school age. As the children grow older a hiatus is left below and another crisis occurs at higher grade levels. Had there been established a more rational land use and density pattern, permitting or encouraging a wider range of dwelling types—from single-family, detached residences, owned by their occupants, to rented row houses and apartments—a more normal range of population groups would have resulted.

Where is the school?

The basic problem of co-ordination in physical terms is that of space. We have become so completely casual and unconcerned about the shaping of our urban areas that we allow all the land in new areas to be filled up by houses and stores and streets without carefully

thinking through in advance what land is needed for schools and other community facilities. The houses are built, the families move in, and then comes the realization that space is needed for schools. One way or another space is found, but not without certain losses. In a recent new subdivision in San Mateo County, houses were built and occupied during one summer; with hundreds of school children waiting for a desk and a teacher, some of the brand new homes had to be withheld from sale and converted into an elementary school by linking them with covered walks. In this instance a substandard facility was used. In other cases, a small site must be accepted; in still others, a site poorly located in relation to the service area or to other neighborhood uses requiring extended bus trips. Generally, sites secured as afterthoughts cost more. Sometimes existing schools must be overcrowded to take care of the new population.

Built but not planned

When we add subdivision to subdivision, school site to school site, we are in effect building a new city. Yet the resultant product is generally lacking in the element most characteristic of a city—that is, the focal point at which may be obtained a variety of services unavailable in rural areas. We allow ourselves to take second-rate sites for schools while good sense would tell us to take only the best for this important function. We miss the chance to relate residential sections and street routes with neighborhood and community facilities in a logical and functional whole. We are building, not planning, new cities, and they are formless. We are neglecting opportunities to use the school itself as the core of the central area of human activities, relating to it such other facilities as recreation, welfare agencies, clinics, churches, libraries, civic buildings, police and fire departments, parks, and shopping centers. This lack of imagination, of creative concern for the design of the community as a whole and of its centers, is a major weakness on the part of city planners themselves, to say nothing of school planners. Exceptions can be found: we have outstanding examples of collaboration in San Francisco's redevelopment program on Diamond Heights and in the Sunset Community Center.

Establishment of standards for space and location should lead to a concept of grouping of community facilities so that they relate to each other, mutually reinforce each other, and together form a core of community services. A community lacking a focal point for the various community activities cannot function fully as a community. The school is essential to this focal point, both physically and socially. California is becoming covered with residential areas which resemble miles of wallpaper unrolled over the landscape, a sea of rooftops, telephone poles, and television antennas unbroken by a recognizable place where community activities can take place.

The school in the community

The school in its central location, its central role in community life, is one of "the intangible instruments of community creation" referred to by Dr. N. L. Engelhardt.[3] Juxtaposition of the school and other community facilities may be an important way of assuring many community gains. Some of these gains might be, for example, a greater knowledge of economic values on the part of school children through occasional exposure to shopping facilities near the school; frequent use of the church by both child and adult if it is within walking distance of the school site; a more mature self-reliance and initiative in children if schools are within easy access on foot rather than so far away that the family car or the school bus must be used; a sense of belonging to a somewhat loosely formed social group, developing from the use of common facilities.

[3] N. L. Engelhardt, Sr., Educational Consultant, New York, in an address on "The Future Community and Its Schools" given at the Conference on Schools and Community Planning, August 1953, sponsored by the School of Architecture and Planning, Massachusetts Institute of Technology.

School and local government

Perhaps the greatest obstacle to coordination is a political one—the independence of the school district in relation to other segments of local government. In Contra Costa County, California, there are 150 separate jurisdictions, many of which are school districts each with its own board. In a typical small city, the city planning department reports to the city council in the same way that a number of other city departments do—parks, libraries, health, and others; in this situation it is readily possible for the physical improvements proposed by these departments to be co-ordinated through the recommendations of the city planning department. But the school, a central and most important community facility and a key to the distribution of streets and other community facilities, stands outside the framework of co-ordination under a comparatively autonomous jurisdiction. Although the California State Education Code requires that all planning commissions review acquisitions of school sites, minimum use is made of this requirement, and in other states no such requirement exists, even on paper. Simplification of the school-districting pattern at the local level and on a metropolitan regional basis is needed to bring about more natural and assured integration with the other political jurisdictions responsible for decision making. Since city planners depend so much on school-planning criteria, the judgment, knowledge, and experience of school planners are needed in determining location, size, and land-use relationships of schools. To this end closer collaboration is imperative.

THE PARTS AND THE WHOLE

While we in the United States have not so far achieved any high degree of success in shaping our cities toward the maximum in convenience and functional qualities, as well as in beauty, many of the separate elements of our cities are exemplary in comparison to those in other parts of the world. One of these elements is the school plant as a building and site unit. With this as a major achievement during the first half of the twentieth century, we might well look forward to making the second half distinctive by reason of creative ideas concerning the location of schools in relation to the city as a whole. Let them be so placed that they not only serve the surrounding population in the best possible way as far as accessibility and space are concerned, but also help bring into being community centers composed of related facilities of which the school is a key element.

WIDER UNDERSTANDING NEEDED

In all of this, we must remember that the laws enabling city planning and the techniques developed are only as good and as effective as the people who use them. Therefore, our greatest need lies in fuller understanding by responsible officials and laymen alike of these complex problems of urban development and of the potentialities of the city planning process. School personnel, par-

ticularly, can be effective in working toward better co-ordination by using the city planning process in their own communities and by spreading through their own educational channels, to adults as well as children, greater knowledge of city structure and city planning. In fact, because of the central position of the school in the urban scene the future of our urban areas should be the joint concern of school planners and city planners. Techniques of preparing for the future, of analyzing expected needs, should be shared and thereby made more fully effective than they have been in the past.

Francis Violich, Berkeley, California, is associate professor of city planning and lecturer in landscape architecture at the University of California. He has served as acting chairman of the Department of City and Regional Planning; consultant to the California Committee on Planning Recreation, Park Areas and Facilities; lecturer and consultant to the Inter-American Housing Center, Bogotá, Colombia; planning consultant to Venezuela's National Commission for City Planning; and Consultant to the Pan American Union, whose Division of Housing and Planning he established in 1945–47. He engages in planning consultant practice in the San Francisco Bay Area. His publications include the book Cities of Latin America (1944), publications for the Pan American Union, and various reports for city planning agencies.

Housing Policy and the Educational System

By CATHERINE BAUER

EFFECTIVE planning can establish the general pattern for community development. But the force which actually creates neighborhoods in three-dimensional, flesh-and-blood terms is residential construction. Wherever new homes are built, people move in who will require schools and all essential community services, whether or not their needs have been fully anticipated.

In the postwar civic scene home building has been a very dynamic factor indeed, owing to the combined effect on housing demand of a long-standing shortage, high marriage and birth rates, general prosperity, and the rising desire to replace slums and blighted areas. At the beginning of 1955 almost ten million nonfarm dwellings, or more than 20 per cent of our total nonfarm housing supply, had been erected in the previous nine years. And this rate is likely to continue for some time to come. Indeed, if slum replacement is to move ahead at the hoped-for scale, an even higher rate of residential construction will be necessary.

More important, however, is the fact that this new housing tends to be produced by methods essentially quite different from the traditional system of home building in the United States. And these new methods pose some entirely new problems of community organization, servicing, and social structure. Enlightened community planning is more urgently needed than ever, but in some ways it is rendered much more difficult. Fundamental social questions are involved, for one thing, which the professional housing and planning administrators are hardly qualified to decide unaided, even if they had the power to do so.

In particular, the educational authorities are directly involved at many points, not only with respect to school plant but also in terms of basic educational philosophy and democratic community values. They should therefore understand these changes in the housing process and the implications for sound community development and responsible civic leadership.

THE REVOLUTION IN HOUSING

Until about twenty years ago, houses and even apartments were mainly built by individual initiative or small-scale private enterprise, with credit from various independent private sources, on land that had been previously subdivided and sold in small parcels. Since construction in any given area tended to be on a piecemeal basis over a period of years, schools and community facilities could be fitted in gradually as required, and ultimately most neighborhoods included a considerable range of dwelling types and income groups.

In terms of modern design, technology, and production methods, however, the home-building business was exceedingly backward. Urban homes were expensive, and costs were further increased by two additional factors: the rising standards of space, sanitation, and safety enforced by official ordinances, and the chaotic, highly speculative mortgage system. Together, these conditions tended to limit the effective market for new dwellings to upper-income families, forcing the vast majority either to pay too much or take whatever they could find among older, cheaper homes. The result was mounting slums and blight and, when the depression struck, almost universal bankruptcy and

paralysis in the whole field of residential construction and home finance. The evidence of failure and signs of impending change are spread throughout the numerous housing studies of the early 1930's. During the past generation, therefore, both the system of home building and its characteristic products have been greatly altered.

Larger-scale operations

In the first place, there is a basic trend toward bigger housing operations by professional building agencies. Individual consumer initiative is not dead by any means: owner-built houses still apparently accounted for about 18 per cent of the total home production in metropolitan areas in 1949.[1] But this included both tailor-made homes for those who could afford them and, at the opposite end of the housing spectrum, substandard shacks in areas where codes are not enforced. In between, the vast majority of new dwellings are provided on an increasingly mass-production basis. By 1949, 25 per cent of the new one-family homes in selected metropolitan areas were turned out by large firms building more than a hundred houses per annum. Moreover, with the tremendous increase in over-all volume, the total number of units built by relatively big operators was at least six times as great as a decade earlier. Today the scale of operations is undoubtedly still greater, above all in the ever expanding suburban fringe areas.

Following World War II there was a surge in large-scale projects that moved from raw land to complete communities within the very short time of two years. Thousand-acre projects such as Panorama City and Lakewood in Southern California, Park Forest southwest of Chicago, the Levittowns in Pennsylvania and Long Island, Fairless Hills in Pennsylvania and Lincoln Village near Columbus, Ohio, were built as single operations to meet local housing needs. The combination of warborn circumstances such as housing shortages in areas of great population growth, record family formation, inflation and easy mortgage payments make possible these mammoth, single phase community developments by the new kind of merchant builder.[2]

Since most of these factors still prevail, the trend continues. And meanwhile in central districts rental projects of unprecedented size are being developed by housing authorities and big institutional investors such as life insurance companies, as well as by large-scale speculative builders and, in a few cities, co-operative initiative.

Federal aid and responsibility

A more sudden and sweeping change in the housing process, however, with at least equally great civic implications, is the degree of federal intervention now taken for granted. Of the 9.4 million nonfarm dwellings constructed from 1946 through 1954, almost four million were financed with mortgages either insured by the Federal Housing Administration or guaranteed by the Veterans' Administration. This proportion was much higher in the major urban centers, amounting to 75 per cent of the "professionally built" one-family houses in certain sample metropolitan areas in 1949. In 1954 almost half the estimated total mortgage debt outstanding in the United States, or about 36 billion dollars worth, was underwritten by the federal government. Moreover, the home-finance terms, practices, and standards inaugurated by FHA and the Veterans Administration now tend to set the pace for the entire private housing market, which is also indirectly influenced by the operations of the Home Loan Bank Board and the Federal National Mortgage Association.

In addition, about 300,000 dwelling units have been constructed by direct public initiative during the postwar period, for the most part by local housing authorities for low-income families from slums, with annual subsidies from the Public Housing Administration. And finally, there is a separate network of federal aids and accompanying controls for the improvement of slum and blighted areas. The 1949 Housing Act provided substantial capital grants to local redevelopment agencies for the wholesale acquisition and clearance of substandard areas, in order to free such sites for suitable reconstruction. The 1954 Act broadened this program to include special aids and inducements for "renewal" in declining areas where modernization and code enforcement might turn the tide. These programs are now in the planning stage, at least, in some two hundred different communities in thirty-two states and territories. Federal grants are also available under certain conditions for state and metropolitan planning, and local public works programing.

Over-all results

All in all, the process of providing American families with homes and neighborhoods has been revolutionized. What was a small-scale, amateurish enterprise, almost wholly local in character and control, has become a highly organized, big-time affair, both at the operating level and in terms of powerful interest groups representing builders, lenders, and reformers of various types, continually jockeying for advantage in the national arena. Moreover, what used to be a strictly private business is now one of the largest and most complex forms of "mixed" private-and-public enterprise extant.

In many ways this complicated new machinery has proved effective. The rate of home construction has been both higher and steadier than at any time in the past, and the postwar shortage is therefore considerably eased (at least for upper- and middle-income white households of average size). Mass-production methods and cheaper financing have enabled millions of families of moderate means to purchase houses on easy terms. Indeed, many had no other choice, since both federal policy and builder practice greatly favor individual ownership, with little encouragement for medium-rental or co-operative initiative. The proportion of owner occupancy increased from 41 per cent of all nonfarm homes in 1940 to 53 per cent in 1950, and is doubtless still going up.

A major effort to tackle slums and blight is also under way for the first time in our history, although the powerful tools available for clearance are not yet matched by adequate machinery or resources to relocate displaced families. A commission appointed by President Eisenhower estimated that five million homes must be demolished and fifteen million homes rehabilitated.[3] But the low-rent public housing program is extremely limited in scope, most slum and blighted areas are fully occupied with no better homes available at comparable prices, and there is an acute housing shortage for minority families at all economic levels. Rehousing the aged, single workers, and other groups with special needs is likewise an unsolved problem. And in the field of rehabilita-

[1] The factual data in this section are from either the Bureau of Labor Statistics or the Housing and Home Finance Agency, in some cases as derived from these sources by Sherman Maisel in his book, *Housebuilding in Transition*, Berkeley (Calif.), 1953.

tion, the current drive may yet produce substantial results but stronger incentives will probably be required sooner or later.

But however the balance sheet may be drawn up, one thing is certain. The new housing system is here to stay, by and large. It may be modified, expanded, or refined in the course of producing the next ten million homes, but there is no question of going back to small-scale laissez faire in the housing business.

Home building, moreover, has become an extremely dynamic factor in the organization and quality of everyday community life. The suburban tide is rapidly changing the shape and social-economic structure of metropolitan areas, creating problems that challenge the traditional concepts of local government, including school administration. The ultimate effects of decentralization and dispersal are not yet visible. Redevelopment, renewal, and public housing pose related issues for central districts. Enormous population shifts are fostered if not compelled by housing trends and policies, which tend to encourage the high rate of residential mobility that makes us the most nomadic nation of modern times. "Home ownership," under the present system, has little of the stabilizing influence that made it the symbol of solid middle-class achievement and settled community status. In short, urban society is in a state of flux.

Since housing practices tend more and more to shape the whole neighborhood environment and its social structure, everyone concerned with the quality of community life should therefore cast a critical eye on the results of the new system to date. For it is in this context rather than in national statistics that certain weaknesses and potential dangers are most apparent, with particular significance for school planning and perhaps the entire educational system.

Implications for the Community and Educational Policy

The opportunity to develop "complete communities" all at once has long been cherished and promoted by progressive planners and architects. As against the endless dreary grid of the land speculator and the chaos often resulting from scattered individual and small-scale initiative, the qualitative advantages of unified planning and design have been stressed quite as much as the potential economies of large-scale building operations. Housing, schools, roads, and all the other elements could be carefully plotted ahead to meet the most advanced standards, and properly integrated to form a community which might be beautiful as well as orderly, safe, healthy, and efficient.[4]

The "neighborhood unit" concept carried these principles of planning and design over into the realm of basic social values. A distinctive residential area, carefully designed and equipped to serve about five thousand people, would help to counteract the impersonality and *anomie* of mass metropolitan society by stimulating friendly contact and responsible participation at the "face-to-face" neighborhood level.[5]

Some of the most interesting and influential experiments in modern housing, from Radburn and the Greenbelt communities to Britain's current New Towns, including also many less ambitious schemes, have been developed on such principles; and at their best these pilot projects demonstrate many of the virtues claimed for this approach.[6]

[4] See Henry Wright, *Rehousing Urban America* (New York, 1935), for a persuasive early analysis; also American Public Health Association, *Planning the Neighborhood* (Chicago, 1948), for detailed technical standards and recommendations.

[5] See Clarence Perry, *Housing for the Machine Age* (New York, 1939); James Dahir (Compiler), *The Neighborhood Unit Plan* (New York, 1947); as well as many statements by Lewis Mumford and others.

"Community" housing: principles and problems

Clearly the present trend toward large-scale housing construction subject to national standards and policy controls, along with increased acceptance of local city planning, could favor the application of these ideas on a much wider basis. And a conscious effort has been made in many cases to translate the principles of integrated community development into ordinary policy and practice. City plans, as noted in the previous article, now tend to be based on school-centered neighborhoods. The HHFA has recently published a set of *Suggested Land Subdivision Regulations* for the guidance of builders and local governments, in which advance co-operation with the planning commission, city or county engineers, school board, and recreation and transportation authorities is stressed. Similar recommendations are made in the *Community Builders Handbook* issued by the Urban Land Institute (an affiliate of the National Association of Real Estate Boards) and in various publications of the National Association of Home Builders. The Federal Housing Administration issues detailed "Neighborhood Standards" for each region as criteria for mortgage insurance and takes pride in its encouragement of community planning.[7]

[6] See Clarence S. Stein, *Toward New Towns for America.* Chicago and Liverpool, 1951.

[7] "In 1934 the homebuilding industry was characterized by speculative land development, by land subdivided in excess of need and only partially improved, and by many small inefficient builders building on scattered lots and creating unstable, heterogeneous neighborhoods. Today the typical operative builder develops land as it is required for immediate building purposes, and constructs not only the dwellings but the utilities, streets, and other land improvements as an integrated operation. This method produces stable, completely improved neighborhoods that are more attractive to home buyers, better risks for lenders, and desirable additions to the communities in which they are located. The land planning service of the FHA has been a significant factor in the transformation that has taken place in the last twenty years in land development." —Byron R. Hanke, Chief, Land Planning Section, FHA Underwriting Division, "Two Decades of Land Planning," *Insured Mortgage Portfolio,* Summer 1954, p. 12.

The Public Housing Administration's standards are concerned with over-all site planning and community facilities, and renewal policy makes minute stipulations with respect to the comprehensive community plans which must be officially adopted before a project can be approved for federal assistance. In the Declaration of National Housing Policy which introduces the Housing Act of 1949, Congress dedicated the act to "the development of well-planned, integated, residential neighborhoods and the development and redevelopment of communities."

In actual practice, however, the results of large-scale housing development on a "community" or "neighborhood" basis often bear little visible relationship to the ideal principles thus set forth. In any case some new problems are increasingly evident in this type of development which were not always anticipated in community-planning theory or fully recognized in the early experiments.[8] Moreover these mounting issues

[8] Neighborhood planning issues have been debated extensively in recent years. General references include: Catherine Bauer, "Good Neighborhoods," THE ANNALS, November 1945; Reginald R. Isaacs, articles in the *Journal of Housing,* July and August 1948; and Svend Reimer, *The Modern City* (New York, 1952), Chap. XVII.

on the housing horizon are in some ways quite as closely related to basic educational problems and policy as they are to housing per se.

In general terms, three such issues seem to stand out:

1. "Community planning" is no longer merely a pleasant, enlightened civic ideal, to be attempted where conditions are favorable. With mass-production housing methods increasingly dominant, effective planning becomes absolutely necessary, if essential community facilities are to be reasonably well located and efficiently provided for the people who will occupy the homes. School programing, in particular, must now be integrated with over-all community planning well in advance of actual housing development.

2. Thus far the new housing system tends to promote a much greater degree of social segregation at the neighborhood level by income, age, and racial groups than has been traditional in the United States. This trend can readily be modified, but only by a conscious civic effort to reshape housing and planning policy in terms of basic community values. Race segregation, particularly, has become a major issue. Since school structure and the educational system are directly affected by neighborhood social structure, the responsibility for solving these knotty problems falls in part on educational leaders.

3. In the packaged neighborhood the home seeker comes in last, and the individual consumer has little real choice or influence with respect to his home and community environment. In redevelopment, moreover, families are forcibly uprooted on a wholesale basis, and their relocation raises fundamental problems of social justice. Effective machinery for bona fide citizen participation in the planning and housing process at the neighborhood level must therefore be created. But this is at base a problem of adult education in civic affairs, and therefore a problem to be shared with the community's educational system, broadly conceived.

SCHOOLS MUST BE PLANNED AHEAD

In another article in this volume, Professor Violich points out the close interrelationships between school planning and other aspects of city planning, emphasizing the need for greater foresight and stronger integration to guide the process of community development. A key factor is the trend toward large-scale housing operations which, along with its obvious opportunities, seems to make effective over-all planning both more difficult *and* more imperative.

It is all too evident that if a big builder (whether speculative or institutional, private or public) is allowed to pursue the economic benefits of mass production with single-minded zeal, housing is likely to blanket enormous areas, with no spaces left over for any other purpose whatever. And in the flood of postwar residential construction, housing initiative too often got ahead of planning, thus contributing to many of the emergency school problems now so universally rampant in suburbia. The homes, however, were badly needed. And if the provision of adequate community facilities, properly located, is now extremely difficult and costly it is not the home builders, by and large, who should be blamed. What was lacking was an equal degree of *civic* initiative, to overcome the anarchy of unrelated governmental agencies, special districts, and so forth which preclude effective land-use controls and advance planning in the burgeoning metropolitan fringe areas. The autonomous school district, as Mr. Violich suggests, is frequently one of the obstacles to better integrated development.

In the redevelopment of central slum areas it is also necessary to anticipate in the planning process changing school demands. The Stuyvesant Town project built by the Metropolitan Life Insurance Company in New York City accommodates 12,000 families but includes no school or other community facility. And in renewal or conservation schemes where an effort is made to stabilize declining areas by selected improvements, the provision of modern schools and playgrounds will often play a key role, if carefully related to an over-all plan.

Builders, investors, home seekers, and housing agencies are, it is true, gradually becoming more sophisticated about the need for schools and other community facilities, properly located in relation to homes. This is real progress, but it only reinforces the need for comprehensive development plans, officially adopted *before* housing enterprise gets under way in any given area.

Moreover, planning should facilitate the advance acquisition of sites for schools and other public uses, before development has enhanced the land values. And if the home builders ought to contribute, by land donations or otherwise, to the facilities required by the population they will bring into an area, then the necessary legal and administrative machinery must be solidly established as an integral part of the system of advance planning and subdivision control. This is a complex and controversial problem, for planners and school administrators alike.[9]

TREND TOWARD SOCIAL UNIFORMITY

The new housing system tends to turn out a highly standardized product unless there is a firm determination to achieve some degree of variety and balance. This standardization is due in part to the rationale of mass production but perhaps even more to bureaucratic influences and certain cherished real estate doctrines. The rigidly specialized system of federal housing aids and controls favors uniform results in any particular project or category, in terms of dwelling type, size, design, tenure, and price level. In addition, many local zoning ordinances still force absolute uniformity of lot sizes and dwelling types over enormous areas. And finally, real estate mythology has actively promoted the credo that any deviation from complete neighborhood homogeneity will undermine property values, an article of faith long embodied in minute detail in every handbook for subdividers, whether from private or public sources.

The combined effect of these influences is visible on every hand, in a high degree of social as well as physical standardization: vast suburban tracts of identical small houses wholly occupied by veteran families of almost equally identical age and income, firmly excluding nonwhites; equally enormous public housing projects in central areas consisting solely of many-storied structures limited to very low-income families of two or more persons (along with many additional strictures on eligibility), sometimes "mixed" as to race but quite often all white or all Negro or all Mexican. In the field of private redevelopment, similar homogenized schemes can also readily be found.

Of course there have long been "protected" upper-class districts on the one hand and equally well-defined slum areas and racial ghettos on the other. But the present housing machinery promotes neighborhood social uniformity to a much more refined and absolute degree than was possible earlier. And as the system is inevitably expanded to include more private construction for

[9] *Proceedings of the Conference on Schools and Community Planning* (August 28, 1953, sponsored by the School of Architecture and Planning, Massachusetts Institute of Technology), pp. 11, 14.

nonwhites, housing for the aged, new types of rental, co-operative, or self-help initiative, and so on, this will simply mean new versions of the large, single-purpose standardized "project," unless there is a very firm and positive civic effort in the meantime to encourage more physical and social diversity in residential areas.

Schools for "project" children

When a community is entirely made up of young veterans, for instance, the sudden bulge in first graders will continue to create abnormal problems of school organization for years to come. But unbalanced age groups are only one small aspect of the educators' problem.

The peculiar social character of the one-class dormitory suburb has been explored from various viewpoints, often with conflicting judgments. But many would agree that there are likely to be heavy pressures for conformity, some degree of anti-intellectualism, a matriarchal social order, and perhaps (despite the frenetic mobility) a tendency to view the city and the world from a rather insular perspective. Moreover, at least two sharp observers have recently suggested that the educational system has a particularly important role to play in such communities. It can either reflect and rationalize the community's inherent limitations *or* try in some measure to compensate for them.[10]

The danger of a more paternalistic type of regimentation in big, high-density, one-class rental projects operated with a firm hand by public housing authorities and institutional investors has likewise been pointed out.[11] And where a school is destined to serve mainly (or often wholly) the children from such a project, it certainly has special responsibilities, both as a neighborhood community center and in the more formal aspects of education.

The whole question of school districting is likewise involved. Where the neighborhood social pattern is highly standardized, is it always a sound ideal for schools to conform to the same pattern? Clearly there are some difficult and controversial issues here, with conflicting values to be resolved. But if schools are supposed to train children to live successfully in a highly variegated world, this is a very real problem for the educational system.

New push for greater diversity

The standardized neighborhood pattern is itself being challenged, moreover, from various quarters. There are efforts to make zoning regulations more flexible, for a wide array of social, civic, economic, and aesthetic reasons. Some signs of a cautious shift in real estate practice and philosophy are visible, although hardly to the point of welcoming low-rent housing or nonwhite families in middle-class communities.[12] But redevelopment schemes in Philadelphia and Detroit, for instance, are designed to encourage small, varied projects, public and private, rental and ownership, to serve all racial groups. And at the political level, racial exclusion practices are becoming a major issue in housing policy, with direct implications for education as well.

[10] William H. Whyte, Jr., "The Transients" [a series of articles on suburbia], *Fortune*, May through August 1953; and Sidonie M. Gruenberg, "Homogenized Children of New Suburbia," *New York Times Magazine*, September 19, 1954.

[11] See particularly Anthony F. C. Wallace, *Housing and Social Structure*. Philadelphia Housing Authority, 1952.

[12] "Better balanced communities and greater stability may often be obtained by having houses of various prices in a single community. Similar opinion with regard to a reasonable diversity of housing types within the neighborhood is developing. A well balanced neighborhood plan containing a reasonable variation of housing accommodations will aid materially in stabilizing values and preventing decline by permitting the individual family to adjust its housing requirements to its age, marital status and size at any given time and still remain within the community of its choice."—Urban Land Institute, *op. cit. supra* (note 2), p. 57.

Race segregation: a critical issue

Since the Supreme Court decision on desegregation of schools, the frontier for race relations has been shifting more and more to the housing field. The sequence is obvious, since the degree of integration in the schools now depends very largely on the residential pattern. And the neighborhood pattern is shaped by housing policy and practices which are in a state of conflict, confusion, and potential change, sometimes promoting complete nondiscrimination (as with public housing and sometimes even private redevelopment, in many northern cities) but frequently enforcing a degree of absolute segregation hitherto unprecedented anywhere in the country (as in most new suburban communities). Housing and redevelopment policies can serve any kind of purpose with respect to race relations. They can even be used to get around the Supreme Court.[13]

With the continued urban migration of Negroes and their improving economic status and power, with public agencies involved in housing at a hundred points, and with large-scale operations tending to force a definite decision one way or the other over wide areas, residential segregation versus nonsegregation is certain to be a lively political issue, nationally and locally, for some time to come. Many civic groups, leaders, and officials, including educators, will have to share the responsibility for its successful solution.

Nondiscrimination has worked fairly well in northern public housing and is just beginning to be tested in some private redevelopment and co-operative projects. Minority families are also gradually taking up residence on a more scattered basis throughout most of the older districts of northern urban centers, and on the whole they are encountering somewhat less resistance and hysteria than formerly. Redevelopment, in breaking up the old concentrations, will inevitably speed up this process but perhaps at the price of more opposition. Most "conservation" or "removal" schemes involve areas of social and racial transition, and there is beginning to be some infiltration even in the suburbs, despite all the barriers.

Social readjustment and the educational system

Most cities and metropolitan areas are therefore confronted with widespread problems of social readjustment, perhaps one of the most vital adjustments that this country has to make in the visible future. And a large part of the responsibility will necessarily fall on the educational system—in the classroom, in the neighborhood, and at the broader civic level.

"CITIZEN PARTICIPATION": BUT HOW?

The final issue can only be suggested with a question mark. With home and

[13] "Although the school decisions in 1954 gave civil rights advocates cause for rejoicing, it may be expected that some local officials will now speed up slum clearance, public works, and urban redevelopment projects which will displace minorities from an area within a public school district and thereby sidestep the Supreme Court's mandate. Not only creation of new all-white sections will be encouraged in order to maintain white schools but abolition of presently mixed areas may be anticipated as well."—Charles Abrams, *Forbidden Neighbors* (New York, 1955), p. 305.

community shaped more and more by big-time decisions, does this inevitably mean another step in what C. Wright Mills calls "the transformation of a community of publics into a mass society"?

The net effect of the new housing system is a neighborhood environment created by forces over which the individual home seeker or resident has little direct control.[14] But if the consumer has little real influence via the traditional mechanics of market choice, what about his potential role as a citizen influencing policy? To what extent can he take part in the public decisions about housing, planning, and redevelopment that will determine how he lives?

Many efforts are being made to encourage democratic participation in the development process. Sometimes citizen groups form spontaneously to attack common problems, whether in unincorporated suburban communities or in blighted areas where redevelopment schemes bring the threat of mass eviction. Such groups may be weak or strong, ignorant or informed, narrow or enlightened. In Chicago, through such organizations as the Hyde Park–Kenwood Community Conference, citizen planning at the district level is being attempted, to deal with problems of social transition and race relations as well as physical improvement per se. But all these efforts are still highly experimental, and although federal policy requires "citizen participation" in renewal programs, there is no definite proven means of achieving it.

In the field of adult education, however, there seems to be a growing movement that may help to provide some of the answers. Although not focused specifically on housing and redevelopment issues, the views of three different leaders are directly pertinent in the most concrete sense.

The philosophy and social imperatives of the new adult education "movement" grow out of the recognition by many educators and sociologists of the declining importance of the primary face-to-face groups in American life, and the pervasive sense of uselessness or ineffectiveness of the individual confronted with the shift of power from the individual to larger and larger social units. . . . [The new role of adult education] is that of being "the handmaiden of community action programs" looking toward the improvement of living conditions of citizens.[15]

On the one hand, man as a human being and as a citizen is shaped by the industrialization and urbanization which have attended the developments of science and technology. On the other hand, as a citizen of democracy, man shapes his industrial and urban society when he understands it. His capacity to shape it will be in direct proportion to his understanding of it. It is not the knowledge itself but the art of using the knowledge that matters.[16]

Instruction for adults has until recently been thought of in terms of remedial education and traditional subject matter. . . . However it is recognized today that some of the most effective adult education takes place outside of the classroom when people come together to study and to do something about their common problems. Community improvement and development activities are in this category. . . . Three of the special activities in which adult education is an integral part of community development [are]: the community school; the community council; and the community development services of colleges and universities.[17]

[14] "Consumers' choice is constrained by a limited market, by factors of financing and price, and by the fact that they are offered only packaged products with a largely predetermined neighborhood environment."—Maisel, *op. cit. supra* (note 1), p. 258.

[17] Herbert C. Hunsaker, "A Review of Community Projects," *School Executive,* May 1954, p. 72.

Knowledge and *effective organization:* these are the basic requirements for democratic participation in the complicated process that shapes modern cities and neighborhoods.

Catherine Bauer is a lecturer in City and Regional Planning at the University of California in Berkeley. She has been a member of the Slum Clearance Advisory Committee of the Housing and Home Finance Agency, a lecturer at Harvard University, a consultant to the United Nations, vice-president of the National Housing Conference, and director of research and information in the United States Housing Authority. She is author of Modern Housing (1934) and many articles and pamphlets.

Education and Recreation

By Jackson M. Anderson

SINCE the turn of the century, there has been a vast increase in the amount of leisure time for people of all ages in our society. Accompanying this expanding leisure has been a significant increase in crime and delinquency, a higher divorce rate, and an alarming growth in the number of mentally ill. Educators and other community leaders, realizing the value of recreation in contributing to personal happiness and thus helping to prevent and alleviate these conditions, are giving increasing support to programs of organized community-recreation activities. Thus recreation is now recognized as an essential community responsibility.

As early as 1917, the National Education Association listed "preparation for the worthy use of leisure time" as one of the seven basic objectives of education.[1] Thus the school has long been charged with a strong responsibility for recreation. This responsibility is twofold.

First, the school is responsible for encouraging its students to develop interests and basic skills in a variety of wholesome leisure-time activities which may be enjoyed throughout life. Many of these desirable interests and skills will come from the learning experiences provided in physical education and other organized classes in the school curriculum. Others will grow out of the play activities, interscholastic athletics, and other extraclass activities and experiences provided by the school. These learning experiences must be constantly examined to make sure that they are really contributing to the development of leisure-time interests and skills. Failure to do so may deny the students in our schools the right to enjoy many types of recreational activities in later life.

The other aspect of the school's responsibility is provision of the necessary leadership, facilities, and programs to meet the recreational needs and desires of the entire community. Awareness of this second responsibility came with the new concept of the "community school." Of course the school is not alone in responsibility for the recreation program of the community, for many agencies both public and private have contributions to make. There is, however, a growing realization of the fundamental importance of the school as a community center for recreation and adult education. Not only is the school strategically located but, in many of our smaller communities, it is the only agency capable of supplying the leadership, facilities, and funds necessary to meet the recreational needs of the community. Since a great majority of the communities in our nation *are* small, the role of the school in recreation is an exceedingly important one.

With the growing realization that recreation is a fundamental human need, essential to the well-being of all people, there is more and more public demand for use of school facilities for community recreation during after-school hours and throughout the summer months. To permit an expensive school plant to lie idle while facilities are needed for community recreation is an obvious waste. The consolidation of schools into larger

[1] National Education Association, *Cardinal Principles of Secondary Education*. Washington, D. C.: Bureau of Education, Department of the Interior, 1917.

and more effective districts or administrative units and the construction of modern school plants with complete recreation facilities have greatly enhanced the school's ability to provide organized programs of community recreation. Thus it is not surprising that today the school is one of the primary agencies administering such programs.

One of the problems the secondary schools now face is the obvious necessity for half-day sessions because of the wave of young people now entering high school. This situation will surely have a tremendous effect on the school's responsibility for recreation.

Administration of Community Recreation Programs

Besides avocational instruction in classroom and extraclass activities, what recreational services are the schools providing? Although these services take many forms, they may, in general, be classified into the following groups: (1) community recreation programs wholly under the administration of the schools; (2) community recreation programs administered jointly by the school and the municipality or some other agency; (3) community recreation programs using school facilities but under the administration of public agencies other than the schools, or under quasi-public agencies. Some typical examples of these types of services will be discussed briefly.

School-agencies administration

Perhaps the best-known example of a municipal recreation program administered by a school agency is that of Milwaukee, Wisconsin, which has long been known as the "City of the Lighted Schoolhouses."

The major recreation program in this city is provided by the Department of Municipal Recreation and Adult Education of the Milwaukee Public Schools. The program is headed by an executive of extensive and varied school and recreation experience, who has the rank of assistant superintendent of schools. In many instances, playgrounds and other recreation areas are acquired by the city and constructed by the Department of Public Works. When completed, however, these areas are turned over to the Department of Municipal Recreation for maintenance and operation. A supervisor with the title of general field assistant has charge of property maintenance and supervision.

Activities in the "lighted schoolhouses" include classes in many applied arts, group athletic activities, literary activities, dramatics, music and dancing, and a variety of civic, social, and patriotic events. The indoor centers are open to school-age children after school hours up to 6:30 P.M., and to others during the evening hours. Scout troops and similar groups of children may use the facilities during the evening hours by special permit from the principal. Highly organized sports for youth and adults are conducted on outdoor play areas during the daytime and under lights in the evening.

A distinctive feature of the Milwaukee program is that, even though it draws its financial support from a special school fund, it is integrated closely with the regular schoolwork, many of the evening program directors being also employed in part during the day. Lighted school centers come under the general supervision of the day-school principal or vice-principal. This creates a strong tie with the general schoolwork and minimizes administrative conflicts between the two programs.

The rapid increase in the number of school-centered community recreation programs is perhaps of greater significance to rural districts than to the cities. The incorporated city is a governmental device employed for the specific purpose of organizing governmental

services of local importance. The rural areas have no such device, except for education, which is administered through a system of local school districts and school boards. These boards are the only governmental agency having immediate contact with local community needs. They also control the main publicly owned facilities which might be utilized in a rural recreation program. Thus the school district offers the only immediate hope for public-sponsored community recreation programs in rural areas.

An excellent example of a rural recreation program is that administered by the County Board of Education in Allen County, Indiana. This county program is headed by a qualified recreation executive who has the title of supervisor of recreation. He reports directly to the County Superintendent of Schools and spends his entire time in organizing and conducting recreation programs throughout the county. These programs are conducted co-operatively with 4-H Clubs, Rural Youth groups, and other agencies. School facilities throughout the county are utilized during after-school hours for recreation activities.

Joint administration by schools and other agencies

The co-ordinated recreation plan of Long Beach, California, has attracted the attention of recreation leaders and educators from all parts of the country. This plan provides an effective method of joint administration of community recreation by school and city authorities. The program is administered by a recreation commission. Four of the nine commission members are the City Manager, the Superintendent of Schools, a member of the City Council, and a member of the Board of Education. Five citizens are appointed by these four and approved by the City Council. The Supervisor of Health and Physical Education of the Long Beach public schools is also Director of Public Recreation.

This co-ordinated plan brings the recreation resources of the school system and the municipality under central direction, thereby avoiding duplication of costs, facilities, services, and personnel. The significance of the co-ordinated plan in enabling the city to meet its increasing needs for recreation has been dramatically demonstrated within the past few years. Modern gymnasiums, swimming pools, school playgrounds, tennis courts, auditoriums, and athletic fields are among the school facilities available, when not needed for school purposes, to supplement the city facilities for community recreation. Thirty-five municipal and sixty-eight school areas are now utilized for the varied program of recreational activities for people of all ages.

A noteworthy plan for joint administration of recreation in a rural area is found in Monongalia County, West Virginia. The Monongalia County Consolidated Recreation Commission was established as a result of the passage of a state recreation enabling act making possible joint action by city, county, and school units. The County School Board, the County Court, and the City Council of Morgantown each appoint three members to make up the nine-member commission. The commission employs a full-time, year-round executive to head up the county recreation program. A budget of over $50,000 is provided by the County School Board, the Morgantown City Council, the county Community Chest, and the County Court. The commission operates seventeen daily playgrounds in the urban and industrial areas, three city parks, and twenty-one weekly and volunteer rural playgrounds. Two community centers, one for youth only and the other for all ages, are operated from five to seven days each week.

Administration by nonschool agencies

One of the finest examples of a community recreation program utilizing school facilities but administered by a nonschool agency is that of Oakland, California. This city was a pioneer in the field of public recreation, its first playground commission having been appointed in 1908. Since that time it has drawn wide attention for the quality and diversity of its program, which is administered by a five-member Board of Playground Directors. This board co-operates closely with the Board of Education and, under a provision of the city charter, is responsible for the operation of all recreation areas and facilities in the city parks and other municipal areas. The Recreation Department is headed by a qualified Superintendent of Recreation.

Because of the climate, the diversified program in Oakland, like that of many other California cities, consists for the most part of outdoor activities carried on throughout the year. Thus the core of Oakland's program is its playgrounds. The school playgrounds are operated after school hours, on Saturdays and holidays, and during vacation periods. Those playgrounds containing baseball diamonds are also open on Sundays. Although sports and games make up a major part of the program, especially during the school year, many school playgrounds also provide story-telling, dramatics, folk dancing, and simple crafts. At the end of each sport season for girls, district playdays are held in each neighborhood throughout the city. Scheduled athletic activities for girls include softball, tennis, batball, kickball, netball, bowl club ball, paddle handball, relays, and crew rowing. Sports days are also arranged for boys, and the more popular boys' activities include softball, basketball, touch football, track, crew rowing, and hahdball.

Recreation specialists are employed to assist the playground directors in conducting these activities. Organized clubs include hobby groups, junior leader groups, dramatics clubs, and swimming and tennis units. Special activities are held frequently to add variety to the program. These activities include doll shows, marble tournaments, soap-bubble contests, treasure hunts, pet shows, parades, kite-flying tournaments, and excursions away from the playground. In each district of the city, the children and playground directors join during the summer in observing a special day of social recreation, stunts, games, and refreshments.

In addition to its playground facilities, the Oakland Recreation Department operates a number of neighborhood centers. The recreation activities and facilities of the various districts in the city are co-ordinated and centralized around these centers. Several centers have gymnasiums, and each adjoins an outdoor playground, some of which are lighted. People of all ages are served at these centers through organized clubs. Interested groups take part in social activities, forums, hobbies, handcrafts, dramatics, social, creative, and folk dancing, music, sewing, cooking, and bridge.

An organized recreation program for employees of more than sixty business and industrial firms is carried on through the Industrial Athletic Association of Metropolitan Oakland. This association, which is sponsored by the city Recreation Department, was organized in 1919 and was one of the earliest industrial recreation associations organized in the United States.[2] Ac-

[2] Jackson M. Anderson, *Industrial Recreation—A Guide to Its Organization and Administration* (New York: McGraw-Hill Book Company, Inc., 1955), p. 58.

tivities for both men and women include bowling, softball, basketball, tennis, golf, swimming, badminton, volleyball, bridge, and crew rowing. Intercompany leagues for men are also organized in golf, horseshoes, baseball, track, handball, and ice hockey. A spectacular spring sports carnival is the outstanding annual event of the association's program. Hundreds of men and women employees of the member firms take part in the colorful parade, with many floats depicting sports, stunts, contests, and demonstration games.

An interesting example of a rural recreation program utilizing school facilities but administered by a nonschool agency is found in Mason County, Kentucky. Here the central authority for the program is the Mason County Playground and Recreation Board, consisting of five members appointed by the county judge. The board employs a qualified full-time director and other necessary personnel, determines policies for conducting the county recreation program, controls all expenditures from the annual budget, operates and maintains playgrounds and community centers, and helps to interpret recreation to the general public.

Unless a community is willing to share the cost, it cannot obtain financial assistance from the county board to conduct a local recreation program. The board pays half the cost of the operation of a playground or community center; the particular community must pay the other half. The board discharges its financial responsibility by providing all paid leadership; the community by furnishing the areas, facilities, equipment, and supplies. If a community desires to expand its recreation program, it must be willing to match any increase allocated to it by the board. The key role which the schools have played in providing facilities is seen in the fact that twenty-seven of the thirty community centers now utilized in the county recreation program are school buildings.

PROBLEMS AND SUGGESTIONS

No one of the three types of administrative patterns for community recreation can be recommended as best for all communities. A pattern which works well in one community might fail miserably in another. The reason is obvious. Not only do communities differ widely as to type, size, and location, but the various agencies within the community differ in their ability to provide leadership, facilities, and funds for recreation. Thus a careful study should be made to determine the best type of community organization for the successful conduct of recreation in a particular community.[3]

Teamwork approach

In trying to determine what pattern of community organization will best meet the recreational needs of a particular community, a teamwork approach is essential. Experience has shown that the best way of achieving this approach is through the creation of a community interagency council or committee. In addition to a representative from the Board of Education, this council should include representatives of the various community agencies performing recreational functions or services. The primary purpose of the council should be to establish a co-operative relationship among the member agencies and to develop, through joint planning, a sound program based on the needs and desires of people of all ages in the community.

The schools and all other public and private agencies in the community should be encouraged to adopt the policy of planning jointly—preferably through the interagency council—any new construction of recreational facilities. Such a policy will reduce duplication and waste to a minimum. It will also ensure that new school plants or other community buildings be of maximum use for community recreation.

[3] Jackson M. Anderson, "Evaluating Community Recreation," *Journal of the American Association for Health, Physical Education, and Recreation*, Vol. 24 (May 1953), p. 42.

Desirable legislation

One of the most serious problems in some states is the need for recreation enabling acts which will permit local communities to develop adequate programs of recreation. However, there are at least thirty-five states in which the Board of Education and the school district have broad legal powers for the conduct of community recreation.

Some states have passed laws assigning funds to assist school districts in providing recreation programs and services. The state of Florida has passed legislation adopting an "Eleventh and Twelfth Months Educational Enrichment Program." This law provides financial assistance to local schools to furnish leadership and supplies for recreational, educational, cultural, and social activities during the summer months when the schools are not in session.

Determining community needs

Any program of community recreation which is to be successful must be built around the needs and desires of the citizens of the community. Thus one of the most essential preliminaries to organizing a community recreation program is to conduct a community survey. In smaller communities, the survey may be made by a local college or university which has the resources for conducting such research. Larger communities, however, have experienced greatest success by employing the services of a professional research expert to do this important job.

TRENDS

There is a definite trend toward wider use of schools for community recreation. There is also a trend toward joint planning by all local recreation agencies serving the community. With so many co-ordinated departments of municipal and school recreation jointly financed and administered by co-ordinating bodies from the city and school district, our school leaders need to stress continually strong leadership in recreation as well as multiple use of facilities.

Jackson M. Anderson, Ph.D., Washington, D. C., is assistant executive secretary and consultant in recreation and outdoor education of the American Association for Health, Physical Education, and Recreation. He has served as associate professor of recreation at Purdue University, director of research of the National Industrial Recreation Association, director of recreation of American Airlines, Inc., city director of health, physical education, and recreation, Radburn, New Jersey, and instructor of physical education at New York University. He is author of Industrial Recreation—A Guide to Its Organization and Administration (1955) and numerous articles in professional journals.

Education and Public Health

By Dorothy B. Nyswander

IT is difficult to analyze accurately what has taken place as education and public health, sometimes singly, often together, have worked toward developing the school health program. The program is young in years, and the task, filled with complexities, is far short of accomplishment.

The discussion to follow will be developed around these questions: What are the backgrounds of present interrelationships? What kinds of administrative patterns have evolved? Are there differences in administrative philosophy? What values for children and the community are inherent in differing programs? What nagging problems are sources of conflict? Are present trends toward a solution of problems or amelioration of symptoms?

Backgrounds

The "father" of public health, Lemuel Shattuck,[1] in 1850 indicated the interest in the health of the school child and the potentialities for teaching health in the classroom that have been urgent considerations of knowledgeable public health workers since that time. In public school education at about the same period, Horace Mann was creating a new curriculum in which health was to be included. In 1848 he urged:

> Let human physiology be introduced as an indispensable branch of study into our public schools; let no teacher be approved who is not master of its leading principles, and of their applications to the varying circumstances of life.[2]

Throughout this early period (1850–1900), the influence of Europe was reflected in the health programs of the schools and in public health practice. Medical examinations for school children, individual mental tests, attention for children with handicaps in vision and hearing through special classes and clinics, the teaching of physiology—these were imported together with the theories of Pestalozzi, Montessori, and Herbart. But their appearance on the American scene was spotty.

Beginnings—1900–1930

Programs for health supervision of all children were needed, not hit-and-miss sporadic health services for a few. The cities of Boston and New York took the leadership. The "school nurse" came into being; medical examinations became part of the larger picture of disease prevention; unofficial health agencies focused efforts on the school child; and new societies were organized to improve the health of children. Looking back, it is clear that when *a need to do something* became obvious a pattern not unusual in solving new problems was followed. Each community recognizing the need moved ahead under the leadership of the agency taking the initiative. Thus by 1925 three types of leadership were evident. In some localities school systems were employing staff for health services and health instruction. In others, the health department was providing health services. And in many areas the only help in health instruction stemmed from two unofficial agencies, the National Tuberculosis Association[3] and an association which later became part of the American Child Health Association.[4] The Women's Christian Temperance Union[5] had played its part a bit earlier.

Administrative principles

Dr. Thomas Wood[6] was the able interpreter of principles which today underlie administrative practice, with only minor changes introduced in implementing them.

1. The administrative responsibility for employing personnel to give health services to children in school may rest either in the school board or the Department of Health.
2. The administrative responsibility for health instruction of children rests with the schools.
3. The administrative responsibility for the control of communicable diseases and the sanitary environment of the schools belongs to the health department.
4. The unofficial health agencies and professional health associations may aid either official agency in promoting health services or health instruction but have no administrative authority.
5. Boards of Education do not have responsibility for providing treatment services.
6. Parents should be urged to seek advice from their family physician when they can afford to do so.

The myriad ways in which these principles have been developed into health programs have produced a patchwork quilt for the nation as a whole that confounds a foreign visitor seeking uniformity.

An active and productive period

The first three decades of this century were a period of intense activity. Programs were started. Research was conducted to improve techniques used in health appraisals of children. A powerful resource was found in the American Child Health Association,[7] which identified weaknesses in current practices and recommended changes. On some of the issues pinpointed twenty years ago there has been little progress. In the reorientation of health instruction, however, growth is evident. From an emphasis on knowledge of the human body (physiology and anatomy), the curriculum in health began to emphasize what students needed to know to live healthfully. From regarding health as an objective, apart and different from other educational goals, health teaching became part of the integrated approach to the teaching of "the whole child," a concept which at that time was new to many people.

School administrators also made basic contributions emphasizing the importance of the health of the school child. Health was first in the list of objectives offered in *Cardinal Principles of Secondary Education.*[8] Health services

rated a thoughtful chapter in a publication by the Educational Policies Commission.[9]

Child health demonstrations were financed in rural counties by the Commonwealth Fund; other foundations supported experimental work in mental health and nutrition. The period culminated in 1930 in the third White House Conference on Child Health and Protection.[10]

This was the golden era in school health. It was marked by creativity in thinking about the problems; research, demonstrations, and pilot studies were fostered; the Joint Committee on Health Problems in Education[11] initiated its influential publications; health department personnel and educational leaders were concerned and did something about their concerns; voluntary agencies expanded their educational programs. It was an era of inquiry and productivity.

GROWTH AND CONFLICTS—1930–50

In the next period, health departments began to take on new functions. Proper sewage disposal and insect control had checked malaria, typhus, yellow fever, cholera, and typhoid; immunizations were available and in wide use against smallpox, diphtheria, hydrophobia, and typhoid. Diseases which had been scourges for centuries had been all but conquered. Tuberculosis, however, was still a threat and death rates of mothers and infants had to be lowered.

Specialists in nutrition, mental health, and education were brought in to supplement medical and nursing skills. The education of the public regarding the nature and prevention of disease became a priority for all health personnel. As Winslow had written in 1923:

> Education then is the keynote of the modern campaign for public health. Tuberculosis and infant mortality are pre-eminent among all the causes of preventable disease and death. . . . In each case the fight must be won, not by the construction of public works, but by the conduct of the individual life.[12]

Thus with health goals which could only be attained through the educational process, it was inevitable that public health personnel should become concerned with what was being taught in the schools and with the health of school children. School children would be the adults of the future. At the same time health departments reached out into the community through citizens' committees, participated in health councils, and intensified efforts, with methods borrowed from social work and adult education, to teach adults.

What was happening to educational systems during this period? They, too, were enlarging their vision as to their responsibilities to children. The needs of children and of the community in which the children lived became pivots for curriculum development. As a result the importance of the child's environment in home and neighborhood came to the fore. Schoolmen began asking parents and citizens to help in the education of the "total child." With broader concepts of child growth and development, new types of workers were needed on school staffs. Physicians, nurses, and a few teachers, all with postgraduate training in school health administration, were employed. The guidance personnel with its core of psychologists, psychiatrists, psychiatric social workers, and visiting teachers became part of school programs. Dentists, dental hygienists, nutritionists, and medical social workers were added.

Thus it appears that schools and health departments were following parallel lines of development. Both had enlarged vistas of what their jobs should be and because of this, for very different reasons, they needed new kinds of staff and greater support from the community. It is little wonder that with the same kinds of health workers employed in the two agencies, and with the need often to work with the same segments of the adult population, the parallel lines sometimes crossed—to the confusion of everyone.

Impetus to better services in health departments came through national legislation which, in 1935, made funds available to state health departments in the form of grants-in-aid.[13] It became possible to provide services in areas where, heretofore, none were available and to train personnel. The effects of this support were felt immediately. One of the results was the employment in many places of personnel trained in maternal and child health and in school health. It was not uncommon to find state health departments employing health educators only to assign them to state departments of education so that they could participate in planning the health curriculum and in teacher training. This influx of funds to state health departments seemed threatening to some of the health service personnel employed by schools.[14]

The conflict as to who should administer the school health service program reached a crisis during the years 1946–49. During these years several attempts were made to get bills through Congress to step up health services, health instruction, and physical education by providing funds to the states. The question was, Which agency in the state should administer the funds?

Opposite opinions were voiced by public health and school administrators. Naturally, the bills failed to pass, although the United States Office of Education, the federal Public Health Service, and one or two professional organizations did their best to get an acceptable compromise. On the local levels the conflict for power became intensified during and after this period. School personnel believed that health departments wanted to "take them over." And some health departments undoubtedly did.

PRESENT "COLD PEACE"

As usual, persons with level heads on both sides of the fence restored the peace, a peace of sorts. Two states, Indiana and Mississippi, worked out unique administrative patterns in which the state Departments of Health and Education have joint responsibility in financing and supervising the school health program. A résumé of the present status is given by Kilander.[15] Of 2,886 city school systems, administration of the school health service program is by the Board of Education in 60 per cent; by the Board of Health in 11 per cent; jointly by Boards of Education and Health in 23 per cent; and by other agencies in 6 per cent. son [16] interprets these data as a trend toward joint administration and financing.

In 1951 a working basis was restored. This came about through a statement [17] of twenty-one principles for the conduct of school health service programs issued by the National Council of Chief State School Officers and the Association of State and Territorial Health Officers. It was a statement long overdue but gratefully received.

Positive factors

In the school health program today, the following positive factors may be noted:

Interdepartmental relations are on a formal working basis as far as program responsibilities go.

Co-operative effort is evident in providing in-service training institutes for teachers.

Steady progress is being made in schools of education and departments of health and physical education to prepare teachers to include health emphases in their classroom work.

Health curricula and textbooks are improving rapidly, incorporating principles found currently in other fields of instruction.

Technicians to do routine vision and hearing testing and clerical workers to relieve nurses and teachers are gradually being introduced.

More study is being given to health services needed for handicapped children.

Public health nursing continues its efforts to educate schoolmen and parents to the professional use of nursing skills in schools.

Greater influence on health curricula and some changes in the health services are being introduced by those physicians, nurses, or directors of health and physical education who, with a public health point of view, are administering the health program in schools.

Needed improvements

There are also discomfiting features:

Although advances in health curricula are being made, there have been only a half dozen studies during the past fifteen years which have contributed to improving the conduct of the health service program. Many practices still in vogue are those advised by Wood and Rowell in the 1920's. There has been no testing of their validity. Studies are needed to validate the necessity or advisability of annual medical examinations, of annual dental examinations by school dentist or dental hygienist, of periodic medical examinations, and of the referral system of selecting children for medical attention and its effectiveness in different types of rural and urban areas. Dozens of routine practices by nurses and physicians need careful scrutiny.

Thoroughgoing investigations need to be made of the value of every health record and printed notice now in use.

No serious attempts have been made to evaluate the use made of health records by the staff. It is still possible to find schools with adequate nursing time where teachers, on being questioned about children with health problems in the classroom, have little or no knowledge about the health needs of a single child. "Oh, that is the nurse's job. She can give you the information." Or, "The nurse must have that information. She keeps the records in her office." Such remarks by teachers are symptoms not only of a breakdown in the communication system but also of lack of acceptance by school administrators and health personnel alike of the idea that *the teacher is a fundamental member of the "team";* that without the teacher, health services to children by other staff members are a fifth wheel which rolls along quite independent of the basic goals of education.

In many areas, the personnel administering the school health services lack qualifications for the job. Health departments lack medical staff with keen interest in the potentialities of the school program. A good pediatrician may be oriented only to clinical services with infants and preschool children. His training has not made him comfortable with the educational program of the schools. He has little skill in program planning. City schools often employ physicians with few qualifications for their task. Not able to think creatively in the field, they carry on in traditional ways. Not administrators, they fail to use opportunities to co-ordinate health services with the health instruction, physical education, and guidance programs which are within their own administrative framework. Their relationships with the health department are formal, distant, and stereotyped.

The most serious handicap in towns and rural areas, however, is the employment of nurses by school districts without provision for their supervision or professional growth. Many of these nurses have had neither training nor experience in public health nursing. Their vision of the job is limited to their clinical experience in hospitals and the expressed needs of principals and teachers. Their work is oriented to the child and the employer, not to the family or the community. School administrators in such situations isolate nurses from their own profession, and the health program in the school reflects this fact. Indeed, a health program may not exist at all, for the mere presence in the school of a physician, nurse, or dentist is no guarantee that the specialist is able to develop a plan which provides health supervision to every child in the school, education to teachers and parents, utilization of community resources, and integration of the different activities within the school contributing to the development of healthy children.

Where qualified nursing or medical supervision is lacking in both the schools and the health department, little can be done to remedy this situation. But in many instances a qualified and interested director of maternal and child health and a qualified director of public health nursing are found in the health department. These people sit on the side lines biting their fingernails. The school requests their services neither in program planning nor for supervision. The community is the loser.

THE ISSUES

What are the issues today that block better co-ordination between schools and health departments, that keep them from joining forces? There are several, different in kind and intensity.

Differences in orientation

Basic to many of the issues is the different orientation of personnel in schools and personnel in health departments. The schoolman is interested in the child. All his forces are focused on helping the child to learn. When a new staff member is added, his task is to add something of value to the child's experience. The child is the unit with which he works. When he asks for aid

[16] Charles C. Wilson, *School Health Services* (Washington, D. C.: National Education Association and American Medical Association, 1953), p. 377.

[17] National Council of Chief State School Officers and the Association of State and Territorial Health Officers, *Responsibilities of State Department of Education and Health for School Health Services* (Washington, D. C.: National Council of Chief State School Officers, 1951), pp. 9–10.

from the community, he seeks it to enrich the learning of the child.

For the health department the unit is the family. The problem may be one of prenatal care, tuberculosis, nutrition, geriatrics, or mental health. The fundamental concern is the education of all members of the family; the thinking of the staff encompasses the interdependencies and problems of family members. The child's health is part of the constellation of the family's health. The particular health problem of the school age child is seen in relation to the problems the mother is having with an infant or to the father who has been diagnosed as tuberculous. Priorities of health problems as seen by the family are recognized.

The public health worker is disturbed because he cannot communicate to the schoolman the values which he sees in the family approach to health promotion. The schoolman feels as though he were beating his head against granite when he insists that the needs of individual children for attention must be met. Neither professional group comprehends the other's philosophy, and the "social distance" between them seems to have no bridge. Each group is oriented according to the philosophy of its professional schools, which have failed to include training in understanding other points of view.

Administrative responsibility

Administrators in their training learn that responsibility and authority should be inseparable, and in their work they soon find out that having "control" of services makes life much simpler. But in both public health and education new objectives have been accepted for which skills not possessed by one agency are needed. The development of a complex program using resources outside the agency demands a new dimension in administration, namely, administration by a committee or commission. The classes for children with cerebral palsy are an example of this kind of administration. Schools, health departments, medical schools, and voluntary agencies interested in the crippled child share in providing specialized staff, funds for operation and maintenance, and supervision. The program works.

Differences in financing programs

What effect does the autonomy of the school district have on its relationships with the health department?

Although the federal grant-in-aid program to state health departments gave considerable impetus to the school health field the picture on the local level is different. The budget of a city or rural health department is only part of the budget for all local governmental services; accordingly, to obtain funds for additional nursing staff to give increased school service is often difficult. The budget of the school board is another matter. The decisions regarding budget items are made by the school board itself, whose sole responsibility it is to provide the best schools that the community can afford. At the local level, therefore, Boards of Education find it easier to finance additional nurses and other health service personnel than do health departments.

Health officers recognize the greater ease with which health personnel can be added to the school payroll, and some of them, knowing the need of services within the school and convinced of the futility of trying to employ additional staff, are encouraging school boards to go ahead. At present, in many cities and counties of California where nurses are employed by school boards, the schools have for school children alone approximately the same number of nurses that local health departments have to serve the needs of the entire population.

Different methods of financing school health personnel have brought about differences in employment standards. Health personnel employed by schools have a salary scale at variance with that of health department personnel. The hours of work and vacation periods of personnel employed by schools are similar to those of teachers. Health department personnel naturally view with a jaundiced eye these discrepancies in salaries and working conditions. The last straw is added when health department personnel are asked to take over special school cases or meet emergencies during the summer because school personnel are on vacation.

Separate financing presents other problems. It produces multiple programs within cities and counties. Different school districts within a county may each have a different school health program. Some may have contracts for nursing services with the county health department; others employ their own health staff. In cities, with but few exceptions, the health department gives health services to parochial schools. Thus within cities there are usually two different school health service programs. And within counties there may be three or more. These variations are confusing.

Research and appraisal

The lack of significant studies in the field of school health may stem from the difficulties just presented. Or it may have its origins in complacency or in the stability which a "cold peace" brings. Whatever the causes, there is at present little evidence of administrators' seeking an answer to the question, "How well are we doing in the school health program?" Opinion is substituted for data. Old ways are easy ways. Data will not be forthcoming until willingness is expressed by administrators to appraise any and all parts of the school health program.[18] Health departments and schools alike are evading the issue of appraisal.

It is from community leaders on the outside that questions are coming. They ask where the data are showing to what extent community facilities for meeting the diversity of local needs are available to parents of every school child. What analyses have been made of the professional skills needed in the school health program, to point the way toward new types of workers or different training for those we now have? Is the assumption valid that the health services are educational? Research in these areas takes courage; some of the answers may threaten the status quo.

CONCLUSION

In most of the country there is still a hodgepodge of health services in schools which cannot merit the term *program,* if by program is meant planned sequences of activities toward accepted objectives. Efforts to bring programs into being, however, are not lacking. State co-ordinating councils in many states have done yeoman's work to improve the situation.

The crux of the difficulties is at the local level. Here is where the professional people live who do the work. It is not always easy for them to be objective about what they are doing. Here differences in philosophy, administrative policies, and ease of financing programs create situations which are tolerable but uncomfortable. Tensions are controlled but near the surface. All this would not be serious were it not for the fact that these two agencies, the

[18] New York City is an outstanding exception. The Department of Health and the Board of Education have during the past thirty years periodically secured funds for investigations of the health service program.

school and the health department, are agencies of the people created by them to serve them.

New patterns of working together need to be experimented with at state and local levels. One such pattern on the state level might be that of administration through a commission made up of representatives of health, education, and individuals outside the two departments with a demonstrated interest in the welfare of children. The functions of this commission would be in line with the philosophy of state services to localities. Where state employees give no direct services to localities the commission would have one type of co-ordinating service to render. Where direct services are given by one or both of the departments, a different approach would be needed. In either case the approach to localities would be that of a "team."

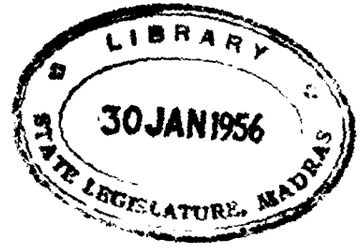
Administrators' responsibility

The complexity of the problem on the local level, especially in rural counties, will only be resolved by administrators themselves. It is to be hoped they will do so before the public insists upon it. At present there is no one solution. Situations are too varied to hazard a suggestion. Solutions will be found only through initiating a plan and evaluating it.

The school superintendent and the health officer are key figures. They need to understand better than they now do each other's responsibilities. This personal relationship between the two administrators cannot be overemphasized. It permeates the attitudes of their staffs; it will be reflected in the kind of planning for health care children in schools receive. Better understanding has in some instances been brought about by making the local health officer a nonvoting member of the Board of Education. In other communities the school superintendent and the health officer each attends the board meeting of the other agency.[19]

Another effort toward understanding has been the employment of a medical director by funds from both agencies. In the health department this physician serves as the director of maternal and child health; in the school department he is the co-ordinator of health services. In this plan, the nursing staff, dental staff, technicians for testing hearing and vision, and physiotherapists may be employed by either the Board of Education or the Department of Health.

Many variations of this plan are possible. A medical director or a public health nursing supervisor employed by either the health department or the schools, or by both, is accepted as a member of both departments and gives leadership to the staff under him irrespective of who pays his salary.



Co-operation is an empty word unless there is an investment in the job by the "co-operating" parties. There is little that staff members can do to develop significant patterns of work unless the framework has been built for them by the top echelon. Where this has been done some interesting ventures have been undertaken. School nurses and public health nurses have divided up the total area, and each nurse gives generalized public health nursing service. In other places district superintendents of schools, when employing health staff, make it clear that professional leadership will come from the supervisor of public health nursing or other professional staff of the local or state health department.

At present sharing skilled services in order to meet the health needs of the community waits upon the vision of administrators. It is no longer a question of who pays the salary for whom. It is a question of imagination in making full use of all personnel and facilities to improve life within the community.

How can administrative insights be heightened? Health officers in their training may learn little or nothing about school administration. The converse is also true. The conclusion should be obvious. Interdepartmental planning of common experiences for future administrators of schools and health departments should begin on the university level. Here is the place where divergent philosophies can be recognized if not reconciled; where respect for the contributions of each profession to society can be built; where practical problems can be debated without the heat which the job situation creates. Here, too, is the place for analysis of old procedures and the time for fertile invention of new.

Dorothy B. Nyswander, Ph.D., Berkeley, California, is professor of public health education in the School of Public Health, University of California. She has been a consultant to departments of education and institutions of teacher education with the Inter-American Education Foundation; co-ordinator of an international seminar in health education in Panama (Foreign Operations Administration); visiting consultant to Latin America (World Health Organization); member of the Expert Committee on School Health (World Health Organization); director of Health Education Demonstration, New York City Department of Health; director of the Astoria Study, New York City Board of Education and Department of Health; professor of educational psychology, University of Utah. She is the author of Solving School Health Problems (1942) and articles in educational and public health journals.

Education and Social Welfare

By Kermit T. Wiltse

OUR concern with achieving better co-ordination of the efforts of the educational and social welfare agencies of the community is grounded on the premise that these two types of agencies must work closely together if the children and youth of the community are to be well served. This would seem an obvious premise scarcely worth reiterating if it were not for the observable fact that such co-ordination of effort is nearly nonexistent in many of our American communities and approaches the ideal in none of them.

Co-ordination of the efforts of educational and social welfare agencies in meeting the needs of children and youth has two aspects. One is the relationship of the educational agencies of a community to the existing social welfare agencies as they collaborate in meeting the problems of individual children or groups of children and youth and work together toward improving the effectiveness of both the educational and social welfare services of the community. The second is the utilization of social-welfare-trained personnel within the schools themselves. This second aspect is commonly referred to as the development of school social work and results from an expanding concept of the purpose and function of the educational agency rather than a new concept of social welfare.

Definition of Terms

It is necessary first to state what is meant by the terms "educational agencies" and "social welfare agencies" of the community, as they are used here. For the purposes of this article, in speaking of the educational agencies of the American community, the focus is primarily upon the public elementary and secondary schools. Day schools located in the child's home community and supported by religious orders or private payments are included wherever they meet essentially the same educational need as the public schools. Social welfare agencies cannot be so precisely delineated. Again for the purposes of this article, in speaking of the social welfare agencies of the community, the focus is upon those agencies which are established by the community to help individuals and groups of individuals who are experiencing or evidencing problems in their social adjustment. Central to our consideration here are certain public agencies created by various combinations of federal and state laws and county and city ordinances. Of particular importance are the juvenile courts and the juvenile detention and probation services, the youth detention and parole services, state and local mental hospitals and mental health clinics, the child welfare services in the public welfare department, and that part of the public assistance program that provides financial aid to needy children and families.

Each community has its own constellation of services supported by local community chests and individual subscription, the number and type being generally larger and more varied in the urban communities than in the rural. Family and marital counseling agencies, institutions for the care and treatment of dependent and disturbed children, foster home placement agencies, mental health clinics, and a wide va-

riety of group-serving agencies that are more or less geared to helping children with identified or identifiable problems in their social adjustment should be particularly kept in mind. As we consider the variety of public and private agencies engaged in some type of service for the general good or improvement of the community, a line cannot be sharply drawn distinguishing agencies termed "social welfare agencies" from those that are not so designated. However, if we keep in mind the essential point that a social welfare agency is directed toward individuals who are experiencing a more or less identified or identifiable problem in their social adjustment, a line, albeit not a sharp one, can be drawn between such agencies and the innumerable institutions, agencies, and associations of every community that are aimed at meeting the normal needs experienced by everyone.

Types of Community

When we begin to talk about co-ordination and collaboration between the educational and social welfare agencies of the community in other than a vacuum, we have to visualize real people doing actual educational or social welfare tasks in various types of communities. We have to visualize the one-room school (of which there are quite a few still in existence) located, for example, on the plains of North Dakota. Let us take the example of a child coming to school poorly clothed and apparently neglected. What is the problem of co-ordination of the teacher's concern with the concern the public child welfare worker located in the county seat thirty miles away would have for any child in the county suffering emotional and physical deprivations? What similarity, if any, does the problem of co-ordinating their efforts bear to the problem of the principal of a junior high school in New York City who desires to relate the efforts of himself and his staff concerning individual problem children in his school to the multiplicity of community social welfare agencies and activities? As we attempt to visualize all the variations between these two selected extremes, each community presenting something of a unique pattern of both educational and social welfare activities, we may wonder what useful generalizations can be made that will apply in whole or in part to all situations.

Obstacles to Co-ordination

The most cogent generalization that can be made is that educators are by and large lacking in real knowledge of the purpose and nature of the welfare agencies of their communities and particularly lacking in understanding of the methods of the social workers that staff these agencies. By educators we mean real people—teachers, principals, and superintendents. Certainly there are many exceptions to this generalization, but proportionately their number is few. This assertion is based on a variety of observations—personal experiences of the writer and numerous written expressions of specialists in the educational field. It can also be asserted that social welfare agency personnel—by which is meant people primarily identified with the profession of social work—do not always appreciate the nature of the educational process and the nature of the tasks of the people who implement this process. Education, like social work, is a relatively new profession. Some who are identified with it have little preparation for their job. Perhaps many more, as is true also of social work, have little real sense of identification with their profession. All social welfare personnel, however, have themselves experienced the educational process and are in favor of the purposes of education if not always with a par-

ticular method, whereas very few educators have personally experienced a welfare service. They are likely to share the still prevalent misconception that grew out of the historical linking of welfare services with charity and relief giving and produced the stereotype of social workers as "uplifters" or "do-gooders." A more realistic conception of a social worker as a person with specific professional education implementing defined social welfare services, each of which is focused on certain types of problems in individual adjustment, is only beginning to emerge, and many social and psychological forces, plus the lack of sufficient professionally trained social workers to staff the welfare services of the nation, will retard the development of a new cultural concept for many decades to come.[1]

There is little that happens to the educator in the course of his professional training either to give him a real knowledge of the nature of modern welfare services in general and of the services likely to be available in a specific community or to change whatever stereotype he may have acquired about social workers. It is improbable that he took a single course devoted to a study of the resources likely to be available in the social welfare services of a typical community. As part of a social-problems course, perhaps in his sophomore year, he may have studied the community as a theoretical concept and briefly surveyed types of treatment for various classes of social problems. But this does not give him an adequate appreciation of how he himself as a teacher or administrator in a public school can more effectively utilize the social welfare resources of the community to meet the needs of children and youth. The specialized content of education, and similarly the specialized content of social work, have become so large that opportunities for a student of one to learn about the other in the course of his college work are minimal and often accidental.

[1] A study of the educational attainment of all personnel employed in positions classified as social work positions in 1950 showed that only one out of five had completed the master's degree in social work which is the standard requirement for full professional status.—*Social Workers in 1950* (New York: American Association of Social Workers, Inc.), p. 8.

PREREQUISITES TO CO-ORDINATION

True co-ordination and collaboration between two different professions identified with different agencies serving the community depend upon the existence of certain attributes in each, namely, (1) security of the members in their own profession, based on their having met specific educational requirements of a professional order; (2) knowledge of the purposes of the other profession and some understanding of its methods; and (3) an appreciation of how their respective roles complement and supplement each other.

Considering the total national picture, none of these three conditions is met to a substantial degree. Individuals, entering both teaching and social work without sufficient specialized training for the tasks they are to perform, are not professionalized. However, they are only a little less ready for teamwork with members of the other profession than those who have a sense of identity with their own profession but have had little opportunity to understand the purpose and nature of the other profession or to consider on what problems and in what ways members of the two professions must work together if their communities are to be well served.

Educators would be more likely to conceive of the schools as one of a number of agencies in the community engaged in serving the children and youth of the community if this perspective were consistently presented to them in the course of their professional preparation. It is a subtle point, but it often seems to persons from the outside that school people are prone to think of the school as the center of the community rather than as one of the many agencies serving the community, each of which must understand and relate itself to the others.

Most urban and semiurban American communities have some kind of community welfare council to co-ordinate, extend, and develop the various health, welfare, and recreational services of the community. The schools should always be represented on such co-ordinating and planning councils. In fact, educators should be in the forefront in leading toward more adequate social welfare services in their particular communities. A real concern for the total welfare of the children and youth they serve dictates nothing less. This is over and above their need for effective help with specific problems, such as the kind of service that can be given by a well-qualified juvenile court staff in dealing with the problems of the habitual truant.

It is difficult to discuss this whole matter of co-ordination between the educational and social welfare agencies without seeming either so general as to be meaningless or so specific that the ideas are not transferable. From the standpoint of social welfare, anyone who has worked in this field can cite numerous examples of fruitful collaboration with educational agencies and school people and, in the same breath, examples of inability to achieve communication and hence co-ordination, often with tragic consequences to children. The failures usually go back to a lack of bridges built during the professional preparation of educators and social workers across which communication could have been established. The successes can be attributed to individual educators and social workers who are able to make an imaginative analysis of the essential ingredients of the tasks before them, usually as related to specific problems obviously the concern of both the school and the social agency, and to go on from there to work out patterns of communication and collaboration.

TOWARD WORKING TOGETHER

A specific example of an imaginative effort to develop understanding and collaboration was the conference between educational and social welfare agencies conducted in Oakland, California, during the summer of 1954. This three-day, workshop conference was sponsored jointly by the Oakland Public Schools and the School of Social Welfare, University of California. The title of the conference was "Teamwork Between Teachers and Social Workers in Helping Parents, Children, and Youth with their Social Problems." The stated purpose was to bring teachers and social workers to consider their complementary roles in helping children in the public schools with their problems in social adjustment.[2] Some of the typical problems identified and possible solutions suggested are quoted here because they so well illustrate the basic problems of relationship between educational and social welfare agencies which have been the subject of this article.

Two basic problems were identified which were related to the organizational structure of communication between educational and social welfare services. One was the need for more specific information on the part of school people

[2] This material is drawn from the unpublished reports of the conference in the files of the School of Social Welfare, University of California, Berkeley.

about the actual services of the social agencies of the community, including those provided within the school system. The other was the need to develop or to define channels of communication between schools and social agencies, and among social agencies when more than one is related to a particular social problem of children in school.

Various aspects of these two basic problems were explored, but essentially each came back to these two fundamental needs—more adequate information about each other and better channels of communication in order to work together. Whether we are thinking of the one-teacher school on the plains of North Dakota or the huge school system and the complicated network of social welfare agencies of a large urban area, the problems of co-ordination and collaboration come down to these two fundamental issues.

Many different suggestions looking toward solution of these two basic problems can be listed. The Oakland conference developed such possible mechanisms as (1) some type of social service index to help teachers know when a child's family is already receiving help; (2) organized case conferences between agencies and including the classroom teacher; (3) a network of neighborhood councils in which school and various agency personnel would play an active part, these councils in turn co-ordinated into a city-wide system; (4) a more dynamic use of materials giving information on the functions of the different social welfare agencies and how to use them, with the school libraries playing a more active role in obtaining and disseminating such information; (5) a continued and dynamic use of city-wide conferences such as this one, plus smaller institutes and workshops dealing with specific problem areas.

Different communities would inevitably utilize different variations on these mechanisms of collaboration. Quite different things will work in different communities, because of the different type of community (rural, urban, etc.), the different agencies, and even the different personalities involved. If both school and social welfare people think of themselves as representatives of institutions complementing each other in the service of children and youth there will be more imagination displayed in developing mechanisms for co-ordination and collaboration.

SOCIAL WORK IN THE SCHOOLS

A different approach to the solution of these basic problems of collaboration between the professions of social work and education has been the development of what is commonly termed school social work. School social work began almost simultaneously in New York City, Hartford, and Boston in 1906 and 1907.[3] At first the service was provided by certain social welfare agencies responding to the need for co-operation between the school and the community for the benefit of the child. In New York City, two settlement houses, Hartley House and Greenwich House, assigned two workers to visit schools and homes and to work closely with school and community groups to bring about greater understanding between home and school in the interests of the child. In Boston, the Women's Educational Association established a home and school visitor in one school in 1907. In Hartford, the beginnings were made by a "special" teacher who

[3] For a more thorough statement of the development of visiting teacher services see U. S. Office of Education, Federal Security Agency, *The Place of Visiting Teacher Services in the School Program*, Bulletin 1945, No. 6 (Washington, D. C.: Government Printing Office, 1944), pp. 7–15.

was assigned to assist the school psychologist in securing histories and to carry out recommendations of the psychological clinic. Rochester, New York, where a visiting teacher service was established in 1913, was the first city in the country where the service from its inception was financed by the Board of Education. During the 1920's a demonstration project in thirty widely distributed urban and rural areas was financed by the Commonwealth Fund.[4] At the end of the demonstration period, the local community, if it felt that the project had been valuable, was to share the expense and take over full responsibility for the service. As a result, twenty-one communities incorporated the service into their school systems.

In 1944, the last date for which accurate figures are available,[5] full-time school social work services were in operation in 266 communities; the number has increased considerably since then. In 1919, the American Association of Visiting Teachers was formed and in 1945 was reincorporated as the National Association of School Social Workers. The present membership is approximately 650.[6]

In this brief history of the development of school social work, some important facts are apparent. Beginning as a service provided by social welfare organizations outside the school, the visiting teacher idea was rather quickly taken over by school departments as part of their regular program, and the number of school departments providing this service has grown steadily if not phenomenally. In a visiting teacher service which was part of the school system, the initial emphasis was naturally upon the visitor as primarily a teacher, a member of the educational profession, but emphasis has now shifted to recognition that he must be a qualified social worker as well as an educator. The interprofessional requirements of the job of school social worker pose a problem for personnel training as well as for the individual worker.

Function of the school social worker

The question of function has occupied the attention, and been responsible for a major part of the published opinions, of school social workers[7] since their emergence as an identifiable group. A perusal of back issues of the *Bulletin of the National Association of School Social Workers* reveals that the largest proportion of the articles are devoted to exploring various aspects of social workers' functioning in school programs and to interpretation of the results of their activity. This is to be expected when one profession—especially a new and self-conscious one such as social work—is endeavoring to find its way in relation to an older, more established institution, and a new member—the social worker—is trying to play on a team in which the roles of the teacher and the principal are traditional and those of the school psychologist and the school nurse well established. That with school social workers actually functioning in only a small number of American school systems a similarly

[4] A detailed description of the development of this project may be found in the Annual Reports of the Commonwealth Fund, New York, 1921 through 1926.

[5] U. S. Office of Education, *op. cit. supra* (note 3), p. 18.

[6] Florence Poole, "School Social Services," *in* American Association of Social Workers, *Social Work Year Book, 1954* (New York: American Book–Stratford Press, Inc., 1954), p. 469.

[7] The term "school social workers" is used loosely here to cover all who identify themselves professionally with social work though in their particular school system they may have various titles such as school social worker, visiting teacher, school guidance worker, or home and school counselor.

small proportion of school people have even glimpsed what social work may have to contribute to the educational process is also to be expected.

What auxiliary services must participate in the educational program if the purpose of the school is to be effectively carried out is one of the most urgent and pervasive issues facing educators today. The roles of the school doctor, the school nurse, and the school psychologist have been increasingly defined and accepted as an integral part of a modern and forward-looking educational system. Is the role of school social worker destined likewise to be increasingly defined and accepted as an integral part of the educational system, auxiliary to the main function, but an essential aid to the educational process? The steady increase in the utilization within the school program of personnel trained in social work would certainly suggest an affirmative answer.[8]

Social work in the school is not an independent enterprise but an integral part of the educational system. Helen Witmer[9] reminds us of this fact in describing the responsibility of the social worker in the school as one of contributing his skill to the fulfillment of the school's purposes. He is not a family welfare, child welfare, or mental hygiene worker who has an office in a school building and whose salary comes from school funds. He brings the knowledge, the skill, and the accumulated experience of another profession—social work—to teamwork with the teacher and other specialized personnel, such as the school psychologist, for the solution of the educational problems of individual children and youth.

[8] For example, since 1944, seven states and Puerto Rico have passed and implemented legislation on a state-wide basis.

[9] Helen Leland Witmer, *Social Work: An Analysis of a Social Institution* (New York: Farrar and Rinehart, Inc., 1942), pp. 357–67.

A co-ordinating mechanism

The focus of this article has been upon the co-ordination and collaboration between two types of personnel, educators and social workers, representing two major social institutions, educational and social welfare agencies. The social worker functioning as an integral part of the educational agency represents a most significant and promising mechanism for linking these two professions in joint efforts to solve problems of school adjustment of individual children and youth. The social worker in the schools must be seen neither as an early case-finding and referral agent only (although referral to community resources is a very important part of his function) nor as a social welfare agency transplanted to the school system. His duties include direct help to individual children and parents, consultation with teachers and with other school personnel, and conferences with representatives of other community agencies. But the concept to be kept clearly in mind to bring these diverse activities into perspective is that he is applying the knowledge and skills of social work to the solution of educational problems of individual children and youth. A child is seen as a *child in school* and parents are seen as *parents of a child in school,* not simply as a child or parents who might be experiencing any one of a variety of difficulties in their social adjustment.[10]

[10] For a more thorough discussion of the rationale of social workers functioning within school programs and the nature of their tasks see Florence Poole, "An Analysis of the Characteristics of School Social Work," *Social Service Review,* Vol. 23 (December 1949), pp. 454–59. Also Mildred Sikkema, *School Social Work Practice in Twelve Communities* (New York: American Association of Social Workers, 1953), p. 27, for a statistical breakdown of a distribution of interviews.

The social worker's special skills

Out of his educational experience in preparation for his profession, the social worker brings to bear upon a child's individual problem in school adjustment certain specific knowledge and skills. His focus is upon the relationship of the individual to his social environment, and therefore he has particular ability to understand the meaning of the school experience as social experience for the child. He has given much time and study to the meaning of parent-child relationships and, therefore, has special understanding of the effect of parental attitudes and behavior upon the child as it may relate to his difficulties in school. He has learned to use his relationship to the person being helped as the medium through which help is given —specifically, help to parents in changing attitudes and responses that adversely affect their child's adjustment in school, or help to a child in changing his response toward the school experience. Finally, and of great importance, he brings specific knowledge of the social welfare resources of the community and can enter into quick and effective communication with the agencies which supply them.

When we examine this whole problem of achieving better co-ordination between the educational and social welfare resources in the interests of children and youth, we see school social work as one of the most important linking mechanisms to develop in our century.

SUMMARY

This brief analysis of the problem of co-ordinating the efforts of educational and social welfare agencies in meeting the needs of children and youth has identified the basic obstacles to co-ordination as insufficient understanding and appreciation of each other on the part of educators and social welfare personnel; a specific lack of knowledge on the part of educators of the purpose and nature of the welfare services of their community; and inadequacy of the channels of communication necessary if people are to work together. Solutions to these problems lie in three directions: (1) additional cross-fertilization between educators and social workers during their educational preparation; (2) imaginative efforts on the part of educators and social welfare agency personnel in the community toward developing additional structures for communication and co-ordination; (3) employment of social-work-trained personnel by school systems to contribute their skill to the solution of individual student problems and to link the school more directly with the social welfare agencies of the community in dealing with problems that go beyond the purpose and resources of the school.

Kermit T. Wiltse, D.S.W., Berkeley, California, is assistant professor of social welfare, School of Social Welfare, University of California. In addition to his academic duties, he has served in a consultative capacity to civic, state, and national governmental agencies and has participated in public lectures and forums. Recent publications of his include annotated case material on "The Tigner Family" in The Field of Social Work (1955 edition), and other articles on the subject of social casework in general public assistance and in the Aid to Dependent Children's program.

The School and the Public Library

By Frances Henne and Frances Lander Spain

In the history of public education for children and young people [1] in this country, probably no two social institutions have had a closer working relationship than the school and the public library. This relationship has had a variety of arrangements and practices—all emerging, in one way or another, from the belief that books form an essential element in the lives of youth and should be made easily accessible to them. From the start, making books easily accessible for all children and young people meant providing free public libraries and school libraries; not just because home libraries, church libraries, and bookstore facilities were relatively scarce and often meager in content, but primarily because the idea of a free society stood for free libraries as well as free schools. These concepts hold true today.

During the last seventy-five years, community library service for youth has consisted of three major types: (1) books and library services for youth in the public libraries; (2) books and library services for youth in both the public libraries and the schools, with the public library usually assuming the responsibility for partial or total library services in the schools; and (3) books and library services for youth in both the public libraries and the schools, with each of the two agencies assuming complete and independent administrative responsibility for its libraries. These three patterns may be considered as forming a sequence of developments in the history of library service for youth, in that the first type prevailed during the beginnings of library service for children and young people, the second type predominated during the intermediary or transitional stage, and the third type characterizes the existing situation.[2] Even though the third type represents accepted theory and approved practice, the first and second types are still frequently found today.

[1] In this paper, the term *children* refers to children who are thirteen years of age or younger; the term *young people* refers to the high school age group; and the term *youth* refers to children and young people collectively.

Types of School and Public Library Relationships

These patterns of library service brought into existence many relationships between the schools and the public libraries: some direct and involving formal agreements; others indirect or implied, and often resulting in informal co-operation between the two agencies. It is the purpose of this paper to indicate the kinds of existing relationships that schools have with public libraries and to note the types of co-operation and co-ordination that are desirable.[3]

[2] For details and bibliographic references, see Mildred Batchelder, "Public Library Influence on School Libraries," in Alice Lohrer (Editor), "Current Trends in School Libraries," *Library Trends,* Vol. 1, No. 3 (January 1953), pp. 271–85; Lucile F. Fargo, *The Library in the School,* Fourth edition (Chicago: American Library Association, 1947); H. L. Cecil and W. A. Heaps, *School Library Service in the United States* (New York: H. W. Wilson, 1940); C. B. Joeckel, *The Government of the American Public Library* (Chicago: University of Chicago Press, 1935), and Effie L. Power, *Work with Children in Public Libraries* (Chicago: American Library Association, 1943).

[3] Although this paper is not concerned with library service for adults in general, it should be noted that there have been, and still are, numerous instances of public libraries sponsoring adult education programs.

The most important and significant relationship existing between the public libraries and the schools today is probably that of mutual approval and support. Those connected with the school recognize that in the public library there are materials of communication and advisory services that are available for and used by groups closely identified with the school—children, young people, teachers, school administrators, parents, and others. Similarly, the public library staff recognizes that a good school library and the services that accompany it form an essential and integral part of the school, without which the school cannot achieve its educational objectives and without which the public library objectives are distorted. Those responsible for the schools and those responsible for the public libraries, as citizens and educators, are desirous that their communities have good schools and good libraries, and lend support to each other in achieving that objective.

Library Service to Children

A variety of conditions and situations exists in the provision of library facilities for children of elementary school age. In terms of the accessibility of libraries, the following situations are those that are most commonly found today:

1. Communities that have good school and public library facilities. In these communities, the child has access to two complementary library services for children, with similar collections of books and other materials—one in his school and one in his public library. The child needs and uses both libraries, sometimes for books and other materials for academic work and at other times for books and other materials not related to school assignments.

2. Communities that have good public library services for children and either no libraries or some partial form of book service in the elementary schools. In communities of this type, libraries and library services are virtually nonexistent for the many children who do not use the public library.[4]

3. Communities that have good elementary school libraries and either poor or no public library service for children. In these communities, some children are deprived of very rich and rewarding experiences in their lives.

4. Communities that have neither good public library facilities for children nor libraries in the elementary schools.

Types of administration

The over-all pattern of library service for children becomes more complex when the number of arrangements employed for administering this service is considered.[5] In some communities, the school assumes full administrative responsibility for the school library, and the public library assumes full administrative responsibility for public library service to children. In other instances, the public library assumes full responsibility for library services in the schools as well as for children's library service in the public library. In still other

LeFevre, "Administrative Control," in Alice Lohrer (Editor), "Current Trends in School Libraries," *Library Trends,* Vol. 1, No. 3 (January 1953), pp. 286–97.

situations, a co-operative form of administering the school libraries is maintained by the schools and public libraries—one agency may furnish the books for the school library and the other agency may provide the library staff, or some other variation of this co-operative agreement may exist. The administrative arrangements just noted apply to communities with separate school boards and public library boards. In addition, there are some communities where the public library is under the general administration of the local school board. Further variations in these existing patterns may be noted in those cases where the units of administration, either public library or school, are county units rather than municipal district units; and where materials, and sometimes services, are provided by the state library or state education agency.

Standards and needs

Despite these many variations in the extent to which library services and facilities are provided for children and in the ways in which they are administered, some common elements and basic facts that have specific implications for school and public library relationships emerge.

Most children of elementary school age do not have easy access to good library service and materials. This condition should be of the gravest concern to all educators and librarians. Although the number of elementary schools having libraries grows at a relatively encouraging rate, the typical elementary school still remains without a library. The school may have funds for band and athletic equipment, but not for library services. In innumerable communities, public library facilities for children are meager, in sharp contrast to those many highly developed and excellent children's departments that we erroneously tend to think of as being typical of all public library service to children.[6] Frequently, a community may have no elementary school library service and no or limited public library service, and thus the children in that community are entirely or almost wholly without books and library services. Probably the greatest gap in the total library picture today is the lack of library facilities and services for children in rural areas. Size of community and economic ability do not always account for existing conditions, however. Many public library units in large cities do not have what can be termed a good library for children; and, with a few notable exceptions, the development of elementary school libraries in large cities has been shockingly slow.

Educational objectives, national standards for school libraries,[7] the desirability of acquainting all children with the uses and pleasures of reading, the influence of accessibility, and many other factors dictate that elementary schools with two hundred or more students should have a school library. It is the responsibility of the school board to provide such services and not that of the public library or some other group. When the school board shirks this responsibility, the public library performs a social, cultural, and educational service of a very high order by giving partial or complete library service to the elementary schools. But such measures should be considered transitional in nature. There still remain, however, numerous situations in which the public library provides the school library service.

Other expedient practices utilized by schools as a substitute for full school library services should also be considered transitional and temporary measures. Such practices include the administering of school library service by members of the parents' association; substituting classroom collections for a complete library service that includes a school library as well as changing classroom collections; regularly scheduling classes in an adjacent public library for all books and library services; or depending entirely on bookmobile service that consists only of scheduled stops at schools, with the children entering the bookmobile for all their books.

The community has a responsibility to provide also public library services for children.[8] Good public library service for children means an adequate collection of books and other materials, the services of a librarian interested in and trained for this type of library work, a program of services, and easy accessibility for children. The concept of a public library free for the people means free for children, too. The public library's program enriches the child's experiences with books and libraries. In addition, the public library is often the only resource that children have for books and libraries, since limited library facilities currently characterize the elementary school scene. Even in places where the schools have good libraries, the public library is usually the only library resource available for children during parts of the year and parts of the day. Size of community, geography, or economic inability to furnish good public library service for children may, on occasion, justify having the schools undertake all children's library service in the community. But such situations constitute exceptions, and the reasons for their existence must be clearly understood and interpreted in terms of the conditions that they represent.

LIBRARY SERVICE TO YOUNG PEOPLE

The secondary school student uses the school library and the public library for both academic and nonacademic purposes. Although the school library will have most materials required by school assignments, as well as a wide variety of other materials, the high school student using a main library or a well-developed library branch has access to a wider variety of reference resources and a more inclusive general collection of books and other materials than he will usually find in the high school library.

Although the various combinations of complete, partial, and no library service, already noted in the case of children, may also be found in school and public library services for young people, certain distinctions should be noted. In the secondary schools, beneficial pressures exerted by state and regional accrediting agencies have long been implementing the development and improvement of secondary school libraries. The status of secondary school library facilities and services is superior to that of elementary school libraries. Even so, optimum goals are far from being reached. Some secondary school libraries fail to meet even minimal standards. Practically all school libraries are notoriously understaffed, a prevailing condition that limits the over-all effectiveness of school library service.

In the public libraries, young people have long had access to the collections and services of the adult department. For many years, however, no specialized services were provided for this age group.[9] In recent years, the public li-

[9] For a historical and descriptive account of library work with young people in public libraries, see Margaret C. Scoggin, "The Library as a Center for Young People in the

brary's interest in and concern with young people and the special library programs for them that have emerged have constituted one of the major developments in library service. In many communities, particularly some metropolitan areas, public library service to young people has been extensively developed, with separate rooms or sections for them in addition to the total resources of the library, a wide program of varied activities, and the assistance of a young people's librarian.[10] The basic philosophy is that of making the young person feel welcome in his public library. Unfortunately, in some communities the high school student does not receive this welcome in the public library, and the typical public library does not have a staff member whose main interest and responsibility are concentrated on working with young people.

The same types of administrative relationships between school and public library agencies that may be found in library service for children occur also in the program of library service for young people, but to a far lesser extent. In all but a small fraction of instances, the Board of Education has assumed complete responsibility for administering and financing library services in the high school.

Library Services to Teachers and Parents

The school library is an indispensable resource for the teacher, not only as a means for the achievement of his teaching objectives but also in connection with the preparation of his teaching materials. Teachers use the public library, too, and in a variety of ways. Elementary school teachers, particularly those in schools having no library, withdraw children's books from the public library for use in their classrooms. In general, teachers will find more professional books and magazines in the public library than in the teachers' collections in the schools, and even in those localities where the Board of Education provides a central professional library, they will frequently find the public library more convenient and accessible. Nor is it unimportant that the public libraries provide teachers with most of the materials for their own personal reading—a service that contributes directly toward developing better teachers and good teaching in the school.

Although some schools have a special collection of books for parents, most parents depend upon the public library for books dealing with child and adolescent psychology and similar subjects. Many parents withdraw children's books from the public library for reading aloud in the home, for their children's own reading, and for other purposes. Some public libraries offer a series of discussion groups for parents, in which children's books are discussed and described; and in most children's departments, parents consult the children's librarians about the reading problems of their children.

Public Library Services to Other Groups

In addition to the services offered to school groups that have been described in the preceding sections of this paper, the public library provides services for other groups of special interest to the schools—preschool children and their parents, individuals associated in various ways with the field of children's books, and out-of-school youth.

Almost without exception, the public library provides the "reading" materials for preschool children. Not only does it make books available for parents to take home for reading aloud and for sharing with their children, but it also has picture-book hours and storytelling for children of preschool age. For the parents of these children, the public library has books and other materials on child care.

The children's department of public libraries are used by writers and illustrators of children's books, by individuals connected with radio and television programs, by staff members from social and welfare agencies, and by many others who are working in innumerable ways in the general field of children's books and reading.

The public library plays a unique and important role in the community as the library for those young people who drop out of high school before graduation and for those who graduate but do not go on to college. The public library does not offer a special program for these young people, but it is keenly aware of them and makes use of a variety of measures to encourage them to use the public library and its resources.

Standards of School and Public Library Relationships

Teachers and school administrators promote the cause of good public library service, and public librarians promote the cause of good schools. Generally, this type of mutual recognition, support, and promotion consists of no more than the behavior and attitude characteristic of responsible citizens interested in the welfare of their community. Some occasions or situations, however, require more direct action. In some locales, school officials should campaign actively for the development of good public library service in their communities; in like manner, public librarians should do everything possible to promote good school library services. Under any circumstances, school personnel and public librarians need to be familiar with the objectives, programs, and potentialities of good library service in both the school and public library.

Over and beyond mutual support and promotion, the school and the public library need close communication and co-operation. An exchange of information about what is going on in each agency is important. Since the public library provides services and materials for the school-related needs of children and young people, it should be kept posted on curricular requirements. In turn, the school should be interested in the extent and nature of the use made of the public library by students, and should receive some sort of report on the subject. The school librarian and the librarian working with children and young people in the neighborhood public library are the best channels of communication between the two institutions, but where there is no school librarian or no public librarian delegated to work with youth, other channels must be formed.

Another type of co-operative relationship existing between the school and the public library pertains to teaching children and young people how to use libraries and their resources effectively. Since the acquisition of this knowledge forms a significant part of the educational program, the school must assume responsibility for its inclusion in the curriculum. Most of the basic skills and types of knowledge needed to use a library and its resources can and should be acquired by students by the end of the eighth grade. The school library should contribute most to this learning process, but the public library plays no insubstantial part. Where there are no elementary school libraries, the public library is usually the only agency that gives library instruction to children.

Community" in Frances Henne, Alice Brooks, and Ruth Ersted (Editors), *Youth, Communication and Libraries* (Chicago: American Library Association, 1949), pp. 147–64.

[10] American Library Association, Committee on Postwar Planning, *The Public Library Plans for the Teen Age*. Chicago: American Library Association, 1948.

From using school libraries, children and young people learn how to use and to evaluate books and other materials for many purposes. That they should also be aware of the nature and services of the public library as a vital social institution in their community cannot be emphasized enough. They should be introduced to the public library when they are young and encouraged to use it, and they should know what public libraries represent in the lives of adults. Information about and discussion of the public library should be systematically provided for in the social sciences or other parts of the school curriculum.

The relationships noted above represent co-operative arrangements that are informal in nature.[11] At the present time, these informal co-operative measures seem to be the best type of relationship between schools and public libraries in communities that have both agencies. Deviations from this pattern that have been described in this paper as being transitional or intermediary in nature should be considered only as temporary expediencies. Those variations that exist in situations where all public library and school services are administered by law under one board will probably continue. Some additional variations, as previously noted, may be justifiable in terms of existing conditions in particular situations. There is no current evidence, however, to support adopting as standard policy certain propositions that are raised from time to time: that schools and public libraries should be administered by a single board; that all public and school library services for youth should be administered by the public library; that all library service for youth in the community should be provided by the schools; or that all library service in the community, for adults as well as for youth, should be provided in the schools. The parallel development existing between public and school library service seems the best plan for the demonstrable needs of the youth in the community. Children and young people make use of both services.

Quite a different problem exists for sparsely settled and economically substandard areas, where there is apt to be little or no public library service in the real sense of the the term and where school libraries tend to be poorly developed. For these areas, a good overall library program can be developed only by the closest co-operation and planning between the local school unit and the regional or state public library officials.

Continued co-operation between schools and public libraries to provide the best possible library service to youth will strengthen and expand the services each can give—thus making books available to children and young people, wherever they are, and giving them intelligent direction in their use.

[11] For a detailed listing of "Specifics of Co-operation," see Joint Committee of the National Education Association and the American Library Association, *Schools and Public Libraries Working Together in School Library Service* (Washington, D. C.: National Education Association, 1941), pp. 45–57.

Frances Henne, Ph.D., New York City, is associate professor, School of Library Service, Columbia University. She has served as librarian of the University of Chicago High School and as associate professor of the Graduate Library School of the University of Chicago. She has been president of the American Association of School Librarians and is currently co-chairman of that association's committee for the revision of national standards for school libraries. She is joint editor of Youth, Communication and Libraries (1949), joint author of A Planning Guide for the High School Library Program (1951), and a contributor to professional periodicals and books.

Frances Lander Spain, Ph.D., New York City, is co-ordinator, Children's Services, the New York Public Library. She has served as librarian and head of the library science department of Winthrop College and as assistant director of the School of Library Science of the University of Southern California. She has been the recipient of a General Education Board fellowship and a Fulbright award, the latter for teaching library science in Thailand. She has served on numerous professional committees, has been a member of the Board of Education for Librarianship, and is second vice-president of the American Library Association. She is a contributor to professional periodicals and books.

The School and Delinquency Control

By Bertram M. Beck

A REVIEW of the rather extensive literature pertaining to the school's role in dealing with the problem of delinquency brings two problems sharply into focus. One concerns the growing tendency to expect the school to do something about everything; and the other the tendency to use the term "delinquency" as if it were a diagnostic entity like diptheria for which there is a specific course of prevention and treatment.

As knowledge in the social and human sciences develops, the interrelationship of one body of knowledge to the other becomes increasingly apparent. Thus, we know that cultural attributes are as important in understanding child behavior as are parent-child relations; that the psychic factors in the production of disease are intimately involved with the physical factors; that the biologically rooted response of the infant colors the psychologically rooted response of the mother to the infant—and essentially we begin to perceive the complexity of all professions having their conceptual roots in the social sciences.

Out of such perception has come an increasing similarity in the articulated goals of many professions. The public health worker is no longer interested merely in preventing or treating disease but in total health maintainance—which, in essence, involves all facets of human adjustment. The teacher is no longer merely instilling knowledge but is interested in the "whole child." The social worker is concerned with the totality of experience as it bears upon his client. Even the psychoanalyst comes to realize that patients have families and live in communities.

As professional goals become broader and boundaries more difficult to perceive, pressure is placed on the individual practitioner to assimilate more and more knowledge so as to discharge his broader responsibilities. The teacher not only must know how to teach reading but must understand the social and psychological obstacles to the development of reading skills, and be able to do something about overcoming them. The public health nurse not only must be able to provide prenatal care but must know the physical, cultural, social, and psychological factors which influence maternal capacity and be able to deal with such factors.

Desirable as such one man interdisciplinary efforts are, the general effort seems to ignore the fact that the expansion of each discipline which has made it possible to perceive interrelationships also makes it increasingly difficult for one person to gain command of any one discipline. Consequently, there is more and more for the prospective teacher to know about how reading skills are imparted without also being required to master the content of professions related to teaching; and more and more for the public health nurse to know about the physical aspects of prenatal care without also being a sociologist, psychologist, and anthropologist.

Need of a Diagnostic Base

Failure to grasp these realities of teacher training and practice has given rise in education to a rich vocabulary having to do with meeting individual or group needs without the conceptual base of psychosocial dynamic structure that makes it possible to discern what these needs are and precisely how they can be

met. This is manifest in the literature having to do with the school's role in preventing delinquency, where the characteristics of the good school are enumerated in terms of plant, staff, and curriculum in the pious assumption that, by creating such schools, delinquency will be prevented. One looks in vain for attention in such writings to the nature of delinquent behavior and how or why it might be suppressed or repressed by the programs advocated. Small classes, teachers who like children and understand them, varied curriculum, guidance services, and the like can and should be defended as necessary to the maintenance of educational processes in a democracy. The attempt to advance them under the banner of delinquency prevention may well boomerang when incidents of delinquent behavior which the school could not prevent catch the morning headlines, despite improvements in the school system.

The effort to define the school's role in the prevention and treatment of delinquency must have a diagnostic base. While research in delinquency has not yet yielded an exact topology of delinquent behavior, sufficient work has been done to discern several major categories of delinquent behavior and to relate our school efforts to such categories. In this paper several such categories of delinquent behavior are described, and the school programs most appropriate to their prevention and treatment enumerated.

Types of Delinquents

In 1944, Dr. Richard L. Jenkins reported in the *American Journal of Orthopsychiatry*[1] on a study of five hundred boys at the Michigan Child Guidance Institute. Dr. Jenkins merely reported his own observations, and no effort has been made to compare his subject with equivalent nondelinquents. Nevertheless, he discerned three different groups—the social delinquent, the asocial delinquent, and the neurotic delinquent. Since 1944, several substantial pieces of research have been reported which tend to confirm Dr. Jenkins' observations.

The Social Delinquent

The recent study by Sheldon and Eleanor Glueck, *Unraveling Juvenile Delinquency*,[2] has shed much light on the characteristics of the social delinquent who comes to our schools from the urban slum areas. These youngsters are adventuresome, destructive, restless, aggressive, and rebellious. They have little capacity for relationship with adults and resent supervision and authority. They have a great deal of loyalty, however, to their own gangs and to their own form of social control. They evidence little guilt or anxiety about their delinquencies, and are relatively happy children until society interferes with their mode of behavior.

Beginning in the thirties, Clifford Shaw and his colleagues in Chicago began to discern this group of delinquents and attributed their conduct to the nature of the neighborhood in which they were reared.[3] Much more recently, Allison Davis has given new depth to Shaw's earlier study by pointing out that the concept of right and wrong is not the same on both sides of the tracks.[4] Children brought up on the wrong side of the tracks do not learn to

[4] Allison Davis, *Social-Class Influence Upon Learning*. Cambridge, Mass.: Harvard University Press, 1943.

suppress or repress aggression because the immediate environment in which they live is one in which aggressive acts are really not taboo. Children on the right side of the tracks tend to conform to the conventional behavior of their elders. Since society is stratified, the values of the larger community—the right side of the track—do not successfully permeate into the slum areas. The recent Glueck study to which reference has been made answered the question of why all children living in a slum are not delinquent. The Gluecks discerned, by comparing nondelinquents and delinquents in a slum area, that there was a measurable difference in the quality of family living between these two groups. The nature of the parent-child relationship made the difference, but once that relationship was impaired you did not usually get a neurotic child; instead you got a child who learned the lessons of the streets, and those lessons were there ready to be learned.

The school addressing itself to the problem of the social delinquent from slum areas is well advised to place emphasis on programs designed to enrich the neighborhood. The all-day neighborhood school, for example, can offer cultural and recreational opportunities of a constructive nature reducing the street-corner contagion of delinquency. The first years of operation of the all-day neighborhood school in such an area will undoubtedly be trying, since aggressive groups will disrupt the program, damage property, and tend to keep more passive youngsters out of the program. Expert supervision is required, making full use of male supervisors whose personal and social orientation is such that they can like the delinquent without liking the delinquency, can be firm without being hostile, and can be understanding without being sentimental. Where such supervision is not available, the all-day neighborhood school in the slum area would be well advised to operate for the first years serving adults and young children only, raising the age of youngsters admitted only as the preschool children and children of the early grade who come into the program at the beginning grow into their teens. Such a progression provides the operation with a core of youngsters having a long standing identification with it. Where the problem is social delinquency, the school's major preventative task is to extend its function so that it may meet certain of the legitimate needs of youngsters not met in depleted homes and communities.

The prevention of social delinquency in the slum area also necessitates a staff and curriculum appropriate to the particular problems presented by class and cultural differences. Teachers do, of course, have a responsibility for bringing their students toward the values of the larger society, but this responsibility cannot be discharged merely by superimposing the middle-class value system of the teacher on the students. The best teachers for the deteriorated area are often those who have come up out of the area themselves. To recruit such teachers special teacher-training scholarships might be offered to promising high school graduates in such areas. To hold good teachers in high delinquency areas there may need to be a premium paid over and above the regular salary scale.

Where teachers indigenous to the area cannot be found, special in-service training programs are needed to provide a realistic understanding of the particular ethnic groups within the area and their class and cultural values. In curriculum development, stress will be placed on motivating students, since there is often little value placed on academic learning in the homes from which they come. Opportunities for work-study and vocational training must be provided to meet the real needs of these children and their families.

Early signs of social delinquency can readily be detected by attention to two groups of children—those who truant and those who are retarded in development of reading skills. A history of reading retardation or truancy or both is characteristic of most social delinquents. Schools in high delinquency areas require, therefore, an extra supply of teachers qualified to do remedial reading work. They also require access to fully qualified social workers, psychologists, and psychiatrists so that the underlying causes of persistent truancy can be understood. Where the truancy is school induced, remedy may be found in adaptation of the school program. Where the roots of the difficulty are in parent-child relations, responsibility rests with the school social worker or with the appropriate community agency. Unless such resources are available there is little the school can do. Unpleasant as this fact may be, facing it will conserve much time, energy, and money spent on the nonproductive efforts of unqualified persons to unravel the complexities of parent-child relations.

THE ASOCIAL DELINQUENT

The second group of delinquent children, asocial delinquents, are encountered much less frequently than the social delinquents. Jenkins, Lippman, Anna Freud,[5] and John Bowlby [6] have discerned this group, distinguished from that of the social delinquent in some of its characteristics only by their severity and in others by major differences. Like the social delinquent, these asocial children are extremely narcissistic, and their behavior has a primitive, instinctual quality to it. Unlike the social delinquent, they can neither give nor receive affection, with adults or with their peers. They know no loyalties, and there is often not a trace of guilt or anxiety about their conduct. In nature these children are very close to the classical definition of a psychopath.

These children come from the homes of both rich and poor. They have usually suffered some severe traumatic disturbance in the course of their growth. Frequently they are children born out of wedlock. John Bowlby in his early study, *Forty-Four Juvenile Thieves,* and more recently in *Maternal Care and Mental Health,*[7] has highlighted the frequency with which these children have been separated from their own parents during childhood. These are the children for whom we often get the truly pathological family case histories replete with alcoholism, crime, and other social evils.

When dealing with these children, teachers must give up clichés about keeping children out of court or freeing them from the stigma of a court record, for a delaying action with this type of delinquent is dangerous and socially improvident. Attempting to treat the child permissively makes the situation worse rather than better. He should be brought within the scope of the official agencies just as soon as the first real delinquency occurs. The prognosis for treatment is very poor. There is no problem here of resolving inner conflict because there is no inner conflict—that is the root of the difficulty. This type of child requires a basic personality reconstruction and is best treated in the controlled environment of an institution.

[5] "Psychopathic Behavior in Infants and Children," *American Journal of Orthopsychiatry,* April 1951. A round-table discussion.

[6] John Bowlby, *Forty-Four Juvenile Thieves: Their Characters and Home-Life.* London: Bailliere, Tindall and Cox, 1946.

[7] World Health Organization, 1951.

Obviously the school's role cannot be enlarged to include the treatment of the asocial delinquent. In most instances, these youngsters are too damaged to remain in the school system. Despite the obvious, however, schools that operate on a benign platform of verbalization about "needs of children," without a solid diagnostic base, do indeed put these youngsters through a mill of paper work, special classes, and well-intentioned but inept "counseling" which cannot benefit the child but can only impair the morale of teachers and pupils alike.

The contributions which the schools can make to the prevention of asocial delinquency lie in the field of education in family life. Discussion groups and material integrated into the curriculum at appropriate points can prepare junior and senior high school students for their roles as parents and, consequently, strike at the source of asocial behavior—deprivation of maternal care.

THE NEUROTIC DELINQUENT

Programs of education in family life as well as parent education will also help to prevent the third type of delinquency —neurotic delinquency. These children do not occur in large numbers, but as a result of the influence of psychoanalytic theory on educational practice most of our techniques and methods are vaguely or specifically related to the needs of the neurotic child.

The true neurotic delinquent often comes from the middle or upper classes. Subjected to the same parental influences in underprivileged areas, he is likely to become a social delinquent. His parents are usually beset by their own personal problems, and there is a lack of warmth in family relationships. Often there is a rigid and domineering father. The possessive mother is less frequent, since the child of such a mother is rarely openly delinquent. The behavior of the child has a compulsive quality to it. It is not "healthy" delinquency. Some aggression is open and manifest in the delinquent act, but a great deal of the aggression is turned inward, so that the child suffers guilt and anxiety. His problems are inside himself; he often engages in delinquent acts alone. He is responsible for the more sensational delinquencies—compulsive fire setting, sex offenses, crimes of great violence, and the like.

While teachers probably cannot "cure" a neurosis, they can often offer a neurotic child a kind of relationship and certain opportunities for personal development that will enhance the child's chances of functioning in an acceptable fashion, despite the neurosis. To increase the potential for such child aid, teachers need to have a basic fund of knowledge regarding child development and, what is more important, need to have a skill in using themselves in a constructive relationship to the child. These attributes are not easily attained by means of didactic instruction in psychological subjects. Practice teaching must incorporate help to the teacher in understanding how the personal needs of the teacher obscure perception of children's needs. Teachers currently employed require opportunities to come together in small groups to discuss individual children and, under the guidance of trained and qualified group leaders, develop self-awareness and gain additional knowledge of child development. Basic human needs of teachers must be met before they can meet the needs of their pupils. Adequate salaries and working conditions, a good school plant, small classes, modern teaching materials, proper curriculum development, and understanding, supportive, progressive school administrators furnish the climate in which teachers can do their best for pupils.

The emphasis in the school program needs to be on developing teacher potential rather than on a proliferation of adjunctive services. When the teacher has done her best and deviant behavior persists then help outside the classroom is needed. Such help may be sought from fully qualified therapeutic personnel in the school system or from appropriate community agencies. Without these resources little can be done. To reiterate a point previously made, schools are ill advised to maintain substandard counseling and guidance services that are more form than substance and primarily serve as recipients of the buck to be passed. If the choice is between such substandard services and nothing, schools are well advised to choose nothing and invest their funds in better classroom personnel.

ORGANIC AND "ACCIDENTAL" DELINQUENTS

In addition to the categories of delinquent children already mentioned reference should be made to a small number of organic delinquents, children whose behavior is due to actual brain damage. The school, of course, can neither prevent nor treat this type of delinquency. Knowledge of its existence, however, underlines the importance of utilizing the school health program not only in respect to general health maintenance of school population, but for special health appraisal of children with problems.

A somewhat dissimilar category is that of "accidental" delinquency—children behaving in a fashion normal to their development but contrary to our all-inclusive state statutes defining delinquency. Teachers and others who are overzealous sometimes enmesh such children in the machinery designed for the genuine delinquent.

Such youngsters may actually receive a push toward delinquency as their self-concept comes to be that of a delinquent. Teachers and others who deal with the young need to have a good working knowledge of the flexible limits of normality at different stages of child development. This is particularly true in reference to sex behavior. Because of the emotional overtones surrounding sexual behavior, great harm can be done by teachers who because of their own standards, beliefs, or upbringing see pathology where none exists. School personnel need to understand and accept the fact that one does not have "to do something" about everything. Many incidents of apparent misbehavior are best overlooked and quickly forgotten.

THE SCHOOL AND OFFICIAL AGENCIES

Bovet in his World Health Organization pamphlet noted the evidence for the syndromes discussed and went on to point out what he terms "a secondary homogeneity" amongst delinquent children.[8] He pointed out that all delinquents coming to the attention of the official agency have experienced a common psychological impact engendered by two factors: (1) Society has called them on the carpet because of their own behavior, not because somebody did something to them. This alters the public attitude towards them and alters their own concept of self; with rebellious children it may well engender greater hostility and cause heightened delinquency. (2) The official agencies that treat them have an element of authority, and implicit in their treatment is the threat of more severe consequences if the child does not conform. This is almost always true regardless of the language of treatment that may overlay these more severe consequences.

[8] L. Bovet, *Psychiatric Aspects of Juvenile Delinquency*. Geneva, Switzerland: World Health Organization, 1951.

This, of course, does not mean that the official agencies have no role in treatment, for, as has been indicated, certain children need precisely the type of treatment offered by the official agency.

It does mean that schools must develop close working relations with police, juvenile courts, and institutions for delinquents. Special efforts need to be made to reincorporate into the school community youngsters who have had contact with these official agencies, lest they see themselves as segregated and rejected, and continue to strike out at that which rejects them.

DELINQUENCY IN SUBURBAN LIFE

One of the most recent and most significant studies of delinquency demonstrated that the essence of the failure of communities to induce social conformity arises from the prevalence of intergroup conflict which works against the development of the spirit of togetherness.[9] It has been demonstrated that those things commonly associated with delinquency, such as poor housing, poverty, and the like, do not necessarily cause delinquency if there is a collective strength among persons burdened by such problems, with that strength engendering positive group feeling.

Such studies make it possible to see how the so-called "better" communities constructed virtually overnight on yesterday's cornfields without community services or tradition may be limited in their capacity to promote acceptable social behavior. Because each family comes to such a new development separately, removed from contacts with kin or the sense of tradition that characterizes older communities, the lack of the spirit of togetherness may lead to delinquency bred of exclusion from the community of a kind comparable to that produced by the slums.

In such communities, these so-called better communities, teen-agers faced with problems of draft and military service find little support from adults, who are essentially uninterested in the basic cause for which the youngsters are asked to sacrifice. Lacking the reward of social advancement for good behavior and seeing the future as cloudy and problematical, such teen-agers may well band together in groups similar to the slum gang, with their own dress, their own language, and their own code of moral behavior quite different from the code to which the adults in the community give at least lip service.

With this type of suburban social delinquency schools cannot cope unless they are ready to act as centers of community mobilization.

Schools having contact with practically all children and their parents can bring citizens to an awareness of youth's needs and can stimulate the development of civic programs of study and action to meet those needs. To accomplish this task requires the leadership of a farseeing and courageous school administrator. The needs with which we are concerned include those which must be met through the schools as well as those which must be met through other community agencies, programs, and services. The school which attempts to give over-all vigorous community leadership, therefore, runs the risk of antagonizing many vested interests.

Nevertheless, the sum total of what we know about delinquency today makes it plain that it is a problem which cannot be solved short of a major effort to reintegrate the community around a positive concern of its members each for the other. While such an effort must have specific goals in terms of improved programs and services, its major import is in the process of adult leadership rather than in the specific goals. Out of such a process comes the community which cares and, because it cares, does not isolate young people, inducing a reaction of hostility against authority. The state of our public school system in most communities is ample evidence of a community that does not care enough to support programs concerned with the conservation of human values. In a community thus marked by materialistic values, young people, lacking the nourishment of positive group identity, are prone to act against the group.

By giving all-out leadership to citizen study-action programs to meet the needs of young people, the school begins to provide the necessary base of support for necessary programs and services. More important, however, it makes a contribution toward the creation of a social, ethical, and moral climate within the community in which delinquency and kindred ills will not flourish.

Bertram M. Beck, Washington, D. C., was director of the Juvenile Delinquency Project of the United States Children's Bureau. Educated at Antioch College and the University of Chicago, he has served as a psychiatric caseworker in the Air Force and as a family caseworker, publicist, and specialist in public affairs and social legislation for the Community Service Society of New York. He has taught at the City College of New York and the Smith College School of Social Work. He is the author of several books, including Five States—A Study of the Youth Authority (1950) and Simple Arithmetic About Complex Children (1952), and of articles appearing in the Encyclopaedia Britannica (1955), the Social Work Year Book (1954), and numerous journals and periodicals.

Mr. Beck has recently become associate executive director of the National Association of Social Workers, New York City.

Occupational Education in the Schools

By William P. Loomis and Louise Moore

MOST of the activities covered in this report concerning placement and follow-up are based upon operations of the schools in the field of trade and industrial education, which includes training for employment in manufacturing, construction, technical, and service occupations. However, many of those persons in public school systems who have responsibility for youths entering industrial occupations also assist youths who wish to enter other types of occupations.

Choosing and Entering Employment—Current Difficulties

The experience of a young person in selecting and entering employment today is a far cry from that of a boy or girl fifty or even twenty-five years ago. The present greater variety of employing establishments and of types of work available, legal requirements for employment, and the need for some evidence of specific abilities to obtain most desirable jobs seem like a maze and a barrier to the average young person. Especially is this true when, as in many instances, immediate relatives or friends do not or cannot offer, or have sufficient information to recommend as desirable, specific kinds of work opportunities.

Other factors contributing to the problems that face young people of today in selecting and obtaining a suitable career in certain localities include the desire of many rural youths to go to the city where greater opportunity is thought to exist; rapid changes in employment requirements due to new methods of work and new machines and devices; dislocation of industry resulting in an oversupply of labor in some areas; and the fact that pre-employment or apprentice training and technical knowledge are required to qualify for many of the most desirable jobs in industry and the personal service field.

Public School Preparation for Placement

Youth employment problems have brought about several significant changes and additions to public school services. It is obviously difficult to provide placement services for young people if they leave school without information or experience upon which to base their choice of occupation and upon which the school can recommend them for employment. To provide this foundation, many schools conduct the following activities and services:

Practical arts courses are provided in junior and senior high schools covering general career areas, such as commercial, homemaking, and industrial. Among the purposes of these courses is the development of appreciation of the types and standards of work in these fields. They are not of great importance as a specific preparation for actual employment but are of considerable value from the standpoint of vocational guidance. For example, an industrial arts course may include elementary experiences in metalworking, electrical work, automobile work, and woodworking.

Guidance services for youth are also provided in junior and senior high schools and include attention to the selection of courses that provide a foundation for adult life, keeping in mind both cultural and economic needs.

In the junior high school, vocational guidance may begin with the desire of the average youth of that age to engage in useful activities. Success at and consequent attraction to certain types of work during these experiences may have considerable influence upon future selection of an occupation, and on employment.

When the boy or girl is faced with the necessity of choosing a definite occupational aim, a course in occupations is often available. The characteristics and requirements of a variety of occupations are covered in these courses. Supplementing such courses are visits to industries and business establishments in the community. Informative talks by prominent local employers and by representatives of the local public employment service are often arranged. These talks deal with general and specific factors that have to do with work opportunities, obtaining employment, and ways to be successful and obtain advancement.

During this career-decision period, the school guidance counselor has responsibility for work with the individual youth. The counselor's success depends largely upon his ability to gain the confidence of the youth and to provide sound and realistic advice and information.

Vocational preparatory courses are offered in many senior high schools and special vocational high schools. These courses include commercial work, homemaking, and industrial work in skilled occupations; courses in agriculture are fairly common in high schools serving rural areas. The commercial and industrial courses are steppingstones to employment in wage-earning occupations. Ages of entrance into these courses vary from fourteen to sixteen years, and the length of full-time courses in school ranges from one to four years, with a considerable portion of the school time given over to occupational preparation through practical work in shops or laboratories that prepares for employment in occupations available in the locality. Determination of the types of occupations to be included in the program is usually made in co-operation with employers, labor organizations, and the local Employment Security Office.

Student's Selection of an Occupation

Enrollment in a vocational course requires a decision on the part of the youth with respect to the choice of a specific occupation. Prior to final decision, considerable attention is given to the adaptability of the youth to the requirements of the job. In one school system it was recently noted that the selection of courses is preceded by testing for mechanical or clerical aptitudes, mental ability, and achievement levels in reading and arithmetic.

In connection with counseling that precedes selection of an occupation, considerable weight is given to the occupational interests, attitudes, and previous school record of the youth. It has been found that a youth who is not interested in occupational preparation while in school, or whose abilities are not adapted to the requirements of the work done in the occupation, seldom succeeds either in school or after employment.

As an additional safeguard to occupational adaptability, a youth who enrolls for preparatory training in a school and whose achievement is not satisfactory after a fair trial period, is encouraged to enroll in another course more suitable to his interests, abilities, and aptitudes. In this connection, it should be pointed out that the shop, laboratory, and classroom teachers are an important element in the adjustment of high school students to the types of work in which they will be most likely to succeed. When the solution to prob-

lems of adjustment is sought, teachers confer together as a group, and with the counselors and youth individually. The guidance counselor may initiate or stimulate consideration of youth problems and serve as a central figure in the adjustment process, but he must have the co-operation and assistance of the teachers who have daily contact with the youth.

PLACEMENT OF YOUTHS IN JOBS

Under this heading, the report will be based largely upon methods of placement of youths who have been enrolled in high school vocational courses relating to employment in trades and in technical and service occupations. It can be assumed, however, that there may be much common ground with vocational courses in other fields. Placement of students who have been enrolled in college preparatory courses, or in other courses having no particular occupational objective, presents problems and requires methods that will not be specifically discussed here.

There are two types of vocational programs in which placement of youths in jobs is essential:

1. *Part-time co-operative programs.* In these programs, youths are trained for full-time employment in specific jobs after leaving school through part-time employment in those jobs while still in school. The part-time employment is confined to occupations that offer a real opportunity for training in job skills and for advancement.

In these programs, the student worker alternates between school and planned work experiences under the direction of the employer. Alternation between school and work may be on a half-day, weekly, or other suitable equal time basis. The youths usually work in pairs for one employer, although this is not a requirement if the assignment of one youth is satisfactory to the employer.

These programs usually begin in the eleventh or twelfth grade when the student worker is at least sixteen years old. The youth is paid current minimum wages by the employer during his working time. During the school period, he receives some technical and other instruction related to his work while employed, as well as instruction in other subjects usually required for high school graduation.

The youths in co-operative programs are always under the supervision of a co-ordinator, who may also teach subjects related to the occupation or occupations in which they are employed. A most important and invariable responsibility of the co-ordinator of these programs is to visit the youth while at work, interview the employer and immediate supervisor, obtain information on the student worker's progress on the job, and determine what should be particularly emphasized in the related technical and other instruction in school. Much attention is also given to the youth's job adjustment in the initial period of the program.

There is always an agreement between the school and the employer as to alternation between school and work, on-the-job experiences to be covered during the program, and the compensation to be paid by the employer. The employer is also familiar with the youth's school program.

Part-time co-operative programs may be conducted following preliminary vocational preparatory courses. Some programs are planned to admit qualified youths from any course in the high school who have determined that they desire this type of specific training. It is preferable that all youths who enroll in these programs have had, through industrial arts courses, at least a rather good sampling of types of work.

Placement of youths enrolled in part-time co-operative courses is arranged by the co-ordinator, with assistance from one or more of the following agencies or groups outside of the school organization:

Local public employment service. The youths register with the local office and are tested for job adaptability. The school is notified of employers who may be willing to co-operate and the types of work available.

Advisory committees for trades or occupations. Advisory committees are made up of employers and selected members of labor organizations representing specific occupations. They are a valuable adjunct in the placement of youths in these programs.

Individual employers. Since the school co-ordinator makes frequent contacts with employers, new opportunities for placing additional youths are discovered.

Labor organizations. Craft unions that maintain "hiring halls" are of considerable value in making placements in these occupations.

2. *Vocational trade preparatory courses.* The operation of vocational preparatory full-time school programs and the selection and adjustment of youths who are enrolled in such courses have been described previously.

In the trade and industrial preparatory program, the placement of youths after training is considered essential to the operation and success of the program. The reason for this is that if a youth spends a large part of his time in school preparing to enter a specific occupation, he should expect to obtain employment in this occupation or in an occupation very closely related to it.

If a large percentage of graduates go into other occupations, it may be concluded that one or more of the following conditions exist: provision for proper placement has been inadequate; there is not sufficient opportunity for employment in the occupations for which the youths are being trained; or employers have discovered that the school training is not of high quality. Under any of these conditions, expenditure of public education funds for a continuance of the training program cannot be justified.

Youths for whom placement assistance should be provided by the school fall into two categories: youths who leave school before completing the full course; youths who complete the full course and graduate, usually with a high school diploma.

Those who do not complete the full trade preparatory course, for one reason or another, may be able to obtain employment in a type of work to which their school training has a positive correlation. This is especially true if the student is assisted by the school in obtaining employment. Original placement of these youths, if in jobs related to the school training, is usually in semiskilled jobs that in themselves are not considered as desirable as all-around skilled occupations. However, the principal long-range limitations with respect to ultimate success depend largely upon the youth himself—his ambition and his inherent capacity.

Youths who graduate from preparatory courses usually obtain employment as advanced learners, and the school training is followed by full-time work that provides training or seasoning on the job. For the skilled trades, the training period after high school is usually recognized as apprenticeship, which is an organized training system that assures a rounding out of skills in the various operations and techniques under actual working conditions. Post high school training for graduates from preparatory courses for technical and service occupations is not always organized as apprenticeship. Some technical course graduates, such as engineering technicians and mechanical or

chemical laboratory assistants, enter the occupations at existing pay scales for beginners and advance as their skill and competence increase through their daily work experiences.

PLACEMENT TECHNIQUES

Methods of placement and assistance from agencies outside of the school organization vary with almost every local school program. The following is a composite of the various methods used:

Registration with the local public employment service, with an indication of the type of work desired and the approximate date when employment can be accepted, may be required of the youth some time before leaving school. Qualified youths are referred to openings as they come to the attention of the local office.

Teachers of the shop or laboratory subjects in the school keep in close touch with plants and establishments that employ workers in their special fields, and recommend those youths who will be available and competent for jobs that come to their attention.

Special school-industry co-ordinators, employed by the school, or in smaller school districts the supervisor of the program, through their constant contacts with employers, gain knowledge of job openings and, through proper channels, see that qualified youths apply.

The school guidance department maintains a file of eligibles by type of job for which qualified and serves as a clearinghouse for requests coming into the school. Such requests and recommendations are always cleared with interested teachers and co-ordinators.

Trade advisory committee members provide a means of general information to employers with respect to types of beginning workers available from the school, and they frequently assist directly in the placement of workers.

Employers who have had satisfactory service from former students in the school call upon the school when they need new employees with specific skills and knowledge.

Youths are encouraged to obtain work with prospective employers in the summer months during the course, thus making personal contacts with employers prior to graduation.

It is not to be assumed that all youths need assistance in obtaining employment, or that the placement of youths who complete trade preparatory programs is always a problem for the school. Many youths, on their own initiative, select the places where they wish to work and obtain assurance of employment long before they graduate. Likewise, many schools maintain such close relations with the employing industries and are known to have such high standards of preparation that most or all of those who will graduate have been interviewed and promised employment long before the end of their last school term. Frequently, the demand for these new workers is so persistent that youths are permitted to go to work for their employer, either on a part-time or full-time basis, in April or May immediately preceding graduation.

AFTER-EMPLOYMENT FOLLOW-UP

A carefully planned and well-organized follow-up program adds much to the effectiveness of a school's trade preparatory courses. Too many schools neglect this important service. The effectiveness of a program of this kind is indicated when the school management and teachers keep in touch with former students and maintain the interest and support of leaders and workers in the local industries who got their start through the school program.

Many schools and community-wide trade and industrial education programs do keep in touch with former students and with the industries that employ them. The various methods used in follow-up include:

Apprenticeship after graduation fosters continued contact of the school with former students during the years they attend related instruction classes.

The birthday-card method of annual follow-up is used by some schools. This always includes an appropriate greeting, possibly an invitation to visit the school, and information is requested about place of employment, progress in the occupation, and so forth.

Periodical or occasional follow-up by the double postcard method contains a friendly greeting from the school and requests information on a form printed on the return card. The information requested will vary, but it nearly always covers employment status of the recipient, and in some cases asks for suggestions on improvement of the instruction offered by the school, and on types of adult extension training that might be beneficial to him or to others.

Surveys of graduates and employers of graduates through questionnaires are sometimes used for special purposes. These purposes always have to do with matters pertaining to the success of former students or the improvement of the school program. This method is rather involved both for the school and the respondent. The method is worth while only if returns are carefully analyzed and followed up with appropriate conclusions and actions.

A request for information from the school alumni association, especially where the school is strictly vocational in nature, usually brings good results. Alert school personnel take an interest in the activities and membership of these organizations.

Sending each former student of the school an announcement of the adult evening courses offered by the school is a follow-up device the value of which is frequently overlooked. When accompanied by a suitable communication, such personal interest is appreciated and will tend to keep and maintain continued interest in the school on the part of the former student. It may also increase the enrollment in extension courses.

William P. Loomis, Washington, D. C., is program specialist for trade and industrial education, Division of Vocational Education, U. S. Office of Education. He has served as chief of trade and industrial education in the Pennsylvania Department of Public Instruction, and professor of industrial education at the Pennsylvania State University, University Park. He is the author or editor of various state and federal publications in his special field, the most recent a bulletin entitled The Operation of a Local Program of Trade and Industrial Education with Emphasis on Improving Instruction through Supervision.

Louise Moore, Washington, D. C., is specialist in girls' and women's training, Trade and Industrial Education Branch, Division of Vocational Education, Office of Education. She is author of Girls' and Women's Occupations (1955), and of other bibliographies, books, and articles on vocational training for girls and women.

Towards Co-ordination in Great Britain: A Survey

By W. O. Lester Smith

"ADMINISTRATIVE chaos" was a phrase much used by reformers at the close of the nineteenth century to describe the educational landscape. Irrespective of their political sympathies, they recognized that constitutional reconstruction, both at the center and locally, was a prerequisite of advance. This reconstruction was accomplished by two Acts of Parliament, the Board of Education Act (1899) and the Education Act (1902); the former dealt with administration at the center, the latter provided the system of local administration that, with minor modifications, operates today.

The Board of Education Act established one central department for education in England and Wales, with functions and responsibilities previously discharged by three separate bodies. The Education Act abolished the 2,568 School Boards, and also the 788 School Attendance Committees which had functioned where there was no School Board, and it made the 62 County Councils and 69 County Borough Councils the local education authorities.

Both acts contained concessions and compromises which tended to make the new organization less orderly than it would have been without them. Many had hoped for a Ministry of Education and a Minister, but instead Parliament created a Board of Education. The effect, however, was much the same, for the Board, which was composed of the chief officers of state, never met throughout the forty-five years of its life. But the fiction of an active board was always retained in spite of the fact that presidents functioned without its advice. "Successive Presidents delighted to describe themselves as 'transient heads of a phantom Board,' and officials exercised their ingenuity in attributing to the Board anthropomorphic qualities. Thus the Board was 'pleased' or 'surprised'; it learned with 'satisfaction' or 'concern'; it is even alleged to have been 'unable to retain its composure' at some flagrant irregularity." [1]

No explanation of the government's preference for a "Board" was forthcoming at the time the act was passed; when asked later to account for it, the Duke of Devonshire, who steered the bill in the House of Lords, said that he had forgotten the why and wherefore. But it is reasonable to assume that in the laissez-faire mood of that time it was deemed better to have a board available to check any transient president with a tendency to interfere and intervene. And certainly that is the explanation of the provision in the act limiting the function of the Board to one of "superintendence" of matters relating to education in England and Wales. But this definition of its functions did not prevent the Board from usually getting local authorities to do what it wanted or from achieving some degree of co-ordination throughout the country.

Central Department and Local Authorities

The development of the relationship between the Board and local authorities makes an interesting story, in

[1] *Education, 1900–1950,* Report of Ministry of Education for 1950 (London: His Majesty's Stationery Office, 1951), p. 2.

which personal factors counted for much. There were two principal phases. The first can be attributed almost entirely to the first Permanent Secretary after the passing of the 1902 act, Sir Robert Morant, a co-ordinator by nature with a liking for power and a desire to dominate. A great administrator of the forceful kind, he stretched the limited authority of the Board to the utmost, and was largely responsible for the nationwide drive to provide new grammar schools which followed the passing of the Education Act of 1902. A recent Permanent Secretary, Sir Maurice Holmes, has described his methods:

> His attitude towards the newly constituted Local Education Authorities was far removed indeed from the spirit of friendly cooperation which characterises the present relationship between the Ministry and Local Authorities. He knew what he wanted done, and by a curious mixture of browbeating and persuasiveness he usually succeeded in getting it done.[2]

The second phase, which began when Morant left the Board of Education in 1911, has been described as a "progressive partnership between the Central Department, the local education authorities, and the teachers." [3] It has had its ups and downs, but it has grown into a relationship of genuine friendliness, the outstanding characteristic of the educational service in this country. These good relations have, more than any other factor, been the mainspring of co-ordination, making it a natural process based on good sense rather than on schemes and procedure. Reference will be made later in this article to the unevenness of the achievement, but considering the Board's limited powers, the degree of co-ordination accomplished has been remarkable.

Checks to Co-ordination

There were, however, three features of the Education Act of 1902 which checked the progress of co-operation and co-ordination. Of these, one was an unfortunate compromise designed to allay the fierce opposition to the abolition of the School Boards. This opposition was strong in urban areas that were not county boroughs; their representatives objected vehemently to the proposal that their schools should be administered by the County Councils. So Parliament agreed that certain areas within the County Council area should be allowed to administer elementary education only; the areas accorded this concession were noncounty boroughs with a population of over 10,000 in 1901, and urban districts with a population of over 20,000 in 1901. Two consequences of this compromise were regrettable. In the first place, it was a mistake to make the census of one specified year the determinant of the concession. The second consequence was more serious; the existence of these separate authorities for elementary education blocked the road of advance towards a reorganization of education into primary and secondary stages and towards the goal of secondary education for all. It was not until Mr. Butler had the courage in 1944 to end this anomaly that the road to universal secondary education was opened.

Another aspect of the Education Act of 1902 which made a co-ordinated advance difficult was the permissive character of the clauses dealing with education other than elementary. Just as the laissez-faire temper of that day had led Parliament to limit the role of the central department to one of "superintendence," so it caused the legislature to leave the local authorities largely free to decide what provision they would make for secondary and technical edu-

cation. Such freedom encouraged progressive authorities to exercise initiative, undertake developments on a wide scale, and pioneer in particular directions. But it also led to wide discrepancies between one area and another, and children born in the territory of an authority making good use of its permissive powers had much better opportunities than had those born in areas that could with some justice be described as backward.

The third feature of the Education Act of 1902 that made co-ordination difficult was connected with the dual system. When the foundation of our national system were laid by the Education Act of 1870 it was agreed that there should be both school board schools and voluntary schools within the national system. Before 1902 the voluntary schools, mostly Church of England or Roman Catholic, received government maintenance grants and in the early days building grants. The 1902 act not only confirmed the dual system but fortified it by providing that the voluntary schools, like the council schools (as the board schools were now called), should be wholly maintained by local rates and national taxes, leaving the churches responsible only for expenditures on structure. This concession roused the bitter opposition of the Nonconformists, but it was soon found that this additional financial aid still left the churches unable to provide accommodation of a standard comparable to that in the council schools. Furthermore, the Hadow Report of 1926, which urged the division of elementary education into senior and primary stages, led to demands which the churches, unable to afford the cost of building and reconditioning schools, were unable to satisfy. Local authorities, when contemplating a co-ordinated educational advance, were always faced with the prospect that the managers of voluntary schools, even if willing to co-operate, might find themselves prohibited from doing so because they were unable to shoulder the capital expenditure involved. This greatly limited the programs for reorganization, especially in the rural areas where most of the voluntary schools were.

FINANCIAL ARRANGEMENTS

A major weakness of early administration was the absence of a coherent system of finance. The state made grants to the School Boards and, after 1902, to the new local authorities, and the first grants to voluntary societies were made as far back as 1833. The School Boards and, later, the local authorities levied local rates. But not until 1918 was an attempt made to establish an organic financial relationship between the central government and the local authorities. The Education Act of that year, for which H. A. L. Fisher was responsible, effected a complete reform of the system of grants to local authorities. For the fifty-seven separate grants payable by the Board of Education, there was substituted a system of annual substantive grant related to local expenditure and dependent upon the maintenance of an efficient system of education by the local authority. Unfortunately there had to be two substantive grants, one for elementary and one for education above the elementary level, because of the existence (already referred to) of separate authorities for elementary education. The grant for elementary education was calculated on a formula which took into account the number of children in the area, the expenditure on their elementary education, and the financial capacity of the area to meet that expenditure as measured by assessable value. The grant for education other than elementary was calculated at a flat rate of 50 per cent of the net local expenditure.

Today, except for certain special services such as school meals, the grant payable by the Ministry of Education to local authorities for all their educational expenditure (within the province of that Ministry) is based on a formula similar to that adopted in 1918 for elementary education. The principle followed is that of relating the grant—to quote words used by Mr. Butler in 1944—"to the number of children in the area and the capacity of the area to pay for their education." But the point that should be stressed is that

> the finance of public education . . . has grown from a system of particular—and largely unrelated—subsidies to a system of joint finance based upon a real partnership between the central authority and local education authorities. It is, in fact, a story of progress from "contract" to "status" between the two in the pursuit of a common adventure.[4]

SCOTLAND AND WALES

In the gradual approach to a unified and co-ordinated system of education, traditions have been respected and diversity encouraged. Of this regard for distinctive tradition Scotland is the outstanding example, for although England and Scotland have shared one Parliament since the Union of 1707, the Scots have fully retained their separate educational system and traditions, the Secretary of State for Scotland being responsible for the central administration of Scottish education.

Wales, on the other hand, has conformed to the English administrative pattern, but since 1907 there has been within the Ministry (or, until 1944, the Board) a separate Welsh Department wholly sympathetic to the desire of the Welsh people to preserve and enrich their national culture and maintain their own language. In the nineteenth century it was the practice of English administrators—Matthew Arnold among them—to discourage the use of Welsh in schools, but during the present century there has been a complete reversal of this policy. The central government in its dealings with English counties and county boroughs has usually lent a sympathetic ear to local points of view, and recent experience suggests that co-ordination and diversity are not incompatible.

[4] *Education, 1900–1950,* p. 32.

EDUCATION ACT OF 1944

While the years before World War II saw the steady growth of an orderly system, two great obstacles stood in the way of effective co-ordination: one the restriction imposed by statute on the powers of the central authority—the Board of Education could still only "superintend"—and the other the inability of the voluntary schools to find money for school construction. The Education Act of 1944 removed both of these roadblocks. There is now a Minister with powers of direction and control, and by a substantial readjustment of the dual system voluntary school managers have been enabled and can be required to bring their buildings up to modern standards.

The spirit of partnership has survived the shift in the balance of power, but the Ministry is now indisputably the senior partner with a Minister able effectively to exercise a co-ordinating function. He can settle priorities, impose minimum requirements, ensure certain standards of staffing, and maintain a level in the scale of grants and awards to students and pupils; can also ensure that provision is made for particular needs, as, for example, the education of handicapped children. All this sounds dictatorial, but after more than ten years' experience of the working of the act one can say without hesitation that no Minister has shown any tendency to

use his immense powers unfairly or to excess. The largest local authority, the London County Council, has like others had its battles with the Minister, especially over secondary school organization, but as the following comment shows it shares the general view that the Minister has not encroached unduly:

> Each local education authority has a real measure of freedom and responsibility. The policies of different authorities vary considerably, for example, in the organization of secondary education, and the Ministry has not sought to discourage diversity.[5]

Especially notable is the fact that co-ordinating policy is never allowed to encroach on academic freedom. Universities are outside the province of the Ministry of Education and independent of the local authorities; government grants to universities, amounting to about two-thirds of their expenditure, are administered by a University Grants Committee operating on behalf of the Treasury, and although in the distribution of grants problems of co-ordination constantly arise, the respect for academic freedom is absolute. Grants made to universities by local authorities are unconditional, but the universities have the wisdom to see that authorities are represented on their courts and councils. A similar attitude prevails in regard to the curriculum of schools; this is recognized to be the responsibility of the teachers, and they in turn are careful not to abuse the freedom they enjoy in this respect. The Ministry never does more than "suggest," and although Ministry and local authorities determine the types of schools and sometimes argue fiercely in so doing, once the issue of type is settled they are careful to leave teachers free to develop the inner life of each school.

[5] *The London Education Service* (London County Council, 1954), p. 93.

CONSULTATIVE MACHINERY

Vital to the co-ordinating process is the consultative machinery set up by the Minister. Of this some existed before 1944. Under the Education Act of 1902 a Consultative Committee was established to advise the President of the Board of Education on questions which he referred to it, and it produced some of the most seminal reports in our educational history, notably the Hadow and Spens Reports. After World War I a committee under the chairmanship of Lord Burnham was constituted to act as a negotiating body to settle teachers' salaries; it is composed of representatives of local education authorities and teachers' organizations. A Secondary Schools Examinations Council was also created to co-ordinate the work of approved university examining bodies, which are responsible for the secondary school certificate examinations. With the passing of the Education Act of 1944 the existing consultative machinery was strengthened, and some important additions were made. The former Consultative Committee was replaced by Central Advisory Councils for England and Wales respectively, and they were empowered by the act not only to advise on matters referred to them but also upon "such matters connected with educational theory and practice as they think fit." Scotland has a similar council, which has issued some valuable reports. The Burnham Committee was given statutory status, and the Minister now has legal authority to see that the remuneration paid by local authorities to teachers accords with scales agreed upon by this negotiating body and accepted by him. The Secondary Schools Examinations Council was enlarged to make it more representative of the various interests concerned.

Of the consultative bodies set up since 1944 the most important are two

National Advisory Councils, one on Education for Industry and Commerce, and the other on the Training and Supply of Teachers. The first, widely representative of industrial, commercial, and teaching interests, serves as apex of a system of regional consultative bodies for further education. The second keeps under continuous review the supply of and demand for teachers, and studies the problems of teacher education, acting also as a clearinghouse of opinions that have already found expression in area organizations. There are, too, a few independent co-ordinating bodies aided by the Ministry, which include on their executive councils representatives of the Ministry, local education authorities, and teachers. Among these are the National Foundation for Educational Research, the Educational Foundation for Visual Aids, and the Central Bureau for Educational Visits and Exchanges.

The problem of consultation is rendered much easier by the existence of well-established associations both of the local authorities and the teachers. The County Councils Association has an Education Committee, and so has the Association of Municipal Corporations, which speaks for the boroughs; and there is also an important Association of Education Committees which concerns itself entirely with the problems that confront local education authorities. Education Officers too have their association, which is able to offer expert advice on current problems of educational administration.

THE LOCAL AUTHORITY

It is important not to give the impression that co-ordination is more actively pursued at the national than at the local level. The Education Act requires every local authority to appoint a well-qualified Chief Education Officer, and upon his administrative ability and that of his staff the quality of local co-ordination largely depends. One of the most important functions of an education authority is to maintain close contact with school governors and managers, with the many voluntary bodies engaged in adult education, youth service, and social services affecting education, and by a system of advisory committees to ensure the interest of industrial and commercial experts in the promotion of technical education. In county areas, to counter the isolation that distance from headquarters may involve, the act requires a system of divisional executive committees. Another important requirement of the act is that every authority must have a detailed development plan or scheme for primary, secondary, and further education; approved by the Minister, the plan serves as a chart for every stage of advance. School governors know its contents and intelligent local citizens can by studying it acquaint themselves with the authority's intentions over a long term of years. This educational development plan is drawn up to harmonize with housing, road, and other projects as revealed in the city or county plan.

CO-ORDINATION WITH OTHER SERVICES

Every County and County Borough Council has a wide range of functions, of which education is but one, albeit a very important one and the one which involves the largest expenditure. These councils are, under the Education Act, required to appoint an Education Committee with a majority of aldermen and councillors and a minority of co-opted persons, selected because of their interest in or special knowledge of education. Thus in London, where the Council consists of 150 members, the Education Committee's membership is 50, of whom 12 are co-opted. Although an Education Committee has considerable dele-

gated power, it reports regularly to the Council, usually each month. Thus its policy is almost automatically co-ordinated with that of the other committees of the Council. Moreover, as one of a hierarchy, the Education Officer is in constant touch with other leading officials—the Clerk of the Council, the Treasurer, the Chief Constable, the Medical Officer of Health, the Surveyor, the Architect, the Librarian, the Parks Superintendent, the Children's Officer, and others. As Dr. Alexander observes,

> In the education service not only the Chief Education Officer but also other principal officers of the Authority have important contributions to make. It is, for example, usual for the County or County Borough Treasurer to be principal finance officer of the Education Committee, and for the County or County Borough Architect to be architect to the Education Committee.[6]

At one time in both central and local government there was a tendency for departments to work in isolation; today the tendency is the reverse. It has been found, however, that interdepartmentalism has defects no less serious than those of isolationism. It can cause delay, and lead to procedures and compromises not in the best interests of education.

CO-ORDINATION IS NOT ENOUGH

Our empiricism leads us often to disregard logic or pattern. For example, while youth employment is administered centrally by the Ministry of Labour with the help of a representative Advisory Council, its local administration is in some areas performed by the education authority and in others by regional officers of the Ministry of Labour. Of the 181 education authorities in England, Scotland, and Wales, 121 have opted to administer this service; the largest authority, the London County Council, operates through nineteen Youth Employment Committees. Again, when in 1948 the National Health Service was instituted, it was widely believed that as an inevitable sequitur the school health service, which had for nearly fifty years been a most valuable integral feature of the local education service, would be absorbed.

> Fortunately [to quote Dr. Alexander], greater wisdom prevailed. . . . The advent of the National Health Service therefore merely strengthened the school medical service, since it made available the whole range of medical treatment to the school medical service.[7]

At the close of his *History of the English People* Élie Halévy observes that it is difficult to understand us unless you remember that this is essentially a free country with a vigorous group life. Even today with the state so active in education, there is a strong element of voluntary enterprise, especially in adult education, youth work, and that educational borderland, community centers and village halls. In all these spheres the local authority co-operates, and with deliberate unobtrusiveness seeks to introduce some degree of co-ordination. During the last war an attempt was made to establish a youth service, which was to be a system of partnership between local authorities and voluntary bodies engaged in the provision of youth clubs and other projects for youth. It was successfully launched; local authorities constituted Youth Committees and appointed Youth Organizers, while the voluntary bodies themselves established at the national level a Standing Conference of Voluntary Youth Organizations, which fulfills a co-ordinating function. But during these postwar years other urgent needs, particularly the building of new schools and the creation of a system of universal secondary education, have had to receive prior attention; and although there is no lack of co-ordinating machinery, feeling is growing that the time is ripe for another purposeful drive in the interests of youth. County colleges, included in the Education Act to supply continued education for young workers, have not yet been established, and it must be admitted that the youth service has in many areas lost some of its first ardor, while economic conditions and the claims of other services have limited the funds available for its development. When the wartime government introduced its scheme for the youth service, it was careful to say that "coordination is not enough."[8] That comment has now almost a prophetic ring as regards the youth service, and most will agree that in administering education it is a maxim of general significance.

W. O. Lester Smith, M.A. (Oxon.), LL.D., Rhydymain, Dolgelley, North Wales, was professor of sociology of education, University of London (1949–53), chief education officer for Manchester (1931–49), and director of education for the county of Essex (1924–31). He is the author of To Whom Do the Schools Belong? (1942), Education in Great Britain (1949), and other books.

Co-ordination in Great Britain: Trends and Issues

By William P. Alexander

IT was as recently as 1870 that provision was first made in Great Britain to create a national system of elementary education, under School Boards established at local government level for that purpose. By the turn of the century that task had been largely completed. A growing consciousness that for brighter pupils there should be some opportunity beyond elementary school and, perhaps more important, that a more effective instrument was needed at local government level led to the Education Act of 1902, the significant terms of which have been discussed at some length in the preceding article. The war of 1914–18 gave further impetus to the development of the education service, as indeed wars inevitably do, heightening our consciousness of the importance of young people. The Act of 1918, later consolidated with other relevant statutes in the Act of 1921, assigned to local education authorities the duty of making further provision for education beyond the elementary school, and also expanded the scope of their work to include aid for recreational and social activities of young people. So the pattern grew in scope until the war of 1939. This tragedy in world affairs created a new atmosphere, in which there was a deep consciousness that the war would be won not by rich nor poor, not by country nor town, but by all, each contributing according to his capacity. In that setting, the Education Act of 1944 was born. Here was a statute embracing education from the earliest age into adult life and giving local education authorities powers and duties of an extremely wide nature. Their task was, in fact, to secure the education of all the people in their areas, and for this purpose education was conceived as the development of the individual according to age, ability, and aptitude. This was, indeed, a new concept; of its translation into actuality the local education authority was to be the effective co-ordinating instrument, bringing together all those who were concerned with the welfare of children and young people.

According to the present organization of the education service in Britain, the central government, through the Ministry of Education (in Scotland, the Secretary of State for Scotland), is concerned with national policy; the local education authorities, comprising County Councils and County Borough Councils, are responsible for the implementation of that policy; and the teaching profession is very largely responsible for matters of curriculum and method in the school. The powers of the education service include provision for health, through the school medical service, and for the general welfare of children, including the provision of clothing, school meals, or other things necessary to ensure the children's benefiting fully from education. Also included is provision for youth in its recreational or leisure time.

Government Departments Concerned with Youth

At central government level there are several departments concerned with services affecting children and young people. The Ministry of Agriculture retains powers relating to agricultural education; the Ministry of Labour and National Service still has powers relating to employment of young people; and the Home Secretary and Home Office have responsibility for children or young people who become delinquent. In this situation there has been a demand for closer co-ordination at central government level in order to secure effective operation at local government level. Let us look for a moment at what has so far been achieved.

Ministry of Agriculture

In agricultural education there is an ever growing tendency for the Ministry of Agriculture to act in consultation and co-operation with the Ministry of Education, in order that the local education authority, which covers agricultural education as part of its general duties, may act effectively. Thus we find officers of the Ministry of Education acting in an inspectorial capacity for agricultural education as well as for other forms of further education. But the effective co-ordinating instrument in this case is the local education authority, under whose care agricultural education is treated as a natural part of the pattern of education.

National Health Service

In the health service the problem has been dealt with more effectively. The creation of a National Health Service had full regard to the fact that under the Education Act it was the duty of local education authorities to provide or secure the provision of a full system of medical inspection and treatment, without charge, for all children and young people on the registers of educational establishments. The school medical service is therefore part of the education service and to a large extent carries the responsibility of looking after the health of children. The child is at home, of course, as well as at school and has a full right to the facilities of the National Health Service whenever these may be required. Co-ordination at the local authority level is secure in the fact that the local authority Medical Officer of Health is as a general rule also the Principal School Medical Officer and in collaboration with the Chief Education Officer secures the effective co-ordination of general medical practice with the school medical service.

Ministry of Labour

In the sphere of employment the Ministry of Labour joins with the Ministry of Education in a body called the Central Youth Employment Executive, which is charged with all matters pertaining to the employment of young people. The local education authority is given the opportunity to be responsible at local level for the youth employment service and in 90 per cent of the cases exercises that option. In the other cases the Ministry of Labour makes direct provision. The general pattern is one in which the local education authority is the responsible authority for youth employment and appoints an officer and staff charged with these duties. Government aid is secured through the Central Youth Employment Executive, in which both the Ministry of Education and the Ministry of Labour are represented.

Home Secretary

Finally, let us turn to the responsibilities of the Home Secretary relating to children and young people who are delinquent. Remand homes and approved schools were in many cases controlled by the local education authority acting for the local authority as such. Recently the government reviewed this problem of children and young people under need of care and protection or guilty of offenses before the courts. After considerable debate it was decided to retain the responsibility for these children in the hands of the Home Office in

its Children's Department, and to create at local authority level a children's welfare department deliberately designed to be independent of the education authority as such, in order to ensure its acting, so to speak, in a parental capacity and using the services of the education department as other parents did. In particular, however, the responsibility for remand homes and approved schools passed to the hands of the Children's Committees. It is only fair to add that many of those concerned with the education service took the view that it would have been better to entrust this responsibility to the local education authority as such and to the Ministry of Education at government level. The arrangements work well, but again it is to be noted that the effective co-ordinating instrument is the local authority, which is the authority both for education and for children's welfare as defined under the statutes of the Home Secretary.

THE LOCAL AUTHORITY

It will be recognized, therefore, that in this total pattern the local authority (the County Council and the County Borough Council) is the most important single instrument in the co-ordination of all services which affect children and young people. It exercises powers for education and for children's welfare and acts as a police authority, a library authority, and a health authority, bringing together on the one hand whatever government departments may be involved and on the other whatever voluntary agencies may be operative in the area.

For this reason it will perhaps be helpful to look more closely at the relation between the local authority and the central authority, particularly as regards the education services and their significance in the total local authority pattern. First it should be made clear that education is by far the most important service of the local authority, involving at least half of its total expenditure for all purposes and in many cases a substantially higher proportion. In the education service the local authority has responsibility for all executive action: it builds schools, technical colleges, colleges for training teachers, schools for handicapped children, youth centers, medical clinics, and so on; it employs teachers and all other staff members. (At present, in the employment of a local education authority for every teacher there is also at least one other person, engaged in work such as the school medical service or the serving of school meals.)

Financial responsibility

In the education service the local authority on the average accepts financial responsibility for 40 per cent of the expense and the central government, through the Ministry of Education, for 60 per cent. This financial relationship is of the highest importance. It may be argued that in any service only when one partner accepts a substantial financial responsibility can it properly be trusted to make decisions involving the other partner. At the present time in a total appropriation of the order of £400,000 per annum the local authorities accept about £150,000, which they raise from local resources by what is essentially a property tax.

National associations

It is clear that 146 local education authorities in England and Wales, if they are to be effective co-ordinating instruments, must be in a position not merely to act in their own areas but to negotiate and reach agreements at national level. To that end there are national associations of local authorities, which must be regarded as an important part of the co-ordinating pattern.

The Association of Education Committees is a body in which the membership includes the Education Committees of all local education authorities in England and Wales, with the exception of the London County Council, which acts directly with the government departments concerned in these as in all other matters. The County Councils Association represents the Councils of the county authorities and is concerned with all matters with which they are concerned. The Association of Municipal Corporations acts similarly for the county boroughs. These associations jointly and severally undertake negotiations with the central government or with bodies of employees on salaries and conditions of service and act as the co-ordinating instruments for local government. If, for example, there is any legislation or administrative action proposed by the government which will affect local authorities in their relations with children and young people, the associations will be brought into consultation and as a general rule government action will be taken not merely after consultation with the associations of local authorities but in agreement with them.

In similar manner, employees of local authorities organized at national level are in constant consultation and negotiation with the associations on matters affecting their membership. For example, the National Union of Teachers, representing the teaching profession, is in continuous consultation with the Association of Education Committees, and in certain matters, as for example the salaries of teachers, the national body responsible in this field—the Burnham Committee—represents on the one side the national associations of teachers and on the other the national associations of local authorities. The decisions of the Committee are submitted to the Minister of Education, who may accept or reject but may not amend them. Since the establishment of the Burnham Committee thirty-five years ago its reports have always been accepted by the government; after acceptance the Minister makes an Order under which the approved salaries of teachers must be paid by all local education authorities.

It is, therefore, not unreasonable to regard the associations of local authorities as an important instrument of co-ordination not only between education and other governmental services appertaining to children and young people but in all matters which affect children and young people, for they are in constant consultation with national bodies representing voluntary organizations, with national organizations of the churches, and with national organizations of employees, as well as with the government departments concerned.

PRESENT TREND IN CO-ORDINATION

In summarizing the present trend in co-ordination, therefore, it is perhaps fair to say that the main instrument of co-ordination, as far as legislation for these children and young people is concerned, is the local authority, and the essential instrument securing the closest co-operation of central and local government is effective associations of local authorities. It should be added that the tendency over the years has been to strengthen and broaden the concept of education so that at central government level the great bulk of work pertaining to the welfare of children and young people falls within the ambit of the Ministry of Education. It would be even truer to say that it has been brought almost wholly within the ambit of the local authority at local government level.

VOLUNTARY ORGANIZATIONS

This statement must not be interpreted as neglecting the very important

part which voluntary organizations play in the welfare of children and young people. Britain is particularly happy in the very great contribution which voluntary organizations have made to the welfare of the young, and while it may be true that that contribution becomes less important as public authorities increasingly accept their responsibilities in these matters, the fact remains that voluntary organizations still play a significant role. It is the local authority's task not merely to provide but also to secure the provision of appropriate services, and in many matters, particularly in recreative and welfare facilities for young people, the local authority co-operates with a wide range of voluntary organizations, aiding them financially and acting as an effective co-ordinating instrument.

FIFTEEN-TO-EIGHTEEN-YEAR-OLDS

At this stage the reader may well ask whether the implication of what has been recorded is that all is well in these matters in Britain. The answer is in the negative. There are several outstanding problems yet to be resolved. Perhaps the most important of these affects young people. At the present time the school-leaving age is fifteen years, and the services as they affect children up to that age are well co-ordinated. But from fifteen to eighteen there is a serious gap. The Education Act of 1944 included a provision for the establishment of county colleges, at which part-time attendance will be compulsory for all young people up to the age of eighteen after they have left school. The importance of this provision lies in the fact that county college students would receive health service and all other welfare services at present tied in with the education service in schools.

Unfortunately, this part of the act has not yet been implemented, for reasons which are fairly obvious: the greatly increased number of children after the war involved a very heavy building program, and other educational reforms that took precedence over the establishment of county colleges together with the building program have created a situation which makes it impracticable to tackle this provision until about 1960. There is, however, high hope that in the early 1960's county colleges will be established. They would constitute without doubt a most effective co-ordinating instrument for services to young people, enabling all youngsters up to the age of eighteen to have not only the continued benefit of regular contact with the education services but also effective medical inspection and treatment. They would, furthermore, enable all the voluntary organizations concerned with young people to work in even closer collaboration with the local education authorities than they do at present. Until these colleges are provided there is probably no really effective solution to some of the problems of youth welfare.

AN INCLUSIVE AND FLEXIBLE SYSTEM

It is to be noted, too, that co-ordination at central government level would undoubtedly be strengthened if some of the powers vested in the Ministry of Agriculture and in the Home Office were vested instead in the Ministry of Education, and such a transfer would seem to be in accord with the trend of the last few decades. The concept of the education service has been consistently broadening in scope to include not merely the instruction of children and young people but all aspects of their welfare—physical, mental, moral, and spiritual. In this pattern Britain believes that it is essential to maintain the basic principle of distribution of power. National policy rests with the central government; executive responsibility with the local authority, and both are concerned to secure within the education service freedom of action to the teaching profession in matters of content and curriculum. In this way the diverse needs of different areas can be effectively met, while at the same time, through national organizations of local authorities, teachers, and voluntary organizations, uniformity of action can be secured where it is necessary and desirable. It is perhaps not unfair to suggest that Britain has made a good deal of progress in achieving a system at once flexible enough to meet the diverse needs of individuals properly and at the same time closely enough co-ordinated to ensure corporate action by agreement at national level wherever such action is necessary.

William Picken Alexander, PhD., L.H.D., London, England, has been general secretary of the Association of Education Committees (England, Wales, Northern Ireland, Isle of Man, and Channel Islands) since 1945, and has served as secretary to the Local Authorities' Panel of the Burnham Committee and associated committees negotiating salaries of teachers. He was formerly schoolmaster in Scotland (1929–31); assistant lecturer in education, Glasgow University (1931–32); Rockefeller research fellow (1932–33); deputy director of education, Walthamstow (1934–35); director of education, Margate (1935–39); and director of education, Sheffield (1939–44). He is a fellow of the British Psychological Society. He is the author of Intelligence, Concrete and Abstract (1935); The Educational Needs of Democracy (1940); A Performance Scale for the Measurement of Technical Ability (1947); A Parents' Guide to the Education Act (1944); Education in England (1953); and coauthor of County and Voluntary Schools (1949).

Liverpool: A Case Study in Co-ordination

By H. S. Magnay *

THE county borough system, according to which a single council is responsible for all services coming within the province of local government inside the boundary of the town in question, is highly conducive to proper co-ordination between the various local government services. Co-ordination is, of course, effective in the counties also, where there is a two-tier system of local government, but more elaborate arrangements to bring it about are usually necessary.

Co-ordination of services is, however, not the only virtue to be expected of a system of local government, and there have always been advocates of the system of *ad hoc* elected bodies responsible for education, which prevailed in England from 1870 to 1902 and in Scotland until considerably later. These advocates have argued that an elected body, responsible to an electorate for education alone, is more likely to develop the education service vigorously and with enthusiasm, and to find the time to acquire an intimate knowledge of the system of education for which it is responsible, than a County Borough Council to which education is one among many responsibilities. There is unquestionably much force in this view, and it may well be that in some areas the School Boards, had they been continued in existence, would have achieved more than did the County Borough and County Councils.

This view, however, is a sectional one, and it is difficult to deny the validity of the argument that in each local government area there should be one body capable of taking an over-all view of the comparative needs of all the local government services and attempting to allocate resources in accordance with these needs. The members of such a body must assume a heavier responsibility, but, if they and their advisers perform their task well, the town ought to be better governed than it would be by a group of *ad hoc* boards.

Composition of the Education Committee

A County Borough Council functions through standing committees. The mere presence of councillors on more than one committee is a factor making for co-ordination. In Liverpool, the Education Committee contains fifty-three members, of whom thirty-four are members of the Council, and nineteen are co-opted because of their knowledge and experience of education. This year, of the thirty-four elected members of the Education Committee, ten are also members of the Health Committee, nine are members of the Libraries, Museums and Arts Committee, five are members of the Housing Committee, five of the Children's Committee, five of the Establishment Committee, four of the Highways and Planning Committee, four of the Economy Committee, three of the Finance and General Purposes Committee, and one of the Parks and Gardens Committee. The presence of members of the Education Committee on other committees at which particular matters of interest to the education service are discussed does at least ensure that the point of view of the Education Committee is voiced by persons who will usually feel that they have some responsibility for it. Too much reliance must not be placed on this factor, but it has unquestionably proved of value.

* In the preparation of this article I am deeply indebted to my friend and colleague Mr. C. P. R. Clarke, M.A., B.Litt(Oxford), Deputy Director of Education, Liverpool, for his assistance, and to my friends and colleagues Mr. Thomas Alker, LL.M., Town Clerk of Liverpool, and Mr. J. G. Murray, Assistant Town Clerk, Liverpool, for their advice.

Co-operation Among Chief Officers

Similarly, the fact that all the chief and subordinate officers are officers of a single council is an important factor making for co-ordination. The chief officers are constantly thrown together. In Liverpool, they are required to attend the monthly meetings of the City Council and of some of what may be described as its supervisory or regulatory committees. It is natural that a spirit of comradeship and partnership should develop among them and that they should make use of the opportunities for meeting thrown in their way to discuss and co-ordinate policies. When the chief officers set the tone their example is followed at all levels of the hierarchy, so that most fruitful co-operation in detail follows. Of course there have been examples of departments of a council which function as if they were separate organizations. Such anarchy is unusual in County Borough Councils and County Councils, but would almost certainly be more common if there were no single co-ordinating authority.

Co-ordination Through Regulatory Bodies

It is not enough, however, that an organization's general arrangements should be conducive to co-ordination. If the organization is to function as a streamlined unity, there must be actual arrangements for co-ordination, and it must be the business of some committee to bring them about. The need for such planned co-ordination is accepted in greater or lesser degree by nearly all Councils, but in Liverpool the detailed arrangements for it are exceptionally well-developed.

Finance and General Purposes Committee

The Finance and General Purposes Committee of the City Council, which includes among its members the chairmen of the other major committees, is recognized as the senior committee and has certain defined supervisory or regulatory powers over the other committees. It has, however, no general power of supervision over the other committees, which report directly to the City Council except on matters requiring the consent of the Finance and General Purposes Committee under the Council's standing orders. Thus any proposal to incur, for a particular project, capital expenditure to be financed by loan, or to make a grant to an outside organization, requires the approval of the Finance and General Purposes Committee. Disputes between committees are bound to occur occasionally, and in such cases the Finance and General Purposes Committee is authorized to arbitrate. But its main instrument of control is its power to advise the City Council about the sum of money to be voted for the purposes of each committee in the annual estimates. Policy and finance are inseparable, and each committee can develop a policy just in so far as the City Council votes it the necessary funds.

In advising the Council on estimates, the Finance and General Purposes Committee is co-ordinating the annual programs of the spending committees and

is relating them to the total sum of money which it thinks it reasonable to call on the ratepayers to pay during the year. Co-ordination inevitably amounts to an assessment of the relative priorities of the programs, which must compete to some extent with each other, unless no limit is set to the call on the rate. This is the point where acute differences of opinion will arise, and study of the local press all over the country at estimate time always reveals examples of tension between the co-ordinating Finance Committee and operational committees wishing to press on with their programs at a pace faster than the local community, in the opinion of the Finance Committee, can afford.

As education is now by far the largest spending service left to local government, the Education Committees of County and County Borough Councils are particularly apt to be involved in such tensions. In some places machinery has been set up to anticipate and avoid possible conflict. In Birmingham, for example, a subcommittee, composed of representatives of the Education and Finance Committees, is called annually with the object of reaching agreement about reasonable proposals before draft estimates are submitted to the Education Committee.[1]

Establishment Committees

Most County and County Borough Councils have felt the need for co-ordinating the actions of their various committees over the employment of staff, and have set up Establishment Committees for this purpose. In Liverpool, the Education Committee employs, in addition to teachers, a staff of administrative officers, clerks, caretakers, cleaners, groundsmen, and staff for the preparation and service of school meals. Obviously, similar servants of the same employer should have similar conditions of service. Any proposal of the Education Committee relating to the salaries, wages, or conditions of service of the categories of administrative and general staff just outlined requires the consent of the Establishment Committee.

It has become the almost universal practice in England and Wales to have salaries, wages, and conditions of service of most kinds of staff determined by national or regional joint negotiating machinery, representative of both employers and employed. Questions to be decided at local level have then tended to become those of interpretation of national and regional awards and of grading within these awards. Experience shows that the views of employing committees on such questions can differ so widely that it is essential to have an Establishment Committee to attempt the difficult task of ensuring fair treatment for all the Council's employees. In Liverpool, the Education Committee alone is responsible to the City Council for matters relating to the establishment of teachers and to the application and interpretation of the nationally negotiated Burnham scales of salaries for teachers. The Establishment Committee has no jurisdiction in such matters, as the question of co-ordination with the activities of the Council's other committees does not arise.

Liverpool Economy Committee

The Liverpool City Council has set up a third standing committee with supervisory powers—and in this its practice differs from that of most Councils—known as the Economy Committee. The function of the Economy Committee is to scrutinize all projects estimated to cost more than £1,000. It also has the task of examining the capital estimates of all spending committees, and has a general duty to promote economy throughout the City Council's service. The Economy Committee, like the Finance and General Purposes Committee, is therefore in a position to review the major proposals of all committees in relation to each other and to the capacity of the city to pay for them, and can curb anything it may choose to regard as a flight of extravagance on the part of a spending committee.

[1] *Education*, Vol. 105, No. 2719, p. 417.

CO-ORDINATING FUNCTIONS OF TOWN CLERK

The achievement of co-ordination at officer level throughout the City Council's service is one of the most important functions of the Town Clerk (or in a county area, the Clerk of the County Council), who is the senior chief officer of the Council. In Liverpool, the Town Clerk is secretary as well as legal adviser to all committees of the Council. This is now the usual practice in English local government, though there remain a few areas where the Chief Education Officer is secretary to the Education Committee. The Town Clerk, as secretary, is responsible for minuting the proceedings of all committees, and in that capacity he will obviously see that each committee is informed of any relevant decision of another committee or of any relevant argument which is taking place or is about to take place in another committee. He will also take the initiative in calling together chief officers on any matter requiring consultation between them. A number of Town Clerks and Clerks of County Councils have set up within their departments organization-and-methods branches for the purpose of advising the committees of the City Council or their chief officers about the organization of the departments for which they are responsible. In this way the Town Clerk is able to bring about much co-ordination in matters of administrative detail between departments.

CITY PLANNING

The greater part of Liverpool grew up unplanned long before Parliament was convinced of the need for town and country planning, so that the city carries a population far denser in relation to its area than would be tolerated in any new town today. It follows that there is an acute land shortage. All the local government services find that they need land in order to comply with higher standards, now defined nationally, and they tend to enter into competition with each other, since there is not enough land for all needs.

Education and Housing Committees compete for land

The education and housing services are the fiercest competitors. The Education Act of 1944 required all County and County Borough Councils to formulate their future programs in the form of development plans for primary and secondary education and schemes for further education. Regulations, having the force of law, defined the land requirements of the existing and proposed new schools and of establishments of further education described in these schemes and development plans. It is not difficult to observe these regulations in rural areas or in small towns, but in Liverpool and other big towns their effect is revolutionary. The sites of most schools in the congested inner areas are of microscopic size compared with the new standards, and few of those schools have any playing fields. Given Liverpool's conditions, it will not be practicable to provide more than about two-fifths of the land prescribed by national regulations, and provision of even

that amount has involved a demand for land for educational purposes on a scale to which the city has not been accustomed and which has not escaped some criticism.

At the same time the Housing Committee of the City Council needs even larger areas of land. The Housing Committee has a long waiting list of families in need of a house, and has a duty to rehouse tenants of condemned slum houses in central areas. Some limit must be placed to the spread of the town over the adjacent countryside, both to conserve good agricultural land and for other planning reasons, so that there is a strong and legitimate pressure to house as many persons as possible within the city boundary.

The development plan

The Education and Housing Committees search for land with all the eagerness of the nineteenth-century prospectors for gold and diamonds, while the much smaller claims of the other committees cannot be neglected. Some machinery for co-ordination was therefore essential; otherwise jungle law would have prevailed and the land would have gone to the earliest and most vigorous searcher. The Town and Country Planning Act of 1947 set up the necessary machinery by constituting the County and County Borough Councils as planning authorities and by requiring them to prepare within five years a development plan, showing in detail how they proposed that the whole of the land within their areas should be used. Thereafter, the development plans are to be reviewed at intervals of five years, since new needs are constantly arising and old ones altering, so that no determination of land use can be frozen for an indefinite number of years ahead.

The Liverpool City Council set up a committee, known as the Post-War Redevelopment Committee, to be responsible for the preparation of the development plan under the Town and Country Planning Act of 1947, and for its amendments, and generally to act as an arbitrator between Council committees on matters of land use. The development plan is its judgment of Solomon, which cannot please every committee but is recognized to be equitable. It is worth noting, as an illustration of the subtle interplay of the central and the local authority, that the City Council had not a completely free hand in determining the future use of land. The City Council as planning authority could not have decided that land which it owned as education authority, for use as a school playing field, should be turned over to the Housing Committee as a site for houses, without obtaining the consent of the Ministry of Education.

The administrative organization of the City Council is designed to ensure co-ordination between departments in planning as in other matters. The City Engineer and Surveyor, in addition to his engineering functions, is the City Council's planning officer, and also the officer responsible for land acquisition. The City Engineer and Surveyor's Department contains separate sections dealing with planning and with estates and valuation, each under a senior subordinate officer. These sections co-operate closely with each other and with all departments of the City Council's service which require the use of land.

Redevelopment projects

Town and country planning in most rural parts of Britain and in the outer districts of the larger cities is mainly the determination of the future use of undeveloped land. The inner districts of cities such as Liverpool present an

entirely different problem. Population grew so rapidly during the nineteenth century and the concept of town planning was so utterly remote from the ideas of the time that towns were allowed to grow up in a way that would now be regarded as intolerable. Houses and industrial premises are so jumbled up, and the people are so tightly packed together, that the only possibility is to scrap nearly all the standing buildings and begin again, working by better standards.

In Liverpool, redevelopment of this nature is taking place in the districts behind the north and south docks. Since operations on such a scale cannot be undertaken by a large number of individual developers, the City Council has to take responsibility for sponsoring the schemes. It has to have prepared complete plans for new "neighborhood units," similar to plans for entirely new towns on undeveloped sites. The City Engineer and Surveyor, as planning officer, remains responsible for advising the City Council on fundamental planning principles governing the schemes, such as the density of the population and the proportion of the total area to be reserved as public open spaces or for community buildings. The City Council has, however, entrusted the preparation of the plans for the redevelopment areas to another officer, the City Architect and Director of Housing, whose department contains a section specially for that work. Most of the development in these inner areas will consist of houses, and practically all the houses will be built by, and will come under the control of, the Housing Committee of the City Council. The Education Committee has, therefore, to state to the Housing Committee its land requirements for the educational needs of the population to be rehoused in the redevelopment area, any difference of opinion being settled by direct discussion, with the possibility of appeal to the Post-War Redevelopment Committee.

Housing estates

In making land available for educational needs on new City Council housing estates co-ordination between the committees responsible for education, planning, and housing has proved easier than on redevelopment areas. As a housing estate is an entirely new entity and there is no existing population on the spot, the Education Committee expects sufficient land to be made available to enable it to comply with statutory requirements, unless there are special reasons to the contrary. It is a comparatively simple matter on the basis of past experience to deduce from the number of houses to be built the number of school places required and the amount of land needed for them.

Thus the Liverpool City Council has obtained co-ordination between the education service and city planning through the Post-War Redevelopment Committee and by means of direct discussion between the Education and Housing Committees and between their officers.

Community centers

In one specialized territory, that of community centers, the Council has set up formal machinery to co-ordinate the activities of the Education and Housing Committees. The principle has been accepted that each large housing estate and redevelopment area should have a center which will serve as a focus for the cultural and recreational activities of the local neighborhood. The centers must have sites reserved for them, and in due course the City Council will have to build them or assist voluntary organizations to build them. The Education Committee has a legal power to

erect and maintain community centers, while the Housing Committee has concurrent powers under the Housing Acts relating to new housing areas. The Education Committee receives a grant from central government funds at the rate of 60 per cent of its approved expenditure, whereas no such grant is available to the Housing Committee. Not unnaturally, the City Council has assigned the responsibility for community centers to the Education Committee. To ensure agreement on the main lines of policy, the Council has constituted a joint subcommittee consisting of an equal number of members of the Education and of the Housing Committee. This joint subcommittee considers all matters of importance in connection with community centers before they are submitted separately to either the Education Committee or the Housing Committee.

SOCIAL WELFARE

In Liverpool, the Education Committee of the City Council gradually attained status as a major social welfare organization, as the Children and Young Persons Acts assigned social welfare functions to the local education authorities. The Act of 1933 placed on the local education authorities important duties in connection with the prevention of cruelty to, or neglect of, children and young persons and the regulation of their employment. It made the local education authorities responsible for taking into their care children committed by the juvenile courts as in need of care and protection, and for the establishment and maintenance of remand homes and of "approved schools," that is, boarding schools approved by the Home Secretary for the benefit of young people committed to them by the juvenile courts because of offenses or because they were in need of care and protection. In 1903 the Education Committee in Liverpool had taken over from the School Board a staff of attendance officers whose job was to visit the homes of absent pupils in order to insist on regular school attendance. It may seem a far cry from the semi-police function of the "School Board men" who had to enforce school attendance for the first time to the School Welfare Officer of today who is looked upon in many homes as a friend and adviser. The transition, however, has been easy and natural, since the officers soon found that social difficulties were at the root of the more persistent cases of irregular attendance and that to counteract these difficulties they had to co-operate with other social agencies. The organization of School Welfare Officers soon built up a rich experience which proved of great value to the new staff of special officers employed to carry out the Education Committee's duties under the Children and Young Persons Acts.

The Children's Committee

The Children's Act of 1948 required local authorities to set up a new committee, the Children's Committee, and to appoint a new officer, the Children's Officer, to be, with his staff, at the service of the Children's Committee. The act transferred from the Education Committee to the Children's Committee responsibility for children in need of care and protection and also for the management of remand homes and approved schools. Prima facie the act might seem to be a step away from unified conduct of the city's social welfare services. Two committees now function in what was the province of one, thus creating a new need for co-ordination. It was argued, however, that the Education Committee of a County Council or County Borough Council already had a very big job on its hands in its responsibility for the education service, and that it could not be expected in addition to lavish as much time and attention on the care of children as would be given by an independent committee specially formed for the purpose. Similarly, it was argued that there should be a separate officer, the Children's Officer, who should be in a position to give his whole time to the intimate human problems of deprived children.

Given the decision to set up Children's Committees, the question of co-ordination with the work of the Education Committee had to be faced at once. The need for co-ordination would have been less had the Children's Act of 1948 gone further and transferred more functions to the Children's Committees, for while the Children's Committee was given responsibility for children in need of care and protection, the Education Committee remained responsible for preventing neglect of, and cruelty to, children. It is not easy to draw the line between the two functions, and it is necessary for both committees to employ social welfare officers, with equivalent qualifications, for home visiting. The Liverpool City Council has not thought it necessary to set up special co-ordinating machinery, leaving co-ordination, instead, to the good sense of the two committees and their officers. Co-operation has been easier because the Liverpool children's department took over from the education department practically the whole staff which had done the work previously, and that staff remains a high proportion of the total staff of the children's department.

Variety of agencies in social welfare

Co-ordination in the social welfare field is particularly desirable and particularly difficult because so many agencies, both statutory and voluntary, are involved. The Health, Housing, and Watch (responsible for the police) Committees of the City Council are involved in addition to the Education Committee and the Children's Committee. Also in the field are governmental organizations, such as the National Assistance Board (which performs the work carried out before 1948 by the Public Assistance Committee of the City Council) and the Probation Service, and an exceptionally large number of voluntary organizations. Frequently, the statutory authority has the power and the duty to perform a function which is also performed by a voluntary organization. The voluntary organization will usually have done the pioneer work in the field, and in accordance with the English tradition every encouragement is given it to continue. Thus while the Education Committee is legally responsible for preventing the neglect of children and maintains an organization for the purpose, the National Society for the Prevention of Cruelty to Children also operates in this field. In some areas the local education authority has handed over the whole job to the National Society. In Liverpool, there is an agreement precisely defining the spheres of action of the two bodies and providing for systematic consultation on casework. One object of the agreement is to ensure that under no circumstances is one home visited separately by officers of both organizations, since such unco-ordinated visits would be harmful to the interests of the children and young persons.

National government circular on co-ordination

The danger of lack of co-ordination in the social welfare field is so great that in 1950 three government departments, the Home Office, the Ministry of Health, and the Ministry of Education, issued a

joint circular [2] urging co-ordinated use of the statutory and voluntary services to mitigate by social action the causes of neglect and so to avoid the need of removing neglected children from their parents. The circular asked County and County Borough Councils to designate an officer to be responsible under them for devising arrangements to secure full co-operation among all the local services, statutory and voluntary, concerned with the welfare of children in their homes; to arrange for the designated officer's holding regular meetings of officers of the local authority and other statutory services and of local representatives of the voluntary organizations; and to see that significant cases of child neglect and all cases of ill-treatment coming to the notice of any statutory or voluntary service in the area are reported to the designated officer and brought before these meetings.

Some councils have designated the Children's Officer as the co-ordinating officer requested in the circular. So far, Liverpool has not found it necessary to set up the recommended machinery. In my opinion there is real danger that meetings attended by representatives of a very large number of organizations may consume an inordinate quantity of staff time without achieving fruitful results. In a large city such as Liverpool, many cases cannot await submission to a regular meeting; action has to be taken immediately. It has, therefore, seemed better to continue to rely on organized bilateral agreements for co-operation. Faithfully carried out by both sides, these seem to work successfully and to avoid the obvious pitfalls.

SCHOOL HEALTH SERVICE

Co-ordination of the education and public health services has presented few difficulties. The Education Acts have placed on the Education Committees of County and County Borough Councils, not on the Health Committees, the responsibility for organizing and conducting a school health service for the medical inspection and treatment of school children. The school health service is, therefore, organized as an integral part of the education service. Many advantages flow from this integration. The cordial support of the teachers vital to the success of the service can be more easily obtained when teachers and school health service staff regard themselves as colleagues working together under the same committee. The influence of teachers on parents is often important, for example when a new technique is proposed, such as the use of the BCG (bacillus Calmette-Guérin) vaccine against tuberculosis. Medical inspections can be arranged with the least disturbance to schoolwork, and the medical staff is available for consultation on health matters, including the plans of new school buildings.

Questions of co-ordination in the work of the Education and Health Committees do not often arise. In Liverpool, some clinic buildings are used both by the school health service and by the maternity and child welfare service, which is the responsibility of the Health Committee; and the staffs of both services have the advantage of facilities organized by the health department for training and refresher courses.

The administrative arrangements are conducive to co-ordination. In Liverpool, as in most other areas, the Medical Officer of Health for the city is also Principal School Medical Officer. The Medical Officer of Health is assisted on the school medical side by a Deputy Principal School Medical Officer, whose staff of doctors, dentists, and so forth is distinct from the other staffs under the control of the Medical Officer. The headquarters of this staff of the school health service is in the education office, and the administrative and clerical staff is for all practical purposes regarded as part of the establishment of the education department. The Education Committee is advised on medical matters by the Medical Officer of Health and has set up a School Health Services Sub-Committee which considers all matters relating to the school health service. The Medical Officer of Health (or his representative) and the Director of Education (or his representative) attend meetings of the School Health Services Sub-Committee, so that it can hear the views of both officials in the event of a difference of opinion between them. The recommendations of the School Health Services Sub-Committee, before presentation to the Education Committee, are considered by the Special Services Sub-Committee, which is one of the five major subcommittees of the Education Committee and which has a general responsibility for co-ordinating the work of the school health service, the school meals service, the school attendance and welfare service, and the special schools for handicapped children.

[2] Circular 157/50 Home Office.

YOUTH EMPLOYMENT SERVICE

The youth employment service, like the school health service, is administered in Liverpool as an integral part of the education service. The central government department responsible for youth employment matters is the Ministry of Labour and National Service. The Employment and Training Act (1948) authorized but did not compel local education authorities to administer the youth employment service in their area; 115 out of 146 local education authorities, including Liverpool, exercised that option. In the areas of the other thirty-one local education authorities, the Ministry of Labour and National Service administers the service directly, and co-ordination between its activities and those of the local education authorities has to be worked out in detail. Where the local education authority is responsible for the service, the Ministry of Labour and National Service has to approve a scheme for the constitution of a Youth Employment Committee. In Liverpool, the Youth Employment Committee contains members of the Education Committee, who are in the minority, and representatives of teachers, employers, employees, and voluntary organizations. The Youth Employment Committee reports to the Education Committee through the Further Education Sub-Committee.

Functions

The primary function of the youth employment service is to give vocational guidance in schools. Such guidance includes both talks in the schools on careers by officers of the Youth Employment Committee and individual interviews with those leaving school. Guidance of this sort would have little effect unless backed up by the wholehearted co-operation of the teachers, particularly of those who have special responsibility for advising on careers, in schools where one member of the staff is assigned to this work.

Achievements in Liverpool

In Liverpool, the co-operation between teachers and the youth employment service is particularly close. One feature of the service is a group of officers who specialize in advising those who are leaving secondary grammar schools. They have acquired a knowledge and experience both of industry and of secondary grammar schools which enable them to be of the greatest possible assistance to school leavers, and their help is greatly valued by the heads and staffs of those schools.

Other specialist officers in the Liver-

pool youth employment service devote themselves to serving the needs of those leaving special schools for handicapped children. A sympathetic, individual approach is needed to these boys and girls, many of whom tend to lack self-confidence. It has been found that careful placing in suitable jobs, with close follow-up during the early years of employment, often makes a decisive contribution to the success of these boys and girls in their jobs, enabling them to earn their living as happy members of the community.

The Youth Employment Committee is in day-to-day touch with local industry and commerce, and is in a position to organize visits of school children and young persons to local industrial and commercial undertakings. It also maintains close liaison with the establishments of further education. The officers, when giving vocational guidance and doing follow-up work after employment, lose no opportunity of urging young people to qualify themselves further; in fact, the youth employment service is a leading recruiting agent for further education.

It cannot be doubted that the outstanding success of the youth employment service owes much to its organization as part of the education service. The teachers accept its officers as colleagues, and all necessary arrangements for vocational guidance are made on the authority of the Director of Education in the same manner as are other arrangements relating to school life.

YOUTH SERVICE

The Education Committees of County and County Borough Councils are also responsible for what is usually known as "youth service," the object of which is to provide opportunities for young people who have left school to spend their leisure in worth-while activities. The pattern of organization in this sphere is as infinitely varied as in that of social welfare. Voluntary organizations were everywhere first in the field and remain lively and vigorous in a sphere in which voluntary effort is peculiarly appropriate. In Birmingham, the Youth Employment Officer is also responsible for the youth service, but this combination is unusual. Many Education Committees have constituted Youth Committees which bring together representatives of the statutory and voluntary organizations working for the welfare of youth.

In Liverpool, the Liverpool Council of Social Service, a strong voluntary organization employing a full-time staff, has set up a committee known as the Liverpool Youth Organizations Committee; it contains representatives from the Education Committee and from all the interested voluntary and statutory organizations. The Youth Organizations Committee meets monthly and is an open forum for discussion on all youth matters. The Liverpool Education Committee does not itself organize youth clubs, but it sets aside annually a substantial sum of money to assist voluntary clubs which are doing the job. These grants are made on the advice of a joint subcommittee composed of members of the Education Committee and of the Youth Organizations Committee. It is generally agreed in Liverpool that this pattern of co-operation has been exceptionally successful.

UNDERLYING CO-ORDINATION

We have seen that though the county borough system of single-tiered local government in large towns is itself conducive to co-ordination of services, the actual forms assumed in co-ordination of the education service with other local services are many. They differ according to the services involved—their nature and their earlier history; they vary with variations in the local framework into which they fit. Often, too, strong-willed individuals, whether officers or members of committees, have molded patterns lasting after the reasons for them have been forgotten.

It is abundantly clear, in any case, that co-ordination does not come of itself, that it is likely to be conspicuously absent unless active steps are taken to promote it. And in the end, after the best possible machinery has been set up, co-ordination will be achieved only by the will to co-operate of the individuals who use the machinery.

Harold Swindale Magnay, M.A. (Cantab.), has been director of education in the City of Liverpool since 1946. He served as game ranger and district reclamation officer, Tanganyika (1925–27), as assistant master at the Royal Grammar School, Newcastle-upon-Tyne (1927–30), as assistant director of education in Newcastle (1930–34), and as director of education in Barnsley (1934–40) and in Leicester (1940–46). He is honorary treasurer and past president of the Association of Education Officers and honorary treasurer and past chairman of the Association of Art Institutions. He has been a member of various educational commissions, including the University Grants Committee and the Fulton Committee on Education in Sierra Leone.

Education and Other Public Services in France*

PUBLIC opinion and government in France have for the last few years given particular attention to the general problems of the younger generation. Indeed, various signs have made people realize that youth was undergoing a serious crisis.

Among the manifestations of this malaise, some might be considered normal in that they are to be found in all times and places: a taste for radical philosophical and political theories, systematic criticism of the older generation, a concern for having more voice in state councils, and so forth. But this disease of the ages is today particularly manifest in France, where time-honored institutions are little adapted to the needs of modern living.

Within its own jurisdiction, which includes most of the child's activities, the Ministry of Education has been able to maintain a certain cohesion. At the level of the transition from school to the working world, however, as well as on the social and judicial levels, government responsibilities need to be better co-ordinated.

The School World

Educational services do not escape the centralization which has long characterized French administrative life.

Metropolitan France and Algeria are divided into seventeen "academies," each of which embraces, on the average, five or six departments. Attempts are being made to give these districts a certain autonomy in the choice of their educational specialties, so that instruction may correspond more closely to the vocational needs of the area. Budgetary matters are left to the departments and communes, especially for primary education (six to fourteen years). It is known, however, that, contrary to the practice of numerous other countries, and in particular the Anglo-Saxon nations, the various academies are only a method of territorial division convenient for carrying out national provisions. Curricula, examinations, teacher training, and the regulations and methods in force are the same for the entire country.

All the services in the administrative offices of each academy and in the department depend more or less immediately on the central administration in Paris, which gives them all necessary directives. To know the structure and the objectives of educational public service in France, it will therefore suffice to examine the operation of this central administration.

At the head is the Minister, sometimes assisted by a secretary of state, who prepares the budget (almost 400 billion francs[1] last year), initiates all undertakings legally within the scope of administrative authority, requests parliamentary decisions, and regulates, in detail, the work of the service at the national level. He does this by decrees, orders, and circulars distributed to the rectors.[2]

The prerogatives of the Minister are not limited to the organization of instruction only: in addition to his school duties he is responsible for libraries, archives, arts and letters, museums, architecture, sports, and, under some governments, scientific research.

School and university questions come under the jurisdiction of four general departments: Education of the First Degree, Education of the Second Degree, Technical Education, and Higher Education. Preparation of the budget devolves upon the Department of General Administration. The Department of Youth and Sports unites all the services concerned with sport and with youth in the widest sense: popular education, recreation, youth movements, and so forth. Finally, for more than a year, all the services in the academies and the departments which relate, within the school system, to the health of youth have been under a Department of School and University Hygiene.

To these departments, there must be added, among the bodies directly dependent upon the Minister's Cabinet, the University Service for Relations with Foreign Countries and Overseas France, which is in charge of education outside the borders and in the French Union; the National Service Center for Students, which manages the numerous social institutions created since the war for students in the universities and professional and technical schools (student hostels, restaurants, and so forth), and, finally, the National Center of Pedagogical Documentation, which exercises the triple function of information center, pedagogical research center, and distribution center for educational material used in the schools, such as books, records, films, and scientific collections.[3]

The operation of this collection of departments and services is inspired by various advisory bodies where the opinion of school personnel is freely expressed. The most important is the Higher Council of National Education, a widely representative academic group whose advice the Minister requests whenever he deems it useful, especially in regard to bills and decrees which he has prepared.

This assembly, the interdepartmental commissions, and the numerous groups of specialists, assisted by the undeniable *esprit de corps* uniting all ranks of the state school system, give great cohesiveness to the public service of national education. Concern for the interest of the child has priority in the administration as well as among school personnel. And in the last analysis all are closely united in the secular ideal, that constitutional principle by which the state school, strictly neutral, must admit all the ideological families of the country, with no distinction as to doctrine or opinion.

It is in the name of this ideal, incidentally, that members of the state school system contest the right of private educational institutions to receive public aid. Defenders of the "free" (that is, independent, or private) school, on the other hand, and particularly of the "confessional" (i.e., Catholic) school, have at their disposal, in the present Assembly, a majority determined to vote subsidies for them. The old argument between the "two schools" is therefore not yet nearing its conclusion.

The Child Outside the School

In spite of certain imperfections and maladjustments to the necessities of modern times, which will be discussed further on, the institutions providing school and university life to French youth are relatively homogeneous and well co-ordinated on all levels. The same could not be said for the child when he is considered aside from his purely intellectual activities. As a student, the French youth is taken over by

[1] About 1,160 million dollars.—Editorial note.

[2] Each of the seventeen academies is headed by a rector, who resides in the university town of the area and has in his general charge all public education—primary, secondary, and higher—in the district.—Editorial note.

[3] For a further account of the Center, see the description at the end of the article.

a vast administrative machine; as a future worker, his "extra-scholastic" destiny is regulated by a great number of public services, all competent and attentive, but scattered among several ministries.

The rural youth who, upon leaving primary school, wants to pursue specialized studies, is dependent upon two different ministries: that of National Education, which organizes, as an extension of the public primary schools, after-school agricultural training, and that of Agriculture, whose producers' unions consider themselves capable of recruiting their own labor with the help of private organizations, often Catholic. This double jurisdiction, and the conflict in doctrine which accompanies it, have up to the present time seriously checked agricultural school development. Public opinion and political and educational circles are at the moment greatly exercised over this problem.

In the industrial and commercial field co-ordination of the school with employment is satisfactorily ensured. National vocational advisory commissions inform the Department of Technical Education of the needs of different branches of the country's industrial and commercial activities. Moreover, the union of these commissions into a higher council of vocational development is being contemplated. Liaison between the Ministry of National Education and the Ministry of Labor is likewise well ensured by specialized committees. Finally, there is an organic connection between the service of family allotments and the academic authorities, aid to families being dependent on school attendance from six to fourteen years of age. But the absence of labor inspection specialized in the control of working conditions for child labor still leads, in certain areas, to abuses which need to be corrected.

Centers of apprenticeship and vocational courses, established by state or municipalities, by business concerns or vocational organizations, enable children who have left the primary schools to serve their apprenticeships while receiving a complementary general training. Adults who wish to perfect themselves and to improve their vocational status can take evening courses, particularly in Paris those of the National Conservatory of Arts and Trades. This institution has also just established provincial centers for workmen and employees who, directed too soon toward the world of production, can by taking the courses planned for them improve their vocational qualifications and attain positions corresponding to their actual abilities.

EDUCATIONAL REFORM

In spite of this organization and the progress which it has made since the war, too many children enter active life without other intellectual baggage than what they have acquired in primary school between the ages of six and fourteen. Adults who have not had secondary or higher education seldom have access to the better positions in industry. Though one can point out such-and-such a philosopher who was a mailman before becoming a professor at the Sorbonne, and so-and-so, the well-known aeronautical engineer who, at the age of twenty, was still working in his father's pastry shop, these cases remain rare. Secondary and higher education, moreover, is developing only in too small a proportion the scientific and technical cadres necessary to a modern nation. Because of their concern for preserving a certain disinterested culture, these levels of education have not sufficiently adapted their organization and methods to economic and social developments.

Families and children, too, often disregard these needs. In spite of information distributed everywhere by school guidance services and the justly widespread belief that the scientific and technical fields are much less crowded than the literary or legal fields, careers in the latter are still chosen by an excessive number of young people. The infatuation with the nonspecialized "education of the second degree" produces an overabundance of more or less gifted students with no well-defined vocation heading for the overpopulated schools of law and letters while the country clamors for more average workers and qualified technicians.

Official services regularly warn the people against this serious lack of balance between supply and demand, which is dangerous for the country as well as the young people themselves. But prejudice against early specialization and technical instruction continues in France, and the structure of the present pedagogical organization, even amended, could not fully meet the needs of a country industrially inclined.

Therefore the governments which have succeeded each other since the war have considered fundamental reforms in the educational system. The latest project is to be submitted to Parliament before the legislature ends. Elaborated by important individuals belonging to various branches of the nation's activity, this project gives priority to vocational training and prolongs required schooling from fourteen to sixteen years of age. It foresees that the *baccalauréat* will no longer be indispensable for entrance to the advanced technical and professional schools and the traditional university faculties. Such a measure would make admission practices in these institutions more democratic and would permit young French people who have not attended the lycée to solicit, if they show themselves worthy, the highest public and private positions.

What fate awaits this project in the councils of the ministry and the deputies? Opinions as to the best way of renovating the state school system diverge too widely to make prediction possible.

HOUSING

A great problem in France today, which affects its youth in particular, is that of housing. Recent statistics have shown that, because of the lack of new buildings near developing industrial centers, one-third of the young workers have to live away from their families in solitary, uncomfortable rooms. Twenty per cent of them, for reasons already indicated, have been obliged to take employment other than that for which they had prepared in school; 8 per cent are unemployed and will remain so unless they consent to a cruel separation from their homes and families.

JUSTICE

Certain stirring news items from no less startling films have given cause to believe that there has been a growth of juvenile delinquency during the year 1954. Fortunately, however, actual figures give no foundation for this fear.

Great progress has been made in France by way of confirming the preventive and re-educational role of the law for children. A special tribunal functions in each judiciary district. Under the responsibility of a Department of Supervised Education in the Ministry of Justice, minors are placed in one of a dozen state institutions charged with their betterment or in similar private institutions. The coercive and rigorous methods of former times have entirely given way to educational and treatment methods with excellent results.

Preventive action is less effective, as in most countries. Official bodies safeguard the moral quality of publications destined for the young, and give advice

to the national commission for film control. These precautions, however, do not prevent the distribution of a very large number of films and newspapers of dubious moral value. At the request of parents' associations in the lycées, various campaigns have been launched to strengthen the control of publications and the criteria already in force prohibiting certain films to children under sixteen. It has likewise been recommended that lectures be given in the upper classes to permit students of the lycée who are at least seventeen or eighteen years old to attack sexual problems in a healthy way. In France as in other countries, however, these efforts are opposed by certain groups.

THE ARMY

From the age of twenty, and until the age of twenty-seven if a postponement has been granted for the completion of his studies, every Frenchman in good physical condition must spend eighteen months in the service. Efforts have been made by the military administration to utilize the skills of recruits in the best possible way. Within the means at its disposal, the army is at present opening psychological centers to determine, on induction, the aptitudes of the young men in the contingent and to give them corresponding assignments. Nevertheless, for each radio engineer sent into the signal corps there are many agrégés who become drivers and many mechanics who become office workers. Inversely, for each army driver who has become a truck driver in civilian life, there can be found a good number of cooks doing clerical work when they discard their uniforms. This poor utilization of resources is a waste not only for the army but also for the recruits themselves. As a general rule the qualifications obtained in the service do not continue to be used in civilian life. Many young men who served in the navy or air force succeed, it is true, in finding a place for themselves in the merchant marine or in civilian aviation after a period of adaptation. For the majority in the infantry, however, the eighteen months of military service still too often represent a kind of long enforced vacation. The government has recently expressed its intention of undertaking extensive reform of the present system, so that the term of military service may better serve the development of youth and the needs of the country.

THE SUPERIOR YOUTH COMMITTEE

In order to make the necessary coordination, to synchronize the efforts of the various ministries, and to arrange the activities of those under thirty in their and the country's best interest the Mendès-France government set up during the few months it was in power a "State Secretariat in Charge of Youth." Even though it was short-lived and commanded no budget, this State Secretariat did a valuable job. Under its leadership, commissions in each ministerial department studied the questions which interest the younger generation. Measures were recommended: educational reform; centralization of the councils of school and vocational guidance; development of the re-education of juvenile delinquents; elaboration of a child labor code; particular effort in the matter of housing; arrangements for military service; and so on. Last May, M. Edgar Faure, the successor of M. Mendès-France as President of the Council, announced the creation of a "superior youth committee" made up of representatives of the administration, of various educational institutions, and of youth groups and charged with coordinating governmental action in all "extra-scholastic fields"—housing, the army, labor, juvenile delinquency, and so forth—where the situation of young people is particularly disturbing.

A PERIOD OF TRANSFORMATION

To summarize, the fate of young people in France today depends on the one hand upon an educational system which is highly structured and sometimes progressive, and on the other upon a multitude of services which are without organic interconnection or whose recommendations are disregarded on the executive level.

There will be proposed to Parliament before summer a reform of education to adapt the state school system to current economic and social changes; and we may hope that the Superior Youth Committee, for its part, will soon present to the government a coherent program of measures designed to achieve in the interest of young people the coordination which is now lacking.

It is therefore indisputable that on these various levels France is entering a period of reform and rejuvenation. The general effects will of course not make themselves felt for a long time: the adaptation will be the slower, the more restrained, even, because the country intends to conserve in its new structure the spirit of the time-honored institutions. But the enterprise of some and the energy of all continue, as in the past, to mitigate structural defects and anticipate tardy reforms.

Le Centre national de documentation pédagogique, Paris, directed by Mr. Louis Cros, is a state institution which is part of the Central Administration of the Ministry of National Education. It contains the Pedagogical Museum, the Central Library of Public Education, the Central Repositories of Recordings and Films for Public Education, the services of study and pedagogical research, the audio-visual instruction services, the publication service of the Ministry of National Education, the International School Correspondence, and the Bureau of School Co-operatives.

The work of the Center has three aspects: (1) informational—to assemble and make available documentary material on education in France and abroad—organization, administration, methods, and results—and also documentary and illustrative material useful for teaching; (2) distributive—to supply the public schools with needed educational material such as books, artistic and scientific collections, films, and records; and (3) developmental—to test and appraise the effectiveness of instructional methods and materials, and in every possible way to encourage pedagogical improvement and utilization of the best educational techniques available.

Education and Other Governmental Agencies in the Netherlands

By F. Th. van der Maden

EDUCATION in the Netherlands cannot be understood without knowledge of its background—political, social, cultural, economic—and of the tasks that lie ahead. Some of the elements in the picture are as follows: (1) the loss of the colonies, immense war damage, and a catastrophic flood; (2) the unique demographic position of the Netherlands in Western Europe, with the highest national birth rate and the lowest death rate; (3) the high-speed industrialization necessary to create employment, especially in the agrarian districts which have a shortage of land and the largest population growth; (4) the need of stimulating emigration as a partial solution to the employment problem; (5) the general aim of giving youth a better education for life in a democratic society and in a fast-developing technological world, by promoting family life, school life, education outside school, and improved conditions of labor and leisure.

Educational Policy

In the "Republic of the Seven Provinces" (1581–1795), a federalized commonwealth, education was the task exclusively of the local municipal and religious authorities, and Calvinism was its base. The more centralized Kingdom of the Netherlands, which arose as a new state after the Napoleonic wars, favored national public education. The political struggle over these conflicting policies lasted till 1917, when the "pacification principle" was introduced into the national constitution. The educational issue was for more than half a century a basic principle in party and cabinet formation. The left wing in Parliament claimed a monopolistic position for public (state and municipal) education, but permitted others the right to establish schools on religious principles; the right wing (Calvinists and Roman Catholics) claimed not only the right to establish private schools but also complete government support of them.

In 1917 government and Parliament agreed on a constitutional paragraph in which freedom of education is guaranteed, with total financial aid for both public and private primary education. The government has the obligation of securing adequate public primary education in each municipality. Private organizations when claiming a private primary school for a sufficient number of pupils—this number depending on the total population of the municipality —have a right to establish such a school. The state is to pay the total salaries and pensions of all teachers and other staff members according to nation-wide salary and pension scales, the municipalities being responsible for the total cost of building and other materials.

This arrangement, which is the basis of education in the Netherlands, guarantees education by means of a national policy, yet at the same time offers possibilities of freedom, of decentralization, and of self-government.

This is also the guiding principle in other work for the benefit of Netherland youth. It is in actual fact an adaptation of the general principles of subsidization, functional decentralization, and sovereignty in each peculiar sphere, according to which the responsibility for the executive work must be taken where possible by the authority

most closely connected with the interest in question. In this way the various government agencies are entrusted with a task which is more leading and co-ordinating than executive. Only in the case of a lack of private initiative have the government agencies an executive task.

This social philosophy has been shown to be necessary in obtaining essential co-operation, because of the deep cleavage in the Netherlands population caused by different ways of life. There is however an awareness of the danger for community life of too far-reaching a cleavage in social and cultural activities along lines of religious ideology.

Alongside unanimity with regard to the principle, there have arisen differences of opinion with regard to its practical application.[1]

Network of School Agencies

In the Netherlands the further elaboration of these principles has led to state laws in which school organization, programs, financing, and supervision are laid down.

The Ministry of Education, Arts, and Sciences is the national organization which has been given the responsibility of applying the legal decisions, thereby acquiring a strong co-ordinating position. As the Minister is responsible to Parliament, he has continual opportunities to consult it, especially in the thorough yearly discussion of the budget. The National Education Council is the highest permanent advisory organ; the members, being experts, play their part in forming the Education Acts. A large body of school inspectors attached to the Minister and controlling the application of legal rulings has intensive contact with the schools and is in a position to advise both Minister and school.

The majority of pupils attend government-financed private schools. State schools are the exception in the Netherlands, most of them belonging to secondary and higher education. All public elementary schools are organized by the municipality. The municipalities, in addition to this organization of their public schools, have legal and financial responsibilities to the private schools, and they usually possess a special administrative education department. The larger towns have their own experts, inspectors, and advisers.

Recent School Problems

Following the crystallization of the pacification principle for education in the national constitution and the guarantee of freedom and financial support given to private schools, public interest in education lapsed for a few decades. A renewed interest followed World War II.

Some of the main problems and criticisms were: (1) growing shortage of teachers as result of lessening supply and a greater demand for them, coupled with rapid population growth and a general desire for more education; (2) a resulting shortage of buildings; (3) stagnation of the educational system and insufficient adaptation to the changing needs of society—its greater complexity, and the necessity of a swift industrialization process; (4) insufficient attention to individual differences between children as a result of differences in home life and in natural ability and the difficulties of adequate differentiation of educational offerings under the legally required uniformity of school programs and examinations; (5) insufficient freedom for the centrally controlled public schools; (6) insufficient

[1] Recent discussions of the draft of a law on social work were concerned particularly with delegation questions. Preparation for emigration is also delegated for the most part to private associations. See "The Organization of Emigration from The Netherlands," *International Labour Review*, Vol. 81, No. 4 (April 1955), p. 413.

co-operation with parents; (7) insufficient integration into general national policy.

During recent years, there has been much discussion of these problems with considerable governmental activity. Investigations have been carried on by state, private, provincial, and local authorities. A number of Education Acts are in process of development, and some steps have been taken concerning such matters as a national plan for teacher education; temporary deferment of military service for teachers; reserving more land, money, and manpower for school buildings; more differentiated educational opportunities for industrial workers; more scholarships; greater freedom of management for public schools; stimulating parent-teacher co-operation; further co-operation among the universities; relating education more closely to developing economic and social needs; expanded further education; more extended co-operation between the Ministers of Education and of Social and Economic Affairs.

GOVERNMENT AND YOUTH WORK

Intensive governmental interest in youth work as an important educational agency dates only from recent years. Before World War II no direct contacts existed between the state and youth work. The more active role of the Ministry of Education led in 1945 to the formation within it of a well-equipped "Department for Education Outside School." Close contact and co-operation was formed with "The Netherlands' Youth Community," a private over-all organization in which the numerous confessional organizations, as well as youth organizations of a nonsectarian character, have united for joint activities. This co-operation led among other things to considerable state subsidies for youth work, the amounts being divided along lines set up by common consent. For all this financial, material, and moral aid given by the state to youth work, it retains a complete freedom.

Special attention is paid to the work of the associations active on behalf of unorganized youth (clubhouses, and so forth). This work is being supervised by an Interdepartmental Committee for Youth Aid in which several ministries and other state agencies are represented. Extension of this work for unorganized youth, those most vulnerable to the dangers of nihilism and criminality, has been facilitated by state grants, special grants being given for scientific research into "unorganized youth."

With one exception the work for unorganized youth is done by private associations. A number of state-owned camps and boardinghouses used during the crisis years of the thirties for social-cultural work among the thousands of young unemployed are at present used as reception centers for youths who appear, from police and school reports and other indications, to be heading toward crime. The stay is voluntary and lasts three to twelve months. The work is carried on in close co-operation with private organizations and it is intended ultimately to place this form of youth work entirely in their hands.

Most provincial authorities take an active interest in youth work outside school. This work is stimulated in various ways by semiprovincial "organizations." Youth work is also supported by the municipal authorities in many towns and villages, for example, by financial aid and by putting buildings and grounds at their disposal. In Amsterdam and The Hague well-equipped local Youth Action Committees have been set up with financial aid and office facilities from the municipalities.

EDUCATION, LAND USE, AND CITY PLANNING

A serious shortage of land for the farming population and a rapidly growing population demanding expansion of town and village, of industrial sites, and of grounds for recreational and educational purposes have led to the establishment of a "State Service for Town and Country Planning." This permanent body for research and advice, at the highest level, on national land use is assisted by a permanent commission on which the different ministries and other state agencies interested in land use are represented. Special attention is paid to the possibilities of preserving existing recreation areas and creating new ones.

Provinces have their own "Provincial Planning Services," while the large towns also have well-equipped institutes at their disposal for city planning. These local planning institutes, which have excellent information services, are able to pay special attention to educational aspects in their town planning. A well-known example is the Dudok plan, a most harmonious long-term development plan for The Hague.

As the Municipal Councils are in a position to give effective leadership in town development, the possibility of a satisfactory educational development through good co-ordination of the municipal services arises. There is the impression that this is generally successful as far as supplying school buildings is concerned, but that sufficient attention is not always paid to the needs of youth work, adult education, sports, and other necessary outside school activities. Local authorities must provide for school buildings but not for the needs of education outside the school.

EDUCATION AND HOUSING

A growing awareness of the role of housing in education has made the Netherlands conscious of serious shortcomings in this respect. Although slum districts are not as numerous as in many other countries, in a great number of cases dwellings must be termed insufficient. Too little space, light, and fresh air, inadequate plumbing, overcrowding and the necessary sharing of houses, are sources of spiritual and physical damage. The situation grew considerably worse during and after World War II. Thousands of houses were wrecked by acts of war; others were demolished by German occupants.

The immensity of the housing need led immediately after the liberation (1945) to the setting up of a Ministry of Reconstruction and Building, equipped with wide powers to combat the difficulties. Shortages of manpower and materials, however, caused serious delays, and even now necessitate reconstruction and new buildings in strict adherence to a balanced building plan which fixes the volume of building permitted to each type—housing, industry, education, churches, and so forth. The details of the building plan, which is determined each year, are worked out by the ministries concerned with building activities.

Because of the general shortage of houses and other buildings the granting of priorities causes great difficulty. A housing shortage is expected until 1965. Each year the extent of the total building plan and the share accorded the various types of building give rise to widespread public discussion. The criticisms are increasingly directed toward the volume, the equipment, and the finishing of the houses. In view of the serious need, the Ministry of Reconstruction and Building has laid down strict rules for the building industry, whereby building is to be largely concentrated on small, unpretentious dwellings intended to bring help as quickly as possible to those in need of homes.

Control of housing standards, building and upkeep, is in the hands of the municipal authorities, who may condemn dwellings as uninhabitable when they do not conform to minimum standards.

Scientific research in the housing field

deserves special attention. The Ministry of Reconstruction and Building recently published reports containing people's appraisals of different kinds of dwellings. The Building Center (private), the Netherlands Household Council, and other organizations are working together in the same field, endeavoring to fit floor plans and equipment of houses to the needs of modern family life. Educational aspects of housing should thus be given more attention than in the past.

EDUCATION AND RECREATION

We have already indicated the serious shortages of open-air recreation space in the Netherlands. The social scientists and social workers have for years been stressing the important educational role of good recreation. Provisions for recreation become more urgent in the Netherlands as forced industrialization shifts people into a sociocultural climate which might prove unconducive to the development of a sound leisure pattern. Therefore in the new schools planned for young male and female workers special attention is paid to leisure and recreational possibilities.

It is somewhat surprising that in spite of the importance of problems of leisure and recreation no general line of governmental policy could be traced. The fear continually recurring in the Netherlands of government intervention in matters where the hierarchy of values is immediately at stake has prevented foundation of recreational research centers. Meanwhile need for a central advisory body and for a more positive governmental policy becomes increasingly obvious. Recent discussions concerning the expected general five-day working week have stressed the urgency of the situation.

Governmental services do not of course altogether ignore recreation and leisure. The Ministry of Education pays active attention to camping, hiking, community singing, folk music and dancing, sports, and so forth. Considerable state subsidies have been afforded in recent years to these and other activities. Since World War II the fields of radio, television, films, and the press have also been given attention by the Ministry of Education.

During the last few years, much thought has been given to vacations as recreation periods, stimulated by the fact that they are now generally longer and that greater prosperity offers more opportunity to use them. Because of the limited availability of vacation facilities, spreading of summer vacations has been attempted, by agreement among governmental agencies, railways, hotels, schools, industry, and so forth.

The activities of the municipalities in the field of recreation are varied. Besides financial aid to private organizations, technical and material help is generally offered by making buildings and grounds available. Many municipalities are active in organizing vacation activities for youth and adults. Some provinces and municipalities have created, in close collaboration with private initiative, "Culturele raden" (cultural councils) or "Gemeenschappen" (communities) for their areas.

EDUCATION AND PUBLIC HEALTH

Close co-operation has developed in the Netherlands between education and public health services. The Ministry of Education, which pays strict regard to hygienic standards, must approve all school buildings. All teachers of primary education must have a periodic examination for tuberculosis.[2]

The vast majority of pupils of private and public primary schools are under regular medical control. The doctors are for the most part officers of the Municipal Health Service, with whom a good relationship exists. According to the advice given, children are directed to specialists, or they may be sent to sanatoria, open-air schools, and other health institutions. Weak city children in large numbers are sent to agrarian areas for a period of a few months. School dental organizations are fully developed, though complete service is regrettably hampered by the shortage of dentists.

Special care is given to mentally and physically handicapped children. A large network of special schools—also along religious lines—has been developed. The decision to place a child in a school for handicapped children is agreed upon by the parents and the medical and pedagogical specialists.

The relationship between the educational institutes for children, such as orphanages, and the public health service is extensive and varied. Here special attention is paid to mental health as well as to physical well-being. Based on scientific research in this field a great attempt is nowadays made at family (or pseudofamily) education.

It is impossible to give a complete survey of all the health work done for youth in the Netherlands, but the highly important work in mental health done by the Child Guidance Clinics and Pedological Institutes should be mentioned. Organizations for scientific research are the National Federation for Mental Health and the Institute for Preventive Medicine.[3]

EDUCATION AND SOCIAL WELFARE

Some aspects of the relationships between education and social welfare have already been discussed. A few of the many others will be noted briefly.

Vocational guidance services

These services are occupying an increasingly important position. The work is being carried out to an important degree by state-subsidized, private institutes with a religious background, in the belief that an individual's religious alignment is of such importance that it must also play a part in the choice of further education and of a career. The private institutes which are responsible for about two-thirds of the advice given are affiliated with a National Institute which supplies the necessary documentation. State guidance services come under the Ministry of Social Affairs and Public Health; there are also a few municipal services.

The visiting teacher

In recent years a number of visiting teachers have been appointed by municipal education authorities to work on difficulties arising from social causes.

Children of migratory workers

Arrangements have been made for the education of children of bargemen and caravan families and other children always on the move, through special schools in harbors and other strategic areas, with uniform programs, individual teaching, and a record book for each child which follows him from school to school.[4]

Re-education of problem families

Re-education of antisocial families, usually mentally subnormal, became a spectacular form of social welfare work during wartime, when large-scale evacuation from the western cities was necessary. Special camps proved to be the

[2] The Amsterdam municipal university requires of all students a yearly TB examination.

[3] A pamphlet by Dr. A. Querido, *Mental Health in the Netherlands* (The Hague: Government Information Service, 1954), gives a brief, clear summary of its field.

[4] Elisabeth B. Schlesinger, "Education on Dutch Canals," *Harvard Educational Review*, Vol. 21, No. 1 (Winter 1950).

only solution, as the families were unwelcome in decent homes. The good results of these camps led to their being continued after the cessation of hostilities. A team of social workers, homemakers, youth leaders, psychiatrists, and sociologists are working on a plan for readaptation of these problem families to community life. The work is financed and directed by the Ministry of Social Work.

In recent years some of the large municipalities have begun the re-education of problem families in their own areas. Special housing projects have been set up for this purpose, where social workers and group workers are carrying out a program of comprehensive re-education. One project is in an overcrowded area of Rotterdam. Amsterdam and The Hague began projects before World War II, The Hague making use of "control dwellings" where families start life afresh under fairly strict supervision.

EDUCATION AND DELINQUENCY

The growth of delinquency as a symptom of individual and social tension and maladjustment has attracted much attention in recent years. Delinquency is increasingly assuming the character of big-town criminality. The occupation of 1940–45, when moral and economic pressures caused a lowering of moral standards, is partly to blame. But we are beginning gradually to realize that this tendency has a deeper basis and demands special treatment, not only penal measures, but more preventive, pedagogical, and cultural activities.

Of the various governmental authorities that have a share in the struggle against juvenile crime, we shall mention a few.

Justice

Under the Child Laws of 1901 a somewhat pedagogical basis for judicial activities has been developed. Youth Judges are appointed to deal with youthful crimes. One of the "Family Tutors" is assigned to the family of the offender at the family's request or by judge's orders, and educational measures in the family are taken in conjunction with his advice. At his request the Youth Judge may take such radical measures as removal of the young person from the family circle for pedagogical and psychological examination and treatment. The Family Tutors are unpaid and work on a voluntary basis.

Houses of correction, prisons, and other institutions for youthful criminals have been thoroughly revamped over the years. There is a progressive Youth Prison in Zutphen, where young criminals are given a considerable amount of freedom, with the possibility of uncontrolled outside activities, and other far-reaching pedagogical measures.

Police

This institution also has modernized and humanized its fight against criminality among the young, with the accent on preventive work. The large towns have their own Youth Police, a force with high standards to meet various educational tasks.

Other agencies

We have already described the work of the Ministry of Education for pre-criminal youth in camps and boardinghouses. Some municipal authorities have also entered this field, by subsidizing analogous work of private organizations, by nominating officers for youth work, and by creating school gardens and other local spare-time activities. We have already indicated the consideration given in and around the large towns to making vacation periods as advantageous as possible.

People are growing more and more conscious of the close connection between crime and unhappy surroundings

and of the fact that some of the proposed countermeasures are superficial and inadequate for any real attack on juvenile delinquency. More and more notice is being taken of the backgrounds which seem to produce young criminals. We have already mentioned work with the problem family. Slum clearance and other measures for improvement in housing are also attracting attention. The stimulation of education, in and outside the school (more and better education and training), youth movements and clubhouses, and improvement of human relations in industrial and other occupations are also gaining interest with a view to combating crime. With no attempt to make an all-inclusive listing, we still must mention the activities of the State Labor Inspection and of various governmental housing and health services. The present longer term of military service also offers educational opportunities: psychological tests and psychological services are good points of contact.

RÉSUMÉ

It has naturally been impossible in the foregoing paragraphs to give a complete picture of the educational situation in the Netherlands and the coordination of the various governmental agencies in meeting the needs of children and youth. Only a rough sketch could be presented, to suggest important activities and their mutual relationships. We hope, however, that these outlines show clearly.

Educational activities in the Netherlands were largely brought into existence by private initiative. Government agencies are expected (1) to give leadership in the educational policy; (2) to carry out educational activities where private initiative is impossible or remains fragmentary; and (3) to give financial and other material support to the educational activities of private organizations.

Following a short period of rigidity between the world wars, a dynamic educational activity came into being, wherein the state and other governmental agencies play an important role. The submission of long-term plans, the Education Acts under consideration, and the many state commissions testify to educational vitality.

With the manner in which activities on behalf of young people are at present spread over various ministries, we cannot claim a completely successful coordination and integration. It is clear, however, that generally speaking we are on the right road and moving in the right direction.

F. Th. van der Maden, The Hague, the Netherlands, is head of the Sociocultural Sector of the Central Planning Bureau and secretary of the State Commission for the Investigation of the Possibilities of Youth Development. He has served as deputy head of the Division for Cultural Statistics of the Central Bureau of Statistics and investigator of the International Institute of Statistics and has published on educational and social topics.

Education and Related Services in Sweden*

By Åke W. Edfeldt

LEGISLATIVE measures for public aid and protection of children are of rather recent origin in Sweden. Up to the beginning of this century, children were treated in the same manner as adults in need of help, and poor law relief was the only public aid available. The first legislation for child welfare was passed in 1902; it provided for the care of foster children and the education and upbringing of delinquent and morally neglected children. Then came the so-called Children's Laws of 1917, with provisions for children born out of wedlock, adoption, and so forth.

For the most part, public care of children remained under the Public Assistance Administration up to 1926, when the Child Welfare Act of 1924 came into force. By this act, the responsibility for the care and protection of children was separated from public assistance and lodged with a new local authority, created by the act and known as the Child Welfare Committee. The Act of 1924 has been subsequently revised and extended, particularly by amendments in 1934 dealing with young persons between eighteen and twenty-one years of age, and in 1945 and 1946 in respect to child welfare institutions, foster care, and child and youth welfare schools. A Child Welfare Commission, appointed in 1950 by the government, is now reviewing the Child Welfare Act as well as public child welfare legislation.

Local Child Welfare Committees

The statutory members of the local Child Welfare Committee include a member of the local Public Assistance Committee, a clergyman, a man or woman teacher, at least two other persons known to be actively interested in the welfare of children, and, frequently, a medical officer. At least one of the members is to be a woman. The committee is empowered to delegate authority to voluntary or professional welfare officers.

The committee is charged with responsibility for promoting the welfare of children and young persons and to that end takes such measures as may seem desirable in the interest of children and young people, including the establishment of adequate child welfare facilities. It has the duty of providing for needy, sick, and unprotected children, who are given what is called "public care." The committee also deals with maltreated and neglected children, those exposed to dangers to life or health, vicious children or children in danger of becoming vicious, and juveniles leading a disorderly, idle, or immoral life or showing other signs of vice. This second group of children and young persons may be taken care of by "protective upbringing," if preventive measures are considered useless or have proved to be so.

Any private citizen or public authority may request the intervention of the Child Welfare Committee. Certain categories of public servants, such as medical officers and district nurses, are required to report to the committee any case which in their opinion requires its intervention.

The Child Welfare Committee is also charged with a number of other duties such as administering the general children's allowance scheme, supervision of children born out of wedlock, the approval and payment of maintenance advances, the administration of maternity assistance, and the recreational schemes for children and housewives.

* Many parts of this article are taken from papers prepared and published by The Swedish Institute, Stockholm, Sweden.

Arrangements for Young Children

The state-subsidized services which, under the supervision of the Child Welfare Committee, provide for the part-time care of preschool and older children operate along three lines: kindergartens, day nurseries, and afternoon homes.

Kindergartens

The kindergartens are intended for children between three and seven years of age; these children are taken care of a few hours a day and get an opportunity to take part in various social and educational activities under the guidance of trained personnel. Kindergartens must be located in hygienic premises, be sufficiently roomy to permit ample freedom of movement, and be suitably equipped with play material. Great attention is paid to the social development of the child. In communes where they have been established by local authorities, with low fees, the demand from all sections of society exceeds the accommodations.

Day nurseries

The day nurseries, which are increasing in numbers, provide all-day care for the children of working mothers. They receive children mainly between the ages and two and seven years. A small number of day nurseries also have departments for children between six months and two years of age. The children are usually left at the nurseries for eight to ten hours a day. In rural areas, day nurseries for farm children have been established to relieve parents engaged in seasonal farmwork. The service is still in the trial stage, and the nurseries are open only for brief periods in summer and autumn.

Afternoon homes

Afternoon homes receive school children of employed mothers after school hours and give them an opportunity for play and homework. The children are usually served one hot meal while there.

"Family day homes"

Owing to the shortage of day nurseries, a substitute service of "family day homes" has been tried in Stockholm and some other towns. These are private homes, providing part-time care for one or two children, subject to the same supervision by the local Child Welfare Committee as regular foster homes. Parents pay the same fee that they would in the regular day nurseries.

Special government committee

A special government committee has recently been studying a scheme for extended state support of these services. Its inquiries embrace the psychological, pedagogical, medical, social, and labor-market aspects of the services. Consideration is being given to the possibility of incorporating the kindergartens into the elementary school system.

General Children's Allowances

Since 1948, general children's allowances payable at the rate of 260 kronor per year have been granted all children under sixteen years of age (since 1952 the allowance has been increased to 290 kronor), regardless of the economic status of their parents or legal providers.

The children's allowance scheme succeeds the former deductions granted for children in the state income tax, and since 1952 also those in the communal income tax. Owing to the system of progressive taxation in force, the value

of these deductions varied considerably. Therefore it was felt that a scheme employing a uniform cash benefit would be more equitable, since the low-income families, which constitute the majority of the taxpayers, failed to profit from these deductions. The present rate of children's allowances far exceeds the average value of the former deductions, but above a certain income it becomes less than the tax deductions previously granted.

SCHOOL LUNCHES

School meals were known in Sweden as early as 1845, but not until the end of the century did they take on a wider scope. They were as a rule provided on the private initiative of such bodies as the Red Cross and housewives' organizations, or by local authorities. Beginning with the fiscal year 1937–38 state subsidies have been granted for this service, which now is administered by the local school authorities.

In the beginning, the meals served in school possessed the character of charity or public relief, but in many school districts, particularly in the northern sections of the country, the long distances to school created a common need for them. Another reason for public interest in this matter is the opportunity they present to counteract undesirable dietary habits, whether due to poor economic circumstances or simply to ignorance. A properly balanced school meal a day represents a substantial improvement in the diet of many children.

Since July 1, 1946, children in the schools are entitled to free, state-subsidized school lunches if so desired by their parents. However, owing to the lack of technical facilities prevailing at present, the local school authorities may reserve the available meals to children who live far from school, to ill and delicate children, or to children in poor circumstances.

SCHOOL MEDICAL SERVICE [1]

The management of school health work is in the hands of the State Board of Education; or, more specifically, it is under the direction of the Chief Medical Officer for Schools employed by this authority. It is to be noted that he is thus not in the employ of the highest medical authority, the Medical Board (*medicinalstyrelsen*), but on important questions he consults with this board.

Duties of the Chief Medical Officer for Schools

Among the duties of the Chief Medical Officer for Schools are the following:

To arrange, guide, and superintend the work of school hygiene in the schools.

To promote the development of school hygiene work among youth, and in doing so to further the holding of medical examinations of young people in the schools, in order to discover pupils in need of medical care or other measures related to school hygiene.

To secure the establishment of open-air schools, and classes or schools for pupils with weak sight or hearing.

To further measures concerning the education and teaching of pupils who diverge from the normal mentally.

To act as adviser concerning the teaching of gymnastics, the arrangements for school baths, school children's meals, and school holiday camps, and to further the development of dental attention in schools.

To advise the Board of Education on plans for new school buildings, or major rebuilding or additions.

Health cards

In every school where there is a school health service run or supported by the state, a health card, established by the Board of Education, is kept for every child. The health card is "valid" throughout the country. Begun when the child starts going to school at about seven it accompanies him from school to school and from one type of school to another, until school attendance ceases.

[1] This section of the article is taken from a paper prepared by Gösta Lindquist, Secretary, State Board of Education.

The school doctor and the school nurse

In the medical work of the schools close contact is maintained with the parents and guardians. This contact is established in different ways: (1) Parents are called to the school, when needed, for a conference with the school nurse or school doctor; (2) the school nurses visit the homes of pupils when such contact is considered desirable; and (3) at parents' association meetings information is given on matters of school health. The visits of the school nurse are made for the purpose of securing information needed by the school (such as the nature of a pupil's illness) and of giving advice on health matters, not with the intention of giving medical care.

An important principle in the operation of the school hygiene work is that teachers as well as medical personnel should participate in it.

In all the schools in the country at certain intervals so-called "general form examinations" must be made, that is, examinations which include all the pupils in a class. Such examinations are made at the beginning of the school year, about once every second year during the time the child spends at school, and in any case in the first class and the graduating class in both elementary and higher schools. In certain school districts with large schools, the general form examinations are held once a year. In all schools each child is examined by a dentist once a year.

Furthermore, there has been introduced into Swedish schools the provision that preliminary medical advice on choice of occupation shall be given by the schools.

Of course, the school doctors and school nurses visit the schools for other purposes than the general form examinations. During the rest of the school year they examine the so-called "control-children," that is, children who are ill, weak, or unusually subject to illness, and also children who are sent for an examination by doctor, nurse, parents, or guardians.

Mentally retarded children are gathered into special classes; abnormal pupils are sent to special institutions.

The school doctors are also called upon when school children for one reason or another want to obtain work during their leisure time. The law states that juveniles (that is, children under eighteen) may not be employed before they are fourteen. Except for work during the vacation period, the child must have completed the program for the elementary school. Exceptions may, in certain circumstances, be made, but only for light work which cannot be thought to have ill effects on his health or bodily development or on his schoolwork. The juvenile attending school must have the school's permission to take on work, and the school medical officer must give his opinion. All young people under eighteen in Sweden who take on jobs must have a juvenile work book, in which the school medical officer makes his remarks on the child's health and the employer notes the juvenile's work, hours, breaks, and so forth.

Dental work

The dental hygiene which every child enjoys as long as it goes to school may also be considered as a part of the general health program. It consists of a thorough examination each term, followed by the treatment which the den-

tist considers necessary. This treatment includes not only ordinary repairs but even such things as straightening the teeth.

HOLIDAY ARRANGEMENTS

During recent years the Swedish authorities have, through different measures, tried to give almost every child the chance to have a summer holiday. This was deemed especially desirable during the war.

First, a state subsidy was given for study and holiday travel for elementary school children from city families of small means. In the summer of 1940, when an evacuation of the larger communities was discussed, a public grant was made for the evacuation of children. From 1940 to 1946 considerable experimentation was carried on regarding the holiday program, and regulations as to the length of stay, the organization of camps, free travel of mothers who accompanied their children, and so forth, were developed.

In the winter of 1945–46 it was thought that this project had been tried out long enough to become a permanent institution. The committee of 1941 on population policies proposed in 1945 extensive measures by the state for the purpose of providing housewives and children with rest and recreation. The proposal was passed, with small alterations, by the Parliament, and since June 1946 the activity has been regulated through three royal proclamations. Certain alterations were made by Parliament in the period 1949–54.

The state now subsidizes: (1) travel for children and accompanying persons to a privately arranged holiday spot and for children, staff, and accompanying persons to summer camps; (2) travel for housewives to a privately arranged holiday spot, and for guests and staff to holiday centers for housewives approved by the Royal Social Welfare Board; (3) grants to housewives to facilitate their holiday arrangements; (4) operating grants to summer camps for children and to holiday centers for housewives and grants to special organizations who place children with private country families.

Holiday travel grants

Children are entitled to holiday travel grants who during the year when the travel is undertaken are at most fourteen years of age. There is no stipulation as to minimum age. The Child Welfare Committees who are responsible for the local administration of the activity, however, are requested to warn the parents of the risk of infection which railway travel involves for a very young child and of the fact that a change in the environment may prove harmful.

A person who accompanies a child younger than eleven years is also entitled to holiday travel. When there are special reasons, for example, if the child is mentally retarded or delicate or if the travel is especially complicated with many changes of trains, an accompanying person may get a holiday travel grant even if the child is older than ten years. The accompanying person may get two travel authorizations, in order to take the child to the vacation place and then to return to get him, or only one if he is to remain with the child at the holiday place. Only one travel grant is made to a child or housewife in a year.

As these travel grants also aim at giving housewives an opportunity to get recreation, the mother should, as a rule, accompany her child. If because of illness, employment, or other reasons, the mother cannot go, another person may take her place.

Since the purpose of the travel scheme is to give children and housewives a strengthening and stimulating stay in a new and healthy environment, the absence from home should not be too short. A minimum absence from home of four weeks for children and of ten days for housewives is stipulated, and exceptions are admitted only for very strong reasons. Absence shorter than fourteen days for children and seven days for housewives is never permitted.

As a rule the travel grant may be given to any place the applicant chooses, whether city or country, including even the frontier stations for Denmark, Finland, and Norway. When the travel cost is less than five crowns, no holiday travel grant is given.

The grants apply only to the cheapest means of travel. They may be used any time during the year except certain days around the more important festivals.

Summer camps

Summer camps for children are run by communities and by voluntary organizations. There is at present accommodation for about 38,000 children at the camps each year. In most cases the child's stay in the camp is provided without cost to the parents. Each child undergoes a medical examination before leaving for camp, and every camp must have an agreement with a doctor who is responsible for hygienic conditions in the camp and for care in case of illness.

The state subsidizes the children's camp activity partly by giving free transportation (regardless of income, though it is understood that only children from families of small means should be chosen for the camps) to children and staff going to camps, partly by giving a grant, varying from twenty-five öre to one crown per child per day, towards the running cost. The camps are subjected to the same inspection as other child welfare institutions.

Families take a "summer child"

Complementary to the summer camps activity is a scheme to procure private summer homes for children whose parents cannot arrange this themselves. The activity is undertaken by communities or by voluntary organizations, some communities and organizations having on their program both summer camps and placement in private families. The child's stay generally costs the parents nothing, though the family which takes care of a "summer child" is paid by the responsible organization.

This arrangement has proved to be a very valuable one, for children often get a more individual care in private families and come into a more intimate contact with the countryside than if they stay in a camp.

The activity is subsidized by the state, partly through cheap transportation of children and accompanying persons under the conditions prevailing for holiday travel grants for a privately arranged vacation, and partly by a small contribution—from fifty öre to one crown per child per day—to the organizations that undertake this activity. About 17,000 children get summer recreation in this way each year.

The teacher's role

In addition to what has been said about the administration of these services, it should be noted that the Swedish school system is very much involved in this work. Since the teachers all over the country have fairly good contacts with the parents, they are able to tell which children need help and which do not. The administration of holiday travel grants, summer camps, and so on is the business of the elementary school teachers, the local school administration, and the State Board of Education, in co-operation with the local welfare committee. Even if there are specially

trained social workers in most of the welfare institutions, the teacher is always applied to when there is a question about a child. The school administers the "summer child" activity. The teachers select the children to go to the country and also handle the financial aspects, they arrange for travel expenses, the payment of travel grants to accompanying persons, and the payment of the "summer parents." Before "summer children" are placed in summer camps and private families, the teacher has to do inspector's work. For all these duties teachers receive compensation.

Åke W. Edfeldt, Ph.L., Stockholm, Sweden, is assistant psychologist in the Department of Education of the University of Stockholm and research assistant in the State Institute of Educational Psychology. He was earlier a teacher of special classes. He has published in the fields of reading and achievement testing.

Education and Other Governmental Services in Switzerland

By ROBERT DOTTRENS *

SWITZERLAND is a Confederation of twenty-five sovereign states, which, within the limits set by the Constitution and federal laws, freely organize the life of the people.

If the cantons—the states—have no prerogatives in certain areas, such as national defense, the postal service, telegraph, telephone, customs, and foreign relations, there are others in which they enjoy great freedom of action. This is especially the case in the field of education and child welfare.

There could be no question in this short study of describing twenty-five different systems which, in the matter of public instruction, range from the most complete centralization (Geneva) to the greatest possible decentralization, in the cantons where school authority is divided between the communes and the cantonal administration.

ROLE OF THE CONFEDERATION

This article will therefore only explain the situation as it exists in Geneva at present, and will show one of the ways in which the government of a Swiss canton has applied the laws that are valid in all of Switzerland. The Confederation, in fact, establishes the principles and leaves to the cantons the task of putting them into practice. These general principles have been established:

1. By the federal Constitution in its article 34/5 which states that, in the exercise of the powers which are conferred upon it, and within the limits of the Constitution, the Confederation takes into account the needs of the family, and that the laws enacted by virtue of this article will be executed with the help of the cantons and the collaboration of public or private legal organizations.

2. In the Swiss Civil Code (1912), whose second book establishes family law: marriage, divorce, legitimate and illegitimate descent, guardianship, and inheritance.

3. In the Swiss Penal Code (1942), sixth section, whose provisions do not apply to children who have not reached the age of six.

4. Finally, in the federal laws which complement constitutional provisions when the need is felt to take for the whole territory of the Confederation measures to ensure defense of general interests; for example, the federal law concerning the fight against tuberculosis, and the federal law on vocational training.

As far as public instruction is concerned, the work of the Confederation is decidedly restricted: it sees first of all to the enforcement of the provisions of Article 27 in the Constitution, which states that in Switzerland elementary education is required, and that, in the public schools—freedom of education is guaranteed—every child must be able to attend classes without injury to his conscience or his beliefs. The management of the schools must be under the civil authority.

There is no federal department of education in Switzerland, and the other fields of public instruction in which the Confederation acts or can act are under the jurisdiction of various departments: the federal Department of the

* Translated by Theresa G. Munson.

Interior, which controls medical and veterinary studies, public and social hygiene, family and child welfare, and so forth; the federal Department of Finance, which controls subsidies to professional schools of engineering and domestic science, vocational training, social security, and so forth; and the federal War Department, which controls gymnastic instruction, physical education, and sports. The principal characteristic of all these measures lies in the decentralization of the organs charged with their supervision, application, and improvement.

This decentralization has also made it possible to adapt the necessary actions to limited areas and to take into account their historical evolution, traditions and customs, and questions of a religious, linguistic, or social nature.

GENEVA

The canton of Geneva, because it is a small urban state, has undoubtedly been able to establish more easily than others a co-ordinated extensive system of diverse organs working together on behalf of its children. The description of this system will permit the reader to gain a sufficient idea of the vigilance and perseverance with which the rights of the child are safeguarded in the city of Calvin and Jean Jacques Rousseau.

The cantonal Department of Public Instruction has the general management of and responsibility for the measures suitable to the various activities which will be discussed in this article.

THE CHILDREN'S BUREAU

On July 2, 1937, a law was promulgated creating a Children's Bureau, with the aim of ensuring the protection of the physical and moral health of children and youth, and, in a general way, of promoting their development. This bureau, connected with the Department of Public Instruction, co-ordinates and encourages the efforts of families and of public and private institutions, and assists judicial, educational, and administrative authorities in the execution of their mandate.

The Children's Bureau includes the following: the School Medical Service, the School Observation Service, the School Social Service, the Service for Vocational and Apprenticeship Guidance, the Service for the Protection of Minors, the General Guardianship Service. These last two services, moreover, in their activity springing from the Swiss Civil Code, are subject to the guardianship authorities, just as the juvenile court is subject to judicial authority. Parents or children are obliged to appear when summoned by these various agencies. If they refuse, small penalties can be imposed upon them, and if need be, force can be used.

The School Medical Service

This service has authority in all questions concerning school hygiene and the health of school children. Its duties are entirely practical, to the exclusion of all purely scientific research. It controls the hygienic conditions of public and private school buildings. It organizes the fight against diseases which can be contracted in school; it provides for individual health examinations and recommends measures with a view to improving the health of children. It proposes measures of disease prevention and necessary disinfection, and supervises the execution of these measures. It watches over the health of teachers and organizes the medical examination of prospective teachers.

From the time of admission to school, a health record is kept for each student, and from year to year, all comments made by the medical examiners are noted: the general physical examination and examinations by specialists (nose, throat, ear, nervous system).

A school dental clinic is specifically in charge of the improvement of oral hygiene and the preventive treatment of dental caries.

The federal law for the fight against tuberculosis has already been mentioned. At the present time, the School Medical Service is engaged in the application of measures ordered by a decree of the State Council of January 11, 1952, which made a medical examination obligatory for students, teachers, and school employees. This examination is repeated every three years. It includes a lung X ray and the Mantoux test (an injection of 0.1 cc. of tuberculin).

In conjunction with the Social Service and the school inspectors, it is the Medical Service which periodically designates those children who are admitted to a "Preventorium" or to one of the two permanent high-altitude schools which the canton of Geneva has established in the Alps in Valais and Vaud. It must be added that every teacher, and with greater reason every school principal, can, at any time of emergency or doubt, request by a mere telephone call the services of a nurse or a physician.

There remains one special institution: the Sick Benefit Fund which, in collaboration with private funds, supervises the application of the law concerning the required health insurance for school children in return for a small fee paid by their parents.

The School Observation Service

This service attends to those children who, because of problems of personality, intelligence, or family environment, are hindered in their development, cannot fully profit by instruction, and are a potential source of physical and moral danger to their schoolmates.

The Observation Service studies all the cases which are entrusted to it by official agencies or by the parents themselves. The director personally examines all reported children and takes appropriate measures, which may be any of the following:

1. A change of school or class for the child. The school system of Geneva includes: (*a*) regular classes for children of normal mentality and behavior; (*b*) classes for children presenting minor adjustment problems (intelligence and personality); (*c*) special classes for the mentally retarded; (*d*) observation classes for problem children; (*e*) outdoor classes (semiboarding) for sickly or nervous children; (*f*) high-altitude outdoor classes (boarding schools).

2. Admission to one of the "observation classes." These classes are organized for either boarding or semiboarding students. The teachers and the physician connected with the institution have the task of discovering the causes of personality problems and of ensuring their treatment on the pedagogical and medical level, so that the child may be permitted to return to normal school life, or, if it is deemed necessary, of providing for his placement in a training school. In the latter case the Social Service and very often the Service for the Protection of Minors intervene.

3. Admission to the special classes. These classes of special instruction are placed under the pedagogical management of the Service Director.

4. Admission to the home for children who are deaf or hard of hearing.

An orthophonic or voice-training service is also a part of the Observation Service.

Usually, social workers handle all cases which have warranted the intervention of the service, taking action concerning the family and making contacts with the other services of the Children's Bureau and the school authorities.

Lastly, the service may be charged with maintaining contact with those young people from fifteen to eighteen years of age who have been the object of repeated interventions while they were in school, or who have been students in training schools or special classes for backward or problem children.

The School Social Service

The School Social Service intervenes on behalf of needy school children. It gives sickly children the benefit of rest homes and cures necessary to their health. It manages the school clothing service. It co-ordinates the work of public and private social agencies such as day nurseries, school kitchens, open-air schools, or vacation camps. It also makes any investigations requested of it by the various other services of the Department of Public Instruction.

This service supervises the application of the law concerning the employment of school-age children (that is, under fifteen). This law (January 14, 1942) forbids the employment in a regular job of a minor less than fifteen years of age. Except for farm labor and other cases subject to special authorization, it is unlawful to employ outside the family, in any capacity, children less than thirteen years old. Between the ages of thirteen and fifteen, children can be hired for running errands or for other light work for a maximum of two hours per school day and five hours during vacations. This work cannot be in a theater or in an unsanitary place, nor between the hours of 12:00 M. and 2:00 P.M., or after 7:00 P.M.

The employment of these children is subject to the written consent of the School Medical Service, which can be withdrawn at any time. If the authorization has been refused on grounds of health, an allocation can be awarded to needy families thus deprived of financial assistance.

Service for Vocational and Apprenticeship Guidance

This service advises public school students and their parents on the sensible choice of a trade or vocation; it aids in the placement of young workers. It supervises the application of federal and cantonal legislation on vocational training and in the matter of the protection of nonapprenticed minors. It provides, in particular, the control of the vocational instruction, theoretical and practical, of apprentices.

As far as vocational guidance is concerned, the service has adopted two primary aims.

The first is to inform students and parents of the necessity of learning a trade, and of choosing it carefully. It utilizes all suitable means to this end: talks in the schools, films, visits to factories, visual material supplied to students and teachers, and so forth. For students who do not plan to continue their studies after the age of fifteen there are organized so-called "after-schooldays classes" which between the ages of thirteen and fifteen guide the school activities of students toward practical problems—manual labor in the shop, acquaintance with trades and skills, and ethical standards of work.

The second activity in vocational guidance is the examination of individual cases which the service conducts in strict liaison and in collaboration with private agencies (the Private Apprenticeship Bureau and the Private Bureau of Vocational Guidance) or with institutions under the jurisdiction of the Department of Public Instruction (the Bureau of Vocational Guidance of the University Institute of Educational Sciences and the Laboratory of Experimental Pedagogy of the same institute, which has in its charge the study of questions related to educational guidance).

Service for the Protection of Minors

Subject to the jurisdiction of the other agencies of the Department of Public Instruction, the Service for the Protection of Minors maintains a general surveillance over minors and takes every measure to protect children and young people.

Its work is above all of a preventive nature. It has the task of identifying children whose parents do not fulfill their obligations. Complaints, notifications, and accusations are directed to this service; the judicial, school, and administrative authorities of the canton and the commune are required to bring to its attention the cases of any children in moral or material danger.

When preventive action fails, the service then asks the authorities to apply the protective measures provided by law (removal from custody and the termination of parental rights). In this case, the Service for the Protection of Minors studies the child's situation and sends the accumulated information to the guardianship authority, whose duty it is to advise the court.

It also carries out the investigations requested by the juvenile court and the guardianship authority, according to their instructions. It watches over those minors whom the juvenile court has released on probation. All this work is accomplished in close co-operation with the schools, the Observation Service serving as an intermediary, since it generally handles most of the cases at the beginning.

The investigators and social workers of the Protection of Minors are more and more devoting their efforts to a humane understanding of their task: the destiny of the child, his emotional problems, and the conditions of his development are their dominant concerns.

The General Guardianship Service

This service facilitates the work of the guardianship authorities in the application of the laws concerning the appointment of guardians and trustees. It assumes the guardianship of those children who have been taken away from their parents by court decision.

OFFICIAL YOUTH FOUNDATION

Along with the Children's Bureau, there is good reason for mentioning the Official Youth Foundation and the juvenile court. The Official Youth Foundation has grown out of an old protective organization called "The Forsaken Youth," from which the present Service for the Protection of Minors also developed. This foundation manages the properties and administration of two schools for orphaned boys and girls and children whose parents have been deprived of their parental authority or their right of custody.

JUVENILE COURT

The juvenile court, composed of a career judge presiding and a doctor and a teacher acting as associate judges, handles criminal cases in which adolescents of fourteen to eighteen years of age are implicated.

In regard to children of six to fourteen years of age, the Penal Code primarily prescribes educational measures, application of which is entrusted to the Service for the Protection of Minors. Adolescents from the ages of fourteen to eighteen can be sentenced to imprisonment. If it is apparent that educational measures would be preferable, the Code allows the child to be sent to a correctional school or placed in a trustworthy family. The General Guardianship Service is then put in charge of his supervision.

CO-ORDINATION OF SERVICES

The work of the different services mentioned above is co-ordinated by the Advisory Committee of the Children's Bureau, which meets periodically under the chairmanship of the chief of the Department of Public Instruction. It is composed of the chiefs of services of the Children's Bureau, the presiding judge of the orphans' court, the presiding judge of the juvenile court, the Director of Elementary Education, a representative of the municipal authorities of the City of Geneva, and two representatives of private agencies interested in child welfare. This committee studies general questions related to various youth problems and ensures coordination of the various services of the Bureau.

ADMINISTRATIVE IDEALS

As can be seen from the description of this network, the administration of child welfare is particularly well organized in Geneva. As far as is possible, all precautions have been taken to defend the right of each child to live and develop normally in a community which seeks its own development in that of each of its members; to have action taken with a maximum of speed and efficiency while respecting as fully as possible the rights of the parents, whose sense of responsibility the authorities are trying to restore and develop; and finally to reduce to a minimum duplication and conflicts of jurisdiction.

PRIVATE INITIATIVE

This article would be incomplete if nothing were said about the role and the importance of private initiative in the field of child welfare, a role and an importance so well recognized by the authorities that they do their utmost to facilitate the work of these private agencies by aiding them financially and by resorting frequently to their good offices.

It is a Swiss policy, not confined to Geneva alone, to have citizen participation in the solution of all the problems of education and child welfare. This accounts for the flourishing development, in Switzerland, of private institutions and agencies devoted to public service, both Catholic and non-Catholic, working with generosity and devotion in the most varied fields such as day nurseries and kindergartens; school canteens; vacation colonies, youth hostels, outdoor camps, ski camps; leisure-time recreation and sports; libraries for children and adolescents (in particular the Swiss Reading Society for Young People); and temperance societies.

PRO INFIRMIS AND PRO JUVENTUTE

Two great foundations must be mentioned in particular, in view of their importance and their national character, Pro Infirmis and Pro Juventute.

Pro Infirmis, as its name indicates, is concerned with physically handicapped children and adults. It assists and cares for sick children placed in establishments of re-education and treatment. The foundation is composed of ten associations, each of which takes care of a particular type of illness. Its fifteen cantonal offices work in close collaboration with similar institutions, lending each other mutual aid on behalf of the children in their care. On the educational level, the Swiss Society for Difficult Children (a section of Pro Infirmis) seeks to combat the causes of educational and personality problems which certain children present, by improving educational conditions in the institutions though training specialized teachers, by contributing to a better organization of leisure activities, or by arousing public opinion and the authorities in favor of this category of children.

Pro Juventute, founded in 1912 by the Swiss Society for Public Service, which was from 1810 the first social service organization in Switzerland, has as its aim to arouse and cultivate a feeling of responsibility in regard to youth; to develop a taste for social work in young people; and to encourage private help for youth. Its practical work is carried on in most of the areas of child and youth welfare. The financial resources which the foundation needs are derived from the annual sale of "Pro Juventute" postage stamps; the profit on these stamps, which cost a little more than the regular stamps, goes to the foundation. The importance which these stamps have gained for collectors is well known. Their sale is principally promoted by Swiss school children. The foundation has regional secretaries in all the cantons. There are two hundred secretaries at the present time: clergymen, teachers, and people from all social and economic ranks, all working without remuneration and independently for the goals of the foundation.[1]

The foundations Pro Infirmis and Pro Juventute have each a journal which gives information on the activities of the organization. These publications bear the same titles as the foundations.

[1] In the following two works can be found useful complementary information on the institutions and activities to which this article has been devoted: Emma Steiger, *Manuel du Service Social Suisse,* fourth trilingual edition (German, French, Italian) prepared on behalf of the Swiss Society for Public Service (Zurich, 1948), and H. Kleinert and others, *Lexikon der Pädagogik* (3 vols.; Berne: Verlag A. Francke, 1950–53).

Robert Dottrens, Doctor of Sociology, Geneva, Switzerland, is professor of education at the University of Geneva, codirector of the Institute of Educational Sciences (Institut J.-J. Rousseau), and director of pedagogical studies in the Department of Public Instruction. He was formerly inspector of elementary education. He is the author, among other books, of Éducation et démocratie (1946), L'Apprentissage de la lecture par la méthode globale (1930; fourth ed., 1951), L'Enseignement individualisé (1936; third ed., 1953), Nos Enfants à l'école (1954), and, with others, of Lexikon der Pädagogik (3 vols., 1950–53).

A Sociologist on School-Community Relationships

By Gordon W. Blackwell

PRACTICAL proposals for more effective co-ordination of public education services with other state and local governmental services concerned with children and youth should be based on two bodies of knowledge: (1) sociological characteristics of the local community, and (2) experiences in the community organization movement in American society. This paper will explore these two topics and point up implications for school-community relationships.

Dimensions of Community [1]

Sociological analysis of the nature of the local community reveals at least seven factors operative in the dynamics of community structure and function. These we call sociological dimensions of a community.

Population characteristics

To illustrate the nature of these different dimensions, let us take as the first example a situation with which many public school officials are confronted in southern cities. They often find among the Negro population a high illiteracy rate, a loose type of family organization, and departure from middle class mores of sex behavior. Often the husband-father is not in the home. Such a situation has implications for teachers. Many reasons are given for it, but if the matter is studied carefully, one may find that a basic reason lies in the sex ratio of the Negro population, which in southern cities as a whole is about 90, meaning only 90 males for every 100 females. In some southern cities it is as low as 80 or a little less. Of course, such behavior may be expected in a population with a sex ratio as askew as that. This, then, illustrates the first dimension of community, namely, the population characteristics. Age, racial and ethnic composition, population trends, the various vital statistics, come into this first dimension of community.

Institutional structure

Let us take another example, a community of ten thousand people. A study will reveal that there are eighty-five to a hundred organized groups and formally established agencies operating in that community. We find among those agencies and organized groups twenty which are particularly concerned with children and youth, and we may find them getting into each other's hair a bit: some bickering and jealousies, a lot of misunderstanding as to what each is doing. The need, of course, is for some type of co-ordination and planning.

Perhaps the analogy is not too far-fetched to say that a community of that size is not unlike the River Rouge plant that Ford has in Detroit. Thousands of workers are there. The plant has a particular objective, the finished Ford car. It is organized into many departments, and the proper relationship between those departments in operation is vital if the industry is to be successful.

[1] This section draws upon the author's previous article, "The Social Scientist Looks at the Health Council Movement," *Public Health Nursing*, Vol. 42, No. 6 (June 1950), pp. 316–21.

Any part of the plant that does not do its job well, or gets behind, upsets the whole schedule of production. The efficiency we have achieved in large-scale mass production has been due to careful planning and co-ordination—in a dictatorial fashion, very largely, it is true, but it has worked. In contrast, most American communities have had little or no planning or co-ordination, often no machinery for it, and the result is that each is functioning as a community at perhaps 25 to 50 per cent efficiency. If we were competing as businessmen in the meeting of human needs, many of our communities would go bankrupt. The problem we face in this aspect of community life is how we can democratically work out procedures and machinery for planning and co-ordination.

This point illustrates the second dimension of community, which sociologists call the institutional structure.

Many organized groups touch only a few of the people in a community. Studies in cities reveal that 40 to 50 per cent of the people are members of these organized groups. In rural communities the percentage may be even smaller. So when we bring in representatives from these organized groups, we should not pretend that we are getting a complete representation of the community.

Value systems

For the next dimension of community, let us take the illustration of two communities side by side in Tennessee. They are both rural communities with the same climate and the same natural resources. But in one we find the typical picture of a southern sharecropping, cotton community—soil erosion, poor housing, low standards of living, poor school attendance, illiteracy, poor health —and in the other, right next door, we find well-kept homes, green fields, stable and healthy families, bright-eyed children.

What is the explanation of these differences? Inquiry would reveal that the second community was settled years ago by an immigrant group from Switzerland who brought with them values very different from those the southern plantation economy has developed. Thrift, love of the soil, careful farming practices, are a part of the value systems of the people in one community. There is all the difference in the world between the two communities.

The third dimension, then, is the value systems of a community, which involve the folkways, the mores—things that people hold dear. Here we find many of the motivating forces for what happens in a community. We should ask, "How highly is education rated in the community? Where does it really rank among the values of the people?"

Social stratification

If we look for another illustration, we might come upon a school superintendent who finds that the schools are not successfully meeting the needs of some segments of the population—perhaps the group from across the railroad tracks or a particular racial group—and inquiry reveals that what we call the social stratification of the community is functioning to the detriment of a community-wide program of public education. Numerous studies have shown that American communities are stratified into social classes—the rigidity of these classes may actually be increasing—and into minority groups, racial and ethnic. This social stratification dimension must be understood if we are to work effectively in the community setting. It presents a problem, too, as we attempt to co-ordinate the schools with other community agencies.

Interpersonal relationships

A newly formed council on youth services starts off with a bang. Americans are the easiest people in the world to organize if you just go out and talk something up a bit! In the beginning there is a great deal of enthusiasm, and the leaders are sure that a great deal can be done for the community's young people. If you look in on the community in a year or so you may find that the council has died. Nothing has happened, and you wonder why. It may possibly be because those developing the council failed to bring into the program many of the real leaders in the community. They have co-opted some of the nominal leaders and the officeholders but have failed to understand that the real leaders are those who have prestige and enjoy the confidence of the community whether or not they hold official positions. The relationships involved are not identical with social stratification along class or racial lines, although they influence each other and may coincide at some points. Techniques exist for locating the real leaders in the community, and failure to use them may be why this council did not succeed. Another dimension of community, then, which has to be considered is the pattern of interpersonal relationships.

In a small southern community we recently analyzed patterns of local leadership. Since the community is biracial in social organization, we asked the white people who they thought the Negro leaders were, and then we asked the Negroes who they thought were the leaders in their group. We got very different responses from the two sources. Often the majority group decides who will take part in the planning, who will make the decisions, and they fail to get the real leaders from a minority group.

This pattern, then, of interpersonal relationships and leadership constitutes still another dimension of community.

Power structure

In another situation we perhaps find the community aroused about a problem. It may be smoke control or rat control or narcotics control, or it may be enforcement of a housing code. Many of the groups in town go on record as opposing the undesirable situation and urging community action. The newspapers and radio support the movement, and there is a great hullabaloo. Yet nothing happens. We wonder why. If we look beneath the surface we may find that certain people of power in the community, whose vested interests are threatened, have, under cover, worked out a way to keep anything from happening.

A very important dimension of American communities, then, is the power structure. The locus of power may be found in the political organization of a community—but not always. Often it is in the economic organization of the community. Perhaps a labor union has become so powerful that it determines what happens in the community. More frequently it has been management of big business or industry that has pulled the strings behind the scenes and has determined what really happens in a community. In a company town we can see that situation clearly.

In other communities the locus of power may be the church. In a community near Milwaukee, the minister even decides to whom a family can sell its land. Here a single institution exercises almost all the effective means of controlling the actions of individuals in the community.

The man who owns both newspaper and radio station, as happens in some small communities, by controlling these media of mass communication may be of great importance in the power structure.

Ecological patterning

Finally, the seventh dimension of community is revealed when we look at something that can be seen in many communities—a fine old residential section gradually invaded by business or small industry. The old homes turn into boardinghouses. Prostitution, poverty, poor health, delinquency, and crime flourish—the combination we all know so well in many cities. What is happening is a change in the land-use patterns of the community, in what we call the ecological patterning of the community—a term designating the division of a community into many different kinds of land use, with different kinds of neighborhoods as a result. These neighborhoods or zones gradually invade each other, and sometimes social problems come in the wake of such changes. The implications for location of schools and other agencies dealing with children and youth are evident.

One answer to this situation is adequate physical planning, usually by an official city planning board, which can greatly alleviate the results of these changes in the land-use patterns. The question of the outer boundaries of the community—the real sociological community—is also involved.

Importance of dimensions of community

These, then, are seven dimensions of community. We do not understand the true nature of a community, we cannot work effectively in it, without considering all seven of these dimensions. We may not examine them as the sociologist does, with theoretical concepts and elaborate research techniques, although often that approach is needed. Through common sense, however, and through living in the community, we can arrive at a reasonably good understanding of these matters.

Communities differ tremendously in these seven variables, and that is one reason why local school-community relationships also differ so much. They should; they have to. There is no one blueprint of community co-ordination which can fit the American community in general. The community setting is the social medium in which services to children and youth function and in which local efforts at co-ordination are attempted.

THE COMMUNITY ORGANIZATION MOVEMENT

The distinction between "social organization" and "community organization" [2] may be explained as follows: The first term is generally used in an inclusive sense to embrace the totality of continuing social relationships which develop in a society in a manner for the most part spontaneous rather than rationally designed. Using the term in this broad sense, one can speak of the social organization ("social systems" in the terminology of Parsons) [3] of a large society, of a region, or of a community. For our purposes we may view the community as a locus for a set of basic, interacting institutions through the functioning of which a majority of the residents find it possible to meet their needs and have developed something of a sense of togetherness, with a consequent potential ability to act together as an

[2] Gordon W. Blackwell, "A Theoretical Framework for Sociological Research in Community Organization," *Social Forces*, Vol. 33, No. 1 (October 1954), pp. 57–64. The discussion here draws upon this earlier article.

[3] Talcott Parsons, "The Position of Sociological Theory," *American Sociological Review*, Vol. 13 (April 1948), p. 159; see also his *The Social System* (Glencoe, Ill.: The Free Press, 1951); and Talcott Parsons and Edward A. Shils (Editors), *Toward a General Theory of Action* (Cambridge, Mass.: Harvard University Press, 1951).

entity.[4] We think of community in its more restricted, local sense as compared with MacIver's more generalized concept.[5] Any community, then, has a social organization, or a set of social systems, which has grown up in large part spontaneously over a given time span.

But this is not what we mean by community organization. The two terms should not be confused if we are to think clearly about local co-ordination between the school and other youth-serving agencies. Clarification is needed at several points.

Whereas the social organization of a community is a product, albeit in constant, dynamic flux, community organization should be viewed as a *process*. Social organization has resulted largely from uncontrolled evolutionary processes, at least until recently in certain societies where the idea of planning has taken hold. Community organization, on the other hand, is itself a rationally directed effort to modify the social organization of a particular locality to achieve rationally designed co-ordination. It is utilitarian, purposive. While social organization embraces all of the complex structure of institutions and social relationships in their dynamic functioning and interplay, the process of community organization may be initiated within a selected segment of the social organization of a locality, such as education, or it may be comprehensive in its coverage.[6]

[4] Local areas inhabited by people in relatively close physical proximity do not always clearly exhibit the characteristics of community—particularly large urban agglomerations. Rather than classification of the local area as "a community" or "not a community," it may be designated as conforming "more" or "less" closely to the concept of community.

[5] Cf. R. M. MacIver, *Community: A Sociological Study* (London: Macmillan, 1920), pp. 22–23: ". . . any area of common life. . . ."

[6] Accordingly, in this article, the term "a community organization" is not used to indicate a local association or agency.

Further describing the process as it has developed in American society, we find that community organization is generally voluntary and advisory in nature. It usually involves a number of steps, although the order in which they are taken may vary and the distinction between each step may be more intellectual than real: (1) decision as to goals or wants of the community; (2) identification of needs (comparison of goals and present conditions); (3) analysis of resources (natural, human, institutional) for meeting these needs; (4) development of alternate proposals often involving co-ordination; (5) decision, or choice of a "solution"; (6) social action to put the "solution" into effect; (7) evaluation of degree of success or failure in meeting the identified needs.

Ideological bases

To a greater or lesser degree in various localities, community organization in American society may be found to rest upon the following culturally determined ideological beliefs or assumptions:

A belief in the values of local autonomy within limits consistent with the optimum development of the larger society—a sort of antidote for extreme centralization.

A belief in the folk—in folk wisdom guided by the expert, in contrast to belief in the infallibility of the expert.

A recognition of the important role of the specialist or expert in modern society.

A belief in the value of group processes—group decisions rather than one-man, dictatorial action.

A concern for the entire community—the development and co-ordination of natural, human, and social organizational resources to meet all the needs of all the people, rather than the vested-interest approach of one segment of the population, a particular agency, or a particular organized group.

An emphasis upon the long view of developing community resources, as contrasted with short-run objectives of meeting immediate community needs.

A willingness to make progress slowly on a firm basis as opposed to flash achievement which is not lasting.

A concern for means as well as ends—the opposite of the totalitarian philosophy.

Since the community organization process must take place within a given social organization, its ideological basis will be largely determined by the social organization and culture it seeks to modify and will vary accordingly. Community organization in a fascist state must rest upon a quite different ideological doctrine.

Summary definition

To summarize, then, by community organization we mean a rationally directed process seeking to modify the social organization of a locality so that the needs of individuals may be more satisfactorily met. Co-ordination is crucial in this process. For the next larger societal grouping—that is, region—the term regional planning is somewhat analogous.

TENTATIVE PRINCIPLES

We may now suggest certain tentative principles which may be helpful in guiding efforts to co-ordinate education with other community services. These principles grow out of analysis of the sociological dimensions of community and what has been learned from the community organization movement in American society; in a way they are sample hypotheses which need to be tested.

1. The more simple the institutional organization, social differentiation, and social stratification of a community, the more simple can be the administrative mechanism designed to facilitate the community organization process (for example, the community forum) and the more informal can the process be at all steps; correspondingly, the more complex the social structure, the more formal and complex must be the mechanism (for example, the council of youth agencies). By way of commentary on this hypothesis, it is perhaps significant that the Ogdens in their grass-roots community organization efforts in small Virginia localities have emphasized the importance of keeping social mechanisms simple and as informal as possible.[7]

2. To the extent that the areal base for community organization (for example, the area served by a school system) coincides with the real, sociological boundaries of the community, the chances for successful accomplishment of the objectives of the co-ordination process will be increased. Demonstration of the failure of various agency programs to operate over areas conterminous with real communities has been made by Lee Coleman for a Georgia county.[8]

3. Those aspects of social structure which are most closely related to the value systems of the people are of most functional significance in the community organization process, serving to facilitate or hinder the process depending upon whether their aims and methods are in accord or conflict with the value systems.

[7] Jean and Jess Ogden, *Small Communities in Action* (New York: Harper and Brothers, 1946); also *These Things We Tried* (Charlottesville, Va.: University of Virginia Extension, 1947).

[8] *Communities and Administrative Areas of Greene County, Georgia* (U. S. Department of Agriculture, Bureau of Agricultural Economics, 1941).

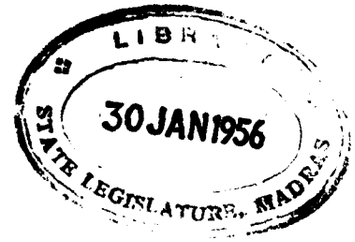
4. When the recommended patterns of social action in community organization require participation by a large proportion of the population, those aspects of social structure which are characterized by informal, primary, face-to-face relationships such as kinship, neighborhood association, and informal clique association will be more effective in securing the desired social action than will be the media of mass communication.

5. The *real* leadership of a community varies considerably from the *nominal* leadership (those holding public and private offices). Leaders of the two types have different functions in the community organization process.

6. When the mechanism for facilitating community organization (for example, youth services council) is used for operating a special program (for example, a teen-age center) or for providing special services to individuals (for example, education for handicapped children in their homes), it loses much of its effectiveness in the achievement of the original purposes of the process. Co-ordination should be kept separate from program operation.

7. Factors making for difficulty in community organization may include: (*a*) heterogeneity and complexity in the social structure of the community; (*b*) failure to enlist the participation and support of the real leaders of the community; (*c*) differences in value systems of various social groups or strata in the community; (*d*) lack of administrative know-how in the operation of a formal mechanism for community organization; (*e*) discrepancies between agreed-upon objectives for community organization and functional needs fulfilled by the existing social systems; (*f*) obstruction of the community organization process by elements in the power structure of the community; (*g*) discrepancies between, on the one hand, the objectives and methods of the community organization effort and, on the other, the value systems inherent in the social structure; (*h*) efforts to hurry the process faster than the understanding of the people can be developed and faster than modifications in a complex social structure can be attained on a lasting basis.

These are suggested, then, as tentative principles or hypotheses which should be tried out in community co-ordination efforts and subjected to research.



IMPLICATIONS FOR PUBLIC EDUCATION

Finally, we turn to the possible implications of the foregoing remarks for those responsible for the public schools: teachers, administrators, school board members, parents.

The public schools in American society are among our most locally centered, indigenous social institutions. In spite of increasing state and federal financial support, the schools generally remain locally controlled and extremely sensitive to local public opinion. This has never been more evident than in the current consideration of racial integration in the public schools. The schools are part of and are affected by the social warp and woof of the community. It follows that the nature of the schools and their co-ordination with other services to children and youth will be directly affected by the several sociological dimensions of the community. Those responsible for the schools need to understand this in some detail.

In an abortive effort some years ago to develop a symposium on community organization, the hopeful editor designated the chapter on education by the title "Shall the Schools Take Over?" His bias against the public schools was revealed—he was in social work! It also reflected the fact that sometimes the public schools seem to be forever taking on new functions and on occasion are not so co-operative as one might hope they would be in efforts to achieve community co-ordination. This expansiveness may arise partly from the fact that the schools constitute a financial operation of considerable size, and take a large cut from the tax dollar. It may also be caused partly by a lack of understanding by school people of the essential nature of community organization—its co-ordinating functions—and its importance as a growing, vital movement in American society.

Gordon W. Blackwell, Ph.D., Chapel Hill, North Carolina, is Kenan professor of sociology and director of the Institute for Research in Social Science at the University of North Carolina. He previously served as head of the Department of Sociology at Furman University, where he was on the staff of the Greenville County Council for Community Development. He has conducted research for several federal agencies and for the Commission on Teacher Education. He is author of Toward Community Understanding (1943), coauthor of Church and Community in the South (1951) and Future Citizens All (1952), and has contributed articles to numerous professional journals.

Co-ordination: The Viewpoint of a Political Scientist

By Eldon L. Johnson

THE favorite educational dream of many political scientists—the complete integration of school administration and local government—will certainly not be realized in the foreseeable future, if ever. Public opinion, although perhaps indifferent at the outset, would be against it when aroused by fear of "politics," depressed standards, and impoverishment. Professional educators would be vociferously against it. Public officials could not prove clean hands if they were to take the initiative. But apart from all this, the average citizen has a special affection for education, a special conviction that it is a professional matter, and therefore a special resistance to tampering with accustomed methods of governing education. It may be accurate to say some of this is folklore and mythology, but that does not change the situation. It only helps to explain.

We are left, therefore, with the difficult problem of seeing that schools and other governmental services communicate, co-operate, and collaborate in more subtle ways, less officially and less formally. The task is to see that the schools and other governmental services, while maintaining their "territorial integrity," harmonize their related efforts on all public programs concerned with the development of children and youth.

In education literature, one gets the impression that the Constitution perhaps provided for the separation of school and government, just as of church and state. There can be no doubt that a good thing has been carried too far, just as the "merit system" has thrived negatively on the fear of spoils politics so long that the lingering psychology blocks much positive personnel administration. At present, in a similar way, we suffer from the negative fear of contaminating education and educators by having them rub elbows with other public officials, whereas the times clearly call for positive approaches of the mutual-aid variety. No evil flows from the separation of school and government when they have no, or few, problems in common. But that time is past. The barricades will have to come down, somehow. The trouble arises when problems are common but the attack is separate, if not indeed rival or competitive or possessively exclusive. Common problems call for common solutions, although the co-operators need not in any sense lose their identity. The evil of separation is the propensity to build rival power structures and to thwart the emergence, recognition, and service of the community of interest.

Citizen Opinion

No one has to demonstrate to the average citizen that schools and government need closer co-operation and co-ordination. The people who apparently do not understand this are, strangely enough, the school officials and the government officials—to a considerable extent, the professional educators and the professional political scientists. Textbooks in school administration often avoid civil government, while talking much about "the community"; textbooks in political science often ignore education, while talking much about public services. Educational books commonly do not mention

city government and municipal departments, even under the heading of "public relations," although there may be elaborate treatments of parent-teacher associations, clubs, teachers, and citizens at large. One author says public relations deal with "teachers, parents, general public, school children, and the individuals and groups of the larger communities of the state and nation." [1] He omits the whole parallel structure of local nonschool government.

However myopic the professional point of view may be, the average citizen wants public services efficiently performed, economically administered, and democratically controlled. He does not make nice distinctions between schools and government. He knows he pays for *all* public functions and that one function cannot expand except at the expense of the others. He is at least not surprised that "city rates" may apply to utility, sewage, and other public services when extended to the schools. He expects the city to hold school elections. And as a final testimony to his unconcern for the separatism which professionals so dearly prize, he blames local government officials for all public ills, including those school ills over which no jurisdiction is exercised. For example, the mayor of Minneapolis was blamed in 1948 for strike conditions among the teachers when he was actually trying hard, in an unofficial manner, to keep the school board and teachers' representatives negotiating.

Preconceptions and Misconceptions

The best hope for maximizing co-ordination of school and government, without complete integration, undoubtedly lies in the training of future school personnel, particularly school administrators. Hope lies in the direction away from the philosophy of extreme separatism: in the training of school superintendents to be more community centered and less school centered, more aware of the role of the schools as *a part of* the public rather than *apart from* the public, and more cognizant of the *problem* than of the doctrine or of the tradition. What can be done in this respect?

First, there needs to be a more realistic appreciation of the schools as a related part of the public enterprises of the community, not as a unique whole existing apart. There needs to be an appreciation that education as a public need and satisfaction is not fundamentally different from other public needs and satisfactions—welfare, recreation, health, protection, sanitation, and so forth. All call for knowledge, skill, integrity, efficiency, and responsibility in their administration. None lends itself to a Republican or Democratic way of doing the job. There is need, in other words, for the public schools to be regarded as genuinely public in the most comprehensive sense.

One basic misconception has been so often repeated, and the gloss so compounded over the years, that it will take herculean effort to end the damage—and damage it really does. The misconception is that the school boards and districts, being creatures of the state government, are somehow unique and somehow fundamentally different from all other civil government at the local level. Yet the fact is that *all* local government stems from the state—all city, county, or other local government. If there is "home rule," it was conferred by the state. The schools enjoy no uniqueness in this regard so far as legal theory is concerned. This is not at all to deny that states, for various reasons, including this distorted philosophy itself, have given schools special status in many cases; but it was

[1] Harlan L. Hagman, *The Administration of American Public Schools* (New York, 1951), p. 333.

not done because education had any prior rights or supragovernmental mandate. Neither is this to deny that the separate administration of the public schools, historically, has had its great merits. The point is that the independence of school boards is a matter of public policy, not a matter of fundamental or immutable law, and certainly not a matter of *requiring* operation at arm's length from all other government. There has been in this area, or so it seems to a political scientist, a great deal of strained logic and illogical catechizing.

This separation reaches its climax in the phrase "keep the schools out of politics." Exactly what this means is difficult to say. If it means to keep the schools out of the main stream of public policy, to divorce them from all other public affairs, to keep them unrelated to alternative uses of the tax dollar, or to reduce knowledge of and debate about what they are doing, then we have avoided one danger by embracing another—the danger of professionals responsible only to their profession, the danger of professional *control* and professional *policy making* as well as professional administration, the danger of making public schools less public. When an educational writer says that the schools are "the most responsive, most sensitive, and most locally activated system of government," [2] yet that they are governmentally unique and politically uncontaminated, he is using a vocabulary which makes no sense to a political scientist. There can be no question about what the described process is: it is political. The question, rather, is whether it really exists. Every school constituent should hope it does. When a commission of educators says the school must be independently governed and "set apart from the executive and legislative branches" to avoid changes "in personnel *and in policy* by the voters," although "the suggestion is not that the schools be removed from the control of the people, but rather that the people be enabled to act directly in this most important area of government," [3] the confusion is compounded.

It would help, therefore, if the training of future school administrators could include some more realistic treatment of political processes and the nature of "the public" and its controls. A *public* as well as a professional philosophy is needed. These are public schools run by public officials. Public processes need, therefore, to be understood and appreciated—not merely depreciated, or ignored, or denied to exist. Training along these lines would dispel from the minds of both administrators and the public the common impression that education is peculiarly and possessively the business of professionals. This impression has been well stated by the author of a careful state survey of intergovernmental relations, who said: "Despite the argument that independence permits among other things greater public scrutiny and control, the real desire apparently is to restrict control in so far as possible to professional educators." [4] To this impression the professional educators themselves unwittingly add by such well-intended pronouncements as, "Educational leaders should not only heed the expressed will of the people; they should also help the people to find their will and to express it." [5] Educators also give that impression by wanting maximum integration in education while resisting much of it with other civil government; by wanting to make the United States Office of Education "independent"; by removing state superintendents and state boards of education from the jurisdiction of the governors; and by seeking earmarked taxes. Something more seems to be at stake, the critics are thus permitted to say, than merely "escaping politics." In any case, says one student of this problem, "It seems fairly clear that organizational structure is not the determining factor in the existence of politics in the schools." [6]

CO-ORDINATION OF YOUTH SERVICES UNDER THE SCHOOLS

Since it is clear that co-operation and co-ordination, rather than integration, between schools and governmental agencies are the best we can hope for, and indeed sufficient if we can get it, the training of school personnel should also approach proposed organizational solutions with an open mind, keep attention fixed on the problem rather than on some general theory, and thus enable the fluid boundaries of government and schools to merge, fit together, and supplement in whatever ways the law of the situation will permit. This kind of training will respect the integrity of the governmental agencies and try to fit them into the co-ordinated whole, as it will also respect the integrity of the schools. Not all the adjustment can come from the nonschool side, nor can the schools expect merely to "take over," building a new entity at the expense of existing organizations. Some possible danger of this is implied in the Educational Policies Commission's proposal for "the ultimate unification" of all public education activities under a "public education authority" for the co-ordination of all social services and education pertaining to children and youth.[7] This is to replace the old, limited "school board" concept. It is "to co-ordinate public services on behalf of the child" and to give the needs of children one integrated treatment regardless of the number of agencies involved. Any other approach, this line of reasoning assumes, "leads to confusion, authoritarian policies, and lack of a unified approach to the educational needs of the individual." [8]

Such proposals for organization on the basis of persons—"youth" in this case—need to be examined carefully. They have their advantages for the persons involved but also their disadvantages for other persons, as do organizations for veterans, for labor, or for farmers. Also, while such a unitary organization might do better all things for all youth, it might also cease to do so well what had previously been at the center of attention: education in the more restricted sense. Care might have to be exercised to keep education from becoming increasingly custodial, for the relief of the homes and the labor market. Assuming that the custodial functions—looking after youth's health, welfare, delinquency, recreation, and so forth—are desirable, the question remains whether they can best be combined under the domination of the formal institutions of education. Organization according to persons always cuts athwart organization according to purpose; therefore, a "youth authority" conception, centered around the schools, really proposes the partial dismantling of existing local government, taking

[7] Educational Policies Commission, *Educational Policies for Community Recreation* (Washington, D. C.: National Education Association, 1940), p. 31.

away certain of its health, welfare, recreation, and other social service functions. This is a new kind of integration, working toward the schools rather than toward the local government. Before this is done, careful attention should be given to whether this is the direction in which we ought to move, what the price to be paid will be, and whether this is the proper and best use of professional school personnel. Local government is not likely to take much more kindly to this kind of merger than education takes to merger with other local government. So we are likely again to be brought back to co-operation and co-ordination, rather than mergers and integrations.

EXPERIMENT IN TRAINING SCHOOL SUPERINTENDENTS

One of the most promising ways of training school superintendents who will be resourceful toward the achievement of these ends is a dual approach combining graduate education in the relevant social sciences and research experience in community studies. An experiment of this kind is now in progress under Kellogg Foundation auspices, through the Co-operative Program in Educational Administration, in several universities. One institution [9] has experimented with two interdisciplinary seminars for candidates for advanced degrees in education: one on the nature and problems of administrative behavior and the other on the scope and method of the social sciences. The professor in charge, normally a social scientist, is assisted by staff members representing other areas, including at different times political science, anthropology, business administration, psychology, sociology, economics, and education. All participate as required to bring into play the points of view of the different disciplines as focused on central problems. The case-study method has been used in part, with each student also required to prepare a case report from his own administrative experience. The scope and methods seminar deals with basic concepts and materials jointly explored by staff and students "in order to relate the problems of education and school administration to the social context" of the community. Student reports are subjected to reactions from the representatives of the several social sciences. Reading likewise extends into the several disciplines, drawing upon as much relevant diversity as possible. The prospective superintendent is thus expected to extend himself, to indulge in useful self-analysis, to get new insights and techniques, to feel at home with problems as well as with abstractions, and to develop understanding of social organization and social processes.

As a result, observers at doctoral examinations are struck by the fact that the candidates have new vocabularies and new interests. They introduce authors, titles, and materials from fields traditionally unknown to "education majors"—a point from a sociologist here, a concept from an anthropology reference there, an illustration from a study in political behavior somewhere else. This acquaintance and those habits, it is hoped, will enable the superintendent to see the problems of youth and schools as they spin in their specialized orbits, held in place by all the forces of the community; in other words, to see the schools in the context of the community.

In addition, doctoral candidates hoping to be superintendents serve a kind of research apprenticeship en route to their dissertations, concentrating again on studies of the community—for example, on leadership, on political behavior, on decision making, on social organization, on attitudes toward school administration, on growth factors, on school-community planning. While candidates may choose particular aspects of a major problem, attention has been focused on co-operative research on a community-wide study, with all participants sharing in the research design, the formulation of techniques, and the discussion and criticism as the project moves toward completion, with particular facets of the project becoming individual dissertations. This experience is shared with the supervising professors from the relevant social sciences. The purpose, again, is to develop the habit of seeing youth and schools in the community setting, in the midst of forces which inevitably play upon them, and in perspective with other governmental and social agencies and functions.

Experiments of this kind, while uncommon as yet, do give hope that the goals sought will somehow become more consciously held, and therefore that means to such ends will more likely be devised. These and other schemes and strivings may eventually make their permanent impact on school administration by becoming embedded in the curriculum and training plan for school administrators. Some such new plan would go a long way toward bringing about one of the most fruitful and solidly meshed types of co-ordination—co-ordination by ideas, rather than by pressure or by expediency; co-ordination by inner desire rather than by outer compulsion.

OTHER STEPS TOWARD CO-ORDINATION

But looking at the problem from the here and now, rather than from the ideal future, experience already suggests many worth-while ways of relating education and other governmental services more advantageously both for children and for community. Any discussion of hopes and desirable developments must look to the maximization of these promising trends.

The co-operation of health officers, county agricultural extension agents, social welfare personnel, and federal representatives on school lunch programs shows that frictions, particularly interlevel frictions, disappear as programs mature and routine patterns of relations develop. Schools and local governments have demonstrated the advantages and techniques of joining together for library services, as in Minnesota, where some co-operative county-city-school arrangements have successfully combined under a representative board named by the mayor.[10] More variations on this theme would be desirable. Something similar is possible, as often demonstrated, in recreation commissions representing schools and all other interested governmental units. The National Education Association has criticized the overlapping of library, recreation, and school functions, as represented by three circles lined up tandem with slight overlaps at the edges, and has proposed a unified and shared "authority" with library, recreation, and schools fitted as pie-shaped pieces into a single circle.[11]

Another of the crying needs which always appeal to the political scientist is the rationalization and reordering of the unbelievable hodgepodge of units of government, often specialized and unifunctional, possessing unique boundaries and resembling each other only in ability to tax, stacked one on another like a child's blocks in impossible-appearing stages of imbalance. Unless specialized districts are reordered in many areas, there can be little hope of co-ordina-

[9] University of Oregon. The author gratefully acknowledges the helpful reactions from Donald E. Tope, Director of the Co-operative Project in Educational Administration there; Vincent Ostrom, Associate Director; John M. Foskett, Professor of Sociology; and their several doctoral candidates.

[11] Educational Policies Commission, *Social Services and the Schools* (note 8 *supra*), p. 26.

tion. There are too many vested interests, vested in too many different places, in too many different offices, and in too many different personalities. Districts without roughly similar boundaries face almost insuperable obstacles in significant co-operation. Here is an abundant field for reform and progress for schools and community together.

It would help also if schools and government could interrelate their activities through joint meetings and overlapping memberships on governing boards of social agencies, junior placement services, city and school planning, and libraries, and for health, recreation, and adult education. Community councils, broadly representative of community agencies, also offer insufficiently explored possibilities for co-ordination.

Another device found especially useful is a joint planning office and planning consultant, serving school district, city, county, and special districts together, focusing attention on community-wide problems. This is a means of making sure that the specialized interests are not exploited without at least having attention called both to the dangers of unilateral action and to the advantages of consultation and co-operation. The planning office, for example, can see that recreation and playground planning is co-ordinated, by telling each party what the other is aspiring to and getting all together when any unit is about to move on a common but many-faceted problem. Joint use of expert advice of this kind has the advantages of economy and freedom of operation, in addition both to an authorized ear and to an authorized voice for every party in the councils of every other party. No party is bound, yet every party is informed. The need for co-ordination is perceived before premature action is taken.

IN THE COMMON INTEREST

When the doctrinaire is removed from both sides—from the school's insistence that nothing less than complete and jealously guarded autonomy is tolerable and from the government's insistence that nothing less than complete integration can suffice—perhaps the common aspects and the common interests of the community can be recognized and reestablished. When city and local government becomes more professionalized, as it inevitably will, just as the schools have become more professionalized, co-ordination will be much simpler. The old fear of having the schools "in politics" will be assuaged, a more positive approach will be assured, and a combined effort of schools and government toward problems they face separately but must solve co-operatively will be, at last, both possible and politic.

Eldon L. Johnson, Ph.D., Durham, New Hampshire, is president of the University of New Hampshire. He has served as dean of the College of Liberal Arts and Graduate School (1947–55) and professor of political science and department head in the University of Oregon (1945–47); director of the Graduate School, United States Department of Agriculture (1941–45); and national academic director of the United States Air Forces Premeteorological Training Programs (1943–44).

Some Paths to Co-ordination

By THEODORE L. RELLER

THE growing complexity of society; the increase in population of metropolitan areas, combined with too little planning; the difficulty experienced by youth in finding opportunities for action comparable to its maturity; the chaos of local government units, representing as they too frequently do the needs of the past rather than the present; the confusion in values held by the people; the preoccupation of the nation with the world struggle and its failure to see the true significance of the home front in the conflict; inadequate financing and staffing; and attacks on education make even the formulation of an outline of realistic, desirable developments exceedingly difficult and hazardous. The base moves rapidly while upon it some structuring must be done.

The points of view offered in this concluding article are broad generalizations outlining directions which appear desirable. Important advances in co-ordination are not likely to be made unless these issues are widely understood, debated, and accepted or modified. It is not intended that the items constitute a complete list or that together they represent a "program." Rather, they should be regarded as suggesting desirable directions. To seek a "pattern" in this vast area would be most unfortunate—for a pattern has little likelihood of being effective in a problem both so immense and so intimate as this one, bearing as it does upon children and youth in their infinite activities. It should also be noted that the items offered are not new or original. They are drawn largely from experiences—satisfying and otherwise—which run through this issue of THE ANNALS. It is in light of the work which has been done in co-ordination, in some communities and in some countries, that the fuller realization of the goal may be conceived and more effectively sought.

IMPROVED COMMUNITY LIVING

Improved community living must become a more important, consciously sought end. Nondescript, ugly towns and cities are unnecessary. Blighted areas in cities and on the fringes of cities are avoidable. New cities do not have to be crowded—without public recreation areas and that touch of nature which might be considered reasonably adequate for children and adults. The achievement of assets such as attractive and satisfying communities in which to live is as worthy of planning and effort as the achievement of great industrial enterprises. The returns from investments in libraries, schools, public health centers, recreation areas, and well-planned communities while perhaps less tangible are no less real than those from any known investment.

How long can we recognize the conditions associated with delinquency and yet continue to permit the development of those conditions? How large a return is the prevention of one case of delinquency? the development of satisfying homes? the use of land in the interest of the people? the creation of a community which stimulates the development of children, youth, and men? Shall education prepare men only to earn a living, or also to live satisfying and creative lives? Those concerned with education have often spoken of education for improved community living—thinking of community in various

contexts—and of living in broad terms. Too often, however, they have not been able to help young people sufficiently in developing the essential knowledge of their own community, the ideals which they may strive for, or the know-how for achieving them. Perhaps all of us in our various roles need to look more carefully at the gap between our professed goals and our achievements.

CLARIFIED GOALS

The purposes or goals of the various public services must be clarified and their interrelationships (in goals) better understood. Each public service tends to see the achievement of goals sought by various services too largely in terms of its own structure and life. There is too little appreciation of the extent to which goals such as health, democratic citizenship, effective family and home life, creative individual and group living, are common to many of the public service agencies. Each agency sees too largely itself and its contribution to the job and fails to recognize the tremendous unrealized strength which might be unleashed were they all to stand together. Too frequently one service sees itself as a competitor of others rather than as a member of a team through which the strength of each could be greatly enhanced—for fuller realization of the purposes of the society and the dignity and worth of man.

SIZE OF PLANNING AND ADMINISTRATIVE UNITS

Local planning and administrative authorities or units must be large enough to be able to meet needs effectively and small enough to maintain and increase local interest and participation. Such authorities are not easily attained. Land use, fringe areas, traffic and transportation, research and planning, special education and other matters, demand larger units than are generally found. However, the larger units—which are generally cities—too frequently appear to be remote from the people. They have not stimulated local interest. The local administrative units for education and other purposes are too often to be explained by history, vested interests, compromise, and accretion rather than by any relation to the needs for which they are expected to make provision. Thus a metropolitan area not only has many different units of widely varying size, wealth, and community characteristics but also has many governmental units superimposed one on the other, though not necessarily covering the same area. This complex structure—chaos sometimes—makes it difficult for the citizen to be informed or to act. It also results in the need for extensive co-ordination of efforts and co-operation among the various governmental units.

A new development on the fringe of the city involves land use, housing, public health, transportation, water and sewage, education, recreation, and other services. How they are met is of concern inevitably to the people of the metropolitan area as well as to those of the small governmental district or even unincorporated area where the development is occurring. We are citizens of metropolitan or other large areas as well as of established governmental units—general purpose or *ad hoc*—even though this is generally not recognized in governmental structure. There would thus appear to be need for metropolitan area districts for certain over-all purposes such as planning and co-ordinaton. Wthin these districts a relatively simple, highly decentralized structure for administration and co-ordination of various services should be developed. The unit which does the planning need not carry through the administration of the services. Thus a local structure could be designed which would be competent to cope with the problems of the area, to ensure co-ordination, and to increase citizen understanding and participation. Those in education as well as in other fields must recognize that the problem of local district structure is a significant one for other public services as well as for their own—and that they have a measure of responsibility for it in all fields.

EDUCATION IS MORE THAN SCHOOLS

Education must be recognized as a service considerably broader than the school. Laymen and professionals interested in education must be interested in more than the school. How can they avoid a compelling interest in housing, in land use, in public health, in recreation, in youth services? Perhaps they need to ponder the view of those educators in England who held that during the twenties the greatest single educational advance was the development which had occurred in housing. Children who grew up in the new estates were not only taller and heavier than they would have been had they remained in their blighted slum areas; they also had a very different attitude toward life, a different understanding. The dependence of education upon public services other than the school speaks of the interdependence of other services in achieving their ends. Public health is not advanced only through the public health service. The library service and public adult education are inseparable. Improved community living can only result from a large co-operative effort. Participating in the improvement of community living is itself education of the highest order.

MANY AGENCIES ARE EDUCATIONAL

As a corollary, it must be understood that many public services are engaged at least in part in education and should therefore be contributing significantly to it. Although education of children and youth may not be the major responsibility of such agencies as juvenile courts, placement agencies concerned with the conditions of employment of youth and with the growth which occurs in such employment, city planning agencies, recreation departments, and public libraries, it remains nevertheless an important one, and they should be willing to co-operate in the development and provision of the educational service. The attainment of the goals of many public services is thus related to the quality of the co-operation among them.

FIXED RESPONSIBILITY FOR CO-ORDINATION

If educational ends are to be successfully achieved, responsibility for the provision of many related activities and the co-ordination of others must be fixed upon some one agent or agency—both when school districts and other *ad hoc* agencies exist and also when all local government services, including education, are the responsibility of a single local governmental authority. The responsible agent should be that charged with the provision of public education, the Board of Education or the Education Committee and its executive officers. Not all services, of course, will be rendered directly by the schools. But with many agencies involved someone must be responsible for co-ordination, lest agencies overlap or compete in one area while another problem equally important goes unregarded. This does not mean that the agent responsible for education dominates the other services which have a contribution to make to it. In this as in all administration, there are modes of behavior which facilitate co-operative action.

It should, of course, be recognized that equal responsibility for co-ordination will fall upon other agencies in

other spheres of activity. In many of these, public education will be one of the co-operating services. In cases in which the agency responsible for co-ordination fails to act or acts in an arbitrary manner, the others sharing responsiblity for the service should stimulate action. Provision for this contingency should be made in the planning and co-ordinating authority of the large area, considered above.

PERIODIC REVIEW

Provision should be made for periodic review of the necessity for and the adequacy of the various services provided and for determination of the need for further co-ordination or additional provisions. Such review and planning should be provided for both in the larger planning authorities and in the smaller units through which the services are actually administered. All interested services should be involved in this review and indeed should, in considerable measure, carry it through. Many unmet needs remain, many goals are inadequately achieved. Competition among agencies and unnecessary overlapping of services are therefore indefensible. The job to be done is far bigger than the combined resources of all parties.

STRUCTURE OR PROCEDURE

Although administrative structure is important, it is perhaps not as important as the actions of those who set policy and administer the services. Desirable co-ordination can be attained (or can be lacking) with fiscal dependence or independence. A satisfactory answer to the problem is not to be found in organization charts and definitions of responsibility. These are important, but the degree of their importance can only be determined when they are in use—in actual process of utilization. Attention must therefore be centered upon the parties involved and the manner in which they operate. This is true in all administration—but especially as regards co-ordination, for which a wholly satisfactory plan of organization never has been set up and remains unlikely unless a way of describing high-level co-operative effort in relation to fixing of responsibility can be found. It is not easy to assign effectively the responsibility of being co-operative—and of spelling out its true meaning under varying circumstances. For this reason a considerable part of the solution to our problem is probably to be found in informal organization—in the purposes, the tact, the mutual understanding and respect, the "know-how" of co-operation, on the part of those involved.

The difficulty of achievement through planned changes in structure has been well expressed by Leighton:

> No matter how good a plan or an idea hatched by an administration may be, it is of little value until it becomes part of the consciousness and activity of the people. The history of government and industry is littered with schemes that have been labelled failure, but which in reality were never tried because they were never understood by those who had to grasp them before they could become action.[1]

Perhaps we have attached too much importance to the dependence or independence of authorities responsible for various services and too little to the procedures for the co-ordination of effort which every community has a right to expect from its public bodies and officials.

Instead of seeking a "solution" to the problem of co-ordination through simple, straight-line administrative structuring which the complexity of the situation does not admit, we need to attack it from a wider base. Certain facts should be recognized: the various services are expressions of the same community; "independence," if it results in isolation of any service, in the long run may weaken rather than strengthen it and reduce achievement of its goals; "independence" is frequently not as real as it appears; struggle and competition among services can go on even within the same structure or organization; public knowledge of all services and informed action regarding them is imperative if the problems are to be met. Some points of approach then seem to be: to clarify our goals; to secure local units large enough to cope with the problems; to seek more effective co-ordination through legal structure or voluntary effort; to fix responsibility and ensure freedom to act on the part of various services; to seek to raise the level of citizen concern and action; and to stimulate professional co-operation and leadership. Simple solutions are not likely to be solutions.

[1] Alexander H. Leighton, *The Governing of Men* (Princeton, N. J.: Princeton University Press, 1946), p. 364.

BREAKING DOWN SEPARATISM

Those interested in and involved in the different public services must be brought closer together—at the administrative, staff, and lay levels. Interdisciplinary understanding and co-operative action is essential. Pre- and in-service professional programs could contribute much here. It is difficult to justify the degree of "separateness" which in most of our universities characterizes the programs for the preparation of leaders for the various public service fields. Surely there are areas of study and experience which should be shared, provisions which could be made beyond suggesting a few courses in other fields. If as students public servants of various disciplines have had opportunity to work together, there is promise that in the field they may be more interested in co-operating—better able to co-ordinate activities, to lead the attack on problems, to seek together the achievement of common goals.

Teachers and the personnel of other services also need more common learning and experience than are generally afforded in their preservice education. The development of more in-service programs cutting across established lines are likewise essential—programs through which knowledge and understanding are developed and plans of attack co-operatively created.

In regard to lay citizen groups much can also be done by those who serve as policy makers in the various governmental bodies or agencies and also those who are active in the voluntary groups interested in one or another service. Much of this citizen co-ordination of effort should be effected at a rather decentralized unit or area level. In the metropolitan area broad lines of advance, of policy and planning, can be developed for the area as a whole—but much of the co-operative effort and understanding can be effected only at the level of the community or some even smaller unit. The area served by a secondary school might be a desirable unit in which thinking could be developed and action taken.

INVESTMENT IN LIFE

Co-ordination must be accompanied by a considerably larger and more realistic investment in children and youth of personnel and material resources. We have come to recognize the significance of large investments in our industrial enterprises. Through them we seek the advancement of the whole society. Is there any reason to believe that large investments in the interest of children and youth will not yield at least equivalent returns? Or that through them the whole society may not benefit? If the final evaluation of the worth of the industrial enterprise is

what it does for man, is there any reason to believe that investments of time, energy, and money directly or consciously in his interest are unwarranted or less defensible economically? What is gained through building homes and communities from which everyone wishes to escape?

Why do many children and youth grow up without adequate library facilities? minimum health services? attention to their social adjustment problems until it is "too late"? homes and communities which assure them that they have a place to win in this democracy? What is gained through crowded schools unable to offer the kinds of opportunities essential to the effective development of youth? When we build new factories we tend to build them as well as we can. It pays. But too frequently we still build "austerity" schools and unplanned communities—communities which are not the best we know how to build, communities which do not promise to yield the satisfactions and opportunities which men need and which can be provided. And as if we had not been seeking educational goals through "austerity" for years, there are those who suggest the "fuller" use of school buildings through a twelve-month school year—not for the ends of those already crowded in them, a purpose which could be justified, but to accommodate more.

No Lesser Goal

Effective co-ordination will result from clarification of aims through relating them to the central objective of ensuring reasonable opportunity for development to all children and youth; from the reorganization of governmental structure and the improved capacity of those responsible for it to work toward that objective; and from the investment of a larger proportion of our human and material resources toward that end. Our society cannot afford a lesser goal —nor long delay in its fuller attainment.

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

WILLIAM Y. ELLIOTT, H. VAN B. CLEVELAND, THEODORE GEIGER, and others. *The Political Economy of American Foreign Policy: Its Concepts, Strategy, and Limits: Report of a Study Group Sponsored by the Woodrow Wilson Foundation and the National Planning Association.* Pp. xv, 414. New York: Henry Holt and Company, 1955. $6.00.

For the international specialist or the layman who is not an economist, but who feels the need of an authoritative handbook on foreign economic policy, this work is a welcome aid. It will prove especially valuable if the reader is one who, like the reviewer, has difficulty finding his way in the bulk of government reports or in the neomarginalist apparatus of so many academic studies in the field.

Most of the nine authorities who constituted the joint-study group are men who have served in executive agencies, government commissions, or Congressional committee staffs, dealing both with foreign policy in general and with economic policy. They thus bring to their survey a wealth of practical economic engineering experience as well as technical expertness. The group was chaired by Mr. Elliott and the draft report prepared by Messrs. Cleveland and Geiger.

Chosen deliberately to indicate the focus of the study, the title aptly shows that the group has aimed at relating general foreign policy to the economic problems of the free world. The major premise of the work is that economic policy must serve our national security and our diplomatic and strategic objectives. The basic viewpoint is one of a hardheaded liberal internationalism, leavened with a healthy skepticism of any supposedly universally valid economic theory.

The study divides logically into two main parts—diagnosis and prescription. The first surveys the genesis of the contemporary international economy, the external economic problems and prospects for economic growth of the industrial sector of the free world outside the United States (that is, Western Europe and Japan), as well as problems of the underdeveloped countries. The second part deals with policy under such topics as criteria of a sound world economic order, economic organization of the western community, economic development policy, foreign economic policy administration, and the relationship of economic to general foreign policy.

If a minor criticism is in order, it would be that there is a little too much emphasis

on noneconomic factors, welcome as that emphasis is. At times familiar political points are covered so fully—even repetitively—that the central economic topics are obscured. The contrast with the usual economic study is so great however that this can hardly be deemed a fault.

OLIVER BENSON
University of Oklahoma

FRANK TANNENBAUM. *The American Tradition in Foreign Policy*. Pp. xiv, 178. Norman: University of Oklahoma Press, 1955. $3.50.

In this compact volume, in which he pulls no punches, Professor Tannenbaum, best known for his books on Latin America and the labor movement, undertakes a task which had long been needed in our study of world affairs. He enters the lists to challenge the champions of *realpolitik*, notably Hans J. Morgenthau and George F. Kennan, contending that their philosophy goes against the grain of the American tradition in foreign policy. This tradition he defines as the association of co-ordinate states, illustrated by the development of federalism in the United States, by the experience of the Organization of American States, and by the structure of Switzerland and the Commonwealth of Nations.

The debate between the "realists" and the "idealists," Professor Tannenbaum rightly points out, "is of greater import to the future of the United States than the old argument between the 'interventionists' and the 'isolationists,'" and in his opinion is just beginning. The American people, he argues, cannot act on the advice of the *realpolitik* school "without ceasing to be either a Christian or a democratic people."

This is strong stuff, and those who, like the reviewer, agree with Professor Tannenbaum's general approach will welcome his cogent analysis, richly documented, of the way in which the concept of the co-ordinate state started and matured in this country. It is regrettable, however, that by concentrating almost exclusively upon American tradition, and by disregarding the traditions of other major components of the universe—Europe, Asia, the Middle East, the USSR—he plays right into the hands of those he challenges, and who can properly criticize him for presenting this crucial issue in too abstract terms. Other nations than the United States have sought, over the ages, a formula which would bring about a viable association of states, but their geographic position, their strategic vulnerability, their economic resources, and other factors, have placed them in a position far less favorable than ours, both internally and externally.

By extolling the American concept of an association of equal sovereign states Professor Tannenbaum begs a number of questions. Is the United States prepared today to subordinate its sovereignty to a federal international administration? The Bricker amendment, the reluctance of this country to consider supranational controls over armaments and economic policy, create legitimate doubts on this score. Or is the United States prepared to welcome all nations, large and small, on equal terms into such an association, irrespective of their ideologies? Washington's attitude toward the recognition of Peiping and its admission to the United Nations indicates a negative answer. And is it realistic to say that the United States does not seek to intervene in the affairs of small nations when this seems desirable in its national interest? How, then, can one explain our decision to check Communism in Guatemala, or to support and finance the government of South Vietnam? To say that the intervention of the United States is benevolent, and that its tradition precludes imperialism, is not to say that intervention does not occur and not in the dim past, but in our own times.

Professor Tannenbaum rejects the balance of power, and offers the co-ordinate state concept as an alternative consistent with the American tradition. He opposes any attempt to divide the world between the United States and Russia. But is this the issue today? The issue, if current events are any guide, is that the influence of the two superpowers is waning in a world where we see not one balance, but many, and that both Washington and Moscow now compete in proposing the principles of equality, noninterference in internal affairs, and independence within a larger community of nations which Professor Tannenbaum attributes primarily to Americans. In this new era of the "cold peace" the United States will have a notable contribution to make out of its past experience, but this contribution will have to be meshed with that of other nations in ways which the *realpolitikers* have explored with a much greater attention to the actualities of international relations than is apparent in this book.

In any case, must it be a question of *either/or?*—either *realpolitik* disconnected from ideals, or ideals disconnected from realities? For many years the study of foreign policy in the United States went on in a stratosphere, where it was assumed that Americans functioned uncontaminated by the considerations of survival which shape the lives of other peoples. When this was discovered, during World War II, to be remote from actual experience, the swing of the pendulum brought some of our commentators to accept uncritically the "tough" approach exemplified particularly by German geopoliticians. It is high time that we should seek a middle course, consonant, as Professor Tannenbaum suggests, with the American tradition, for surely life among nations, as among human beings in general, is compounded, in varying measure at various times, of both ideals and realities.

VERA MICHELES DEAN

BOYD C. SHAFER. *Nationalism: Myth and Reality*. Pp. xi, 319. New York: Harcourt, Brace and Company, 1955. $5.00.

It is now just thirty years since Carlton J. H. Hayes published his *Essays on Nationalism*. At the time of the appearance of this epoch-making work of American historical writing the official custodians of American historiography did not see fit to include a review of the book in the *American Historical Review*. They considered it to be current "journalism" or "sociology" and not "real" history. As Dr. Hayes aptly observed, for many of our historians of the time, nationalism was part of the atmosphere they breathed and not the object of serious historical study. How much the climate of historical studies has changed since that time may be gathered from the fact that the latest historical study of the problem of nationalism comes from the pen of Boyd C. Shafer, newly designated editor of the *American Historical Review*. Largely as a result of the pioneering work by Hayes, and since 1932, by the presence in this country of that other great student of nationalism, Hans Kohn, even the most traditionally-minded of our historians have come to recognize the reality as well as the crucial significance of nationalism for the understanding of modern history and politics. Stimulated by the example and by the personal influence of Hayes and Kohn, a considerable body of literature on nationalism has been produced by younger American scholars to take its place with the continuing volume of studies by European scholars. Boyd Shafer conceived the worthwhile idea of providing a synthesis of this large and ramified literature in order to bring once again to our attention the meaning and significance of nationalism and problems created by it for our present society. As he indicates in his Preface, Dr. Shafer does not offer the volume as a "definitive work on nationalism" and his materials refer chiefly to France, Great Britain, and the United States. But he has read widely and discriminatingly, he has reflected on his reading wisely and critically, and he has set down his mature and meaningful reflections with an elegance of style and clarity of presentation that make the volume a pleasure for both scholar and layman.

Dr. Shafer's volume is divided into five sections. The first section deals with the elusive and tricky problem of definitions. Dr. Shafer quite properly takes the view that nationalism as such did not appear before the eighteenth century. He recognizes the fact that it is "a complex and dynamic" phenomenon which defies short and logical definition, and he wisely observes that "simple explanations of human institutions and actions are nearly always wrong, revealing only the naiveté or the interest of their authors." In the second section, dealing with what the author calls metaphysical, physical, and cultural "Illusions Concerning Nationalism," he brings

to bear healthy, rationalist, and illuminating dissection to expose the inflated unrealities of the various myths developed by historians, social scientists, journalists and, above all, political pamphleteers regarding the grandeur of their own nationalism and the viciousness or inferiority of the nationalisms of other people. The third and fourth sections are devoted to a description of the historical process of the development of nationalism from 1715 to the present. Here the materials on social and economic factors are particularly searching. The final section on "Delusions about Man and His Groupings" represents the author's own credo as developed from his historical investigations. His chief point is that the similarities of men are much greater than their differences, and that since nationalism is the product of historical conditions, "it could evolve in the future into some other kind of loyalty or dissolve into something quite new and unexpected" (p. 212). His final peroration is one that sane citizens of all nations might well take to heart: "If men are not brothers, it is not because they inherently differ. That sentiment of unity and exclusiveness which we have defined as nationalism now keeps them apart. This nationalism, however, does not mean that men could not be brothers, could not live in peace. For there is no basis, historical, biological, psychological, for believing this nationalism must be or will be permanent. Below the surface of their national peculiarities, men remain, so far as we know, more alike than different" (p. 237).

Queens College

GERHARD L. WEINBERG. *Germany and the Soviet Union, 1939–1941.* Pp. 218. Leiden, Holland: E. J. Brill, 1954. Guilders 19.00.

Soviet propagandists have been remarkably successful in diverting attention from the years 1939–41, the period of Nazi-Soviet collaboration. They have done this partly by avoiding all reference to the Soviet-Nazi agreements with their secret protocols and partly by continuously denouncing Western policies. The few documents published under Soviet auspices have not been selected to help scholars like Mr. Weinberg to complete the story told in German documents about the 1939–41 period, but for other purposes that have nothing to do with scholarship.

Mr. Weinberg has scraped the bottom of the barrel of German sources. He has added to previous accounts of the period and has reached some new and significant conclusions.

He believes that the Nazis made their decision to make a political as well as an economic agreement with the USSR between July 10 and July 21. The agreements signed August 23 did not immediately produce cordial relations. The two totalitarian dictatorships began to adopt more friendly postures only after September 28, when they agreed on how to divide Poland and other territories. These settlements and improved relations were followed by Soviet economic aid that in Mr. Weinberg's opinion was much more important to Germany than the volume and monetary value seemed to indicate. The Nazis reciprocated by giving direct aid to the Soviet Union in the blockade of Finland during the winter war.

Mr. Weinberg gives convincing evidence that the Nazi decision to attack Russia was not the result of differences over Finland and the Balkans in the fall of 1940. The decision was made in July, three months before Molotov's historic November visit to Berlin. The decision was "Hitler's answer to the challenge of England—as it had been Napoleon's—and was elaborated into a blueprint for ruthless aggrandizement." As the German policy stiffened in the following months, the Russians became more conciliatory in the futile hope of averting the break they pretended not to expect.

Mr. Weinberg closes this thorough, well-organized, well-written study with an excellent chapter of "Conclusions." He does not believe that Germany had carefully plotted to destroy the Soviet Union and Communism or that the USSR had carefully plotted either to deliver Europe to Germany or destroy the Nazis. Instead, he sees ". . . two great powers plodding fitfully along the path of expediency; one motivated by vast schemes of conquest; the other by the hope of protecting what it has and adding what can safely be picked up."

Stanford University

HARRY CRANBROOK ALLEN. *Great Britain and the United States: A History of Anglo-American Relations* (1783–1952). Pp. 1,024. New York: St. Martin's Press, 1955. $10.00.

Not for some time has anyone written of the relations of Great Britain and these United States since 1783. There has been a growing need for revision of earlier expressed views and for bringing the relations of the two English-speaking people up to date. Admittedly Professor Allen has a bias. To his love of the English he has added an affection for the Americans. His obvious sympathetic treatment of the subject is easily explained.

Although this London professor did much reading before he began to write this long book, he studied only published sources. Thus it is not a definitive study, nor does the author claim such distinction for his efforts. On the contrary, he states that he wrote for the general reader. Possibly true in England, but very few general readers in America will have the sustained interest to read 1,000 pages on Anglo-American history.

This book is divided into four parts with a total of nineteen chapters. Seven of the chapters are grouped under Part I, The Relationship. Here the author analyzes the colonial background and develops the many sidedness of Great Britain's relations with her American cousins. Not until page 253 does Mr. Allen treat the period following the War of American Independence in a topographical or chronological way. If these more than 250 pages of analyses of the Anglo-American relations had been condensed into about fifty pages, the book would have been improved greatly.

Ample discussion is given to the period of adjustment, 1783–94, to the rise of tensions to the War of 1812, and to the restoration of peace following the Treaty of Ghent. Many Americans will be interested to learn that the responsibility for our second war with England rested on Jefferson primarily, Madison next and, finally, upon the War Hawks.

In Part III, Isolation, there are four chapters which begin with the background of the Monroe Doctrine and end with a quarter century of calm following the Alabama claims award. America's isolationism is attributed to her "absorption in opening up the West." The author concludes that it was "no coincidence that the closing of the frontier was followed almost immediately by the Spanish-American War." This is emphasizing the Turner frontier theory too much to the exclusion of such significant factors as absorption in developing the Industrial Revolution.

Finally Part IV, World Power, contains five chapters of 450 pages, the longest part of the book. This is probably the author's best contribution to his subject. But even here there are conclusions with which many Americans will disagree. For example, Wilson is blamed for all disputes between the American and the British delegations at the Paris Peace Conference. This, in spite of the vascillating opinions of Lloyd George.

In a very real sense World War II was the culmination of this narrative for never have two allied nations achieved such military union nor such political co-ordination as did Great Britain and the United States from 1940 to 1945. As the author points out, the fact that these two long-time friendly nations so intertwined during the recent crisis was due to the sincere efforts of Franklin Roosevelt and Winston Churchill.

In their relations to other powers Great Britain and the United States since 1783 have, in many ways, exchanged places. Then England ruled the seas, now America; the financial capital has shifted from London to New York; and the political leadership has moved from Westminster to Capitol Hill and Pennsylvania Avenue. Whatever the future holds in store, concludes this writer, the continued friendly relations of these two powers will be decisive.

Seven maps in the text serve well their purposes. The bibliography is selective, the index accurate. On the whole, the au-

thor has achieved his objective and has written an interesting narrative.

G. C. OSBORN

University of Florida

CLARK M. EICHELBERGER. *UN: The First Ten Years.* Pp. xii, 108. New York: Harper and Brothers, 1955. $1.75.

Clark Eichelberger's intimate connection with the League of Nations and the United Nations should assure this little book a careful and sympathetic reading. Scholars expecting to find a thorough and searching analysis of the problems of the United Nations will undoubtedly be disappointed. This study is not intended for them. It is a popular summary of UN achievements and failures in certain fields, and its purpose is obviously to stimulate popular support for the organization as the central instrument for the preservation of peace in the face of the difficult international problems of our times. Nevertheless, despite its brevity and simplicity, this is an important and rewarding survey. Eichelberger examines the promise and the performance of the UN over the last ten years—on issues of collective security, on the question of peaceful adjustment and settlement of disputes, in the field of technical assistance, and in a number of other areas. In so doing, he illuminates what all of us have known, whatever our points of view. Despite the failures of disarmament, the fiascos over the admission of new members, and the self-righteous verbiage which somehow squeezes every national action of every power into the framework of consistency with the UN Charter, the members of the UN have made that Charter work. It has worked not perfectly, often not even satisfactorily, and yet with more success than one might have anticipated since the start of the cold war in 1947 or thereabouts.

Basically, Eichelberger's hopes for the United Nations are those of a temperate and clear-headed idealism. For the most part, he does not blink reality. He recognizes the utopianism of the schools which plead for an immediate and drastic revision of the Charter in whatever way. He hopes for some change in the admission procedures for new members, but on the whole he recognizes that most difficulties are not structural but political; that an easing of world tensions, because it may lead to more loyal performance by all members of the UN, is the most realistic formula for the development of international organization, at least in the immediate future. And he emphasizes, quite rightly I think, that the chances for a peaceful world will be much brighter if governments increasingly regard the UN as the foundation of their foreign policy rather than as an instrument of policy to be used or bypassed as convenience dictates. It may be, indeed, that Eichelberger underrates the merits of "traditional" diplomacy. After all, the "open" diplomacy of our twentieth-century international conferences, whose purpose has as often been domestic propaganda as negotiation, can hardly be said to have had striking and remarkable success. But this is perhaps to worry a minor point. For it is clear, and Eichelberger understands, that if there is a reasonable amount of good will on all sides, governments, no matter how wedded they may be to more conventional techniques and attitudes, can and will use the UN with growing effectiveness for the purposes for which it was designed. This is, then, an excellent work of propaganda in the best sense, and deserves the attention of all of us who have not as yet given up hope in the face of man's new powers of destruction.

Rutgers University

HARRY BAYARD PRICE. *The Marshall Plan and Its Meaning.* Pp. xvi, 424. Ithaca, N. Y.: Cornell University Press under the Auspices of the Governmental Affairs Institute, Washington, D. C., 1955. $5.00.

It is still too early, as the Preface warns the reader, to attempt a "comprehensive historical appraisal" of the Marshall Plan. Only at a greater distance in time can we get a proper perspective on such a massive undertaking. The author, therefore, should not be blamed if he has failed to give the thoughtful student of world affairs a deeper understanding of the "meaning" of the Plan. (Perhaps that word should have been omitted from the book's title.)

Within his limited terms of reference, Mr. Price has done a capable job. His "evaluation" of the Plan, which occupies the latter half of the book, will be of interest particularly to students of administrative principles and techniques. As respects the significance of the Plan as an historical phenomenon, it adds little if anything to what others have already said and written.

Prepared under the auspices of the Governmental Affairs Institute of Washington at the request of the Economic Cooperation Administration, this book has all the merits but few of the defects of an official history. The author had access to a wealth of material in the ECA files, but at the same time his manuscript was not subject to official approval. Aside from ECA documents and memoranda, Mr. Price has relied heavily on interviews with "knowledgeable persons," some 300 in all, in this country and in thirteen European countries, who had either participated in, or closely observed, the Marshall Plan in action. His talks with leaders of the great enterprise: men like Secretary Marshall, Paul Hoffman, and Averell Harriman and Europeans of comparable stature, besides adding local color give fresh insights. But interviews with minor personalities unknown to the general reader—some of them quoted anonymously—are of questionable value. Moreover, the author's liberal use of verbatim quotation of the opinions of persons interviewed is dubious procedure. Unlike statements in printed documents, such interviews are not subject to verification by other workers in this field.

PERCY W. BIDWELL

Council on Foreign Relations

UNITED STATES GOVERNMENT AND HISTORY

ANDRÉ SIEGFRIED. *America at Mid-Century.* Translated by Margaret Ledésert. Pp. ix, 357. New York: Harcourt, Brace, and Company, 1955. $5.75.

In 1927, André Siegfried, professor of economic geography at the Collège de France, applied his Gallic insight to the problem of American civilization in a book which his translator called *America Comes of Age.* His idea then was that the United States had reached the end of European domination and was entering into an era of mass culture which was genuinely her own. In *America at Mid-Century,* he has provided a sequel which attempts an analysis of that mass culture in its manifestations during the interval.

Once more in this book he proves himself a critic, by his own definition, in the Latin tradition, a dealer in sharp generalizations, and a destroyer of shams rather than a student for whom evidence is the essential of a sound conclusion. A sensitive observer and a frequent visitor to the United States, he is amazingly accurate in most of his statements and highly provocative in his conclusions and predictions. He is a journalist rather than a researcher, a maker rather than a prover of hypotheses.

His central thesis here is worthy of a book. It is that the United States has not lost its Anglo-Saxon, Protestant, idealistic, and isolationist character even though, since 1914, it has fundamentally changed in political, economic, social, and demographic respects. Now a world power with world responsibilities, inheritor and reshaper of the Industrial Revolution, inventor of mass culture and benevolent capitalism, creator of men of action rather than of contemplation, America shares the future with Russia; and Europe must discover a new balance in a world in which she has no real power. M. Siegfried is unhappy for himself, for France, and for Mediterranean and classical culture in general, but he is not unduly bitter. He merely exposes, as his countryman Tocqueville did before him, the problem of self-knowledge that America must face if she is to assume the place in the world that is obviously cut out for her. Although he speaks for the great destiny that is ending, he can also welcome a great destiny that is beginning.

A man of critical summaries, his last chapter is his best and should be read by every student of American civilization. By the same token, his first chapter is his worst. In it he stumbles into the pitfall of prejudice and misunderstanding which has caught so many European critics: the prob-

lem of minorities in the United States, specifically the Negro, the Jew, and the Catholic; and he succeeds in producing a result which is only laughable. But his book is redeemed by his chapters on the American economy, where he is most at home, and by those on the American social background and political life, where he reveals himself as an astute and open-minded commentator on the passing scene. Taken as a whole, his analysis of American civilization is as good a general summary as we have recently had, and it is written with the wit and charm that only a Frenchman could muster.

ROBERT E. SPILLER
University of Pennsylvania

MARVER H. BERNSTEIN. *Regulating Business by Independent Commission.* Pp. xi, 306. Princeton, N. J.: Princeton University Press, 1955. $5.00.

The author of this comparatively brief volume states that it is his purpose "to evaluate critically the role of the independent regulatory commission, to develop a more realistic concept of the process of governmental regulation, and to appraise the independent commission as an agent of governmental regulation."

He adopts as criteria of judgment primarily four factors: (1) the commission's ability to develop political responsibility, involving the Congress and the President; (2) its capacity to operate in the public interest; (3) its competency administratively, especially in terms of expertness and continuity of policy; and (4) its strength to be independent of the interests to be regulated.

He classifies seven regulatory bodies as truly independent: for the transport field, the Interstate Commerce Commission and the Civil Aeronautics Board; for other utilities, the Federal Power Commission and the Federal Communications Commission; and for specific economic practices, the Federal Trade Commission, the Labor Relations Board, and the Security Exchange Commission.

Following an historical evaluation, he suggests a number of conclusions which run quite counter to popular conceptions of the regulatory commission. It is far from the ideal mode of control. It is not "out of politics," but simply out of the spotlight. It has not been expert and quasi-judicial so much as it has been slow in keeping up with technological change, and rather less than impartial in dealing with the industries and enterprises affected. It is no longer the most important actor in the drama of regulation but is outstarred by the executive branch, as the result not so much of the recognition of its own inadequacies, but the alternating pressures of military emergency and economic depression.

Professor Bernstein, as a former consultant to the Bureau of the Budget on regulatory administration is intimately acquainted with the workings of the commissions he is analyzing. He diagnoses the "life cycle of regulatory commissions," pointing up four phases, *gestation, youth, maturity* which he identifies as devitalization, and *old age* which he characterizes as debility and decline. He conducts "a search for the public interest" in a review of the independence, on the one hand, and the responsibility, on the other, which commissions have shown in actual practice. He finds great need for the development of a coherent program of national regulation of economic affairs. As a result, he calls for more and better central planning and supervision of such regulation by the executive branch of the government.

The enforcement activities of the regulatory commissions he appraised as weak, poorly staffed, and inadequately supported; with little, if any, experimentation with new techniques and incentives of compliance or recognition of the need to plan compliance programs or to recognize the interdependency of the various controls which are and might be used. After an incisive analysis of the setting, scope and character of the regulatory process, in which he points out, among other things, that regulation is a two-way process in which the interests regulated work just as hard, if not harder, to influence the behavior of the commission and its staff as these work to carry out the regulatory program, the author reaches his concluding chapter in which he summarizes his findings and recommendations in the form of a baker's dozen of requirements of effective regulation. Particularly the author insists that regulation will be successful only as it has strong political leadership, popular support, and clear legislative mandate; will be effective only as it is integrated in policy and adept in administration.

This is an important book. Its brevity is a tribute to the author's ability to cleave to his objective while hewing through a jungle of both detail and preconception. Its clarity is unusual, especially in academic volumes. Its advent is a recognition of the new scholar who is practitioner as well. Such a book could not have been written without the intimate acquaintance which day to day contact with the problems gives. Yet the author avoids the pitfalls of the "expert" and keeps both his courage and his point of view as broad as the problem he is discussing.

HENRY REINING, JR.
University of Southern California

CHARLES VEVIER. *The United States and China, 1906–1913: A Study of Finance and Diplomacy.* Pp. ix, 229. New Brunswick, N. J.: Rutgers University Press, 1955. $5.50.

This is a competent narrative and critique of the American "dollar diplomacy" which centered around Willard Straight and Manchuria in the last years of the Ch'ing dynasty. The story was long ago outlined by Herbert Croly and has since been dissected by John G. Reid and others, in various aspects and from various points of view. But Mr. Vevier has been able to go to the Straight Papers, to the numerous collections of papers of Huntington Wilson, George Marvin and others in the Library of Congress and elsewhere, and to the National Archives; accordingly he is able to document and point up his analytic summary more cogently and definitively than earlier writers. The result is well-fashioned and readable, on the whole, although the reader may find that even an able summary of such a matter as the Chinchow-Algun agreement of 1909 becomes a bit tedious. The ineptitude of Philander C. Knox is once again confirmed, and Mr. Vevier concludes that the Taft administration was unable clearly "to draw the line between private and national interest."

Since this is as close to an inside account, based on the records of the Americans concerned, as we are likely to get, it may perhaps serve as the last word on Willard Straight's efforts and the American aspect of this phase of American diplomacy; at the same time it may stimulate future researchers to pursue further the context in which American Far Eastern diplomacy occurred. Mr. Vevier has made no independent study of this context. He refers to a total of five Chinese individuals by name, over the period 1906–13, and they all remain shadowy figures seen entirely through American sources. It is true that the diplomatic record among the powers gives short shrift to Chinese diplomacy, such as it was; but the fact remains that the railroads and banks contemplated by the negotiators would have functioned in China, and the negotiators were eventually in large part frustrated by revolutionary events there. More than that, one key figure in Mr. Vevier's account was Straight's chief point of contact in the imperial bureaucracy, the American-educated T'ang Shao-yi. The Chinese side of T'ang's negotiations and his mission to Washington in 1908 can be studied in Chinese sources accessible in the American libraries used by the author. The same is true of the entire Chinese approach to railroad financing. Dr. E-tu Zen Sun has recently demonstrated the value of a two-sided as opposed to a purely foreign based study of railroad diplomacy in her volume *Chinese Railways and British Interests, 1898–1911* (King's Crown Press, 1954). Let us hope that Mr. Vevier's able study is the last word in that school of diplomatic history which traces American policy formation from the inside but never gets outside.

J. K. FAIRBANK
Harvard University

WILLIAM STANDLEY and ARTHUR AGETON. *Admiral Ambassador to Russia.* Pp. 533. Chicago: Henry Regnery Company, 1955. $6.00.

For some twenty months Admiral Standley served as United States Ambassador to

Moscow. How this difficult post happened to be assigned to him is not clear. His acquaintance with Russians, according to the author, dates back to his childhood days in Sonoma County, California. The schooling on the banks of the Russian River was hardly adequate. Small wonder when the Admiral had met Americans who were equipped with better knowledge, the Admiral-Ambassador was jealous and even exasperated when these, for reasons of their own, refused to co-operate with him. About some of these recalcitrant persons Admiral Standley writes with annoyance and regret that he had not met them in the navy; there he would have presented them with the choice of "damn it all . . . , do what you're told or else." And he sadly adds that unfortunately at the embassy "there just wasn't any 'or else.'"

As an autobiography the memoirs offer some interesting bits of reading; as a source of historical data the reader should be cautioned: much of the presented information calls for serious verification. Occasionally Admiral Standley demonstrated levelheaded judgment. Unfortunately, his Peglerian philosophy of history caused by his military background seriously handicapped him from being consistently successful. Steeped in his naval tradition the Admiral lacked diplomatic finesse, political sagacity, and economic vision badly called for at his post. He knew full well that Allied victory was the goal, but he knew less how to deal with an ally during these trying months.

The author's peppery remarks about Roosevelt reveal his dislike of the President whom he regarded as a man who always (!) preferred "appeasement or compromise in a political disagreement to an out-and-out fight"; who always engaged in the "venal trade of votes." Admiral Standley had other scores to settle such as that with the former head of the Lend Lease mission in Moscow, General Phillip Faymonville. Since the latter was directly responsible to the President he refused on occasions to divulge certain data sought by the Ambassador. This antagonized Standley further and deepened his resentment to a point that bordered on frustration. Other personages added little humor to the situation and explain his caustic references to them. Visits of former ambassador Joseph E. Davies and Wendell Willkie, who came with personal messages from the White House and therefore enjoyed special favors in the Soviet capital, taxed the Ambassador's patience beyond his endurance. After some twenty months of such experience he resigned from his post with some dour reminiscences.

Throughout the book there are a number of inaccuracies which call for correction in a later edition. Thus it is incorrect to refer to the "falling of Stalingrad to the Germans." Nor is it correct to state that the city of Ashkhabad is "on the Chinese Eastern Railway." One is equally puzzled by the reference to Peter I as the unifier of Russia and liberator of the serfs. There are a number of incidents such as the case of the wrist watch being requested by some Soviet engineer. The episode has been carefully verified and the version found badly garbled. Such carelessness might unwittingly cause grave unpleasantness to people who deserve more kindly mention.

In the end Admiral Standley recommends a military as well as an economic and moral "posture of strength." He is rather uneasy about our present prosperity which is based upon an "artificial foundation of war economy and a reckless and ruinous policy of deficit spending." The author senses keenly that the present critical era is more than a clash of military nature; it represents a conflict between two standards of morality. If our cherished ethical principles fail to stand up against those of our opponents, the military and economic "postures" alone will prove of little comfort. These are gratifying conclusions which we hope more men with "military posture" will come to realize before it is too late.

ANATOLE G. MAZOUR
Stanford University

ARTHUR S. LINK. *American Epoch: A History of the United States Since the 1890's.* Pp. xxii, 724, xxvii. New York: Alfred A. Knopf, 1955. $6.00.

This book is one more addition to a long and growing list of single volume works on American history in the twentieth century. As such it inevitably conforms to a standardized pattern: beginning with an analysis of American problems of the late nineteenth century, it proceeds with a comprehensive survey of recent American politics, social change, economic activities, and foreign policy. And yet the book differs from its competitors in providing illuminating chapters on demographic developments at various stages during the period under consideration. These make up what is perhaps the most significant contribution of the book. The author has brought together and organized an amazing mass of information.

To this reviewer it seems that Professor Link has a marked antipathy to American business enterprise and, at first, an equally marked sympathy for union labor. He might be described as an unreconstructed Rooseveltian New Dealer.

Professor Link provides an illuminating description of the American people before World War I, which he follows with a section on economic development from 1897 to 1914; and yet he does not supply the logical connection between these two sections: that had it not been for the business men the rapidly growing American population would have had no means of support. Admittedly business leaders in the United States fell far short of perfection, but they did provide a living for millions of people. And in the long run Professor Link somewhat grudgingly admits that big business men were no more of a menace to the general welfare than the irresponsible heads of some labor unions.

In line with his antipathy to business enterprise Link finds considerable fault with the economic views of conservative justices of the Supreme Court. About the Court in the years 1921–30, he writes, "So retrogressive, in fact, was the new Court that on occasion it tended to be blindly reactionary in cases involving economic and social policies."

In the account of Woodrow Wilson, the author is adversely critical. He makes it clear that in his domestic policy, Wilson wavered uncertainly from conservatism to progressivism. In foreign affairs Wilson does not seem to have been endowed with even a moderate degree of statesmanship. In fact those who believe that Wilson was primarily a phrasemaker will not be disturbed in their view by Professor Link's treatment.

This book makes no notable contributions to the accounts of the Harding, Coolidge or Hoover administration. But, as might be expected, Professor Link finds the administration of Franklin Delano Roosevelt particularly praiseworthy in its pursuance of progressive ideals. He even finds justification for Roosevelt's proposal to pack the Supreme Court.

In general, Professor Link's analysis of the diplomatic problems preceding World War II is objective and reliable. But in describing the Atlantic Conference of 1941, he asserts that Roosevelt "refused to make any commitments of a military or naval character." Winston Churchill states flatly, in *The Grand Alliance*, pp. 439–46, that in case the Japanese should make any further aggressive moves in the South Pacific, Roosevelt promised to send them a stiff warning or practically an ultimatum.

For the Truman administration Link finds that Truman "extended the frontiers of progressivism." He also records that Truman "had a capacity for descending to the lower level of political warfare," and that he "contributed to the deterioration of public morality."

Link's survey of the Korean War and the MacArthur episode is noncontroversial in tone.

This book has an excellent critical bibliography.

RALPH VOLNEY HARLOW
Westbrook, Conn.

ALAN P. GRIMES. *American Political Thought.* Pp. xi, 500. New York: Henry Holt and Company, 1955. $6.00.

Increasing interest in the thinking of Americans on matters political has brought a concomitant interest in publication in this field that is especially welcome and encouraging from the standpoint of scholarship and literate exposition and criticism. To this sequence of literature on American political theory, Professor Alan P. Grimes of Michigan State University has presently contributed a useful and effective treatment in his volume, *American Political Thought.*

At first glance Grimes' treatment and organizational pattern do not display singularity of concept nor foreshadow novelty in approach. Chapter headings are: "Rise of Protestantism"; "Puritan Political Thought"; "English Revolutionary Thought"; "American Revolution"; "American Constitutionalism"; "The Federalists"; "Jeffersonian Democracy"; "The Concept of the Common Man"; "The New Society (individualists and utopians)"; "Slavery and the Rights of Man from both the Anti- and Pro-Slavery Sides"; "The National Concept of Sovereignty"; "Manchester Liberalism in America"; "American Utopian Reformers"; "Progressive Movement"; "Modern Anti-Democratic Thought"; "Pragmatic Liberalism."

In many ways these sound traditional enough in the main, and are normally sufficient in description and character to indicate who may be treated as illustrative of these various movements in American political thought. While it may be perceived that most of the older favorites in the sense of their necessary inclusion are covered within this volume of Professor Grimes', it is true that he has not merely parroted any previous list of accepted American thinkers nor has he aped all of his predecessors. Traditionally conceived the work in review may be, but it has not delivered only the timeworn and historic figures and treatments. Less familiar by far to students of political theory are some of those whose analysis by the author constitutes an achievement of considerable magnitude.

Examples of this aspect of *American Political Thought* are the portions allotted to Orestes Brownson, Hinton R. Helper, William Harper, George Fitzhugh, E. L. Godkin, Henry George, Edward Bellamy, Laurence Gronlund, Lawrence Dennis, William James, and John Dewey. The sections on Henry George are an outstanding part of the volume, and represent a good presentation of George in relation to his own times and to American political philosophy as a body of knowledge. Likewise, the treatment of Laurence Gronlund and of Lawrence Dennis is a core summary in a field almost bereft of systematic and comparative analysis.

As a whole the volume is well written; it may not sparkle with a brilliant or scintillating style, but meaning can be extracted from the author's words without the expenditure of labor in an effort to mine sense from obfuscation. Grimes displays a fine sense of organization and of continuity in the historical perspective of his work and his acquaintance with American literature and with the development of ideas therein which lends strength to his work when that strength is needed. All in all, this is a serviceable volume for practical use in courses in American political thought, and as a general handbook.

CHARLES W. SHULL

WILLIAM M. BEANEY. *The Right to Counsel in American Courts.* Pp. xi, 268. Ann Arbor: University of Michigan Press, 1955. $4.50.

This book, dealing with that vital right upon which the other constitutional rights may often depend, has obviously been preceded by an extraordinary amount of very thorough, careful, and discriminating study, orderly thought, and systematic arrangement. The subject has been less treated by scholars than other civil rights. The author has not merely sat in the law library reading and digesting the many cases (fifty-four United States Supreme Court, one hundred seventy-two Federal and 344 state) and the scores of articles in the law reviews (many not referred to in the tables at the end) which he cites and comments on. In the important cases he has obtained and studied the briefs of counsel and the records. More than this, he has himself gone into the courts, personally observed the procedure, and interviewed many judges, prosecutors and lawyers in order to ascertain at first hand how the offer, appointment and assistance of counsel to those accused of crime actually works.

The book shows throughout the result of this practical approach. I venture the confident suggestion that any United States or state judge who reads it with an open mind will agree that his time was thus eminently well spent.

Mr. Beaney's analysis of the leading cases discussed (such as *Powell v. Alabama, Johnson v. Zerbst* and *Betts v. Brady*), although concise, is thorough and informative. His briefer references to other cases give just the fact or facts which we must know.

To me the most unusually satisfactory feature throughout the book is the summary at the end of each topic, section and chapter, sometimes so labeled and sometimes not. The classification from time of the decisions on different points is also very welcome and helpful.

I strongly protest against the practice (found also in many other text books) of referring to books and articles already cited as *"op. cit."* without the prior page where the full citation may be found. This annoying practice is never indulged in citing court decisions, which are always given in full, including S. Ct., L. Ed., N.W., etc. Mr. Beaney's notes are at the bottom of the pages and not inconveniently at the end of the book.

It is believed that the author has not given deserved attention to the practical difficulty of obtaining competent counsel by persons accused of politically unpopular causes.

I am disappointed in the absence of more definite suggestions and recommendations in the otherwise excellent "Summary and Conclusions" at the end. With Justices Murphy and Rutledge gone from the four "incorporators," the "fair trial doctrine" is no more vague and difficult than the "arbitrary and capricious" test which may ultimately be applied to state infringements of the four basic freedoms.

HENRY S. DRINKER
Philadelphia, Pa.

HANS B. THORELLI. *The Federal Antitrust Policy: Origination of an American Tradition.* Pp. xvi, 658. Baltimore, Md.: Johns Hopkins Press, 1955. $8.00.

The curiosity in the United States about economic solutions in Sweden makes it appropriate that this Swedish scholar (like his countryman Myrdal in another area) should review a significant sector of our economy and culture. The title of this book, unless the subtitle is carefully noted, is more inclusive than the contents. This chronicle and estimate, except for necessary background and some reflections at the end, really deals with the years 1890 (when the Sherman Act was passed) to 1903, which, for reasons given, the author regards as having institutionalized our antitrust policy. Within this short span, the treatment of the phases which Dr. Thorelli investigated at first hand and in the original sources (such as relations of attorneys general with their subordinates in the field) is most illuminating. What he has taken from commentators, except as they represent public opinion at the time, is less valuable and, it may be, less valid. Incidentally, in the bibliography he lists as "primary sources" much that another would call distinctly secondary.

The book would have profited had the author's scaffolding been torn down so that his building could appear. Instead, he is constantly clambering about ladders, platforms, and ramps, telling the reader how and why he did this and that. The work that he did himself is good and does not need the explanations of method. The full footnotes would be easier to follow had the publisher put the numbering in larger type; as it is, what goes with what is difficult to know if you are past your sharpest eyesight.

On the whole, Dr. Thorelli feels the "ideological impact upon the economic environment" offers "the principal and lasting significance of the Sherman Act. Antitrust's is a mission of morale. Half a century after the policy became institutionalized it is still a living symbol of economic egalitarianism. . . . In an age when increasing emphasis seems to be placed on security and stability, on co-operation and organization in all fields, antitrust serves as a reminder that life is also dynamic, . . . that those who would rather compete than congregate are at least worthy of toleration. In a century prone to look to the advantages of centralization, antitrust boldly proclaims the advantages of decentralization. . . . "

That is to make it an article of national faith, accepted rather than acted upon, as vague as democracy itself. This is the truth, for the tides of technology, the concentrations in business due to wars and de-

pressions, and the magnified role of central government have flowed over the manes of Senator Sherman and his collaborators. This victory of consolidation and (quite within the law) economical large-scale production was foretold in the very effort to bolster competition. "Antitrust," used by Dr. Thorelli as a noun (meaning fulmination? or prosecution? or complacent rule of reason?), was, in theory, a confession from the first that an era of laissez faire was ending. What place is there in "antitrust" for the use of atomic power? If the federal government, or perhaps an international control agency, farms it out to "private enterprise," can the result be other than an illusion of free initiative?

RICHARD N. CURRENT. *Daniel Webster and the Rise of National Conservatism.* (The Library of American Biography, edited by Oscar Handlin.) Pp. xi, 215. Boston; Toronto: Little, Brown, and Company, 1955. $3.00.

Daniel Webster attained a near apotheosis in popular imagination during the first fifty years after his death. In 1900, when a presumably knowledgeable group of electors first balloted on candidates for New York University's new Hall of Fame, Washington ranked at the top with ninety-seven votes, and Webster tied Lincoln for second place with ninety-six. After another fifty years Webster's memory was threatened with oblivion. School children learned less and less about him until at last a generation of Americans grew up that did not know him, except as a fictional character in Stephen Vincent Benét's story of "The Devil and Daniel Webster." In this delightful yarn Benét has Webster arguing against the sanctity of a contract. It is possible that Webster might have outargued the Devil, but in real life he would never have argued against the sanctity of contracts.

Mr. Current provides an incisive analysis of Webster's career. In 200 readable pages both the personality of the man and his contributions to the development of the nation are set forth. Twelve pages are devoted to Webster's boyhood, education, and the early years of his law practice. Perhaps another ten pages throughout the book deal with his marriages, family life, and farming activities. Webster's great strength in debate (the explanation of his contemporary fame) is best seen in the 20 per cent of this volume which deals with slavery and the other sectional problems of the period. Most enduring are his contributions as a diplomat while Secretary of State, to which Mr. Current devotes some twenty pages. The coverage of party battles and campaigns requires about twenty-five pages, an analysis of Webster's reputation and a note on sources, twenty pages. The remaining third of the author's emphasis, properly distributed through every chapter, is upon Webster's faithful representation of the merchants and industrial leaders who sent the Great Advocate to Washington in 1813 and kept him there almost without interruption until his death in 1852.

Perhaps the honorable and necessary bases of national conservatism are the same today as they were when Webster was sent to Congress. Methods have changed. In his day it was not considered improper for a statesman to be steadily and openly subsidized by his constituents and clients for an amount equal to ten times his official salary. There is little new for a biography of Webster, but there is merit in a clearly written interpretation for a generation that should understand the changing political mores of the nation.

F. O. MIKSCHE. *Atomic Weapons and Armies.* Pp. 222. New York: Frederick A. Praeger, 1955. $5.00.

GEORGE C. REINHARDT. *American Strategy in the Atomic Age.* Pp. ix, 236. Norman: University of Oklahoma Press, 1955. $3.75.

Truly global-legged in range and "city-busters" in potential destructive effects, atomic weapons cast mushroomlike shadows over the daily decisions of responsible statesmen and military leaders. Willing or not, the Western democratic nations face the threat of utter devastation should a third world war begin without the restraint of possible punishment in kind upon the aggressor. The two volumes, briefly examined here, generate productive thinking on the basic problem of survival. They serve primarily, however, to pose a host of related thorny questions.

Armies today are challenged by a wholesale revolution in their traditional *raison d'être.* Lieutenant Colonel Miksche, former Czech officer and a well-informed student of European military history, argues that the mere existence of atomic weapons and the horrors implicit in them will probably neither avert a major war in the future nor prevent the use of atomic weapons. Reciprocal use of atomic weapons on a massive scale, he submits, may ordain a future war in which perhaps no atomic weapons or only tactical atomic weapons may be employed in its initial stages. Thus, Colonel Miksche states the dilemma facing the strategists and tacticians of armies: are atomic weapons "army-busters"? Have atomic weapons rendered ground forces ineffective as a combat force defeating decisively enemy forces in the field? After winning victories on battlefields (which may even exclude cities as such), must armies then occupy the enemy homeland before a war decision can be obtained?

Colonel Miksche on historical grounds sets forth a case for armies which can yet engage in concentrations, break-throughs and envelopments under atomic fire. But in his very last paragraph, he reverses his field by concluding: "Perhaps A-weapons will 'atomize' tactics to such an extent that the forms of ground combat will take on a completely guerrilla-like character." Here is the self-stated germ for a rebuttal of Colonel Miksche's present volume, one might hope the thesis for his next engaging book.

Concerning the achievement of the military decision in a future war by means of an army occupation, Colonel Miksche steps well forward from the ranks with the conclusion: "The question of whether it would be possible to decide a war without physical occupation can, at best, only be answered with a very weak affirmative." The late surrender of Japan, based upon a willingness evidenced long before Hiroshima and Nagasaki, seems unnecessarily slighted. Likewise, Colonel Miksche seems unsure of the effects of what he calls "strategic air warfare" upon the position of troops engaged in the so-called "battle area proper." He appears to share the common fallacious belief that decisive elements of air warfare are synonymous with the bombing of cities in unlimited warfare. Colonel Miksche does indicate bravely and usefully that the role of ground forces in war has been drastically, very drastically, modified by the advent of atomic weapons.

Colonel George C. Reinhardt, U. S. Army retired, has written a sequel to the informative volume, *Atomic Weapons in Land Combat,* which he coauthored with Lt. Colonel William R. Kintner. *American Strategy in the Atomic Age* is a plea for the determination of a "cold war strategy." Rejecting the extremes of exterminating or appeasing Communist imperialism, Reinhardt sets forth his blueprint for the stabilization of international conflict short of an all out third world war.

He substantiates our need for massive and ready military power so that enlightened American policies and actions can proceed with minimum risk. Colonel Reinhardt then examines at length the additional requirements for a strategy for peace, namely: (1) the political art of combat with the Communist ideology; (2) world leadership by the United States in creating effective collective security of the free world; (3) the beating of "atoms into ploughshares" with its potential economic and political benefits; and lastly, (4) the organization for and the implementation of an American "cold-war strategy." Colonel Reinhardt's ambitious plan was not fully attained. His volume may not become a classic. But it documents in timely fashion realities of the present world conflict which academic scholars may be too late in doing. That a professional military man can be a skilled literary craftsman broadly concerned with political and social aspects of military affairs is likewise self-evident.

Air War College

ECONOMICS AND INDUSTRY

NATIONAL BUREAU OF ECONOMIC RESEARCH. *Business Concentration and Price Policy*. Pp. xxii, 514. Princeton, N. J.: Princeton University Press, 1955. $9.00.

This is the report of a conference on business concentration and price policy, held in June 1952, under the auspices of the Universities—National Bureau Committee for Economic Research. At the time of publication, it was the fifth of seven numbers in the Special Conference Series of the National Bureau of Economic Research, the other conference subjects being: problems in the study of economic growth and stabilization (not published); business cycles; research in business finance; regularization of business investment; capital formation and economic growth (in press); and policies to combat depression (in press).

In this report, twelve topical papers are treated, each being discussed by one or more commentators. Papers and comments were highlighted for publication by the chairman's introduction.

Space limits prevent review in detail and make it unwise to distinguish among the thirty-six participants; but we should scan the general scope. An examination of the principles of classification in the census of manufactures helps to clarify usefulness and weakness of such data as bases for measuring concentration. Measures used in empirical studies of concentration are considered statistically and theoretically in four chapters, including one especially concerned with vertical integration. Some presumable reasons for the reach for business bigness are considered in studies of mergers, economies of scale, adjustments to taxes, maneuvers of conglomerate bigness, and types of price discrimination. There is a section on "full-cost" pricing policy, with divergence of views regarding what deliberate use of designated mark-up might suggest about extent or lack of competition. A section on the nature of price flexibility and the determination of relative price changes leaves one aware of the need for more knowledge of the linkage between business concentration and price determination.

Among the numerous questions likely to come to the many economists who will study this much-needed book, a few might be pitched in for a starter. If it is as nearly impossible as it often seems to be for an academic or a government agent to measure concentration in significant relation to behavior of quantities and prices, how can the oligopolist evaluate his own potential and hazard with the success implied in much of the prevalent discussion? If bigness as a result of merger or common control of separate corporations is important, why is not equal bigness similarly important even if it arise in a corporation grown wholly from stock subscription and retained earnings? If economies of scale be viewed as technological potential in relation to some given set of market conditions, what must be added to explain diversity of shops, plants, and firms, not only nationally and regionally, but even in the same industry in the same (freightwise) location? And how except by the conference method can we compel each other to face elemental questions? More such conferences!

J. P. WATSON
University of Pittsburgh

BENJAMIN HAGGOTT BECKHART (Ed.). *Banking Systems*. Pp. xviii, 934. New York: Columbia University Press, 1954. $13.50.

W. T. NEWLYN and D. C. ROWAN. *Money and Banking in British Colonial Africa*. Pp. xiv, 301. New York: Oxford University Press, 1954. $4.80.

Simply put, the first of the aforementioned books is a collection of chapters describing the financial systems and practices in sixteen countries with different industrial structures and types of economic organization: Australia, Brazil, Canada, Cuba, France, Western Germany, India, Italy, Japan, Mexico, the Netherlands, Sweden, Switzerland, the Union of Soviet Socialist Republics, the United Kingdom, and the United States. This "diversified group" of countries has been selected with the view of showing "the way in which the credit systems have adapted themselves to the economic organizations of the respective nations."

Evidently following a fairly rigid and standardized plan, each chapter sets the functioning of the banking and credit system against a survey of the social and economic background and describes the way in which it has assisted the economic growth of the country. It then discusses the role of the various financial institutions: commercial banks, savings banks, urban and rural mortgage banks, and others in financing the credit needs of the nation. This is followed by a review of the place of the central bank and its credit policies and objectives. A concluding section evaluates the banking and credit structure.

Most of the articles were written by experts in banking from the countries concerned. But as is to be expected, the contributions vary in quality. In this reviewer's opinion, the best chapters from the point of view of organization, treatment, and presentation of subject are those dealing with banking and credit in Australia (Torleiv Hytten), Canada (Donald Bailey Marsh), Western Germany (H. Irmler), Japan (Edna E. Ehrlich and Frank M. Tamagna), Mexico (Margaret G. Myers), and Switzerland (Eugen Grossmann). Least adequate is the description of the banking system of the United States.

As the editor, Dr. Benjamin Haggett Beckhart, Professor of Banking in Columbia University, states in the Preface, the book is "a successor volume to *Foreign Banking Systems*" which he and the late H. Parker Willis published in 1929. Apart from the selection of some countries (especially the inclusion of Cuba) with which one might disagree, a major defect of the volume is the absence of a general introduction surveying the changes that have taken place in banking and credit structures in the quarter century since 1929 as a result of the great depression, war, and political revolutions, and the failure in showing how these transformations have altered banking and credit theory. The editor indeed alludes to some of these changes in two brief paragraphs in the Preface; but it is a pity that he has not discussed the subject in sufficient detail to suggest the main lines of development which the individual chapters serve to expose. Such introduction would have bound together and given proper perspective to the sixteen disconnected contributions, and thereby enhanced the usefulness of the book. The work lacks balance as regards the allocation of space to individual contributions to a far greater extent than the earlier edition.

Perhaps the most notable deficiencies are in the treatment or in the omission of specific topics in various articles. For example: the discussion of the evolution of credit control in the Netherlands since World War II is inadequate; and while "open market operations" are mentioned among the principal functions of the Swedish *Riksbank*, the factors that led to the adoption and the method that facilitated the inauguration of open market operations in 1937 are nowhere elucidated. More, although the French capital market is mentioned in a number of places in the survey of the country's banking system, there is nowhere a discussion of it. Surprisingly, also, there is no mention of the United States money and capital markets. And the Amsterdam market is given three and one-half pages. In contrast, about three pages are devoted to the capital market in Cuba, and six and one-half pages to that in Mexico. Finally, it should be noted that the statement in the chapter on the USSR that "the banking reforms in the satellite countries have almost invariably reproduced the Soviet banking structure" oversimplifies the facts.

While the Beckhart volume provides descriptions of banking systems of relatively well known countries in Europe, Asia and the Americas, *Money and Banking in British Colonial Africa* brings to light the working of financial institutions in an area but little known here. Specifically, the book is the first comprehensive, comparative study of the monetary and banking structures of the eight major territories in the British colonies in Africa: Nigeria and the Gold Coast in the west; Kenya, Tanganyika and Uganda in the east, and Northern Rhodesia, Southern Rhodesia and Nyasaland in Central Africa. As such, it fills a gap in the

literature on colonial money and banking and constitutes an invaluable contribution to our knowledge of the subject.

The book is the result of a highly successful integration of research projects independently carried out by the authors, Dr. W. T. Newlyn (Lecturer in Economics, University of Leeds) and Dr. D. C. Rowan (Lecturer in Economics, University of Melbourne), through first-hand investigations in the African colonies.

Against the background of the economic and social changes in the areas over the past 40 or 50 years, (1) the book gives an admirable description and analysis of the advances in, but particularly the present functioning of the monetary and banking systems there; (2) it assesses the capacity of the institutions "to promote certain ends of policy which appears to command general approval and support"; and (3) it sets out "broad proposals designed to promote adaptation of the existing monetary and financial 'systems' of the several territories in order that they may more effectively contribute towards the attainment of the desired ends of policy." In all, the work is a superior scholarly achievement.

The two volumes make available a considerable body of interesting materials for a university course in comparative banking systems.

ARTHUR LEON HORNIKER
Washington, D. C.

WILLIAM H. NEWMAN and JAMES P. LOGAN. *Management of Expanding Enterprises.* Pp. viii, 134. New York: Columbia University Press, 1955. $2.75.

What Makes an Executive? Report of a Round Table on Executive Potential and Performance. Pp. xii, 179. New York: Columbia University Press, 1955. $3.50.

Both of these books are reports of round table discussions by groups of leading business and professional men on the topics indicated by their titles. Both projects were carried out under a grant from the McKinsey Foundation for Management Research. Twenty-one men participated in the discussions which served as the basis for the first book, and nineteen formed the second group. With the exception of two representatives of McKinsey and Company, the personnel of the two groups included no common members. The authors served as chairmen of the meetings and compiled the summaries of the conclusions reached from handwritten minutes or tape recordings made during the session.

Management of Expanding Enterprises is concerned with the problems which begin to develop in the period of a company's growth in which it is no longer possible for a single executive or a small group of top executives to run it as a closely integrated operation. Typical of the issues discussed are: how are the processes of planning affected by size? How does growth affect the standards used to measure executive performance? What patterns of departmental organization are best adapted to different stages of growth and size? What are the opportunities and limitations of "decentralization"? How does size affect employee morale? What is the place of staff functions in an expanding organization? What steps can be taken to insure clear channels of internal communication? How does size affect personal initiative in middle and top management? How can flexibility be achieved in large scale operations? To what extent can control be secured through the selection, indoctrination, and training of subordinates? How much autonomy should be given decentralized operating units? How does size affect the kind of executive required at different organization levels?

The conclusions which are presented in this book represent the pooled judgments of the participants in the round table as summarized and interpreted by the authors. Since the majority of the members of the group are or were top executives of businesses which have reached this stage of their growth, they discussed these problems on the basis of their own personal experience. This lends their conclusions a practical, down-to-earth quality which inspires confidence in their soundness. (This whole field is so new that relatively little has been written on these questions, so that much of what they conclude constitutes pioneering thinking.) The authors have done an outstanding job of organizing the subject matter and presenting a systematic series of conclusions and recommendations which will be of value both to the working executive and to the student of business organization. An Appendix is included which summarizes in a clear and challenging fashion the more important of the questions raised in the discussions since one of the principal aims of the project was to identify areas of management needing further research. These questions are posed with the thought that they represent a challenge and opportunity for men who believe that an improvement in a knowledge of management is a worthwhile endeavor.

What Makes an Executive? is a similar report presenting a distillation of the thoughts and opinions of a group of mature executives, university professors, clergymen, and a psychiatrist relative to the factors involved in the emergence of top leadership in business and other sectors of society. The paramount objective of this project was to develop key questions which, when answered, will lead to new knowledge. Typical of the questions raised are: how to pick young men who have the potential for eventual leadership, how to aid them in developing their potential to the fullest and how to use them to best advantage in key management positions. To provide some material which will be helpful in these areas, the participants discussed both their own experience as executives and the selection and training programs with which they were familiar. Specifically, the topics covered included: the origins of executive potential, the value of a college education, the recognition of potential executives, the development of future executives, the evaluation of executive performance, and the handling of the executive in the organization. There is also a summary which includes suggestions for future policy and research activities.

While this book also reflects the broad, practical backgrounds of the men participating in the discussions, the treatment of the material itself is not as satisfying as in *Management of Expanding Enterprises.* It appears more loosely organized. It sounds more like a typical round table discussion where many points of view are presented but no clear-cut conclusions are reached. (It was taken directly from tape recordings.) It is as though a moderator was needed to integrate the thinking of the group. The material is interesting, many of the questions are challenging, and there are many valuable comments and suggestions. Nevertheless, this treatment seems rather less conclusive than does the report of the other round table. In spite of this weakness, however, the book contains much that will be of value to the executive, to the personnel man, and to the student of executive development.

ROBERT N. MCMURRY
McMurry, Hamstra, and Company

A. J. BROWN. *The Great Inflation 1939–1951.* Pp. xiv, 321. New York: Oxford University Press, 1955. $4.80.

Professor Brown's *The Great Inflation* presents a broad panorama of the world-wide inflationary movement associated with World War II and its aftermath. It is not intended to be a detailed analysis of inflation in individual countries, except to the extent necessary for the broad picture, but it provides an excellent background for studies of individual countries.

Inflation is defined as an inordinate rise of prices. The author's general approach is to provide a certain amount of exposition of theory as a framework for the discussion of the factual situations. The exposition of theory is generally elegant and a great effort is made to bring in "realistic" considerations to which more traditional theory had given less emphasis. Nevertheless, the tie between economic theory and the analysis of an actual situation is frequently not very close; this is not the author's fault, but an indication of the underdeveloped state of economic tools even in the hands of a sophisticated expert.

Besides a detailed description of the inflationary movement from 1939 to 1951, the book gives special attention to the effects of war expenditures, the price-wage spiral problem, policies of controlling inflation—monetary, price control and rationing—hyper-inflation, and the international spread of inflation. In many of these areas the author's clear analysis represents an important step forward in our understanding of inflation. However, his description of the effects of sharply increasing Govern-

ment expenditures fails to take into account adequately the fact that the major effect of increased Government operations on the economy is not when expenditures increase, but much earlier, when commitments are increased. For example, military expenditures of the United States in 1951 were about 22 billion dollars; commitments, however, amounted to 50 billion dollars. The inflationary impact of much higher Government commitments is not very closely related to Government expenditures; their more immediate effect is to increase private expenditures. An analysis via commitments or obligations rather than expenditures would have been more relevant, and would probably have afforded even greater support for the author's basic conclusion that "the expenditure approach to the phenomena of inflation, so enlightening in most circumstances, turns out to be sadly inadequate during the period under review."

Professor Brown finds a bias towards inflation in most economies in times of fairly full employment, and he regards this as "the most persistent and troublesome inflationary threat facing the western world." While the relationship between full employment and rising prices is made quite clear, it is not at all obvious why the price rise must be so "inordinate" as to amount to an inflation. The author's sketchy but challenging remarks on this matter deserve to be expanded into a separate book.

HANS A. ADLER

McLean, Va.

PIERRE MENDÈS-FRANCE and GABRIEL ARDANT. *Economics and Action.* Pp. 222. New York: Columbia University Press, 1955. (A UNESCO Publication.) $3.50.

In this slim volume Pierre Mendès-France and Gabriel Ardant undertake to present, to those who have received a good general education but no specific economic or financial training, the insight given by economics regarding action in practical affairs. Three-quarters of the book is devoted to "The Problem of Equilibrium" in the sense of the maintenance of full employment. There are chapters on the beginnings of economics, the classical theory of equilibrium and its shortcomings, the Keynesian general theory of employment, and the full employment policy to which it leads. This largely theoretical discussion is followed by examples of the application of classical theory to the problem of unemployment (including the policy pursued by the gold-bloc countries in the thirties and by Bruning in Germany and Laval in France), which are contrasted with the more Keynesian policies followed by Great Britain after 1931, by Germany under Hitler, and by the New Deal. A final group of chapters covers the advances in our understanding of what is required to fight inflation, forecasting and co-ordination, the problem of equilibrium under a collectivist regime, and the future of full employment policy.

There is little of interest to the specialist in this section. The extent to which it will be of interest to the general reader for whom it is designed is harder for a specialist to say. It is my impression that the theoretical material has been better covered elsewhere, but what is presented appears generally correct and the two chapters on practical experience demonstrate rather impressively that deflation by government is a poor means of eliminating deflation in the economy as a whole.

The remainder of the volume is harder to summarize. Entitled "The Problem of Choice," it deals with the economic allocation of resources. Although it suggests that there is much to be said for the "natural mechanism" of laissez-faire, it also concludes that Joan Robinson and Chamberlin between them have provided "one of the strongest arguments for either anti-trust legislation or a policy of nationalization or state control of large sectors of the economy" (p. 182). The emergence of monopoly or imperfect competition, the existence of unearned rents, the divorce between ownership and management, irrational behavior, and differences between social and private costs are among the factors making for state intervention in economic affairs. "[Once liberalism's intellectual framework] had been undermined by economic analysis, a kind of guilty conscience made it increasingly difficult to resist the 'encroachments' of the state" (p. 199). But where the government does intervene, the book goes on to argue that "considered mechanisms" should be established in place of "natural mechanisms" to enable the state to economize in a rational fashion.

The final section of the volume I can highly recommend to economists, but not to laymen, as a fascinating example of the confusion prevailing in our profession. What particularly bothers me is that, by and large, the authors have summarized what economics has to offer rather fairly. I happen personally to be quite convinced that the shortcomings of free enterprise, including the impact of monopoly on resource allocation, can be shown to be quantitatively rather trivial; but there is no body of literature on the practical performance of free enterprise economies to which I can refer Mendès-France and Ardant. Most basic of all, neither maintenance of full employment nor proper resource allocation is the solution for France's fundamental economic problem; what she needs most is a more rapid increase in productivity over time. Yet, despite the fact that Ardant was General Commissioner for Productivity, this whole matter is omitted—and quite properly so, as economics has as yet practically nothing to say on the subject!

HENRY H. VILLARD

City College of New York

JAMES DAHIR. *Region Building: Community Development Lessons from the Tennessee Valley.* Pp. xiv, 208. New York: Harper and Brothers, 1955. $3.75.

Mr. Dahir believes that the present development of urban life is "unholy," and that the accompanying rural decline is "unhealthy." He suggests, at least as a partial solution, the development of regions together with the development of subregions and communities. Community and subregion development is now largely missing; he undertakes to discuss, in this popularly written volume, what goes on in the Tennessee Valley looking toward this development. He outlines the TVA's structure and activities and provides chapters on various community movements: the push towards industrial development, the relation of electric power to community development, and the successes and failures of regional planning in the area. Mr. Dahir is pro-TVA, and he puts his finger on one great intangible merit of TVA which is obscured by all the attacks on the Authority from the Roosevelt to the Eisenhower administration. The Authority represents a greatly conceived and imaginative approach to community living; it has struck foreigners in this way, whereas, all too frequently Americans have fallen for the vague and ill defined stamp of "creeping socialism." Mr. Dahir is also not unaware that the planning powers of TVA are limited, and he uses Knoxville as a sample to show what happens when planning is absent. The example is a good one, but it ought to be said that most of the examples of good planning induced by TVA are very meager indeed. TVA is not a city or community planning agency. It has been able to help some, but in Tennessee, at least, the big cities are making all the major mistakes previously made by cities in the Northeast and elsewhere. Such community planning as exists doesn't have much impact, for the governmental design is inadequate. Voluntary community action is no substitute for governmental authority.

LEE S. GREENE

University of Tennessee

BURNHAM PUTNAM BECKWITH. *Marginal-Cost Price-Output Control.* Pp. viii, 283. New York: Columbia University Press, 1955. $5.75.

The book, which fundamentally has an ideological thesis, illustrates a great thought cleavage. It stands for no "differentials," and therefore for equality in the sense of uniformity. Different incomes according to different location, availability in time, and individual ability, can and should be eliminated, is the argument. This goes with socialism and an attempt to generalize "monopolistic competition" (society becoming "the firm"). The main affiliation is with Lange, Lerner, and Sweezy, and some British socialists.

The "theory" is frankly "prescriptive." It states what prices ought to be. The author says it is the only valid theory for so-

cialism and is a significant new argument for socialism.

A disregard for the individual appears in that the harm done to some individuals by proposed policies is considered unimportant (p. 29).

The lack of scholarship and of interest in history as evolution is notable. After a dogmatic statement of the author's ideas about the nature of the economic problem, comes an account, largely secondhand, of early mentions and subsequent discussion of "marginal cost" as related mostly to railway and public utility rates. (Launhardt's *volkswirtschaftlich* is translated as "social"!)

The main logical characteristic is abstraction and assumption, marked by arbitrary, question-begging definition. We are told that either the price or the output of each reproducible good should be directly raised or lowered until the price becomes equal to the marginal money costs of production, defined as "current costs at the intensive margin of production" (pp. 173–74). This marginal cost, or outlay, is to include only (1) continuously variable and (2) directly measurable items with no allowance for depreciation, research, or advertising.

The author omits all nondirect or nonspecific costs, consumer surplus, economic rents, long-term fixed charges, and profits. No place is allowed for time preference or uncertainty.

He doesn't understand that a margin is the difference between two totals. His theoretical margins are illogically separate from totals and therefore from averages.

Finally, the fallacy of the dosing-method surplus appears in his notion of "only a single marginal unit" (p. 13). The interrelation between extensive and intensive margins seems not to be understood by him.

The main good in the book is its emphasis of the idea of allocating "joint costs" according to demand (but without adequate reference to other work done in the field.) Also good are the criticisms of the Marshallian separation of long- and short-run costs, and of price stabilization policies.

The publication of such works; however, emphasizes the need for greater scholarship and for more study of the history of economic thought, lest the time come when the science of economics will have to be learned all over again.

LEWIS H. HANEY
New York Unverisity

NEIL W. CHAMBERLAIN. *A General Theory of Economic Process.* Pp. viii, 370. New York: Harper and Brothers, 1955. $5.00.

Mr. Chamberlain has turned his back on industrial relations, for the time being, and busied himself with ordering the economic world at large. He accepts most of the traditional economic analysis, viewing the economic process as one which is concerned with maximizing the yields and conserving scarce resources. Chapter I is devoted to showing that the economic process is part of a greater cultural process. However, the impingement of noneconomic activity on the economic process is not the great burden of the book, nor is there any analysis integrating the economic process into a general culture process or any other partial social process.

The underlying philosophy of the *General Theory of Economic Process* is the notion that alternative costs are very significant in determining the direction and nature of economic activity. Indeed one might say that the doctrine of alternative costs becomes almost a psychological and socio-psychological theory in Mr. Chamberlain's hands. The result is a refinement in traditional doctrine in the light of Mr. Chamberlain's own vocabulary and interests.

This adherence to custom is especially noticeable in Mr. Chamberlain's use of static analysis. The role of time, historical change or adjustments of economic activity, including techniques and aspirations to noneconomic activity, are not considered at any great length.

A *General Theory of Economic Process* is a statement or restatement of traditional economic analysis by one who brings an expertise from one of the specialized, applied fields of social analysis. The book has many interesting and unusual insights, and so is provocative and stimulating.

SOCIOLOGY AND EDUCATION

GORDON W. ALLPORT. *Becoming: Basic Considerations for a Psychology of Personality.* Pp. ix, 106. New Haven, Conn.: Yale University Press; London: Geoffrey Cumberlege, Oxford University Press, 1955. $2.75.

In this slender and delightfully written volume, Gordon Allport, professor of psychology at Harvard University, eloquently calls for the more adequate study of the whole personality, its growth, and development. Based on the Terry Lectures which Dr. Allport delivered at Yale University in March 1954, the book is a testament of his psychological faith. Modern psychology, he feels, working mainly in the philosophical tradition stemming from Lockean empiricism and using predominantly mechanical, animal, and pathological models, has scaled down the image of man and drawn but half his figure. It has largely ignored, or denied, the autonomous, creative, rational, and individualistic components of personality that give man his full stature as a human being. Oversimplification may succeed only in caricaturing human nature, Professor Allport says, and asks that conceptual openmindedness and a reasoned eclecticism be brought to the psychological task.

The central problem for a psychology of becoming, the author states, is to account for the process of growth whereby an unsocialized infant is transformed into a fully socialized adult. In his view, this process is governed not only by the impact of the environment upon a modest endowment of drives common to the species, but also by the unfolding of inherent capacities and dispositions to structure experience and give it meaning in a manner that is self-aware, self-critical and self-enhancing.

Thus, Dr. Allport would admit as essential data in the scientific study of personality those psychological functions commonly ascribed to a self or ego. Taking off from William James's early notions, he distinguishes eight aspects of the self which together comprise what he calls the *proprium*—the person's own sense of what is intimately and peculiarly his. Included in the *proprium* are bodily sense, self-identity, ego-enhancement (the self-seeking and narcissistic component), ego-extension (identification with objects, persons, values), a rational agent (including the Freudian defense mechanisms), self-image (both assessment and aspirations), propriate striving (compelling and persistent motives as distinguished from peripheral and transitory drives), and emerging as a final and inescapable postulate, the self as knower. These propriate functions, developing over time and fusing in their operation, according to Dr. Allport, are what give personality its peculiar unity and distinctiveness.

The conception of human nature that emerges from these pages—in its rationality, self-objectivity, orientation to the future, in its very perfectibility—is strongly colored by Western Christian and democratic values. In so far as this is a conception of what man *can become* in a free society rather than of what human nature *everywhere is,* few would probably be disposed to quarrel with it. Psychology is a young science itself in the process of becoming. Perhaps it will gain the maturity Professor Allport asks of it however formidable the scientific task.

JOSEPH B. CASAGRANDE
Social Science Research Council

RUSSELL KIRK. *Academic Freedom: An Essay in Definition.* Pp. 210. Chicago: Henry Regnery Company, 1955. $3.75.

Russell Kirk, author of *The Conservative Mind* and *A Program for Conservatives,* has taken a look at academic freedom that is refreshing whether one agrees with him or not. The theme of his essay is essentially in harmony with that of his other works. If academic freedom is to be preserved through this dark time, he says, the work must be done by men of a conservative bent.

The author does not mince words nor is he reluctant to name names. John Dewey is said to reflect a collectivism "which outdoes Marx." Sidney Hook "has done his share in pouring out sloppy rhetoric about democracy." Robert M. Hutchins, despite his many contributions to the cause of academic freedom, in one instance "aban-

doned his own championship of academic freedom, forgot the honor of his own university, [and] violated his own tenure-policies, . . . all for the sake of gratifying a wounded ego." The names of Robert Oppenheimer and Edward U. Condon suggest the type of "scholar in the physical sciences bent upon transferring (through a naïve analogy) power to manipulate nature into power to manipulate men."

Academic freedom, the author maintains, is the natural right of certain persons, usually few in number, to teach truthfully, to employ their reason to the full extent of their intellectual powers, to conserve truth, and to extend it. Academic freedom has never meant complete autonomy for teachers, or "the licentious toleration of a bewildering congeries of private fancies." Like other prescriptive rights, it has its boundaries and its corresponding duties.

An all-out attack is launched against the intolerance of doctrinaire levellers, doctrinaire secularists, and certain professed guardians of tolerance and liberal opinions. The levellers want to lower the academic standards of the colleges and universities so that the masses can charge in. Private institutions provide the sturdiest bulwark against such intrusions. Secularists fail to recognize that the fear of God is the beginning of wisdom, that educational institutions strongly influenced by religious dogmas are the greatest respecters of the dignity of the scholar, and that religious conviction remains an indispensable support to academic freedom.

Certain professed guardians of tolerance and liberal opinion are taken to task, by name, for speaking well of academic freedom but practicing it poorly.

A professor ought to be free to speculate aloud about politics so long as he does not indoctrinate his students. But professors are not alone among those who must restrain their indoctrinating tendencies. Trustees, alumni, and others should not try rashly to impose "loyalty oaths" on faculty members without careful consideration of the implications of the particular oath to be employed. Likewise the professor whose past associations are questioned should anticipate the probable adverse effects of any blanket use he may be impelled to make of protection under the Fifth Amendment.

It is in the nature of essays not to be comprehensive surveys, hence to leave many questions about their subject unanswered. This one is no exception. Yet it is well worth reading—and pondering.

CLAUDE E. HAWLEY
Washington, D. C.

MARTIN MEYERSON and EDWARD C. BANFIELD. *Politics, Planning, and the Public Interest: The Case of Public Housing in Chicago*. Pp. 353. Glencoe, Ill.: Free Press, 1955. $5.00.

This volume is a noteworthy advance in the case study technique of analyzing public decision processes. It is characterized by disciplined analysis of its data, by perceptual sensitivity, by self-awareness regarding the validity of its evaluations, by skillful handling of analytical concepts, and by familiarity with social action theory. It is an advance over the prevailing case study technique in the field of public administration because it liberates that technique from the confines of historicism. The authors move on to relate the events they describe so effectively to social action theory and to a stimulating conceptual analysis of certain key processes involved in the making of the public decisions with which they are concerned.

The decisions governing the choice of sites for the location of public housing projects in the city of Chicago provide the subject matter for this volume. These decisions are the focal point for community-wide controversy because the location of public housing projects contains a potential threat to the existing, socially-maintained pattern of negro-white residential segregation. Thus the authors have written a case study of the characteristics of the decision processes in a modern, polyglot urban community which has to face diverse and variant social goals of an inchoate nature that are thrust upon it by diverse institutions with vaguely defined social roles and self-images of function and power.

In the development of their case study, the authors give special attention to "politics," "planning," and "the public interest,"

both as analytical ideas and as social processes. They do not devote a separate chapter to "strategy," although in their own story inter-organization strategy emerges as a process of decisive importance in decision making. Their treatment of the Chicago public housing controversy necessarily moves them into a discussion of politicians, bureaucrats, and reformers as social types and as personalities. They are hard on reformers, who symbolize rational social action (planning) on the basis of intelligence applied to social problems. Reformers emerge an impotent second best to politicians, and the ideology of reform cannot stand up to the nonideological realism of politics. Realistic machine politics is defended in terms of its social utility, and reform strategy proves no match for the strategy of machine politics when the chips are down. The public interest remains unidentifiable and unresolvable within a milieu of organized interest groups.

WILLIAM A. ROBSON (Ed.). *Great Cities of the World: Their Government, Politics and Planning*. Pp. 693. London; New York: The Macmillan Company, 1955. $10.00.

This is a monumental work, the first to deal consistently and systematically with the large cities of the world in their governmental, political, and planning aspects. First conceived by Professor Robson in 1939 while he was writing *The Government and Misgovernment of London*, but interrupted by World War II, the volume now presented is intended by the editor to accomplish a twofold purpose: "First, that it should describe the local government of a representative group of great cities. Second, that it should show whether, and if so how far, these communities are confronting common problems; and what steps, if any, they are taking to overcome them."

The first purpose is the more successfully accomplished. Twenty of the great cities of the world are each the subject of an essay by an author who knows the city at first hand, and who is interested not merely in its legal aspects but also in its political forces and its governmental realities. Eight of these cities (Amsterdam, Copenhagen, London, Manchester, Paris, Rome, Stockholm, Zurich) may be classed as Western European; five of them (Chicago, Los Angeles, New York, Montreal, Toronto) are North American; four (Bombay, Calcutta, Sydney, Wellington) are in the Far East; two (Buenos Aires, Rio de Janeiro) are in South America; and Moscow represents the Soviet type. Another method of classification might note that eight of the cities are within the British Commonwealth system and tradition; and that, except for only two, or possibly three, cases, all the great cities discussed are within the democratic tradition. This is a sufficiently representative group of great cities to give us a comprehensive view of their basic governmental characteristics as a world-wide phenomenon; and, in addition, to serve as a testimonial to the editor's vision, ingenuity, and patience amid all the vicissitudes of a multinational research project.

The second purpose turns out to be more difficult of accomplishment. The identification of common problems among great cities is complicated by their marked variations in size, age, constitutional status, economic character, geographical factors, resources, and other important variables. It is further complicated by the differing values and preoccupations of the authors of the chapters on individual cities, despite the efforts of the editor to insure consistency of exposition and analysis. An additional difficulty flows from the necessity of appraising a great city within the limits of a single chapter (for example, London, 40 pages; New York, 38 pages).

The editor's second purpose is most fully realized in his own introductory essay, "The Great City of Today," which in eighty pages presents an admirable and perceptive synthesis not only of the whole volume, but of his own reflections on the great city as "a very modern phenomenon." He is convinced that "great cities all over the world are facing common problems which are mainly due to similar causes." These common problems he summarizes as five in number: (1) organization of areas and authorities, (2) popular interest and demo-

cratic participation, (3) efficiency of the municipal services, (4) finance, and (5) planning the metropolitan region.

This pioneering work should stimulate students of urban government and politics in many countries to move forward to full-length studies of individual cities and to comparative studies of various kinds, all useful to the improvement of the great city as a center of modern life.

WALLACE S. SAYRE
Columbia University

ARTHUR EVANS WOOD. *Hamtramck Then and Now: A Sociological Study of a Polish-American Community.* Pp. 253. New York: Bookman Associates, 1955. $4.00.

Hamtramck is a city within Detroit, Michigan, with a 1950 population of 43,355, 75 per cent Polish-American. The elected officials are all Polish. The major industry is the Dodge-Chrysler auto plant.

This study is a colorful historical journalistic-style account of the city government and school issues centered around the Polish leaders. The data on the geographical and population aspects, Polish cultural background, crime and delinquency, organizations, and family life are meager.

The author, a retired professor of sociology at the University of Michigan, obtained the data from Detroit newspaper accounts, informants, some official governmental sources, and by "questionnaires" on some minor issues. There is no systematic citation of sources nor a bibliography, but there is an index.

There is no theoretical framework, unless it be the loose twin notion that Hamtramck "is a 'cultural island'" in process of "disorganization" (pp. 13, 10). One theme is that Hamtramck is not as "bad" as Detroit newspapers (recent exception, the *Detroit Times*) depict it to be (pp. 27, 69, 148, 165–66).

The political corruption described is attributed to the Polish cultural heritage and to American conditions (pp. 28, 232–45). The former attribution is not convincing, and in some cases comic, as when the author connects "coal-stealing" to "the predatory exploits in the manor forests of the old world" (p. 233).

The author's concern that "disorganized behavior" may be due to the Poles' "innate qualities as a people" (pp. 232–3) indicates some of the superficial thinking present. The solution indicated—"indigenous leadership, supported by sound community organization"—(p. 245) is not explained and is mystifying because Hamtramck has had "indigenous leadership," and because the most "constructive" leaders in the past—a school superintendent and a Board of Commerce official—were neither indigenous nor Polish (pp. 69, 72, 87, 88).

Sociologists interested in the theory of immigrant adjustment or assimilation will find no contribution here.

The author has the evaluative, not descriptive, notions of culture (pp. 173, 189), and of assimilation, as when he states that "there has never been any question but that the Poles have been exemplary Americans. They have helped to produce the wealth of our mines and factories and fought in our wars. What more could one ask?" (p. 10). Yet the author does ask "more" when he implies that there may not be "an 'adaptation' to the more wholesome features of American life" (p. 14), or when he deplores the activities of Polish organizations which are such as to "keep the people Polish rather than to make them Americans" (pp. 183, 178, 36).

In general, the author throws encomiums in the direction of the Poles and, at the same time, heaps jargonistic blame on them.

STEPHEN W. MAMCHUR
Wayne University

SARKIS ATAMIAN. *The Armenian Community: The Historical Development of a Social and Ideological Conflict.* Pp. 479. New York: Philosophical Library, 1955. $4.75.

There are fairly large Armenian communities in a number of metropolitan areas in at least three of which (New York, Boston and Detroit) citizens of Armenian origin number close to 40,000 each. There are others wherein their number varies from 10,000 to 25,000. The total number of such citizens in the country is close to 250,000, and probably half of that number belongs to the second generation, born and brought up in this country and whose ways of living and outlook on life differ considerably from those of their immigrant parents. Here we have a distinct case of conflict between the old and the new. And the study of such a conflict would be not only interesting but extremely valuable, especially for the sociologist. One would have assumed that the author of this ponderous work, a sociologist by training and at one time a member of the Sociology Department at the University of Rhode Island, has done just that. Actually and unfortunately, however, this is not so. Notwithstanding his explanatory subtitle the author has not made an adequate study of "the historical development of a sociological and ideological conflict." Instead of limiting himself to his specialized but proper field, he has wandered far into other areas, such as the organization of Armenian communal life in Turkey and in Czarist Russia, the relations of Armenians with Kurds and Turks, the Armenian Question, the rise of political parties among the Armenians, the birth and death of the short-lived Armenian Republic in 1918–20, the diplomacy of the Powers in the Near East, and so forth; and in all these he seems to be no more than a mere dabbler, a wayward amateur.

The book opens with a ten-page breezy Introduction by James H. Tashjian in which one finds a fairly adequate sketch of Armenian history. The next 175 odd pages deal with the Armenian community in Turkey where the clergy necessarily played the leading part. Since the early 1860's Armenian communal affairs there were governed under an "Armenian Constitution." The author claims that under this constitution the clergy usurped its authority and always favored the urban rich against the rural poor, and thus was instrumental in the birth of a sharp class conflict. But this is a broad, baseless assertion. The ill-treatment and the recurrent massacres of the Armenians, the rise of Armenian nationalism, and other events up to and including World War I are narrated in a somewhat desultory and repetitious manner. The next 150 pages (pp. 204–352) deal with the rise of the Armenian Republic in the Caucasus, the spread of Bolshevism there, the loss of Armenian independence, and "Communism, the nationalities problem, and the Armenian ideologies." Thus better than two thirds of the book precedes the chapter on "The Armenian Community in America" (pp. 353–74), followed by the two remaining lengthy chapters, one on the author's exaggerated "Pro-Communist Armenian Campaign," and the other on the Armenian Apostolic Church. The most this reviewer can say of Atamian's first book is that it is of uneven value: it offers some information, but there is a good percentage of misinformation throughout the book. Even allowing for the one-sided and the narrow viewpoint of its author, it does not live up to its claim as a study of "The Historical Development of a Sociological and Ideological Conflict."

A. O. SARKISSIAN
Library of Congress

STANLEY HUGH SMITH. *Freedom to Work.* Pp. x, 217. New York: Vantage Press, 1955. $4.00.

Case studies of the background, legislative development, and administration of specific statutes have long been subjects of doctoral dissertations in political science. The book under review is such a dissertation in sociology, and its topic, the Fair Employment Practices Law in the state of Washington, is of special interest to sociologists. The author does a passable job of defining his problem, surveying the literature, reporting on comparable laws in other areas, detailing the legislative history of Washington's FEP law, recording the types of cases that have been dealt with under the law, and suggesting further research. There is little that is unique in this story, except possibly for the early Communist association with the bill.

While the author performs a service in bringing together the varied relevant facts about FEP in *Washington,* he makes a claim to distinction which is scarcely justified. Numerous reports of the "inside"

legislative history of FEP laws in other states, of their applications and their effects on diminishing discrimination, of local patterns of employment discrimination, and so on, are available in published pamphlets or mimeographed memoranda. The author seems to have limited his search of the literature to books and general periodicals. Other defects are a limited conception of "evaluation" of a law, an identification of discrimination with concentration in lower occupational groups, the absence of an index, and a naive attitude toward scientific methodology (p. 23).

The campaign for an FEP law in Washington began in 1945. The "mass agitation" approach, especially when led by leftists, antagonized the legislators, and the bill was defeated after a promising start. A more representative group led the 1947 campaign but was poorly organized and failed to get many supporters outside of Seattle. Careful organization, an approach directed at the legislature itself, the information given to the legislature by the legal counsel of New York's State Commission Against Discrimination, won the day in 1949. The bill was passed by a Democratic House and a Republican Senate. The law has helped somewhat, but many minority persons do not know about it or are disinclined to use it. There are loopholes which permit employers to evade the law, at least temporarily. But Washington is participating in the gradual national trend toward decreasing discrimination, and Smith is to be commended for recording the facts.

ARNOLD M. ROSE
University of Minnesota

SAMUEL R. SPENCER, JR. *Booker T. Washington and the Negro's Place in American Life.* Pp. ix, 212. Boston; Toronto: Little, Brown and Company, 1955. $3.00.

It is appropriate that The Library of American Biography, edited by Oscar Handlin, should devote a volume to Booker T. Washington (1856–1915). Following his famous Atlanta address and the death of Frederick Douglass, both in 1895, Washington was the foremost American Negro and his people's most influential spokesman. Despite sharp criticism from William E. B. DuBois and other prominent Negroes, Washington was the leader in American Negro affairs until his death.

An account of Washington's slave childhood, his education at Hampton Institute, and the founding and development of Tuskegee Institute into a living monument to his educational philosophy provide a background for the balanced and factual appraisal of Washington's larger role as a Negro leader. This readable little book covers the available material including Washington's own best selling autobiography, *Up From Slavery*. A Note on the Sources directs the more interested reader.

Washington, the educator, stressed a practical education in agricultural and industrial skills to prepare the Negro for economic advancement and independence. At the opening of the Atlanta Cotton States and International Exposition, he proposed that the Negro postpone social and political integration until his economic improvement made him worthy of the rights and privileges of full citizenship.

Washington was convinced that Southern whites and Negroes had a common destiny. In return for the co-operation of Southern whites in providing economic opportunities for the Negro, he was prepared to compromise on other issues until the Negro had achieved his sound economic foundation. The Atlanta address was misinterpreted as an endorsement of the separate, but equal principle and an acceptance of existing conditions and prejudices.

Any evaluation of Washington's gradual, evolutionary approach to the problem of the Negro's successful integration into American life and of the bolder approach of his critics must recognize that his primary responsibility was to Alabama's Tuskegee Institute. Much of his time was spent cultivating Northern philanthropists and foundations and maintaining good public relations. Expediency usually demanded his circumspect conduct although on occasion he worked undercover for the Negro.

Washington expected the Negroes to remain permanently in the South as members of rural communities. He did not reckon on Negro migration and urbanization, and he thought of industrial preparation in terms of the independent farmer, craftsman, or businessman. Nonetheless, the biographer may properly conclude that he "did what was possible, given the time and place in which he lived, and did it to the utmost."

FRANK J. KLINGBERG
University of California
Los Angeles

RONALD HARE. *Pomp and Pestilence: Infectious Disease, Its Origins and Conquest.* Pp. 224. New York: Philosophical Library, 1955. $5.75.

We may safely assume that disease is as old as life itself because disease is nothing else but life, life under changed circumstances, as Virchow defined it. It is obvious that man at all times suffered accidents that caused wounds and fractures of bones, and man reacted very much through the same disease mechanisms. Bacteria have been found in Algonkian rocks. We do not know whether these bacteria were pathogenic or not. In this fascinating book Professor Hare differentiates between symbiosis, when host and parasite operate to mutual advantage; commensalism, the eating at the same table; and a third form of parasitism which may be called pathogenesis, or ability to produce disease. Chapter II is devoted to what bacteriologists call endemic infection, that is infections which occur in the community more or less all the time. Epidemics occur when a parasite is imported into a population previously unacquainted with it and therefore without immunity. Some occur when a large number of susceptibles are brought into an area in which a parasite is found, that causes endemic infections among the native population. Some epidemics are due to a sudden change in the facilities of transmission of a parasite when a carrier of the parasite has a chance to infect water and milk supplies. Others are due to a sudden change in the virulence of the parasite, and some are due to a reduced resistance of the population.

The discovery of the bacteria makes a fascinating story. Anton van Leeuwenhoek was the first to describe bacteria, which he found in the scrapings of his tongue. Since he was perfectly healthy the idea did not occur to him that these microbes may cause disease. A Jesuit Father, Athanasius Kircher, also in the 17th century examined under the microscope pus and blood from plague patients and found tiny worms which made him believe that the contagium of the plague was an animated one. The German anatomist and pathologist Jakob Henle reasoned in a classical study *Of Miasmata and Contagia and of the Miasmatic-Contagious Diseases* that Miasmata and Contagia must be identical and must be animated, but his work remained without repercussion until Louis Pasteur and Robert Koch discovered the true nature of bacteria.

Professor Hare discusses in a brilliant chapter the reaction of the community. On July 20, 1377 the City Council of Ragusa ordered all incoming ships from plague ridden localities to be held on the island Mercana for one month *ad purgandum*. Six years later Marseilles ordered a quarantine on the island of Pornique. The great public health movement started in England because the country was industrialized first and health conditions were appalling. Professor Hare has a chapter on reaction of the individual and ends with a chapter on parasites and population.

Dr. Hare is Professor of Bacteriology at St. Thomas' Hospital in the University of London. He has produced a fascinating book full of most significant facts.

MARTA FRAENKEL and CARL L. ERHARDT. *Morbidity in the Municipal Hospitals of the City of New York: Report of an Exploratory Study in Hospital Morbidity Reporting.* Pp. 229. New York: Russell Sage Foundation, 1955. $4.50.

In the last chapter, the authors evaluate the results of their findings in this exploratory study and recommend that a continuing morbidity reporting system be established in New York City, at first in the municipal hospitals only but gradually expanded to include all hospitals in the community. Problems are anticipated, but de-

tailed instructions are submitted as to how, by whom, and at what cost this may be accomplished.

In the Foreword, Leona Baumgartner, M.D., Commissioner of Health of New York City, and Basil C. MacLean, M.D., Commissioner of Hospitals, give due praise to the wealth of valuable information condensed in this distinguished work and state that steps have already been set in motion to start at the earliest possible date a program of morbidity reporting in the municipal hospitals of that city.

The Appendices describe other experience in hospital morbidity reporting and discuss methodology for processing diagnostic data. No small part of this pilot study was the work involved in the translation of the clinically detailed terms and codes of the *Standard Nomenclature of Diseases and Operations*, in which the hospital discharge diagnoses are originally recorded, into the more mechanically practical groupings of the *International Statistical Classification of Diseases, Injuries, and Causes of Death*. Appendix D, Table 54, lists 451 International Classification diagnoses accounting for 25 or more discharged patients—a useful presentation for persons studying the less frequent causes of illness requiring hospitalization. Appendix D, Table 53, gives the authors' abridgment of the International Classification into their summary list of 196 categories meaningful in relation to causes for hospitalization.

Tables 1–52 array the 121,952 inpatients discharged during the six-month study period, May–October 1952, according to age, sex, color, diagnosis, length of stay, condition on discharge, and in various other significant ways. Of special interest to students of chronic disease and aging are the chapters and tables concerning cancer, tuberculosis, circulatory, and other chronic diseases; psychiatric conditions with special reference to alcoholism; and the hospitalization of patients 65 years and over.

The authors ask and answer a question that may come to the minds of public health administrators: "To what extent will hospital reporting furnish data on specific illnesses for the entire population or for significant age and sex groups? By their very nature, the aggregate of the records from all hospitals in a community will provide a complete picture of certain serious diseases among the population concerned and a partial picture of other serious diseases. Most minor illnesses, however, are omitted."

ALBERT SALOMON. *The Tyranny of Progress: Reflections on the History of French Sociology*. Pp. 115. New York: Noonday Press, 1955. $3.00.

Perhaps the foremost symptom of the degradation of the history of social thought in the last quarter of a century has been the exaggerated concentration on the social significance of totalitarianism and the even more fantastic search for its origins in past social thought, as though it were primarily an ideological rather than an operational product.

This has led to such absurdities as the discovery that Socrates, usually regarded as a martyr to intellectual freedom, was in reality the "first Fascist." French social thinkers have been lined up as putative "fathers" of bureaucratic tryanny: a respectable historian has finally decided that poor old Proudhon, whom historians of social thought had previously been unable to list decisively as a socialist or an anarchist, was actually the founder of fascism. Professor Salomon takes French social thought to task along this line of indictment far more comprehensively.

In his small book, he discusses the effective origins of the law of social progress in the *Discourses* of Turgot, and then seeks to demonstrate that this idea, when adopted by Saint Simon and Comte and both echoed and distorted by Hegel and Marx, led straight to the bureaucratic totalitarianism of Lenin, Stalin, Mussolini, Hitler, and Franco. This development naturally and obviously blasted the optimistic dream of orthogenic, cumulative, and unlimited social progress.

Sociologists are surely entitled to their own opinions, and Professor Salomon has expressed his in this book frankly and with virtually no qualifications. The reviewer can be equally candid. He believes it to

be utterly absurd to regard Saint Simon and Comte as, in any direct and effective sense, forerunners of contemporary totalitarianism. It seems even more preposterous to assign to their mild personal "bohemianism" causal significance along this line. The programs of these men, if they had been literally put into operation, would have led to utopias in which benign sociologists and industrial engineers would have dominated the public scene rather than commissars or gauleiters.

But the main error lies in regarding contemporary totalitarianism as an ideological rather than an operational product. It is obvious that there have been plenty of totalitarian strains in social thought from Plato onward, and even the right-wing totalitarians have developed *ex post facto* ideologies to embellish their bureaucratic systems, but these systems have been the product of contemporary social conditions —chiefly global and total war—rather than of social thought. Russian Communism, which did have a strong ideological background, was a child of World War I and gained its dominant position as a result of the second.

Modern total war is chiefly the outcome of the rise of mass communications and emotional engineering (systematic propaganda), and such books as Sisley Huddleston's *Popular Diplomacy and War* and Oron J. Hale's *Publicity and Diplomacy* throw more light on the rise, nature, and frequency of total war in our day than the whole body of social thinkers from Plato to Talcott Parsons. If one seeks two responsible Frenchmen, then Poincaré and Clemenceau were tenfold more influential than Comte and Saint Simon. And the same factors that led to total war and totalitarianism were the lethal forces that dealt the death blow to the dream of social progress.

The reviewer may be misguided in this view, but it is his opinion that, if one seeks an operational guide to the origin of the twin evils of our age: totalitarianism and "perpetual war for perpetual peace," it is more likely to be found in the writings of Lawrence Dennis (*Dynamics of War and Revolution*), James Burnham (*The Managerial Revolution*), John T. Flynn (*As We Go Marching*), and, above all, George Orwell (*Nineteen Eighty-four*), than in books like those by Professor Salomon. There is little point in blaming Turgot, Saint Simon and Comte for trends and developments they could not possibly have foreseen—indeed, were actually not anticipated by some of the most astute social thinkers at the end of the first decade of the present century.

HARRY ELMER BARNES
Malibu, California

HUSTON SMITH. *The Purpose of Higher Education*. Pp. xix, 218. New York: Harper and Brothers, 1955. $3.50.

It may be questioned that this book is a "pioneering study" (as stated on its jacket), yet, the author has most certainly done more than to put old wine into new bottles. The volume is the work of a faculty committee of Washington University appointed "to crystallize a statement on the objectives of liberal education to be used as a basis for curriculum review." The author has, however, very successfully converted a committee report into a lucid and most readable exposition.

The book gains in clarity of presentation by its organization into two parts. Education Beyond Six Opposites is the novel title of Part I; The Aims of Liberal Education is the orthodox label for Part II. The greater portion of the book (137 pages) is a discussion of the value dichotomies listed under the six opposites as absolutism versus relativism; objectivity versus commitment; freedom versus authority; egoism versus altruism; the individual versus the state; and sacred versus secular.

It was Livingston, I think, who said that true education is impossible without the vision of greatness. Perhaps Professor Smith and his colleagues are asserting that there can be no vision of greatness in education without value judgments. In any event they affirm that it is possible and reasonable for educated people to agree, or to greatly minimize the areas of disagreement, with regard to basic values. Professor Smith's arguments against the cult of aloofness and indecisions with respect to value judgments are vigorous. "Suffice it to say that value judgments are as ines-

capable as judgments of fact. . . . Life requires direction, and in human beings no longer maneuvered by instinct this direction can be supplied only by a stable . . . nucleus of values and beliefs" (p. 36). There will be few educators or laymen who will question such statements. For the classroom teacher, however, the problem is how to recognize and label his own prejudices or predilections and eliminate their influence on his analyses and conclusions.

Fortunately the six chapters in this section of the book are in themselves worthy examples of how to be persuasive without resort to dogma or prejudice. They give evidence in thought and phrasing that disciplined thinking can resolve most of the difficulties that confront the teacher who strives for "objectivity" and yet has a distaste for "neutralism."

For faculty members and administrators constantly concerned with teaching in a liberal arts college, Part II of *The Purposes of Higher Education* is no more than a restatement, of, I assume, universally agreed upon aims and objectives of a liberal education. These aims include instruction in those areas of knowledge pertinent to the study of man and mankind; the acquisition of skills which mark the literate person; the development of discriminating appreciation to the end that cheapness, sham, and shoddiness can be readily detected. To this list of orthodox aims the author adds a chapter on "motivations" which summarizes all the hopes for the liberal education. "The chief task for education is . . . to sink the roots of aspiration deep enough to withstand the months and years of spiritual drouth when they come."

In general, it might be said that this book is a counsel of perfection with no blueprint for attaining the purposes of higher education. But it is inherent in liberal education that it is a counsel of perfection and perhaps it is well that there is no single path to be followed by all of the faculties dedicated to its propositions.

The Faculty Committee and Professor Smith have achieved the almost impossible. They have written another book on higher education sufficiently different and sufficiently stimulating to merit thoughtful reading. Particularly one would wish that it might be read by parents of college students and by the Ph.D. candidates now preparing to teach these students.

SAMUEL S. STRATTON
Middlebury College

JAMES E. RUSSELL (Ed.). *National Policies for Education, Health and Social Services.* (Columbia University Bicentennial Conference Series.) Pp. 550. Garden City, N. Y.: Doubleday and Company, 1955. $7.50.

This formidable book passes in review the policies recently and currently in force in the several fields specified in the lengthy title (plus "Religion in Education"), together with discussions from the floor of some of the issues thus brought to light at the several conferences. By its very nature, or rather because of the fashion in which the material has been prepared for publication, this is not a book to be read (least of all straight through), but rather one to be consulted as whim or occasion require. Specialists will undoubtedly look here for what was said at Columbia, but the nonspecialists will, I am afraid, pick up the book reluctantly and lay it down hastily. The editor has made no visible concessions to the undedicated reader, and they in their turn will pass his volume by.

This is sad, for buried in the book are eminently readable papers which, in a less austere setting, would snare almost any serious reader. One may instance, in order of appearance: "Freedom, Security, and the University Tradition" by A. Whitney Griswold; "The Function and Opportunities of Higher Education in the United States" by Henry M. Wriston; "Financing Higher Education" by Robert D. Calkins (an especially provocative paper); "The Limits of Social Service" by Gordon W. Allport; "The Impact of Income Security Upon Individual Freedom" by Barbara Wootton; and the "Report" of the discussion of academic freedom.

From such a wide-ranging miscellany it is difficult, if not impossible, to draw any very useful conclusions. One general notion implanted in the mind of this reviewer was that, in spite of all discouragements, the "professionals" are still quite optimistic.

Really, what is urgently needed is a conference on how to make conference reports readable. *The Economist* lately remarked that as matters now stand, it is obviously more fun to attend conferences than to read about them. But a report like that on the Corning Glass conference shows that this need not necessarily be so.

C. HARTLEY GRATTAN
Katonah, N. Y.

PHILOSOPHY AND RELIGION

WALTER LIPPMANN. *The Public Philosophy.* Pp. xiii, 189. Boston; Toronto: Little Brown and Company, 1955. $3.50.

Mr. Lippmann has written one of the few important books to appear in the United States since World War II. Its strength lies partly in the fact that the author does not speak from a limited American point of view. His outlook is that of a citizen of the West—a West that has fallen in the nineteenth and particularly in the twentieth century dangerously into decline. The totalitarian mass movements that wrecked parliamentary government in Europe after World War I are only one type of phenomenon that illustrates and demonstrates the falling off. The decline of prestige of the West in the non-Western world is another. The United States is an extension of the culture area of Western Europe and the malady that affects Europe brings illness also to America. Mr. Lippmann in probing what he considers the crisis of our times finds no moral superiority in America. Western civilization is a single entity.

Mr. Lippmann finds the infection that has produced the present *malaise* to lie in the Jacobin philosophy that emerged as one of the products of the French Revolution. Determined to obliterate the authority of the hereditary rulers of the *ancien régime,* the Jacobins proclaimed the doctrine that the will of the sovereign people is right and must prevail. Its justification came from Rousseau who fathered the idea that human nature in its primal state is good and that its basic impulses may be relied upon to work for good.

The Lippmann interpretation of the history of Western democracy in terms of Rousseau is reminiscent of Irving Babbitt in the first quarter of the twentieth century who saw in Rousseau the archvillain of democracy in America. Babbitt's philosophy came to focus on the individual; Mr. Lippmann deals with society. The essential evil of Jacobinism lies in its implicit denial of the existence of principles, a law not made by men, that undergirds society and without obedience to which the good society is impossible. A belief in the existence of such a law is as old in Western tradition, as the ancient Greeks who formulated the idea of a natural law, and as the early prophets who taught the existence of a moral law of God. Mr. Lippmann has coined the phrase, "the public philosophy," to describe this ancient belief—public philosophy dealing with the needs and welfare of society as opposed to the private philosophies that emphasize the needs and welfare of individuals. The core of the public philosophy is the teaching that a fundamental law exists above the will of the sovereign people which they may deny, but only at the risk of such disaster as that which found expression in the totalitarian dictatorships of twentieth-century Europe. The decline of the West has been due to the ignoring of the public philosophy and the assertion of the primacy of the uncontrolled will of the sovereign people.

Mr. Lippmann not only traces the history of the public philosophy. Like the neo-Thomists, who are engaged in a similar enterprise within the framework of Catholic thought, Mr. Lippmann attempts by the use of reason to discover the characteristics of the public philosophy as applied to the theory of property and to the principle of the freedom of speech. These are among the best and most important chapters of the book.

In comment on Mr. Lippmann's interpretation of Western history it should be noted that the doctrine of the fundamental law or public philosophy has existed in American democratic thought since the beginning of the national period. Around the turn of the twentieth century the concept of natural law was frequently perverted to the support of antisocial practices in American industrialism. In the first third of the

present century the prevailing intellectual tendency was to deny altogether the existence of a fundamental law. In that period a philosophy of relativism had high prestige. The conditions of life since World War II have brought a reaction and a new search for the basic principles of a public philosophy. Mr. Lippmann's book is only one among many evidences of a mid-twentieth century renascence of the old doctrine of the fundamental law. Its wide popular sale is another. Paradoxically the phenomenon of the book and its reception is a strong argument, at least so far as America is concerned, against the pessimism with which Mr. Lippmann views the present Western world.

RALPH H. GABRIEL

Yale University

WINFRIED MARTINI. *Das Ende aller Sicherheit: Eine Kritik des Westens.* Pp. 376. Stuttgart, Germany: Deutsche Verlags-Anstalt, 1954. DM 12.80.

This book is a German counterpart to the writings of our modern American conservatives. The title is derived from a pessimistic dictum of the conservative Swiss historian, Jacob Burckhardt: "Since politics has become founded on the internal ferments of the peoples, all security has ended." The major part of Martini's book is a provocative repudiation of democracy from the viewpoint of a liberal conservatism. It is not directed against "material democracy," but rather against the idea of the sovereignty of the people, and it is the thesis of the author that government for the people is jeopardized by government by the people.

Martini starts out with the historical fact that democracy was the unwanted child of Christian humanitarianism and Enlightened liberalism; this unwanted child now has become master in the house and endangers its parents. Montesquieu was defeated by Rousseau and the result was Robespierre. Nineteenth-century liberal democracy, according to the author, was still compatible with good government, since the sovereignty of the people was severely curbed by an effective division of powers, by constitutional monarchy, by a heavily restricted suffrage, and so forth. Modern mass democracy and totalitarian dictatorship, however, are not enemies but twin brothers, as the rise of Hitler in particular demonstrated. Martini advises the Germans to admit—"at least when we are among outselves"—that an impressive majority backed Hitler and that, long before 1933, leftist and rightist antirepublican parties had been working for the abolition of the *Rechtsstaat*. Postwar France and Italy provide similar examples of democracies on the verge of abolishing themselves exactly by democratic means. Since the coming of real democracy—in England, for instance, with the Second Reform Bill of 1867—the liberal element has been in continuous retreat.

Chapters IV and V form the core of the book's antidemocratic argumentation. The author tries to show that voters in a mass democracy are incompetent (samplings of voters' information from both sides of the Atlantic are quoted), that democratic organizations such as labor unions are automatically captured by dictatorial bureaucracies, that "education for democracy" must necessarily fall short of success, that the notion of politically mature and immature peoples is absurd (unless one assumes that maturity and immaturity of a nation can alternate every few years), and finally, that the democratization of foreign politics has led to the dislodgment of professional diplomacy, to nationalistic emotionalism, to a disastrous lack of military preparedness, but also to eschatological concepts of wars as crusades to make the world safe for impossible perfection. Democracy, conceived as the majority principle in modern mass society, is neither conducive to individual freedom within the state nor to the preservation of the freedom of the Western world in the face of totalitarian aggression.

Martini's book is persuasively written in its negative aspects, but is strikingly weak in its positve suggestions. To clinch the antidemocratic argument, a preferable and workable alternative would have to be offered. The author rightly asserts that the alternative between democracy and totalitarianism is not complete. But he himself has nothing better to recommend than a modernized Metternichism, that is, an authoritarian government which respects individual freedom in the nonpolitical sphere. Since in complex modern society the nonpolitical sphere has shrunk almost to nothingness, the author's conservative recipe is inapplicable. In the end he recommends Salazar's Portugal as a model state,—an underdeveloped country off the highroad of Western civilization which the author, after all, desires to preserve.

If the author does not seem to have analyzed his own fascination with authority figures, the merit of the book—beyond an able contribution to conservative ideology—consists in its realistic criticism of the mystique of democracy.

HERBERT MOLLER

Boston University

J. A. O. LARSEN. *Representative Government in Greek and Roman History.* Pp. vi, 249. Berkeley and Los Angeles: University of California Press, 1955. $4.00.

This volume of Sather Classical Lectures is an esoteric work for accomplished students of classical antiquity. Its importance lies not in the presentation of new material, but in a cogent array of evidence that the institutions of representative government are of Hellenic origin.

The theory that the collective judgment of the masses was superior to that of representatives ultimately led to the transfer of decisive governmental functions to primary assemblies. Nevertheless the Achaean League, after c. 217 B.C., revived representative government, with referenda to the popular assembly on matters of great importance. By the period of the Macedonian Empire (167 B.C.), the term *synedriake politeia* had evolved to connote representative government.

The author reserves usage of the term "sympolity" to the federal state, wherein "citizens are under the jurisdiction of both a federal government and the government of a member state." The best example of this type of organization was the Boeotian League with its eleven units of representation, four of which were assigned to Thebes. Each unit had sixty councilors, and the *boule* of 660 members was divided into four groups of 165 each in an arrangement similar to the Athenian prytanies of an earlier era.

Alliances primarily of a military nature were "symmachies," and of these, the Peloponnesian, Delian, Second Athenian, and Hellenic leagues are discussed. The author points out that it was the principle of hegemony that was the primary distinction between the symmachies and the sympolities. Representative institutions were present in both types, however, and in the Hellenic League the apportionment of representation was fixed according to the size of the member state.

Although the fragmentary nature of much of the evidence precludes the definitiveness that characterizes the chapter on Greek institutions, the author persuasively argues for the survival of assemblies in the Roman imperial period, whose chief functions were the conduct of the imperial cult and the annual review of the administrations of provincial governors.

Besides the theory of the collective wisdom of the masses, the natural tendency of the capital to dominate a federation, the strengthening of democratic tendencies by common resistance to oligarchic Sparta, and the King's Peace of 387 B.C. which theoretically restored the freedom of all Greek states helped supplant representative government by primary assemblies.

In its broad outlines this volume is indispensable to the serious student of political theory. It is a notable contribution to classical learning and to the splendid Sather Lectures.

CHARLES EDWARD SMITH

Louisiana State University

G. E. VON GRUNEBAUM. *Islam: Essays in the Nature and Growth of a Cultural Tradition.* (Comparative Studies of Cultures and Civilizations, No. 4. *The American Anthropologist,* Vol. LVII, No. 2, Part 2, Memoir No. 81, April, 1955.) Pp. xv, 260. Menasha, Wis.: American Anthropological Association. 1955. No price.

Mr. von Grunebaum has brought together in this volume twelve essays dealing with various aspects of Muslim civilization. The first essay traces in broad lines the religious and cultural history of Muslim civilization. The eleven succeeding studies are grouped under three general headings: Growth, Expressions, and Encounters.

Under "Growth," the essay entitled "The

Beginnings of Culture Consciousness in Islam" treats the early identification of Muslim with Arab and the later substitution of Islam as the unifying element in cultural diversity. Next, the author discusses the question of whether Arab culture should be defined on a basis of a common religion, language or historical experience.

The "Expressions" of Islam are found in the Koran, Arabic literature, science, and government, and in the Muslim town, to each of which an essay is devoted. The essential structure of Islamic government is set forth in a series of propositions; the Muslim town is contrasted with the classical concept of the city, and its physical structure and administration are described.

The "Encounters" of Islam are with Hellenism, Iranian culture, and Western influences. The Iranian reaction to Islam is expressed in "Firdawsī's Concept of History," and the author uses Westernization in Islam to support his disagreement with Arnold Toynbee's theory of cultural borrowing. In this section there is an excellent study of "Attempts at Self-Interpretation in Contemporary Islam," classified here because such attempts often reflect Muslim attitudes towards Western influences.

These essays cover a wide range of subjects, and students of history, literature, sociology, anthropology, and political science will find much to interest them here. This reviewer liked best the essays on "The Spirit of Islam as Shown in its Literature" and "Attempts at Self-Interpretation. . . ." The former treats the specifically Islamic elements in Arabic literature from the following points of view: content, outward form, inner form, and the attitude toward and expectations from literature. These are then illustrated by an analysis of the eleventh Assembly of Hariri. In the latter essay, Mr. von Grunebaum discusses with great insight the ideas of several modern Muslim reformers and apologists, among whom are Iqbal, Muhammad Kurd 'Alī, Taha Husayn, and 'Abdallāh 'Alī al-Qasimī.

These studies bear witness to the author's extensive knowledge of Arabic literature and his remarkable powers of interpretation. Mr. von Grunebaum states that they may be considered as prolegomena to a larger study on the rise of a Muslim culture consciousness on which he is engaged. This promised work will be eagerly awaited by all students of Islam.

JAMES A. BELLAMY

Philadelphia, Pa.

CONRAD WRIGHT. *The Beginnings of Unitarianism in America.* Pp. 305. Boston, Mass.: The Beacon Press, 1955. $4.00.

The book is an expansion of a Ph.D. thesis at Harvard under the direction of Perry Miller which won the Carnegie Award of the American Historical Association.

It does for the story of American Unitarianism what Whitley and Shakespeare did for the beginnings of the Baptists in England, namely, demythologizes it, thus providing a dependable basis for its true historical origins.

The terminal dates are the Great Awakening in 1735 and the election of Henry Ware to the Hollis Professorship of Divinity at Harvard in 1805. During these seventy years consistent Calvinism in Puritan New England slowly disintegrated under the persistent attack of a minority group of religious liberals known as Arminians who defended "supernatural rationalism" and anti-Trinitarianism. They were not Deists since they supplemented natural religion with special revelation which they found in the Bible. Trinitarian views were abandoned because unscriptural, but Christ was given far higher rank in creation than mere man. The simple humanity of Jesus was then rejected because they were men who did not lack the courage of their convictions. This American Arminianism with such leaders as Chauncy and Mayhew can be adequately understood only within the social structure of New England and the logical pattern of their theology.

Hence, the history of Unitarianism does not begin in Transylvania or Poland. Socinianism is not the geneological ancestor of Unitarianism. American Unitarianism is autochthonous and derives the Arminian name from its similar reaction to the Puritanism of New England.

Charles Chauncy at the first church, Boston, 1727–87, for sixty years, and Jonathan Mayhew at the west church, Boston, 1747–66, for nineteen years, with Ebenezer Gay, Hingham, 1717–87, for seventy years, all Harvard graduates, accomplished the transition from a rigid Calvinism to an Arminian interpretation and paved the way for the great explosion of the early nineteenth century.

Some special features are the maps, showing the separated and overlapping areas of Harvard and Yale men, and the biographical appendix listing the Arminians and the New Divinity Men—sixty of the former, Harvard men with the exception of one from Princeton and Yale and Brown; twenty-one of the latter, mostly Yale graduates with Princeton represented by three, Dartmouth by three, and Brown by one graduate.

The study rightly rebukes the confusion which has prevailed in identifying American Arminians with the Deists but discounts too much the widespread and undermining influence Deism had here before the Revolutionary War. Ezra Stiles was nearer right.

CONRAD HENRY MOEHLMAN

Rochester, N. Y.

JULIAN N. HARTT. *Toward a Theology of Evangelism.* Pp. 123. New York; Nashville, Tenn.: Abingdon Press, 1955. $2.00.

Here is Evangelism in a new key. Stripped of a litter of methodologies, it means a proclamation of the good news of God and his Kingdom. After confronting men in respect and in love, the Christian community leaves results with human response and divine prerogatives. In a race with time the Kingdom comes as an eternal NOW, as a summons rather than a cause, an imperative invitation given out of inexhaustible patience and involving divine revolution for the world and personal transformation for participants in the divine community. The subject is therefore with theological foundations. Dr. Hartt writes with precision of thought and singularly expressive language. His medium of communication is so potent that convincement is not far behind.

A novelty of form now conveys a familiar content. The Christian community to which these ten compact chapters are devoted is a divine creation. In most respects it looks like a compensatory adventure on God's part. The first created edition had doubtful value. God, "the Almighty Father," is a kind of absolute authoritarian. He is "the formidable unbroken silence enshrouding the noises of ephemeral creatures." Either He commanded poorly, or something mussed things up. So now He is a Creator-Judge.

The human situation shows serious miscalculations. Ego and other ego, like Hobbes's presocial-contact creatures, are rock-bottom fact. Society trusses up its members rather tightly, but in the love community each knows himself as a loving personality. History spells fate, and also what man has done to himself. "Guilt pertains to the human situation as such. Sin is the individual person's appropriation and acknowledgment of this guilt." Somehow personal dignity survives all this. Cultures are false masks worn by differentiated units of society, because these units are bloated with pride. Jesus Christ, the "Incarnate Lord," as an act of God is the supreme witness to the Kingdom. He can only repudiate human ideals of good and evil, as a ten-ton truck crushes a childish toy. It is not a question of standards of "good" people, but that the crown prince of a feudal power replaces altogether Jesus who appears in the Gospels.

All this and more savors of another thrust of a current orthodoxy, one born in fear and nurtured in this worldly anxiety. Believing faith steals the spotlight, much as a rustic resents worldly power apparent in a large city. In times of crises believing faith swallows the believer and banishes the object of belief. Then, in order to reassure itself, faith clings to unshakable convictions, seconded by a highly select and socially approved tradition.

IRL WHITCHURCH

Kingfield, Me.

ROSS W. SANDERSON. *The Church Serves the Changing City.* Pp. 252. New York: Harper and Brothers, 1955. $3.50.

Dr. Saunderson has brought a uniquely wide and varied experience in socio-religious research and rare gifts of analysis and characterization to the task of reporting case studies of churches and church agencies that are currently grappling with the "inner

city" problem in a number of urban communities. Attention is focused on eight parishes, but data are presented on more than a score of parish situations and, in all, thirteen Protestant denominations are involved.

The term "inner city" denotes the underprivileged residential areas—though they often have nonresidential features—which have been stranded, so to speak, as the centers of city life have shifted. Their "common denominator" is low income. The tendency of "downtown" churches to flee these areas and relocate in a "favorable" social climate has long been deplored by socially-minded church leaders. Dr. Sanderson's "cases" are examples of strategic, often heroic, and sometimes ingenious adjustment on the part of churches which chose the alternative of accommodation in preference to withdrawal.

The reader is struck by the close correspondence between this movement of accommodation to social need and the social settlement movement which a few decades ago created a new type of social effort among underprivileged city populations. Indeed the "group *ministry*" so strikingly typified by New York's East Harlem Parish is an embodiment of the settlement idea, with this distinctive element added: all activities are conceived as channels for a definite evangelical "outreach." Says Dr. Sanderson, "Whatever the denomination, whatever the pattern of churchmanship, here in these varied ministries to the changing city is a new ripple of the settlement tide, less secular, more theological, but in its motivation, attitudes, and dreams strikingly similar to those of the great founders of a vast social work movement now less conspicuous because so widely accepted."

Size is not a measure of the viability of one of these socially adapted parishes. Some very small churches are decidedly effective. The Puerto Rican small church in New York City is "indigenous, dynamic, self-starting, and self-supporting." But cultural and ethnic inclusiveness is an obligatory goal. Bilingualism should be regarded as "temporary and on the way out." Moreover, Protestantism will now "have to begin more seriously to mend its ways" in relation to segregation.

The problem of financial support is crucial. Membership giving is basic; endowment is a legitimate safeguard as "reserve" for specific needs; public contributions, by way of community chests, for example, may be "legitimately sought for social services rendered on a nonsectarian basis, but not at the price of unfair policy control."

F. ERNEST JOHNSON
National Council of the
Churches of Christ in
the United States of America

COMMONWEALTH OF NATIONS

HERBERT A. DEANE. *The Political Ideas of Harold J. Laski.* Pp. xii, 370. New York: Columbia University Press, 1955. $5.75.

Mr. Deane has done a very interesting and useful study of Harold Laski, who boxed the compass of political ideas about as completely as anyone on the stage of modern political theory has ever done.

It is a painstaking book and quite well worked out in details. It avoids the egregious flattery that some previous works like those of Kingsley Martin have reflected and comes as close as anything we are likely to have to a just appraisal of Mr. Laski's shortcomings and his manifest stimulation to his students as a teacher.

After tracing Mr. Laski's earlier period in which inadequate attention, it may be suggested, is paid to the influence on Laski of his New College training, particularly with Ernest Barker, the book takes up the earlier pluralist period of Laski and his attempt to reconcile it with what he felt was a basic loyalty to John Stuart Mill's liberalism. It became apparent, as Mr. Deane shows, that this was very difficult to reconcile with his rooted belief in socialism which Laski himself attributed to "the outcome of a Jewish upbringing, the sense it conferred of being treated differently from other people, and for no obviously assignable cause." Laski's rebellion against his father and family is noted, but his extraordinary admiration of his brother, who had made good as a king's counselor, is never quite understood as an offset.

The Oxford manner, his ability as a partisan speaker, and his own self-fulfillment, which one might unkindly call the gratification of a natural vanity, drove Mr. Laski into putting himself in the middle of the stage at every opportunity.

As a political theorist this somewhat mixed up his roles. His inherent leanings towards socialism, and in spite of his earlier critical writings towards Marxism, more and more pushed his earlier concern with individual liberty and with pluralism into the limbo of forgotten causes.

If there is an essential weakness in the treatment of Mr. Deane, it reflects the same weakness that he brings out in Laski's own boxing of the compass. There is no really genuine appreciation of the lack of a basic philosophy from which Laski could derive any coherence and systematic strength in attempting to build a body of theory that had more unity than the writings of a columnist.

Mr. Deane himself does not bring to this task much more background and philosophy apparently than Laski did later in his more polemic articles in *The Nation* and in *The American Democracy* in dismissing his earlier adherence to pragmatism as merely an "effort to persuade business men to cooperate in the accomplishment of social changes that would destroy their supremacy." The quotation is from Mr. Deane's paraphrase. Even pragmatism was too much of a philosophy to hold Mr. Laski, who preferred in the end the dogmatic premises of Marxism to the test either of experience or of logic.

There is only one serious omission in the development of Mr. Laski so far as the emphasis of this book is concerned. This was the period in which he followed the popular front line of Moscow by building up the League of Nations into a super state and demanding that it have all the powers of coercive sovereignty which he had denied to the nation state.

On the whole, however, this is a very useful book and it is likely to be enough said on the subject of Mr. Laski for some time to come. The puzzle of Laski was his influence in the United States which far outran his influence in England. Mr. Deane understands his lack of basic influence in the Labor party. One may suggest that the key to his success as a teacher was his enthusiasm and his willingness to praise all his students and stimulate them to further efforts. He was a first-class debater. The impact on political theory of people who have stated extreme and even contradictory positions has long been remarked by students of political philosophy and theory. It is likely to be quite disproportionate if the writer is prolific and has an ear to the currents of popular opinion and a great capacity for self-dramatization, always connecting it where possible with some crusading cause. It generally, of course, results as it did in the case of Mr. Laski in mistaking wishful thinking for facts and treating them as such; a point that on the whole is adequately made by Mr. Deane's book with elaborate documentation, for what it is worth, from the writings of a most prolific partisan.

Harvard University

S. MACCOBY. *English Radicalism, 1762–1785: The Origins.* Pp. 535. London: George Allen and Unwin, 1955. (Distributed by The Macmillan Company, New York.) $10.25.

Students of nineteenth-century England have long relied on S. Maccoby's studies in Victorian radicalism. They will welcome this volume on "The Origins." And with the promise of still another to fill the gap between Tom Paine and Cobbett, we may look forward to a consecutive story of the British Left from 1762 to 1914.

Opening paragraphs make it clear that the author does not conceive the "Oppositionism" which he proposes to trace in narrow terms. He is fully aware that unruly mobs, "left wing" newsmen, pamphleteers, and juries who refuse to convict them, county associations of disgruntled "Freeholders," City "Interests," and personal cliques of friends and kinsmen over whose dinner tables is debated the strategy later used in Parliament, all play their part. And he does well by them all.

He does less well, it seems to me, at least in his arrangement of the social and economic "indications" which he admits are indispensable "if the basic factors condi-

tioning politics are to be better understood." True, the poltical effects of taxes for the American War and East India Company affairs are well noted. But they have been well recounted by others. Had the author earlier placed at his readers' disposal the excellent material on labor and industry, landlords and rents, prices of food and its distribution, and "important currents of thought making," instead of packing it into four admirable, but brief and entirely separate chapters at the end of the book, he would have gone farther towards realizing his own expressed aim. These matters all moved disaffected groups to add their strength to radical demands, and paying them earlier attention would have enlivened as well as added more meaning to the detailed narrative of *who said what and when* in the intricate parliamentary struggle which fills the first four-fifths of the book.

The author lets contemporaries tell much of their own story, drawing chiefly from the press: *The Gentleman's Magazine, Annual Register, Monthly Review,* and others; and to some extent from the writings of participants. They are not new sources; but no one hitherto has picked out the story of the "Oppositionists" with such thoroughness. Mr. Maccoby does not give to this volume, it seems to me, quite the degree of penetration and synthesis found in most of his earlier work. But it is unfair to make a good book suffer by comparison with its predecessors. This one was needed and will prove very useful.

MILDRED CAMPBELL
Vassar College

H. A. CLEGG and ALLAN FLANDERS (Eds.). *The System of Industrial Relations in Great Britain: Its History, Law and Institutions.* Pp. viii, 380. $4.20.

H. A. CLEGG. *General Union: A Study of the National Union of General and Municipal Workers.* Pp. xiv, 358. Oxford, England: Basil Blackwell, 1954. $3.85.

These two books belong among the small but growing number of distinguished British works dealing with industrial relations whose tradition was started by the Webbs and continued by G. D. H. Cole (to whom Clegg's book is dedicated). Clegg and Flanders are highly promising pupils of these masters; their work is remarkably careful and detailed; they ask a number of highly pertinent questions and come up with interesting and illuminating answers. Yet, social scientists will wonder whether there is really so little to be done in this field beyond description, and economists in particular may express some surprise at the slight use of their theoretical apparatus which the authors make.

The first column combines essays by Asa Briggs, "Social Background," O. Kahn-Freund, "Legal Framework," J. D. M. Bell, "Trade Unions," H. A. Clegg, "Employers," Allan Flanders, "Collective Bargaining," Clegg and T. E. Chester, "Joint Consultations." This range is less ambitious than that of J. Henry Richardson's recent *An Introduction to the Study of Industrial Relations,* equally published in 1954. With one major exception such limitation has its advantages since it has permitted the editors to produce a shorter and, in some parts at least, more searching study. The one omission in the present book, which this reader regrets, is the lack of a thorough discussion and analysis of the British wage structure. There are of course many references to wage issues and Mr. Flanders does not fail to continue his well-known discussion of the case for a publicly guided wages policy. But all this, admirable as it may be, is no substitute for an investigation of the wages structure and the economic and other influences operating on it. An American reader will also be surprised at the little space given to issues of lay-offs, dismissals, seniority (mainly Pp. 303–5). Even full employment does not explain this relative disregard.

Space does not permit me to do more than to express admiration for the general level of this work and the real achievement of its editors in avoiding most of the usual pitfalls of symposia. It would be invidious to single out any of the contributions for particular praise. Nevertheless Asa Briggs has performed a major achievement in his brief essay and the book contains some of the most interesting material on union activity in the plant I have come across so far.

Mr. Clegg, a fellow of Nuffield College, Oxford University, devotes his book to the second largest British Union. The National Union of General and Municipal Workers is one of the two giant general unions in England, the other being the Transport Workers Union. Each of them really consists of a number of semi-industrial unions, which form a secure basis for the union, plus large aggregates of laborers working in many industries. This organizational device characteristic for British labor is the alternative to industrial unionism, a kind of giant "district 50" of the United Mine Workers of America.

American readers will be greatly interested in this study, not only because the Union is numerically significant, but also because of the peculiarities of the general union. The author examines the organization most carefully, again with the methods and limitations discussed above. The N.U.G.M.W. has been almost consistently a pillar of the right wing of British labor, and Mr. Clegg uses the American term "business unionism" in describing the spirit of the union leadership. Unfortunately—like many European observers—Mr. Clegg apparently believes that this term not only implies the absence of a philosophy of class struggle, but he also conveys (p. 256) that it is a less aggressive kind of unionism. Strike statistics do not confirm this view.

The general unions have produced some of the most outstanding and powerful British labor leaders such as Ernest Bevin. Mr. Clegg's study will greatly help understand why this is so. The size of the general unions tends automatically to give their leader a particular stature, but more important the system of organization endows the general secretary with an authority which few leaders of craft unions enjoy.

These are two books which no student of industrial relations can afford to miss.

ADOLF STURMTHAL

J. HARVEY PERRY. *Taxes, Tariffs, and Subsidies: A History of Canadian Fiscal Development.* Vol. I: Pp. xviii, 324. Vol. II: Pp. xi, 436. Toronto, Canada: University of Toronto Press, 1955. $25.00.

This two-volume work, sponsored by the Canadian Tax Foundation, was conceived as a preface to the author's *Taxation in Canada.* The material became so bulky that it led to "a book twice the length of the work of which it was originally intended to be an introduction" (p. vii).

The first volume deals with events 1867–1940. In its first two decades the Canadian federation had hard going and, partly as a result, adopted a protectionist program. In the 1890's the economic climate changed for the better, and Canada experienced a boom which continued almost to World War I. This allowed the Dominion government to rely upon revenue from customs and excises (chiefly liquor and tobacco). The provincial governments, however, had to enter—timidly—the field of direct taxation, and the municipalities the area of business taxation.

In Canada, even more than the United States, World War I recast the federal revenue system, despite federal tardiness in facing up to the issues of war finance. Taxation of corporate and individual income began, and, in 1919, a federal sales tax was added. Then in the 1920's the federal government retreated in response to the mood of the times, and to the fact that the important tasks, especially construction of highways, called for provincial and municipal action.

The great depression after 1929 struck with terrific force at provincial and municipal finances. It forced federal intervention, gradual at first and later with a rush, to lift some of the burdens from these governments. But the problems were so great and the solutions so obscure that, in 1937, the federal government appointed a Royal Commission on Dominion-Provincial Relations (the Rowell-Sirois Commission) to give it advice. Its report, although coming after the start of the war, was of vast significance. For the first time a Canadian public document explained the significance of fiscal policy.

Volume II covers the period from 1940 to date. Perhaps because the author experienced events at first hand in the Department of Finance, it has more verve and force than Volume I. From its interesting pages I would particularly commend the exposition of the principles of war finance (pp. 331–33), chapter XXII on the excess profits tax, the brief exposition treating the

refundable income tax (pp. 363–64), and chapter XXVIII treating Dominion finance postwar. The events of the fifteen years 1940–54 are of great interest to students of federal finance. The impression emerges that the federal government did a good job, and yet at the present time no level of government is content. The provincial and local governments declare that centralization has gone too far and that they need more autonomy; the federal government is restive because of its heavy financial responsibilities to the other governments. If easier times lie ahead, a swing toward decentralization may be expected.

The two volumes are, then, a most welcome addition to the literature of Canadian public finance, and the Tax Foundation, as well as the author, deserve our thanks. Mr. Perry has, for fuller measure, provided nearly forty pages of bibliography and an appendix of useful tables. In these volumes he has chosen to be chiefly descriptive. At some future time he should give us a fuller measure of interpretation and analysis, because the brief samples provided this time are so sensible and convincing that one wishes for more.

JAMES A. MAXWELL
Clark University

SLAVIC COUNTRIES

E. H. CARR. *The Interregnum, 1923–1924.* Pp. 392. New York: The Macmillan Company, 1954. $5.00.

Mr. Carr maintains in this fourth volume of his history of Soviet Russia the impressive standards set in the first three. Despite some overlap with the earlier volumes, arrangement and structure are orderly and clear. As usual, the style is superb, though constant use of Russian abbreviations must present problems to those who do not know that language.

The content is the year 1923 in Russia. Economics, foreign affairs, and the first stage of the struggle between Trotsky and the "triumvirate" of Stalin, Zinoviev, and Kamenev furnish the main themes, each receiving roughly a third of the space. In each case, some attention is devoted to background extending to 1922 and to final developments in 1924. Much attention is given to the crucial Twelfth Party Congress of April, 1923 and considerable to the Thirteenth Conference, and Congress, of January and May, 1924. Throughout, the author relates events and issues, in a dispassionate but suspenseful narrative, to the tensions set in motion by Lenin's incapacitation.

Considering the magnitude and complexity of the subjects treated, this work must be acknowledged an outstanding success. Unlike in earlier volumes, Carr uses very extensively not only official Soviet sources, but also non-Soviet material, particularly the very important Menshevik organ, *Sotsialisticheski Vestnik.* Those who have accused him of confining his documentation to pro-Soviet sources may be pleased to note that Max Eastman, Ruth Fischer and Trotsky's posthumous biography of Stalin are among many anti-Stalinist sources effectively employed. However, some of the vital, or sensational—depending on one's point of view—contents of these sources are ignored. For example, though Carr brings out, at least by implication, some of the peculiarities of Lenin's last illness, he says nothing about Trotsky's strongly expressed belief that Stalin poisoned Lenin.

On the other hand, Carr's interpretation of the "interregnum" is in many ways similar to that of Trotsky, although his account is pale and bloodless in comparison with the vivid prose of Trotsky.

In this volume Carr shakes off some of the fatalism and doctrinaire bias in favor of "socialism" which are the chief defects of the earlier volumes. Yet it is curious that he attributes many of the characteristics of the Soviet economy of the early NEP period to "capitalist" policies. Since some of the most important of these, such as the ruthless exploitation of the labor force by the state, were deeply intensified after Stalin launched his more "socialist" policy in 1928, one is puzzled by the author's interpretation. In general, Professor Carr's series thus far has been much stronger as a factual record than as a work of interpretation. Mr. Carr's interpretation is usually implicit. This makes it difficult to appraise and often difficult to discern.

However, a basic pattern of analysis remains. Russia, according to Carr, lacked the prerequisites for "socialism." Consequently, the progressive descent into despotism was inevitable. Carr does not face the possibility that a state monopoly economy, among other factors, may have—I would say did—intensify the already existing Russian tendency toward a despotic type of government which, however, many Russians opposed, and which was being gradually overcome in the period after 1905.

FREDERICK C. BARGHOORN
Yale University

N. N. SUKHANOV. *The Russian Revolution, 1917.* Edited, abridged and translated by Joel Carmichael. Pp. xxxvii, 691. London; New York; Toronto: Oxford University Press, 1955. $10.00.

Sukhanov's account of the Bolshevik seizure of power is a primary historical source. Sukhanov was a versatile, left-wing intellectual, a Marxist though never a Bolshevik. He knew everyone that mattered in St. Petersburg and had a remarkable knack of being in the crucial place when history was being made. His reminiscences of the revolution, first published in seven volumes in 1922, provide an honest and disinterested record of the critical months between the abdication of the Tsar and the assumption of power by the Bolsheviks. Trotsky made full use of these memoirs in his own inimitable *History of the Russian Revolution.* The memoirs are now published in an abridged English translation for the first time. About half of the original text has been translated, and the excisions have been wisely done. The translation is excellent; the editor's footnotes and Introduction are most valuable.

Revolutions, when described in college textbooks, are neat affairs. They have certain major causes (usually four) and certain consequences. The revolutionary process itself seems coherent and rational. Sukhanov reminds us that in real life revolutions are incoherent, chaotic affairs, and that revolutionaries are tired, hungry, puzzled men with stomach disorders who spend a great deal of time doing nothing. This is how Sukhanov describes Miliukov on the first day of the Russian Revolution (pp. 48–49): "Quite alone in the Catherine Hall P. N. Miliukov was walking around, the central figure of bourgeois Russia, the leader of the only official organ of power in Petersburg at the moment, and *de facto* head of the first revolutionary Government.

"He too found himself inactive. His whole appearance said plainly that he had nothing to do, that he did not in the least know what to do. Various people went up to him, asked him questions, gave him information. He replied with evident reluctance and vagueness. They left him, and he started walking around alone again."

Except for Lenin and Trotsky, the Bolshevik leaders in 1917 were quite unprepared for revolution. Sukhanov refers to "the complete shapelessness" of the Bolshevik movement (p. 14); the Bolshevik leaders were flatfooted and incapable of thought (p. 24), "primitive and badly grounded" (p. 44). *Pravda,* the paper edited at that time by Stalin, was "muddle-headed" (p. 224).

The consolidation of Stalin's power after Lenin's death led to a rewriting of history, and in particular the history of the revolution. Stalin's role in 1917 had been relatively undistinguished—Sukhanov refers to him as "a grey blur" (p. 230)—but history was revised to portray Stalin as Lenin's chief partner in 1917. Trotsky, Zinoviev, Kamenev, Bukharin, Radek, and the rest were shown as fools, cowards or traitors—or all three. Sukhanov's too honest account became heresy, and Sukhanov himself was one of the first victims of the Stalinist purges.

SYDNEY D. BAILEY
New York, N. Y.

RAYMOND A. BAUER with the assistance of Edward Wasiolek. *Nine Soviet Portraits.* Pp. viii, 190. New York: The Technology Press of Massachusetts Institute of Technology and John Wiley and Sons, 1955. $3.95.

Raymond Bauer has shown himself, in his *New Man in Soviet Psychology,* to be one of the more sensitive and sensible students of the Soviet Union. In his present study Mr. Bauer, who is a social psychologist, has selected fiction as a vehicle for expressing certain conclusions he has reached

concerning the behavior of Russian citizens. This project was undertaken, as the author tells us, on a "dare," and while much serious research went into the preparation of the book its casual origin is not easily forgotten.

Chapters in the lives of nine different Soviet types are presented here: the student, the collective farmer (quite typically, a woman), the doctor (also a woman), the District Party Secretary, the urban housewife, the writer, the factory director, the tractor driver (who is also a veteran returned from Germany), and, most speculatively, the secret police official. Mr. Bauer and his assistant, Edward Wasiolek, first listed methodically the characteristics of each of these types which they wished to stress; they then devised a narrative which would include these points. The results of their labors is a readable and very often engaging series of vignettes of Soviet life. The characters and the situations appear entirely plausible, and, with perhaps one or two exceptions, give every appearance of authenticity. Indeed, many of the episodes are adapted directly from the testimony of refugees.

It is an exceedingly grim picture of existence in the Soviet Union which Mr. Bauer depicts. While it may seem mild beside the lurid accounts given by some recent emigrés, it is a harsher portrayal than this reviewer considers warranted if the object is to render a well-balanced study of individual behavior and motivation in Russia. It would not occur to this reviewer, for instance, to lay such stress on the deceits which, Mr. Bauer alleges, each Soviet citizen consciously practices in his everyday relations with his associates. Unquestionably there is deceit in Russia today, as a necessary prerequisite to survival. It is easily detected by the social scientist observing Russia from the outside. But the subjective capacity to scrutinize his own behavior which the author ascribes to each of his main characters may be questioned. The very circumstances, it would seem, which have given rise to the practice of deceit among Soviet citizens must also prevent them from being as fully introspective about this practice as Mr. Bauer suggests.

The marriage of fiction and sociology is unlikely, under any conditions, to be an easy one. Mr. Bauer makes it clear (p. 171) that sociology is the dominant partner here, but he does not in this assure the harmony of the union. *Nine Soviet Portraits* remains to the end a *tour de force*, suspended somewhere between passable fiction and what, from Raymond Bauer, we would expect to have been less stereotyped and less transparent social psychology.

CHARLES B. McLANE
Swarthmore College

F. BOWEN EVANS (Ed.). *Worldwide Communist Propaganda Activities.* Pp. xiii, 222. New York: The Macmillan Company, 1955. $3.00.

The main aim of this book is to present a description of the nature, volume, and cost of the total Communist propaganda effort during 1954. It also seeks to provide perspective by putting the account within the framework of the historical development of Communist propaganda theory and practice by describing the worldwide organizational network through which Communist propaganda is disseminated, and by relating the strictly propaganda and ideological aspects of the Communist program to broader Communist objectives and strategies in the cold war. Chapter II is concerned with the central emphasis on propaganda in Communist theory and practice (particularly since Lenin) and points out the continuous, unremitting use of propaganda as an instrument for the propagation of the Marxist-Leninist ideology and for the promotion of foreign policies of Communist states. In addition, the development and present organization of the worldwide apparatus through which the Communists conduct a globally-co-ordinated propaganda is described. Chapters III, IV, and V examine the volume, themes, and media of Communist propaganda during 1952 on a worldwide basis; and Chapter VI treats briefly some of the activities of the major international Communist-Front groups during the year. Each of the remaining four chapters is devoted to the Communist propaganda developments during 1954 in a particular geographic region. In order that Communist propaganda activities may be seen in their proper context, each of these chapters begins with a description of Communist strength, objectives, and strategy in the particular area. The materials used here are from many sources. Some standard works have been used, and they are cited in the footnotes. However, by far the greatest amount of information was selected from a mass of published materials and eyewitnesses' reports obtained from United States government representatives and correspondents throughout the world.

The specialist will find this booklet quite useful not because the material presented here is new, but rather because it has been systematized and butressed by citing facts and figures. In this respect, we have here an extremely useful reference book. The nonspecialists will be overwhelmed with the mass of these facts and figures, and the fellow-travellers will keep on making fun of such "revelations," since the Soviet propaganda machinery has built its success on Hitler's famed principle: "the bigger lie. . . ."

JOSEPH S. ROUCEK
University of Bridgeport

HAROLD H. FISHER. *The Communist Revolution: An Outline of Strategy and Tactics.* (Hoover Institute Studies, Series A: General Studies, No. 2.) Pp. v, 89. Stanford, Cal.: Stanford University Press, 1955. $1.00.

In this manual Professor Fisher has provided an objective outline of Marxist theory and practice. He writes with the authority of one who for more than thirty years has studied the Bolshevik Revolution and its aftermath. He is evidently less at home in Chinese affairs, and his account of the rise of Mao Tse-Tung is less perceptive than other parts of the study. There is a full bibliography of works in English.

Some readers may be surprised by Professor Fisher's insistence that the shift in the Kremlin line to a policy of "peaceful coexistence" preceded Stalin's death by "six months or more" (p. 42). In the opinion of this reviewer, the evidence in support of this hypothesis is overwhelming; indeed, the shift can be fixed at almost exactly a year before Stalin's death.

SYDNEY D. BAILEY
New York, N. Y.

HAROLD J. BERMAN and MIROSLAV KERNER. *Soviet Military Law and Administration.* Pp. xiv, 208. Cambridge, Mass.: Harvard University Press, 1955. $4.00.

In the Preface, the authors promise the reader only an analysis of the administrative and legal structure of the Soviet military establishment. But they achieve more than this. First, they formulate a very plausible hypothesis about the type of integration of the armed forces of the Soviets into the total power structure. On the top level, they find a complete fusion of the armed forces with the other elements of the power machine, not so much on the institutional as on the personal level: the armed forces are headed by the same men who also head the technical apparatus of the government and the political police; this makes a *pronunciamento* rather improbable. But on the middle and lower levels, the armed forces are granted a large margin of autonomy which the authors correctly explain as the result of a cumulative experience of the leaders who learned that semi-autonomy is a functional prerequisite of the efficiency of any army. Second, on the basis of scattered data (systematic data are unavailable), they give some insight into the informal structures existing within the armed forces; here they come to the conclusion that the situation is ambivalent: discipline is strict and relentless; but there are also elements of "parentalism" which, in his earlier works on Soviet law, Harold Berman had given a probably exaggerated emphasis.

The major part of the book is devoted to a concise, but clear presentation of the structure of the military establishment, the regulation of military discipline, the law of military crimes and punishments, the organization and procedure of military courts, and military prosecution. Very interesting is the discussion of the history of the consecutive changes in the disciplinary code showing the steady de-emphasis of revolutionary ideas and re-emphasis of patriotism, but also of the duty of absolute obedience to the orders of the superiors. The book is concluded by an "appraisal" of the Soviet system of military law and administration which, perhaps, is not so much an appraisal as a summary. This summary includes

however a most illuminating digest of the impressions, on the subject, of M. Kerner who, from July 1, 1944 until the end of the war served as a colonel of the Czechoslovak unit on the Eastern front, and a summary of a few cases concerning the application of the military court procedure to essentially nonmilitary offenses committed by railroad workers, an awkward feature of Soviet law indeed.

N. S. TIMASHEFF
Fordham University

WESTERN CONTINENTAL EUROPE

DAVID T. CATTELL. *Communism and the Spanish Civil War.* (University of California Publications in International Relations, Vol. IV.) Pp. xii, 290. Berkeley and Los Angeles: University of California Press, 1955. $3.75 cloth; $2.75 paper.

Any book dealing with the first two and a half years of World War II in Spain is a welcome contribution to the truth. The truth about these lost years of that war is still being hidden behind an iron curtain of our own to hide the shame. Mr. Cattell's book, dealing with the part played by European Communists, with never more than 500 Russians among them, is well documented. It is not, as the title might imply, another effort in the doctoring of history to show that Hitler and Mussolini gallantly fared forth in the name of the Lord to save the Spaniards from the "Communism" of the Azana regime. The author undertakes no such fantastic task. He makes an honest effort to indicate the part the Communists actually played in the Spanish war against the Axis. These Communists were certainly not fighting for democracy, but they were fighting for selfish reasons against the Nazi aggression. Actually volunteers trained in fighting, their help was welcomed, just as the help of the Communist Government of Russia was hailed with enthusiasm by England, France, and the United States in the second phase of World War II. These Communists, trained fighters in the International Brigade, under the command of a German Communist, did save Madrid at a critical moment; but, when, taking advantage of natural gratitude, their commander tried to impose his views he was promptly dismissed.

The legal government bought such arms as it could from Russia solely because the three democracies from whom it preferred to buy had denied it its unquestionable right under international law to buy from them, and the gold it sent to Moscow was solely to pay for the material bought. It placed two Spanish Communists in the Ministry in the dark days for the same reason that de Gasperi in Italy placed Communists in his first Government to unify the people behind the regime in a crisis. Mr. Cattell accurately shows that in the darkest hours toward the close when the Government's sole hope for guns was on Russia, the Communists did force concessions through threats and blackmail. Based on intensive research, this book is a valuable contribution in these days of brazen attempts to so color "history" as to make it conform to the defence of our unhappy policy of unwitting collaboration with the Axis in its war on the gallant democracy of Spain.

CLAUDE E. BOWERS
New York, N. Y.

PAUL FARMER. *Vichy, Political Dilemma.* Pp. vi, 376. New York: Columbia University Press, 1955. $5.50.

As a thoughtful student of modern French history, Mr. Farmer is concerned with the political *malaise* that has come over the French nation. In fact, his original purpose in undertaking a study of the Vichy regime grew out of a desire "to discover what new light this might throw on both the history of France in the period 1918–1939 and on the course of affairs since 1944" (p. v).

To a degree, the work does throw light on continuing and basic French problems, but it would have been more accurate to state the purpose the other way around: the author's interests in the periods before and after Vichy, so far as the present study goes, are really directed toward an explanation of Vichy. This is valid procedure, but in following it Mr. Farmer assumes an importance for the Vichy period, and makes uses of it in his attempt to answer long-range questions, that other scholars may well question. There is no doubt that the principles and practices of the Vichy government derived in considerable measure from the evils of the prewar period; nor that the Vichy scars were deep and in some instances lasting; but Vichy was also a product of special circumstances of defeat and occupation and many of its aspects were unique rather than typical. These facts make it extremely treacherous hunting ground for the historian who seeks to explain France's basic ills. Mr. Farmer recognizes all of this, of course, but the recognition does not sufficiently govern this study. He continues to read into Vichy more than is warranted.

But one may question an author's perspective without denying the general value of his book. *Vichy, Political Dilemma* is the work of a skilled hand and bears evidence of patient, thorough research. Although there are no footnotes, which presumably means that the work was designed for the "general reader," there is an excellent "Note on Sources." Judgments of the Vichy leaders are notably temperate and enlightening. Although the author makes every effort to be fair to these leaders, it can scarcely be said that any one of them gains in stature as a result. There are too many occasions when the author, in an attempt to demonstrate his adherence to the basic tenets of the historian's faith, dwells on explanations of what questions may be properly asked and what answers soundly ventured. These may indicate the consistency of his position, but they are repetitious and make for periods of tedious reading in an otherwise well-written book.

JOSEPH J. MATHEWS
Emory University

MAURICE BAUMONT, JOHN H. E. FRIED, and EDMOND VERMEIL (Eds.). *The Third Reich.* Pp. xv, 910. New York: Frederick A. Praeger, 1955. $9.00.

This inquiry into the methods and procedure of Nazism is published under the auspices of the International Council for Philosophy and Humanistic Studies and sponsored by UNESCO. Twenty-seven European and American scholars have united to present a comprehensive account of the National Socialist movement from its philosophical origins in nineteenth-century nationalist thought to the political policies pursued by the Nazis in their twelve years of power.

The book is divided into three major parts. Prefaced by a long study by Edmond Vermeil on the background of German nationalist ideology, the first group of essays deals with the philosophical forerunners of National Socialism, including Constantin Franz, Paul de Lagarde, Nietzsche, H. S. Chamberlain, Stefan George, Moeller van den Bruck, and Adolf Hitler. Part II analyzes the political, social, and economic circumstances that brought the Nazis to power in 1933. Part III is devoted to examinations of the political methods and techniques of the National Socialist régime, such as the use of propaganda, the misuse of philosophy, anti-Semitism, racialism, the National Socialist vocabulary, the role of the Schutzstaffel (SS), and the position of the Catholic and Protestant churches. Among the excellent essays is Otto Klineberg's study of Nazi racialism.

This giant, encyclopedic volume shows in microcosm some of the difficulties encountered when scholars work on an international scale (British, French, American, Dutch, and Belgian historians contribute essays). The editors fixed only the subjects beforehand and made no attempt to determine the scope of the treatment, on the ground that there was to be no interference with the creative freedom of the authors. While this aim certainly is a most laudable one, the practical effect is that there is a serious amount of overlapping and repetition. Careful editing to avoid this result does not come under the category of "overstrict regimentation."

The Committee, preferring "sincerity and plain speaking to the impersonal neutrality of a lifeless report" (p. xv), allowed each author perfect freedom to adopt his point of view, even in the political sphere. This, of course, was to be expected under the circumstances. The discriminating reader can judge the varying viewpoints for himself and make his own choice. There is as yet no last word on the underlying causes of the Nazi movement.

The contributions of German historians are somewhat depressing. Wilhelm Grenzmann, agreeing with Edmond Vermeil, describes the Nazi "relapse into barbarism" as a poison that had been creeping through the organism for a long time, but hastily adds: "The Germans, of course, were not the only people to be contaminated" (p. 203). Gerhard Ritter echoes Meinecke's German "catastrophe": "It is important for anyone examining these conditions to realize how unprepared internally Germany was for the political events of 1932–33—the sudden rise to power of the Hitlerian party" (p. 384). Though fully one-third of the book is devoted to the intellectual precursors of National Socialism, Theodor Litt warns about labelling "pioneers" of National Socialism: "In every case we must be careful to examine whether, and in what degree, the affinities of which so much was made really existed, or were only part of the make-believe of those virtuosi of the lie" (p. 455). The implication is that Hitlerism was a sudden catastrophe without link to the sphere of ideas and theories. Far from being a bolt from the blue, National Socialism was the final link in a chain of disastrous events.

On the whole, however, this volume should be welcomed as a real contribution to the clarification of National Socialism. It should be of value in the vital task of the quickest possible identification of any similar movements that might appear in the future.

HELGA TIMM. *Die deutsche Sozialpolitik und der Bruch der Grossen Koalition im März 1930.* (Beiträge zur Geschichte des Parlamentarismus und der politischen Parteien, Heft No. 1.) Pp. 216. Düsseldorf, Germany: Droste-erlag, 1952. DM 12.80.

HANS GEORG WIECK. *Die Entstehung der CDU und die Wiedergründung des Zentrums im Jahre 1945.* (Beiträge zur Geschichte des Parlamentarismus und der politischen Parteien, Heft No. 2.) Pp. 247. Düsseldorf, Germany: Droste-Verlag, 1953. DM 12.80.

Recent German historiography is enriched by the first two volumes published by the "Kommission für die Geschichte des Parlamentarismus und der politischen Parteien" (Commission for the History of Parliamentarianism and Political Parties) which is sponsored by the West German Government. Its self-declared task, "to examine aspects of German political life from 1848 to the present," is auspiciously commenced by Helga Timm's competent treatment of the fall in 1930 of the Herman Müller cabinet over the issue of unemployment benefits. This was the last coalition cabinet anchored in the majority parties.

Helga Timm skillfully describes the deterioration of the governing parties into brawling interest groups and the political immaturity of large parts of the population, a process which was aggravated by the impact of the Depression. The Social Democrats faced the dilemma of satisfying their following with increased unemployment compensation and other benefits while balancing a hopelessly deranged budget. The German People's Party, the other wing of the coalition, demanded economy and had in fact shriveled from its broad middle-class basis to a core of economic die-hards.

The author also demonstrates by an exhaustive treatment of the bitter Parliamentary struggles over naval appropriations during August 1928 and the employers' intransigence in the Ruhr strike later that year that the threat to the Weimar coalition government was great even during relatively full employment.

The author labels the fall of the Müller government as the disruption of the tenuous democracy of the Weimar Republic. She ascribes this to the lack of a non-Marxist mass movement to which the petit-bourgeosie could have turned, and to the fact that consideration of social policy had become a subject of party polemics. This analysis gives inadequate weight to the deep cleavages of German society which became especially apparent in the depression. Yet the author deserves high tribute for making a scholarly effort at identifying and interpreting the interplay of forces which helped to determine the fate of the ill-starred Weimar Republic.

The second volume of this series, by Hans Georg Wieck, is an original study of the founding of the Christian Democratic Union and the revival of the Catholic Center Party in the British occupation zone of Germany, from May 1945 to March 1946. Drawing extensively from hitherto unpublished documents, party files, correspondence, and interviews with over a hundred leading participants, Dr. Wieck provides an informative analysis of the political climate in the war-ravished Rhenish-Westphalian industrial basin and in Northwestern Germany. Sensitive to pertinent details, he shows how in many large German cities in 1945 isolated small groups gathered under the leadership of Protestant and Catholic clergymen and of prewar democratic and nationalist party leaders. They were now united by the need for a Christian-oriented, liberal democratic party that was free of Socialist and Communist doctrines.

Considerable attention is given to the deeply rooted disagreement over the question whether the emerging political alignment should be denominational or nondenominational in character. The development of the Christian Democratic Union and the revival of the Catholic Center Party attested both to the irreconcilability of the two views, and to the common desire of all leaders to safeguard religious harmony and strengthen democratic political life. Although scant data are presented on the response of party leaders to the rank-and-file demands, this work represents the successful completion of a challenging task and undoubtedly is likely to remain for long the definitive treatise on the subject. A name index and short summaries on the growth of Christian liberal parties in Western Europe after World War II are appended.

Both works exhibit a degree of scholarship which, it is hoped, subsequent volumes of this series will maintain.

ROBERT MUELLER
New York, N. Y.

NORMAN RICH and M. H. FISHER (Eds.). *The Holstein Papers.* Volume I: *Memoirs and Political Observations.* Pp. xxvii, 216. Cambridge, England: Cambridge University Press, 1955. $5.00.

Historians have so far refrained from writing a full study of the "mystery man" on the Wilhelmstrasse, Baron Friedrich von Holstein (1837–1909), pending the reappearance of the Holstein papers. With the capture by the Allies of the massive archives of the German Foreign Ministry, these papers, formerly in private possession and confiscated successively by the Gestapo and by the Foreign Ministry, have now re-emerged. Their publication has been approved by their former owner as well as by the British Foreign Office and the United States Department of State in their capacity as custodians of the German documents. The Holstein papers that have survived consist of political memoranda, diary fragments for the period 1881 to 1888, memoirs, and a large volume of letters. The present volume presents the memoirs, dealing loosely and fragmentarily with various stages and episodes of Holstein's career; subsequent volumes will consist of diaries and letters.

The editors make the rather exaggerated claim that these papers will lead to a complete rejudgment of German foreign policy, of Bismarck, and of Holstein himself. In particular, the editors assure us, these papers will explode the myth—if it is a myth—of Holstein as the sinister schemer behind the scenes. As everyone knows, Holstein acquired an evil reputation among contemporaries and succeeding generations as the "evil genius" of the Foreign Ministry and was regarded as a warped personality and social recluse. Although he never held a higher office than *Vortragender Rat* (Counselor), he was the most influential person in the Foreign Ministry by virtue of his long experience and Bismarck's confidence in him. After the latter's fall from office in 1890 Holstein virtually dominated foreign policy until in 1906 he was forced to resign because of his reckless policy during the first Morocco crisis.

As a historical source the Holstein memoirs are rather disappointing. They contain a good deal of society talk, petty affairs, and Holstein's observations and characterizations of contemporaries. Some of

this is illuminating and entertaining (illuminating especially the author's character), but it adds little or no new light on the major problems in this period. Holstein's part in the Arnim affair is in no way clarified by his disclaiming to have had anything to do with it beyond his admission of political differences existing between Arnim and Holstein. His venomous comments about Bismarck (in later years), his opposition to the Iron Chancellor's complicated alliance system, and particularly to the "Reinsurance Treaty" with Russia are in no way surprising. That Holstein was violently Russophobic and Francophobic and to a considerable extent Anglophile and favored an Anglo-German alliance has been amply shown in recent studies by Helmut Krausnick, Peter Rassow, and G. P. Gooch. Holstein blames Chancellor Buelow and the Kaiser for the failure to reach an agreement with England at the turn of the century, but that Holstein, too, insisted on an exorbitant price for such an agreement he fails to point out. The Moroccan affair of 1905 is given scant attention.

It is perhaps unfair to expect significant revelations from these memoirs. As the editors point out, there are great gaps in the narrative and certain papers have been removed, lost, or destroyed by interested parties. Finally, it is at least probable that Holstein himself wrote as he wished to be remembered and edited his papers accordingly.

OTHER COUNTRIES

MAO TSE-TUNG. *Selected Works.* Vol. I: 1926–1936; Vol. II: 1937–1938; Vol. III: 1939–1941. Pp. 336; 296; 260. New York: International Publishers, 1954, 1955. $3.00 each.

Mao Tse-tung's contribution to the formal literature of Chinese Communism began with the publication in March 1926 of a brief "Analysis of the Classes in Chinese Society" (I, pp. 13–20). During the next fifteen years, through May 8, 1941—the period covered by the first three volumes of his *Selected Works*—Mao produced fifty-six other works which the editors of the present series thought useful to reproduce. The *Selected Works* do not include all of Mao's works of this period, although no works of significance are known to be omitted; and the present texts have been carefully edited to revise and omit portions of the early works which for one unexplained reason or another were thought to need revision or deletions. Consequently the professional student of the history of Chinese Communism must still rely on Chinese originals of an earlier date for his research. However, for the general reader whose attention has been drawn to China by recent events, and who is interested in the mental processes and perspectives of the man who has been the unchallenged leader of the Chinese Communist Party since 1935, the present texts will be found extremely valuable and representative. They offer insights into the nature and quality of Chinese Communist thought that cannot be had otherwise.

The present three volumes are the officially sponsored translation of the first two Chinese volumes published in Peking in 1951. They include a wide variety of materials: the shorter pieces include press interviews, official policy statements, and such pungent essays as "Combat Liberalism" (September 7, 1937; II, pp. 74–76); the longer pieces include theoretical expositions which were not widely known before 1950—such as "On Practice" (July 1937; I, pp. 282–97) and "On Contradiction" (August 1937; II, pp. 13–53)—and the most important political and tactical works, which have long served as basic guidance for party cadres and the rank-and-file.

Three of the political-tactical works have particular significance. (1) "Strategic Problems of China's Revolutionary War" (I, pp. 175–253) is the unfinished analysis of the military lessons of the "Second Revolutionary Civil War" which Mao presented in December 1936, to familiarize his followers with military doctrines that would be applicable in the war with Japan. This central military analysis was the predecessor of many others, including "Strategic Problems in the Anti-Japanese Guerrilla War" (May 1938; II, pp. 119–56), and "On the Protracted War" (May 1938, II, pp. 157–243). Out of this body of doctrine emerge explanations of the military victory over the Kuomintang and, to some extent, of the Communist military tactics in such other Asian countries as Viet-Nam and Laos. (2) "The Chinese Revolution and the Chinese Communist Party" (December 1939; III, pp. 72–101) is a Marxist-Leninist attempt to fit the Communist Revolution into the mainstream of China's revolutionary experience and to apply Leninist principles to the analysis of the revolutionary potential of the different classes of Chinese society. (3) "On New Democracy" (January 1940; III, pp. 102–56) was the authoritative pre-1949 guide to the political organization, methods, and objectives in Communist-controlled parts of China, and throws important light on the principles of public policy written into the Constitution of the Chinese People's Republic of September 20, 1954.

Maoism—*Mao Tse-tung ssu-hsiang* (lit. "the Thought of Mao Tse-tung")—is the official doctrine of the Chinese Communist Party. It is not a philosophical system of very high order, suffering in this respect the weaknesses of other expressions of Marxist-Leninist doctrine. Nevertheless, Maoism emphasizes the special situation of China, and the special requirements of the revolution in China, and to that extent is the Chinese counterpart of Stalinism. Its basic tenets are found in the first three volumes of Mao's *Selected Works* and establish a tenuous distinction between Chinese and Soviet Communism.

H. ARTHUR STEINER
University of California
Los Angeles

Ennin's Diary, The Record of a Pilgrimage to China in Search of the Law. Translated from the Chinese by Edwin O. Reischauer. Pp. xvi, 454. $7.50.

EDWIN O. REISCHAUER. *Ennin's Travels in T'ang China.* Pp. xii, 341. New York: The Ronald Press, 1955. $5.00.

Ennin was a Japanese Buddhist monk who went to China in the year 838 to travel and to study Buddhism, and who remained there until, falling victim to the great Buddhist persecution of 845, he was expelled from the country, and returned to his own homeland two years later. During these nine and one-half years he wrote (in Chinese) a lengthy diary, notable not only as the first great document of its sort in the Far East, but also as the first detailed account of China by a foreign visitor. Ennin was fortunate enough to have seen China during one of its peak periods of political and cultural glory—the T'ang dynasty—when Chinese Buddhism was at its apogee. Now, in these two handsomely printed volumes (each equipped with excellent maps), Professor Reischauer of Harvard has made this ancient Far Eastern record available for the first time to the Western world.

The first of the volumes containing a complete translation of the diary is a splendid piece of scholarship, primarily designed for the specialist, in which a host of difficult problems, linguistic and otherwise, has been successfully surmounted. The second volume, while equally scholarly, is on the other hand intended for a more general public. In it Reischauer has extracted the essential meat from Ennin's diary, added to it material drawn from other sources, and thus given us, in modern language, a coherent picture of what Ennin saw in ninth-century China. Some of its topics include Ennin's dealings with Chinese officialdom, everyday life in T'ang China, popular Chinese Buddhism, and the great Buddhist persecution of 845.

There is much in Ennin's diary, and even more in Reischauer's book based on this diary, that is fresh and interesting. For the 845 persecution, for example, the diary is our most detailed single source. Yet there is also a good deal in Reischauer's book that, to the general reader at least, will probably seem somewhat inconsequential or pedantic, even though it no doubt has significance for the scholarly specialist. The chapter on popular Buddhism, for example, while telling much about some of the formal aspects of T'ang Buddhism, conveys no idea at all of the qualities, spiritual or otherwise, which made Buddhism the great religious force it was.

No doubt these features of Reischauer's book reflect corresponding features in the

record of Ennin himself, who, as Reischauer points out (*Ennin's Travels*, p. 38), "apparently was not a man of creative imagination." As seen through his diary, Ennin appears to have been a sincere and devout, but nonetheless somewhat matter-of-fact person. He faithfully recorded the factual minutiae of everyday life, including texts of numerous letters and official documents, and, as far as Buddhism is concerned, was apparently chiefly impressed by its miracle-working and ritualistic aspects. It seems a pity that Reischauer has not chosen to tell us more specifically just what it was in Buddhism that Ennin took back with him to Japan and that made him such an important figure there. One interesting point, alluded to but not commented on by Reischauer, is that Ennin, devout Buddhist though he was, was enough of an eclectic to be ready to pray, in moments of emergency, to all sorts of Shintoist and other non-Buddhist divinities.

In the opening pages of *Ennin's Travels*, Reischauer interestingly compares Ennin with Marco Polo, pointing out that the former, as a Buddhist monk coming from a country culturally an offshoot of China, was far better equipped than the latter to enter into a sympathetic understanding of Chinese life, and that his diary is a much more detailed and accurate source of information. This is unquestionably true, yet it is equally true that, judged purely in terms of human interest and its ability to stir men's imaginations, the diary falls far short of Polo's famous narrative. Grateful though we are to Ennin for this record of China during one of its peaks of splendor, and to Professor Reischauer for now making it available to the West at a time when China has again become a world power, there is very little likelihood that it will ever rival in popularity the no doubt often superficial and misleading, yet always fascinating, account of the Venetian traveler.

DERK BODDE
University of Pennsylvania

WERNER LEVI. *Modern China's Foreign Policy*. Pp. xi, 399. Minneapolis: University of Minnesota Press, 1953. $5.50.

Professor Levi's book is an attempt to "analyze and interpret China's foreign policy" during "the past century or so," with China, and "not the countries with which she has had dealings," as "the focus of the study." This admirable objective is only partially attained because (1) the author has not used enough Chinese material to enable him really to get behind the scenes and see what the Chinese attitudes, motives, objectives, hopes and dreams actually were, and (2) his manner of organization and presentation fails to bring out clearly the major developments and trends.

The author attempted to meet the first difficulty by using translated Chinese documents, works by Chinese in Western languages, foreign newspapers published in China and Chinese news releases. He has also used German and French materials far more extensively than do most American writers. Despite this, however, his basic analysis has had to be based on the exterior record as shown in treaties, notes and public statements, and only now and then has his account been illuminated by a glimpse at the interior record—instructions to negotiators, interoffice memos, private letters, papers, and so forth, of those involved in policy making. A thorough understanding of China's foreign policy will only come after the large mass of this interior record now available to scholars has been laboriously studied.

The book of approximately 400 pages is organized into twenty-five chapters without dates or subheads. Chapter headings are only partially descriptive of policy. Fewer chapters, with headings descriptive of policy aims, characteristics or trends, with sub-topics dealing with specific developments illustrating how efforts to implement policy aims failed or succeeded, would have presented the analysis much more clearly and forcefully. Brief statements at the beginning or end of chapters pointing up the significant trends are also needed. As it is, many penetrating observations and significant trends are all but lost in the dead level of presentation. The really important points that the Boxer Settlement of 1901 played into the hands of the reactionary Empress and her clique when it could have easily assured the accession to power of progressive elements (p. 69), and that the failure of the Western powers to respond sympathetically and quickly enough to the upsurge of young progressive China from 1919 to 1922, epitomized by the ignoring of the appeal of Sun Yat-sen and the failure of the Washington Conference to take concrete steps to help China, threw Young China into a leftist tailspin from which it was never fully able to recover (pp. 157–63) are almost lost sight of in the welter of other facts and generalizations. The Sun-Joffe declaration of January 1923, which might have been used to highlight this shift, is not even mentioned (pp. 174–75), although the general shift is discussed.

Despite the amount of specific detail that one finds in the study it is written at a rather high level of generalization, and many of the remarks and statements will not be fully understood or appreciated by one who does not already have the basic details of Far Eastern developments well in mind. The final third of the book dealing with the period of the collapse of Chiang and the development of Communist policy is especially well done. The work as a whole is full of interesting and often challenging interpretations and suggestions, but it has to be read slowly and with care if these are to be noted and given the consideration they deserve.

EARL H. PRITCHARD
University of Chicago

JEAN STROETZEL. *Without the Chrysanthemum and the Sword: A Study of the Attitudes of Youth in Postwar Japan.* (A UNESCO Publication.) Pp. 334. New York: Columbia University Press, 1955. $4.00.

This book is the outcome of a study planned by UNESCO in 1951 and 1952 to investigate the attitudes of Japanese youth in the 15–25 year age range, with special reference to the social reforms in Japanese society administered during the Occupation period. The objective was to determine how these reforms had influenced the attitudes of young people and to assess such attitudes in the light of known constants in Japanese social relations and cultural patterns. The study was directed by Jean Stroetzel, a French social psychologist, in collaboration with F. Vos, a Dutch specialist in Japanese ethnology and behavior. Many Japanese scholars and scientists assisted in the planning of the project and were instrumental in accomplishing the actual research operations. Special mention should be made of the National Public Opinion Institute of the Japanese Government, which did the national-sample attitude survey forming the nucleus of the study.

Methodologically this is a model research undertaking. It is the first major project to consciously employ socio-psychological, personological, and cultural anthropological techniques and knowledge in order to gain insight into the problem of attitudes in a sector of the population of a large nation-society. Recognizing the advantages and limitations of anthropological methods, the researchers successfully used anthropological knowledge of behavior and social patterns as a background against which attitudes influenced by contemporary events and experiences could be placed and ultimately interpreted.

The findings are extremely valuable, if not particularly surprising. Since it is impossible in a brief review to summarize a large quantity of specific data, one may hazard the impression that the attitudes and personalities of Japanese youth as revealed by this study provide the reader with a feeling that Japan is headed in very familiar directions. In Japanese youth, as in the youth of the West, a prevailing anxiety over contemporary historical uncertainties, and a willingness to reserve opinion on political matters (save for a special activist element in the universities, not fully acknowledged by the author) are in evidence—buttressed in the Japanese case by understandable economic and military insecurities brought about by Japan's ambiguous international position.

In spite of this "conservative" or withdrawal tendency *re* political matters, Japanese youth is predominantly prodemocratic and individualistic in the sphere of human relations. The Occupation period reforms, building upon latent liberalism due to industrialization and urbanization, and to

residues from the "liberal era" of the 1920's, have emerged among the majority of young people in the form of favorable views of love *vs.* arranged marriage; considerable personal ambition to "succeed"; discontent with the burdens of the family system; and numerous other "democratic" or egalitarian tendencies. These and other "modern" values are, of course, not symmetrically distributed. The sampling indicates that they vary by locality and region; the more isolated and traditional areas yielding more traditional responses.

Yet underlying this general modern cast of opinion go uncertainties which are interpreted as based on the prevailing functional character of the older institutions. While many young people reject family obligations, their personality analyses indicate that they still depend upon family ties for security to an extent probably greater than in Western countries, and their optimism and ambition are founded on images of an expanding society which the economic and political facts do not necessarily bear out. This is perhaps symptomatic of Japan's intermediate and dynamic position: while her modern history is best interpreted, as Reischauer has pointed out, in the broad categories and processual factors of Western society, her psychology, and the means she often uses to accomplish her "modern" ends, often remain traditional, and if not stereotypically "Oriental," at least "feudal" and "hierarchical," and adjusted to the facts of life in an overpopulated country which must depend upon foreign trade for a living. Japan is still at the crossroads, culturally, psychologically, and historically; her future is by no means certain, and the particular mixture of the traditional and the Western elements in her culture has not yet taken stable form.

JOHN W. BENNETT
Ohio State University

MICHIHIKO HACHIYA. *Hiroshima Diary: The Journal of a Japanese Physician, August 6–September 30, 1945.* Translated by Warner Wells and Neal Tsukifuji. Pp. xi, 238. Chapel Hill: University of North Carolina Press, 1955. $3.50.

Ordinarily one cannot review a book by quoting from its jacket but this is an exception. "This is a day by day eyewitness account of the atomic bombing of Hiroshima and the seven weeks that followed. Terrifying in its portrayal of the greatest man-made catastrophe in history, it is inspiring in its revelation of the heights of human heroism."

Not only is the book an important contribution to medical literature, but it is also interesting from a political science point of view. When the bomb exploded, a government employee, making his way through the darkened streets and fallen houses, ran to the fourth floor of the building where the Emperor's picture was hung, pried open an iron door behind which it was kept, and, with the help of others, carried it to safety ahead of the fire which broke out to the water's edge, the crowds of wounded and fleeing opening up, saluting and bowing to let it pass. The people of Hiroshima reflected the attitude of one old lady who said: "I'm sorry for the Emperor. He didn't start the war." The masses did not realize what had struck them and they were subject to all kinds of rumors including one that the city would be uninhabitable for seventy-five years. According to the author, the military authorities "had betrayed the Emperor and the people of Japan," and the ruthlessness of the army leaders and their stupidity knew no bounds. "Our personal rights were violated and we never knew when we might say something to provoke their irascible and vindictive natures." "The one word—surrender—had produced a greater shock than the bombing of our city." Contrary to the usual Japanese respect for law and order, the city was infested with burglars, looting was common and "the country was in the clutches of the mean and unintelligent." Yet despite all this criticism by Dr. Hachiya, his own exploits and heroism and those of his brave and conscientious staff make up a remarkable saga of Japanese courage and fortitude.

If the author ever entertained any harsh feelings toward the United States for the dropping of the bomb, he no longer seems to harbor them since his diary merely states that Buddhism taught him to be resigned in the case of adversity, and his 1952 postscript declares that when he thinks of the kindness of the American officers and doctors who subsequently took charge, "I think one can overlook thoughts of revenge." Everyone should read this short but fascinating and terrible story. Great credit is due to Warner Wells and Neal Tsukifuji for the lucidity of their translation from the Japanese.

ALBERT E. KANE
Washington, D. C.

HUBERT HERRING. *A History of Latin America: From the Beginnings to the Present.* Pp. xx, 796, xxvi. New York: Alfred A. Knopf, 1955. $6.50.

This is a lively and interesting history of the twenty highly diversified nations south of the United States which we lump together for convenience under the term "Latin America." Fulfilling the promise of the book's title, the author sketches their history "from the beginnings" more than two thousand years ago in Indo-America, Europe, and Africa—the three major areas from which the racially variegated population of modern Latin America was drawn. He has also done all that is humanly possible in this changing world to make good the promise of bringing the story down "to the present": for example, he discusses so recent an event as the overthrow of the "Communist-inspired" Arbenz government of Guatemala in June 1954.

Professor Herring has long been one of the most widely read writers on Latin America, but he has addressed himself primarily to the general reader in all his previous writings. These include *Good Neighbors,* one of the best of the World War II spate of books about Latin America, and numerous articles about Good Neighborland in *Harper's* and other magazines catering to what used to be called the carriage trade.

Now for the first time Herring has addressed himself directly to an academic audience, for the book under review is obviously a college text book—witness its numerous footnotes, its half-dozen statistical tables, and its thirteen-page reading list. In the main, however, he has adhered rather closely to the established pattern of text books in this field. The most striking illustration of this fact is provided by the section on the national period (pp. 243–772). Here, except for a twenty-eight-page group of chapters on "Latin America and the United States," each country is treated separately, with the result that this section, which fills more than two-thirds of the book, is not so much a history of Latin America as an aggregation of twenty national histories.

Although this is a text book, it is written in a style that should give it a wide appeal. The emphasis is on politics and personalities, though there is enough economic and social material to satisfy most readers who like to be provided with that kind of ballast.

Oddly enough in view of Herring's previous interest in cultural matters (see, for example, *Renascent Mexico,* which he coedited), the cultural aspect of Latin American history is rather neglected in this book. Thus, there is only a ten-page chapter on "The Formation of Spanish-American Culture" for the colonial period, and no corresponding chapter at all for the national period. The separate national histories do not fill the gap. For example, of Mexico's two outstanding writers in the past generation, one, José Vasconcelos, is mentioned only in connection with his political appointment as Minister of Education, and the other, Alfonso Reyes, is not mentioned at all. Herring surely knows a great deal about the cultural history of Latin America. Was it assumed that this would not interest either students and teachers or the general reader?

COLLEGE TEXTS

GOVERNMENT BY THE PEOPLE, 2nd Edition

By JAMES M. BURNS, *Williams College*, and JACK W. PELTASON, *University of Illinois*

Recently revised to bring the dynamics of American national government to your students in a more compelling manner than ever, this widely adopted text now reaches well into the Eisenhower administration in its vivid examination and analysis of the workings of our government. The new edition offers tighter, more logical organization, more factual content, and new and improved illustrations, charts, tables, and appendices. The new (restricted) Teacher's Manual is packed with suggestions for class projects, discussions, lecture topics, and testing questions.

1070 pages . 6" x 9" . Published 1954

PROBLEMS IN INTERNATIONAL RELATIONS

By ANDREW GYORGY and HUBERT S. GIBBS, *both of Boston University*

This new text is the first systematic application of the problem method to the field of International Relations. It presents twenty-five carefully selected cases which offer the student an unusual opportunity to analyze concrete situations and apply certain general principles of International Politics. Two-thirds of the problems were written specifically for this book and present new materials; the remaining cases were carefully selected and edited from leading publications.

352 pages . 6" x 9" . Illus. . Published February 1955

THE GREAT ISSUES OF POLITICS

By LESLIE LIPSON, *University of California, Berkeley*

This text offers a new analysis of the fundamentals of the political process. These are presented to the readers as a series of basic issues which arise in every political system, in any kind of state, in all forms of government. The book is original in its theme and approach, treating the subject in a novel way never before attempted. Designed as a discussion between the author and the reader, its aim is to help the reader think about the problems which are basic to politics.

431 pages . 5⅝" x 8⅜" . Published 1954
