FOREWORD

This issue contains a symposium on the formulation of ethical standards of practice within specific professional groups. The volume is in large part a revision of some of the subject matter appearing in THE ANNALS of May 1922.

The materials are presented in two parts. The first contains articles on developments within particular professions. The second contains three comprehensive or generalizing articles that sum up the problem of defining a profession and the evidence that business management is becoming a profession. As the third article, it has been thought appropriate to reprint from the 1922 volume Professor R. M. MacIver's article, "The Social Significance of Professional Ethics."

The authors writing in the various groups have been invited to present not mere descriptions but appraisals or evaluations of:

1. The ethical standards that have been recognized or adopted. If there is a code this is quoted. Brief codes are given in full; the lengthier ones are generously quoted.
2. The processes by which the ethical standards were formulated.
3. Activities by way of encouraging observance or by way of enforcement of the code or other standards.
4. Emerging problems or unresolved issues or difficult matters with which the professional group is dealing.
5. Other aspects deemed important by the author.

These specifications have been applied by the authors selected in accordance with their own judgment.

The symposium is published in the expectation that it meets a need for interpretations of recent experience. Here is at least a portion of the record of a process going on in society. It may be restated that the emphasis here has been to record experience, and thus not to consider in any technical sense the social theories involved. Probably, however, the student of social theory will find here materials which are grist for his mill.

BENSON Y. LANDIS

The Ethics of Public Accounting

By John L. Carey

VANNEVAR Bush has noted as one of the important characteristics of a profession the fact that the typical client who buys professional services is not in a position to judge their quality for himself. He must rely on the reputation of the individual professional practitioner and the standards of conduct maintained by the profession as a whole. *Caveat emptor* does not apply.

For each particular profession, therefore, ethical concepts grow as the public interest in its services becomes more clearly discernible. The development of formal ethical standards in the accounting profession is an especially interesting example of such growth because it has come about in so short a time.

From the earliest days of accounting—double-entry bookkeeping was invented in Italy in the fifteenth century—the honesty and integrity of the individual accountant were paramount, because his work was worthless unless people trusted him. But it is a long step from individual reputation to general professional responsibility, and the accounting profession has taken that step in comparatively recent years, as the number of accountants in public practice and the number of people relying on their work have grown at a spectacular rate.

There were approximately 250 certified public accountants in the United States in 1900 and less than 5,000 in 1920; today there are more than 50,000. On January 23, 1954, Mr. Arthur B. Foye, president of the American Institute of Accountants, predicted that the number of certified public accountants in the United States will double in the next ten to fifteen years. Many things have contributed to this growth: the diffusion of corporate stock ownership, with public demand for an independent examination of corporation financial statements; the establishment, and ever heavier burden of, business and individual income taxes; the interest of management, creditors, labor, government, and the general public in the reliability of financial reporting. Not least important is the fact that there may be honest differences of opinion in accounting, so that objective standards are needed to provide understandability and reasonable comparability.

The ethics of public accounting therefore has two aspects: (1) a code of professional conduct and (2) development of generally accepted accounting principles and auditing standards.

Accounting Standards

Since the emphasis in this paper is on professional ethics rather than standards, it need only be said about the latter that the American Institute of Accountants (since 1937 the only national organization of certified public accountants) has committees on accounting and auditing procedure which regularly issue authoritative statements aimed toward minimizing areas of difference and controversy in accounting practice.

Rules of Professional Conduct

The American Institute has also had since 1917 an official code of professional conduct, binding on all members, which formalizes the generally accepted ethical standards of the accounting pro-

fession.[1] As in other professions, this code is in continual process of modification and expansion in the public interest. At present there are sixteen rules, which may be summarized as follows:

Professional attitude

1. Firm name, style, and description must be appropriate.
2. Practice as a corporation is forbidden.
3. Occupations incompatible with public accounting are prohibited.
4. Members in practice also engaged in other related occupations must observe the same rules of conduct in such other occupations.
5. Advertising is prohibited.
6. Solicitation is prohibited.
7. Institute members must observe the rules of state societies, where they exist, on competitive bidding.
8. Offers of employment to employees of other accountants are prohibited.

Confidence of clients

1. The confidential relationship with the client must not be violated.
2. Splitting fees with, or paying commissions to, the laity is prohibited.
3. Members may not permit another, except a partner or employee, to use his name in connection with financial statements.
4. A member may not sign work prepared by others, except his own associates or other accredited accountants.

Confidence of third parties

1. In certifying statements, members must conform with generally accepted accounting and auditing standards.
2. Contingent fees (fees based on the accountant's findings or the results thereof) in conjunction with audit work are prohibited.

[1] The Rules of Professional Conduct of the American Institute of Accountants appear in full in the Appendix to this article.

3. A member must not vouch for the accuracy of forecasts of earnings.
4. A member may not express an opinion on financial statements of an enterprise financed by public distribution of securities if he or one of his immediate family has a substantial financial interest in the enterprise. If the enterprise is not publicly financed but the statements are used as basis of credit he may not express an opinion unless in his report he discloses any substantial financial interest which he or his family may have in that enterprise.

CONCEPT OF INDEPENDENCE

The concept of independence, implied throughout these rules, is the most important of all, and is in some respects peculiar to the accounting profession. The accountant in public practice recognizes at all times a moral responsibility not only to his client but also to any third party who may place reliance on financial statements with which the accountant's name is associated. This concept of independence, accepted in the profession since early days, is now recognized in law and specifically in the rules and regulations and decisions of the federal Securities and Exchange Commission, which requires that all corporations whose securities are listed on the principal stock exchanges be audited by independent public accountants.[2]

Securities and Exchange Commission

Rules of the Securities and Exchange Commission provide that an accountant will not be considered independent with respect to any client in which he has a substantial financial interest, or with whom he is related as promoter, underwriter, voting trustee, director, officer, or employee. In addition, the Commission has held in specific cases that the following factual situations tended to impair the independence of certifying accountants:

1. The balance sheet was prepared by an employee of the certifying accountants who was also serving as the unsalaried but principal financial and accounting officer of the registrant and who was a shareholder of the registrant.[3]
2. The accountant was an employee or partner of another accountant who held stock of the registrant issued for services rendered in connection with its organization.[4]
3. The certifying accountant consciously falsified facts.[5]
4. The accountants subordinated their judgment to the desires of their client.[6]
5. The agreement between accountant and client indemnified the accountant against liability.[7]

AIA rules on independence

Although the word "independence" is not used in the Rules of Professional Conduct of the American Institute of Accountants, it is clear that a number of the rules are designed to buttress independence. Most important is Rule 5, which reads in full as follows:

> In expressing an opinion on representations in financial statements which he has examined, a member may be guilty of an act discreditable to the profession if
>
> (a) he fails to disclose a material fact known to him which is not disclosed in the financial statements but disclosure of which is necessary to make the financial statements not misleading; or
>
> (b) he fails to report any material misstatement known to him to appear in the financial statement; or
>
> (c) he is materially negligent in the conduct of his examination or in making his report thereon; or
>
> (d) he fails to acquire sufficient information to warrant expression of an opinion, or his exceptions are sufficiently material to negative the expression of an opinion; or
>
> (e) he fails to direct attention to any material departure from generally accepted accounting principles or to disclose any material omission of generally accepted auditing procedure applicable in the circumstances.

Subjective attitudes

It will be noted that the concept of independence exemplified in Rule 5 is subjective, emphasizing attitude of mind and purpose rather than adherence to standards defining prohibited acts and relationships. As stated by the Executive Committee of the American Institute of Accountants:

> Rules of conduct can only deal with objective standards and cannot assure independence. Independence is an attitude of mind, much deeper than the surface display of visible standards. These standards may change or become more exacting but the quality itself remains unchanged. Independence, both historically and philosophically, is the foundation of the public accounting profession, and upon its maintenance depends the profession's strength and its stature.[8]

Under the subjective test of independence, therefore, it may be argued that an accountant might be independent in spite of close relationships with his client, or that he might lack independence in spite of the most correct appearances. His behavior, whether it meets

[2] Rule 2.01, Regulation S–X, Securities Act of 1933, the Securities Exchange Act of 1934, and the Investment Company Act of 1940.

[8] "Independence of the Certified Public Accountant," *The Journal of Accountancy*, July 1947, pp. 51–53.

the test of an objective definition or not, might be the best criterion of independence.

Objective standards

This is not to say, however, that the profession is content either to leave the whole matter to subjective determination or to relegate the task of maintaining the objective concept of independence to enforcement by the courts or governmental administrative agencies. Rules 3, 4, 6, 9, 13, and 15 of the Rules of Professional Conduct of the American Institute of Accountants fortify the concept of independence in objective terms. For example, Rule 13 limits the financial interest which an accountant may have in a client's affairs, as follows:

> A member shall not express his opinion on financial statements of any enterprise financed in whole or in part by public distribution of securities, if he owns or is committed to acquire a financial interest in the enterprise which is substantial either in relation to its capital or to his own personal fortune, or if a member of his immediate family owns or is committed to acquire a substantial interest in the enterprise. A member shall not express his opinion on financial statements which are used as a basis of credit if he owns or is committed to acquire a financial interest in the enterprise which is substantial either in relation to its capital or to his own personal fortune or if a member of his immediate family owns or is committed to acquire a substantial interest in the enterprise, unless in his report he discloses such interest.

Rule 3 prohibits fee-splitting, and acceptance of brokerage or commission from laymen. Rule 4 prohibits members from engaging in occupations incompatible with public accounting. Rule 6 prohibits a member from signing a report purporting to express his opinion as a result of an examination of financial statements unless prepared by him or other accredited accountants as defined in the rule. Rule 9 prohibits a member from accepting fees contingent upon the results of his findings.

ENFORCEMENT

Professional standards of conduct are of merely academic value, however, unless backed by adequate power of enforcement. Disciplinary authority over certified public accountants is exercised by state boards of accountancy, by state societies of certified public accountants, and by the American Institute of Accountants. State boards administer the laws concerning certified public accountants, which exist in all the states. They have power to suspend or revoke the certificate of a certified public accountant for misconduct, specified in the governing statute, or for violations of rules which the boards may have adopted under authority of the statute. State societies may admonish, suspend, or expel members found guilty of violations of the bylaws of such state societies or of their rules of professional conduct. The American Institute of Accountants may admonish, suspend, or expel a member who is found guilty of violation of its bylaws or Rules of Professional Conduct, and may publish the name of the offending member if the trial board so orders.

A complaint may be submitted to the Institute by a state society, or a complaint may be submitted by the Institute to a state society or to a state board.

The Committee on Professional Ethics of the American Institute of Accountants may receive complaints from members of the Institute, from the general public, and from Institute staff members who have been instructed to refer to the committee public documents such as court decisions or press clippings which include any allegation or intimation that a member of the Institute has conducted himself in a manner discreditable to the profession. The committee also receives as complaints releases of the Securities and Exchange Commission in which there is reference to members of the Institute, transmitted by the chief accountant of the Commission.

NEW PROBLEMS UNDER STUDY

It will be readily understood that in a rapidly growing profession new problems of professional conduct constantly occur. To devise a code of ethics good for all time is neither practical nor desirable. However, alert recognition of new problems as they arise plus effective organization can be instrumental in devising rules which will maintain an ever higher level of professional conduct. Suggestions for improvement in the standards of professional conduct are continually under study.

For example, it has been suggested that Rule 5 should provide for enforcement of the Statements on Auditing Procedure No. 23 of the American Institute of Accountants, which the profession has adopted.

Statement No. 23 recommends that an independent auditor, in any report to which his name is attached in conjunction with financial statements, either express an opinion on the fairness of the financial statements, with or without exceptions as might be permitted, or, if his examination has been insufficient to justify the expression of an opinion or for other reasons he must withhold an opinion, state clearly that he is unable to express such opinion and the reasons why.

Another area which is being studied deals with the problem of competitive bidding, particularly with regard to municipal audits.

Competitive bidding for professional engagements is one of the things that tends to lower professional standards. Several state societies have adopted rules forbidding members to submit competitive bids, and Institute members must observe those rules where they exist. One of the difficulties in stopping this practice is encountered in defining a competitive bid in such a way as to be acceptable to all concerned. One effective approach to the problem lies in education of the public to an understanding of the fact that they can hope only to get what they pay for, and that a request for bids often automatically eliminates reputable certified public accountants from consideration.

GENERAL PUBLIC INTEREST

In all professions, of course, rules of conduct are adopted in the general public interest as well as in the interest of clients. The doctor has a responsibility for public health, the lawyer for the fair administration of justice, the architect for the safety of all who use buildings. The accountant in public practice is likewise responsible for reliable and comprehensive financial reporting as essential to the general health of the economy.

But the public accountant also has a special responsibility to many individuals who are not his clients and yet have an immediate stake in his work: the banker who lends money on an audited financial statement, the investor who judges the value of his stock on the basis of a corporation's annual report, government agents who accept it in measuring tax liability.

When a famous fraud case revealed the fact that auditing practices previously considered adequate might fail to reveal a falsification of inventories and receivables, the accounting profession promptly adopted new standards for audit of these assets.

Accounting is not an exact science, and never can be. Currently, for ex-

ample, there is a major difference of opinion among economists, business executives, and accountants themselves with respect to the proper depreciation figure for facilities which would cost more to replace than they cost originally. That is a question of accounting principles rather than ethics.

But even in this difficult question, the public is protected by the *ethical* accounting concept of full disclosure; any departure from presently accepted accounting principles must be clearly indicated in the accountant's formal opinion on the financial statements, and if the departure has a significant bearing on the reported figures, he must qualify his opinion or refuse to express any opinion at all.

Accounting, like other professions, will continue to grow and change as far into the future as we can see. The ethics of the accounting profession are designed to give the public the greatest possible protection throughout this process of growth and development.

John L. Carey, New York City, has been since 1948 executive director of the American Institute of Accountants, of which he was previously assistant secretary (1925–30) and secretary (1930–48). He is editor of the Journal of Accountancy and author of Professional Ethics of Public Accounting (1946).

APPENDIX

RULES OF PROFESSIONAL CONDUCT *

AMERICAN INSTITUTE OF ACCOUNTANTS

(These rules of conduct supplement the disciplinary clauses of the by-laws.)

(1) A firm or partnership, all the individual members of which are members of the Institute, may describe itself as "Members of the American Institute of Accountants," but a firm or partnership, not all the individual members of which are members of the Institute, or an individual practicing under a style denoting a partnership when in fact there be no partner or partners, or a corporation, or an individual or individuals practicing under a style denoting a corporate organization shall not use the designation "Members of the American Institute of Accountants."

(2) A member shall not allow any person to practice in his name who is not in partnership with him or in his employ.

(3) Commissions, brokerage, or other participation in the fees or profits of professional work shall not be allowed directly or indirectly to the laity by a member.

Commissions, brokerage, or other participation in the fees, charges, or profits of work recommended or turned over to the laity as incident to services for clients shall not be accepted directly or indirectly by a member.

(4) A member shall not engage in any business or occupation conjointly with that of a public accountant, which is incompatible or inconsistent therewith.

(5) In expressing an opinion on representations in financial statements which he has examined, a member may be held guilty of an act discreditable to the profession if

(a) he fails to disclose a material fact known to him which is not disclosed in the financial statements but disclosure of which is necessary to make the financial statements not misleading; or

(b) he fails to report any material misstatement known to him to appear in the financial statement; or

(c) he is materially negligent in the conduct of his examination or in making his report thereon; or

(d) he fails to acquire sufficient information to warrant expression of an opinion, or his exceptions are sufficiently material to negative the expression of an opinion; or

(e) he fails to direct attention to any material departure from generally accepted accounting principles or to disclose any material omission of generally accepted auditing procedure applicable in the circumstances.

(6) A member shall not sign a report purporting to express his opinion as the result of examination of financial statements unless they have been examined by him, a member or an employee of his firm, a member of the Institute, a member of a similar association in a foreign country, or a certified public accountant of a state or territory of the United States or the District of Columbia.

(7) A member shall not directly or indirectly solicit clients by circulars or advertisements, nor by personal communication or interview, not warranted by existing personal relations, and he shall not encroach upon the practice of another public accountant. A member may furnish service to those who request it.

(8) Direct or indirect offer of employment shall not be made by a member to an employee of another public accountant without first informing such accountant. This rule shall not be construed so as to inhibit negotiations with anyone who of his own initiative or in response to public advertisement shall apply to a member for employment.

(9) Professional service shall not be rendered or offered for a fee which shall be contingent upon the findings or results of such service. This rule does not apply to cases involving federal, state, or other taxes, in which the findings are those of the tax authorities and not those of the accountant. Fees to be fixed by courts or other public authorities, which are therefore of an indeterminate amount at the time when an engagement is undertaken, are not regarded as contingent fees within the meaning of this rule.

(10) A member shall not advertise his professional attainments or services:

(a) The publication of what is technically known as a card is restricted to an announcement of the name, title (member of American Institute of Accountants, CPA, or other professional affiliation or designation), class of service, and address of the person or firm, issued in connection with the announcement of change of address or personnel of firm, and shall not exceed two columns in width and three inches in depth if appearing in a newspaper, and not exceed one-quarter of a page if appearing in a magazine or similar publication.

(b) A paid listing in a directory is restricted to the name, title, class of service, address and telephone number of the person or firm, and it shall not appear in bold type, box, or other form of display, or in a style which differentiates it from other listings in the same directory.

(11) A member shall not be an officer, director, stockholder, representative, or agent of any corporation engaged in the practice of public accounting in any state or territory of the United States or the District of Columbia.

(12) A member shall not permit his name to be used in conjunction with an estimate of earnings contingent upon future transactions in a manner which may lead to the belief that the member vouches for the accuracy of the forecast.

(13) A member shall not express his opinion on financial statements of any enterprise financed in whole or in part by public distribution of securities, if he owns or is committed to acquire a financial interest in the enterprise which is substantial either in relation to its capital or to his own personal fortune, or if a member of his immediate family owns or is committed to acquire a substantial interest in the enterprise. A member shall not express his opinion on financial statements which are used as a basis of credit if he owns or is committed to acquire a financial interest in the enterprise which is substantial either in relation to its capital or to his own personal fortune or if a member of his immediate family owns or is committed to acquire a substantial interest

* As revised December 19, 1950.

in the enterprise, unless in his report he discloses such interest.

(14) A member shall not make a competitive bid for professional engagements in any state, territory, or the District of Columbia, if such a bid would constitute a violation of any rule of the recognized society of certified public accountants or the official board of accountancy in that state, territory, or District.

(15) A member of the American Institute of Accountants engaged in an occupation in which he renders services of a type commonly rendered by public accountants, must observe the by-laws and rules of professional conduct of the Institute in the conduct of that occupation.

(16) A member shall not violate the confidential relationship between himself and his client.

Standards of Professional Practice in Architecture

By GEORGE BAIN CUMMINGS

AT the Eighty-sixth Convention of The American Institute of Architects held in Boston, June 15–19, 1954, AIA Document 330, entitled "The Standards of Professional Practice," was revised, adopted as revised, and enacted as the official and governing ethical statement of The Institute. The statement, in two sections, reads as follows:

I—Obligations of Good Practice

The profession of architecture calls for men of the highest integrity, judgment, business capacity, and artistic and technical ability. An Architect's honesty of purpose must be above suspicion; he acts as professional adviser to his client and his advice must be unprejudiced; he is charged with the exercise of judicial functions as between client and contractors and must act with entire impartiality; he has moral responsibilities to his professional associates and subordinates; he is engaged in a profession which carries with it grave responsibility to the public. These duties and responsibilities cannot be properly discharged unless his motives, conduct and ability are such as to command respect and confidence.

Planning, technical guidance, advice and counsel constitute the service of the profession. Given in verbal, written or graphic form, they are rendered in order that buildings with their equipment and the areas about them, in addition to being well suited to their purposes, well planned for health, safety, efficient operation and economical maintenance, and soundly constructed of materials and by methods most appropriate and economical for their particular uses, shall also have beauty and distinction.

In order to promote the highest standards of conduct in the practice of architecture, The American Institute of Architects has formulated the following basic principles for the guidance of the profession:

A. An Architect's relation to his client depends upon good faith. Before undertaking any commission he should explain the exact nature and extent of his services, and of his compensation therefor. Where a fixed limit of cost is established in advance of design, the Architect must be given freedom in determining the character of design and construction needed to meet as nearly as feasible the cost limit established but should not be understood to guarantee the final cost which will be determined not only by the Architect's solution of the owner's fixed requirements but by the fluctuating conditions of the competitive construction market.

It is an important duty of the Architect to keep the owner informed, during the progress of the work, as to the probable cost of construction involved.

B. An Architect should consider the needs and stipulations of his client and the effect of his work upon the life and well-being of the public.

C. An Architect may offer his services to anyone on the generally accepted basis of commission, fee, salary or royalty, as Architect, consultant, adviser, or assistant, provided that he rigidly maintains his professional integrity.

D. An Architect should not make use of services offered by manufacturers, suppliers of building materials, appliances and equipment, or contractors, which may be accompanied by an obligation detrimental to the best interest of the client.

E. An Architect's drawings, specifications and other documents should be complete, definite and clear concerning his intentions, the scope of the contractor's work, the materials and methods of construction to be used therefor, and the conditions under which the construction work is to be completed and paid for.

F. An Architect should guard equally the interests of the contractor as well as those of the client. The Architect will condemn workmanship and materials which are not in conformity with the contract documents, but it is also his duty to give every reasonable aid toward a complete understanding of those documents so that mistakes may be avoided. He will not call upon a contractor to make good omissions and errors in the contract documents.

G. An Architect in his investments and in his business relations outside of his profession must be free from financial or personal interests which tend to weaken or discredit his standing as an unprejudiced and honest adviser, free to act in his client's best interests.

H. An Architect should promote the interests of his professional organizations and do his full part of the work of those organizations. He should share in the interchange of technical information and experience with the design professions and the building industry.

I. An Architect should inspire the loyal interest of his employees, providing suitable working conditions for them, requiring them to render competent and efficient services, and paying them adequate and just compensation therefor.

J. An Architect should endeavor to provide opportunity for the professional development of those who enter the profession, by assisting them to acquire a full understanding of the functions, duties and responsibilities of Architects.

K. An Architect should seek opportunities to be of constructive service in civic affairs, and to the best of his ability advance the safety, health and well-being of the community in which he resides.

Finally, every Architect should do his part to forward justice, courtesy and sincerity in his profession. It is incumbent on him in the conduct of his practice to maintain a wholly professional attitude toward those he serves, toward those who assist him in his practice, toward his fellow Architects, and toward the members of other professions, and the practitioners of other arts. He should respect the distinction between professional practice and non-professional enterprise.

II—Mandatory Standards

1. An Architect shall not accept any compensation for his services other than from his client or employer.

2. An Architect shall not render professional services without compensation.

> He shall neither offer nor provide preliminary services on a conditional basis prior to definite agreement with the client that if the contemplated project proceeds, he will be employed as its Architect.

3. An Architect shall not knowingly compete with another Architect on a basis of professional charges, nor use donation as a device for obtaining competitive advantage.

4. An Architect shall not offer his services in a competition except as provided in The Institute's Competition Code.

5. An Architect who has been retained as a professional adviser in a competition shall not accept employment as an Architect for that project.

6. An Architect shall not render architectural services to non-professional enterprises connected with the building industry, except when

> (a) He does not either directly or indirectly solicit orders for the said enterprises.
> (b) He is paid by salary, fee or royalty for his architectural services and does not participate in any profits of the aforesaid enterprises which would influence his professional integrity.

7. An Architect shall not engage in building contracting.

8. An Architect shall not knowingly injure falsely or maliciously, the professional reputation, prospects or practice of another Architect.

9. An Architect shall not attempt to supplant another Architect after definite steps have been taken by a client toward the latter's employment.

10. An Architect shall not undertake a commission for which he knows another Architect has been employed until he has notified such other Architect of the fact in writing and has conclusively determined that the original employment has been terminated.

11. An Architect in soliciting work shall not divide fees except with professionals related to building design, and those regularly employed or known to be associated with his office.

12. An Architect shall not use paid advertising, nor use self-laudatory, exaggerated, or misleading publicity.

> Factual materials, verbal or visual, which dignify the profession or advance public knowledge of the Architect's function in society may be presented through public communication media.

13. An Architect shall not solicit, nor permit others to solicit in his name, advertisements or other support toward the cost of any publication presenting his work.

14. An Architect shall conform to the registration laws governing the practice of architecture in any state in which he practices and he shall observe the standards of practice established by the local Architects' professional body.

15. An Architect shall at no time act in a manner detrimental to the best interests of the profession.

Conclusion

Since adherence to the principles herein enumerated is the obligation of every member of The American Institute of Architects, any deviation therefrom or from the broad principles of good practice as set forth in Section I, shall be subject to discipline in proportion to its seriousness.

The Board of Directors of The American Institute of Architects shall have sole power of interpreting these Standards of Professional Practice and its decisions shall be final subject to the provisions of the by-laws.

NATURE OF THE AIA

Before examining this statement in critical appraisal, the nature of The Institute should be understood. The recent Report of the Commission for the Survey of Education and Registration of The American Institute of Architects indicates the purpose and practice of The AIA as follows:

In 1857 the Articles of Incorporation of The American Institute of Architects stated:

"The object of this Society is to elevate the architectural profession as such, and to perfect its members practically and scientifically."

Today The Institute's By-Laws give fuller definition:

"The objects of The American Institute of Architects shall be to organize and unite in fellowship the architects of the United States of America; to combine their efforts so as to promote the aesthetic, scientific, and practical efficiency of the profession; to advance the science and art of planning and building by advancing the standards of architectural education, training, and practice; to coordinate the building industry and the profession of architecture to insure the advancement of the living standards of our people through their improved environment; and to make the profession of ever increasing service to society."

During the past century, The Institute has become in fact the medium through which American architects accomplish their professional purposes. From its birthplace on the Atlantic seaboard, it now extends across a continent. Its original roster of a few struggling chapters has multiplied to more than a hundred. The unification movement of the early 40's integrated within its structure numerous state associations. From an initial roll of 13, its membership is now approaching 10,000, a majority of all U. S. registered architects. Thus, as a democratic organization within a democratic society, The Institute stands as the sole national agency, geographically comprehensive and professionally representative, uniting all whose concern is the science and art of architecture.

. . . . . .

In 1946 the structural reorganization of The AIA was predicated on the following goal:

"The AIA should so organize as to furnish adequate, inspiring leadership and service to the public, to the profession, and to professional education through the development of long-range objectives so that the architect may occupy himself with every phase of life in the civilization of which he is a part and thus may improve the physical framework of our living." [1]

The nature and intent of The Institute are thus clearly stated to be in the public interest, and the social purpose of the practice of architecture the end to be served.

A CIRCULAR OF ADVICE—1918

The Standards of Professional Practice recently enacted follow closely in form and substance "A Circular of Advice—Relative to Principles of Professional Practice and Canons of Ethics," adopted in 1909, revised in 1912 and in 1918. The present document was first adopted in 1947.

The 1918 Circular, after a preliminary paragraph almost identical with that of the present Standards, treats of the principles under the following headings: On the Architect's status; On preliminary drawings and estimates; On superintendence and expert services; On the Architect's charges; On payment for expert service; On selection of bidders or contractors; On duties to the contractor; On engaging in the building trades; On accepting commissions or favors; On encouraging good workmanship; On offering services gratuitously; On advertising; On signing buildings and use of titles; On competitions; On injuring others; On undertaking the work of others; On duties to students and draftsmen; On duties to the public and to building authorities; On professional qualifications.

The Canons of Ethics which follow are eleven in number. The entire document is not essentially different from the Standards now in effect.

PRINCIPLES AND SOCIAL CHANGE

And that is to be expected. Rules of conduct based upon moral principles would be expected to change but slowly, and only as the conditions under which people live together in society change. In fifty years we have seen this country change from a predominantly rural to a predominantly urban society. We have become a mobile people. We have become a minutely differentiated people, as each new technological change has altered vocational demands. And by those tokens we have become a much more mutually interdependent people. As we have veered toward interdependence, we have become morally more responsible toward our neighbors. So our codes of ethics are being stated or restated ever more in the public interest.

The principles enunciated by The Institute in 1909, when there were less than 2,000 members, doubtless were stated in an endeavor to uplift the level of professional performance, to assure the public of our profession of integrity as well as of competence, and to raise a standard of ethical professional conduct to which all architects of good will might repair.

Those worthy purposes have been served. There is informed opinion to the effect that the level of professional performance has been raised, and at an accelerating rate. The public increasingly acknowledges the profession's integrity and utilizes its competence. The Institute's membership now includes more than a majority of all practicing architects and is increasing steadily.

Revisions of the Standards (always by action of the annual convention, as set forth in the by-laws) have been few and minor. The language in which they are couched has become familiar and venerated. Even nonmembers of The Institute respect them and generally observe them. Other professional bodies and vocational groups understand them and expect architects to adhere to them.

ENFORCEMENT

The Institute enforces these Standards of Professional Practice through a judiciary procedure, which is set forth in the by-laws as follows:

Architectural Practice

Article 1. Unprofessional Conduct.
Section 1. Definition.

(a) The Standards of Professional Practice are those ethics of conduct and practice which are adopted by the Convention of The Institute or by The Board of Directors, and published and distributed to corporate members and applicants for corporate membership, governing the actions of corporate members.

(b) The "Procedure" noted in this chapter refers to the rules adopted by The Board of Directors under which charges of alleged violations of the Standards of Professional Practice are processed.

(c) Any deviation by a corporate member from any of the Standards of Professional Practice of The Institute or from any of the rules of The Board supplemental thereto, or any action by him that is detrimental to the best interests of the profession and The Institute shall be deemed to be unprofessional conduct on his part, and ipso facto he shall be subject to discipline by The Institute.

Article 2. Responsibility of The Board for Discipline.
Section 1. Disciplinary Action by The Board.

(a) Possible actions. The Board shall be the judge of what constitutes unprofessional conduct by a corporate member, and of whether or not he is guilty thereof. When The Board finds a member guilty of unprofessional conduct it shall:

—censure him, or

—suspend his membership for such time as it deems fitting, or

—terminate his membership, provided that in all instances the member complained of has been offered in writing an opportunity to be heard by The Board in his own defense, subject to the Procedure hereinafter set forth, at a hearing fixed by The Board as to time and place.

(b) The Board is final authority in disciplinary action matters. The decision of The Board in every matter concerning the conduct of a corporate member and every penalty imposed by it on a corporate member on account of unprofessional conduct shall be final and conclusive and without recourse as to the member and any person acting for him or in his behalf.

Many judiciary cases—perhaps thirty—arise in the course of a year, some of which do not run "full term." Many complaints or instances of apparent dereliction are submitted to the Board of Directors. In order both to free itself of a too time-consuming matter (the Board meets only four times a year) and to secure the greatest measure of consistency in the interpretation and application of the Standards, the Board in 1951 enacted the following rule: "There shall be referred to The Secretary of The Institute for reply all inquiries on the matter of ethics."

The carrying out of this policy has resulted as intended, and the opinions and admonitions of the Secretary (an elected officer) are rendered promptly, which greatly advantages the membership. Occasionally digests of such opinions and admonitions are published for the information of members and chapter officers. Since the recent convention, a chart of permitted and of prohibited activities in the nature of advertising has been published to the membership (see the accompanying "Guide to Permissive Publicity and Advertising Practice for Members of The American Institute of

GUIDE TO PERMISSIVE PUBLICITY AND ADVERTISING PRACTICE FOR MEMBERS OF THE AMERICAN INSTITUTE OF ARCHITECTS

	Newspaper and Magazine Publicity	Radio and Television Publicity	Newspaper, Magazine, Radio and Television Advertising	Brochures, Pamphlets, Reprints, etc.	Speeches and Panel Discussions
By the individual architect	May furnish material concerning participation in building projects but may not stimulate self-laudatory, exaggerated or misleading publicity.	May participate in radio or TV programs as part of chapter, region or national AIA activity. May participate as individual Architect if the program is in the best interest of the profession.	May participate where an endorsement of the product by the individual Architect is not required . . . where the participation is not to the detriment of fellow Architects . . . where advertisements (or commercials) pay tribute to the profession. May not purchase space (or time) in own interest or interest of the architectural firm. May not advertise by person or architectural firm in special editions or programs.	May produce a brochure or pamphlet covering facts about the firm and can use this medium in discussions with potential clients, provided it is produced at his own expense and that it contains no advertisements.	May speak to public service, community and educational groups to better explain the profession but not to advertise his own professional availability.
By Chapter and Region	May initiate newspaper and magazine publicity in the public interest and for the good of the profession. May encourage the use of Architect credits in newspapers by diplomatic press relations.	May participate in radio and TV programs to better explain the profession.	May participate in interest of public and profession. May purchase space or time in any of above mediums if the advertisement is in the interest of chapter, region or entire profession. May purchase space in special editions of newspapers and magazines if there is no identification of individual Architects or firms.	May produce brochures, pamphlets, etc., for purpose of enlightening public about the services of an Architect and the value of the profession. May mail interesting articles, brochures, pamphlets, reprints, to selected list of community leaders for purpose of explaining the profession to the public.	May through a Speakers' Bureau participate for the express purpose of better explaining the profession to the public.

At its June 1954 meeting the AIA Board of Directors approved chart reproduced above and directed that it be distributed to the membership

Architects"). There is an eagerness on the part of the profession to accept and follow the Standards. It asks only to be advised competently regarding them.

STATE BOARDS OF EXAMINERS

Much is being done to encourage observance of the Standards, beyond that required of Institute members. Every state in the country requires that the user of the title "Architect" shall pass a qualifying examination and become registered as an architect in that state. Each official State Board of Examiners has the opportunity in personal interviews with candidates to stress responsibility for ethical conduct in every architect's practice, and the Standards of The American Institute of Architects are cited as appropriate for study and observance. The Board of Examiners may (and frequently Boards do) ask in the written examination for licensure questions concerning the ethical understanding and attitude of the candidate.

The state refuses to entertain an application from a person judged not to be "of good moral character." Its Board of Examiners therefore stands upon firm ground in assuming that the ethics of the profession, its rules of conduct based upon moral principles, will be comprehended and accepted by the person of admitted "good moral character."

The state reserves the power to revoke, suspend, or annul a license or to reprimand, censure, or otherwise discipline an architect for certain causes, including among others the following:

> . . . upon proof that the holder of such license is guilty of fraud or deceit or of gross negligence, incompetency or misconduct in the practice of architecture.[2]

[2] The University of the State of New York, *Handbook 35: Higher Education, Architecture, Laws, Rules and Information* (Albany, 1953), p. 28. Although the quotation is from the New York State law, other states follow the general pattern and language.

Violation of the accepted ethical standards of the profession may be considered as at least contributory to the proof of misconduct. Thus, to a certain extent, the force of law encourages the observance of ethical standards.

SCHOOLS OF ARCHITECTURE

Collegiate Schools of Architecture, either in specific courses of study or in the counseling of students, encourage observance of the ethical standards of the profession, and again, the published Standards of The American Institute of Architects is used as the basic text. It is assumed that every candidate for an architectural degree will become a practitioner. It is also assumed that he will become a member of The AIA. In many of the schools there are student chapters where he early begins his connection with The Institute. And of course in such assumptions and activities, consideration of the ethics of the profession is predominant.

UNDERLYING ETHICAL CODES

But, actually, "the quality of mercy is not strained" and no amount of duress, threat, or legal constraint will make an unethical person ethical, or an immoral or unmoral person moral. There must be the underlying social good will in order to develop good social conduct. For the code of ethics of the architect expresses the code of the gentleman, of the Ten Commandments, of the Sermon on the Mount, of the Golden Rule. From the well of good will spring justice, fair play, and regard for the rights of others and for the responsibilities of oneself toward others. Given such philosophy and motivation, there is no ethical problem. The reaction to any set of conditions will instinctively be the just, the kindly, the considerate reaction.

It is on this note that the work previously quoted (*The Architect at Mid-*

Century: Evolution and Achievement) ends. The theme is being constantly expressed and stressed with ever widening effect. With it we conclude this review of the status of the ethics of this profession.

The discipline of Architecture demands all of a man's mind, to comprehend and assimilate; all of a man's skill and ability, to practice; all of a man's spirit, honorably to account for its stewardship. It demands integrity, industry, intelligence, imagination, initiative, and likewise courage, perseverance, sacrifice, and constant striving.

We are free men—by the grace of God and our heritage. Conjoined with our freedom, and not to be dissociated from it, is our responsibility. Socially responsible practice of our profession demands that the architect be a "whole man"—gentleman, scholar, citizen, philosopher. Out of his productive time and income he should give a tithe to the betterment of his community and the society to which he owes his life and his living. Nothing less than a lifetime dedication to the ideals of his profession will suffice for his ultimate satisfaction and happiness.

There is one aspect of our responsibility that no one else can discharge for us. Where we as individuals live and practice our profession, we are the profession. The profession and all architects are judged by us. No program of national publicity or public relations will avail if in our own community we fail to do a good job. Here is a responsibility we cannot transfer or shirk. Upon us personally and individually rests the yoke of the discipline of our profession. Of each of us is demanded the most meticulous care in the handling of each commission entrusted to us.

It is fitting, therefore, that in the enjoyment of these opportunities and in the discharge of these responsibilities, the Oath of the Architect should be:

> Humbly and proudly I profess my competence under the discipline of architecture.
>
> Upon my honor I promise unending devotion to the task of continually studying, learning, seeking, experimenting, that I may become ever better educated and trained for my work.
>
> Upon my honor I promise to my community undeviating adherence to the ideal of service to my fellow men, as the goal of my effort, that I may honestly and fully earn my living—my right to live among them.
>
> Upon my honor I promise to maintain that integrity in practice which will insure to each client the finest possible stewardship of his interest.
>
> Upon my honor I promise in the execution of every commission to strive to create beauty as well as order, character as well as safety, spiritual value as well as convenience.
>
> Upon my honor I promise to join with my fellow architects to make our profession of the greatest possible usefulness and benefit to our society, to share and disseminate all valuable professional knowledge, and to pass on to the succeeding generation the full and fine discipline of our profession, enriched because of my dedication.[3]

[3] *Op. cit. supra* (note 1), p. 461.

George Bain Cummings, B.Arch., Binghamton, New York, is a practicing architect in the firm of Conrad and Cummings, Associated Architects. He is a past president of the Central New York Chapter of The American Institute of Architects, a past regional director of the AIA, and its present secretary. He was made a Fellow of the AIA in 1948. He is vice-chairman of the New York State Building Code Commission, and was a member of the New York State Board of Examiners of Architects (1938–50) and its president from 1948 to 1950. He has contributed frequently to architectural publications.

Ethical Standards of the Medical Profession

By WILLIAM T. FITTS, JR., and BARBARA FITTS

THE ethical standards that have developed around the doctor-patient relationship are probably the oldest standards of any of the professions, either in tacit or written form. Dr. Willard L. Sperry, a theologian, former Dean of the Harvard Divinity School, remarks that "the pre-eminence of medical ethics in the field of the several professions may well be due to its long history, a matter of twenty-five hundred years, and to its initial and still classic statement in the Hippocratic Oath." [1] It may also be due to the constant preoccupation of physicians with problems of life and death, which has made doctors somewhat more conscious of ethical and moral values than many other men. Whatever the reason, the ethics of physicians have been regarded as among the highest of the professions.

In 1922 when THE ANNALS OF THE AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE published its first issue on the ethics of business and the professions,[2] the articles contained little adverse comment on the medical profession. The article by Morris Llewellyn Cooke on "Ethics and the Engineering Profession" included the following statement:

> Think of the limitless freedom which the medical profession enjoys in the homes of the world . . . the members of the medical profession have carried themselves so faultlessly in these intimate relationships that we never pause to wonder at it.[3]

[1] Willard Sperry, *The Ethical Basis of Medical Practice* (New York: Paul B. Hoeber, Inc., 1950), p. 84. See Appendix to this article for text of the Hippocratic Oath.

[2] Vol. 101 (May 1922).

[3] *Ibid.*, p. 71.

Only Robert MacIver in this same issue, in discussing "The Social Significance of Professional Ethics," ventured to suggest that

> the medical profession has incurred to many minds a serious liability, in spite of the devotion of its service to actual patients, by its failure for so long to apply the preventive side of medicine. . . .[4]

The rash of controversy that has broken out recently, both within the medical profession and outside of it, over fundamental problems of medical practice—prepayment insurance plans, advertising, the hiring of physicians by institutions, and fee-splitting—would seem to indicate that something fairly serious is happening to the oldest and most pre-eminent of the professions. The present controversy contrasts strongly with the complacent picture of 1922, and at first sight it would seem that the physicians of the country had suddenly abandoned their high standards and disinterested motives in favor of a mercenary concern over fees. The underlying problems go far deeper, however, to a group of factors that have been disturbing the economic and ethical patterns of the profession for some years.

It is our opinion that chief among these factors is the great "splintering of medical knowledge" [5] into specialties, which has made some type of group practice inevitable and thus altered the nature of the doctor-patient relationship. A second factor is the spread of

[4] *Ibid.*, p. 10.

[5] George Packer Berry, "Medical Education in Transition," *Journal of Medical Education*, March 1953, p. 17.

the insurance principle to medicine, which has intruded a third party between the doctor and his patient and has imposed uniform fee scales in a notoriously nonuniform field. A third factor is the radical treatment of serious disease, which appears, when first applied, to verge dangerously upon human experimentation.

The resulting disturbance to the ethical relationships within the profession—of physician to patient, and of physician to physician—has brought about vigorous attempts to revise the written code of medical ethics established by the American Medical Association and to enforce the code more effectively throughout the country.

AMA and Its Principles of Medical Ethics

The ethical principles of the medical profession of this country were first codified in written form by the American Medical Association in 1848 and were based on Sir Thomas Percival's *Medical Ethics*, written in 1803.[6] The AMA code of ethics has been revised at intervals since that time—1903, 1912, 1940, and 1949—and is still undergoing restudy and revision. The code reflects the consensus of the medical profession in this country because the AMA, by its influence and its organization, is the one all-embracing association for the profession. And much of the current controversy over medical ethics concerns the provisions of the AMA code.

The AMA's influence in medical affairs probably derives from the fact that it has never been a purely political organization, as a trade association in industry might be, but has been an outstanding scientific organization as well. The *Journal of the American Medical Association*, published weekly, is the most widely read of the scientific medical journals. Through its Council on Pharmacy and Chemistry, the AMA has standardized drugs and protected the public from harmful medicines. Three-fourths of the income of the AMA is spent on scientific endeavors.[7] "The objects of the Association," states the AMA constitution, "are to promote the science and art of medicine and the betterment of public health."

Organization

The AMA's influence has been both secular and scientific. Its organizational setup has been distinctive in that, with minor exceptions, a physician cannot join the Association directly but must first become a member of his county (or district) medical society and then of his state (or territorial) medical society. The county societies preceded the national association in point of history and have remained strong units of organization and discipline.

Of the approximately 200,000 physicians in this country, 138,000 are members of the AMA. All physicians who are legally qualified to practice medicine and who agree to conform to the Principles of Ethics are eligible for membership. This means that they must have graduated from an approved medical school, served a hospital internship of at least one year, and passed an examination allowing them to practice medicine in their respective state or territory. Membership in the AMA is required by some hospitals and clinics as prerequisite for staff appointment.

The control of the policy of the Association rests with its House of Delegates, which consists of one delegate for every thousand members of each permanently organized state or territorial medical society; one delegate from each of the specialty sections of the AMA; and one delegate each from the United States Navy, United States Army, United States Air Force, United States Public Health Service, and the Veterans Administration.

The body within the AMA which decides questions of an ethical or judicial nature is the Judicial Council. The Council was first organized in 1858 as a Committee on Ethics, appointed yearly by the president of the AMA, to be concerned with the enforcement of the code of ethics and various problems concerning methods of practice. In 1873 the Committee was reorganized as a Judicial Council with twenty-one members appointed for three-year periods by the Nominating Committee; all questions of a personal character and all questions over credentials were to be referred to the Council *without discussion* and its decisions on all matters referred to it were final. Succeeding revisions reduced the membership to a workable size and spelled out its duties (including its right to decide controversies arising under the constitution), and gradually the Judicial Council has become a very influential body within the AMA. Morris Fishbein writes:

> Since that time [1901] many of the great leaders of the American Medical Association have held the position of chairman of the Judicial Council and under their leadership decisions of conduct have been made which have been vital to the maintenance of the highest standards in medical practice.[8]

The Council is charged with interpreting both the Principles of Ethics and the constitution and may make recommendations to the House of Delegates concerning proposed changes in these documents.

As an illustration of the machinery set up to handle controversial ethical problems, we quote from an article entitled "Fight Over Ethics Averted by A.M.A." in the *New York Times* of June 24, 1954:

> A showdown battle in the field of medical ethics was averted today in the legislative assembly of the American Medical Association. The House of Delegates of the association without debate sent to its Judicial Council a New York resolution that would label "unethical" any doctor practicing with a closed panel physicians' group that solicited patients. . . . The Judicial Council was instructed to report not later than next June at the Atlantic City convention. It was considered possible a report might be ready for the House of Delegates' meeting next winter in Miami, Fla.

AMA Principles of Ethics

The AMA Principles of Ethics—with the interpretation of which the Judicial Council is charged—is a mixture of general moral principles and specific rules of conduct. The subject matter falls roughly into three categories: the relation of the doctor to society, to the patient, and to other doctors. The specific rules of conduct, especially those concerning the relation of doctor to doctor, are subject to frequent alterations and revisions as customs change, but the general principles embodied in the codes, like the Hippocratic Oath, do not vary greatly except in the wording. "The prime object of the medical profession is to render service to humanity; reward or financial gain is a subordinate consideration."[9]

The principal revisions or additions to the codes since 1922 have concerned groups and clinics, advertising and the

[9] Principles of Medical Ethics of the American Medical Association, December 1953. See Appendix.

giving out of information to the public, rebates (fee-splitting), and contract practice. Many of these changes reflect the intrusion of a third party or parties into the traditional doctor-patient relationship. For an explanation of their meaning we must look to the larger panorama of changing knowledge and a changing economy.

SPECIALIZATION

The unrest and controversy concerning medical care may result from a number of causes, but specialization is of primary importance. The accumulation of new medical knowledge pouring out of the physical and biological sciences has reached a point where the individual physician cannot encompass it, let alone master the laboratory technics that go with it. He is more and more joined by other physicians in an informal or formal (as the case may be) medical team. Although the general practitioner remains the backbone of medical practice, the types of medical specialists and their total number are increasing with enormous speed. The number of physicians certified as specialists by the Specialty Boards increased from 16,000 in 1940 to 52,000 in 1953—one-third of all practicing physicians.[10] Many other physicians limit their practice in whole or in part to a specialty, although they are not certified by the Boards. In 1932 the AMA Committee on Costs of Medical Care estimated that not more than 18 per cent of the physicians of the country need be specialists,[11] a statement which leads one to wonder whether the trend toward specialization has gone too far or whether new medical knowledge since 1932 does require more and more specialists.

Obviously the number of doctors seen by each patient is increasing, whether seen by separate referrals or in a single group clinic containing an organized team of specialists. The "single practice" system may be said to be evolving toward a "multiple practice" system. This process of specialization has been going on for years in industry but the professions, as MacIver pointed out in the 1922 issue of THE ANNALS, seemed at first sight to have been bypassed by the sweep of economic evolution and to retain the spirit and method of the old crafts:

> The doctor, the lawyer, the architect, the minister of religion, remain individual practitioners, or at most enter into partnerships of two or three members. Specialization takes place, but in a different way, for the specialist in the professions does not yield his autonomy. He offers his specialism directly to the public, and only indirectly to his profession.[12]

Or so it seemed in 1922.

Since that time, however, the splintering of medical knowledge has led to the development of nineteen separately organized specialties and the formation of many subspecialties, each with its trained experts and special tools.[13] The Specialty Boards have had tremendous influence on the practice of medicine because many hospitals and other institutions have made appointments to their staffs contingent on board certification. The requirements for certification are usually three or four years of specialty training following an approved internship, plus an oral and written examination to determine the candidate's proficiency in his specialty. The peculiar problems of each specialty have tended to unite the physicians of that group so that the American medical profession, which was formerly a collection of individual physicians joined by one powerful association (the AMA), now shows a tendency to separate into specialty points of view.

[12] Vol. 101 (May 1922), p. 10.

[13] The first specialty board (in ophthalmology) was established in 1917; by 1933 four more boards were organized, and by 1953 the total was nineteen. *J.A.M.A.*, Vol. 153 (September 26, 1953), p. 391.

Group practice

The struggles of the profession to tie its specialties back together are apparent in the number of surgical teams, group practice clinics, diagnostic clinics, and special disease clinics that have appeared in the United States in the past quarter century. The shift from a "single practice" system of medical care to a "multiple practice" arrangement is now reaping its harvest of major readjustments in the relations of physicians to each other and to the patient. It is a process of readjustment which is being felt all along the line—in medical ethics, medical economics, and medical administration. And the two major areas of controversy (which are really two sides of the same coin) are: how to divide responsibility *for* the patient and how to divide fees *from* the patient. Much of the debate over division of fees which has rocked the medical world and the public in recent months arises from problems of multiple practice, and not from any sudden outburst of mercenary motives on the part of the medical profession.

The division of responsibility for the patient varies rather widely, but the referring physician is usually considered "in charge" of the patient, and the specialist takes responsibility for those periods of specialty care that pertain to him. A surgeon, for example, will take responsibility for the operation and for pre- and postoperative care while the patient is in the hospital, but will probably refer the patient back to the original doctor for all but a few checkups.

Fee-splitting

The division of fees should relate to the division of patient responsibility, but fees depend not only on responsibility but on the amount of training of the physician and on the patient's estimate of value received. Each new specialty as it develops has had to establish an approximate scale of fees. Many critics believe that specialists' fees are too high, and the determination to correct an "unfair" distribution of income has led physicians in certain parts of the country to use secret rebates—a practice widely known as fee-splitting. Although the AMA Principles of Medical Ethics forbids fee-splitting, the practice is widespread. Dr. I. S. Ravdin, in his chairman's address before the section on surgery of the AMA in 1951, stated:

> We hear much about fee-splitting in this country. That it exists to a greater or lesser extent in many communities cannot be denied. When fee-splitting is practiced, patients may be referred *not* to the surgeon best able to effect a cure, but to those who provide the referring physician with the largest share of the patient's fee. We shudder when we read in our papers about the "kickbacks" in industry, and the "5 percenters," yet I wonder if all of us are at times lacking in social consciousness when we turn our backs on this iniquitous practice in surgery. Young men out of the best of our surgical residencies often find it difficult to make a living if they resist the fee-splitting practice.[14]

Fee-splitting usually arises in the division of fees between a surgeon and the referring physician who first sees the patient. For example, the surgeon may charge $150 for the removal of an acutely inflamed appendix in the middle of the night and be paid willingly by

[14] I. S. Ravdin, "Responsibility of the Surgeon to Modern Society," *J.A.M.A.*, Vol. 147 (1951), p. 535.

the patient, who will balk at the $15 charge of the general practitioner who first examined him and made the diagnosis—the general practitioner often spending more time with the patient than the surgeon. The problem then is twofold: how much more should the specialist be paid in a given instance for his more specialized knowledge and (at times) greater responsibility, and should the patient know where his money goes?

At the June 1954 meeting of the American Medical Association the House of Delegates reaffirmed its disapproval of fee-splitting.

Organized medicine today reaffirmed its opposition to "fee splitting," but voted it ethical for two or more doctors in a case to submit a joint itemized bill if the patient requests it.

. . . . . .

The Iowa delegation had sought in a resolution offered last year to draw the whole medical association around to the viewpoint of the Iowa State Medical Society where, for example, a physician, a surgeon and an anesthetist are involved in the same case, the Iowa plan permits them to send a single itemized bill and enables the patient to pay one doctor for the entire bill.

The A.M.A. Judicial Council, headed by Dr. Edward R. Cunniffe of New York, refused to go all the way on this, and the Reference Committee on Miscellaneous Business, of which Dr. R. J. Azzari, also of New York, is chairman, backed up the council.

. . . . . .

. . . and added the following, which was adopted along with the original report:

"In addition, the committee wishes to recommend that the House of Delegates resolve that it firmly opposes 'fee splitting,' rebating or payment of commissions in any guise whatsoever; and that it further opposes any mechanism that encourages this practice." [15]

[15] *New York Times,* June 25, 1954, p. 23.

Ghost surgery

"Ghost surgery" is fee-splitting in reverse, and is not as prevalent as fee-splitting. In ghost surgery, the nonsurgical physician makes the diagnosis and receives the entire fee, which he secretly splits with a "ghost surgeon." The patient either does not know of the existence of the "ghost" or believes him to be a minor assistant at the operation. He credits the operation to his own doctor, who usually supervises all pre- and postoperative care. The danger of ghost surgery lies in the fact that the physician who does the operating usually does not make the diagnosis and may not even examine the patient before he operates.

The American College of Surgeons has conducted a forthright campaign against fee-splitting and ghost surgery,[16] so forthright in fact that the College has been severely criticized for "washing dirty linen in public." [17] In 1951 it removed from its list of hospitals approved for surgical residencies two hospitals in Bloomington, Illinois, whose staffs were engaged in unethical practices. It has encouraged the use of the Columbus Plan,[18] or variations of it, in which groups of surgeons or entire medical societies agree to submit their account books, patient lists, and income tax returns to a certified public accountant at regular intervals for inspection. Variations of this plan have been successfully adopted at the Bloomington hospitals and are now being tried by a group of American College of Surgeons' Fellows in Iowa.

[18] *Loc. cit.*

Standard fees

The problem of fees is further complicated by recent tendencies towards a more uniform fee scale for medical services, a trend strengthened by the growth of medical insurance plans. Most companies have standard fees for every service. The Blue Shield plan, for example, pays $150 for removal of a gall bladder whether the operation is done by the most highly skilled surgical specialist or by a general practitioner, or whether the patient is rich or poor. Many in the profession have urged a standard fee scale and many county medical societies publish a list of acceptable fees. Yet it is difficult to standardize such an unstandard service as medical care. For example, the removal of a diseased gall bladder containing stones may vary from a routine and easy operation to a most difficult one, if the gall bladder is acutely inflamed. The patient who demands a "flat fee" for an operation may get "flat" care.

Lack of agreement on the division of fees has been one of the chief reasons for the high mortality of group practice clinics. If each physician is paid in proportion to what he contributes in individual fees, then certain specialties—for example, surgery—are often highly paid while others such as general practitioners are paid much less. Frequently the general practitioner does just as much work as the surgeon, and attracts more patients to the clinic than the surgeon, who depends on referrals from his nonsurgical colleagues. What percentage should the laboratory physician receive for his services, which are of vital importance in the proper functioning of the group as a whole, although not always directly supplying income? Clearly, a fair division of fees is not easily determined under the present conditions of rapidly varying relationships between physicians.

APPLICATION OF INSURANCE PRINCIPLE TO MEDICAL CARE

Specialization, with its long training and special laboratory technics, has been accompanied by a substantial increase in medical costs to the patient. Although higher costs are frequently offset by shorter hospital visits and lower mortality, patients do not compare their medical costs with the morbidity and mortality rates of twenty years ago, but with the cost of other goods and services that they buy. In recent years nearly all large items of expense that must come out of the consumer's pocketbook have been put on a prepayment insurance or a credit basis, and medical costs have remained as a large and unexpected drain on the patient's budget. The spread of the prepayment insurance principle to medicine was almost inevitable under the circumstances. Therefore the growth of prepayment plans for medical care has been phenomenal. The Blue Cross, a nonprofit hospitalization plan, now covers nearly one third of the population of the United States, and the coverage rises to 60 and 75 per cent in well-organized areas. Blue Shield, which pays the services of physicians, now covers one fifth of the total population, but may run one third or higher in organized areas. Both plans pay a set fee for service directly to the hospital or physician and allow free choice of a physician.

Where plans do not allow free choice of a physician, controversy has been sharp. The New York State Medical Society, prompted by its Kings County component, recently voted to ask the AMA to change its code of ethics on four counts:

Advertising should be understood to be unethical if it was aimed at getting patients for a panel of physicians of a medical care plan, company or other organization.

The practice of medicine by physicians on a salary should be restricted to institutions where patients are "public charges."

Free choice of physician, one of the requirements of the present code of ethics, should be understood to be vitiated if the patient was required to choose a physician from a panel or group of practitioners.

Proration of fees is not unethical if both physicians or surgeons actively participate in providing medical care and if the fee is paid by an insurance company.[19]

The effect of these revisions would be far-reaching, as was pointed out by the *New York Times* in a subsequent editorial:

> A provision in the proposed code which would forbid the payment of a salary to any physician who is not connected with an institution where patients are "public charges" would seem likely to close the offices of group practitioners of medicine and the medical departments of industrial corporations, farm cooperatives and labor unions, even though their medical standards may be high.[20]

The primary target of the resolutions appeared to be the Health Insurance Plan of Greater New York. Dr. George Baehr, president of HIP, replied as follows:

> Interpretation of the code of ethics as prohibiting advertising by a health insurance plan like H.I.P. is designed to prevent it from informing the public of its existence and of its premium rates, benefits and methods of operation. In this manner, it would prevent the public from knowing about and joining a nonprofit voluntary insurance plan which is authorized by law.[21]

It is obvious that these emerging problems are serious ones, and ones that will have to be resolved. It seems that one of the difficult issues is just what constitutes "advertising." If it is improper for an individual physician to advertise, then it would seem that it is improper for an insurance group to advertise for a group of physicians. The crucial question is whether one should label as "advertising" the informing of the public of the existence of a nonprofit prepayment insurance plan, along with its premium rates, benefits, and methods of operation.

It is not likely that the New York State Medical Society's proposals will be adopted as they stand by the AMA, for a blow to voluntary insurance plans would be a blow to medicine's own campaign against socialized medicine.

Problems of Radical Therapy

The remarkable advances of scientific knowledge in medicine have made it possible to carry out many radical measures for the relief of chronic or terminal diseases. For example, procedures have been developed (prefrontal lobotomy) for the treatment of intractable pain, which relieve the pain by destroying that part of the brain responsible for pain perception. Such an operation also changes the patient's personality to some degree. Is this ethical? Surgical technics have been developed to such a point that extensive and deforming operations can be performed with a low mortality rate. These ultraradical operations, performed usually for the treatment of cancer, frequently offer little hope of cure. They prolong life, but often leave the patient wretched and miserable and unable to lead a useful or happy existence. In addition, the surgery is extremely expensive to the patient and his family.

The physician often finds himself hard pressed to know the "ethical" answers to a specific problem. Should "everything possible" be done to effect a cure in an individual patient? One hundred ultraradical operations may yield 5 per cent of cures and many miserable months of life for the remaining patients, whereas a hundred palliative operations may yield no cures but many months of comfort. In Chapter II, Section 2, of the Principles of Medical Ethics is found the statement, "In such instances the physician should act as he would desire another to act toward one of his own family in like circumstances." But does this really answer the ethical problem?

The greatest ethical question arising from radical therapy—euthanasia—has been temporarily put in abeyance by the terrible example of the Nazis during World War II. The pros and cons of "mercy killing" are no longer very seriously argued in medical circles.

One important ethical problem that is currently debated is the question of the controlled "clinical trial" [22] which was recently used on a large scale in this country in the field tests of gamma globulin for poliomyelitis. Is it ethical to withhold medicine from a group of control patients while giving it to a second group of patients for testing? Unquestionably this takes us into the field of human experimentation via the route of statistics. However, any new medicine or treatment is, basically, an experiment on human beings; and the clinical trial is unquestionably a more intelligent evaluation of new medicines than simple trial and error.

Education of Laymen in Medical Affairs

The outpouring of new medical knowledge and new "wonder drugs" could not fail to arouse the interest of laymen. At the same time the medical profession has deliberately fostered public interest in medicine for reasons of its own. It has gradually turned to the public for research funds to help replace the large private contributions that are slowly drying up. It has also promoted informational campaigns about cancer and other diseases to teach laymen to diagnose the early symptoms of these diseases. The reading public has therefore swallowed a steady stream of articles dealing with medical subjects.

The danger of a little knowledge has been only too apparent. Self-diagnosis has become a national hobby. Laymen too often demand treatment with drugs that are new and incompletely tested or entirely inappropriate, simply because they have read preliminary notices by the press. All too frequently patients go wandering from doctor to doctor seeking new ideas to cure incurable diseases, squandering time and money on useless or even dishonest remedies. Is it the duty of the physician to his patient to try to prevent this, or should he not dissuade the patient on the theory that the mental satisfaction of having "tried everything" overbalances the expense?

And how does the code of ethics cover the question of what to tell the patient with an incurable disease, such as certain forms of cancer? A survey of Philadelphia physicians in 1953 showed that the majority of physicians do not tell a patient that he has cancer, although they always tell some member of his family.[23] They may tell the patient himself under special circumstances —if the lesion is usually curable, as, for example, skin cancer; if the patient needs to make special provision for dependents; or if the patient would otherwise refuse treatment.

The problem of truthfulness in medicine is not new, because the best therapy and absolute honesty do not always go hand in hand. But the present glare of publicity has subjected medical matters

[22] A. Bradford Hill, "The Clinical Trial," *New England Journal of Medicine*, Vol. 247 (July 24, 1952), p. 113.

[23] W. T. Fitts, Jr., and I. S. Ravdin, "What Philadelphia Physicians Tell Patients with Cancer," *J.A.M.A.*, Vol. 153 (November 7, 1953), p. 901.

to a close scrutiny and has shown very clearly the difficulties of early diagnosis of cancer. The solution for this ethical problem is, of course, a cure for the disease.

THE IRREDUCIBLE MINIMUM

Human nature being what it is (and it has not improved noticeably since 1922), the medical profession will probably always include a certain irreducible minimum of physicians who are more concerned with their own interests than with those of the patient or the profession. For a number of reasons it is getting easier to cover up mediocre medical care or outright racketeering. Improvements in anesthesia and pre- and postoperative care have reduced the risks of operation so much that an unscrupulous surgeon no longer fears to perform unnecessary ones. In large cities a physician may know very few of his patients personally, and the loss of this relationship removes an important check on professional ethics. Unnecessary operations and illegal abortions are not new problems, but they may become more prevalent if their safety increases and if the personal element in medicine is gradually reduced.

The medical profession has taken steps to safeguard the public against the unscrupulous physician. For example, hospitals throughout the country have set up tissue audit committees to examine carefully all tissue removed at operation.[24] If such tissue is found to be normal, the surgeon is called to account. If he continues to remove more normal tissue than is justified, his operating privileges are suspended.

The American Medical Association has aimed to protect the public against unethical medical practices by instigating the establishment of grievance committees in the constituent and component medical societies. By January 1953 all of the forty-eight state associations, the District of Columbia, and Hawaii had provided committees for hearing and acting on complaints from the public. In many states grievance committees of the component county medical societies handle the problems locally. The spread of such committees has been a recent development following a resolution of the House of Delegates in 1949 urging their adoption. These committees usually hear complaints from any source—patients, physicians, or lay organizations—and they arbitrate cases or refer them to the society's disciplinary body.

A LOOK TO THE FUTURE

The medical profession in the United States has always been distinguished by a strong streak of individuality and independence, the counterpart probably of the same pioneer spirit which originally marked the commerce and industry of the New World. Nowhere is this individualism more apparent than in the profession's emphasis on the sanctity of the doctor-patient relationship. Both the constitution and the Principles of Ethics of the AMA reflect the high regard in which that relationship is held and show the determined efforts of the profession to preserve it intact.

Yet the character of that relation is now undergoing amazing changes under the guise of what are apparently minor economic adjustments. Many medical groups are conscious of this evolution and are attempting to understand and counterbalance the less desirable corollaries that accompany it.

The essence of the doctor-patient relationship is the promise of the doctor to take complete responsibility for a patient once he has accepted his care, and the freedom of the patient in the choice of his physician. Once the physician's responsibility is divided between consultants, other specialists, and laboratory physicians, the strength of the doctor-patient relationship is weakened. Multiple practice is effecting a virtual revolution in medicine because of the fragmentation in responsibility that goes with it. This has been offset to some extent by common consent to leave the primary responsibility with one man, usually the general practitioner or the internist. There is danger, however, that a patient may "slip between the specialists," and to offset this the medical schools are now laying great stress on the "patient as a person," to be viewed as a whole man. Otherwise each specialty sees only its own organ or body part and its own diseases, and a patient's real problems may be missed.

There is another sense in which a patient may "slip between the specialists." When a physician limits his practice to a specialty, he does not normally take emergency calls unrelated to his field, usually because he is incompetent to do so. This means, however, that a patient may be unable to locate the type of doctor he needs or may be refused medical care by several doctors and feel justifiably neglected. The profession has finally recognized its responsibility in this regard by setting up night and emergency services organized by the county medical societies throughout the country.

The division of patient responsibility may ultimately lead to a "nine to five" attitude in medicine as each specialty restricts its area more and more. The intrusion of third parties (insurance companies) into the doctor-patient relationship also weakens the sense of personal responsibility. The flat fees paid by insurance plans for medical care are likewise conducive to a "businesslike attitude" which may not be desirable in a profession.

To replace this loss of an intense individual responsibility, it will probably be necessary to develop a greater sense of the collective responsibility of the profession to society. The absorption of the average physician in his own demanding practice has made him peculiarly blind to the inadvertant gaps in medical care that have arisen through social and economic forces outside his immediate acquaintance. This passive attitude toward the public in general, as opposed to his patient in particular, may be deeply rooted in the nature and history of medical care. In a world where it was impossible to cure more than a few of the sick and dying, the physician unconsciously and in self-protection closed his ears to all but the few he could help.

Insurance plans

The negative attitude of organized medicine and its failure to experiment with insurance plans and related projects have been most unfortunate. The control of medical care is likely to slip out of the hands of the medical profession—as it nearly did during the thirties and forties in the campaign for socialized medicine—if it fails to keep abreast of the health needs and desires of society.

Social medicine

The positive philosophy of "social medicine" (not socialized medicine) as developed in England has been slow to penetrate in this country. The importance of social medicine as a separate discipline is still highly debatable, but its emphasis on the preventive aspects of medical care supplies a real need and brings a much larger horizon to medicine. According to social medicine, the duty of the physician is not just to the individual patient but to the community at large—the body social, as it were; and the physician should study not only individual pathology but the social pa-

[24] George W. Tipton, "The Tissue Audit Committee in an Open Staff Hospital," *Bulletin of the American College of Surgeons*, Vol. 39 (July–Aug. 1954), p. 159.

thology which is recorded in the statistical annals of many disciplines. His scope will then reach out into the fields of statistics, sociology, anthropology, and psychology. This is not a new concept, but the attitude of promoting health as well as curing disease has not been sufficiently emphasized in American medicine, nor the responsibility of the physician for the health of the community as a whole.

Etiquette and ethics

Whatever changes the future may bring to American medicine, the AMA Principles of Medical Ethics will probably continue to undergo periodic revisions. From time to time it has been suggested that some fundamental defect in the Principles accounts for the frequency of these revisions. A most serious criticism was leveled at the code by Chauncey Leake in his *Percival's Medical Ethics* (1927):

> The term "medical ethics," introduced by Percival, is really a misnomer. . . . it refers chiefly to the rules of etiquette developed in the profession to regulate the professional contacts of its members *with each other*. . . . For the average physician, medical ethics (of which there is no satisfactory exposition) means only medical etiquette, and actually there is usually as great a penalty attached to a transgression of one as to the other.[25]

We do not share the view that a code of ethics should be inviolate and unchanging. Moral truths may be unchanging but their application varies as social and economic factors change. The relatively new problem of scientific research on humans (the controlled "clinical trial") is an example of a new ethical problem not specifically covered by the older codes.

Professional codes are concerned, by their nature and their historical development, not only with moral principles but with rules governing the relations of members to each other. Only by eliminating unfair competition between members can a profession establish a high standard of ethics. The early history of codes and rules of ethics indicates that they have been primarily a method of asserting internal professional discipline. When the conditions of competition change, the codes necessarily change with them.

The current problems now facing the medical profession would seem to make it imperative that the problems and history of medical ethics be well understood by physicians everywhere. There is at present relatively little information about ethical problems imparted in the medical curriculum. Many ideals and attitudes are passed along unconsciously from teacher to student, but this may not be enough in an era when ethical attitudes are no longer forced upon doctors by close and intimate contact with patients. Possibly the answer lies in a greater stress on moral character in the selection of medical students and in a greater stress on the teaching of ethical principles in medical schools.

William T. Fitts, Jr., M.D., F.A.C.S., is associate professor of surgery at the University of Pennsylvania, Philadelphia, and a diplomate of the American Board of Surgery. He is engaged in teaching, research, and the practice of surgery, and has written a number of articles for medical journals.

Barbara Fitts, M.A., his wife, was formerly a research assistant with the Federal Reserve Banks of New York and Philadelphia and now edits the U. of P. Medical Bulletin.

APPENDIX

THE SO-CALLED PAGAN OATH OF HIPPOCRATES *

I swear by Apollo Physician, by Asclepius, by Health, by Heal-all, and by all the gods and goddesses, making them witnesses, that I will carry out, according to my ability and judgment, this oath and this indenture:

To regard my teacher in this art as equal to my parents; to make him partner in my livelihood, and when he is in need of money to share mine with him; to consider his offspring equal to my brothers; to teach them this art, if they require to learn it, without fee or indenture; and to impart precept, oral instruction, and all the other learning, to my sons, to the sons of my teacher, and to pupils who have signed the indenture and sworn obedience to the physicians' law, but to none other.

I will use treatment to help the sick according to my ability and judgment, but I will never use it to injure or wrong them.

I will not give poison to anyone though asked to do so, nor will I suggest such a plan. Similarly I will not give a pessary to a woman to cause abortion. But in purity and in holiness I will guard my life and my art.

I will not use the knife either on sufferers from stone, but I will give place to such as are craftsmen therein.

Into whatsoever house I enter, I will do so to help the sick, keeping myself free from all intentional wrongdoing and harm, especially from fornication with woman or man, bond or free.

Whatsoever in the course of practice I see or hear (or even outside my practice in social intercourse) that ought never to be published abroad, I will not divulge, but consider such things to be holy secrets.

Now if I keep this oath and break it not, may I enjoy honor, in my life and art, among all men for all time; but if I transgress and forswear myself, may the opposite befall me.

PRINCIPLES OF MEDICAL ETHICS OF THE AMERICAN MEDICAL ASSOCIATION †

PREAMBLE

These principles are intended to serve the physician as a guide to ethical conduct as he strives to accomplish his prime purpose of serving the common good and improving the health of mankind. They provide a sound basis for solution of many of the problems which arise in his relationship with patients, with other physicians, and with the public. They are not immutable laws to govern the physician. The ethical practitioner needs no such laws; rather they are standards by which he may determine the propriety of his own conduct. Undoubtedly, interpretation of these principles by an appropriate authority will be required at times. As a rule, however, the physician who is capable, honest, decent, courteous, vigilant, and an observer of the Golden Rule, and who conducts his affairs in the light of his own conscientious interpretation of these principles, will find no difficulty in the discharge of his professional obligations.

CHAPTER I

General Principles

Character of the Physician

Section 1. The prime object of the medical profession is to render service to humanity; reward or financial gain is a subordinate consideration. Whoever chooses this profession assumes the obligation to conduct himself in accord with its ideals. A physician should be "an upright man, instructed in the art of healing." He must keep himself pure in character and be

* Translated by W. H. S. Jones.

† As revised December 1953. Copyright 1953 by the American Medical Association, 535 North Dearborn Street, Chicago 10, Illinois, and reprinted here with its permission.

diligent and conscientious in caring for the sick. As was said by Hippocrates, "He should also be modest, sober, patient, prompt to do his whole duty without anxiety; pious without going so far as superstition, conducting himself with propriety in his profession and in all the actions of his life."

The Physician's Responsibility

Sec. 2. "The profession of medicine, having for its end the common good of mankind, knows nothing of national enmities, of political strife, of sectarian dissensions. Disease and pain the sole conditions of its ministry, it is disquieted by no misgivings concerning the justice and honesty of its client's cause; but dispenses its peculiar benefits, without stint or scruple, to men of every country, and party and rank, and religion, and to men of no religion at all." ‡

Groups and Clinics

Sec. 3. The ethical principles actuating and governing a group or clinic are exactly the same as those applicable to the individual. As a group or clinic is composed of individual physicians, each of whom, whether employer, employee or partner, is subject to the principles of ethics herein elaborated, the uniting into a business or professional organization does not relieve them either individually or as a group from the obligation they assume when entering the profession.

Advertising

Sec. 4. Solicitation of patients, directly or indirectly, by a physician, by groups of physicians or by institutions or organizations is unethical. This principle protects the public from the advertiser and salesman of medical care by establishing an easily discernible and generally recognized distinction between him and the ethical physician. Among unethical practices are included the not always obvious devices of furnishing or inspiring newspaper or magazine comments concerning cases in which the physician or group or institution has been, or is, concerned. Self laudations defy the traditions and lower the moral standard of the medical profession; they are an infraction of good taste and are disapproved.

The most worthy and effective advertisement possible, even for a young physician, especially among his brother physicians, is the establishment of a well merited reputation for professional ability and fidelity. This cannot be forced, but must be the outcome of character and conduct. The publication or circulation of simple professional cards is approved in some localities but is disapproved in others. Disregard of local customs and offenses against recognized ideals are unethical.

The Relationship of the Physician to Media of Public Information

Sec. 5. Many people, literate and well educated, do not possess a special knowledge of medicine. Medical books and journals are not always easily accessible or readily understandable.

The medical profession considers it ethical for a physician to meet the request of a component or constituent medical society to write, act or speak for general readers or audiences. On the other hand, it may often happen that the representatives of popular news media are the first to perceive the adaptability of medical material for presentation to the public. In such a situation the physician may be asked to release to the public some information, exhibit, drawing or photograph. Refusal to release this material may be considered a refusal to perform a public service, yet compliance may bring the charge of self-seeking or solicitation.

An ethical physician may provide appropriate information regarding important medical and public health matters which have been discussed during open medical meetings or in technical papers which have been published, and he may reveal information regarding a patient's physical condition if the patient gives his permission, but he should seek the guidance of appropriate officials and designated spokesmen of component or constituent medical societies. Spokesmen should be empowered to give prompt and authoritative replies and a list should be issued which identifies them and discloses the manner in which they may be reached. These provisions are made with full knowledge that the primary responsibility of the physician is the welfare of his patient but proper observation of these ethical provisions by the physician concerned should protect him from any charge of self-aggrandizement.

Scientific articles written concerning hospitals, clinics or laboratories which portray clinical facts and technics and which display appropriate illustrations may well have the commendable effect of inspiring public confidence in the procedure described. Articles should be prepared authoritatively and should utilize information supplied by the physician or physicians in charge with the sanction of appropriate associates.

When any sort of medical information is released to the public, the promise of radical cures or boasting of cures or of extraordinary skill or success is unethical.

An institution may use means, approved by the medical profession in its own locality, to inform the public of its address and the special class, if any, of patients accommodated.

Patents, Commissions, Rebates, and Secret Remedies

Sec. 6. An ethical physician will not receive remuneration from patents on or the sale of surgical instruments, appliances and medicines, nor profit from a copyright on methods or procedures. The receipt of remuneration from patents or copyrights tempts the owners thereof to retard or inhibit research or to restrict the benefits derivable therefrom to patients, the public or the medical profession. The acceptance of rebates on prescriptions or appliances, or of commissions from attendants who aid in the care of patients is unethical. An ethical physician does not engage in barter or trade in the appliances, devices or remedies prescribed for patients, but limits the sources of his professional income to professional services rendered the patient. He should receive his remuneration for professional services rendered only in the amount of his fee specifically announced to his patient at the time the service is rendered or in the form of a subsequent statement, and he should not accept additional compensation secretly or openly, directly or indirectly, from any other source.

The prescription or dispensing by a physician of secret medicines or other secret remedial agents, of which he does not know the composition, or the manufacture or promotion of their use is unethical.

Evasion of Legal Restrictions

Sec. 7. An ethical physician will observe the laws regulating the practice of medicine and will not assist others to evade such laws.

CHAPTER II

Duties of Physicians to Their Patients

Standards, Usefulness, Nonsectarianism

Section 1. In order that a physician may best serve his patients, he is expected to exalt the standards of his profession and to extend its sphere of usefulness. To the same end, he should not base his practice on an exclusive dogma or a sectarian system, for "sects are implacable despots; to accept their thralldom is to take away all liberty from one's action and thought." § A sectarian or cultist as applied to medicine is one who alleges to follow or in his practice follows a dogma, tenet or principle based on the authority of its promulgator to the exclusion of demonstration and scientific experience. All voluntarily associated activities with cultists are unethical. A consultation with a cultist is a futile gesture if the cultist is assumed to have the same high grade of knowledge, training, and experience as is possessed by the doctor of medicine. Such consultation lowers the honor and dignity of the profession in the same degree in which it elevates the honor and dignity of those who are irregular in training and practice.

Patience, Delicacy, and Secrecy

Sec. 2. Patience and delicacy should characterize the physician. Confidences concerning individual or domestic life entrusted by patients to a physician and defects in the disposition or character of pa-

‡ Sir Thomas Watson.

§ Nicon, father of Galen.

tients observed during medical attendance should never be revealed unless their revelation is required by the laws of the state. Sometimes, however, a physician must determine whether his duty to society requires him to employ knowledge, obtained through confidences entrusted to him as a physician, to protect a healthy person against a communicable disease to which he is about to be exposed. In such instance, the physician should act as he would desire another to act toward one of his own family in like circumstances. Before he determines his course, the physician should know the civil law of his commonwealth concerning privileged communications.

Prognosis

Sec. 3. The physician should neither exaggerate nor minimize the gravity of a patient's condition. He should assure himself that the patient, his relatives or his responsible friends have such knowledge of the patient's condition as will serve the best interests of the patient and the family.

The Patient Must Not Be Neglected

Sec. 4. A physician is free to choose whom he will serve. He should, however, respond to any request for his assistance in an emergency or whenever temperate public opinion expects the service. Once having undertaken a case, the physician should not neglect the patient, nor should he withdraw from the case without giving notice to the patient, his relatives or his responsible friends sufficiently long in advance of his withdrawal to allow them to secure another medical attendant.

CHAPTER III

Duties of Physicians to the Profession at Large

Upholding the Honor of the Profession

Section 1. A physician is expected to uphold the dignity and honor of his vocation.

Membership in Medical Societies

Sec. 2. For the advancement of his profession, a physician should affiliate with medical societies and contribute of his time, energy and means so that these societies may represent the ideals of the profession.

Safeguarding the Profession

Sec. 3. Every physician should aid in safeguarding the profession against admission to it of those who are deficient in moral character or education.

Exposure of Unethical Conduct

Sec. 4. A physician should expose, without fear or favor, incompetent or corrupt, dishonest or unethical conduct on the part of members of the profession. Questions of such conduct should be considered, first, before proper medical tribunals in executive sessions or by special or duly appointed committees on ethical relations, provided such a course is possible and provided, also, that the law is not hampered thereby. If doubt should arise as to the legality of the physician's conduct, the situation under investigation may be placed before officers of the law, and the physician-investigators may take the necessary steps to enlist the interest of the proper authority.

CHAPTER IV

Professional Services of Physicians to Each Other

Dependence of Physicians on Each Other

Section 1. As a general rule, a physician should not attempt to treat members of his family or himself. Consequently, a physician should cheerfully and without recompense give his professional services to physicians or their dependents if they are in his vicinity.

Compensation for Expenses

Sec. 2. When a physician from a distance is called to advise another physician about his own illness or about that of one of his family dependents, and the physician to whom the service is rendered is in easy financial circumstances, a compensation that will at least meet the traveling expenses of the visiting physician should be proffered him. When such a service requires an absence from the accustomed field of professional work of the visitor

that might reasonably be expected to entail a pecuniary loss, such loss may, in part at least, be provided for in the compensation offered.

One Physician in Charge

Sec. 3. When a physician or a member of his dependent family is seriously ill, he or his family should select one physician to take charge of the case. The family may ask the physician in charge to call in other physicians to act as consultants.

CHAPTER V

Duties of Physicians in Consultations

Consultations Should Be Encouraged

Section 1. In a case of serious illness, especially in doubtful or difficult conditions, the physician should request consultations.

Consultation for Patient's Benefit

Sec. 2. In every consultation, the benefit to the patient is of first importance. All physicians interested in the case should be candid with the patient, a member of his family or a responsible friend.

Punctuality

Sec. 3. All physicians concerned in consultations should be punctual. When, however, one or more of the consultants are unavoidably delayed, the one who arrives first should wait for the others for a reasonable time, after which the consultation should be considered postponed. When the consultant has come from a distance, or when for any other reason it will be difficult to meet the physician in charge at another time, or if the case is urgent, or it be the desire of the patient, his family or his responsible friends, the consultant may examine the patient and mail his written opinion, or see that it is delivered under seal to the physician in charge. Under these conditions, the consultant's conduct must be especially tactful; he must remember that he is framing an opinion without the aid of the physician who has observed the course of the disease.

Patient Referred to Consultant

Sec. 4. When a patient is sent to a consultant and the physician in charge of the case cannot accompany the patient, the physician in charge should provide the consultant with a history of the case, together with the physician's opinion and outline of the treatment, or so much of this as may be of service to the consultant. As soon as possible after the consultant has seen the patient he should address the physician in charge and advise him of the results of the consultant's investigation. The opinions of both the physician in charge and the consultant are confidential and must be so regarded by each.

Discussions in Consultation

Sec. 5. After the physicians called in consultation have completed their investigations, they and the physician in charge should meet by themselves to discuss the course to be followed. Statements should not be made nor should discussion take place in the presence of the patient, his family or his friends, unless all physicians concerned are present or unless all of them have consented to another arrangement.

Responsibility of Attending Physician

Sec. 6. The physician in charge of the case is responsible for treatment of the patient. Consequently, he may prescribe for the patient at any time and is privileged to vary the treatment outlined and agreed on at a consultation whenever, in his opinion, such a change is warranted. However, after such a change, it is best to call another consultation; then the physician in charge should state his reasons for departing from the course decided at the previous conference. When an emergency occurs during the absence of the physician in charge, a consultant may assume authority until the arrival of the physician in charge, but his authority should not extend further without the consent of the physician in charge.

Conflict of Opinion

Sec. 7. Should the physician in charge and a consultant be unable to agree in their view of a case, another consultant should be called or the differing consultant should withdraw. However, since the patient employed the consultant to obtain his opinion, he should be permitted to state it

to the patient, his relative or his responsible friend, in the presence of the physician in charge.

Consultant and Attendant

Sec. 8. When a physician has acted as consultant in an illness, he should not become the physician in charge in the course of that illness, except with the consent of the physician who was in charge at the time of the consultation.

CHAPTER VI

Duties of Physicians in Cases of Interference

Misunderstandings to Be Avoided

Section 1. A physician, in his relationship with a patient who is under the care of another physician, should not give hints relative to the nature and treatment of the patient's disorder; nor should a physician do anything to diminish the trust reposed by the patient in his own physician. In embarrassing situations, or whenever there seems to be a possibility of misunderstanding with a colleague, a physician should seek a personal interview with his fellow.

Social Calls on Patient of Another Physician

Sec. 2. When a physician makes social calls on another physician's patient he should avoid conversation about the patient's illness.

Services to Patient of Another Physician

Sec. 3. A physician should not take charge of, or prescribe for another physician's patient during any given illness (except in an emergency) until the other physician has relinquished the case or has been formally dismissed.

Criticism to Be Avoided

Sec. 4. When a physician does succeed another physician in charge of a case, he should not disparage, by comment or insinuation, the one who preceded him. Such comment or insinuation tends to lower the confidence of the patient in the medical profession and so reacts against the patient, the profession and the critic.

Emergency Cases

Sec. 5. When a physician is called in an emergency because the personal or family physician is not at hand, he should provide only for the patient's immediate need and should withdraw from the case on the arrival of the personal or family physician. However, he should first report to the personal or family physician the condition found and the treatment administered.

Precedence When Several Physicians Are Summoned

Sec. 6. When several physicians have been summoned in a case of sudden illness or of accident, the first to arrive should be considered the physician in charge. However, as soon as is practicable, or on the arrival of the acknowledged personal or family physician, the first physician should withdraw. Should the patient, his family or his responsible friend wish some one other than he who has been in charge of the case, the patient or his representative should advise the personal or family physician of his desire. When, because of sudden illness or accident, a patient is taken to a hospital without the knowledge of the physician who is known to be the personal or family physician, the patient should be returned to the care of the personal or family physician as soon as is feasible.

A Colleague's Patient

Sec. 7. When a physician is requested by a colleague to care for a patient during the colleague's temporary absence, or when, because of an emergency, a physician is asked to see a patient of a colleague, the physician should treat the patient in the same manner and with the same delicacy that he would wish used in similar circumstances if the patient were his responsibility. The patient should be returned to the care of the attending physician as soon as possible.

Substitution in Obstetric Work

Sec. 8. When a physician attends a woman who is in labor because the one who was engaged to attend her is absent, the physician summoned in the emergency should relinquish the patient to the first engaged, on his arrival. The one in attendance is entitled to compensation for the professional services he may have rendered.

Disputes Between Physicians

Sec. 9. Whenever there arises between physicians a grave difference of opinion, or of interest, which cannot be promptly adjusted, the dispute should be referred for arbitration, preferably to an official body of a component society.

CHAPTER VII

Compensation

Limits of Gratuitous Service

Section 1. Poverty of a patient, and the obligation of physicians to attend one another and the dependent members of the families of one another, should command the gratuitious services of a physician. Institutions and organizations for mutual benefit, or for accident, sickness and life insurance, or for analogous purposes, should meet such costs as are covered by the contract under which the service is rendered.

Conditions of Medical Practice

Sec. 2. A physician should not dispose of his services under conditions that make it impossible to render adequate service to his patients, except under circumstances in which the patients concerned might be deprived of immediately necessary care.

Contract Practice

Sec. 3. Contract practice as applied to medicine means the practice of medicine under an agreement between a physician or a group of physicians, as principals or agents, and a corporation, organization, political subdivision or individual, whereby partial or full medical services are provided for a group or class of individuals on the basis of a fee schedule, or for a salary or for a fixed rate per capita.

Contract practice *per se* is not unethical. Contract practice is unethical if it permits of features or conditions that are declared unethical in these Principles of Medical Ethics or if the contract or any of its provisions causes deterioration of the quality of the medical services rendered.

Free Choice of Physician

Sec. 4. Free choice of physician is defined as that degree of freedom in choosing a physician which can be exercised under usual conditions of employment between patients and physicians. The interjection of a third party who has a valid interest, or who intervenes between the physician and the patient does not *per se* cause a contract to be unethical. A third party has a valid interest when, by law or volition, the third party assumes legal responsibility and provides for the cost of medical care and indemnity for occupational disability.

Commissions

Sec. 5. When a patient is referred by one physician to another for consultation or for treatment, whether the physician in charge accompanies the patient or not, the giving or receiving of a commission by whatever term it may be called or under any guise or pretext whatsoever is unethical.

Purveyal of Medical Service

Sec. 6. A physician should not dispose of his professional attainments or services to any hospital, lay body, organization, group or individual, by whatever name called, or however organized, under terms or conditions which permit exploitation of the services of the physician for the financial profit of the agency concerned. Such a procedure is beneath the dignity of professional practice and is harmful alike to the profession of medicine and the welfare of the people.

CHAPTER VIII

Duties of Physicians to the Public

Physicians as Citizens

Section 1. Physicians, as good citizens, possessed of special training, should advise concerning the health of the community wherein they dwell. They should bear their part in enforcing the laws of the community and in sustaining the institu-

tions that advance the interests of humanity. They should cooperate especially with the proper authorities in the administration of sanitary laws and regulations.

Public Health

Sec. 2. Physicians, especially those engaged in public health work, should enlighten the public concerning quarantine regulations and measures for the prevention of epidemic and communicable diseases. At all times the physician should notify the constituted public health authorities of every case of communicable disease under his care, in accordance with the laws, rules, and regulations of the health authorities. When an epidemic prevails, a physician must continue his labors without regard to the risk to his own health.

Pharmacists

Sec. 3. Physicians should recognize and promote the practice of pharmacy as a profession and should recognize the cooperation of the pharmacist in education of the public concerning the practice of ethical and scientific medicine.

Legal Ethics

By HENRY S. DRINKER

THE origins of the rules of conduct applicable to lawyers in the practice of their profession, known as legal ethics and legal etiquette, are found in the Ten Commandments, in statutes, in common-law decisions, in the canons adopted by the bar associations and the decisions of their ethics committees construing them, and in the usages, customs, and practices of the bar. Some of them, such as the prohibition of embezzlement, are applicable to everyone, although as an incentive to their observance the lawyer has to consider not only his own reputation for probity but also that of his profession. The obligation of fidelity to trust and the duty not to represent conflicting interests are applicable to all agents and fiduciaries, although the lawyer's intimate confidential relations with his clients require of him the observance of the utmost good faith—*uberimma fides*—at least as scrupulous as in the case of any other fiduciary, if not even more so. The proscription of solicitation and advertising and of enticing another's clients is peculiarly applicable to lawyers, although the doctors have recognized it. The duty not to negotiate directly with an adverse party who is represented by a lawyer is peculiar to the legal profession.

HISTORICAL ORIGINS

These principles of legal ethics and etiquette originated in the Inns of Court in London, where the barristers—the legal ancestors of the modern lawyer—established themselves during the twelfth and thirteenth centuries. They were practically all the sons of well-to-do parents, who did not have to worry about earning their keep and who traditionally looked down on all forms of trade and on the competitive spirit characteristic thereof. They regarded the law in the same way that they did a seat in Parliament—as a form of public service in which the gaining of a livelihood was not an objective. The profession of the law hence acquired a certain dignity which it has been the aim of the bar to preserve ever since.

The conditions under which the barristers practiced their profession materially contributed to this attitude. They were a select fraternity who lived together and met one another every day, both at dinner and in court, on a friendly basis. "Do as adversaries do in law," said Tranio in *The Taming of the Shrew,* "strive mightily, but eat and drink as friends."

Obviously such intimacy as this would have been impossible for men who were continually blowing their professional horns and plotting to steal away one another's clients.

These amenities of the profession were brought back to this country by the many young men who, in the latter part of the eighteenth century and the first part of the nineteenth, went to the Inns of Court for their legal training and on their return home became leaders of the American bar. That they have not given way before to the aggressively competitive spirit which has characterized our industrial development is due to the inherent conditions which differentiate the law, as a profession, from a mere business, and primarily to the influence of the bar associations in their determination that it shall remain so.

Owing to the influence and competi-

ion of the young men who in colonial ays thus received their training in the nns of Court, high standards of educaion, craftsmanship, and conduct were stablished and maintained in America n the period immediately following the Revolution.

During the second third of the nineeenth century, however, there develped a growing hostility against special rivileges granted by the government. 'rofessions, and particularly bar assoiations, were deemed undemocratic and n-American. This manifested itself verywhere in a lowering of the required ualifications of character, education, nd training. In 1860 Pennsylvania vas the only state which required stulents of law to register at the beginning of their period of study. In a umber of states statutes and even contitutional provisions were passed upolding the inherent and "natural" right f every voter of good moral character o practice law. In others the right of dmission was assured after a brief peiod of study. There was also widepread objection to the organized bar s a "secret trade union" or a privieged class not open equally to all citiens. Even bar meetings, which had been primarily social gatherings of the egal fraternity, or for the purpose of onoring a distinguished judge or lawer, usually recently deceased, were for he most part discontinued. In the peiod immediately after the Civil War, he bar reached its lowest ebb.

BAR ASSOCIATIONS

About 1875 the leaders of the bar, ealizing the deplorable condition into which their profession was falling, as well as the imperative necessity of takng a firm stand against the rising tide f commercialism and the growing inluence of those who would turn the profession from a "branch of the administration of justice" into a "mere money-getting trade," began the movement for the re-establishment at the bar of standards of character, education, and training, and also for the organization of bar associations all over the country. This movement has grown and prospered until now it is universally recognized that for the protection of the public no one may practice law whose character has not been subjected to examination and found worthy, and who has not passed a prescribed test as to his education and legal training. Also bar associations have been organized in all the states, in the District of Columbia, and in a great many counties. These are not merely fraternal societies, holding annual dinners and memorial meetings, or trade associations for the material advancement of their members, but organizations devoted to the pursuit of a learned art in the spirit of public service.

In twenty-five states the bar is "integrated," whether by statute or by authorized Rule of Court: every practicing lawyer must be a supporting member of the bar association, subject to its canons and to discipline by it. In all the other states there are voluntary associations.

The oldest bar association in the United States is apparently that in Philadelphia, which was established in 1802. The American Bar Association was established in 1878. The earliest association to adopt a Code of Ethics was Alabama, which in 1887 formulated its original fifty-six Canons, based largely on Judge Sharswood's lectures on Professional Ethics, delivered at the University of Pennsylvania in 1854, and on the fifty Resolutions in Regard to Professional Deportment, published by David Hoffman of the Baltimore bar in 1834. The Alabama Code was adopted, with minor changes, in a number of states, and in 1908 the American

Bar Association, after extensive study and consideration, adopted thirty-two Canons of Ethics, to which, as amended from time to time, fifteen more have since been added. They have been construed by its Committee on Professional Ethics in a very considerable body of published decisions. While these Canons and decisions have not the force of statute or case law, they are generally recognized by the courts as setting forth the view and attitude of the bar on the problems covered and as embodying sound standards of professional conduct, which the courts will enforce by censure, suspension, or disbarment of members of the bar who are found to have violated them.

NATURE OF DISCIPLINARY PROCEEDINGS

Proceedings to discipline a lawyer for professional misconduct are not in their nature punitive, criminal, or for the redressing of grievances on the part of those wronged by them, but are to protect the public, the bar, and the courts from the presence of persons unfit or unworthy of continued confidence in the performance of professional duties and relations. The pardon of the offense charged or restitution to the injured party, although perhaps relevant to the severity of the discipline administered, is no defense. *Res adjudicata* does not apply to disciplinary proceedings, nor is there nor can there be any statute of limitations applicable thereto.

Proceedings to discipline a member of the bar by censure, suspension, or disbarment differ from proceedings for contempt, the purpose of which is to maintain and vindicate the authority and dignity of the court and to protect the due and orderly administration of justice, whereas that of disciplinary proceedings is to keep the legal profession free from unworthy membership and to protect clients from untrustworthy advisers and advocates. Contempt proceedings may be dealt with summarily by the court against which the contempt is committed, whereas disciplinary proceedings are the function of the court in which the offender has been licensed to practice. He is entitled to notice of the charges against him and an opportunity to refute them, but not (except in three states) to a jury trial.

While the legislatures may prescribe minimum qualifications of character and preparation for admission to the bar and specific causes necessitating disbarment, they may not constitutionally provide that certain specified qualifications will entitle one to practice or to be reinstated after disbarment, since, under the threefold division of powers prescribed by the Constitution, this is the exclusive function of the courts.

GROUNDS FOR DISCIPLINE

The cases dealing with the discipline of lawyers involve two distinct characteristics:

1. Those involving conduct demonstrating that the lawyer is one who cannot properly be trusted to advise and represent clients.

2. Those in which his conduct has been such that to permit him to remain a member of the profession and to appear in court would cast a serious reflection on the dignity of the court and the reputation of the profession.

In cases of the first class, although the dereliction is usually in his professional capacity, this is not essential, since it may be demonstrated in other ways that he is basically an unsafe person to manage the legal business of others.

The burden of proving that he is worthy of admittance to the bar is on the applicant, that of proving him deserving of discipline is on his accusers, the latter burden being proportionate to the length and excellence of his record for good conduct.

CENSURE, SUSPENSION, OR DISBARMENT

For minor offenses the lawyer is censured by the court. For more serious ones he may be suspended from practice, either for a specified term or indefinitely with leave to apply and show good cause for reinstatement. For the more serious offenses he is disbarred. In many of the latter cases the court has granted reinstatement on a finding that he has reformed. It is believed, however, that such reinstatements are too often the result of sympathy or pity for the lawyer and his family with too little consideration for the public and the reputation of the profession. Some courts have persuasively said that disbarment should be ordered only where the court is thoroughly satisfied that the lawyer is one who should never be permitted to practice again, and that accordingly he should be reinstated only in case the court finds that its original conclusion was erroneous.

OBLIGATIONS TO THE PUBLIC RESULTING FROM EXCLUSIVE PRIVILEGES

By admission to the bar, the lawyer is granted the exclusive right[1] (1) to hold himself out as a lawyer; (2) as such, to advise clients and to represent them as an advocate; and (3) to appear for them in court proceedings.

In recognition of these exclusive privileges the lawyer is charged with the duty to the public: (1) to see to it that those admitted to the bar are properly qualified by character, ability, and training, and that those who thereafter prove unworthy of these privileges are deprived of them; (2) to see to it that able and upright judges are chosen and that any who prove manifestly unworthy or unfit are removed; (3) to represent without charge those unable to pay; (4) not to stir up litigation; (5) not to aid in the unauthorized practice of law.

The lawyer's obligation to keep the bar free from those who are unworthy to represent clients or are a discredit to their profession can be performed only by the wholehearted co-operation of the bar. Too often, it is feared, lawyers permit their friendship or sympathy for one of whose dereliction they have full knowledge to obscure their duty to the public, resulting in the serious injury of the prestige of the profession. Canon 29 requires every lawyer to expose without fear or favor all corrupt or dishonest conduct on the part of fellow members of the bar.

It is also their clear duty to see to it that able and upright judges are chosen and that those who prove manifestly unworthy or unfit are removed. This duty they should perform, despite the natural apprehension of reprisals should their efforts prove unsuccessful.

From the earliest times there has been recognized the duty to defend indigent criminals, when asked by the court to do so, and also to represent worthy persons unable to pay adequate compensation. The bar has organized and supported numerous Legal Aid Bureaus for this latter purpose.

At common law the stirring up of litigation constituted the serious crime known as maintenance, which is aggravated when the perpetrator is a lawyer, who by reason of his special professional privileges is precluded (Canon 28) from instigating, promoting, or prolonging litigation for his own benefit.

Canon 47 provides that no lawyer shall permit his professional services to be used to aid or make possible the unauthorized practice of law by any layman or lay agency. What constitutes the practice of law, beyond the holding oneself out as a lawyer and appearing as such in judicial proceedings, is not clearly settled.

[1] There has been some difference of opinion and considerable litigation on the part of the bar associations through their committees on unauthorized practice with regard to the extent of this exclusive privilege and as to what constitutes the unauthorized practice of law. This problem is outside the scope of the present article.

OBLIGATIONS TO THE COURTS

In order to preserve public respect for the judicial office it is obviously necessary for lawyers, as officers of the court, at all times to maintain a respectful attitude to the courts and not to attempt improperly to curry favor with them. A lawyer may not use his personal relations with a judge to influence the court's decisions. Nor may he properly discuss with the judge any case in which he is engaged except in the presence of counsel on the other side; or file any memorandum or brief without giving his opponent a copy. Nor may he communicate with a juror or attempt to curry favor with him by flattery or special attention.

His attitude to the courts must be characterized by candor and fairness. His duty to further the interest of his client does not require him to employ any sort of trickery, chicane, deceit, or misrepresentation. He may not call a witness to swear to facts which he knows to be untrue. Agreements or understandings with the court must be scrupulously carried out and inquiries by the court fairly answered.

It is a most serious offense for a lawyer to alter court records or to do anything amounting to an abuse of legal process.

He may properly interview persons known to be witnesses for the other side. He may not, however, under Canon 9, interview the other party though the latter is expected to be a witness. He may never make to any witness the suggestion that in his testimony he suppress the truth or deviate from it.

While a lawyer may properly render professional service before legislative or other bodies, this must be done openly and in his true character and by means addressed to reason and understanding as distinguished from the exertion of personal influence.

OBLIGATIONS TO CLIENTS

In his relations with his client the lawyer is in the strictest sense a fiduciary to whom the client may entrust the most important secrets, confident that they will not be disclosed. He should be able to rest assured that the lawyer's relation to him will never be abused or taken advantage of for the lawyer's personal benefit. As a protection against the strong influence over the client to which their confidential relation necessarily gives rise, all dealings between attorney and client are most strictly scrutinized, and are presumptively invalid to benefit the lawyer or to operate to the prejudice of the client.

The lawyer's fiduciary relation applies to persons who, although not strictly clients, he has or should have reason to believe rely on him as a lawyer to advise them.

He must not mingle his client's funds with his own or use them for his own benefit. Nor may he accept any compensation or commission or other advantage from other parties to the transactions in which he is employed, without the knowledge and consent of his client after full disclosure. To do so would be a breach of his fiduciary relation and would interfere with his wholehearted loyalty to his client.

He may not purchase any interest in the subject matter of the litigation which he is conducting where so to do involves a speculation on his part on the outcome of the matter.

It is his duty to give his client candid and straightforward advice on all questions as to which he is consulted and

without regard to his personal interest to settle the controversy where this is to the client's advantage, as a fair settlement usually is.

His duty of unwavering loyalty to the client precludes him from representing or furthering any conflicting interest, except in very unusual cases where both the client and the other party desire him to do so after full disclosure by him and a full understanding of the facts and situation by all parties involved. This duty applies to law partners and to associates, who may not represent clients having interests which conflict with one another.

Membership by a lawyer in a labor union involves an improperly divided loyalty.

The acceptance of a retainer involves the representation that the lawyer has no relations with others which would interfere in any appreciable degree with his exclusive devotion to the cause confided to him, and that he has no personal interest which might affect his judgment or endanger his fidelity.

When the interests of clients diverge or become antagonistic their lawyer must be absolutely impartial toward them, which, unless they both or all expressly desire him to represent them, usually means that he must represent none of them.

A lawyer is in no way bound, however, to take a position on an abstract point of law consistent with that for which he has contended in other cases.

He may not attack the validity of a specific document which he has drawn or a construction thereof which he has supported.

It is often wise for a lawyer to refuse to represent conflicting interests even with the consent of all parties, since he will always be subject to the disagreeable even though unmerited charge of betraying professional confidence.

A lawyer retiring from judicial or public position may not thereafter accept employment involving the correctness of any factual situation on which he has thus passed. This does not, however, preclude an ex-judge from changing his position on any point of law.

The lawyer's duty to preserve his client's confidences precludes him from disclosing communications made by the client to him in his professional capacity. This privilege outlasts his employment and may be waived only by the client. It does not, however, preclude the lawyer from making disclosures necessary to prevent a fraud or crime or necessary to refute an accusation by the client against him.

Acceptance of professional employment

Except where assigned by a court to defend those who cannot afford to pay counsel, a lawyer in the United States is not under any duty to accept any client but may choose his own cases and may decline any employment for any reason or without a reason.

He should never presume to undertake professional employment for which he is not reasonably competent, but should recommend or associate a specialist. Having undertaken a matter, he may withdraw provided the client's cause will not suffer thereby.

Defense of one known to be guilty

Although a lawyer may refuse to undertake a case which appears to him unsound or incapable of being successfully prosecuted or defended, or to defend a criminal whom he believes to be guilty, he is not bound to do so. Our legal system does not constitute the lawyer the judge as to the justice or soundness of the causes committed to him. Experience has shown that in many cases a lawyer's first impression of a case has turned out on further investigation to be erroneous. We deem it in the ends of justice to have all the facts and arguments on each side of the controversy presented by expert counsel, stimulated to a maximum of industry and ingenuity by the contest, the ultimate decision to be for the court and jury.

How far he may go in support of the client's cause

A lawyer is not bound to believe in the ultimate justice of his client's case and may not state such belief if he in fact entertains it. He is justified in asserting such defenses as usury, infancy, bankruptcy, and statutes of fraud or limitations. He may not, however, have any part in fraud, in trickery, or in actions involving deliberate violation of the law, nor may he employ coercive tactics or abuse of legal process, or countenance payment to secure specific testimony, or use underhanded means to secure evidence or disreputable tactics to further the client's cause.

On the discovery of fraud or imposition on the part of his client, he is bound to make disclosure necessary to preclude the client from having the advantage of it.

A lawyer may not ordinarily be an important witness in a case which he is conducting as an advocate.

Necessity of direct relations with client

The lawyer is precluded from delegating his professional functions. His relations with his client must be individual, personal, and direct, and not controlled or exploited by any intervening lay agency. It has accordingly been held improper for a corporation, a labor union, or an association to employ and pay a lawyer to advise its employees or members, even where the dealings between lawyer and client are direct, where there is no conflict of interest between the client and the corporation or association, and where it is distinctly in the interest of the corporation to keep its employees free from the worry and difficulties of litigation. As applied to cases of the latter type the present writer does not agree with the soundness of these decisions, believing that the public should have the benefit of group legal service as it has of medical.

Compensation

In the United States the lawyer's fee for professional services is not, as in England, regarded as an honorarium, but as legally enforcible whether under special agreement or on a *quantum meruit* basis. A lawyer usually finds it wiser, however, not to accept any fee from an honest client higher than the client thinks he should pay. The basis for compensation is the time, labor, and skill required in the particular case; whether the employment will preclude his employment by or cause antagonism on the part of other valuable clients; the amount involved and the benefit of his services to the client; the contingency or certainty of the compensation; whether the employment is casual or continuous; and the customary charges of the bar for similar services. A lawyer may, however, where no coercion is involved, stipulate for any fee he chooses.

A minimum fee schedule adopted by a bar association is not enforcible, but indicative only of the customary charges.

Contingent fees are not improper where reasonable under the circumstances. In some jurisdictions they are subject to court supervision.

The client must be ultimately responsible for the expenses of the litigation, although the lawyer may advance them subject to reimbursement.

Division of fees

A layman may be employed by a lawyer on any agreed basis to advise and assist the lawyer, and a lawyer

may accept employment by a layman at a stated salary or other agreed basis. The charge for the lawyer's services must, however, be fixed by him and not by the layman, nor may any such arrangement be used to enable the layman to practice law.

Fees of lawyers for professional services may be divided only with another lawyer, and only on the basis of service or responsibility. This precludes the division of fees by a lawyer on a percentage basis with collection agencies, and the division of fees with another lawyer merely as a forwarder of the case. The latter rule, under Canon 34, condemned a long-standing practice at the bar, but is being recognized. It also precludes the division of fees on a percentage basis on future business with retired partners or their estates.

OBLIGATIONS TO OTHER LAWYERS

A lawyer should be candid, fair, and courteous to other lawyers. His duty to further the client's cause to the utmost of his ability does not require him to sacrifice the good will of his colleagues, which is one of his most valuable assets, and one of which, in retaining him, the client gets the advantage. A lawyer is bound to observe every undertaking made in the course of the proceedings as well as the recognized customs of the bar.

The client has the right to be represented at all times by counsel of his own selection. A lawyer has no vested right to represent the estate of his deceased client, even at the latter's direction.

A lawyer retained to replace one discharged must see to it that the latter is specifically so advised, but is not responsible for the fees owing to him. The superseded lawyer must tell the client all he should know about the case. Under certain circumstances he has a lien for fees owing to him.

From early times it has been deemed highly improper for a lawyer to communicate in any way upon the subject of controversy with a party represented by counsel. This is specifically enjoined by Canon 9. This duty is possibly suspended if the other lawyer unreasonably refuses to submit to his client a reasonable offer of compromise.

One of the amenities which, over many years, lawyers have recognized toward one another is the obligation to refrain from deliberately stealing each other's clients. This, as well as the obligation not to advertise and solicit, it is impossible to define precisely. As we approach the borderline between what is generally considered proper and what is improper, the question, as in the case of many other problems of professional ethics and etiquette, becomes one of good taste.

Canon 7 condemns any disparagement of another lawyer in order to supplant him. It also precludes the making of a competitive bid for professional service, as well as every other deliberate attempt to entice away another's clients.

Advertising and solicitation are specifically condemned by Canons 27, 43, and 46, the only exceptions being advertisements by bar associations to acquaint the public with the advantage of employing lawyers, and law lists circulated primarily among businessmen and designed to enable them to choose competent lawyers.

As construed by the ethics committees of the bar associations Canon 27 is tightening rather than relaxing the condemnation of all kinds of advertising and solicitation, direct or indirect.

Partnerships among lawyers are specifically recognized by Canon 33, but may include none but members of the bar entitled to practice at the locus of the partnership. The partnership name may not be fictitious and must not be misleading, but may contain that of a deceased partner where this is sanctioned by local custom. The name of one retiring to become a judge should not, however, be retained.

THE LAWYER'S CARDINAL LOYALTIES

Neither fidelity to the court, apprehension of judicial disfavor, nor friendship and sympathy will relieve the lawyer nor should deter him from his constant obligation to see to it that no unfit person is made or continued a judge or a member of the bar, whose honor and dignity it is always his duty to uphold and maintain.

To the court the lawyer must be thoroughly candid and sincere, both in word and in action, shunning every sort of deceit or misrepresentation, preserving a self-respecting independence in the discharge of professional duty, without denial or diminution of the courtesy and respect due the judicial office.

To his client he owes absolute candor, unswerving fidelity, and undivided allegiance, furthering his cause with entire devotion, warm zeal, and his utmost ability and learning, but without using means other than those addressed to reason and understanding; employing and countenancing no form of fraud, trickery, or deceit which, if brought to light, would shame his conscience or bring discredit to his profession.

To his brethren at the bar he should show courtesy and good faith, respecting their opinions and the relation between them and their clients, disdaining to supplant or surpass them by advertising, publicity, artifice, or by any means other than the establishment of a well-merited reputation for professional capacity, achievement, and fidelity to trust.

To himself and his profession he owes tireless industry, unbounded enthusiasm, delight in its problems, and joy in its struggles, and—above all—loyalty to his own ideals and to the traditions of a noble profession.

Henry S. Drinker, LL.B., Mus. Doc., Litt.D., Philadelphia, Pennsylvania, was admitted to the Pennsylvania bar in 1904 and has practiced law in Philadelphia since that date. He has been a senior member of Drinker, Biddle & Reath since 1932. He is the author of The Interstate Commerce Act (1908), The Chamber Music of Johannes Brahms (1933), and Legal Ethics (1953).

Principles of Professional Conduct in Engineering

By H. A. Wagner

WHEN the American Academy of Political and Social Science, in The Annals of May 1922, published a symposium on ethical standards of business and the professions, it showed that engineering had made measurable progress in defining professionalism and recognizing its ethical obligations, and also in reducing these first broad concepts to relatively "specific" principles of professional conduct. The symposium also revealed that scant progress had been made in the establishment of agencies to interpret, apply, and enforce these principles. Thirty-two years have elapsed, and the situation is little changed. Then, as now, engineering was hampered by the lack of an inclusive organization, universally recognized as its authorized spokesman, empowered to pass judgment on unethical conduct and punish offenders as the American Medical Association and the American Bar Association and their constituent state societies deal with unethical practice in their respective fields.[1]

[1] Engineers are represented by more than a hundred admirable national societies; pre-eminent among them are the Founder Societies, each representing one of the four major branches of engineering (civil, electrical, mechanical, mining and metallurgical). Since 1917 they have collaborated in certain types of activities through a series of agencies which they have created. Through some of these agencies, at intervals, other engineering societies have been loosely affiliated with the Founders. None of these agencies has ever been recognized by the public as the equivalent of the American Bar Association or the American Medical Association; consequently, none has ever been able to influence public opinion as do these two organizations, or use this force to discipline offenders against codes of ethics. Engineering's ethical codes, for example, require engineers to discourage the spreading of exaggerated statements regarding engineering, but the societies cannot deal summarily with offenders, as the American Medical Association chastises doctors who publicly endorse or seem to exploit new wonder drugs or therapy not fully tested or not approved by the profession.

Canons of Ethics for Engineers

Despite this fact, engineers have reached a certain accord in regard to ethical principles. Many of the national societies and numbers of state and local organizations have officially adopted the Canons of Ethics formulated by the Engineers' Council for Professional Development, an agency created by the Founder Societies in 1932. In 1947, the Council synthesized the major principles found in the ethical codes formulated by many of the leading societies. Many of the original codes were in operation in 1922, and some of these were published in The Annals, notably those of the American Institute of Electrical Engineers (which seems to have been the leader of the movement, with a code drafted in 1910 and officially adopted in 1912), the American Society of Civil Engineers, the American Society of Mechanical Engineers, and the American Association of Engineers. Two of these might more properly have been called "creeds" rather than "codes," as they were modeled after the Hippocratic Oath. Others referred to specific practices then too prevalent which were regarded as hurtful to the profession. Through the years the societies extended the coverage of their codes and revised "principles of professional conduct" as changing conditions of practice and new problems required. Nearly all the provisions of these codes could be classified under

the headings found in the Canons of Ethics for Engineers adopted by the Engineers' Council for Professional Development, namely, obligations imposed by membership in a profession, and the engineer's relations with the public, with clients and employers, and with other engineers. A copy of the code is appended.

Not all the engineering societies have adopted the ECPD Canons of Ethics, but none of the adopted codes is at variance with the Canons. Some of the societies have found it advisable to retain codes drafted for and by their own members, because these codes deal in greater detail with problems which, if not peculiar to particular segments of the engineering profession, are at least more acute in these fields of practice. In certain branches of engineering, for instance, the ownership of engineering records and data may pose ethical problems of such complexity that a society may find it necessary to incorporate in its code of principles of professional conduct a section devoted to this aspect of ethics more detailed than is necessary in Canons of Ethics drafted for engineering societies in general. Other organizations, especially those composed of engineers engaged in a particular industry (automotive, refrigerating, illuminating, aeronautical engineering, and others), may adopt the Canons officially, or may consider that they have tacitly accepted these rules because most of their members belong to technical societies which have adopted the ECPD Canons of Ethics. Still other technical and industrial groups subscribe to the principles but believe that "moral responsibilities cannot be legislated" and rely upon constitutional provisions for dealing with members who "fail to be honest or live up to the code of any gentleman." It can be said that the societies are in accord with regard to fundamentals, but that there are practices denounced by the societies in their codes which are still defended by large numbers of engineers.

American Association of Engineers

In the invitation to prepare this discussion of ethics in the engineering profession, the author was instructed to detail the work of at least one national and one local group. He has chosen to trace the movement in the American Association of Engineers, first of all because he is most familiar with the procedure in that organization. In the second place, three of the distinguished engineers who contributed to the 1922 symposium were members of this organization and the American Association of Engineers was the agency through which they worked to improve ethical standards.[2] The third reason for choosing the AAE to exemplify the evolution of ethical standards is that two of its original aims, stated in the preamble to its constitution, are basic elements in professional ethics. The AAE announced that it intended to "stimulate public service in the profession" and "to promote unity in the profession." In the first aim the AAE recognized the most distinctive characteristic of a profession—its obligation to serve society. In the second, it recognized an equally important characteristic, the principle that engineers in all stages of professional development are by the very nature of a profession under obligation to deal fairly with each other for the good of the profession and its members. The fourth and most compelling reason for the author's choice of

[2] These three engineers were: Morris Llewellyn Cooke, tactician of the AAE campaign for higher ethical standards; Frederick Haynes Newell (known as Father of the Reclamation Service), President of AAE in 1919–20; H. W. Clausen, in whose memory the Clausen Medal is awarded for "distinguished service for the welfare of engineers."

the AAE is the fact that the association's campaign was not fortuitous; it was well planned and carried forward in stages by leaders who were fully aware of the importance of timing.

Engineering's first code

Morris Llewellyn Cooke, well known for his work in later years in the Rural Electrification Administration, was tactician of the movement. It was he, in 1918, who called for a "true-blue and inspiring code of ethics for engineers." He specified that it should be the work of one man, not of a committee, because "committee work is accomplished to a greater or less degree by compromise and we do not want compromise in ethics." At the same time he said:

> Until we engineers can place the service of humanity as the significant and dominant plank in our platform, the profession will continue to have the status of the hired servant, and veer here and there as the winds of business and other special interests may dictate. . . .

His suggestion was adopted, and Isham Randolph wrote the code which appeared in the 1922 ANNALS, reprinted in the Appendix of the present article.

Practice Committee codification

At Mr. Cooke's suggestion the Association created a Practice Committee to which were referred real and hypothetical questions concerning the ethics of specific practices. These questions were considered by the Practice Committee, and some of them were assigned to state and local chapters of the Association for study and discussion. The decisions of the Practice Committee and reports from the chapters were published in the Association's journal. By every possible means the Association stimulated the interest of its members in questions of ethics. This was in line with the plan made by Mr. Cooke who, in 1920, in an article in *Professional Engineer* (the Association's official publication) said:

> Ethical conduct is such as has received more or less general sanction. This means that conduct which at one time or place may receive very generous approval at another time or in a different locality may be generally considered reprehensible. . . . Higher standards only become the rules for conduct when through education they have become accepted as proper by a sufficiently large or influential element within the constituency. . . .

Mr. Cooke recommended that:

> the Practice Committee should subdivide the cases submitted to it into at least two classes: (a) Those upon which the best sentiment of the profession is now capable of concrete expression, and (b) those which require special analysis and protracted study and discussion in order to develop what is our best thought.

At this time, too, Mr. Cooke warned against any "effort at rigorous discipline." He said that the educational work of the Practice Committee was its most valuable contribution, and that clarifying an engineer's relationship and responsibilities would count more at that time than trials for unprofessional conduct. The questions submitted to the Practice Committee involved many practices detrimental to engineers, to the profession, and to society, but they were accepted or common practices, and presumably in harmony with existing principles of ethics. By provoking discussion of these practices harmful to the profession, the American Association of Engineers led its members to acceptance of higher standards of ethics.

During this period C. F. Taeusch, associate professor of philosophy at Iowa State University, became the adviser of the Practice Committee. Dr. D. B. Steinman, eminent and internationally known bridge engineer of New York,

directed the work of codifying Practice Committee decisions for publication in *Professional Engineer* in 1923 (with identifying names of persons or places deleted). In 1927 the Association issued a booklet entitled *The Engineer and His Ethics*, which contained this codification of Practice Committee decisions, the Isham Randolph Code of Ethics, and the Vow of Service, written by Dr. D. B. Steinman—all reprinted in full in the Appendix. This booklet was distributed to AAE chapters and to engineering schools. Thus the Association followed the advice of Mr. Cooke in clarifying for engineers and future engineers their relationships and responsibilities.

Booklet for the public

Realizing that the public had an important though unrecognized interest in the ethical standards of engineering and a direct influence upon those standards, the Association in 1929 brought out a booklet prepared by its Committee on Services and Fees of Practicing Engineers, entitled *How To Employ and Use the Services of Practicing Engineers*. This booklet struck directly at the unwise practice of engaging engineering services on the basis of competitive bids. In addition to information on legitimate methods of engaging the services of engineers, the booklet contained a typical form of agreement, a schedule of minimum recommended fees, and the Code of Practice of the American Society of Civil Engineers, adopted by that organization in 1927. The Association used the ASCE Code rather than its own 1924 codification of Practice Committee cases "in the interest of uniformity and to avoid duplication of effort."

OTHER NATIONAL SOCIETIES

Since 1927 many of the national societies have developed and published manuals of practice much more comprehensive and detailed than the AAE's booklet on employment and use of the services of practicing engineers. Each society emphasizes problem areas which are of special concern to its members. Every national organization is using its resources to "clarify relationships and obligations" of engineers and to bring about acceptance of principles which prescribe practices beneficial to engineers, the profession, and the public.

ENFORCEMENT PRACTICES

Unlike the professions of law and medicine engineering cannot enforce its codes by drastic means, for reasons which were stated in the beginning of this article. Each society must handle violations of its code by its own members. Although a Judiciary Committee was created in 1922 by the American Association of Engineers to serve as a court of appeal from decisions of the Practice Committee and given authority to suspend or expel members who violated the code, it has considered few cases. Other societies have similar agencies, but if they have resorted to rigorous discipline of violators of ethical codes, it has been done with such discretion and dignity that few members of the societies have been aware of the action.

Suspension or expulsion from membership in a major engineering society is a terrific rebuke, but it may have little effect on the individual's future practice of engineering, unless the action is widely publicized. The fear of suspension or expulsion may be a strong deterrent against unethical conduct among members who have joined national organizations for prestige and "contacts." For mercenary reasons they cherish the respect of top-ranking consultants and of engineers eminent in private practice or in industry. Such punishment as can be meted out by the

societies is not a strong deterrent against unethical conduct on the part of less sensitive or less ambitious men. The man who is prone to unethical conduct is likely to be callous. He may have a relatively small but satisfactory field of practice in an area where the public generally and most of the businessmen who are potential users of his services know little of the great national engineering organizations. The societies have no disciplinary power over nonmembers.

Unethical engineers are protected in some degree by the ethical obligation of engineers to refrain from "harming" another member of the profession. Engineers who have seen signs of incompetency or dishonesty are reluctant to initiate action unless the evidence amounts to almost incontrovertible proof, or the element of real and present public danger is so apparent as to compel such action, that is, lay a positive ethical obligation upon the engineer who is aware of the situation.

REGISTRATION LAWS

During the years when campaigns for registration laws engrossed the societies, it was expected that such laws, when they were adopted by all the states, would "put teeth" in the ethical codes. Statutory penalties and state agencies for enforcement, it was believed, would make codes of ethics effective. Overlooking the effect of the "grandfather clause" which elevated many mechanics and surveyors to the rank of engineer and ensured the right of many incompetent and unethical engineers to continue practice, proponents of the laws expected registration to screen undesirables and thus exclude potential violators of ethical codes. Soon after the laws went into effect it was apparent that the boards charged with administering registration laws were given staffs inadequate to enable them to police all phases of the practice of engineering. Their resources were hardly adequate for the job of searching out cases of misuse of the title "engineer," unauthorized practice, and evasion of provisions in regard to "responsible charge." They had little opportunity to initiate action against engineers who were dishonest or incompetent.

It was soon apparent that both individual members of the profession and engineering organizations were very reluctant to bring charges, initiate action, or even appear as witnesses against men who were accused of dishonesty or incompetency. The profession looks to the National Society of Professional Engineers through its constituent state societies for dynamic leadership in enforcement of registration laws. Perhaps, in the future, canons of ethics can be written into the registration laws and enforced.

EVOLUTION OF PRINCIPLES

Despite the fact that the societies are relatively impotent in legalistic enforcement of ethical codes, they have in a very valid way "enforced" them. The real measure of progress in ethics is not the number of cases of unethical conduct detected and punished; the real measure is the evolution of clear principles of conduct accepted by a majority of engineers as right and just and worthy of support. Since 1922, the societies, by formulating principles of ethics and by provoking discussion of ethical codes made up of such principles, either in society meetings or society publications, have built up strong convictions which will govern the actions of all but a small, surreptitious minority. They have organized sentiment within the profession against many practices accepted in 1922 by a majority of engineers as ethical, although they were admittedly harmful to the public and to the profession of its members. Some of these practices, one of which was competitive bidding, were justified as meeting a statutory requirement—an excuse which has been debunked in a series of court decisions.[3] Despite engineering's codes and the courts' interpretation of the statutes, competitive bidding will *be* unethical only when the principle laid down in the engineering code has wide acceptance by the public and practically unanimous indorsement by members of the profession.

CHANGING STANDARDS

Not all the ethical problems facing the profession today are those inherited from the generation which spoke in THE ANNALS of 1922. Conservatives of that day were unable to see any distinction between "unionism" and "collective bargaining." The American Association of Engineers in 1918 represented the unorganized technical employees of the railroads before the United States Railroad Wage Commission.[4] The Association's spokesmen were officials of the very railroads involved. No coercion was used or threatened. The Association relied entirely upon the fairness of the Wage Commission and the public, and based its case upon the fact that despite increased living costs the salaries of technical employees had not been increased and that in comparison with the wages of organized labor the salaries of engineers were not commensurate with the services they rendered or the time and money spent in preparation for engineering careers. The American Association of Engineers contended that it was "professional" and highly ethical for a society composed of employer and employee engineers to work for the social and economic welfare of all members of the profession. It denounced, however, alignments in which employee engineers were pitted against employer engineers and "collective bargaining" which was based on coercion. Since the passage of the Wagner Act in 1935, a new generation of engineers has found the problem of "collective bargaining" fraught with ethical considerations. Because the Wagner Act gave the National Labor Relations Board arbitrary power to assign engineers, without their consent, to heterogeneous bargaining units represented by labor unions, the American Association of Engineers prepared a manual called *Technologists' Stake in the Wagner Act* to show engineers how to defend their *real* "freedom of association" under the act and to bring about amendment of the statute. Although the Taft-Hartley Act has ensured autonomy to professional employees, a new generation of engineers insists that collective bargaining is the order of the day and hence ethical, and proclaims its right to "organize" along union lines without sacrifice of professional status. The controversies arising from this situation are bitter, and the discord is ominously apparent in the very silence of all codes on the subject.

One concept which has altered with changing conditions is the attitude of the profession toward the practice of engineering by corporations. In 1922, many eminent engineers were fairly dogmatic on this issue. Today many of them are not so sure that the corporate form is per se "unethical," because of

[3] The American Society of Civil Engineers has reprinted for wider distribution an excellent article which appeared originally in the May 1954 issue of *Civil Engineering,* captioned "Competitive Bidding for Professional Services Not in the Public Interest," in which the author digests a series of court decisions which deny the validity of the "statutory" argument.

[4] On March 31 to April 2, 1919, the Association also testified before the Board of Wages and Working Conditions (appointed May 25, 1918) of the United States Railroad Administration, the Engineering Council assisting in presentation of the case.

the mammoth responsibilities assumed by engineering firms and the staggering capitalization needed to staff the firm with specialists and acquire instruments, laboratories, libraries, and other appurtenances.

OLD PROBLEMS IN NEW GUISE

Some of the new problems are really very old, but they are disguised by innovations in the form of tricks and devices to conceal evasions and violations of ethical principles. Many of these have to do with unethical methods of "getting jobs," which John R. Snell bluntly describes in an appeal for "A Fighting Code of Ethics" in the July 1954 issue of *Consulting Engineer*. He lists "kickbacks," "commissions," "finder fees," "payment for influence" to assist in obtaining (or in payment for) engineering work.

> It is interesting to note [says Mr. Snell] that as a general rule these malpractices exist in locales where corrupt political administrations are tolerated. In fact, the misuse of the construction industry and its heavy publicly subsidized appropriations is one of the important means of support of corrupt government.

He notes that engineers are "in one way or another responsible for the annual expenditures of about 35 billions," and adds, "This is a public trust we cannot glibly brush aside as the responsibility of others." Mr. Snell believes that architects and engineering societies "must agree on a modern, aggressive high level code of ethics." To enforce the code he would have all co-operating firms set up a single standard system of bookkeeping and would have the books of each firm audited periodically to detect infringements of the code.

MAJOR ETHICAL ISSUES

Engineering has made giant strides since 1922 and engineers have inherited social problems of staggering importance—responsibilities which their narrow technical training has ill fitted them to assume. The Red Queen in *Through the Looking-Glass* said, "Now here, you see, it takes all the running you can do to stay in the same place. If you want to get somewhere else, you must run at least twice as fast as that!" Engineers, despite their long struggle to raise ethical standards, confronted with unsolved problems, old and new, find themselves in just about the same place they were in 1922. Only a race of supermen could sprint as fast as they must to meet the obligations imposed upon them by the kaleidoscopic changes brought about largely by their own handiwork. They are harassed by petty problems which obscure major ethical issues—on one side by those which deplore "raiding" (the practice of offering irresistible inducements to particularly gifted engineers employed by a competitor) and on the other by those who decry "gentlemen's agreements" between firms (not to hire each other's employees). Perhaps it is fortunate that they find such problems complex and absorbing. Their preoccupation with such details may keep them from facing ethical considerations involved in their responsibility (along with physicists and chemists) for devilish instruments they have devised which may either save our nation from destruction by an aggressor or blast civilization to extinction.

Herman Alexander Wagner, M.E., Ph.D., Chicago, Illinois, is a consulting engineer. He is past president of the American Association of Engineers, has contributed numerous articles to professional engineering journals, and has often acted as mediator and arbitrator in disputes involving professional engineers.

APPENDIX

ENGINEER'S VOW OF SERVICE *

We dedicate ourselves to the service of mankind as members of the Engineering Profession.

We consecrate our professional knowledge and skill to the advancement of human welfare, safety and progress.

As we benefit by the technical knowledge and public esteem won for the Profession by the Engineers who labored in the past, we shall ever strive to augment that heritage before passing it on to the Engineers who are to follow.

We therefore affirm our guiding purpose:

So to live and work as to justify the trust and confidence reposed in the Engineering Profession.

To carry out professional engagements with generous measure of performance, and with fidelity toward those whom we undertake to serve.

To foster a spirit of courteous consideration and fraternal co-operation within the Profession.

To extend encouragement and a helping hand to younger Engineers and to those in need.

To place Service before profit, the honor and standing of the Profession before personal advantage, and the Public Welfare above all other consideration.

SPECIFIC PRINCIPLES OF GOOD PROFESSIONAL CONDUCT †

The compilation consists of four parts as follows:

Part I. Relations of the Engineer to the Public.

Part II. Relations of the Engineer to Clients and Employers.

Part III. Relations of the Engineer to Employees.

Part IV. Relations of the Engineer to other Engineers.

Part I

RELATIONS OF THE ENGINEER TO THE PUBLIC

1. The Engineer should regard his duty to the public welfare as paramount to all other obligations.

2. He should not use his professional standing as a means of sponsoring or promoting commercial or other undertakings of a speculative character.

3. He should scrupulously avoid connection, by act or omission, with any illegal or questionable undertaking or participation in any enterprise inimical to the public welfare.

4. He should not advertise in self-laudatory language or in any other manner derogatory to the dignity of his profession.

5. He should avoid any publicity giving the impression that technical service in technical matters can be dispensed with; or that technical proficiency along any line is easy of acquisition; or that exaggerated returns may be expected from any limited course of technical instruction.

6. He should avoid any questionable statements or any statements couched in language that would convey a false impression, in any of his reports, advertisements, or articles.

7. He should avoid contingent fees as tending to prejudice the quality of the service which he renders; when retained to report on a property or project he should be scrupulously careful to make no

* Written by Dr. D. B. Steinman; adopted by the American Association of Engineers on June 17, 1927.

† Specific Principles of Good Professional Conduct was compiled by the Practice Committee of the American Association of Engineers, under the chairmanship of E. E. Carpenter (1923), codified by Dr. D. B. Steinman (Chairman, 1924–25), and adopted by the Board of Directors in 1924.

business arrangement for compensation or otherwise that might tend to bias his report.

8. The Engineer should strive to give a full measure of service for the best interests of his client and of the public, and should charge fair and adequate fees for such service. He should maintain the professional attitude in negotiations for his services; and he should avoid all practices which have a tendency to affect adversely the amount, quality or disinterested nature of professional services, such as charging inadequate fees, competing on a price basis where (as is almost invariably the case) the service to be rendered or the character of its proper performance cannot be precisely defined, spending large amounts of money in securing business, or consenting to furnish monetary guarantees of cost estimates.

9. The Engineer should use every care to make his estimates accurate and reliable, and in particular should guard against allowing self-interest to lead him into making an inadequate estimate.

10. He should refrain from using any improper or questionable methods of soliciting professional work.

11. He should participate in clean politics and should strive to be a force to assist in the cleansing of politics.

12. He should take an active interest in the public welfare in behalf of which he should ever stand ready to volunteer his special knowledge, skill and training for the use and benefit of mankind.

Part II

RELATIONS OF THE ENGINEER TO CLIENTS AND EMPLOYERS

1. The Engineer should pursue his professional work in a spirit of strict fidelity and full loyalty to his clients and employers.

2. He should inform a client or employer of any business connections, interests or affiliations which might tend to influence his judgment or impair the disinterested quality of his services.

3. He should accept compensation for his services in connection with any work from one source only, except with the full knowledge and consent of all the interested parties.

4. He should hold as confidential such information relating to the business or technical affairs of a client or employer as the latter regards or may be presumed to regard as personal or proprietary.

5. He should not engage in any outside work without the full knowledge and consent of his employer.

6. When connected with any work, he should not accept commissions, outside employment, promise of employment or any other consideration from a contractor engaged upon that work.

7. He should have no business dealings or connections with any client of his employer without the full knowledge and approval of his employer.

8. He should entertain no offers of employment or other considerations from a third party, when such may in any way influence his actions or decisions with respect to the relations which may exist between such third party and the Engineer's employer or client.

9. He should not accept commissions or other considerations for specifying or recommending supplies, equipment or service.

10. He should not pay commissions to others for recommending his services to prospective clients.

11. He should have no interest direct or indirect in any materials, supplies or equipment used in the construction work of his client or in any firms receiving contracts for his client's work without informing his client in advance of the nature of such interest and obtaining his sanction.

12. He should not engage in the independent practice of engineering without the knowledge and sanction of his employer, and under no circumstances should he compete with his employer on the basis of lower fees.

Part III

RELATIONS OF THE ENGINEER TO EMPLOYEES

1. The Engineer should treat his employees or subordinates in a spirit of fairness, with due regard and consideration for their personal welfare and professional advancement.

2. There should be a professional bond between employer and employee when both are engineers, which will dictate and impel reciprocal interest and mutual consideration.

3. The Engineer should pay adequate salaries commensurate with the importance and responsibility involved in the service.

4. He should encourage the professional pride of his employees or subordinates in their work and should offer them every means of protecting their reputations and the quality of the work entrusted to them by not interfering with the proper performance of the duties for which they are responsible.

5. He should recognize the freedom of his employees to change employment and should in no way hinder employees or subordinates on bettering their condition.

6. He should not discharge an employee, nor withhold employment from him, nor discriminate against him in any way on account of his affiliations or activities in any professional, political, or religious organization.

7. He should respect his employee's right to freedom of thought, speech, and outside activity as long as the same does not impair the efficiency and value of the employee's service.

8. He should see that his employee is adequately covered by insurance against risk of casualty arising from his work.

9. In advertising or offering employment, he should refrain from any misrepresentation as to the conditions and permanency of such employment.

10. If in public employ, he should assume the responsibility of consistently protecting the interests of his subordinates.

11. He should make every effort to provide steady employment for his employees and when forced to discharge an employee he should give the most generous notice possible and exert every reasonable effort to assist the employee in finding another position.

Part IV

THE ENGINEER'S RELATIONS TO OTHER ENGINEERS

1. The Engineer should not by word, act or omission, injure falsely or maliciously, directly or indirectly, the professional reputation, prospects or business of another Engineer.

2. He should not attempt to supplant another Engineer after definite steps have been taken toward his employment.

3. If employed in conjunction with another Engineer, and by the same client, he should not review and comment conclusively upon the work of the other Engineer except with his full knowledge and consent or unless the connection of such other Engineer to the work has been previously terminated.

4. He should not use unfair means to effect his professional advancement or to injure the chances of another Engineer to secure and hold employment.

5. He should not attempt to inject his services into a project at the expense of another Engineer who has been active in developing it.

6. He should not interpose between other Engineers and their clients when unsolicited. When solicited, he should avoid any possibility of doing a brother Engineer an injustice.

7. He should not seek or solicit a position occupied by another Engineer.

8. He should not attempt to secure work on the basis of lower salaries or fees.

9. He should be courteous, fair, considerate in his dealings with other Engineers.

10. He should conduct any necessary comment on or criticism of the work of other Engineers with careful regard for the good name and dignity of the engineering profession, and he should scrupulously refrain from criticism to personal advantage, as in negotiating for an engagement.

11. He should not commercialize his affiliations with, or official position in, any technical organization.

12. He should not use his professional affiliations to secure the confidence of other Engineers in speculative commercial enterprises.

13. As a member of any professional organization, he should avoid any act tending to promote his own interest at the expense of the dignity and standing of the organization.

14. As an officer of a professional organization, he should sedulously avoid any

appearance of using his position for personal advertising.

15. He should cooperate in upbuilding the engineering profession by exchanging professional information and experience with his fellow engineers and students of engineering, and by contributing to the work of engineering societies, schools of applied science, and the technical press.

16. He should regard himself as a debtor to his profession and should dedicate himself to its advancement.

THE PROFESSION'S FIRST CODE OF ETHICS *

Any code of ethics must be predicated upon the basic principles of truth and honesty. "Whatsoever things are true, whatsoever things are honest," are the things for which engineers must contend.

An engineer may not "go beyond and defraud his brother" by any underhand act or method. He may not do or say anything which will injure his brother's reputation or his business for the purpose of securing his own advancement or profit. This admonition carries with it no obligation to refrain from telling known and absolute truth about an unworthy brother, as a protection to others; but the truth so told must be such as can be substantiated, and he who tells it must have the courage which will not shrink from the consequence of his telling.

The engineer owes his client allegiance demanding his most conscientious service. But conscientious service to the client must never entail a surrender of personal convictions of truth and right.

An engineer who receives compensation from an employer may not receive gift, commission or remuneration of any kind from a third party with whom he does business for that employer.

An engineer seeking to build up his business may not resort to self-laudation in advertising. He may state briefly the lines of work in which he has had experience, and enumerate responsible positions which he has held and give his references.

An engineer who employs others, either in his own service or in that of the client who employs him, should recognize in his relationship to them an obligation of exemplary conduct, of helpfulness and personal interest in those with whom he is thus brought in contact, and he should discharge such obligation tactfully and kindly.

The honor of the profession should be dear to every engineer, and he should remember that his own character and conduct reflect honor, or the reverse upon the profession.

If, then, he so lives that his own honor shall never be smirched by his own act or omission, he will thus maintain the honor of the organization to which he belongs.

CANONS OF ETHICS FOR ENGINEERS †

FOREWORD

Honesty, justice, and courtesy form a moral philosophy which, associated with mutual interest among men, constitutes the foundation of ethics. The engineer should recognize such a standard, not in passive observance, but as a set of dynamic principles guiding his conduct and way of life. It is his duty to practice his profession according to these Canons of Ethics.

As the keystone of professional conduct is integrity, the engineer will discharge his duties with fidelity to the public, his employers, and clients, and with fairness and impartiality to all. It is his duty to interest himself in public welfare, and to be ready to apply his special knowledge for the benefit of mankind. He should uphold the honor and dignity of his profession and also avoid association with any enterprise of questionable character. In his dealings with fellow engineers he should be fair and tolerant.

* Written by Isham Randolph; adopted in 1918 by the American Association of Engineers.

† Adopted by the Engineers' Council for Professional Development, October 25, 1947.

PROFESSIONAL LIFE

Sec. 1. The engineer will co-operate in extending the effectiveness of the engineering profession by interchanging information and experience with other engineers and students and by contributing to the work of engineering societies, schools, and the scientific and engineering press.

Sec. 2. He will not advertise his work or merit in a self-laudatory manner, and he will avoid all conduct or practice likely to discredit or do injury to the dignity and honor of his profession.

RELATIONS WITH THE PUBLIC

Sec. 3. The engineer will endeavor to extend public knowledge of engineering, and will discourage the spreading of untrue, unfair, and exaggerated statements regarding engineering.

Sec. 4. He will have due regard for the safety of life and health of the public and employees who may be affected by the work for which he is responsible.

Sec. 5. He will express an opinion only when it is founded on adequate knowledge and honest conviction while he is serving as a witness before a court, commission, or other tribunal.

Sec. 6. He will not issue ex parte statements, criticisms, or arguments on matters connected with public policy which are inspired or paid for by private interests, unless he indicates on whose behalf he is making the statement.

Sec. 7. He will refrain from expressing publicly an opinion on an engineering subject unless he is informed as to the facts relating thereto.

RELATIONS WITH CLIENTS AND EMPLOYERS

Sec. 8. The engineer will act in professional matters for each client or employer as a faithful agent or trustee.

Sec. 9. He will act with fairness and justice between his client or employer and the contractor when dealing with contracts.

Sec. 10. He will make his status clear to his client or employer before undertaking an engagement if he may be called upon to decide on the use of inventions, apparatus, or any other thing in which he may have a financial interest.

Sec. 11. He will guard against conditions that are dangerous or threatening to life, limb, or property on work for which he is responsible, or if he is not responsible, will promptly call such conditions to the attention of those who are responsible.

Sec. 12. He will present clearly the consequences to be expected from deviations proposed if his engineering judgment is overruled by nontechnical authority in cases where he is responsible for the technical adequacy of engineering work.

Sec. 13. He will engage, or advise his client or employer to engage, and he will co-operate with, other experts and specialists whenever the client's or employer's interests are best served by such service.

Sec. 14. He will disclose no information concerning the business affairs or technical processes of clients or employers without their consent.

Sec. 15. He will not accept compensation, financial or otherwise, from more than one interested party for the same service, or for services pertaining to the same work, without the consent of all interested parties.

Sec. 16. He will not accept commissions or allowances, directly or indirectly, from contractors or other parties dealing with his client or employer in connection with work for which he is responsible.

Sec. 17. He will not be financially interested in the bids as or of a contractor on competitive work for which he is employed as an engineer unless he has the consent of his client or employer.

Sec. 18. He will promptly disclose to his client or employer any interest in a business which may compete with or affect the business of his client or employer. He will not allow an interest in any business to affect his decision regarding engineering work for which he is employed, or which he may be called upon to perform.

RELATIONS WITH ENGINEERS

Sec. 19. The engineer will endeavor to protect the engineering profession collectively and individually from misrepresentation and misunderstanding.

Sec. 20. He will take care that credit for engineering work is given to those to whom credit is properly due.

Sec. 21. He will uphold the principle of appropriate and adequate compensation for those engaged in engineering work, including those in subordinate capacities, as being in the public interest and maintaining the standards of the profession.

Sec. 22. He will endeavor to provide opportunity for the professional development and advancement of engineers in his employ.

Sec. 23. He will not directly or indirectly injure the professional reputation, prospects, or practice of another engineer. However, if he considers that an engineer is guilty of unethical, illegal, or unfair practice, he will present the information to the proper authority for action.

Sec. 24. He will exercise due restraint in criticizing another engineer's work in public, recognizing the fact that the engineering societies and the engineering press provide the proper forum for technical discussions and criticism.

Sec. 25. He will not try to supplant another engineer in a particular employment after becoming aware that definite steps have been taken toward the other's employment.

Sec. 26. He will not compete with another engineer on the basis of charges for work by underbidding, through reducing his normal fees after having been informed of the charges named by the other.

Sec. 27. He will not use the advantages of a salaried position to compete unfairly with another engineer.

Sec. 28. He will not become associated in responsibility for work with engineers who do not conform to ethical practices.

Codes of the American Rabbinate

By BEN ZION BOKSER

THE American rabbinate is organized in a variety of associations corresponding to ideological as well as regional divisions in the Jewish community. These associations have adopted a series of codes which attempt to standardize procedures and enforce sound ethical practices in various phases of a rabbi's work.

The Rabbinical Assembly of America, which represents the Conservative group in Judaism, adopted its code in 1950; some minor revisions were made in it at the Assembly's convention in 1953.[1] This code must be examined in conjunction with the special Code of Procedure in Placement of Rabbis, adopted in 1947, which is printed in its entirety in the Appendix to this article.

The Central Conference of American Rabbis, which represents the Reform rabbinate, adopted a code at its annual convention in the summer of 1940.[2]

The New York Board of Rabbis, which represents the Reform and Conservative as well as the Orthodox rabbinate in New York City and its environs, adopted in 1943 a code of Standards for Religious Functions.[3] In 1948, the Board adopted a code of Principles Governing Congregational-Rabbinical Agreements, printed in the Appendix.

The problems with which the rabbinic codes deal derive, for the most part, from the autonomous character of the synagogue and its total freedom from hierarchical control. The rabbi is not assigned by any central synagogue body to a particular congregation. Every selection of a rabbi is an act of mutual choice and for a mutually agreed period of time.

The individual Jewish family is similarly free to affiliate with a congregation of its own choice, or to remain unaffiliated. The unaffiliated family can always decide to draw upon specific services from a congregation or a rabbi, discharging its obligations by the payment of a stipulated fee or offering.

The contractual nature of the rabbi's relationship to his congregation introduces an element of insecurity into the rabbi's career, for he is subject to the changing whims of the members of his congregation. Furthermore, the presence in each community of a large periphery of unaffiliated families has often created rivalry among congregations whose welfare depends, among other things, on the size and affluence of the affiliated membership.

PLACEMENT PROCEDURES

One of the objectives of the rabbinic codes is to minimize competition among rabbis in placement. The Conservative group has established a central placement procedure which is administered by an official of the Rabbinical Assembly, in consultation with a committee representing, in addition to the Conservative rabbinate, the lay congregational leadership in the United Synagogue of America, and the training school for Conservative rabbis, the Jew-

[1] The code of the Rabbinical Assembly was issued to its members in Hebrew. Copies may be secured at the office of the Rabbinical Assembly, 3080 Broadway, New York City.

[2] The code of the Central Conference of American Rabbis was printed in full in the 1940 issue (Vol. 50) of the Conference *Year Book*.

[3] This code may be obtained at the office of the New York Board of Rabbis, 10 East 73rd Street, New York City.

ish Theological Seminary of America. The Joint Commission on Rabbinic Placement, as it is called, handles the entire process of rabbinic placement; the individual rabbi is forbidden to enter into direct negotiation with any congregation concerning a pulpit vacancy.

The Reform group never created an instrument of placement parallel to the commission which functions in the Conservative group and in which the rabbis have a decisive voice. In the Reform group, placement appears to be centered in the administrative officials of the Hebrew Union College, the Reform seminary for the training of rabbis. The code of the Reform rabbinate accordingly permits the individual rabbi to apply for a vacancy. A provision banning this was voted down by a referendum of the membership of the Central Conference of American Rabbis by 139 votes to 126. A rabbi, however, must not enter into any conversations about a pulpit until the incumbent has definitely severed his relationship with it. The Reform code parallels the Conservative code in forbidding a rabbi to render any ministrations to a colleague's congregation or to a family in a colleague's congregation, except at the invitation or with the permission of his colleague.

ELIMINATION OF COMMERCIALISM

All rabbinic codes endeavor to eliminate commercialism from the rabbinic profession and from the synagogue life generally. The Rabbinical Assembly code forbids the rabbi to advertise his availability as a performer of marriages or to accept an association with hotels or halls where weddings are performed. He is not to charge a stipulated fee for any service rendered to members of his own congregation, but an exception is made in the case of families not affiliated with the rabbi's congregation. The rabbi must not solicit families that are affiliated with another congregation to join his, and he is enjoined to use his influence against such competitive efforts on the part of members of his synagogue.

The code counsels a rabbi not to accept an invitation from families affiliated with another congregation to render a rabbinic service such as officiating at a funeral or a wedding unless it be with the participation of the rabbi of the congregation to which they belong, or at least with his consent. Fee-splitting between rabbis is forbidden. Substantially similar are the provisions in the codes of the Central Conference and the New York Board of Rabbis.

The rabbi's tenure in office is dealt with in the Principles Governing Congregational-Rabbinical Agreements of the New York Board of Rabbis. These Principles stipulate that the initial term for which a rabbi may be engaged is one year. The succeeding terms are to be three and five years each. After a rabbi has ministered to a congregation for approximately fifteen years, the relationship between rabbi and congregation is to be deemed permanent. This statement also includes recommendations that the congregation arrange for some insurance or retirement plan for the rabbi, and a policy of severance pay if the congregation terminates the services of an incumbent in its pulpit.

SANCTIONS

The provisions in the code of the New York Board of Rabbis governing congregational-rabbinical agreements carry, of course, no sanctions with them, but only the moral pressure which the organized rabbinic opinion in the area covered may command. On the other hand, the codes adopted by the rabbinical associations to govern the conduct of the rabbi himself carry with them sanctions. An amendment to the

Rabbinical Assembly's code which was adopted in 1953 stipulates three levels of sanctions which the Executive Council of the Assembly may adopt against an offending member upon the recommendation of the Ethics Committee. We quote this provision in full:

> Degree of sanctions to be taken against members of the Rabbinical Assembly and applied in accordance with the nature of the violation:
>
> 1. For unwitting and unpremeditated violations, a letter of caution shall be sent to the offending member by the Committee.
>
> 2. For more serious violations, there shall be either a letter threatening suspension, or a six month, one year, or two year suspension from membership in the Rabbinical Assembly, to be imposed by the Executive Council.
>
> 3. For grave violations which have been committed consciously and deliberately, the Committee has the right to recommend expulsion from membership in the Rabbinical Assembly.

The code of the Central Conference when originally submitted to the annual meeting of the Conference did not include any sanctions, and the members instructed the committee to include sanctions in the final draft of the code. The Arbitration Committee of the Conference is vested with the authority of recommending to the Executive Board of the Conference suitable disciplinary action in the case of violations.

Rabbi Ben Zion Bokser, Ph.D., Forest Hills, New York, is the spiritual leader of The Forest Hills Jewish Center, where he has served for the past twenty years. He is a lecturer in homiletics at the Jewish Theological Seminary of America and editor of its "Eternal Light" radio program. During World War II he served as chaplain in the United States Army. He is the author of Pharisaic Judaism in Transition (1935), The Legacy of Maimonides (1950), and The Wisdom of the Talmud (1951); his latest book, Out of the World of the Caballa, will be published shortly.

APPENDIX

CODE OF PROCEDURE IN PLACEMENT OF RABBIS

JOINT COMMISSION ON RABBINIC PLACEMENT *

Mindful of its obligation to the congregations which it serves and to the members of the Rabbinical Assembly, the Joint Commission on Rabbinical Placement has adopted the following Code of Procedure in order to assure the placement of rabbis in a manner which is equitable, dignified and ethical.

1) Members of the Rabbinical Assembly may negotiate for pulpits only through the offices of the Commission.

2) At no time will a member of the Rabbinical Assembly submit his name, or even indirectly cause his name to be submatted, as a candidate for a pulpit without the prior approval of the Commission.

3) No member of the Rabbinical Assembly will enter into negotiations with a congregation in any matter affecting placement without the prior approval of the Commission.

4) No member of the Rabbinical Assembly will accept an invitation to preach or otherwise address a congregation or any of its subsidiary or affiliated groups, if the pulpit of that congregation is vacant or is in the process of being vacated, without the prior approval of the Commission.

5) A member of the Rabbinical Assembly will at no time accept an invitation to occupy a pulpit of a congregation except

* Under the auspices of the Jewish Theological Seminary of America, the Rabbinical Assembly of America, the United Synagogue of America, New York. Adopted in 1947.

by invitation of the incumbent of the pulpit or by invitation of the Commission.

6) Members of the Rabbinical Assembly shall not insert advertisements concerning placement, or reply to such advertisements.

7) Should a congregation of its own accord invite a member of the Rabbinical Assembly to become a candidate for its pulpit, such congregation will be referred to the Commission.

8) In making recommendations for pulpits, the Commission shall be guided by the following considerations:

a. requirements of the congregation,
b. qualifications of the candidates,
c. seniority of candidates,
d. chaplaincy service, and
e. needs of candidates.

9) A rabbi accepting a call to a congregation will normally be expected to remain with the congregation for a minimum of two years.

10) A member of the Rabbinical Assembly will not resign from his pulpit without prior consultation with the Commission.

11) No member of the Rabbinical Assembly will recommend a rabbi to a pulpit unless so directed by the Commission.

12) Should a congregation seek the advice of a member of the Rabbinical Assembly regarding a rabbi for its pulpit, the member will consult the Commission before rendering such advice.

13) All recommendations of the Placement Commission shall be official in character, representing the collective decision of the Commission.

14) The Commission shall not recommend any person to a position until it shall have been definitely established that the present incumbent of that position, whether or not he be a member of the Rabbinical Assembly, has officially been informed by his congregation or has officially informed the congregation, that a vacancy in the pulpit will exist at a definite date in the near future.

PRINCIPLES GOVERNING CONGREGATIONAL-RABBINICAL AGREEMENTS *

THE NEW YORK BOARD OF RABBIS

PREAMBLE

The agreement entered into between a rabbi and his congregation is between a religious community and its chosen leader. It goes beyond the stipulation of a legal agreement; it also covers a spiritual relationship. A rabbi is not to be considered as an employee of the congregation. He is a consecrated servant of God called by the congregation to serve the religious, educational, spiritual and pastoral needs of the membership. His ministry shall not be limited to his congregational duties, but shall be left free to serve the larger community. The very nature of the congregation in Israel as a holy assembly and the lofty character of the rabbi's office dictate that the agreement between rabbi and congregation be preserved on the highest plane of mutual integrity, mutual respect and mutual devotion to the religious purpose for which the congregation exists.

* New York, adopted May 25, 1948.

1. THE RABBI'S OFFICE

The rabbi shall be the spiritual leader of the congregation, the recognized authority on Jewish law and practice, the preacher and the one in charge of religious services. He shall also direct the religious school and other educational endeavors of the congregation. His pulpit shall be completely free. No one shall appear in the pulpit during religious worship unless it be at the invitation of the rabbi.

2. TERM OF OFFICE

The minimum term for which a rabbi shall be called shall be one year; the succeeding term shall be for a minimum of three years; the following succeeding terms shall be for a minimum of five years each.

It is a desideratum that after a rabbi has ministered to a congregation for approximately fifteen years, it shall be considered that the relationship between rabbi and congregation is permanent. The rabbi's ministry shall then continue for an indeterminable period or until the rabbi attains a mutually agreed upon retirement age.

3. RETIREMENT AND INSURANCE

The congregation and the rabbi shall agree that the rabbi be enrolled in a retirement plan to which he may be eligible, and each shall agree to pay the respective share of the cost based upon the rabbi's salary.

4. NON-RENEWAL OF AGREEMENT

Agreements between rabbi and congregation shall be renewed upon expiration except for the weightiest reasons, which reasons should represent a genuine expression of the will of the congregation.

In the case of non-renewal of agreement, both rabbi and congregation shall give sufficient notice so that the rabbi, on the one hand, might make himself available for calls to other pulpits, and the congregation, on the other hand, might make provision for uninterrupted rabbinical ministration.

Should the congregation fail to renew the rabbi's agreement on or before its expiration, it shall pay the equivalent of ten per cent of the salary provided for in his current agreement, multiplied by the number of years he has served the congregation under his current and previous agreements.

5. ARBITRATION

In the event of any dispute or disagreement arising between rabbi and congregation, the matter in controversy shall be settled by arbitration, by three arbitrators jointly selected by rabbi and congregation from rabbinical or synagogue bodies.

The Code of the Catholic Clergy

By Paul Hanly Furfey

THE priest's code of conduct is quite definite and detailed. Basically, his obligations are defined by canon law, that is, by the legislation of the Roman Catholic Church. Canon law, like ordinary civil law, is a rather complicated and technical subject.[1] The complete discussion of the canonical obligations of priests lies far beyond the scope of this article. Therefore, it is only fair to warn the reader that what follows is necessarily somewhat oversimplified.

Two Categories of Priests—Diocesan and Religious

Priests are divided into two categories, diocesan and religious respectively, whose status and obligations differ in important respects.[2] Diocesan priests are attached to a particular diocese and are subject to the local bishop; religious priests are members of a religious community—the Jesuits, Franciscans, and Benedictines are examples—and they are subject to superiors who are officials of the community. Diocesan priests possess private property like ordinary citizens, whereas religious priests either renounce private property entirely or at least renounce the administration and private use of it, in either case living in community from a common fund. By and large, the chief activity of diocesan priests is staffing parish churches as pastors or assistants; nearly all bishops and diocesan officers are chosen from their ranks. Religious priests are more typically engaged in special works such as college teaching or the home or foreign missions. There are, however, very many exceptions to these generalizations. Of the 45,451 Catholic priests in the United States, about 63 per cent are diocesan and 37 per cent are religious.[3]

Obligations Common to All Priests

Certain obligations are identical, or at least very similar, for both diocesan and religious priests; it is convenient to consider these together. First of all, there are certain obligatory exercises of piety. All priests are obliged to recite the Divine Office daily. This is a collection of psalms, hymns, prayers, Bible readings, and other pious material, varying from day to day, and usually taking somewhat more than an hour to recite. In addition to the Divine Office, certain other exercises of piety are mandatory for all, for example, daily meditation and examination of conscience, frequent confession, and retreats at regular intervals; the specific application of these general rules varies among diocesan priests and the various communities of religious priests.

All priests are bound to show respect and obedience toward their legitimate superiors. All have the obligation of continuing their studies, particularly the study of the sacred sciences, after ordination. Annual examinations are held to test the progress of the younger priests; and for all priests there are frequent "clerical conferences" for the discussion of technical matters. All priests must wear distinctive clerical garb. The exact nature of the prescribed dress varies from country to country. In some countries the ordinary dress of the Catholic clergy is the cassock, a close-fitting, ankle-length garment with sleeves. In the United States the cassock is worn only around the church and rectory; street dress for priests consists of ordinary black clothes plus the Roman collar.

Clerical chastity

The law of clerical chastity imposes a twofold obligation on priests. First, they are forbidden to marry, and the Church rejects as invalid any marriage which a priest might attempt to contract, say, before a justice of the peace. Secondly, the law of chastity imposes on priests the obligation to preserve purity of life. Thus a priest has a double obligation to abstain from sexual sin; for he is bound to purity not only by the natural law, but also by the special obligations of his state of life.

Forbidden occupations

Priests are forbidden to engage in certain occupations and amusements, either because they are unbecoming to the clerical state or because they would be likely to distract a priest from his primary duties. For example, the occupations of actors, clowns, bartenders, or jailers would be considered unbecoming. The holding of certain public offices and the practice of medicine and surgery, though not unbecoming, are forbidden as alien to the clerical state. There are also restrictions on the practice of law in secular courts. Priests are ordinarily forbidden to volunteer for military service, except as chaplains. As a general principle, priests are not allowed to engage in any form of business, including wholesale and retail selling, manufacturing, banking, or stock speculation. The nonspeculative investment of funds in stocks and bonds is not considered a violation of this prinple. There are restrictions on the assumption by priests of the duties of guardian, trustee, or executor; there are restrictions, also, on the giving of bail.

Amusements

The types of amusements that are forbidden to priests are described in rather general language in Church legislation. In these matters a great deal depends on circumstances. After all, a theatrical performance may be anything from a sacred drama to an indecent comedy. Priests are expected to use sound judgment and to avoid plays, motion pictures, prize fights, and other public spectacles if their presence would be unbecoming or a source of scandal. They should avoid saloons and bars and should not attend horse races. Priests must not promote or attend dances, even dances organized to aid some worthy cause.

Diocesan Laws and the Diocesan Clergy

Every bishop of a diocese has broad powers to make laws for his own territory. Naturally, diocesan laws made by a bishop must not be contrary to the general law of the Church, but they may particularize or extend this general law in accordance with local needs. A bishop may make and promulgate laws at any time and in any manner he wishes; but often he chooses to do this through a diocesan synod. A synod is a meeting of the principal priests of the diocese convoked by the bishop. The laws of the diocese may be codified in the form of statutes drawn up by the synod.

[1] To become a thoroughly competent canon lawyer takes three years of graduate work in a special school of canon law.

[2] The present article takes no account of priests belonging to Oriental rites in communion with Rome. There are a few hundred such priests in the United States and in some respects their rights and obligations are very different from those of the ordinary (Latin rite) Catholic priests.

[3] All statistics in the present article are taken from *The Official Catholic Directory, 1954* (New York: P. J. Kenedy & Sons, 1954).

Diocesan laws, since they apply only to a particular locality, are likely to be more specific than the general legislation of the Church. They add flexibility to canon law. The Church's general legislation, applying as it does to the entire world, cannot take into account the varying conditions of particular dioceses; but diocesan statutes can do just that. For example, the statutes might prescribe that every rectory have a listed telephone. This would obviously not be an appropriate law for the universal Church, but it might be very appropriate for a diocese in the United States. Again, statutes may set up a schedule of fees; obviously this is also something that must vary from locality to locality. There are many such matters which are more efficiently regulated by local legislation than by general canon law.

Religious priests under diocesan law

Diocesan legislation is naturally of more direct significance for diocesan than for religious priests, for the former are directly attached to a diocese whereas the latter belong to religious communities. However, even religious priests are not entirely independent of diocesan laws. The subject is a complex one; but it can be stated as a general principle that the bishop of the diocese can in any case at least legislate for religious priests in matters concerning the public affairs of the diocese itself, although all religious enjoy a certain autonomy in managing the internal affairs of their communities. For example, if a religious priest is pastor of a parish, he must observe the rules that the bishop makes about parish management in the same way that a diocesan priest would observe them.

Diocesan officers

There are a great many rules and regulations defining the rights and obligations of various diocesan officers. The rights and obligations of some of these officers are defined by the general canon law of the Church. In other cases the office itself has no existence in canon law, but is entirely the creation of the local bishop who therefore defines the functions of the priest who holds it by diocesan law. Among the officers whose duties are defined by general canon law are the vicar general who assists the bishop in the administration of the diocese, the chancellor who acts as the executive officer of the diocese, and the *officialis* who is the judge of the diocesan court. Pastors of parishes also have their functions defined in detail by canon law.

In most dioceses in the United States the offices of diocesan superintendent of schools and diocesan director of charities have been established. The importance of these officers seems to be increasing and in the larger dioceses they are likely to be in charge of large professional staffs. Other priests may be assigned to edit the diocesan newspaper, to take charge of various institutions, or to serve as diocesan directors of the different Catholic societies.

SPECIAL OBLIGATIONS OF RELIGIOUS PRIESTS

Religious priests have certain obligations over and above those that they share with diocesan priests. These additional obligations arise from two sources: first, from the vows of poverty, chastity, and obedience taken by all religious priests, and secondly, from the rules of the particular religious communities to which they belong. It is worth noting here in passing that not all religious are priests. There are in the United States 154,055 sisters, 8,691 brothers, and several thousand ecclesiastical students in religious communities who also share the obligations of the religious state. Religious priests, then, make up only a small fraction of the total number of members of religious communities.

Chastity

Practically speaking, the obligation of chastity is exactly the same for religious and for diocesan priests. The technical difference is that religious priests assume the obligation by pronouncing an explicit vow, whereas diocesan priests assume it implicitly by virtue of their ordination.[4]

Obedience

By the vow of obedience the religious binds himself as a matter of moral obligation to obey his lawful superiors when they issue formal commands in regard to matters belonging within their sphere of authority. Of course, diocesan priests also have a moral obligation to obey those in authority over them. They must obey the bishop and the various officials appointed by the bishop. In practice, the real difference between religious and diocesan priests is that the former are likely to be called on to practice obedience much more frequently. Practice varies a good deal from one religious community to another, but in many cases the religious priest is required to ask explicit permission in regard to minor affairs of everyday life, say, to make an appointment with a dentist or to spend an evening with friends. Diocesan priests usually enjoy a good deal more independence and can make minor decisions on their own authority.

Poverty

Every religious takes a vow of poverty by which he either renounces all ownership of private property or at least renounces the administration and independent use of it. The exact obligations which religious priests assume in virtue of their vows of poverty vary from one religious community to another. The subject is too complex to permit exhaustive treatment here. However, the following statements are true, at least in a general way, of all religious priests. Such priests normally live in community. Like members of a family, they share the same dwelling, the same common table, the same recreational facilities. If there is an automobile, it is not owned by one religious as an individual, but by the community as a whole, and its use is shared by the members of the community as directed by the superior. All acquisition and spending of money is a community matter, not a matter to be settled by the individual member on his own initiative. If a religious priest receives an honorarium for giving a lecture or writing an article, he must turn the money over to his superior. On the other hand, if he wishes to buy a new hat or subscribe to a magazine, he must get permission. Thus neither in earning nor in spending can the religious priest exercise the same right of private property as the ordinary citizen. It is a right which the religious renounces by his vow of poverty. The vow also requires the religious to live with a certain simplicity. Luxurious living would be contrary to the vow. Diocesan priests must also observe certain principles in their management of money matters, but the vow of poverty restricts the freedom of the religious priest to a much greater degree.

Rule of the religious community

In addition to the obligations that they assume by the vows of poverty, chastity, and obedience, religious priests must observe the rules of the particular religious community to which each be-

[4] The diocesan priest assumes the obligation of chastity when he is ordained subdeacon, usually about a year before his ordination to the priesthood.

longs. The rules of each community are drawn up very carefully. By the nature of its rules each community can express the distinctive spirit by which it differs from other communities. Thus a community devoted primarily to the foreign missions would differ in spirit from one devoted primarily to education, and this difference of spirit would be reflected in their respective rules.

There are some eighty-eight religious communities of priests in the United States, varying in size from those having half a dozen priests or less to those with several thousand. Some of these communities were founded in this country; others are American branches of Old World foundations. Some were founded within the last few years; others have centuries of tradition behind them. Some specialize in one particular type of work; the work undertaken by others covers a wide range. Naturally, the obligations of religious priests vary widely from community to community.

A few examples will illustrate the wide variety existing among religious communities. The Jesuits, founded in 1540, are a very large community in the United States. They undertake almost all forms of priestly work, but are perhaps best known for their work in higher education. Many well-known universities are under Jesuit auspices, including Fordham, Georgetown, and St. Louis. The Salesians, in contrast, are a comparatively small and new community, interested in a specialized work. They concentrate on work with boys and run youth centers, camps, and schools. The Missionary Servants are an American foundation, established as recently as 1921; they are dedicated primarily to the work of the home missions. Some communities put a great deal of emphasis on prayer and penance. The Trappists are an extreme example. They rise at two o'clock in the morning, spend seven hours a day in community prayer in chapel and five hours in manual labor, abstain from meat, fish, and eggs except in case of sickness, and, as far as possible, maintain perpetual silence. The Benedictines also emphasize community prayer and the spirit of contemplation, but they do a great deal of active work as well, particularly in the field of education. These random examples are enough to show how widely religious communities differ among themselves; of course, the duties and obligations of the priest members of these communities differ correspondingly. It is difficult to make any general statement about the obligations imposed by religious rules over and above the obligations of poverty, chastity, and obedience that are common to all religious communities.

LIBERTY AND LAW

It will be clear from what has gone before that the rights and duties of Catholic priests are rather rigidly determined. Even the diocesan priest finds his liberty considerably circumscribed by canon law and diocesan statutes. The religious priest must also observe the rules of his community and these, in some instances, are very detailed indeed. To an outsider it might therefore seem that the life of a priest is hedged around with so many regulations that the spirit of voluntary service might be supplanted by a spirit of legalism.

What guards the priest against this danger is the fact that every obligation to which he is subject is an obligation freely undertaken. No one can be forced to become a priest or to enter a religious community against his will. Before a young man binds himself permanently to the obligations of the priesthood, he must have proved himself during several years of preliminary training which offer him plenty of opportunity to change his mind. No one can enter the priesthood as the result of a sudden whim, or without long deliberation. The obligations of the priesthood and of the religious state are sacrifices freely and deliberately chosen out of a love of God and neighbor. Duties undertaken for love can never become irksome.

Paul Hanly Furfey, Ph.D., LL.D., Washington, D. C., is professor of sociology and head of the Department of Sociology at the Catholic University of America. He is a diocesan priest attached to the Archdiocese of Washington. His major research and writing have been in the fields of social psychology, the history of social thought, and the methodology of sociological research. He has written numerous articles and several books, of which the latest is The Scope and Method of Sociology (1953).

Ethics of the Protestant Ministry

By Nolan B. Harmon

THE Protestant ministry has been a long time in formulating a code of professional ethics. The reason is simple—and conclusive. No code of ethics *can* be formulated that will have any binding effect on Protestant ministers. Dr. William H. Leach says:

> It [the ministry] is the oldest profession in the history of mankind and yet has no carefully worked-out schedule of professional work nor of ministerial ethics. . . . There is no profession in which his relations to his fellow men and co-workers is so loosely defined.[1]

The matter, however, goes deeper than a casual feeling that since the ministry is a profession there ought to be professional laws holding it together. The chief reason for the absence of any professional ministerial codes governing conduct is that the ministry itself is assumed to follow, by the very nature of its calling, the highest principles of religion and ethics. Practicing as well as preaching the tenets of Christianity is the announced goal of the whole profession. Why then, it may be asked, should the ministry be expected to bind itself to minor matters of routine, or follow man-made rules which, at their very best, cannot supplant the tremendous principles of the Christian faith? The whole Christian ministry is a code of conduct in its outward as well as in its inward manifestations. It cannot, therefore, be expected that men who have committed themselves by private vows and by public ordination to the ministry of Christ, who take the Bible as their rule and guide, will find it necessary thereafter to look to some sort of ecclesiastical Emily Post for guidance on minute matters of ethical conduct. Sometimes it may indeed be that these are no more than niceties of mere etiquette.

[1] *Church Administration* (New York: George H. Doran Company, 1926), p. 24.

No Binding Common Code

There are other deep reasons why there can never be a more binding code of ministerial ethics for the Protestant ministry.

In the first place, it is impossible to get general agreement among ministers regarding points which have to do with ethics and morals. It is quite true, as has just been pointed out, that all do endeavor to follow what they believe to be the highest religious and moral principles. But ministers—in common with all other Christians—differ greatly as to the application of these principles. Sometimes they even differ as to principles themselves! We have many churches and sects today which cannot agree on some of the great moral issues which divide mankind. How then may we expect them to get together upon minor matters having to do with moot points of professional conduct?

There is not and cannot be any interdenominational court or tribunal which may enforce upon any minister a system governing his morals or his conduct. In Protestantism, every man's conscience provides his own law. Each man is esteemed to be the judge, under God, of his own Christian conduct and must be allowed to walk by the light of his own conscience—provided he keeps the unity of the faith. If his ancestors went to war to prevent men from telling them how they should kneel or

stand or sit at Communion, he is not going to let anyone tell him today how to make a pastoral call or what church publicity he may profitably use. The whole system of Protestantism is bound up with the individual's right in this matter.

On many matters having to do with ethical conduct, the various Protestant denominations have their own individual regulations governing their ministers. Other matters they leave to the obligation every minister is under to keep the moral law and live as a Christian. The Protestant Episcopal Church, for instance, has its canon law; the Methodist churches have their Discipline; other churches likewise have guiding articles or perhaps a sort of denominational "common law," and to these the men of the respective churches look for guidance and authority upon many questions of ethical procedure. To accept guidance from these rules does not abrogate the principle which we cited above; namely, that every man shall be the judge of his own conduct. When a man enters into the fellowship of a particular church, he is always asked if he is willing to follow its customs or polity, discipline and doctrines. He is under no compulsion to do so *up to that particular point*. Once, however, he has promised a great denomination that he will abide by its regulations and rules, he is thereafter morally compelled to obey these regulations and rules as they have been publicly announced and are perhaps privately called to his attention.

Even the minor denominational bodies and religious sects have their rules and principles. A man joining any one of these and assuming the obligations of the particular brotherhood to which he promises his allegiance is expected to keep those rules and regulations which he has thereby promised to keep. Being thus bound by rules and requirements which seem to his own fellowship to be the most important, it is not likely that the ordinary minister will look beyond these for extradenominational courses of conduct.

Finally, every minister is himself supposed to be an arbiter in the field of morals and ethics. He is personally regarded as a judge who decides in such matters, and therefore it is assumed that he can be trusted to regulate his own personal conduct properly. We may as soon expect a medical association to draw up "health rules for physicians" or to issue books on what medicine is good for a doctor, as to expect ministers to tell each other what courses of moral and ethical conduct they consider proper for their professional life. The whole ministry is, as we said above, given to the proclamation and promulgation of high moral and ethical principles.

Jots and Tittles

Furthermore, many matters of professional ethics do not involve vast moral principles. They have to do with jots and tittles or with the niceties of ceremony, and scarcely reach up to the inflexible bulwarks and buttresses of the moral law. When a matter *does* go over into a question of morals, then the minister's conscience, not to say his church, may rightly speak up. But many details of ministerial conduct can rightly be classed as matters of small importance. Whether the car carrying the ministers to a wedding should stop first at the residence of the bishop and then go on to pick up the lower clergy, or vice versa (the latter is correct), such procedures are really of small moment, though it must be admitted that the clergy, too, has a protocol which it sometimes likes to observe. However, many ministerial customs and procedures can rightly be classed as in-

consequential as far as morality or religion is concerned.

COLLECTIVE MINISTERIAL CONSCIOUSNESS

In spite, however, of all these reasons why there should not be and cannot be a compelling system of professional ministerial ethics among the Protestant clergy, there has gradually evolved through the years a certain collective ministerial consciousness. The clergy of an older generation did not look with favor upon the idea of a collective brotherhood, as they were influenced by the reasons we have already given. Henry Ward Beecher in his day advised that the ministry should not stick together as a unit. But call it by what name we will, a vague, intangible, interdenominational professional consciousness has come alive among the Protestant ministry. It has certain sanctions, and to a degree its findings can be codified. Its sanctions, it must be admitted, cannot be enforced by physical means, but undoubtedly there is a consensus of ministerial approval or disapproval which can be applied and which does have weight with individual clergymen. Like international law, ministerial ethical judgments must get force and power from public opinion, not from "armed might."

CODES

In line with this gradual evolvement of an interdenominational professional consciousness, there have appeared a number of "codes," as they are called, which were adopted (most of them) some years ago for proper ministerial guidance. Curiously enough, these various codes came forth in a sort of ethical spate all at the same time and with some little ecclesiastical publicity. Since that date, there has been no great effort further to codify professional ministerial conduct. At about the same time there came out two books, *Ministerial Ethics and Etiquette* by Nolan B. Harmon, Jr.,[2] and *Morals for Ministers* under the initials R. E. X.[3] *Ministerial Ethics and Etiquette* reproduced in its pages the codes available at the date of its publication, and on the basis of common ministerial practice detailed all manner of procedures considered proper for the minister. This volume, recently revised, continues to carry in toto the following codes: the Congregational Code adopted by the New Haven (Connecticut) Association of Congregational Ministers in 1925 and presumably still in force; the Methodist Ministers' Ethical Code adopted by a group of Methodist ministers meeting in conference at Rockford, Illinois;[4] the Presbyterian Code, reported as adopted by the Presbytery of New York;[5] and the Unitarian Ministers' Code of Ethics, adopted by the Unitarian Ministerial Union.[6]

It will be noted that these various codes, with the possible exception of the Unitarian Ministerial Union's Code, were adopted by minor divisions of their particular denominations.

Necessarily, these codes had for the larger ministerial brotherhoods of the country suggestive value only. The Presbytery of New York might adopt a code for its own practice, but that would not bind other presbyteries of the United States. Neither would a small Methodist Conference meeting in Rockford, Illinois, have a right to adopt something for the Methodist connection which would be binding upon the Methodist Church over the world. These facts will be understood and have already been hinted at in the paragraphs above, in which we described the difficulty of getting any code which might have general acceptance. The separate codes, however, do have a suggestive value, and have been taken as such.

[2] Nashville, Tenn.: Cokesbury Press, 1928.

[4] Published in *Christian Century*, December 16, 1926.
[5] Printed in an article by William H. Leach in the *Methodist Quarterly Review*, July 1927.
[6] Printed in *Church Management*, August 1926.

It will be impossible within the scope of this article to reprint—or even to outline in a specific way—the separate ministerial codes just referred to, though they are not long. They confine themselves particularly to relations as they should be between ministers, since it is at this point that the greatest tensions occur within the Protestant brotherhood. To be sure, many other matters are treated in the various codes, such as the minister's duty to keep himself physically fit, to allow time for professional study, to be scrupulously honest and prompt in the payment of debts, and so forth. It has, however, been the experience of this writer, when invited to address ministerial gatherings upon the subject of ministerial ethics, that the principal issues and tensions upon which ministers wish guidance have to do with the relationships between brother ministers.

RELATIONS BETWEEN MINISTERS

For instance, it is not proper for one minister to seek to proselytize members of another minister's flock; it is not proper for a minister to make overtures to, or consider overtures from, a church whose pastor has not yet resigned; it is unethical for a minister to speak ill of the character or work of another minister, especially his predecessor or successor; it is unethical for a minister on leaving a charge to leave the parsonage or manse in other than first-class condition; it is unethical for a minister to render ministerial service to the members of another parish without first consulting and getting permission from the minister of that parish—such matters are greatly to the fore in ministerial thinking. Every code which has been formulated to date has endeavored to outline rather strictly the proper procedures to be followed when tensions arise from situations such as these.

Everyone knows that a minister should not steal a purse accidentally left in the church; but when a member of another congregation comes, and on his own accord asks that he be permitted to join a particular church, states he is not happy, and cannot find Christian fellowship in the church where his membership has been, what shall the "sought" minister do about him? Will it be a "steal" if his membership is received? Even if the pastor who is to be left agrees to the matter after he has been approached by the receiving minister, how will he really feel about the whole situation? Personal equations are hard to put down with exactness, and church members, like women, can be wooed in subtle and not always obvious ways. One thing is certain: the ministry as a whole looks with great disfavor upon "sheepstealing" and has made this evident in every code, written and unwritten, which has appeared to date.

GROWING SOLIDARITY

We have discussed at some length this matter of ministerial relationships because they are at the heart of Protestant codes. The written codes, as has been stated, have not again been featured in the public press as they were some years ago; but it can be said quite accurately that in recent years there has been deepening within the Protestant brotherhood of the nation a sense of solidarity toward the work of its own high calling.

The ecumenical movement, as it is

called—the drive toward the union of all Protestant churches, groups, and forces in the world—is an outstanding feature of modern church life. As this movement grows in force and effectiveness, we may expect a further solidification of ministerial mores and a deeper and more insistent pressure for observance of commonly accepted codes of conduct.

Publicity-seeking ministers

Already the brotherhood of all ministers is enforcing its findings, especially against publicity-seeking ministers, by an outspoken criticism that is usually echoed strongly by laymen. Ministers who perform stunt marriages, or who mark down the dignity of their calling by engaging in practices which, while news from a reporter's point of view, only gain a certain notoriety, are usually pilloried publicly in a devastating way. Any minister who wishes to arrange for a marriage in a balloon or—and this is a new idea!—perhaps en route to the ground in a parachute accompanied by the couple, can certainly make the Monday morning headlines. Or he can marry such-and-such a movie actress for the sixth time if he so chooses, or in the name of pulpit freedom can sound off on some political move so as to get "two sticks" notice in the paper. Whether he realizes it at the time or not, he will find out later that the vast brotherhood of consecrated Christian ministers, whose business it is to live as well as preach the Gospel, will be irresistibly against him. There may not be outward sanctions to be enforced, but there are inward spiritual sanctions which sometimes become tremendously effective. Woe unto a man when the gates of brotherhood are barred against him! The stunt marriage will be remembered against the preacher when he seeks a new pulpit, and his reputation for taking the other minister's members will precede him when he preaches in a new place or when the visiting committee sizes him up as a possibility for their vacant pulpit. It does not matter that he seems to be "sheepstealing" in an open and aboveboard way. Ministers, like mathematicians, have their own system of arriving at the truth, and what a man *does* speaks louder than what he or his friends say.

Brotherhood of the Protestant ministry

The great Protestant denominations have indeed grown closer to each other through the years, and their common ministry has achieved a degree of brotherhood which was not thought possible seventy-five years ago. That brotherhood may be expected to increase, and while its rules and regulations, its codes and practices, may not gain the formal weight of the Hippocratic Oath taken by physicians, nor be as fixed as the regulations of the bar association for the admission of members, the professional consciousness is *there*. A good minister of Jesus Christ marches in step with other ministers and is anxious so to do.

We expect the idea of a professional code to deepen among ministers as the ecumenical movement gathers momentum. It is not likely that there will be one church within the lifetime of our generation. Protestantism itself calls for each to think as he feels it is right to think, and that means in essence that divisions are allowable and expected, granted that all is done within the framework of Christian love and in line with the standards of Christ. But divisions among Christian ministers wherever such divisions break the brotherhood are not allowable. The brotherhood takes precedence over any individual idiosyncrasies. The code of ethics that governs the Christian ministry may never be written in its entirety, but in its essentials it will prove to be more and more effective. The men who give their lives to the service of the Prince of Peace will always be the first to ask for peace among themselves, for brotherliness, and for charity to all. What is this but professional ethics that transcends all ethics, and part of the "peace that passeth all understanding"?

Nolan B. Harmon, L.H.D., D.Litt., New York City, is Book Editor of the Methodist Church, editor of the Abingdon Press, and editor of the quarterly Religion in Life. He is author of Ministerial Ethics and Etiquette (1928) and has made studies in the entire field of professional ethics among ministers.

A Code of Ethics for Public School Teachers

By Cyrus C. Perry

TWO characteristics differentiate the profession of the public school teacher [1] from most other professions: the setting in which he practices and the nature of his clientele. These characteristics have affected the development and application of ethical standards in the teaching profession.

Unlike members of professions who practice largely as individuals and under private auspices, public school teachers practice in an institutional setting, as public employees with a common employer. As such, they are subject to supervision and direction which constitute restraints on unethical conduct not present in the case of a private practitioner. Because they are engaged in a governmental, tax-supported enterprise, the public has a direct interest in their professional standards. Probably no public service generates more interest in a community than its school system; the extent to which a community will adequately support its schools may depend upon its regard for the quality, character, and professional conduct of the teaching personnel. An adverse public judgment against a few teachers can work injury to the majority, and this in turn results in a disservice to the children.

Public school teachers, to a greater degree than private practitioners, have direct and varying ethical obligations to a multiple clientele. These obligations extend not only to the children with whom they deal but to the parents, the employing school board, and the community as a whole. In addition, as part of a common enterprise, their direct day-to-day contacts with colleagues present unique problems in professional relationships.

[1] The term "teacher" is used herein to mean instructional, administrative, and supervisory personnel of all types.

Early Developments

Most teachers today recognize the desirability of codes of ethics applicable to their professional relationships. They are aware that codes serve as a guide in applying their particular body of professional knowledge. Until late in the nineteenth century primary emphasis in relation to ethics was placed upon a teacher's personal conduct, habits, and religious convictions. The proceedings of the early meetings of the National Education Association show concern for such standards primarily as related to the character of the teacher as a person and his ability to instruct pupils in moral and ethical principles.

In the latter half of the nineteenth century, there began to develop an awareness of the broader professional aspects of ethics. This came about partly because of the expansion of public education and the development of professional procedures of instruction and school administration. In time this broader view resulted in the formulation and adoption of codes by various teachers associations, the first being the Georgia State Teachers Association in 1896.

Multiple Codes

Currently there is no single code applicable to all public school teachers. The code of the National Education Association technically is binding only on its membership. While many teachers believe there should be one governing

code, the decentralized organization of the profession into state and local education associations throughout the country makes such general application impractical at this time. All of the states and territories have state-wide associations of public school teachers which are affiliated with the NEA. In addition it is estimated that there are at least 9,000 local associations of which about 5,000 are NEA affiliates. These state, local, and territorial associations are independent entities with their own governing bodies; all but a few of the state associations and many local associations have adopted codes. In addition certain state and local groups, for example, superintendents and principals, have codes applicable to their particular problems and interests.

Role of the NEA

There are over a million public school teachers in the United States. The National Education Association with some 560,000 members is their principal membership organization. As such, it should logically take the leadership in the development of ethical standards for the profession. The responsibility of the NEA for such leadership was recognized in the article on ethics for teachers in the May 1922 issue of The Annals, prepared by the chairman of the Ethics Committee of the Pennsylvania State Education Association. At that time the NEA had no code. After commenting on the work of a number of state ethics commissions, the article concluded:

> If similar commissions could be established in other states and if there could be established a national commission to which appeals from the state commissions might be made, a national code of ethics with an accompanying body of decisions and interpretations would gradually be established. The National Education Association would seem to be the proper organization to take the first steps in this direction. Probably no one thing would go farther toward the securing of proper recognition of the teaching profession than the approval by the National Education Association of a national code of ethics and the establishment under the auspices of that association of a national commission on professional ethics.[2]

The original NEA Code, adopted in 1929, grew out of a recommendation of the Committee on Ethics for the Profession which had been appointed in 1924. The Committee consisted of fifty-six members of the Association employed in various types of positions in elementary and secondary schools and colleges. In large part the Code was based on the results of a questionnaire sent to more than three thousand NEA members. It contained twenty-one ethical principles. The Committee recommended that the Code be used by teacher education institutions and that all state teachers associations establish ethics committees to interpret its provisions, investigate violations, and promote its use by teachers. Amendments were effected in 1939 and 1941 which dealt primarily with the power of enforcement.

By 1950 it was believed that the existing Code was obsolete in some respects. At the request of the Ethics Committee, the NEA Research Division sent to a random selection of 4,000 members a questionnaire similar to the one used in 1928. A representative response was obtained which confirmed the belief that a revision of the Code was warranted. A preliminary draft was submitted in 1951 to some 4,000 members of the Association, including the NEA officers, members of the Representative Assembly, members of NEA committees, and officers of state education associations. The final draft of the

[2] George Gailey Chambers, "Codes of Ethics for the Teaching Profession," The Annals, Vol. 101 (May 1922), p. 126.

proposed Code was recommended by the Ethics Committee and adopted by the Representative Assembly in 1952.

NEA CODE

The Code establishes five principles; they deal with the teacher's obligations to students, to parents and homes, to school and community, to employer, and to professional associates. Under each principle certain specific obligations are set forth. The Code is printed in its entirety as the Appendix to this article.

ACTIVITIES OF NEA

The NEA Committee on Professional Ethics is composed of five members and currently includes a superintendent of schools, a principal, two classroom teachers, and a faculty member of a school of education. Its purposes and functions as laid down by the Representative Assembly of the Association are to study the Code and make recommendations for improving it, to publicize and promote its use by members of the profession, and to render opinions interpreting its provisions. The Committee is also authorized to hold hearings in cases of alleged violation and to make recommendations for disciplinary action to the Executive Committee of the Association.

The Committee meets several times a year to formulate and establish policies. It is assisted in its work by a staff representative at NEA headquarters who also serves as legal counsel. Since the adoption of the new code in 1952, the primary activity of the Committee has been to acquaint public school teachers with its provisions and to carry out programs to encourage its observance. To this end, the Committee during the past two years has (1) distributed on request more than 250,000 copies of the Code; (2) responded to hundreds of requests from members and teachers associations for advice and information on ways to develop constructive programs on ethics; (3) advised teachers as to whether certain contemplated steps in connection with their professional employment would be proper; and (4) rendered formal committee opinions, published in the Association's *Journal*, construing the Code on specific type-fact situations submitted by individual members, state and local teachers associations, and schools of education.

PROJECTS WITH LOCAL ASSOCIATIONS

The organization and activities of the approximately 9,000 state and local teachers associations are so varied that no single association program could be presented as typical. No study has been made showing the nature and extent to which such organizations conduct planned and constructive programs in the field of ethics. The thousands of requests to the NEA Committee on Professional Ethics for materials is evidence of great interest among state and local associations as well as individual teachers. It has been apparent for some time, however, that if this widespread interest is to be channeled constructively, some initiative must be taken on the national level to stimulate and coordinate local activity. To this end the NEA Committee is currently inviting local associations to take part in a nationwide study program which seeks to bring home the implications and importance of the national Code.

The Committee has recently published and distributed to thousands of local associations an *Action-Study Guide* which outlines the purposes and objectives of the Code and presents under each principle of the Code a series of questions suitable for workshop discussions and research, with the request that the results be returned to the Committee for study and compilation by the NEA Research Division. Illustrative are two sets of questions dealing with the first principle of the Code:

1. The Code suggests that the ethical teacher deals impartially with students regardless of their personal qualities and their social and economic backgrounds. Just what is "impartial" treatment? Does it mean "equal" or "same" or "as necessary for each individual's best development"? Perhaps it means all of these. What are some of the factors or conditions in your community which teachers must know about if they are to be impartial in the sense of the Code?
2. The teacher who is ethical with his students recognizes their individual differences and tries to adapt his instruction to meet individual needs. Can one do this and be impartial? What individual differences are typical in your classroom; in your school; in your community? What resources does the school system make available for dealing with these differences? What ethical obligation does the classroom teacher have to seek ways for overcoming the impediments (such as large classes) so as to find and deal with the differences among children?

Prior to the publication of the *Action-Study Guide*, a number of local associations were invited to participate in a preliminary project. They were asked to discuss and report the extent to which teachers were fulfilling their ethical obligations and ways in which they could be assisted in fulfilling them. This preliminary exploration indicates that the public school teacher's primary interest in ethics is in terms of professional growth rather than his individual welfare or advancement and is directed to those provisions of the Code which deal with his relationships to children, parents, and the community. The results of this project lent encouragement to the study now under way.

OBSERVANCE AND ENFORCEMENT

While various programs are under way at the national, state, and local levels to encourage observance of codes of ethics, there has been no concerted effort toward enforcement through disciplinary action. Since the adoption of the NEA Code in 1929, only one member has been removed for violating its provisions. It is not known to what extent the various state and local associations have enforced their codes through disciplinary proceedings, but it is highly unlikely that more than a few have taken such action.

The absence of a record of disciplinary action is not a serious reflection on the status of ethical practices in the profession. Undoubtedly the overwhelming number of public school teachers are fulfilling their professional obligations apart from formal code requirements. The profession is made up largely of people dedicated to their work who, because of their character and training, can be relied upon to adhere without coercion to self-imposed standards compatible with good ethical practices.

There are, of course, some teachers who fail to adhere to accepted standards. However, in connection with its program of rendering interpretative opinions, the NEA Committee on Professional Ethics has found that a substantial number of alleged violations are due to thoughtless action or to lack of knowledge of accepted professional practices. Thus an important function of the NEA Committee is education in these areas through publication of opinions construing the Code.

Leaders in the profession generally agree that national, state, and local associations look forward to the time when disciplinary action will be taken against those members whose conduct reflects adversely on the public schools. The program of the NEA Committee on Professional Ethics is designed in part to this end. It is believed that the current study program and the building

up by the Committee of a body of opinions construing the Code are desirable first steps. However, the primary consideration in developing these programs on ethics is neither disciplinary action nor promotion of the teacher's individual welfare. Rather it is professional growth.

Codes of ethics are points of reference for individual teachers in developing their own standards. They also are guides to the profession in seeking to achieve its ideals of professional service. As a code is studied, analyzed, and discussed by individual teachers and groups, its implications become increasingly understood and its application to the practice of teaching raises standards in the profession generally and, in turn, the level of service to the community.

Cyrus C. Perry, LL.B., Ph.D., Washington, D. C., is legal counsel to the National Education Association. He was formerly assistant corporation counsel in New York City, representing the Board of Education and Board of Higher Education in legal matters, and was subsequently executive assistant to the corporation counsel. He has been a lecturer on education law and administration at New York University.

APPENDIX

CODE OF ETHICS

NATIONAL EDUCATION ASSOCIATION *

We, the members of the National Education Association of the United States, hold these truths to be self-evident—

—that the primary purpose of education in the United States is to develop citizens who will safeguard, strengthen, and improve the democracy obtained through a representative government;
—that the achievement of effective democracy in all aspects of American life and the maintenance of our national ideals depend upon making acceptable educational opportunities available to all;
—that the quality of education reflects the ideals, motives, preparation, and conduct of the members of the teaching profession;
—that whoever chooses teaching as a career assumes the obligation to conduct himself in accordance with the ideals of the profession.

As a guide for the teaching profession, the members of the National Education Association have adopted this code of professional ethics. Since all teachers should be members of a united profession, the basic principles herein enumerated apply to all persons engaged in the professional aspects of education—elementary, secondary, and collegiate.

FIRST PRINCIPLE: *The primary obligation of the teaching profession is to guide children, youth, and adults in the pursuit of knowledge and skills, to prepare them in the ways of democracy, and to help them to become happy, useful, self-supporting citizens. The ultimate strength of the nation lies in the social responsibility, economic competence, and moral strength of the individual American.*

In fulfilling the obligations of this first principle the teacher will—

1. Deal justly and impartially with students regardless of their physical, mental, emotional, political, economic, social, racial, or religious characteristics.
2. Recognize the differences among students and seek to meet their individual needs.
3. Encourage students to formulate and work for high individual goals in the development of their physical, intellectual, creative, and spiritual endowments.
4. Aid students to develop an understanding and appreciation not only of the opportunities and benefits of American democracy but also of their obligations to it.
5. Respect the right of every student to have confidential information about himself withheld except when its release is to authorized agencies or is required by law.
6. Accept no remuneration for tutoring except in accordance with approved policies of the governing board.

SECOND PRINCIPLE: *The members of the teaching profession share with parents the task of shaping each student's purposes and acts toward socially acceptable ends. The effectiveness of many methods of teaching is dependent upon cooperative relationships with the home.*

In fulfilling the obligations of this second principle the teacher will—

1. Respect the basic responsibility of parents for their children.
2. Seek to establish friendly and cooperative relationships with the home.
3. Help to increase the student's confidence in his own home and avoid disparaging remarks which might undermine that confidence.
4. Provide parents with information that will serve the best interests of their children, and be discreet with information received from parents.
5. Keep parents informed about the progress of their children as interpreted in terms of the purposes of the school.

THIRD PRINCIPLE: *The teaching profession occupies a position of public trust involving not only the individual teacher's personal conduct, but also the interaction of the school and the community. Education is most effective when these many relationships operate in a friendly, cooperative, and constructive manner.*

In fulfilling the obligations of this third principle the teacher will—

1. Adhere to any reasonable pattern of behavior accepted by the community for professional persons.
2. Perform the duties of citizenship, and participate in community activities with due consideration for his obligations to his students, his family, and himself.
3. Discuss controversial issues from an objective point of view, thereby keeping his class free from partisan opinions.
4. Recognize that the public schools belong to the people of the community, encourage lay participation in shaping the purposes of the school, and strive to keep the public informed of the educational program which is being provided.
5. Respect the community in which he is employed and be loyal to the school system, community, state, and nation.
6. Work to improve education in the community and to strengthen the community's moral, spiritual, and intellectual life.

FOURTH PRINCIPLE: *The members of the teaching profession have inescapable obligations with respect to employment. These obligations are nearly always shared employer-employee responsibilities based upon mutual respect and good faith.*

In fulfilling the obligations of this fourth principle the teacher will—

1. Conduct professional business through the proper channels.
2. Refrain from discussing confidential and official information with unauthorized persons.
3. Apply for employment on the basis of competence only, and avoid asking for a specific position known to be filled by another teacher.
4. Seek employment in a professional manner, avoiding such practices as the indiscriminate distribution of applications.
5. Refuse to accept a position when the vacancy has been created through unprofessional activity or pending controversy over professional policy or the application of unjust personnel practices and procedures.
6. Adhere to the conditions of a contract until service thereunder has been performed, the contract has been terminated by mutual consent, or the contract has otherwise been legally terminated.
7. Give and expect due notice before a change of position is to be made.

* Adopted by the Representative Assembly of the NEA in 1952.

8. Be fair in all recommendations that are given concerning the work of other teachers.

9. Accept no compensation from producers of instructional supplies when one's recommendations affect the local purchase or use of such teaching aids.

10. Engage in no gainful employment, outside of his contract, where the employment affects adversely his professional status or impairs his standing with students, associates, and the community.

11. Cooperate in the development of school policies and assume one's professional obligations thereby incurred.

12. Accept one's obligation to the employing board for maintaining a professional level of service.

FIFTH PRINCIPLE: *The teaching profession is distinguished from many other occupations by the uniqueness and quality of the professional relationships among all teachers. Community support and respect are influenced by the standards of teachers and their attitudes toward teaching and other teachers.*

In fulfilling the obligations of this fifth principle the teacher will—

1. Deal with other members of the profession in the same manner as he himself wishes to be treated.

2. Stand by other teachers who have acted on his behalf and at his request.

3. Speak constructively of other teachers, but report honestly to responsible persons in matters involving the welfare of students, the school system, and the profession.

4. Maintain active membership in professional organizations and, through participation, strive to attain the objectives that justify such organized groups.

5. Seek to make professional growth continuous by such procedures as study, research, travel, conferences, and attendance at professional meetings.

6. Make the teaching profession so attractive in ideals and practices that sincere and able young people will want to enter it.

Organized Labor and American Ethics

By KERMIT EBY

IN 1951, the Committee on Resolutions of the Congress of Industrial Organizations presented to the convention its resolution on Ethical Practices. The resolution was adopted, apparently by unanimous consent.

In the resolution, the Committee lamented "the flouting of higher ethical standards to which all Americans subscribe, and which have been flouted by individuals or groups of individuals." Emphasis was placed on the too frequent departures from "the higher moral standards by which all Americans should live." It was agreed that the breakdown cut across all sections of society, including labor.

> For every bribe-taker, there is a bribe-giver; for every tax-fixer, there is a tax-evader; for every "five-percenter" in the nation's capitol, there is a special interest group seeking special favors; for every racketeer and gangster, there is an individual or corporation willing to use his service for ignoble ends, or to knuckle under, without moral stamina, to illicit propositions.

These acts and the guilty individuals are deplored in the resolution, the consequences on the moral fiber of our nation bewailed, and emphasis given to the fact that

> each act of dishonesty or lack of ethics in the labor movement deprives workers of their right to decent, honest, democratic trade-unionism which is single-mindedly devoted to the advancement of the social welfare and economic well-being of American workers.

We in the C.I.O. have constantly *been vigilant to purge our ranks of subversives and corruption, wherever they appear.* Our organization, in expelling eleven Communist-dominated unions with a membership of almost a million, demonstrated its devotion to decency and democracy. We are ready to act with similar firmness against any evidence of corruption that may arise in our ranks. There is no place in C.I.O. for racketeers, for agents of racketeering interests, or for any immoral elements.

Every effort, the resolution continued, will be made to rid the movement of such influences, so that "our organization will remain clean, decent, and honest." The resolution concluded:

> If every element in our society will maintain constant vigilance against dishonest and unethical practices, the people of this country will have scored a major victory in behalf of democracy and against the weakening of moral standards, that can serve as an ally to the sinister forces of subversion and aggression.

Speaking for the resolution, delegates Berne (Communications Workers) and Stettin (Textile Workers) again lamented the breakdown in American morals, assured the nation of labor's vigilance, and concluded:

> . . . with this organization having passed this resolution, we are going to have a clean face in the American public, and I think it is an excellent resolution . . . because I (we) believe that what should motivate people in public life when they hold office is a sense of responsibility, of service, and not of profit.

Thus, troubled by charges of subversion and corruption, the convention of the CIO resolved these things. To this day, an observer is unclear as to the effects thereof. Following a similar emphasis, and moving beyond the "abhorring" stage, the United Automobile

Workers, meeting in Atlantic City in 1952, gave its International Executive Board authority to "curb Communists and racketeers in local unions." This was to be accomplished by amending the constitution so as to vest "the international executive board with powers to review the findings of local trial boards and order new trials." Justification for this step was the contention that it is the duty of the international officers to step in and protect the interests of the local union when it is powerless to oust officers who place personal or political gain above their responsibilities to the rank and file.

This, in a union known for its democratic practices, is a usurpation of power which leaves unanswered the old, old question, "Who will watch the watchers?" It could be, and sometimes is, argued that men who are properly rewarded with honors, salary, and expense accounts are beyond ambition. Frankly, I doubt it!

AMERICAN FEDERATION OF LABOR

There have also been actions by the American Federation of Labor. Prodded by overt corruption in the International Longshoremen's Association of New York, the Executive Board of the AFL addressed its attention to the problem of racketeering. (The details would fill many volumes.) Writing to the officers and members of the Longshoremen's Association, it declared:

> We have concluded that these disclosures are of such a serious nature as to call for immediate action by us. We wish to make clear the position of the American Federation of Labor on crime and racketeering within your international and its local unions.
>
> Your relationship with the American Federation of Labor demands that the democratic ideals, clean and wholesome free trade unionism must be immediately restored within your organization, and all semblance of crime, dishonesty, and racketeering be forthwith eliminated.

The language is very similar to that of the CIO, except that the AFL does not equate corruption and subversion. Corruption, not Communism, caused the AFL to lose face.

DUBINSKY AND LEWIS

Something new, however, was recently added when David Dubinsky of the International Ladies' Garment Workers' Union suggested:

> Many rank and file trade unionists, with a long and passionate devotion to the freedom and independence of free trade unionism, know that any form of governmental intervention in union affairs is an evil. But when these same unionists see some of the welfare funds squandered and misused by racketeering elements, some of whom are muscling their way into the trade unions precisely in order to get their hands on these welfare funds, many rank and filers and leaders will come to look upon governmental intervention—to protect welfare funds—as a lesser evil.[1]

Needless to say, Mr. Dubinsky's article has evoked considerable editorial response, mostly favorable, praising him for his "labor statesmanship," a term which not too many years ago was scarcely considered complimentary.

No recapitulation of labor's position on corruption and subversion would be complete without a word from John L. Lewis. At a hearing before the Committee on Labor and Public Welfare of the United States Senate, April 24, 1953, to a question from Senator Kennedy of Massachusetts on his refusal to sign a non-Communist affidavit Lewis replied:

> the CIO took in the personnel employed by the corporation before they became members. The original fault, if any, does not lie with the union. . . . We have special circumstances in various types of organization, including government subdivisions. You have a man who does not act according to Hoyle or according to ethical and moral standards. I do not think any national legislation is needed by the legitimate unions of this country.

[1] *American Federationist*, Vol. 61 (July 1954), pp. 12–13.

MATERIALISM AND CONFORMITY

Probably more professions from the leaders of American labor might be added to the record. More of the same is, however, unnecessary to establish the fact that leaders of American labor, like all other upright Americans, deplore corruption and are against sin, in government, in business, and in their own organizations. And if eighteen years of work in both the AFL and the CIO taught me anything, it was that labor spokesmen are as honest and sincere as, if not more so than, their counterparts in government and business. This is their strength and—unfortunately—it is also their weakness. For our times demand that being as good as our counterparts is not really good enough, either for our unions or our country!

The tragedy of the labor movement is simply that its leaders, its members, and its institutions are increasingly corrupted by the dominant values of the society of which they are a part and which they once desired to reform. The primary ideals of our current civilization are based upon materialism, secularism, and conformity. Many are the times when I moved from a meeting of union executives to one of similar composition in business, to find that the conversations in the two places were strongly similar. Both were concerned with problems of budgets and of money. It is impossible to understand many unions today separately from the corporations with which they do business. Hart, Schaffner, and Marx is big business, but the Amalgamated Clothing Workers is even bigger. Ernest Bevan, when once asked what produces a labor leader, replied, "The man who sits across the table from him." He might very well have replied, "The union takes on the structure of the corporation with which it negotiates."

There is a story, now folklore in the steel union, which goes like this: Once there was a brash young idealist who dared run against an old-time regional director. Now this director was out of the miners' union, and he had grown fat and sleek in the service of his fellows. More seriously, the idealistic challenger charged, the incumbent had got fat by being free and easy with union money. To this the director, in a speech to his fellow workers, replied, "See this suit. Feel its quality. It cost me $150, and this shirt, all silk, cost me $10; shoes, $18.50, Florsheim; watch chain, 21-carat gold." He then patted his stomach and said, "Do you know what I had for breakfast? $2.50 steaks." He then concluded dramatically, "Do you know what I want for you? Suits at $150, $10 shirts, $18.50 shoes, 21 carat chains, and steaks for breakfast." The regional director won the election, so the story goes.

The story is perfectly consistent with the American dream of upward mobility, and the idea that if your boy can make it so can you. Seeing the union boss "on top" gives the worker vicarious satisfaction. The real test of the leader faced with these drives is determined by his ability to keep them in check. Many of them do not, unfortunately. At the 1953 UAW–CIO convention, the Resolutions Committee recommended that Walter Reuther's salary be raised from $11,500 to $18,000 a year. In the course of the debate, delegate after delegate argued that Reuther's salary should be as high as Philip Murray's, when he was president both of the United Steel Workers and of the CIO ($40,000 per year). Delegate Lloyd Jones. Local 2,

expressed the "match 'em" sentiment when he said:

> When I go into negotiations with the Murray Corporation, I have little men who are called co-ordinators, and I find their salaries are $20,000 a year. When I talk with my industrial relations manager, the sixth in line, his salary is $25,000 a year; when I move on above him . . . I find they go up to the vice-president at $45,000 a year. . . . I join with the previous speaker . . . I say, "Let's tell our International President that we are going to give him Phil Murray's salary, as president of CIO, and president of its biggest union, UAW.

Delegate Andy Rapchak, of Local 228, was even more emphatic:

> Now if we are going to be a bunch of cheapskates on this floor here, *how in hell do we expect the companies to give us concessions when we meet with them?* The first thing that they will throw back at us is, "You won't pay your leaders, but you want us to pay your men!" . . . If we are going to have leadership the same as the industrialists do, we should be men enough *to pay as they do!* . . . I, too, say $50,000 and right on down the line.

WALTER REUTHER SPEAKS

To which Walter Reuther replied:

> We have a lot of work to do; we have great battles to fight; we have crusades to lead; and if you try to evaluate what we will work for only in terms of monetary reward, you miss the real point. . . .
>
> I am not interested in being rich. Because if I was interested in being rich, I would be sitting on the other side of the bargaining table, not this side. I sat across from G.M. officials, and the lowest paid guy got $90,000 and the highest one got $100,000.
>
> We never felt envious, because we have something they can't buy, with all their millions, and that is the loyalty and support of a lot of honest workers in this country. . . . I think we have the most wonderful union in the world. We want to keep it that way, and that kind of union has got to have dedicated leadership. . . .
>
> It believes in the movement, and you can't buy that kind of leadership with money. You can only get it, if the people you pick as leaders believe in it.

Walter Reuther's position prevailed in the UAW. I wish it were the prevailing position throughout the entire labor movement, in government, and in the churches. For in each the assumption is that there is a positive correlation between performance and pay. I doubt it!

As an illustration, we might point out the almost positive correlation between a pragmatic concept of the union as a business proposition and union leadership as a means of getting and keeping a sinecure. It is in such unions, led by cynics, that corruption flourishes; the apathy of the rank and file is a direct result. Bread is important but, ironically, men are more inclined to die for the vision of the Kingdom than for the more prosaic realities of the daily "fix."

This is a factor that perhaps needs to be understood by those who lead labor. Exhortations against corruption in a world where the chief emphasis is on success as measured by income and conspicious consumption are not enough. Men will steal or be apathetic to stealing when all around them the rewards go to the thieves. They will steal less, much less, when theirs is a dedication to a cause. This is the reason for the truism in organized labor: the dedicated are corrupted by power, the cynical by money and comfort. In all my years in CIO I never encountered any significant corruption. To the men around me, money was a means to an end, not an end in itself.

LABOR'S MORAL DILEMMA

The beginnings of labor's moral dilemma are deep within itself, and even more thoroughly, deep within the society of which it is a part. The first realization necessary to an understanding of labor's role in America is that it was born out of Gomperism and pragmatism, rather than Marxism and Fabianism. Idealistic critics of the labor movement often take this fact as an indication of labor's lack of an underlying political or economic philosophy which might serve to guide its decisions. This is not quite true. Labor on the whole has a philosophy, a typically American philosophy which might be described as pragmatic dynamism. "A nickel an hour is worth more than a theory any day," a prominent leader once informed me. It is this argument for "more" which makes it imperative that even the most idealistic of labor leaders deliver at the bargaining table. Reuther is one of the most successful, as the record of the UAW attests.

So is John L. Lewis. The difference is not one of success, but of emphasis. Walter Reuther understands that there is not real prosperity for his autoworkers in an America of unemployment and in a world of hunger. But let him speak for himself:

> I have tried before and I will say again, it is true that if we can get America to give more attention to helping people help themselves in the positive fight against hunger and poverty in the world . . . we would have to send fewer of our boys with guns and flame throwers to fight on the battlefronts of the world!

Mr. Lewis, on the other hand, appears to put the security of his miners first.

In a world such as ours a union and the society of which it is a part are well served only if it is understood that there is no security for the parts separate from the whole. Further, the ethic grows out of this understanding and thrives on its implementation. Conversely, the monopolistic leads to the collusive, the collusive to the corrupt, and the corrupt to apathy and decay. It is trite but true: "Where there is no vision, the people perish."

Here again an illustration may be more effective than argument. When I was executive secretary of the Chicago Teachers Union, I was severely censured by one old-timer for presenting the whole garment of intellectual and community interests as the union's responsibility. "We hired you," the old-timer said, "to protect our pensions and get us raises. Never mind the curriculum and John Dewey." We are, he said in essence, no more and no less than the plumbers and the electricians, that is, a monopolistic self-seeking craft. For my disagreement, I was later fired, but to this day, I am convinced that in a Chicago dependent upon state and federal income, the narrower viewpoint is self-defeating even in the economic sense.

LEAVENING INFLUENCES

We begin our concluding section of this discussion of ethics in the labor movement with a question: Are there leavening influences in the movement which will keep it from being corrupted by the values of the world in which it exists? My answer is Yes. However, having so answered, I must admit that there will be occasional manifestations of the ills by which an acquisitive society is beset.

The resolutions, on the surface though they may be, are significant in that they mark a willingness on the part of organized labor to respond to a critical public opinion. For years, suffering from an inferiority complex, the labor movement refused to recognize criticism as such. This attitude could be understood when the movement was young and on the defensive; but a movement which claims the strength of 16,000,000 members has no need of a complex. No man or organization is mature until willing both to tolerate and to encourage analysis and criticism.

While the resolutions, as I said, are a beginning, there is yet a long road to travel. Some fifty labor papers cross my desk monthly. I read several and scan the rest. I do not read them all, for once the line is understood, there is no particular intellectual stimulus in its repetition. These labor papers are the voice, the apologists of the union-power hierarchies. They repeat the speeches, the activities, of these leaders, some significant and some not so. Frankly, they are puff sheets. But they are becoming less so. For the workers are becoming too sophisticated to fall for an unabashed line; too many of them (although not enough) are attending institutes; too many are reading other than union material. And workers have an advantage which other Americans often do not: they are at least exposed to arguments on economics and politics which clash pretty sharply with the prevailing opinions of the capitalistic press.

Again, while there is entirely too much of a one-party approach to national politics in unions, there are many sharp and bitter struggles for power and position on local levels. These give experience in political give and take.

Probably ten to twelve thousand CIO members attend some kind of an institute yearly. At these institutes, discussions are held on all kinds of economic and political subjects. Between 2,500 and 3,000 autoworkers met in Chicago in the spring of '54; included in their discussions were the annual wage, McCarthyism, taxation, and so on. I noticed vitality in those discussions, vitality growing out of necessity. It is such developments which may encourage growth of ethical thought.

Since I have often been seriously critical of the fear of criticism shown on the part of union leaders, I am encouraged when such an established organization as the AFL finally admits that it is not beyond criticism and that those who dare to criticize are not disloyal.

The labor movement today becomes increasingly a service organization. And like all organizations which provide service for their members, it must do so as effectively as it can. There really is not much difference between working as an expert in a union pension office and working for a Social Security government office. Yet there is a difference, and it is significant, for unions are also agitational, sometimes almost revolutionary organizations. The economic gains they administer are often won by struggle on the picket line and through the political rally. Docile members do not make good activists. In fact, here is a real dilemma for union leaders: how to sensitize their members to action but not to such a degree that the members focus their drives on the leaders. It is because of this need for an alert rank and file that only the most corrupt and dictatorial unions can ignore the desires of their membership. This is what so few outsiders understand. Union leaders stay in power not too long after they fail to serve their members' interests.

Thus what appears to be antidemocratic in the larger configuration may be democratic and serve the greater interest. As long as this continues to be true, unions are a bit better than organizations which rest at the peak of the pyramid instead of at the base. At least so I rationalized when I made decisions which set inflationary wage patterns. I was not going to ask the $64-a-week man to be more moral than the $750-per-week executive.

HUMAN RELATIONS AND POLITICS

Long ago, some white workers learned that if the Negro were not lifted to their economic level, they would be reduced to his. Granted that this is a bread-and-butter approach which smacks of the pragmatic, it at least got results. Today the CIO is uncompromising in its fight for racial equality, and the AFL increasingly so. In both cases, the upward thrust grows out of the people. This I assert is good, even though I know that there is still plenty of prejudice among some workers and union leaders who do not believe in the policies they are called upon to implement.

Today, organized labor is in politics to stay. The reason is again obvious. Government increasingly plays a decisive role in its drive for economic security. Facts secured from the Bureau of Labor Statistics and decisions of the National Labor Relations Board, among many other things, influence the decisions affecting labor's security. The leaders of labor understand this and are determined to have their say in this our compensatory state.

And if our trend toward urbanization and industrialization means anything, the influence of organized labor is destined to increase. At regular intervals, drums are sounded, warning of the influences of such a trend. As if workers were not Americans, too, and privileged to their own political place in the sun!

Often I have counted the resolutions at labor conventions. No other resolutions are broader in scope, more generous in outlook. Education, health, conservation of resources, industrial and international peace, are at the center of labor's concerns. More than two-thirds of the resolutions encompass the welfare of all Americans.

This, I again assert, is true because the workers are still inspired by the American dream. Having less, they aspire to more. But more significantly, workers know depression and unemployment, inadequate housing and poverty, and because they know these things, they can more readily sympathize with other people who lack to an even greater extent the good things of this earth.

Consequently, the leaders of labor—authoritarian as they often are, human as they always are—are still, united with their fellows, a force for good in the world. In a relative world, a world of compromise, I prefer to cast my lot with the forces which bring the greatest good for the greatest number. Unfortunately, or perhaps fortunately, there is not such a thing as a worker isolated from his community. Like all other Americans, he is a composite of the total influences which play upon him. Therefore neither he nor his organization is outside of the corrupting or spiritualizing forces of the whole.

We have seen how these forces and the values they stimulate lead to corruption and reaction; how workers want their leaders paid by corporation standards, how some succumb, and also how in a union of 1,300,000 (the UAW) these corrupting forces were resisted. We have also pointed out that the nickel-an-hour approach to problems is often prevalent, but we are not oblivious to the fact that that nickel, more often than not, buys milk. We have looked briefly at the attitudes taken by unions on race and politics, and have found them generally good.

Kermit Eby has been professor of the social sciences in the Division of the Social Sciences of the University of Chicago since 1952, having previously been an associate professor (1948–52). Prior to that he was director of education and research of the CIO in Washington. He also served for a time as executive secretary of the Chicago Teachers Union. Before entering the labor movement he was a teacher in the public schools and also a minister of the Church of the Brethren. He is the author of articles in national religious and labor publications and of several pamphlets, Political Primer, Labor and Education, Labor and Religion (all 1944).

Democracy and Public Employee Morality

By O. Glenn Stahl *

"THOSE holding public office, as servants of the public, are not owners of authority but agents of public purpose." This basic framework for the moral standards that apply to government employment has rarely been so well stated. This particular statement appeared in a proposed Code of Ethics for officials and employees of Arlington County, Virginia, that was prepared by a citizens' commission but never adopted by County authorities.[1]

The phrase "agents of public purpose" pitted against "owners of authority" puts succinctly the eternal conflict between good and evil that besets the public worker. As "agents," they are bound to loyal and efficient performance. "Public purpose" denotes the will of the people, democratically expressed through the ballot box or otherwise. In contrast, those who look upon public employment as an opportunity for self-aggrandizement and for exercise of authority to favor themselves or their friends seem to conceive their role as "owners of authority."

In comparing the ethical problems of government employees with those in private enterprise, writers commonly refer to the public service as if it were an occupation—on a par for example with law, medicine, business management, engineering, or teaching. As a matter of fact, of course, it is a composite of *all* occupations, not one for which a separate discipline, a distinctive technical preparation, and a special code of conduct exist. It is a composite of occupations many of which themselves embrace definite ethical standards, in whatever context they may operate. Practically every occupation discussed in this issue of THE ANNALS, and literally thousands of others, are represented in the public service.

The only group approximating a distinct occupational caste is that of the political heads—elective or appointive—who commonly make up the top echelon in state, local, and federal governments. Neither these political heads nor the legislators and workers in Congress, the state legislatures, and local lawmaking boards and councils constitute the focus of attention for this paper. Here we shall be primarily concerned with the full-time year-in and year-out civil servants—where properly so designated, the *career* civil servants. Therefore we are thinking of men and women from many different walks of life and a variety of educational backgrounds, not necessarily a cohesive professional body.

To refine our subject further, it may be well to rule out of the discussion those routine occupations in government employment that have an ethical environment no different from that of their counterparts in private employment. Generally the same obligations of honesty and integrity prevail for clerical, skilled and unskilled, and even many technical workers in government as

* The opinions expressed in this article are the author's and do not necessarily reflect the official view of the United States Civil Service Commission, with which he is connected.

[1] From Section 13 of the Code as published in *Public Administration Review*, Vol. 13, No. 2 (Spring 1953), p. 120. Through technicalities in a court action ousting the County Board members who had set up the citizens' commission, an antireform group came into power which refused to recognize the importance of one of the best written codes of ethics in the country.

prevail for these groups in the business world.

The publicly employed group on which discussion of moral behavior can profitably center is that comprising the professions, business specialities, and other occupations in government in which some degree of judgment or discretion is exercised—however trivial—in the execution of public policy. This does not automatically *exclude* all employees doing menial tasks or *include* all doing vital work. It may well include, for example, the meter reader for a publicly owned utility service. It may, however, have no special application to a laboratory technician in a public hospital whose careful processing of blood samples must be viewed in the same ethical light regardless of the ownership of the institution.

It may be the bureau chief or the sanitary engineer, the tax assessor or the park ranger, the police officer or the personnel examiner—we are dealing for purposes of this discussion with many occupational categories, usually under circumstances where discretion must be exercised and where publicly adopted laws or rules govern the conduct of either the worker, the citizen affected, or both.

PLACE OF PUBLIC SERVICE IN COMMUNITY ETHICS

Any fair-minded student of the subject will concede that, by and large, the public expects higher standards of conduct from its public servants than it does from its members engaged in private enterprise. The very surprise and indignation occasioned by the internal revenue scandals is recent evidence in point. "We are shocked," says Herbert Emmerich, "not because we have a low regard for public officials, but because we expect them to have so high a standard of integrity." [2] The same point is stressed by Senator Paul H. Douglas in his book *Ethics in Government*,[3] as well as by many other observers.

We must learn to see the actual behavior of government employees in perspective. The Senate subcommittee which reported in 1951 on ethical standards pointed out: "The moral standards of the country, indeed, provide the ethical environment which in turn conditions the standards of behavior of public officials." [4]

This subcommittee went on to observe:

> We also believe that the ethical standards of public officials are probably higher than those prevailing in business and other walks of life. On this point, also, there was persuasive testimony from men of experience in both Government and business and from observers of both. Public officials apparently are more conscious of the problem of moral standards. The resentment which public officials sometimes show when subjected to public criticism may be explained in part by their awareness of the fact that some of their critics would be even more vulnerable to criticism if the same standards were applied.[5]

Public schizophrenia

There is a kind of public schizophrenia that pervades this subject. On the one hand articulate citizens demand extraordinarily high moral standards of public servants, and on the other they seek special action from officials favoring themselves against the larger pub-

lic interest.[6] George A. Graham, currently serving as staff director of the Hoover Commission Task Force on Personnel, pointed up in a recent book the necessity for all branches of society to bear the responsibility for ethical conduct in public affairs:

> The business executive who thinks only in terms of his corporation, the labor leader who thinks only in terms of his union, the leader of organized agriculture who thinks only in terms of his farm organization are all a menace to the basic integrity of the nation. . . . In a free society the responsibilities of the statesman fall on everyone, and upon each person in accordance with his power and ability.[7]

The public interest

The ultimate standard of conduct for the public servant, therefore, is the public interest as opposed to group or private interests. And so must be the standard for our own society as a whole.

Whenever doctors look upon their own prosperity as synonymous with the status of the public health, whenever associations of manufacturers oppose legislation for the general welfare, whenever labor leaders mistake the interests of their union structures for the interests of all citizens, whenever veterans' organizations exploit patriotism for class legislation, whenever voters view their Congressmen merely as tools to get favors and special consideration, we shall fall short of our goal of the highest possible public ethics. What we need are more and more people dedicated to the public interest itself—rather than to special economic or social or sectional interests.

We already have the largest representation of this kind of dedication *in the public service.* Except for the "stepping stone" artists and the clerical and laboring levels where public employment may represent just a job, most people are attracted to the public service because of their zeal for identification with a larger good than some narrow group interest. It is for this reason, as well as the demands of office itself, that we find the highest moral standards in public employment. Corruption or "shady deals" are actually relatively rare among career civil servants. Even in a major scandal like that in the Bureau of Internal Revenue of 1950–51, only 0.13 per cent of the career people were involved. A supporting example is also found in the disclosures of unsavory influence on key officials of the Reconstruction Finance Corporation—where the agency was initially organized with almost wholly political appointments and, although later covered under civil service, retained much of its political flavor.

This is not to condemn inferentially those who spend a transitory period in the public service. But I believe that the proportion among them—regardless of party—who are really imbued with the public interest is often less than among career public servants.

Such is the perspective in which I believe we must examine the essential characteristics of the moral attitudes and behavior of public employees.

DEMOCRATIC CHARACTER OF PUBLIC SERVICE IDEALS

If the ultimate standard, the basic ethic, for the government employee is pursuance of the *public interest,* then the meaning of democracy—authority derived from consent of the governed—is implicit in our consideration of the subject. For the sake of convenience, this democratic base for the moral standards of civil servants may be analyzed first in its external aspects, vis-a-vis the public, and then in its internal, administrative aspects.

External relationships

Public administration in a democracy must serve the public in a manner that strengthens the processes and integrity of democratic society. One of the tests of a public servant is his earnestness in recognizing, as Gordon R. Clapp has phrased it, "the utmost importance" of letting "the people decide for themselves what policies and objectives the public service shall have."[8]

The responsibilities of employees to the public, to the law, and to their current executive leaders are tied together by the common bond of democratic consent. Paul H. Appleby has observed:

> In nearly all administrative decisions the sense of virtuous performance is to be pursued by attempting to inject some increased allowance for the more public interest and some increased concern for those citizens not immediately present or heard.[9]

It is at this point that potential conflict looms between the credo of the professional specialist and the democratic exigencies surrounding the servant of the public. As Appleby admonishes: "In this pursuit there must be care not to confuse one's professional viewpoint, functional preoccupation, or personal prejudices with the public interest."[10] Indeed, the reconciliation of our continuing dependence upon experts in government with the realities of democratic needs and behavior is a central problem of statesmanship and, therefore, at the heart of the civil servant's moral climate.

No one has warned against the limitations of the specialist more eloquently than Harold J. Laski over two decades ago. A political system which fails to keep the expert under control, he says,

> will lack insight into the movement and temper of the public mind. It will push its private nostrums in disregard of public wants. . . . It will mistake its technical results for social wisdom, and it will fail to see the limits within which its measures are capable of effective application. For the expert, by definition, lacks contact with the plain man.[11]

In further definition, Laski states:

> The expert, in fact, simply by reason of his immersion in a routine, tends to lack flexibility of mind once he approaches the margins of his special subject.[12]

Expertise, it may be argued, sacrifices the insight of common sense to intensity of experience. It breeds an inability to accept new views from the very depth of its preoccupation with its own conclusions. It too often fails to see round its subject.[13]

The public servant who does not see round his subject may, however unwittingly, violate the moral law of sensitivity to the public will. Specialization, in the operating programs of government and in pressure groups on the outside, is probably more often the source of unethical behavior in relation to the maintenance of the integrity of democratic institutions than is outright corruption.

Government must be thoroughly grounded on a healthy respect for and intelligent understanding of the democratic environment.

[6] Former Governor of Nebraska, Val Peterson, now Federal Civil Defense Administrator, stressed this point in a recent address in Washington. See "The Public's Split Personality," *Personnel Administration,* Vol. 17, No. 3 (May 1954), pp. 1–5, 11.

[13] *Ibid.,* p. 3.

We are forced to the conclusion that in the last analysis much of our success in the quest for a responsible bureaucracy will depend upon our ability to foster among the citizenry as a whole, and therefore among the bureaucracy, a respect and devotion to representative institutions.[14]

Herein lies the basic democratic character of the ethical standards found or sought in the external relations of the public employee.

Internal relationships

A cardinal tenet of our democratic faith is respect for human personality, for individual dignity and worth. Not only does this foundation undergird our political system and our civil liberties as a whole; it is also a basic assumption upon which administration must rest.

The success—and therefore the moral behavior—of an administrative undertaking depends ultimately upon the capacity, the integrity, and the motivation of people. Social science research is rapidly confirming our instinctive belief that favorable human relations in an organization are promoted by a democratic environment with high employee participation. Furthermore, we find that the existence of good human relations is not an isolated feature of management but is a quality and attitude woven throughout the entire fabric of administration.

Here we approach common ethical ground with the management of private enterprise. But there is a peculiar necessity for the democratic spirit of administration in the public service, because it is difficult to motivate employees to achieve the high consciousness of their democratic role vis-a-vis the public if there is little democratic practice and recognition of the dignity of man in internal administration.

Hurst R. Anderson has put the ethical necessities in their broadest sense by stating that administrators must commit themselves to "a philosophy of personal and group living which allows everyone to live, work, and contribute to the general good." [15] This permissive philosophy, tempered by necessary co-ordination and control of the specialist, is essentially the democratic spirit in administration—the spirit of respect for subordinates, colleagues, and chiefs that makes for mutual dependence and trust, maximum productivity, and minimum friction. No code of ethics can be effective unless it is exemplified in the acts of top management. It can set no higher standard than that followed by "those who by their action are able to affect in significant ways the careers of their associates and subordinates." [16]

The positive nature of a democratic administrative environment is well stated by Gordon R. Clapp:

> . . . we will get the most out of the talents we have in the service if we build on the strengths of individuals instead of emphasizing their weaknesses. The systems of administration we organize in our agencies, the methods of selection, the techniques of placement, the ideas of appraisal, the delegations of authority, the teamwork arrangements, all these must rest on the assumption that public employees will do their job well. Watchdog systems that assume weaknesses and try to forestall them will never get top-notch performance from employees.[17]

[14] David M. Levitan, "Administrative Responsibility," *Political Science Quarterly* (Academy of Political Science, Columbia University), Vol. 61 (1946), p. 598.

[15] "Ethical Values in Administration," *Personnel Administration*, Vol. 17, No. 1 (January 1954), p. 8. This article, based on an address by President Anderson, of The American University, is a brilliant statement of special value to the public administrator.

[16] Phillip Monypenny, "A Code of Ethics as a Means of Controlling Administrative Conduct," *Public Administration Review*, Vol. 13, No. 3 (Summer 1953), p. 187.

Thus, again, we see that the framework for moral standards of the public employee has a democratic base and that the maintenance of this basis for internal management is more critical in the public service than in any other environment.

THE FUTURE

If the desirable moral standards of public workers require a high regard for our democratic processes and institutions, then all citizens must be concerned with the conditions that contribute to or detract from that regard. A vital condition is the attitude of the general public itself. The issue has been so well stated by David M. Levitan as not to permit paraphrasing:

> If administrative officials are to appreciate the high role of the citizen and to accord him the dignity becoming free men, they must themselves experience the blessings of free men. Harassed employees—themselves deprived of the privileges and immunities of citizenship—will be ill prepared to accord to others that which is denied to them. A dual interpretation—one applicable to government employees and another to others—of the due process and other liberty guaranteeing clauses of the Constitution is repugnant to the philosophy of the Constitution. Nor is there room in America for two classes of citizens—those who work for the government, and those who do not.[18]

Heroes of the public service

The government employee's democratic impulses can hardly be strengthened if undemocratic practices govern his life—whether through internal administrative restrictions or through abuse and arbitrariness heaped upon him by the general public, legislative bodies, or demagogues. Senator Douglas would undoubtedly be supported by thoughtful leaders in both political parties in the following statement:

> It is fortunate that there are in government large numbers of men and women who lead devoted lives of public service. They work extremely hard for far less pay than they could get in private industry. They never sell out the public interest but instead defend it under great difficulties. They do all this, moreover, without receiving appreciable praise. They are generally either little known or actually ignored by the public. Sometimes they are bitterly attacked by interests which are seeking to obtain unfair privileges or which are swayed by unfounded prejudices. These men and women are indeed unsung heroes, who deserve far more recognition than they receive.[19]

If this caliber of public servant is to be maintained and increased in number, action must be taken for development of the kind of *esprit de corps*, employee selection and training, working conditions, and incentives that will make this condition possible, and for avoiding "open season" on bureaucrats. Many constructive proposals have been made, largely in the nature of institutional arrangements or personnel reforms making the government working atmosphere more conducive to the highest ethical conduct. Of particular interest are those recommended by the Senate Subcommittee on Ethical Standards previously referred to.[20]

[18] *Op. cit. supra* (note 14), p. 587.

[19] *Op. cit. supra* (note 3), p. 27.

[20] "Other proposals in the field of personnel policy are: (1) better salaries in the higher brackets; (2) the protection of judicial procedures for Federal employees accused on loyalty charges; (3) simplified dismissal procedures for all employees (protection is needed against the stigma of disloyalty which is a severe extra-legal penalty, not against dismissal); (4) continued delegation to the departments of large responsibilities for recruiting, training, and developing civil serv-

Unfortunately there is too little opportunity outside of government for practice in the rigorous objectivity and impartiality demanded of public servants. In practically all but a few businesses and professions, the principals can buy and sell where they wish, they can play favorites without fear of punishment, they can disclose or conceal information on their operations largely as they please, they can accept gifts without question of propriety, and they need seldom worry about conflict of interest.

Outline for progress

A continuing strengthening of the moral base for public administration is not likely to come through reliance solely on fringe actions such as periodic entry into the service of persons from private activity, the adoption of codes of conduct, or the inquiries of legislative committees—however essential all these may be. More fundamental and durable progress will be found, in this writer's opinion, in such long-range emphases and actions as the following:

1. More conscious attention in our secondary and higher educational systems to the public service, to the role of the citizen as well as of the public employee in governmental action, and to the ethical implications of public employment. Such education should reflect part of our cultural heritage, worthy of passing on to *all* students, not just those specializing in the social sciences.

2. Continuous emphasis within state, local, and federal government service on moral standards, primarily by the long shadow of behavior of our leading officials and by such special devices as an administrative staff college [21] in the federal service that would afford greater opportunity for mutual respect, understanding, and example among higher ranking personnel.

3. More communication to the people by public agencies on their achievements, their plans, their organization, and their employees—not so much in the form of news releases as by a continuous policy of reporting and a trained attitude that recognizes the public servant's role as a broker and interpreter for the commonweal.

4. More positive recognition by the public—through citizen organizations, universities, and foundations—in the form of honors and privileges given to public workers who perform distinguished service or who exemplify the best in exercise of public responsibility.

This is not the place to spell out the details and the subplans that might contribute to these general lines of approach.

FEDERAL CREED OF SERVICE

We can take heart that as recently as 1951 the career personnel directors in the federal government evolved a creed of service which in tightly packed phrases sets forth all that American citizens should aspire for in public employment:

We as members of the civil service accept our obligation and our opportunity to serve the American people well and in full measure, doing our best to further the free and democratic institutions of our country.

We believe it is our duty to

Carry out loyally the will of the people as expressed in our laws

Serve the public with fairness, courtesy, integrity, and understanding

Help improve the efficiency, economy, and effectiveness of our work

. . . and thus do our part in performing the great services of the Government.

ants according to standards fixed by the Civil Service Commission and subject to its supervision and audit; (5) greater diligence in discovering and rewarding outstanding performance and dedicated service among civil servants; (6) more systematic and intensive professional training particularly for officials and employees who will serve in posts abroad. The nature and number of these suggestions emphasize the widely held view that high standards of conduct for the Federal Government are dependent upon maintaining a high quality of personnel in the service." —*Op. cit. supra* (note 4), p. 60.

[21] See *Proposal for a Federal Administrative Staff College* (General Series, Pamphlet No. 5; Washington, D. C.: Society for Personnel Administration, 1953).

O. Glenn Stahl, Ph.D., Arlington, Virginia, is executive vice-chairman of the Interagency Advisory Group (formerly the Federal Personnel Council), United States Civil Service Commission; member of the Executive Council of the Civil Service Assembly of the United States and Canada; adjunct professor at The American University; and editor of Personnel Administration. For ten years he was associated with the Federal Security Agency, from 1948 to 1951 as director of personnel. He is the author of Training Career Public Servants for the City of New York (1936), coauthor of Public Personnel Administration (third ed., 1950), and contributor to various journals in the fields of political science, education, and personnel administration.

The Control of Ethical Standards in the Public Service

By Phillip Monypenny

THE need of improving the standards of ethics of governmental officers and employees was much discussed after a series of legislative investigations during the last administration, and the discussion has taken a somewhat different turn after even more exciting legislative inquiries under this one. The previous series of discussions resulted in the recommendation that a code of ethics be drawn for governmental employees, at least in the national government. Such codes already exist for some groups of public servants, probably the best known being that of the International City Managers' Association. The codes so far adopted or proposed are directed to rather simple if somewhat intangible standards of conduct, but accompanying discussions have suggested more far-reaching goals of conduct. If the simpler standards are all that are to be included it would seem that a code of ethics is unnecessary. There are laws against larceny and bribetaking. We all disapprove the granting of exceptional favors unless we happen to be the recipient. But the report of the Douglas subcommittee was concerned that officers and employees represent the public, not smaller groups, that they refuse to yield to the pressure of special interest as they go about their work of executing legislative directives, something which is a far more complicated matter.[1]

[1] U. S. Senate, Committee on Labor and Public Welfare, Subcommittee on Ethical Standards, *Ethical Standards in Government* (Eighty-second Congress, First Session, 1951); Paul H. Douglas, *Ethics in Government* (The Godkin Lectures at Harvard University, 1951; Cambridge, Mass.: Harvard University Press, 1952).

Certainly ethics, or something akin to it, is an important matter in government. Reliance on the integrity of the appointed personnel of government, especially in circumstances in which supervision by elected officials is very remote, is an inescapable element of large-scale government. The building of a chain of connection between the political impulses of the population and the action of government rests on the responsiveness of the employee group to political impulses directed through elected officials. Although there are plenty of formal controls to enforce this responsiveness, it probably rests, like so many other important social controls, on factors internal to the individual rather than on immediately external factors like threats or promises. It is to controls of this kind, the internal ones, that the term "ethics" may be applied. In this paper we shall examine what may be expected of ethics as a control, and what may not.

Stated Rules and Political Arrangements

The formal controls that enforce subordination to stated rules, whether legislative or administrative in origin, are scarcely a matter of ethics. If they cover the situation, they leave no leeway to the individual; he is not called upon to consult his inner sources as a guide to action. It is not the business of the individual to change such rules, even though he may disapprove of them. Conscience only requires that the stated

rule be followed. But what of the standards of action when the legal rule is unclear? Is this a matter of employee ethics, or are there other determinants, not set up by employee discretion? In most governmental action there are such determinants, not cast in a legal form. The custom of not enforcing parking meter limits as long as the meter is kept filled with coins may be well understood, minor violations of the building code may be deliberately overlooked, obsolete traffic ordinances may be allowed to rest unenforced, as matters of deliberate administrative policy having well understood political sanctions. In such situations the rule and its nonenforcement, or its counterpart, administrative action despite the absence of a clear legal directive, may be deliberate acts of policy, approved by politically effective elements of the population, even though in both cases the ordinary vehicle of adjustment, formal legal action, is not used.

Political pressures

So we may move from the legal rule as a guide to action to politically effective arrangements embodied either in nullification of existing rules or in the use of administrative action not based upon any obvious authority. The absence of a formal rule does not mean however that action rests upon the unguided conscience of the individual employee. The simple view that the whole duty of officers and employees is to act in accordance with the literal letter of the law runs counter to a large body of governmental practice, especially in our state and local governments. If this be wrong much of popular control which operates by pressures as well as by election is also wrong. The political controls which give to elected officers their primacy in the governmental scheme also ensure that pressures which may affect their election will affect the action of their subordinates. Our view of the obligations of an employee is therefore expanded to include both the observation of the existing law and the practical necessity of respecting the pressures by which his office is surrounded. If these exhausted the possible guides to action there would be no place for ethics as a separate system of control. The obligation to obey would be the sum and substance of the ethical code for the public service.

Beyond Obedience

Many people, however, are unwilling to accept subordination to statute or to political authority as the sole obligation of public employees. They expect a welfare official to do more than simply allocate the money he has and make no comment on the suffering that will ensue from inadequate legislative provision for welfare needs. They expect the police captain to take some action against gambling in his district even if some of the local party leaders are privy to such gambling. They expect the purchasing official to refrain from accepting gifts from suppliers even if no law is broken and there is little chance of embarrassing publicity. Some even hold it the duty of generals and admirals to make frank comments on the adequacy of the military program of the administration under which they temporarily serve. In other words, they expect those who are to be the transmission belt for the popular determination of governmental policy to have their own view of their mission and of appropriate policy.

Is this an appropriate or even a safe expectation? There are two ways of justifying it, though they are certainly not conclusive of the question. No matter how much one fears in theory the independent action of the bureaucrat or how much he prizes the sub-

ordination of the elected to the appointed official, there are circumstances in which it is hard to accept the individual human being as purely the instrument of others, indifferent to the purposes for which he is being used, or schizoid, completely ignoring his own opinions as he acts. Of course any subordinate who chooses to act in opposition to his superiors acts at his peril. From another standpoint the legal and informal determinants of governmental action do not necessarily form a seamless web which precisely determines all governmental events. The individual office holder, even the individual employee, has apparent freedom of action in many situations, and his action may be an element in developing an opinion in favor of the values which his action embodies. The level of devotion which he brings to the carrying out of his clear obligations may certainly vary. His perception of the situation in which he seeks to carry out given policies certainly cannot be controlled by formal or informal rule.

If this qualification of the transmission-belt view is correct, then the question of what the officer or employee will do when he has some freedom of decision is an important element in the total determination of governmental policy. Without accepting the view that bureaucracy is an uncontrollable leviathan we may still anticipate that the actions of elected officials, whether legislative or executive, do not completely determine the conditions of all governmental action. It is in this area of apparent indeterminacy that the responsibility of the employee to do other than just follow orders comes into being. It is here that his effective ethics, the choices he makes, the values that his work embodies, are in evidence. Is there anything that can be done deliberately to influence this working ethic?

Ethics as a Means of Social Control

Ethics as an agency of social control, which is our concern here, is a different matter from ethics as a standard by which the individual as an individual may lead a good life. The two conceptions of ethics are not unrelated but they do serve different purposes. To live a good life as an individual is an end in itself. Whether the destruction of an institution of which the individual is a part results from his assumption of the good life is irrelevant. But ethics as a means of social control does not have its end in the life of any single individual. It is a means to secure certain general results in society which affect many individuals. An unswerving adherence to the individual standards of the good life does not necessarily answer all of the ethical questions which arise under the second conception of ethics.

Group standards

Ethics as a system of control also deals with groups, not with isolated individuals. Particular individuals may be capable of very high standards of performance, but it is large groups which must be moved in all social endeavor. Groups impose their own standards on the individuals who join them; they develop their own standards out of their own experience. A man in isolation may change his own conduct radically. It is difficult for a group to develop new standards in relation to the activity which makes it a group.

The standards for groups are therefore likely to be more modest than those which a dedicated individual may embrace. They will also be partial in relation to the whole life of man, covering the aspect of affairs which are common to the group. They must grow

out of present practices and standards. They must be capable of relatively easy application to the events of the day: they must not be so general that a long and sophisticated chain of reasoning is necessary to relate the standards and the action required at the moment; in this respect they are the opposite of constitutional law. The standards developed for governmental employment will probably be various, developed separately for the many different kinds of work which is done by governmental employees. A United States assistant district attorney working up a criminal case must rely on quite different standards of judgment as to what is practical and what is right from those of an auditor in the General Accounting Office verifying a long chain of fiscal documents or a federal public health officer passing on a state grant-in-aid request.

69626

Conflicts and contradictions

Even the simple requirements may not be simple when they contradict prevailing standards and prevailing organization in the society of which government is only part. It is easy to say that employees should not steal, that they should be impartial, that they should not seek private profit in the course of their work, that they should not betray or profit from confidential information. But these standards will not be easy to meet unless the job pays enough to live on, unless employees are protected against hostile action by disappointed persons, unless both the general community and superior officers will reward and protect the impartial performance of office. One can easily think of countries in which these requirements are not present, as they are not in parts of the United States. In such a situation, whatever the formal code, the total system of obligations in which the employee lives does not lay these simple moralities upon him; its imperatives are of a contrary order.

Value and Basis of Written Codes

Assume for the moment, however, that these conditions have been met and that a code of conduct has been drafted which goes beyond the obvious requirement of obeying the law to some of the more subtle and difficult standards, such as that governmental power will be used not only to accommodate those with the loudest voices but also to investigate the situation of the relatively quiet ones and that agency personnel will not become indebted in subtle ways to those on whose conduct they are expected to pass judgment. Why is such a code likely to be any more effective than more formal imperatives which, we are told, are all too widely disregarded?

The action of various professional groups in adopting ethical codes suggests that there is some value in a formal statement of obligations which goes beyond those defined in the law. What such a code rests on is the identification of the individual with the group, an identification which includes his acceptance of group standards and his susceptibility to group action, whether of disapproval or approbation. Every working group determines to some extent the professional future of its members as the group evaluates their conduct and reacts to that conduct. The situation in government is not essentially different. In a given agency there may be no professional group as such, but the working group which includes people at various hierarchic levels has a life of its own which its members cannot easily ignore. The future of the individual and his immediate satisfaction in his work depend in part on judgments within the group. Inevitably there is a working ethic in such a group, and the problem is not

so much to supply one as to modify the existing one to the desired standard.

Any attempt to raise ethical standards must rest on this basis of the group and the group standard. If the new standard is related in some manner to values and beliefs currently held, if it sets out a standard of conduct which is practicable, if it is developed by those who exercise leadership, and if the subsequent actions of those in authority support it, then it is likely to be an effective influence on conduct. Fully considered these are rather formidable limitations. But they do not exhaust the difficulty of evaluating and raising the ethical standards of government.

It will not be easy in any period to develop a generally agreed-on standard for the public service. The values which are to be promoted can scarcely be abstracted from the situation in which decisions that embody them are to be made, and the result of a decision as well as its moral defensibility colors our judgment of its rightness. The Light Brigade acted by the highest standards of military loyalty, yet a little more cowardice, a little more tendency to question legitimate authority, might have resulted in some evaluation of the order given and a more successful outcome to the battle. Soldiers live not to die nobly but to protect their country. The public service demands not alone nobility of purpose but also understanding of the situation within which noble purposes must be pursued. The ethical significance of any governmental act lies not merely in the immediate act but likewise in its consequences as far as these are understood. We do not pay men to be saints but to serve our needs.

Many of the familiar phenomena of government that take place in shabby courthouses and dingy city halls, in the musty rooms of battered political clubs, in the shabby splendor of hotel suites, seem to those used to more prepossessing surroundings to have also a moral dinginess, even though in our imperfect state no other processes have been developed for popular government. If Senator X must have his judgeship, if his candidate is selected to meet an obligation to Boss Y, and if the President by these appointments assures a favorable vote on a measure he has promised to the people who voted for him, is the President's ethics faulty, or the Senator's, or even the Boss's, since each of them has his place in our political world? In any kind of political action people must be united, and if they will not be united by grand ideas then they must be united by favors, with some grand ideas getting some support in the process.

Although these examples are not taken from the strictly administrative sphere they indicate considerations that are not always absent in administrative action, particularly on the part of the responsible political officers of any undertaking. People at lower levels should not hold to administrative standards so sanctified and remote from the larger world in which their particular activity takes place that they cannot appreciate the imperatives of people at higher levels and co-operate when necessary.

The right questions

Codes will be drafted most easily when there is settled policy, when the ends to be achieved are clear, when there is a considerable accumulation of experience. It is then, however, that they are least likely to be needed to raise the standard of performance. Codes will be hardest to draw just when temptation is at its peak and criticism most strong, in the developing area of governmental policy where there are unresolved conflicts between competing groups and competing policies. For such areas Dean Leys has probably made the most useful recent contribution to the discussion of ethical standards.[2] He views ethics not as a matter of rules, but of questions as to the sources to be consulted for applicable rules and as to the ends which are to be promoted. The right questions he thinks will permit the possible choices and their implicit values and consequences to be most clearly stated. If the choices are set out with the clearest possible statement of conditions, the unexamined presumptions which are probably responsible for more deplorable governmental action than any willful wrongdoing will be reduced. Catastrophes in tenements left without periodic inspection, shareholders forced from farms by agricultural assistance programs which ignored their peculiar status, unsophisticated investors led into disastrous enterprises—miscarriages of policy and administration such as these result as much from unwarranted assumptions about the lack of danger as from deliberate intent. In Leys's book the ethical questions posed by various schools are accompanied by contemporary situations in government and business in which choices have been made with or without a due consideration of ethical elements in the decision. If governmental personnel ask the right questions the standards of action will in the long run be higher, even if preliminary answers are later rejected.

[2] Wayne A. R. Leys, *Ethics for Policy Decisions: The Art of Asking Deliberative Questions* (New York: Prentice-Hall, 1952).

CONFLICTING CHOICES

The development and evaluation of ethical standards in government are harder because the conflicting values among which choices must be made are not always posed as opposite pairs, good or evil, free enterprise or monopoly. Usually there will be a range of desirable things, not in themselves opposed, among which choice must be made, either because of the limits of fiscal resources or because of the limits of the social apparatus through which action must be taken. Anyone who wants to get a view of the poignant incompatibility of apparently desirable things may read the cases Harold Stein has edited illustrating types of administrative decisions.[3] In the "Natural Cement Issue," one finds state support for home industry posed against the lowest possible costs of highway construction. In the "TVA Ammonia Plant," the postwar plans of the chemical fertilizer industry are pitted against the postwar plans of TVA for experimentation with nitrogen to complement its successful work with phosphates. In the "Reconversion Controversy" the maintenance of a martial spirit and full industrial potential is pitted against the minimizing of unemployment and the protection of small plants as war orders slackened in the closing months of the war.

If appointive governmental personnel, either those in political offices or those in the lower ranks, must participate in these hard choices it seems necessary for those outside government to respect the difficulties they face and to suspend judgment until there is time for an adequate evaluation of what was done and of the situation in which it was done. Unrestrained and irresponsible criticism does not provide a good setting for the development of a responsible public service. It is not enough to say, "I disagree with your assumptions, which I freely impute to you, therefore I disagree with your action." Even if the assumptions were known accurately, the action taken could not be judged by that alone. Value premises are only a part of the action, sometimes

[3] Harold Stein (Ed.), *Public Administration and Policy Development* (New York: Harcourt, Brace and Company, 1952).

a small part, and the complexity of political life is such that it is altogether possible that different value premises, given the objective situation, would result in similar conclusions.

DEVELOPMENT OF ETHICAL AWARENESS

We may conclude therefore not that a concern about ethics is unnecessary in the public service in view of controls already present, nor that a simple set of rules can be set up which will solve the problem for all time, but that all persons with official responsibility need to have their attention drawn to the implications of their actions—and of inaction also—and to the presence of ethical problems in all decisions, thus to sharpen their awareness of the choices they are making. In particular administrative agencies codes of ethical conduct covering practices and problems peculiar to those agencies might have considerable value in providing express guides to action which might otherwise be left to individual or group convenience or immediate pressures.

Phillip Monypenny, Ph.D., Urbana, Illinois, is associate professor of political science at the University of Illinois. His particular interest is public administration in the United States. He taught previously at the City College of New York and at the University of Puerto Rico, and has served as consultant to state and local governments on a variety of problems. He is the author of several articles on personnel administration and on ethics for the public service.

The Problem of Defining a Profession

By MORRIS L. COGAN

TO define "profession" is to invite controversy. C. L. Stevenson has said, "To choose a definition is to plead a cause, so long as the word defined is strongly emotive."[1] It is quite apparent that "profession" is just such a word. When definitions of it are proposed they are rarely subjected to rational consideration. Reactions tend to be polarized toward an enthusiastic and uncritical acceptance or toward a rancorous and defensive rejection. So many advantages have accrued to profession, so many claims to it are made by so many people, that the cutting edge of a definition—be it ever so blunt—is almost sure to draw cries of protest from many aspirants to the title. If the definer is prepared to accept these risks, then he must in addition be prepared to see his work result in failure or at best seemingly insignificant accomplishment, for the concept with which he is dealing is extremely difficult to identify and describe. The man who addresses himself to the problem of defining a profession should be able to say with equanimity: "It is better to light a little lantern than to curse the darkness."

THE LITERATURE OF PROFESSION

There is a rather extensive literature of definitions of profession. Research into these writings reveals no general agreement on any "authoritative" statement.[2] The meanings found in most dictionaries are similar, and although these are often cited, they appear to offer to most writers only a convenient point of departure or, perhaps more precisely, a primary theme upon which radical variations are composed. The legal definitions of profession are almost always so closely related to the conditions of a specific case that they are rarely susceptible of wider application, and the arbitrary definitions commonly adopted for purposes of research or descriptive statistics are of almost equally restricted utility.

Some of the writers most notable for their interest in the analysis of profession simply refuse to venture a definition. Outstanding representatives of these are Alexander M. Carr-Saunders and P. A. Wilson, who, after an extensive treatment of the characteristics of profession, are forced to conclude that certain vocations, possessing these characteristics in a greater or lesser degree, approach more or less closely to the condition of profession.[3] Oliver Garceau writes: "There is no accepted definition of a 'profession.' Interpretation of such a concept is a matter of personal temperament."[4] More recently Roy Lewis and Angus Maude have written that "a moral code is the basis of professionalism. . . ."[5] Beyond this common thread of a special morality,

their efforts at analysis collide head on with the difficulty of identifying and clearly delineating such elusive concepts as the associational standards of admission and conduct, the general and special education, the unified body of knowledge, that are requisite to profession.

Flexner's criteria

In brief, a survey of some of the literature on this topic reveals that the promulgation of a satisfactory definition has progressed but little beyond the six criteria proposed by Abraham Flexner in 1915: (1) intellectual operations coupled with large individual responsibilities, (2) raw materials drawn from science and learning, (3) practical application, (4) an educationally communicable technique, (5) tendency toward self-organization, and (6) increasingly altruistic motivation.[6]

THREE LEVELS OF DEFINITION

Some confusion of terms is evident in many recent discussions of profession. This perplexity appears to derive in large part from the difficulty of communicating ideas and resolving differences when a single term (profession) is used to designate disparate referents. This disparity appears to arise from the use of "profession" at three different levels of definition. If productive consideration of the problem of defining a profession is a desideratum, then an initial clarification of some of the denotations of the word may be useful.

Historical and lexicological definitions

The first type of definition is historical and lexicological. If a specific profession is to be defined, and if such a definition is not to be purely arbitrary, that is, not to be divorced from the rich historical and traditional associations clustering about the term, then the definition must be related to the general concept of profession. This concordance with the "principal features or structure of [the] concept [is necessary], partly in order to make it definite, to delimit it from other concepts, and partly in order to make possible a systematic exploration of the subject matter with which it deals."[7] Once a lexicological and historical examination has been made as the initial step in the process, then it is possible to begin to isolate the essential features of profession in general, and thus to describe—even if only tentatively—the boundaries that set it off from other allied terms: vocation, trade, craft, art, semiprofession, and so on. Research of this kind may provide the framework within which the process of defining a specific vocation can proceed with some assurance that the vocation will tend to remain, in spite of its differentiae, essentially a species of the genus profession. The task is certainly difficult. It involves a recognition of the complexity of the concept and a sustained effort to cut through the nuances and the multiple secondary meanings clustered about the core meaning.

The standard etymological works constitute valuable sources of definitions at the first level. The research in such treatises must however be supplemented by examination of other writings. Among the most illuminating of these are the statements made by Abraham Flexner,[8] Alexander M. Carr-Saunders and P. A. Wilson,[9] Robert Ulich,[10] and Alfred North Whitehead.[11]

An objective and rigorous analysis of such writings may provide the basis for a defensible statement of the essentials of profession. The results of one such attempt are reproduced below for purposes of illustration.

> A profession is a vocation whose practice is founded upon an understanding of the theoretical structure of some department of learning or science, and upon the abilities accompanying such understanding. This understanding and these abilities are applied to the vital practical affairs of man. The practices of the profession are modified by knowledge of a generalized nature and by the accumulated wisdom and experience of mankind, which serve to correct the errors of specialism. The profession, serving the vital needs of man, considers its first ethical imperative to be altruistic service to the client.[12]

After such a first-level statement has been formulated, the problem of defining a *specific* profession then becomes the concern of the practitioners, who may at this point address themselves to the unique conditions of their area of specialization.

Persuasive definitions

The second level of definition is called "persuasive." Professor Charles L. Stevenson has noted that such statements are used "consciously or unconsciously, in an effort to secure, by [the] interplay between emotive and descriptive meaning, a redirection of people's attitudes."[13] Why is it desirable to encourage definitions of this second type, definitions designed to redirect people's attitudes? The answer lies in the nature of profession and in the behavior of man: profession demands arduous training and the practitioner's personal commitment to an exacting ethical code; men have commonly needed to be persuaded to undertake such training and to follow the dictates of such a code. Both attributes are required, and a failure in either is a failure of profession. It is interesting to note in this connection that the most persistent criticisms of professional groups are in essence allegations of such failure. The public school teachers, for example, are accused of inefficiency due to inadequate preservice education; doctors and lawyers are often criticized for violation of their ethical code.

If profession is to remain desired and desirable, then powerful persuasive definitions are a sine qua non. In recent history it has been all too easy to dismiss such statements as hortatory or messianic. The derogatory force of these adjectives derives from the idea that such appeals do not really influence behavior. It is part of the pessimist myth of our times that the seer and the visionary are without followers, that the appeal to ideals must fail, whereas the appeal to self-interest is universally invincible. Yet it is clear that in human affairs, yesterday's idealistic commandments often become today's laws and are tomorrow translated into action. One has only to observe the series of persuasive definitions in the history of antislavery, recently culminating in the desegregation ruling of the Supreme Court. That there are daily regressions in the course of man's behavior is not to the point; the force of the decision is toward the ideal behaviors, and the persuasive powers of the Supreme Court's decision will probably be of greater influence than the immediate legislative and administra-

[13] *Loc. cit. supra* (note 1).

tive actions deriving from it. Where, as in profession, it becomes necessary to redirect men's attitudes, the power of the persuasive definition should not be underestimated. Morris R. Cohen has written:

> It would be a mistake to conclude that the issue [of definitions] is merely verbal and of no real significance . . . no question of this sort can be *merely* verbal, because words are most potent influences in determining thought as well as action.[14]

Two striking examples of the force of the persuasive definition are to be found in the degree to which the Hippocratic Oath and the persuasive definitions offered by Abraham Flexner have both been translated into the program and behavior of contemporary medical societies. To be deflected, then, from formulating persuasive definitions of profession is to be deflected from the extremely important functions of definition at the second level. A few essays of this kind deserve special mention: Morris L. Cooke's "Professional Ethics and Social Change," [15] Robert D. Kohn's "The Significance of the Professional Ideal," [16] and Roscoe Pound's "The Professions in the Society of Today." [17]

The insights provided by the first- and second-level definitions are especially valuable for the construction of theoretical models within which profession may be examined and from which important hypotheses may arise. Such definitions have, however, uniformly collapsed when they have been inappropriately applied as the operational criteria for decisions as to whether *specific* phenomena are to be called professional, nonprofessional, or unprofessional. The failures following upon such misapplication have tended to be generalized, and the positive values of such statements have therefore often been discounted or overlooked entirely.

Operational definitions

The third level of definition is termed operational, and is designed to furnish the basis upon which individuals and associations may make specific decisions as to the behavioral concomitants of profession. The demand for operational definitions stems from the scientific temper of the times. It is a demand for the observable and the measurable; it will not be satisfied by lexicological and persuasive statements.

Operational definitions are the guidelines for the practitioner as he faces the day-to-day decisions of his work. They are, for example, the rules for professional conduct; they mediate the practitioner's relations to his client, to his colleagues, to the public, to his association. They set forth the specific criteria of general and special education for the professional, the requirements for admission to practice, the standards for competent service.

An example of operational definitions in action may be seen in the requirements for preservice medical education. At present this prerequisite to actual practice may be stated as "graduation from an accredited medical school." But behind this apparently simple statement lies a long history of operational definitions promulgated and applied. It has been necessary to set up standards (definitions) for the accredited schools: their admission requirements, curriculum, qualifications of the instructional staff, facilities for instruction, and the like.

[17] *New England Journal of Medicine,* Vol. 241 (September 1949), pp. 351–57.

The complex problems of professional ethics have been rather effectively attacked by associations of architects. They have studied and publicized certain "cases"; they have prepared, illustrated, and circularized "ethical documents" specifically designed to offer guidance to the architect in the complicated situations he daily faces, in which he must have operational definitions that will clarify his often conflicting responsibilities to client, public, inspectors, subcontractors, and colleagues.

To build up the body of decisions, illustrative cases, and precedents is a task that makes severe demands upon the time and energy of the practitioners. That this time and energy are well spent is evidenced by the findings of Benson Y. Landis. Dr. Landis has made a sociological analysis of professional codes and has concluded that the optimal control of ethical behavior is generally achieved by those professions that have set up the machinery for control based on "a code containing clear definitions of situations." [18]

The major advantage of the operational definitions is that they restrict the area of idiosyncratic professional behavior and tend to stabilize the boundaries between genuine professionalism, unprofessionalism, and nonprofessionalism. It should not be assumed, however, that the operational definitions are at present an aqua regia in which all the obdurate problems of the professions can be dissolved. Such definitions are relatively rare, since most professions have contented themselves with the generalities of the first- and second-level statements. Where they do exist, they are often rather primitive, lacking precision. What is needed is research, examination of behaviors, trial and inevitable error in developing the theory of profession and in investigating its behavioral accompaniments.

[18] Benson Y. Landis, *Professional Codes* (New York: Teachers College, Columbia University, 1927), p. 96.

PROBLEM AREAS AND RESEARCH

Most of the important studies of profession have been done, almost fortuitously, by sociologists, educators, and students of government. It would seem to be up to the organized professions themselves now to encourage research and self-examination. For their own welfare the professions need to support extensive investigations of their own history, their behavior, and their problems. Otherwise they may have to resign themselves to vagueness about their own rights, privileges, and responsibilities; they may expect creeping encroachment by pseudo professions; they may witness the gradual dissolution of the very attributes that have contributed to their survival and growth.

Professionalism under the state

Some of the areas in which research may be valuable deserve mention here. Both the state and the large corporations are absorbing more and more professionals. It is a moot question whether it is possible to maintain professionalism under such conditions. For example, the fact that most teachers are employees of a municipality may have inhibited their professional growth, since the conditions of teaching tend to obscure the locus of responsibility to the client (Is it to each child? to the class? to the local community? to the whole society?) and also tend to limit associational solidarity and self-regulation. At the very least the professions should be examining the enormous readjustments taking place in the relations between practitioners and the state under the socialist regime in Britain. These

are of major importance to professions in the United States. Such processes need to be subjected to close scrutiny. The insight gained from this research may contribute to the survival of professions.

American Medical Association

A closely related problem is at present plaguing the medical associations of the United States. It is clear, for example, that the American Medical Association has failed to define its proper role to the satisfaction of its members and the public. The pressures building up around the question of socialized medicine owe a portion of their intensity to ideological differences, it is true; but some of this intensity is also due to the unwillingness of the AMA to define its role in relation to government. Indeed, it is safe to say that most professional associations have failed to examine the assumptions underlying the maintenance of political lobbies, the functions of the association in the certification of practitioners, the delegation of regulatory powers to nongovernmental groups, and the association's part in the regulation of practice.

Other trouble spots

Very little attention has been given to problems of individual and associational professionalism. Is profession inevitably a group phenomenon or may it be achieved individually? Are there two kinds of profession—personal and associational? If there are, can these two roles come into conflict, that is, is it possible that the dictates of personal professional ethics may force a practitioner to resign from an association whose activities appear unethical to him?

Another trouble spot in organized profession is the frequent conflict between the associational functions of internal protection of members and protection of the client. At the verbal level there appears to be no conflict at all: practically every code gives priority to the welfare of the client. In actual practice, however, the issue is confused, and a great deal of research will probably be necessary before it is clarified. For example, is highly selective recruitment of practitioners a guarantee of competent service to the client, or is it rather a guarantee of economic protection to the successful candidate and at the same time an artificial restriction of vital public services?

Among schoolteachers this issue is even more clearly drawn. Is a teachers' strike a deprivation of services vital to the children or is it rather an ethical imperative for the protection of these very children? Easy answers to such questions are not possible, yet answers must be sought. Otherwise the professions will have to be content with decisions which are no more than vagaries and with actions whose justifications are no more than a defensive posture.

Perhaps it would be appropriate to add a word of caution as to the power of definition to solve the problem of the arrogation of the title "profession" by certain vocations. This process is viewed with a great deal of alarm by many persons, who therefore seek a sharp definition that will serve to cut these claimants off from the title. It should be obvious that definition alone will not accomplish this purpose. Perhaps the best way to make such distinctions clear is to ensure that the genuine professions demonstrate such a consistently high order of professional behavior that ultimately every inappropriate assumption of the title will appear inept, ludicrous; thus the unqualified claimants will either labor to achieve genuine profession or retire from the field.

SUMMARY

In summary, it appears that some of the problems of defining a profession can be resolved if the practitioners (1) seek to establish a general framework within a lexicological and historical context, (2) provide ideal incentives through the persuasive definitions, and (3) develop the behavioral and operational definitions that give direction within the unique conditions of a specific profession.

Morris L. Cogan, Ed.D., is lecturer on education and director of secondary apprentice teaching at the Harvard Graduate School of Education. He is the author of "Preparation for College in the United States" (Universities Quarterly, May 1954) and other articles.

Business Management: A Profession?

By Howard R. Bowen

WALTER Rauschenbusch, the great architect of the "social gospel," once wrote:

> Business life is the unregenerate section of our social order. If by some magic it could be plucked out of our total social life in all its raw selfishness, and isolated on an island, unmitigated by any other factors of our life, that island would immediately become the object of a great foreign mission crusade for all Christendom.[1]

That such words could be written by a responsible religious leader only forty years ago attests to the great progress in the mores and conduct of American business since the era of the "muckrakers." Whatever may be the faults and inadequacies of business today, words so extreme as these no longer fit. Business has unquestionably become more humane and more responsible than it was a generation ago.

At the very time Rauschenbusch was writing, the eminent jurist, Louis D. Brandeis, saw the possibilities of professionalism in business:

> . . . success in business must mean something very different from mere money-making. In business the able man ordinarily earns a larger income than one less able. So does the able man in the recognized professions—in law, medicine or engineering; and even in those professions more remote from money-making, like the ministry, teaching or social work. The world's demand for efficiency is so great and the supply so small, that the price of efficiency is high in every field of human activity.
>
> The recognized professions, however, definitely reject the size of the financial return as the measure of success. They select as their test, excellence of performance in the broadest sense—and include, among other things, advance in the particular occupation and service to the community. These are the basis of all worthy reputations in the recognized professions. In them a large income is the ordinary incident of success; but he who exaggerates the value of the incident is apt to fail of real success.
>
> To the business of to-day a similar test must be applied. True, in business the earning of profit is something more than an incident of success. It is an essential condition of success; because the continued absence of profit itself spells failure. But while loss spells failure, large profits do not connote success. Success must be sought in business also in excellence of performance; and in business, excellence of performance manifests itself, among other things, in the advancing of methods and processes; in the improvement of products; in more perfect organization, eliminating friction as well as waste; in bettering the condition of the workingmen, developing their faculties and promoting their happiness; and in the establishment of right relations with customers and with the community.[2]

This paper deals with two questions, both suggested by Brandeis' eloquent words: (1) Is business management in fact becoming a profession? and (2) Should business management take on the attributes of a profession? There are many who answer one or both of these questions in the negative. My conclusion is that both questions can be answered affirmatively—that business management is gradually assuming some of the marks of a profession and that this tendency *is on the whole* desirable.[3] But before taking up these questions directly, it is well to consider just what is meant by the word "profession."

[1] *Christianizing the Social Order* (New York: The Macmillan Company, 1914), p. 156.

[2] *Business—A Profession* (Boston: Small, Maynard & Company, cop. 1914 and 1925), pp. 3–5.

A full-fledged profession is a vocation in which the following conditions exist: (1) pursuit of the vocation demands that practitioners acquire an intellectually based technique; (2) practitioners assume a relationship of responsibility toward clients; (3) practitioners are organized into responsible associations which set standards for admission to practice and exert control over the actions of their members through codes of ethics.[4] In most professions, the social control exerted by the association is reinforced by public licensing and supervision. Among the traditional professions in which these conditions are most fully realized are theology, law, and medicine. Later additions are, among others, dentistry, veterinary medicine, engineering, architecture, teaching, and accounting.

With these criteria in mind, let us now consider the extent to which the conditions of professionalism are fulfilled in present business management.

Intellectually Based Technique

The art of management has increasingly become a subject for study and research by disciplined and disinterested investigators and scholars. The early work in this field is associated with the name of Frederick W. Taylor, who made pathbreaking studies of efficiency, especially in the art of cutting metals. Taylor's most important contribution, however, was not the particular results of his studies but his approach. He showed that the problems of business might be studied with the same objectivity, the same rigor, and many of the same methods as are common in the laboratories of physical sciences.

In time, many more investigators applied themselves to the problems of business, and their interests were eventually broadened to include not only productive techniques in the factory and offices but also problems of sales, advertising, finance, records, accounting, inventory control, quality control, employee selection and training, job analysis, worker morale, incentives, collective bargaining, public relations, and administrative organization. The effect of these studies, as they have accumulated from the modest beginnings of a half-century ago, is to persuade businessmen (1) that there are efficient and inefficient ways not only of cutting metals but also of meeting problems of business relations; (2) that efficient methods are less costly and therefore more profitable than bad methods; and (3) that the efficient ways may be more easily and surely discovered through the proven methods of painstaking experiment and disinterested observation than through following rules of thumb or uninformed prejudice.

As a result of the development of an intellectually based technique, the practice of management is becoming an art for which one must prepare himself through education and experience. The education need not be formal education; yet increasing numbers of younger men are preparing themselves for managerial roles by study in schools of business, and more and more junior executives are studying for positions of

[3] This paper is based in part on my book *Social Responsibilities of the Businessman* (New York: Harper & Brothers, 1953).

[4] Cf. Paul Meadows, "Professional Behavior and Industrial Society," *Journal of Business*, July 1946, p. 150. See also A. M. Carr-Saunders and P. A. Wilson, *The Professions* (London: Oxford University Press, 1933); R. H. Tawney, *The Acquisitive Society* (New York: Harcourt, Brace and Company, 1920), pp. 91–122; Talcott Parsons, "The Professions and the Social Structure," *Social Forces*, May 1939, pp. 457–67.

greater responsibility by attendance at the many institutes, night classes, and company training programs now being provided. In short, there is a more or less systematic body of knowledge which one must acquire before one is qualified to fill a managerial position in a large corporation. This is not to say that one may learn to become a successful manager by reading books any more than one can become a great physician by reading books. In both cases, certain personal qualities and long years of experience are required. Nevertheless, formal knowledge is a practical necessity.

RESPONSIBILITY TO CLIENTS

Business is sharply distinguished from the traditional professions in the nature of its clientele and in the character of its relationships to that clientele.

In the traditional professions, the clients are primarily the persons or groups who are served by the practitioners—they are the "customers." And professional ethics are concerned primarily with the relationships between the practitioners and the customers. But the clients of business, that is, the persons who are affected by business operations and for whom business is therefore responsible, include not only customers but also stockholders, workers, suppliers, citizens of the communities in which business is conducted, and, in our interdependent world, the public at large. Responsibility toward clients, then, means responsibility toward all those persons whose lives are touched by business operations.[5] In this sense, the concept of professionalism as applied to business is even broader and more inclusive than as applied to medicine or law or theology.

In most of the traditional professions, the human relationships involved are distinctively *personal* relationships. They are primarily the relationships of individual practitioners to clients who are known face to face. But in business—particularly in the large corporation—the "practitioner" is a *group* of persons who jointly constitute "management" and who are collectively responsible for the conduct of the enterprise. And the clients, often, are known only vaguely and impersonally as "stockholders," the "market," "organized labor," the "public," and so forth.[6]

Because the clientele of business is so diffuse and ramified and distant, and because business relationships are so impersonal, it is much more difficult for businessmen, as compared with members of the traditional professions, to perceive their responsibilities and to respond to them. It is one thing for a physician to realize and accept his responsibilities toward a patient whom he knows as a fellow human being; and it is quite another thing for a business management to understand that its decisions may affect the lives of flesh-and-blood human beings and to act accordingly. Our whole ethical tradition is more immediately serviceable for direct interpersonal relationships than for the kind of impersonal and distant human relationships which are common to business. This means, on the one hand, that it is unusually difficult for businessmen to acquire professional attitudes and practices, and on the other hand that businessmen deserve great credit for the substantial progress already achieved.

[5] This is, of course, not an absolute distinction. Practitioners of the traditional professions have responsibilities to the community—the physician for public health, the lawyer for justice, and so forth. Yet the emphasis in professional ethics is upon the relationship of the practitioner to the person served.

[6] Again this distinction is not absolute in a day of giant law firms and great medical clinics.

Management as a balance wheel

There is no doubt of an increasing acceptance among businessmen of important obligations toward their diverse clients. The concept of "stewardship" is, of course, an old one, and many businessmen have been thinking in this direction. Especially within the past few years, large numbers of business leaders have publicly acknowledged and actively preached the doctrine that they are servants of society and that management merely in the interests (narrowly defined) of stockholders is not the sole end of their duties.[7]

The following are two examples (many more might be supplied) of statements by leading businessmen in which they acknowledge their role as trustees:

> Today, most managements, in fact, operate as trustees in recognition of the claims of employees, investors, consumers, and government. The task is to keep these forces in balance and to see that each gets a fair share of industry's rewards.[8]

> It is becoming clear that in our modern society top management has the opportunity—in fact, I should say the duty—to act as a balance wheel in relation to three groups of interests—the interests of owners, of employees, and of the public, all of whom have a stake in the output of industry. Management can best represent the interests of ownership by acting fairly and wisely with respect to the claims of employees and the public as well. It is a difficult but vital role. It seems to me only too obvious that the very survival of private enterprise requires that private enterprise act to maintain a productive and equitable relation among these three elements: the individual's right to, and the social necessity for, profits; the economic and human aspirations of all workers; and the public's demand for an abundance of goods at low cost. The alternative is plainly intensified industrial conflict followed by increased government regulation forced by an impatient public.[9]

One must not, of course, exaggerate the extent to which businessmen and their corporations have disavowed their selfish impulses and turned their thoughts to the social welfare. And the progress that has occurred has been achieved primarily as a result of changes in the social climate of opinion, attitudes, and values within which business functions. Nevertheless, businessmen have made great progress in their responsiveness to their obligations to society.

PROFESSIONAL ASSOCIATIONS

The luxuriant growth of trade associations, better business bureaus, chambers of commerce, and service clubs suggests that business is in the process of developing professional associations analogous to those in the traditional professions. These businessmen's associations do not presume to enforce standards of competence for entry into the practice of business management or to regulate the conduct of their members. But they are at least marginally concerned with formulating codes of ethics and with promoting consultation among businessmen on problems of mutual concern. In the past the orientation of these associations has often been toward the narrow interests of members, and the attitudes of association officials have frequently surpassed those of member businessmen in their

[7] In an earlier issue of THE ANNALS, I tried to show in some detail the growing sense of social responsibility on the part of businessmen: "How Public Spirited Is American Business?" THE ANNALS, Vol. 280 (March 1952), pp. 82–89.

[8] Clarence Francis, Chairman of General Foods Corporation, address at the annual conference of the Harvard Business School Alumni Association, June 12, 1948.

[9] F. W. Pierce, Director of Standard Oil Company of New Jersey, address before the Cincinnati Chapter of the Society for the Advancement of Management, December 6, 1945.

reactionariness. Nevertheless, such associations have on the whole broadened the vision of members by focusing attention on the problems of the industry, business at large, or the community, as well as of the single enterprise.

Businessmen's associations have also been useful in providing the sense of group consciousness which is so essential as a basis for ethical behavior.

How Control Business?

We have now considered professionalism in business in terms of three criteria: (1) intellectually based technique, (2) responsibility toward clients, and (3) professional organization. With reference to each of these criteria, it can be said quite definitely that business has been moving in the direction of professionalism. Business management is clearly becoming a learned art for which the practitioner must prepare himself through education and experience. Businessmen are steadily becoming more conscious of the manifold consequences of their actions and more concerned about their social responsibilities. And business organizations are becoming increasingly interested in the ethical aspects of business operations. But it can be said with equal definiteness that business has by no means reached the advanced state of professionalism attained by, for example, the medical profession. And it seems most unlikely that it will (or should) ever attain that degree of professionalism.

The concept of "profession" implies, essentially, a particular form of *control* over the conduct of the practitioner. This control is through voluntary codes which have been formulated by his peers with primary concern for the public interest and which are enforced by these same peers. Professionalism means peer-group responsibility for the conduct of the individual practitioner of the learned arts. When we speak of professional conduct, we refer to actions of a practitioner which are consistent with the accepted code of his peer group. Professionalism is, in other words, a form of social control over the behavior of individuals. When we speak of professionalism with reference to business, we are in fact concerned about the questions, How should business be controlled? and, Is professionalism a feasible or desirable method of control over business?

There is no doubt that business must be subjected to some form of social control. Men cannot safely be turned loose in pursuit of self-interest without some method of ensuring that their behavior will be conformable to the general welfare. In general, there are three types of control available for the purpose: (1) competition, (2) governmental regulation, and (3) professionalism.

The advocates of laissez faire proposed that detailed governmental control over business decisions should be minimized, and that the control, instead, should take the form of widespread and relentless competition. (The early proponents of laissez faire lived too early to consider professionalism as a form of control.) Later, when it became apparent that extreme laissez faire afforded insufficient control over business to prevent certain abuses or undesirable conditions, other forms of social control were advocated. One of these was governmental regulation. Extreme socialists proposed that this should be virtually the sole form of control. Another alternative was professionalism, or voluntary control under the aegis of a peer group to define social responsibilities and enforce "ethical" behavior.

There are few responsible persons in the United States today who believe that any one of the three forms of social control can be relied upon exclusively. There are few remaining advocates of extreme laissez faire, even fewer socialists, and almost no proponents of complete self-regulation by business.

Americans have strong faith in competition as a regulator of business conduct, yet they doubt its usefulness as a sole form of control. They feel that government—in the form of policemen, judges, and regulatory commissions—is useful in curbing the selfishness of men and directing their activities into socially desirable channels. At the same time, they are skeptical of the socialist model of all-pervasive governmental regulation. Americans feel that there is a place for professionalism or self-regulation, yet they do not have confidence in the wisdom and restraint of private businessmen to regulate themselves without external control.

The kind of economy we are evolving is a mixed economy in which control by competition, by governmental regulation, and by self-regulation are combined. Honest men differ as to the most desirable proportions of these three types of control, and when specific problems arise they differ as to which type of remedy is preferable. But they are generally agreed that some combination of the three is essential.

Significance of professionalism

The importance of professionalism (or voluntary regulation) for business is that it offers a type of control that is intermediate between competition and governmental regulation. In so far as businessmen can learn to perceive the social consequences of their actions and voluntarily act in terms of the social interest, the abuses of laissez faire and the dangers of excessive governmental regulation may both be avoided. In this respect, tendencies toward professionalism in business may be regarded as wholesome.

At the same time, it would be naïve and dangerous to assume that voluntary regulation could or should largely supplant competition and governmental regulation in the control of our economic life. Business is different from the traditional professions in the degree to which control through competition is possible or desirable. In the case of medicine, for example, control is achieved primarily through professional self-regulation supplemented by governmental regulation, and competition is obviously unsuitable as a major form of control. For business, on the other hand, competition is a workable form of control which, though it cannot be relied upon exclusively, is more efficient than either professionalism or government. Under these circumstances, business is unlikely ever to become a full-fledged profession, nor is such a development desirable. For professionalism in business is not without danger. The apparatus of organizations and codes that is characteristic of professionalism could easily become a mask for monopoly. The tendency toward professionalism in business may be regarded as socially desirable only if it becomes a means of lessening the need for governmental control—not if it becomes a device for stifling competition.

Howard R. Bowen, Ph.D., Williamstown, Massachusetts, is professor of economics at Williams College. He has served as chief economist of the Joint Committee on Internal Revenue Taxation, economist with the Irving Trust Company, New York, economic consultant to the National Council of Churches in connection with their studies of Ethics and Economic Life, and chairman of the Committee on Business Enterprise Research, Social Science Research Council. He is author of Social Responsibilities of the Businessman (1953), Christian Values and Economic Life (1954), and other publications.

The Social Significance of Professional Ethics*

By R. M. MacIver

THE spirit and method of the craft, banished from industry, finds a more permanent home in the professions. Here still prevail the long apprenticeship, the distinctive training, the small-scale unit of employment and the intrinsic—as distinct from the economic—interest alike in the process and the product of the work. The sweep of economic evolution seems at first sight to have passed the professions by. The doctor, the lawyer, the architect, the minister of religion, remain individual practitioners, or at most enter into partnerships of two or three members. Specialization takes place, but in a different way, for the specialist in the professions does not yield his autonomy. He offers his specialism directly to the public, and only indirectly to his profession. But this very autonomy is the condition under which the social process brings about another and no less significant integration. The limited "corporations" of the business world being thus ruled out, the whole profession assumes something of the aspect of a corporation. It supplements the advantage or the necessity of the small-scale, often the one-man, unit by concerted action to remove its "natural" disadvantage, that free play of uncontrolled individualism which undermines all essential standards. It achieves an integration not of form but of spirit. Of this spirit nothing is more significant than the ethical code which it creates.

There is in this respect a marked contrast between the world of business and that of the professions. It cannot be said that business has yet attained a specific code of ethics, resting on considerations broader than the sense of self-interest and supplementing the minimal requirements of the law. Such a code may be in the making, but it has not yet established itself, and there are formidable difficulties to be overcome. When we speak of business ethics, we generally mean the principles of fair play and honorable dealing which men *should* observe in business. Sharp dealing, "unfair" competition, the exaction of the pound of flesh, may be reprobated and by the decent majority condemned, but behind such an attitude there is no definite code which businessmen reinforce by their collective sense of its necessity and by their deliberate adoption of it as expressly binding upon themselves. There is no general brotherhood of businessmen from which the offender against these sentiments, who does not at the same time overtly offend against the law of the land, is extruded as unworthy of an honorable calling. There is no effective criticism which sets up a broader standard of judgment than mere success.

If we inquire why this distinction should hold between business and professional standards the social significance of the latter is set in a clearer light. It is not that business, unlike medicine or law for example, lacks those special conditions which call for a code of its own. Take, on the one hand, the matter of competitive methods. It is a vital concern of business, leading to numerous agreements of all sorts, but these are mere *ad hoc* agreements of a particular nature, not as yet deductions from a fully established principle which business, as a self-conscious

* Reprinted with some changes from THE ANNALS, Vol. 101 (May 1922), pp. 5–11.

whole, deliberately and universally accepts. Take, on the other hand, such a problem as that of the duty of the employer to his workpeople. Is not this a subject most apt for the introduction of a special code defining the sense of responsibility involved in that relationship? But where is such a code to be found?

THE IDEAL OF SERVICE

Something more than a common technique and a common occupation is evidently needed in order that an ethical code shall result. We might apply here the significant and much misunderstood comparison which Rousseau drew between the "will of all" and the "general will." In business we have as yet only the "will of all," the activity of businessmen, each in pursuit of his own success, not overridden though doubtless tempered by the "general will," the activity which seeks first the common interest. The latter can be realized only when the ideal of service controls the ideal of profits. We do not mean that businessmen are in fact selfish while professional men are altruistic. We mean simply that the *ideal of the unity of service* which business renders is not yet explicitly recognized and proclaimed by itself. It is otherwise with the professions. They assume an obligation and an oath of service. "A profession," says the ethical code of the American Medical Association, "has for its prime object the service it can render to humanity; reward or financial gain should be a subordinate consideration," and again it proclaims that the principles laid down for the guidance of the profession "are primarily for the good of the public." Similar statements are contained in the codes of the other distinctively organized professions. "The profession," says the proposed code of the Canadian legal profession, "is a branch of the administration of justice and not a mere money-getting occupation." Such professions as teaching, the ministry, the civil service, and social work by their very nature imply like conceptions of responsibility. They imply that while the profession is of necessity a means of livelihood or of financial reward, the devoted service which it inspires is motivated by other considerations.

In business there is one particular difficulty retarding any like development of unity and responsibility. It may safely be said that so long as within the industrial world the cleavage of interest between capital and labor, employer and employee, retains its present character, business cannot assume the aspect of a profession. This internal strife reveals a fundamental conflict of acquisitive interests within the business world and not only stresses that interest in both parties to the struggle but makes it impossible for the intrinsic "professional" interest to prevail. The professions are in general saved from that confusion. Within the profession there is not, as a rule, the situation where one group habitually employs for gain another group whose function, economic interest, and social position are entirely distinct from its own. The professions have thus been better able to adjust the particular interests of their members to their common interest and so to attain a clearer sense of their relationship to the whole community.

Once that position is attained the problem of occupational conduct takes a new form. It was stated clearly long enough ago by Plato in the *Republic*. Each "art," he pointed out, has a special good or service. "Medicine, for example, gives us health; navigation, safety at sea, and so on. . . . Medicine is not the art—or profession—of receiving pay because a man takes fees while he is engaged in healing. . . .

The pay is not derived by the several 'artists' from their respective 'arts.' But the truth is, that while the 'art' of medicine gives health, and the 'art' of the builder builds a house, another 'art' attends them which is the 'art' of pay." The ethical problem of the profession, then, is to reconcile the two "arts," or, more generally, to fulfill as completely as possible the primary service for which it stands while securing the legitimate economic interest of its members. It is the attempt to effect this reconciliation, to find the due place of the intrinsic and of the extrinsic interest, which gives a profound social significance to professional codes of ethics.

STANDARDS COMMON, CODES DISTINCTIVE

The demarcation and integration of the profession is a necessary preliminary to the establishment of the code. Each profession becomes a functional group in a society whose tendency is to organize itself less and less in terms of territory or race or hereditary status, and more and more in terms of function. Each profession thus acquires its distinctive code. It is important to observe that what is distinctive is the code rather than the standard. The different codes of racial or national groups reveal variant ethical standards, but the different codes of professional groups represent rather the deliberate application of a generally accepted social standard to particular spheres of conduct. Medical ethics do not necessarily differ in quality or level from engineering ethics, nor the ethics of law or of statesmanship from those of architecture. The false old notion that there was for that most ancient and still most imperfectly defined profession of statesmanship a peculiar code which liberated it from the ordinary ethical standards has died very hard. In truth there could be no conflict of ethics and politics, for politics could justify itself only by applying to its own peculiar situations and needs the principles which belong equally to every sphere of life.

Ethics cannot be summed up in a series of inviolate rules or commandments which can be applied everywhere and always without regard to circumstances, thought of consequences, or comprehension of the ends to be attained. What is universal is the good in view, and ethical rules are but the generally approved ways of preserving it. The rules may clash with one another, and then the only way out is to look for guidance to the ideal. The physician may have to deceive his patient in order to save his life. The lawyer, the priest, and the physician may have to observe secrecy and keep confidences under conditions where it might be the layman's duty to divulge them, for the conception of the social welfare which should induce the one to speak out may equally in the peculiar professional relationship compel the other to silence. Every profession has its own problems of conduct, in the interpretation within its own province of the common principles of ethical conduct. The medical man to whom is entrusted, under conditions which usually admit of no appeal save to his own conscience, the safeguarding of the health of his patient, with due consideration for the health of the whole community, has to depend upon a special code applicable to that situation. So with the legal profession which, for example, has to provide professional service for all litigants, irrespective of the popularity or unpopularity of the cause. So with the architect, who has to determine his responsibility alike to the client, to the contractor, to the workmen, to the "quantity surveyor," and to the community. So with the university professor, who has to uphold the necessity of academic freedom against the pressure of prejudice and the domination of controlling interests which care less for truth than for their own success. So with the journalist, in his peculiarly difficult situation as the servant of a propagandist press. So with the engineer, the surveyor, the accountant, or the technician generally, who has to maintain standards of service and of efficiency against the bias of profit making. So with the manager, the secretary, or the officer of a corporation—for here business assumes most nearly the aspect of a profession—who has to reconcile the trust imposed on him by his employers with the duty he owes to himself and to those whose services he in turn controls. Out of such situations develop the written and the unwritten codes of professional ethics.

RESPONSIBILITY TO THE WIDER COMMUNITY

We need not assume that these codes originate from altruistic motives, nor yet condemn them because they protect the interest of the profession itself as well as the various interests which it serves. To do so would be to misunderstand the nature of any code. An ethical code is something more than the prescription of the duty of an individual towards others; in that very act it prescribes their duty towards him and makes his welfare too its aim, refuting the false disassociation of the individual and the social. But the general ethical code prescribes simply the duties of the members of a community towards one another. What gives the professional code its peculiar significance is that it prescribes also the duties of the members of a whole group towards those outside the group. It is just here that in the past ethical theory and practice alike have shown the greatest weakness. The group code has narrowed the sense of responsibility by refusing to admit the application of its principles beyond the group. Thereby it has weakened its own logic and its sanction, most notably in the case of national groups, which have refused to apply or even to relate their internal codes to the international world. The attempt of professional groups to co-ordinate their responsibilities, relating at once the individual to the group and the group itself to the wider community, marks thus an important advance.

We must, however, admit that it is in this matter, in the relation of the profession *as a whole* to the community, that professional codes are still weakest and professional ethics least effectively developed. The service to the community they clearly envisage is the service rendered by individual members of the profession to members of the public. The possibility that there may still be an inclusive professional interest—generally but not always an economic one—that at significant points is not harmonized with the community interest is nowhere adequately recognized.

The problem of professional ethics, viewed as the task of co-ordinating responsibilities, of finding, as it were, a common center for the various circles of interest, wider and narrower, is full of difficulty and far from being completely solved. The magnitude and the social significance of this task appear if we analyze on the one hand the character of the professional interest and on the other the relation of that interest to the general welfare.

CHARACTER OF THE PROFESSIONAL INTEREST

The professional interest combines a number of elements. It includes what we may term the extrinsic interest, that devoted to the economic and social status, the reputation, authority, success, and emoluments attaching to the profession as a body. It includes also the technical interest directed to the

art and craft of the profession, to the maintenance and improvement of its standards of efficiency, to the quest for new and better methods and processes, and to the definition and promotion of the training considered requisite for the practice of the profession. It may also include a third interest which can be classed as cultural. To illustrate, in the profession of teaching the technical interest in the system of imparting knowledge is one thing, and the cultural interest in the knowledge imparted quite another. Even more obvious is the case of the minister of religion, whose technique of ministration is as a rule very simple and whose main interest lies in the significance of the doctrine. The distinction is clear also in the spheres of the sciences and of the fine arts where the interest in truth or beauty may be discerned from the interest in the modes of investigation or of expression. In other professions it may be harder to identify the cultural as distinct from the technical interest, but if we interpret the term "culture" widely enough to include, for example, such objects as health and the beauty of workmanship, it may be maintained that the cultural interest belongs to every profession and is in fact one of the criteria by which to determine whether or not a given occupation is to be classed as a profession.

Now these three strands of interest are usually interwoven in the general professional interest, but sometimes they are separated and subject to the pull of opposite forces. Thus while the technical and economic interests usually go together and while, for example, the maintenance of standards usually works towards the economic advantage of the profession, these may be unfortunately disjoined. Better technique may at points be antagonistic to professional gain. The lawyer may, to take one instance, lose a source of profits by the introduction of a simpler and more efficient system of conveyancing. The architect, working on a percentage basis, may find his pecuniary advantage at variance with his professional duty to secure the best service for the least cost. Likewise, opposition may arise between the economic and the cultural interest. The teacher and the preacher may suffer loss from a wholehearted devotion to the spirit of truth as they conceive it. The artist, the playwright, the author, may have to choose between the ideals of their art and the more lucrative devices of popularity. Finally, the technical and the cultural interest may work apart. Routine methods and processes may dominate the professional mind to the obscuration of the ends which they should serve. A notable statement of this opposition is given in the valuable investigation into professional organization in England which was published in two supplements of the *New Statesman*.[1] The investigation points to "the undisguised contempt in which both solicitors and barristers, notably those who have attained success in their profession and control its organization, hold, and have always held, not only all scholarship or academic learning of a professional kind, but also any theoretic or philosophical or scientific treatment of law."

Here, therefore, in the structure of the general professional interest we find a rich mine of ethical problems, still for the most part unworked but into which the growing ethical codes of the professions are commencing to delve. A still greater wealth of the material for ethical reflection is revealed when we turn next to analyze the relation of the professional interest as a whole to that of the community.

[1] April 21 and 28, 1917.

PROFESSIONAL INTEREST AND GENERAL WELFARE

Every organized profession avows itself to be an association existing primarily to fulfill a definite service within the community. Some codes distinguish elaborately between the various types of obligation incumbent on the members of the profession. The lawyer, for example, is declared to have specific duties to his client, to the public, to the court or to the law, to his professional brethren, and to himself. It would occupy too much space to consider the interactions, harmonies, and potential conflicts of such various duties. Perhaps the least satisfactory reconciliation is that relating the interest of the client to the interest of the public, not merely in the consideration of the particular cases as they arise but still more in the adaptation of the service to the needs of the public as a whole as distinct from those of the individual clients. Thus the medical profession has incurred to many minds a serious liability, in spite of the devotion of its service to actual patients, by its failure for so long to apply the preventive side of medicine, in particular to suggest ways and means for the prevention of the needless loss of life and health and happiness caused by the general medical ignorance and helplessness of the poor.

In addition it must suffice to show that the conception of communal service is apt to be obscured alike by the general and by the specific bias of the profession. It is to the general bias that we should attribute such attempts to maintain a vested interest as may be found in the undue restriction of entrants to the profession—undue when determined by such professionally irrelevant considerations as high fees and expensive licenses; in the resistance to specialization, whether of tasks or of men, the former corresponding to the resistance to "dilution" in the trade union field; in the insistence on a too narrow orthodoxy, which would debar from professional practice men trained in a different school; in the unnecessary multiplication of tasks, of which a flagrant example is the English severance of barrister and solicitor. Another aspect of the general bias is found in the shuffling of responsibility under the cloak of the code. This is most marked in the public services, particularly the civil service and the army and navy—and incidentally it may be noted that the problem of professional ethics is aggravated when the profession as a whole is in the employ of the state. "An official," says Émile Faguet in one of his ruthless criticisms of officialdom,[2] "is a man whose first and almost only duty is to have no will of his own."

DANGER OF SPECIFIC GROUP BIAS

This last case brings us near to what we have called the specific bias of the profession. Each profession has a limited field, a special environment, a group psychology. Each profession tends to leave its distinctive stamp upon a man, so that it is easier in general to distinguish, say, the doctor and the priest, the teacher and the judge, the writer and the man of science, than it is to discern, outside their work, the electrician from the railwayman or the plumber from the machinist. The group environment creates a group bias. The man of law develops his respect for property at the risk of his respect for personal rights. The teacher is apt to make his teaching an overnarrow discipline. The priest is apt to underestimate the costs of the maintenance of sanctity. The diplomat may overvalue good form and neglect the

[2] *The Dread of Responsibility* (New York: G. P. Putnam's Sons, 1914).

penalty of exclusiveness. The civil servant may make a fetish of the principle of seniority, and the soldier may interpret morality as mere *esprit de corps*.

All this, however, is merely to say that group ethics will not by themselves suffice for the guidance of the group unless they are always related to the ethical standards of the whole community. This fact has a bearing on the question of the limits of professional self-government, though we cannot discuss that here. Professional group codes are, as a matter of fact, never isolated, and thus they are saved from the narrowness and egotism characteristic of racial group ethics. Their dangers are far more easily controlled, and their services to society, the motive underlying all codes, vastly outweigh what risks they bring. They provide a support for ethical conduct less diffused than that inspired by nationality, less exclusive than that derived from the sense of class, and less instinctive than that begotten of the family. As they grow they witness to the differentiation of community. Their growth is part of the movement by which the fulfillment of function is substituted as a social force for the tradition of birth or race, by which the activity of service supersedes the passivity of station. For all their present imperfections these codes breathe the inspiration of service instead of the inspiration of mere myth or memory. As traditional and authoritative ethics weaken in the social process, the ethics formulated in the light of function bring to the general standard of the community a continuous and creative reinforcement.

Robert M. MacIver, D.Ph., LL.D., Litt.D., D.Sc., L.H.D., Palisades, New York, former Lieber professor of political philosophy and sociology at Columbia University (1929–50), professor of political science, Barnard College (1927–36), professor of political science at the University of Toronto (1915–27), has written extensively in the field of sociology. Among his many publications are Society—Its Structure and Changes (1931), Society—A Textbook of Sociology (1937), Leviathan and the People (1939), Social Causation (1942), and Democracy and the Economic Challenge (1952).

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

KENNAN, GEORGE F. *Realities of American Foreign Policy.* (The Stafford Little Lectures at Princeton University, 1954.) Pp. ix, 120. Princeton, N. J.: Princeton University Press, 1954. $2.75.

This is a notable little book with a big moral lesson for us all in these days: let the American example rather than reliance on international constructs of the law or preachment to others be the rule of our foreign policy.

"Let us face it," says George Kennan in these Stafford Little Lectures at Princeton: "in most international differences elements of right and wrong, comparable to those which prevail in personal relationships, are —if they exist at all—simply not discernible to the outsider." What then are the realities of international life as contrasted with the political moralities of the so-called American mission? They are, as Mr. Kennan sees them: (1) an utter lack of uniformity in the degree to which the various component parts of the free world have advanced along the path of civilization, (2) the population revolution of our times, (3) the technological revolution, (4) the fact that in international affairs we deal with governments not peoples, and cannot deal with governments, particularly in democratic countries, without affecting the opposition factors that may someday constitute a successful government.

These realities defy moral formulas and political devices. We cannot cope with them merely by measures of multilateral mesmerism (like the "fantastic" Kellogg-Briand Pact) for the arrangement of peace. Nor can we make other people like us by a one-sided largess. What we need to do is not to make them like us but cause them to respect us. The best way to do that is to practice on ourselves what we preach to others, or better still not to preach at all but "to conduct ourselves in our capacity as a member of the world community so as to enhance the chances for the preservation of the values we cherish here at home."

Mr. Kennan lays down some specific suggestion for measures of self-control—reflecting the philosophy of the New Deal —that will help win respect throughout the world, such as: (1) a change in psychology and practice from an exclusive to a receptive nation: this means lowering tariff and immigration bars, a thousand times more it means removal of barriers to the mind and spirit; (2) conservation and development of our natural resources and beauty; (3) municipal and regional plan-

ning to do away with "blighted areas, filthy streets, community demoralization, chaotic traffic conditions, and utter disregard for esthetic and recreational values in urban development."

As to the overbearing problem of Soviet power, Mr. Kennan abjures any thought of preventive war. He still believes in a policy of containment, not denying the possibility of massive retaliation in case Russia starts a major war.

SAMUEL FLAGG BEMIS
Yale University

NORTHROP, F. S. C. *European Union and United States Foreign Policy.* Pp. 230. New York: The Macmillan Company, 1954. $4.75.

The celebrated Sterling Professor of Philosophy and Law of Yale University has given us another book on international politics. The first chapter is entitled fittingly: "A Remarkable Phenomenon." The entire book is a remarkable phenomenon: The continuum of philosophical contemplation and sociological jurisprudence is enlivened—frequently at the most unexpected places—by copious quotations from the *New York Times,* the London *Economist,* and political campaign literature, statistical tables such as the one captioned suggestively "Comparative Quantitative Living Law of the Continental European Community in Percentage of Popular Vote and of Seats in the Lower House of Parliament," and slashing attacks on the Republican Party.

Professor Northrop's analysis centers upon the indisputable division of Europe's population into Protestants and Catholics. His thesis may be construed as follows: Protestants are less ready than Catholics to yield up national sovereignty to a supranational authority; the Council of Europe is not by a long shot close to being a supranational government because its Protestant member states, Britain and the Scandinavian states, cannot follow the Catholic ones, West Germany and Italy, into taking the final plunge which the latter have suggested; France is poised in animated suspension between her Catholic and her Cartesian–Rationalist tradition; and European Defense Community could have made a go of it because its member states would have been predominantly Catholic. Hardly anyone will quarrel with these views. They are sensible; they are limited, however, to the cultural element—"religious and secular living law" in the author's terminology—in European relations. They do not account for economic and strategic developments and their psychological consequences that have worked against European unification and have contributed more decisively to the wrecking of EDC than the Catholic-Protestant bias.

Professor Northrop makes a good case for the contention that Europeans are too particularistic and too conscious of their historical divisions to unite politically. He then proceeds to disregard his case and to place the blame for the failure of European unity not upon the Europeans, but upon an alien villain. That villain is the Republican conspiracy. It is what President Eisenhower, Secretary Dulles, and Senators Knowland, Wiley, and McCarthy have done as well as what they failed to do and especially what they said that: (a) wrecked Mr. Truman's and Mr. Acheson's noble schemes for Europe, and (b) angered and estranged our European allies. This is a remarkable discovery, albeit one not sustained by Professor Northrop's own sources. Reading through the back issues of the London *Economist* of 1951 and 1952, this reviewer came to the conclusion that it was European fear of involvement in the Korean War, Soviet nuclear weapons, and a shift in the emphasis of U. S. economic aid from butter to guns, proclaimed by Mr. Acheson, that caused American-European tensions. If to these fears are added the hopes engendered by the post-Stalinist "New Look," then any conceivable subsequent errors on the part of United States policy can only have had a minor share in American-European misunderstandings. The Republican Administration inherited from its predecessor vast commitments and ticklish problems and had to make choices none of which probably were to its liking. It came up with not a few happy solutions, despite a drastic reduction in budgetary appropriations. The Korean Armistice, South-East Asia Treaty Organization, the Iranian, Suez, and Trieste settlements, and the admission of Germany to North Atlantic Treaty Organization are no mere trifles, the fact notwithstanding that none of these achievements were foreseen by Professor Northrop. This does not mean that, by reversing Professor Northrop's polemic, Messrs. Truman and Acheson should now be denounced as dolts. It does mean that Professor Northrop's ominous forebodings were just a shade hasty and off the mark.

There is a crying need for the philosopher's counsel in making foreign policy decisions. But the connection between Dr. Northrop's partisan complaints and Neo-Platonism—which I understand Professor Northrop's philosophical position to be, although his terminology does stump me—appears contrived and tenuous. In any case, it is always a good idea to wait until the returns are in before sitting in judgment over those poor fellows who have to *make* foreign policy. Incidentally, the Stoics, to whom the author refers frequently, taught the virtue of restraint and prudence. The pools of learning, just like ordinary pools, manage sometimes to be agitated and opaque without being very deep.

ROBERT STRAUSZ-HUPÉ
University of Pennsylvania

SCHIFFER, WALTER. *The Legal Community of Mankind: A Critical Analysis of the Modern Concept of World Organization.* Pp. x, 367. New York: Columbia University Press, 1954. $5.50.

This is a new look at old, much plowed ground, and an outstanding contribution to the fund of knowledge essential for the projected revision of the United Nations Charter. In a brilliant synthesis, drawing together the pertinent teachings of political theory, international law, and that new discipline, international organization, the author analyzes the basic ideas which were written into the Covenant of the League of Nations. He then proceeds to show how these ideas not only conflicted with each other, but likewise disregarded the realities of international politics. These realities the founders, in common with many workers for world peace, conveniently ignored. In the last chapter, the author points to similar defects in the United Nations Charter. He remarks that in contrast with the League's founders many authorities today, their hopes for the success of a loose international organization frustrated, now advocate the establishment of a veritable world government.

In the Covenant can be discerned a conceptual framework which is something of a *potpourri* of the teachings of Grotius, Pufendorf, Wolff, Locke, Kant and the progressivist and positivist schools of thought of the nineteenth century. In the forefront of the ideas of 1919 was a belief that an effective international organization could be established without disturbing the existing system of sovereign independent states. Even bolder was the assumption that this organization could work even without substantial changes in the existing political conditions with which it would inevitably have to deal. There was likewise a naive expectancy that political interests would somehow disappear from the international scene; that common, unpolitical interests would ultimately unite the peoples into a peaceful, legally organized community. But, as Dr. Schiffer points out again and again, even with some redundancy, this really meant that the success of the League depended upon conditions which, had they existed, would have made the creation of that body unnecessary. In fact, the League was expected to bring about a state of harmony and goodwill which had to exist in the first place before the League could begin to function successfully. No way has yet been found out of this dilemma; in fact, the basic assumption upon which the United Nations was constructed at San Francisco, as submitted frankly by the representatives of the Great Powers, was that their wartime unity and harmony could continue indefinitely. We have all witnessed the tragic deterioration of the United Nations, especially since 1950, which has followed the breakdown of the ephemeral co-operation between East and West.

In 1919 the optimistic progressives, notably Wilson and Smuts, had great faith in the general reasonableness of statesmen, or at least in the peoples behind them. They anticipated that the relations between states

would evolve inevitably toward an era of peace because of the overpowering effect of reason inspired by goodwill. If, however, some state was tempted to act in an unsociable manner, even indulging in aggression, it was hoped that it could be brought back to reason by the force of world public opinion. Public opinion, however, could find effective expression only in states enjoying the blessings of self-government and democracy. Thus Wilson was quite logical in his view that only "self-governing" states should be permitted to join the League. True, not all the states were as yet democratic, but, encouraged no doubt by the creation after the war of so many new states with constitutions superficially free and democratic, the President confidently hoped that soon the democratic way of life would become universal. Russia being weak, and Germany and Italy still far from the time of Hitler and Mussolini, such hopes were not at the time completely fantastic. It should be added that the founders anticipated that reason and goodwill would not always triumph, for they provided for sanctions—obligatory economic and optional military sanctions. But, as Dr. Schiffer points out, and as was to be borne out by experience, the application of sanctions in a crisis itself depended upon the willingness of the members to meet their obligations, and there was no one there to police the policeman. *Quis custodiet custodes?*

At a period characterized by so much sophomoric thinking on problems of international organization—notably by extremists who would expel Soviet Russia from the United Nations, or, on the other hand, immediately establish a world federal state—this sober, mature, and realistic facing up to the basic unsolved difficulties standing in the way of organized peace is a most welcome and in fact an invaluable contribution.

JOHN B. WHITTON
Princeton University

MCNAIR, ARNOLD DUNCAN. *The Development of International Justice.* Pp. 34. New York: New York University Press, 1954. (Distributed by Oceania Publications.) $2.50.

This small volume contains the two lectures which the President of the International Court of Justice delivered in December 1953, at the Law Center of New York University. The first lecture deals with the development of international tribunals since the end of the eighteenth century. Like Judge Hudson, the speaker points to four landmarks in this development: the Jay Treaty of 1794, the Alabama Arbitration of 1872, the Hague Peace Conferences, and the establishment of the Permanent Court of International Justice in 1922, followed now by the present International Court of Justice. He discusses the rule that only states can litigate before this Court; speaking of the frequent demand that individuals should get the right to bring a claim against a foreign government, the speaker stands against the right of an individual uncontrolled by this government to do so. Further remarks deal with the problem of *ad hoc* and national judges. The very frequent citation by the Court of its own previous decisions and of those of its predecessor is strongly underlined.

The second lecture deals with the development of international law. A strong believer in case law, the speaker sees in the accumulation of case law by this Court and other international tribunals as well as by national courts a most important contribution. He is rather skeptical toward the procedure of codification of international law by conventions, a procedure which has been disappointing and may be positively harmful; there is also little chance for the success of this method in this period of crisis and tensions. But he stands strongly for codification by "restatements" through scholars, not delegates of governments, and urges that the task, so excellently done for 1927–39 by the Harvard Law School Research in International Law, be continued.

Concluding, the speaker states that the development of international justice is not a panacea for all the troubles of the world, that it alone cannot guarantee peace. For a court of law has to give effect to *existing rights,* whereas the most serious conflicts between states involve the problem of *change* of the law. But lawyers have a special duty to perfect the rules of international law and the machinery for its administration.

WYNNER, EDITH. *World Federal Government. Why? What? How? In Maximum Terms.* Pp. 84. Afton, New York: Fedonat Press, 1954. $2.00.

"A dangerous affliction of the Western world is its addiction to minimum proposals" (p. 31). This is an overpriced tract—and tracts should never be overpriced—for world government "in maximum terms." It is well written, but always one must ask, is it designed to be effective beyond the converted? This reviewer wonders just how relevant is the subtitle: "Proposals for United Nations Charter Revision."

After stating that "success requires a far greater tactical flexibility then the bulk of the federalist movement has yet shown" (p. 71), the author proposes that the world constitutional convention provides the tactical flexibility in the struggle for world government. It is therefore no surprise that she states, "currently there is a dangerous tendency to put all the world government eggs into the basket of United Nations revisions, a tactic providing little in the way of public education on world government."

Pages 42–46 carry a summary maximum proposal—enough to scare off the lukewarm. But is it good strategy for the author to introduce this by saying it "contains sufficient excess baggage to permit some of it to be abandoned during the bargaining process" (with whom?) without specifying what she considers "excess baggage"?

RICHARD H. HEINDEL

UNITED STATES GOVERNMENT AND HISTORY

HARRIS, LOUIS. *Is There a Republican Majority?* Pp. xvii, 231. New York: Harper and Brothers, 1954. $3.50.

The public opinion polls first became widely known in this country at the time of the 1936 presidential election. In that year, and in each election year since, the private polling organizations have published pre-election forecasts of the electoral decisions, based on samples of voters interviewed during the campaign period. For the most part, the reports of these polls have been confined to newspaper releases with the inevitable strictures regarding brevity and simplicity which such publication entails. The contribution to social science from these polls has not been great.

Now, however, one of the major polling organizations (Elmo Roper) has prepared a detailed statement of its data regarding the 1952 election. This volume, written by Mr. Louis Harris of the Roper staff, is concerned with an explanation of the factors which led to the Eisenhower victory. It is a book which students of political behavior will welcome and we may hope that additional monographs of this kind will be forthcoming from the polling agencies.

Mr. Harris has based the greater part of his analysis on the major demographic divisions which make up the electorate. He shows the candidate preferences of men and women, urban and suburban, white collar and union labor, Irish and German, Catholic and Jew, and a number of the other social aggregates which are customarily thought to have political significance. He identifies, partly on the basis of his polling data and partly on supposition, the issues which he believes moved these different groups. He describes certain changes which the Roper polls found in the attitudes of these groups as the campaign progressed.

These data are obviously of great interest. They bear on questions of great importance to scholars and practitioners alike. The answers they give puzzle this reviewer a great deal, however, since in many cases they flatly contradict comparable data gathered by him and his Survey Research Center associates at the time of the 1952 election. Consider these three findings in the Harris study: (1) Women swung more sharply to Eisenhower than did men. (2) Negroes voted in greater numbers in 1952 than in 1948. (3) Young voters gave

Stevenson a majority of their votes. None of these conclusions is supported by the Survey Research Center data and numerous other discrepancies appear which go far beyond sampling error.

The explanation of these differences is not altogether obvious. The two surveys used different methods of sampling; they also defined voters differently. It would require a very detailed analysis to determine why the discrepancies in the findings of the two surveys occurred. In the absence of such an analysis this reviewer advises all readers of survey reports to examine with a sharp eye the methodologies on which the data are based.

ANGUS CAMPBELL
University of Michigan

CONNALLY, TOM. *My Name Is Tom Connally.* As told to Alfred Steinberg. Pp. viii, 376. New York: Thomas Y. Crowell Company, 1954. $5.00.

Tom Connally of Texas cut his eyeteeth on politics. He grew up in a household where it was served, as table talk, at every meal. He first ran for office, and was elected, at 25. He quit running, and being elected, at 75. He served in Congress for thirty-six years, twenty-four of them in the Senate. He was Chairman of the Senate Foreign Relations Committee while this country fought its greatest war, while the United Nations was born, and while the cold war with Russia culminated in the hot war in Korea.

Now Tom Connally, at 77, has written an autobiography in the "as told to so-and-so" style made popular by the mass circulation magazines. It is a detailed account of Connally's life and of the great events in which he was a participant. It is replete with anecdotes that tend principally to emphasize the prowess of Connally as a political protagonist, but it adds little to what has already been published about those with whom he came in contact and the destinies they shaped.

There is a compelling charm in Connally's recollections of his Texas boyhood, of his strong-willed mother and his kindly, well-to-do farmer father who loved the old South and who doted on politics for its own sake.

There is much of self-revelation in Connally's estimates of the men with whom he worked and fought, estimates composed almost always more of derogation than of praise, even in the case of the two presidents, Roosevelt and Truman, to whose support he devoted the most important part of his political life.

His sharpest attack was directed against the late Senator Arthur H. Vandenberg, whom he regarded as a Johnny-come-lately convert from the ranks of isolationism and whose popular acclaim he frankly resented.

His highest praise was reserved for Soviet Foreign Minister Molotov whom he found "an attractive man" and "one of the ablest diplomats I have ever known." This admiration betokened no softness toward Communism on Connally's part. It was just that he recognized in Molotov a man whose toughness of fibre matched his own.

It is regrettable that, despite the plenitude of anecdotes, the book does not convey adequately the essential flavor of Connally as a Senator, the dignity with which he wore the overlong white hair, black coat, and string tie that would have made most men look like caricatures of Senators; the mercilessness of his invective in debate; the terror he struck in those with less facile and embittered tongues. Perhaps there is no way to convey in print the contempt he could manifest when he referred to an antagonist as "the VERY distinguished Senator" and at the same time gestured with his hand, palm down, to indicate a man who stood only knee high.

Even so, none who reads the book will doubt that Connally is a man who rejoices in giving as good as he gets, and then some.

It is, on the whole, an enjoyable though not particularly informative book.

ROBERT ROTH
Philadelphia Evening Bulletin

PRITCHETT, C. HERMAN. *Civil Liberties and the Vinson Court.* Pp. xi, 297. Chicago: University of Chicago Press, 1954. $5.00.

The book surveys the seven years of the Vinson Court, particularly from the point of view of civil liberties. Not only that, but the opinions of the judges are analyzed, as are the judges personally. An endeavor is made to classify them as liberal or conservative (restrained)—or liberal on some issues and restrained in others. Thus knowing the predilections of the individual judges from their past opinions and associations, one should have some guide as to how the individual judge or group of judges will decide a future case. The chances are you will guess wrong. The whole business is confusing. As a judge once remarked after hearing the plaintiff: "This Court has no desire to hear the defendant. To hear both sides has a tendency to confuse the Court."

For instance, several cases before the Vinson Court involved the question of whether "confessions" were voluntary. How much police pressure makes a confession involuntary? Ordinarily a man arrested is not inclined to open his heart to his prosecutor. He rarely does so if he has legal advice. Mr. Justice Jackson has said: "Any lawyer worth his salt will tell the suspect in no uncertain terms to make no statement to the police under any circumstances." Why then should not the court hold that no "confession" is admissible unless the defendant first has had legal advice. Then we would be sure a confession was voluntary. Look at the instances where the young, poor, and helpless, particularly among the Negroes, "confess" in order to avoid police pressure, physical or otherwise. In the Trenton Six case, one of the defendants, implicating not himself but the others, turned to the police and said: "Now can I go home?" But the court tries to determine just how much pressure in the particular case renders the confession involuntary. The present method condemns the lawyerless, the ignorant, and the poor.

Unreasonable search and seizures? A Chinaman whose ostensible business is that of running a laundry, but who on the side handles narcotics, talks indiscreetly to a friend. The friend is "wired for sound" so that the defendant's words reach the ears of the police. Is this wiretapping? Or merely eavesdropping? A narcotics peddler, seized by the police, swallows the evidence. The police use a stomach pump. Is this an unreasonable search and seizure?

The Bill of Rights prohibits legislation abridging free speech. Does this apply to Communists engaged in "conspiracy," whatever that might mean? What is clear and present danger? Is the right to free speech an absolute? That depends on how you define free speech. Have you a right to yell "fire" in a theatre? Does that not depend on whether you think there is a fire?

Justices Black and Douglas have one point of view. Other judges differ. It all reminds me of Mr. Justice Holmes's dissent in a case of many years ago, where Mollie Abrams and others were sentenced to twenty years in jail for publishing a pamphlet which she "had as much right to publish as the Government has to publish the Constitution of the United States now vainly invoked by them." You cannot help feeling that Mollie Abrams was incarcerated because she was not a better lawyer than Mr. Justice Holmes. And so with all these divided decisions which make men free citizens or criminals. Time was when any indefinite law was held unconstitutional on the theory that no citizen should be in a position where he might "guess" himself into jail.

Mr. Pritchett's analysis of the decisions of the Court during the period when Mr. Vinson was Chief Justice, and particularly his charts indicating the groupings within the Court, highlight the uncertainty which prevailed in the field of civil liberties. Perhaps never before in our history has it been so important that there should be a reasonable measure of agreement on what actions by both state and federal authorities constitute violations of the guaranties of the Bill of Rights. We hope, therefore, that the Court, under the leadership of Chief Justice Warren, will be able to develop a greater measure of unanimity in defining of what our liberties consist.

Certainly anyone who is engaged in dealing with these problems will find Mr. Pritchett's book invaluable as a guide.

ARTHUR GARFIELD HAYS
New York City

PRICE, DON K. *Government and Science: Their Dynamic Relation in American Democracy.* Pp. x, 203. New York: New York University Press, 1954. $3.75.

Since the end of World War II the U. S. Government has come into the position of assuming the responsibility, in large measure, for the support of nonmilitary science as well as military science. The justification for such a position is based, of course, upon the fact that in the world struggle for survival, we must see to it that we remain at all times as strong as possible in all departments, civilian science being near the top of the list. On this argument the government has taken over much of the responsibility for all science and has poured billions into it. There is no question but that, in terms of quantity at least, scientific output has greatly expanded under the forced-draft treatment. But as inevitably happens when any phase of human activity gets drawn into the orbit of big government, the benefits are accompanied by the loss of certain freedoms that have long been held to be essential to a healthy science.

Mr. Price addresses himself, in the broad sense, to the problem of arranging our affairs so that we can enjoy the benefits of governmental support in science and still not suffer too many attendant evils. In at least two ways, however, his book contains much more than a search for a solution to the immediate problem. First, because of his extensive personal experience in government-science administration, Mr. Price is able to throw a great deal of light upon the chain of events, the false starts and the pulling and hauling that have resulted, over the past decade or more, in the presently existing policies. Second, Mr. Price takes a novel approach in building up the background material in that he is as much interested in the effect of science upon government as in the reverse process. His point of view is that the near-infinite complexity of government has, to a large extent, been forced into being by the discoveries of science. There was a time when the services rendered by government were simple and largely nontechnical. The inspection of lighthouses, supervision of weights and measures, and other technical services formed but a short list. In recent decades, scientific developments have forced the government to establish huge organizations to give the required service and supervision in such areas as aeronautics, atomic energy, agriculture, highways, and power. Every new scientific advance forces further responsibilities upon the government and makes it grow bigger. The analysis of the interplay between science and government, equally in both directions, seemed, to the reviewer, to be one of the unique and interesting features of the book. As a source of much inside information and as a stimulating presentation, but with, understandably, no solution, the book is highly recommended.

Mr. Price, while with the Federal Bureau of the Budget, worked on the legislative plans for the Atomic Energy Commission and the National Science Foundation; he served as Deputy Chairman of the Research and Development Board of the Department of Defense; he was with the Public Administration Clearing House, and is now Associate Director of the Ford Foundation.

H. R. CRANE
University of Michigan

MILLETT, JOHN D. *Management in the Public Service.* Pp. xi, 417. New York: McGraw-Hill Company, 1954. $5.50.

The well-known and versatile author of this first of a two-volume work on the managerial and the political problems of public administration makes no apology for his concern with the mechanics of getting work done as contrasted with the substantive aspects of government policy and program. He regards the elected chief executive in our governmental system as much more than a chief administrator sharing, as he does, with the legislature and the judiciary the supervision and oversight of administrative agencies. Thus he chooses to deal with the problems of public management primarily at the department head or operating level.

In an introductory chapter, management is defined as "the process of directing and facilitating the work of people organized in formal groups to achieve a desired goal." Again, management is conceived as "a system of authority and responsibility in administrative effort." Attempting a somewhat more adequate formulation of the technical, as differentiated from the substantive, phases of management than Gulick's familiar POSDCORB, Millett proceeds to a consideration of the common problems of work direction, work operation, and internal services. The three major parts of the volume which follow are built around these tasks of management. The problems of work direction dealt with in Part I include leadership, planning, communication, supervision, and public relations. The problems of work operation, to which the author devotes approximately one half of the volume, include the traditional technical or auxiliary staff services, such as organization, budgeting, and personnel with the addition of a less common, though useful, treatment of legal service. The internal services of capital plant, supply, printing, transportation, communication, and records management are treated much more briefly in Part III.

A concluding chapter discusses the important and always provocative subject of the values or ends of management. The author, who uses "the quest for effective performance" as the subtitle of this volume, accepts efficiency as a relative or intermediate value, though he affirms it as "an absolute necessity for our national survival." Public administrators, he submits, must be charged with achieving effective performance while possessing an abiding faith in the higher and more fundamental values of satisfactory service, responsible performance, and good government.

Though there is nothing strikingly new in this book, Millett deals with familiar concepts and problems in a stimulating fashion, and adds substantially from his rich experience as teacher, researcher, and administrator to the reader's appreciation and grasp of the common tasks of public management as he defines them.

LLOYD M. SHORT
University of Minnesota

MARVICK, DWAINE. *Career Perspectives in a Bureaucratic Setting.* (Michigan Governmental Studies, No. 27.) Pp. viii, 150. Ann Arbor: University of Michigan Press, 1954. $2.25 paper.

The author has undertaken in this study to find out to what degree agency goals are compatible with the interests of the persons engaged in conducting the administrative work of governmental bureaus. The study is based upon a survey, made in 1950, of the attitudes of some 200 professional and administrative persons engaged by a single federal agency (name not specified) in carrying on a research-evaluation program for the national defense establishment.

The persons in this agency were found to belong to three career types: "institutionalists"—civil or military service career persons; "specialists"—scientists, lawyers, engineers, accountants; and "hybrids"—both government service and specialty-group persons. These three types were further distinguished as "bureaucrats committed to a place, committed to a skill, or uncommitted to either."

Analyses were made of the career types (approximately seventy persons in each) which indicated that they did not differ markedly as to age, sex, or organizational distribution. But in other personal characteristics the types were significantly different. The institutionalists were predominantly military persons, few of whom had ever been employed by nongovernmental organizations, and only a small number of whom sought to improve their educational qualifications after coming to work for the government. The specialists and hybrids, on the other hand, were overwhelmingly civilian, with higher educational qualifications, heavier family responsibilities, wider experience with nongovernmental employers, and given to improving their educational status by going to night schools in Washington. Hybrids differed from specialists only in that they often had more experience in public employment and heavier family responsibilities.

The career plans of the three types were found to be markedly different. The institutionalists expected to work out their careers in government jobs, advancing for the most part to executive activities. The specialists looked forward to careers without executive activities, and cared little

whether they were employed by government or by private concerns. But the hybrids were more like the institutionalists in their career plans, despite the fact that in educational qualifications and job experience they resembled the specialists: they looked forward to careers in government service, and they expected to perform executive duties at some time.

From the standpoint of management, the institutionalists were regarded as being "place-bound and rule-oriented,"—the ideal type of bureaucrat, though they were thought to react diversely to official directives depending upon job conditions. The specialists were inclined to be indifferent to the material benefits and social life of the place where they worked, but they exhibited a degree of inflexibility respecting policy changes. The hybrids concentrated mainly on considerations of influence, advancement, and salary; they were given to calculating the personal advantages which could accrue to them through changes in agency goals and procedures.

In conclusion, the author emphasized that his study was quite limited inasmuch as the findings were based upon only a single federal agency and he indicated that further research was needed to determine career perspectives. The reverse side of the coin—the major administrative problem of the degree to which bureaucrats substitute their own ideas for announced government policies or fail to implement new executive directives—was not considered.

A. E. BUCK
Institute of Public Administration
New York

TAX INSTITUTE. *Federal-State-Local Tax Correlation:* Symposium conducted by the Tax Institute, December 3–4, 1953, Princeton. Pp. viii, 248. Princeton, N. J.: Tax Institute, 1954. $5.00.

The twenty-two participants in this Tax Institute symposium represent the academic, legal and accounting professions, private tax research organizations, and tax administration. The individual contributions are segregated into five parts dealing with background considerations, intergovernmental relations, federal and state aid, conflicts of jurisdiction and potentialities of co-operation. The result of the varied background of the contributors and the selection of topics considered is a singularly comprehensive and yet compact presentation of the historical, comparative, theoretical, practical, administrative, and political aspects of the problem of intergovernmental tax co-ordination. A bibliography and an index are included.

The book gives a forthright picture of the many and difficult problems involved in any program looking toward better fiscal co-ordination. No undue optimism pervades the work. Rather the road to reform, in the light of experience with the task, is viewed as long and arduous. There is no wide and smooth freeway such as separation of sources of revenue, or shared taxes, or tax credits, or tax deductibility, or tax supplements or grants-in-aid that leads easily and quickly to the promised land. Indeed the abiding conclusion of the symposium seems to be that only gradually and in modest degree are we likely to make progress toward the goal. Any overall solution, of whatever nature, is remote and therefore the immediate emphasis should be upon the reduction of administrative conflicts, although acceptance of this position in no way should discourage us from looking forward hopefully to the potentialities for good of special study agencies such as the Commission on Intergovernmental Relations. Nor should we discount the progress already made as in, for instance, exchange of audit information and the use of common allocation formulas.

The question may arise as to whether this volume is merely another plowing of well tilled ground. In part the answer would be yes in that there appears here a review of the nature of the problem, a portrayal of certain differing viewpoints upon it, and a consideration of familiar proposed approaches to a solution. But, on the other hand this work breathes with the vitality born of the long and close experience of its authors in the field. They have toiled therein. Their contributions are in perspective, are concise and realistic. They have come down to earth and have here done the kind of painstaking cultivation so essential to progress toward a better product.

MARVEL STOCKWELL
University of California
Los Angeles

JEFFERSON, THOMAS. *The Papers of Thomas Jefferson.* Vol. IX: *November 1785 to 22 June 1786.* Edited by Julian P. Boyd and Mina R. Bryan. Pp. xxix, 669. Princeton, N. J.: Princeton University Press, 1954. $10.00.

The ninth volume of this historic edition covers the eight months from November 1785 to June 1786. For Jefferson this period had the nature of an interlude, following and preceding a number of great events. The troublesome problems that remained after the treaty with Britain cast their shadow repeatedly across the letters and diplomatic papers. Britain had not yet completed its transfer of military posts. The United States had not paid, and was not yet in a position to pay, the debts that were due to British creditors. On a short visit to London, Jefferson and Adams together explored these matters. But, while they met with some understanding among the merchants interested in Anglo-American trade, they found little encouragement and few well-wishers at the Court or in the Cabinet. Jefferson himself wrote a lengthy explanation of the debt problem to one of his own creditors, Alexander McCaul, and the letter (pp. 388–90) deserves study as a model of statesmanship, clarity, and tact.

Jefferson in Paris, like Adams in London, was making a determined effort to find new markets for American commerce. Much of the correspondence covers the negotiation of a trade treaty with Portugal and the attempt to expand the volume of trade with France. Entry into the Mediterranean was barred by the piracy of the Muslim powers along the Barbary Coast. In preliminary negotiations with these states, the United States discovered how much must be paid in order to buy them off. Jefferson and Adams exchanged letters which go into the relative expense of paying annual ransom, or equipping a small fleet to launch a punitive expedition "to the shores of Tripoli."

Many of these difficulties which beset this first generation of overseas American diplomats stemmed from the same source: to wit, the weakness and domestic discord of the thirteen States. Jefferson goes to great pains in reports to John Jay and in letters to such men as Madison and Monroe, to point out the embarrassments incurred abroad by the United States because of the lack of agreement on the home front. The varying practices of the States in regard to their debts, and the competitive commercial policies which certain States were pursuing *inter se,* made it wellnigh impossible to speak overseas with strength or conviction. The premonitory signs are already clear to the reader that the Articles of Confederation must be drastically overhauled because the authority which they permitted to the center was insufficient to the needs of the new nation.

LESLIE LIPSON
University of California
Berkeley

BLUMBERG, NATHAN B. *One-Party Press? Coverage of the 1952 Presidential Campaign in 35 Daily Newspapers.* Pp. viii, 91. Lincoln: University of Nebraska Press, 1954. $2.50.

It is a commonplace that the United States has close to a one-party (Republican) press in editorial policy and that this Republican advantage has increased over the years until by 1952, support by circulation was only 10.88 per cent for Stevenson, who had no newspaper support in nine states, negligible support in eight big industrial states, and an editorial advantage over Eisenhower in only three states, all southern. Mr. Blumberg reviews the evidence on this situation, but his primary interest is not to measure editorial, but news support in terms of the column-inches of space given to the two chief candidates. He says that he wishes to leave "content analysis . . . to those whose interests lie in that direction." He selected a sample of thirty-five dailies, whose circulation is about 14 per cent of the daily total; and he studied them for the thirty days preceding the election. In general, less partiality was apparent in terms of space given the two candidates than many critics of the

behavior of the press had asserted. Mr. Blumberg's largely quantitative analysis is only occasionally supplemented in his sections on individual papers by qualitative judgments, such as "The Chicago *Tribune's* editorial preference ran through its news columns clearly and unmistakably." But the evidence for such judgments is not presented.

No disparagement of Mr. Blumberg's study is intended by this generalization: the definitive study of the partiality of the press remains to be made. His sample was very small. The thirty-day period in some instances distorted his results, for a visit by Eisenhower and Nixon to a state where neither Stevenson nor Sparkman appeared in the thirty-day interval naturally produced more space for the Republican candidates. Whether the author answers the question posed in his title will rest upon an answer to the question whether relative assignment of space is an adequate criterion of newspaper partiality—for any reasonably diligent reader of the papers knows that, given two news stories of the same length, equally illustrated with photographs, and both placed on the same page, one may be warm, personal, even affectionate, while the other can be condescending, cold, or even caustic in style and treatment. A study such as this, furthermore, will not reveal instances of the suppression of news items thought to be favorable to the candidate opposed by the publisher. Within these limitations, Mr. Blumberg's little book is a contribution to our knowledge of the press and American politics.

DAYTON D. MCKEAN
University of Colorado

JACOBS, WILBUR R. (Ed.). *Indians of the Southern Colonial Frontier: The Edmond Atkin Report and Plan of 1755.* Pp. vii–xxxviii, 108. Columbia, S. C.: University of South Carolina Press, 1954. $5.00.

The development of an Indian policy in America has always been more or less a trial and error procedure. The Spanish, the French, and the English pursued different policies. Then came the United States policy which, east of the Mississippi River, was an adaptation of the English. West of the Mississippi, especially in the Southwest, the Spanish policy so firmly fixed afforded the basis for a superimposed English-United States policy. In the upper Mississippi valley, the French policy, the result of a century's activity, was a factor in determining the English policy after 1763. Here then is a reason for the publication of Dr. Jacob's interesting volume on Edmond Atkin, the first Southern superintendent, and his *Report and Plan of 1755.*

The well written and amply documented sketch of the life of Atkin (twenty-one pages) affords an excellent background for the *Report and Plan.* Atkin was born in England in 1707 and came to America with John Atkin "probably his brother" where they established a profitable trading concern. It was largely through this enterprise that Edmond Atkin came to local political prominence and finally the office of superintendent for the southern Indians.

While in England Atkin wrote the comprehensive document dealing with Indian affairs. *The Report* "to the Right Honourable the Lords Commissioners for Trade and Plantations" is a detailed account of the Indians of southeastern United States, as well as some consideration of Indians north of the Ohio River as they are concerned with the whole "western" Indian problem. This permitted the presentation of the French policy in dealing with Indians; it had to be understood, at least should have been understood, by the English in order to carry on the "French and Indian War." Atkin proposed plans to check the French after showing that they were not so successful through the establishment of forts as they were through their policies. His *Plan and Report* analyzed and proposed a revised Indian policy.

Military activities, trade, taxes, political relations, intoxicating liquor (always an Indian problem), trader jealousies, lack of integrity—and understanding—on the part of certain colonial governors, character of the Indians themselves, are but a few of the many subjects presented by Atkin who had a mind for minute details. His evaluation of the Cherokees, Choctaws, Chickasaws, Creeks, and lesser tribes is fair and generally accurate.

Dr. Jacobs who had access to a copy of the original *Report,* which is lost, has done a remarkable piece of research work. This volume should be read by every person who pretends to know the frontier and its Indian problems.

HAFEN, LEROY, and ANN W. HAFEN. *Old Spanish Trail, Santa Fe to Los Angeles.* (Far West and the Rockies Historical Series, 1820–1875, Vol. I.) Pp. 377. Glendale, Calif.: Arthur H. Clark Company, 1954. $9.50.

At long last the story of an important and historic Western trail, too long hidden in near oblivion, legend, and rumor, is now told.

We moderns, often preoccupied with the problems arising from the intricate character of our modern mass media of transportation, only occasionally are aware of the thin threads of communication and transportation which held provinces, colonies, and empires together in bygone days. The modern motorist speeds down U. S. 91 from south central Utah, through a corner of Arizona, and a slice of Nevada, into southern California and Los Angeles, little conscious that for miles he is following an important sector of an old trail laboriously worked out by plodding feet, both biped and quadruped, in the long ago.

For most of the Spanish-Mexican period of California, isolation was the word. Surrounded by deserts to the east and southeast, and by limitless stretches of ocean to the west and south, California's future was never full of promise until the coming of the Anglo-American and the opening of the Overland Trail in mid-nineteenth century.

The Old Spanish Trail was a tenuous link between two far-flung provinces of the Republic of Mexico (California and New Mexico), only lately independent of Spain. In existence less than two decades, it came to an abrupt end with the flood of overland travel coincidental to and following the Mexican War. Trail breaking by Kearny's Army of the West, and road building by the Mormon Battalion opened up the hitherto impossible southern route from Santa Fe to Los Angeles. Mormon settlement in the Great Basin and the following rush of humanity westward resulting from the Gold Rush in California opened up the central overland route, and the Old Spanish Trail was dead.

LeRoy and Ann Hafen, born and raised on the southwestern leg of the Trail (the only sector still paralleled by an important modern highway), are pre-eminently qualified to write this book both through training and long experience in the study and writing of Far Western history.

The story of the Trail, a narrow footpath extending in a great arc northwest from Santa Fe and then southwest to Los Angeles, is told against the background of half a continent and several centuries of time. It does seem that more than occasionally the book drifts far afield from the Old Spanish Trail, when it chronicles in some detail the subsequent lives and careers of those who passed over the Trail to California and later became prominent Anglo-Saxon citizens of that province and state. There are several other areas where the subject matter is of only casual interest to the Trail. On the other hand, there are many interesting features of the book —the descriptions of the terminal towns, Santa Fe and Los Angeles, interspersed with accounts of contemporary observers of more than a century ago, are particularly interesting, especially for those familiar with the modern counterparts of those cities. The chapters dealing with the Mountain Men and explorers constitutes almost a capsule history of the presettlement period of the Rockies and Spanish Southwest.

This book is advertised as the first in a fifteen-volume series under the general title, "The Far West and the Rockies." The Hafens are to be congratulated for such an excellent start for their series, and the Arthur H. Clark Company for its usual excellence in the bookmaking art.

ECONOMICS AND INDUSTRY

BAKKE, E. WIGHT, et al. *Labor Mobility and Economic Opportunity.* Preface by Paul Webbink. Pp. vii, 118. Published jointly by the Technology Press of Massachusetts Institute of Technology and John Wiley & Sons, New York, 1954. $3.50.

One of the outstanding features of our society is the free movement of labor among jobs, industries, employers, and geographic areas. The voluntary movement of workers has had a profound impact upon the progress and stability of the American economy. It also has affected other institutions including the family, church, government, and education. Until recently most of the literature on labor mobility has been either of a polemical or speculative nature. Only a few miscellaneous facts were known.

With the establishment of university industrial relation centers, a start was made on empirical research in several local labor markets. The work is being co-ordinated and stimulated by the Committee on Labor Market Research of the Social Science Research Council which has sponsored this collection of essays. The contributors to this volume are members of the Committee and all have been engaged in basic research on the behavior of labor markets.

Based largely on census data and the literature pertaining to labor markets, Philip M. Hauser provides a conceptual and statistical background for the interpretation of the other essays. His chapter is followed by reports by Gladys L. Palmer, Charles A. Myers, and Dale Yoder on the methods of analysis and principal findings of the field studies on local labor markets undertaken at the University of Pennsylvania, the Massachusetts Institute of Technology, and the University of Minnesota. Impediments to labor mobility are discussed by Clark Kerr in his chapter on "The Balkanization of Labor Markets." In the essay introducing the book, E. Wight Bakke indicates the significance of labor mobility and its relationship to our present economic, political, and social institutions. While recognizing the possibilities of uneconomic labor turnover, Miss Palmer, in the concluding essay, shows that labor mobility is essential to economic opportunity and the effective utilization of manpower in prosperity and depression as well as in war and peace.

The findings of these authorities indicate that the traditional hypotheses of economists are misleading in assuming that net differences in economic advantages, chiefly wages, are the main causes of labor mobility. While certain of the individual conclusions in the essays are in conflict, such as the importance of economic considerations in job changes, and there remain large gaps in our knowledge, these objective studies, which take into consideration social, psychological, and institutional as well as economic aspects, will result in a better understanding of the labor market. This small volume is an example of heuristic research of an interdisciplinary nature making use of empirical and deductive techniques. Both the layman and specialist will profit from reading it.

WALRAS, LÉON. *Elements of Pure Economics or the Theory of Social Wealth.* Translated by William Jaffé. Pp. 620. Homewood, Ill.: Richard D. Irwin for the American Economic Association, and the Royal Economic Society, c. 1954. $7.50 List.

All economists will welcome Professor Jaffé's admirable translation of Walras, and political scientists will value the opportunity of examining the work and the point of view of perhaps the greatest architect of modern scientific economics.

Walras uncompromisingly maintains that the pure science of economics is concerned with the explanation of economic conduct and should have no policy implications. He therefore roundly rebukes Adam Smith for his assertion that political economy "proposes to enrich both the people and the sovereign" (p. 52), but concedes that Ricardo and Malthus have more claim to scientific standing (p. 53). He is equally critical of the naturalistic viewpoint, such as that of J. B. Say, which attempted to show that a certain economic order was natural and therefore good (p. 54).

Despite his scientific self-consciousness, Walras was unable to construct a science that had no policy implications—for himself at least. For his construction of the general equilibrium system leads him directly to the conclusion: "Freedom procures, within certain limits, the maximum of utility; and since the factors which interfere with freedom are obstacles to the attainment of his maximum, they should, without exception, be eliminated as completely as possible" (p. 256).

The usefulness of a pure science of economics, in Walras' view, depends largely on those who use it:

> In any case the establishment sooner or later of economics as an exact science is no longer in our hands and need not concern us . . . less than a century has elapsed between the publication of Adam Smith's work and the contributions of Cournot, Gossen, Jevons, and myself. We were, therefore, at our post, and have performed our duty. If nineteenth-century France, which was the cradle of the new science, has completely ignored it, the fault lies in the idea, so bourgeois in its narrowness, of dividing education into two separate compartments: one turning out calculators with no knowledge whatsoever of sociology, philosophy, history, or economics; and the other cultivating men of letters devoid of any notion of mathematics. The twentieth century, which is not far off, will feel the need, even in France, of entrusting the social sciences to men of general culture who are accustomed to thinking both inductively and deductively and who are familiar with reason as well as experience. Then mathematical economics will rank with the mathematical sciences of astronomy and mechanics; and on that day justice will be done to our work (pp. 47–48).

One cannot but wonder whether Walras would feel that the twentieth century has fulfilled his hopes.

These matters are peripheral—but a brief review cannot begin to do justice to the general equilibrium system, of which most of us have previously read only brief desiccated versions. Bumbling classical errors such as those involved in the wages fund doctrine or the theory of rent are ruthlessly exposed by the Walrasian logic. Yet, somehow or other, one retains the opinion that Smith, Ricardo, and Mill, though innocent of mathematics, were very great men.

ARTHUR SMITHIES
Harvard University

BROWN, HARRISON. *The Challenge of Man's Future: An Inquiry Concerning the Condition of Man During the Years that Lie Ahead.* Pp. xii, 290. New York: Viking Press, 1954. $3.75.

Much of this book was written on an island, a fact that undoubtedly helped the author understand the earth's limits in a manner that seems to have been beyond many of the writers cited in his bibliography. He cites thirty-odd titles on resources and/or population published during the past ten years. Among these Dr. Brown's book is outstanding, and despite a certain smell of the lamp, in many ways the best.

He has entered a controversial field, winnowed out facts and probabilities from prejudices, hopes and dogmas, and put together a presentation that, at least to this reader, seems so reasonable that its general soundness can scarcely be questioned. Unlike earlier writers, who (though their readers have strangely missed the point) have been primarily concerned with technology, *or* population-resource ratios, *or* certain resources, Brown concerns himself with the totality of factors that are generally accepted as important: energy, natural resources, population dynamics, and socio-economic influences.

His extrapolations from these, made with impressive erudition and a plausibility that would probably be acceptable to most specialists, are an intellectual adventure couched in brilliant writing. He does not build a one-track road to Avernus. Neither does he provide a technological escalator to the Elysian Fields. He leaves this reader with the impression that the bets, if any, are on the black.

There are a few lapses. Dr. Brown has, for example, been somewhat misled on the degree of progress toward an oral contraceptive; and, while he points out that we still do not know how to cope with tropical soils, he reprints the fantastic estimate of

a billion untapped acres for tropical agriculture.

Most books on this subject have suffered from an elementalistic approach and lack of adequate field experience. Dr. Brown's structure is nonadditive and conceived in terms of dependent variables; while it gives little evidence of firsthand acquaintance with geographic and sociological factors, as a map of man-earth relationships the book has an unusually high degree of reliability. Strongly recommended from every point of view!

WELCH, FRANCIS X. (Ed.). *Preparing for the Public Utility Rate Case.* Pp. 323. Washington, D. C.: Public Utility Reports, 1954. No Price.

The avowed purpose of this volume by the research staff of Public Utility Reports, Inc. under the editorship of Francis X. Welch, Editor of *Public Utilities Fortnightly*, is to serve as a handbook and guide for the guidance of those concerned with public utility rate cases. It is addressed to public utility managerial officers, staff technicians and attorneys, public utility consultants, expert witnesses, protestants in rate cases and their counsel, and members and staff of public utility regulatory commissions. It is a "how to do it" volume based upon the experience of the editor and his staff in preparing, trying, and reporting cases before regulatory commissions.

Public utility rate cases are important matters—important to the managements, owners and employees of public utilities, to the users of their services, and to the public which must assume the responsibility of regulating utilities through legislators, regulatory commissions, and courts.

The thesis of the editor and his associates is that a rate case should be thoroughly prepared technically and with the proper information to the public and employees of why the rates should be adjusted as requested in the case. It should be competently tried with counsel, witnesses and testimony designed and correlated so as to present the utility company's case thoroughly and forcefully. It must be decided objectively by the commissions in the public interest. The record in the case should be adequate to serve as the basis of appeal to the courts if the case is decided by the regulatory commission contrary to what the parties in the cases believe to be the sound expression of the law. They express the view that, "good and sound practice thus comes to the aid of good and sound regulation."

The handbook takes the reader of its specialized chapters through the mechanics of preparing every aspect of the rate case from the time a decision is reached to embark upon this complex, expensive, and time-consuming venture until the decision and order of the regulatory bodies have been made.

The material in the volume is readily located through use of chapter headings and index. It is a useful addition to the literature of public utility management, law, and regulation.

G. LLOYD WILSON
University of Pennsylvania

STOCKING, GEORGE W. *Basing Point Pricing and Regional Development: A Case Study of the Iron and Steel Industry.* Pp. vii, 274. Chapel Hill: The University of North Carolina Press, 1954. $6.50.

This work began as a study of the effects on the economy of the South of the basing point pricing system in steel. As the author soon properly recognized, however, this problem could hardly be considered apart from the effects of the basing point system on the total United States economy, or without reference to important aspects of the steel industry other than its pricing system. In short, the book really deals with industrial organization and market structure in the steel industry with special reference to (1) pricing practices and (2) the South.

The author's conclusions are critical of the steel industry and of the basing point system. In this respect, he resembles a long line of distinguished economists, from Frank A. Fetter (*The Masquerade of Monopoly*, 1931) to Fritz Machlup (*The Basing-Point System*, 1949), who have attacked the basing point system as an instrument of collusive pricing and wasteful of resources. Stocking's book, like those of Machlup and Fetter, is addressed to the lay reader as well as the professional economist. Like his predecessors, Stocking tends to smack his lips over the evidences he finds of dark conspiracy and exploitation. But there are significant differences.

Those economists who have disagreed with the attack on the basing point system have not, generally speaking, been satisfied with the steel industry's performance; rather, they have argued that the trouble is more basic, and that the particular form of pricing used is of little importance. Stocking is more sympathetic with this position than was Fetter or Machlup. This is illustrated by the fact that Stocking does not agree with his predecessors' advocacy of *compulsory* f.o.b. mill pricing. Rather, Stocking favors the permission of freight absorption, so long as it is "nonconspiratorial," and so long as it does not tend to eliminate competition. Further, Stocking is much less sanguine in the view that a mere change in pricing rules will produce competitive prices, better resource allocation, and a fair deal for the South. But it should help.

The reviewer believes this to be the most effective, withal the most moderate, of the critical treatments of the steel industry's basing point system. The professional economist will find that the study embodies some new factual findings, based on Temporary National Economic Committee materials, as well as a careful sifting of the old voluminous evidence. Likewise, it contains a penetrating analysis of the complicated recent legal developments with respect to basing point pricing.

The layman with an intelligent interest in public economic policy and the professional economist will each find this a useful and stimulating work. Professor Stocking writes clearly and persuasively, but generally avoids the tendentiousness which has plagued so much work in this area.

GARDNER ACKLEY
University of Michigan

PRIMM, JAMES NEAL. *Economic Policy in the Development of a Western State, Missouri 1820–1860.* Pp. viii, 174. Cambridge, Mass.: Harvard University Press, 1954. $3.75.

Few studies have had a greater impact on generally accepted ideas than the publications of Oscar and Mary Handlin, *Commonwealth: Massachusetts, 1774–1861*, and Louis Hartz, *Economic Policy and Democratic Thought: Pennsylvania, 1776–1860.* No one can any longer seriously suggest that the role of government in the United States prior to the Civil War followed Adam Smith's recommended policy of laissez-faire. The carefully documented experience in Massachusetts and Pennsylvania indicates that, at least in those two areas, the state played an active part in economic affairs. There was no adherence to any principle that made it improper *per se* for the state to engage directly in supplying economic goods and services needed by the people, while government aids to economic activities were so numerous as to be commonplace. Decision on the role the state should take in particular areas was largely determined by pragmatic considerations.

With the Handlins and Hartz studies as models, James Neal Primm has undertaken a similar analysis of Missouri. This was a happy choice. Located in the heart of the Mississippi Valley, Missouri drew its settlers from both the northern and southern areas farther east. Admitted as a state in 1820, Missouri thus provides a test of the extent to which the Pennsylvania-Massachusetts pattern may have been modified by a difference in the timing of settlement or the influence of the "frontier."

In general the results of the study confirm the fact that Missourians shared the same pragmatic attitude toward the role of government in economic life as their countrymen in Massachusetts and Pennsylvania. The author notes, however, ". . . the development state policy in Missouri often diverged in concept and in detail from the experience of eastern states" (p. 124). These differences he ascribes, ". . . to Missouri's relative youth as a state, her remoteness from eastern centers of population and wealth, her smaller financial resources, and the comparatively wide dispersion of her population."

State action on economic questions did not begin in Missouri, for example, until a half century or more after both Massachusetts and Pennsylvania had achieved their political independence. But the ink was hardly dry on the new state constitution in July 19, 1820, when agitation became strong for aid to the large debtor class which had been hit hard by the panic that had affected the whole country in 1819. Laws affording relief to debtors were passed which reflected popular opinion even though they were largely nullified later by court action.

There was strong sentiment for the establishment of a state bank—to the exclusion of private banks—which would be state owned and operated for the benefit of the people. A compromise was reached which provided half state and half public ownership of the bank stock, with management in the hands of elected officials. Missouri's active participation in "internal improvements" was delayed largely because of limited financial resources. Even so, there was some criticism of these activities, not on principle, but because Missouri had been too precipitate in following the lead of "old and wealthy states."

Primm's excellent monograph is a welcome addition to the literature on this general subject. It is hoped that it will inspire similar studies of other areas. It may be further hoped that scholars will be attracted to carry the analysis of the role of the state into the post-Civil War period, when national consideration appears to have shifted the emphasis from the state to the federal level.

HAROLD F. WILLIAMSON
Northwestern University

GATES, PAUL WALLACE. *Fifty Million Acres: Conflicts over Kansas Land Policy, 1854–1890.* Pp. xiii, 311. Ithaca, N. Y.: Cornell University Press, 1954. $4.50.

This scholarly monograph makes an important contribution to the history of the trans-Mississippi frontier and to the pioneer history of Kansas in particular. It suggests that similar studies of other states would be profitable in rounding out the story of how most of the great public domain of the United States was transferred to individual land holders, and in describing the tremendous social, economic, and political effects that followed from this step. In the rich iron ore region of northern Minnesota, for example, homesteaders, both bona fide and sometimes only hired squatters, were bought out by eastern iron and steel interests to the mutual profit of each.

In spite of the legend of homespun equality and democracy on the frontier, there were always to be found big men, privileged characters, little men, and paupers, living together just as they always have been everywhere in every age. Land speculators, both large and small, cattle kings, lumber monopolies, and mining corporations have sometimes jostled pioneer settlers, preempted vast natural resources, and at times run the frontier in their own way. This is well illustrated by Gates's volume.

During the last half of the nineteenth century, federal land policies in Kansas made life difficult for the common man who yearned to establish a farm home on the expanding frontier for himself and his family. The normal land laws dealing with the public domain did not apply to approximately half of all the land in Kansas because this was reserved for Indians. In these reservations the government tried to settle the Indians on farms to which it gave them title in fee simple, and then it sold the surplus privately.

The endeavor of man to secure riches without much labor, with the resultant corruption and political pressures, makes the story of land sales in Kansas a sordid one. Land speculators, both large and small, and railroad promoters, fairly or foully, secured grants to be sold to settlers. One of the worst examples was the attempt of the Leavenworth, Lawrence, and Galveston Railroad to secure the 8,841,927 acre Osage Indian Reservation at a bonanza price, with most of the land to be exempt from taxes for years, and the usual provision for lands for schools omitted. A long, bitter struggle ensued, but resulted in the end of the policy of the Indian Office circumventing the Land Office, nullifying statutory laws governing the sale of lands in the public domain, and assisting speculators to get lands by making "treaties" with Indian tribes.

Railroad companies which tried to be just and reasonable did not escape the ire of squatters on their lands. The latter were often ignorant of the fact that federal land laws applied in Kansas to only half its area; in other cases, they knowingly occupied land only as speculators on a small scale. When the law clamped down, however, thousands of innocent home-seeking pioneers either left or tried to save their farms by borrowing at extortionate interest rates, in many cases only to be foreclosed after years of stark poverty.

Professor Gates has thrown new light on the entire agrarian story of the granger and populist movements of the period covered. Perhaps it is too much to expect in addition a paragraph or sentence here and there, dovetailing land history into the political, social, educational, and economic history of the period, and also to indicate how Kansas conditions compared with conditions elsewhere on the far-flung settlers' frontier. Such integration and broad interpretation, however, are seldom expected or found in monographs. The author's thorough and wide research, his lucid style, his ability "to resist the usurpation of particulars and penetrate to the catholicity of things" produced a book which yields both pleasure and profit to the reader.

A. T. VOLWILER
Ohio University

SOCIOLOGY AND EDUCATION

HSU, FRANCIS L. K. (Ed.). *Aspects of Culture and Personality: A Symposium.* Pp. xiii, 305. New York: Abelard-Schuman, 1954. $4.00.

Symposia based on interdisciplinary conferences of social scientists represent a current vogue in publishing. As usual in such cases, the papers in the present volume are presented along with a candid version of what transpired in discussion. The conference, called to deal with "Anthropology and Psychiatry," was sponsored in 1951 by the Wenner-Gren Foundation. As is also common in ventures of this sort, the contributions focus unevenly on the central topic.

Two themes in the conference record struck this reviewer as noteworthy. First is the very frank realization by the participants of difficulties inherent in interdisciplinary co-operation. In contrast to the ambitions of ten years ago, the present times seem to be marked by a much less sanguine attitude toward the possibilities of effective communication and continuity of theory between, say, anthropology and psychiatry. Perhaps enough of us now have tried what we preached to feel bewildered by the problems encountered. There is emerging a realization that it may not be worthwhile to press the struggle for collaboration beyond what comes naturally or grows out of an investigator's quite specific problem. Second, one notes in the conference (as well as in the meetings of learned societies) the implicit expectation that a discussant should look for weaknesses or shortcomings in the paper on which he has been asked to comment. Very shortly we may expect to have "discussion" acquire the same skewed negative meaning that "criticism" already enjoys. An especially shocking instance of the tendency is revealed by Jules Masserman. It is disturbing to witness this notable psychiatrist, who apparently also possesses competence in symbolic logic, destructively attack a paper in which anthropologist Jules Henry uses algebraic formulae to express the acquisition of certain emotional attitudes in socialization. "This sort of thing just isn't done," Masserman says in effect, quite oblivious to the value of adventuresome creativity in scientific endeavor.

National character, learning theory, Rorschachs of Chinese in Hawaii, the dynamics of culture in relation to the individual, next steps in culture and personality research, a cross-cultural definition of psychopathology, and Amish child rearing are some of the topics examined by such people as Ralph Linton, Thomas French, T. W. Richards, John Gillin, Clara Thompson, Manford H. Kuhn, O. H. Mowrer, and Louis Schneider.

JOHN J. HONIGMANN
University of North Carolina

CHESSMAN, CARYL. *Cell 2455-Death Row.* Pp. 361. New York: Prentice-Hall, 1954. $3.95.

Cell 2455-Death Row is not all that Chessman has written during the more than six years since he entered San Quentin's Condemned Row. Acting as his own attorney, though without legal training, he has written over a million words in connection with the appeals which have carried his case seven times through the California and federal appellate courts to the doors of the Supreme Court of the United States, but never inside those doors. He has won reprieve after reprieve while about fifty less resourceful men have walked by his cell to the gas chamber.

One can understand why a book written under these conditions would be spotty in quality. Some of it is strongly phrased and reads well. The first eleven pages, a description of the reactions of two men to their impending execution, have a tense and gripping power. There is plenty of lively material in the remainder of the book, but the author's account of the long series of burglaries, armed robberies, shooting matches with the police, and high-speed getaways in which he was involved makes the reader feel that he is watching a third-rate movie in which Chessman is producer, director, and leading man, and vastly admires himself in all three roles.

The professional reader would like to know what makes Chessman tick, but he will not find the answer in this book, unless by indirect inference. His life story would throw valuable light on those whose cause he says he is pleading, "the criminally damned and doomed," if one could be sure it is a truthful account. It is only natural that he denies the two particular crimes for which he was sentenced to death, for they are particularly repulsive and atrocious crimes. But that denial and the conceited and insincere tone of much of the book make one unsure of every word he writes about his crimes and their motivation.

Chessman is officially classified as a psychopath, a diagnosis he has characterized as "patently ridiculous" but which he appears in his book to accept. Certainly his involved plan, at age 19, to go to Germany and shoot Hitler was close to psychopathic, but it may easily be pure fiction. Indications that he is what we call a psychopath are found throughout the book: his early and sustained rebellion against authority, his egocentricity, his inability to profit by experience or to have genuine love for any other person, his overweening admiration of himself as having "diabolic cunning," "ruthless self-discipline," "inspired and deadly accuracy" with a gun, as a "character much too improbable for fiction," and so on. Most of all, he admires himself as one whom the "malignant gods" are determined to destroy.

Whether the State of California destroys this man in the gas chamber or not, the malignant gods of his own making have already done so. If he lives, it will be under two sentences of "life without possibility of parole," plus thirteen other long consecutive sentences, none of which will begin to run until the year 2009, when sentences previously imposed would be completed. There are eloquent and thoughtful passages in the closing chapter of *Cell 2455,* particularly those on page 353 in which he seems to me to come close to the secret of his tragic criminal career, that indicate a capacity, not yet developed, for writing of depth and distinction.

AUSTIN MACCORMICK
University of California
Berkeley

GRYGIER, TADEUSZ. *Oppression: A Study in Social and Criminal Psychology.* Foreword by Hermann Mannheim. Pp. xiv, 362. London: Routledge and Kegan Paul, 1954. $6.00.

The author of this monograph is not a professional criminologist: he is a very unusual clinical psychologist with experience as a governmental official in the Polish Embassy to the Komi Republic, a former inmate of a labor camp in Russia, and now a displaced person himself. Because of the author's wide background and learning, the book adds substantially to our criminological knowledge.

Oppression is a study of social psychology of the greatest interest in a field which probably in the future will be called clinical criminology, namely, the study and treatment of individual offenders. A study of oppression is basic for the practical worker in this field. All information obtained by clinical criminologists is met with the objection that the criminals *are* so, not becoming so. As an out-group they are met with emotional disapproval, and that which the clinical worker may see as the result of oppression (in the family, in approved schools, in prisons) is in the community mostly seen as constitutional wickedness. That long imprisonment has an influence on prisoners of war affecting their future behavior is a recognized fact, but no complete study is available. Even better material for the study of the influence of oppression could be found in the surviving inmates of the concentration camps. When Germany was just defeated, Grygier succeeded in crossing the German border. Through the United States Military Government of Bavaria, he got access to prisons and camps for a scientific study of Polish prisoners in Bavarian prisons and of Polish displaced persons (1) from concentration camps, (2) from former forced labor in industry, and (3) from forced labor in agriculture. As a result of the German policy in Poland the concentration camps contained Polish citizens who were not temperamentally different from other Poles. If when he saw them they were different they had been made so in the camps.

Personal data were examined for 181 prisoners and 4,100 individuals in DP camps. One hundred and two prisoners and 650 from the camps took an intelligence test. The more intelligent from the three "levels of oppression" mentioned and from the prisons, altogether 280 persons, took two personality tests. Thirty prisoners and 122 from the camps were included in equated samples.

The delinquents differed from the controls in the general direction of aggression and showed more concentrated forms of aggression. At the level of fantasy, a predominance of pessimism and feelings of inadequacy are found. The more oppressed subjects gave more extra-punitive responses. The concentration camp group showed a delinquency rate forty-five times higher than the less oppressed control group.

In the last chapter Mr. Grygier relates his results to the problems of war and international co-operation. The same personality structure is found in prejudiced and in oppressed people. His data are not sufficient to prove these last points, but we now "know that the similarities are striking enough to increase intolerance in both groups: if the oppressed could themselves remain tolerant, the oppressors would probably feel less need to persecute them" (p. 286).

The hypotheses that oppression tends to produce in the oppressed an extra-punitive attitude (i.e., greater readiness to put the blame on other people), that this is due to a defensive process, and that it leads to more aggression and what is called psychopathy and crime are strongly supported. From the reviewer's point of view these hypotheses are also supported by his own practical experience: lessening the oppression in an institution for psychopathics makes it easier to keep good order in the daily life, cuts down disciplinary problems, and is a better way to resocialization of the inmates than the ordinary prison atmosphere.

This book deserves to be widely read and used. The problems are so important that they ought to be taken up again in other cultural settings.

GEORG K. STÜRUP
Institution for Psychopathic Criminals
Herstedvester, Denmark

HARTER, D. LINCOLN and JOHN SULLIVAN. *Propaganda Handbook.* Pp. 440. Philadelphia: 20th Century Publishing Company, 1953. $5.00.

This book raises interesting questions, not so much about propaganda analysis as such, but rather, questions about the usefulness of superficially descriptive presentations of a subject that would seem to call for the most precise and exact formulations. A careful reading leads this reviewer to the inevitable conclusion that, on balance, more is obscured or confused by the author's presentation than is clarified.

The purpose of the book is "to analyze

propaganda movements through applying standard tests and asking penetrating questions." Admittedly some good questions are raised, and some interesting insights presented. It is in the inadequacies of the "standard tests" that the shortcomings become evident, and these shortcomings persist even when it is remembered that the volume is designed "for the student and the public, not for the expert in 'stimuli and response.'"

Basic to the volume is a battery of seventy-seven propaganda techniques, presented, it appears, as fundamentals in terms of which the art of propaganda may be analyzed. These include such categories as cloak of virtue, red herrings, purr words, history proves, window dressing, black and white contrast, ignoring, picturizing, theatrics—to name a few. The difficulty is that while four chapters are given to describing and illustrating the categories, definition is lacking that makes possible their systematic use. Criteria are not included that allow satisfactory differentiation of one man's "window dressing" from another's "glittering generality."

The authors do state that the basic list is "neither rigid nor all-inclusive." But if it is neither of these, and if, as they say, the techniques are different from each other but do overlap, it is hard to know just what in reality they represent, or what valid results are obtained from trying to apply them in the analysis of any assumed instance of propaganda.

The same descriptive approach in the subsequent chapters results in other confusions. Propaganda is defined as "any attempt to persuade persons to accept a point of view or to take a certain line of action." Education *is* propaganda by this definition, as the authors would agree. Yet on other pages there is reference to the "line between educational and propaganda material."

One is troubled, too, by such generalizations as "Propagandists are prone to follow the lead of the social sciences in making broad pronouncements about history and humanity which cannot be supported by inductive reasoning." And where is the evidence that "psychologists and sociologists themselves become psychopathic cases trying to make 'scientific analyses'" of human responses? It is disturbing when a book is larded with loose generalizations such as these. One is likewise disturbed by a book for the general reader that basically seems to rest on an assumption that one explains by naming. It is for these reasons that at the outset of this review the question was raised concerning the utility of a book that has such an approach, even admitting that its chapters individually do contain some interesting materials, and that it does call attention to the fact that there are problems of propaganda that call for analysis.

MALCOLM M. WILLEY
University of Minnesota

HANDLIN, OSCAR. *The American People in the Twentieth Century.* (Library of Congress Series in American Civilization.) Pp. x, 244. Cambridge, Mass.: Harvard University Press, 1954. $3.75.

This is a sequel to Mr. Handlin's *The Uprooted* for which he received a 1952 Pulitzer Prize. It is one of a series sponsored by the Library of Congress and because it is intended for popular consumption, academic impedimenta are largely dispensed with. Migrating peoples carry with them the cultures of their homelands, form associations for mutual aid, intermarry, and thus continue, even beyond the third and fourth generations, cultural values of their ancestors. The author thus finds in "ethnic antecedents" a key to group formations and struggles within American society. He knows his material thoroughly and has the imagination and literary skill to present an entertaining and instructive picture.

After sketching the groupings according to color, nationality, and religion, he follows them through the frustrations and conflicts of World War I, the restrictionist and Americanization movements, the prolonged depression, the New Deal ("offered a platform on which all 'minorities' could stand together," p. 203), fascist and Communist propaganda, new labor organization, and a decade of global war. He touches on many situations with a deft hand.

A critic, especially if he be a sociologist and an Old American, finds some points of criticism. The author covers so wide a subject in so small a space that his material is selective, his history impressionistic. His presentation is often onesided. Writing from the standpoint of his ethnic groups, he fails to give adequate representation to the views and activities of the average native American, too often selecting colorful examples and brash utterances of native extremists. The "Boston Brahmins" were not representative. He says: "immigration made American society fluid" (p. 7). Or was it already the most fluid in the world? Did the huge tide of 1900–14 render it more fluid during the 1930's? Was it a mere "assumption" in 1917 that "the United States was still joined by genealogy and culture" to Great Britain? The author should be the first to answer "Yes." Over three-fourths of the colonial population derived from Great Britain and northern Ireland; from them we derived our "ethnic antecedents." It was these principles of civil, political, and religious liberty plus our rich natural endowment that gave our society unusual social mobility, made America the promised land of the world's oppressed, and enabled it to turn millions of Europe's proletarians with socialistic and Communistic ideologies into property owners devoted to many of those same antecedents.

Were the aliens "completely loyal" during World War I (p. 148)? Was there no plain common sense back of restrictionism, and is continued restriction based solely on "prejudices" (pp. 208–9)? Recall those studies showing no increase in the purchasing power of an hour of labor from 1882 to 1914. The immigrant was undercutting his own market. Did restriction become "an expensive luxury" during World War II? Or was it a godsent opportunity to raise the standards of living of the previous immigrant hosts and their children?

Finally, the title is far broader than the content. This is really a work on American minority groups. Written on a chronological base, it does not replace the sociological studies of these same ethnic elements. However, Professor Handlin's approach is valuable, and one may hope he will persist in further studies along this line. The America of today is far different from that of 1900. It is quite possibly even more dynamic; it certainly has made great advances in science, technology, the fine arts, and democratic equality. Much of the whys and wherefores of these changes still need unraveling.

Smith College

COLE, STEWART G. and MILDRED WIESE COLE. *Minorities and the American Promise: The Conflict of Principle and Practice.* Pp. xiv, 319. New York: Harper & Brothers, 1954. $4.50.

Stewart G. Cole is an experienced practitioner in the fields of intergroup relations and adult education. In this volume, he and his wife have provided a compact summary of majority-minority relations in the United States today, placed these relations in the moral framework of the American creed, and offered suggestions for bringing creed and deed together.

There are several aspects of the study which are particularly commendable, though these aspects are not exploited to full advantage. The Coles wisely devote a chapter to the local community setting of intergroup relations and show a healthy awareness of the role of social class factors in this setting. Nevertheless, the use of social class materials from the research literature is far from sophisticated, and several opportunities for delineating the subtle *interplay* of class and ethnic factors are missed.

The authors are on sound ground in inserting a section on the "philosophy" of intergroup relations in which the social-structural goals of Anglo-conformity, the melting pot, and cultural pluralism are evaluated. This is an area of analysis which is crucial both to strategy in the battle against discrimination and prejudice and to fruitful research, and its comparative neglect by both practitioners and social scientists is costly. The Coles reject all three of these "philosophies" and go on to support a fourth called "dynamic democracy" which, in their words, "conserves the best elements of the melting pot and cultural pluralism." This reviewer approached the chapter (VII) which was to describe this synthesis with considerable interest, since he has been concerned in a

recent publication with the same problem. Regrettably, most of what he could glean from the Coles's discussion was a set of indisputable moral homilies on the need for a balance between "human freedom" and "social responsibility." The central problem-area of social structure (intermarriage, cliques, community organization, institutional affiliation) was bypassed.

While in its most ambitious areas the volume under review may not have wholly succeeded, at least it has raised some of the right questions. Moreover, as a summary for the layman of the setting of intergroup relations and of recent pertinent developments in such areas as employment, housing, religion, and education, the general worth of the study is considerable. The book would be particularly valuable in the hands of interested nonspecialists and members of adult study groups who want recent information about intergroup relations in a volume of modest size written in nontechnical language.

MILTON M. GORDON
Haverford College

KIGER, JOSEPH C. *Operating Principles of the Larger Foundations*. Pp. 151. New York: Russell Sage Foundation, 1954. $2.50.

Dr. Kiger's idea of examining material revealing the intellectual processes of foundation trustees and officers to determine whether he could identify certain principles which had guided and were guiding foundation operation was a good one. There is need for studies which take a comprehensive view of foundations. The student of foundations and their impact on our society is too often confronted with the absence of adequate source material.

This book has given the public access to many significant portions of the voluminous and enlightening records of the Select (Cox) Committee to Investigate Foundations appointed by the 82nd Congress. The availability of this material is especially significant in view of the fact that these records have been, for over a year, consigned to the Select (Reece) Committee to Investigate Foundations appointed by the 83rd Congress. In fact, the records were only fully accessible to the public during the early part of 1953 when they were housed in the Library of Congress.

The wealth of foundation material which it was Dr. Kiger's privilege to examine as Research Director for the Cox Committee prompted his interest. Under a commission from the Russell Sage Foundation, he delved into earlier foundation studies and into the published reports of the major foundations. The result is that he has pulled together for the first time materials from a wide range of the best sources bearing upon the characteristics of America's major foundations.

His findings contain explanations for the motivation of foundations. It is a picture of diversity in both structure and function—including all types of legal structure, various methods of selecting officials and exercising administrative control, differing patterns of grant making; a functional emphasis on using foundation resources as the venture capital of philanthropy; determination to safeguard freedom of action, both for themselves and the recipients of their grants; and, finally, recognition of responsibility to make an accounting to the public.

The work is fully documented throughout and will, therefore, lead the reader to other sources from which he might obtain greater detail on a segment of especial interest to him.

WILMER SHIELDS RICH
American Foundations Information
Service of Raymond Rich Associates

WORCESTER, DAISY LEE WORTHINGTON. *Grim the Battles*. Pp. 410. New York: Exposition Press, 1954. $4.00.

American social workers in 1955 do not usually identify their professional responsibilities by using the words "grim" and "battle," but at the time Vassar graduate Daisy Lee Worthington began her career in 1907 these terms were eminently descriptive. As a young and inexperienced social worker, teamed with her future husband, Wood F. Worcester, she was thrown into the grim battle of child labor in the southern cotton mills as an investigator for the Commissioner of Labor. From then until she paused to publish the semi-autobiographical account of her life's war against poverty in America, she seems to have fought with vigor and tenacity to "mitigate some of [the economic system's] harsher effects" on human beings.

Her emotion-charged book presents a readable and often thrilling description of her efforts to aid the victims of "industry's ruthless course," of private charity's "blind move to [the] disaster" of depression collapse, and the wreckage left by the self-interest of "antisocial doctors." Mrs. Worcester's literary theme and her life's focus is summed up in her final paragraph when she says, "I believe that this is the only effective challenge to Communism—the unequivocal promise of a great nation to work for the abolition of hunger within its own boundaries, thereby giving to the world an example of a people that can have freedom from want in conjunction with all other freedoms."

Her account exudes an aura of crusade and reform which should have a salutary influence on 1955's corps of sophisticated, highly-trained social work technicians. It probably will not convince all of them that Mrs. Worthington's emphasis on the "abolition of hunger" really mirrors the vitality of social work. Some may question the justice of her condemnation of private charity for its depression failure and her open cynicism of mental hygiene. Many certainly will not accept her conception of the "conflicting ancestral strains" of governmental welfare services and voluntary social work. Nor will all agree that the effect of the Community Chest movement has been to "retard rather than hasten progress."

Most readers probably will join in saying, however, that this book contributes a much needed touch of old-fashioned zeal to the literature of social work, and that Mrs. Worcester's story should be required reading for any who have forgotten that hunger does indeed destroy what democracy strives to preserve. If the war against poverty ever does wane in America, this account of former days and old battles may well serve to spark a new attack on a new front by a new generation of crusaders.

A. DAVID BOUTERSE
Pennsylvania Citizens Association
for Health and Welfare

BOND, FLOYD A., et al. *Our Needy Aged*. Pp. xxx, 401. New York: Henry Holt and Company, 1954. $4.50.

This is one of a growing number of solid, factual books about older people in America. It reports a co-operative study made by six members of the faculty of Pomona College, of the departments of economics, sociology, and government. There are four major sections: a survey by interviews with a sample of the older people of California, a description and analysis of the development and present status of Old Age Assistance in California, a comparison of the California plan of OAA with other state plans, and a chapter of recommendations with respect to the future of Old Age Assistance.

The authors trace the rise of Old Age Assistance in California. From 1928, when 2 per cent of people aged 65 and over received relief payments until 1941, when 24 per cent of the people aged 65 and over received assistance, was the period during which the American people came to accept the idea of cash payments to the needy aged. The State of California led the way.

California does not call this program Old Age Assistance, as do the other states, but Old Age Security (OAS) which confuses it in the minds of many people with the federal Old Age and Survivors' Insurance program (OASI). This is regarded by the authors as a misfortune, for it blurs what is to them a basic and valuable distinction between an *assistance* program based on the *needs* of older people and an *annuity or insurance* program, based on the *earnings* of those who have in this way provided for their own old age.

To this reader, Chapter III, on "Pensions, Politics, and Pressure Groups," was especially interesting. This is a history of old age pension politics from the Townsend Plan of 1934 down to the present. The principal villain of the piece is George H. McClain, a leader in the "Ham n' Eggs" campaign of the 1930's, and since 1941 the leader of the principal organization for expanding the Old Age Pension program, now known as the California Institute of Social Welfare. The professional economists and students of government generally have

little use for the political leaders of old age pension movements, and these authors are no exception.

Part of the study was made by interviewing a carefully designed sample of 890 out of the 880,000 people aged 65 and over in California in 1952. Ninety per cent of the people in the sample were interviewed. This is the most extensive sampling study yet made of the old age groups. Topics covered by the interview were: living arrangements, marital status, nationality and race, geographical mobility, occupational experiences, employment status, retirement experience, attitudes toward retirement, educational level, religious attendance, membership in associations, leisure time activities, income, property, and attitudes toward Old Age Assistance.

ROBERT J. HAVIGHURST
University of Chicago

KRUTCH, JOSEPH W. (Ed.). *Is the Common Man Too Common?* Pp. xii, 146. Norman: University of Oklahoma Press, 1954. $2.75.

This "informal survey of our cultural resources and what we are doing about them" assembles twelve essays which appeared originally in the *Saturday Review*. They discuss in a provocative, sometimes amusing, always interesting manner questions every thoughtful observer of recent cultural developments cannot help asking. The writers, however, are not content with raising these questions; they also try to answer them and to lay bare the reasons why modern culture has become a problem. The situation of modern man, especially in the United States but elsewhere too, has no parallel in the past. For the first time in history large masses have not only access to cultural values, because every individual may receive much more education than ever before, and because mass media make such values available to almost everyone, but also because modern man finds sufficient leisure time for enjoying culture, if he wants it. But this is precisely the problem: does the common man want it? And if he does not, what means are at hand to create in the mind of the common man an attitude appreciative of the great cultural values? The dilemma arises because the same "instruments and techniques which have made mass wealth and mass culture possible make it also possible to manipulate, and to vulgarize, and stultify the masses." The mass media which make accessible to the masses whatever matter they chose to publicize are largely dominated by the necessity of profit. They furnish what is bought and, consequently, adjust their presentation to the taste of the average. Thus, the masses receive what they want, but not what they need if the general cultural level is to be raised above its actual low level. However, there are indications that a true interest in higher things is growing up in increasingly widening circles. How this fact may be utilized for raising the cultural level is one of the main topics of these essays. The greatest obstacle is, as Krutch puts it, "the confusions that arise when the common denominator is consciously or unconsciously allowed to function as a standard of excellence." Besides the business aspect there is the disregard for humanities which have been pushed in the background by the prevailing concern with science. Krutch contributes the introductory essay, which gives the title to the book. Lindemann writes on books, A. Cooke on the press, G. Seldes on radio and TV, A. Mayer on motion pictures, and N. Cousins on the creative artist within modern civilization. Business and culture are discussed by H. K. Guinzburg. President Griswold of Yale has important things to say on higher education, a topic with which deal also J. W. Dodds (On Humanistic Values) and President de Kiewiet of Rochester, on educational awareness. G. F. Kennan, once United States ambassador to Russia, deals with cultural intolerance. The concluding study by D. W. Brogan of Cambridge returns to the general question by analyzing the taste of the common man. Brief though these studies be, they are informative and worthy not only of being read, but of serious consideration. Without being unduly optimistic, the authors believe in the possibility of a future in which the common man may cease to be "too common" and will be able to participate in and to appreciate the great cultural values modern civilization has put at his disposal.

RUDOLF ALLERS
Georgetown University

KASIUS, CORA (Ed.). *New Directions in Social Work.* Pp. xxi, 258. New York: Harper and Brothers, 1954. $3.50.

This symposium, honoring Philip Klein of the New York School of Social Work, and containing thirteen chapters by eminent contributors aimed "to be a useful, honest, and courageous one." In large measure it has achieved these objectives, but with considerable variability between the high quality of the chapter on "The Financing of Social Welfare" and the inexplicable and inexcusable finale entitled, "The Folklore of Social Work." In any symposium there are inevitable risks of unevenness of quality, but in the opinion of this reviewer a note of apology for the latter chapter must be introduced which this volume, otherwise, should not deserve.

The strongest chapter is Eveline Burns's on "The Financing of Social Welfare," in which social workers are squarely confronted with the obligation to face the economic facts of life. Next in substance is Michael Davis's "Needs and Problems of Medical Care," which does the same for the area of medical care about which social workers have been too pusillanimous. One develops considerable respect for Alfred J. Kahn's "The Nature of Social Work Knowledge," not so much for the conclusions to which he comes as for the solid, though tortuous, thinking that interpenetrates his exposition. Much the same may be said for the chapter by Maas and Wolins, "Concepts and Methods in Social Work Research," for although the "conclusions" are anything but conclusive, the reader cannot escape the implications for social work research of the reasoned analysis of concepts and methods in contiguous areas.

Not too many years ago the Hollis-Taylor study of social work education appeared. It may not be inappropriate to ask of the profession to what use, if any, that report has been put by either social work practitioners or educators. There appears reasonable evidence that it has had limited usefulness, and it may be important to know why. The "shock" method employed by the senior author of that study seemed hardly conducive to an enthusiastic response from the profession. These observations are related to the instant volume *New Directions in Social Work,* which certainly packs in far more sound educational philosophy in a few pages than is to be found in the entire Hollis volume. For example, the chapters by Harry Lurie, "The Responsibilities of a Socially Oriented Profession"; by Arthur Altmeyer, "The People and Their Government"; by Lester Granger, "The Changing Functions of Voluntary Agencies," and by Donald Howard, "Social Work and Social Reform," have real significance for practice and education. These chapters stir social workers to examine not only their experience of conforming to the communities around them—and the price with which that conformity has been bought—but also those instances in which they have dared to express their difference and to gain stature thereby. In this respect the volume written for Philip Klein is written for the entire profession and has real significance for it. It certainly contains more substantial thinking, justifies its conclusions more convincingly, and faces social work with more usable tasks than the volume to which reference has been previously made.

ARTHUR E. FINK
University of North Carolina

EELLS, WALTER CROSBY. *Communism in Education in Asia, Africa, and the Far East.* Washington, D. C.: American Council on Education, 1954. $3.00.

This book is based on six articles which originally appeared in *The Educational Record* during 1952 and 1953. To these have been added chapters on the causes of Communist influence in education, the fate of schools and colleges under the present government in China, and suggestions for combating such influences. The author was advisor on higher education to the Supreme Commander for the Allied Powers from 1947 to 1951. The main chapters reflect his encounter with Communist influences in educational circles in Japan and con-

versations and reading during visits to thirty countries of the Pacific, Southern Asia, and the Near East.

There is a wealth of information here varying considerably in weight of evidence from country to country, but all illustrating familiar techniques of exploitation of local situations. An appraisal of the significance and impact of these activities depends upon historical and cultural perspectives for which one must look elsewhere. For example, unfriendly attitudes to the West, so easily exploited, reflect a long and humiliating colonial experience; pride of country and a love of independence have been nourished by contact with Western literature and institutions; fear of present power in the West is often closely associated with admiration for the West's achievements. Educational systems and institutions developed with varying emphasis in other times and upon various Western models are under great pressure in many places to meet the new needs of independence and the post-war world. The tasks of educators in developing vital and relevant programs are colossal and resources often meager. The concluding chapter of this volume lists a number of suggestions for strengthening the hands of those who are developing democratic educational and other institutions.

PAUL J. BRAISTED
Edward W. Hazen Foundation

ASHMORE, HARRY S. *The Negro and the Schools.* Foreword by Owen J. Roberts. Pp. xv, 228. Chapel Hill: University of North Carolina Press, 1954. $2.75.

In making possible publication of *The Negro and the Schools* The Fund for the Advancement of Education (Ford) has struck the highest note in helpfulness. Wisdom lay in:

1. Reliance on research; confidence in the telling effect of truth accurately found, clearly, simply stated. A foremost threat to the demagoguery of Talmadge, Byrns and White is the quiet effort of a research organization, The Southern Regional Council, which is receiving aid from The Fund for the Republic (also Ford).

2. Reliance on Southern scholarship. Reminiscent of that powerful little pamphlet of the depression decade, *The South, The Nation's Economic Problem Number One; The Negro and the Schools* has been ably done chiefly by Southerners. The Fund has set itself up as no advocate of desegregation. It has simply financed illumination on the problem from the most acceptable source.

3. Timeliness. Here is a prime example of what Theodore Brameld has called *reconstructionism* in education. Education must work for the advancement of basic human values and must be *future centered.* This volume, begun in early 1953, appeared just prior to the Supreme Court's most moving decision of May 17, 1954. With ten of the forty-five authors centered at George Peabody College for Teachers (where Ford funds have now placed a clearing house for publicity touching the consequences of the Court's decision and a center for information), that college promises leadership in education's most advanced form.

4. Breadth of setting. From Charles Sumner's defense of racial integration in 1849 to almost the moment of the May 17 decision, the problem is given historic setting. From a sociological aspect, such revolutionary trends, as industrialization of the South, migration of Negroes to the North, and migration of Negroes and whites to Southern (as well as Northern) cities, are clearly shown. One senses that the decision of the court was inevitable and was dictated by rapidly changing conditions within the South as well as by world forces which made continuation of this caste system inflammatory.

From reading this volume one understands better why the South is taking its fate philosophically. I have been through the South studying the reaction. There are mixed feelings, but, on the whole, there is resignation, and among many a sense of relief. Democracy as a concept has been a seething spirit, an expanding one. This volume will help further one of its most recent advances. For an American dilemma is being resolved.

The Negro and the Schools treats the slow steps by which the courts have recognized the constantly expanding meaning of democracy as reflected in racial attitudes against the background of social change itself. Charles Sumner had put the issue squarely in the case of *Roberts v. City of Boston* when he argued (1849) that the operation of segregated public schools "tends to deepen and to perpetuate the odious distinction of caste, founded in a deep-rooted prejudice in public opinion." But the court then took the irresponsible view that any caste distinction involved "if it exists, is not created by law and probably cannot be changed by law." A more responsible attitude was revealed in the "separate but equal" doctrine of *Plessy v. Ferguson* in 1896. This doctrine held against a growing storm of opposition. In 1938 the first Negro crossed the color line in higher education under court order. This movement spread rapidly and with significant ease among the state universities of the South. But it moved still under the Plessy dictum of "separate but equal," the contention being that available facilities were not *equal.*

Behind those changes which led to the momentous decision of May 17, 1954, vindicating Sumner's contention completely, lay a vast fabric of social and economic change. The volume sketches those changes in instances such as the attitudinal impact of Negroes participating on foreign soil in wars for this nation. It gives in considerable statistical array other changes, as in population shifts and in the gradual motion toward actually equalizing facilities between the races.

The volume is helpful in its case studies of desegregation, from which it becomes clear that sociometric study is needed as to the readiness of the various areas of the nation to accept integration of the schools.

MORRIS R. MITCHELL
Putney School of Teacher Education

PHILOSOPHY AND RELIGION

SOROKIN, PITIRIM A. *The Ways and Power of Love: Types, Factors, and Techniques of Moral Transformation.* Pp. xiv, 552. Boston: Beacon Press, 1954. $6.00.

In this encyclopedic work the founder of the Harvard Research Center in Creative Altruism presents his analysis of the factors and techniques of moral transformation through the power of love. Professor Sorokin's thesis is simply stated: there is no solution to any of humanity's problems —war, crimes, materialism, revolutions, suicide, psychoneurosis—except by way of a creative altruism. Without love, armament, diplomatic machinations, police force, or schools of education cannot avert the catastrophe. Only an all-transcending love can accomplish the miracle.

The social scientists have little to say about the nature of love, the efficient ways of its production, accumulation, and use. And so we know less about "love energy" than about heat, light, and electricity. Professor Sorokin intends to correct this situation. In twenty-three chapters, divided into three parts, he exfoliates his program of moral transformation. Part I deals with "Love: Its Aspects, Dimensions, Production, Transformation, and Power"; Part II with the "Structure of Creative Personality"; Part III with "The Ways of Altruistic Growth"; and Part IV with the "Techniques of Altruistic Transformation of Persons and Groups." In following through on this project, Professor Sorokin surveys many cultures, makes liberal use of the collateral findings of others, indulges in many caustic criticisms, and presents numerous original ideas of his own.

In his own lifetime Sorokin has witnessed the fruits of human brutality and hatred: hunted by the Bolsheviks in 1918, captured and condemned to be shot, he saw his friends executed, and observed human bestiality in its most degrading forms. Thirty-five years later he is more convinced than ever that "cruelty, hatred, violence, and injustice never will be able to cerate a mental, moral, or material millenium."

This is an impressive work. My own dissatisfaction with it stems from the difficulty of determining the proper place for fumbling, fallible, but self-corrective human intelligence in Sorokin's scheme. In two chapters (six and twenty-three), Sorokin deals with the role of the "superconscious" in man's mental life. Here the creative-intuitive features of natural science, technology, fine arts, philosophy, religion, and extrasensory perception find their origin and drive. But the whole

problem of "intuitionism" in mathematics is smudged by Sorokin's treatment. Certainly it is inaccurate to classify Bertrand Russell (at least the Russell of the post-Wittgenstein influence) as an intuitionist. Moreover, the entire development of logical Positivism is passed over (including Charles S. Peirce's "evolutionary love"—though the Positivists have also conveniently ignored Peirce's more "metaphysical" ideas). Aside from this defect, the book impresses one as a masterpiece of systematic synthesis.

OLIVER L. REISER
University of Pittsburgh

LINDBERG, JOHN. *Foundations of Social Survival.* Pp. 260. New York: Columbia University Press, 1953. $3.50.

This is an extremely interesting treatise in social theory and thus perhaps no easy reading. Not that the author writes obscurely, or in an esoteric jargon not unusual among social scientists. On the contrary, the author writes well and once the reader has grasped the conceptual framework he is captivated by the profound and yet clear development of the problem; what from the standpoint of pure social theory are the foundations of social survival for the *civitas humana,* for the political community, for the more universal overreaching civilizations, and lastly, for the West. Spengler and Toynbee discussed this problem in their formidable volumes with a tremendous array of inductive material. Dr. Lindberg, economist by profession but steeped in classical learning and familiar with philosophy and theology, approaches his problem theoretically. He inquires how the great thinkers of antiquity, Plato, Aristotle and the Stoics, who were after all as much political-social theorists as they were philosophers, tried to solve the problem of social growth, of balancing the static and the dynamic elements in the social order so that social change in the form of social growth is possible and thus the survival of the city. Dr. Lindberg contends that the foundations of social survival for the great thinkers were to find a social balance among the basic functions of the body politic: the economic production, the biological reproduction, the function of the family, the internal order function, and the external defense functions. At the same time the inevitable conflict between private and public reason, individual and common good, must be resolved by a balance between outer kingdom and inner kingdom, so that the basic social functions are performed at a tolerable social "cost," that is, when obedience to the ruler through established habit minimizes the use of force, for force is expensive; it uses up in progressive ratio the "social transfer," the amount of goods and services set apart for the establishment and the preservation of order and defense, for the ruler, the administrators, soldiers, priests, educators. If obedience to the order be a habit, an internal free assent and not enforced, fear-inspired external conformity, then the myth or reason must produce and nourish in the inner kingdom this virtuous habit. Yet myth, the belief in the gods of the city, is essentially static and also endangered by questioning reason; and reason instead of conserving civil virtue may fall to the temptation of skepticism. They were not able to "lay the Monsters" always threatening the city with their wild order, destroying irrational emotions; furthermore, myth and reason, even if ruling the inner kingdom, produce an essentially static society unable to solve the problem of social survival, even if a *civitas maxima* is formed as it was in Rome and under the inspiration of Stoic philosophy.

In Part II, Dr. Lindberg shows that Christianity with its gospel of love, with its idea of the universal City of God always in the state of becoming, presents a valid theoretical model of social survival, because it tames the lusts, lays the monsters, and produces an elite of those serving love which makes obedience to the order and the inner norm effective. This elite is the saints—not the geniuses nor the wise men of the ancient city—in their exemplary, yet different life-forms of the *Imitation of Christ.* They create a potential of social growth without endangering the City by establishing an inner harmony among the basic social functions, the outer kingdom and the inner kingdom ruled by love and divine truth-producing free obedience to the norm.

This thought-provoking, profound treatise proves again that the social sciences and philosophy need each other, for it is obvious that H. Bergson, especially his last book, *The Two Sources of Religion and Morality,* has been a most productive influence.

BOWLE, JOHN. *Politics and Opinion in the Nineteenth Century: An Historical Introduction.* Pp. 512. London: Jonathan Cape, 1954. 25 *s.*

In his latest book, the successor to *Western Political Thought,* John Bowle presents, as a many-colored, storied tapestry, the political thought of the nineteenth century. It is lively reading and will undoubtedly command a large audience. Although he makes a determined attempt to relate political thought to its larger historical context, the author is a little misleading in his title. The emphasis is entirely on the ideas of the thinkers; the relation between political thought and political action is dealt with, for the most part, only inferentially. The work has two main parts: Book I, "The Political Thought of the Romantic Age," including chapters on Hegel, Bentham, Comte, Mazzini, De Tocqueville, John Stuart Mill; and Book II, "The Political Thought of the Age of Darwin," with chapters on Herbert Spencer, T. H. Green, Marx and Engels, Nietzsche, *inter alia.*

Mr. Bowle, despite the fact that he has devoted himself primarily to chronicling ideas, is not content to be a mere historian. His larger purpose is that of the true political scientist, the aim of guiding us to our proper destination in a world bedeviled by the mushroom cloud of thermonuclear destruction. That destination is membership in "the parliament of man, the federation of the world." The history of political thought, to Mr. Bowle, is the history of how some ideas "enhance life," while others promote death. He holds, quite rightly I think, that obsolete ideas, such as "metaphysical myths of inevitable national and class conflict," are more than we can afford, particularly if they tend to bring on these very conflicts. Yet a reviewer may be pardoned if he points out that Mr. Bowle has not established, by an independent argument of his own, that the true criterion of timeliness or obsolescence in political ideas is their tendency to promote or hinder what Mr. Bowle calls world commonwealth. After all, how many serious thinkers have argued that war is better than peace, death than life? Mr. Bowle's death-promoting ideologists, or most of them, seem to have believed that they were promoting life as assuredly as Mr. Bowle thinks that he is. A mere classification of ideas on the hypothesis that world government is the solution to our problems does not contribute much to the support of that hypothesis.

In a review as brief as this, it is impossible to discuss individual interpretations. We may, however, venture a few words concerning the author's method in treating the history of political ideas. This is revealed in such a phrase as "Both Thomism and the enlightenment had assumed a transcendental sanction. . . ." The statement, taken literally, is untrue: both Thomists and men of the enlightenment had offered what they regarded as proof of the existence of transcendental sanctions. Mr. Bowle, I believe, regards these proofs as inadequate. But an inadequate proof is not necessarily the same as an assumption of what is to be proved. Mr. Bowle, however, has throughout sketched for us the positions argued by the nineteenth-century thinkers, rather than the arguments for their positions. I doubt that Mr. Bowle is troubled by this, since he considers "political philosophy . . . [to be] part of the age it mirrors . . ." (p. 13). That it is part of its age is, of course, a truism. That it is a mirror means, however, that it is a derivative phenomenon, that the claim to base ideas upon arguments is only part of the illusion produced by the mirror, and that what determines the ideas is not the arguments which support them, but the historical "age." Perhaps Mr. Bowle is right, and his method the true one. But what are we to think when Mr. Bowle goes on to tell us that "modern political philosophers are a luxury

or a menace unless they recognize this need [the need for world commonwealth]." For if political philosophy is nothing ultimately but the mirror of environment, it would seem to depend upon the environment, not upon the political philosopher, whether or not he recognizes this need. I do not see how Mr. Bowle can have it both ways.

CHASE, STUART, in collaboration with MARIAN TYLER CHASE. *Power of Words.* Pp. xii, 308. New York: Harcourt Brace and Company, 1954. $3.95.

This book is a popularization. To some academicians, that may damn it, but popularizations are useful in a democratic society and Stuart Chase is a master of the genre. Ponderous studies come to life in his simple and apt illustrations and easily flowing language.

Chase surveys a wide range of research areas impinging on communication. These include: information theory, computing machines, the psychology of perception, animal communication, linguistic development of children, structural linguistics, psycho-linguistics, intercultural communication, semantics, group dynamics, and memory and comprehension. In each of these areas he takes the reader over two or three important and suggestive pieces of research which convey the flavor of the field. The specialist might protest the incompleteness of these samples which but skim the cream. For a popular book, however, it is enough that the illustrations be accurate and appropriate. They cannot be complete. Mr. Chase states correctly what students of communication have actually said and often states it better than they, themselves.

A more subtle difficulty for the popularizer is to separate the wheat from the chaff: which studies are good and significant, which incompetent or misleading; which are real contributions and which are not. Another subtle difficulty for the popularizer is the temptation to present the discoveries he summarizes as the golden key to all man's hopes.

Stuart Chase is a devotee of semantics. His earlier book, *The Tyranny of Words* (1938), maintained the semanticist's thesis that many of mankind's ills spring from confusion about language. His present book is more sophisticated. He sees the field of communications research as a broader thing than a crusade against terminological confusion. He still oversells, however, the legitimate points of which the semanticists have made us more aware. While he gives to each scientific discipline concerned with communications a single short but clear chapter, he gives semantics (which is also treated as a science rather than as a philosophical school) about half the book, and of all the versions of semantics, he pays the greatest respect to the tracts of Korzybski. We receive the impression that semantics not only corrects some widespread misconceptions, but that it also can solve political problems, cure neuroses, and perhaps even bring peace to the world.

It is laudable that the communications research of recent years should become accessible to a wider public through the able pen and intelligent exposition of Stuart Chase. It is unfortunate that this should be accompanied in part by some overtones of a doctrinal crusade. The merits of the book, however, balance this defect.

FRIEDRICH, CARL J. (Ed.). *Totalitarianism: Proceedings of a Conference held at the American Academy of Arts and Sciences, March 1953.* Pp. x, 386. Cambridge, Mass.: Harvard University Press, 1954. $6.50.

Totalitarianism has been variously subjected to study and analysis by historians, political scientists, and experts from other fields. The three-day conference of the American Academy of Arts and Sciences in Boston (of which the present volume is a report) represented one of the first major attempts at an interdisciplinary approach to the phenomenon of totalitarianism. The authors of the twenty-one papers read at the conference represent all the major fields within the political and social sciences in addition to philosophy, theology, law, psychology, and practical diplomacy and journalism. They include such well-known experts as George Kennan, William Henry Chamberlin, Frank W. Rounds, Harold D. Lasswell, the late Waldemar Gurian, Bertram D. Wolfe, and the brilliant editor of this volume, Carl J. Friedrich. Among the discussants were outstanding scholars like Hannah Arendt, Merle Fainsod, Sigmund Neumann, Michael Karpovich, Geroid T. Robinson, and David Riesman. Most of the conference participants have had extensive opportunity to observe and experience totalitarianism at close range. Some of them, indeed, have had to flee from totalitarian countries; one of them, Jerzy Gliksman, whose paper dealt with "Social Prophylaxis as a Form of Soviet Terror," had suffered two years as a slave laborer in the USSR.

The conference was divided into seven main parts dealing with various aspects of totalitarianism: political, ideological, psychological, social, economic, and intellectual. The final session was devoted to "Totalitarianism and the Future." The conference did not, of course, attempt to reach final conclusions or to draw up practical resolutions. On the contrary, it revealed the complexity of the problem and brought out in sharper focus the divergent views of the experts. There was above all a struggle for definitions of totalitarianism and authoritarianism, their counterparts, and antecedents. The controversy around the term "totalitarian mystique" (as used by Alex Inkeles), as distinct from "ideology," and such *ad hoc* inventions as "ideocracy" (Gurian) and "logocracy" (Arendt) as possible alternatives for the term "totalitarianism" serve to highlight the semantic difficulties involved. Much light was shed on the nature and practical effects of totalitarianism, particularly as manifested in Soviet Russia and Nazi Germany. Less illuminating and possibly dangerous, in the opinion of the reviewer, were the efforts to identify "authoritarian" traits in people living in totalitarian or free societies. The evidence purporting to demonstrate ideological compliance presented by the psychologists (Maria Jahoda and Stuart W. Cook), based on socio-psychological experiments by Solomon E. Asch, was challenged by several participants. Some of the statements regarding totalitarian propensities seemed to take for granted a genuine "ideological compliance" and "docility" on the part of the people living under totalitarian rule. The June revolts in Eastern Germany (which, of course, occurred after the time of this conference) should guard us against facile generalizations on this point. Moreover, it is important to make a sharper distinction between individuals who actively supported a totalitarian regime (as the majority of Germans during the 30's) and those on whom it was imposed by force (in Communist countries).

We are indebted to the American Academy of Arts and Sciences for publishing these proceedings and thus giving us an opportunity to participate, as it were, in this significant conference. The papers and discussions, although inevitably somewhat uneven, were on a high level. Bibliographical footnotes and a competent introduction by Professor Friedrich increase the usefulness of this volume. One closes the book with the wish that other interdisciplinary approaches to totalitarianism will soon follow.

COLE, G. D. H. *Socialist Thought: Marxism and Anarchism 1850–1890.* (A History of Socialist Thought, Vol. II.) Pp. xi, 482. New York: St. Martin's Press, 1954. $6.00.

In this second volume of a History of Socialist Thought the well-known British scholar G. D. H. Cole continues his theme to the 1890's. Major attention is given to the origin and development of the First International Workingman's Association in the 60's and its decline and fall in the 70's. The author vividly recounts the struggle between rival aims and tendencies within this organization which he terms "the birth pangs" of socialism as an international force, which for the first time became "decisively a working-class movement." Socialist leaders had now to take into consideration the desires of the trade unions as well as the interest of political parties in social reform.

The present volume is more immediately concerned with rivalry in Germany between Lassallians and Eisenachers and still more with the contest between Marxists and anarchists. Socialist hope of a general European revolution was dashed by the defeat of the Paris Commune, ably discussed by the author. Paris, the center of revolutionary action in the past, no longer could be turned to. In Britain, the condition of the working class had been improving so much that the workers turned to trade union bargaining and extension of the franchise in preference to conflict with the governing classes. Italy and Spain, where the greatest possibilities for revolutionary action existed, turned to anarchism rather than to socialism. Marx himself came to accept the fact that "the chances of the International as an agency of European revolution had disappeared" (p. 192), and he preferred to terminate its affairs lest it resort to impractical and costly revolts. The anarchist leader Bakunin and his followers on the contrary were undeterred by happenings in the West and wished to take advantage of every opportunity for revolutionary action however local and unpropitious it might be, instead of waiting for opportunities for a general European rising. Thus, it was argued, the revolutionary spirit might be kept alive.

Things finally reached such a pass at the Hague Congress of 1872 that Marx and Engels thought of abandoning London as seat of the General Council and transferring it to New York as a haven where it might exist until the "time was ripe for its re-emergence in Europe" (p. 201).

However meticulously and successfully the author has unfolded the tangled web of socialist and anarchist affairs, he is, it seems to the reviewer, even more successful when he devotes a chapter to the adventurous life and character of Bakunin and to the ideas for which he stood. The same may be said of the chapter devoted to Lassalle. Not only have socialism and socialist leaders in the various countries throughout Europe been well covered, but there is also a chapter devoted to American socialism. The reader will find the chapter entitled "Anarchists and Anarchist Communists-Kropotkin" of special interest and value.

GURIAN, WALDEMAR, and M. A. FITZSIMONS (Eds.). *The Catholic Church in World Affairs.* Pp. xi, 420. Notre Dame, Ind.: University of Notre Dame Press, 1954. $4.25.

Dr. Gurian begins this most useful and timely book by noting that Ranke thought that the history of the Popes was a suitable subject since the "Papacy belonged to the past." As Macaulay's famous "review" of Ranke showed, there were observers who thought that the Papacy had a great deal of life in it, but even Macaulay (or his New Zealander) might be astonished not only by the importance of the modern Papacy, but by its strength in countries like the United States, Germany, and Holland, and by its ambiguous position in countries like Spain and Latin America. But whether with approval or resentment or merely from curiosity, the world has come to realize that the Papacy, and the Church of which it is the central and ruling organ, is one of the great forces of the contemporary scene.

This book is a symposium and it suffers from some of the inevitable faults of symposiums, but only from the necessary minimum, for the editorial control has been admirably exercised. And, although there are variations in the excellence of the contributions, the general level is high and only one contribution, that on Spain, seems to come from a different world and to be addressed to a different audience (assuming that it is addressed to any audience outside Spain).

There are many merits in this book, but one of the most striking is candor, admirably exemplified in Father Dunne's "Church in Latin America" and in Father McAvoy's "Catholic Church in the United States." Indeed, the latter essay, of first-rate importance for American non-Catholics, leans over backwards in some ways; it does not, in my opinion, allow enough for the recent rapid rise in the general academic status of some Catholic universities. But its candid insistence on the atomistic character of Catholic organization in America is a point well worth making, and one too often ignored.

The essays fall into two classes: discussions of the general relation of the Church to modern society and discussions of the place of the Church (or of religion) in various countries and regions. Thus, there is an excellent discussion of the present tendencies in European Protestantism as well as admirable studies of the Catholic situation in Germany and France. One novel essay is that by Professor Fitzsimons on "The Catholic Church in England" which is of especial interest for America where the situation is in some ways so like, in others so unlike. On two minor points, I am inclined to quarrel a little with Professor Fitzsimons. I think that the editor of *The* (London) *Tablet* was making a perfectly valid point when he described his position as "High Whiggery" not "High Toryism." In its general political and social outlook, *The Tablet* is closest to *The Economist*. It does not lack social zeal, but it believes that free enterprise increases wealth. And in the discussion of the education question, Professor Fitzsimons does not make it quite plain that under the Forster Act of 1870, Catholic schools got aid from the central government, though not from local authorities. More important in this connection is the exclusion of Scotland from the picture. Not only are there more Catholics, proportionately, in Scotland than in England, but there has been no "school question" there since 1918. It was for a version of the Scottish system that the English bishops asked in 1947.

As I have said, the article on Spain stands out by itself. Other articles make it plain that the attitude of the Spanish church is a stumbling block and a stone of offence to non-Spanish Catholics. But for Señor Serer, the things the outside world dislikes (the things that, for example, Father Dunne thinks account in part for the deplorable state of the Church in parts of Latin America) are proofs of Spanish rightness. The proposition Hispanidad = Catholicism is asserted but not proved, and the whole article is written in a rhetorical style that reminds us that Señor Serer is a countryman of Gongorá. And, alone among the contributors on special regions, Señor Serer does not discuss the basic question of the recruitment of the clergy. But its very "Spanishness" makes this a valuable document, which is perhaps *not* out of place in an admirable book animated by a very different spirit.

D. W. BROGAN
Cambridge University

VLAVIANOS, BASIL J., and FELIKS GROSS (Eds.). *Struggle For Tomorrow: Modern Political Ideologies of the Jewish People.* Pp. 303. New York: Arts, Inc., 1954. $6.50.

During the past sixty to seventy years many profound cultural changes, some of which were expressed in new ideologies and movements that were more or less political, occurred among the Jews in response to changes in their relationships to the people among whom they lived. Political scientists, historians, and the public cannot easily obtain good survey treatments of all these origins and alterations. Source materials are often in languages other than English, and in newspapers, periodicals, and pamphlets that are available in few libraries. The editors therefore assembled papers which attempt to account for the beliefs and vicissitudes of Jewish organizations since the 1880's. All but two such papers are written by leaders or experts who are protagonists of one or another action group. The volume is an important, clear, and extremely useful handbook for scholars, students, and laymen. Much of it is exciting reading. It is obviously an indispensable purchase for college and municipal libraries. It should serve for some time as a reference that is especially valuable for political scientists and historians, as well as for assigned readings in college courses.

One wonders what might have been the additional value of a larger volume which included as accompaniments of the stirring chapters which it now contains, short discussions by scholarly nonparticipants, if they could be found, who weigh, evaluate, and interrelate all the varied social currents in recent and contemporary Jewry,

not merely those which took organizational form and possessed political meanings. We might have a more balanced picture if the work included sociological and psychological analyses of people of Jewish ancestry in process of thoroughgoing acculturation, people who have remained uncertain, inarticulate, and uninvolved in action groups. We might know more about that deep current composed of persons who have voted, so to speak, with their feet, and voted in favor of choices different from those which were articulated by the advocates of the ideologies and movements which are discussed in this book.

Specifically it includes treatments, most of which are themselves primary source documents, of six Zionist associations: General Zionism, Labor Zionism, Religious Zionism, Mapam—a short article written by the editors themselves, Revisionism, and Ihud; one each on Jewish Territorialism, the Bund, Agudism, Assimilationism, Volkism, Communism—not by a Communist, and Anarchism. The longest chapter is on the Bund. Each chapter has an introduction by the editors and contains a short bibliography by its author. A useful index completes an excellent symposium.

MELVILLE JACOBS
University of Washington

CURRAN, FRANCIS X., S.J. *The Churches and the Schools: American Protestantism and Popular Elementary Education.* (Jesuit Studies.) Pp. vii, 152. Chicago: Loyola University Press, 1954. $3.00.

As set forth in the Preface of this study, one in a series of Jesuit Studies published by members of the Society of Jesus, the author's objective is to explore the causes that led Protestants in the United States to relinquish the traditional claim of the Christian Church "to exercise control over the formal education of its children in the elementary schools" to the state.

The author points out that only in the United States has Protestantism during the past century relinquished that claim, whereas the Protestant churches in Europe and the Catholic Church universally have continued to maintain control of the education of the young.

The abandonment of elementary education by American Protestantism, the author asserts, has resulted in the disappearance of numerous Protestant academies and high schools during the past century. Similarly, though a large number of colleges established by Protestant denominations still exist, many have passed completely out of denominational control, while many of those that remain maintain an extremely tenuous connection with the founding denominations. The type of education imparted by these denominationally controlled colleges differs slightly from that of the secular colleges.

The author sets forth as his thesis the contention that it was the "anti-Catholic animus" of American Protestantism that constituted the greatest factor in relinquishing the traditional claim of church-controlled popular education, placing it under the sole control of the state. This "anti-Catholic animus," he observes, resulted in a concerted action on the part of Protestantism, particularly evangelical Protestantism, to control the public school and formal education; to make the public schools Protestant through the teaching of religion and requiring the reading of the Bible—the King James version. The author, further, contends anti-Catholicism inspired the early demands for secularization of the state schools, for it was believed that such secularization would serve to destroy the faith of the Catholic children. Finally, that anti-Catholicism was unquestionably "the most important single factor in the evolution of the educational thought of the Methodist, Baptist, and Congregationalist churches in nineteenth-century America."

No one will question the element of bigotry and anti-Catholicism as factors in influencing the attitudes of churches and even legislative assemblies in American history. But the reader will question whether the author has placed undue emphasis on this religious-hatred animus to the exclusion of a proper evaluation of the forces of democracy that were at work during the past century. Did not the lack of trained teachers, the costly operation of church

schools, the "double tax," in many instances the superiority of state equipped schools, a lack of pupils, a dearth of strong leadership, and frequently a lack of interest and strong faith (all factors which the author recognizes), more than the "anti-Catholic animus" constitute the motivating factors in causing the majority of the Protestant churches to relinquish their rights and privileges, perhaps even their responsibility in elementary education?

Couple with these facts the further impelling forces, both public and private, that were at work in favor of public education under the leadership of such men as Horace Mann and others. American industrialism changed the economic and social life of millions. An ever increasing number of immigrants flocked to our hospitable shores, for America had become a beacon light to the oppressed from every land. May it not be that these and other facts of history constituted the greater force in bringing about a secular public school system rather than fear or hatred engendered by the animus of anti-Catholicism?

The author has produced a thought-provoking study. He points out the shifting attitudes toward elementary education by churches, their idiosyncrasies as well as their inconsistencies which are demonstrated in so many instances. Many extreme positions and statements are quoted on almost every aspect of the subject. Readable, well documented, and with a good index.

ALVIN W. JOHNSON
Washington, D. C.

BENNETT, JOHN C., HOWARD R. BOWEN, WILLIAM ADAMS BROWN, JR., and G. BROMLEY OXNAM. *Christian Values and Economic Life.* Pp. xv, 272. New York: Harper and Brothers, 1954. $3.50.

This symposium is Volume VI of a series of books comprising a study of Christian ethics and economic life, begun in 1949 by the Department of the Church and Economic Life of the Federal Council of Churches, which in 1950 was merged with other agencies to form the National Council of the Churches of Christ in the U.S.A. The National Council "points out that the volume is not a statement or pronouncement of the National Council. Each author is solely responsible for what appears under his name." Thus the book consists of the personal interpretations of competent scholars. There are references to statements of church conferences and bodies on the issues considered, but these are not prominent in the volume.

Professor Bennett, of Union Theological Seminary, states that it is the hope of those responsible for the study that it may provide "the most useful materials now available for the formation of a Protestant economic ethic that is relevant to our situation." His own contributions are among the more precise statements in the vloume. "There should be no place in the Christian life for 'conspicuous consumption'—though few of us are without guilt in this respect."

Considering Christian ethics and economic power, Mr. Bennett states that "Christian love does not mean a sentimental dispensing of charity. . . . It does involve a willingness . . . to give to causes and institutions that depend on private support; to welcome the justice that is often embodied in public taxation; to support economic changes that may be costly to us if they are in the public interest; to share and share again wisely and generously."

In a review, with perspective, of ethics and economics, Professor Bowen, of Williams College, advocates "a narrowing of the distance between ethics and economics, so that the contributions of each can be joined for the purpose of achieving more coherent social policy." His discussion appears to imply that those interested in Christian values have customarily proceeded without much knowledge of what goes on in the market place, while the analysts of the market place have often ignored considerations of social welfare.

Dr. Brown, of the Brookings Institution, summarizes much of his long study of the economics of international relations under the title: "Some International Implications of Christian Economic Ethics." Bishop Oxnam, of the Washington Area, the Methodist Church, gives a Churchman's interpretation of the changing economic order and

its challenge to the conscience of the Christian citizen.

Chapters summarizing the findings of the entire study in terms of "goals of economic life" and "major economic problems" are contributed by Professor Bowen who served for a time as economic consultant to the project.

BENSON Y. LANDIS
National Council of the Churches of Christ in the United States of America

HARDY, EDWARD ROCHIE, In Collaboration with CYRIL C. RICHARDSON (Eds.). *Christology of the Later Fathers.* (Library of Christian Classics, Vol. III.) Pp. 400. Philadelphia: Westminster Press, 1954. $5.00.

This is the first volume to appear in the proposed twenty-six-volume series, Library of Christian Classics, as edited by John Baillie, John T. McNeill, and Henry P. Van Dusen. The series is designed to make available to the general reader a section of what the distinguished general editors believe, and rightly, to be "the most indispensable Christian treatises written before the end of the sixteenth century." Subsequent volumes will include such titles as *Early Christian Fathers, Alexandrian Christianity, Early Latin Theology,* and the principal writings of such figures as Augustine, Aquinas, Luther, Calvin, Zwingli, and the English Reformers. If the present volume is a reliable indication, the series will be a most useful contribution to a field of learning in which contemporary Protestantism—clerical and lay alike—is woefully ignorant. Editors and publishers are to be congratulated upon undertaking so important and demanding a task.

The present volume is largely concerned with the contributions of Athanasius, Gregory of Nazianzus and Gregory of Nyssa. In the case of each of these three writers, particularly significant treatises are presented in English translation and with brief, but illuminating introductions. In addition there is an admirable general introduction, "Faith in Christ, Theology, and Creeds," by Dr. Hardy, which in thirty-six pages leads the nonprofessional reader through what could easily seem a most unrewarding and fantastic maze: the affirmation of Nicaea against Arianism, the development of the so-called Trinitarian Formula—what it was and what it was not—and, in particular, the problem which those of the yesteryears were so concerned about, the relation of God and man in Christ. Dr. Hardy is especially to be congratulated upon his lucid treatment and understanding presentation of what might well seem to the average reader simply dated logomachy. His insistence that the modern problem of Christology is diametrically the reverse of the ancient is an important contribution: for us the problem lies in how in the human life of the historic Jesus the presence of God is to be explained; for the fathers, early and later, it was rather how the divine Word of God, which they easily saw appearing on earth, could have had a complete human nature. That is, not how the human could have been uniquely divine, but how the divine could have been genuinely human.

In addition to the major treatises of these three fathers is a series of twelve documents illustrating the Christology of the Ecumenical Councils. These very important documents include such writings as the letter of Arius to Eusebius, the letter of Arius to Alexander (the clearest statement of early Arianism), Eusebius's letter describing the Council of Nicaea, the Chalcedonian Decree, and the Statement of Faith of the Third Council of Constantinople.

All in all this volume is a distinguished contribution in understanding. To understand the past is important; to attempt to live it is something quite different. Once again the biblical word is apt: their ways are definitely not our ways and their thoughts (despite a few anachronistic echoes) not our thoughts.

MORTON S. ENSLIN
Dennis Port, Mass.

MORTON, T. RALPH. *Community of Faith: The Changing Pattern of the Church's Life.* Pp. 153. New York: Association Press, 1954. $2.50.

This study was first published in Great Britain as an Iona Community volume under the name of *The Household of Faith.* The name was changed to *Community of Faith,* the American Preface was written by Alexander Miller, lecturer in religion at Stanford University in California, and John Oliver Nelson, professor of Christian Vocation, Yale University Divinity School, added some queries for Americans.

In the original book, the various types of living in community from earliest to modern times were presented.

Professor Nelson's discussion is skeptical in regard to the need for these in contemporary American life. The economic witness is less important here than in a country with "less to go around." The status of American women is more favorable. Americans can find renewal of life in existing organizations and fellowship to which they belong or might. Above all, would not the Morton plan be accused of collectivism and socialism in a capitalistic framework?

CONRAD H. MOEHLMAN
University of Southern California

COMMONWEALTH OF NATIONS

MENDELSOHN, RONALD. *Social Security in the British Commonwealth: Great Britain, Canada, Australia, New Zealand.* Pp. xv, 391. New York: John de Graff, 1954. $7.00.

In spite of the bitter opposition it frequently encounters from some quarters in the United States, the welfare state is likely to remain as a legitimate goal of social policy. The present system of social security is an accepted institution which, in all probability, will expand as new problems of need—for example, medical care—prove to be inadequately treated within the private economy. It is therefore appropriate for Americans to be conversant with the experiences of those countries that have more highly developed systems of social security.

For this reason, *Social Security in the British Commonwealth* is of special interest. Dr. Mendelsohn has analyzed the social security systems of Great Britain, Canada, Australia, and New Zealand. For each country he has examined the impact of its historical tradition, its governmental structure, and the interwar depression on the genesis of its social security program. He has then compared the various systems with respect to the adequacy of the individual benefits, the universality of the benefits, and the efficiency of administration.

Dr. Mendelsohn might well have stopped here, in which case the book would have been a useful reference for the facts of social security in the British Commonwealth. Fortunately, he continued and related social security to the problem of maintaining a high level of income and employment. To a very large extent social security is remedial; the need for it arises from a social and economic structure which permits interruptions of the flow of income. The effect of these remedial measures on economic activity is complex. On the one hand, they introduce a stability element into the level of aggregate consumption. On the other hand, they may, under certain conditions, inhibit the willingness to work. Dr. Mendelsohn has cast social security in the proper perspective by considering these problems.

The picture that emerges in the British Commonwealth is that of a gradual development from a system of private, individual, unregulated charity to a system of universal social security covering all of the economic contingencies which can arise between birth and death. The rates of development are by no means the same in each country—the British system, for example, is far more comprehensive then the Canadian system—but the trend is unmistakable. This book will be of interest to anyone who is concerned with the growth of British social institutions. It will be doubly interesting to those who believe that the British methods of solving the problem of economic insecurity foreshadow things to come in the United States.

KARL DE SCHWEINITZ, JR.
Northwestern University

JEFFERYS, JAMES B. *Retail Trading in Britain, 1850–1950.* Pp. xvii, 497. New York: Cambridge University Press, 1954. $9.50.

Domestic trade, Mr. Jefferys tells us, still bore the marks, as late as 1850, of the

old system prevailing before the industrial revolution of the eighteenth century. Broadly, the limited and crude demands of the workers of town and countryside were met mainly by the traditional markets and market halls, fairs, and by peddlers and traveling hucksters. These retailers commonly resorted to "open display and vociferous advertisement." Caterers to the well-to-do included most but not all of "the craftsmen producer-retailers and the fixed-shop retailers of the towns," and they relied mainly on reputation and skill to attract custom. The clear and open marking of prices was exceptional; "common to practically all methods of retailing was the method of haggling, higgling or chaffering as to price."

Mr. Jefferys has undertaken an historical and analytical description of the transformation of the industry since 1850, with emphasis on recent periods of relatively good statistical data. He explains the changes in the channels of trade (for example, the decline of the small-scale producer-retailer) and in the structure and organization of retailing (as the growth of co-operatives, department stores, and "multiple-shop" retailers). There are detailed accounts of the rise of large-scale retailing in fifteen branches of trade, beginning with groceries and provisions.

The persistence of traditional modes of carrying on retail trade is explained in part by the view that Britain, as late as 1850, "was not yet an 'industry state' "; agriculture, the author says, was still the largest occupation. The point seems overemphasized; as early as 1841, the first census that gave fairly good occupational data indicated that hardly one out of five of the occupied population was even then engaged in agriculture. In another section, however, the author associates the late transformation of trade with such lagging economic and social changes as the expansion and consolidation of working-class demand and the growth of the middle classes. The first waves of output by the new techniques flooded the channels of foreign trade; one is reminded of Franklin's remark that the spinners and weavers of England in his time wore rags but "make cloths and stuffs for all parts of the world." By the middle of the nineteenth century, the increase and widespread diffusion of real income called for a transformation of domestic trade consistent with the earlier and continuing changes in modes of production.

Mr. Jefferys' volume maintains the high traditions of scrupulous research in a great variety of fields of modern business history —traditions fostered notably a few decades ago by Professor George Unwin and his associates in their emphasis on the study of intrinsic business records.

WITT BOWDEN

Washington, D. C.

PINKHAM, LUCILE. *William III and the Respectable Revolution: The Part Played by William of Orange in the Revolution of 1688.* Pp. viii, 272. Cambridge, Mass.: Harvard University Press, 1954. $4.50.

This is a highly controversial book. The author, who is professor of history at Carleton College, reexamines the English Revolution of 1688 and concludes that: (1) the decisive factor was not the policy of James II but the role of William III, Prince of Orange, and William intervened not so much to strengthen the coalition against Louis XIV as to fulfill deeply rooted personal ambitions to become king of England; (2) James II himself sought neither royal absolutism nor Catholic hegemony in England; rather he desired religious toleration for all and had it not been for William's intervention, would likely have settled his difficulties with Whigs and Tories; (3) the Revolution of 1688 has become "a political myth"; it was in no sense "glorious," but was merely "a respectable revolution" in which "the right people" staged a "palace revolt" in their own interests, reducing royal power and establishing aristocratic control in its place.

The "Whig interpretation" of the Revolution has in recent years undergone more modification than is apparent in this book, but Professor Pinkham does challenge a version still widely accepted. Her own position, well grounded in detailed research, is stated vigorously and in a lively manner, considering the intricate nature of her material—parallel development of policy in England, of policy in the United Provinces, and of diplomacy on the continent in the years 1685–1688.

Some of her conclusions will win less ready acceptance than others. Much of the time she moves in the shadowland of motivation. For William this is particularly difficult, for he was extraordinarily reticent. Probably no one will ever fix with any exactitude just when he determined to seek the English throne. For her own view that this design reached back even into the reign of Charles II, Professor Pinkham depends of necessity on circumstances and actions, and upon statements of others than William. But her analysis is intelligent and her conclusion tenable.

In ascribing to William a far more active role than that suggested by Macaulay or by Trevelyan, one can stop well short of eliminating James II entirely. Though certainly historical judgment of his reign has been affected by the outcome, there is abundant evidence of a Catholic policy which alienated elements much wider than the circle of party leaders. This and other important factors Professor Pinkham rather brushes aside. In refusing to accept the Revolution as regenerative, she is on more solid ground. It is exceedingly difficult, as she points out, to reconcile a view of altruistic and disinterested conduct in 1688 with the palpable opportunism and cynicism which followed.

Professor Pinkham's provocative study will take its place among those against which older views are being tested and in the process of which the story of seventeenth-century England is being rewritten.

LYON, JEAN. *Just Half a World Away: My Search for the New India.* Pp. x, 373. New York: Thomas Y. Crowell Company, 1954. $5.00.

The India of today offers inexhaustible material for journalists, reporters, and writers of all kinds. There has been a steady succession of travel books on India in the last several years, particularly since India's independence. Miss Jean Lyon's book on India is somewhat unusual in that it is a factual record of her experiences and not of her personal reflections and impressions. Miss Lyon reveals in her narrative a genuine friendliness and affection for the peoples of India and their ways. The author, an accomplished journalist, may have gone to India in her role as a reporter, but soon after her arrival in India, she found herself making India her "home." For nearly three years Miss Lyon crisscrossed the length and breadth of the country, lived with Indians of all categories and classes and seems to have been perfectly at home with Maharajahs and beggars, with orthodoxy and untouchability, with the market place and the *ashram*. This is not to say that she accepted India in toto or that she was uncritical of what she saw. In fact the narrative betrays much scepticism and even a subtle cynicism, but all the same, Miss Lyon has an abundant sympathy for the people and a deep faith in the values of life as perceived by the common man in India.

The India of today is going through a peculiar revolution. The Indian is unwilling to throw away centuries of tradition and the weight of an immemorial past and at the same time he is bent on modernization. Village self-sufficiency and atomic energy, the good life based on simplicity and contentment and the abundant life based on mass production and mass distribution, the bullock-cart and the aeroplane —here is a picture of old layers refusing to be submerged and new layers being added on to the old. Most foreigners are left with a sense of bewilderment in their search of the new India, but not Miss Lyon. She has acquired a genuine understanding of the peoples and their problems. She offers no solutions to India's problems, but she analyzes them with great lucidity.

At the end of her travels Miss Lyon reflects in the seclusion of her Himalayan cottage on East-West, Indo-American relations. She accepts the fact that India is not an empty vessel that is waiting to be materially and idealogically filled by foreign powers. India may need a great deal of help from other nations but she also has a few basic values of her own to give to other nations. This book will serve as an

excellent introduction to foreigners wishing to search for the new India. The Indians should benefit equally by seeing themselves through friendly foreign eyes.

M. S. SUNDARAM
Embassy of India to the United States

THIRUMALAI, S. *Post-War Agricultural Problems and Policies in India.* Foreword by Manital B. Nanavati. Pp. xvi, 280. New York: Institute of Pacific Relations, 1954. $3.50.

This book is the result of a research study into postwar agricultural problems and policies in India conducted by the Indian Society of Agricultural economics at the invitation of the Institute of Pacific Relations. It is divided into three parts, the first gives an historical background of Indian agriculture from the pre-British periods up to World War II, the wartime policies and the consequences of partition of India, the technical problems of agriculture like irrigation, soil conservation, land tenures, and methods of cultivation all of which provide an explanation, in part at least, for the basic defects of agricultural production.

The second part deals with the geography of Indian agriculture—the physical and human factors, the interaction of which through the ages has been responsible for evolving the present type of land use. Chapter IV, however, seems to be rather misplaced; the main problems of agriculture are dealt with in this chapter before there is a description of land use (Chapter V) and agricultural production (Chapter VI), and it might have avoided some repetition if Chapters IV and VIII were combined.

The third part which forms nearly half the book gives not merely a very detailed and clear analysis of the basic problems of agriculture, but also suggests the manner in which orderly development is to take place. Thus, in dealing with minimum wages for agricultural labor, the conclusion that "the introduction of scientific management in farming should necessarily precede the enforcement of any measure like the fixation of minimum agricultural wages" is unassailable; because it shows how that would affect favorably only one constituent element in the economy, but would have adverse repercussions on the other elements.

When analyzing economic factors and data, the book maintains an exceptionally high standard; the physical aspects of agriculture, however, are not adequately treated. The cultural aspects receive appropriate consideration and the conclusions are fully warranted. For example, it shows how in the determination of crop production pattern, the human factors have played a more important part as reflected by the consumer's taste or demand mostly for subsistence, and to a small extent for commerce. Consequently, the country is characterized by subsistence farming, and, in the whole evolution of agricultural organization, there has been such an integration with other aspects of cultural life that agriculture is not just an occupation, but is a way of life.

There are some printer's errors here and there, as for example, on page 125 line 9, page 195 line 18; but there is a serious error on page 48 where it is said that "the total area of undivided India was 1,581 square miles. The partition assigned an area of 1,220 square miles to the Indian Union and 361 square miles to Pakistan. Of this the area covered by the Provinces alone was 632 square miles in the Indian Union and 233 square miles in Pakistan." Actually, these figures are all in thousands; three zeros have been omitted in each case. It is hoped that these errors will be corrected in the next edition.

GEORGE KURIYAN
American Geographical Society

MANDER, LINDEN A. *Some Dependent Peoples of the South Pacific.* Pp. xix, 535. New York: The Macmillan Company, 1954. $6.75.

The "dependent peoples" of Professor Mander's title consist of most of the native inhabitants of British Oceania: the Maori of New Zealand, Australian aborigines, Western Samoans, Papuans and Melanesians of Australian New Guinea, Solomon Islanders, Tongans, Fijians, and the unhappy residents of the New Hebridean condominium. This economically poor, culturally diverse, and polyglot population is

perched on many lower rungs of the ladder of advancement toward self-government or full citizenship in modern states; and the degree and kind of its dependency vary considerably from country to country. The painful record of their grudging absorption into a Western society reluctant to admit them, except on its own terms, has raised problems of cultural co-operation and government for which there are still no clear answers. The real subject of this long book, however, is not the people themselves nor their reactions to the impact of European enterprise, but rather the development of apparatus and institutions, programs and policies, through which the colonial governments aid, educate, and rule their native charges.

An Australian by birth and political scientist by training, the author has traveled extensively in the area covered, has maintained close personal touch with officials and scholars, and has ranged extensively through its voluminous but uneven literature of travel, ethnography, history, and *Hansards*. Using the major political divisions as a framework, he presents eight case histories as listed above. For each of these he draws upon anthropological sources to sketch some characteristics of pre-European cultures and culls the historical record for highlights of European penetration and impact. But the bulk of the descriptive material in each of the chapters consists of a chronicle of the major innovations, adaptations, policies and programs of the respective colonial administrations. Problems of land ownership and usage, "indirect rule," education and health, missionary enterprise, and native political movements are traced in each area from their earliest appearance to the postwar period. A final chapter on "South Pacific Regionalism" provides an interesting survey of recent intergovernmental approaches to some problems common to the entire area.

Students interested in the progress of non-self-governing territories, but who have no familiarity with recent conditions and events in the South Pacific, may find this a useful series of accounts. They should appreciate the author's industry and scope, and they will be heartened by his cautious optimism over apparent trends toward a better future for the subject peoples. The volume appears under the auspices of the International Secretariat, Institute of Pacific Relations. Primary sources are indicated in brief footnote references, but there is no bibliography. The index is inadequate and there are no maps.

STEPHEN W. REED
Yale University

HANRAHAN, GENE Z. *The Communist Struggle in Malaya.* With an introduction by Victor Purcell. Pp. xii, 133. New York: Institute of Pacific Relations, 1954. $2.00.

This is a valuable, documented account of Communist organization and methods in Malaya from their beginnings in 1924 through 1953. The author's focus is primarily political, with comparatively little attention being given to the socio-economic context.

In the first two chapters, covering the period 1924–40, Mr. Hanrahan shows the close relationship between the Malayan Communist Party and the Comintern, but sees the Chinese Communist Party beginning to exert a paramount influence on the Malayan Party even before World War II, with the latter's membership already primarily recruited from Chinese Malayans. In this part one misses some estimate as to what part of prewar labor unrest was really Communist-led and inspired and what part was merely so labelled by some colonial officials.

Chapter III, "The Malayan People's Anti-Japanese Army," contains an account of the growth of the Communist-dominated anti-Japanese resistance movement with an assessment of the actual degree of strength and efficiency which it attained. Chapter IV, "The Period of Indecision and the Policy of Moderation," describes the divided counsel within the Malayan Communist Party and its wavering policies during the period September 1945—June 1948. Initially the party's leaders assumed that Malaya would be occupied by a Chinese army. Thereafter they attempted to develop political strength by building up their control over labor organizations, but

in the process appeared to lose peasant support.

Chapter V, "The Guerrilla Revolt" and Chapter VI, "The New Revolutionary Line" contain the most new material. With the launching of the mid-1948 insurrection, the Malayan Communist Party pursued an over-all strategy dominated by the experience of the Chinese Communist Party, with modified Peking rather than Moscow policies being followed. In the final chapter Mr. Hanrahan describes the important switch in party tactics commencing in October 1951 where the endeavor to win mass support took precedence over military and terrorist actions, a change which he notes was coincident with a global shift of Communist policy. He concludes that at present neither the government nor the Communists is strong enough to destroy the other, but that "this is a stalemate only in respect to Malaya itself, for any radical change in the situation outside Malaya would probably destroy the existing balance of power."

Though this study is generally well documented, it would be helpful for the reader to be told something concerning the credentials of Wu-tien-wang whose unpublished manuscript is frequently cited. While, for the most part, the author provides a substantial foundation of facts for his inferences and deductions, occasionally this is not the case.

HOEFFDING, OLEG. *Soviet National Income and Product in 1928.* (A Research Study by the Rand Corporation.) Pp. x, 156. New York: Columbia University Press, 1954. $3.75.

This is an adequate addition to similar calculations of Abram Bergson for 1937 and Abram Bergson and Hans Heymann, Jr., for 1940–1948.

The author makes it clear that contrary to Bergson and Heymann, he had to deal with correct and reasonably complete statistics, and all that was needed was to adapt them to the procedure used by Bergson and Heymann for the later years. Soviet statisticians of the twenties deserve the greatest credit for building up such complicated accounting as that of the national income from almost nothing in only a few years. This reviewer has the greatest regard for this monumental statistical work and prefers to use the official estimates until and inclusive of 1928 as they are and chain the calculations for the subsequent years to them.

The disadvantage that the Soviet estimates of national income were based on their own concept of national income, ascribed to Marx, seems to be overemphasized by Dr. Hoeffding. It would be wonderful to have a series of reliable estimates for national income, Soviet concept, in the USSR for all the years after 1928.

Hoeffding's estimates for 1928 necessarily share in the advantages and disadvantages of the estimates for later years made by his colleagues. As are the latter, his estimates are made at established prices of the year involved and in "adjusted rubles," accepted by the authors as being at factor cost. To reach the estimates in "adjusted rubles," adjustments are made for indirect taxes, subsidies and (a welcome innovation) for differential profits (Tables 6 and 7). An important shortcoming is that no adequate provision is made for interest.

Under Soviet conditions (very intensive utilization of plan capacities; great inadequacy of investment funds in branches and sectors with low priorities), the cost of use of *effective* investments is extremley high. The investments in agriculture must be written down as ineffective (farm output increased negligibly). Immense amounts of effective capital were poured into heavy industry and transportation which resulted in very large increases in output and performance, and *in substantial reductions in relative factor cost.* Rates of interest appropriate for the United States are much too low for Soviet conditions. The small profits of the Soviet enterprises, suggested by the authors as a substitute for an interest charge, are greatly insufficient for this purpose.

In the Bergson-Heymann computations adjustment is also made for farm prices but under an unjustified assumption that farm incomes remain constant.

The principal use for the estimates of national income at prices prevailing in each year, whether these be factor or market cost, seems to be measurement of the changes in the relationships of the factor or market cost itself as among various economic branches. To widen the usability of the accounts, statisticians the world over are striving to make these estimates at comparable prices or costs. This is not done either in the book under review or its companions. Yet, attempts are made on a broad scale to utilize the findings for 1928 and 1937 for measuring the changes in economic structure in the intervening period (pp. 79–96).

Hoeffding writes (p. 81); "comparison of the two estimates [his for 1928 and Bergson's for 1927 in "adjusted rubles"] does not support what might seem to be a plausible inference from general information of Soviet economic experience in 1928–37, namely, that the first two Plans achieved and maintained a significant increase in the share of gross national product devoted to investment." Not only "inferences from general information," but estimates made in the only permissible yardstick—comparable prices show almost a doubling of the share of gross investment in gross national product (such an increase is implied also in the calculations for the share of net investment by Colin Clark and Julius Wyler).

All other changes in economic structure in that vital period of the Soviet economic history are likewise greatly minimized in Hoeffding's comparisons. It is, for example, easy to demonstrate that the share of the consumption of households had declined much more from 1928 to 1937 than by 16 per cent shown on p. 80, if it were computed in comparable prices, for example, in Bergson's "adjusted rubles" of either 1928 or 1937.

Much work would be needed to expand the usefulness of the computations in "adjusted rubles" beyond the narrow limits they have today.

NAUM JASNY
Soviet Economics Study Group

BERGSON, ABRAM, and HANS HEYMANN, JR. *Soviet National Income and Product, 1940–48.* (A Research Study by the Rand Corporation.) Pp. xii, 249. New York: Columbia University Press, 1954. $5.00.

"We assume . . ." "We guess . . ." "We shall not go far wrong if . . ." Yet it is all immensely worth while. Not for the detailed numerical answers, in which I have even less confidence than the authors, who are modest enough. But very much for the immense wealth of incidental learning and useful calculation, the book is a great quarry for lesser men to build out of. Also, the main orders of magnitude can perhaps be relied on. They never differ by as much as 50 per cent from those, yet unpublished, of Mr. A. Nove (Glasgow University); which is very reassuring.

The book under review is an extension of Prof. Bergson's previous *Soviet National and Product in 1937* to 1940, 1944 and 1948, and it is to the latter that we must go for the very special "philosophy" that underlies both. This is that Soviet relative prices in the plan era are sufficiently rational to be used, after various adjustments, for all the ordinary intertemporal and international comparisons which we base on other price systems. This seems to go both too far and not far enough. Too far in that when we get down to details Soviet relative prices are hopelessly irrational, and for this there is abundant and incontrovertible evidence. There might be, nevertheless, a rational proportionality between the average prices of the major categories of goods and services in which the authors deal.

On the other hand, such rationality is not needed for valid comparisons. Soviet planners would of course *plan* better with rational rubles, but bourgeois slanderers can *calculate* all right with irrational ones. Such rubles give a very different proportion of, say, investment to national income than would a revaluation of all Soviet outputs in dollars or pre-plan rubles. But the solution is not several closely printed pages of arbitrary finagling with the ruble: it is the ordinary procedure of valuing both national incomes in both sets of prices, as

is always done between non-Communist monetary systems.

If neither dollars nor pre-plan rubles nor current rubles give us the ideal scarcity relationships that ought to obtain in USSR, the adjusted ruble is no better. For we simply do not know what these relations are—that is, we do not know what would happen if Lerner's Rule were enforced instead of Khozraschot, and the turnover tax and the agricultural procurements abolished. Yet, in many passages the authors imply that their adjusted factor cost ruble answers precisely that question. All this is a wild goose chase. What we need is for each sector of the economy to have its own ruble-dollar purchasing power parity (for international comparisons) and its own price index (for intertemporal comparisons).

But if the "philosophy" is misguided the statistics are very good indeed.

Oxford University

WESTERN CONTINENTAL EUROPE

KLIMOV, GREGORY. *The Terror Machine: The Inside Story of the Soviet Administration in Germany.* Translated from the German by H. C. Stevens. Pp. 400. New York: Frederick A. Praeger, 1953. $4.00.

At first glance this book appears to be the story of Major Klimov, a young ambitious Russian engineer, as he participated in the day by day activity of Soviet Army headquarters in Berlin. As an account of the relations between the Soviets and the defeated Germans or between the Russians and the other members of the Control Commission, the book is interesting and revealing but not unique. Others have concentrated more on the story of the difficulties among the victors or on the merciless treatment accorded the losers by soldiers and bureaucrats.

The real contribution of *The Terror Machine* is not as an inside story of Soviet rule over the Germans but as a revealing analysis of the Russian people and especially of the young Russian mind. We become aware of the spiritual strength of the Russian people, partially a result of the victory of 1945. Joy came not because the peaceful existence of prewar years was once more possible but because "we stood at a frontier, a frontier that marked the end of the darkest period of our life, and the beginning of a new, still unknown period." A major task had been well done and the people faced forward with their leaders, forgetting that they had lived in a land of decrees and repression and fear.

As the story unfolds after V-E Day at Russian headquarters in Berlin or back home on leave in Moscow, the Russian people are slowly made aware that the regime has not changed and that the individual is still part of a mass bent to the will of the dictatorship. The paralysing fear of authority once more reigns. One of the most revealing passages—and there are many—is Major Klimov's description of a Control Commission luncheon at the residence of the head of the British delegation. Since the members of the Russian delegation had no orders on how to act, they were at a loss and suspicious of each other. "As I chanced to look up from my plate, I met General Shabalin's eyes gazing at me keenly . . . of course I knew the general was in duty bound to keep an eye on me. But I noticed that he was not so much watching me as attempting to decide whether I was watching him."

This book is almost a must for those who realize we must know the Russian people if we are to live at peace with them.

RALPH F. BISCHOFF

New York University

PINSON, KOPPEL S. *Modern Germany: Its History and Civilization.* Pp. xv, 637. College ed. New York: The Macmillan Company, 1954. $7.50.

American scholars have long waited for the appearance of a complete, definitive one-volume treatment in English of modern German history. Previous publications in German history have suffered from one drawback or another: among them Veit Valentin's *The German People* (weak in organization and indifferently written); the "Short Histories" by S. H. Steinberg and Shuster and Bergstraesser (more than fulfilling their titles by being too short); J. Ellis Barker's *Modern Germany* (now outdated), and A. J. P. Taylor's *The Course of German History* (a scintillating *tour de force* but rigidly condensed).

Koppel S. Pinson's admirable *Modern Germany* seems to be the answer to this pressing need in American academic life. Superbly planned, organized, and executed, this book is a model of clarity. The narrative flows smoothly, with many passages of high literary quality. The author's knowledge of both source and secondary material on German history is encyclopedic in nature; his incisively critical documentation is among the most notable features of the work. He strikes a careful balance among intellectual, political, economic, social, religious, and psychological factors, interweaving them skillfully and with good judgment. This is first-rate historical writing.

Pinson has avoided an extensive, detailed account of Bismarck's diplomacy, the wars of national unification, and the two world wars, and, instead, has directed his attention to such significant forces as liberalism, nationalism, and industrialism. The chapters on the Catholic and socialist traditions in Germany are significant contributions in a book distinguished in general by its originality, a laudable characteristic in any textbook. Especially noteworthy is the author's penetrating analysis of the Revolution of 1848, whose failure in the Germanies he attributes to "the enormous disparity between the political aspirations of the German liberals and the mass support, and [the] actual power and influence they commanded" (pp. 106–7). His account of the origins of World War I, based on study at the Hoover War Library, and his descriptions of the Weimar Republic, the emergence of Nazism, and the Hitler regime are among the best and most convincing treatments of these subjects yet published.

Naturally, there is room for difference of opinion in the interpretation of German history, one of the most controversial fields of modern history; opposing views of the same sets of facts need not be regarded necessarily as lacking in historical objectivity. Other specialists will advocate different views on the role of Prussia in German history (on the ground that Pinson underestimates this central theme), the relationship of Junkerdom and militarism, the extent of the difference between German and Western liberalism, whether or not Nazism can be understood only as a specifically twentieth-century phenomenon, and whether or not the historian Friedrich Meinecke, as an apostle of German liberalism, should be regarded with reverential awe. Others will take issue on such minor points as Pinson's attack on the current revisionist approach to Metternich's conservatism (pp. 55–56), or his denial that Richard Wagner was a herald of Hitlerism —after demonstrating in a brilliant section the tremendous influence of Wagner beyond "clusters of sound" both inside and outside Germany (pp. 264–67).

Such disagreements and differences of opinion are to be expected, as Pinson recognizes (". . . There never is one side that is all black while another is all white" . . . [p. 294]). All in all, this book appears to the reviewer as the finest and most useful history of modern Germany yet to appear in English. A genuinely welcome contribution; it is within the best tradition of American scholarship.

LOUIS L. SNYDER

City College of New York

SALVEMINI, GAETANO. *Prelude to World War II.* Pp. 519. Garden City, N. Y.: Doubleday and Company, 1954. $7.50.

To review in a few brief sentences a book of over 500 long pages is always a bold undertaking. When the book to be considered has flown from the pen of the respected dean of Italian historians and when it deals with twenty years of international history, such an enterprise is almost bound to seem impertinent and furthermore to be pointless. Fully conscious of its difficulties, I assume the task willingly, however, but with the utmost diffidence. My only aim is to call attention to this remarkable work and to indicate the purposes and methods of its distinguished author.

As is well known, Professor Salvemini was, during the very years of which he tells the story, the witness in exile of his

country's destiny. H ewas by American hospitality spared the humiliation of residing in his native land, then rendered uninhabitable for all upright scholars. Written in Cambridge, dedicated to "My colleagues and students at Harvard," finished in July 1949, printed in Great Britain and published in New York in 1954, the *Prelude to World War II* very naturally bears the traces of these circumstances.

This is the case, as I see it, in two principal respects.

First, as concerns the documentation on which the work is based. Professor Salvemini's main sources seem to be British and American newspapers, particularly the London *Morning Post*, *Observer*, and *Daily Mail*, and the *New York Times*. He writes, in his very frank and revealing Preface:

"If documents were available in greater number, newspapers would have received less attention. Since most documents are still buried in archives, or are being destroyed, one must resort to indirect evidence, and that furnished by the Press is precious."

As the author, however, is a very experienced historian and endowed furthermore with exceptional intellectual integrity, he is naturally led to prefer to mere newspaper reports direct quotations of speeches and diplomatic notes as could be found in the press.

This brings me to the second characteristic of the book which strikes me as an inevitable result of the circumstances under which it was prepared. Gaetano Salvemini is a great Italian patriot. His love of liberty led him to leave his fatherland for a country in which Mussolini's Fascist policies were in deep disfavor long before America entered World War II as one of Italy's foes. What position could he assume? To defend these policies would have meant to become untrue to his innermost convictions. To denounce them undiscriminately would expose him, in his own eyes still more than in those of his American hosts, to the reproach of siding with the latter, whose protection he was enjoying against his fellow countrymen whose lot he was not sharing. As he is anything but a renegade, his double fidelity to his principles and to his nationality drove him to the conclusion that, as he writes, "one is entitled to respect a people while not condoning the crimes of its politicians, and to denounce the dishonesty of its politicians without being charged with hostility against their people."

This conviction of the compatibility of the guilt of the rulers and of the innocence of their people underlies Professor Salvemini's whole story. It allows him to denounce not only Mussolini and Hitler, but also the French and especially the British politicians. In his view their weaknesses made them the unwilling but still the real accomplices of the Italian and German archcriminals. After a very clear and particularly careful analysis of European international politics from the birth of Fascism to the outbreak of World War II, Salvemini sums up his conclusions in condemning most of the leading European statesmen of his time.

His very personal, preponderantly diplomatic and ethical conception of history makes Professor Salvemini's work eminently readable. There is something refreshingly juvenile about his constant censoriousness and his frequent outbursts of indignation.

Is history however only the story of diplomatic maneuvers, somber intrigues, and bloody adventures? Why did the country of Dante, after World War I, fall a prey to Fascism? Why, ten years later, did the grandchildren of Goethe and Beethoven succumb to Nazism? What is the true significance of the Bolshevist threat to present civilization? Such are questions to which the readers of Professor Salvemini will find no adequate reply in his remarkable work, but which they will ask more avidly and more intelligently after being enlightened by his careful scholarship and his great expository talent.

WILLIAM E. RAPPARD
Graduate Institute of International Studies
Geneva

SPENCER, PHILIP. *Politics of Belief in Nineteenth-Century France: Lacordaire, Michon, Veuillot.* Pp. 285. New York: Grove Press, 1954. $6.00.

There has been need for this book, and the author has measured up to the task he chose.

Politics of Belief examines the work of three Frenchmen of the nineteenth century who strove as Catholics to grapple with the problem of how the Church should meet the challenge of the modern world. Lacordaire is presented as the "penitent Christian and impenitent liberal," Veuillot as the leading representative of those whose answer was an exaltation of the Papacy and a condemnation of the modernists, and Michon as symbolizing those torn by the tension between faith and reason.

Lacordaire, in the author's view, ultimately proved a victor; Veuillot outlived his seeming triumph; while the issue which vexed Michon will never be resolved, but must be debated anew in each generation.

Too seldom have scholars outside France —and seldom, too, the French themselves —given serious attention to the debate which provides the matter of this book. Yet in this realm of discussion, as also in other realms involving secular problems of social politics, French thinkers of the early and mid-nineteenth century explored issues which still mark the basic problems of both secular and religious thought in our own times.

This book therefore deserves the attention of both specialists, concerned with the history of French thought in the period between 1830 and 1870, and the serious general reader, seeking a better understanding of his own conscience-wracked age.

The author is to be commended for his gracious and colorful style, as well as his diligent scholarship and temperate judgment.

Portland, Maine

COBBAN, ALFRED. *Ambassadors and Secret Agents: The Diplomacy of the First Earl of Malmesbury at the Hague.* Pp. 255. London: Jonathan Cape, 1954. 21 *s* net.

Sir James Harris, who later was created Earl of Malmesbury, was British Ambassador with the States-General of the Dutch Republic during the years when, in the aftermath of the disastrous Fourth English War (as the participation in the war over the American revolt is traditionally called in Holland), the country was torn by a vehement conflict between the so-called "Patriots" and the Stadtholder, William V of Orange and his adherents. This conflict, which in 1785–87 came to verge on civil war, could not leave the surrounding powers indifferent. The Orangist party had always advocated an English alliance, the Patriots, for that reason, could not count on the support of France.

Professor Cobban describes the struggle between the British and the French Embassies at The Hague, each, but particularly the latter, making use of agents of various grades of reliability and usefulness. Harris's task was to put heart into the Orangist party in the various provinces, whose titular head, Prince William V, was totally unfitted for the stress of the times. The Prussians also come into the picture, largely on account of the Princess of Orange, who was a sister of the new king of Prussia and a woman of a strong and active character. In the end it was a Prussian army that restored Stadtholderly power in The Hague. It was England, however, working hand in hand with the Prussians, that reaped the benefit by establishing her influence in the republic. Not for long, though, for in 1795 the French Revolutionary army overran the country, and the Patriots, in exile or at least out of power since 1787, set up the Batavian Republic on more or less revolutionary principles and closely bound to France.

Professor Cobban has drawn on a mass of unpublished material, and his book throws a good deal of light on a diplomatic episode of which very little is known outside Holland. His pen pictures of Harris and a crowd of his associates and antagonists make good reading. One cannot help feeling, however, that he has missed the most important aspect. He states that he will not deal with the Dutch domestic side of these complications more than is necessary to make the diplomatic struggle intelligible. To pass a valid judgment on Harris's activities, the historian must, none the less, have a clear conception of the crisis in which the diplomat interfered.

In itself, moreover, this crisis would have repaid more sustained attention. With its enlightened and democratic tendencies the Dutch Patriots Movement presents a striking rehearsal for the French Revolution. But, the conflict within its ranks between democrats and aristocrats, and the social standing of each, have never become clear to the author. Inevitably he has to make numerous references to Dutch institutions, personalities, and incidents, but as he does not give more than perfunctory, and in essential points, erroneous indications of the general background, the effect on the reader must often be bewildering.

The explanation of the book's defectiveness in this respect is probably the author's obvious ignorance of the Dutch language which has prevented him from making any effective use of the Dutch historical literature to which he nevertheless occasionally refers.

Le Groupe d'Études de la Comptabilité Nationale. *Premiers Éléments d'une Comptabilité Nationale de la Belgique, 1948–1951.* Pp. xii, 209. Bruxelles: Les Éditions de l'Institut de Sociologie Solvay, 1953. 250 f. b.

Belgium is one of the few countries in Western Europe without an official system of national accounts. Until now students of the Belgian economy have had available only the invaluable measures of the national income by Professor Fernand Baudhuin, of the Catholic University of Lauvain.

It is therefore extremely gratifying to have this pioneering and authoritative (although unofficial) work on the national accounts of Belgium for the years 1948–1951, prepared by the special "Groupe d'Études de la Comptabilité Nationale" of the Institut de Sociologie Solvay, at the Free University of Brussels. The research of the group was carried on "under the authority" of Professor Henri Janne, the director of the institute, and under the chairmanship of Professor Etienne-Sadi Kirschen. The study not only marks an important event in the evolution of Belgian national income statistics but probably it also is the first macroeconomic investigation in Belgium.

The Belgian national accounts presented in this work are based on the system developed by the Organization for European Economic Co-operation (*A Standardised System of National Accounts,* Paris, 1952), which is currently utilized by a number of countries in Western Europe and by some international organizations. This makes possible for the first time international comparisons of the Belgian national income and product with those of other countries. However, the work is not a mere compilation of statistical information: it combines with the purely technical descriptions of the national accounts a significant analysis of the nature and operation of the Belgian economy in the years 1948–1951. The text comprises an historical chapter, nine other chapters, and a conclusion. It is enriched by one hundred analytical tables and thirteen illuminating graphs.

The introductory chapter discusses the evolution of the study of national accounts, and their various uses and limitations. It then describes the development of the study of national accounts in Belgium. Here—as well as at other appropriate points throughout the text—the authors make clear the serious statistical obstacles that had to be surmounted in building up a Belgian system of national accounts. They point out that for many areas of the Belgian economy the necessary statistical information is simply not available, while the published statistics vary in preciseness, and the necessary basic co-ordination of the existing statistical data has not yet been achieved. Moreover, the authors continue, "the economic statistics actually published in Belgium concentrate attention on some aspects only of the economic life, such as the evolution of basic industries, the movement of prices, or the monetary situation, to the prejudice of aggregates (*grandeurs*) which only the national accounts make conspicuous, such as the total production, the total consumption, or the formation of capital." Consequently, they warn that "the preciseness of the published figures in this work is variable. It is relatively satisfactory as regards the principal receipts and expenditures of the state, as well as for the balance of payments. It is somewhat less good for most of the other aggregates (for example, the construction of housing or consumption of food). In some cases, the margin of error may attain 10 to 20 per cent. For the global figures, and more particularly the gross national product, it appears that the probable difference must not exceed 5 per cent."

These statistical gaps and problems have necessitated a number of methodological changes from the OEEC's "standardized system" (for example, regrouping and reduction in the number of accounts), which are discussed in Chapter II on "The Mechanism of the National Accounts." This chapter defines systematically the sectors of the economy, the national accounts, and the principal economic aggregates—gross national product, national income, and utilized resources (*ressources utilisées*), that is, total expenditures. These economic aggregates are analyzed in detail in the subsequent three chapters (III–V): "The Analysis of Production"; "The Analysis of Expenditures of the Economy" and "The Analysis of Income." And Chapters VI to X are devoted to "a description of the principal tables" which introduce and illuminate "the salient facts of the economy," namely, "Private Consumption"; "Receipts and Expenditures of the State Sector"; "Internal Formation of Capital"; "The Balance of Payments," and "Financing of the Formation of Capital."

Although primarily of inestimable value to researchers on the Belgian economy, this important work also should be of interest to students and specialists in the field of national income accounting.

ARTHUR LEON HORNIKER
Washington, D. C.

OTHER COUNTRIES

SANGER, RICHARD H. *The Arabian Peninsula.* Pp. xiv, 295. Ithaca, N. Y.: Cornell University Press, 1954. $5.00.

The literature dealing with the Arabian desert has been greatly enriched by this book of Richard H. Sanger. He was formerly officer in charge of Arabian Peninsula Affairs in the Department of State of the United States and, more recently, Public Affairs Adviser of the Bureau of Near Eastern, South Asian, and African Affairs.

The book covers the great Arab Quadrangle, which is mostly desert, and thus leaves apart the Fertile Crescent. Saudi Arabia occupies the bulk of this arid tableland, but Mr. Sanger also devotes interesting chapters to Kuwait, fortunate owner of the world's deepest oil well known today; to pearl- and petroleum-rich Bahrein; besides the Sheikhdoms of Muscat and the Trucial coast. Aden and its parched hinterland also engage his attention, as does the Imamate of Yemen, which the Romans called Arabia Felix.

Mr. Sanger knows much of this vast region from first hand. He represented the State Department on a mission to Yemen not long ago, and he seems to have visited several of the exotic sheikhdoms, apart from the more obvious places of Saudi Arabia. He knew the late King Ibn Saud, knows his son and heir, on the throne today, and several important sheikhs.

The desert has an ineffable fascination for some people. Mr. Sanger seems to be one of them, and that is, probably, why he writes so superbly about it. His enthusiasm, never inartistically obvious, carries away the reader, too. He writes feelingly about the people of the tent, engaged in an uphill fight against the forces of a sedentary civilization. He deals understandingly with the people of the palm, in line with historic progress. Arabia and petroleum are synonymous today and so the author treats us to a well-informed description of Aramco, which is America's largest Middle East investment. It is also the entering wedge of a civilization which surpasses Arabian Night wonders in native eyes.

The emptiest thing in the world, as some explorers call it, Arabia's Empty Quarter, is poetically described here on the basis of the explorers' own accounts. Soon this Quarter will be filled with the tattoo of riveters as oil exploration pierces its cosmic silence.

The Arabian peninsula has shown to the author that the history of our globe has

become one for the first time in man's recorded life. The West has completely overwhelmed the East, which has fallen under the spell of the machine. Will it be its salvation, will it be our doom? Time was when the East gave us our imperishable values. But what is the use of those values, corroded as they were by disease, ignorance, and poverty? The synthesis of the best produced by East and West may yet provide the escape, but how and through what agency?

It is perhaps because of Mr. Sanger's official position that he had to gloss over the disease, ignorance, and poverty of the Arabian peninsula. It is a pity, because we need that information, too, and it would have further enhanced the value of an otherwise brilliant book.

EMIL LENGYEL

New York University

LANDAU, JACOB M. *Parliaments and Parties in Egypt.* Foreword by Bernard Lewis. Pp. vii, 212. New York: Frederick A. Praeger, 1954. $3.50.

The first of the Arabic-speaking nations to become emancipated from the Ottoman rule, Egypt was also the first to develop parliamentary institutions and political parties in the Western sense. While the new political order came to prevail in many areas of the Middle East, disappointments and frustrations with respect to parliaments and political parties ultimately led to a reaction against these Western institutions.

Dr. Landau's monograph, originally a doctoral dissertation at the University of London, deals with the development of parliaments and political parties in Egypt in a detailed and factual manner based on research into the available original sources. Part I treats of the development of parliamentary institutions from the establishment of the first Consultative Assembly of Notables in 1866 under Ismail Pasha to the advent of Major-General Mohammed Naguib and the abolition of the monarchy in 1952, through the various constitutional changes in Egypt. Part II traces the evolution of Egyptian political parties, beginning with the old Egyptian secret societies in the mid-nineteenth century. While this aspect of the development of Egyptian political institutions centers primarily on such major parties as the National Party, *Al-hizb al-watani,* and the *Wafd,* the picture is completed with a delineation of the minor political groupings or parties, both in the early twentieth century and in the interwar era. Dr. Landau points out that, to all intents and purposes, Egyptian political parties have all stemmed from the national movement in Egypt, that they have been poorly organized, however wide their seeming appeal or clientele, and that they have tended to center around dominant personalities and leaders, rather than party programs or principles. The author also points out that differences in party programs or principles have developed in the past, not so much on the basis of social and economic textures, but on attitudes toward (1) Great Britain and (2) Islam.

While the volume is not strikingly written, and has some of the faults and many of the virtues of a doctoral dissertation, it is a succinct and concise treatment of a very important subject. It closes with a bibliography of the more important sources, including manuscript and archival material, which have gone into the study.

HARRY N. HOWARD

Arlington, Va.

HARRISON, BRIAN. *Southeast Asia: A Short History.* Pp. xi, 268. New York: St. Martins Press, 1954. $3.50.

The author of this book, currently the professor of history at the University of Hongkong and formerly lecturer in history at the University of Malaya, has undertaken the ambitious task of summarizing for the general reader the entire sweep of the history of the half dozen or more countries of Southeast Asia in less than 260 pages of text. The story starts with the Java Ape Man and runs through to the postwar recession of the tide of European imperialism. It is a welcome first-attempt effort to integrate a vast body of political history hitherto available only in scattered works in various languages often difficult of access. The author summarizes admirably the account by Coedès of the history of the ancient Hindu and Buddhist empires of Indonesia in particular. He has done some original research in the history of British policy in Malaya and the Straits and also gives a fairly detailed account of the history of Java and Sumatra. He may be commended for correlating the events of modern European history with contemporaneous developments in Southeast Asia, especially in the half century following 1780.

Unfortunately, the comprehensive grasp of knowledge of the area so indispensable for anyone attempting to generalize in brief compass concerning so vast a span of history is simply not available to the author outside the areas of his specialization. His account of the histories of Burma, Siam, Indochina and the Philippines reflects, at best, only a superficial reading of available secondary materials. Even with respect to Java, the author gives evidence of no appreciation of the tenacity of indigenous Javanese culture in resisting alien intrusions, Hindu, Buddhist, Islamic, or Christian.

Minor misstatements of fact are numerous. The Salween River Valley, for example, was never used extensively as a trade route from China to the Bay of Bengal (as stated on p. 19), nor is there a river valley connection between the Arakan and India. The Chettyars and other Indians never acquired ownership of one-third (p. 224) to one-half (p. 212) of the cultivated land of Burma, but only some 2¼ million acres in a total of 18 million. The University of Rangoon was founded in 1921, not in 1923, and separation from India occurred in 1937 not 1939 (pp. 228 and 247). With respect to Indochina, the Pigneau de Behaine treaty of 1787 was never executed by France as implied on page 150, and the character and motivation of French imperialist policy in the nineteenth century is very meagerly appreciated. Professor Harrison's contention (p. 236) that Southeast Asian nationalism was limited to the Western-educated elite needs to be qualified. The feeling of resistance to foreign rule was deeply rooted and included an instinctive defense of cultural values regarded by the people as being outraged and betrayed not only by the foreigners, but also by many of the Western-educated elite themselves.

Such defects and criticisms underscore the fact that historical scholarship within this new field has apparently not yet reached the point where a really adequate short history of Southeast Asia can be written. Professor Harrison's pioneering effort has contributed to that goal partly because it has demonstrated that much more work needs to be done.

JOHN F. CADY

Ohio University

NEWMAN, BARNARD. *Report on Indo-China.* Pp. 245. New York: Frederick A. Praeger, 1954. $4.00.

One can enjoy this book without being impressed by its scholarship or by its bid for lasting value. It conveys impressions of a trip through a zone torn by battle. Bernard Newman is adept at such reporting, having written two score books on travel, war, and politics in less than that many years. His work bears the nervous imprint of swift writing, but it is competent writing, journalism of a high order, and valuable today when not enough is obtainable about Indo-China.

His own photographs and those from the French and Vietnamese Press and Information Services, with which he supplements them, are admirable. They reflect the author's trip from Saigon through Vietnam's principal show places. He meets the Emperor; describes Dalat, the Northern Capital, and the Baei d'Along; visits the Mois tribesmen; inspects numerous battle fronts; and arrives in the hinterland to see Laos, marvel at Angkor, and salute Cambodia. For those who have once felt the spell of Angkor, few others can describe it, yet Bernard Newman does find words to express his appreciation at first viewing the Temple of Angkor Vat, and all must agree with him when he concludes: "This is a sight to draw a man half way round the world and make him feel glad that he came."

The author has illuminating pages about Vietnam and his visit to the center of the Cao Dai Catholic cult, with its discursive and attractive nuns and its private army.

But if one were to seek enlightenment from his pages on the Binh Xuyen religious sect, which has remained aloof from the Diem cabinet, the largest of the three sects that struggle for power and which controls the police of Saigon, one would find not even an entry in his index.

I am sorry, too, that he lists only Ceylon, Burma and Cambodia as the centers of little Vehicle Buddhism, omitting Thailand, where the religion found refuge for a thousand years, and whence priests were invited centuries ago to spark the revival of Buddhism in Ceylon.

Being chaperoned by the French, Mr. Newman writes a history of Cambodia as seen from Paris. He mentions Battambang only of the three provinces "ceded" by the Japanese to Thailand during the Japanese occupation of Southeast Asia. He makes only fleeting reference to Son Ngoc Thanh, temporary premier of Cambodia after the abortive declaration of independence of 1945. While Mr. Newman was in Cambodia this former premier was a leader of underground nationalist troups in division strength, but our author omits reference to Son Ngoc Thanh's letter to King Norodom Sihanouk promising to surrender himself and his men whenever governmental powers were restored to the elected representatives of the people. It speaks well for the improved status of this land of Cambodia which Mr. Newman saw in turmoil, but where Communists have never won a foothold that Son Ngoc Thanh has now come in to make terms, apparently contented.

Some of Mr. Newman's chapters smack of special pleading, and his omissions hurt his case. In describing how war comes to Indo-China, he omits all reference to General Valluy's telegram to Colonel Debes, Commander of the French troops at Haiphong, and to the latter's action of November 23, 1946, which is like telling of the American Revolution without mention of the Boston Massacre.

I think that the French who are leaving and the free Asians who are taking over in Cambodia, South Vietnam and Laos may also be glad that Bernard Newman came to visit them. His is not the definitive book on this troubled epoch, but he holds a mirror to the rush of events. He is an optimist in his final word:

"The French have done excellent work in laying the foundations of progress, and can be just as beneficent when they lay down the role of tutor and adopt that of friend."

WILLIAM LEON SMYSER
University of Pennsylvania

NEEDHAM, JOSEPH, with the research assistance of LING WANG. *Science and Civilisation in China.* Vol. I: *Introductory Orientations.* Pp. xxxviii, 318. New York: Cambridge University Press, 1954. $10.00.

This book—the first of seven volumes which, when complete, will provide for the first time in any language a history of Chinese science—deserves much more space than can be allotted to it here. Its author brings unique qualifications to his formidable undertaking: a distinguished career at Cambridge University both as a biochemist and as an historian of science, coupled with almost two decades' study of the Chinese language and history, and supplemented by some four years of residence in China itself.

This introductory volume treats of such matters as the nature of the Chinese language, sources for the study of Chinese science and technology, and China's geography and political history. Of particular interest is its lengthy concluding section on the history of China's intellectual contacts with the outside world (the ancient Near East, India, Iran, the Islamic and Western civilizations), at the end of which comes a stimulating discussion of diffusion, independent invention, and other problems involved in the study of cultural interconnections. On page 242 there is a fascinating table listing twenty-six examples of Chinese technology (many of them wholly new, even to specialists), with indications of the time lag (anywhere from one to seventeen centuries) between their first occurrence in China and later appearance in the West.

The encyclopedic body of material covered by this volume is carefully and judiciously handled, lucidly presented, and enlivened by a warm literary style. Careful documentation is provided by a bibliography listing almost a thousand items in Western languages, together with several hundreds in Chinese. Both in it and in the main text, Chinese characters are supplied for all Chinese names and terms. Aside from occasional minor errors, inevitable in a widely ranging work such as this, the book's main weakness, if it has one, is an overabundance of detail on certain topics (for example, geography or political history) which, at times, seems somewhat unnecessary. In its typography, format and numerous illustrations (including maps and a Taoist painting reproduced on the cover), the book is an exceptionally beautiful example of the art of the printer.

Not only China specialists, but all persons interested in the history of cultural exchanges between different civilizations, will look forward to the publication of the remaining six volumes, to deal successively with the philosophical background of Chinese science; mathematics, astronomy and the earth sciences; physics, engineering and technology; chemistry and industrial chemistry; biology, agriculture and medicine; and the Chinese social background from which all these things sprang.

DERK BODDE
University of Pennsylvania

BARCLAY, GEORGE W. *A Report on Taiwan's Population to The Joint Commission on Rural Reconstruction.* Pp. xii, 120. Princeton, N. J.: Office of Population Research, Princeton University, 1954. $2.50.

This little book is more important than its informal publication might suggest. It was prepared by Mr. Barclay as a report on nearly a year's study in Taiwan as demographic consultant to the Joint (United States-Chinese) Commission on Rural Reconstruction. At the same time it is a supplement to Mr. Barclay's recently published study of *Colonial Development and Population in Taiwan* (1954).

Together these form a remarkably lucid case study of the demographic history and prospects of the island of Formosa. The first covers the period of Japanese colonialism, the second the postwar period of Chinese Nationalist control. The purposes of the two volumes, however, are quite different: the first was designed for a scholarly audience, while the present one is directed at the practical administrative and policy problems of Taiwan itself.

In the present volume, Barclay displays a clarity and simplicity of presentation rarely achieved by social scientists. His description of the system for maintaining population data in Taiwan, and of the nature and significance of the available data, is a model for the treatment of so technical a subject.

The broader significance of the study of Formosan demography lies in the fact that it provides an especially well-documented example of a peasant population undergoing selective modernization. In its demographic aspects this has meant a reduction in the death rate as a result of cheap public health measures without a change in the values and practices that maintain very high fertility. The unique statistical record maintained by the Japanese between 1905–43 is probably the most accurate available for such a population over a long period of time.

The rate of natural increase in Formosa has now approximated 2½ per cent annually for a generation. Such a rate of growth cannot continue in the long run and this is the dilemma posed by the author. At such a rate, he points out, "it would take the people of Taiwan only a century and a half to produce the reputed 450 million of the whole of China, and less than 250 years to surpass the present population of the entire world" (pp. 45–46).

Either the birth rate must ultimately go down or the death rate must go up. The reduction of fertility is made difficult according to the author: (a) by official opposition, (b) by the absence of knowledge and means for restricting fertility, and, most important, (c) by the family system and the attitudes and values of which it is composed. These give little hope of early change. *"In the absence of alternative ways* of getting things done, ties of family and friendship are relied upon by nearly everyone for accomplishing many indispensable transactions and services. . . . Thus, the large-family pattern will tend to

persist until, as in all countries that have had success in modernization, new standards of behavior are developed for nonfamilial activities" (p. 103).

Mr. Barclay hopes that education will create new aspirations, especially for such personal benefits as maternal health, that may be increasingly satisfied by concrete progress in economic and social achievement. Intelligent planning in the latter sphere is hampered by lack of knowledge. Barclay closes with some realistic warning and advice on the need for an early census in order to salvage the excellent statistical system left by the Japanese.

DUDLEY KIRK
The Population Council

BUTOW, ROBERT J. C. *Japan's Decision to Surrender.* (Hoover Library on War, Revolution, and Peace, Publication. No. 24.) Pp. xi, 259. Stanford, Calif.: Stanford University Press, 1954. $4.00.

A novel could not be more exciting than this exceptionally well documented, indexed, and scholarly account of Japan's decision to surrender. Reading other men's minds is at best a difficult if not impossible task, as the author readily acknowledges; but because it is based upon numerous original sources, both in English and Japanese, the story is convincing.

Although vividly portraying the power of so few (the "Big Six") to control the destiny of so many, the book discloses the conflicting views of those in authority and the indecision which remained until the final moment. The evidence is clear that it is not only in the Western democracies that important decisions are sometimes hard and slow in the making. War Minister, General Anami; Army Chief, General Umezu; and Navy Chief, Admiral Toyoda expressed the desire to fight on. They were almost always opposed by Foreign Minister Togo and Navy Minister, retired Admiral Yonai, who wanted an early termination of the war and were usually supported by elderly and vacillating Premier, retired Admiral Suzuki. This conflict made quick decisions by either the Cabinet or the Supreme Council on vital issues almost impossible. The former group, consciously or unconsciously influenced by the samurai tradition inoculated into their younger and fanatical subordinate officers, wanted to negotiate a peace only after a final operational success on the field of battle, if need be on the very shores of Japan itself, in the belief that this would procure better surrender terms, but they never adequately indicated how this success could be achieved. The latter group, instigated and supported by Lord Keeper of Privy Seal, Kido, wanted immediate peace with honor on the sole condition that the imperial institution be preserved. The Emperor, himself, eventually cut the Gordian knot and caused the final decision for peace by exercising his influence through his unprecedented pronouncements and actions.

How the Japanese leaders used the art of "haragei"—saying one thing while meaning another—to achieve their ends in a sort of play acting is well described. There is a fine account of the launching of peace feelers in Sweden and Switzerland, especially those initiated unofficially by subordinate officers at great risk to themselves. These officers were informed through the Office of Strategic Services channels that their venture would end in failure unless official negotiations were commenced in advance of a possible Soviet entry into the war. The quest for Soviet aid (in spite of the Yalta Agreement the contents of which the Japanese were apparently not fully cognizant) and later Soviet mediation make absorbing reading. The part played by the use of the atomic bomb at Hiroshima and Nagasaki, and the intense struggle within the United States Government in reaching the decision to consent to a continuance of the Imperial House, are also indicated, if not sufficiently stressed. The importance of the time element, the commission of hara-kiri by Anami and Kido, and Suzuki's fear of and escape from assassination by the younger officers make the ordinary cloak and dagger story seem pale by comparison. From the Japanese decision of September 6, 1941 to prepare for war while continuing negotiations for peace to that of June 22, 1945 when they elected to prepare for peace while continuing the war, the reader's interest and intellect are stirred. This is a "must" book.

ALBERT E. KANE
Washington, D. C.

FITZGIBBON, RUSSELL H. *Uruguay: Portrait of a Democracy.* Pp. xiv, 301. New Brunswick, N. J.: Rutgers University Press, 1954. $5.75.

Among books about single Latin American countries by political scientists (or, in fact, anyone else, including "travel writers"), Fitzgibbon's *Uruguay* is at once one of the easiest to read and one of the most informative. He has succeeded in describing and analyzing with a vivid, human style not only the political forms and behavior of the smallest and most democratic nation of South America, but has also provided at least the outlines of the total culture and social organization of the country. Were it not for the relatively slight United States reader interest in Latin American affairs, the book would doubtless have been featured on the list of a commercial publisher. As it is, Rutgers University Press has presented a fine edition that deserves to be widely circulated.

It is important for those interested in democracy to understand Uruguay, the least extensive and yet the most progressive nation in South America. This Dr. Fitzgibbon helps one to do in terms of history, geography, political analysis, economics, an interpretation of the arts, patterns of communications, the role of the religion, and a shrewd appraisal of the country's international position—terms, however, that practically always have direct empirical reference to the human situation.

Although the treatment of Uruguay's accomplishment is sympathetic, it is not one of unqualified optimism. The life of any nation except Utopia consists in a continual attempt to solve problems. Although Uruguay is not presented with some of the difficulties that beset other Latin American countries, it has its share. For example, it has relatively less ethnic, geographic, and social diversity than many of its neighbors of the Hemisphere. But, on the other hand, it is faced with the task of bridging the enormous gap between the life of the disproportionately enormous capital city and that of the rest of the country, and it is permanently placed as a buffer state between "two jaws of the pincers: Argentina and Brazil," to mention no other continuing problems. Uruguay has its challenges and also its opportunity to set an example for the rest of Latin America and the free world. On Fitzgibbon's showing, the chances appear good that both will be met successfully by the peaceful participation of the people as a whole and for their benefit. If one South American country can do this, perhaps others eventually will do likewise. Uruguay as of now, at least, is a living negation of the proposition that "democracy and social progress are impossible in Latin America."

JOHN GILLIN
University of North Carolina

BOXER, CHARLES R. *Salvador de Sá and the Struggle for Brazil and Angola, 1602–1686.* Pp. xvi, 451. London: University of London, Athlone Press, 1952. $7.50.

Imperial Portugal once looked out from Lisbon upon an empire stretched on both shores of the Atlantic, and into Asia. Trade in sugar and slaves linked two of these frontiers in a triangular commerce which connected Angola (slaves) with Brazil (sugar) and Portugal. Many officials of the empire had seen service and made profit in Brazil, Africa, and the East. Occasionally an official of the Crown, such as Salvador de Sá, combined extensive private wealth, made by his family in Rio de Janeiro, with useful service to the Crown. Many Brazilian colonials were permitted to serve the Portuguese Crown directly than Spain allowed in her American administration.

The Luso-Brazilian world of the seventeenth century had few families as rooted in the New World, yet valued in the European councils of Portugal, as were the Sás of Rio. Through the life, ambitions, and adventures of Salvador de Sá, almost all the interests of the day came to life: the drives of the *paulistas* into the West

and South, the overland trade with Spanish Tucuman and Potosí, the Portuguese *drang nach süden* to the River Plate, the naval and land wars with the Dutch, slave trade in Africa, mining, shipbuilding, and sugar wealth in Brazil; the potent role of the Jesuit order in Brazil; the diplomatic relations of Portugal with the France of Mazarin and the England of the Restoration. Salvador de Sá was part of most of these and witness of all of them.

The personal material for Sá's biography is very limited and incomplete. The author, however, has skilfully expanded the history of Brazil and Portugal to cover up the absence of private and diaristic data. What little of these exist, he has read and used, but less than a handful of items can be found. Consequently the material in the volume is a vast dragnet of relevant data found in Dutch, British, Brazilian, Portuguese, and French letters, travel, secondary works, and archival documents. These have passed through the author's remarkable historical knowledge about Portugal and settled into a clear, organized pattern of description and narrative history. We may not know as much as we like about the life of Salvador de Sá, but we receive an excellent grasp of Luso-Brazilian affairs, and Angola, Lisbon, Rio de Janeiro, and Buenos Aires come from background to foreground as Salvador de Sá conquered, administered, or visited in all these places.

The scarcity of memoirs or diaries of Iberian historical figures is well known. Researchers cannot do anything about it. Contemporaries mention that "notable old stickler," Salvador de Sá, but Professor Boxer has set him back upon his stage of action. His history is very pleasant in style, quite fair yet frank in interpretation, and a real contribution to historical literature. Appendices, bibliography, index, and maps complete the usefulness of the work.

HARRY BERNSTEIN
Brooklyn College

HUMPHREYS, R. A. *Liberation in South America, 1806–1827: The Career of James Paroissien.* Pp. xii, 177. London: University of London, Athlone Press, 1952. (Distributed in the U. S. by John de Graff.) $5.00.

This is the story of the independence movement in southern South America, and of the contribution of a British soldier of fortune to its success. The author does not claim that this contribution was of great significance. The discovery of the Paroissien papers, however, afforded an opportunity to narrate the story afresh, gaining the reader's attention by means of the personal adventures of a man who was in touch with the outstanding leaders and who presented his own views of their traits and achievements. Moreover, the well-informed and imaginative reader can easily envisage Paroissien as typical of hundreds of other foreigners who, with similar motives, took part in one of the great "liberation" efforts of recent history.

The narrative is superb. Details abound, but they are neatly subordinated and fitted into the broad setting of the times in Europe and America. The author's careful disclosure of his sources immediately captures the reader's confidence and he is soon fascinated by the personal element. Perhaps Paroissien was not a great man, but he was full of adventure, enthusiasm, and courage. Like the hero in a Greek tragedy, he moves inevitably to his doom. He went to South America to accumulate a fortune and fate was kind to him for two decades, until he engaged in the investment "boom" of 1822–1825. Although he was in prison for a time, accused of conspiracy, he was fairly prosperous for more than a decade in terms of both money and honors. His ruin was brought about by an attempt to work the silver mines of Potosí. Financial panic in England and disorders in Peru and Boliva wrecked his mining company. Setting sail for the British Isles in 1827, he died at sea and his corpse was cast into the Pacific Ocean. He was only forty-three at the time of his death. "Trader, doctor, soldier, diplomat, company promoter, and mining entrepreneur," he had spent most of his life in Argentina, Chile, Bolivia, and Peru.

LETTERS TO THE EDITOR

Dear Sir:

We write this letter to express both our appreciation of, and certain objections to, Professor Bronfenbrenner's review of our book *The Hard Money Crusade.*

In criticizing our emphasis on full employment and economic growth as central objectives of economic policy, Professor Bronfenbrenner says that under such a policy "the threat of unemployment and underproduction will no longer be effective in restraining the wage and price demands of organized labor and the farm bloc." We appreciate such a frank statement of views. It helps document our observation that "hard money" policies are often advocated by people who sincerely object to full employment and believe in the value of corrective recessions.

Professor Bronfenbrenner also states categorically that without the threat of unemployment and underproduction "the economy will require something like permanent price controls to prevent a runaway inflation." "Gross and Lumer either fail to see the full implications of their system or fail to be candid in presenting it." But the relation between full employment and inflation is much more complex than the reviewer indicates. Although we have not attempted to analyze this relationship in full, many economists believe it possible for farmers, unions, and industrialists—under nonwar conditions—to engage in the kind of bargaining that will produce wage price policies compatible with a sustainable rate of economic growth and without runaway inflation or permanent price controls.

According to the review, we advocate that "tight money should never, *never,* NEVER be imposed on an economy regardless of price movements." This is a misstatement. In Chapter VIII we show how certain tightening measures—particularly control of consumer credit and speculative credit, bank reserve requirements, supplemental reserve plans, and direct controls on the volume of loans—are desirable under certain conditions. Moreover, the book deals only with the American economy. It does not discuss the role of money policy in "an economy" in general. The role of money policy in underdeveloped countries, for example, is a horse of a somewhat different color.

Professor Bronfenbrenner is also worried that "major institutional changes" are implied by Fair Deal monetary policies. We believe that in a dynamic democracy institutional change is always taking place. One of the purposes of the book, of course, is to indicate some of the institutional changes needed to establish more popular control over the Federal Reserve System.

BERTRAM M. GROSS AND
WILFRED LUMER
Public Affairs Institute

Dear Sir:

Certain of Messrs. Gross and Lumer's objections to my review of their book are based upon misunderstanding. Others reflect genuine differences of opinion.

1. The *fact* of underemployment and underproduction serves no useful economic purpose. Thus far I agree with Gross and Lumer. But the *threat* of underemployment and underproduction serves a useful economic purpose in restraining organized business, labor, and agriculture from inflationary price demands. We hope that the threat need seldom or never be exercised to be effective, but it must be held constantly in reserve. What I oppose, and what Gross and Lumer favor, is therefore not full employment as such, but *guaranteed* full employment.

2. The "qualitative" credit controls on which Gross and Lumer rely in checking inflation have been until now so insignificant quantitatively as to add up to no controls at all. The trouble is that when credit is refused for speculative purposes, the borrower speculates with his own funds and borrows ostensibly for his ordinary business. When I accused Gross and Lumer of forsaking the monetary weapon entirely, I was discounting their listing of qualitative controls as lip service, since housing credit is not among the types they propose to choke off when inflation threatens. As to the "quantitative" controls, which they list most succinctly: these may keep credit cheap for the Treasury, but not for private

borrowers, and are indeed "hard money" under another form.

3. So Gross and Lumer's "popular control over the Federal Reserve System" is hardly a sufficient institutional change to check an inflation without hard money for private borrowers. Barring some sort of psychological revolution in the attitudes of organized business, labor, and agriculture—which I will believe in when I see it—extensive and prolonged price controls on the wartime model will also be necessary. They may cumulate in a major redistribution of income, as they did in Great Britain and as some Fair Dealers would not mind their doing here. I do not attack either controls or income redistribution, but suggest merely that Gross and Lumer let their readers realize the full extent of the institutional changes which their proposals may require.

PROBLEMS IN INTERNATIONAL RELATIONS

by ANDREW GYORGY and HUBERT S. GIBBS,
both of Boston University

This new text is the first systematic application of the problem method to the field of International Relations. It presents twenty-five carefully selected cases which offer the student an unusual opportunity to analyze concrete situations and apply certain general principles of International Politics. Two-thirds of the problems were written specifically for this book and present new materials; the remaining cases were carefully selected and edited from leading publications. Ten well known authorities in the field of International Relations contributed new cases which are published here for the first time. All cases were carefully selected to provide geographic balance throughout the book. Among the twenty-five problems there is adequate coverage for Western Europe, Eastern Europe, the Middle East, Southeast Asia, the Far East, and Latin America.

Teaching aids include 20 new maps and detailed bibliographies.

352 pages . 6" x 9" . To be Published February 1955

FOREWORD

Africa plays an increasingly important role in world affairs. The continent is involved, to an ever widening extent, in a complex network of world communications, global strategy, and world politics. Changes are in process which are modifying, and in some areas transforming, the economies, social structures, cultures, ideologies, and aspirations of the divergent peoples of Africa. In the course of these changes, the political relations between African territories or countries and the great centers of organized political power in the Western world are being reshaped and realigned, in some regions radically so.

In effect, we are now witnessing in Africa the early stages in the development of a revolutionary situation which is barely perceptible in some areas but is clearly manifest in other parts of the continent such, for example, as the Union of South Africa or the Gold Coast. The symptoms of this emerging revolutionary situation [illegible]ored in the weakening of traditional systems and the erosion of ancient [illegible]rms and sanctions; the development of new types of economic, social, and [illegible] structures within which peoples who were relatively isolated from one another in times past are now brought into a complex web of contacts, with resulting insecurities, tensions, and conflicts; and the emergence of new relationships, social types, and movements which are not easily contained, if at all, within the framework of traditional social orders and established political and power systems.

The purpose of this issue of THE ANNALS is to illuminate some of the basic realities and situations prevailing and to analyze selected developments and issues in contemporary Africa. The first four articles focus on the environmental realities, the fundamental characteristics of the peoples and cultures of Africa, and the continent's role historically in world affairs. The four articles that follow outline some of the characteristic economic features of Africa, with emphasis on conditions and problems associated with economic change. The last three articles in this section diagnose specific developments in selected areas, while the first article, by Mr. La Macchia, gives a more generalized exposition of African economic situations and issues.

The six articles in the section on "Political Framework and Dynamics" explore some of the continent's important political problems and analyze specific political situations in selected regions and countries. As originally planned, this section was to include an article on the important and dramatic political developments in Kenya and Uganda, but because of the contributor's illness he was unable to finish the article. It should be stressed, however, that it was not the aim in any of these sections to cover all areas but merely to provide a generalized account of the fundamentals, with some "case studies" of particular situations which seemed to have wider implications.

The three articles in the final section provide brief accounts of the impact of urbanization, Christianity, and education in Africa, with special reference to the role of these factors in social change. Actually, of course, there is no sharp separation between economic, political, and social situations in Africa—or elsewhere. The breakdown used here merely suggests a scheme and points of emphasis for the analysis of the varied aspects of the complex reality represented by contemporary Africa.

The editors recognize that certain of the significant situations and dynamic thrusts in the continent are either ignored or given only incidental consideration. No attention is given to the rise of a new state in the Sudan or the important problems inherent in this development, and there is no discussion of Egypt or its increasing preoccupation with African affairs, particularly in relation to the Sudan. Developments and issues in the independent states of Libya, Liberia, and Ethiopia are largely ignored. The absence of a discussion on political developments in British East Africa has been noted. The operational and ideological role of the United Nations is only occasionally cited, and there is no treatment specifically of the seven trust territories in the continent. The role of Islam in sub-Saharan Africa is not considered, and the question of Asian influence is barely mentioned. The impact of the East-West conflict on Africa and the extent of and potentialities for Communist subversion receive only incidental consideration. Finally, there is no specific exposition of United States interests, programs, and policies in Africa, or of the dilemmas posed for us by the revolutionary situations emerging in the continent.

Such omissions are regrettable; but given the limitations of space, and considering the extraordinary diversity and complexity of the African scene, some gaps in coverage and analysis are unavoidable. Despite the incomplete coverage, however, it is hoped that this issue of THE ANNALS will contribute to our understanding and, at the same time, stimulate further study of the conditions of life prevailing and the new men emerging in contemporary Africa.

WILLIAM O. BROWN

Africa: The Environmental Setting

By ROBERT W. STEEL

AFRICA is a vast and still only partially known continent. It stretches for 5,000 miles from near Bizerte, Tunisia, to the Cape of Good Hope and for 4,600 miles from Dakar, French West Africa, to Cape Guardafui in Somaliland. It covers nearly 11¾ million square miles, 9 million of which lie within the tropics. It remains, in large part, scientifically unknown and economically undeveloped. Though no longer the "Dark Continent" of the nineteenth century, it is still far less understood than any other of the great land masses, except Antarctica. We are as ignorant of its physical nature as we are of many of its economic, social, and political problems. There is still much to discover in Africa, many tribes to study, a diversity of languages and cultures to understand, a great range of plants, animals, and diseases to investigate, and vast tracts to be surveyed and mapped.

BARRIERS TO EARLY PENETRATION

The nature of the geographical environment in this widest sense must be appreciated if either the past history, the present conditions, or the future possibilities of Africa are to be properly understood. It was no mere accident of history that left Africa so little explored only a century and a half ago. Europeans had merely touched the fringe of the continent because Africa had appeared primarily an enormous obstacle to seamen as they voyaged to the riches of the East. Apart from the tales of fantastically wealthy kingdoms such as Monomotapa and that of Prester John, there seemed no intrinsic resources within the continent to encourage its opening up. But it was the physical conditions that really discouraged, if they did not wholly prevent, penetration beyond the coastlands. Natural harbors were few; the rivers were generally navigable only for short distances inland and frequently reached the sea through intricate channels in densely vegetated, fever-ridden deltas. Moreover the nature of the climate of the coastlands was sufficient to discourage all but the most fearless of missionaries and traders. Inland the plateau rose steeply and uninvitingly, with its rim broken but infrequently by watercourses, the falls and rapids of which made navigation impossible. In the northern part of the continent stretched the vast forbidding deserts which separated so effectively and for so long the Mediterranean world from tropical Africa.

Some of these obstacles were overcome, in part at least, by the journeys of explorers like Mungo Park, David Livingstone, H. M. Stanley, and J. H. Speke during the nineteenth century. In the process the traffic in slaves was suppressed and, whenever possible, replaced by new forms of trade, such as that in the oil-palm products of West Africa. The rapid political occupation of Africa came later and culminated in the "scramble for Africa" in the 1880's. Economic development was slow and depended largely upon the discovery of minerals, such as diamonds at Kimberley in 1867 and gold on the Witwatersrand in 1886, or upon the construction of railways, several of which in West and East Africa were opened about the turn of the century. Yet despite such activity it could still be said of Africa

by A. H. Keane, writing as late as 1907, that whereas the political conquest of Africa had already progressed so far that it was almost a European dependency, the geographical conquest had advanced much less rapidly and was still unfinished.

PHYSICAL ENVIRONMENT AS A LIMITING FACTOR

The last half-century in Africa has seen many striking changes. There has been a steadily growing European interest in Africa, an ever increasing demand in both Europe and North America for the raw materials of the tropics, and a new conception of imperial responsibilities which has particularly affected Britain, France, Belgium, and Portugal (the European countries most directly concerned). Social consciences have gradually been awakened, and the strategic potentialities of Africa have been recognized in a new way. There has been a fresh assessment of the possibilities of Africa and of the African peoples, and the whole process of readjustment between Africa and the rest of the world has been greatly stimulated—and profoundly modified—by World War II and its aftermath with all their consequences in terms of political and social relationships and of economic development. The Africa of the middle of the twentieth century presents us with a wholly different picture from that which fifty, thirty, or even fifteen years ago gave us.

Yet in this rapidly changing Africa of today many, indeed most, of the geographical realities remain, some of them seeming almost to have an increased significance. The trends and issues of today must always be viewed against this background, complex and varied though it usually is. The very size of Africa makes generalization difficult and sometimes dangerous, but the meaning and the limitations of this geographical environment must be constantly recognized on every scale—continental, regional, and local—since, in the words of Professor L. Dudley Stamp, "throughout much of Africa, especially tropical Africa, the course of man's life is still dictated in large measure by the physical environment."

GEOLOGY AND TOPOGRAPHY

Geologically and topographically Africa is often described as a continent of uniformity and monotony. This is, however, an overstatement, the inadequacy of which is readily shown by the variety of conditions existing in many individual political units. Over extensive areas it is a great high plateau where the ancient hard crystalline basal complex is exposed, sometimes with granite or granitic rocks dominant and elsewhere with highly metamorphosed schists and gneisses. Many of these rocks have hardly been altered during millions of years; and there has been little folding by later earth movements, apart from the Atlas Mountains and the Cape Ranges at the northern and southern extremities of the continent respectively. There has, however, been considerable elevation and depression of the plateau, resulting in great strains which have given rise to some of Africa's most conspicuous physical features—the Great Rift Valley of East Africa and its associated volcanoes (the highest, Kilimanjaro, reaching 19,565 feet above sea level) and the volcanic peak of Mount Cameroon (13,353 feet) in West Africa. Elevation has also been responsible for the isolation of several large inland seas or lakes which have since wholly or very largely disappeared; remnants survive in the upper Niger Valley, the Lake Chad region, and the central parts of the Congo Basin.

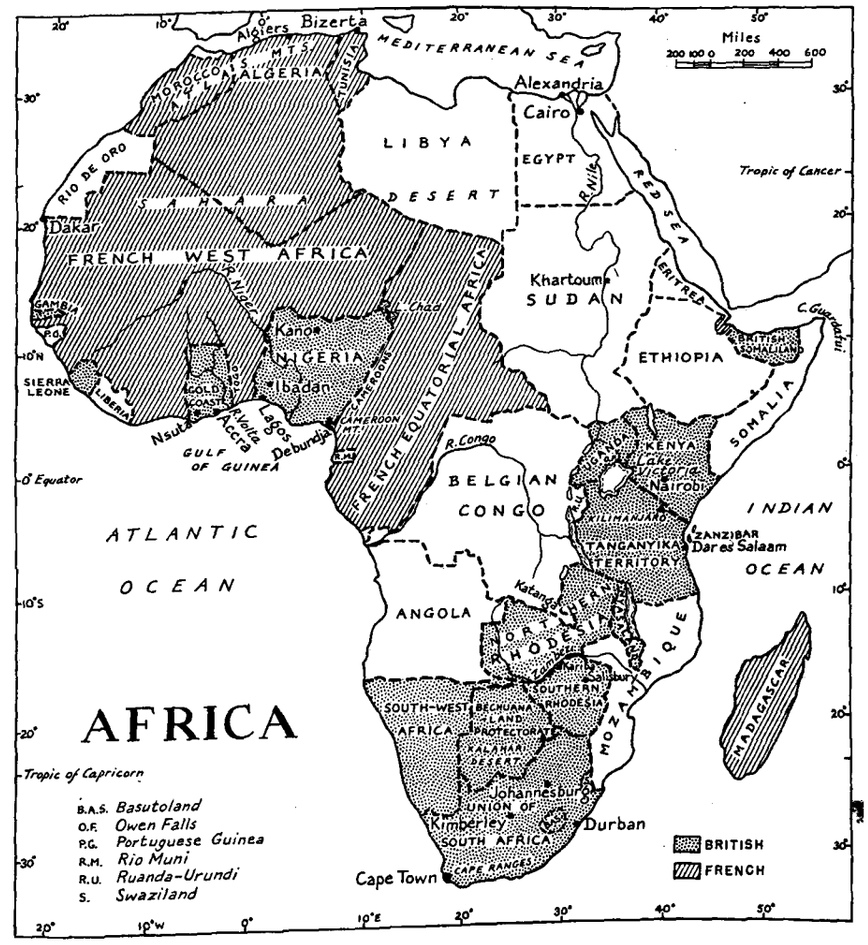
The plateau has a considerable range in altitude, and its continuity is much more conspicuous in southern and eastern Africa than over much of the west and north. Only limited areas exceed 6,000 feet in altitude, though these have special significance because of the diverse ecological conditions that they offer and because of their effect upon white settlement. At the other extreme, there are but few real lowland areas, 600 feet or less above sea level; such areas are especially difficult to develop in tropical regions because of their excessive heat, their inadequate drainage, or the dense and impenetrable nature of their vegetation. Much of the continent lies at between two and six thousand feet above sea level and consists of the hard resistant rocks already noted. Their soil cover is usually thin and unproductive, and the inaccessibility of many of these areas from the ocean is intensified by the forbidding character of the plateau rim and by the unnavigable nature of the rivers, which cascade down the plateau edge to reach the sea across the narrow, usually undeveloped coastlands.

CLIMATE AND NATURAL VEGETATION

But important though topography may be, the essential features of the African landscape are generally provided by climate and natural vegetation. Again there is much uniformity of conditions over wide tracts of the continent. The whole of tropical Africa may be said to be hot throughout the year, with relatively small changes of temperature between the seasons. The coldest areas (apart from small, very elevated parts) experience the "Mediterranean" climate typical of central California, with mild, wet winters and hot, dry summers: such districts occur in North Africa and in the extreme southwestern portion of the Cape Province of the Union of South Africa. Altitude does, however, matter greatly, and the generally high elevation of much of the continent causes considerable modifications in temperature. These account for the snow-capped peaks on the equator and call for fires and blankets at night in many places that are very hot indeed by day, and they are primarily responsible for attempts to establish permanent white settlement in many widely scattered parts of tropical Africa.

Of greater significance than temperature is rainfall. Large areas in Africa have average totals of more than one hundred inches in the year, and a very high proportion of the belt included between the two tropics receives forty or more inches a year. One of the wettest places on earth, certainly at sea level, is Debundja at the foot of Mount Cameroon overlooking the Gulf of Guinea, with 412 inches per annum. At the other extreme are the Sahara and the desert and semiarid regions of southern Africa, where whole years may pass without any rain and where average rainfall figures are very low and of little meaning in terms of settlement or agriculture. Seasonal distribution must, however, be considered as well as annual totals. Areas with between twenty and forty inches of rainfall a year, amounts which are, by the standards of temperate regions, more than adequate for cultivation, may suffer severely from drought, at least in some years, owing to the markedly seasonal distribution of the rainfall or the great year-to-year fluctuations in the total fall or the intensity of either the evaporation or the runoff. A high proportion of the annual total may, for example, come in a few torrential downpours that occur perhaps at the end of a prolonged dry season, when the surface is sun-baked and very hard. Thus little rain will penetrate and water the soil. Worse still, the rain may wash away such soil as there is and thereby aggravate what is already one of Africa's most serious problems, that of soil erosion.

The many variable factors affecting climate present us with a far from simple picture about which generalization is both difficult and dangerous. The empirical methods of the indigenous agriculturist may indeed be a more reliable guide to the complex of all the physical elements of the environment than the most carefully prepared distribution maps of the scientist. A study of vegetation belts does, however, indicate something of the physical nature of the environments in which men live in Africa. Equatorial rain forest covers much of the coastlands of West Africa and all the central parts of the Congo Basin. Towards the two tropics and, in East Africa, across the equator as well, the characteristic vegetation is loosely described as "savanna" and may range from deciduous and fairly open forest through impoverished woodland to poor, arid, and treeless grassland merging into the thorn scrub of the desert margins. Extensive areas both north and south of the equator consist of desert and semidesert, and in the extratropical areas of North and South Africa are the limited occurrences of the Mediterranean vegetation of forest and brush. In the more elevated parts of the East African plateau and in Ethiopia the vegetation is greatly modified by altitude and consists of varying zones of forest and grassland.



DIVERSITIES IN MODES OF LIFE

These generalized subdivisions of the continent serve to emphasize the nature of the underlying geographical realities, but they conceal much of the diversity of conditions and may fail to indicate the many ways of life of the peoples of Africa. To divide them into cultivators and pastoralists is an obvious oversimplification for, although it is true that agriculture is everywhere the chief occupation and means of livelihood, there is seldom any clear-cut distinction. Many farmers, European and African, combine the growing of crops and the rearing of livestock. There is, however, value in the broad distinction because it is a reminder of the limiting factors of the environment. The nomad or seminomad seeks water and fodder for his stock where they may be found. The cultivator, in contrast, must depend upon the nature of the soil or the humidity of the atmosphere in the place where he is, even though he may be able to modify these conditions to some extent by fertilization, by the rotation of crops, by the adoption of irrigation or dry farming, or by numerous other devices that enable him to adapt himself to the potentialities or the difficulties of his environment.

Cultivation ranges from the European-owned vineyards of French North Africa and the horticulture of the Cape Town region to the primitive "shifting cultivation" of the forest tribes of the Congo Basin, from the prosperous cotton-growing of the Baganda of Uganda or the coffee cultivation of the Chaga on the fertile, well-watered slopes of Mount Kilimanjaro to the subsistence farming of the Tallensi of the dry Northern Territories of the Gold Coast. So far as African farming is concerned it may be said, with some important and significant exceptions, that methods are usually primitive, though this is due at least as much to the harshness of the environment as to the backward nature of the cultivators. Shifting cultivation, for example, remains the common method of farming in most of the forest areas and over large parts of the wetter savanna zones. Scientific research has not yet produced any practicable and effective alternative to this prevailing system. Today this type of farming is dignified by such terms as "bush fallowing" or "rotational farming," and it has been described as an admirable adaptation to environment provided that

the amount of land available is large and the number of people concerned is small. Yet it remains a most unsatisfactory, because extravagant, way of using the land. The facts that population appears to be increasing quite rapidly in many parts of Africa and that shifting cultivation has, under present conditions, to be practiced over such extensive areas serve to underline the seriousness of the challenge which African farming presents to the skill of the agriculturists and scientists of the more advanced communities of the world.

The keeping of livestock, principally cattle, sheep, and goats, is prevented or made very difficult over vast tracts by the incidence of numerous diseases, such as rinderpest, East Coast fever, and, above all, trypanosomiasis. The latter is caused by the tsetse fly, one of the most widespread and persistent of all the many pests of Africa, particularly in the intertropical regions. On the other hand, stock can often be kept in areas that are much too dry for crops, since the animals can, if necessary, move with their owners in search of new sup-

plies of food or water. These migrations are sometimes extensive and permanent, as with the Bedouins of the Sahara with their camels or the Masai of Kenya and Tanganyika with their cattle. Others are only seasonal and take place over limited areas, as in the drier parts of West Africa or in the Bechuanaland Protectorate.

Science has already done much to check the ravages of disease, including trypanosomiasis, and to produce breeds that are better able to survive the rigors of some African climates. But its operations have been greatly hampered by the presence of wild game, which makes the complete eradication of, for example, the tsetse fly almost impossible, and by the social habits and traditions of many pastoral tribes. The stockbreeder and the veterinary officer can have but limited scope in a society that measures its wealth solely in livestock, in terms of quantity not quality, and whose marriage and other customs are closely bound up with the possession of large flocks and herds.

Too much stock upon too restricted an area has given rise directly to the exhaustion or erosion of the soil and to the lowering of the water table to an alarming extent in many districts. Furthermore these particular problems are not confined to tropical regions or to native farmers. They are, for example, among the most serious of all the problems faced by the Union of South Africa, and are by no means restricted in their occurrence to the crowded Native Reserves of Cape Province. As a result of soil erosion, in European and African areas, the Union is said to lose annually to the Indian Ocean 187 million tons from its land surface.

Despite many modern economic developments, most Africans still make their living from the land, whether as cultivators or pastoralists, or as more advanced "mixed farmers" who grow crops and also keep livestock (whose manure helps to maintain soil fertility) or as mere gatherers of what they can find in the forest or fish from the streams. While the number of non-native farmers is relatively small in relation to the total agricultural production, their contribution to total production and to the improvement of agricultural techniques bears no relation to the smallness of their number, whether it be in Algeria and Morocco, the Union of South Africa, Northern and Southern Rhodesia, Angola, Nyasaland, or Kenya.

In fact a very high proportion of the 5 million Europeans and 700,000 Asians in Africa—out of a total population of perhaps 175 million—are not directly concerned with agriculture but with mining, commerce, education, administration, and many other pursuits. The Union of South Africa, for example, is the world's chief producer of gold. One-fifth of the world's total output of copper comes from the Katanga Province of the Belgian Congo and the Copper Belt of Northern Rhodesia, adjoining districts in the heart of Central Africa. French North Africa is an important supplier of iron ore to European manufacturers, and the manganese mine at Nsuta in the Gold Coast claims to be the largest in the world. Africa maintains its monopoly of diamonds and produces significant quantities of chrome, cobalt, uranium, and many other minerals.

INTERNATIONAL TRADE

A single mine has great economic and social repercussions over very extensive areas, through its effect upon the demand for labor and upon the admixture of tribes. Nevertheless it is essential to keep a sense of proportion in assessing the importance of the commercial opening up that has taken place in Africa during the past half century. Significant though African production of numerous tropical and subtropical foodstuffs and raw materials may be, it must be recognized that the continent's participation in international trade remains small. Some years ago it was estimated that the share of the whole continent of Africa was about 4.5 per cent of the world's export trade and 4.8 per cent of the world's import trade, and that the comparable figures for Africa south of the Sahara were 2.8 and 2.6 per cent respectively. Though these figures may have been altered to some extent as a result of the numerous economic changes of recent years, they must remain substantially true, and they underline the fact that Africa, however important may be its contribution in certain commodities, cannot be regarded as a continent of outstanding productivity. Not only is its share in world trade small, but its progress and absorption into the world economy has so far been almost exclusively bound up with the discovery and exploitation of minerals.

POPULATION

Just as vegetation epitomizes to an extent the general nature of the physical environment, so the distribution and density of population are often useful guides to an assessment of the human geography of a region. Africa is unfortunately one of the least known of all the continents from a demographic point of view. We do not know with any certainty what is the total population of the continent: the figure of 175 million already quoted may be as much as 25 per cent above or below the true figure. Only recently the total population of Nigeria has been established by a series of censuses in the Northern, Western, and Eastern Regions to be at least thirty-three million, compared with the twenty-six million which has, till now, been regarded as the "official estimate." But while there may be innumerable doubts and uncertainties for the demographer and the statistician about totals, age, composition, trends, and many other facts of population that we expect, and need, to know today, certain features are sufficiently firmly established to justify governmental and indeed international concern and to give rise to administrative action.

Density

The population map of Africa shows every variation from the remarkable densities of the irrigated Nile Valley in Egypt to the uninhabited tracts of the Sahara, with such extremes often occurring in the closest possible proximity to one another, as in the examples quoted. The average for the whole continent, perhaps only fifteen persons to the square mile, suggests a state of underpopulation. Of all the continents only Australia is less densely peopled. Vast areas have such a small and widely scattered population that they cannot possibly be properly developed under present conditions. The Belgian Congo (900,000 square miles), for example, has about twelve million, whereas nearly four million live on the 20,500 square miles of the trust territory of Ruanda-Urundi. French West Africa is approximately four times as large as its neighboring British West African territories, yet its total population is less than twenty million, compared with the figure of about thirty-eight million for the British territories. In the British Federation of Rhodesia and Nyasaland there are only six million people, one third of them concentrated in the 38,000 square miles of Nyasaland (52 per square mile), with another third in Southern Rhodesia, and the other third scattered over the huge area of Northern Rhodesia, whose density of population averages only 6 to the square mile.

It must not be assumed, however, that all these lands could support a much greater density of population. There is, for example, a steady flow of labor from many French areas in West Africa to better endowed districts in the British colonies, and while Southern Rhodesia is a large-scale importer of labor, especially from densely peopled Nyasaland, Northern Rhodesia, with its generally infertile soils and poor natural vegetation and its variable rainfall and (apart from the restricted Copper Belt) its poor endowment of resources, supports with difficulty its present population in many districts. Barren and inhospitable British Somaliland hardly provides a living for its 700,000 people in an area larger than England and Wales or the state of Missouri.

Problems of overpopulation

Within the ocean of sparse population there are important and significant islands of overpopulation, and small though they often are they nevertheless constitute focal points of attention, since they represent those areas where there is the greatest maladjustment between man and the land. While it would be an overstatement to claim that pressure of population upon resources is always a main cause of much of the unrest so common in Africa today, to ignore its significance, whether locally or on a larger scale, is equally wrong. Sir Philip Mitchell's suggestion that the basic problem in many parts of East Africa is "the need to adapt agricultural practice and economic policy to the requirements of an increasing population" is applicable to areas throughout the continent.

Lack of population frequently shows itself when economic developments take place, either in the form of mineral exploitation or commercial agriculture, in both cases associated with the immigration, and possibly permanent settlement, of Europeans. Such developments give rise to labor migrations, such as the flow of people from the interior of West Africa to the mining areas of the Gold Coast, or of the population of Ruanda-Urundi to the European estates of Kenya or to the African cotton farms of Uganda. In southern Africa Nyasalanders go in large numbers to seek employment at the mines or on the European farms and increasingly in the manufacturing industries of Southern Rhodesia; the people of Mozambique and Basutoland travel to the gold mines and the other industries of the Witwatersrand. It should be noted that in some cases these migrations indicate the extreme difficulties of making a living in a harsh and unpromising environment, as in the dry areas of French West Africa; in other cases they reveal the existence of these islands of overpopulation, such as Ruanda-Urundi and the southern parts of Nyasaland, which, under existing economic conditions, are incapable of supporting their relatively high densities of population.

The effects of local overpopulation are seen not only in migration but also in land use. Many areas are overcropped or overstocked; soils become exhausted, excessively steep slopes are brought under cultivation, soil erosion readily occurs, and the water table may be progressively lowered. Environmental conditions are often in themselves an adequate explanation of such consequences. In the forested areas of the British protectorate of Sierra Leone, for example, the high rainfall is responsible for the leaching of the soils, and shifting cultivation has taken a heavy toll of the natural vegetation and the soils of the area. Fortunately the introduction of new farming techniques and the reclamation of swamps for rice cultivation may alleviate the situation and restore an equilibrium between population and land before irreparable damage results. Elsewhere, however, administrative action by governments can be largely blamed for the existing position. Thus in the widely different circumstances of Kenya and of the Union of South Africa the establishment of Native Reserves which are too small for the population that they are called upon to support has resulted in the large-scale exhaustion and destruction of the soil. Professor W. M. Macmillan showed years ago that many parts of Cape Province were quite incapable of supporting their population, even allowing for extensive migration to employment on the Rand and elsewhere. More recently it has been recognized that too many parts of Kenya are having to carry more than three hundred persons to the square mile, a figure that is low by European or American standards but is, for agricultural or pastoral peoples under present conditions in Africa, much too great, however low may be the standard of living.

Attempted alleviations

Pressure of population may be alleviated, at least temporarily, by the migration of peoples to other areas where economic opportunities are greater. Indeed this has sometimes been the basis of policy in many parts of Africa, and the possibilities of greater internal development, of the better and more intensive use of the land, or of the more intensive exploitation of resources, have been ignored as long as immediate pressure of population could be relieved in other, and simpler, ways. Today the shortcomings and shortsightedness of such policies and the difficulties that arise from both permanent and temporary migrations are being increasingly recognized. Attention is being given—as in the Sierra Leone swamp-rice projects—to the remedies available on the spot. Development plans have given prime consideration to the local rather than to the distant employment of labor, wherever internal resources permit, though many of these plans remain to be translated into practice and will have to face the opposition of powerful vested interests, such as the employers of migratory mine and estate labor. In any case the damage is already done in many districts. Detribalization has resulted, the land has suffered through the prolonged absence of a high proportion of the young adult males, villages have been abandoned through the wastage of the soil or through the advance of the tsetse fly. The economic and the political bases of society have been so disturbed that no amount of social planning can now make good this damage.

Towns

One final feature of population distribution should be mentioned—the increasing tendency of Africans to live in towns. In some areas towns have long been typical of the pattern of settlement, as with the capitals of the Muslim emirates of Northern Nigeria or of the Yoruban peoples of the Western Region of Nigeria. Such towns have invariably increased in both the size of their population and the scope of their functions with the administrative and commercial development of Africa during the twentieth century. Elsewhere towns have generally been few and far between, though their number has greatly increased as a result of the European and (in East Africa) Arab penetration of the continent. Coastal stations in West Africa have grown until Lagos and Accra have populations of more than 230,000 and 140,000 respectively. In Kenya, Nairobi has a mixed population of 110,000, with Europeans, Asians, and Africans roughly in the ratio of 1, 3, and 6, on a site that was uninhabited little more than fifty years ago. Mushroom towns have been created in the Copper Belt of Northern

Rhodesia and in the neighboring Katanga Province of the Belgian Congo. The growth of towns, like Nairobi of highly mixed composition, has been a striking feature of the economic development of both the Union of South Africa and Southern Rhodesia: the Rand conurbation centered on Johannesburg numbers 1¼ million, including 550,000 Europeans. In addition to these large towns there has been a tremendous growth in the number of smaller towns: in the Gold Coast alone, for example, there are now some sixty towns with more than four thousand inhabitants, principally in those districts that have undergone a complete economic transformation in recent years through the cultivation of cocoa and the development of mining. The creation and growth of these towns and urban communities, large and small, naturally result in new and special types of problems of which comparatively little is as yet known. They constitute an important part of the geographical background that has emerged in the present century.

PROSPECTS FOR CHANGE

There are, too, many other features that are new and that have altered or may in the future modify this background. Permanent and static though the physiography, soils, and even the climate and vegetation of Africa may seem, the other aspects of the total environment—such as land use, economic development, population patterns, and communication networks—are essentially dynamic and constantly changing. They are directly and immediately affected by political reorganization, by new concepts of economic development such as the British Colonial Development Corporation or the French FIDES (*Fonds d'Investissement pour le Développement Économique et Social des Territoires d'Outre-Mer*), or by ambitious and comprehensive economic planning such as the Volta River scheme and the Kariba and Owen Falls projects in West, Central, and East Africa respectively. New things are coming out of Africa, as they always have, and many of these—in economics, in politics, and in society—will be considered in the articles that follow. These new developments will be better understood, their possibilities more correctly assessed and the obstacles more properly recognized, if the realities of the complex and varied geographical background of Africa are constantly remembered.

Robert W. Steel, M.A., is a fellow of Jesus College, Oxford, and senior lecturer in colonial geography in the University of Oxford. He has carried out geographical research in Sierra Leone, West Africa, and was a member of the Ashanti Social Survey team in the Gold Coast in 1945 and 1946. He is the author of a number of geographical papers on colonial and other topics, and editor (with A. F. Martin) of The Oxford Region: A Scientific and Historical Survey (1954). He has edited the Transactions and Papers of the Institute of British Geographers since 1950.

Peoples and Cultures of Sub-Saharan Africa

By MELVILLE J. HERSKOVITS

CHANGE is nothing new to sub-Saharan Africa. It is as unrealistic to attribute excessive stability to African cultures during the centuries before European occupation as it is to overemphasize change in present-day African life. Where writing is absent, the historical picture is two dimensional, and ethnographic portrayal must therefore lack movement. It does not follow, however, that this unrecorded past must of equal necessity have been stagnant. The dynamic nature of contemporary Africa represents an extension into the present of a continuing characteristic of African life made apparent by the study of African prehistory, and reinforced by the logic of the differences discernible in the distribution of physical types, languages, and cultures over this great land mass.

The population of Africa south of the Sahara cannot be given with any degree of accuracy, but an approximation of 150 million seems acceptable to most authorities. This, for native Africans, is to be contrasted to some 3 million Europeans, 750,000 Indians, and a sprinkling of Syrians, Lebanese, and others. The numerical difference is emphasized when we find that some two-thirds of the Europeans and about half of the Indians live in South Africa. Elsewhere, as in French West Africa, we find ratios of 17 million Africans to 63,000 non-indigenous residents, or in the Belgian Congo 11 million Congolese to 60,000 from outside, or even in Kenya, with what is for Africa a large non-African population, over 5 million Africans in contrast to some 30,000 Europeans and about 120,000 Indians, Arabs, and Goanese.[1] This disparity gives a special character to the impact of the outside world on Africa, and renders it imperative that any evaluation of the present situation in the continent and particularly any planning for the future regard the indigenous African and his traditional ways of life and thought as a major factor in determining the facts and assessing the probable results of change.

Our equation, however, must also take into account the heterogeneities of Africa —the more than seven hundred languages, the innumerable tribal groupings, even the differences in physical type. The resulting complexities of the problem force a balancing of similarities against differences as the only valid methodological procedure; and this, in turn, depends on the particular situation under study and the fineness of focus with which it is regarded. In some regions relatively minor differences between fairly small tribal units can be important, as in the Cameroons highlands; elsewhere, unities over large areas can override conditions imposed by the drawing of colonial boundaries, as in Central Africa, along the line of division between the Congo and Northern Rhodesia.

PHYSICAL TYPES

It is not likely that, as between Africans, differences in physical type have been of any great significance in

[1] United Nations, *Non-Self-Governing Territories: Summaries and Analyses . . . Transmitted . . . During 1952*, Vol. II (New York, 1953).

influencing relations between the indigenous peoples of sub-Saharan Africa. In the technical sense of the term "race" as a major division of mankind, the racial factor over all this region is a constant, for all the Africans belong to the Negro race, despite variations in stature, in body build, in hair form and facial characteristics, even in pigmentation. The Africans of the Guinea Coast are classical Negroids, dark in color, longheaded, broad nosed, with everted lips, small, finely formed ears, and in the main short of stature, having slender legs and powerfully developed torso. North of them lives the Sudanese type, marginal to the "true Negro" and the Caucasoids who inhabit the Mediterranean littoral of the continent. In East Africa the so-called "Hamitic" form finds its most extreme expression in the peoples of the Upper Nile, Kenya, and Ruanda-Urundi, a type with bodily proportions that accentuate the vertical axis, slender in build, with long, narrow face and nose, smaller lips, and numbering among them the tallest peoples of the world. They are very heavily pigmented, however, and their hair is of the wiry, curled Negroid type, standing off the head instead of matting close to it as in the western part of the continent.

Inhabiting most of the vast region of the central and southern parts of Africa are the forms that, for want of a better term, are called "Bantu-speaking peoples." Migrations in Africa have been generally west across the northerly half of the continent, southwest from the region of the lakes toward the Atlantic, and south along the eastern portion. This has resulted in continuous mixture in central and eastern Africa, and has produced the many Negroid groupings, from the Cameroons and French Equatorial Africa south to Angola and southeastward to Mozambique and the Union, that exhibit the heterogeneity resulting from continuing ancestral crossing. In the Congo, too, are enclaves of Negroid Pygmies, while at the extreme south of the continent, the pygmoid Bushman and the larger Hottentot, both highly specialized, lighter-colored forms, have survived a harsh environment only to face extinction under contact with European peoples.

The reason why these differences in physical type have not significantly influenced contacts between African peoples is not far to seek. For one thing, the principal subdivisions encompass great areas, so that contacts between them in significant number have, on balance, been slight. Though instances are to be found, some striking—as in Ruanda-Urundi, where conquest by the Watutsi of the indigenous peoples, the Bahutu and Batwa, of markedly different physical characteristics, resulted in the imposition of a hierarchical social system correlated with these differences —such instances are not numerous. It was only with outside contacts and, indeed, only in relatively recent times that the racial problem, as such, became important in Africa. Its most exacerbated form is manifest in the color bar of the Union of South Africa, where it has been elevated to the status of the dominant political doctrine called *apartheid*. Its importance is also documented in the affirmations as to the absence of color prejudice in official and unofficial French and Portuguese writings, while its significance is apparent on the social level in the Belgian Congo, and on the social and political level in British East Africa, in the continuous flow of discussion in these territories concerning the need to develop multiracial entities so as to ensure future stability.

The importance of the racial problem obviously derives from the fact that Africans and Europeans differ sharply in skin color, that human physical trait which marks off groups of men most readily and is the first to be noted on initial contact. This trait provides a ready frame for drawing racial lines, and for distinguishing groupings to which all kinds of differences of a nonbiological order, actual or assumed, can be assigned. To it are attributed positive as well as negative influences, as where African preference for Mohammedanism as against Christianity is held to result from the fact that no element of color difference enters, with Negro Mohammedans converting Negroes, and no color line drawn in any mosque. That propositions of this sort overlook the existing tensions in the relations between Africans and Indians in eastern Africa, in which color differences are not important, does not lessen the significance of the overriding fact that, in contemporary Africa, the presence of physical differences between Africans and non-Africans is critical in shaping present-day alignments in all aspects of African life.

LANGUAGES

The linguistic picture reflects more clearly the process of contact, change, and consolidation that has characterized the African past. Where isolation with resulting fragmentation is stressed, the fact that sub-Saharan Africa has so large a number of distinguishable languages makes impressive documentation. Yet it must not be forgotten that from the early days of linguistic study in Africa, scholars have been able to discern a series of basic similarities behind the screen of differences which have enabled them to classify this linguistic welter into a restricted number of language families. For many years, these were reduced to three: the Sudanic on an east-west axis from Cape Verde along the Guinea Coast to the Ethiopian highlands; the Bantu, covering most of the continent south of the Equator and reaching to the north of it; and the Hamitic, roughly in the north with respect to the other two families, including Hausa in the west and Galla and Masai in the east. Under this system, Hottentot and, with somewhat less conviction, Bushman, were by some classified as Hamitic.[2]

More recently, however, a revision of this earlier grouping has been proposed and in broad outline has met with the general approval of students of African linguistics.[3] In these terms, the linguistic picture is dominated by the great sweep of a language family called Niger-Congo, which encompasses the whole of the Guinea Coast deep into the interior, including languages previously termed Sudanic and the Bantu forms of speech as well. The Hamitic family disappears. One part, termed Afro-Asiatic, encompasses Ethiopia, moving northeastward into Asia Minor and north and west through Egypt and the northern part of Africa. The remainder is differentiated into a number of smaller units, while Bushman and Hottentot are grouped as an independent "Click" family, taking its name from the phonetic device that, among the languages of mankind, almost uniquely distinguishes them.

Yet the Africans, despite the wide variety of their languages, have not been linguistically provincial. There is ample evidence in the early literature of travel that tribesmen with the ability to speak a number of tongues besides their own were regularly encountered, and this is a reflection of the intertribal contacts that, as we shall see when we consider the nonlinguistic aspects of

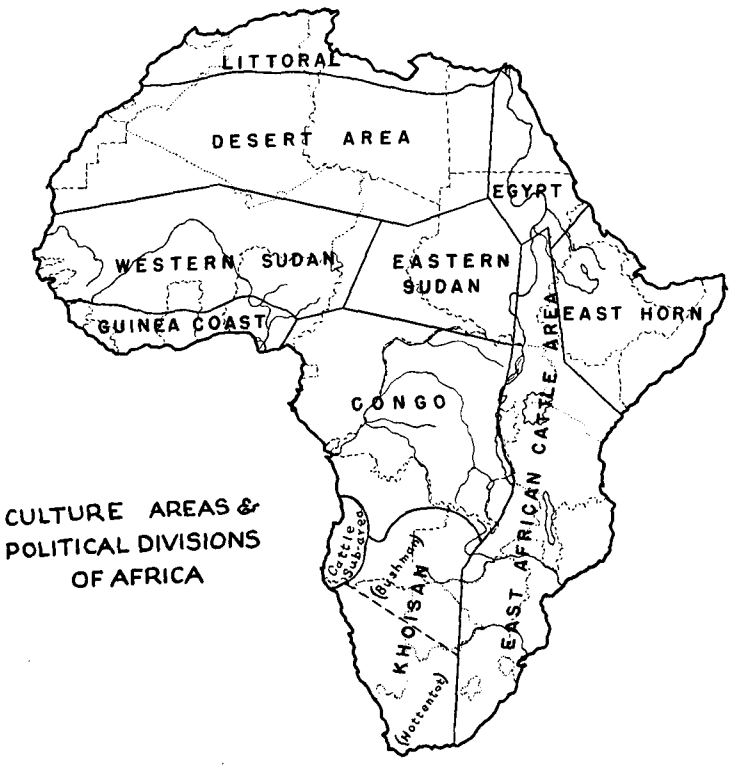
[2] For the best short expression of the conventional classification of African languages see Alice Werner, *Structure and Relationship of African Languages* (London, 1930).

[3] Joseph H. Greenberg, "Studies in African Linguistic Classification," *Southwestern Journal of Anthropology*, Vol. 5 (1949), pp. 79–100, 190–98, 309–17; Vol. 6 (1950), pp. 47–63, 143–60, 223–37, 388–98.

aboriginal African cultures, resulted in the unities that mark large areas of the continent and, in some measure, sub-Saharan Africa as a whole.

One important aspect of the linguistic picture is the existence, in various parts of the continent, of auxiliary languages. Kiswahili in the east-central part, and Lingala and Kikongo in the western Congo, come most immediately to mind as outstanding examples. On the Guinea Coast, pidgin versions of European languages served a similar purpose. The best established of these, the Creole of the Colony of Sierra Leone, has because of historical circumstances attained the status of what linguists call a creolized language. As the primary mode of speech of a considerable group of people, it will probably persist in the future as much as any African language. Elsewhere, however, the major historic function of the pidginized modes of speech has been to pave the way for learning the "proper" European languages, which today in much of Africa, with the rapid spread of schooling, have replaced them. Whether in central and eastern Africa these world languages will take the place of the auxiliary forms of speech that have been long established, only time will tell, but at the present this does not seem probable.

The fact that African languages were unwritten poses many questions. In what languages, for example, should Africans be taught to read and write? There seems general agreement that secondary and higher education should employ languages of world-wide distribution, so that students may have direct access to the world's knowledge. Yet what of primary education? Or one may consider the fundamental query as to the relation between language and thought, which has been posed by Africans who reason that to rely for the acquisition of knowledge on a foreign tongue imposes an unreasonable handicap to comprehension, to expression, and particularly to creativity.



An essential further point to be resolved concerns printing. Authorities believe that it is economically not feasible to print books for a language community numbering less than a hundred thousand persons. Though there are a considerable number of African languages whose speakers attain or exceed this figure, there are many more where this condition is not fulfilled. Here, however, another factor enters, one that, wanting a better term, may be characterized as analagous to national pride. Where, as in the Niger Delta, there are many tongues, each with but a relatively small number of speakers, which ones will give way? Attempts of mission boards, commissions of professional linguists, and governmental bodies to suggest, persuade, or impose the use of a single African tongue in such situations have met with little success.

It is becoming clear that in most of sub-Saharan Africa the language of the European power that now governs a given territory will in the future be spoken there, especially to facilitate intertribal communication within it, and for its contacts with the outside world. Conversely, however, the use of different European languages in different African territories, when considered from the point of view of Africa as a whole, seems to function as a divisive force, as is apparent from certain African reactions to propositions to establish a union of all West African territories. This will therefore have to be taken into account in forecasting political developments. The symbolic values of speech being what they are, however, it is difficult to envisage a time in the predictable future when any African language will be replaced by a European one, or where given African languages will completely give way to more widely distributed African tongues.

BASIC CULTURAL ORIENTATIONS

As with languages, so the similarities and differences among African cultures are to be balanced against each other, to give perspective against which current happenings are to be projected. On the broadest level, the similarities include those elements in African cultures which are continental in their distribution and mark off these ways of life from those of other major world regions. Next come the conventions that, while spread less widely, are none the less found in areas of broad compass and distinguish the major culture types of the continent. As we move to the tribal or local group level, the special characteristics that mark each off from its neighbors come to the fore. These characteristics, described in intensive studies of specific societies, are from the comparative point of view to be regarded as variations on the broader cultural themes of wider areal or continental distribution.

The accompanying map, which delimits the culture areas of Africa projected against present political boundaries, indicates an important potential source of tension arising out of the disregard of ethnic lines in partitioning the continent. Such tension is already apparent in the demands of the Ewe of Togoland and of the peoples living in the Cameroons, whose territories were so divided, to be reunited; and it is logical to suppose that these demands will stimulate similar movements among other peoples similarly situated. The areas are given according to their spread at a time which may roughly be designated as the beginning of intensive European expansion in Africa. That

CULTURE AREAS & POLITICAL DIVISIONS OF AFRICA

changes in these cultures have occurred since that time is obvious, though with a few exceptions the basic patterns that dictate the differentiation of these areas are still operative despite the way in which colonial boundaries are at variance with them.

The most dramatic of the changes that have resulted from contact is found in the Khoisan area, where the fate of Bushman and Hottentot cultures has paralleled that of the peoples themselves. The Bushmen, whose ways of life are among the simplest known to man, have been reduced to a few surviving bands in Southwest Africa and Angola. Never having developed herding or agriculture and possessing a sparse technology, they were always hard put to it to survive the rigors of their desert environment. Contact first with cattle-owning Bantu and later with the migrating Boer settlers, whose herds they raided as they would any herd of wild animals, made them fair game. The Hottentots, themselves a herding people who, unlike other cattle-keeping Africans to the east and north, regarded their herds as consumption rather than prestige goods, became servants and farm workers of the incoming whites, and later wage laborers. They were gradually absorbed into the Colored population of the Union of South Africa, whence their culture has, except among a few small groupings, almost disappeared.[4]

Elsewhere, basic cultural orientations have persisted with far less change than a reading of current reports would indicate. Fifty years of linguistic and cultural contact with persons of differing ways from their own, holding positions of power and hence of prestige, did not fail to affect the general African cultural picture. But outside the new centers of population—and within them, more than is commonly held—pre-existing patterns continue. In the back country, all over Africa, life in its basic configurations moves largely as in pre-European days, and where contact has been close and pressures of a social, political, economic, and religious nature have been strong, the mechanism of cultural reinterpretation has come into play. As a result, pre-existing values are retained, but given expression in new outer form.

It is unnecessary to repeat here the features of each of the culture areas that reach from the Sahara south and east to the region inhabited in earlier days by the Bushmen and Hottentots.[5] Let us rather group these six sub-Saharan units in terms of a basic criterion that has been of major importance in shaping responses to recent contact. For this purpose a contrast may be drawn between, on the one hand, the East African Cattle Area, the Eastern Sudan, and those southern and western portions of the East Horn that lie outside the cultural dominance of the literate Amharic groups and, on the other hand, the Congo, Guinea Coast, and Western Sudan areas. The peoples of the former grouping are in the main pastoral, while the latter contains societies that are basically agricultural, where herding is either entirely absent or, if present, has a different place in the culture.

The differences between the cultures of these two principal regions flow from the nature of their basic economies, and follow well-recognized and long-established principles that have been demonstrated to have world-wide applicability. That is, population density is not so great in the pastoral as in the agricultural regions, so that the political units are smaller and the economic systems simpler in structure and more direct in their functioning. From the point of view of assessing the reactions of Africans to contact, these, and other elements in the cultures of these regions that are related to them, are critical.

[4] Sarah Gertrude Millin, *God's Stepchildren* (2d ed.; London: Constable & Company, 1951), gives a vivid account in fictional form of this process.

[5] See M. J. Herskovits, "The Culture Areas of Africa," *Africa*, Vol. 3 (1930), pp. 59–77, and, for a revision of this earlier mapping, *idem, Backgrounds of African Art* (Denver, 1945).

THE PASTORAL SOCIETIES

Outstanding in the pastoral societies of eastern Africa is the special position of the principal animal herded. It is on the basis of this complex of cultural elements clustering about cattle keeping that the largest culture area of this grouping was designated, which, since it has been the most richly documented, may serve as typical of the basic pattern of the pastoral areas as a whole. In terms of this pattern, the most important animal—cattle in East Africa, camels or horses to the north—is the essential element in the prestige system, holding a place that transcends its economic role, ramifying into the social and political aspects of these cultures and into the artistic and religious life as well. Herding is not confined to this principal animal—sheep, goats, and donkeys are variously found, while in parts of the cattle area where the tsetse makes it impossible for this animal to survive, the smaller beasts substitute for it in its socioceremonial role.

A subsistence economy, clearly distinguished from the prestige system and marked by family self-sufficiency, is based on agriculture. There is accordingly little or no exchange of produce, since each group grows what it needs and consumes what it grows. This is in striking contrast to the prestige system, which provides some of the strongest supports for the total tribal social structure through the exchange of beasts on the occasion of marriage—the famous bride wealth, so long termed "bride price," and misinterpreted as wife purchase.

Wealth, as defined in these societies, is restricted to the principal animal herded, and its acquisition is a man's primary ambition. Because wealth, and the prestige associated with it, is in these societies counted in terms of the number of beasts a man possesses, it is to his advantage to have the largest number of head possible. Considerations of quality, opportunities to exchange his animals for other goods, and the idea of consuming them as food have only recently begun to enter. On the other hand, the self-contained character of the subsistence economy has made for a scattering of population and an absence of those features which mark off systems utilizing goods from outside. In eastern Africa, that is, the institution of the market was not found, nor was there any form of least common denominator in exchange. Moreover, except for workers of iron, no craft specialization existed or indeed, in so far as indigenous institutions have been maintained, exists. Among these pastoralists, also, the village, which is the largest type of settlement, in much of the area continues to be the family habitation, where a small group, of the order of the extended family, lives. These people are not nomads, for the beasts are driven to pasturage daily and returned to the habitation at night for protection against wild beasts that roam the plains and inhabit the bush. Gardens are close by, and to these the women repair to weed and reap the harvest after the ground has been made ready by the men.

Other aspects of the culture are attuned to this key. All reports agree on the importance of the ancestral cult—which is the core of the religions of the eastern Africans—wherein the priest in

charge of ritual is the family head.[6] Political structures, as might be expected over so vast a region, show great variation, apparent in the discussion of the five East African political systems considered in the volume edited by Fortes and Evans-Pritchard.[7] Yet the importance of segmentary kinship sections, the role of groupings based on age, technically termed age grades, and the emphasis on local autonomy all tend to distinguish this part of the continent.[8] Art forms are, in the main, those of the household—basketry, which is of high order, beadwork, and designs incised on calabashes. This again brings us to the slight degree of specialization here, in contrast to that which is present where the better-known African art products in wood, metal, and cloth are executed.

AGRICULTURALLY BASED SOCIETIES

The contrasts between the cultures of eastern Africa and those of the western part of the continent are most striking in the elements that have been noted in the preceding paragraphs. In explaining these differences, the ecological factor cannot be neglected. The high, dry plains invite herding, just as they pose many difficulties for the agriculturalist, as those who would introduce new farming techniques are discovering. On the other hand, the lower-lying forested area that comprises so much of the Congo Basin and western Africa inhibits pastoralism and makes the emphasis on agriculture that marks the cultures contained in it a logical adaptation to environmental demands. With agriculture as the sole economic base, the division between subsistence and prestige systems is absent; with a more productive ecological setting and concentration on agriculture, denser populations can be supported, an appreciable economic surplus is produced, and the cultures manifest a degree of specialization of labor that ranks high in the nonindustrialized world.

This specialization of labor takes on two forms. In west-central Africa, especially in the basin of the Congo, it is tribal; along the Guinea Coast and to the north, it is by craft. The tradition of specialization explains why this area has developed the great variety of textiles and the many kinds of pottery found there. This tradition, too, has been responsible for the development of metal working, which not only provides implements of all kinds for daily use, but has produced such recognized art forms as the Ife and Benin bronzes, the Agni-Ashanti gold weights, the Dahomean and Cameroons brass figures, and the intricately designed Congo throwing knives. It has made possible the embellishment of houses and temples with carvings and paintings of a high order, and the development of sculpture that from Guinea and Sierra Leone to the Congo has given the world the masks, statuettes, and other carved figures that today have world-wide renown.

Specialization has made for trade, and trade for markets and the development of pecuniary units of value. These, in turn, have encouraged commercial and, concomitantly, cultural contacts which, though restricted in the case of any given people, have resulted in an interlocking series of relationships that have facilitated the diffusion of the basic patterns which mark off the region. As concerns other aspects of the social structure, the phenomenon of specialization has caused the development of

[6] A sampling of African religious systems from the whole sub-Saharan area will be found in Daryll Forde (Ed.), *African Worlds* (London, 1954).

stratification and a class structure. This is the region of stable kingdoms, of established priesthoods and explicit theological systems maintained by those specialists in government and in the manipulation of the supernatural that only economies capable of producing substantial surpluses over subsistence needs can carry in the highly developed forms found in this region.

The empires of the Western Sudan—Melle, Fulah, Ghana, Bornu, Songhai, and Hausa—the kingdoms of Ashanti-Dahomey, Yoruba, Benin along the Guinea Coast, and those of Kongo, Lunda, Bushongo in the Congo are among the best known; but there are many others, down to the smaller principalities that, with simpler but comparable political forms, were interspersed among these more powerful, more numerous, and more widely spread entities. And with the ability to support a larger population has come urban living, especially in the Guinea Coast and the Western Sudan, where the writings of the earliest explorers attest to the existence of populous centers since before the time of initial contact with the literate world.

BASIC PATTERNS AND CULTURAL ADJUSTMENTS

It is evident that the differences between these two great cultural provinces —the pastoral east and the agricultural west—have been significant in the adjustments of their peoples to European contact and control. One need but consider the differential adaptations that had to be made in the policy of indirect rule in British East and West Africa to see one manifestation of this. The relative ease with which Africans in the western part of the continent and the Congo took over the growing of cash crops may, again, be contrasted with the difficulty experienced in inducing the cattle-keeping peoples of the eastern portion to accede to the commercial utilization of their herds, or to adopt methods of improving the quality of their beasts. The very fact that the world economic order has a pecuniary base made adjustment in this sphere less of a break with earlier tradition for the agriculturalists than for the pastoralists. This factor is also operative in some of the concomitant features of modern commercial enterprise, such as selling for profit or the institution of credit. One need but contrast the degree of business success of the Indians in the eastern part of Africa, for example, with the experience of Near Eastern traders in such a Nigerian city as Onitsha, where the Ibo marketwomen and shopkeepers hold a virtual monopoly of trade because of their skill in trading.

Underlying regional and areal differences are broader unities. Such elements of culture as unilateral descent systems, the religious importance of the ancestor—which is great even where ancestral worship does not predominate —and the consequent respect for age as evidenced in the role of senior members of any given grouping are found everywhere. This stress on age differences underlies the institution of age grades and the educational device of the puberty school, which has set a tradition that predisposes the African to formal training in literacy. Everywhere, also, we find an aboriginal tradition of land tenure that has as constants the concept that ownership of land vests in the community, that control over it by an individual persists only during its occupancy and use, and that the sanctions of tenure, in the final analysis, are supernatural. A pluralistic world view, with controlling but manipulatable forces near at hand, has made for a receptivity to Christianity and Islam, and goes far to explain the relation between separatist cults and nationalist movements.

The actual, as against the institutional, position of women is everywhere similar, whereby women play a decisive role, often unrecognized by outsiders, in determining attitudes and reactions and in shaping tribal policy. Nor can the African technique of social control through satire in song and narrative sequence, or the role of magic which as elsewhere in the Old World continues with functional significance, even where industrialization is most advanced, be overlooked when the major unities of sub-Saharan Africa are considered.

The retention of old ways under new conditions can be richly documented by comparing the accounts of early travelers with those of contemporary observers of present-day modes of behavior. On the other hand, we must also recognize the receptivity of the African to innovations, as is apparent from the instance of this noted during the early days of penetration of the Congo by Torday and Joyce among the Bushongo, whose traditions tell how one of their rulers, Shamba Bolongongo, had many years before traveled widely, bringing to them from the Bapende the techniques of weaving raffia fiber, the embroidery of raffia cloth from the Bakalai, and the planting of tobacco and the game of *mancala;* how he reformed the hierarchy of the court by naming representatives of the various trades to office; how he instituted military reforms by abolishing arrows and throwing knives as weapons and restricting arms to the sword; and how he added the police function to the duty of his soldiers.

If to traditions of this sort we add the historical implications of the migrations, conquests, and consequent mingling of peoples throughout sub-Saharan Africa down the years, we come to understand how the present situation, as regards cultural change, is nothing essentially new to the African, and that his techniques of adapting to innovation go deep into his past. Yet at the same time we cannot forget the local and regional differences in aboriginal culture, with the evidence they yield that despite contact and the resulting borrowing, African peoples have known how to maintain old ways as well as to accept new ones. Granting the primacy of the African in the African scene, the considered treatment of any given situation in the light of these two mechanisms is thus seen to be essential to adequate comprehension and skillful resolution.

Melville J. Herskovits, Ph.D., Evanston, Illinois, is professor of anthropology and director of the Program of African Studies at Northwestern University. He has long been interested in Africa, his doctoral thesis, published in 1926, having been concerned with the role of cattle in the life of the native peoples of East Africa. His first field research was in Dahomey in 1931; in 1953 he spent nine months in Africa, visiting all parts of the continent south of the Sahara, where he studied the problem of reaction to European contact, with special reference to the differentials under different degrees of mechanization and industrialization and in terms of the differing colonial policies of the governing powers.

Peoples and Cultures of North Africa

By PHILIPPE W. MARÇAIS *

OBLONG-SHAPED North Africa is bounded on the west by the Atlantic Ocean, on the north by the Mediterranean, and on the east by the desert which stretches into Egypt and the Sudan. In the south the vast emptiness of the Sahara separates it from Negro Africa. The ancient Greeks called this land Libya; the Romans called it Africa. Later, the Arabs referred to it as *Djeziret-el-Maghreb* ("Island of the West"). In the days of Turkish rule it was commonly known as Barbary or Barbary States. Since the beginning of the twentieth century it has been more usual to call it Africa Minor or North Africa.

The very vagueness of these names, as they have been used over the centuries, suggests that the area has never been precisely defined. Since a good definition, if needed, ought to be based upon some characteristic which is common to the entire geographic area, it might be best to call this area *Berbérie* (French term meaning "Land of the Berbers"), inasmuch as *Berbérie* denotes a certain amount of ethnic and cultural unity which the area does, in fact, possess. Politically, however, we distinguish today various sections of this Berber strip which borders the sea for 2,500 miles: Morocco, Algeria, and Tunisia, which together form French North Africa, and Libya, which includes Tripolitania, Fezzan, and Cyrenaica. The Sahara not only claims the largest part of Algeria but forms the continental base of all these countries, each of which offers many contrasts, lacks natural frontiers, and is being shaped by sentiments of nationality that are rising, though unequally, in all of them.

North Africa has an insular character, which the Arab conquerors of the seventh century had not failed to discern: it is "a block of highlands hemmed in by the seas and the sands." Its relief offers many contrasts. The Atlas Mountains—which form two parallel ranges, one on the coast and the other inland—cut the land into longitudinal zones; other ridges and ranges, running transversely, divide the zones into plains, plateaus, and depressions. Altitude is fairly high in the center of this mountainous system, but becomes quite low at its two ends, particularly at its eastern end (Tunisia and Libya). The climate presents a diversity even more striking than the relief. Temperate and humid on the coast, it is severe and dry in the interior, where contrasts are often extreme, with snow in the winter and more than 90 degrees Fahrenheit in the summer. Rainfall is extremely variable. Rains abound on the coast, particularly during the cold months, but are infrequent in the interior, where a harsh and enervating dry heat usually prevails. The vegetation shows the influence of this physical and climatic environment: scrubland and some forest in the mountains, fruit trees on the coast, grainfields in the valley and plains of medium altitude. The rest of the area consists of steppes and vast stretches of pasture land, often scanty in vegetation, until one reaches the palm-rimmed oases that dot the desert.

THE PEOPLES

To find any cohesion in a land of so many physical differences and con-

* Translated by George Horner and Mark Karp.

trasts, one must look for it in the human element. North Africa is essentially a Berber country.[1] The Berbers are the oldest ethnic group yet found in this area, although their origin is obscure. The few clues so far obtained from prehistory lead one to believe that the Berbers do not constitute a homogeneous race. By interpreting these clues, two basic types, both white, have been generally distinguished: *Mechta el-Arbi,* which strongly resembles Cro-Magnon man, and a pre-Mediterranean type. Anthropologists, on the basis of what they have learned about them thus far, classify Berbers into several types: (1) short, dolichocephalic, brown haired (perhaps related to the Mediterranean stock); (2) short, brachycephalic, brown haired (suggesting a Kurd type); (3) tall, dolichocephalic, blond haired, blue eyed (easily resembling a European Nordic); (4) the hybrid, who often resembles the second and third types, and in other cases shows a strong proportion of Negroid blood. One should not, therefore, speak of Berbers as if they formed a single race. One should, instead, speak of different Berber types, since it is possible to define different types in fairly precise terms. Moreover, it is certain that several types existed in North Africa in ancient times. From an anthropological point of view, therefore, North Africa shows great diversity, which has been further accentuated by numerous interminglings between different types of Berbers as well as of Berbers with many other racial elements.

The native population includes, in addition to Berbers, Arabs and Jews. Since the eighth century Arabs and Berbers have intermarried so often that it is not always possible to distinguish clearly between them. It is generally estimated that the two major Arab invasions brought about 400,000 men to North Africa, 150,000 in the seventh century and another 250,000 in the eleventh and twelfth centuries. In the interval between the two invasions, as well as later on, many smaller groups of Arabs probably immigrated into North Africa, but it is not possible to evaluate their numerical importance. The principal difference between Arabs and Berbers is language. Even language, however, cannot always be used as a distinguishing criterion, since there are many Berbers who now speak the language of their conquerors, while a few Arabs have adopted Berber speech. Nevertheless, it seems more reasonable to distinguish between Arabic-speaking and Berber-speaking groups than between Arabs and Berbers.

[1] The word "Berber" comes from the Latin *Barbari* ("Those who do not speak Latin").

Languages

As a natural consequence of the fact that the Arab conquerors came from the east, Arabic is, on the whole, used more widely in the eastern than in the western part of North Africa. Nevertheless, the distribution of Arabic- and Berber-speaking groups in the Maghreb is very uneven. Coming from Egypt, one meets the first Berber-speaking people in the oasis of Siwa, near the Cyrenaican border. Except for a few scattered villages in the Libyan desert, one meets no important Berber groups until one reaches Tripolitania, where the Berber-speaking Djebel Nefousa represent about 23 per cent of the population. Tunisia, on the other hand, has been thoroughly Arabicized. Berber is still spoken on the island of Djerba and in a few southern villages, but the number of Berber-speaking Tunisians represents only 1 per cent of the total population. In Algeria the percentage is considerably higher: 27 in the department of Constantine (including the Aurès Mountains and Little Kabylia), 34 in the department of Algiers (including Great Kabylia and the Atlas Mountains around Blida, Miliana, and Ouarsenis), but only 1 per cent in the department of Oran, where the use of Berber is limited to the mountains surrounding Tlemcen. In Morocco the percentage may be as high as 40. The Rif, the Middle and High Atlas, the Sous Valley, and the Anti-Atlas are Morocco's principal Berber-speaking areas. Berber is also widely used in the thinly populated Sahara. It is spoken at Touat, Tidikelt, and in most *ksours* of southern Oran; in Mzab and at Ouargla, south of Algiers; along Oued Ghir, south of Constantine; at Gadâmes, in southern Tripolitania; and throughout the area inhabited by the Tuareg—the eastern and southern portion of the Sahara, as far as Zinder.

Looking at North Africa's linguistic map, one may see how the ancient Berber language, which is of Hamitic origin and indigenous to the area, has lost much ground to Arabic. Unwritten Berber dialects, sometimes quite different from one another, have been preserved in such relatively inaccessible places as mountains (e.g. Kabylia), valleys (Sous), islands (Djerba), isolated communities (the *ksours* of southern Oran), or desert regions (the Sahara of the Tuareg). Everywhere else Arabic has replaced Berber. Several varieties of it are spoken in North Africa, although they all have roots in classical Arabic. The degree of similarity to classical Arabic varies greatly, however, depending on whether the language was introduced by nomad invaders (and there were several nomad invasions about which we have little knowledge) or whether it spread to the countryside from cities, as, for example, from Kairouan; depending also on whether the language remained relatively sheltered from neighboring influences or whether it was progressively modified, over the centuries, by contacts with Bedouins.

Arabic is also the language of North Africa's Jews, although a few Moroccan Jews speak Berber. Some Jews have ancient roots in this land; others are relatively recent arrivals. The largest group consists of Sephardic Jews who fled Spain during the Christian *Reconquista* of the fourteenth and fifteenth centuries. It is estimated that there are approximately 500,000 Jews in North Africa—250,000 in Morocco, 140,000 in Algeria, and about 100,000 in Tunisia. An additional 35,000 once resided in Libya, but nearly all were recently expelled. At one time North Africa's Jews lived in closely knit, mostly urban communities, which, except for language and some customs, borrowed little and kept apart from the rest of the population. The impact of European civilization on the Maghreb made itself felt with extraordinary rapidity among the Jews: it accelerated their exodus from the country to the cities, particularly in Tunisia, helped to end their segregation, as for example in Constantine, and divorced them from native customs and Arabic speech.

THE ECONOMY

Even though North Africa has a long seacoast, maritime activity never flourished in this area. In part this may be due to the dearth of good natural harbors; but more important in this respect seems to be the absence in the native population of that urge to go to sea that successively brought Phoenicians, Greeks, Normans, Spaniards, Turks, and in the last century Westerners, to North Africa's shores. Today only the activities of some fishermen on the Moroccan coast and in the Gulf of Gabès may be said to represent a native maritime tradition. Everywhere else in North Africa such navigation as is carried on bears the imprint of Spanish, Italian, Turkish, or other foreign influence.

The native economy is predominantly pastoral and rural. The repetitious succession of plains, mountains, fertile regions, steppes, and deserts creates a fairly uniform pattern, so that, owing to geographic factors, the pattern of native economic activities is roughly the same throughout the Maghreb.

Hunting and herding are undoubtedly the most ancient native pursuits. Today, however, hunting is no longer an essential activity. Even herding has been declining since the last hundred years, but much land is still devoted to it. Nomadic activities dominate the entire Sahara—from the Atlantic Ocean to the borders of Egypt, and from the Saharian Atlas to the bend of the Niger. In the winter the Bedouin, who subsists essentially on camel and sheep, stays near his water sources and palm groves; in the spring he moves toward more fertile lands, often walking hundreds of miles in search of pasture land for his herd; and in the fall he journeys back to his winter quarters. As instances of this seasonal rhythm one may cite the Larbaa tribe, who inhabit the Tell in the southern portion of the department of Algiers, and constantly engage in quarrels with other nomads and sedentary groups over questions of commonage; or the Ouled Sliman, who hibernate in northern Chad and move their flocks as far as the shores of Tripolitania.

"Commercial" nomadism is practically inseparable from pastoral nomadism. Once the caravans of "commercial" nomads provided a kind of liaison between white and black Africa. They imported slaves and facilitated the exchange of grain, dates, wool, butter, cattle, and salt between sedentary and nomadic populations. Today the caravans are only a memory. Their disappearance has impoverished Bedouin life. It has reduced the bold and warlike nomad to the status of a meek herder, whose sphere of activity is steadily shrinking.

The seminomads—such as the Beni Guil of Morocco, the Hamyan of Algeria, and the Hemamma of Tunisia—are found in the high plains that skirt the Atlas Mountains of the Sahara and of the Tell. They spend the winter in the steppes and the summer in the high plains. When going northward, they usually travel in small caravans. In some regions their movements form a fairly regular pattern, in others less so. They raise livestock, primarily sheep, but the continental climate is so hard on the herds that seminomads enjoy few prosperous years. The increase of acreage under cultivation by sedentary farmers reduces the amount of land available for grazing and thereby affects these small herders even more adversely than the nomads.

Mountain areas

The way of life in the mountains is very different. Although activities vary with the region and natural resources, rearing of livestock, agriculture, and arboriculture are the principal occupations. Irrigation has made possible the cultivation of cereals in the Atlas Mountains of Morocco, but farming is still secondary to the raising of sheep and goats, which is carried on despite the limited area available for grazing. Rearing of goats and cultivation of olive and fig trees are the principal means of livelihood in the Rif and Kabylia. In other mountain regions the same meager resources are relied on for a livelihood, supplemented only by the exploitation of forests. Unlike the inhabitants of the plains and steppes, who do not move into the mountains, many mountaineers migrate into the valleys and plains. They form the majority of the new population in the cities and provide the largest contingent of North African labor abroad. Overpopulation in certain mountain regions makes emigration necessary. Population density in one *arrondissement* of Kabylia, for example, is 200 persons per square kilometer (about 518 per square mile). Consequently the men must go elsewhere to find the means of supporting their families.

Coastal areas

The fellahs occupy the Atlantic and Mediterranean coasts, the long valleys watered by the *oueds*, the hills, the low-altitude plateaus, the plains of Constantine and eastern Tunisia, and the lowlands of the interior. They are either peasants who long ago became attached to the soil or former nomads forced by the precariousness of pastoralist existence to settle on the land. They grow cereals, more or less successfully, depending on the quality of the soil and the abundance of rainfall. Some of them, in addition, raise early vegetables and grapes; others raise sheep and goats. In eastern Tunisia they also cultivate olive trees, which the Phoenicians introduced in North Africa three thousand years ago. The peasants usually live scattered in small groups and hamlets; sometimes they form a village. Today, however, they are strongly attracted toward the modern cities. In the movement toward the cities, rural life is often but a transitional stage—lasting sometimes a few years, sometimes a generation—between nomadism and urbanism. The European colon plays an important role in the process of attracting and adapting the peasants to modern urban life. He is in contact with peasants when he employs them as *khammès* (farm hands), and even when there is no close association, the contrast between his way of life and that of the peasants has an influence far from negligible.

URBAN LIFE

Urbanism is no novelty in the Maghreb. It dates back to the founding of Carthage, the first important city in that area. Tunisia has had a large urban population since the Middle Ages. Almost one-fifth of Tunisia's 3,200,000 inhabitants live in cities, which include the capital city of Tunis, Bizerte, the holy city of Kairouan, Sousse, Sfax, and some large market towns in the Sahel. This may, incidentally, help to explain why an ancient, cultured, and refined bourgeoisie has been able to acquire a dominant influence in Tunisia. In the cities, traders and artisans are intensely active. Tunis, a very large city for a country of Tunisia's size, exerts a magnetic influence on the people. They stream in from all parts of the country in quest of education or of government jobs, or to attend public debates and trials.

Like Libya, which has only one large city (Tripoli), Algeria is a vast rural and pastoral country, without an urban tradition. Excluding Tlemcen, which culturally belongs to Morocco rather than to Algeria, the old cities—such as Algiers, Miliana, or Médéa—or at least the oldest parts of them, scarcely date back to the period of Ottoman domination. Other cities, such as Constantine, show the characteristics of Berber villages. Ports like Algiers, Oran, and Bône have greatly expanded; other centers on the coast and in the interior have hardly expanded at all. Those established since European occupation, such as Blida, Sidi-bel-Abbès, Sétif, and Batna, have grown considerably, though not sufficiently to be regarded as cities. Out of a total population of 8½ million, about 1½ million, as compared with about 200,000 a hundred years ago, live in cities. Urban life is therefore recent in Algeria. Its two major characteristics are the sizable proportion of Europeans and the rural origin of the native population. The native section of Algiers, for example, is largely inhabited by Kabyles. The newcomers

have submerged the old urban elements, the Arab *hadri* and the Turkish *kouloughli*. Lacking an ancient tradition, urban life in Algeria is becoming increasingly Europeanized.

The situation is different in Morocco, where the cities stand out in sharp contrast to the independent mass of Berbers in the mountains. Out of a total population of about 9 million over 1½ million, mostly natives, live in cities. There are some new cities, such as Agadir, Port Lyautey, and Casablanca. Casablanca has expanded enormously; its population is currently estimated at about half a million. But, in addition, Morocco has several ancient cities: Rabat, which functions as administrative capital; Salé, which is located directly opposite Rabat; Fès, a commercial city which has retained a medieval atmosphere; Marrakech, which once was an enormous Saharan village; and many others. All of them are constantly expanding. The lively activities of traders and artisans, bourgeois tastes, and polite manners help to preserve an urban tradition which is a blend of past glory, Andalusian heritage, and Berber contributions. By exerting a conservative influence through its traditional element and a revolutionary one through its new and sizable proletariat, the Moroccan city plays a vital role in the current development of the country.

Social Organization

Despite the large number of cities, some of which have served as local capitals, North Africa has never had a single capital because of the lack of political unity. This lack of unity is usually attributed to geographic factors, such as the elongated shape of the area, the character of its relief, its position between the sea and the desert, the absence of a natural center, and the lack of converging valleys. What should also be mentioned, perhaps with greater justification, are the clannishness of the natives and the fundamental antagonism between plainsmen and mountaineers, as well as that between sedentary and nomadic populations.

Arabs and Berbers have always shared a particular conception of social life. Their society is a web of numerous cell-like units in which the basic element is not the individual, but the patriarchal family, that is, a group of men united by blood ties and living together with their wives and offspring under the absolute authority of the oldest male, the *pater familias*. Each of the men, moreover, may have more than one wife. All members bear the family's name and share its food and shelter—which may be a tent, a *gourbi* (a Berber type of hut), or a house. Among rural and pastoral populations the family usually owns all property, including herds, fields, trees, and farm and domestic equipment. Most activities are organized on a group basis, each family category—men, women, and children—having a different task to perform. The woman's position is clearly inferior to that of the man. She may be married against her will, repudiated by her husband, or see herself joined by another wife. Among Berbers she is also excluded from inheritance. In daily life there is a strict separation of the sexes: the women must eat and attend to their tasks unseen by the men, who meanwhile attend to the external affairs of the community. The *kharrouba* of the Kabyles is the most typical example of this kind of extended family.

Kinship ties or spatial contiguity leads to the formation of larger groups, the douar (a group of tents) of nomads and the village or village quarter of sedentary populations. Douars and villages own land, grain reserves, silos, and granaries, some of which, as in the Atlas Mountains of Morocco and in the Aurès of Contantine department, are fortified. They are autonomous and intensely active social units, formed by the need for joint enterprise which arises from certain events in familial life and from such tasks of common interest as construction or management of rural works.

Several douars or villages often combine to form a still larger unit, the tribe. The tribe—which is called *qbila* in Arabic and *taqbilt* in Berber—is an ill-defined social unit. Not so long ago, when insecurity was rampant, it was based on military solidarity. Today it is generally based on common interests, which may include rights of pasture, wellsprings, and irrigation canals, and on an ancestral tradition of solidarity and *esprit de corps*. Once a week the men of the tribe get together and trade in the *souk*, or market. In Morocco there are also special markets for women. Among Arabs authority over the tribe is exercised by a sheik, *kebir*, or *caid*, who is chosen by the chiefs of the douars and villages. His position is no greater than that of a *primus inter pares*. He makes decisions and is advised by a council of notables, the *djemaa*. Among Berbers a male assembly manages tribal and village interests. Among Berber-speaking and highly conservative mountaineers administration and justice are based on custom, which in Kabylia is called *kanoun*—an ancient Mediterranean name meaning "canon," or "rule." Each tribe has its own body of customary rules and precedents, which are cited orally to decide each case of violation of tribal law and to fix the sanction—which may be moral, social, pecuniary, or penal. Custom varies with the region and easily adapts itself to local needs, but remains highly impervious to outside influences. The influence of custom is the most significant feature of Berber society. It divides the people into politically independent, xenophobic, and warlike blocs, always ready to enter into alliances, the *soffs*, for the purpose of fighting each other. This highly pronounced particularism is the principal factor that keeps North Africans divided into small groups, unable to rise above the notion of a confederation. Intense preoccupation with local interests prevents the formation of an Arab-Berber nation united by religious faith.

Religion

North Africa achieved religious unity following the introduction of Islam into this land by the Arab conquerors of the seventh century. The simplicity of Mohammedan dogma makes it directly accessible even to a population with a way of life as archaic as the one we have described. All that this dogma implies is complete surrender to the will of one God who has decided in advance the fate of every individual and promised eternal happiness to those who will believe in Him and heed the teachings of the prophet Mohammed. The requirements of Mohammedan religion are also quite simple. Every believer must fulfill five obligations: profession of faith, prayer, almsgiving, fasting during the month of Ramadan, and pilgrimage to Mecca. In addition, there is the fundamental concept of the rite, that is, prescribed speech and behavior, as well as the equally important concept of the difference between purity and impurity, from which prohibition of consumption of pork and alcoholic beverages is derived. Like Judaism, from which it originated, Islam is a highly formalistic religion. It is a complete system, the religious character of which permeates every aspect of life, whether individual or collective, familial or social. It guides thought, gives rise to institutions, inspires cultural activities, and forms the foundation of private and public law. Islam molds individuals and groups, and in this sense it may be said

that the civilizations which it has inspired consist of believers and communities which have no civic or national sentiment.

The Islamization and Arabization of North Africa occurred simultaneously. The Arab conquest gave rise to a succession of empires during which several cities, such as Kairouan and Fès, were founded. These cities became the principal centers of Islamic fervor, thought, and culture in North Africa. Through worship, education, and administrative measures the Arab conquerors' religion spread from the cities to the countryside, reaching at first the large villages, then the regions which could be penetrated with relative ease, and finally, though less effectively, the more inaccessible areas. The Arab Bedouin who invaded the steppes, plateaus, and valleys also played an important part in the process of Islamization of the country. Excepting the Jews, all North African natives are Muslims today, in the sense that they all claim to be Muslims and regard themselves as members of the same mystic community. In the cities, however, people are more strict, more orthodox, and have a better knowledge of Islam than in the countryside. Animism, beliefs in magic, and certain pre-Islamic ritual practices have survived, especially in the countryside. More precisely, it is the Berber-speaking groups which have retained, for the same reason that they have retained their ancient language and customs, most of the pre-Islamic cults of nature, beliefs in family genii, and women's superstitions. Thus a deep gulf separates the cities—where most people are pious largely as a result of education, worship in the mosques, and social pressure—from the countryside, where many pagan superstitions still obtain. An important movement of puritan reform led by the *Oulémas* (Muslim scholars and doctors of the law) has been active for several years in an effort to persuade North Africans to give up the popular brand of Mohammedanism, which includes religious brotherhoods and Marabouts (saints), in favor of orthodox belief and practice.

French Influence

More than a century of French influence in North Africa has brought about substantial changes in all fields. Population has increased enormously. In Algeria it has increased from 2 to 8 million in less than a century, in Tunisia from 1 to 3 million between 1867 and 1946, and in Morocco from 4 to about 9 million since 1912. In Libya the rise in population has been much less significant. The causes of this demographic development are many: among the most significant are the creation of conditions of security, the progressive elimination of famines, a wider distribution of the food supply, the decrease in epidemics, and better medical care of infants. Clearly, a people which believes that man cannot stay unmarried and that he has been created, as the biblical expression goes, to be fruitful and multiply, cannot fail to grow rapidly once it is afforded better protection against death.

The development of economic resources is keeping pace with the increase in population. An effort is being made to meet new needs by applying modern methods to agriculture and stock rearing which, in their traditional form, have for centuries constituted the basic elements of a precarious economic equilibrium. The tractor and the reaper-binder are used to cultivate vast tracts of land, where the soil is conserved and enriched; the old-fashioned plow, however, is still used in many places, where the yield is consequently low. Anyone visiting the countryside when farmers are at work in the fields cannot fail to notice the disparity between European and native techniques, as well as the attachment of the natives to primitive methods of cultivation. Other Western types of activity, such as construction of public works, mining enterprises, shipyards, and various industries, have helped to develop the country's resources, thereby increasing the food supply.

The creation of a new economy has tended to aggravate the disintegration of the traditional social system, although both processes have been taking place at the same time. In Algeria the old structure has been shaken as a result of early territorial and administrative revisions. The tribe has been reorganized and broken up into smaller units. Moreover, collective ownership of land has given way to individual ownership. Within the last few years a rural proletariat has appeared, particularly in former pastoral areas, although it is still disorganized and ill-adjusted to modern labor requirements. At present, however, the most serious social upheavals stem from the mass influx of rural population into the cities. A huge urban proletariat is in process of formation. Cities like Casablanca, Agadir, Algiers, and Oran at first attracted only a few individuals, later some groups, for whom housing facilities had to be improvised. Now entire families are moving in. Intelligent, but unskilled and having little or no technical training, these urban dwellers form an unstable labor force. Divorced from their own social system of communal values, they struggle to develop individuality of conscience and behavior.

As a last item, one may mention the existence of a labor surplus in North Africa. It consists almost entirely of Berber mountaineers. Many of them cross the sea to earn their living in France, where there are now about 300,000 North Africans.

Conclusion

These are, in brief outline, the major demographic, economic, and social problems of an immense country, which in trying to bridge the distance between primitive and modern times within a few decades faces a crisis of greatly accelerated growth. The native masses are only vaguely conscious of this crisis. The Algerian, Moroccan, and Tunisian elite, however, often show a deep and objective understanding of the problem. To them has fallen the responsibility of guiding, together with France, the necessary evolution of the countries into which North Africa is now divided. Increasing participation in administration and government enables these elite to approach that political maturity which alone can justify national aspirations.

Each of the North African countries currently claims an identity of its own: Libya is a state of mixed population with a Bedouin majority; Tunisia has an ancient oriental civilization; Algeria has been westernized in the course of a century; and Morocco can be distinguished by its Berber particularism. All of them, however, must solve the basic problem of woman's emancipation before they can become modern states.

Philippe W. Marçais is professor at the Faculté des Lettres of the University of Algiers and the author of several books on North African linguistics, ethnology, and sociology. He is currently engaged in an ethnographic and linguistic study of the Fezzan.

Past and Present Role of Africa in World Affairs

By Harry R. Rudin

THAT Africa, the continent nearest Europe, should be the last great area of the globe to attract the exploring and exploiting attentions of the Europeans is a matter requiring explanation. In earlier times Africa had not escaped the attentions of other peoples in the Mediterranean world. Phoenicians, Greeks, Romans, and Arabs had at various times exercised control over all or parts of North Africa, where the remains of their cultures are still discernible. Arabs, who had dominated the Indian Ocean from the sixth century on, established settlements on Africa's east coast, where they engaged in trade for gold, spices, and slaves. Arab influence was weakened with the coming of the Portuguese in the sixteenth century, but in the seventeenth century, under strong rulers of Oman, the Arabs started to drive out the Portuguese and to re-establish Arab power, which persisted into the late nineteenth century.

Unknown Africa

In that period of curiosity called "the Age of Discovery" Europeans knew very little about the great kingdoms and empires that existed in the Chad and Upper Niger regions. Here were great states that filled their history with wars and conquests, states that had very elaborate political systems, even important universities. The Songhai kingdom on the Upper Niger near Timbuktu had an impressive polity and economy long before the first Elizabeth ascended the throne of England. States of great significance existed in this part of Africa near the end of the nineteenth century and had to be dealt with by either war or diplomacy before the colonial powers of Europe could establish any measure of control.

Early in the fifteenth century people in Western Europe knew of rich lands beyond the Sahara Desert from which gold and slaves came into North Africa and Muslim Spain. Getting into these regions was one of the purposes behind the cautious explorations of Portuguese sailors along the west coast of Africa under the sponsorship of Prince Henry the Navigator. A simultaneous desire of Europeans to find a shorter route to the even greater wealth of the Far East was a more powerful incentive to get around the massive continent that barred the way. Those who looked in the west for that shorter route to Cathay found a different obstacle, North and South America; but these lands invited exploration and exploitation and were found to possess such wealth as to make most Europeans forget their original quest for a short cut to the Far East. The harbors, rivers, and climate of the Americas tempted whites into the interior, where they could settle, develop plantations, and in other ways exploit the resources of a rich continent. In Africa the inhospitable climate and hostile natives, the lack of good rivers and harbors giving easy access into the interior tempted no Europeans into penetrating the continent. So far as Africa's promise of wealth went, Europeans had to be satisfied with trading posts along the west coast to obtain gold, ivory, and slaves. In the seventeenth century there were numerous posts of this commercial character, established by "adventurers" from France, Portugal, England, Sweden, Denmark, the Netherlands, Prussia, and even the Duchy of Kurland.

Greater Importance of Far East and America

The first actual settlement of European colonists in Africa was that started at the Cape of Good Hope in 1652 by the Dutch East India Company, which, like similar trading companies from other European states, sought to make itself the successor of the Portuguese in the Far East. This colony served as "the Tavern of the Seas," where sailors could break their long and scorbutic voyages to India and the Spice Islands and put in for fresh food and water. In the course of time the colony grew, its population increasing as a result of religious persecutions in Europe that caused Huguenots and others to seek asylum here. With the increase of population, people moved into the rich farm lands of the hinterland, despite the wishes of the Dutch East India Company. As these colonists moved northward they made their first violent contacts with the Bantu people, who were being forced out of their original home in the lakes region of Central Africa by the pressure of incoming Hamitic peoples. This was the beginning of South Africa's relations with the Bantu, relations that have not lost their violent character in the middle of the twentieth century.

Until the nineteenth century Africa was of secondary interest to Europeans, who were much more concerned about the wealth possible either by trade with the Far East or by plantations in the Americas. For the Far Eastern trade Africa offered its shores for way stations; for the American plantations it offered the labor of its slaves. It has been estimated that during the three centuries or so of the European slave trade in West Africa twelve to fifteen millions of slaves were taken from their homes for work in America. This Christian slave trade had a shorter history than that of the Muslims on the east coast; but it should be pointed out that many of the slaves traded by the Arabs achieved positions of great influence in the Muslim countries, involuntary though their presence there was. The slave trade of Western Europe came to an end after the strange prickings of conscience in the humanitarian eighteenth century led men in the first half of the nineteenth century to the abolition of the trade and of slavery itself.

During the wars of the French Revolution and of Napoleon the British were anxious to maintain and protect their growing trade in the Far East. There was a danger that the French, having conquered the Low Countries, might make themselves masters of the Dutch colony at the Cape and thus be in a strategic position to interfere with British commerce. To anticipate the threat, the British occupied the Cape in 1795. France's countermove was to send Napoleon to Egypt in the hope of recovering the position that France once held in the Levant; the French also hoped to destroy the base of British power by the recapture of India, with Egypt used as the springboard for military operations. Although the British abandoned the Cape in 1803, they retook the place soon thereafter and annexed it to the Empire in the treaties that marked the collapse of France's costliest effort to defeat her traditional rival. Thus the British made sure of their route to India and China at the time they abandoned the slave trade, as if to symbolize the fact that, with the disappearance of the traffic in human beings, Africa had value only as it protected the routes of the Far Eastern trade.

The Suez Canal

This interest in the Far East kept alive the interest of Europeans in Africa.

The defeat of Napoleon in Egypt did not end French activities in that part of Africa. One of Napoleon's schemes was to shorten the route to Asia by reconstructing at Suez the canal that had existed in ancient times. His defeat meant that he was not the one to carry out this plan. But Frenchmen revived the plan in the 1830's, when they threw their support to Mehemet Ali of Egypt and his grandiose schemes of conquest in the Near East. It was not until 1855, however, that the Viceroy of Egypt awarded to Ferdinand de Lesseps the concession for the construction and operation of a canal at Suez. That Frenchmen should have control of a route that cut by almost 50 per cent the distance between Liverpool and Bombay was unthinkable to the British. They marshaled every conceivable argument against the scheme. This verbal attack failed and the British had to accept the accomplished fact of the canal, the opening of which was a gala occasion in November, 1869.

In 1875 the bankruptcy of the Egyptian khedive enabled Disraeli to acquire for Britain the shares that the improvident ruler offered for sale. Contrary to the belief of many Americans, the British did not acquire control of the canal by this purchase, which represented 44 per cent of the total number of shares. Despite their holding so many shares, under the constitution and bylaws of the Suez Canal Company the British have only ten directors on a board of over thirty. Even the occupation of Egypt in 1882 by the British did not give Britain control of the canal, which belongs to the Canal Company, holding a ninety-nine-year lease. According to the convention signed by the powers in 1888, the canal must be neutral and open to trade in times of both war and peace. Under the terms of the original concession of a hundred years ago, the Canal Company must hand the canal back to Egypt in 1968.

EXPLORING AND PARTITIONING AFRICA

The explorations that made inner Africa known to Europeans were the work of the nineteenth century, for the most part of the second half. Except for a small area here and there little was known beyond the coastal rim prior to 1800. Opening up the interior can be said to have its systematic beginning with the founding of the African Association in England in 1788. In 1795 the Association sent out Mungo Park to find out where the waters of the Nile entered the sea, if they did. Some people believed that the Niger had connections with the Nile; others that its waters entered the sea in what was later discovered to be the mouth of the Congo; and still others believed that the river emptied its waters in a lake in the Sahara. Similarly fantastic notions existed as to the course and source of the Nile. Early maps of Africa show the Nile and the Niger running here and there in the interior with little regard for the physiography made known by the explorers of later times. Between 1820 and 1850 the mysteries of the Niger were solved, and an acquaintance had been made with the powerful Muslim kingdoms in the Niger and Chad regions. The snow-covered peaks of Kilimanjaro and Kenya were first seen by Europeans in 1849. The Nile kept the secret of its sources until 1870. The work of David Livingstone and of H. M. Stanley in the 1860's and the 1870's gave the world its first reliable information about the Congo's vast system. It is difficult to believe that much of our knowledge of Africa is less than a hundred years old.

The partitioning of the continent was precipitated by the convocation held in Brussels in 1876 at the invitation of Leopold II of Belgium, who professed a great interest in the humanitarian work of exploring and civilizing the Congo. Later, Leopold employed Stanley, who made hundreds of treaties with the Africans in the Congo. Leopold told the world that it was his purpose to create a federation of native states in Africa and that he would be their European representative. While engaged in this work for Leopold, Stanley found Brazza engaged in similar work for the French. Both the English and the Portuguese were aroused to a recognition of their own interests by these activities of the French and the Belgians; in their fear they signed a treaty that would have blocked the French and would have nullified plans for the international control of navigation on the Congo. So loud and strong were the protests all over the world against this treaty that the British government did not press for its ratification by Parliament. Out of this dispute over the treaty came the conference at Berlin in the winter of 1884–85, when arrangements were made for freedom of trade in the Congo Basin, for navigation on the Congo and Niger Rivers, for the suppression of slavery, for restrictions on the sale of arms and liquor, and for recognition of the principle that, to be valid, occupation of lands in Africa had to be effective. The race for lands in Africa was on; but it was finished soon after it had begun. By 1890 the vast continent had been virtually divided, a process that had occurred with the force of an explosion, so short was the time it had taken.

Importance of commercial and territorial expansion

To account for this unusual historical phenomenon is no simple task, particularly since the relevant archives have yet to be studied before scholars can know why this or that part of Africa attracted the attention it received. This rather sudden revival of imperialism had been preceded by a mood and a policy of anti-imperialism of varying degrees of strength in the several states of Western Europe. Anti-imperialism had been based essentially on the arguments of Adam Smith and his school, who believed it was uneconomic to possess and administer overseas colonies. Industrialism and its concomitants gave such persuasive powers to this point of view that people were convinced toward the middle of the nineteenth century of the need of loosening the bonds that subordinated colonies to the mother country and of letting colonial trade follow its natural course to the greater material advantage of all concerned.

This anti-imperialist sentiment disappeared rather quickly in the 1870's, when a general depression sent Europeans on a quest for new markets outside Europe. To prevent the dumping of surplus goods on domestic markets by their neighbors, they first raised their tariffs. But a tariff offered no protection to the overseas markets scattered here and there along the African seaboard and elsewhere; nor could a tariff alone enable Europeans to dispose of the surplus goods glutting their warehouses at home. By the formal occupation of territories in distant parts of the world, Europeans protected the trade they had there by making doubly sure that other governments could not move in and exclude them. The reader should be warned, however, that the protection of markets was not the sole reason for occupying territories in Africa and elsewhere; on the contrary, there were places where countries proceeded to occupy lands without the prior investment of a single penny, sou, or pfennig.

The seizure of lands in faraway places is so full of the drama of high adventure as to give to colonies a more important role than they actually possessed. As a simple matter of fact, the great commercial expansion that took place in other than colonial areas was of vastly greater economic significance to countries in Europe than the economic activities taking place in places where the exciting seizure of territory placed Eu-

ropeans in positions of mastery over peoples of other races.

The partitioning of Africa gave direction to the vectors of interest followed by European countries. Having acquired possession of South Africa in 1815 and control of Egypt in 1882, Great Britain, particularly Cecil Rhodes in the 1890's, cherished the dream of a rail connection between these two places located a continent apart. The dream was never realized; but the effort to give it substance had a decisive influence on Britain's relations with other European countries in Africa—with Portugal, desirous of linking Angola and Mozambique; with the Congo Free State eager to have access to the Nile and the Sudan; with Germany, where a few high officials sought to create a *Mittelafrika* of ample dimensions out of territories belonging to Germany and to others; with France, seeking a trans-African empire by the union of French Equatorial Africa with French Somaliland in a venture that ended at Fashoda; and with Fascist Italy, believed to be trying in World War II to link Libya with the large Italian Empire created in East Africa by Mussolini with the conquest of Ethiopia in the 1930's.

Diplomatic agreements

While disputes of varying degrees of intensity arose in Africa to disturb the relations of European countries with one another, the fact remains that European powers did not find in these African squabbles reasons for going to war. It can even be said that Africa offered the powers the means of diplomatic accommodation in agreements providing for the exchange of territories. The foundations of the Anglo-French Entente of 1904 were laid in Morocco and Egypt, the French getting from the British a free hand in the former by giving the British a free hand in the latter. That the peoples native to these two areas were not consulted illustrates the fact that innocent victims are often sacrificed on the altars of international friendship. Other parts of Africa had a similar role to perform in the many agreements that Europeans made with one another between 1890 and 1919; actually even later, when one considers the negotiations with which Fascist Italy embarrassed both Great Britain and France in the twenties and thirties to get the fulfillment of promises made in the secret treaty of London in 1915 that Italy would get territorial compensation in Africa if France and Britain took possession of Germany's African colonies. Thus there is a sense in which it can be said that Africa contributed to the peace of Europe.

Economic base for Europe

Beyond that contribution, Africa and those other parts of the world engaging the commercial and colonial attentions of Europe combined to place an international economic base of broad proportions under the rapidly developing life of Europeans. Here is the explanation for the unfulfillment of the dire predictions made by Malthus at the beginning of the nineteenth century. Instead of the wars, famines, and plagues foreseen by this Cassandra in a clerical collar as nature's method for keeping the population of Europe within the limits of Europe's own food supply, this internationalization of the European economy brought in such quantities of food and resources as to enable the population to grow from 187 millions in 1800 to 400 millions in 1900. It also gave Europeans the highest standard of living in their history, ridding them of the famines that had been occurring about every ten years from earliest times.

A later prophet, Karl Marx, predicted that the factory system in Europe would create recurring crises in overproduction, leading inevitably to the need of state

intervention to possess or to control the instruments of production and distribution. The fulfillment of these predictions was postponed for two generations by this overseas extension of Europe's economy. The depression of the late twenties and early thirties could not find a solution in the kind of world-wide economic expansion that brought Europeans into Africa and all over the world in the 1880's. The inability of our times to find an extra-European solution has resulted in the return of the regulatory state of mercantilism and the steady disappearance of laissez faire. As a part of this broad economic expansion of Europe Africa made its contribution to Europe's prosperity and even to her polity.

AFRICA ESSENTIAL TO THE WEST

In recent decades Africa's economic contribution has changed considerably. In the 1880's, apart from the gold and diamonds of South Africa, the commodities sought by Europeans were ivory, palm oil, palm kernels, natural rubber, precious woods, and the like—in general, articles that were part of Europe's luxuries. The private trader was the agent who sought these goods and sold them for a profit. In the twentieth century technology has given us vastly different needs for our prosperity and our security. In addition to the private trader, governments are now interested in the exploitation of Africa, especially where critical minerals are concerned. These changes have given Africa an importance that was not dreamed of seventy years ago. Manganese is now needed in the manufacture of steel; cobalt and columbite are essential for the production of the heat-resistant steels used in jet planes; industrial diamonds have found new uses endlessly in modern industry; chrome, copper, lead, zinc, bauxite, and tin are no longer in adequate supply in the West but have been found in Africa. America is now importing iron ore from Liberia for steel plants lacking adequate domestic sup-

TABLE 1—MINERALS EXPORTED FROM AFRICA, 1938 AND 1950

Colony	Mineral	Quantities Exported	
		1938	1950
Nigeria	Tin ore	23,489,000 lbs.	25,574,000 lbs.
Do.	Columbite	0	2,354,000 lbs.
Gold Coast	Manganese	726,000,000 lbs.	1,593,000,000 lbs.
Do.	Bauxite	0	114,948 long tons
Sierra Leone	Chrome ore	498 long tons	13,909 long tons
Tanganyika	Diamonds	3,590 carats	131,237 carats
Northern Rhodesia	Copper, blister	413,700,000 lbs.	487,158,000 lbs.
Do.	Copper, electrolytic	77,803,000 lbs.	164,166,000 lbs.
Do.	Lead	(?)	27,730,000 lbs.
Do.	Zinc	14,969,000 lbs.	50,792,000 lbs.
French Equatorial Africa	Diamonds	16,003 carats	116,481 carats
Belgian Congo and Ruanda-Urundi	Refined copper	154,870 metric tons	167,007 metric tons
Do.	Tin	1,813 metric tons	4,020 metric tons
Do.	Tin ore	6,657 metric tons	16,353 metric tons
Do.	Diamonds	5,759,000 carats	2,457 kilograms
Do.	Cobalt	5,401 metric tons	9,026 metric tons
Angola	Diamonds	671,000 carats	555,000 carats

TABLE 2—EXPORTS FROM AFRICA TO THE UNITED STATES, 1938 AND 1950

Colony	1938 (Thousands)	1950 (Thousands)
Nigeria	$ 3,290	$36,974
Gold Coast	6,591	64,450
Sierra Leone	215	1,430
Tanganyika	855	6,205
Kenya and Uganda	2,645	13,744
Northern Rhodesia	15,572	30,299
Southern Rhodesia	1,851	6,939
Nyasaland	3	417
French West Africa	1,484	3,756
French Equatorial Africa	11	39
Belgian Congo, Ruanda-Urundi	1,039	25,495
Angola	180	10,316
Mozambique	209	3,831 [1949]
Liberia	1,030	13,921 [1949–50]

plies. The uranium of the Belgian Congo and of South Africa is an absolute need in the manufacture of atomic weapons. Since the craving appetites of Mars and industry are difficult to satisfy, prospecting is being feverishly carried on in all parts of Africa as new sources of supply are sought for our prosperity and our security. The changes that took place in this regard in Africa between 1938 and 1950 are apparent from Table 1.

There is another way of representing the growing economic significance of Africa to the West. In dollar values the exports of Kenya and Uganda, Northern Rhodesia, Southern Rhodesia, Nyasaland, and Tunisia increased two and a half times between 1938 and 1950. In the same period Gold Coast exports increased nearly three times; those of Nigeria three and a half times; those of the Belgian Congo and Ruanda-Urundi, French West Africa, and French Morocco four times; those of Angola five times; and those of Liberia eight times.

In the past the United States never manifested much interest in Africa, certainly not enough to make the occupation of territory by Americans at all likely. Americans out of New England appeared on the east coast of Africa in the early nineteenth century as whalers, or as traders interested in slaves, ivory, hides, tortoise shell, gum copal, and so forth. On the west coast American humanitarians were behind the colonization society that founded Liberia as a home for emancipated slaves. Americans were the first to recognize the Independent State of the Congo, for reasons that gave evidence of considerable political naïveté on our part; Americans fought the Barbary pirates; and Americans established in the eighteenth century with Morocco relations of a very friendly character, which have suffered much in recent years. It was during World War II that Americans found Africa of a critical importance. North Africa acquired strategic significance as a base of operations for the reconquest of a Europe overrun by Nazis; and here and there below the Sahara Americans established air bases that had a necessary role in the task of winning the war. It is as a source of strategic minerals, however, that Africa has assumed a major importance for the United States. Table 2 makes clear our country's growing share in African exports.

Just as the Entente victory in 1918 resulted in territorial rearrangements in Africa, particularly with regard to the colonies of Germany, so also World War II resulted in important decisions regarding Italian possessions. There

was no difficulty about Ethiopia, who recovered her lost independence. With regard to the other territories of Italy, the big powers of the West desired arrangements that would exclude Russia from Africa and from the eastern Mediterranean; hence, the long lapse of time between the signing of the peace treaty with Italy in 1947 and the final disposition of the Italian colonies. The French, the Arabs, the Russians, the British, and even the Americans all had particular and conflicting interests in the future of Libya—territorial, political, strategic. After long and at times intemperate debate the General Assembly of the United Nations voted to make Libya independent, a decision that became actuality on December 24, 1952. Eritrea was made autonomous for local affairs and federated with Ethiopia. Italian Somaliland was put under Italian trusteeship for a period of ten years; during this period the people are to be prepared for independence.

Because of the cold war in the middle of the twentieth century Americans cannot limit their interest in Africa to mineral resources alone. As the leader of the West against the threat of aggressive Communism, the United States is making strategic use of North Africa in case it should again become necessary to come to the aid of a Europe overrun by invaders from the east. Stretching from Casablanca in the west across North Africa to the Suez Canal (there is now an American director on the board of the Canal Company) lies the main strategic defense for the West, marked by air fields and naval bases. It is in connection with the methods whereby the United States acquired the right to construct air bases that the formerly friendly relations between Americans and Moroccans have grown cooler. Despite the assistance given by America to win her independence, Libya had long shown herself less than eager to accept the presence of an American air field built years ago; it was finally accepted as accomplished fact by the Libyan government only a few weeks ago. In both Tunisia and Morocco there were loud outbursts of opposition when these French protectorates were brought within the defense perimeter of NATO. From these reactions to the West in North Africa one can deduce only that the strategic line constructed there rests on a foundation of sand in more senses than one, for behind the demand for independence is the understandable desire not to be in the front-line trenches of a third world war.

Europe's needs

Like the Americans, Europeans are becoming aware of their increasing need of Africa. The independence that has come to Asiatic lands has narrowed considerably the international economic base on which Europeans formerly rested their security and prosperity. As the territorial base of European life contracts, so also the commercial base, as tariffs, exchange restrictions, quotas, the lack of foreign exchange, and other factors interfere with the freedom of goods to move across international lines or with the ability of peoples to get the resources their security and prosperity require, despite the Atlantic Charter's promise of equal access to the resouces of the world. There has also come in recent decades a contraction of the areas into which European surplus populations could move and settle down. Now such peoples must remain at home, where governments try to solve their problems by increasing food production in Africa (a continent that cannot feed its own growing population), and by using Africa's resources as a means for paying for the food that has to be imported. Portugal has a plan for settling hundreds of thousands of her people in

African territories despite the fact that Africans are in virtual rebellion where whites have settled in large numbers.

THE COLD WAR

It is ominous that, just when the West needs Africa most, Africans are demanding greater freedom and better economic opportunities for themselves. This conflict of interests has come when the West finds itself involved in the cold war with Russia. In addition to the places already named, troubles of the gravest sort have developed in Kenya and are threatening to break out in the Union of South Africa. In 1954 after much haggling Egypt succeeded in getting the British to withdraw their 80,000 troops from the Canal Zone and to abandon the Empire's greatest military base.

We may well raise the question whether Africans will take their stand on the side of the West in the impending showdown with Russia. It is perfectly clear that they are no longer satisfied with a continuing colonial status, despite the bold and costly colonial development schemes worked out by their colonial masters since the end of World War II. For their struggle against the metropolitan powers the West has given rather effective weapons to the Africans—verbal ones in the promises of the Atlantic Charter and the Charter of the United Nations, political ones in the organs of the UN. In their efforts to win greater freedom the Africans can count on the sympathy of countries that have but recently won their independence and on the support of the Russians, who miss no opportunity to make it clear that they are still fighting capitalistic imperialism and that the best way to effect the collapse of capitalism is to undermine its imperial foundations. Quite unintentionally, in their successful wars against Italy and Germany in this century, the powers have convinced many Africans that there is little hope of getting their status improved unless their masters are first defeated in war. Thus, unless colonial powers undertake the kind of revolutionary policies adopted by Great Britain for making the Gold Coast and Nigeria self-governing, the danger exists that Africans may find their interests at this point bound up in a Russian victory over the West. It is difficult to avoid the conclusion that Africa may prove to be a greater obstacle on the road of the West to a peaceful and prosperous future than she was centuries ago on the route of the West to the riches of Cathay.

Harry R. Rudin, Ph.D., New Haven, Connecticut, is Colgate Professor of History and chairman of the History Department at Yale University. He is author of Germans in the Cameroons, 1884–1914 (1938) and Armistice—1918 (1944) and of articles on Africa and European diplomacy.

African Economies: Basic Characteristics and Prospects

By FRANK R. LA MACCHIA

A GENERAL survey of African economies presents formidable difficulties. The problems are complex, and changes are occurring so rapidly as to render generalizations which were valid only a few years ago highly questionable today. Africa cannot be characterized briefly and accurately as either poor or wealthy. It cannot be stated categorically that it is or is not a continent of "vast, untapped resources." The fact is that a great deal has yet to be learned about the potential wealth of Africa. There is a considerable body of knowledge of the resources of Africa, but the greatest part of the work in the fields of mapping, geological and topographic surveys, mineral, soil, and hydrological surveys, and the systematic compilation of meteorological data still remains to be done.

In the following discussion, it is proposed to highlight: (1) the existing resources and potentialities of the African economies; (2) the nature and effects of economic change; (3) the position of Africa in the world economy; and (4) the character of forces favoring or resisting orderly economic development. In doing so, it is hoped that certain misconceptions will be erased and further thought and discussion stimulated.

BASIC ECONOMIC RESOURCES AND POTENTIALITIES

The economies of Africa have in common underdeveloped human and natural resources. Low incomes are universal, ranging widely from perhaps $30 a year per capita in the least advanced areas to $250 in the Union of South Africa. Most countries would probably fall in the $40 to $70 range. The great majority of the people are farmers and pastoralists, producing largely for subsistence but also increasingly for sale. Standards of food consumption are low, diets are deficient in protein, and famine in certain areas is not unusual. Capital formation has been a slow and difficult process, relying principally on the investment of European governments and enterprise. Local savings are generally meager but are increasing as the habit of saving spreads with the growth of the money economy.

In spite of these similarities, the African economies are at different levels of development. Some are more advanced than others in methods of production, income, and standards of living. All combine in varying degrees elements of subsistence and money economies. These differences are due to factors such as climate, soil fertility, availability and accessibility of mineral and water resources, the extent and nature of European settlement, enterprise, and influence, indigenous trading habits, and the use of money.

In the Union of South Africa, extensive mineral resources have combined with a moderate climate to attract the largest population of Europeans in Africa. They have applied the requisite technology and with the aid of foreign capital have developed large primary export industries. They have also provided a sufficiently large and prosperous internal market to generate substantial growth of manufacturing industries. These developments have in turn fostered the growth of a large urban, Afri-

can wage-earning population, as well as the widespread use of money throughout African villages. Similarly the Rhodesias and French North Africa have attracted large numbers of Europeans, thus providing the major stimulus to investment and development. In British West Africa there is no European settlement of any consequence, but European influence in the form of missionary effort, trade, investment, government, and law has been exerted for nearly two centuries.

Abundant rainfall in certain of the coastal areas of West Africa favors the production of tree crops. The bulk of the world's cocoa and palm kernels and oil is produced here by African farmers. British West Africa, besides being the world's largest producer of cocoa, has substantial mineral resources. It is one of the largest producers of manganese and the largest producer of columbite, and substantial quantities of tin, gold, and diamonds are mined there.

The Belgian Congo throughout most of its area has abundant and well-distributed rainfall, which provides the basis for its great variety of crops. The Congo's economy is as dependent on its agricultural exports as on its better-known mineral and metal output. Crops produced for export include tropical tree crops—coffee, palm kernels and oil, tea, rubber, cocoa, and bananas—as well as a variety of field crops such as cotton and groundnuts. The Congo's diversity, magnitude, and quality of mineral resources are almost legendary. Besides being the world's largest source of industrial diamonds and cobalt and a major producer of copper, tin, and uranium, it also produces appreciable quantities of manganese, gold, and zinc. European enterprise not only owns and operates the mining and ancillary industries but contributes the largest proportion of agricultural production. Africans produce virtually all of the cotton, and some of the palm kernels and oil, coffee, and groundnuts.

Soils

The African environment is on the whole an exceedingly difficult one and often presents problems which have only long-term or costly solutions. In a continent essentially agricultural, the conditions of agriculture are generally unfavorable and result in acreage yields which are far below world averages. Soils vary greatly in fertility but are generally mediocre or poor. Many areas are seriously eroded or exhausted as a result of recurring torrential rains and poor farming practice. In many areas soils are so constituted that after a rain they harden and render cultivation exceedingly difficult. It is increasingly open to doubt that plowing in tropical areas is the correct method of working soils, since this may result in rapid oxidation of organic matter on exposure to tropical temperatures.[1]

Water

Water is also a major problem. Rainfall in many areas fluctuates enormously in timing and quantity from year to year. Unfortunately, the indigenous people of Africa have not, generally speaking, acquired the techniques of irrigation and water storage, drainage, and flood control. Relatively little land even in areas of European settlement is actually under irrigation. There are under way large irrigation projects in French North Africa and experimental schemes in Southern Rhodesia, but the problem has hardly been tackled in most areas. There is in addition an urgent need for many more wells and boreholes and storage dams to supply the consumption requirements of human beings and livestock.

[1] See L. D. Stamp, *Africa: A Study in Tropical Development* (New York: John Wiley and Sons, Inc., 1953), pp. 97 ff.

Shortage of capital

The generally low incomes of African farmers limit the supply of capital for investment in equipment. Agricultural credit is sorely needed, but often no credit facilities exist. Where they do, the risks involved in extending credit to indigenous farmers may be considered too great because, without security of tenure, they lack the desire or ability to make real improvements on their farms.

Population pressure

Rapid population growth in such areas as Nyasaland, Southern Rhodesia, Kenya, and French North Africa has resulted in fragmentation of the land into units too small to provide an adequate means of subsistence. Without countermeasures, malnutrition and deficiency diseases become more widespread and production of crops for sale tends to decline. By contrast, in certain areas settled by Europeans, there are large landholdings, often underutilized and undercultivated.

The expanding population in much of Africa south of the Sahara has thus limited severely areas on which Africans may carry on their traditional practice of "shifting cultivation." Accordingly, periods of fallow have been reduced to the danger point. There is inadequate knowledge and little understanding of crop rotation, fertilizers, the need for terracing slopes, and other methods of soil conservation and rehabilitation.

There are now under way programs of agricultural development designed to attack some of the problems cited and to help realize the limited potentialities of African agriculture. These include extension services, education in agricultural schools, experimentation, free distribution of fertilizer, and the establishment of agricultural credit institutions. Road programs are helping to expand production by providing readier access to markets. Large areas throughout tropical Africa could be brought under cultivation if it becomes economical or absolutely necessary for survival to clear tsetse-fly areas. The tsetse fly, the vector of trypanosomiasis—sleeping sickness in humans and nagana in cattle—covers vast areas of land throughout tropical Africa, for example, two-thirds of Uganda and half of Northern Rhodesia.

Labor problems

The problems of human resources in Africa are no less formidable than those of the physical environment. Although in certain areas population pressure is acute, the chronic and major problem in Africa is the inadequacy of the labor supply, both quantitatively and qualitatively. The continent is sparsely populated by about 16 to 18 persons per square mile. This average density does not reflect the existence of serious population pressures in North Africa, Nyasaland, Ruanda-Urundi, and parts of West, Central, and South Africa.

In areas of rapid economic growth in the postwar period, labor shortages have been acute. These shortages are due in part to the small labor force but also to the inability of the African subsistence populations to adapt rapidly to the requirements of the Western economic system. In the early history of European penetration, compulsion was frequently resorted to in an effort to obtain sufficient labor. Today forced labor is less prevalent and is limited mainly to certain areas where labor on public works is exacted for failure to pay taxes, or where administrators are authorized to requisition labor in an emergency and for the maintenance of village roads. Private employers have to rely on the usual incentives to attract and keep labor, and on recruiting services such as those in the Union of South Africa and

Southern Rhodesia, which recruit mainly from Mozambique and Nyasaland but also from as far away as Tanganyika. In Southern Rhodesia, a free transportation service is provided for immigrating Africans.

Incentives

Incentives have been inadequate and not of the type which would induce Africans to remain in employment. Labor turnover rates of 200 and 300 per cent are not uncommon. Africans newly arrived in the towns and employed for the first time in a Western-type firm for money wages do not respond to money incentives in the same way as do urbanized Africans, whose responses are by and large not distinguishable from those of Europeans. Rural Africans leave their villages because the land no longer provides the means of subsistence, but perhaps also frequently out of curiosity and a desire for adventure. For them it is a demonstration of manhood and independence and an opportunity to bring back highly prized possessions such as bicycles and treadle sewing machines, which greatly enhance their owners' prestige. Thus the newcomer is often a "target laborer," who is interested in earning only enough money with which to purchase specific articles. The sooner he earns it, the sooner he leaves employment. Although this type of labor still exists, it is being reduced as the towns acquire an increasingly large proportion of married men with their families who consider themselves more or less permanent urban residents.

Productivity

African labor is largely undifferentiated, unskilled, and inefficient by Western standards. Wages are therefore extremely low by the same standards, although it is probable that they are in general even lower than their efficiency justifies. The reasons for low productivity among Africans are quite apparent. Most Africans are subject to a wide variety of diseases and usually are afflicted with several at a time. Malaria appears to be the most widespread and has the most serious economic impact in terms of absenteeism. Add to this bilharziasis, numerous parasitic diseases, tuberculosis, yellow fever, sleeping sickness, venereal diseases, and a host of others, and one wonders that many Africans can walk around, much less work.

Lack of training

Africans are inefficient because they lack training. There is a dearth of basic and technical schools, in-service training, and labor apprenticeship schemes; moreover, opportunities for advancement for Africans are often limited by law or custom. Functions requiring skills, managerial talent, and administrative ability are performed by Europeans and other non-Africans. In areas of heavy European settlement there is a tendency to perpetuate these conditions in order to prevent the "dilution" of European labor and otherwise protect what are considered to be European interests.

The Gold Coast and Nigeria, on the threshold of complete self-government and with the weight of public responsibility largely on African shoulders, feel most acutely their shortages of technically competent engineers, managers, accountants, and other professional persons—those possessing the abilities necessary for the management of a modern society. Ethiopia, Liberia, and Libya, still dependent in large measure on foreign advisers, are becoming increasingly aware of these deficiencies. With the help of those advisers, they are developing a steadily expanding corps of their own technically qualified personnel.

Mineral resources

Although the great majority of the population of Africa is engaged in farming, the principal initial investment interest of Western enterprise, and hence the prime mover of economic development, is largely the continents' mineral resources. The bulk of private investment has been in the mines. Public investment has been directed principally toward the provision of railroads, roads, telecommunications, and power systems to serve the mining regions. Even today private investment is going primarily into mining and the metal industries. Current railroad construction and hydroelectric power development are justified largely in terms of a potential expansion in the production of minerals and metals for export.

There are two major railway projects under way in East and Central Africa—one in Uganda and the other in Southern Rhodesia and Mozambique. The Uganda project is an extension of the Mombasa-Nairobi-Jinja line of the East African Railways to provide access to the copper and cobalt deposits at Kilembe. The other line, connecting the Mozambique and Rhodesia Railways, will link the asbestos and chrome center of Southern Rhodesia with Lourenço Marques. When completed this line will relieve the strain imposed by the unprecedented volume of traffic on the railway system of the Rhodesias and the port of Beira in Mozambique. This traffic load resulted from the great postwar expansion of mineral and tobacco exports from the Rhodesias and large-scale imports of capital goods for development.

Potentialities in the mining industry are still attracting a considerable amount of attention. New copper and cobalt mines and refineries are being developed in the Northern Rhodesia Copper Belt. Iron-ore mining in French West Africa, begun in 1953, is producing at the rate of a million tons a year, somewhat less than Liberia's iron-ore production, which started a year earlier. The discovery of uranium in association with gold mining has given the industry a great boost in the Union of South Africa. Throughout Africa there is also considerable exploration and prospecting under way. In certain areas, workable mineral deposits have been found, but in order to exploit them it is first necessary to provide new transport facilities or hydroelectric power. For example, there are promising deposits of copper and iron in Mauritania and aluminum in French Guinea. But the copper and iron require railway construction and port development, and hydroelectric power is required for the production of aluminum. Similarly, the planned production of aluminum from the large bauxite deposits in the Gold Coast will require the construction of a large hydropower dam on the Volta River, a new port at Tema, and a new railroad.

Fuel resources

Africa is poor in fuel resources, at present producing a little petroleum in French North Africa and Egypt and coal mainly in the Union of South Africa, Southern Rhodesia, and Nigeria. Oil explorations have been conducted in other areas but have thus far met with no commercial success.

On the other hand, the hydroelectric power potentialities of the continent are the largest in the world. As the African economies expand, gradual realization of this potential will become necessary.

ECONOMIC CHANGE

Before European penetration, the traditional indigenous economy was one of

agricultural production for subsistence and barter, with money playing a relatively insignificant role. Under the impact of European civilization in the form of missionaries, traders, industrialists, agricultural settlers, plantation owners, and government officials along with their Western values, morality, patterns of behavior, and institutions, profound and lasting changes have occurred in the native economic and social systems. Tribal wars have been halted, famines have been averted, infant mortality has been lowered, the general death rate from disease has been reduced, and the use of money both as a medium of exchange and a standard of economic values has been steadily enlarged. All these contributed to increased physical well-being and a rapid increase in the human and livestock populations of many areas. In many areas serious population pressures occurred. In regions of European settlement they were aggravated by the reservation of the better lands for European use. On the other hand, the introduction of the plow and other improved hand implements made it possible to cultivate larger areas, although sometimes with harmful effect to the soil. Under the influence of traders, Africans became increasingly aware of the cash value of cereals and other crops as a means of obtaining cloth, pots and pans, and other simple consumers goods, and later, tools, sewing machines, and bicycles. The requirements of government also made them conscious of the need for cash to pay taxes. Missionaries not only brought Christianity but gave basic and practical education, instilled habits of cleanliness, and provided medical care.

Transition to exchange economy

The Western-type money economy reached into every corner of Africa. The rapid expansion of transport and communications and the development of mining, industry, and European plantation agriculture brought a persistent and heavy demand for African labor. As a result today there is virtually no African community which does not depend in some measure on money earnings. The transition from subsistence native economies to full-scale exchange economies is, however, by no means complete.

In the United Nations' interesting and valuable study recently published, *Enlargement of the Exchange Economy in Tropical Africa,* an attempt is made to determine statistically the extent of the the commercialization of the subsistence economies of nine territories.[2] This report concludes that between 65 and 75 per cent of the total cultivated area and about 60 per cent of the total male population over fifteen years of age are devoted to subsistence production.

Within these average percentages, considerable variations exist. In the Gold Coast, for instance, only 21 per cent of the male labor and 25 per cent of the area are employed in subsistence production, while in French West Africa it is 77 per cent and 81 per cent respectively.

About three million, or 13 per cent of the adult male population, in these nine African territories are employed outside the indigenous agricultural economies, the largest proportions primarily in Southern Rhodesia, the Belgian Congo, and Kenya. Despite the importance of mining, the high ratio of capital to labor in this industry makes it a far smaller employer of labor than agriculture. Only 11 per cent of the wage earners is employed in mining compared with approximately one third

[2] Belgian Congo, French Equatorial Africa, French West Africa, Gold Coast, Kenya, Nigeria, Southern Rhodesia, Tanganyika, and Uganda.

in agriculture, and 10 per cent in secondary industries. The largest absolute numbers of African wage earners in agriculture are in the Belgian Congo, Tanganyika, Kenya, and Southern Rhodesia. One would expect this because of the existence of relatively large and numerous European farm holdings in these territories. The greatest number in mining are, in descending order, in the Belgian Congo, Nigeria, Southern Rhodesia, and the Gold Coast; in secondary industry it is the Belgian Congo and Southern Rhodesia.

Effect on native economies

The steady movement of labor into money-earning activities outside of the native economies has had serious effects. The demand in European areas has been largely for male labor without their families. The result has been to reduce the number of employable males in the native economies, completely denuding some villages of economically productive males, leaving only the women and children and a few aged and feeble men to perform the necessary work. Food production has been adversely affected and countries formerly self-sufficient—although at minimal nutritional levels—are now importing considerable quantities of foodstuffs to supplement local production. However, the diversion of resources from subsistence agriculture to export and ancillary industries has enabled Africa to produce more for export; with increased foreign-exchange earnings it can pay not only for the additional food it requires but for capital equipment for development as well.

The disruptive effects of separating families have also been felt in the urban, mining, and European agricultural areas. It has contributed to high turnover rates in industry, which in turn have retarded the growth of a skilled African labor force. Many employers are becoming aware of the importance of developing a settled and contented labor force and are encouraging workers to bring their families with them as fast as housing can be provided. In the Northern Rhodesia Copper Belt today about half of the workers now have their families living with them, a much larger proportion than a decade ago.

The transition from subsistence economies to exchange economies is accompanied by many noneconomic stresses, particularly in areas of relatively large European settlement. As Africans become more integrated into the exchange economy they become more responsive to monetary incentives, but they quickly learn that ability, initiative, and skill are not necessarily rewarded by advancement in status and income. The relegation of Africans to an inferior political, economic, and social status stimulates resentment, bitterness, and frustration. Under these circumstances, the growth of a middle class of Africans having a vested interest in a harmonious, evolutionary process of development in co-operation with the more enlightened members of the European community is exceedingly difficult, if not impossible.

AFRICA'S INTERNATIONAL ECONOMIC POSITION

Africa's contribution to the world economy has been principally in the form of its exports of raw materials. It has constituted a market of only limited importance, accounting in 1952 for about 7 per cent of the world's total import trade. It has also provided some opportunities for employment and profitable investment. Certain British territories have made net contributions to the dollar and gold holdings of the sterling area or supplied commodities which would otherwise have had to be purchased from the dollar area. The

British territories and the Belgian Congo have had an export surplus in their merchandise trade. In general, however, Africa's trade shows an increasing import surplus in the postwar period. In 1952 it reached 1.2 billion dollars or 27 per cent of total exports. Since both exports and imports have been increasing, this reflects a larger expansion of imports than exports, a situation one might expect to find in an area in the process of development. Most of the import surplus was accounted for by the French territories and the Union of South Africa.

The data reflect a net flow of resources in the form of consumer and capital goods from the rest of the world to Africa, financed by international loans, grants, new private investment, and reinvested profits. In return, the rest of the world—principally the European metropoles and the United States—have received African exports which comprise a very modest proportion of their total imports but nevertheless constitute a large share of their imports of specific commodities. This is because Africa's production of an impressive number of products represents a significant percentage of the world's total output. In 1952, for example, Africa produced 99 per cent of the world's industrial diamonds, 94 per cent of its columbite, 84 per cent of its cobalt, 56 per cent of gold,[3] 41 per cent of beryllium, 35 per cent of phosphate rock,[3] 33 per cent of manganese, 29 per cent of chrome, 21 per cent of copper, 16 per cent of asbestos (but a much larger percentage of a highly desirable grade), 13 per cent of tin, and 10 per cent of graphite (but most of the strategic flake variety). It also produced a major share of the world's uranium supply. In addition Africa produced 80 per cent of the world's output of palm oil and kernels, 66 per cent of its cocoa, 68 per cent of sisal, 26 per cent of groundnuts, and 13 per cent of the coffee.

[3] Gold and phosphate rock percentages exclude Soviet bloc production.

Diversification

The Union of South Africa contributes almost 20 per cent of Africa's total export trade. Its exports are fairly diversified and include a large variety of manufactured goods as well as primary products. By contrast all the other territories of Africa rely largely on the production and export of primary products for their income, some depending heavily on one or only a few commodities. Before Northern Rhodesia federated with Southern Rhodesia and Nyasaland, its income depended almost entirely on exports of copper. With federation Northern Rhodesia is now part of a more diversified economy, which is, nevertheless, still dependent on a relatively small number of products—including copper, its major commodity, and tobacco, asbestos, gold, chrome, clothing, hides, and tea. The Gold Coast is heavily dependent on cocoa, although income from exports of gold, diamonds, manganese, and mahogany has risen in recent years.

Liberia is predominantly dependent on rubber and iron ore for its income. French West Africa relies on a half dozen agricultural exports for most of its income. In all of Africa south of the Sahara, aside from the Union of South Africa, the Belgian Congo has the most highly diversified agricultural and mineral economy, although its secondary industries lag behind Southern Rhodesia's. Five major commodities—copper, tin, coffee, cotton, and palm oil—comprise about 65 per cent of the Congo's total exports; of the rest no other product constitutes more than 4 per cent of the total.

Morocco, Algeria, and Tunisia, with their relatively large European populations and substantial French investment, produce a variety of products for export—grains, olive oil, fruit and vegetables, canned fish, phosphate rock (of which they are the world's largest exporter), manganese, lead, and iron ore.

Postwar economy

The trade of the dependent territories of Africa is oriented toward their respective metropoles by virtue of close political, investment, monetary, and personal associations. These ties have become firmer as a result of exchange and import controls, so that the metropoles' share of their territories' trade, traditionally predominant, is now larger than prewar. The trade of Liberia and Ethiopia is mainly with the United States, while Libya's trade is with Italy and the United Kingdom.

The postwar period provided a great stimulus to Africa's economies. Demand for Africa's products was strong and steady, and was reflected in continuously rising prices. Sterling devaluation in 1949 and later the rapid increase in world demand for strategic commodities arising out of the Korean conflict resulted in further increases in prices. Entrepreneurial profits were high and provided the basis for an expansion of private investment. Local governments shared in the general prosperity through revenue collections, and some were able to increase their reserves appreciably while devoting relatively small sums to development. This is particularly true of the Gold Coast, Nigeria, and to a lesser extent Uganda and Northern Rhodesia. Elsewhere, as in the Belgian Congo and Southern Rhodesia, revenues encouraged a rapid expansion in public expenditure and borrowing for development.

Since the peak in 1951, prices of African exports have generally fallen, with the notable exception of copper, cocoa, tobacco, and until very recently coffee, but not seriously enough to have caused any significant changes in the size of development budgets.

Marketing Boards

The peculiar vulnerability of primary producing countries to the effects of price changes in world markets is universally recognized. In certain of the British territories, namely the Gold Coast, Nigeria, and Uganda, the mechanism of marketing boards is being utilized as a means of offsetting the serious disadvantage of excessive dependence on the production for export of a small number of commodities. Originally established to expedite the collection and sale to the United Kingdom of agricultural products during World War II, these boards have since the end of the war become: (1) instruments for mitigating the effects on the local economies of severe fluctuations in the world prices of their products; (2) devices for combating price inflation; and (3) a means of mobilizing savings for economic development.

By paying producers prices lower than world prices, the Marketing Boards accumulate reserves. A part of these reserves are allocated to a stabilization fund to regularize producers' incomes in the event of a serious fall in world prices, while the remainder is normally available for economic development. The Boards have pursued a conservative policy of fixing producers' prices in order to avoid inflation and have generally underestimated the trend of world prices for their products. The result has been a large, rapid rise in the Boards' reserves. Only a very small part of the reserves have so far been made available for development. However, it is anticipated that expanded development programs now planned will require not only the use of Marketing Board funds available for this purpose, but loans from abroad as well.

PROGRAMS AND POLICIES OF ECONOMIC DEVELOPMENT

Before World War II centralized planning and execution of public development programs had not yet become accepted as the means by which the metropoles could exercise their responsibilities toward their dependent territories in Africa and elsewhere. This is, of course, not to say that there was therefore no economic development. On the contrary, the rapidity of economic change in the postwar years was made possible by—or in some cases occurred in spite of—basic facilities most of which had been constructed over the preceding half-century and which represented considerable public and private investment. The obsolete and obsolescent transport, communications, and power facilities have been strained to the utmost during and since the war to meet the abnormal and sharply rising demands of Europe and the United States for foods and minerals. Disruption of normal supplies during the war and continued shortages after the war, at least until 1952, denied Africa the physical capital needed to rehabilitate existing facilities.

In the postwar period, the United Kingdom, France, Belgium, and more recently Portugal have adopted policies and programs designed to further the economic and social development of their territories and have made available for this purpose extensive grant and loan funds. The two major economic policy objectives appeared to be the following: (1) to improve the standard of living and promote the welfare of the inhabitants of the dependencies and, in the case of the United Kingdom's territories, to establish a firm basis for self-government in the very near future; and (2) to encourage the dependencies to make increasingly important contributions to the economies of the mother countries as they develop further. During a time when Europe was beset by balance-of-payments problems the metropoles turned to their territories to maximize the production and export of dollar-saving or dollar-earning commodities. The shortage of fats and oils in the United Kingdom prompted that country to undertake the bold and disastrous Groundnut Scheme in Tanganyika, in which the British taxpayers lost over 84 million dollars. In the Korean and post-Korean buildup of Western strength Africa is viewed as an important contributor of strategic commodities required by the West.

All plans in British, French, and Belgian territories have certain elements in common. They are generally ten- or four-year plans which have been reviewed and revised frequently to reflect changes in cost estimates and modifications in the scope or character of projects as experience dictated. All plans place greatest emphasis on the development of basic facilities, that is, transport—roads, railways, ports—thermal and hydroelectric power, and telecommunications. A smaller proportion of funds is devoted to such directly productive activities as agriculture, manufacturing, and mining, while development in the fields of education, health, and housing is generally assigned the smallest share.

Government participation

In all cases, the metropoles contribute only a share of the costs of development in the form of grants or loans. Grants of 420 million dollars allocated by the United Kingdom government to its African territories from the Colonial Development and Welfare Fund constitute approximately 16 per cent of the estimated cost of the formal development plans.[4] In addition the United Kingdom has made available for direct investment in all of its colonies through the Colonial Development Corporation and the Overseas Food Corporation 280 million dollars and 140 million dollars respectively. A further source of public investment funds is the London market, where the territories have been able to float substantial loans for development.

France finances development of its territories south of the Sahara through FIDES (the Investment Fund for Economic and Social Development) and the Caisse Centrale. France's grant contribution to FIDES is 55 per cent of the cost of the development program while the local governments' share is 45 per cent. The Caisse Centrale is authorized to extend loans to the territories to help them meet their contributions to FIDES. In North Africa, France makes grants to Algeria, Tunisia, and Morocco through a Fund for Modernization and Equipment, supplemented by loans from the French treasury. Belgium's financial contribution to the Congo's development program is entirely in the form of loans.

The formal plans by no means represent the total developmental effort. They often exclude the investments of certain public corporations and railway programs. They exclude, of course, private investment programs which in the Belgian and British areas approximate or exceed public investment. To cite data on public investment in the formal development plans therefore provides an incomplete picture of total investment. Nevertheless, it does indicate the important role played by government in the development of Africa. Excluding the Union of South Africa and Egypt, total public investment in the formal development plans from 1946 through 1953 was approximately 3.8 billion dollars. The largest expenditures were made by France and the French territories—2 billion dollars in North Africa and 0.7 billion dollars in Africa south of the Sahara; expenditures in the British territories, including Southern Rhodesia, amounted to 0.7 billion dollars, and the Belgian Congo 0.3 billion dollars. Agencies of the United States have contributed substantially to African development. United States grants and loans to all African countries, including the Union of South Africa, through 1953 were approximately 600 million dollars. The International Bank for Reconstruction and Development has also made important contributions and has shown an interest in doing even more. Its loans have totaled 110 million dollars to the Union of South Africa, 70 million dollars for Belgian Congo development, 42 million dollars to the Rhodesias, 8.5 million dollars to Ethiopia, and 7.5 million dollars to French West Africa.

Criticisms of current plans

The lack of balance in some of the programs has been quite evident. In some territories the Europeans have been under nationalist attack for pursuing economic policies which benefited largely the European populations and only incidentally, if at all, the indigenous populations. They have been further criticized for not adequately providing for health and educational deficiencies. The programs undertaken in a number of territories were often of large scale, spectacular, costly, and resulting in little apparent benefit to the indigenous population. Moreover, in a few territories public investment has not induced nearly as much private investment as the governments had hoped.

Partly because of political pressure and partly because of the validity of the criticism that the programs were, on the whole, not placing sufficient emphasis on rural agricultural development

[4] Excluding Southern Rhodesia, which as a self-governing colony did not qualify for grants.

and on ameliorating the social problems of the cities, a few programs have recently been recast to place slightly greater emphasis on this type of development. There is an increasing awareness of the importance in the long-range development of Africa of basic and technical education and of improvements in the productivity of the small farmer. Countries can no longer afford an illiterate, unskilled, and undernourished population. Nevertheless, social programs do divert scarce resources from directly productive investment and constitute a current charge against the whole economy for future benefit. Expenditures on social programs should not reach the point where capital and recurrent costs become so high as to necessitate the postponement of urgently needed economic development projects.

OUTLOOK

The magnitude and speed of future development in Africa depends on a variety of factors, economic, political, social, and psychological. Among the more important economic factors is the future level of capital investment. Obviously, for many years it will be necessary for Africa to continue to rely on a flow of finance from abroad whether in the form of intergovernmental loans and grants or private investment. Nevertheless, as in the past, the territories will have to bear the major share of the burden of development, including the deferred financial load of external loans, out of income earned by the employment of their own resources.

The basis for future income required to continue and expand development programs in the public and private sector and to service external loans will be the export industries. If the prices of Africa's exports are maintained at about their present levels in relation to import prices Africa's ability to pursue development programs should not be impaired. Incentives to expand production will be operative, incomes will increase, and governmental revenues will be buoyant. If, on the other hand, there is a steady decline in export prices without a proportionate fall in import prices, output of the export industries will tend to fall and incentives to expand productive capacity will diminish with declining incomes. Public development programs would become more costly during a period of contracting governmental revenues. Under the circumstances, without expanded external aid the result would be a reduced rate of development.

The outlook for Africa's export industries is on the whole reasonably good. Prices of a number of African commodities which slumped after the Korean crisis have recently risen again. There should be a sustained and increasing demand over the years for Africa's exports, given the present rate of economic expansion in the United States and Western Europe.

The noneconomic factors affecting development involve fundamental attitudes, customary behavior, and incentives which do not lend themselves to rapid change. Among these are African nationalist attitudes toward foreign private investment; popular attitudes towards continuing and expanding public development programs; the willingness of the people to be taxed for the provision of essential public services; the business initiative and imagination of private individuals and their quickness to take advantage of private opportunities offered by the expansion of public facilities; the rate of growth of a local body of technological, administrative, and executive ability; and the development and spread of a sense of public responsibility and devotion to duty among elected and appointed officials. In areas where problems are complicated by the existence of several races and by laws, regulations, and behavioral patterns of a discriminatory nature directed against the African majority and nonwhite minority, the speed of future development will depend in addition on the course of race relations: the degree to which wage and employment rigidities are relaxed; the extent to which non-Europeans are permitted to participate in the planning and execution of development programs; and the response of non-Europeans to opportunities offered.

Frank R. La Macchia, Washington, D. C., is an international economist with the Department of State's Office of International Financial and Development Affairs. He served as a research economist on Africa for the Department of State from 1948 to 1952. In 1952–53 he was Consul in Salisbury, Southern Rhodesia.

The Changing Economic Structure of French West Africa*

By Jo W. Saxe

BETWEEN 1854 and 1865 General Faidherbe, an energetic soldier, consolidated French trading establishments on the coast of West Africa and extended French influence to the interior. Marching inland from four Senegalese towns—which had been French since pre-Revolutionary times and the inhabitants of which had enjoyed some of the rights of French citizenship since 1848—Faidherbe's troops set up a series of military and trading centers as far as the Niger River. In 1904 the colonies of Senegal and Sudan, which Faidherbe had established, were federated with the southern territories of Guinea, Ivory Coast, and Dahomey; and in the early twenties the Federation was expanded to include Mauritania in the north and Niger in the east.

The creation and consolidation of the Federation, like Faidherbe's penetration of the interior, were essentially achievements of individual soldiers and administrators; they were never more than an adjunct to French policy elsewhere. To some extent rivalry with the British, who were establishing themselves in Nigeria and the Gold Coast during the same period, spurred penetration of the interior. In the course of negotiations largely about other problems, the French and the British eventually agreed on the boundaries of their respective territories in West Africa. The French West African Federation which emerged from these agreements lacked natural unity both in territory and population.

Nevertheless the eight territories of the Federation were tightly knit together. In 1946, under the terms of the new French Constitution, they became an integral part of the French Republic. French political tradition—as expressed in the 1848 grant of civic rights to inhabitants of four Senegalese towns and in the incorporation of the Federation's diverse territories into the French Republic—was to have important consequences in later stages of West Africa's economic development.

Today French West Africa extends from Lake Chad to Dakar and from the Sahara to the Gulf of Guinea. It covers one-sixth of the area of Africa and contains about 18 million people, or less than one-tenth of the continent's total population. Seven foreign enclaves—of which two, Nigeria and the Gold Coast, are of considerable political and economic importance—lie within its land borders.

A substantial part of French West Africa is desert or subdesert savanna, where little more than stock raising is possible. To the south of this region is a broad band of savanna with a longer rainy season, where food grains such as millet and sorghum can be grown. This savanna becomes progressively more humid and somewhat wooded toward the south. On its wetter southern edge and in the drier northern edge of the tropical rain forest which lies between the savanna and the southern coast, tropical tubers, corn, cocoa, and coffee can be grown. The rain forest itself is composed of tropical hardwoods, of which a certain number find a market in Europe. Along the coast are found oil and coconut palms.

The river valleys and deltas, particularly the great valley of the Niger, the valley of the Senegal, and the delta of the Casamance, are sufficiently well watered to make the cultivation of rice possible.

Almost all the soils of the area are poor in organic matter and fragile in structure. Continuous or intensive cultivation causes a rapid decrease in fertility. The more valuable and readily marketable hardwoods are scattered throughout the rain forest, making the felling and transporting of timber more costly as the more accessible areas are logged out.

The known mineral resources of the Federation are few. Small gold and diamond deposits are mined by Africans and Europeans. Recently, large bauxite and iron deposits were found in Guinea, not far from the port of Conakry. Both deposits have a low value per ton, however.

French Influence

Traditionally, the population of French West Africa devoted the largest share of its production to subsistence, leaving only a small margin to be traded abroad for manufactures and foodstuffs. Under French influence, however, West Africa's foreign trade underwent changes so radical as to provoke an agricultural and economic revolution. The flow of trade was increased and regularized, particularly in palm nuts and palm oil. Moreover, new crops were introduced. Of these, peanuts and cocoa, especially the former, rapidly became the most important, both because climatic and soil conditions were suited to them and because native methods of farming could readily be adapted to their cultivation. Introduced into Senegal as early as 1840, peanuts were being exported in substantial amounts at the end of the nineteenth century. Completion of the railroad from Dakar to the Niger River in 1923 and development of roads in southern Senegal made further expansion possible. Exports of peanuts rose to 400,000 tons in 1929 and to over 600,000 in 1939. Cocoa was introduced into the Ivory Coast shortly after the turn of the century. Exports reached 16,000 tons in 1929 and 55,000 tons in 1939. Together, peanuts and cocoa formed about 60 per cent of total exports by value in 1939. The introduction of peanuts and cocoa was followed by that of coffee and bananas. At first these were grown only on European plantations in the Ivory Coast and Guinea. Coffee was rapidly adopted by native farmers, but bananas continued even after World War II to be principally a plantation crop. In 1939 coffee and bananas made up about 10 per cent of the value of exports. Gold, palm nuts, and palm oil made up an additional 15 per cent.

In 1914 the French extended their administration to every part of the Federation and were building the ports, warehouses, railroads, and roads which were necessary for collection and shipment of exports and for distribution of imported consumer goods to African farmers. By 1934 the railroad system reached a total length of more than 2,300 miles and was virtually complete. Ports and port facilities were improved, good gravel roads were extended throughout the peanut-raising regions of the Senegal, and many schools, hospitals, dispensaries, and administrative buildings were built.

The growing trade and construction brought a considerable French population to the new political and economic centers of the Federation—the ports and railroad towns.

All these innovations profoundly changed the activities of a part of the African population. Within the export crop zone, that is, the coastal areas in which the new crops could be grown

* Where necessary, the author has used his own estimates to fill gaps in the published statistics on which this account of the French West African economy is based.

economically, production of food crops declined as that of peanuts and cocoa increased. Rice began to appear among the imports of the Federation. But changes were not limited to this zone. Temporary and permanent immigrants came from the interior to work for wages in the coastal areas, in response to the demand for seasonal labor on peanut farms, on cocoa farms, on banana plantations, and in the logging camps, as well as for the construction and operation of ports, warehouses, and railroads. Taxes, consumer goods, and various administrative measures played a large part in bringing about this migration. The demand for seasonal labor for the cocoa farms of the Gold Coast led to a similar migration from the interior of French West Africa.

ECONOMIC "SECTORS" OF THE FEDERATION

Thus, as a result of French public and private enterprise, a new economic structure had been firmly established by the end of the 1930's. This structure can best be described by dividing it into six relatively well-defined, if somewhat unconventional, economic sectors. Accounts of the transactions between these sectors would be, in effect, the social accounts of the Federation. The receipts side of these accounts can be arranged to show the gross "national" income or product of the Federation, and the expenditures side to show its gross "national" expenditure.[1]

The first three sectors are similar to three which are defined in the simplified system of national accounts of the Organization for European Economic Cooperation (OEEC):[2] Government, Enterprises, and Households. The first of these is identical with the Government sector as defined by OEEC. The second differs from the corresponding OEEC sector in that it includes European-owned farms but excludes African farms and handicrafts. The third excludes traditional African households. The remaining three sectors have been devised to fit French West African conditions. These are: Farmers (African farmers producing for export), Migrant Wage Earners, and the Traditional Economy.

African farms excluded from Enterprises are included in the Farmer or Traditional Economy sector. Migrant Wage Earners are set apart because of their relatively large number and their ambiguous position between the Traditional Economy and the five sectors which comprise the newer "European" economy. In respect to transactions with the rest of the world, it will be sufficient for descriptive purposes to assume that they are made only by the Enterprise or the Government sector.

The division of French West Africa's economy into these six sectors is based on similarities in economic behavior of units which are included in each sector and on differences in the way of life between units of different sectors. The nature and import content of consumption by units in the Household sector, for example, is radically different from that of units in the Traditional Economy; that of Farmers differs from both, having an import content smaller than that of Households and larger than that of the Traditional Economy.

[1] The statistical data required for a detailed presentation of these accounts are not available. The French government is preparing similar accounts for some postwar years, but these accounts have not yet been completed or made public. Data for prewar years probably do not exist. There are, however, some statistical series which go back to the 1930's, as well as a number of estimates and qualitative appraisals of the flow of goods and money. On the basis of this information it is possible to set forth in very general terms the relative importance of the sectors before the war and the nature of the relations between them. When this is followed by a description of the changes in the structure of French West Africa during the war and postwar years, it is also possible to estimate changes in the size and distribution of the "national" product of the 1950's.

[2] For details see OEEC National Council Research Unit, *A Simplified System of National Accounts* (Paris: OEEC, 1954).

ECONOMIC STRUCTURE OF THE INTERWAR PERIOD

In the late 1930's the Traditional Economy had relatively few transactions with the rest of the economy. It received a small cash income from sale of food or handicrafts to Farmers and Migrant Wage Earners, made a few purchases from Enterprises, and paid taxes to Government. Migrant Wage Earners were in a similar position, but were increasing in number and were beginning to provide a sort of bridge between the Traditional Economy and the "European" sectors.

Farmers were the next largest sector, and their activities accounted for a large part of the "national" product. They received a substantial cash income for their production of peanuts, cocoa, coffee, and so forth, and spent a large part on purchases of imported goods from Enterprises. It was characteristic of the Farmers' accounts that they showed a substantial credit balance with Enterprises (that is, that they received more for their crops than they spent in purchasing consumer goods) and a small deficit with Government (that is, that they paid taxes but received no cash payments from Government). But payments to Enterprises and Government did not require all of their cash income. The balance was used to hire migrant labor or to make purchases from the Traditional Economy, or it was hoarded. There is some evidence that a minimum amount of the currency in circulation was held more or less permanently by Farmers.

The Household sector included French residents of the Federation, largely composed of civil servants and employees of Enterprises, and Africans holding similar positions. It was a relatively small sector, in balance with Government, since Households paid relatively large amounts in taxes. It was probably also in balance with Enterprises, since receipts of Households from wages and salaries were balanced by expenditures on imported consumer goods purchased from Enterprises. Consumption by Households differed substantially from consumption by the Traditional Economy, Migrant Wage Earners, and even Farmers. It was, for example, somewhat smaller in the aggregate than consumption by Farmers, larger per capita, and included a wider range of goods. There were more Africans than Frenchmen in the Household sector, but consumption by Africans was smaller per capita than that by the French. To the extent that Africans were newcomers to the sector, they consumed fewer imported goods, since they were still under the influence of the way of life of the sectors from which they had come. However, there was a tendency for Africans in this sector more and more to align their way of life with the standard set by the French. This tendency was very probably reinforced by the political rights enjoyed by African inhabitants of the four Senegalese towns previously mentioned. Nevertheless, the Household sector was probably somewhat smaller than the Farmer sector in the interwar period. The relatively small numbers involved (perhaps 150,000 to 200,000 including Frenchmen, as compared with 500,000 to 1,000,000 Farmers) and the relative newness to the sector of many Africans, limited the share of Households in the "national" income and the pressure of their consumption on the import side of the balance of payments.

The Government sector seems to have been about the same size as the other two. It was probably in surplus with almost all of the other groups, judging

by a consistently small budgetary surplus on current account and its limited capital expenditures. It had grown in size over a period of decades, but seemed to be relatively stable during the 1930's.

The Enterprise sector was the largest, partly because it did a very large share of all the foreign business of the Federation. In respect to internal transactions with Farmers and Households, Enterprises spent more than they received: purchases of export crops exceeded sales of consumer goods despite gradually increasing purchases by Households. Abroad, on the other hand, Enterprises sold the export crops of the Federation and bought a somewhat smaller amount of consumer goods. Enterprises also bought a small amount of capital goods abroad, largely on Government account. These purchases were responsible for a small trade deficit. On the basis of exports of crops produced by Farmers, imports of consumer goods, and amounts of prewar budgets, it appeared that the Household and Government sectors were of about the same size and that the Enterprise sector was about three times the size of either—that is, either receipts or expenditures of Enterprises within the Federation were three times as large as receipts or expenditures of either of the two other sectors.

WARTIME DEVELOPMENTS

The prewar economic structure of French West Africa did not survive World War II. From 1940 to 1943 the Federation was in the hands of the Vichy government. The authority of the administration in political and economic affairs was increased in an effort to produce supplies for France, particularly edible oils, and to maintain the integrity of French control against both the Germans and the Free French. Neither effort was successful. Production and exports slowly declined, and the Germans began to take an active part in the disposal of the diminished output.

The Free French government at Algiers replaced Vichy shortly after the Allied landings in North Africa in November 1942. With the interruption of trade with France, production and exports declined more rapidly.

The increasing inability of both governments to provide shipping either to bring imports to the Federation or to evacuate its exports reduced the level of trade in 1944–45 to little more than one-third of the average over the previous decade. Neither regime had been able to maintain export production, which had been progressively abandoned in favor of production of food crops, particularly in Senegal. There was a considerable migration of Africans to the cities in search of employment, as money income was no longer forthcoming from the sale of export crops. Moreover, what consumer goods were available could be found only in the cities. There was also a large increase in the French population. Nine or ten thousand persons came to West Africa during 1939–42 and were unable to leave until the end of the war. In addition, there were Allied military units which were being moved through the area. As a result, demand for consumer goods and for African labor increased.

Open inflation was avoided by tight price and wage controls, Lend-Lease, and British assistance. In 1944 the situation was aggravated by a campaign to produce goods required by France and the French forces. Production quotas and requisitioning of crops and of labor were briefly and unsuccessfully applied. The result was a further disruption of the prewar economic structure of the Federation.

There were two other specific results of the war. One was that all the equipment of the Federation—ports, railroads, roads, buildings, motor vehicles, and so forth—gradually deteriorated through continued use without adequate maintenance and replacement. The other was that a considerable effort was made to produce certain manufactured goods in French West Africa. In this respect the most important and successful innovation was the creation of an oil pressing and refining industry in Senegal.

POSTWAR CHANGES AND REFORMS

Postwar political and economic changes combined to reinforce the disruptive effects of the war and to introduce new elements into the economy of the Federation. The political structure was completely reformed. An Assembly was established in each of the territories, the number of which was increased from seven to eight in 1948, and a federal council was established at Dakar. In all of these bodies Africans had a majority of the seats. Moreover, French West Africa was allotted sixteen seats (later increased to twenty) in the new National Assembly, twenty in the Council of the Republic, and twenty-two (later twenty-seven) in the newly created Assembly of the French Union. Almost a million West Africans were eligible to vote in the 1946 elections and 600,000 of them did. By 1951 three million were eligible, and half of them voted. The powers of the administration were curtailed in favor of the new Assemblies, particularly in matters of finance. The authority to tax, borrow, and spend public funds was almost completely in the hands of the Assemblies. Representatives of the Overseas Territories in the French Parliament were largely responsible for the enactment of a law in 1950 which accorded substantial equality of pay and allowances to African employees of the French government and its subdivisions, including the Federation of French West Africa and its component territories. In 1953, the same representatives were influential in the enactment of a comprehensive labor code for the Overseas Territories. The code brought wage standards and working conditions of Africans substantially closer to those obtaining in France. These and other measures indicated a strong tendency of Africans to change their way of life to one approximating French standards more closely.

French government expenditures

Acting under the same influences which had brought about political reform, the French government enacted several measures and voted large sums of money to provide for the social and economic development of the Overseas Territories. French West Africa had benefited from a program of public investment during the thirties, but the postwar program was on an unprecedented scale. The earlier programs were financed largely by borrowing, were for the most part limited to construction of ports and railroads, and were relatively small in amount. The postwar program was financed by French government grants and loans on very favorable terms, and it included almost every aspect of the economic and social life of the Federation. The relative importance of public investment expenditures in French West Africa rose from less than 10 per cent of total public expenditures in 1938 to 40 per cent in 1952. This proportional increase was accompanied by a sizable absolute increase in public expenditure in real terms over the same period. The public investment programs required a large increase in current government expenditures as well, particularly for maintenance of new schools, hospitals, and so forth.

The French government also extended

its activities in French West Africa in other ways. It assumed the costs of defense and a considerable part of the costs of the executive arm of the Federation's government. It bore a large part of the cost of an expanded judicial system and undertook to pay for certain navigation, air transport, and communication facilities. As a result large amounts of money, equipment, and personnel were made available.

All of these measures encouraged an increase in the French population of the Federation. The newcomers, however, were somewhat different from the prewar French inhabitants. There was a greater variety of occupations among them; the ratio of women and children to the total was higher; and settlement in the Sudan, Ivory Coast, and Guinea tended to reduce the concentration of the French population in Dakar and other Senegalese towns. This increase and diversification of the French population induced a similar trend among Africans in the cities and encouraged the growth of various urban institutions: banks, shops, service trades, schools, motion picture theaters, and so forth.

Production and exports

Important changes occurred in the production and exports of the Federation. The total value of the peanut crop as an export was increased by local processing of a substantial part of the crop into oil and oil cake. However, the relative importance of peanuts as an export declined while that of coffee and cocoa rose. This increase reflected not only an increase in production but also high world-market prices. The absolute and relative importance of exports of wood, palm nuts, palm oil, and bananas remained more or less stable.

Mineral production increased, notably iron ore and bauxite from Guinea and phosphates from Senegal. Exports of all three, however, barely replaced gold exports in value, the latter having fallen sharply from prewar levels as a result of low prices and rising costs of production. There was hope that a newly discovered copper deposit in Mauritania could be profitably exploited, but this had to be preceded by a long period of exploration and research. The future of the mining industry thus appeared to be prejudiced to some extent by uncertain markets and the need for heavy capital investments before production could begin.

In sum, the resources of French West Africa had not changed, except for an increase in coffee and cocoa production and the discovery and exploitation of certain minerals. The economic structure, however, had changed radically. The change can be appreciated from a brief description of the six sectors of the economy as they appeared in 1952–53.

Changes in the economy

With the migration of some of its inhabitants to the coffee and cocoa farms and to the cities, the Traditional Economy diminished in size. Its transactions with the rest of the economy appeared to be slightly larger than in the interwar period.

Migrant Wage Earners continued to occupy an ambiguous position. They appeared, however, to be moving away from the Traditional Economy and toward the "European" economy.

Farmers were barely holding their own absolutely and failed to improve their relative position. The prewar surplus in their accounts with Enterprise was probably reduced somewhat by a deterioration in their terms of trade and by an increasing tendency to consume imported goods, although evidence on these points is scant and difficult to interpret. It is clear, however, that the situation of Households changed radically, while that of Farmers did not.

Households became very important. Their numbers increased substantially, as a result of the immigration of Frenchmen and of the influx of Africans from other sectors. The new African members tended more and more toward higher levels of consumption, including consumption of imported goods. The relatively large numbers of Africans in this sector and the more rapid change in their way of life, compared with Farmers, as well as the stronger political and social bargaining power which they had obtained as a result of postwar reforms, made it possible for them to obtain a substantially larger share of the "national" income.[3] The prewar limits on the claims of this sector on the "national" income and its pressure on the import side of the balance of payments were considerably relaxed.

Government also expanded greatly, not only in real terms but also proportionally to Enterprises. Capital expenditures increased from six to eight times over the prewar level and current expenditures about three times. It is estimated that the number of Government employees doubled between 1939 and 1952. An increased proportion of Government payments went to Households, but Government bought more imported goods from Enterprises as well. Government expenditures increased more than receipts from taxation. The resulting deficit was met largely by French government contributions to the public investment program. The economic and social reforms of the postwar period were, in effect, a floor under Government expenditures on salaries and social services. There was every indication that the Government sector would continue to expand and that it would of necessity continue to rely on external assistance. Although taxes were raised, there was certainly a political limit on tax increases. This situation will leave Government heavily dependent on external assistance, unless there is a considerable increase in productivity within the economy. Both mining and production of export crops seem to be close to ceilings on output—and perhaps productivity—set by physical factors. If this is the case, Government will be faced with the problem of developing the Traditional Economy to a point where output will not only be able to meet all the new claims on the "national" income but will also be sufficient to meet new claims from members of the Traditional Economy whose consumption is certain to be affected by such a development.

The Enterprise sector, while it increased in importance, increased proportionally less than Government and Households. On the same basis as that used to estimate the relative importance of these sectors in the interwar period, Enterprises were only twice the size of Government and Households, both of which were still at about the same level. Farmers fell far behind in importance to Government and Households. Enterprises had a deficit in their operations abroad, since Households were consuming more imports and Government was buying more imported capital goods.

PROSPECTS AND PROBLEMS

In conclusion, it may be said that the growth of "national" revenue in most sectors of the economy appears to be either limited by physical factors or dependent on assistance from abroad. Foreign assistance provides capital and a continuing subsidy to consumption, which has been increasing as a result of political and social reforms. The French government and the government

[3] There were about 300,000 to 400,000 Frenchmen and Africans in this sector in the 1950's, while the number of Farmers did not seem to have changed since the 1930's.

of French West Africa are aware of this problem and are attempting to solve it by initiating a revised public investment program. Whereas the first postwar public investment program was directed toward improving transportation, communications, and social services, the second is to be directed toward developing the agricultural productivity of the Traditional Economy and Farmers. This will be a long process, and a part of the investment will of necessity be siphoned off to conserve natural resources and to provide for rising standards of consumption in those two sectors. At the same time the Household sector is likely to continue to grow, and its standards of consumption will probably continue to increase more than proportionally to its increase in numbers. Postwar reforms have given to Africans, particularly to those in the Household sector, the power to enforce their claims to a new way of life. Under the pressure of these claims, Government will be obliged to expand many of its activities in such fields as public health, housing, and education.

The resources which Government can obtain from the economy do not appear to be sufficient to meet all these claims and to supply the capital for development of the sectors in which an increase in productivity may be possible. No doubt some rearranging of the economy in the form of changes in the fiscal and marketing systems is possible and may provide some of the needed resources. But a considerable deficit will be met in the future, as it has been in the recent past, by the French government. Wartime disturbance and postwar reform have laid the burden of change in French West Africa on France.

Jo W. Saxe, Oxford, England, Ford Foundation fellow, has traveled extensively in French West Africa. He currently holds a studentship at Nuffield College, Oxford University, where he is preparing a study of the economic structure of the French Union. Previously he served as assistant economic commissioner in the Mission to France of the Foreign Operations Administration (and, from 1948, in the agencies which preceded it), where he was concerned with the Overseas Territories of the French Union.

Economic Planning and Development in the Belgian Congo

By J. Huge

GEOGRAPHIC factors play a basic role in determining the pattern of economic development in the Belgian Congo. The Congo is a large land area (900,000 square miles, or almost a third the size of the United States), situated in the center of the African continent and connected with the Atlantic Coast only by a narrow corridor along the lower stretches of the Congo River. It has a system of navigable waterways 11,300 miles long, made up of the Congo River and its tributaries, but the principal mineral deposits of the area are concentrated in the eastern part of the country—in the area furthest from the sea. Its hot and humid equatorial climate is not particularly favorable to European settlement except in the higher altitudes.

In 1953 the native population of the Belgian Congo was 12,026,000, the population density being 13.3 inhabitants per square mile. Most of the natives live in their tribal environment and devote themselves to agriculture, but an important fraction (over 20 per cent) now live in the population centers created by the Europeans. These are the "detribalized" natives, most of whom are employed in European enterprises.

The economy of the Congo is still largely based on foreign trade. Mineral products and raw or semiprocessed agricultural products are exported from the Congo in return for imports of capital goods, materials for industry, and consumer goods—though most consumer goods in the Congo are produced locally.

As Table 1 shows, the total value of exports in 1953 was over 400 million dollars. Minerals (mainly copper, tin, cobalt, diamonds, and gold) account for over 60 per cent of the total value of exports. Copper is by far the most important of the minerals; in 1953 the export of this commodity amounted to over 137 million dollars. Most (80 per cent) of the nonmineral exports consist of palm-oil products, cotton products, and coffee.

Imports to the Congo in 1953 amounted to 360 million dollars. As seen in Table 1, industrial equipment and materials make up the largest part of imported goods.

The economy of the Congo has been developing rapidly in recent years. One indication of its growth is the increase in the volume of foreign trade, as shown in Table 2.

The rise in imports from 1945 to 1950 reflects the efforts made to re-equip the country industrially after World War II, as well as the beginnings of the Ten Year Plan. The new investments did not appreciably influence the volume of exports until somewhat later.

When studying the development of exports from the Congo it should be emphasized that these exports are becoming increasingly diversified. This diversification has taken two forms: the trend toward substitution of semiprocessed materials for raw material exports, as for example the export of zinc metal instead of zinc ores, palm kernel and peanut oil instead of unprocessed palm kernels and peanuts; and the introduction of new export products, such as cobalt alloys and manganese ore.

TABLE 1—Principal Exports and Imports of the Belgian Congo, 1953
(millions of dollars) [a]

Exports	
Minerals [b]	262.1
Industrial Products [c]	39.2
Agricultural Products [d]	105.3
Animal Products	3.2
Total value of exports	409.8

Imports	
Industrial and Agricultural Machines and Tools	84.0
Heavy Metal Equipment (girders, plates, rails, tubing, etc.)	34.9
Food and Beverages	32.1
Automotive Vehicles and Parts	31.5
Cloth and Clothing	25.9
Petroleum Products	14.4
Others	138.0
Total value of imports	360.8

[a] Belgian Congo francs are converted to dollars at the official rate of exchange, approximately 50 Belgian Congo francs to one U. S. dollar.

[b] Principal minerals are copper, tin, cobalt, diamonds, gold, zinc, manganese, tungsten, and zinc ores. Some 93 per cent of the value of mineral exports is represented by the following items: copper ($137.5 million); tin and tin ore ($39.6 million); cobalt and cobalt products ($37.8 million); diamonds ($1.7 million); gold ($1.3 million).

[c] "Industrial Products" refers principally to agricultural products which have been processed to some extent; vegetable oils account for 75 per cent of the value of these industrial products.

[d] About 80 per cent of the combined items "Agricultural Products" and "Industrial Products" is made up of palm-oil products ($39.5 million), cotton products ($40.0 million), and coffee ($33.5 million).

Another index of the increasing pace of development of the Congo's economy is found in the expansion of native expenditure for consumer goods. In 1951 natives spent roughly 340 million dollars on consumer goods, 228 million dollars of which were for food and 68 million dollars for clothing; this is almost twice as much (in real terms) as natives were spending on similar goods in 1938.[1] Most of these increased consumer expenditures were for nonfood items. Thus food consumption has increased by only 50 per cent in the years since 1938, while consumption of clothing, decorative items, and household equipment tripled and in some cases quintupled during the same period, indicating a substantial improvement in living standards. This improvement resulted from a rise in native purchasing power; wages have gone up appreciably in connection with the increasing productivity of labor.

Along with the increased diversification of exports is a marked tendency toward an increase in the number of variety of local industries producing for the internal market. For example, the new industries installed during the past few years include manufacturers of bags, blankets, canvas, bottles, fibro-

[1] The growth of native consumer spending is evident in the following index of physical volume of consumption (1948–49 equals 100): *1938*, 67.1; *1948*, 94.6; *1949*, 105.4; *1950*, 108.2; *1951*, 129.1.

TABLE 2—The Volume of Foreign Trade, Selected Years, 1920–1953[a]
(1951 equals 100)

Year	Imports	Exports
1920	9.6	8.8
1930	29.2	34.9
1938	29.5	65.0
1945	20.7	74.9
1950	72.4	97.3
1951	100.0	100.0
1952	142.0	106.8
1953	141.7	111.8

[a] The index used here is a Laspeyre type of index of the quantity of imports and exports.

cement, plywood, and construction materials.

The index of industrial production naturally reflects these new developments. As shown in Table 3, industrial production increased about fourfold from 1945 to 1953. The process of industrial growth in the Congo is typical of a developing economy; imported goods are being brought in at less and less finished stages, while locally produced raw materials are being processed domestically to an ever increasing extent. Analysis of the kinds of goods imported confirms these trends; the largest part of imports consists of capital goods.

The gross national product, first calculated in 1950, stood at 712 million dollars in that year. In 1951 it was 928 million dollars, and in 1952 it rose to slightly over one billion dollars. By comparison, the fiscal burden is very light. Government expenditure was 98 million dollars in 1950, 128 million in 1951, 140 million in 1952, and 152 million dollars in 1953. This relatively low level of public expenditure, coupled with the continuing growth of the national income, indicates that the Belgian Congo is capable of supporting the public investment effort of the Ten Year Plan.

TABLE 3—INDEX OF INDUSTRIAL PRODUCTION, SELECTED YEARS, 1930–53 [a]

(1947–49 equals 100)

1930	21.4
1938	28.5
1945	64.0
1950	147.4
1951	179.4
1952	206.9
1953	250.0 [b]

[a] The index used here is a Laspeyre type of index of the volume of industrial production.
[b] Provisional figure.

TEN YEAR PLAN

The objectives of the Plan are both economic and social. In drawing up the Plan, the Belgian government had as a main target the raising of the standards of living of the populations for which it is responsible. A quickened pace of social progress was essential if this was to be achieved. But if this progress is to be possible and permanent it must be based upon a stable and prosperous economy. The economic and social aspects of the Plan are therefore intimately related.

The Ten Year Plan is not based on the concept of a government-regulated economy. It is designed to stimulate the economic development of the country, and thereby raise living standards, by planned public investment. The essence of the Plan is the development of transportation and power; this will lay the foundation for the expansion of industry necessary for the growth and stabilization of the economy. Hence, since its inception, the Plan has provided for the investment of approximately half of its funds in transportation and power production; the readjustments made in the Plan as it has been put into effect have not changed the relative importance assigned to these two sectors.

Economic development depends upon increases in the productivity of labor. Since the native population in the Congo is rather limited in numbers, increases in total production can come only from increasing the per capita output in the economy. It was thus necessary to provide for the gradual mechanization and rationalization of methods of production.

Two basic difficulties stood in the way of transforming methods of production—the lack of technical proficiency characteristic of the native industrial worker and the lack of organization in native agricultural production. To meet the first of these problems an extended program of vocational training was incorporated into the Ten Year Plan.

With regard to native agriculture, the Plan provided for a gradual conversion of the inadequate farming methods to a system of rational cultivation—from a purely extensive system of agriculture to an intensive one.

Finally, it was decided under the Plan to attack and quickly resolve a number of social problems, such as public health and hygiene, basic education of the native masses, and housing for the natives living in the large urban centers. Also, provision of public funds for investment in the fields of water supply and construction of silos, warehouses, and public buildings was incorporated in the general program.

Execution of the Plan

This sketch of the broad outlines of the Plan shows that it involves the adaptation of public investment to the need of the country for economic development. The Plan has no coercive aspect of any kind; it has been placed at the service of the economy and will not subject the latter to any rigid goals; it consists primarily of a coordination of existing projects, the number and importance of which made coordination necessary.

The period of ten years which is assigned to the Plan does not mean that when this time has elapsed the equipment of the Congo will be considered finished. It means simply that the programs which have been presented have been projected as far as possible into the future. Even now we know that the effort will have to be continued beyond the end of the ten-year period, partly because of the enlargement of original projects, partly because new projects will be added.

In drawing up and implementing the Plan, it has been essential to consider carefully its effects on the economy as a whole. Given the limited reserves of native and European manpower in the territory and the shortage of transportation equipment and power, an unnecessarily large volume of public works could burden the economy and push it toward inflation. On the other hand, if the Plan is carried out with due consideration for current economic conditions it can play the role of a stabilizer in the economy. It is clear, after several years of the Plan's operation, that it is already filling this latter role.

Technological as well as financial factors have had to be considered. Although the Belgian Congo has rich potentialities, there are technical as well as financial limitations on the development of these resources. Thus, in putting the Plan into operation it has been necessary to weigh the technological practicability of projects, the possibility of financing the original expenditures, and the capacity of the Congo's economy to bear the future amortization and maintenance costs necessarily involved.

For the financing of the original investments, loans have been and are available—mainly from Belgium, the Belgian Congo, Switzerland, the United States of America, and the International Bank for Reconstruction and Development. To a certain extent the Plan may also be financed by the operating budget surpluses, after the setting aside of a substantial anticyclical stabilization fund. These available funds are sufficient to permit investments at a rate approximately equal to what the Congo's economy can absorb.

As for the question of meeting the additional costs involved in the Ten Year Plan's investment program (such as the expenses of operating and maintaining the economic and social installations to be created by the Plan and the payment of interest and repayment of capital borrowed), it is not likely that there will be any problem. Under the original limits set by the Plan, these increased

costs appeared to be compatible with the expected increases in national income and public revenues. The years which have passed since the drafting of the Plan have confirmed this forecast, and earlier expectations have even been surpassed insofar as the increase in national income and public revenues is concerned.

It should be noted that no special administrative organization has been created for the carrying out of the Plan. Its execution has been entrusted to the existing government departments and the important semiofficial organizations charged with transportation, water supply, agricultural research, and so forth. New organizations had to be created, however, for the study and construction of electric power projects and housing in the native cities.

Programs of the Plan

The total amount of investment of the Ten Year Plan (1950–59) was originally estimated at 500 million dollars, but soon after it was put into operation the Plan had to be re-examined in the light of changing circumstances and the rising costs of the projects. It became apparent that the original program (and later additions to it) would have to be spread over a period of more than ten years. Despite the longer period required for the realization of the Plan, the amount allocated for the original ten year period has been increased to approximately 960 million dollars.

Of the credits allotted through 1959, 43.9 per cent is devoted to transportation, of which 16.8 per cent is for river transport, 13 per cent for roads, 10.1 per cent for railroads, and 4 per cent for improvement of air transportation facilities. Electric power developments receive 6.4 per cent and the improvement of agriculture 5.5 per cent of the Plan's investments. Of the remaining funds, 25.8 per cent is devoted to social improvements and 18.4 per cent to improving the equipment of governmental services.

Transportation

Up to now, transportation organization in the Belgian Congo has been largely based upon its river system. This vast system (11,300 miles of navigable rivers) offers the advantage of draining the biggest part of its territory. This system has gradually been connected by rail to the outlying industrial regions. Although cheap, the present transportation system suffers from all the disadvantages inherent in slow river transport, with the additional disadvantage that numerous transshipments are necessary for most voyages of any length.

Under the Ten Year Plan the situation will be ameliorated in the following ways: (1) The river system will be improved by increasing its navigability, developing the harbor installations, and adding to its fleet capacity. (2) The speed of transport will be accelerated by connecting the two principal existing railway systems, Port Francqui–Katanga and Kindu-Albertville. A second connection, the railway Port Francqui–Léopoldville, is being studied. This line should put the most distant eastern part of the colony in direct communication with the seaport of Matadi. (3) A modern road system will be developed. The complete project provides for the establishment of the main north-south and east-west axes as well as a series of feeder lines connecting to the railways and rivers places which are poorly served by the existing system. (4) The ground installations of the airports will be adapted to meet the requirements of modern aircraft.

The road program consists mainly of the creation of asphalt-covered highways. The first phase will be started

with the east-west highway across the colony, the connection of the Kivu to the Congo River, and the construction of the most important feeder lines. The Plan provides for a thousand miles of these roads to be finished by 1959. The program will be continued after this date. Studies now under way cover 3,100 miles of roads.

At the same time that this program is being realized the Ten Year Plan is continuing the improvement of the secondary road system (more than 70,000 miles) by the important program of mechanical maintenance and the replacement of the old temporary works and ferryboats by metal bridges. The program for river transport includes the extension and modernization of harbors, the improvement of the river system, and the increase of the fleet capacity.

The seaports of Matadi and Boma are provided with 1,300 yards and 235 yards of quays respectively. In Matadi 610 yards of new quays will be constructed and in Boma 260 yards. The latter will, in addition, be provided with 375 yards of lighterage quays. Finally, a new port, provided with 90 yards of quays, will be developed at Banana.

To cope with the increase in traffic which must be handled by the river system, equipment of the river ports will be improved by the building of jetties and loading quays. These harbors are to be provided with adequate handling equipment. The harbor of Léopoldville is the object of special attention; 950 yards of new quays will be added to the 925 yards already existing.

To improve navigability, channels will be deepened and a system of luminous buoys installed. By dredging the mouth of the Congo, channels thirty feet deep have been created and maintained. Luminous buoys have been installed recently between the port of Matadi and the ocean, a distance of 90 miles, as well as on the middle stretch of the Congo between Léopoldville and Stanleyville, a distance of 1,080 miles. The program is being continued on the main tributaries of the river.

The fleet of the *Office des Transports coloniaux,* serving the interior river system, is constantly being increased. Thus its capacity has been enlarged from 100,000 tons in 1948 to 210,000 tons at present. The rail transport program provides for the creation of a new rail connection of 275 miles between the localities of Kamina and Kabalo, connecting the east to the southeast. These works are in progress.

As for the existing railway systems, the Ten Year Plan pays particular attention to increasing their capacity by improving the rails and the rolling stock. The track has been doubled on certain sections of the Léopoldville-Matadi line and the capacity of the terminal stations has been developed accordingly. The rolling stock has been modernized as a result of the replacement of steam power by electric diesel power. The electrification of a section of the line Léopoldville-Matadi is provided for in the Plan.

The program for air transport is in progress, with the construction and development of fifty-four main airports as the goal. Among these should be noted the Léopoldville airport, the three-mile-long runway of which has just been finished. Stanleyville and Elisabethville, which with Léopoldville are the principal economic centers of the country, will be equipped with airports capable of receiving aircraft of the DC-6 type. Five airports are planned to handle aircraft of the DC-4 type, twenty-one those of the DC-3 type, and twenty-five others lighter weight aircraft. In addition, local airfields and emergency landing fields are being planned at numerous points in the territory.

Electricity

Up to the present, the production of electric power has been supplied both by the public authorities through a system of thermal generating stations (diesel) of weak power and by private companies (mainly in the mining industry) which have established hydroelectric centrals of varying capacity. The hydroelectric power available in the Congo has increased from 96,500 kilowatts in 1949 to 275,000 kilowatts at the end of 1953. The installed capacity of the thermal stations can be estimated at about 35,000 kilowatts. Since the Belgian Congo is poor in fuels but especially rich in water power, it is from this latter source that larger quantities of power will be obtained. According to very approximate estimates the unharnessed power available in the territory of the Congo is 130 million kilowatts, of which 24 million kilowatts are economically utilizable. The Ten Year Plan provides for the establishment of hydroelectric power stations in the principal cities—notably in Léopoldville, Stanleyville, Bukavu (Costermansville), and Albertville. In the first stages, the power of each of these stations would be from 20,000 to 50,000 kilowatts. Work is already in progress in Léopoldville and Stanleyville.

Private enterprise is constantly developing its means of power production. Taking into account the projects now under study, an installed capacity of 800,000 kilowatts in hydroelectric stations will be reached in the near future.

Agricultural development

Agriculture is important in the economic life of the Congo; one-half of the total exports of the colony, in terms of volume, consists of agricultural products. Actually the importance of Congo agriculture is only partially revealed by export data, since a large proportion of the total commodities produced are consumed locally. In terms both of domestic consumption and exports, therefore, agriculture is crucial in the Congo economy.

Help given the European settlers should be mentioned here. European settlers have profited from the establishment of processing factories for agricultural products (notably tea), the creation of farming schools, and various measures designed to aid these farmers in adapting to tropical conditions. It is, however, in the native sector of agricultural production that the greatest effort has been made under the Plan.

The development of native agriculture has both economic and social aspects, since it demands a complete change of old-fashioned methods of cultivation, methods which are bound up with tribal organization. The natives are concentrated in little villages of a few families each. They are ignorant of the principles of rotation. They cultivate the soil to exhaustion and then move on in search of new lands to cultivate. This procedure results in an extremely poor utilization of the soil with all its consequences—small yields, erosion, and laterization of bare lands.

The Plan's accepted program seeks to remedy this situation by regrouping and stabilizing these farmers on lands where soil surveys have been made and by organizing crop rotations according to studied cycles. Gradual mechanization and the use of fertilizers will lead to increasing yields.

Communities created on this new basis are called *paysannats indigènes* ("native land settlements"). They will receive the economic and social equipment required for their development, such as co-operative stores for buying and selling, distribution of potable water, schools, dispensaries, and public buildings. The settlement of 450,000 native families in these communities, out of a total of 2,500,000, is foreseen by 1965. Thus far 120,000 families have been settled.

Other forms of aid to agriculture include antierosion and deforestation projects, agricultural surveys, the selection and breeding of basic plant stock for the planters, and, in order to remedy the lack of animal proteins in the native diet, the development of stock raising and pisciculture.

Social measures

The first objective of the Ten Year Plan in the social field is the improvement of public health. The Plan as a whole includes campaigns for research on and treatment of diseases, the elimination of insects, the development of health education, and the construction of hospitals, laboratories, and schools. A great effort is under way for the distribution of drinking water in tribal and detribalized native centers.

Education in all its phases is being actively developed. There are already 11,500 primary and kindergarten schools, 93 teacher training schools, and 12 schools for future native employees of local administration throughout the colony. For secondary education there is a total of 187 institutions; and for technical and vocational training there are about a hundred. Finally, the interracial University Center of Lovanium has begun its first courses.

Industrialization has made heavy demands on native manpower and has brought large numbers of natives to the main economic centers. An acute housing shortage has thus developed, with a consequent danger of social disturbances. To remedy this situation it was decided to create an Office of African Cities for the construction, within the framework of the Ten Year Plan, of houses for natives in the larger towns. The Office at the present time operates branches in Léopoldville, Bukavu, and Stanleyville; its action will be extended elsewhere. It plans the construction of 40,000 houses by the end of 1959. At the moment 6,149 houses are completed and 2,470 others are under construction.

Equipment of public services

The development of public services has been included in the Ten Year Plan. These programs cover a wide field, including telecommunications, meteorology, geology, cartography, and the construction of new administrative buildings. For example, under the aerial photocartography program 215,000 square miles have been surveyed since 1950. Adding the surface surveyed by private organizations to that figure, the total surface photographed amounts to 275,000 square miles, almost a third of the territory of the Belgian Congo.

THE PLAN IN THE CONGO'S ECONOMY

While the Plan is being carried out a rapid evolution of the economy is taking place. The period of superficial exploitation of the raw materials of the territory is now over; an intensive development of the resources of the Congolese economy is in process. In mining, simple surface mining is giving way to the extraction of ores from deeper lying deposits; agricultural yields are increasing; and industry is adding more and more value to raw resources.

The reserves of the Congolese subsoil are important. In addition to the ores which have up to now constituted the basis of mining production, new minerals will be exploitable in the near future, on condition that the equipment and above all the power are available. These include particularly the many special metals which modern technology uses in growing quantities.

The Congo's reserves of hydroelectric power are among the richest in the world, and the harnessing of these reserves will permit the satisfaction of all foreseeable needs. In agriculture, the period of intense development has only started. An immense increase in production is possible for food crops as well as for cash crops.

The aim of the Plan is to stimulate the development of these resources by improving the basic economic structure of the country and by adapting it to meet new needs.[2]

J. Huge is a geologist and a mining engineer. Prior to 1950 he was in the Department of Economy of the Belgian Congo. In 1950 he was assigned to the Administration of the Ten Year Plan, and since 1953 he has been director of the Commissariat of the Plan.

The Union of South Africa: Economic Problems in a Multiracial Situation

By SHEILA T. VAN DER HORST

CONTACT between black and white has been more far-reaching and sustained in the Union of South Africa than in any other part of southern Africa. Today the livelihood of all the Union's inhabitants is dependent in some degree upon the world economy, upon industrial specialization and trade. One would go far to find one of its inhabitants, black or white, who does not want, and in some measure obtain, the products of modern industrial processes.

AN ECONOMY IN TRANSITION

The transformation from a predominantly rural economy, largely organized on a subsistence basis, has taken place during the last century. A hundred years ago many of the white pastoral farmers scattered through the interior produced little for sale, while among the African tribes the family was the unit of production and consumption, and there was little specialization and trade beyond the family group.

The development of mining and the consequent growth of markets in the mining towns and the ports which supplied them began an agrarian as well as an industrial revolution. Adjustment to the new circumstances has been made unusually difficult by the heterogeneous composition of the population, varying so greatly in culture, race, and language. To the struggle for survival in a poorly endowed environment has been added strife between conflicting claimants to land. Conflict and competition sharpened by cultural, color, and linguistic differences have, as yet, prevented the development of a socially and economically coherent society. South Africa is in a state of economic and social transition, but there is no agreement, even among the politically dominant whites, as to the desired goal, let alone as to the path to be followed.

Economic development has been limited both by the response of the indigenous peoples to the stimuli introduced by white traders, missionaries, settlers, and governments and by the social and political structure established by these newer groups. Economic forces have led to the growth of a common system of production, and the great majority of adult men in all racial groups have been drawn into a Western-market economy and are, temporarily or permanently, in paid employment in mines and factories, on commercial farms producing specialized crops, in transport, commerce, the professions, public services, and domestic employment. But although the whites have welcomed the Africans as laborers they have feared the indigenous tribes, in early times as a military threat to the struggling white outpost, and today as a potentially hostile black proletariat. Moreover, as the Africans have become accustomed to mining and industrial work, groups of white workers, fearing competition, have combined to protect their vested interests. Limits have thus been set to the incorporation of nonwhites, and particularly Africans, into the industrial structure. In all industries and undertakings the labor force is racially mixed, but members of the different racial groups are not employed indiscriminately. Throughout the economy, employment continues to conform to a general pattern originating in the fact that from the outset the

whites have provided the initiative, skill, and capital, and the nonwhites most of the manual labor.

As a result of the initial reluctance of the Africans quickly to change their way of life and become full-time wage laborers on the mines and in the towns and the subsequent reluctance of the whites to accept Africans as fellow citizens, the system of labor migration continues to permeate the economy. Failure to appreciate the full significance of the developments taking place and official attempts to maintain the status quo have prolonged the transition and aggravated the difficulties of social adjustment. It has been too little realized that methods of production cannot be isolated from other aspects of culture and that the introduction of new techniques is not compatible with the preservation of old ways of life. Change has been at once too fast and too slow. Consequently, the economy presents a curiously mixed and patchwork picture with sharp contrasts, inconsistencies, and contradictions.

POPULATION

With an area of some 473,000 square miles, the Union of South Africa is equal in size to the four states of California, Arizona, Utah, and Nevada. Its population numbers 12½ millions, including migrant workers from neighboring territories.[1] The population is usually classified into four different "racial"[2] groups. The whites, or Europeans as they are called throughout southern Africa, number 2½ million. They comprise descendants of the original Dutch East India Company servants and settlers and later immigrants of European, and predominantly British, origin. The Africans, locally known as Natives or Bantu, number 8½ million. They first came into permanent contact, and recurrent conflict, with the white settlers some hundred and fifty years ago when the eastward dispersal of white settlement met the southwestward expansion of the African tribes in the hinterland of the present town of Port Elizabeth, over four hundred miles to the east of the colony's headquarters at Cape Town.[3] The Colored people, who number a little over a million, form a separate population group. They are of mixed blood, for the most part the product of intermarriage and concubinage. Their forefathers were the slaves imported from the Dutch East Indies and other parts of Africa during the regime of the Dutch East India Company, the Hottentots who grazed their cattle at the Cape at the time of early settlement, and the white officials, settlers, and sojourners at the Cape, once known as the "Tavern of the Seas."[4] The Colored people are concentrated in the southwest around the area of early white settlement, although there are small groups throughout the Union and most towns have a few Colored families; 90 per cent live in the Cape Province.

The fourth population group is the Indian or Asian, numbering some 366,000. Descendants of indentured laborers imported from India during the latter part of the nineteenth century to work on the sugar plantations on the Natal coast and of traders who followed, they are concentrated in Natal and have since been debarred from entering the other provinces of the Union except by special permission, nowadays rarely given. A small number of Indians, largely traders and market gardeners, are scattered through the Transvaal and Cape Province. Of the Indian population, 82 per cent is in Natal, 13 per cent in the Transvaal, and 5 per cent in the Cape Province. The Orange Free State has not permitted Indians to settle there.

In 1951 the Africans formed 67 per cent of the population, the whites 21, the Colored 9, and the Indians 3. These proportions have remained almost constant over the last fifty years, the high birth rate in the nonwhite groups having been counteracted by a high death rate.

[1] The Union draws some hundreds of thousands of migrant laborers from neighboring territories. The High Commission Territories of Basutoland, Bechuanaland Protectorate, and Swaziland, in particular, which are under the political control of Great Britain, are economically interdependent with the Union. Labor is drawn from them in the same way that it is from the Native Reserves within the Union.

[2] I use the term as it is customarily used in South Africa without any implication of scientific correctness.

TABLE 1—PERCENTAGE OF POPULATION IN URBAN AREAS

Population	1904	1911	1921	1936	1946	1951
White	53	52	56	65	73	75
Indian	15	46	31	66	71	76
Colored			46	54	59	61
African		13	13	17	23	24
TOTAL	23	25	25	31	37	39

Townward movement

The most marked development in regard to the structure of the population has been the townward movement of population during the last forty years. Table 1 indicates the proportion of the population enumerated in towns and villages at successive censuses.

It will be noticed that the townward movement began first among the whites. For the African population these figures are not a true indication of permanent urbanization because large numbers of the Africans in urban areas are more or less temporary residents there, who come to the mining and industrial towns from the rural areas within the Union and from other African territories and return to rural homes after spells of work on the mines and in the factories, commercial firms, and private houses of the whites. The majority of these migrant laborers are men, but an increasing number of African women are finding their way from the rural areas to the towns to supplement the meager agricultural production or simply to join their menfolk. The number of African women in urban areas has increased more than sevenfold in forty years, from less than 100,000 in 1911 to 762,000 in 1951. Despite the increased migration of women and the increase in the number of African urban families, in 1946 there were 185 male Africans in urban areas for every 100 females, as compared with a masculinity rate of 97 for the European, 92 for the Colored, and 111 for the Indian population. The unbalanced composition of the urban African population in the major towns and the accompanying excess of women, children, and old people in the rural areas have far-reaching social and economic consequences.

NATIONAL INCOME AND ITS DISTRIBUTION

The economic development of the Union has not proceeded at an even pace nor have modern techniques and methods of production spread through the whole economy. Alongside highly capitalized mines, modern factories, and commercial farms producing specialized crops, there are large districts, amounting to some 12 per cent of the whole country, where methods of production have advanced little beyond the substitution of the plow for the primitive hoe. But life in these areas has not remained untouched by the impact of white settle-

ment and mining and industrial developments, for they form the reservoir from which much of the labor to man the mines and factories is drawn. Drained of their manpower, yet increasingly overcrowded, these areas have stagnated and even deteriorated, and they present a marked contrast to the increased specialization elsewhere.

The general level of productivity in the Union is not high. Whether from the point of view of current classifications into developed and undeveloped areas or into rich and poor, South Africa falls into an intermediate position. In terms of national income it is in the same group as Cuba, Puerto Rico, Austria, Hungary, and Italy.[5] In 1952–53 the average national income was £100 per head. But averages of this kind are misleading where, as in Africa, the distribution of incomes is very unequal. Comparisons are also misleading because of the difficulty of evaluating income in money where ways of life and climatic conditions vary greatly.[6]

Racial differences

One of the most characteristic features of the Union is the great general disparity in the incomes of the different racial groups. Little detailed study has been made of income distribution but calculations based on the data available gave average annual incomes in 1936 as £130 per head for whites, £28 for Indians, £19 for Colored persons and £10 for Africans.[7] There has almost certainly been some improvement in the relative position of the nonwhites in addition to the increase in the national income since that date. Nevertheless, the gap between the incomes of most whites and most nonwhites remains very large. In manufacturing industry, where the gap is least, the average African man's earnings are approximately a quarter of the average white wage. The wages of Colored persons and Indians are as a rule higher than Africans'. In 1950 in manufacturing industry they averaged 40 and 37 per cent respectively of white wage earnings. In the mining industry the gap is much greater, African earnings, including the cost of food and housing provided, averaging one-eighth to one-tenth of white earnings.

The reason for the large difference in incomes is twofold. In the first place mining, which set the pace and pattern for economic development in South Africa, was dependent at the outset upon the importation of skilled labor from abroad, and high wages had to be paid to attract experienced miners to the remote, rough, and expensive mining camps. At the same time local African labor could be obtained for much lower rates. Africans, however, were at first prepared to work only for short periods of a few months, were genuinely unskilled, and could only be used for rough manual work. For the last fifty years trade union action, backed by social and legislative sanction, has successfully maintained the more highly paid work as the preserve of the white. This pattern of employment and wages has outlived the circumstances which gave rise to it and has spread beyond the mining industry and become typical of the older trades and industries, particularly in the inland provinces. In the coastal cities the racial stratification of employment is not so clear cut, as the Colored people in the Cape and, to a less extent, the Indians in Natal have occupied an intermediate position.

There is little doubt, however, that even if the more highly paid jobs were not reserved for them, the incomes of the whites would on the whole be higher than those of the nonwhites, for white immigrants have brought skill, technical knowledge, and capital to South Africa. Little is known regarding any possible innate differences in industrial capacity between the different racial groups. Whether or not such innate differences exist, differences in upbringing and environment, and in opportunities for employment, education, and the acquisition of property, are sufficient to account for a large measure of the disparity in productivity and income which is characteristic of the different racial groups.

Lack of mobility

The social and industrial structure being organized on a color basis, there is little mobility between the unskilled and semiskilled manual worker on the one hand and the skilled, supervisory, and executive occupational groups on the other. The type and grade of work done by individuals and hence their incomes are determined by their racial group as much as by individual aptitudes and preferences.

To this rigid stratification are added the low productivity of much of the land and the system of labor migration which retards the growth of an efficient labor force and perpetuates the circle of low productivity, and consequent poverty, in both industrial and agricultural areas.

Productivity in Rural Areas

Notwithstanding increased urbanization, some 60 per cent of the total population, but only 25 per cent of the white, still lives on the land. The share of the national income accruing to agriculture is, however, only 15 per cent of the total, giving an average yield from agriculture of just less than £30 per head for those in rural areas, less than one-third of the average income per head. These low returns go far to explain the townward movement of population. The reasons for the low average returns from agriculture are, in the first place, that a great part of the country is handicapped by having a low and variable rainfall. Only one-third of the Union receives more than twenty-five inches of rain a year and only half more than twenty. The soils, moreover, lack phosphates, and good soils are patchy. Large areas are arid and suitable only for extensive grazing. The irrigable and potentially irrigable area is very small. Only about 6 per cent of the area of the Union is cultivated, and it is estimated that at the most 15 per cent is ever likely to be cultivated.[8] In most parts agricultural yields are low and variable, owing partly to lack of capital and poor methods of cultivation, particularly where land is occupied by Africans; nevertheless agriculture is also severely handicapped by natural features.

Methods of agricultural production vary from specialized production, on highly capitalized fruit, grain, and wool farms and commercial estates, to scratching a few acres of soil and planting traditional crops and grazing a few head

of scrub cattle, sheep, and goats on communal pasture lands in the Native areas. In the area set aside for white ownership, comprising some 87 per cent of the total area used for farming, 55 per cent has a rainfall under twenty inches and is only suitable for extensive grazing. The average size of a farm is large, more than half being over 600 acres in extent and more than a quarter over 1,000 acres. Since the war farming has prospered, and there are a considerable number of wealthy sheep, maize, and fruit farmers. Mechanization on farms owned and controlled by whites is increasing; the number of tractors has risen from 6,000 in 1937 to 48,000 in 1950; and the output of agricultural products which remained stagnant in the thirties and war years is growing.[9]

Hired labor on farms is predominantly African, although in the western Cape farm laborers have usually been Colored and the employment of Africans in this area is a comparatively recent development. Some two million Africans live, largely with their families, on farms owned and occupied by whites and another half million on farms owned, but not occupied, by whites. The terms and conditions on which these Africans live on farms vary from full-time employment at a cash wage to labor tenancy. Labor tenants are required to work for certain periods in return for the right to cultivate small plots of ground and graze a limited number of stock.[10] It has now become usual to pay a small cash wage during the periods of work for the land owner.

Problem of Native Reserves

In 1951 there were 3½ million Africans in the Native Reserves excluding perhaps half a million migrant laborers, more or less temporarily absent at work in the mining and industrial centers. Instituted a century ago in the British colonies as a protective measure to prevent the African tribes from being entirely dispossessed of their land, the Reserves have become economic backwaters, the Union's backward areas. Moreover, the right of Africans to acquire land outside these areas has been whittled away to vanishing point while within them, with some modifications, tribal systems of land tenure have been retained and have been a potent factor retarding improved methods of farming. Stagnation and poverty are the hallmarks of the Reserves. In them agricultural methods remain primitive and unproductive.[11]

[9] Calculated at prewar prices, the value of crop production was virtually the same in the mid-forties as the mid-thirties but increased 27 per cent between the years 1944–47 and 1949–52.—"The Revolution in Our Agriculture," *Farming in South Africa* (Department of Agriculture, Pretoria, South Africa), Vol. 29, No. 336 (March 1954), p. 163.

[10] According to the Agricultural Census returns in 1952, the average value in cash and kind of the monthly wages of farm labor was £27 for white men, £6 for Colored and Indian, and £3 for African.—Agricultural Census No. 26, Census Year 1951–52, *Labour on Farms and Wages of Farm Labourers* (Union of South Africa, Bureau of Census and Statistics, 1954), p. 1.

[11] A sample survey of one district showed the average value of the income from farming of a family of six as only £7 2s. 3d. a year, including the value of produce raised and consumed. The produce raised was estimated to fluctuate between 15 and 30 per cent of basic requirements of foodstuffs and clothing. —D. H. Houghton and E. M. Walton, "The Economy of a Native Reserve," *Keiskammahoek Survey*, Vol. II (Pietermaritzburg, South Africa: Shuter & Shooter, 1952), pp. 106, 184.

See also "The Reserves," Native Economic Commission 1930–32, U.G. 22, 1932 (Pretoria: Government Printer), Part I; "The Native Reserves and Their Place in the Economy of the Union of South Africa," Social & Economic Planning Council, *Report No. 9*, U.G. No. 32, 1946, pp. 12–13; M. Elton Mills, "Land Tenure," *Keiskammahoek Rural Survey*, Vol. IV.

There is no doubt that the output of these areas, which comprise some thirty million acres, could be increased very greatly by improved agricultural techniques. Experimental work has shown that in some areas twice the usual yield could be obtained by better methods. But the problem is not a simple one. Administrative attempts to improve agriculture have come up against the conservatism of the people, their ritual attitude towards cattle, traditional or only slightly modified systems of land tenure, and the system of labor migration which drains these areas of their manpower and yet is necessary to prevent starvation. At any one time more than 40 per cent of the men between fifteen and sixty are away at work on the mines and in industries situated for the most part hundreds of miles away. Moreover, those who are at home are there only temporarily "resting" between spells of work in the towns, and they do little productive agricultural work.

The introduction of modern farming methods and the creation of a skilled, self-supporting peasantry would require far-reaching changes. Experience in South Africa confirms Professor Kuznets' warning:

> Above all, policy action must be made in full cognizance of the social and cultural corollaries of higher levels of economic performance, and of the implicit destruction of longstanding and entrenched interests and attitudes which the adoption of these corollaries threatens.[12]

Yet new methods and the adjustment of old ways of life are essential if the increasing population is even to maintain, let alone improve, its low standard of living. In the Reserves, in the first place, a redistribution of land would be necessary and a reduction in the number of families who now occupy land but are largely dependent on the earnings of emigrant breadwinners. According to tribal usage every married woman cultivated a small field, usually three to five acres in extent, while grazing land was held in common. This widespread distribution of small patches of land and communal grazing lands has been retained. Consequently, the potentially more enterprising cannot acquire additional land and establish themselves as whole-time farmers on economical holdings. Secondly, traditional attitudes towards cattle will have to be modified, and commercial values will have to take the place of tribal religious and social values. Thirdly, effective reconstruction requires the growth of a class of full-time African farmers and agricultural workers and a reduction and eventually an end to the constant flow of nonspecialized workers between the industrial and the rural areas. The increased productivity of the Reserves is accordingly closely linked with the stabilization of the labor force and the permanent settlement of workers in the mining and industrial areas. While the right of Africans to enter, acquire property, and remain in the towns is insecure, they cling to a rural foothold and retain small plots which they are not able to use effectively.

[12] Simon Kuznets, *op. cit. supra* (note 6), p. 250.

Importance of Gold Mining

It was mining, and particularly gold mining, which stimulated South Africa's economic development and brought her into the world economy. Mining drew men, capital, and railway lines first to Kimberley and then to the bleak and sparsely settled Witwatersrand, whose towns now contain an eighth of the Union's total population and between a quarter and a fifth of its white population.

Although today manufacturing indus-

try as well as farming exceed gold mining in the numbers employed and in the share of the national income accruing to them, gold mining continues to be of key importance, for much of the prosperity of both farming and manufacturing is still directly or indirectly dependent upon gold production. Gold also remains South Africa's principal export.

Up to 1936 two-thirds of the private capital invested in the Union from abroad was invested in mining[13] and since World War II it is estimated that a quarter of foreign investment has been in gold mining.[14] In addition foreign capital has helped to finance the large amount of auxiliary investment required to develop new mining areas.[15]

The expansion of manufacturing and constructional industries which has been such a marked development of the last twenty years was, in the first place, largely a result of the increased prosperity of the gold-mining industry, resulting from the increased price of gold in the thirties. Net investment in the Union in the years 1933–39, estimated at 345 million pounds, was almost double the investment for 1923–29, and one fifth was directly in gold mining.[16] At the same time gold constituted 70 per cent of the exports which enabled manufacturing industry to pay for imports of materials and equipment. In the interwar period manufacturing industries imported 50 per cent of the materials used and all the machinery and specialized equipment, while they contributed approximately 3 per cent of exports. Although exports of manufactured goods have increased greatly, notably to the Union's northern neighbors, manufacturing industries still require foreign exchange far in excess of what they earn,[17] and so are indirectly dependent upon exports.

SOCIAL CONSEQUENCES OF INDUSTRIALIZATION

World War II further stimulated manufacturing and constructional industries. The engineering and metal industries in particular expanded, and new branches were established for war production and to meet the needs of the home market.[18] Since the war this expansion has continued, encouraged in the immediate postwar years by difficulties in obtaining goods from overseas and by the continued rise in both money and real incomes and protected, since 1949, by import and exchange controls. Investment has taken place at an unprecedented rate. Between 1946 and 1952 net investment is estimated to have averaged 205 million pounds a year, of which just under 40 per cent was financed by funds from abroad. Even allowing for the 200 to 300 per cent increase in construction costs, this represents a considerable increase over the estimated average investment of 50 million pounds a year in the prewar period which was also a time of expansion.

TABLE 2—RACIAL COMPOSITION OF WORKING POPULATION IN 1946
(Percentage of total working population)

Industry	European	Indian	Colored	African
Farming, Forestry, Fishing	4.8	0.4	2.8	92.1
Mining and Quarrying	10.7	0.1	0.5	88.6
Manufacturing Industry	35.0	3.6	14.1	47.2
Transport and Communication	59.1	1.1	6.7	33.2
Commerce and Finance	56.1	7.6	7.4	28.9
Public Administration, Defense, and Professions	52.7	1.7	7.4	38.2
Entertainment and Sport	46.9	3.3	6.2	43.7
Personal Services	3.5	1.0	10.5	84.9

Source: Industrial Legislation Commission of Enquiry, U.G. 62, 1951, p. 16.

The number employed in manufacturing and constructional work has increased fourfold in the last thirty years and more than doubled since 1939, having been 176,000 in 1920, 353,000 in 1939, and 713,000 in 1950. In 1946, 21 per cent of the white working population, 22 per cent of the Colored, 25 per cent of the Indian, and 14 per cent of the African male adult population were engaged in these types of work.

Concurrently with the continued expansion of manufacturing industry, new gold fields are being developed with a potential output comparable to that of the Witwatersrand. At the same time, other mineral production, notably coal, diamonds, copper, asbestos, manganese, chrome, and iron ore, has continued to increase and has more than doubled since prewar days. Uranium has also been added to the mineral products. The value of mineral production, other than gold and uranium, has risen from 12 million pounds in 1939 to 63 million pounds in 1951.[19]

The simultaneous expansion of mining and manufacturing industry has been made possible by the import of capital, by immigration, by the redistribution of labor within the Union, and by the increased absorption of the indigenous African population into industry and trade. (The racial composition of the working population in the principal industrial groups in 1946 is shown in Table 2.)

The economic integration which has taken place poses social and political problems which could be ignored while agriculture, mining, and domestic service were the chief avenues of employment for Africans. Agriculture, for the most part, relied upon workers resident on the land, and mining from the outset was organized on the basis of migrant laborers who returned to their rural homes after a term of work on the mines. The mines, with minor exceptions, provide accommodation for their African laborers in barracks, known as compounds, and there has been little opportunity for wives and families to

[19] Official Year Book, No. 21, 1940 (Pretoria: Government Printer, 1940), p. 812; Government Mining Engineer, *Annual Report 1951,* U.G. No. 50, 1952 (Pretoria: Government Printer), p. 59.

accompany mineworkers and live with them at their place of employment.

The growth of manufacturing industry and commerce has occurred at a time when increasing familiarity with Western ways and the pressure of new wants have combined with the exhaustion of the soil to bring about more permanent migration. Women have followed the breadwinners, and families are increasingly being established in the towns despite the theoretical division of the country into black and white spheres.

Urban conditions

This movement has presented a formidable physical and fiscal problem of providing housing, transport, and public and social services; it has also challenged the traditional social structure. White and black have been brought together in the more crowded circumstances of town life in relations other than the customary one, of master and servant or administrator and tribesman, in which Africans first entered the colonial economy. The difficulties of adjustment have been increased by the reluctance of the whites to face up to the social and political implications of the new conditions created by industrialization, and by their refusal to concede permanent rights, including rights to acquire property in the growing towns. Moreover, their attempts to enforce partial segregation, by requiring that Africans employed in industry shall live in separate areas outside the towns, have added to the cost of providing roads, transport, power, sanitation, and other services.

The whole responsibility for accommodating African workers in industry has been thrown upon the urban authorities. Municipalities have been confronted with the problem of providing public housing for the great majority of the two million Africans in urban areas, who exceed in numbers the white urban population but whose low wages do not enable them to pay rents sufficient to meet the high cost of building. As a consequence, thousands of urban workers and their families are still living in one-room shacks and hovels, in conditions which defy description, with no security or opportunity for maintaining decent family life.

Attempted regulation

The cost of providing accommodation, fear that the towns may attract more work seekers than will be absorbed, and reluctance to countenance the growth of a black urban proletariat have led to attempts to stem and regulate the townward movement. The right of Africans to enter urban areas to look for work has been severely restricted. The restrictions on movement are difficult to enforce and lead to evasion and frequently to great hardship. At the same time, attempts to control the urban settlements and townships, to enforce the general prohibition on the sale of European liquor, and to limit and regulate the brewing and sale of traditional African beers, lead to vexatious police raids. Consequently the law is brought into disrepute and the jails are filled with petty criminals convicted for statutory offenses which carry no moral stigma. Serious crime is increased by the breakdown of traditional and community sanctions and the failure to develop new ones. Traders, missions, schools, and administrators together with industrial developments have brought about the dissolution of the old tribal culture, but a new synthesis has yet to be evolved.

INFLUENCE OF RACIAL POLICIES ON ECONOMIC DEVELOPMENT

Attempts to protect the whites from the potential competition of nonwhites have been an important factor restricting productivity and delaying adjustment to changing conditions. Systematized regulation of apprenticeship has excluded Africans, and in the northern provinces other nonwhites, from the skilled trades and has limited the number of white artisans. This has increased the shortage of skilled labor which has retarded development when other conditions were propitious. At the same time lack of opportunity for nonwhite youths to acquire skill, training, and employment has led to considerable unemployment among those not strong enough to do heavy manual work and unwilling to go into domestic service.

Labor unions

The phenomenon of organized labor adopting restrictive devices is not confined to South Africa, but in the Union such action has been reinforced by color prejudice. Trade union organization has been largely confined to white and mixed (Colored and white) trade unions.[20] Collective bargaining has been fostered by the state and given statutory sanction, but African trade unions, although not illegal, are not recognized by the state nor included in the state-sponsored system of collective bargaining. Moreover, unions registered for collective bargaining are not permitted to admit African members. In South Africa, breach of contract has been a criminal offense for the majority of African workers. Consequently strikes of Africans have generally been illegal. In 1953 the prohibition on strike action by Africans was extended and all strikes of African employees are now illegal. The denial of the strike weapon, together with the fluctuating composition of the labor force resulting from the prevalence of migrant labor, has retarded the growth of African trade unions and, in contrast to white unions, they have not been a potent force in the labor market.

[20] Legislation is pending prohibiting the formation of new mixed unions and encouraging the separation, on a racial basis, of existing mixed unions.

Recruiting of labor

The reservation of skilled work for white men and the maintenance of high wage rates in these occupations has placed a heavy burden on industry. In the gold-mining industry, which cannot pass on the cost by raising the price of its product, the rigid demarcation of spheres of employment has been an important influence determining labor policy. Precluded from reorganizing their labor force to make the most effective use of the labor now available, the Transvaal gold and coal mines maintain an elaborate recruiting organization. Wage rates are standardized and individual mines are not permitted to raise wages to attract labor, but recruited labor is distributed among them on the basis of agreed quotas. On the terms and conditions offered, most Union Africans prefer other types of work, and the mines draw more than 60 per cent of their African labor force from outside the Union where wages are lower and opportunities for paid employment are fewer. The High Commission Territories supply some 17 per cent of the total.

Restrictions

The newer manufacturing industries have been less hampered in their use of labor and have drawn on all sections of the population, although few African women are, as yet, employed in industry. Employers do not, however, have a free hand in organizing their labor force. Government regulations require separate work places and wash places, as well as separate canteens, where these are provided, for members of different racial groups. The employment of a fully integrated labor force is thus precluded by law as well as custom. Nonwhites are not employed in positions of

authority over whites; consequently, opportunities to mount the industrial ladder are limited. Nevertheless, the expansion of industry has widened the range of employment open to members of all racial groups, particularly as machine operatives. The employment of nonwhite supervisors and clerical workers is also increasing in the growing number of concerns in which the labor force is predominantly nonwhite.

In the government service and state-controlled undertakings such as the railways, whites are given protected employment in unskilled occupations, at wages above those prevailing for the type of work, as well as in skilled and administrative work. Only in the police force and as teachers and nurses are nonwhites employed in any number by the state on other than manual work. In these branches nonwhites are employed to serve members of their own racial groups.

The general restriction of opportunities for nonwhites has serious social and economic repercussions. It breeds a sense of frustration and grievance among the nonwhites and reduces their incentive to work. It has also meant that the small white population of 2½ million has to provide the professional, executive, administrative, technical, and most of the clerical workers for all the Union's private industries and public services. The consequence is that scarcity of labor for skilled, technical, supervisory, and administrative posts has retarded economic development.

Apartheid

The manifest instability, injustice, and wastefulness of the existing situation have led to the enunciation of the policy of *apartheid*. This policy means different things to different people. To some it represents an attempt to revive the old defensive frontier policy of nonintercourse. To implement it fully would reverse the developments of three centuries, disrupt the economy, and partition the country. Proponents of *apartheid* maintain that it is essential for the preservation of Western civilization in the Union, that the white group should retain its separate identity and political supremacy, and that it is only by separating the different racial groups that unrestricted development can be permitted without threat to the whites. This argument has great political appeal, but it ignores the economic integration which has already taken place and the interdependence of white and black in every branch of production. As the policy is economically impracticable it tends to become simply a theoretical justification to make racial discrimination morally acceptable.

Outlook for Economic Development

The recent expansion in manufacturing industry has led some to look to further industrialization as a solution for South Africa's low productivity and relative poverty. The Union is the most industrialized country in southern Africa, and it has sometimes been suggested that she might become the workshop of Africa. In this respect she has certain advantages over her northern neighbors in that her population has had longer contact with a market economy and is more accustomed to the idea of full-time employment for wages. Her transport services and public utilities are more developed. In competition with the rest of the world, however, her chief advantage lies in proximity to African markets.

In addition to the featherbedding of white employment, a general policy of protecting agriculture and manufacturing industry has been followed. As a result South Africa is practically self-sufficient in food production, but large sections of the community are not adequately nourished, the consumption of dairy produce, meat, and green vegetables being very low. The methods of assisting agriculture and manufacture have raised costs and handicapped the export industries, increasing their dependence on the supply of low-paid African labor. Yet the present economy is largely dependent upon international trade. Even within the curb of exchange controls, expenditure upon imports has been between one-quarter and one-third of gross domestic expenditure.

The population is increasing at the rate of 2 per cent per annum, and it is essential that productivity should increase in order to maintain even the present low average level of income. Since the war the national income, crudely adjusted by the retail price index, has increased at an average rate of between 4 and 5 per cent per annum, although there have been fluctuations from year to year and the rate of increase has fallen since 1951. This increase has accompanied the inflow of capital, and a continued inflow appears to be necessary to support anything like past rates of increase.

South Africa's future economic development is closely linked to her economic relations with the rest of the world, including other parts of Africa. These relations in turn will be influenced by the manner in which the internal conflict between economic requirements and political theories is resolved. There are formidable problems of adjustment and mutual accommodation ahead, if the diverse racial groups are to be knit into a stable society in the new conditions which have emerged as the result of rapid economic change. The economic outlook cannot be divorced from the political.

Sheila T. Van der Horst, Ph.D., Cape Town, Union of South Africa, is senior lecturer in economics at the University of Cape Town. She is on the Council of the Economic Society of South Africa, is a member of the Executive Committee and chairman of the Cape Western Regional Committee of the South African Institute of Race Relations. She is author of Native Labour in South Africa (1942), of the chapter on Labour in the Handbook on Race Relations in South Africa (1949), and of various articles on South African labor and monetary problems published in the South African Journal of Economics and other periodicals.

Colonial Issues and Policies with Special Reference to Tropical Africa*

By Kenneth Robinson

AFRICA ceased to be the Dark Continent only by becoming the colonial continent, and it is because Africa is still, in so many ways, the colonial continent that its problems have come to occupy an increasing share of the time and energies of the Western world, in an age when colonial government has come to be widely considered a dangerous anomaly whose only justification must be sought in the effectiveness with which it prepares for its own disappearance. As late as the beginning of World War II, however, the continuance of non-African control of virtually the whole of Africa was equally widely taken for granted as the only practical possibility, at least until a future so remote that it need not be considered. The European masters of the African continent were, it was supposed, free, within very wide limits, to decide what were the appropriate objectives of policy and how they were most likely to be realized.

Changed Attitudes to Colonialism

Since the end of the war, however, Africa has ceased to be a world apart and become part of the world. Colonial rule is not merely on the defensive but in many parts of Africa on the way out, and everywhere it is regarded as, at best, an inevitable expedient to be replaced as soon as possible. Some of the factors that have produced these changes were indeed inherent in the activities of the previous period, while others are the outcome of increases in the speed and extent of social and economic change resulting from the war. But perhaps the most important are the result of changes external to Africa itself, changes in the attitude of the rest of the world to Africa, exemplified not only by the colonial powers but more strikingly by international opinion, as expressed in the chapters of the United Nations Charter relating to trust territories and non-self-governing territories.[1] This changed attitude is often accompanied by a lack of historical perspective which easily leads to the assumption that a mere half-century of European rule has obliterated some of the characteristics that made it inevitable, and thus to the ignoring of features of the political realities in Africa which, significant before the period of European control, may well re-emerge when that control finally disappears.

European control, in this context, means essentially the influence and ultimate control of relatively remote West European rulers and the day-to-day rule in the African territories of agents appointed by and responsible to them. Once substantial European settlement has taken place, European "settlers"—in the broadest sense of permanent residents—present characteristics and attitudes increasingly differentiated from those of such "external" agents of control. The transfer of control to settlers, in fact, means not a straightforward continuance of West European rule but its transfer to an African-based elite (albeit of European origin) which may well seek to make permanent a new and different form of colonial rule over the subject masses. This is, indeed, what has happened in the Union of South Africa, and it is still uncertain whether it can be prevented from happening in North Africa. It is not as self-evident as doctrinaires currently assert that if recourse were had to *l'épreuve de force*, the European residents of North Africa must lose out entirely to "nationalist" forces, any more than the Jewish immigrants in Palestine succumbed before similar forces. The history of British intervention in the Sudan, to take another instance, suggests that British withdrawal from those territories might well result in the resumption of the Muslim thrust south, interrupted only three-quarters of a century ago, unless those to whom power is transferred seek to prevent this and are able to find effective means of doing so. To recognize these possibilities is not, of course, to make any judgment about their desirability: it is merely to emphasize that the real basis of imperialism is to be sought in disparities of power between one political unit and another.

Africa was the colonial continent par excellence because it was politically fragmented, technologically retarded, and economically poor: a little more than half a century of European control has not so decisively changed these characteristics that the mere withdrawal of the European colonial powers can be counted upon to ensure "independence."

Desire for Independence

The great motive power in African politics today is, however, the desire for independence. For the important, though in most parts of tropical Africa still numerically small, minority who have acquired some of the values of the more technologically advanced "Western" way of life, probably the most profound aspiration of political life is the desire if possible to attain, but at any rate to assert, an equality with the rest of mankind, and more particularly their European rulers.[2] So long as the world is organized politically on the basis of a number of theoretically equal and independent units, this desire to assert equality will almost inevitably assume the form of a demand for the creation of territorially based sovereignties, formally at least independent of any external control. However uncertain may be the criteria by which the possibility of such statehood is, in any given case, to be assessed, it is abundantly clear that few, if any, of the indigenous social units of tropical Africa could provide even the minimal base for such an evolution.

"Independence," even of the most tenuous and formal kind, can only be attained in considerably larger units, with more numerous people and larger real resources. These larger units, it has been commonly assumed, must be the territorial units created by the colonial powers, although their boundaries were drawn up with little regard to existing ethnic divisions and no thought of affording the basis for the evolution of new sovereign states. It is often argued that the setting up in such a composite territory of the formal structure of a political democracy will provide an effective focus for the unification of the peoples round the new political institutions with which they may come to identify themselves. Several recent instances suggest, on the con-

*I have incorporated in this article parts of a convocation address entitled "Africa in Mid-Century" which I was privileged to deliver at the University of Ohio on July 19, 1954.

[1] Cf. Kenneth Robinson, "World Opinion and Colonial Status," *International Organization*, Vol. 8 (November 1954), pp. 468–483.

[2] Cf. Léopold Senghor, *Journal Officiel, Débats Parlementaires, Assemblée Nationale*, November 22, 1952, p. 5503: "Vous les savez, les Africains ont actuellement le mystique de l'égalité . . . ils veulent que les mêmes principes soient dès l'abord posés pour la Métropole et les territoires d'outre-mer. Ces principes d'égalité posés, les Africains sont disposés à tenir compte des réalités."

trary, that the imminent withdrawal of the colonial power may well result in the re-emergence or emphasis of cleavages between different ethnic groups within the originally artificial colonial unit.[3]

Quite apart from this issue of "tribal separatism" it is idle to ignore the existence in Africa, as elsewhere in the world, of groups which, for one reason or another, cannot immediately or easily find their place in a large-scale exchange economy with a modern secular political system but which for a considerable time to come will need special administrative and other arrangements for their protection. Experience elsewhere—in the United States, in New Zealand, in Australia—strongly suggests that attempts at a brutal and compulsory "integration" or "assimilation" of such groups to the pattern of a large and different society are seldom successful. Special provision for their administration may well be necessary in many parts of Africa, if separate independent states replace existing colonial administrations.[4]

POLITICAL PROBLEMS

The political issues confronting Africa today thus stem largely from the very conditions which made it the colonial continent, although also from some new factors which have made their appearance during the period of colonial rule, notably the permanent settlement in certain parts of the continent of European and Asian immigrants. The major problem is whether forms of political organization can be devised which will make it possible to replace colonial rule without a reversion to the political fragmentation and absence of any large-scale framework of law and order which were such important factors in making colonial rule possible, but also without the mere substitution, in some areas, of other imperialisms for the colonial rule of Western Europe; and, finally, without merely transferring power to a charismatic dictatorship, whether "indigenous" or of one of the immigrant races. The assumption that there can be only one solution of this problem, namely the successful creation of a fully democratic Western type of representative government in a number of new territorial sovereignties, though widely held, does not seem a very hopeful one, if only for the reason that this form of political structure was evolved in circumstances quite different from those of Africa and requires, for even moderately successful functioning, conditions which seldom obtain there. Against this necessarily summary assessment of present political problems in Africa, it is now proposed to consider the objectives and methods of the major governments which have been concerned with its affairs during the period of colonial rule.

COLONIAL POLICIES BEFORE WORLD WAR II

It has already been emphasized that during the half century between the partition of Africa and the beginning of World War II, it was taken for granted that most of Africa should be, and would for long remain, under external control.[5] The dominant characteristic of British policy was that described by the word "trusteeship." While no doubt some kind of self-government would have been asserted as the ultimate objective of trusteeship, it was assumed that, at any rate in the African territories, this was a very remote possibility, though there should of course be a gradually increasing degree of participation by the inhabitants in the political decision-making process.[6] There was, however, a fundamental ambiguity in British policy. On the one hand, there were in all the African territories Legislative Councils. In all of these councils in 1939 there was, it is true, an official majority, but the historical evolution of the Commonwealth elsewhere made it inevitable that they should nevertheless be regarded by the small English-educated intelligentsia as "Parliaments in embryo." It was inevitable, too, that this intelligentsia should look to an increase in the number of the elected members of the Legislative Council, and their eventual assumption of ministerial responsibility, as the predestined end of political development, an attitude fully shared by European settlers in East and Central Africa, though they assumed that such developments must, at least for an indefinite future, be restricted to members of their own community.

These Legislative Councils were, in fact, relics of an older British approach to the problems of colonial rule. In Africa, as British penetration had increased and vast areas been added to the Empire—these areas inhabited by peoples whose social, economic, and political organization, though little known and less understood, was clearly totally unlike that of Western Europe—a different philosophy of colonial government had been evolved, that generally known as "indirect rule" but more precisely described as the "native authority system." According to this philosophy, the customary authorities in African tribal society, chiefs and elders, were to be recognized and supported by the administration, their rule was to be purged of gross excesses, and they were then to be assisted gradually to adapt themselves to the new needs and the changing world resulting from British rule and contact with Western society. Great emphasis was placed by most of the exponents of this system on the evil consequences of too rapid social change: the ideal forms of economic development were those which least disturbed the rural life of the African, especially those under which, without disturbance to that way of life, he might learn to grow for himself cash crops, like cocoa in the Gold Coast, cotton in Uganda, or groundnuts in Northern Nigeria.

Native administrations

"Indirect rule" was not concerned to answer the question, Where is all this leading? It was the duty of the trustee to hold the ring, to keep the scales even, so that, in the phraseology then current, "the African could develop on his own lines."[7] These innumerable "native administrations," as they were called,

[3] See, for example, "Grievances in Ashanti," *The Times* (London), November 30, 1954, for Ashanti agitation for a federal constitution in the Gold Coast; U. K. Colonial Office, *Withdrawal of Recognition from Kabaka Mutesa II of Buganda* (Cmd 9028) and *Buganda* (Cmd 9320) for Buganda separatism; and *Special Report on the Ewe and Togoland Unification Problem* (UN Document T/1101) for the analogous issue of Ewe unification.

[4] A good popular account of experience in America, Australia, and New Zealand will be found in Walter Kolarz, "The Rebirth of Native Peoples," *The Listener*, Vol. 52, No. 1342, November 18, 1954, pp. 838–40. For a more extended discussion, see A. Grenfell Price, *White Settlers and Native Peoples* (Melbourne, 1950). Such special provision exists, for example, in India (Article 244 and the fifth schedule of the Constitution of India).

[5] This view was, of course, challenged by settlers, especially those in Kenya, and by radical opinion in Britain and France, though this was usually more concerned to purify, supervise, or even internationalize such external control than to advocate a substitute for it.

[6] Cf. the statement of the British Colonial Secretary (Malcolm MacDonald) in the House of Commons, December 1938, *Parliamentary Debates*, Vol. 342 (Fifth Series), p. 1246.

[7] The best account of the philosophy of "indirect rule" is by Margery Perham, *Native Administration in Nigeria* (Oxford, 1937). The most complete account of its actual accomplishments is by William Malcolm Hailey, *Native Administration in the British African Territories*, 4 vols. (London, 1950).

varied in size and capacity from the great, well-organized emirates of Northern Nigeria with budgets running even in those days into hundreds of thousands of dollars, occasionally employing European technical officers, to small groups of a few thousands, hardly recognizing the existence of a single political authority at all and with an annual revenue of no more than a few hundred dollars; from native administrations which really could manage for themselves the collection of revenue and the provision of some local services, to those which were merely the outward forms behind which a British administrative officer actually did the work. The problem of how this heterogeneous collection of "native administrations" could ever take over all the increasingly complex activities of government, and, if they could not, what form of indigenous organization might eventually replace the British administration was too remote a contingency to be worth much consideration.[8]

French policy

The permanence of the association between metropolitan France and the overseas dependencies and the necessity for that association to be expressed in the clear-cut legal forms appropriate to a single political entity have been not so much objectives of French policy as its obvious and unquestioned basis. This juridical and administrative integration of the dependencies with the metropolitan country has not, however, invariably been accompanied by the assumption of the practicability, at all events in the present or the immediate future, of that social and cultural assimilation which it is so commonly taken to imply, and the significance of which was perhaps most succinctly expressed in the phrase of Schoelcher, "the French Republic does not intend to make distinctions in the human family." So far as the tropical African territories were concerned this was a possibility which seemed quite as remote as the objective of self-government in British territories, and French policy between the wars did not advance any nearer to its realization than to make it possible for a tiny minority of selected individuals among the millions of inhabitants in these territories to enjoy the rights of French citizenship. Only Senegal was represented by a deputy in the French Parliament, and both the single Senegalese deputy and the special citizenship accorded *en bloc* to the natives of the four Senegalese coastal towns without the individual application, or the acceptance of French private law, required elsewhere, were, in fact, like the Legislative Councils in British territories, legacies of a much earlier period of French policy.

The current policy, called "association," aimed at the deliberate creation of an African elite, accepting the standards of Western civilization and "associated" with their French rulers in the work of colonial development. French policy was accordingly more ready in principle to welcome social and economic change in Africa, and even to seek to accelerate it, since the objective was not that Africans should develop on their own lines, whatever those might be, but that they should be assisted to take their place, eventually, as French citizens, alongside other French citizens in a modern world. It had, however, come to be accepted among most of those at all directly concerned with actual administration in the tropical African territories that such a policy was either undesirable or only to be achieved in a remote future.

[8] See Donald Charles Cameron, *My Tanganyika Service and Some Nigeria* (London, 1939), p. 115, for some discussion of these issues.

Belgian colonial administration

The Belgians had no national philosophy of colonial rule, in the sense in which the development of self-governing institutions was such a philosophy to the British, or social, economic, and eventually political integration with metropolitan French life was such a philosophy to the French. The Belgian philosophy was indeed a far clearer example of a purely empirical approach than was that of the British who so vaunted themselves on their practical outlook. The Belgians, however, had their own particular preoccupation. It was to avoid the repetition of scandals such as had disgraced the administration of the Congo Free State before the Belgian government had itself assumed responsibility for the Congo. Some characteristic features of the Belgian system had their origin in this preoccupation, notably the complete subordination of the administration to authorities in Belgium responsible to the Belgian Parliament. The Belgians extended no rights of participation in any political bodies in the Congo to Africans or to resident Belgians. Their administration was wholly official and paternalistic, and if in some respects it resembled the British in adopting the forms of "indirect rule," most of the period up to the end of World War II was in fact marked by a continuing increase in the direct control of Belgian officials. Belgian policy, however, was far more ready than was British policy to try to face up to the problems inevitably involved in the provision of labor for mining and other large-scale enterprises under European management and the consequent emergence of increasingly large numbers of Africans living outside their tribal societies in new urban areas. One result of the Belgian preoccupation with economic development was an absence of the industrial color bars developed further south, a willingness to train Africans to do the work of more expensive Europeans; another was a marked tendency to emphasize the more immediately practical aspects of education—the extension of primary and technical education—to the exclusion of secondary or higher education apart from that provided by the Catholic missions for the training of priests.

Portuguese colonies

Portuguese policy, though redefined in the Colonial Charter of 1933, has long remained unchanged in essentials. Africans who achieved the necessary standards of education and European culture might be given the same legal status as the Portuguese themselves. Their numbers were, inevitably, very small, and subordination in a colonial regime was the lot of the vast majority of the African population.

Common assumptions and practices

Underneath the obvious divergences of policy there were, before World War II, certain similarities. Earlier versions of the policy of "identity," assuming identical social institutions and political rights for Africans and Europeans, were everywhere represented by mere historic survivals, even where they were not actually being reversed. The dominant policies emphasized the pragmatic necessities of "differentiation" even when they did not proclaim the desirability of avoiding the destruction of African social institutions and the complacent imposition of a Western pattern of life. They were, moreover, invariably associated in practice with a subordinate role for Africans in relation to Europeans. The colonial powers, on the whole, emphasized their negative duties —the prevention of extortion and injustice, the maintenance of law and or-

der, rather than the promotion of large-scale social change.

TRENDS IN POLICIES SINCE WORLD WAR II

This pattern was drastically changed by the events of World War II and its aftermath. Some accounts of different parts of Africa today suggest that a complete transformation has occurred and imply that the westernizing influence of economic and social change has entirely destroyed any specifically African, let alone customary tribal, society. Other people go to the opposite extreme and appear to deny the reality of any substantial change, or indeed, in some cases, its very possibility. In fact the nature and extent of these changes induced by Western contact vary greatly as between one area and another, and this great variation presents not only colonial powers but such emerging African governments as those of the Gold Coast and Nigeria with a major problem and challenge. How have the policies and activities of the colonial powers responded to these changes?

British policy

British policy has changed least inasmuch as the development of self-governing nations, if possible within the Commonwealth, if not, in friendly association outside, remains its objective; and in so far as it always provided much of the essential legal and administrative foundations for such a development by its treatment of each territory as a separate unit, with distinct laws, budget, public service, and Legislative Council.

But British policy has changed most in two ways: first, its acceptance, though with some misgiving and uncertainty in regard to those territories in East and Central Africa with a substantial settled European population, of Western parliamentary government of the British type as the kind of self-government to be built on these foundations; and, secondly, its acceptance of an immense change in the speed at which such developments may be expected to be brought about, especially in the West African territories, where there is no settled European population. These changes have had four main consequences since the war: (1) There has been greatly increased representation of the people of the territory in their respective Legislative Councils. (2) Cabinets, or executives composed largely of elected members of the legislature, have been developed, each responsible for some department of government, although still including also some British officials, usually in charge of finance, law and order, and defense and external affairs. (3) The system of native administrations has been replaced by systems of African local government more representative of the ordinary people, largely, if not wholly, elected—perhaps the most exciting, though sometimes dispiriting, attempt now being made in the world to develop a grass-roots democracy, to teach by practical experience the nature of elections, the meaning of representation, and the problems of the financing and operation of local public services.[9] (4) The final consequence of the changed outlook in British policy has been the much greater readiness to speed up economic development, using not only public moneys but also (not entirely successfully) newly created public instrumentalities to supplement private enterprise in this field.

French tropical Africa

French tropical Africa, too, has seen substantial changes since the war.[10]

[9] For these developments see the *Journal of African Administration*, published quarterly by Her Majesty's Stationery Office, London.

[10] See Kenneth Robinson, *The Public Law of Overseas France Since the War* (Oxford: Institute of Colonial Studies, 1954), and "French Africa and the French Union" in C. Grove Haines (Ed.), *Africa Today* (Baltimore: The Johns Hopkins Press, 1955), pp. 311–31.

Everywhere the rights of citizenship have been greatly extended. The special legal system which up till 1946 was applied to all who were not citizens, which in practice meant practically all Africans, has been totally abolished, as has the system of forced labor. French criminal law and trial on criminal charges by ordinary French courts have been extended to all the inhabitants instead of being restricted, as they were before the war, to the few thousand Africans who had become French citizens.

All the tropical African territories now send deputies to the French National Assembly, senators to the Council of the Republic, and councilors to the new Assembly of the French Union. They send, for example, thirty-seven deputies to the National Assembly, instead of the solitary one returned by Senegal before the war. In the eight West African territories and in Togoland, all electors vote together on the same electoral roll; elsewhere the new African citizens vote on one roll for their deputies, while French citizens of metropolitan status vote on another for theirs. Although it is possible for Africans to acquire metropolitan status, the vast majority of this latter electorate are Frenchmen of France. Since the number of Frenchmen in all the French tropical African territories with a combined population of thirty million probably does not exceed 150,000, and they return six of the thirty-seven deputies, this involves a substantial measure of preference.

The local Assemblies established in all the territories are wholly elected, but except in Senegal and Togoland, the same system of two electoral rolls, one for French citizens and one for the African citizens, is used, though the majority of the members is, in every case, elected by the latter. Although the franchise, which is rather complicated, falls short of universal suffrage, it is fairly wide, and the electorate has increased from about one million in 1946 to about five million in 1952. These territorial Assemblies are not, like the Legislative Councils in British territories, intended to be "Parliaments in embryo" but are modeled closely on the General Councils which exist in each of the ninety departments of Metropolitan France. They have some executive powers, must be consulted by the administration on a wide range of subjects, and most important of all vote the territorial budget, though they must include in it provision for certain "compulsory" expenditures.

The French have not devoted so much attention as have the British to the development of local government bodies in the rural areas, though there has, in the last five years, been a steady increase in the number of municipalities set up in the towns. In the Cameroons and Togoland, however, elected rural local authorities with their own budgets and sources of revenue have recently been established and plans have been tabled for similar developments in French West Africa. French policy, like British, has not so much changed its objective as its speed. It does not aim at the creation of new self-governing units, but at the incorporation, eventually on a basis of equality, of these areas in a larger unit, Greater France or the French Union.

Changes in Belgian practice

In Belgian Africa, there have been, perhaps, less dramatic changes of tempo. It was only very recently, in 1952, that in the trust territory of Ruanda-Urundi the basic law which would permit the development of a system of representative local government councils was passed, and although similar develop-

ments have been officially stated to be the aim in the Congo proper, this has not yet been given legal form. Perhaps the most radical change in Belgian practice, in the long run, will turn out to have been the development of more secondary education and the establishment of a university in the Congo, which opened in 1954. It may be that Belgian concentration on economic and social development, to the exclusion of any provision for participation in political activity, will prove to have been sound. But experience elsewhere suggests that such development must eventually give rise to the emergence of new classes demanding some share in political power and that there are dangers in too long a delay in establishing a basis for some form of political participation, since too long a delay means that when at last the pressure cannot be withstood, a big jump has to be made overnight.[11]

PRESENT PROBLEMS AND OUTLOOK

All these policies are reverting to the older policies of "identity," though with widely varying degrees of wholeheartedness. The demand for "identity" in the sense of acceptance as equals is indeed the basis of much African "nationalism." This involves the attempt to transfer to Africa social, and especially political, institutions not designed to suit African conditions and certain to be extensively modified by the African environment if they succeed in surviving there. These Western democratic forms of government which Africans demand and which attempts are being made to establish in Africa are, even in most favorable conditions, exceedingly difficult to maintain and work successfully. They call for a degree of political consensus which has been achieved in comparatively few parts of the world and in still fewer where there exist, within one political unit, communities with as vastly different social and cultural habits as, for example, Europeans, Asians, and Africans in East and Central Africa. But even where there are no non-African communities to reckon with, it is, of course, most misleading to think of Africans as presenting any substantial homogeneity of social and cultural patterns. As the cementing force of opposition to colonial rule is removed by advances towards self-government these divisive factors may present even greater difficulty than they do now. Moreover, any country in which very rapid social change is in progress is almost bound to generate serious tensions dangerous to the stability even of a well-established indigenous political system enjoying deep-rooted loyalties, let alone to a recently imported exotic system like Western parliamentary democracy. If such threats to the stability of the political systems of the new African states which British policy seeks to establish in West Africa should develop, they should not be ascribed to allegedly inherent deficiencies in the African peoples but to the other aspects here indicated.

The French Union

In the French territories of West and Central Africa, there has not, as yet, been an overt development of nationalist movements, in the sense of African political parties campaigning for separate self-government or independence. The actual demands of the postwar political movements have been expressed in terms of an extension of social, political, and economic privileges to Africans within the French system, for equality with the metropolitan French. But there are signs that this phase is passing and that African political leaders, particularly in French West Africa, are beginning to demand greater autonomy, greater real powers for the Territorial Assemblies, and the development of some kind of federal relationship between the African territories and France.[12] If the French Union structure proves sufficiently flexible to accommodate these pressures, it may well provide a viable basis for the continued association of a Western European country and her one-time African colonies, but the adjustments required to accommodate these pressures have no real precedent in the history of French colonial policy.

East and Central Africa

But the difficulties of combining political stability and forms of democratic government, considerable though they are in territories like those of West Africa, in which there are no settled non-African immigrant communities, are relatively small in comparison with the problems of those territories in East and Central Africa with settled European and Asian populations. In contrast both to the Union of South Africa and the French North African territories, the European settled populations in East Africa, and even in the Federation of Rhodesia and Nyasaland, are small, both absolutely and in relation to the numbers of Africans, less than 60,000 in the three East African territories, Kenya, Uganda, and Tanganyika, as compared with 18 million Africans, and less than 200,000 in the new Federation of Rhodesia and Nyasaland, as compared with 6 million Africans. Under the general label of "Partnership" different approaches to the political problems of political race relations are being tried out in the Federation of Rhodesia and Nyasaland, in Tanganyika, and in Kenya. All involve acceptance of the principle of African participation in government, but although this is accepted by some of the European settlers, it is opposed, in each case, by a considerable minority. In none of these territories of East and Central Africa, therefore, can success be predicted with any confidence, and in all of them the course of events is being influenced by factors outside the territories themselves. Neither in North nor in South Africa, where the same problem exists, though the proportion of European settlers to the African populations is enormously greater, has a solution been found; moreover, it is precisely that area which appears furthest from a solution, the Union of South Africa, which exercises the most direct influence, alike on Europeans, Asians, and Africans in East and Central Africa. Its history and example enormously increase the suspicions of Africans and Asians of any attempt to devise methods of dealing with such issues in these other territories, while encouraging some of the more intransigent demands by European settlers for domination over the other communities.

Gold Coast

It is difficult to assess at all precisely the influence which the emergence of an almost completely self-governing and wholly African government in the Gold Coast is having on African expectations and aspirations in these areas, but African demands for a real share of political power are certain to be encouraged. The next five years will be of critical importance in the resolution of these problems of political race relations in these areas. Europeans, Asians, and Africans are being presented with what is probably their last chance to find a basis of mutual accommodation in the political field.

[11] These misgivings are shared by many Belgian authorities. See, e.g., *L'évolution politique du Congo Belge (Compte Rendu des Journées Inter Universitaires d'études coloniales)* (Brussels, 1953).

[12] See Léopold Senghor, "L'Avenir de la France dans l'Outre-Mer," *Politique Étrangère*, 1954, pp. 419–26.

Democratic government

Recognition of the explosive force of the deep-seated demand for the acceptance of the African, and the emerging African countries, as of equal status with other parts of the world, and of the vital importance to the Western world of the earliest practicable resolution of the surviving tensions of colonialism, must be matched by readiness to examine the specific social and political problems of individual territories and to attempt to appreciate coolly their significance for political stability. The immense effects of the rapid increase in communications in creating new demands, social, economic, and political, are still too little realized. But, on the other hand, many stubborn facts, and in particular the consequences both internally and externally of disparities in power, are not thereby obliterated. We need a much greater willingness to accept the empirical approach in politics and not to attempt the universal application of one particular model of political organization. "It is easier and quicker to install the *forms* of democratic government than to achieve the *substance* of a broad diffusion of economic, political and social competence without which the forms may be a snare and a delusion." [13]

[13] Eugene Staley, *The Future of Underdeveloped Countries* (New York, 1954), p. 225.

Kenneth Robinson, Oxford, England, is fellow and librarian of Nuffield College and reader in colonial government at Oxford University. Formerly an assistant secretary in the Colonial Office, he served in the Gold Coast during World War II and has traveled widely in British and French territories in Africa. He was visiting lecturer in African studies at the School of Advanced International Studies of Johns Hopkins University in 1954, and has written many papers and articles on African subjects.

Current Political Movements in Africa

By JAMES S. COLEMAN

ONE of the most striking features of the African political awakening has been the mushroom appearance of an unexpectedly large number and wide variety of sociopolitical movements and associations. Although these movements differ markedly in their degree of organization, solidarity, and objectives, there has been a tendency to lump them together indiscriminately into one of two categories. In the eyes of most African nationalists they are considered as simply different aspects—but emphatically integral parts—of a rational and single-minded "struggle for freedom"; whereas to many resident Europeans or colonial administrators they are regarded simply as either irrational and atavistic reversions to barbarism or as manifestations of manipulated discontent on the part of self-seeking and exploitative minorities of *déracinés*. It is the purpose of this essay to discuss and analyze briefly the origin, development, and differing characteristics of these movements and to note the impact they have had upon colonial policies.

BACKGROUND TO AFRICAN AWAKENING

Most forms of politically relevant group activity in contemporary Africa are in one way or another the product of the stimulation or provocation of (*a*) the dynamism of the Idea of Progress, the processes of commercialization and industrialism, and other distinguishing attributes (that is, individualism, rationalism, and secularism) of that historical cluster of phenomena known as "Westernism"; and (*b*) the confusions, frustrations, and bitterness produced by the carriers of the "Western impact"—a paternalistic colonial system, an intensive and at times intolerant Christian evangelization, and comparatively unenlightened agents of Western economic enterprise. These two sets of factors—one stemming from the provocative challenge of a technologically advanced intrusive culture and the other from a variety of superimposed alien institutions—have combined to create social situations which lay the basis for the birth and development of political movements.

These "ripe" situations are distinguished by at least three special elements. One has been the staggering blow modernity has dealt the structure of authority, systems of belief, and the cohesiveness of traditional African societies. Indiscriminate missionary education, the relatively uncontrolled operation of Western economic forces, and the adaptability and impatient drive for self-transformation on the part of many African peoples have produced situations of profound disorganization, instability, tension, and insecurity. Another element has been the accumulation of both material and psychic grievances that have been and are bitter and pervasive. Some of these are the inevitable "transition pains" of societies undergoing rapid change. Others are natural human reactions to avoidable situations of hopelessness and denial arising from unimaginative colonial policies. Still others simply reflect an agonizing awareness by Africans of the painful facts of life—that a deep gulf exists between African socioeconomic realities on the one hand and the new wants and aspirations generated by culture contact on the other. This despair is matched in in-

tensity only by their passionate conviction that with African self-government and forced industrialization they can rapidly bridge the gap. Finally, there has been an upward thrust of new leadership cadres from the more westernized groups acutely distressed by their own insecurity and bitterly aggrieved over the disabilities and inequities of alien rule.

Play of external influences

These situational factors of social disorganization, accumulated grievances, and the emergence of a new and claimant leadership are only part of the background; a variety of external influences have intruded or operated either to further ripen the situation or more particularly to inspire, assist, provide direction, or activate the emergent leadership cadres. The most important carriers of these influences have been (*a*) Africans who have traveled or resided abroad, especially as students at universities in Europe and the United States; (*b*) the printed word, particularly in the form of literature directed to target groups in Africa by interested organizations abroad as well as through the medium of the African-owned nationalist press; and (*c*) those non-African individuals and groups within and without Africa who for various reasons have undertaken to champion what they have claimed to be the cause or interests of the Africans.

Among the many sources from which these influences have originated, four deserve special mention: the metropolitan country, the United States, Soviet Russia, and India. The role played by unofficial organizations and political parties of the metropolitan country in the African political awakening has been vastly underestimated. The activities of such groups as the Fabian Colonial Bureau, and later the Africa Bureau, have won for its leaders the affection of most African nationalists and the hostility of not a few administrators as well as of most of the white settlers of East and Central Africa. The current activities of the more militant Congress of Peoples Against Imperialism and the recently launched Movement for Colonial Freedom are representative of the continuing stimulus provided by unofficial organizations in the United Kingdom to Africans temporarily resident there as well as in the African territories. A similar function has been performed by political parties and the labor federations in metropolitan France.

Unofficial organizations and influences operative in and from the United States have also played an important historical role. Nationalist leaders such as Premier Nnamdi Azikiwe (Nigeria), Prime Minister Kwame Nkrumah (Gold Coast), Dr. Hastings Banda (Nyasaland), Mr. Peter Mbiyu Koinange (Kenya), and Dr. E. B. Kalibala (Uganda) and scores of other political leaders and activists throughout British Africa are graduates of American universities. Many American religious sects (Negro and white), as well as militant Negro movements such as Marcus Garvey's Universal Negro Improvement Association (which still survives) and the pro-Communist Council on African Affairs, have also had their effect.

The Soviet Union has supported nationalist development in Africa as part of its global strategy to create situations of instability and weakness within the Western world, to train and indoctrinate Communist leadership cadres with the expectation that by manipulating mass discontent and nationalist symbols they could seize power in African Soviet Republics, and, in general, to carry out Lenin's dictum to attack the West through its dependent territories. The instruments in this program have been many and varied. The seducement of African students in England and France by British and French Communists has been the most direct. Other approaches have included the irresponsible use of United Nations organs to harass colonial powers and build up the image of the Soviet Union as savior of the colonial peoples, university scholarships or summer "Vodka" tours to African students for study or travel behind the Iron Curtain, the establishment of liaison between pro-Communist international front organizations (for example, the World Federation of Trade Unions and the International Students Union) and African student groups and labor organizations, and the effort to feed propaganda through pro-Communist African newspapers or other literature outlets in Africa.

As the vanguard in the struggle against British colonialism, India has exerted a remarkable influence. It has been and remains a symbol of the successful achievement of independence, and success stories in situations of intense aspiration can serve as powerful stimuli. The Indian National Congress has been both an inspiration and the model for organization founders in Africa. Moreover, Indian minorities in South and East Africa, who continue to look to India for guidance, have had a very direct and important influence upon African political developments, including in some instances active organizational collaboration.

Here then were two sets of circumstances conducive to the appearance of political movements: (1) the prevalence among most African societies of what might be called "transitional crisis"—an exploitable and highly inflammatory condition marked by a sort of generalized malaise and sense of frustration, an instability of expectations, and a predisposition towards almost any form of action or radical change that promised tension release, direction and focus, and a set of apparently realizable goals; and (2) the play of a variety of special external influences which served to aggravate those situations and to inspire and agitate the minds of the new politically claimant elite.

Precipitating factors

In addition to these predisposing and external influential factors, there have been certain special circumstances or unique events that have precipitated the birth of political movements. At least three of these deserve mention.

One refers to situations of uncertainty and doubt regarding the legitimacy, effective power, or stability of political authority. Developments during and since World War II—such as imperial self-criticism and pledges of constitutional reform, the shortage of administrative staff, victorious independence movements elsewhere, and the emphatically anticolonial character of postwar world opinion—all tended to raise doubts, to reveal weaknesses, and either to set in motion a process of political change or to create the assumption and expectation of change.[1] In short, the mere existence of political uncertainty, whether from a collapse or weakening of government power or from the assumption or fact of political change,

[1] These situations of political doubt and confusion have been primarily a phenomena of British Africa—in part because of the self-liquidating theory of self-government and in part because of the more intensive open self-criticism generated by British democracy. The paternalism that has prevailed in Portuguese and Belgian territories, and to a qualified extent in French areas, has tended to forestall or to extinguish any serious questioning of the political order. The remarkable number and type of political movements which have appeared in Togoland and the Cameroons under French trusteeship is explained in part by the fact that they are the only areas of French tropical Africa where both the legitimacy and the ultimacy of French authority are seriously in doubt.

has provoked political ferment and organizational development aimed at radical change.[2]

A second type of precipitant has been the actual or threatened intrusion or imposition of some new disability or set of coercions—real or imaginary—involving deeply felt needs such as land, security, or status. Indeed, any change considered detrimental—even the abolition of clitoridectomy—might become a symbol for arousing and focusing generalized discontent. Colonial legislation and other official action prejudicial or believed to be prejudicial to African land rights, as well as measures involving, or believed to involve, new taxes, have been among the most common provocations to mass action and organizational formation. Again, constitutional changes, whether projected or in progress, which have been and are disadvantageous (or appear to be so) to the interests, integrity, or aspirations of one group (class, tribe, or race) vis-à-vis another group have also been crucial stimuli to formal political activity. For example, the Uganda National Congress became more active as a result of the apprehensions created over the project to integrate the Buganda kingdom into a Uganda state and by the crisis resulting from the deposition of the Kabaka (King). Similarly, both the Nyasaland and the Northern Rhodesian African Congresses were energized by their vision of the potential disabilities Africans would acquire in a Central African Federation infected by the native policy of Southern Rhodesia. Indeed, there are few politically relevant movements in Africa today that have not been "triggered" by some variant of one of these factors.

A third and perhaps most decisive precipitant has been the appearance of an unusual African leader—a messiah, hero, or national leader, possessed of something akin to Weber's charisma. It has been this uncommon type of leader—himself frequently the product of the most tortured cultural ambivalences—who has been able not only to mobilize, channel, and focus aspirations and mass discontent upon a fixed set of objectives such as self-government or "Africa for the Africans," but also to incite surprisingly large numbers of Africans to "political" action by articulating their aspirations through the manipulation of modern or traditional symbols or through the exploitation of situations of acute political uncertainty or threatened disabilities.

VARYING PATTERNS OF POLITICAL MOVEMENTS

Although most African political movements have common roots in the conditions created by modernity and the colonial experience, and tend to acquire shape, focus, and *élan* under certain similar circumstances, there have been and are wide differences. These differences can be found in their goals, the symbols they employ, the social background of leadership cadres, the instruments and techniques for securing and maintaining discipline among followers as well as support or acceptance among the masses, and the degree and nature of formal organization. Moreover, most movements can be further distinguished by determining where they fall—according to the above criteria—between such sets of polar extremes as *traditionalist*-modernist, rational-irrational, programmatic-opportunistic, constitutional-terroristic, and materialistic-idealistic. Yet the complex blending of old and new

[2] As Gaetano Mosca would argue, a period of renovation and revolution has commenced which permits "all to aspire to the most exalted positions and some to attain them . . . (and) . . . once such a movement has set in, it cannot be stopped immediately." See his *The Ruling Class* (New York, 1939), pp. 67–68.

that one finds in these movements places positive limits upon even the most rigorous and systematic efforts designed to establish clear-cut categories.

In each political movement one finds a different mixture of interacting factors drawn from the following:

1. *The precolonial situation,* including the nature of authority patterns of indigenous African societies, the fluidity of intergroup and intragroup relationships at the beginning of colonial rule, and the historical circumstances under which that rule was imposed.

2. *The colonial experience,* including especially the differential play of forces of acculturation, the survival of traditional structures of authority and forms of association, the degree of exposure to unsettling external influences, and the size and political orientation of those groups most affected and aggrieved by alien rule.

3. *The contemporary limits to political activity,* with special reference to the rigidity of colonial policy and institutions, the freedom of the milieu in terms of political expression, and the realizability of political aspirations of the new claimant elites.

These several variables have been and are the important determinants of the form, structure, and orientation of African political movements. Each movement, however, is highly relative to the historical situation in which it is rooted as well as the milieu into which it is born.[3] Once these necessary reservations are made, stressing both the complexity and relativeness of these phenomena, a more detailed treatment of three selected types can be made, namely: messianic, tribal, and territorial movements.

Messianic politico-religious movements

Among the several responses that have been made to situations of tension, deprivation, and frustration produced by culture contact, the so-called messianic movement is perhaps the most inscrutable and difficult to categorize. The history of sub-Saharan Africa during the past fifty years is filled with accounts of such movements, and several are currently either openly or covertly active, or they are simmering beneath the surface, or perhaps even some are in gestation. Although there are many variations among these movements, they share certain common attributes. One is that although basically religious in their origin and symbolism, most of them have tended to acquire a strong political significance in that the extinction of the European presence is considered to be a prerequisite for the realization of their vision of the good life. Another is that a "prophet" or "messiah," or a millenary dogma, serves to provide a sense of purpose, direction, and certitude. A third common element is the promise and expectation of a radical "transformation" in the form of either a return to an old or the realization of a new "golden age." These attributes account for that type of xenophobic, fanatical, and nonprogrammatic anti-Europeanism which messianic movements represent and which distinguishes them rather sharply from the more organized and westernized "nationalist" movements.

Certain special situations tend to be linked with the occurrence of these movements in sub-Saharan Africa. The peoples involved very frequently have been subjected to intensive Protestant evangelization marked by considerable sectarian competition and rivalry. Cir-

[3] The decisive causal variable in some movements may be the social structure of the indigenous culture; in others it may be the degree and character of missionary enterprise; while in others it may be simply the absence of competition from other politically claimant races.

cumstances of acute despair and confusion, political denial and hopelessness, or economic insecurity have frequently prevailed. In particular, outlets for meaningful political expression have tended to be absent. These movements are far more common in British East and Central Africa, the Belgian Congo, and in French Equatorial Africa before the postwar political reforms—areas where the presence of white settlers or the prevalence of a rigid paternalism precluded any significant sense of political self-realization or hope on the part of Africans. Finally, the movements have tended to be phenomena of *particular* African tribes or cultural groups rather than Africans in general. Thus, the *Dini ya Msambwa* of western Kenya has been confined almost exclusively to the Bukusu and Suk tribes; the Mau Mau is an affair of the Kikuyu, *Kimbangisme* in the Belgian Congo and *Amicalisme* and *Kakisme* in French Equatorial Africa are expressions of the Bakongo; and so forth.[4]

Despite these coincidences there are significant variations in the character and orientation of the differing politico-religious movements subsumed under the general rubric "messianic." At least three might be broadly distinguished:

1. *Puritanical movements* such as, on the one hand, the episodic, highly localized, and thus far inconsequential Mahdist movements among the Islamized groups of the western Sudan and, on the other hand, Christian revivalist and prophet-led movements which attack witchcraft, idols and shrines, and many traditional African customs.[5]

2. *Chiliastic movements* of the "Watchtower" variety which preach that "the Kingdom is at hand in this generation" in which there will be "a complete absence of all the ills of this world." Their political significance is strikingly revealed by the fact that they are banned in most African territories.

3. *Nativistic movements*, whether of the "rational" (self-transforming) or of the "magical" (divine intervention) types, which aim to recapture certain aspects of traditional tribal culture.[6]

Tribal political movements

The concept of the "detribalized African," useful though it may be in referring to social change at the most general level, is a very inadequate tool for the description and critical analysis of specific African political phenomena. The concept tends to evoke the distorted image of polar extremes—of "tribalized" witch doctors and secret societies on the one hand and of "detribalized" barristers and their "national congresses" on the other, with very little connection between the two. This is indeed a gross distortion of African realities: with few exceptions most Africans—including diviners and barristers—stand somewhere between the two extremes. Moreover, few reflective Africans today would argue on behalf of either the inevitability or the desirability of complete westernization. Eclecticism is the dominant strand in current African political thought. Old Africa is slow to die, and one of the reasons is the respect New Africa has for it.

Thus, the proportion of "traditionalism" to "modernism" in any given movement is not fixed or stable, and in any case both ingredients are normally present. While the messiahs, leaders, and activists tend to be "modernists"—in the sense of coming from the ranks of those groups most exposed to Westernism—their own personalities, as well as the movements they lead, are complex mixtures of both the old and the new. This relativeness of the content of non-messianic movements makes classification both difficult and arbitrary. For analytical purposes the most useful criterion for distinguishing between the varying forms is the unit of focus of politically relevant activity: (1) the *tribe* (used in a generic sense to refer to the largest of any indigenous African political grouping) or (2) the *territory* (the artificial political unit created by the imperial powers, such as Uganda and Nigeria).[7]

In the case of tribal movements, differences in scale and size of the traditional unit provide the most useful criterion for broadly distinguishing two levels of organization, namely, *kinship associations* and *pan-tribal movements*. Kinship associations are found in large numbers in nearly every urban, mining, or industrial center of sub-Saharan Africa. Functionally, they are not unlike the cultural associations formed by first-generation American immigrants in the large impersonal eastern cities of the United States. They have sprung into being as a consequence of the persistence of the strong feelings of loyalty and obligation to the kinship group (family, lineage, or clan) or to the village where the lineage is localized.

Most kinship associations commence as simple mutual aid, protection, or self-help societies; but many tend to take on highly important political functions. In the case of the local politics of the village or town of origin, the branches organized by the "sons abroad," as well as the "parent" branch organized by home-town activists, become centers for local political action on the part of the educated elements. In the case of politics above the local level these associations perform a variety of highly significant political functions: they have been and are fountainheads for the dissemination of political—particularly "nationalist"—ideas in the interior, training grounds for cadres of political activists, vehicles for the emergence of new "tribal" or "national" leadership, as well as the primary organizational cells for pan-tribal unions and territorial political movements.

Pan-tribal movements have been organized attempts to foster a feeling of loyalty and unity towards, and to advance the prosperity and welfare of, the tribe. The latter refers to the widest sense of conceivable community above that of the kinship group but below

[4] This tribal focus of messianic movements does not invalidate the distinction made in this essay between such forms of expression and "tribal movements" discussed subsequently. Moreover, the tribal bias is not an invariable characteristic, as evidenced by the infectious spread of Mau Mau and the multitribal nature of the Maji-Maji Rebellion in Tanganyika. See R. M. Bell, "The Maji-Maji Rebellion in the Liwale District," *Tanganyika Notes and Records*, Vol. 28 (January 1950), p. 38.

[5] For example, the Kyoka Movement in north Angola (1872), the Harris Movement of Liberia and the Ivory Coast, the Second Elijah Movement in Nigeria (1914), and more recently *Kimbangisme-Amicalisme-Kakisme* in the Belgian Congo and French Africa.

[6] As in the case of all analytical types, there are no pure nativist movements. The classification signifies rather a conscious traditionalist *orientation* and is sufficiently broad to include such contemporary expressions as the *Dini ya Msambwa* and the Mau Mau of Kenya, with certain qualifications. Indeed, the spirit of nativism is reflected in the oft-quoted dedication in Jomo Kenyatta's book, *Facing Mount Kenya* (London, 1953): "To Moigoi and Wamboi and all the dispossessed youth of Africa: for perpetuation of communion with ancestral spirits through the fight for African freedom, and in the firm belief that the dead, the living, and the unborn will unite to rebuild the destroyed shrines."

[7] Except for Basutoland and Swaziland there are no African territories that are conterminous with tribe; hence by our criterion, except in cases of tribal pretentiousness or imperialism, there are no tribal movements that have a territorial focus; and by definition there are no territorial movements with a tribal focus. This is true despite the fact that the Ibo have predominated in the National Council of Nigeria and the Cameroons, the Yoruba in the Action Group of the Western Region of Nigeria, the Baganda in the Uganda National Congress, and the Kikuyu in the proscribed Kenya African Union.

the level of the territory. These movements have been launched initially for several very different purposes, few of which were strictly "political" in origin.[8] Many sprang into being simply as a result of the stimulus of competition, the power of suggestion, or the urge for imitation. There was a phase in Nigerian political development, for example, when it was considered fashionable for all "progressive" Africans to found their own "national" or "state" (that is, tribal) union. Finally, there have been some cases where a pan-tribal institution emerged as the logical capstone to autonomous kinship associations which had been founded independently and over a period of time in several widely dispersed cities and towns.

These pan-tribal unions have been a phenomena mainly of British Africa, a fact for which at least three explanations may be given: (1) the prevalence of greater freedom of association; (2) the policy of deliberate tribal preservation (indirect rule), as well as strong official encouragement of movements for pan-tribal (as distinguished from "territorial") integration and consciousness; and (3) the official attitude towards the Western-educated elements as manifested both in the earlier exclusion of those elements from the central apparatus of colonial government and in the more recent effort to channel their energies into local government.

Once formed and in being, pan-tribal unions have tended to become politicized. This is in part the result of the official policies just enumerated. It is also the result of the gravitation of the politically conscious educated elements to their tribe of origin not only because of the persistence of tribal loyalties and obligations or their new appreciation of African culture, but also because the tribe could provide them with a relatively secure political base, a fairly reliable personal following, and masses whose aspirations, belief systems, grievances, and tensions they knew intimately and therefore could most easily and legitimately appeal to or manipulate. Moreover, in many cases tribal unions have taken on the political functions of organized pressure or bargaining groups on behalf of tribes placed in a minority or disadvantageous position as a consequence of constitutional developments at the territorial level. Finally, tribal unions were "organizations in being" which territorial politicians found highly useful not only as a structure in which they could climb to positions of leadership in territorial politics but also as an immediately available, developed organizational apparatus and a cadre of political activists.

Although divisive in terms of the development of a territorial consciousness and loyalty, most pan-tribal unions have been incomparable instruments for wide-scale integration of peoples never before united. Two remarkable examples of this have been the Ibo State Union and the Kikuyu Central Association. Both of the large tribes which these unions represent (Ibo, 5 million; Kikuyu, 1 million) are distinguished by a high degree of decentralization of indigenous authority; in neither case was there a tradition or a memory of a pre-existing unity or statehood. Yet in each instance the pan-tribal union, by focusing upon certain genuine cultural similarities such as language or common ceremonies or upon certain shared disabilities or grievances, or simply by being led by a "national" hero, has been able to create an Ibo or a Kikuyu "tribal" consciousness transcending former localisms, at least among certain strata of the population.

[8] For example, the Ibo Federal Union of Nigeria was originally founded by Western-educated Ibo leaders to mobilize the resources of the Ibo peoples in a heroic drive towards self-transformation through Western education. The Pan-Yoruba *Egbe Omo Oduduwa* was launched initially as a cultural organization ". . . to foster the study of the Yoruba language, culture and history." The All-Ewe Conference was organized to unite the Ewe peoples through the elimination of restrictive colonial frontiers. The Pan-Chagga Kilimanjaro Native Cooperative Union had a purely economic origin, as suggested by its title. The Kavirondo Welfare Association was conceived by a missionary as a means to develop communal life in the reserves of Kenya. The Kikuyu Central Association came into being for the specific purpose of presenting the African land case before a British Commission of Enquiry. The Descendants of Kintu in Uganda, however, was founded as an oppositional movement of the Baganda against the Mengo ruling classes in the Buganda kingdom —an obvious political purpose.

Territorial political movements [9]

The line between tribal and territorial movements is not sharp. Indeed, Dr. Nnamdi Azikiwe, Premier of the Eastern Region of Nigeria, was for long simultaneously president of the Ibo State Union and of the pan-territorial National Council of Nigeria and the Cameroons. Yet there is one crucial difference between the two movements —the fact that the target of the territorial movement is the capture of, control over, or participation in, the central institutions of power and government of the territory. In the pursuit of these objectives, two types of territorial organizations have emerged: (1) the *nationalist movement* which among other things agitates for a constitutional order that will make such control and participation possible; and (2) the *political party* which seeks to achieve and hold power, via the electoral process, in the constitutional order thus established.

[9] See list in Table 1.

TABLE 1—PRINCIPAL POLITICAL ASSOCIATIONS IN CONTEMPORARY SUB-SAHARAN AFRICA [a]

Group A: Territories of British West Africa

Area or Region	Political Association	Area or Region	Political Association
Gambia	Democratic Party Gambia Moslem Congress	Nigeria Western Region	*Action Group National Council of Nigeria and the Cameroons[b]
Sierra Leone	*Sierra Leone People's Party National Council of the Colony of Sierra Leone	Northern Region & Northern Cameroons	*Northern People's Congress Northern Elements Progressive Union Middle Belt People's Party Middle Zone League National Council of Nigeria and the Cameroons
Gold Coast	*Convention People's Party Ghana Congress Party Moslem Association Party Northern People's Party National Liberation Movement	Eastern Region	*National Council of Nigeria and the Cameroons National Independence Party United National Party
Togoland (British)	*Togoland Congress Convention People's Party All-Ewe Conference	Southern Cameroons (British)	*Kamerun National Congress Kamerun People's Party

* Identifies the political party which received the highest vote in the most recent election to the representative assembly of the territory or state concerned.

[a] This list is not exhaustive. It includes only those territorial movements that are constitutional and have some sort of formal organization. It therefore excludes tribal, messianic, and subversive political movements. The Belgian and Portuguese territories are omitted because of the absence therein of the conditions necessary for formal political associations to have a meaningful existence. The closest approximation would be such pressure-group associations as the *Fédération des Associations de Colons du Congo et du Ruanda-Urundi* (Fédacol) or the *Union des Colons du Ruanda-Urundi* (Ucorudi).

[b] The NCNC controls a majority of the seats from the Western Region in the Central Nigerian House of Representatives.

TABLE 1—*Continued*

Group B: Territories of French Tropical Africa

Territory	Metropolitan Parties	African Parties[c]
French West Africa		
Mauritania	Rassemblement du Peuple Français[d]	*Union Progressiste Mauritanienne (IOM) Entente Mauritanienne
Senegal	Section Française de l'Internationale Ouvrière[e]	*Bloc Démocratique Sénégalais (IOM)
Sudan	Rassemblement du Peuple Français	*Parti Progressiste Soudanaise (SFIO) Union Soudanaise (RDA)
Guinea	*Rassemblement du Peuple Français Section Française de l'Internationale Ouvrière	Indépendants d'Outre-Mer (IOM) Union Forestière Union du Maude Rassemblement Démocratique Africain
Upper Volta	Rassemblement du Peuple Français	*Indépendants d'Outre-Mer (IOM) Union Voltaïque Amicale Voltaïque Union du Lobi
Ivory Coast	Rassemblement du Peuple Français Section Française de l'Internationale Ouvrière	*Rassemblement Démocratique Africain
Niger	Rassemblement du Peuple Français	*Union du Niger Indépendant (IOM) Rassemblement Démocratique Africain
Dahomey	Rassemblement du Peuple Français	*Parti Républicain Dahoméenne (IOM) Groupement Ethnique du Nord Union Progressiste Dahoméenne
Togoland (French)		*Union des Chefs du Nord Togo Parti Togolais du Progrès (IOM) Comité de l'Unité Togolaise Mouvement de la Jeunesse Togolaise
French Equatorial Africa		
Chad	Rassemblement du Peuple Français	*Union Démocratique Tchadienne (RPF) Rassemblement Démocratique Africain
Middle Congo	Rassemblement du Peuple Français Section Française de l'Internationale Ouvrière	*Parti Progressiste Congolais (RDA)
Ubangi-Chari	Rassemblement du Peuple Français	*Mouvement d'Évolution Sociale de l'Afrique Noire
Gabon	Rassemblement du Peuple Français	*Indépendants d'Outre-Mer (IOM) Défense des Interêts Locaux Union Gabonaise
Cameroons (French)	Rassemblement du Peuple Français Section Française de l'Internationale Ouvrière	Évolution Sociale Camerounaise Union des Populations du Cameroun (RDA-PC) Renaissance Camerounaise Bloc Démocratique Camerounaise

[c] The abbreviations indicate the parliamentary group or broader association to which the party is attached (*apparanté*) or allied, i.e.: IOM: *Indépendants d'Outre-Mer*, an organization of overseas *parlementaires;* SFIO: *Section Française de l'Internationale Ouvrière;* RDA: *Rassemblement Démocratique Africain*, a Pan-French African political movement having its greatest strength in the Ivory Coast; RDA-PC: signifies that the U.P.C. identifies itself with the pro-Communist wing of the RDA.

[d] Formal name of the Gaullist movement.

[e] Formal name of the French Socialist Party.

[f] The Federal Party and the Confederate Party are also the majority and minority parties, respectively, in the Legislative Assembly of the new Federation of Rhodesia and Nyasaland.

Accordingly, in so far as it wins political concessions from the colonial power, a territorial nationalist movement progressively takes on the attributes of a territorial political party. This is precisely what has occurred in the ideal conditions of British West Africa where nationalist movements have been long in gestation and favored with a situation which made a transformation to a political party possible.

In French tropical Africa a rather different, if not a reverse, development has occurred. Although prewar French

policy effectively prevented the emergence of nationalist movements, the dramatic extension of citizenship and suffrage to Africa under the 1946 Constitution called political parties suddenly into being for the purpose of electing candidates for office in the new institutions. With the passage of time these territorial "electoral" parties have tended to take on certain attributes of a nationalist movement, although none —except for certain parties in the trust territories—have seriously advocated secession.

In the plural societies of British East and Central Africa a very different situation has developed. There the racial composition of the population, the social forces at work, and the political climate have been such as to rob Africans of the usual objective of a nationalist movement (independence or political equality) as well as a constitutional order in which political parties could meaningfully participate. As a consequence of this absence of function and hope, not only are political movements far less developed but also there is a strong predisposition towards conspiratorial and messianic movements.

Several factors have operated to focus African political energies and passions upon territorial, as distinguished from tribal, movements. In the modern world mere "bigness" has a seductive attraction. It is not only a symbol of power, equality, and respectability but also a means by which to "make one's voice heard." Largeness in scale is also considered essential for rapid industrialization and economic development. Also, except for such large cultural groups as the Yoruba, Ibo, Ewe, Hausa, Baganda, Kikuyu, few African tribes are so constituted or situated in the eyes of educated Africans themselves as to become independent national states. Again, in some instances simple imitation and emulation, or the irrepressible expansiveness of thought and aspirations characteristic of a "liberation" mood, are not negligible factors. Moreover, the social groups most actively working for change have frequently been those whom circumstances have placed closest to the territorial superstructure (students and teachers, clerks, and artisans employed by colonial government and foreign firms, and so forth) or those elements, such as traders and merchants, who have benefited most from a broad area of economic interchange. All of these groups find it comparatively easy, if not attractive, to think and act in "territorial" terms. Furthermore, there is the obvious fact that only a territorial movement can seriously challenge the power and legitimacy of a colonial government. Perhaps the most decisive factor, however, has been the coercive influence of territorial representative institutions—Legislative Councils, Regional Assemblies, *Assemblées Territoriales*, or *Grands Conseils*—which have compelled African political leaders to organize and act with a territorial frame of reference if they want to act meaningfully.[10]

In many situations there exists an uneasy alliance between tribal and territorial movements. All of the knotty problems—and potential instability—implicit in the existence of incipient national separatism in a multinational state are in evidence. While in the early stages tribal movements were useful, if not indispensable, organizational props to leaders of territorial movements, many of these leaders have become irritated by, if not fearful of, the "pressure group" fickleness of tribal unions representing minority groups. Moreover, some of these tribal leaders fear that they will be challenged by the leadership that might rise through the structure of the larger pan-tribal unions. The more centrally minded Jacobins among these leaders detest these *corps intermédiaires* because they represent a constant threat to "national" territorial unity and a potential obstruction to rapid social and economic change. These centrifugal and centripetal pressures are among the most critical political forces at work in many parts of Africa today.

[10] French Africans find it easier to think and act politically in "territorial" terms not only because of the *étatisme* of the French system but also because of the French policy of direct rule. The effect of this policy is strikingly revealed in the different political orientation of African modernists in Dahomey, where the French extinguished the kingdom of Dahomey, and in Uganda, where the British preserved the kingdom of Buganda.

EFFECT OF POLITICAL MOVEMENTS ON COLONIAL POLICIES

Just as there tends to be a polarization of attitudes concerning the cause and nature of African political movements so are there extreme views regarding the actual effect they have had and are having on colonial policies. African nationalists tend to the view that little or no change would have occurred had it not been for the intense pressure they generated from below. Imperial spokesmen argue, however, that most postwar reforms in colonial policy were self-produced or that in any event the changes are but current applications of traditional principles. Both are partially correct. Certainly, apart from the revolutionary sociopolitical forces asserting themselves within Africa, World War II produced profound changes in the world "climate of opinion" regarding colonialism as well as in imperial attitudes and policies.

There can be little doubt, however, that the unexpected appearance of highly organized and disciplined mass movements under a new militant leadership, such as the Convention People's Party of the Gold Coast or the Action Group of the Western Region of Nigeria, has forced a drastic revision in imperial calculations far beyond West Africa. These movements revealed in startling fashion that, given determined and skillful leadership and "ripe" situations, tremendous social forces could be tapped and channeled into political activity. This revelation dealt a devastating blow to the major assumption underlying all previous policy regarding the African peoples, namely, that they constituted an inert mass that could be manipulated and molded at will—and indefinitely—by the alien intruder.

The impact of these movements upon policy has varied greatly. On the British West Coast since 1945 there has been a continuous interaction between African nationalist movements insatiably pressing for new increments of power and a prudent and responsive British administration conducting a delaying action—a process which has now reached the stage where self-governing African states will soon be entering the main stream of world affairs. In French tropical Africa a separatist nationalism —except in Togoland and the Cameroons —has not developed; but political parties operating as pressure groups within and without the National Assembly are compelling a greater devolution of power to the African territorial governments and Assemblies than either the Napoleonic tradition or the policy of assimilation would normally envisage. In British East and Central Africa, African movements, whether in the form of the terroristic Mau Mau or the National Congresses of Uganda, Northern Rhodesia, and Nyasaland, have compelled a far more liberal interpretation of the concept of "partnership" than European settlers would have thought conceivable five years ago. Moreover, for the time being the gravitation of total power into the hands of resident white settlers has been arrested, at least in Kenya,

Uganda, and Tanganyika. Finally, in the Belgian Congo, the extraordinary attention paid during the last few years to the problem of the status and future of the *élite noire* is a reflection not only of the existence of pressures from burgeoning social forces within the Congo, but also of the strong impact that political movements in neighboring French and British areas have had upon official Belgian calculations.

In sum, while there is little doubt that the rise and maturation of African political movements has undermined smug prewar assumptions, the variation in the impact of such movements nevertheless does, as noted above, point up the crucial importance of colonial policies during the initial stages in determining the form and direction taken by these movements striving for new relationships beyond colonialism. In Africa, as elsewhere in the non-European world, policies of avoidance and repression are not only sterile, but, in the long run, quite futile. Once unleashed and in motion, social energy is irrepressible and uncompromising in its quest for direction and expression. Policies of responsiveness and constructive guidance offer the possibility that such expression will be responsible, purposive, and creative. Meanwhile, the ubiquitous and cynical agents of a new imperialism are abroad armed with special skills and seductive formulas for the manipulation of unsatisfied social energy and incipient political movements.

James S. Coleman, Ph.D., Los Angeles, California, is instructor in political science at the University of California at Los Angeles. During World War II he was a member of the General Staff Corps and of the Supreme Headquarters Allied Expeditionary Force Mission to the French government. In 1951–52 he was engaged in field research in British and French West Africa under a Fulbright scholarship. In 1952–53 he was a teaching fellow in the Department of Government of Harvard University. He is author of several articles on political developments in tropical Africa.

Context and Sources of Political Tensions in French North Africa*

By BENJAMIN RIVLIN

THE crisis in French North Africa, although possessing many distinguishing features of its own, is not unique in our times; it comes under that familiar genus of contemporary political problems called "colonial." Actually, the crisis in French North Africa belongs to one of the more complex varieties of the colonial problem, for besides conflict between a native nationalism and a colonial power it involves conflict between an indigenous population and strong European settler groups. Recent official French statistics reveal the following division in the population of French North Africa: [1]

	MUSLIMS	EUROPEANS
Algeria ...	7,500,000	1,000,000
Tunisia ...	3,250,000	250,000
Morocco ..	7,900,000	400,000

In each of the territories, political and economic power rests in the hands of the French minority, but an ever growing spirit of nationalism has risen among the indigenous population to challenge the dominant position of the French. Since the end of World War II, French North Africa has been in the throes of a struggle, becoming increasingly acute, between these two determined forces.

HOSTILITY TO FRENCH DOMINATION

Native hostility to French domination goes back to the outset of French penetration into the region. When the Maghreb was subjected to French control in the nineteenth and early twentieth centuries, a vital culture, albeit technologically backward and politically weak by Western standards, was already established there. The native culture was a Muslim culture that went back for more than twelve centuries. For half of this period, this culture experienced a steady decline from the great heights it had attained as a center of civilization during the Middle Ages. But there remained a living heritage among the Muslim population in the form of their Islamic religion and their history. Despite cleavages within it, Islam played an important role as a cohesive force in the Maghreb; for Islam was not only a religion but a total way of life. Thus it was not surprising that the native population at first resisted the alien invaders by arms, and later, when defeat became inevitable because of superior force and power, resisted assimilationist pressures which implied inferiority of the native culture. Much of this resistance was inspired by traditional religious leaders, who strove with determined stubborness to withstand the pressures of assimilation and the threat of religious deterioration. To this day, religious elements have played an important role in the movement of native self-assertion in French North Africa.

* The author wishes to express his indebtedness to the Social Science Research Council for the grants that made possible much of the research for this article.

[1] Office of Technical Publications of the French Prime Minister, *Facts and Figures About French North Africa* (Paris, 1952), p. 8. These figures must be considered as rough estimates. Figures for Morocco refer to the French zone only. In Morocco there are some 220,000 Jews and in Tunisia some 70,000. The number of Jews in Algeria is difficult to determine, since in Algeria the Jews are French citizens.

More significant, perhaps, from the point of view of the current crisis was the establishment of French control and the pursuance of an official developmental policy which set in motion a process of social change that broadened the basis of hostility between the natives and the French. The introduction of modern techniques of production transformed the area from a static pastoral system into a relatively modern one, which was closely integrated into the industrial economy of France. Accompanying demographic changes saw the emergence of a European minority, which was particularly large in Algeria, and a shifting trend among the native population from rural to urban life. The effect of these long-run economic and demographic changes was felt in the development of two opposing phalanxes. On the native side, the new economy produced an *haute bourgeoisie* and merchant class, generally resentful of French rule, and the restive, poverty-ridden, and detribalized masses of the urban slums. On the other side, it produced an entrenched privileged French community of colons, entrepreneurs, and *petits fonctionnaires*, all with a great stake in the area.

Simultaneously with these developments, another long-run change—this one in the intellectual sphere—took place in North Africa. The impact of the Western liberal-democratic tradition on the indigenous population gave rise to a native intellectual elite. It was inevitable that the French tradition of *liberté, égalité, fraternité* should take root, for the glaring contrasts in the living standards that were emerging in French North Africa betwen the natives and the French provided rich soil for their growth. Thus the French, perhaps unwittingly, created a new dimension to the ideological framework as well as a new source of leadership for the native nationalist movements.

From the very beginnings, French policy proceeded with little awareness of, or concern for, the possibility of a conflict between France and the indigenous population, a possibility which eventually materialized with the rise of nationalist movements. French policy was concerned with a twofold task: to bolster France in the great European competition for empire by keeping the reins of government in North Africa securely in French hands; and to establish a permanent and secure home for French settlers and preserve their privileged position in the region. Native nationalism represented a force inimical to the desired stability; to meet its challenge, France adopted a policy of forceful repression of any manifestation of native dissidence, since she either did not or was unwilling to recognize the problems emerging from the long-run process of change at work in the Maghreb. The policy of force inevitably served to aggravate the situation rather than to alleviate it. A chain of challenges and responses was touched off: repression led to more dissidence, dissidence to repression, and so on to this day.

DEVELOPMENTS IN THE THREE TERRITORIES

Having presented some general observations as to the nature of the conflict, a closer look at specific developments within the three territories is now in order. It should be kept in mind that Algeria, Tunisia, and Morocco came under French control at different times under differing circumstances. French penetration into Algeria began in 1830, and full control over the country was not attained for some five decades. The protectorate over Tunisia was established in 1881–83, while that over Morocco came into being in 1912, although it took some twenty-two years to "pacify" the country.

Algeria

In Algeria, the first North African territory to come under French control, the watchwords of the French administration were *réfoulement* (driving or forcing back) and "We shall forget their [the natives'] existence." [2] A policy of colonization was embarked upon shortly after the French occupation began. Native lands were sequestered and land grants were given to French settlers. Algeria was viewed as a prolongation of France. Eventually, three departments (Algiers, Oran, and Constantine) were organized in Northern Algeria, representation for the French settlers was secured in the French National Assembly, and even local administration of French-settled communities followed as much as possible the model of the metropole. The French population of Algeria increased steadily; land was brought under modern cultivation; roads were built; modern European cities sprang up; and the economy of Algeria was integrated into that of France. All in all Algeria was being transformed from what Napoleon III had called in 1860 "an Arab kingdom" to a French province across the sea.

But this transformation hardly resolved the issue of the smoldering conflict between the French and native societies. Although the policy of integrating Algeria into France is often referred to as "assimilation," that is, making the territory and its inhabitants French, it is an error to think that a successful assimilation was achieved. The territory of Algeria may be juridically called "part of France," but the people did not become French by fiat. The case of the Algerian Jews, who were all made French citizens by the Crémieux Decree (1870), does not detract from the validity of this observation. To the Jews, who had lived for centuries as an oppressed minority, French citizenship meant increased security, a chance to breathe freely.[3] To the Muslims, however, French citizenship offered no attraction of new security; on the contrary it threatened to undermine their world by introducing a new civil code that superseded Koranic law. Consequently no Crémieux Decree was conceivable for the Muslims, as the latter were psychologically unreceptive to French citizenship. It is quite true that French law opened the door of citizenship to a limited number of Algerian Muslims. To qualify for citizenship a knowledge of French was required, as well as renunciation of one's personal status under Koranic law by the acceptance of the jurisdiction of the French civil code. Those who followed this course were assimilated, but the vast majority of Algerian Muslims remained outside the pale of the French community. In the meantime, resentment and disaffection spread among unassimilated Muslims, as the impact of the French presence began to take effect. When the French tried to meet the mounting pressure of the nationalists in Algeria by the Statute of 1947, which made all Algerian inhabitants French citizens, they only confirmed the social dichotomy of the Algerian population. Since the Algerian Muslims in 1947 were no more prepared than their ancestors were in 1870 to give up their adherence to Koranic law in order to become French citizens, the 1947 statute permitted them to acquire French citizenship without having to surrender their personal Koranic status. However, those Muslims who were not subject to the French civil code were placed under a separate electoral status.

[2] S. H. Roberts, *History of French Colonial Policy* (London, 1929), Vol. I, p. 161.

[3] See André Chouraqui, *Les Juifs d'Afrique du Nord: Marche vers l'Occident* (Paris, 1952), pp. 82–85.

The statute created two electoral colleges: the first college consisted of Frenchmen and a relatively small number of assimilated Muslims; the second was made up of the vast majority of the Algerian population. Each college elected an equal number of deputies to the French National Assembly and to the newly created Algerian Assembly.[4]

The Statute of 1947 was not designed merely to placate mounting Algerian nationalism. It was, perhaps, more basically a plan for preserving French domination over the country. By segregating unassimilated Muslims from Frenchmen in the election process, the statute served to placate the French population, which feared that it would be overwhelmed by the sheer number of Muslims if the franchise and representation were based on absolute equality. Thus the Statute of 1947 confirmed the unassimilated status of Algerian Muslims. Today, notwithstanding the legal fiction that Algeria is a part of France and that French citizenship is universal in Algeria, there are two distinct communities in the country: a minority which controls the country's economy and government and a majority of about 85 to 90 per cent of the population which has inferior status and manifests an unwillingness to be permanently subordinated to the minority and its way of life.

Rivalry for Tunisia and Morocco

At first glance it would seem that the difficulties arising in Algeria would be avoided in Tunisia and Morocco because the two latter were not annexed by France but were brought under French control as protectorates. After the conquest of Algeria, French imperialist interests eyed the two Muslim kingdoms that enclosed Algeria on the east and west. But France was not alone in having designs on Morocco and Tunisia. The race for colonies was in full force towards the end of the nineteenth century, and France faced competition from Italy in the case of Tunisia, and from Germany, Great Britain, and Spain in the case of Morocco. One effect of this rivalry was to prevent outright annexation of the two countries, which were ruled by native sovereigns. To overcome these difficulties and at the same time achieve political and economic control over the countries, French diplomats utilized the technique of the protectorate. This technique permitted the achievement of the desired goal in a relatively simple fashion. Instead of removing the ruling sovereign and destroying existing native institutions, all that was necessary was to obtain the reigning potentate's assent to measures empowering the French to reform the existing regime. Thus the Convention of La Marsa of June 8, 1883, extracted the pledge of the Bey of Tunisia to "undertake the administrative, judicial and financial reforms which the French Government shall consider useful" in order "to facilitate for the French Government the accomplishment of its protectorate." Similarly, the Treaty of Fez of March 30, 1912, stated in its first article that "the government of the French Republic and His Majesty the Sultan have agreed to institute in Morocco, a new regime which will bring about the administrative, judicial, educational, financial and military reforms which the French Government shall consider necessary to introduce in the Moroccan territory." Since the French had a variety of persuasive weapons, including the acquiescence of the European powers in their action and armed forces at their disposal, the reigning monarchs had no alternative but to accede to the establishment of the protectorates.

[4] For an analysis of the Statute see L. Gray Cowan, "The New Face of Algeria," Part I, *Political Science Quarterly*, Vol. 66 (September 1951), pp. 340–65.

The protectorate technique

For the French the protectorate technique was an admirable arrangement. Empowered to introduce reforms, they established a new regime headed by a Resident General who exercised full governmental powers, even though nominally he was acting for the sovereign Bey or Sultan. The net result was the formulation of a policy largely in the interests of the French settler element. The innovations introduced by the reforms established favorable conditions for French settlement and economic expansion. Land was expropriated for European settlement, roads were paved, ports were developed, railroads were built, and modern administrative methods were introduced. Financially and economically, the countries were linked to France. Together with Algeria, Tunisia and Morocco became markets for French industrial products and sources of raw materials.

The protectorate regime, however, did not prevent the development of conflict between the European and indigenous communities. In fact it institutionalized the dichotomy between Europeans and Muslims. As in the case of Algeria, the native population's resentment of the favorable treatment and superior status accorded to Europeans gave rise to indigenous nationalist movements. The fact that Tunisia and Morocco retained a semblance of sovereignty and that their legal personalities remained separate and distinct from that of France—in contrast to Muslim Algeria which, following its annexation and under the impact of the policy of *réfoulement*, lost whatever legal personality it had prior to the French conquest—undoubtedly served to stimulate nationalist sentiment in those two countries. For, the partial retention of native sovereignty served as a symbol of independence and cultural autonomy. The nationalists attacked the protectorate arrangements, arguing that these arrangements were archaic vestiges of nineteenth-century imperialism. Claiming that the protectorates were never designed to be permanent, they called for the restoration of their rights to self-government and independence.

Since it was never pretended that under the protectorate regime French nationality replaced Tunisian or Moroccan nationality, French settlers in these two countries remained aliens. For a long time their alien status did not bother the French in Morocco or Tunisia, since the French administrations were exercising the real powers of government in their favor. With the rise of native nationalism, however, French settlers became alarmed over the implications of possible restoration of native political power in countries which were their adopted homelands, but in which they were legally aliens. Consequently, they opposed any concession to nationalist aspirations and built up strong counterpressures to preserve and perpetuate their rights and privileges. No longer wishing to rely for the protection of their interests on the Resident General, they demanded a direct and substantial voice in the government of the protectorates. In this way they would achieve the dual objectives of assuring their political power and of undermining their legal status as aliens.

Demands such as these have served as a red flag to the nationalists. In recent years the French government has proposed changes favoring settlers in the protectorates. Such proposals, however, have been sternly rejected by the nationalists and have touched off a reaction that has included appeals to the United Nations, campaigns of civil disobedience in the form of boycotts and strikes, and even violence in some in-

stances. Clearly, the most crucial element in the crisis in Tunisia and Morocco is the difficult problem posed by the conflict between native and French communities.

COMMON FACTORS IN TENSIONS

The conflict in French North Africa must also be considered within the context of the colonial crisis that began to develop after the end of World War I and reached its climax in the aftermath of World War II. A combination of factors after World War I—the Wilsonian doctrine of national self-determination, the Soviet revolution and its wide appeal to colonial peoples, and the depression of 1929—shook the foundations of the old colonial system. Restiveness grew among colonial peoples and a tide of self-assertion, taking the form of militant nationalist movements, rose to challenge the status quo. The nationalist movements of the Maghreb were part of this rising challenge, which was heightened after World War II. The promises of a new and better world as expressed in the Atlantic and United Nations Charters fanned the hopes and expectations of the colonial peoples.

World War II had a particularly great impact on French North Africa. The presence of Allied forces in the area, a major theater of military operations, had important consequences. It affected the thoughts and behavior of all strata of the population, from the Sultan of Morocco, who had a famous conversation with President Roosevelt, to the average native, who saw his European ruler defeated in battle. Furthermore, the Muslim world outside of the Maghreb was in the midst of a great change. The Arab League had come into existence. Independence had been attained by one Muslim state after another—Syria, Lebanon, Jordan, Pakistan, Indonesia, and Libya. Other former colonies such as India and Burma had also become free. Further evidence of Muslim self-assertion was being manifested by Egypt and Iran, which were standing up to their former European overlords on such matters as the Sudan, the Suez, and oil. Witnessing these developments and inspired by anti-imperialist sentiment, the nationalists of North Africa intensified their efforts to end colonialism in their countries.

Political movements

Intensification of nationalist efforts took the form of a stepped-up program for political action. The nationalist leadership realized that without the application of political pressure and the demonstration of their political strength they could get nowhere. The past decade witnessed the emergence of a stronger nationalist organization in each of the territories, and their acquisition of a broader popular base. Whereas in their early stages the nationalist movements drew their strength mainly from intellectuals, religious leaders, and the *haute bourgeoisie*, they now reached into the masses. In Algeria, of particular significance in the postwar years has been the emergence of the *Mouvement du Triomphe des Libertés Démocratiques* (MTLD) as the most important nationalist group in the country. Although this group is now experiencing some internal difficulties, it is still the most important nationalist force in Algeria, and it owes this position to its great strength among the urban proletariat and the poor agricultural worker. In Tunisia, a strong labor movement, the *Union Générale des Travailleurs Tunisiens* (UGTT), and an agricultural organization, *Union Générale de l'Agriculture Tunisienne* (UGAT), were developed as important arms of the leading nationalist party, the Neo-Destour. In Morocco, although denied the right to form their own unions, Moroccan workers with leadership provided by the Istiqlal (Independence) party were organized in large numbers, either clandestinely or within the officially recognized French labor organization, the *Confédération Générale du Travail* (CGT). It should be noted that the Moroccan nationalist movement, generally considered the least developed and having the weakest popular base among nationalist movements in French North Africa, demonstrated great popular support during the past two years by its ability to lead successfully a program of civil disobedience. Moroccan nationalism probably received its greatest boost from the crude policy of repression employed by the French in Morocco. Nothing perhaps did more to unite the Moroccan people and to make them aware of nationalism than the deposition in August 1953 of Sultan Mohammed V, following the latter's refusal to agree to prosettler reforms.

Economic development

The French aided the nationalist cause during this postwar period in still another way. The tempo of economic activity was stepped up and its direction turned away from its prewar orientation.[5] The war experience had demonstrated the great weakness of the existing economic relationship between France and North Africa. Having been entirely dependent upon France for manufactured goods, North Africa suffered greatly when it was cut off from the metropole during the war. It is said, for example, that throughout French North Africa not even a soap factory existed in 1940. French elements in North Africa were determined that such a situation should not be permitted to continue, and as a result many new industries began to crop up in North Africa. The threat of another war in Europe reinforced this development through a steady flow of flight capital from France and other parts of Europe. Increased industrialization and economic activity meant the creation of conditions—as, for example, the acceleration of the rate of native urbanization—favorable to greater nationalist activity.

Postwar economic development also greatly enhanced the stake of the European population in French North Africa. That the European population should therefore harden its attitude toward nationalists followed almost naturally. In the past decade many fruitless efforts were made to arrest the growing tension in Franco-native relations. At various times during this period it seemed that some headway towards amelioration of the situation was in the offing, but at no time was the impending settlement achieved. It is not easy to work out a solution that would harmonize the interests of settlers and natives. Because of the conflict, which is still growing, between these two groups, French Premier Mendès-France, who has proposed certain concessions to the nationalists, is experiencing considerable difficulty in his attempt to stabilize the situation in French North Africa.

Crucial population division

Clearly, were it not for the presence of a settler element, the problem of adjustment between France and the native nationalists would be much simpler. This is not to say that France, in trying to preserve its control over North Africa, has no concern other than protecting the interests of the European minority. Considerations of national prestige, the French Union, and the French national economy are also involved. Every French government since the war has hesitated to make concessions to the

[5] See *L'Économie de l'Union Française d'Outre-Mer* (Second series; Paris, 1954), pp. 32–34.

nationalists lest this be interpreted as a sign of France's weakness as a world power. However, were it not for the presence of European settlers in North Africa, France would have greater freedom in working out a settlement with the nationalists. The crucial problem in French North Africa, therefore, continues to be the division of the population into two distinct cultural elements, the native and the French, each possessing a driving determination to survive as an entity, each pressing for political control to achieve this end.

Benjamin Rivlin, Ph.D., Brooklyn, New York, is assistant professor of political science at Brooklyn College. In 1951 and 1953 he conducted research in France and North Africa under the terms of grants from the Social Science Research Council. During World War II he served with the Office of Strategic Services in Washington and North Africa and more recently has worked on African affairs in the research branches of the State Department and the Trusteeship Division of the United Nations. He is the author of numerous articles on North African affairs and of the Carnegie Endowment's case study, The United Nations and the Italian Colonies (1950).

British West Africa: Patterns of Self-Government*

By DAVID E. APTER

WITH considerable applause from the West, new nations are taking shape in the Gulf of Guinea, infamous slaving ground, historic trade area, and that part of the continent of Africa once known as the "white man's graveyard." Africans in British West Africa are, with great skill and good humor, divesting the European of his colonial burden. They are doing so within the structural framework of secular democratic government. That great problems occur in such a process almost goes without saying. That Africans are capable of handling their difficulties can be easily demonstrated. In British West Africa where no permanent European settler population lives off plantations, estates, or farms,[1] Africans are attempting more than even a benevolent colonialism could hope to offer. Such efforts enhance the significance and meaning of parliamentary government in the larger process of social change.

We shall attempt a quick look at the problems of developing a central system of authority which are attendant upon political developments now occurring in British West Africa. Ignoring the developments in Sierra Leone and Gambia, the efforts in the Gold Coast and Nigeria throw into sharp relief the complicating effects which size, tradition, wealth, and constitutions, among other factors, have brought to bear in these differing colonial territories on the West Coast of Africa. In formal terms, the Gold Coast has developed a unitary system of authority as its basis of secular political rule. Nigeria has, on the contrary, been forced to accept a federal system. Meanwhile the Gold Coast has achieved the greatest constitutional advance along the lines of self-government, while self-government by 1956 is the slogan of many Nigerian nationalists. How can we compare the simultaneous development of political freedom in these two areas? What significance can be drawn from the parallel? To answer our question we will look first at the common colonial framework under which both were ruled by imperial Britain. We can then view the political developments in the Gold Coast where the Convention People's Party under its Life Chairman, Kwame Nkrumah, the Prime Minister, has brought the country to the very verge of independence. Finally, a more impressionistic commentary on Nigeria will, perhaps, serve to illustrate some of the factors of the indigenous environment, both social and economic, which help or hinder the development of a central secular system of authority.

BACKGROUND OF BRITISH COLONIAL AUTHORITY

Both the Gold Coast and Nigeria were administered as Colony and Protectorate[2] under the system of indirect rule. While the actual term is a vague one, it developed in practical fashion in Northern Nigeria and was adopted in one fashion or another for most of British Africa.[3] In Northern Nigeria

* Research in *British West Africa* was undertaken in 1952–53 under the auspices of the Social Science Research Council.

[1] By law Europeans are barred from land ownership and there is no permanent European settler population.

[2] The distinction between Colony and Protectorate has largely disappeared.

[3] See F. D. Lugard, *The Dual Mandate in British Tropical Africa* (Edinburgh: W. Blackwood and Sons, 1922).

the Fulani and other Islamic kingdoms were conquered by a small British force, which was then faced with the problem of having to administer a large territorial area, having a large population, with only a limited European complement to do so.[4] In an area where intertribal warfare was common, the effort to provide a framework of stability and peace under the British flag, partly as a device to stimulate trade and partly because stability and peace were regarded as essentials of British rule, would have required a large police and administrative staff. This was impossible, and the defeated chiefs and emirs were called upon to give their allegiance to Britain and, in return, were allowed to rule according to their own laws and customs, backed up by the prestige and force of British arms. The ideal was a dual system of authority in which the chiefs and the district officials co-operated closely. The traditional pattern of life was maintained as much as possible, excepting where that pattern was repugnant to British law.

This system worked reasonably well. Chiefs served as agents of British rule. Modifications in social organization such as those brought about by the introduction of commercialism, a money economy, and new types of occupations and consumer products were made without sudden catastrophic consequences, as the old systems of authority subtly shifted in their nature and functions. The commonly accepted official view was that so long as the structure of tribal government was maintained, no violation of tradition would take place —hence there would occur no fundamental breakdown in social life. It was presumed therefore that there would result few disruptions which might require a large administrative staff, a costly item for a reluctant Colonial Office.

While the system of indirect rule was applied generally throughout West Africa and other parts of British Africa, the results were varied. In places like the Northern Territories of the Gold Coast, where much the same cultural tradition as in Northern Nigeria prevailed, indirect rule worked out as envisioned, that is, as a partnership in authority. Ultimately it was believed that by developing local agencies of rule under the chiefs, self-government would come about. In the Colony[5] and Ashanti areas of the Gold Coast, and in the Eastern[6] and Western[7] Regions of Nigeria, the very opposite of what was intended occurred. In these areas putting chiefs into the administrative hierarchy of the colonial service, no matter how "indirectly," violated the traditional prescriptions of office of these authorities. The result was to foster the growth of a nationalist movement which, in the Gold Coast, came ultimately to regard the chiefs in the same way as the British, that is, as imperialists. Much the same thing occurred in the Eastern and Western Regions of Nigeria, aggravated in the former instance by the fact that no traditional system of formalized chieftaincy existed, and the British had appointed paramount chiefs who had no indigenous source of support.

EMERGENCE OF NATIONALISM

In both Nigeria and the Gold Coast the traditional patterns of social life and organization have had thrust in their midst very modern Western types of organization. There has been the clear emergence of new status groupings based

[4] See A. C. Burns, *History of Nigeria* (London: George Allen & Unwin, 1951).

[5] The Colony is the coastal area of the Gold Coast.

[6] Predominantly Ibo.

[7] Predominantly Yoruba.

on money incomes, on occupational positions, and on awards of political authority. Further, there were sharp pressures toward upward mobility, heightened by the possibilities of success via well-known routes, for example, education, politics, or commerce. The situation was permissive. In other words, no racial barriers to the opportunities of Africans existed, in contradistinction to British East and Central Africa, where certain kinds of activity and roles are absolutely barred to Africans. With such an environment it was possible for expectations to develop far in advance of actualities. The situation was exaggerated by the penetration of commerce into all corners of Africa. In the Gold Coast today, for example, even the most "bush" cocoa farmer is dependent upon the decisions of the government as it fixes the prices he will receive for his cocoa from the Cocoa Marketing Board.[8] The amenities of Western culture have forced their way into tribal society, sometimes with drastic effects.[9] Large numbers of youth, for example, who have had some schooling or job training are no longer content with the normal agricultural system of the past, the authority of the chiefs and elders, or even the responsibilities and demands put upon them by traditional family life. An atomization of traditional social structure often occurred in which the family, the village, the territorial division were no longer the exclusive social organizations to which individuals belonged.

For those who found such organizations restrictive, political parties served to refocus their lives, providing acceptable opportunities to whatever gratifications people sought. Much of the more flaming radical nationalism came from the slums of Usshertown in Accra, or from Lagos or Ibadan, where traditional society had loosened its hold while new ways of life and standards served as a major attraction. Some of the prerequisites for nationalism and mass organization came about when education did not automatically result in acceptable jobs, when demand for commercial products was not matched by purchasing power, and hostility against the British as rulers found no acceptable medium of expression. The early nationalists, mainly chiefs and the "British Africans" (that is, those who were trained under British auspices and became "black Englishmen" divorced from the general public), were gradually displaced as important political figures by members of the mass radical "movement-party" devoted to rapid change and self-government. In the Gold Coast the intellectuals, lawyers, and other professional men in the United Gold Coast Convention themselves received little of the support given to Kwame Nkrumah in the movement which provided psychological sustenance to thousands, whether Fanti, Ashanti, Ewe, or Krobo. The Convention People's Party superseded traditional tribal boundaries, recruiting individuals from a broad base in which many differing peoples, for many diverse motives, shouldered the common burden.

[8] A Statutory Board.

[9] A Gold Coast Liberation Movement has been initiated in Ashanti as part of a protest against the price of cocoa fixed by the government. This organization has set as its object a federal system and is supported by the Asanteman Council.

Nigeria

A similar development in Nigeria, particularly under Dr. Azikiwe, was unable to unite diverse groupings in a common organ devoted to independence. The degree of public disenchantment with colonial officialdom proved less intense in Nigeria, particularly in the rural areas. With a huge territory in

which the penetration of Western patterns of subsistence moved more slowly than in the Gold Coast, and where traditions of tribal warfare and local particularism remained strong, regional-tribal boundaries proved too strong for the emergence of a popular mass party coalescing large groups from all parts of Nigeria, devoted to independence under a single leadership. Rather the contrary occurred, in some instances where the "movement-party" might count on more traditional bonds as a stimulus for recruitment than was true of the Convention People's Party in the Gold Coast. In this regard, party rivalry is exacerbated by tribal nationalism. Such a system would seem self-perpetuating so long as the Action Group in the west of Nigeria and the National Council of Nigeria and the Cameroons continue to appeal to regional ties and to tribal membership.

It is in the Gold Coast rather than in Nigeria that there has occurred the most rapid advance toward self-government via a newly developed central conciliar system based on the British parliamentary model. Compared to the Gold Coast, Nigeria is in far more difficult straits, with a population of over 31 millions, and three regional divisions having widely differing cultural attributes as well as competing and conflicting political aims. The Muslim emirates of Northern Nigeria remain more or less autocratic. They tend to stand against independence, fearing the domination of the Ibo and Yoruba to the south. In the Northern Territories of the Gold Coast, where much the same conditions exist, the situation is less telling for several reasons. One perhaps that is difficult to evaluate today is the fact that the Northern groups were in part subject to the Ashanti in the central part of the Gold Coast. Perhaps more important today is the fact that they are the most poverty-stricken, the most poorly educated, and the generally least influential of the three major groupings of the Gold Coast. By contrast, the Northern Region of Nigeria is about three times as large as the Western and Eastern Regions combined, and has a population over twice as large as either one of them.

THE GOLD COAST

In spite of all the ills that plague her, the Gold Coast remains the most hopeful spot on the map of Africa, if one is concerned with African freedom and self-government. As the people of the Gold Coast are themselves aware, the world is watching this small territorial artificiality as it takes over the reins of government and, under an African Prime Minister, Cabinet, and Legislative Assembly, creates a nation state.[10]

The Gold Coast has already come a long way since the British formally established their rule in the latter part of the nineteenth century. Gold Coasters have left behind and perhaps lost forever some of their traditional heritage, in their haste for the symbols and artifacts of Europe. But much of their traditional environment remains, holding both promise and problems for those who seek to make Ghana [11] a free nation of free Africans in what remains a predominantly colonial continent.

Traditional Gold Coast society was not limited to the Gold Coast as we know it today. With borders drawn arbitrarily, this small nation of some

[10] For a short discussion of the political problems attendant upon such development see "Political Democracy in the Gold Coast" in the forthcoming volume *Africa in the Modern World*, Norman Wait Harris Foundation Lectures (University of Chicago Press).

[11] The nationalist name for the Gold Coast taken from the historic Ghana kingdom of the Sudan, which reached its glory in the eleventh century and from which some Gold Coasters claim the modern Akan derive.

92,000 square miles, containing a population of some 4½ millions, has been cut off from people in the Ivory Coast, a French possession to the west. Its historic affiliations in the north are towards the French Sudan and the Mossi peoples, while its eastern border cuts through the much disputed Ewe country towards the coast, where approximately one-third of the Ewe people live in the Gold Coast proper, one-third in Togoland under British Administration,[12] and one-third in French Togoland and Dahomey. Further, a great cultural and and historic bifurcation can be seen, dividing the Gold Coast into the predominantly Islamic peoples of the Northern Territories and the Akan and other peoples of the coastal and forest regions to the south. The latter treated the Northerners with contempt, formerly found slaves among them, and kept them in acknowledged obeisance. Today the southerners are finding new reasons for their traditional prejudices. Their lands produce cocoa, they have money to educate their youth, they dominate the Convention People's Party, the nationalist organization which has brought the country to the threshold of independence, while the Northerner ekes out his existence under the dry desert heat which rolls in from the Sahara.

In spite of divisions and continual cleavages this area, with historical tribal disputes often extenuated by new conditions, has developed under colonial aegis and nationalist prompting into a parliamentary state. The leadership is confident that all they need is political power in order to move mountains, build roads, equip schools, and turn the country into a modern nation. They have been given political power, and both the British and the Africans are impressed with the skill and efficiency with which these objectives have been tackled. Almost everyone is in favor of the present government, the British no less, perhaps, than some of the Convention People's Party zealots. From 1946 when the Burns Constitution, which gave Africans a majority of the Legislative Council, came into effect, providing representation for chiefs, municipal leaders, and appointees of the Governor, until today when the Legislative Assembly (elected from 104 electoral districts on a popular electoral basis) determines what is law, power has been given to Africans to do with it what they will.

[12] *Togoland* is a United Nations Trust Territory.

Problems

Many hardships still face the people of the Gold Coast. They have, to a great extent, many of the problems common to what are generally called "underdeveloped" areas, where extractive industries and agricultural produce predominate and where no institutionalized pattern of savings and investment or wage labor exists.[13] There are severe shortages of trained personnel. Recently an accelerated plan for education came into effect to promote universal education, but the prospects for its success are not yet clear.[14] Illiteracy is high, particularly in the north.[15] The new University College of the Gold Coast which gives a London University External Degree has been one attempt to meet the needs for an educated population (along the lines of the Cambridge model), while the Kumasi College of Technology has been established to turn

[13] For a discussion of Gold Coast economic conditions and their relevance to politics see "Some Economic Factors in the Political Development of the Gold Coast" in *The Journal of Economic History*, Vol. 14 (1954), No. 4.

[15] The present Minister of Education is from the Northern Territories.

out the technicians which a modern development program would require.

The nationalists seek to develop the country as the first fruit of political freedom. Yet they inherit certain basic deficiencies such, for example, as limited port facilities and shortages of crucial building supplies. Even cement, the major building material, must be imported from Great Britain at large cost, although a cement plant will soon be constructed under a government plan.[16] Meanwhile development projects increase employment and wages, but no corresponding increase in consumer products is available to supply the enlarged buying community, which wants the pots, pans, clothes, automobiles, and radios made in other parts of the world. The danger of inflation is therefore acute.[17] On the other hand cocoa, the primary product of the Gold Coast, from which most of her income is derived, is tied in value to the world market. The prosperity and income of the Gold Coast depends upon how much cocoa and chocolate America and Great Britain consume. Partly for this reason and partly as a move to develop the internal resources of the country, the Volta River Development Scheme, which will produce electricity, irrigate the Accra plains that are arable only part of the year, and produce processed aluminum from the large bauxite reserves of the Gold Coast, has been initiated in an effort to reduce the Gold Coast dependence upon one commodity, cocoa.

In spite of the great programs of development upon which the government has engaged, it is important to note that government remains the great entrepreneur. The most alert, active elements in the nationalist movement have, in co-operation with their British administrative staff, pushed for economic change as part of the political program of nationalism. By their use of authority, they have given central government extremely utilitarian functions by which they maintain their own support. Yet it must be remembered that the Gold Coast is still a place where more people have their hands outstretched waiting to be helped than will help themselves. It is a place where people do not quite know where to turn, particularly in the rural areas, to enjoy the fruits of political freedom in economic terms. Under these conditions, government becomes the great focal point of economic and social change, translating the vague wants and dissatisfactions of the public into "positive action." [18]

The pressures upon the government are all the more critical since it must maintain its popularity at the polls. For many whose expectations were too great, or who find themselves threatened by those who no longer keep to traditional ways of life, nationalism is bitter. For the Elders, who occupied positions of great prestige in traditional society, as for the chiefs, being spurned by aggressively minded youth is a bitter pill to swallow. For others, who expected miracles once Kwame Nkrumah came to office, less change is evident than they desired. Streets were not suddenly paved, wells did not appear overnight, and the problems that plagued them before plague them still. The government of Kwame Nkrumah must handle demands of all kinds in an atmosphere of shortage, of badly trained personnel, and of great hopes and expectations. It must be aware of the problems facing rural schools in a little bush village, and hear the complaints of the chiefs who come with their staffs of office, clad in their brilliant "togas," with their retinues, their umbrellas, their petitions, and their dignity, to protest to the government that they are being undermined.

[16] See W. R. Lewis, *Report on Industrialization* (Accra: Government Printer, 1953).

[17] See Dudley Sears and C. R. Ross, *Report on Financial and Physical Problems of Development in the Gold Coast,* Office of the Government Statistician (Accra: Government Printer, 1953).

[18] "Positive action" was the original slogan of the CPP, referring to a policy of nonviolent but active opposition to the British authorities prior to the Constitution of 1950. It was during the positive-action campaign that Nkrumah and others were put in jail in 1948.

Kwame Nkrumah

Kwame Nkrumah, the first African prime minister in a British dependency, is a most unusual person. A compound of idealism, political shrewdness, organizing genius, and good common sense, he has created a mass political party and a social movement which claims thousands of members throughout the Gold Coast, yet which is committed to no dogma, no fixed set of principles, and no binding objectives save one, self-government. In almost every village there is a "swish" [19] house with the red, white, and green pennant of the Convention People's Party fluttering from a stick. Each unit will have its district or local secretary, its propaganda secretary, and, invariably, several local ward boys who do "favors" for the population, usually for a small fee. A picture of Nkrumah in business suit or toga may adorn the wall. Outside, the town looks much as it must have appeared to the District Commissioners who on "shanks' mare" made their tours of the districts and villages thirty years ago (or to the chief who now sits increasingly deserted in his house, while the retainers, now ward boys, are increasingly disrespectful and strive to replace him in the central positions of authority). Kwame Nkrumah has indeed led a mass radical movement to political responsibility. He has displaced the well-dressed lawyers and professional men who once laid claim to the title "nationalist." He has taken the young away from the Elders and chiefs and alerted them to potentialities which only a few years ago they would have never envisioned. The District Commissioner of yesterday might see little change in the landscape, but he could scarcely walk through the seemingly undisturbed villages without being acutely aware that something big had happened.

[19] "Swish" is red laterite soil which is used for building materials in the Gold Coast.

Convention People's Party

What kind of movement and party organization has Kwame Nkrumah created? He has created a weapon, crude, strong, and solid, which brought him and his followers out of jail into positions of authority. It is a cross between a Tammany machine and an evangelical movement. Instead of preaching tribal membership and tradition, it promises salvation to all who join, and to join is to believe in and fight for independence. It is open to all those who will direct themselves to the well-defined goal, freedom, but the terms of freedom are being worked out on a more pragmatic basis. To date these terms have increasingly been those of parliamentary democracy. The movement collects the culturally displaced persons who see in the political party a means to gain personal advantage. It collects opportunists who want political power and know that there is no power other than that granted by Nkrumah. It supports those partly educated dissatisfied youth who have seen an image of a different world, and who believe that Nkrumah will lead them to greater prosperity, dignity, and achievement than possible under colonial rule.

It is often a rags-and-tatters political party, given to great enthusiasm,

united in devotion to Nkrumah, undisciplined, organized in some respects like a Communist party, with a central committee and Nkrumah as "Life Chairman." Yet it is radical, empirical, and popular, rather than elitist, dogmatic, and parochial. It is by no means an organization where all decisions flow from the top down, but rather one where good communications, local freedom of expression, and "rebellions" against party directives help to keep the "Life Chairman" in touch with popular attitudes and give him some idea of public sentiment in villages and towns.[20] The Convention People's Party is not separated from the general public by self-importance and prestige positions, or by strings of degrees, or by occupations other than politics. The leadership devotes its full time to the business of creating a public interest, and catering to it in regular ward-heeler fashion. The opposition, a conglomeration of intellectuals, lawyers, discredited nationalists and ex-CPP members, and Northern Territories and Muslim groups, is neither a cohesive group nor an alternate government. The most serious effort to create a national opposition, under the guidance of Dr. K. A. Busia, professor of sociology at the University College of the Gold Coast, met with failure at the polls.[21] Such an opposition has neither the issues, the personnel, the time, nor the money to actively oppose the government. Theirs is a perennially negative position, attempting to criticize a man and a program which, at present, have never been more popular. It has often been stated that no true opposition will appear in the Gold Coast parliament until final self-government is achieved. Others, less hopeful, feel that after the British leave it is most unlikely that Nkrumah will tolerate any real opposition which might threaten his supremacy. In any case, for the moment it is difficult to see how an opposition based on more than purely transitory matters [22] might develop, excepting, perhaps, the rebirth of regional nationalism, which is possibly latent in Gold Coast politics.

Responsible representative government

We have tried to give some indication of how and why nationalism has emerged in the Gold Coast, and how the challenge of public responsibility and office has been met. Nationalism has become legitimate. Yesterday's radicals are the responsible public figures of today. Nkrumah has risen from "dangerous agitator" to Africa's greatest statesman in only a few short years, both in the esteem of his own people and the estimate of the British from whom he wrested power. Using a unitary parliamentary system, he is proceeding to wield a national democratic society out of the hitherto fragmented segments of the population. The earlier impact of commercialism and the decay of tribal organization is being minimized, while the stimulation of new ideas and objectives is more and more represented in an integrated national policy.

In spite of certain dangers in this process of developing a parliamentary system in the Gold Coast via the Convention People's Party, as matters stand now it is likely that the Gold Coast will have a far easier time developing an accepted unified pattern of parliamentary authority in the near future than Nigeria. If anything, Nkrumah is holding back on the final dissolution of colonial status in order to maximize later success. Having a firm majority in the Legislative Assembly and faced by a timid regional opposition representing the North, the development of the internal economy and local development are matters which preoccupy the regime. The government is less concerned with decisions regarding what should be done than it is with questions of what is the best way to achieve objectives. For this purpose the parliamentary system with its administrative adjunct serves admirably. The Nkrumah government which was advocating immediate self-government in 1949 is now itself reluctant to make the final step. In other words, the point has been reached where constitutional matters are not the primary questions of the day, nor are issues over the participation and degree of control to be exerted by Africans. There is responsible representative government—the routine of government business continuing under the Nkrumah government in the fashion of cabinet government.

[20] Recently there has been an attempt to tighten up control over locals which do not stay in line. During the recent elections when several locals chose candidates who did not have official CPP blessing, the candidates were expelled from the party if they failed to drop out of the race. Sixty-four members of the party were expelled for this reason.

[21] Busia, himself, was the only member of his party, the Ghana Congress Party, elected in the 1954 election.

[22] Such as the present Ashanti "separatist" movement due in part to local objections to the price of cocoa fixed by the government and which has as its object a federal constitution.

NIGERIA

Several miles to the east of the Gold Coast across the French dominated areas of French Togoland and Dahomey, the largest colony in the British dependent empire, Nigeria, follows hard on the heels of the Gold Coast in constitutional change and self-government. The Ibo of the Eastern Region, supporting the National Council of Nigeria and the Cameroons (NCNC) under its dynamic leader Dr. Nnamdi Azikiwe, the Yoruba of the Western Region united in the Action Group led by Obafemi Awolowo, and the Muslims of the North under their emirs in the Northern People's Congress and the Northern Elements Progressive Union indicate tribal separatism and divisions which make rapid political progress difficult. A federal constitution, regarded as the only workable scheme for uniting Nigeria into a single entity for political purposes, has been regarded by many as a device by the Colonial Office to slow down the pace of nationalism. In spite of such criticisms, it is difficult to see any alternative to federalism at this time. Recent constitutional discussions in London and Lagos held under the auspices of the Secretary of State for Colonies have indicated the extent to which regional differences and local prejudices have made co-operation difficult.[23] At present the possibilities for co-operation between the Action Group and the National Council of Nigeria and the Cameroons look hopeful. Upon that co-operation much of Nigeria's national future rests.

If the Gold Coast faces difficulties caused by disease, ignorance, shortages in trained workers, lack of port facilities, poor transport, and a population geared more to new demands than to new efforts, Nigeria faces all these on a more grandiose scale. By contrast, the Gold Coast is in a superior position to take the structures of parliamentary government and use them for operational purposes, that is, solving just these kinds of problems. In Nigeria, with a large population, the amount of resources, both human and physical, required to pursue programs of political and economic construction looms much larger. At the same time, the federal system based upon regional integrity

[23] How the federal constitution was established and the issues raised is a revealing chapter in Nigerian political history. See *Proceedings of the General Conference on Review of the Constitution*, January 1950 (Lagos: Government Printer, 1950).

has resulted in partially separate budgets, tax schedules and requirements, and separate governmental organs with their own council of ministers, prime minister, house of assembly, administrative service. The various regional governments are therefore left to advance as they can towards political development, while the over-all role of the central government remains unclear. This poses a unique difficulty in the way of creating a consciousness of national membership and promoting a viable central system of authority for a united Nigeria.

Regional separatism

Considering that the Gold Coast and Nigeria were ruled by a common colonial system, and both originally showed marked tribal differences and demarcations, particularly as between north and south, the question is often raised regarding the relative insignificance of regional separatism in the Gold Coast and its persistence in Nigeria. In spite of the growth of new social groupings whose interests, both intellectual and economic, would seem more unifying than any possible tribal affiliations, why has tribal separatism been maintained? One answer, perhaps, lies with the character of indigenous institutions in Nigeria, the response of which to the stimuli of Western culture was in some ways very different from that among the Akan groups in the Gold Coast. In the Gold Coast those chiefs and lawyers who had performed conspicuous service for the British administration were ultimately regarded as traitors and viewed as absolute barriers to real freedom. They, no less than the British, were objects of public odium and in the final sweep of radical nationalism chiefs, their retinues, their followers, and the lawyers and politicians of indirect rule were all classified together, and scarcely any have survived in public office today. By abolishing their former leaders and chiefs, Nkrumah was able to direct attention to himself as the central leader. Such a situation did not occur in anything like the same degree in Nigeria. In the Eastern Region, among the Ibo, the lack of a centralized system of traditional authority and indigenous patterns of marketing and commerce allowed a superficial adaptation to British ways of economic life, while scarcely impeding social organization. A somewhat atomistic form of traditional life helped to absorb the immediate impact of European culture. When, however, the British began to install paramount chiefs among the Ibo, who have little formal system of chieftaincy, the basis for later nationalism was laid. Today the NCNC, which recruits largely from the Ibo groups, is the strongest potential for a national political party in Nigeria.

Western Region

In the Western Region a complex system of "cult" groups or semireligious organizations, such as the old Ogboni societies, exercised subsidiary authority. These groups allowed traditional activities to continue in spite of increasing contacts with Western authorities and culture. They deflected the full impact of colonial rule from the agencies of chieftaincy, and the latter were not "undermined" as in the Gold Coast. Moreover, the British "saved" the Yoruba from continuing the long and costly series of wars which had reduced the strength of the Egba, and almost destroyed the authority of the Alafin of Oyo. Depredations from the Emir of Ilorin among the Yoruba were halted. Not only did the British help re-establish peace among the Yoruba, but they enhanced the power of some of the local chiefs, and by considerable segments of the population were regarded more as saviors than as colonial adventurers.[24] One result has been a less wholehearted disaffiliation from chieftaincy. The various traditional societies like the Ogboni served to deflect some of the more drastic effects of British rule, while newly strengthened chiefs aided the re-establishment of trade and normal social life so sorely taxed from years of intertribal warfare and raiding. Even today the Oni of Ife is regarded as one of the powers behind the Action Group, and the chiefs still figure in political life in a way which they have been unable to do in the Gold Coast for perhaps twenty years.

The North

Meanwhile in the North where a more patriarchal social pattern under an accommodated system of Islamic law persists, orientation to radical political change is decidedly negative. Efforts to enhance the nationalist position in the North[25] have often resulted in riots and deaths. The emirs recognize the threat to their supremacy of the southern inspired nationalist movements.

Weakened nationalist potential

With such sharply differentiated cultural differences within the area demarcated by the present boundary of Nigeria, the establishment of sanctioned symbols of centralized authority is difficult. In the Gold Coast, the political party has served up a unifying theme around self-government while denigrating traditional social organization. In Nigeria traditional social organization has combined with secular politics, and it has been difficult for a mass movement cutting across tribal boundaries to develop. The local organs fulfill some of the same functions which the Convention People's Party performs in the Gold Coast, thereby weakening the nationalist potential and reducing mass solidarity and recruitment. Among the Ibo, for example, tribal unions keep alive tribal bonds and separatism, particularly among migrants to Yoruba country to the west. Such tribal unions promoted protection, security, and cohesiveness based on ethnic and cultural affiliations. But although they facilitate local activity in community life, they reduce the sharp awareness of an all-embracing national polity in which all Nigeria should participate.[26]

PARLIAMENTS AND SOCIAL CHANGE

One of the great questions which plague political scientists is how to calculate the effects of a given measure in the context of social change. The West African experience does give some indication of how secular conciliar institutions can affect the massive reorganization of social life by peaceful means. In both Nigeria and the Gold Coast, government is one of the means of promoting a new way of life.

Because of the crucial role it can play in these processes, central government assumes an importance in underdeveloped areas which has not been habitual in the West. It is of crucial significance where large territorial areas having a multitude of demands need to be developed on an integrated basis. Central government is then in the position of balancing developmental priorities against local requirements, short run objectives against long run objectives, receiving a total revenue out of which capital investment can proceed.[27]

[24] A good example of this position is found in Samuel Johnson's *History of the Yoruba* (London: George Routledge & Sons, Ltd., 1921).

[25] Particularly by the Northern Elements Progressive Union.

[26] See Aloba Abiodun, "Tribal Unions in Party Politics," *West Africa*, July 10, 1954.

[27] Implicit here is the key role of government as investor. Contrary to popular assumptions, private capital is scarce and un-

Further, administrative organization and conciliar organs are integrated from local to central levels under British administrative practice. The Gold Coast "revolution" has involved replacing expatriates with Africans, while establishing a parliament, with cabinet government, as the central decision-making body. This type of organization has facilitated the rapid development of the Gold Coast towards self-government.

Regionalism versus nationalism

In Nigeria, however, central government is in a sense residual to regional government. Close administrative and political ties are found at the regional level and matters of public business are conceived of in regional terms. The region has become the functioning group to be represented in the central legislature. Administrative officers receive their instructions from a public divided into relative power blocs with differing degrees of effective demand. In other words, the responsiveness of authorities in Nigeria is more to pure power than in the Gold Coast. Such a pattern inhibits the growth of national consensus and obfuscates and distorts basic needs in society. Priorities are scheduled more on the basis of local demands than according to a projected state of affairs. That such a condition is highly desirable under some circumstances will be conceded, but special conditions in underdeveloped areas tend to minimize the advantages of federalism. If parliamentary institutions are to have genuine meaning in a nonindigenous environment, then they must become part of the meaningful pattern of daily life. In the long run, the advantages accruing from an efficiently operating central authority seem great. The successful integration of nationalism with parliamentary organs in the Gold Coast has made the transition to self-government almost an administrative shift. Having gathered a large mass following, the party machinery has sought to maximize the benefits it can bring, both to the country and to party members and officials, by using the full paraphernalia of parliamentary government. Nkrumah can capitalize on the administrative hierarchy of ministries and departments to service public needs, meanwhile retaining the *expertise* of British administrators as needed. At the same time an expansion of the offices available to party members built into a system of parliamentary and bureaucratic interrelationships makes the parliamentary system useful to the nationalist cause. Those agencies which provide the Convention People's Party with an efficient means of capitalizing on its initial political successes reduce the danger of a distortion and perversion of authority, while democratic processes can become more and more entrenched.

In Nigeria the recognition of regional needs and imperatives has tended to harden local and regional parochialism. The perpetuation of such conditions in a federal system means that general consensus expressed through parliamentary means can only be tentative, and on minor issues. Equally, a sense of national solidarity and membership in a united Nigeria is postponed. In the Gold Coast the "revolution" against local particularism, tradition, and regionalism has occurred. The "movement" became the party. The radicals assumed the propriety of the parliamentarian. This has not yet occurred in Nigeria. The regions have remained affiliational and orientational boundaries, and the advantages of independence under such circumstances seem gravely reduced.

Both the Gold Coast and Nigeria are examples, however, of different approaches toward the development of self-governing democracies in West Africa. The value of parliamentary institutions as vehicles of social change is being tested in this process. Equally, the cause of African freedom hangs in the balance.

available in anything like necessary amounts, and government assumes the entrepreneurial function.

David E. Apter, Ph.D., Evanston, Illinois, is assistant professor of political science at Northwestern University. He was engaged in field research in West Africa in 1952–53 under a Social Science Research Council Area Research Training fellowship, and is author of the forthcoming volume, The Gold Coast in Transition: A Case Study of Political Institutional Transfer.

British Central Africa: Politics Under Federation

By Kenneth Kirkwood

THE fact that the Federation of Rhodesia and Nyasaland [1] is barely a year old raises a number of difficulties for the analyst of politics under federation. If, however, we view recent events against the political background of Central Africa and the related territories of British Africa we can more safely comment on current developments and the outlook for the future.

World, Commonwealth, and African Background

In the Federation of Central Africa where less than a quarter-million whites live among more than six million indigenous Africans, racial problems dominate the political scene. The estimated population in 1951 is shown in the accompanying table.

Estimated Population in British Central Africa, 1951

	Whites	Africans	(Asian and Other Colored)	Total
Southern Rhodesia	138,000	2,010,000	10,500	2,158,500
Northern Rhodesia	37,000	1,890,000	3,500	1,930,500
Nyasaland	4,000	2,390,000	5,000	2,399,000
Total	179,000	6,290,000	19,000	6,488,000

The following words used by a former Secretary of State for Commonwealth Relations, in a House of Commons debate on federation, provide a concise and convenient comment on the world setting:

> Behind the matter we are to discuss to-day lies one of the central problems of our generation, which will certainly be with us throughout this generation, namely, the question of colour and of racial relations. In many parts of the world colour conflict has transcended class division as the motive force of politics and history. I think that the claim of the Soviet Union to be able to solve problems of colour is now much more potent than her claim to solve social and economic problems of the world.[2]

Within the Commonwealth of Nations today a major choice facing all her peoples is whether they are to seek to create a strong, united, multiracial international association or to consolidate bonds based on differences in ethnic and social origin. During the discussions on Central African federation there were marked differences in outlook, on questions such as the weight to be attached to African opposition, between Britain and the older, or "Anglo-Saxon," dominions on the one hand and India, Pakistan, and the new, or "non-European," member nations of the Commonwealth on the other. Where many Britons, Australians, Canadians, and New Zealanders continued to think in terms of the prewar policy of trusteeship towards the nonwhite peoples, Indians, West Africans, and West Indians were highly critical of any actions which appeared to be out of harmony with the postwar "partnership" policy of the Commonwealth.

[1] "Federation of Rhodesia and Nyasaland" is the official name. A motion to adopt "Rhodesia" as the name for the whole Federation was introduced, but rejected, in the first session of the Federal Assembly.

[2] Patrick Gordon Walker, *Parliamentary Debates* (Hansard), *House of Commons*, Vol. 504, No. 137, col. 777, July 24, 1952.

In Africa the new Federation may best be examined within the context of the "plural" or "multiracial" societies of British Africa. Situated between the Union of South Africa, committed to an official policy of *apartheid*, and the territories of British East Africa, profoundly disturbed by the Mau Mau outbreak in Kenya, Central Africa may be seen as the last area or zone where Britain might hope to avert the dangers of extreme nationalism and racism.

Major Political Forces

The political aspirations of the Africans must be taken fully into account in any realistic appraisal of current policies and probable future trends in Central Africa but it is only recently, notably since 1945, that African political movements in the Rhodesias and Nyasaland have strengthened, in leadership and organization, to the point where they demand close and continuous attention. Before 1945, and even today, the struggles between rival groups of whites have preoccupied political leaders in Central Africa and the United Kingdom. The whites have tended to divide on two fundamental issues: the acceptance or otherwise of the Crown and the "British connection," and the control and regulation of relations between whites and Africans in Africa. If the nature and course of developments in Central Africa are to be understood we should keep in mind these two distinct, yet related and constantly interacting, planes of division.

Broadly stated, a small but vocal minority of whites in Central Africa, composed mainly of Afrikaans-speaking adherents of the Dutch Reformed Church from South Africa, are either republican in outlook or indifferent to the British Crown.[3] Most members of this group are also strongly opposed to any external intervention on behalf of the indigenous native peoples, or Africans, and the great majority are traditionally segregationist in their outlook on racial questions. (There is a small but important minority of Afrikaans-speaking liberals or nonracialists.)

The majority of the whites are English-speaking and most belong, albeit nominally, to one or other of the liberal Christian denominations. The English-speaking whites may be divided, almost equally, into those of British South African origin (from the Cape Province, Natal, and the Witwatersrand) and those who came directly from the United Kingdom. But although English-speaking settlers are conscious of differences in their place of origin and whether or not they are "new" or "old" settlers, it is difficult to determine any significant correlation between place of origin and length of residence in Africa with race attitudes and attitudes to the Crown. In general, the great majority of English-speaking whites have a conscious loyalty to the Crown and a desire to preserve the British connection, but a majority strongly oppose any United Kingdom control over native policy.[4]

[3] For historical reasons, notably the rivalry between Kruger and Rhodes in the late nineteenth century, many Afrikaans-speaking Central Africans view the political boundary between South Africa and the Rhodesias as purely arbitrary. They maintain close links with their fellows in South Africa and are very conscious of the powerful political position of Afrikaner-nationalists in the more populous and developed Union.

[4] Sir Godfrey Huggins drew considerable applause when, during a Southern Rhodesian debate on federation, he referred to the possibility of Central Africa's following the revolutionary path of the former British North

They also favor a policy of differentiation between Africans and Europeans, and a significant minority support a policy of *apartheid,* or thoroughgoing segregation. If it is helpful to label these main groups we might describe them as British-Dominionist, African-nationalist, and Afrikaner-nationalist.

If space permitted we should describe several other significant groups and subgroups among the whites and Africans, but a mere list of groups or "factors" must suffice. The general Imperial factor [5] is still important, as are the British-Liberal and British-Conservative subfactors. Historically, the Chartered Company factor was very significant, and the Missionary factor [5] must still be taken into account. The emergent Native-Liberal factor promises to become more potent in the future, drawing as it does upon nonracial Christians, African and white, and upon individuals of other religions and of nonracial secular outlook. The White Trade Unionist factor also justifies separate consideration. The main purpose in listing these further groups or "factors" is to emphasize the complex nature of the forces which operate in the highly dynamic political process of emergent Central African nationhood.

CLOSER ASSOCIATION MOVEMENT IN CENTRAL AFRICA

Under this head it is convenient to consider separately the early attempts to unite the three territories, and the successful postwar endeavor. As in the case of South Africa, much is to be learned from the conclusions and efforts of the pioneer thinkers and actors who examined or sought to achieve closer political association. It is also possibly of more than incidental interest that whereas Union came about in South Africa after several unsuccessful attempts at federation, federation was effected in Central Africa after several unsuccessful attempts at union or amalgamation. In both cases the eventual form of the political association was strongly influenced by considerations of native policy or race relations.

A white movement

The British South Africa Company administration [6] sought to amalgamate Northern and Southern Rhodesia during World War I, but this move was nullified by the strong resistance of the settlers in Southern Rhodesia. It was not until after Southern Rhodesia achieved Responsible Government in 1923, and until the copper mines of Northern Rhodesia had attracted a substantial number of whites in the late 1920's, that the modern movement for closer association was initiated. It is difficult to overemphasize the fact that "closer association" has been an almost exclusively white movement since its inception; just as it is difficult to exaggerate the importance of the fact that one of the principal motives of the local whites in seeking closer association was to remove or reduce the control of the United Kingdom government over native policy and administration.[7] If these facts are kept in mind, the events and reactions of whites and Africans become readily intelligible.

American Colonies, if the United Kingdom were to obstruct the aims of the local whites.

[5] As examples of the traditional British usage of "factor" see C. W. de Kiewiet, *The Imperial Factor in South Africa* (London: Cambridge University Press, 1937) and R. Oliver, *The Missionary Factor in East Africa* (London: Longmans, Green & Company, 1952).

[6] The British South Africa Company administered the Rhodesias under a twenty-five year Royal Charter from 1889 to 1914. A Ten Year Supplemental Charter prolonged their administration until, in 1923, Southern Rhodesia was granted a Responsible Government constitution. The Colonial Office assumed responsibility for the government of Northern Rhodesia in 1924.

[7] Under the Southern Rhodesia Constitution Letters Patent of 1923 the right was reserved to the United Kingdom government to approve or disapprove legislation affecting African interests. There is no case on record to show that any law passed by the self-governing whites has been disallowed, although certain changes of detail have resulted from United Kingdom requests. In Northern Rhodesia white settlers have influenced native policy, but power and responsibility has rested directly with the Colonial Office and Colonial Service. In Nyasaland the white settlers have had little influence.

Hilton Young and Bledisloe Commissions

In the decade before the outbreak of World War II the aspirations of the supporters of closer association were frustrated by the determination of the British government to preserve intact what one English scholar has described as the southern frontier of the Trust, that is, the boundary between Northern and Southern Rhodesia. To British investigators, notably the majority of members of the Hilton Young Commission of 1927–29 [8] and the Bledisloe Commission of 1938–39,[9] the unproved native policy of parallel development in Southern Rhodesia supplied a major obstacle to the closer political association of that territory with Northern Rhodesia and Nyasaland. In the latter territories, administered by the Colonial Office, no theoretical barriers, horizontal or vertical, restricted or governed African advancement. Individual members of both commissions saw a strong case for the rearrangement of administrative organization and control in Central Africa, and the Bledisloe Commission, in particular, recognized a need for interterritorial co-operation between the three territories. But neither commission was prepared to ignore the different aims of native policy north and south of the Zambezi, recently described as a "Mason-Dixon line," nor were they willing to ignore the opposition of the Africans in the northern territories to closer political association with Southern Rhodesia.

In view of the subsequent adoption of the federal principle it is also pertinent to recall that the Hilton Young and Bledisloe Commissions rejected federation as well as amalgamation as being undesirable. The illiberal nature of the draft constitution drawn up by a conference of local white political leaders at the Victoria Falls in 1936,[10] and other indications of the aims of the settlers in seeking union, led the Bledisloe Commission to dismiss amalgamation, even though the economic and formal administrative advantages of this form of union were perceived. The alternative proposal of federation was rejected out of hand by both commissions because they saw little or no hope of a stable federal arrangement between a Colony enjoying Responsible Government and two Protectorates directly under the Crown. From their analysis they concluded that any such association would occasion friction between Southern Rhodesia and the United Kingdom government which would lead to the disruption of the federation or complete amalgamation.

Efforts in Central Africa

The acceptance by the United Kingdom government of the recommendations of these commissions disappointed the white political leaders in Central Africa, but Sir Godfrey Huggins, the Prime Minister of Southern Rhodesia, and Mr. Roy Welensky, leader of the white unofficial members in the North-

[9] *Rhodesia-Nyasaland Royal Commission Report.* Cmd. 5949/1939.

[10] *Ibid.,* pp. 113–15.

ern Rhodesian Legislative Council, persisted in their efforts to induce the United Kingdom government to re-examine the whole question of closer political association. For some years Huggins and Welensky supported the Central African Council,[11] which was instituted in 1945, but this consultative, co-ordinating body, with no legislative powers, proved unsatisfactory to the two leading political figures of the Rhodesias, and in 1949 a further meeting of white political leaders was held at the Victoria Falls to consider closer association.[12] The normal work of the Central African Council was interrupted when committees of officials were appointed to reconsider the desirability and the form of closer association.

Under Labour government

It was in 1950 that the British Secretary of State for the Colonies in the Attlee Labour government announced that there would be a fresh examination of closer association. In 1951 a Conference of Officials was held in London. These officials, drawn from the Public Service of Southern Rhodesia, the Colonial Service in Northern Rhodesia and Nyasaland, and the Colonial and Commonwealth Relations Offices in London, duly recommended, as a matter of urgency, that the three territories of Central Africa be brought together under a federal form of government.[13] The political dominance of the Malan Afrikaner-Nationalist government, returned to office in South Africa in 1948, and the rapid deterioration in race relations consequent upon the enforcement of *apartheid* occasioned the officials' sense of urgency.

In September 1951 the proposals of the officials were discussed by a conference of political leaders from the United Kingdom, the Rhodesias, and Nyasaland. The conference, held at the Victoria Falls, was attended by African representatives from Northern Rhodesia and Nyasaland, but Southern Rhodesia did not deem it necessary to include an African in its delegation, primarily because it considered its government to be representative of all races in the Colony. The Victoria Falls Conference reached agreement on a few important general matters, but little headway was made towards federation.[14] The British Cabinet Ministers, especially the Secretary of State for the Colonies, were subsequently criticized by local whites for being too concerned with African welfare and for the weight which they attached to African opposition to the federation proposals. However, barely a month after the conference the British general election saw the return of the present Churchill Conservative government, and new Secretaries of State for the Colonies and Commonwealth Relations assumed office.

Under Conservative government

There is no doubt that the new Conservative ministry was far less mindful of "partnership" than its predecessor. Certainly the responsible Ministers thought and acted within a framework of Trusteeship, and, as Trustees, they considered it legitimate for the United Kingdom government to make decisions for their African wards, and, if necessary, to impose these decisions. If this fundamental difference in outlook between the postwar Labour and Conservative governments is grasped it is easy to understand the course of events in 1952 and 1953. In January 1952 a private meeting took place in London between the British Ministers, the Prime Minister of Southern Rhodesia, and the Governors of Northern Rhodesia and Nyasaland. This paved the way for a further conference on federation in London in April 1952.[15] Two Africans from Southern Rhodesia attended, but they later declared their opposition to federation and refused to participate in subsequent proceedings. The African representatives invited from Northern Rhodesia and Nyasaland boycotted this conference and subsequent meetings.

Despite strong protests from the parliamentary opposition, the Labour and Liberal parties, who were alarmed by the manner in which the government ignored African demands and requests and by the amendments to safeguards for African interests in the draft constitution,[16] the Conservative Ministry continued on its path. Preparatory Judicial, Fiscal, and Public Service Commissions were appointed,[17] and in January 1953 a further conference was held to approve the final federal scheme.[18] African representatives from all three Central African territories were sent to London at this time to make evident the strength of African feeling against federation. They were sympathetically received by the British press and public, but little official attention was paid to their views. From a formal legal standpoint the decisions of the United Kingdom government and the Governors of Northern Rhodesia and Nyasaland on federation were sufficient to bind these territories, but under Responsible Government in Southern Rhodesia, where a referendum had been promised, it was necessary to consult the electorate. The referendum was held in April 1953, and a substantial majority approved the federal scheme.[19] In July 1953 the Federation of Rhodesia and Nyasaland (Constitution) Order in Council was finally approved by a majority of the House of Commons, and the Order was

[11] The Central African Council, with an able secretariat, promoted a number of important parallel laws and interterritorial services during the years when it was active.

[12] The failure of the whites to invite African representatives to this unofficial conference did much to undermine the confidence of the African political leaders in the good faith of the local white politicians and influenced their subsequent outlook on federation.

[13] *Central African Territories: Report of Conference on Closer Association* (London, March 1951). Cmd. 8233/1951. With this report should be read Cmd. 8234/1951 (*Central African Territories: Geographical, Historical and Economic Survey*) and Cmd. 8235/1951 (*Central African Territories: Comparative Survey of Native Policy*).

[14] Cmd. 8411/1951 contains both the communiqué issued after the Victoria Falls Conference, September 1951, and the statement of the Conservative government, issued in November 1951. The conference communiqué declared that economic and political partnership was the only policy under which federation could be brought about, that it was important for Central Africa to preserve the British connection and to strengthen British traditions and principles, and that a common handling of certain general problems was desirable, provided that "an acceptable scheme with adequate safeguards for all could be agreed upon." The communiqué makes plain, however, that the Africans were reluctant to consider federation and that they first wanted "partnership" defined and put into progressive operation.

[15] Cmd. 8573/1952 explains the background and certain details of the April–May conference, and it sets out the "Draft Federal Scheme" which was adopted by the conference and discussed in Parliament in the middle of 1952.

[16] In the original proposals of the officials a specially protected Minister for African Interests was included in the Federal executive.

[17] See *Reports of the Judicial Commission, July 1952* (Cmd. 8671/1952), the *Fiscal Commission, August 1952* (Cmd. 8672/1952), and the *Civil Service Preparatory Commission, August 1952* (Cmd. 8673/1952).

[18] See *Report by the Conference on Federation,* London, January 1953 (Cmd. 8753/1953) and *The Federal Scheme* prepared by the conference (Cmd. 8754/1953).

[19] The result of the 1953 Southern Rhodesian referendum was 25,570 votes to 14,729 in favor of federation. Although no direct comparison is possible, it is of interest that in the 1922 Southern Rhodesian referendum, 8,774 voted in favor of Responsible Government, and 5,989 for entry into the Union of South Africa. This was shortly before the return of the first predominantly Afrikaner-Nationalist government in the Union in 1924.

made on August 1, 1953. It is significant that the Labour and Liberal parties maintained their strong opposition to the end.[20]

THE FEDERAL GOVERNMENT

The full machinery of the Federation has yet to be brought into operation, but the main constituent elements are in being. A Governor-General is at the head of the structure of government. The substance of power, however, lies in the hands of a Ministry of six, drawn from the Federal Assembly and under Prime Minister Sir Godfrey Huggins. All Ministers of the Federal Executive are white elected members. The Federal Assembly comprises thirty-five members, of whom twenty-six are elected by exclusively or predominantly white constituencies; fourteen from Southern Rhodesia, eight from Northern Rhodesia, and four from Nyasaland. Of the other nine members, who specially represent African interests, six are Africans. The two African members from Northern Rhodesia and the two from Nyasaland are returned by African electors, but the two Africans from Southern Rhodesia are elected by the voters registered on the Common Roll of the Colony, that is, by an overwhelmingly white electorate.[21] The remaining three representatives of African interests are whites: the Southern Rhodesian member is elected by all the voters on the Common Roll, but the Northern Rhodesian member and the Nyasaland member are appointed by the Governors of their respective territories.

As a special safeguard for Africans there is an African Affairs Board, composed of representatives of African interests, which is a standing committee of the Federal Assembly.[22] Its main functions are to screen federal measures which may prove harmful to Africans and to recommend constructive measures. A special procedure is laid down in the Constitution to enable the Board to communicate its views to the Prime Minister, the Governor-General, and the United Kingdom government. The United Kingdom government has the ultimate power to approve or disapprove measures which appear to be detrimental to African interests.[23] A Federal Supreme Court and Federal Public Service complete the structure. The latter is still in process of formation under an Interim Federal Public Service Commission: the probable relative numbers, positions, and prospects of Africans and whites in the Service have yet to become apparent.

[20] The Opposition's main argument was based on the fact that the Africans had not consented to federation. The Opposition called divisions in the House of Commons when they voted against the second and third readings of the enabling bill, and also when on July 27, 1953 they voted against the motion for an address to the Crown requesting the making of the Federation of Rhodesia and Nyasaland (Constitution) Order in Council.

[21] In November 1953 there were 48,870 white, 481 African, 586 Colored, and 606 Asiatic voters registered on the Common Voters' Roll of the Colony.

[22] There were several important changes to the composition and procedure of the African Affairs Board, as originally proposed by the officials, before it was finally agreed that the six members of the Board, three African and three white, should be drawn from the nine representatives of African interests in the Assembly. The officials had proposed *inter alia* that a Federal Minister for African Interests should be the chairman of the Board, and that the civil servants at the head of African affairs in the three territories should be members.

[23] The Constitution provides that any law to which the African Affairs Board objects shall be reserved for the signification of Her Majesty's pleasure. The United Kingdom government also has power to disallow a Federal law at any time within twelve months after it has been assented to by the Governor-General.

PRESENT TRENDS AND ISSUES: FEDERAL

All six Ministers of the Federal Executive and nineteen of the other ordinary elected white members of the Assembly represent the Federal party. The only other political party which is represented is the Confederate party, which has a solitary member who was returned by a Southern Rhodesian constituency. In the absence of any normal party political alignments the chief interest of the first session has lain in the behavior of members on racial issues.

From the evidence available thus far three broad groups may be distinguished. The largest, or central, group, led by Sir Godfrey Huggins, accepts the goal of eventual interracial partnership but, for an unspecified future, favors the continuance of differential treatment for Africans, especially in the social sphere. The liberal or nonracial group comprises about six members made up of the four Africans from Northern Rhodesia and Nyasaland, the white representative of African interests from Nyasaland, and the Federal party member for Lusaka, Northern Rhodesia. The segregationist group also comprises about six members: it is led by the Confederate party member[24] from Southern Rhodesia who, from time to time, has received the support of right-wing members of the Federal party. The white representatives of African interests from Northern and Southern Rhodesia, who are, respectively, the Chairman and Deputy Chairman of the African Affairs Board, and the two African representatives from Southern Rhodesia are included in the central group because they have tended to side with the Prime Minister and his supporters. They are, however, in the left wing of the center group, and the Africans from Southern Rhodesia have sometimes formed a bridge with the nonracial group.

The above crude classification is based partly on knowledge of the past behavior of members, but mainly on their reaction to specific racial issues which have arisen in the course of the first session. There have been several issues of this kind during debates on draft laws such as the Income Tax and Immigration Bills, while certain motions have dealt specifically with race relations. The most controversial and revealing debate was on a motion introduced by an African member from Northern Rhodesia and seconded by an African from Nyasaland. The original motion called for equality of treatment of all races in all public places within the Federation, and for the enforcement of equal treatment by Federal legislation. The debate, however, was largely confined to racial discrimination in post offices and on the Rhodesia Railways. The white missionary representative of African interests from Nyasaland therefore moved an amendment calling for the admission of all first- and second-class passengers, irrespective of race, to the restaurant coaches on the Rhodesia Railways, and for the removal of racial divisions in the post offices. This motion was defeated by a 24 to 6 vote. Although they participated in the debate, none of the representatives of African interests from Southern Rhodesia voted in the divisions. A Federal party amendment was then carried and the original motion fell away. This amendment called for an endeavor to provide improved facilities for all races.[25]

[24] The native policy of the Confederate party is essentially the same as the *apartheid* policy of the Union government. The party advocates "the principle of separate development and land apportionment as between European and Native" and "the principle of special Native representation." See *The Confederate Party: Statement of Principles* (Salisbury, Southern Rhodesia, 1953).

[25] *Parliamentary Debates* (Hansard), *Federation of Rhodesia and Nyasaland: Federal*

PRESENT TRENDS AND ISSUES: TERRITORIAL

The Nyasaland African Congress has recently demanded the advancement of Nyasaland to self-government status,[26] and African leaders, including representatives in the Federal Assembly, have reaffirmed their opposition to federation. They also expressed a strong desire to be linked politically with Northern Rhodesia and Tanganyika and to cut adrift from Southern Rhodesia. These demands, especially the demand for self-government, have been ill-received by whites, most of whom perceive a serious threat to the whole structure of the Federation if Nyasaland Africans are accorded a form of government comparable to that which exists in Southern Rhodesia. The African National Congress also warned of a possible cessation of the flow of African migrant workers from Nyasaland. It is doubtful if this could be achieved, but the threat has perturbed many white employers in the Rhodesias who are dependent on Nyasa labor. As an indication of the general reactions to this situation in Nyasaland we may quote the white editor of a right-wing Southern Rhodesian journal who has chosen to draw on the authority of Abraham Lincoln to support his view that the "preservation of the Union" is a higher duty than the recognition of "state rights."

Northern Rhodesia

African National Congress leaders in Northern Rhodesia have made demands similar to those of their fellows in Nyasaland, but two recent developments of particular interest have commanded public attention in that territory. They are the introduction and acceptance of the "Moffat Resolutions" in the Northern Rhodesian Territorial Legislature,[27] and the breakdown in negotiations to end the industrial color bar on the copper mines. John Smith Moffat, a white member nominated to represent African interests in the Legislative Council, won the overwhelming support of African and white members of the House for his resolutions which declared that the objective of policy in Northern Rhodesia must be to remove from each race the fear that the other might dominate for its own racial benefit, and that every lawful inhabitant has the right to progress according to his character, qualifications, training, ability, and industry, without distinction of race, color, or creed. While the declared goal was a franchise with no separate representation for the races, the special interim arrangements for communal representation would have to continue, to prevent domination of one race by the other. Meanwhile the United Kingdom should continue to hold the balance on contentious issues.

In the practical field of race relations the failure of the mining companies and the white trade unionists to reach agreement on means of allowing the advancement of African workers on the copper mines is very significant. These particular negotiations, which have been in progress for fifteen months, have been followed with keen interest by Africans throughout the territory. As the copper mines are the mainspring of the territorial and the Federal economy, the issue is of crucial importance. The Northern Rhodesian government, in an effort to break the deadlock, has now appointed a Board of Inquiry to make recommendations. In view of the past failure of similar investigations it is difficult to forecast the outcome of this inquiry, but there can be little doubt that the white mineworkers will strongly resist recommendations which appear to threaten their interests.

Southern Rhodesia

In Southern Rhodesia the territorial Prime Minister, Mr. Garfield Todd, the ex-missionary successor of Sir Godfrey Huggins, is in a strong position in the territorial Assembly where his party, the United Rhodesia party, committed to the support of federation, holds twenty-six of the thirty seats.[28] Two strikes, one by African mineworkers and one by white railway workers, have threatened the colonial economy during the life of this government, elected in January 1954, but both were settled by decisive government action. Apart from these industrial disturbances the principal preoccupation of the government appears to have been its effort to devise means of retaining white immigrants in the territory, in competition with the opportunities afforded by the Union of South Africa and Northern Rhodesia. A good deal of attention has also been given to the defense training of whites, and the citizen forces have received special instruction in methods designed to ensure internal security.

The Colony has continued to apply its traditional policy of "parallel development" towards the Africans, and there have been no major amendments to the Land Apportionment Act and Natives (Urban Areas) Accommodation and Registration Act, which effect territorial segregation, or to the Industrial Conciliation Act, which helps to enforce a policy of occupational segregation. The only significant amendments to the Land Apportionment Act are those which are designed to permit the new university to cater to both African and white students, and to permit the first African barrister to occupy chambers in the center of Salisbury, the Federal capital. In the political sphere the Prime Minister has announced his intention of reviewing the franchise qualifications, but the precise nature of the proposed amendments remains uncertain.[29]

Assembly, July 20, 1954, No. 29, cols. 1483–1532; July 29, 1954, No. 35, cols. 1938–84. The debate on a motion proposing the admission of African students to the Gwebi Agricultural College, Southern Rhodesia, also contains much of interest; see *Ibid.*, August 3, 1954, No. 37, cols. 2098–2138.

[26] Nyasaland is a Protectorate under the control of the United Kingdom government. It is administered by a Governor and Commander-in-Chief who is assisted by an Executive Council composed of a majority of senior officials, *ex officio*, including the Secretary for African Affairs, and nominated unofficial members. The Legislative Council is composed of official and unofficial members nominated by the Governor. It has been usual to have a majority of whites among the nominated unofficials. Africans have recently demanded at least parity of representation with whites.

[27] Northern Rhodesia is also under the control of the Crown but it has a substantially greater measure of "self-government" than Nyasaland. The "member" system is in operation and a minority of elected unofficials hold portfolios in the Executive Council. Again, the white unofficial members of the Legislative Council are elected, not nominated. They are, however, counterbalanced by *ex officio* and nominated officials, and by members, including Africans, appointed to represent African interests.

[28] Southern Rhodesia is the only territory with a reasonably well-developed political party system. In the years immediately after the war Sir Godfrey Huggins' United party had a bare majority and was in danger of defeat by a party resembling the Confederate party, which advocated thoroughgoing racial segregation. From 1948, however, the United party has continued to hold at least 24 of the 30 seats, even though the majorities gained by it in about seven of the constituencies have been of less than 100 votes. The present Opposition comprises two Independents, one member of the Independent Rhodesia party and one member of the Independent Labour party.

[29] The Southern Rhodesian practice of having a nonracial electoral register, or Common Voters' Roll, was taken over from the Cape Colony. Throughout the history of the territory there have been attempts to prevent or minimize further African enrollment, and in

PROBLEMS AND PROSPECTS

Prognostications about the Federation of Rhodesia and Nyasaland range from predictions of imminent, disastrous interracial warfare, to forecasts of a new era of unbounded economic prosperity, when all races will co-operate with great mutual cordiality. While I feel a sense of cautious optimism, I believe that the achievement of partnership will be a long and painful process.[30]

The first general problem to consider arises from the fact that it is a small, permanently settled white minority which has been given the major responsibility for the good ordering and management of affairs in Central Africa. The tasks of a governing minority in any society, culturally homogeneous or heterogeneous, large or small, are difficult, but they are greatly magnified when a small, racially identifiable immigrant population is given charge of far greater numbers of people possessing markedly different cultural characteristics. As a helpful comparison we may note that the total white electorate of Central Africa is roughly equivalent in number to the electors in one constituency in the United Kingdom.

Unless the United Kingdom is prepared to participate actively in the government of Central Africa it is very doubtful if partnership will come about by peaceful means, or in a form which will ensure the preservation of values and standards of government comparable to those found in the Western world today. Space does not permit me to describe in detail the type of institution (an African Affairs Council) which I believe is urgently required in the United Kingdom if Britain is to participate effectively in the achievement of partnership, but the proposal aims at the effective mobilization and utilization by the United Kingdom government of the expert knowledge of Africa which is available in England, Scotland, Northern Ireland, and Wales.[31] I think it important that satisfactory means be employed to make real and stable self-government possible in the multiracial societies of Africa.

The above proposals presuppose at least some degree of willingness on the part of whites and Africans in Central Africa to engage in fruitful co-operation with the United Kingdom. I believe that this willingness still exists among all peoples in Central Africa, despite the recurrent fears which are evoked among Africans and whites by changes of government in Britain, and despite the anger felt by Africans at the imposition of federation. If some method is devised to remove or minimize the unfortunate effects of British party political disputes on human relations in Africa, it could, in course of time, supply a stimulus to white and African leaders to co-operate with Britain in the interests of their own groups and of future generations.[32]

the 1948 elections both major parties committed themselves to an abandonment of the common franchise. But the principle and practice has survived thus far, mainly through a raising of the qualifications in 1951.

[30] I should make clear that I personally regret (*a*) the failure to decide upon a satisfactory representative system before federation, (*b*) the minority representation accorded Africans, and (*c*) the imposition of federation upon an unwilling majority.

[31] Institutions which are broadly comparable to the African Affairs Council I have in mind are the Belgian Colonial Council and the former British Council of India, which operated from 1858 to 1935. Frederick D. Lugard, in his *The Dual Mandate in British Tropical Africa* (London, 1922), Chap. IX, pp. 174–78, suggested the formation of an African Council, and William Malcolm Hailey, in *An African Survey* (London, 1938), pp. xxv–xxviii, discusses the general problem of such institutions.

[32] Although its importance should not be exaggerated, I think it significant that during the prefederation discussions on safeguards for African interests a number of whites pointed out that such safeguards might be needed for the whites, especially in future years.

Leadership

In the small white population, leadership is at a premium even though the whites enjoy educational services which are substantially better than those provided for Africans. Sir Godfrey Huggins has an outstanding intellect and is endowed with a forceful and pleasing personality, but there are very few individuals of his caliber, and with his knowledge and experience, who are in a position to succeed him. There are younger men who could continue Huggins' work, but everything depends on the success of their endeavors to command the support of a significant number of the white electors and, at the same time, to establish effective bridges with leaders of the emergent African "middle class." At present, time appears to be against them, and the real danger exists that the large number of uneasy and uncertain voters who have supported Sir Godfrey Huggins in the past may, when he retires, choose to follow a racist leader who exploits their doubts and fears. As I see it only courageous and rapid action, designed to satisfy the legitimate desires of Africans for more political and economic opportunities and governmental responsibilities, and a decisive lead to remove social pinpricks, can ease the prevailing tensions and avert the dangers of extreme white or African racism.

Nothing is more important in Central Africa than assisting the emergence of an adequate number of statesmanlike African leaders with an appreciation of Western political and legal traditions, and an understanding of the functions and procedures of Western democratic institutions. If whites in Central Africa find it impossible to recognize the need to encourage the emergence of such African leaders it is to be hoped that the United Kingdom will not hesitate to intervene, in the interests of the white minority as well as of the Africans.

My cautious optimism for the future of the Federation of Rhodesia and Nyasaland is founded largely on an appreciation of the human qualities of Africans, especially the moderation and patience of many educated men and women. In concert with the nonracial whites they can create a union based on partnership.

Kenneth Kirkwood, Oxford, England, is Rhodes Professor of Race Relations at Oxford University. He was the organizer of the Institute for Social Research at the University of Natal, and is chairman of the Natal Regional Committee and member of the National Executive Committee of the South African Institute of Race Relations. He formerly lectured at the University of Witwatersrand, Johannesburg, and he has engaged in travel and research in Africa for many years, mainly in South, Central, and East Africa. In 1952–53 he was attached to the Universities of London and Oxford and in 1953 he visited the United States on a Carnegie traveling fellowship. His published articles and booklets include The Proposed Federation of the Central African Territories (1951) and The Group Areas Act (1951).

Union of South Africa: Politics of White Supremacy

By Gwendolen M. Carter

THE election of May 1948 brought to political control in South Africa Dr. Daniel F. Malan's Nationalist party, which represented both a more extreme Afrikaner nationalism than had held such power before and a more clear-cut, legalistic approach to the relations between Europeans and non-Europeans. Though they governed at first with the support of the more moderate Afrikaner party, the Nationalists achieved independent political power in 1950 through the elections in South-West Africa, and an over-all majority of 29 seats in the House of Assembly[1] in the general election of April 1953. Moreover, although the Opposition parties—the United party and the Labour party—which were united in an election pact, polled some hundred thousand more votes in 1953 than did the Nationalists,[2] the latter increased their percentage of the popular vote over that received in 1948 more than did their opponents. Thus, the Nationalists seem likely to stay in power in South Africa in the foreseeable future. What are the reasons for their political success? What does it mean for the Union of South Africa, in the handling of its complex racial situation and in relation to its international position?

Basis of Afrikaner Nationalism

It must be remembered that Afrikaner nationalism is not a new phenomenon in South Africa. In 1912, within two years of the Act of Union (which created a unitary state out of the two British colonies, the Cape and Natal, and the two former Boer states, the Transvaal and Orange Free State), General Hertzog broke away from the Union Cabinet of Generals Botha and Smuts to form the first Nationalist party. Hertzog, whose Nationalists governed the Union from 1924 to 1932,[3] was dedicated to the so-called "two streams" policy, that is, to developing the Afrikaners (the modern descendants of the original Dutch, German, and French settlers), who were still predominantly farmers or urban workers, to the place where they could be on equal terms with English-speaking South Africans, whose lesser numbers were more than counterbalanced by their more prosperous economic status. When Hertzog fused his party with that of General Smuts in 1934 to form the United party, it was under the view that both the European peoples of the Union had reached the stage of development where their co-operation could be on terms of equality.

It was at that moment that Dr. Malan, in turn, broke away from Hertzog to forge the political arm of a widespread movement which preached Afrikaner separatism in every aspect of life. Though challenged for supremacy among Afrikaners by other groups, in particular the Ossewa Brandwag, a cultural organization which roused the widest, most fervent Afrikaans nationalist sentiment in generations, the Nationalists ultimately made themselves the undisputed political leaders of nationalistic Afrikanerdom. At the same time, they helped to weld that community into a new cohesiveness which forms a major element in their political success.

In part, the Nationalists have appealed to the past to secure the widespread support they now command in the Afrikaner community: to the way in which the British imperial factor pursued the trekkers who sought to escape into the isolation of the interior in the nineteenth century; the Anglo-Boer war; the discrimination against their language, Afrikaans, until the 1920's. More particularly, however, the Nationalists emphasize the separate identity of the Afrikaner people and the imperative need to preserve it against those Europeans both inside and outside the Union who hold other values. Their sharpest attacks are directed against the Communists, whose materialist philosophy conflicts with the deep religious sentiment of the Afrikaner, but they also oppose what they call "liberalistic" sentiments, in particular those which support racial equality.

Closely allied to these views is the characteristic Afrikaner attitude to the Bantu, who comprise 8½ of the 10 million nonwhites of the Union. More than a century of close contact with a primitive and pagan people ingrained in the Afrikaner a sense of his own cultural superiority to, and basic racial differences from, the non-European. Always he has been fearful of being overwhelmed physically and/or culturally by the vastly greater numbers of the Bantu. To this is now added a new sense of strain, particularly for the growing body of Afrikaner urban workers, as the Bantu come increasingly to the cities to take jobs created by South Africa's industrial revolution.

Apartheid

Nationalists under both Hertzog and Malan have encouraged South African industrialization in order to free the country from economic dependence on other countries, in particular Great Britain. But, as Mrs. Van der Horst has pointed out, economic development of this type, particularly in a country with a relatively small white population and a shortage of skilled labor, tends to intermingle the different population elements and make for social mobility. Both processes run counter to traditional South African mores. It is largely because the Nationalists with their policy of *apartheid*, that is, rigid racial separation defined in law, promise more chance of maintaining these traditional mores in the face of economic development that its program has been so appealing to the average Afrikaner. In other words, *apartheid*, as the Nationalist sees it, is the means for preserving and even intensifying racial and social divisions in a dynamic economic situation.

Some Nationalists, particularly in SABRA (South African Bureau of Racial Affairs) and the Dutch Reformed Church, have enunciated the conception of "ideal *apartheid*," that is, complete territorial separation between Europeans and Bantu. But this would involve such a revolution in South African life, which is built in every sphere on the basis of cheap native labor, that realistic political leaders reject it as not currently feasible. Most proponents of ideal *apartheid* now hold it out as an ultimate goal, to be achieved perhaps in two or three hundred years. In this form, ideal *apartheid* provides a justification for the Nationalist policies of denying the Bantu rights in the European areas in which they are employed,

[1] Of the 159 seats in the Assembly, three are held by native representatives, who are Europeans elected by Africans in Cape Province who can meet certain qualifications. Africans throughout the Union also elect, through an indirect system, four Europeans to the Senate. Otherwise they have no franchise. There is universal suffrage for Europeans.

[2] In 1953, there were 20 unopposed seats, 18 conceded to the United party and 2 to the Nationalists; in 1948, there were 11 uncontested seats, 10 going to the United party and 1 to the Nationalists. Calculations for these seats vary. A common one, used here, is to reckon 7,500 votes for the winning party and 1,500 for the other.

[3] From 1924 to 1929 with the support of the predominantly English-speaking Labour party.

as well as an encouragement for any move to build the Native Reserves into a Bantu national home.

Apartheid legislation, as formulated by the Nationalists, has both goals: to keep the European areas of the Union under the exclusive control of white South Africans, and to promote a distinctive life for the Bantu. Both build on traditional South African practices, a major reason why the main opposition group, the United party, finds it easier to criticize Nationalist *apartheid* legislation in details than in principle.

The key to South African life, in fact, is that the great mass of European South Africans think of their country in the same terms as Americans, Canadians, and Australians think of theirs, that is, as a white society dedicated to the values of Western civilization (except racial equality). For these South Africans, the fact that a large majority of the people resident in the Union do not belong to this Western, white society provides problems with which the Europeans must cope rather than reasons for a fundamental reconsideration either of customary standards or basic principles.

Opposition Parties

At the same time, there are some Europeans in South Africa who, either on grounds of expediency or of principle, oppose some or all aspects of the Nationalists' *apartheid* policy. The United party itself has a wing which declares that the economic intermingling of South Africa's peoples should be allowed to follow its own logic both in industry and in domicile. This group points out the handicap for economic development of putting impediments in the way of encouraging a larger, permanently domiciled, and better-trained Bantu population in the European areas. In so doing, it is supported by, or (perhaps more accurately) reflects the views of, secondary industry, which draws more than half its labor supply, including the semiskilled, from Bantu.

Those who press the logic of the current situation still more rigorously, like the small, intellectual-based Liberal and Labour parties, maintain that political rights must also be extended to the Bantu as they acquire Western education and ways of life. For them, the obvious overcrowding in the Reserves coupled with the findings of the authoritative Fagan Report of 1948 that more than half the Bantu are outside the reserves at any given time, indicates the fundamental fallacy of the Nationalists' assumption that the Reserves, even with the addition of the British Protectorates—Basutoland, Swaziland, and Bechuanaland—can ultimately support the Bantu. Having thus attacked the rationalization of an ultimate ideal *apartheid,* not on the ground of desirability but of feasibility, they maintain that there remains no justification for excluding the Bantu from the political rights which should be the concomitant of his economic contribution within the European areas.

The Liberal party even went so far at its autumn 1954 Congress, under the urging of its Transvaal members, as to approve ultimate universal suffrage, thus going well beyond its original platform of "equal rights for all educated men." Though it affirmed the view that universal suffrage could be achieved only by a series of stages, its acceptance of universal suffrage as an ultimate objective, with all this would involve because of the numerical predominance of the non-European, is a radical innovation in political programs other than those of the non-Europeans themselves.

This new stand of the Liberal party, however, is chiefly a reflection of its political impotence. Though there may well be a growing liberalization of sentiment towards the non-European, especially among English-speaking South Africans, it is still far too weak and scattered to provide a base from which to win elections. This was proved decisively by the Provincial elections of 1954, the first in which the Liberal party (which was formed after the United party defeat in 1953) had a chance to participate. Despite some able candidates and a great deal of hard campaigning, the Liberals proved unable to win a seat, and in several cases lost their deposits.

More surprisingly, the same fate was suffered by the Union Federal party, which had similarly broken away from the United party after the 1953 election. The Federalists are based chiefly in Natal, the predominantly English-speaking province, and are dedicated to retaining the link with the Crown, upholding the English language and culture, and, more vaguely, liberalizing the franchise provisions for non-Europeans. Though Nationalist statements on the imminence of a republic in South Africa, particularly noticeable at their 1954 Transvaal Provincial Congress, make the Federalist emphasis on the Crown the more important to many English-speaking South Africans, the party seems to have little future, and may well rejoin the United party in due course.

Though the 1954 Provincial elections thus serve to confirm the position of the United party as the official Opposition, in what is still in effect a two-party system, they have not eased the strains existing within that party. Its small but articulate liberal wing still feels that it can best serve its purposes from within rather than outside the party. Nonetheless, their effectiveness seems to have receded from the high-water mark of February 1954 when the United party leader, Mr. Strauss, took pains to endorse the growing economic integration of races in South Africa. The United Party Transvaal Congress in the autumn of 1954 spent some nine hours debating the problem of freehold for non-Europeans in urban areas, and another four on the issue of African trade unions, both endorsed in part on earlier occasions but still resisted by many members of what still remains essentially a conservative party. The issue of a franchise for Africans was not even raised. In November 1954 the United party formally adopted at its Union biennial conference a statement on the non-Europeans which accepted their permanent place within South African society. It is questionable, however, whether this offers a dynamic native policy which could provide an alternative to that of the Nationalists.

Apartheid Programs

As far as effective policy is concerned, therefore, the initiative remains with the Nationalists. They have incorporated in legislation the main outlines of their *apartheid* policy and are now trying to carry it through in detail. The Group Areas Act, the cornerstone of residential *apartheid,* under which any area may be designated for the exclusive occupancy of any one race—Europeans, Bantu, Colored (mixed blood), Indians, or even Chinese, of whom there are a very small number—has not yet been put into effect anywhere because of the complexities involved. Under special legislation (the Natives Resettlement Act and the Natives Urban Areas Amendment Act), however, the government is removing the "black spots" in urban centers, particularly Johannesburg. In the Western Areas Removal Scheme, Bantu in townships adjoining European sections of Johannesburg are being forcibly moved to new sites further from the city, losing in the process some of the few freehold rights possessed by Bantu in European areas. Only as the result of insistence

by the Johannesburg municipality are they being allowed in some compensation to buy land in the Reserves. Similar plans to remove "black spots" elsewhere and limit African residence in urban centers are causing concern to the municipalities (whose jurisdiction is being overridden), affecting land values because of uncertainties, and creating widespread ill feeling among non-Europeans.

The Nationalists are also enforcing the legislation against Bantu influx into the cities: refusing them permits to enter some areas where living facilities seem inadequate though jobs are available; making it more difficult for "foreign" natives, that is those from outside the Union, to hold positions in the cities; deporting unemployed natives from urban centers to the farms where there is great shortage of labor; and, constructively, insisting that municipalities provide jobs for the Bantu born and brought up in their own locations. In some advanced towns like Boksburg on the Rand, Bantu are given a wide range of aptitude tests to determine where best they can be used.

Bantu education and labor

Less encouraging from the Bantu point of view is the legislation affecting their education, work, and organization. The Bantu Education Act, 1953, transferred native education (except higher and special education but including teacher training) from the provinces to the central government, placing it under the Department of Native Affairs, which is strongly imbued with *apartheid* philosophy, and seeks to enforce a more uniform pattern of instruction by replacing mission with so-called Bantu-controlled schools. The new arrangements avowedly seek to broaden the effect of education by bringing it to many more than the 40 per cent of Bantu children who now receive some formal education; in March 1954 the Minister of Finance declared, however, that the government contributions to Bantu education would be pegged, and any increase in funds for schools must come from the Africans themselves. Moreover, the ultimate objective of the Act is said by the Minister to be to prepare the Bantu for "their opportunities in life . . . in accord with the policy of the State." Not surprisingly, many Africans fear that the end result of the legislation may be to reduce the quality of Bantu education and thus limit their professional opportunities still further.

In economic life, recent *apartheid* legislation gives the Minister of Labor power to limit labor in certain industries to a particular race, thus making a vertical as well as the normal horizontal color bar. Though Bantu are not ordinarily allowed to take positions designated as skilled, there has been considerable downgrading of certain jobs, in practice, to allow Bantu to hold them—evidence of how difficult it is to resist the pressures caused by shortage of skilled labor. That this can or will be prevented by legislation seems unlikely. As far as industrial organization is concerned, however, the African is in a very weak position. African trade unions have never been recognized under the Industrial Conciliation Act, but in practice they have existed, and have had considerable effect from time to time. In presenting the Native Labor (Settlement of Disputes) Act, 1953, the Minister of Labor expressed the hope that it would lead to the natural death of African trade unions. The measure sets up an elaborate hierarchy of boards to deal with industrial disputes in which Africans are involved. These boards have the power to make binding settlements, and Africans are represented only on the regional level. Since the Bantu have no right to strike, their present possibilities of effective industrial influence are slight.

Native Reserves

In the areas where Bantu organization is welcomed, that is, in the Native Reserves, the Nationalists have consciously attempted to restore tribal divisions and traditional lines of authority. Partly, this is to provide a reinforcement of Bantu culture and, to this extent, may be seen as one of the major manifestations of positive *apartheid,* that is, creative rather than restrictive. Many Bantu believe, however, that tribalism is outworn and that the Bantu Authorities Act, 1951, now put into force at the tribal level in several small areas, seeks to thwart African nationalism rather than to give more self-government to rural Africans.

Political organizations

So far, the Nationalists have not directly attacked the organizations through which the non-Europeans attempt to mobilize their nationalist sentiment and make it effective. The African National Congress, by far the most important organization among the Bantu, worked in close conjunction with the South African Indian Congress in the defiance campaign of 1952. This campaign sought to arouse European sentiment against the so-called "unjust laws," notably the pass laws under which every male African must possess a pass if he is outside the Reserves, but also the culling of cattle, the Bantu Authorities Act, the Group Areas Act, and the Suppression of Communism Act. Though little sympathy was roused among Europeans by the program of passive disobedience under which some eight thousand Africans voluntarily courted arrest and imprisonment, the defiance campaign made a considerable impact on the thinking of the authorities, who were surprised, and disturbed, by the degree of organization and discipline displayed.

Rather than launch a frontal attack on the organizations themselves, however, the authorities have preferred to act against their leaders, who have been systematically prosecuted, condemned, immobilized, and forbidden to attend meetings. The instruments used for the most part have been the Riotous Assemblies Act and the Suppression of Communism Act, 1951; the latter makes it an offense to try to change the existing social, industrial, economic, or political structure of society by promoting disturbances or encouraging interracial hostility. This act was reinforced in the spring of 1953 by the Criminal Law Amendment Act and the Public Safety Act, which imposed heavy penalties, such as flogging, for many offenses, including advocacy of passive disobedience. These techniques have been extremely effective in curbing non-European action and, quite possibly, the extension of organization. Throughout 1954, the African National Congress and the South African Indian Congress have been trying to organize a Congress of the People to draw up a Charter of Human Rights for Non-Europeans to dramatize their present position. It has yet to be seen, however, that they will be able to hold the mass meetings which they plan.

DILEMMAS POSED BY APARTHEID

While these restrictions may be effective in preventing mass demonstrations by the non-Europeans or even an extension of their growing solidarity, they intensify rather than limit the bitterness felt by every educated and articulate Bantu. In fact, the key feature of the present situation in South Africa is the increasing polarization of sentiment. To a degree, the adoption by the Liberal party of universal suffrage as an ultimate objective is a rather desperate

attempt to build a bridge between the non-Europeans and at least a small group of Europeans. The latter are well aware that the Suppression of Communism Act has also been used against a very considerable number of white trade union leaders, with a consequent limitation of the effectiveness of the non-Nationalist trade unions which is not unlike that experienced by non-European organizations. By adopting the political objective which the more radical non-European organizations have been demanding for some time, the Liberal party is trying to indicate that it not only recognizes the similarities of the problems faced by liberal-minded Europeans to those of non-Europeans, but also that it believes all adults in South Africa, regardless of race, should share ultimately in the determination of its policies. But even so far-reaching (for European South Africans) a declaration seems to have done little to attract non-European leadership. What might have been taken with open hands only a short time ago is now regarded only with suspicion.

This steady tendency for non-European opinion to become more extreme, and estranged from all Europeans, is not only a result of European actions and attitudes; it helps in turn to create them. Short of large-scale violence, it is difficult to envisage any general acceptance by European South Africans of ideal *apartheid* as an immediate necessity. But the Nationalists and the main body of the United party seem each to have been supported in their own views by the sense of growing intransigence among non-European leaders. Where the Liberal party is led to make more and more concessions to non-European sentiment—and thereby seems completely to have eliminated itself from any chance of winning a seat in a parliamentary or provincial election—the bulk of United party members become increasingly cautious about endorsing policies which might lead to greater concentrations of non-Europeans near the cities or put more power in their hands. Convinced though they are that Bantu labor is essential to the economic development on which depends their own individual prosperity, as that of the country at large, they are hesitant about concessions like freeholds which do not offer any sure return.

The approach of Nationalist leaders is still more clear cut. They endorse economic development but not at the expense of what they see to be the primary objective—the security of Afrikanerdom. Narrowly racial though this may seem at first glance, the Nationalist believes implicitly that it is bound up with the future of white civilization in South Africa. Thus they are prepared to welcome into the Nationalist party any European who accepts their view of life and their political leadership. Confident that their approach to the non-European offers the best and perhaps only hope of developing a modus vivendi in the world's most complicated racial situation, they feel that ultimately all other Europeans must recognize this also.

Moreover, the Nationalists believe that persistent political defeat, coupled with its obvious inner dissensions, will lead the United party to split even more than it did following the 1953 elections, with the hiving off of the Liberal and Union Federal party, and the rebellion against Strauss's leadership which led to the expulsion of six United party members who have now formed the Conservative party. In the long run, then, the Nationalists believe that the desire to share in political power, plus the growing intransigence of the non-Europeans, will lead to a common white front under their direction.

What stands in the way of this development? Perhaps the hope of the United party that it can regain political power, though this is very slim. More particularly, a fundamental—though perhaps not unbridgeable—difference in political attitudes and objectives. The Nationalist party accepts the parliamentary system because it has not been curbed by it in its progress towards political power. No other system, in fact, offers the Nationalists so good a chance to win decisive political power with a minority of the votes. But the Nationalist attitude both to the Citizenship Act and the Representation of Voters Bill shows a lack of feeling for the normal conventional restraints of the parliamentary system which is disconcerting to many of their opponents. In the Citizenship Act, passed by a very small majority shortly after they came into office, the Nationalists removed the special privileges customarily granted to British immigrants in gaining citizenship, despite the widespread protests of most of the English-speaking minority in the country, the group most particularly affected.

The Representation of Voters Bill has had a more checkered career. Intended to make political *apartheid* complete by removing the Colored from the Common Roll in Cape Province, the Nationalists have tried one expedient after another: action by a simple majority, which was declared unconstitutional by the Appellate Division of the Supreme Court; making Parliament itself a High Court with ultimate jurisdiction over the Constitution, which was similarly declared unconstitutional; and several more recent attempts to secure the necessary two-thirds majority within Parliament itself. On the one hand, it may be said that the recent consistency with which the constitutional approach has been used undercuts criticism of earlier methods. At the same time, the rank and file, as well as some more prominent figures in the party, have frequently demanded packing the Supreme Court or the Senate to bypass constitutional forms. It is this tendency in the Nationalist party to seek objectives by whatever means are feasible which constitutes its greatest difference from the traditionally minded, conservative, and highly constitutional United party.

Other differences between the parties might be more easily overcome. The United party includes not only all the English-speaking not in one or other of the minor parties but also a substantial number of Afrikaners. It still receives some 20 to 30 per cent of Afrikaans votes. But these are being whittled away as the pressures of militant Afrikanerdom increase. Even the English-speaking may gradually be attracted to the Nationalists if the constitutional issue is once settled. Big business and industry in the Union get along well with the Nationalists, who have had a good record of prosperity, likely to continue. But this accretion will be slow, and over a long period of time.

Future Role of Non-Europeans

Decisive to the situation, in the long run, are the non-Europeans. Not much action can be expected from the million Colored, most of them in Cape Province, despite their resentment at being displaced from the coveted role of "appendage to the whites," as Hertzog called them, and made to feel the sting of *apartheid*. In fact, of all the groups in the Union, the Colored have been most affected by *apartheid* legislation, though this is, in some measure, because they had fewer restrictions previously than either Indians or Africans. But despite their resentments the Colored have been singularly lacking in ability to weld themselves into a cohesive group or to work with other non-Europeans. Even their Marxism tends to be Trotskyite.

The Indians are a relatively small but

potent group. Their third of a million are mostly in Natal; a small but influential group is on the Rand in the Transvaal. Their strength is in the intelligence, training, and sense of purpose of the leaders of the more radical group; it lies also in the support they secure, implicitly or explicitly, from India. Discrimination against Indians in South Africa is spread before the United Nations annually by the Indian government, evidence of its continuing concern.

In the end, however, it is the Africans, or Bantu, who by sheer weight of numbers will be the decisive factor. Many of them are still satisfied by the opportunities they receive; others scarcely know about anything beyond their kraal or village limits. But the most significant fact about the Bantu is the rapidity with which the ideas and sentiments of so many of them have changed. Six years ago, economic concessions would have been enough to consolidate the moderates in their positions of leadership in Bantu organizations; perhaps two years ago, political overtures would have been enough. By now, it is doubtful whether any concessions would satisfy the younger, more radical leaders, many of whom are Communist trained or influenced. Yet it is difficult to evaluate either what they think or how they are going to act. The barriers built by the Nationalists with great skill, the constant police espionage, the immobilization of the relatively few leaders, dam up resentment; there are few clues to how this bitterness can or will express itself. If it is in violence, then the retaliation will be so terrible that it may take years to rebuild a nationalist movement among the Africans. Passive resistance of any obvious sort brings individual retaliation which is a powerful deterrent. Perhaps only a complete economic boycott could be totally effective, yet the difficulties in the way of organizing it, particularly in the face of current restrictions, are enormous.

Some people believe that economic advance may siphon off pressures by giving non-Europeans the chance for individual advancement. Yet it seems more likely that the consequences of economic advance will be a greater awareness of how much is still being withheld in the way of social, residential, and political privileges.

Within this broader setting, white South Africa continues its parliamentary and party activity. If never consulted, the non-European is at least never ignored. Increasingly the focus of attention is upon him in party programs, speeches, and legislation. This is something relatively new in South African affairs, which used to be dominated by the old struggle between Boer and Briton, or, in the newer terminology, Afrikaner and English-speaking South African. That division remains and is temporarily acute because of the militancy of Afrikanerdom. But its future depends on how dangerous non-European tension becomes. This rests, in turn, on the degree to which the aspirations of the non-Europeans are satisfied, either within the program of *apartheid* or despite it.

Gwendolen M. Carter, Ph.D., Northampton, Massachusetts, is professor and chairman of the Department of Government at Smith College. She is the author of The British Commonwealth and International Security (1947) and numerous articles and pamphlets on the Commonwealth and African affairs, and coauthor of Major Foreign Powers (1949, 1952). She was in South Africa in 1952–53 on a Rockefeller Foundation grant studying the political parties and the election; she had made an earlier study tour in 1948–49.

Dynamics of Urbanization in Africa

By DANIEL F. MCCALL

TOWN life, and a constantly increasing movement of people to the expanding towns, is one of the most striking characteristics of present-day Africa. Town life, in itself, is not new to the continent. An early Dutch merchant was surprised at the size and orderliness of Benin City and compared it favorably with the Amsterdam of his time; Diogo Cam was impressed by the efficient organization of the capital of the Bakongo kingdom; Arabic writers testify to an extensive development of urban centers in the medieval Sudanic Empires; and there are the immense ruins of stone towers and walls of Zimbabwe in Central Africa. The Yoruba people are particularly noted for their propensity to build large towns; Ibadan, the third largest town in Africa, has often elicited surprise that it could survive on an essentially indigenous basis.

These old towns, however, were different from modern African towns in several ways: they were different in structure in that they were organized on the basis of kinship, and power and commerce were channeled through that form of organization; they were different in scale[1] in two ways, in actual size and in extent of outside contact; and they were parochial in culture.

Many of these older towns have disappeared and those which remain, like Kano, have been modified and are being further transformed. The new cities and towns are the result of contact with the West; one writer says that the cities are a colonial creation,[2] and another, that the city is the creation of the whites and peopled by blacks.[3] The old towns grew out of, and maintained, their distinctive cultures; in the new towns, Africans who are being urbanized are also, to some extent, being westernized. The old towns had trade with some other areas, but the new towns are an integral part of the network of world trade. This paper is concerned only with the new type of town.

The proportion of people living under urban conditions is already significant, but it is not possible to give exact figures for the whole area because of the inadequacy of available statistics. However, in the Union of South Africa, where the process of town growth has gone farthest, approximately 25 per cent of Africans are living in towns,[4] but in some territories, particularly in East Africa, the number may fall below 5 per cent. North and West Africa come next after the Union in the matter of urban growth, and Central Africa has shown a considerable recent growth.

FACTORS IN URBAN DEVELOPMENT

The towns are administrative and commercial centers; they are therefore the nexus between Africa and Europe. As investments increase, urban growth accelerates. Towns are a symbol and an index of economic development. The rate of growth of African towns in this century has been rapid but this pace has accelerated astonishingly during World War II, owing largely to the need of the West for strategic materials and bases.

[4] Sheila T. Van der Horst, "The Union of South Africa: Economic Problems in a Multiracial Situation," in this issue of THE ANNALS.

In the postwar period a number of factors, such as the desire of the European powers to meet the threat of anti-colonialism, the acceptance of the doctrine that rich countries should help poor countries, increased knowledge of African economic problems, the generally increased scope of governmental activity in business, and a feeling that the African people should be rewarded for their loyalty during the war, combined to encourage the public sector of investments which it is hoped will stimulate private investment.[5] All of the territories have development plans envisaging extention of transportation and communication systems, education and medical programs, and electrification and industrialization which, if successful, will undoubtedly contribute to urban growth.[6]

The harnessing of hydroelectric power, of which Africa has an enormous potential, is now in varying stages of planning or realization in various parts of the continent. The utilization of this power will necessitate new industries which will require labor, and since the only reservoir of labor is the subsistence sector, more and more people will be drawn out of the tribal villages to build new towns and to enlarge the old ones.[7]

This period has already witnessed the development of some secondary industry which, outside the Union of South Africa, is relatively insignificant in the total economy but is important in regard to urban growth. Some production for the local market has begun. Furniture, cement, bread, beer, and cigarettes are now being made, and textiles are being machine woven from local cotton.

A favorable world market has furthered the increase of cash crops; and finally, in certain areas, there has been a transfer of some capital from Asia. Such developments help to explain the fact that several towns have doubled their populations in the last decade.

It should be recognized that the economy of an African territory is a fragile one. It is an adjunct of the economy of the metropolitan power and would be the first to be affected in the event of a slump. The emphasis on mining, and the tendency toward monoculture with the consequent dependence on a single export, or at best on a small number of exports, make an African economy extremely vulnerable.

A fragile economy

The modern African town did not grow out of the needs of, and in service to, its own hinterland; its primary relationship is to Europe. In many cases it has grown beyond the capacity of its hinterland to support it without radical agricultural reform, which has not been achieved anywhere as yet, so that some of the food for townsmen has to be imported from overseas. Even so, some of the towns are a burden upon the land; wood and charcoal are brought to the town, where people can afford higher prices, and fuel becomes scarce in villages at considerable distances from the urban market.[8]

[7] Industrialization based on electricity and automotive transport, unlike that based on steam and railways, need not result in excessive concentration, but it can be assumed that, even with planning for a dispersed development of industry (of which there has been no indication as yet), any increase in industrialization in Africa will contribute somewhat to urban growth. Cf. William F. Ogburn, "Inventions of Local Transportation and the Patterns of Cities," in Paul Hatt and Albert J. Reiss, Jr. (Eds.), *Reader in Urban Sociology* (Glencoe, Ill.: The Free Press, 1951), p. 262.

[8] Similar effects in the competition for water supplies and other goods were pointed out by Lewis Mumford, "The Costs of Costiveness," in his *The Culture of Cities* (New York: Harcourt, Brace and Company, 1938), pp. 240 ff.

In any economy there is an exodus from the towns when commerce declines, but in Africa a slump not only would mean an abrupt halt in town growth and a dispersal of urbanites but the villages probably could not absorb them. The land under the present methods of farming could not tolerate a return of the urban population to agriculture.

African territories, like other places, cannot hope to achieve autarchy, but an increase in food production and the production of more industrial goods for local consumption would make the economy healthier and the basis of town growth more secure. For the most part, industry means processing for export. The oil from peanuts and palm nuts is being extracted; logs are being sawed into boards; some ores are smelted into ingots of the metal. This reduces the shipping space needed, thereby lowering transport costs, creates more jobs, which require more training for new skills, and increases the amount of money in local circulation; the result is an increase in urban activity but not in economic stability.

THE TOWN AND ITS HINTERLAND

The towns and the countryside are inseparably interrelated; in truth, they are different aspects of the same reality —like the two faces of a coin. The character of the town is determined, among other things, by the nature of the hinterland from which it draws its labor force and for which it acts as emporium. But rural life has been transmuted by the same forces that have given rise to the towns. Money transactions are replacing traditional exchanges of gifts in kind and service. Crops are grown for export now as well as to fill compound storage bins. Much of the money in circulation in the villages has been remitted to rural families by absent members working in the towns, mines, and plantations.[9]

African society has been affected to such an extent by the impact of the West that the tribe is a sick institution even in the rural areas.[10] The superimposition of outside authority, the intrusion of proseletyzing religions which attack the ideological foundations of tribal authority, the values of the market place superseding the values of the kinship system and allowing commoners to become richer than the chief, all contributed to the decline in effectiveness of tribal organization. The necessity of meeting new situations for which there were no tribal precedents, the temporary or permanent loss of much tribal manpower to outside employment, the corruption of chiefs in their role of custodian of land, and the venality of many of them in spending such profits for personal use have further reduced the capacity of tribal organization to function.

The social disorganization of the countryside further contributes to the growth of the towns, which, to a greater extent, are able to provide the basis for the synthesis of a new society.

B. Leakey, *Mau Mau and the Kikuyu* (London: Methuen & Co., 1952).

DIVERSITY AND SIMILARITY OF TOWNS

In a continent as large as Africa, one would expect some regional variation, and, of course, these differences are felt in the structure and life of the towns. National differences among Europeans as well as the diversity of tribal cultures, length of contact, religion, availability of education and the type offered, altitude, latitude, and climate contrive to give different towns different characteristics, but all are undergoing more or less identical processes although the outcome may vary from place to place because of different combinations of such factors.

Given this range of variation, it is difficult to make any generalization on the characteristics of urban centers that would be true of the whole continent. The fact that we are dealing mainly with the process of urbanization allows us to consider some details as irrelevant, but even in the realm of process there are variations. Only the central tendencies can be indicated.

All Africans living in, or moving into, towns find their customs affected by the fact that town relationships are predominately universalistic rather than particularistic; [11] all statuses, except racial, are achieved rather than ascribed; and kinsmen make up only a small part of the people with whom they daily interact. Contacts are numerous but casual; relationships involve segmental roles rather than the whole personality; ethnic and cultural heterogeneity, mobility, the impersonal nature of commercial contracts, and the mere numbers of the community combine to give the individual an anonymity which lessens the effectiveness of approval and derision of others in control of behavior,[12] so that law enforcement agencies become indispensable. The division of labor has antisocial forms and crime is a profession.

The conditions of employment entail the necessity of regularity and punctuality, forcing change from habits based on rural seasonal patterns. Training on the job gives new motor habits and skills. Common experience encourages organization for common interests. A greater variety of goods are available, and new standards of living can be aspired to, even if they are not always reached.

The town is a source of social change because it has its own necessities of organization, arising out of its economic functions and the ethnic diversity of its population, but it is also a transmitter of other forces, such as education and commerce, which also make for a social change. The town is both a response to forces of change and a focus for them, a place where they operate more intensively.

SEQUENCES OF URBAN GROWTH

The following outline of urban growth is an abstraction which applies, within limits, to most African towns. Although only a few have yet completed the process, they generally can be placed somewhere along this line of development.

Before the town is founded, there is a tribal population, probably sparsely settled and living by subsistence farming. A few intruding Europeans select a site suitable for mining, or for a port, a trading station, or a headquarters for regional administration.

There might already have been a village at the spot; in fact, that might have been one of the reasons for choosing the site. A certain amount of labor is needed for the activities which Europeans have begun, and this is hired from the village and the surrounding countryside. As the enterprise expands, labor is drawn from greater distances, and as the number of people increases, it becomes necessary for the supply of food and other necessities to be organized, and for the community to be governed. This, in turn, means additional employment and adds to the growth of the town.

At first tribesmen come into the town to earn money for a specific purpose, such as to pay taxes or to buy a bicycle, and consider their stay in town as a temporary sojourn. They may return when other needs arise; in fact, the desires and necessities for which money is required tend to become recurrent and the habit is formed of spending a certain number of months each year in town.

Some skills as well as muscle power are needed: tallying and keeping records requires schooling, and certain manual operations require training. Clerks and experienced workmen may be brought in from older towns, or even from Europe, but eventually a school is indispensable for the continuance of the commercial and governmental functions of the town. When a school is established, it may be under the auspices of a religious mission and dedicated to other purposes, but most of its graduates will generally find employment as clerks. Manual training is often furnished by the employing company on an apprenticeship basis.

The kinds of tasks performed in the town will multiply; agricultural products that in the beginning were merely collected for export may now be processed first. Even services necessary to the town itself contribute to specialization. As the complexity of labor requirement increases, employers encourage workers to stay on the jobs for which they have been trained. For the employees, a rise in income makes it feasible to keep a family in town.

At this point, the town has a few permanent residents who are outnumbered by the temporary residents, and in addition there are always some visitors who come for various reasons. This majority of temporary residents are semiurban, semirural, spending part of their time in town and part on their farms. Of them, one might say that, in general, the child grows up in the village, the young man comes into the town to earn a living and, when aged, returns to the village. This type of town dweller is tied to his rural relatives and they to him; they send him food from time to time and he sends money home, and they cultivate the fields which will support him in his old age.

There is a great deal of movement back and forth between the country and the town at this stage; relatives may come to visit a man and crowd into his quarters while they sample the excitements of the town or look for work; and he fairly regularly goes home to rest and to display his acquisition of goods and to distribute some of them to kin and relatives by marriage. To the degree that this situation obtains, it minimizes the development of distinctive contrasts in urban and rural traits. As long as these ties last, a villager has somewhere to stay in the town and someone to show him around the pitfalls and through the intricacies of the maze of urban relationships; the villager is abashed at the strangeness and the complexity of the town but does not feel completely solitary and lost.

[11] Marion Levy, Jr., *The Structure of Society* (Princeton: Princeton University Press, 1952), pp. 248 ff.

[12] "Informal means of social control—such as gossip . . . could remain powerless were it not for the fact that they are backed up by economic pressures. . . . "—Svend Riemer, "Villagers in Metropolis," in Edgar A. Schuler *et al.* (Eds.), *Outside Readings in Sociology* (New York: The Thomas Y. Crowell Company, 1952), p. 648.

Equally important, the townsman avoids making changes in habits that will alienate his rural kinsmen to whom he will return.

During this period, country patterns tend to persist in the town, but town ideas also get disseminated to the villages, and the difference in the rate of change between the two is thus lessened.

The demographic structure of an African town, during this phase, is different from, and inverse to, that of the rural areas. The town has a preponderance of males and youth. There are comparatively few children in the towns and very few of the aged, but between the ages of seventeen and fifty, that is, the employable years, an individual has a greater chance of survival in the town. The number of females, smaller in total than that of the males, shows the same bell-shaped distribution in ages. The newer the town, the greater the unbalance in the demographic structure; the older the town, other things (such as the government's urban policy) being equal, the greater the approach to demographic stability.

Toward demographic stability

The subsequent developments in town growth are largely measures tending toward demographic stability, that is, to a lessening of the disproportion in the sex and age ratios. One important prerequisite for stabilization of town populations is housing. African townsmen, primarily, are a labor force, and it is cheaper for employers to provide housing for a single man than for a family. If a married man is hired, he is frequently given the same-sized quarters as a single man; when the married man later wants to visit his family, he may quit his job and hope to find another when he returns. This means high turnover of labor, which in turn contributes to keeping low the level of skill, so that the employer is constrained to offer inducements, at least to his more skilled workers, to remain; better housing is often provided for this reason. Skilled workers tend to change jobs less often than the unskilled.

Another prerequisite for demographic stability of the towns is a larger income for the urban family. In the country, the wife supplements the husband's income by her labor on the farm; in the town there are usually few opportunities for her to contribute to the family income. In the Union of South Africa, an increasing number of urban African women are employed in domestic service and other occupations. Many, however, are dependent on earnings from illicit beer brewing; income from this traffic is curtailed by frequent police raids. In West Africa, women are petty traders who sell food, cloth, cigarettes, and many other things; and some earn more—a few, much more—than their husbands. This economic opportunity, as well as the age of the towns, explains the more nearly normal sex ratio found there.

A further prerequisite for stabilization is a system of social services. Kin groups, due to dispersal, can no longer fulfill their mutual obligations to help an individual in distress. Welfare costs have to be born by the governments, and this helps to account for administrative ambivalence towards urban stabilization.

In South Africa, a further factor slows down but does not reverse the tendency toward stabilization. The philosophy of *apartheid* designates the African as essentially a rural being, and the town is considered as belonging to the white man. The African can come to the town on sufferance when the purpose is for the service of the white man, but it is thought proper that the African's wife should stay on the reserve and keep a farm; economic development, however, has made this impossible, and cities are building housing for African families despite the contradiction of this action with the prevailing ideology.

In spite of these obstacles, the growth of commerce and industry with its division of labor and specialization and the fight against high rates of labor turnover, constantly force increased stabilization.

As long as an unbalanced sex ratio continues it has serious implications in regard to family life, birth rate, and mobility. Many of the men in the towns are bachelors, but those who are married may keep their wives in the country to cultivate the farms, although a wife sometimes joins her husband in the town. If a man is a polygynist, he is able to achieve both ends of having a wife with him and one tending the distant farm.

The scarcity of women in towns militates against the fidelity of a town wife, who is unceasingly importuned during her husband's absence at work by numerous womanless men. A husband sometimes sends his wife back to the village, where his relatives can guard her chastity, and then, perhaps, he begins to prey upon some other man's wife, or forms a liaison with an unmarried woman, or consorts with prostitutes. Sexual infidelity is a frequent source of friction and a significant factor in the brittleness of urban marriage.

This separation of many of the men in the towns from the women in the villages has a depressing effect upon the birth rate and population growth. In comparison with the rest of the world, Africa appears sparsely populated, and many development plans hinge upon availability of labor supply. Population has increased owing to suppression of warfare, improvement of sanitation and health facilities, and rising levels of living, but a continuation of the unbalanced sex ratio in both towns and rural areas may slow down the rate of increase.

Beginnings of classes

As the urban population progresses toward stabilization and tends to become distinct from the rural population, further divisions in the urban population take place. An incipient class structure appears. Wealth, education, and occupation set some apart from others less favored or gifted, or perhaps merely newcomers, and doing the less remunerative work.

Differences in fortune, training, and ability in the competitive towns give rise to a number of stations, or statuses, which approximate classes, whose members influence each other in evolving group mores which are a departure from the past.

Several factors hinder the solidification of classes in urban Africa. One such factor is the continuation of kin obligations, which drain the resources of the successful individual to aid his less fortunate relatives. Another is that trade is dominated by European, Asian, and Levantine merchants, and a large, well-to-do African middle class based on commerce is prevented from arising. Discrimination, which varies in degree (and in the rationalization for it) in different territories but is never absent, puts all Africans in one category and all Europeans in another. As long as the European fills the dominant role and is exclusive, the emergent upper group of Africans will feel psychologically bound to the lower group. And frequently housing shortages prevent the rising elite from separating itself residentially from the other elements.[13]

The lesser differentiation of women

[13] M. McCulloch, *Survey of Recent and Current Field Studies on the Social Effects of Economic Development in Inter-Tropical Africa* (UNESCO, in preparation).

also retards class formation. Women receive less education than men and although more urban women than rural women are literate, still the number is small. The occupational opportunities for a woman are limited and in some places absent, so that she is less affected by these modifying influences than the man, and because she is not employed, she is free to visit the country relatives and may keep up the contact with her husband's kin as well as with her own. Therefore, the woman, generally, is more conservative, more apt to preserve the traditional customs, and less likely to take up town ways that are glaringly different. To some extent illiterate wives slow the rate of internalization of urban attitudes by the husband and are not able to identify themselves on his level of the class structure.

Children also are often not able to identify with the father's status because of the common practice of sending children to grow up in the country with relatives; accordingly, adjustments to urban and class attitudes have to be made as adults, after rural patterns have been set. Thus men show the marks of class more than their wives and children, a fact which raises the question whether class exists, since class is usually considered as being composed of families. Among the elite especially, where families tend to be stabilized, this less often applies.

Class formation tolls the knell of tribalism in the urban environment. The marks of class are independent of the marks of tribal membership; classes comprise people of various tribes. A European language is not only a means of communication but a symbol of status (like European clothes) for the elite. For other levels, a vernacular lingua franca usually serves the multitribal population. The lines are still fluid and the word "class" should be used with care, but we are not dealing with a static situation and it is necessary to indicate the trend.

Old and new overlapping

The processes outlined above are operative simultaneously and are interrelated. In the towns we see the old and the new, the contrasts and conflicts of Africa, the past refusing to die and the future struggling to be born. Nowhere has the town completely sloughed off its tribal background; nowhere has the urban synthesis finally jelled; but everywhere change is moving in that direction. It is not implied here that there is a renunciation of all African cultural features but merely of traditional organization.

URBAN SOCIAL STRUCTURE

The feeling of ethnic solidarity carries over into the town and is especially important for new arrivals. Some sections of towns tend toward a tribal or language homogeneity. Even when this is not possible, some form of organization is usually felt necessary for the protection of the members of a common ethnic group in the strange environment of the town. Each "strangers' community" may elect a headman to represent it, and town authorities sometimes find it convenient to deal with certain matters through the several headmen of the various tribal elements. Or a Tribal Union may be formed for mutual aid.

On the other hand, mutual sharing groups in which each contributing member takes the "kitty" in rotation exclude kinsmen, since custom frowns on exactness in exchanges between kinsmen. Other collectivities which have begun to knit the disparate tribal elements into common units are schools, churches, trade unions, political parties, nationalist movements, and public places of recreation such as beer halls and football fields. The more that Africans identify themselves with these groups, the less important tribal affiliation becomes; these associations perform services, or create outlets for emotion and energy, that formerly were found in the tribal organization.

Classes

The upper stratum of African society, which one could logically term a middle class,[14] keeping in mind that the European forms the upper class, includes the most educated, who in some places may be university graduates trained in Europe or America, and in other places locally educated persons of lower level; the upper ranks of government service, which may mean Senior Civil Service, or merely chief clerks; the most responsible employees of commercial firms, which may be managerial staff or only storekeepers or cashiers; perhaps teachers, headmasters of schools, and ministers of religion; and sometimes privately established professional men, or traders successful enough to survive the non-African competition. The actual composition varies with the occupational opportunities in the territory, which in turn depend upon economic, educational, and administrative conditions.

Between the elite and the laborers are an artisan group—tailors, shoemakers, goldsmiths, masons, carpenters, and other skilled workers. Even where the level of skill is low and the craft could be learned in a few months, the apprenticeship is for a number of years, so that ordinarily anyone out of his teens would be discouraged from beginning, but there is nothing actually to prevent anyone from moving from the category of laborer to that of artisan or even to the elite, if he can acquire the education and the income.

[14] G. D. H. Cole, "The Conception of the Middle Class," in Schuler *et al.* (Eds.), *op. cit. supra* (note 12), pp. 345 ff.

Family

The above positions and institutions in the social structure are innovations, but previously existing institutions, such as the family, are modified in the new milieu. An African who ventures into a town is an offshoot of a kin group, and others may follow to the extent that they can be supported; but those who cluster around the man who has gained a foothold in the town are only a fragment of his primary group. The family in the town exists under difficulties and tends to approximate the nuclear family in form, that is, a husband, wife, and children. Other relatives found in the compound of the extended family in the country are found more rarely in town dwellings.

When a crisis arises and the members of the nuclear family want to discuss it with others, being habituated to the extended family of the villages, they call in whatever kinsman, no matter how distant, who happens to be in the town. Proximity in space takes the place of closeness of relationship in the town.

Marriage

In most areas, there are three kinds of marriage which are recognized as legal: civil, church, and customary. The first two are on the Western model and the latter is supposed to be according to tribal customs. In fact, however, customary law cannot operate effectively to attain traditional goals in the towns[15] because a marriage is a contract between families and not merely between individuals, and it often happens that both of the families are not in the town and may even be unknown to each other. Traditional gifts are usually commuted to money, and labor services, if ob-

[15] A. L. Epstein, *The Administration of Justice and the Urban African: A Study of Urban Native Courts in Northern Rhodesia*, London: Her Majesty's Stationery Office, 1953.

served, are shortened in time. Furthermore, customary law marriage between members of different tribes is an anomaly unless, as sometimes happens, both agree to accept one of the tribal forms. If a man is an immigrant into a town where one tribe is dominant he may do this. In addition to legal marriage, there are casual unions which break up when either party so desires.

OUTLOOK

The towns and cities will play an increasingly vital part in the life of Africa. The town is the door through which Africa is entering the modern world. Civilization in the twentieth century is an urban civilization. "The influences which cities exert upon the social life of man are greater than the ratio of the urban population would indicate, for the city . . . is the initiating and controlling center of economic, political, and cultural life that has drawn the most remote parts of the world into its orbit and woven diverse areas, peoples, and activities into a cosmos." [16] In Africa cultural groups are beginning to appear in the cities; nationalist movements get rural support but have their headquarters in the towns. Nations are in the process of formation in Africa and the towns are the crucible. The towns today give us an insight into the future. "As the city is, so will the nation be." [17]

Impact of Christianity in Africa

By EMORY ROSS

AFRICANS south of the Sahara in our day face a challenge not before put to so large a group of people. This challenge is for an unprecedentedly complex triple change:

1. Horizontal change, across the whole range of concepts and practices of life —in thought, language, religion, political and social organization, land, marriage, inheritance, occupations, economics, housing, disease causation and cure, recreation, communications of all kinds, and in nearly every other aspect of life.

2. Vertical change, from the most primal large society remaining on earth, the animistic communal primitivism of 160 million Africans, to something approaching the West's present society, the most individualistic, specialized, and technological society which the world has yet seen.

3. Speedy change, both horizontally and vertically, at a pace not before attempted by any such mass—change attempted by many thousands of Africans in a two or three generations instead of in the three or four milleniums "normally" taken by Western society.

UNORTHODOX NATURE OF CHANGE

Such triple change cannot be effected in any orthodox or perhaps in any orderly fashion. There is no established order for it in past experience with such mass. It is in essence unorthodox.

Because it is thus unprecedented, this speedy change from animistic communalism to some pattern of an individualistic democracy based in considerable measure on the Hebraic-Christian religion suffers from the ignorance and inexperience both of the West and of Africa.

FORCES IN CHANGE

The West did not intentionally initiate such inclusive and speedy change in Africa. It began with merely incidental touching of Africa four or five hundred years ago as a way station on the journey in the search for the fabulous Indies. It later scratched spots on the fringes of Africa to seize slaves destined to bring change and progress in the West's own New World, not in Africa. Then, a century or so ago, it ventured exploration here and there in Africa, and finally produced a Livingstone.

Livingstone stimulated a Stanley and other venturesome penetrators of Africa. King Leopold II of the Belgians sparked a Western political acquisitiveness aimed at Africa. British, French, and German rivalries began to heat over several fires. Africa was involved and was "partitioned" in a fashion unprecedented in any other like land mass.

Two power crises then took their names from Africa, Fashoda and Agadir, the latter in 1911. Three years later the Western world went to war. Africa had no initiative in the war but was engulfed in it. It suffered greatly, and its whole fabric was rent. Thereafter, its raw materials were dug and taken with ever increasing speed to repair the West's self-ravages and to prepare for further struggle.

World War II

This came in 1939 without Africa's volition, but with even more involvement than in 1914. Rommel hit Egypt, pounded Suez, and a thousand African communities. some of them thousands

of miles away, were shaken. Troops, artillery, bulldozers, airfields, harbors, bridge gangs, pipelines, tank depots, naval stores, munition dumps, roads—in two years Africa was penetrated by the "fall out" of World War II from the Mediterranean to Table Bay, from Monrovia to Mackinnon Road.

Six or seven hundred thousand Africans were drawn into military combat and labor services in distant places. Many hundred thousand others were used nearer home in these strange new works of global war.

Billions of dollars poured through millions of man-hours to spread throughout Africa elements of almost the total product of the scientific, technological, war-waging West. The multiple effects on Africa can never be assessed or measured with certainty. One only knows that they were immense.

In the interest of the West

This whole long onslaught has not been primarily for Africa's sake but for that of the West. It is unlikely that anyone would have had the temerity, or would have put up the money or mobilized the outside manpower, to risk so untried and unpromising an experiment in such swift human change for the sake of Africa itself. It was rather the mounting expansion and crisis of the West in these past two or three generations—its hungry maw reaching for raw materials in greater and greater volume than ever before demanded or even imagined; its need for political, economic, and strategic bases overseas to support its own internal struggle and to arm for its own crises—which originally contributed most heavily to European action in Africa.

Africans were initially prodded, pushed, and in some cases even compelled by forced labor and then military enlistment into a speed and type of change they had not dreamed of, and which many did not want. Pressures built up, speed stepped up. And now a mass is in movement. It probably will not stop, cannot be stopped. The desire is for change. Africa's triple change—across the board, up the scale, unprecedented and unpredictable in speed—is under way.

AFRICAN CONCEPTIONS OF CHRISTIANITY

In considering the impact of Christianity in Africa south of the Sahara, it is essential that we keep clearly in mind that the African animistic communal society links its religion tightly with the whole of its life. There are great variations in belief and practice within the approximately eight hundred tribes in Africa. But long association and friendship with Africans through the years evoke the conviction that Africans, in their tribal societies, generally regard life as the product and within the control of their religion. The whole of their life and society is the expression of their religion.

This being so it is natural that in their new contact with a new type of life and society possessing a religion new to the African, they should regard this new life and society as the expression of that new religion.

What then is more logical to the African than that the West should be regarded as the product of Christianity, its society as a Christian society, its people as Christians—in short, the West and all its products as Christian?

The early tendency of the Africans to so classify the West was perhaps reinforced by the not infrequent past references in the West—less frequent in later years—to the "Christian West," to our "Christian civilization."

When therefore the African point of view is considered in terms of the part played by the Christian religion in Africa in the past century or so, it is not

sufficient to confine attention only to Christian missionaries, missions, and churches, to Christian schools and hospitals. The Africans early tended to regard all Westerners as representatives of Christianity, all these Westerners' political, economic, social, racial, personal patterns and actions as representing Christianity in life. It was in essence doing only what perhaps most Westerners were doing with respect to African people and society: regarding that society and all its works as representative of an animistic religion.

It is probable that today some Africans educated in Western patterns are prepared intellectually to accept the idea that important segments of our Western life and action are not Christian, and even that numbers of professing Western Christians do not expect or work towards the Christianization of all these segments. But that does not mean that these Africans all admire that philosophy. Indeed it probably means in numbers of cases that Africans are disappointed, uncertain, and confused. They see that the Christianity which they thought had undergirded, stimulated, and controlled the great new Western accomplishments which they now desire was in important ways not even as powerful as their old animism in controlling a whole life and society. Christianity probably seems an insecure base on which to build a whole new life.

The slave trade

It is with some such background as this that we should try to evaluate Christianity in Africa. In such an evaluation it is essential to remember that the "Christian" West's first large-scale approach to Africa was for slaves. Slavery had long existed in Africa, as in almost all primitive societies: a domestic slavery, largely, with all the attendant abuses and cruelties. It was the West, however, which, touching the coast in many places and stimulating coastal Africans to raiding the interior for slaves, internationally commercialized the slave trade, established transoceanic transport for it, made it "big business" in its day. Accompanying this was a certain amount of talk of the Christianizing advantages which pagan Africans had in being captured, shipped, sold, and worked in the Christian West.

This doubtless appears now to most Westerners as what it was: pious humbug, a negation of Christianity. But there are here and there in Africa today some of Western descent who appear to Africans to be invoking their Christianity and the value to Africans of their Western science and productivity as reasons for their minority, and almost exclusive and complete, domination of the social, economic, and political scene throughout large African areas and over large numbers of Africans.

The parallel between this and the earlier Christian apologetic for slavery is of course not exact, but it is suggestive enough to Africans who remember the religious sanctions set forth for the "Christian" West's first large-scale relations with Africa—slavery.

Race prejudice

The common racial and cultural prejudices are likewise important factors in parts of Africa in making Africans critical of the Christianity with which those prejudices seem to enter Africa. Of course, it can be and is pointed out that Christ's teachings and constant examples while on earth were all against racial and cultural prejudices and exclusions, and that therefore Christianity cannot be held responsible for the prejudice now found. That attitude doubtless seems unrealistic or even hypocritical to a good many Africans. They believe they can see Western "Christians" put-

ting numerous disabilities on other races and cultures in the West, in the East, and in Africa.

IMPACT OF CHRISTIANITY

It seems clear then that the impact of Christianity in Africa has by no means come only through Christian missions. These impacts have come through many different national cultural, economic, and political channels from the West. Even within the different Christian missions those national forces have not infrequently produced quite different attitudes, methods, and results.

The theme of this paper therefore is that religion, in this case Christianity, is not something in a separate compartment of life called church or missions or worship. It is an integral, inextricable part of life, all life. It is a major element of that holism of which Jan Smuts, Haldane, Whitehead, and others have written. Its impact upon that wholeness of life represented within a tribe by Africa's animistic communal society comes through the whole of the life poured in upon Africa in these later years from the so-called Christian West. The impact is from many sources; it is direct and indirect. Its effect is total in character.

Generally, despite weaknesses and errors already named and later to be named, it seems correct to say that the impact of Christianity from the West upon African life has been thus far the strongest element in change and progress in the past three generations. The following points support this conclusion.

Individual choice

First, Christianity has been the chief influence in introducing and spreading the concept—revolutionary in Africa's communal society—of individual choice, initiative, and power, coupled with sobering individual responsibility for one's fellows and one's society. This has been a power of Christianity in all lands and in all generations since Christ. It has entered Africa not only through teaching and example in Christian missions but also in many political and economic contexts, in social customs, and in the historic bases of the Western peoples entering Africa who had themselves gained it through the influences of Christianity in their own lands.

The whole man

Second, Christianity has been, everywhere in Africa south of the Sahara, the introducer of Western-type education of the whole man: head, hand, and heart. Christian missions still carry the bulk of the load of this broad education, sometimes without, but increasingly with, the aid of public funds.

Medical and health gains

Third, Christian missions have been almost everywhere the introducer of Western medical, surgical, and public health methods, and the pioneer trainer of Africans in these skills.

Self-help

Fourth, Christianity has pioneered in self-help programs, in agricultural improvements, in training for trades and professions, and it was in many cases earliest in giving Africans practice and responsibility in these. It was the pioneer in aiding Africans to travel and study in the outside world.

Displacement of animism

Fifth, through Christian spiritual illuminations and through slowly convincing demonstrations in medicine, surgery, science, agriculture, and general education, all in a Christian atmosphere, it has given many Africans most powerful aid in the essential displacement of animistic superstitions, fears, and oppressions. The continuance of those animistic inhibitions in full strength would render quite impossible African advance in modern science, economics, technology, and political forms, and in new optimum social forms and toward a new spiritual community embracing all.

African Christians

Sixth, although statistics are never wholly revealing in matters of the heart and mind, and most African statistics have special weaknesses, the best available figures indicate that there are 21 million or more professing African Christians. The same source indicates that in all the rest of the so-called non-Christian world, with about fifteen times the population of Africa, there are some 20 million Christians. As of now, Christianity has drawn more Africans together than any other power entering Africa in modern times.

IMPLICATION OF DIVISIONS IN CHRISTIANITY

These elements are of great importance in the building of a new society in Africa. But human weaknesses among Christians in the West and among such Westerners in Africa are so numerous and so great that Christianity cannot yet develop its fullest re-creative power in Africa. As there are splits in human personalities and societies, so are there splits in the Christianity brought in from the West to Africa, sharply reducing its effectiveness.

Let me suggest four splits in the spiritual and cultural forces in the West and in Africa which now exist, which in some places appear to widen, and which, if they continue unrepaired and uncontrolled in the future, may bring crisis mounting to explosion and despair in the spiritual and cultural experiences of Africa and the West and remove or greatly reduce the most powerful of all forces guiding economic, political, and social development.

Split between Protestants and Roman Catholics

The first of these four splits in the Christian world is the split between Protestants and Roman Catholics. We in the West know something of the historical, national, and political reasons behind this split. We are still somewhat emotionally sensitive to it all. But those historic and current conditionings of ours are for the most part quite hidden as yet from the Africans. Probably for most Africans this is one of the incomprehensible and bewildering aspects of the Christian religion as imported from the West. This is a split of the first magnitude in Christianity in Africa.

Its gravity is, of course, also recognized in the West, but oftentimes with a kind of fatalistic sense of inevitability. It does not at first appear as inevitable to the African as he hears both groups preaching from what appears to him as the same book, the Book of Books, and teaching the Fatherhood of God, the brotherhood of man, and the unity with our Maker within the church.

It would seem that whatever may be possible to be done for the healing or the narrowing of this first split I mention, and for the development of better functional understandings and relationships in many parts of Africa between Roman Catholics and Protestants, would make a contribution of the first magnitude in our spiritual and cultural fellowship and co-operation with Africa.

Splits among the Protestants

The second of the four splits is among Protestants themselves. Protestants' Western denominational divisions are nearly all represented in Africa, at least all of those having missionary interests. There are fifteen Christian councils in as many political divisions in Africa south of the Sahara, and most of them

represent some solid co-operative Protestant planning and action. But none of them has within its membership all of the Protestant forces within its area. In public education matters the co-operation among most members within a given Christian council is generally good. This is also true with regard to government relationships and in the production of general Christian literature and other good reading materials. Co-operation in leprosy work and in some places in other medical undertakings is to be found.

But the fact remains that in what is the most important single training task which Christians alone must do in Africa—the training of the Christian ministry and the church's lay leadership—there is only limited interdenominational and international co-operation here and there throughout the continent. There is not, for example, in the whole of Africa a single union Protestant theological seminary of full rank. There are, indeed, very few spots where any solid co-operation exists between denominations for the training of the Protestant ministry.

This example of Protestant divisions is not lost upon African Christians. In some places it operates to divide members of the same or related tribes along theological lines, although it must be said that for the most part the Western denominational loyalties appear to be rather less rigid among large numbers of Africans than they are in the Westerners' homelands. This is hopeful for the future.

But where political, economic, educational, cultural, and other disabilities put upon Africans are most pronounced and severe, as currently for example in the Union of South Africa, there the Western religious denominational pattern is not only followed but widened. There are more than 1,100 separatist African denominations registered in the Union. Using the split pattern of Western Christianity, as between Protestants and Roman Catholics and among Protestants themselves, the underprivileged majority has run denominational riot in the Union. This is in considerable measure an effort to escape white domination in at least one sector of life. But the adoption of the Western Christians' split pattern is demonstrably not the way to gain spiritual solidarity in Africa any more than it has been in Europe and the Americas.

Split between Negro and white

The third of these four splits within the church and our society is that between colors, between black and white. Segregation on grounds of color in our home churches and society, and barriers, tangible and sometimes rather intangible, on color grounds in Africa is for Africans—as it should be for us—a negation of the basic Christian Gospel of God's Fatherhood, of love and brotherhood, and sharing of the "oneness" there is in Christ.

What seems to Africans as color discrimination exists in almost all parts of Africa, brought chiefly by the Christian West. It may not be in reality discrimination based wholly on grounds of color. There has been historically discrimination of various types in Liberia and Ethiopia by members of the ruling group in relation to some or most of the people making up the mass of the population. This is now diminishing and was obviously not color discrimination. But when such discrimination occurs between white and Negro the general tendency of the Negro is to assign it almost wholly to color. Reasoning and argument about such assignment is often of little avail, for emotions and feelings and not the more rational processes of the mind are in control. And, besides, obvious and avowed color discrimination does exist in many parts of the West and in Africa, and Africans know it.

Nowhere in the West is color discrimination more evident than in the United States. And no groups seem slower to root it out than thousands of individual Christian congregations in this country. More interracial progress has been made in political, industrial, labor, academic, sport, theatrical, musical, and other groups, than in tens of thousands of churches. Africans are coming to know this also. For there are more than a thousand African students in America now, and scores of other Africans come each year here on government or private business.

And when, in addition, they see the excesses regarding race in the Union of South Africa, and the place of the dominant church in them, and the segregation within and without the church in many other places in Africa, it is small wonder that this split between black and white assumes major proportions as they think of Christianity and of continuing Western dominance in most of Africa.

The progress toward better racial attitudes in the United States both before and after the Supreme Court decision of May 1954 holds great promise in our international relations. But there is much lost ground to be made up by Christians in Africa, ground indispensable for the foundations of a world Christian society.

Split between spiritual and secular elements

The fourth of these four splits is the one in the West between the elements we call "spiritual" and those we classify as "secular." It is difficult, confusing, and often painful for the African to learn that Christians seem to regard some things as spiritual and some others as "secular," separated fairly sharply from the spiritual. To African traditional thought and action such a division does not make sense. It is a negation of the facts of life as he and his fathers have observed and lived it for generations. Life to him is a unity guided and almost always controlled by the spirit.

To accept a religion with all the power, beauty, and promise of Christianity and then gradually to find that this Gospel as practiced so largely in the West is expected to control only a part of life and not to enter, except rather superficially, into what is called "secular" aspects of life—that is a disillusionment of great dimensions.

One doubts that any other one split in spiritual and cultural concepts in the West is more important in our relations with the Africa of today and tomorrow than is this Western split between religion and great sectors of human life.

This split seems to Africans to manifest itself, for example, in our reluctance, sometimes refusal, to try to deal with political problems where Africans feel their interests are jeopardized. In industrial, labor, economic, and related matters they feel their basic rights are often acutely involved. It is hard for them to understand Western Christians' attitude that these somehow are things with which spiritual forces do not seek directly to deal. We need not be surprised, in these circumstances, if they rather suspect that our reluctance stems from our feeling of group identification, racially and culturally, with the ruling white political and economic powers, and from our hesitancy to do things which might weaken white solidarity and white supremacy. That may seem to them a more likely explanation than that this new and powerful Christian Gospel cannot tackle effectively these urgent problems of life.

This split manifests itself, too, in our not bringing from the West a clear, viable Christian philosophy of man's spiritual relationship to the all-giving and all-powerful Mother Earth. We

from the West can produce more crops from the land, sometimes. We often urge Africans to use "better" methods of agriculture. We on occasion seem to agree when governments or plantation owners (with government sanction) force Africans to adopt new commercial crops or new methods of cultivation.

But where, Africans can naturally ask, in all this Western emphasis on land and the new uses of it is there a clear Christian replacement of the old and tried animistic spiritual attitude and practice regarding land? This right relationship to land is one of the most important things in the African's life. His life and all life depend on it. It is a matter that must be spiritually based, and soundly. It must be spiritually, as well as "physically" (there is little difference to the animistic African), good for the whole "tribe," that is, society. What is the Christian West's spiritual attitude and control regarding land, the African wonders?

The fact is that in the West a spiritual conception of the land has disappeared. Our real approach is technological, not spiritual. Yet we should have been able to gain the former without losing the latter. That combination of the two is what masses of Africans instinctively want. That is what nearly all of the so-called "underdeveloped" peoples of the world want. They have a deep inner reluctance to become as highly developed technologically as we are if at the same time they must become as underdeveloped spiritually as we appear to them to be. They cannot yet believe that is truly necessary. Even primitive Africans instinctively resist such "progress."

The African's spiritual linkage to his tribal land is one of the most powerful forces in his life. It is embittering to be put off his land by foreign whites, as in some places he is. Or to be concentrated on "locations" that are a stench. Or to be assigned "reserves" within his own ancestral lands by foreigners who, when they came, "had the Bible and we had the land. Now we have the Bible and they have the land."

It is hard for him to accept the separation, in a religion as powerful as Christianity, of things spiritual from things physical like land; of things spiritual from things "secular," as in industry, labor, and politics. It is not illogical that he should begin to suspect that Christianity is not as powerful as he had thought it to be, and that some of its practices developed in the West may not be as pure as its pulpit presentations.

These four splits and others growing out of them in the Christian life in the West are great handicaps to the Christian Gospel in Africa. The oneness, the wholeness, of the hoped-for Christian life and community are broken. The fullness of life which Christianity promised in Africa seems to them not yet widely produced. They freely aver that Christianity has helped them do many things in Africa. But they wonder if Western Christianity is really concerned with the whole of life in Africa.

CONCLUSION

If the foregoing be accepted as a generally valid sketch of some of the effects of Western Christianity in Africa, two conclusions may be drawn:

1. Christianity, in direct and indirect ways, has had probably the most fundamental, widespread, and creative effect of any element entering Africa south of the Sahara in modern time.

2. Christianity, handicapped by its Western human distortions from the original teachings Christ gave in a society not so far removed from its own animistic communal origins, has failed to give everything it might to Africa's rapidly changing people.

This failure presents grave dangers. It may so discourage and embitter the African that he will in the end fanatically combat the West on all fronts. It may lead him to develop his own distortions of Christianity on the ground that if the West can warp that powerful religion to its own selfish national and cultural ends, so can Africa. Finally, it may leave him as defenseless prey to other outside philosophies and ideologies which at this stage are not yet established among Africans and thus are not required to produce anything at all in African society. They have now only to promise. And they cleverly promise among their most attractive wares what seem to Africans to be some of the same values offered by Christianity, and partially produced, but then frustratingly refused completion by the "Christian" West.

Such dangers are serious; and they pose a critical challenge to Christianity and the peoples and governments of the West.

Emory Ross, D.D., New York City, was a missionary in Africa from 1912 to 1933, serving four years in Liberia, and about eighteen years in the Belgian Congo as missionary and secretary of the Congo Protestant Council. From 1934 to 1953, he was secretary and secretary of the Africa Committee of the Canadian and North American Mission Boards for Africa South of the Sahara. He is the author of several books, including Out of Africa (1936) and African Heritage (1953). He gave the Lugard Lecture in 1953 and the Hoernle Lecture in 1954. He is president of the Phelps-Stokes Fund and president of the American Leprosy Missions.

Education in Africa: Its Pattern and Role in Social Change

By Margaret H. Read

In order to give this section on education some integration and validity, arbitrary limits have been set on the territories covered. They include all territories from the Sahara to the Zambezi River, and from the Atlantic Ocean to the Nile Basin. By excluding North Africa, Egypt, the Sudan, Eritrea, Ethiopia, Somaliland, Southern Rhodesia, and the Union of South Africa, the remaining territories, with the exception of Liberia, are all at present non-self-governing or trusteeship territories with a political relationship to some metropolitan country in Europe.

In the general assessment of education within these set limits a historical perspective is essential, and here we find that the existing data are very uneven in respect to coverage and precision and that the needed research has not yet been done except in isolated studies. This historical view is the more important considering the rapidity of modern change, especially in territories, such as the Gold Coast, where political changes herald great expansions of educational facilities.

The relation of descriptive material to analytical studies raises another set of problems in presenting this article. Since 1945 in spite of certain large-scale surveys of education in particular areas, there have been very few "compilation studies" of the extensive amount of material appearing in periodicals and in annual and special reports. There are three major problems for the student in this field. One is the difficulty of relating educational plans as they appear on paper to actual achievement in practice. Another is the lack of "bench marks" for estimating advance in educational facilities and in school enrollment and attendance. The third is the absence of accepted criteria for assessing educational progress, using that term in a wide and comprehensive sense.

Traditional Training

Modern studies of socialization, especially among preliterate peoples, have drawn attention to the provision for training in behavior and in technical skills which has been described sometimes as a traditional educational system. The use of these terms and the attempt to equate tribal training in Africa with a modern school system have led to considerable confusion among Europeans, and to resentment among African peoples on two counts: one the ignoring of the training given by them to their children and the other the reiteration by educational writers that tribal training should have a place in the school system without taking any steps to achieve it or to integrate it. One of the sharpest clashes between Europeans and Africans arises from a misunderstanding by the European of the significance of traditional interpersonal behavior as taught by tribal elders; and one of the major reasons for the increasing fragmentation of African society in urban and industrial centers is the abandonment by African parents and elders of all attempts to train their children on traditional lines.

The patterns of socialization among African peoples have received on the whole very little attention from social anthropologists. Among the studies which have been made two distinct patterns

emerge: those among the small communities, organized on a clan or restricted tribal basis, such as the Tallensi of the Northern Territories of the Gold Coast, as described by Professor Meyer Fortes; [1] and those among the large tribal units or military states, where there was a centralized political authority and a hierarchical social status system. The age-set systems of the East African peoples are found both in smaller tribal groups and in larger centralized ones, and were sometimes, but not always, related to cattle keeping and to training for warfare.

The life of the small communities, such as the Tallensi, was centered in the struggle for livelihood and in the intricate pattern of kinship relationships. We find therefore an emphasis on the importance of children to the family groups, demonstrated in the indulgence shown during the early years of childhood, followed by the desire of children to grow up as quickly as possible and take part in adult activities, both social and economic. This stress on children being "little adults" was in sharp contrast to the recognized age sets in East Africa, where after the infant and wholly dependent stage was passed, boys and girls, according to their age, had recognized and progressive positions and responsibilities in the life of their community and later of the tribe as a whole. The emphasis in most of the training in the age sets was on obedience, endurance, and co-operation in a recognized unit. Training in both the larger and the smaller communities emphasized correct behavior to equals, superiors, and inferiors, and the acquiring of the necessary technical skills for craft work, cultivation, cattle keeping, or warfare.

When the former training of children and young people in African societies is compared with the modern school systems now operating, certain features of the traditional patterns appear to have been abandoned, notably those which showed the close correlation between the training of personality and character and the integration and cohesion of family, clan, and tribal units. Three of these elements were absent in the early forms of schooling as introduced in Africa, and though their significance has been progressively realized, the attempts to incorporate them into the modern school system have been spasmodic and not altogether successful.

Physical development and social recognition

The first was the close correlation in African tribal society between physical development and social recognition. The so-called age sets were organized not so much by age in years as by recognized physical changes—the appearance of second teeth, prepuberty changes, the actual onset of puberty, the birth of the first child, and so on. The emphasis in the majority of African societies on fertility and on the capacity to beget and bear children was the keynote of the initiation rites where they were on an organized tribal basis. This emphasis included instruction given during these rites, and privately, before and at puberty, in sexual intercourse, sex hygiene, and sexual behavior in general. This instruction, which was associated with general social behavior and the responsibilities of young adults, was given at or about the period of the most important physical change for boys and girls. Their normal activities ceased while they were withdrawn from ordinary life to undergo this training, and they returned to their community as individuals charged with new knowledge and new responsibilities. The age at which children went to school, the

[1] Meyer Fortes, *Social and Psychological Aspects of Education in Taleland* (Oxford, 1938).

prevalence of mission boarding schools, and features of the initiation rites which were dangerous to health and objectionable on Christian moral grounds caused the missionaries to clash with this traditional training. The result was that it was largely abandoned by Christians, and at the same time the essential sex teaching and training in social behavior were omitted.

Enlargement of social and political horizons

The second element in the traditional training which was squeezed out by modern schools was the gradual enlarging of the social and political horizons of the children. The learning of genealogies of the families and clans, as among the Ashanti and the Baganda, the recognition of social groupings in hierarchical tribal settings and of their reciprocal relationships, the hearing of tribal "history" in praise songs and legends told at tribal gatherings—these were forms of direct learning which had no place in schools but had set times and places in a traditional situation. In more specific behavior patterns the organization of age villages, as among the Nyakusa,[2] of boys' dormitories in villages and of competitive dance groups between village and village as among the Ngoni, and of attendance at tribal law courts where codes and norms of behavior were in review—all these gave young Africans a training in citizenship which was related to their own society.

Artistic expression

The third element for which the early schools, and to a great extent the schools of today, made no place was those aesthetic activities which had for African peoples a deep emotional content. Music of all kinds, vocal and instrumental, tribal dancing, the telling of hero stories and folklore, tribal expression in dress, house decoration, carving and painting of ritual and common objects, dramatic recitations and miming—these touched the roots of African emotional life.

ROLE OF TRADERS AND MISSIONARIES

It is generally accepted that in all the African territories south of the Sahara missionary societies were responsible for opening schools wherever they established their stations. It is not always realized that the commercial company, especially in West Africa, played a significant part in what the Portuguese first and the French and Belgians later called "the mission of civilization."[3] European thought in the seventeenth and eighteenth centuries saw no incompatibility between establishing "forts" to regulate the slave trade and educating a very limited number of Africans to assist them in their enterprises. This education implied as a rule conversion to Christianity, and in this respect the early trading companies anticipated the work of the missions.

Some of the chief gaps in the history of education in Africa are gradually being filled by historians, by missionary writers reviewing their work for centenary celebrations, by research students carrying out investigations in a limited field on material in the Records Office, in local archives, in the archives of mission houses, and in the Vatican library. The results of this research, as illustrated in Dr. Roland Oliver's book, *The Missionary Factor in East Africa*,[4] and in recent unpublished theses on West Africa in the University of London, show how varied were the beginnings of educational work in all the African territories. The common element, in trading posts and in all kinds of mission stations, was the need for intermediaries between the foreign traders and missionaries and the people. The emphasis in the majority of missionary enterprises, apart from their primary task of conversion to Christianity, was on the importance of training teachers, evangelists, clerks, and artisans who would assist them in establishing their mission stations and by taking over the routine duties enable the missionaries to extend their work.

Another result of recent research has been to establish the intention of the early missionaries to emphasize the training of Africans in agriculture and elementary technical skills such as building and carpentry. There has been widespread criticism over the last half century that mission schools gave too literary and academic an education, and unfitted boys for working on the land. Investigations of missionary records have shown that in many cases mission boards and the missionaries themselves intended to emphasize the practical vocational aspects of education. The eventual emphasis on literary skills was largely due to pressure from the Africans themselves because that was what they wanted from the schools; and also, at a later stage, to standards of academic attainment set up by systems of inspection and examination.

Present mission schools

The contemporary picture in the African territories today is that of a widespread network of mission schools at all levels, from the "bush" or village school up to the full secondary school and teacher training college. The widest development of mission schools has occurred in the Belgian Congo and in British territories, with the exception in the latter of Northern Nigeria, where the treaties made with the Muslim emirs at the beginning of the century precluded the opening of Christian schools among the Muslim peoples. A common feature in the Belgian Congo and in British territories has been the use of the vernacular languages in the lowest classes of the primary schools. The study of these languages, and their reduction to writing, was one of the outstanding contributions of the pioneer missionaries. While they attacked and rejected much of the African cultural background in their attempts to abolish "heathen practices," these early missionaries did signal service to the African peoples and to the future of African studies by recording and transcribing the vernacular languages and by giving the African peoples the New and Old Testaments in their own language.

In the British territories the missions depended for their educational, and indeed for all their work at first, on contributions from the home churches, and on the gifts, often in kind, from African peoples and the almost universal payment of fees by the pupils in schools. As the governments in the territories assumed full responsibility for all the administrative services, they established a system of grants-in-aid for mission schools, dependent on the standards attained and the reports of inspectors appointed and paid by the government. The present methods of financing schools, in Liberia as well as in all the non-self-governing territories, have developed from the history of mission schools over the last fifty to sixty years. In addition to the government schools, which now exist in all territories, there are assisted and nonassisted schools, conducted primarily by missions but also by plantations and other industrial undertakings.

In the Belgian Congo a distinction is made between "national" missions based in Belgium and "foreign" missions based in other countries. After 1948 the foreign missions were offered equal sub-

[4] London, 1952.

sidies for their schools if those in charge were equally qualified—that is, if they had taken courses in French language and literature and had studied the Belgian educational system and Belgian history and culture. In British territories there is a supposition that non-British missionaries will be able to use and teach English in their schools. In the past it has not been stringently enforced, but the tightening up of the grants-in-aid system indicates that this requirement will in the future be necessary for continued financial support.

DIVERGENT EDUCATIONAL SYSTEMS TODAY

The new edition of Lord Hailey's *African Survey*[5] to appear shortly has a section on education which incorporates the situation as recorded in the most recent surveys and studies. Two recent comprehensive surveys have been made, one on the Belgian Congo by Dr. J. Vanhove[6] and the other on the British territories in East and Central Africa and in West Africa, carried out by two educational missions.[7] No studies of contemporary educational systems comparable in scope and integration have been made in the French or Portuguese areas or in Liberia, though some significant effects of education on social change have been recorded in recent French sociological studies. It is clear from the information available, whether integrated in a survey or scattered throughout reports and articles, that Africans in these territories have educational opportunities which differ widely in type and extent, and that the systems also show divergences in the philosophy and intentions behind the facilities offered. This is true also in the ten British African territories, which have no uniformity in their educational systems. Since it is impracticable to describe the existing system in any detail, a selection has been made of four of the most salient features of the present day found to a greater or lesser degree in all the territories and relevant to the effects of education on social change.

Integration with metropolitan systems

This feature affects the non-self-governing territories only and is directly connected with the general political relationship between the African territory and the metropolitan country. Thus there are variations in the administration and planning of education, as illustrated in the Gold Coast with its almost complete autonomy and in French West Africa with its close integration with metropolitan France. This relationship, however, cannot be summarily dismissed as one of virtual autonomy or integration. It has to be analyzed into several component factors: the responsibility for policy making and implementation; the financing of education; the determining of educational standards and of the equivalence of certificates and degrees; and the varying educational opportunities offered to different racial groups in multiracial states such as the Belgian Congo and Kenya. In the British territories, though there is in London an Advisory Committee on Education in the colonies, which assists in recruiting and training expatriate teachers and in giving specialist help in the territories which ask for its co-operation, the full onus of policy making lies with the ten respective governments, and they are also responsible for the financial implementation of their policies. They have looked, however, since 1940 for additional financial help, especially in capital expenditure, from the Colonial Development and Welfare Fund, grants being allocated on the basis of long-term and shorter-term planning. In educational standards, local autonomy exists up to the end of the secondary school period, when external examinations are taken, based on the Cambridge School Certificate. A West African Examinations Board has now been set up which will conduct examinations within these territories at the secondary school level. In the French territories the postwar educational system in France has been taken as the model, and the colonial teaching and inspectorate service are unified with that of France.[8] The responsibility for policy making and finance lies with the Director of Education in each of the two French territories, and all diplomas and certificates awarded by him are valid throughout the French Union. Contributions to colonial education are made from the French Development Fund. In the Belgian Congo, though there is recognition of the dual nature of the Congo population and of the essential link with the French language and with Belgian cultural institutions, policy is determined in the Congo and education is financed from Congo sources.

Degree of educational uniformity and methods of control

Two factors have influenced the development of education in all these territories, including Liberia. One is the multiplicity of mission schools which preceded but now exist alongside the state schools. The other is the marked divergence between education in the towns and the coastal areas generally and in the hinterland away from the main routes of communication. Nowhere is there any uniformity in educational facilities between the towns and the up-country areas; nor is there anywhere, in spite of all attempts at control, much effective equivalence in the kind of education given in mission and state schools, especially at the lowest levels. Throughout the African territories the methods of control of educational facilities and standards at different levels follow the same pattern: the inspection of schools through a central inspectorate; an examination system, which varies in its application to primary, secondary, and technical schools; the standards of academic attainment required for entry into postschool training or into direct employment; and the control of the training of teachers and of their conditions of service. Systems of inspection based on a central government department of education are a universal method of control. It has been the experience in most British territories that where mission or government supervisory services to assist teachers were set up, following the recommendations of the Phelps Stokes Commission in the 1920's, the effectiveness of the inspecting staff has been much increased. In addition the appointment of education advisers to the Protestant and Roman Catholic missions in a territory, paid for by state funds, has made for better co-operation in carrying out policies. In the French territories the leaving certificate of the primary schools is equivalent to the French "certificat d'études" and is universally recognized for entry into employment and into vocational training. In British territories where the school nomenclature varies greatly, and especially in those areas where educational standards are rising rapidly, the entry into employment from the schools is being raised continuously.

The situation created by the coexistence of schools under government and

[8] French North Africa is not considered here. The units in French Africa referred to are the Federations of French West and French Equatorial Africa.

voluntary agencies is nowhere seen more clearly than in the recruitment and training of teachers. The history of mission education and the recent educational surveys have shown that the expansion of school facilities and the maintenance of standards in the teaching profession are very difficult to reconcile. In all the territories "untrained" teachers are found in large numbers and are regarded by the education authorities as their major problem, professionally and administratively. Governments exercise some control through the grants-in-aid system where it is based upon the qualifications of the teaching staff in a school. Professional standards are maintained through the recognition given to teachers trained in normal colleges. Thus the diploma awarded in the nine Écoles Normales in French territories is valid throughout the French Union, but this high standard of teaching when applied to staffing primary schools makes them too expensive to establish universally.

Appearance of educational ladder

In the names of the kinds of schools provided there is no uniform practice, not only between the different regions but between the British territories also. The universal term "primary school," for example, means the first eight years in Liberia; in the Belgian Congo it is a four year course divided after the first two years into an ordinary and a selective course; in French West Africa there is one type of primary school lasting five years for Africans and Europeans; in French Equatorial Africa there is a village junior primary of four years and a regional or urban full primary of six years; in the hinterland of several British territories there is an unrecognized preprimary or "bush school" course, and a full primary one of six years, or a four year junior primary and a further four years called senior primary or middle school. The demand for secondary education, both academic and technical, which far exceeds the facilities available, poses the problem of selection in an acute form, and this in its turn is closely connected with the language medium used in the primary and middle schools. In all territories the medium in the secondary schools is the European language of the metropolitan country, though in the Belgian Congo and in most British territories courses at the secondary level can be offered in African languages. Where the primary schools, as in the state schools of French West Africa, use only French as the medium of instruction, the problems of selection can be solved by competitive examinations. In many other territories the basic instruction is given in the primary schools in a vernacular language, with a European language introduced either early in the curriculum or at a later stage. Here selection for the secondary school poses problems of testing intelligence as well as attainment, in order not to exclude able children who may have been handicapped by language difficulties.

Universal primary schooling

Compulsory education may exist as a policy on paper, but it can only be made effective where there are school facilities provided for every child. Several territories, Belgian, French, and British, have compulsory ordinances which can be put into effect in restricted areas, but it is clear that no considerable area of any territory has all its school-age population enrolled in school. The best documented study of the expansion of educational facilities is found in the Gold Coast publications, beginning with the report dealing mainly with reorganization in the years 1937–41 and following through with the Ten Year Plan of 1947, the Accelerated Development Plan of 1951, and the report

on progress in education in 1954.[9] These documents illustrate clearly the two major problems in educational expansion in Africa: the provision of finance and the provision of teachers. They also illustrate the determination of a territory on the verge of self-government to provide universal schooling facilities in all but the most remote section of its territory.

HIGHER EDUCATION AND AFRICAN ADVANCE

From French and British West Africa before World War II an increasing number of Africans were going to the metropolitan countries to take university degrees and higher professional training in law and medicine. Some of these men went at their own expense, others secured state scholarships. French policy continued and increased after 1945 the system of scholarships. British policy did the same, but also set up university colleges, one in East Africa, two in West Africa, and most recently one in Central Africa. These university colleges had a dual purpose: to give increased facilities for Africans to get degrees and higher professional training; and to equip a number of them to fill administrative and professional posts in their own countries. In 1950 an Institute of Advanced Studies was opened at Dakar, already an important research center, to give diplomas in arts, science, medicine, and law, with the intention that it should become the university of French Africa. In 1954 university courses were begun at Kisantu in the Belgian Congo under the auspices of the University of Louvain. In 1951 a new university college was opened in Liberia, based on the higher college founded in 1862.

In most African territories therefore there now exist institutions for higher education of a university grade. There is a clear intention to integrate the standards of work and the degrees given with university standards in the metropolitan country and thus to ensure that Africans have equivalent qualifications for senior administrative posts and that they are eligible for research grants. The pursuit of research in the human and physical sciences and in fields such as history, law, and language is taken for granted in the university colleges. In addition there are three social science research institutes in British East, West, and Central Africa; in the Belgian Congo research institutes in medicine and agriculture have long been at work, and the Institute for Scientific Research in Central Africa is actively engaged in an extensive program of research in the natural, biological, and social sciences in the Congo. In Dakar l'Institut Français d'Afrique Noire has established a world-wide reputation for its published and projected research.

EDUCATION AND SOCIAL CHANGE

There is general agreement, based on abundant evidence of a political and economic character, that the spread of modern education has been one of the most powerful forces in African social change. Yet there have been very few studies, either historical or contemporary, which focus in a limited area on the sociological changes resulting from modern education, such as the one by K. A. Busia on Sekondi.[10] It is clear that the impact of schools, over a historical period, has had very different results in the coastal areas and the hinterland, where in some remote parts

[9] Gold Coast: *Report of the Education Committee* (Accra, 1942); *Ten Year Plan of Development and Welfare* (Accra, 1947); *Accelerated Development Plan for Education, 1951* (Accra, 1951); *Progress in Education in the Gold Coast* (Accra, 1954).

[10] Kofi Abrefa Busia, *Report on a Social Survey of Sekondi-Takoradi* (London, 1950).

it is still possible to study the effects of the first impact of the new schools on a preliterate people. Hence though the generalizations which follow, based on data drawn from material in other fields, can be regarded as valid in respect of the main social changes due to education, they are less illuminating as guides to future planning than they would be if they were supported by detailed sociological studies for given areas.

Occupational mobility

As we saw at the opening of this article, one of the first purposes of the early schools was to train Africans to serve European enterprises, commercial, missionary, administrative. From that time on, the traditional and relatively standardized forms of livelihood and employment underwent progressive changes. Warfare, cultivation, herding stock, fishing, trading, craft work were the main occupations in tribal life. The demands of European enterprise, for which boys were taught and trained, introduced a money economy as well as new skills. This led to two main forms of mobility. One was a change over from following the local traditional and family form of livelihood—a change which implied individual choice, new rewards, new skills. The other was the movement of individuals and groups from remote areas to centers of employment, inaugurating the modern phenomenon of migrant labor. Sociological research has shown clearly that one effect of the spread of schools is to increase emigration from rural areas, and it was pointed out in the British educational survey of East and Central Africa that "the flight from farming" was causing great concern about the maintenance of the basic food supplies.

Urbanization

The growth of towns for administrative, commercial, and industrial purposes caused a demand for increased facilities for schools and also for some educational solutions for the problems of seasonal unemployment, slum conditions, and juvenile delinquency. The contrasts here between the Copper Belt towns in the Belgian Congo and in Northern Rhodesia are illuminating. The Belgian policy of permanent urbanization, as contrasted with that of mainly migrant labor in Northern Rhodesia, led to the use of school facilities and of adult informal education to meet the new situation for the Africans. It provided also a ladder of advancement in technical training which created a new skilled artisan class which was at home in and enjoyed industrial employment and urban amenities.

Rural community life

The combination of migrant labor, cash crops, and a money economy has probably caused more changes in social life in the villages than the village schools themselves. Since many of these schools were part of the missionary enterprise, the religious and ethical teaching given has had significant effects, especially on the outlook and status of women. The postwar work in community development and adult literacy has not only given women the skills of reading and writing but has created amenities such as water supplies, better roads, co-operative stores, maternity homes, dispensaries, giving village women more leisure, more security, and less isolation. In many parts of Africa women's clubs and societies have been started or have received a new impetus where they existed before, and women are emerging from a purely domestic and physically arduous life to take part in community affairs, to express their women's point of view, and to organize themselves for further advance.

This changed outlook among rural women is part of a wider change in the status and authority patterns in village life. Wherever local government on modern lines is being introduced, younger educated men and women are taking responsibility, and the traditional status and authority of the older age group is being challenged. In many rural areas the division between Christian and non-Christian in the community is on the basis of age, since the younger group have been to school and have been baptized, and show signs of challenging traditional authority where it seems to them to oppose social and economic advance.

Part of the change in outlook in rural areas is also due to the gradual penetration of informal education through the media of radio, films, and newspapers. The spread of the small household receiving set known as the "saucepan specials" in Northern Rhodesia, coupled with the publication of *The African Listener*, directly connects literacy with listening in. The popularity of the new vernacular journals is another instance of the desire to use a new-found skill; and the development of African film units in several territories is related to the growing interest in locally made, as distinct from foreign, films.

Intergroup and interpersonal relations

Social change can be measured in concrete terms, such as new types of houses, clothing, and amusements; supplies of water and electricity; and circulation of newspapers and sale of radio sets. Though most of these developments are a result of education, many of them can be enjoyed by the illiterate and are a result of general economic improvements. It is modern education, however, which is mainly responsible for the new middle classes in the towns, and for the vigorous women's groups in towns and rural areas. It is responsible too for the gradual splitting up of the former large joint families and patriarchal households, and for efforts on the part of younger educated women to bring up their children on more modern lines. These new group and personal relations create tensions within the existing society and in some areas, such as the big towns, by undermining the stability of family and household groups create new forms of insecurity.

Margaret H. Read, Ph.D., London, England, is head of the Department of Education in Tropical Areas in the London University Institute of Education and professor of education in the University. She held a research fellowship under the International African Institute for field research in Central Africa and was a lecturer in social anthropology at the London School of Economics until 1940. She was a member of the Commission on Higher Education in West Africa and is now a member of the Colonial Social Science Research Council, and of the two Advisory Committees at the Colonial Office on Education and on Social Development. Former and forthcoming publications include The Indian Peasant Uprooted (1932), African Standards of Living and Social Change (1938), Africans and Their Schools (1953), and Education and Social Change in Tropical Areas (1955).

Bylaws of The American Academy of Political and Social Science

Revised as of January 24, 1955

Article I. Name

The corporation shall be known as "The American Academy of Political and Social Science."

Article II. Purpose

The purpose for which the corporation is formed is the promotion of the progress of political and social science, especially through publications and the holding of meetings.

Article III. Members

The corporation shall have the following classes of members and such other classes or forms of membership as the Board of Directors may at their discretion from time to time determine:

A. Annual Members—Any person who shall pay to the corporation the amount of the annual dues prescribed from time to time by the Board of Directors shall be an annual member of the corporation for the twelve months' period for which the payment is made.

B. Life Members—Any person who shall pay to the corporation the sum of $200, shall become a life member of the corporation and as such shall have all the privileges of annual members, but shall not be subject to the payment of any dues.

Article IV. Meetings of Members

Section 1. The annual business meeting of the members shall be held on the fourth Monday of January in each year. The place and the hour of such meeting shall be fixed by the President. The Board of Directors may change the date of the annual business meeting if in their judgment another date may be desirable.

Section 2. Special meetings of the members shall be called at the discretion of the President, or at the written request of any two directors, or of any ten members. Any such request shall state the general nature of the business to be transacted at such meeting. Special meetings shall be held at such place as shall be fixed by the Board of Directors, or, if they fail to do so, then by the President. The time of holding the special meetings shall be fixed by the President and shall be within thirty days of his receipt of the request for the meeting.

Section 3. The Secretary or the President shall give not less than ten days' notice of the time and place of each annual and special meeting of the members. The notice of every special meeting shall state the general nature of the business to be transacted thereat.

Section 4. Twelve members present in person shall constitute a quorum for the transaction of business at all meetings of the members.

Section 5. In lieu of written notice to members of any annual or special meeting of the Corporation at least ten (10) days' notice of such meeting shall be given by advertising once in one newspaper of general circulation within the City of Philadelphia, and once in the legal journal published in the County of Philadelphia, if any.

Article V. Directors

Section 1. The business and affairs of the corporation shall be managed by a Board of Directors. The persons presently acting as directors shall continue to serve as such until their respective terms expire. Beginning with the annual meeting of members in 1955, the Board of Directors shall consist of twelve (12) persons and at said annual meeting in 1955 there shall be elected four directors for a term of three years, two directors for a term of two years, and one director for a term of one year. Thereafter four directors shall be elected at the annual meeting of members each year, for a term of three years.

Any unexpired term created by the resignation, death, or total incapacity to act of any director may be filled by a majority of the remaining directors though less than a quorum. If they fail to so elect, the members shall do so at their next annual business meeting or at any special meeting called for that purpose.

Section 2. A meeting of the Board of Directors shall be held immediately following the annual business meeting of the members. If a quorum of directors be then present no notice of such meeting shall be necessary and at such organization meeting the Board of Directors may elect officers for the ensuing year and may also transact any other business coming before the meeting. In addition to such meeting, regular meetings of the Board of Directors shall be held on the fourth Fridays of May and October in each year at such place and hour as may be determined by the President or by a majority of the directors.

Section 3. At the discretion of the President or at the written request of any two members of the Board of Directors, a special meeting of the Board of Directors shall be called by the President. Any such request shall state the general nature of the business to be transacted at such meeting. The time of holding a special meeting shall be fixed by the President and shall be within ten days of his receipt of the request therefor. Such meeting shall be held at the place at which regular meetings of the Board are held unless the Board shall otherwise designate.

Section 4. The President or the Secretary shall give to each director not less than five days' written notice of each regular and special meeting. The notice shall state the time and place of the meeting and in the case of a special meeting shall state the general nature of the business to be transacted thereat.

Section 5. Five (5) members of the Board of Directors shall constitute a quorum for the transaction of business at meetings of the Board of Directors.

Section 6. The President shall have the power to appoint such committees as he may deem necessary and to prescribe the duties of such committees.

Section 7. The Board of Directors shall submit each year at the annual business meeting of the members a report of the principal activities of the Board during the preceding calendar year and a statement of the financial condition of the Academy.

Section 8. The Board of Directors shall have the power and authority, by affirmative vote of a majority of those present at any duly convened meeting, to borrow money and to purchase, sell, lease away, or otherwise acquire or dispose of real estate.

Article VI. Officers

Section 1. At the first meeting of directors after the annual business meeting of members in 1955 and each year thereafter, the directors shall elect a President, a First Vice-President, a Secretary, and a Treasurer. They may also elect one or more additional Vice-Presidents and an Assistant Secretary and an Assistant Treasurer and such other officers and assistant officers as they may desire. All officers shall hold office until the organization meeting of the Board of Directors following the next annual meeting of members and until their successors are elected and qualified. Any officer shall be subject to removal by the Board of Directors at any time. A vacancy in any office may be filled by the Board of Directors at any meeting thereof.

Section 2. The President shall be the chief executive officer of the corporation and shall be responsible for conducting its activities, subject to the control of the Board of Directors. He shall preside at all meetings of members and of the Board of Directors at which he is present.

Section 3. The First Vice-President shall in the absence or during the disability of the President have all the powers and perform all the duties of the President provided however that the Board of Directors may grant the President a leave of absence for any period and may delegate the powers and assign the duties of the President for such period or any portion thereof to some officer other than the First Vice-President, including any officer specially elected or appointed for the purpose, and may revoke such delegation of powers and assignment of duties at the pleasure of the Board.

Section 4. The Secretary shall keep the minutes of all meetings of the members and of the Board of Directors. He shall give notice of all such meetings, shall have custody of the corporate seal, and shall affix the same as required by the Board of Directors. In the absence or during the disability of the Secretary, his duties shall be performed by the Assistant Secretary.

Section 5. The Board of Directors may by resolution not inconsistent with these Bylaws add to and define the duties of any officers, and any officer whose duties are not defined in these Bylaws or by the directors shall have the duties ordinarily pertaining to his office.

Article VII. Fiscal Provisions

Section 1. The fiscal year of the corporation shall coincide with the calendar year.

Section 2. Any of the funds of the corporation on deposit with any bank or trust company shall be subject to withdrawal on the signatures of such persons as may be determined from time to time by resolution of the Board of Directors.

Section 3. The books and accounts of the corporation shall be audited annually by independent auditors who shall be elected by the Board of Directors. A copy of each such report of audit shall be delivered to each member of the Board of Directors.

Article VIII. Amendments

These Bylaws may be amended by a majority vote of those present at any meeting of the members of the corporation or of the Board of Directors. Any such change made by the Board of Directors shall continue in effect unless and until altered at a meeting of the members of the corporation.

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

LIE, TRYGVE. *In the Cause of Peace: Seven Years with the United Nations.* Pp. xii, 473. New York: The Macmillan Company, 1954. $6.00.

It is perhaps too early to judge the exact role of Trygve Lie in the shaping of the United Nations, but this description of his seven years as Secretary-General adds to the information upon which such judgment must be based. The Charter gives to the Secretary-General far wider power than the Covenant gave to his predecessors in the League of Nations. The right to present to the Security Council any situation which he judges a threat to international peace and security is the linchpin of these powers. At the same time, the Secretary-General is the administrative head of the large and complicated Secretariat of the United Nations. Many observers had the impression during Mr. Lie's tenure of office that administration was neither his forte nor his major interest. These memoirs appear to confirm that assessment. His concept of the duties of the Secretary-General makes clear that he saw the office as an independent and powerful instrument to be used in the effort to preserve the peace in the face of growing international divisions. It is true that in his Preface he suggests that he may at some future time give us his reflections on the many administrative problems which confronted him, but I suspect that no reader will fail to carry away the feeling that such problems were not the major concern of the first Secretary-General. His account of his stewardship is heavily weighted with descriptions of his individual efforts to conciliate the many critical issues of the cold war—in the questions of Iran, Palestine, the Berlin blockade, the Korean war, Red China's representation in the United Nations. He is most revealing in his discussion of his swing round the major capitals of the world as he attempted to promote his so-called ten-point peace plan in 1950. For while the basic outlines of his program and efforts have been well-known, his account does fill in details which add much to our knowledge of the significant elements of the cold war era. His growing disillusionment with the policies of the leaders of the Soviet Union, despite his earlier efforts at impartiality (which, among other things, won him the criticism of American representatives and public), come out almost as a central theme of the volume. More to the point, his descriptions of meetings with Soviet representatives, from Stalin down, leave little doubt of the fundamental intransigence of the Soviet position, even in the instances when they accepted some measure of compromise.

In contrast to his extended description

of such political matters is Mr. Lie's discussion of his handling of a major administrative question, the problem of the "loyalty" investigations of U.N. employees. Here, despite his long analysis of his position, the account seems to indicate that he lost control of the situation. It may be, as one reviewer has already suggested, that his role here persuaded many of his supporters not to insist upon his postponing his resignation until the end of his second, three-year term of office. In any event, the observer from the outside has the impression from these pages that Mr. Lie took a much less independent position on this issue—and managed it much less skillfully—than in the case of the problems of international peace which occupied most of his attention as Secretary-General.

On the whole this is an important book, particularly for the layman who has some concern for the major problems of our time. It reveals no great international secrets, but it is revealing of the attitude and the work of a man of good will attempting to do an almost impossible job and, it should perhaps be added, finally sacrificed as a result of the deep international tensions which he did his best to ameliorate.

BOWIE, ROBERT R., and CARL J. FRIEDRICH (Eds.). *Studies in Federalism.* Pp. xlii, 885. Boston; Toronto: Little, Brown & Company, 1954. $15.00.

This volume was inspired by an interest in the movement for some kind of federal union for the countries of Western Europe. Financial assistance was provided by a grant from the Ford Foundation as secured for the Federalism Project by the American Committee on United Europe. Messrs. Bowie and Friedrich were directors of research; they were assisted by a group of associates and research assistants. In a Preface, Professor Friedrich explains that most of the same material has appeared in French and much of it in German. He further notes that these studies "were prepared at the request of the Comité pour la Constitution Européenne of the Mouvement Européen."

In general, the directors and editors followed a plan of assigning to "native" authorities the task of covering aspects of federalism in their own countries. The studies were confined to Australia, Canada, West German Federal Republic, and the United States.

A Summary of Contents will reveal the principal topics and phases of federalism treated and those who wrote about them:

1. The Federal Legislature, by Robert R. Bowie; 2. The Federal Executive, by Carl J. Friedrich and Robert H. Guttman; 3. The Federal Judiciary, by Paul A. Freund; 4. Defense, by Robert R. Bowie and William J. Schrenk; 5. Foreign Affairs, by Louis B. Sohn and Paul Shafer; 6. Commerce, Transportation, and Customs, by Arthur E. Sutherland; 7. Federal Powers Over Currency, Banking, Credit, and Foreign Exchange, by H. van Buren Cleveland and Herbert J. Spiro; 9. Agriculture, by Ayres Brinser; 10. Labor and Social Security, by Carl J. Friedrich and Albert A. Mavrinac; 11. Personal Rights, by Robert G. McCloskey; 12. Citizenship and Immigration, by William J. Schrenk; 13. Defense of the Constitutional Order, by Carl J. Friedrich and Arthur E. Sutherland; 14. Overseas Territories, by Robert R. Bowie, Carl J. Friedrich, and Guy J. Pauker; 15. Admission of New States, Territorial Adjustments, and Secession, by Carl J. Friedrich; 16. Amendment of the Constitution, by Edward McWhinney.

There are useful bibliographies including general works on federalism and books and monographs relating to the federal systems and practices in the five countries studied. Appendices carry the "Draft Resolution of the Study Committee for the European Community" and the "Draft Treaty Embodying the Statute of the European Community." The Introduction by Professor Friedrich provides a helpful review of efforts towards a constitution for the European community.

This volume is essentially a factual review of aspects of federalism in the five countries chosen for attention. There are some limitations which attend a large cooperative labor of this nature, but a patient pursuit of the storehouse of reliable information found in this volume will reward all those interested in federal government.

The recent events in Europe leading to the sidetracking of the European Defense Community (EDC) in favor of the newer plan for what is officially described as "Western European Union" should certainly not decrease the importance of this work; on the contrary its usefulness is all the more apparent.

HART, B. H. LIDDELL. *Strategy: The Indirect Approach.* Pp. 404. New York: Frederick A. Praeger, 1954. $5.95.

As one of the best known military theorists of our time, B. H. Liddell Hart definitely influenced generalship on both sides in World War II. For this reason the present book is important as it brings up to date the military philosophy previously expounded in his other works.

History proves, he says, that success in war is due generally to the "indirect approach" rather than to the "direct." His "indirect approach" may or may not be such in a geometric sense for he writes, "a decision is produced more by the mental and moral dislocation of the command than by the physical dislocation of its forces and these effects transcend the geographical and statistical calculations which fill nine-tenths of the normal book on military history."

To prove his point, Liddell Hart reviews war from Marathon to the Arab-Israeli conflict. This covers the bulk of the pages. The narrative is too concise for a beginner, but it could hardly be more full in a single volume. In Conclusions he says that "we can crystallize the lessons in two simple maxims—one negative, the other positive. The first is that, in the face of the overwhelming evidence of history, no general is justified in launching his troops to a direct attack upon an enemy firmly in position. The second, that instead of seeking to upset the enemy's equilibrium by one's attack, it must be upset before a real attack is, or can be successfully launched."

The meat of the book, however, is Part IV, "Fundamentals of Strategy and Grand Strategy." Here Liddell Hart analyses not only military strategy, but also such questions as why sometimes the result of victory is an unsatisfactory peace. As to the present, he regards the "H" bomb as a "direct" and, therefore, incorrect approach.

He also points out the difference in war aims of "the acquisitive State" which "inherently unsatisfied, needs to gain victory in order to gain its object, and must therefore court greater risks in the attempt. The conservative State can achieve its object by merely inducing the aggressor to drop his attempt at conquest." This differs with General MacArthur's "There is no substitute for victory."

An outstanding chapter is "Hitler's Strategy" which is compared with that of Clausewitz, Napoleon, Lenin, and Ludendorf. Hitler gets more credit for ability than in most current history. However, the author shows how Hitler, like Napoleon, became intoxicated with success and then, impatient, turned to "direct" actions and downfall.

The book is well worth the time of any serious student of world affairs or politico-military history, particularly as Liddell Hart numbers among his disciples many of today's leaders.

Washington, D. C.

GROSS, FELIKS. *Foreign Policy Analysis.* Pp. xxiv, 179. New York: Philosophical Library, 1954. $3.75.

The problem to which Professor Gross addresses himself in this small volume—the application of scientific thinking and concepts to foreign policy analysis and formulation—is indeed one that has been "sadly bare of clear ideas," as Mr. Adolf A. Berle, Jr. asserts in a brief foreward. The author approaches the subject with a proper acknowledgment of the "serious limitations of application of a scientific method to a study of social phenomena." He wisely warns the reader not to expect "any startling new theories," and he admits that the processes which he outlines have been basic to the foreign policy analyses of "empirical realists" in the past, although not consciously organized into a scientific system.

Ideology is central to Professor Gross's conception of foreign policy. As he puts it, "there can be no foreign policy without an ideology; more, there are no men without

ideologies." In his opinion the ideology of a nation furnishes the objectives of foreign policy. Designating as "factors" those elements necessary "to enforce such objectives," he identifies them as geographic, economic, demographic, military, social-political, and social-psychological; he labels as factor X the element of chance and accident. Foreign policies, in the author's analysis, are "patterns of behavior" or "courses of action" which, in a long-range view, are in the nature of strategy determined by ideology; short-range policies are like tactics. In substance, Professor Gross's system of science is one of relating ideology, factors, and policies. Nothing exact or mathematical is claimed for the processes described. They offer logical methods of thinking about foreign policies, but they provide no test-tube finality.

No doubt the processes presented by Professor Gross would be useful to analysts of past and present policy. The extent to which they could be used for the determination of future policy is not so clear, because here, since the variables are not yet in view, they cannot be taken into account for events yet to come. The author incorporates into his system the "problem paper" approach of the Brookings Institution, with the formulation and discussion of alternative courses of action as a means of deciding upon future policies.

All in all, Professor Gross has made a good beginning to a scientific approach to foreign policies. His book is commendable —if for no other reason than that it presents a new point of view. In time it may be that foreign policies, like medicine, will be transformed from an art into a science, to use an analogy suggested by the author in his final chapter.

NORMAN L. HILL

EUROPEAN MOVEMENT. *The Economic Future of Europe.* Pp. 188. New York: Frederick A. Praeger, 1954. $3.50.

This slim volume contains the preliminary papers of the European Movement's Second Conference of Westminster held in January, 1954. Unfortunately for American readers, it is nowhere stated just what the European Movement is and what it stands for, or what particular issues on the conference agenda the four "Introductory Reports" and four "Working Papers" that make up the volume were intended to illuminate. Without any prefatory explanation on these points, the book is best regarded as a collection of essays by nine eminent Europeans on the broad theme indicated by its title.

Unless the reviewer is mistaken, however, all the contributors subscribe to a common thesis. One strand of this thesis is that, for political and social reasons, real levels of living in Europe have to be raised appreciably and that, broadly speaking, only two means to this end are available. The first is to integrate the European market into a unified whole so that the labor and capital resources already in hand can be more effectively utilized. The second is to raise efficiency and output within this integrated market by stepping up the rate of productive investment. But both are necessary and must be pursued together. All the contributors are thus concerned to explore the practical means towards their common objective. Baron René Boel, a Belgian banker and industrialist, examines the monetary problems of Europe—dollar shortage, convertibility, and European Payments Union—as they bear on trade and investment. Lord Layton reviews the existing international economic institutions to determine how and how far they serve to promote the desired end. G. M. Nederhorst, a Dutch socialist, gives an interesting analysis of the implications of economic unification for national wage levels, displacement of workers, and migration. Johannes Semler and Muhlis Ete explore the questions of how best to mobilize European capital for new investment, the potentialities of a common investment policy for Europe instead of merely national policies, and investment in the overseas territories. René Piaton writes on other problems in the expansion of production.

The second strand of the common thesis is that the full potential of the European economy cannot be realized without the restoration of vigorous trade and investment within the world as a whole. In other words, the European countries can do a good deal for themselves, but the solution to such problems as instability of raw material prices in world markets, the development of underdeveloped areas, unbalanced exchanges, and dollar shortages must be shouldered by other countries, chiefly the United States. The two papers by André Philip and Julian Amery deal essentially with these non-European aspects of raising real incomes in Europe. Both are excellent though perhaps Amery's paper is fresher and more original in its approach.

One cannot but admire the devotion and sincerity with which these members of the European Movement have approached the economic problems of Europe. The authors see their separate problems realistically yet optimistically. But the real nub of the whole problem is put very nicely in the short paper by Professor I. Svennilson in these words: "we cannot preserve the present economic nationalism of the welfare state and at the same time continue to talk about economic integration. Political co-ordination or even integration is necessary in order to formulate the plans or conclude the agreements which will lead to economic integration. If the various countries are not prepared to proceed in this direction, and to give up at least some part of their political autonomy in sphere of economic policy, there seems to be little sense in continuing to play around with ideas about economic integration." The painful truth of this assertion would appear to be incontestable to any sensible person here or abroad.

WARBURG, JAMES P. *The United States in a Changing World: An Historical Analysis of American Foreign Policy.* Pp. xv, 496. New York: G. P. Putnam's Sons, 1954. $5.75.

In thirty chapters and an Epilogue, Mr. Warburg deals with American foreign policy from 1607 when the Colonies were merely pawns to the present when Washington has become the world's chief stage. He assembles a vast body of facts, analysis of which would require a book. Only as they illustrate the author's approach to what may be termed *Tendenzgeschichte* may one note particular points. Familiarity with his previous writings alerts the reader to an early buildup for the New Deal point of view. Thus it is illuminating to discover (p. 19), *in re* the approaching Revolution, that "in the urban centers the ever present resentments of the ill-housed and ill-fed were readily mobilized into a spirit of revolt against the existing order." Here is an astonishing backward projection of modern clichés more appealing to the publicist than the historian.

Again, the Constitution is viewed as surprisingly liberal considering the prosperity of the Founding Fathers—an echo of the earlier Charles A. Beard. More credit is awarded Thomas Jefferson for democratic principles than for diplomacy. Anticipatory is Jefferson's interpretation of revolutionary excesses—French, but Russian may be substituted—as the outcome of previous tyranny than as an indictment of democracy. Jacksonian Democracy attested the conflict between the few beneficiaries of the industrial revolution, finance capitalism and the "American System," and the disinherited majority (p. 106).

There are few factual errors. Shay's Rebellion (p. 32) should be Shays'; two English adventurers were hung (p. 89). One was Scottish and only one was hung: Johnson's drunkenness (p. 158) was not at his inaugural but at his swearing in as Vice-President. Seal fisheries were not settled satisfactorily under Benjamin Harrison (p. 182). To impugn the integrity of F. D. Roosevelt at Pearl Harbor is wholly beyond the author's power (footnote p. 339). Nicholas Biddle, on the other hand, was "selfish, vain, and irresponsible" (p. 107). The wickedness of Senator Joseph McCarthy transcends description.

The normalcy of Warren Gamaliel Harding is the author's *bête noire*. Eisenhower would not consciously pursue this base objective but his "concessions to a demagogue whom he obviously despised" are an uncomfortable reminder of von Hindenburg and Hitler (p. 467).

Wide reading and much thought underlie the present volume. The resulting synthesis is interesting and at times profound and merits close attention. But the reader

whose ancestral roots and whose personal memories lie in pre-New Deal America will be prepared to challenge the author's views at many other points than opportunity was accorded to the present reviewer.

LOUIS MARTIN SEARS
Purdue University

PROUDFOOT, MARY. *Britain and the United States in the Caribbean: A Comparative Study in Methods of Development.* Pp. xii, 434. New York: Frederick A. Praeger, 1954. $8.50.

Side by side in the Caribbean lie a number of island dependencies belonging to two world powers, Great Britain and the United States. Because of differences in relations with the metropolitan powers they provide an excellent laboratory for the study of comparative colonial administration. As a former lecturer in modern history at Oxford married to a Northwestern University geographer, Mrs. Proudfoot is well suited to make such a study. She has, on the whole, succeeded admirably.

The title of the book is slightly misleading, for it covers selected dependencies—Puerto Rico and the Virgin Islands of the United States, and Barbados, Jamaica, Trinidad, and St. Lucia in the British Caribbean. The Virgins and St. Lucia are, moreover, but lightly covered. It might have been better to omit them altogether than to slight them, for added complexity in the study is not compensated for by any great mass of information about them.

Mrs. Proudfoot's approach in this study is functionally comparative. That is, she discusses each matter—relation of dependencies to metropolitan country, internal administration and politics, economic and social life, and the like—for each of the colonies in turn before moving on to the next point. This is at the same time enlightening and confusing; enlightening in that it makes integrated comparisons possible, confusing in that the reader finds it difficult to picture any one of the islands as a unit. Nonetheless, the book supplies a comprehensive view of the dependencies covered but, as in most surveys, breadth of coverage is achieved at the expense of depth.

Relatively little new material appears in this study, but it reflects a painstaking compilation of widely scattered official and unofficial material that has not previously been combined, especially in the thirty-four factual tables at the end of the work. It is regrettable that much of the information does not extend beyond 1951, for recent cultural studies in particular would be a valuable addition. See, for example, THE ANNALS, January 1953, dealing with Puerto Rico.

This book is best suited for the "expert" who already is acquainted with the area, for the array of fact might overwhelm the neophyte. Given the mass of data included, inevitably a few factual errors crept in, and I for one cannot accept all of the author's statements and conclusions, but she has provided a worthy contribution to the literature of the Caribbean.

UNITED STATES GOVERNMENT AND HISTORY

BROWN, STUART GERRY. *The First Republicans: Political Philosophy and Public Policy in the Party of Jefferson and Madison.* Pp. 250. Syracuse, N. Y.: University of Syracuse Press, 1954. $3.00.

Professor Brown has condensed into less than 200 pages a sound and thoroughly documented history of the Jeffersonian party during the first thirty-four years of the Republic. He sets forth accurately the principles, philosophy and policies of the Jeffersonians. Seldom anywhere has a political party been led by men of the stature of Jefferson, Madison, and Monroe. On the few occasions when Jefferson and Madison did not see eye to eye, the differences were minor. True Jefferson insisted on a bill of rights which Madison at first thought unnecessary, but it was Madison who sponsored the first ten amendments that constitute our Bill of Rights. The party was united in opposition to the Federalist's financial, economic, and foreign policies. It was Gallatin who, as Secretary of the Treasurer, made the system designed by Hamilton conform to the American idea. The Jeffersonian hostility to Hamilton's Bank, explained by Federalist propagandists as due to Jefferson's and Madison's "ignorance of banking," is described by the author as due to their understanding of liberty and equal rights. These "first republicans" successfully challenged the Federalist's system of privilege. Thus Gallatin proved Hamilton's imitation of Pitt's funding system to be a fraud. Thus Jefferson defeated the Federalist plan to scrap the treaty with France on the ground that it was made with a monarchist and feudalist society which had been destroyed with the reminder that the treaty was made with France, not just Louis Capet; and he laid it down as the American policy that treaties are points of honor and cannot be scrapped to meet the momentary requirements of domestic politics. Thus in opposition to the Hamiltonian reliance on measures that would discourage foreign trade the Jeffersonians favored a liberal trade policy, and, as the author says, they would have given warm support to Cordell Hull's reciprocal trade plan.

Professor Brown makes clear that the Jeffersonians enunciated the fundamental principles on which the nation has operated for a century and a half. Where the Federalists said that Congress had no right to information from the Executive on treaties negotiated, Jefferson declared that since Congress must determine on ratification or rejection, it is entitled to the inside story. And when the Federalists tried desperately to crush democracy and deny the freedoms with the Alien and Sedition laws, the Jeffersonians fought the battle of civil rights—"the first great fight for civil liberty" on the success of which was "conditioned the whole future of the United States."

The average American knows, as Henry Adams wrote, that no treaty as humiliating as that of Jay would have been accepted any time after 1800, but few are familiar with the scurvy trick played on Monroe by the Federalists in sending him as Minister to France to soften the resentment there over the Jay treaty and then recalling him "in disgrace" for cultivating friendly relations after Robespierre was dead and the Terror was ended. Here we have the sorry story.

An admirable and authoritative book that all Americans would do well to read.

CLAUDE G. BOWERS
New York, N. Y.

KONVITZ, MILTON R. *Bill of Rights Reader.* (Cornell Studies in Civil Liberty.) Pp. xix, 591. Ithaca, N. Y.: Cornell University Press, 1954. $6.50.

Even a cautious observer of the contemporary political scene can note a definite, if modest, brightening in the atmosphere that pervades civil liberties and personal freedoms.

A concommitant of this trend is an awakened public interest in the problems of freedom and security. This renewed interest is, of course, a manifestation of approaching sanity. But it is more than that; it is a cause of it as well. In a democracy it is still a safe bet that given light the people will in the end find the way.

It is in this respect that Professor Konvitz's collection of cases on civil rights represents a real contribution. When our Constitution finally emerged from the convention without a bill of rights and the omission raised a storm of objection, Madison, who himself thereafter became the chief draftsman of the Bill of Rights which was later added to the Constitution, expressed his perhaps prophetic skepticism as to the value of such a declaration of rights "because experience proves the inefficacy of a bill of rights on those occasions when its control is most needed." Nevertheless, he agreed that "a bill of rights would be a good ground for an appeal to the sense of the community." The court decisions compiled and edited by Professor Konvitz present indeed good ground for an appeal to the rational and mature sense of the community.

While apparently designed primarily for college and law school use, the book can and should receive a wider circulation. Fortunately, Supreme Court decisions, at least in the field of civil rights, are largely

free of the legalistic jargon that so repels non-lawyers. Indeed some of the decisions (as, for instance, Justice Jackson's opinion in *West Virginia State Board of Education* v. *Barnette*) are stylistic gems and are masterpieces of eloquence that can be appreciated by any intelligent layman.

Professor Konvitz's choice of cases, while more modest than Emerson and Haber's, is sound. This reviewer is particularly pleased with the prominent position accorded to religious liberty, which, historically, is the progenitor of all other liberties. That this position is still maintained is evidenced by the cases in Professor Konvitz's book; these show clearly that none of the freedoms guaranteed in the Bill of Rights is as secure today as is freedom of religion. One need only compare *Finer* v. *New York* with *Kunz* v. *New York,* both decided by the Supreme Court on the same day, or *Tucker* v. *Texas* with *Dennis* v. *United States* to see how differently political and religious heterodoxies are treated by the Supreme Court.

It is, of course, not to be expected that a critic will fully agree with all Professor Konvitz's inclusions and exclusions. This reviewer, for example, finds it difficult to justify the omission of *Kedroff* v. *St. Nicholas Cathedral,* a decision of monumental significance. If a choice had to be made between the *Kedroff* case and *Watson* v. *Jones,* this reviewer believes Professor Konvitz erred in choosing the latter. *United States* v. *Ballard,* though a difficult case to grasp, is likewise too important to have been omitted. Nor is this reviewer persuaded by Professor Konvitz's explanation for his omission of any opinions by Holmes or Brandeis. *Schenck* v. *United States,* the concurring opinion in *Whitney* v. *California,* and the dissent in *Abrams* v. *United States,* though temporarily eclipsed by *Dennis* v. *United States,* and *American Communications Association* v. *Douds,* are not dead; this reviewer ventures to suggest that they are likely to outlive *Dennis* and *Douds.* By and large, however, the selection shows genuine understanding of the basic issues, the opinions are edited with care and judgment, and the introductory comments, while they could well have been expanded, are in most cases adequate. All in all this is a useful book and should receive wide circulation.

LEO PFEFFER
American Jewish Congress

DE GRAZIA, ALFRED. *The Western Public, 1952 and Beyond.* Pp. ix, 226. Stanford, Cal.: Stanford University Press, 1954. $3.00.

The analysis from which this book of many insights developed was carried on by the Survey Research Center of the University of Michigan and was financed by the Carnegie Corporation as a part of a national study of the 1952 presidential election. A sample of 2,021 Americans was chosen, according to principles of statistical probability, to stand for the people of the nation. The West's portion of the sample was 210 cases, later increased to 452 to make it more representative. In the study, the West is the eight mountain states and the three Pacific Coast states. Three-fourths of the votes of the eleven states were cast by California, Oregon, and Washington, a fact which should be kept in mind as one considers Professor De Grazia's conclusions.

In September and October of 1952 interviewers from the Survey Research Center, with a pre-tested questionnaire of approximately 50 questions, interviewed the 452 persons selected. Immediately following the election 210 persons, nearly all of whom were in the original 452, were seen again by the interviewers, who on the return trip had a shorter questionnaire of some 30 questions. All the information gathered was transposed to International Business Machine tabulating cards containing punched codes. Then the crank was turned, and quickly the political secrets of the West were revealed.

The chief finding of the study is that in 1952 the West voted as did the nation, that is for Eisenhower, only more so. The Republican presidential vote in the West increased by 8 per cent more than in the nation as a whole, the mountain states swinging even more vigorously to Eisenhower than did the coastal states.

No overriding issue seemed to explain the swing, although the unpopular Korean War was the most important Republican asset. The 25 per cent of the voters who had not made up their mind by the opening of the campaign, and who composed the group that decided the election, were precisely the ones who were most opposed to continuing the Korean War. Local issues peculiar to the West were not of importance in the election. National and international considerations were uppermost in the minds of Westerners as they went to the polls.

Party organization did not play much part in the vote outcome, De Grazia found. Relatively few people reported being contacted by party workers, and of those reached, few believed they had been influenced. Voters apparently made up their minds from information reaching them via mass media. Only 11 per cent of the voters waited until the last two weeks of the campaign to decide how to vote, and two-thirds of these voted for Eisenhower.

Although De Grazia states the West votes far more like other American regions than previously believed, the study does indicate some differences. The West in 1952 voted significantly fewer straight tickets, and the rural areas of the West voted more liberal than did rural areas in other regions.

The most important truth about Western politics that De Grazia lassos is that the West is oriented toward the positive or welfare state. In the minds of Westerners, the Democrats have become associated with the idea of such a state. Consequently, when the Republican party wins, "it wins as a recess from the Democratic party, or as a change of horses of the same gait or speed."

The only amendment I have to offer to De Grazia's conclusion is that when the presidential candidate of the Republicans wins in the West, he wins because the people want to change to a horse of *slower* speed.

THOMAS C. DONNELLY
New Mexico Highlands University

WILLCOX, WILLIAM B. (Ed.). *The American Rebellion: Sir Henry Clinton's Narrative of his Campaigns, 1775–1782.* Pp. li, 658. New Haven, Conn.: Yale University Press, 1954. $7.50.

There has always been argument and uncertainty regarding the contribution of Sir Henry Clinton to the winning of our War for Independence. Accepting the general ineptness of British command, one may yet ask why Clinton did not do more to aid Burgoyne? Why he remained largely inactive around New York for three years? Why he shut himself up on Manhattan Island while the world was being turned upside down? Recalled shortly after Yorktown, Clinton found that he was receiving full blame for that defeat. He demanded a parliamentary inquiry; it was refused. The remainder of Clinton's life, over a decade, was devoted to the preparation of his personal memoirs of the war in America. Obviously, he aimed to justify his conduct and pin the blame on others. Nearly half the manuscript dealt with the campaign of 1780–81. Clinton died before his manuscript was ready for the printer, and together with all of his papers it eventually became a part of the manuscript collection of the Clements Library at the University of Michigan. Scholars have had access to it, but this is its first publication.

In appraising this massive volume (with its more than 200 pages of documents, letters, and extracts of letters) the reader may well ask certain questions: of what historical significance is this manuscript of Clinton's? Does the editing bear the stamp of careful and intelligent scholarship? Will the reader gain insight into the thinking and character of a man so largely responsible for the American victory?

There are several reasons why this account has great historical significance. The length and importance of Clinton's service is one factor. Another is the dearth of analytical writing by the Revolutionary military leaders, on either side. Yet one may well ask to what extent a manuscript, prepared for publication years after the events described took place, and written for the sole purpose of self-justification, can be trusted? Professor Willcox asserts that "however suspect his [Clinton's] analysis, in the process of making it he composed a study in the problems of command—not only strategy but logistics and finance, politics and personal relations—

that is unique in the literature of the war." Furthermore, after years of careful study in which he compared Clinton's manuscript with the letters, papers and military orders of the war years, the editor concludes that "if the test of reliability is the accurate reporting of events and views, his narrative is as reliable as the most exacting scholar could desire."

This reviewer has already indicated his answer to the second question, concerning the quality of the editing. Professor Willcox demonstrates not only a thorough mastery of the Clinton Papers, but an unusual ability to analyze military situations and to discuss military problems. Furthermore, no one can read the superb Introduction without sharing the editor's understanding of the character of this paradoxical and little-known general. While it may be wished that the author's style were as delightful as the editor's, this is a volume that no student of the eighteenth century can safely ignore.

RALPH ADAMS BROWN
State University of New York

DAY, DONALD, and HARRY HERBERT ULLOM (Eds.). *The Autobiography of Sam Houston.* Pp. xviii, 298. Norman: University of Oklahoma Press, 1954. $5.00.

"From many points of view he [Sam Houston] is the most striking figure of his century, certainly in North America. His is truly an epic figure for his is truly an epic life" (p. xi).

On March 2, 1793, Sam Houston was born. He lost his father when quite young, and his mother moved from Virginia to Tennessee. Sam soon ran away from home and passed several years with the Cherokee Indians.

During the War of 1812 he enlisted in the army and served under Andrew Jackson. In the Battle of Horseshoe Bend, Houston was wounded and Andrew Jackson cited him for heroism. When strong enough Houston journeyed on horseback to Washington. "I reached the seat of Government," said Houston, "soon after the burning of the capital. In common with every true friend of my country, my blood boiled when I saw the ruin, and I experienced one of the keenest pangs of my life" (p. 15).

At the conclusion of the war Jackson resigned his commission and began the study of law. He was elected to Congress in 1823 where he served until he became Governor of Tennessee in 1827. On January 22, 1829, Houston "made a romantic marriage, only to leave his wife a few weeks later to go into disgrace and self-imposed exile, giving up his political career [resigning the governorship] with a statement that he 'would not fight with a woman'" (p. xii).

He made his new home among the Cherokees in Arkansas. During his residence there, he became acquainted with the frauds practiced upon the Indians by the federal officials, so he undertook a mission to Washington for the purpose of exposing them, but the results were futile; meanwhile, there is no doubt that Sam Houston learned of Jackson's interest in Texas. When trouble subsequently appeared in Mexico, Houston moved to Texas. After Santa Anna failed to give the people of Mexico a government based on the Constitution, the Texans revolted. A militia was organized, and Sam Houston soon became Commander in Chief of the armed forces. He finally brought it to a glorious conclusion by the battle of San Jacinto when Santa Anna and his entire army were captured.

Sam Houston became the first president of the Republic of Texas on October 22, 1836. He now told President Jackson that "my great desire is that our country Texas shall be annexed to the United States . . ." (p. 135). As Houston was not eligible to succeed himself, he was followed by Mirabeau B. Lamar, who had visions of grandeur.

In 1841 Houston was again elected President of Texas. He still urged the annexation of Texas to the United States, but he retired from office before he saw the consummation of his dream in December 1845 when Texas became a state in the Union. Sam Houston now became a senator of the United States. Here he served his country well from 1846 to 1859, when he became governor of Texas. As governor he fought valiantly to keep Texas in the Union. He was deposed as governor because he refused to pledge his allegiance to the Confederacy.

The editors are to be congratulated on the excellency of their work. They have accomplished their purpose by letting Sam Houston speak for himself. The illustrations are interesting, the bibliography is adequate, and the index is satisfactory.

GEORGE D. HARMON
Lehigh University

TODD, RICHARD CECIL. *Confederate Finance.* Pp. x, 258. Athens, Ga.: University of Georgia Press, 1954. $5.00.

The great contribution of Bernard Baruch to public finance makes appropriate the award to the author of this book by the United Daughters of the Confederacy of the Mrs. Simon Baruch University Prize. The volume contributes to a neglected area of Southern history; it throws some light on the current attitudes of the South; and perhaps most importantly emphasizes problems of importance to the survival of this nation should it again become a theatre of war.

In terms of Southern history, no facts of major importance have been added. It does strongly suggest a re-evaluation of the public service of Christopher G. Memminger, the Charleston banker who was Secretary of the Treasury until the Confederate Congress made him a scapegoat, a willingness that even continues in the recent *History of the Southern Confederacy* by Professor Eaton. Mr. Todd demonstrates that Memminger was in fact a harried genius and that the twin problems of insufficient revenues and inflation were so vast that the would-be nation could not survive a long struggle.

It is the direct concentration upon the revenue resource problem which gives the book its greatest value. The drama of last charges, turning of flanks, blockade running, and debates about constitutional law are absent. Instead there are faced the hard realities of produce loans, printing press money, counterfeiting, requisitioning, price control, tax collection, and the organization of these activities in a region badly sliced by invading armies. The lesson seems plain that if atomic warfare ever were to isolate parts of this nation, effective resistance and civilian morale would depend upon adequate taxation, and measures for requisitioning and stemming inflation.

There are profound suggestions with respect to the impact of Confederate financial experience upon present Southern attitudes about the function of Government; it is unfortunate that these are not further developed. Why is there usually support for heavy taxes and balanced budgets from the South, a debtor area? Why is it that a great agricultural producing region has been the source of much support for direct anti-inflationary measures? Is the States's rights tradition consistent with the typical Southern attitude favoring centralized direction of foreign and financial policy, and such newer issues as public housing and the maintenance of farm income? Perhaps the biographer of the late (and usually underrated) Senator Burnet Rhett Maybank, descendant of Robert B. Rhett, Charleston's leading secessionist, will make an attempt to answer some of these questions.

JAMES A. DURHAM
Executive Office of the President

HOBBS, EDWARD H. *Behind the President, A Study of Executive Office Agencies.* Pp. vi, 248. Washington, D. C.: Public Affairs Press, 1954. $4.50.

In two previous studies, *Executive Reorganization of the National Government* (1953) and *The Executive Office of the President* (1953), the author established himself as a competent student and analyst of the administrative organization of the national government. With this experience as background, the author brings together in the volume under review a series of chapters treating in detail past and present agencies that have made up the Executive Office of the President. The series is tied together at the beginning with an historical treatment of the Executive Office and at the end by a chapter dealing with the machinery under President Eisenhower.

Each of the several agencies dealt with —Bureau of the Budget, National Resources Planning Board, White House Of-

fice, Council of Economic Advisers, National Security Council, National Security Resources Board, and Emergency Mobilization Agencies—is treated in parallel fashion. A brief historical note is followed by a description of the agency, its personnel, functions, and relationships with other parts of the national government. But the treatment is more than descriptive. Included also are criticisms and recommendations made by the Hoover Commission and similar bodies, professional students of public administration, and the author himself. From the detailed studies emerges an overall view of how the President gets his advice and performs the manifold duties required of him.

Readers will appreciate the historical tidbits with which the book abounds. They will also appreciate the scholarly manner in which the author has applied himself. But the greatest rejoicing will occur over the fact that the author and publisher have made available in a single volume a detailed account of relatively new and obscure agencies that play important and crucial roles in the American government. Without detracting from the Presidency itself, the book takes the reader backstage for a glimpse at the men, women, and organization which make it possible for the President to carry out his crushing responsibilities.

The book is too detailed and academic for popular consumption. Specialists in public administration will find few suggestions that are new. Some readers would welcome a more critical approach. Footnotes are at ends of chapters. Visual materials are absent. But for reference and teaching this volume fills an important gap in the literature dealing with the national government.

JOHN H. FERGUSON
The Pennsylvania State University

POTTER, DAVID M. *People of Plenty: Economic Abundance and the American Character*. Pp. xxvii, 219. Chicago: University of Chicago Press, 1954. $3.50.

This important volume is based upon lectures given at the University of Chicago under the auspices of the Walgreen Foundation for the Study of American Institutions. Professor Potter is the Chairman of American Studies at Yale University and is well qualified to make an analysis, from an interdisciplinary point of view, of that often mentioned concept, the American character. Even in the wide area of American studies, however, cultural anthropology, social psychology, and psychoanalysis are rather unusual auxiliary fields.

Part I of the book is preceded by a long Introduction which shows the relationships between history and the behavioral sciences and makes a plea for a united effort on the part of these disciplines to co-operate in the study of human culture and the search for a science of man. Part I itself has two sections, one showing the dilemma and frustration of the historians who have written of national character without comprehension of all aspects of the problem; the other discussing the valuable contributions to such an analysis already made by the behavioral sciences and suggesting lines along which the historians and scientists might pursue investigations.

Part II is much longer and has seven chapters discussing different phases of the nature of American abundance and of its part in shaping national character. These are very interesting and provocative chapters showing the effect of plenty upon American social and political institutions, in fact upon all aspects of American culture and upon the inner life of the people, determining how they look upon themselves and the world outside. Professor Potter goes beyond the physical plenty in the resources with which the continent was endowed and analyzes the abundance that has continued to be produced from man's use of those resources. This is the author's main contribution to this line of thought, for Americans have from the beginning been aware of the effect of abundant natural resources. It is in this continuing growth of wealth and resources caused by the inventive and adaptive ability of the people that Professor Potter finds one trait of a national character and reason for his apparent optimistic belief that, with a clearer knowledge of the bases of their culture and a closer examination of their history, the people of plenty may progress to a fulfillment of the American "dream."

The chapter, "Abundance and the Mission of America," offers some interesting conjecture on the reasons why it has been difficult to export American democracy and why the world today is not entirely friendly to the United States. Chapter IX on "Abundance and the Frontier Hypothesis" may be, with the first chapter, the section of the book most interesting to historians, for here Professor Potter makes his contribution to the mid-twentieth century's re-evaluation of, if not attack upon, the so-called Turner thesis. This section and some similar parts of Professor Henry Nash Smith's *Virgin Land* seem to contain valid criticisms of, and supplementary ideas for, the Turner frontier hypothesis as it has been expanded by the numerous Turner disciples in the sixty years since Turner published his work. One must, however, call attention to the fact that Professor Potter and his contemporaries, who criticize the Turner emphasis on the frontier as the edge of settlement or of unused land and resources, forget that from the vantage point of the mid-twentieth century they may be able to define "frontier" not as Turner's generation did but as—in Professor Potter's words—"the edge of the unused," and thus make a frontier hypothesis that fits the need for explaining the continuation of American abundance long after the free land frontier had disappeared.

The chapter on advertising as an institution of abundance is intriguing and amusing and may have a validity that a younger generation will be able to accept without question. The final chapter with its return to a consideration of the author's interest in the behavioral sciences will probably seem to most historians a bit fantastic and a mental exercise of little use to either those sciences or to the historian, despite a willingness to grant Professor Potter's original premise of the necessity to view American culture as a whole.

ALICE FELT TYLER
University of Minnesota

STURM, ALBERT M. *Methods of State Constitutional Reform*. (University of Michigan, Michigan Governmental Studies, No. 28.) Pp. xii, 175. Ann Arbor, Mich.: University of Michigan Press, 1954. $2.50.

Many of the publications of state university bureaus of research are not for review; they aren't even for reading. On receipt, they are to be put on shelves with books of the same size. Such studies are chiefly items in the decoration of a professor's office. This sad commentary does not apply to the Michigan studies, which have always been more than merely useful; necessary, really, to the student of state and local government.

Professor Sturm's monograph on methods of state constitutional reform was written by him from published sources. He also consulted experts in every state in the Union, as well as Puerto Rico and Hawaii, a type of research which has become quite popular in recent years, as well it should. The solicitation of advice was by mail; the only other way to make a satisfactory survey would be personal visitation, a method both expensive and time consuming. At any rate, this is an exercise in comparative government, carried out in the currently approved fashion. As a study, it is of immense value to political scientists. It should also be of interest, perhaps, also of inspiration, to leading citizens and public officials.

It is possible, briefly, to summarize Sturm's findings and conclusions. There have been many changes made in state constitutions. Two-thirds of the states have replaced their original documents. The old distinction between fundamental law and statutory matter has broken down: most modern constitutions are cluttered up with trivia. In most states, conventions are used for altering constitutions, but when there is sharp definition of "revision" and "amendment," conventions are employed for the former purpose, and not the latter. In either case, there is widespread reliance on popular referenda. Most minor changes originate in the legislature or with the people, by means of the "initiative." An interesting development is the "constitutional commission," such as that of New Jersey, Georgia, and Minnesota. Sturm notes two problems, each occurring within an area of importance to constitutional

change: (1) legislatures usually resist efforts to reduce the length of documents or their own prerogatives; and, (2) the citizens do not participate fully in decisions on "issues." There is less nonvoting when candidates are pitted against each other.

Most of Sturm's proposals for improvement and reform are eminently practical. However, since we, the citizens, don't want any disturbing reforms, there probably won't be any of consequence in the next few decades. The rural voters of Georgia, for example, are not going to allow any changes depriving them of advantages they now enjoy. Sturm shares the preference which most political scientists have for short, compact constitutions consisting entirely of "fundamental law." But he doesn't seem to be very optimistic about the realization of this ideal.

ROY V. PEEL
University of Utah

BURTON, HAL (Ed.). *The City Fights Back.* Pp. 318. New York: Citadel Press, 1954. $5.00.

The subtitle states prosaically that this is "a nation-wide survey of what cities are doing to keep pace with traffic, zoning, shifting population, smoke, smog, and other problems; narrated and edited from material developed by The Central Business District Council of the Urban Land Institute."

The book is all of this, but it is more; it is a vividly written ecological study which tells how cities—New York, Los Angeles, Cleveland, Pittsburgh, Allentown, Donora, and a dozen more—are shaking off the slow-creeping paralysis and decay and making "downtown" again the heart of the city. It is a realistic appraisal of the factors which led to the decay—indifference, opposition of some land owners, politics in city transit systems, opposition to zoning, absentee ownership, and the "rugged individualist" who asserts that he can "do with his property as he pleases." Failures are recounted as well as successes, but there are changes in many cities of which they may well be proud.

The author does not believe that there has been a "flight to the suburbs" but only that the city has overreached its former boundaries. As evidence, he cites the fact that few downtown stores have given up their locations in the heart of the city but only have established branches, and that many report increasing sales in the downtown establishment.

Although the pattern of organization varies, most city planning has been initiated by one or a small group of civic leaders *within the city*. Seldom has it been successful when promoted by outsiders. The second step is the organization of a committee or a council which may be independent of the municipal government or be given some official status. The third step is bold and courageous planning, both immediate and long range, followed by funds to translate plans into expressways, parking centers, new or refurbished buildings, parks and civic centers.

There are two omissions in this "Tale of Cities." One is that of housing and family relocation. The other is the important part played by public funds—local, state, and Federal—in slum clearance, in low-cost and apartment housing, and in reconstruction of many types.

The book concludes with a number of appendices that give helpful details not included in the narration.

FRANCIS J. BROWN
American Council on Education

LUTHIN, REINHARD H. *American Demagogues: The 20th Century.* Pp. xv, 368. Boston: Beacon Press, 1954, $5.00.

This is an important handbook for understanding one aspect of American Politics. It is, as the author says, concerned with those politicians "who in their aspiration for political place and power pandered to the passions and prejudices, rather than the reason of the populace, and performed all manner of crowd-captivating tricks, only to betray the people." With a net so wide, the wonder is that Mr. Luthin could confine his study to ten demagogues of recent or contemporary history. Many an American politician—and not a few whom history regards as statesmen—would also fit the definition of demagogue here proposed. But no one can quarrel with the inclusion of those "masters of the masses" who come in for special scrutiny in this volume.

A chapter each is devoted to James Curley, the Boston Brahmin-Baiter; Theodore "The Man" Bilbo of Mississippi; William Hale Thompson of Chicago otherwise known as "Big Bill the Builder;" "Alfalfa Bill" Murray of Oklahoma; "Boss" Hague of Jersey City; "Ma" and "Pa" Ferguson of Texas; Eugene Talmadge, "The Wild Man" of Sugar Creek, Georgia; Vito Marcantonio, the leftist political chameleon from Harlem; Huey Long; and Wisconsin's "Briefcase Demagogue," Joseph McCarthy.

Mr. Luthin, who is a lecturer at Trinity College in Hartford, has been extraordinarily successful in capturing the flavor of the demagogue, the environment in which he thrives, and those perverse charismatic qualities that make him click. All politicians, by definition, have some of these traits, the demagogues being those who have them in unique pattern or degree. One stands in awe at their capacity for vivid invective and vituperation. "A vicious, malicious, pusillanimous, cold-blooded, premeditated, plain ordinary United States Senatorial liar," said Bilbo in describing his opponent in 1934. His enemies were "poor folk beaters, shooters of widows and orphans, international well-poisoners . . . , spitters on our heroic veterans, unemployment makers, munitions manufacturers, and skunks who steal Gideon Bibles."

Even as the demagogue loots the land and its people, they love him for the solace he brings to their own guilt-laden souls. When Talmadge was accused of stealing public funds, he shouted to the crowd, "I stole it all for you," and they cheered him to the echo. William Hale Thompson "socking King George on the snoot"; Jim Curley crying out against the Brahmins of Boston; Alfalfa Bill inveighing against "the interests"; Huey Long denouncing the "Wall Street Money Devil"; Joseph McCarthy reviling "Fifth Amendment Communists and their collaborators"; all play essentially the same role.

In a summary chapter on "The Mark of the Demagogue" the author offers an arresting analysis of some of the major methods and characteristics of American demagogues. Among other tactics he exploits racial, religious, sectional, and class antagonisms; identifies himself as a "common man" and his foes as aristocrats or worse; assumes the role of wise country bumpkin against the city slicker and of the semiliterate yokel against the intellectual. Most demagogues are symbol specialists in a fashion undreamed of by semantic scholars. William Jennings Bryan's alpaca coat, Bill Thompson's sombrero, Talmadge's red galluses, Joe McCarthy's briefcase, are symbols of identification as familiar as "candy mint with a hole" or "His Master's Voice." In a vulgar and primitive fashion the demagogue knows how to put on a good show, to provide the pageantry and entertainment that people in the mass cry for and enjoy. Huey Long's sound trucks, Gene Talmadge's barbecues with "Fiddler John Carson" on the stump, Hague's Jersey City Police Quartet, Curley's vaudeville, and Bill Thompson's animal acts, "packed 'em in" and prepared them for their demagogic innoculation. Demagogue and sloganeer are virtually synonymous, and Curley's tirades against the "goo-goos," Bill Thompson's "America First," Huey Long's "Share Our Wealth," and "Every Man a King" are random samples. And the demagogue himself becomes a slogan; "Our Jim," "Ma" and "Pa," "Old Gene," "Big Bill the Builder," "The Man" Bilbo evoke emotions that defy catalogue or analysis.

There is, of course, more to the demagogue than these traits and tactics. There is the soil of sectionalism, of racial discrimination and religious bigotry, of poverty and ignorance, and fear and hate out of which these monsters grow. But one is bound to admit that in their own way they make their mark on our society and their contribution to our culture. But to assay these aspects of the American demagogue would require another book.

PETER H. ODEGARD
University of California
Berkeley

LUNDBERG, FERDINAND. *The Treason of the People.* Pp. 370. New York: Harper & Brothers, 1954. $4.50.

"The chief purpose of this book," its author announces in an early passage that both sets the tone and typifies the style of the chapters to follow, "is to focus critical

attention on a neglected branch of our system of government—the citizenry—with a view to demonstrating how the major beneficiaries of the democratic idea fail to measure up to it, and how they are allowing to be established the preconditions to another kind of system (not necessarily a dictatorship, but possibly so) even as so many persons and groups vociferously hail the triumph of democracy in our midst." This undertaking is described on the dust jacket as "a shocking exposure of how we have failed as American citizens."

With an air of having solved single-handed a peculiarly baffling and sordid murder case, Mr. Lundberg proceeds to reveal such "shocking" details as these: usually less than half of those eligible to vote go to the polls in national elections, and many of those who vote do so "mechanically," that is, fail to cast "an intelligent ballot." The jury system often works badly. The American people spend more money on such things as gambling, movies, radios, bowling, liquor, and tobacco—that is, on "the frivolous, the inane, and the trashy"—than on such things as education, medical research, and adequate housing, that is, "the serious, the enlightening, and the spiritually, morally, intellectually or even physically sustaining." This last discovery leads Mr. Lundberg to the interim conclusion that "the public as a whole—and this means the electorate—is infantile, always excepting a minority."

Mr. Lundberg also finds it reprehensible from the democratic point of view that the draft has to be resorted to in time of war, that there is always a lot of "griping" among service men despite the fact that they are "pampered," and that many civilians have been known to engage in war profiteering. Other "shocking" revelations include the following: Negroes and other ethnic groups are often discriminated against; pressure groups are powerful and tend to serve their own interests rather than the general welfare; all organizations, with political parties singled out for special mention, are run by their leaders ("oligarchs") and not by the rank and file. These discoveries lead Mr. Lundberg to the painful conclusion that democracy is a failure.

The basic flaw in all this is Mr. Lundberg's understanding of democracy, a concept which he never bothers explicitly to define. It is clear from the context, however, that he regards it as a system under which an unfailingly rational populace considers all questions solely in the light of their bearing on "the common interest" and, by an unexplained process of "representation," translates its collective wisdom and virtue into law. If one sets off from such a simplistic, not to say simple-minded, notion of what democracy means, it is easy to conclude that democracy does not work —and that the average citizen commits "treason" vis-à-vis the "democratic idea."

ECONOMICS AND INDUSTRY

BRIGHT, ARTHUR A., JR., and GEORGE H. ELLIS (Eds.). *The Economic State of New England.* Pp. xii, 738. New Haven, Conn.: Yale University Press, 1954. $6.00.

In economic development as in grand opera there seems to be a fascination in what a previous generation would have called "a decline." The New England economy, like that of the South, has therefore received an almost disproportionate attention. The analysis here under examination was undertaken by the Committee of New England, organized by the National Planning Association; the former group contained the usual array of big names from agriculture, business, manufacturing, labor, government agencies, and the like; it appointed as head of its research staff Arthur A. Bright, Jr. and on his death in 1953 George H. Ellis. Under the direction of these two men a staff drafted twenty chapters covering the various phases of the New England economy. Although the book is thus undertaken in the fashionable tradition of co-operative scholarship or division of labor, it has an exceptional unity of treatment and approach. In general it is not hostile to state intervention in the economy; it has a preference, however, for voluntary and regional rather than enforced or national activity, notwithstanding a caveat that "historically New England has placed national interests above regional interests. It must continue to do so." All programs must "be assessed in terms both of benefit for growing areas and of burden on older economic regions. In seeking solutions to regional programs, New England must not resort to recrimination, irresponsible exploitation of federal programs, or special pleading for preferred treatment." The report comes to the conclusion that the destiny of New England continues to lie in manufacturing activity.

Of all the recent post-mortems on New England, the volume here under review is the most full and the least opinionated. There is no doctrinaire war cry for a return to laissez faire; on the other hand there is no doctrinaire adherence to the blessing of state enterprise. On both counts the treatment of electric power is revealing. A comparison of the discussion with that in Seymour E. Harris's *The Economics of New England* demonstrates the superiority in inclusiveness and balance of the work here under review though Harris' book is nowhere near as extreme as some of its popularizers have made it out to be. Perhaps the measure of agreement the present volume achieves is best revealed in the fact that the dissenting opinions of Mr. Victor J. Canzano, Cotton Director of the Textile Workers Union of America, here included, are infrequent and, in the opinion of this reviewer, largely on matters of detail.

EDWARD C. KIRKLAND
Bowdoin College

OSBORN, RICHARDS C. *Corporate Profits: War and Postwar.* (Bureau of Economics and Business Research, Bulletin Series, No. 77.) Pp. 79. Urbana: University of Illinois, 1954. No price.

A solid and important piece of statistical and economic analysis has been done by Dr. Richards C. Osborn of the University of Illinois in the monograph under review. The subject matter is important; the data carefully compiled; the implications are far-reaching. This reviewer knows of no comparable collection of figures showing the course of corporate profits, employee compensation, return on corporate net worth and stock prices set against the background of price-level and national product.

Professor Osborn has compiled the figures on the size of prewar, wartime, and postwar corporate profits from 1939 to 1953; he has noted the adjustments in corporate profits and some aspects of government policy (notably the "full employment" policy with respect thereto), and the relationship between corporate profits and actual employment. He concludes that corporate profits have not been "too high," depending—this is important—on the conception one has of their proper function. Profits, though by 1953 they had climbed (after taxes, p. 65) to double those of 1939, have not, he concludes, "been too large after taxes on the basis of reasonable or valid criteria of measurement." Unless, of course, it is considered that the government already is in a position to assure stability of return so that risk is no longer significant. His concluding essay, "Corporate Profits in the American Economy," opens without attempting to answer a range of huge questions—among them that of the true source of risk capital.

Resisting the temptation to discuss most of the more fascinating facts developed, one or two may be noted. "Manufacturing" corporate profits (before taxes), both during the war and after the war, rose very rapidly: in 1951 they were seven times those of 1939. But (after taxes) the increase was not too far out of line with the increase in price level—that is, they followed the course of prices. In fact, this earning power was really used by the government as a means of collecting taxes. Again, stock prices (the Stock Exchange is once more in the news) from 1939 to the early months of 1954 increased by approximately the same percentage as did the cost of living—though there has plainly been an increase since then. One reason for the increase both in profits and, more sluggishly, in stock values, is that corporations today "turn over" their net assets about twice as fast as they did in 1939: that is, they have vastly increased their capacity

to produce and distribute (per dollar of assets) and have reaped a corresponding profit.

Notably interesting is Osborn's discussion of the relationship between corporate profit and what is now called "full employment" policy. In effect this is a brief review of the policy of the President's Council of Economic Advisers under Mr. Leon Keyserling's leadership, set in the context of business thinking in terms of incentive profits and economists's and governmental thinking that the American system cannot progress unless substantially all groups are potential consumers for a steadily expanding product. Osborn implies criticism of Keyserling's view that some shift of before-tax corporate income should be made from "business" to consumers; and of his apparent fear that the United States was accumulating too much capital rather than too little. The writer wishes Osborn's own views had been added to his concise summary.

Endless other relationships can be observed, and the study consequently opens a vista of thinking to thoughtful students of contemporary American economy. The best this reviewer can do in the allotted space is to urge careful attention to an invaluable collection of important source material.

ADOLF A. BERLE, JR.

Columbia University

TROMBLEY, KENNETH E. *The Life and Times of a Happy Liberal.* A Biography of Morris Llewellyn Cooke. Pp. 262. New York: Harper & Brothers, 1954. $4.00.

This is a "must" book for those interested in public versus private power. It is especially valuable for university professors and students because it gives a play-by-play account of the long contest for and against the Tennessee Valley Authority and rural electrification. This contest is still undecided as shown by the recent testimony by the ex-governor Sidney McMath of Arkansas. He testified before a Senate Judiciary Subcommittee that the Arkansas Power and Light Company decreed his "political execution" when he refused to block a rural electrification co-operative project. Historical background is given for the contemporary Dixon-Yates contract to build a private power plant to sell power to the government TVA plant.

This book is much more than the story of public versus private power. It is the account of a happy, vigorous engineer in many fields of public service and reflects his successful working philosophy. Morris Llewellyn Cooke, the public-spirited engineer, I first knew as Director of Public Works in a reform administration of the City of Philadelphia. Here he cleaned up a municipal mess and brought a suit at his own expense which reduced electric rates to the consumer.

Throughout a long life, he originated and promoted ideas and programs directed to the relief of social and economic abuses or vacuums. One of these programs was the more constructive use of natural resources. By the appointment of President Franklin Roosevelt, he served as Chairman of the Water Resources Policy Committee.

Cooke's most conspicuous public service was as head of the Rural Electrification Administration where he was much opposed but ultimately successful. This was one of his major achievements—to promote the legislation, set up a new government administration and carry it through to success against the all-out opposition of powerful political and economic interests.

Not less interesting is the account of his services in labor-management relations and scientific management in industry. The principal actors in these fields stride vividly across these well-written pages.

Cooke always tried "to keep enough things going so that some things would be going right to compensate for those going wrong." The philosophy which kept him cheerful under attack and durable to old age include: "regard troubles and difficulties as inevitable." "Watch out if things get quiet." "Peace and progress are in irreconcilable conflict."

The author, Kenneth E. Trombley, has been an army officer, an advertising copywriter, and in recent years an editor of *The American Engineer.* He writes "this book was developed in the glow of an irrepressible personality and soul-stirring inspiration," which he succeeds in conveying to the reader.

OTTO T. MALLERY

Philadelphia, Pa.

PALMER, GLADYS L., with the assistance of CAROL P. BRAINERD. *Labor Mobility in Six Cities: A Report on the Survey of Patterns and Factors in Labor Mobility, 1940–1950.* Pp. xiv, 177. New York: Social Science Research Council, 1954. $2.75 cloth; $2.25 paper.

Labor Mobility in Six Cities is a product of exceptional collaboration even in this era of co-operative institutional research. The Social Science Research Council is of course itself an outstanding example of voluntary co-ordination for stimulating research. The work was sponsored financially by the Air Force. The ten-year work histories comprising the source data were collected by the Bureau of the Census. The planning and management of the survey were handled by a technical subcommittee, under the chairmanship of Gladys L. Palmer, for the Council's Committee on Labor Market Research in co-operation with seven university research centers and the Office of Statistical Standards.

The volume lists numerous preliminary reports too bulky for general publication but designed to meet the immediate interests or needs of agencies concerned with manpower problems. The published volume therefore gives only a summary view. Possibly the effort to state the conclusions in concise and generalized form accounts for an occasional appearance of laboring the obvious, as when it is stated (p. 100) that "relatively few workers enter and many leave contracting occupations and industries, and the reverse occurs in expanding segments of the economy," or (p. 127) "a labor force adapts more readily to changes in the industrial demand for labor than to changes in the occupational structure." No doubt, however, a quantitative analysis even of such obvious generalizations has some bearing on certain manpower problems, especially in a period of acute labor shortages.

Although quite technical, the volume contains much of general interest, and the tabulations are detailed enough to make possible a certain amount of independent evaluation and use. Mobility is rather rigorously defined for the purpose of the analysis as a change of employer during the ten-year period; and it was found that about three-fifths of the persons included in the samples were mobile in the sense of having had at least two employers. Among the "mobile" men, 70 per cent made at least one occupational shift that involved a different level of skill. Laborers exhibited a high degree of mobility and moved in large proportions to higher levels of employment; at the same time, the relative demand for laborers declined significantly—evidence tending to support a rather hopeful view of the effects of the more recent technological and managerial changes on levels of skill.

The fully warranted claim is made for the survey material that "it constitutes the most comprehensive body of data yet available on the mobility of the work force in this country."

WITT BOWDEN

Washington, D. C.

SOCIOLOGY AND EDUCATION

LOWIE, ROBERT H. *Indians of the Plains.* (Anthropological Handbook Number One.) Pp. xiii, 222. New York: McGraw-Hill Company (for the American Museum of Natural History), 1954. $4.75.

Since the early 1900's the American Museum of Natural History has published in its Anthropological Handbook Series a number of useful volumes on American Indians. These clothbound, well illustrated little books have been familiar not only to visitors to the Museum, but also to many students of the American Indian in all parts of the world. There have been no other regional summaries of Indian life quite so handy or quite so authoritative. The quality was kept high by securing the recognized authority on each important area of the Americas. Thus Herbert J. Spinden, student of the Maya calendar system, wrote the one dealing with civilizations of the Aztecs and Mayas, and Clark Wissler, who

initiated the systematic study of the cultures of the buffalo hunters of western United States, wrote the *Indians of the Plains Handbook*. These were standard equipment for graduate classes in anthropology until the 1930's, when they began to be dated.

As a result of continuing vigorous research in every area of American anthropology, the handbooks have been in need of revision for nearly twenty years. The first one issued was *Indians of the Plains*, by Clark Wissler, for long Curator of Anthropology in the American Museum of Natural History, colleague of Franz Boas, important influence in his own right on American anthropology, and throughout his career indefatigable student of the Plains Indian way of life. Now some years after Wissler's death, the need for a revision of his often-reprinted handbook has been met.

The present volume is a wholly new production, although it follows the original very closely in plan. The American Museum has chosen as author the man who can without any question be accepted as the authority on Plains Indian life and custom—Robert H. Lowie, Professor Emeritus of Anthropology of the University of California, former staff member of the American Museum of Natural History, and life-long student of the Crow Indians.

Dr. Lowie's book is about as usefully arranged a summary of information on the Plains Indians as one could wish for. The first chapter lists the Plains Tribes, classifies them linguistically, maps their locations at about the time of first contact with whites, gives population figures over a century or more for each of the thirty-three tribal groups, and discusses briefly the "diagnostic traits" which distinguished the Plains Indian culture. Chapter II is the longest, dealing with the "Material Culture" and presenting in fascinating array all those characteristic products of the buffalo hunters from the tipi to the bullboat and the parfleche. Chapter III, dealing with Dr. Lowie's speciality of kinship and social organization and well flavored with his salty style, is a comprehensive survey of the complexities of family, warrior society, and tribal organization. Chapters IV, V, and VI are respectively devoted to recreation, art, and supernaturalism, the last two surely two of the most interesting chapters in the book. Chapter VII contains much new material, revising completely Wissler's earlier conclusions on "Prehistory and History." Chapter VIII is an all-too-brief discussion of the "virtually complete assimilation" by the Plains Indians of the white man's ways. The final chapter is an original and extremely interesting consideration of the distinctive features of Plains culture and how and when these traits took form.

The illustrations are superbly chosen; many are the same as those which appeared in Wissler's handbook and which could hardly be improved upon, but there are many more in addition which make vivid and concrete almost every section of the book, including those on social life and religion. The Index is a tremendous improvement over the earlier edition. Every tribe is listed with topical reference to every aspect of culture mentioned in the text for that tribe. It may in fact be said that the Index, as much as any other feature of this well-printed and wisely illustrated volume, justifies calling it a handbook. The concept of it as a brief compendium of the most important facts about one of the most important regional Indian cultures has been kept in mind throughout by author and editor.

EDWARD H. SPICER
University of Arizona
Tucson

LA PIERE, RICHARD T. *A Theory of Social Control*. Pp. xi, 568. New York: McGraw-Hill Book Company, 1954. $7.50.

In spite of the *de haut en bas* attitude of the sophisticated toward textbooks, when one not only achieves distinction as a course manual but makes contributions to our thinking, it deserves such encomiums as any reviewer can bestow.

Professor LaPiere's is such a textbook. Twenty years of reflection and teaching have given him an excellent mastery of the literature, chiefly in English, upon which he draws. In addition, he has attempted "to devise a conceptual system that would account for conduct that is not wholly explained by socialization and situational interaction," a system that would be much more satisfactory than the mere machinations of the masters of the mass media, a phrase that might please even the alliterative Mr. Toynbee.

The theory, in brief, affirms that between the person and the situation the force exercised by group norms and standards and the rewards and punishments in terms of enhanced or deteriorated status which such (small) groups manipulate are potent motive makers.

This theory is developed with a multitude of down-to-earth illustrations in Part II of *A Theory of Social Control*, which treats of the nature and structure of groups, their norms and values, and goes on to the dynamics of their operation, and the decisive actions that groups under the leadership of authority take against reluctant or recalcitrant members. All of this, although occasionally on to abstract or too naive a level, comes home to men's business and bosoms and is the very stuff of social living.

It is much to the author's credit that he is historically minded (one of the highest awards of the intellectual critic) and that in days when we are told to talk of American ways of life in the plural, he is on his guard against gross oversimplifications.

Readers will have various reactions to the apparent assumption that group survival is a kind of final value not to be questioned and that the function of philosophic thinking is only to provide rationalizations and ideologies that are more or less effective, but about whose ultimate truth we should preserve a becoming scepticism. While Darwin and Darwinism do not appear in the index, one cannot fail to think they are in the background of LaPiere's discussion of the essential social process of achieving dynamic equilibrium.

It would be fun to teach this book, and a wise teacher could make a highly enlightening educational experience out of it.

W. REX CRAWFORD
University of Pennsylvania

MILES, ARTHUR P. *American Social Work Theory: A Critique and a Proposal*. Pp. ix, 246. New York: Harper & Brothers, 1954. $3.00.

American Social Work Theory represents the author's attempt to deal with what he calls "the" theory of social work, emphasizing what is termed the modern period (from the mid-1930's) rather than the so-called sociological period which preceded it. The author characterizes his effort as "a critique and a proposal."

It does not appear entirely clear to this reviewer to whom the critique part is actually aimed. If it is addressed, as the proposal must be, to professional social workers, the analysis seems somewhat superficial.

Most of the emphasis is an attempt to support the contention that the most important factors in an explanation of personality are found in the culture from which the individual comes, rather than in Freudian psychology. He attacks (and perhaps with some justification) what he calls "rampant Freudianism." He appears really to go to extremes at times in trying to point out the shallowness and limitations of Freud while still trying to keep at least one commendatory foot on the diving board.

He points with documented justification to the religious origin of the modern social work emphasis on the dignity of the individual. And he feels that the Western Christian tradition is the most important factor in explaining American social work.

The discussions regarding social case work, social group work, and community organization for social work, which consume almost two-thirds of the book, add very little to the literature of social work in the opinion of this reviewer. The confusion between method and process is as disappointing as it is common.

The proposal in the final chapter has some points to commend it, particularly the plea for a broader social scientific approach to building a theory of social work.

Some superficial people may characterize this book as an intemperate treatise on "Freud isn't God." This, it would seem, would be unfair. On the other hand, some may feel that it will have some value in that it is intentionally provocative at many points. For example, at one place this appears: "Case Work has the largest and best-developed body of literature in the field, and throughout its history there have

been enough literate practitioners to continue the refining of the process."

An error in editing appears on page 161 in reference to Grace Coyle's Social *Process* (not Progress) in Organized Groups. Many of the references seem dated, that is, not modern.

This reviewer feels this work suffers from partial observation and lack in thoroughness of analysis.

W. I. NEWSTETTER
University of Pittsburgh

SIMMONS, LEO W., and HAROLD G. WOLFF. *Social Science in Medicine.* Pp. iv, 254. $3.50.

SAUNDERS, LYLE. *Cultural Differences and Medical Care.* Pp. 317. New York: Russell Sage Foundation, 1954. $4.50.

Although these two volumes were undoubtedly written without close collaboration of the authors, they are so distinctly within the same frame of reference that, in effect, they represent Volumes I and II of what might well be a series of books. The first is an analysis of the basic premise that, without minimizing the primary importance of the physical factors involved in illness, "a sound foundation clearly must include whatever the social sciences can contribute to the personal and more comprehensive problems of medical care." The second specifically applies this premise in the case of Spanish-speaking people of the Southwest.

One of the authors of *Social Science in Medicine* is a professor of sociology, the other of medicine, yet the entire volume is so integrated that it is impossible to determine which is responsible for writing the various chapters. The authors frankly admit the difficulty in translating their premise into the treatment of the mentally and physically ill, but they have done a superb job in pointing the way. They have assiduously avoided both the technical vocabulary of either field and the generalities into which they could so easily have fallen.

The entire volume is an analysis of the interrelationship resulting from the following graphic presentation.

The Individual acts in *His Environment*
1. As an *Organism* in its *Physical Habitat*
2. As a *Group Member* in his *Society*
3. As a *Person* in his *Culture*

In their analysis of the impact of environment upon the individual, the authors emphasize the need of knowing not only the total cultural pattern but also that of the subgroups—family, church, and many others—with which the individual identifies himself. "Recognition of identifiable subgroups with corresponding subcultural elements takes on special importance in our present approach to medical care." The perspective given by an understanding of these *subgroup-subcultural* segments of society is made more specific by the authors' emphasis upon the necessity of relating them to the situation of the individual at the time and place of the illness.

The final chapter is an illustration of this sociomedical alliance. It is a candid examination of the hospital and of hospital practice in its treatment of patients and the problems which arise from inadequate recognition of the values to be gained from the contributions of the social sciences. Extensive footnote references are included and the volume concludes with a considerable bibliography.

Cultural Differences and Medical Care shows the need for the sociomedical alliance in a culture group which is often at variance with that of the medical practitioner. "When the practice of medicine involves the application of elements of the institution of medicine in one culture to the people of another, or from one subculture to members of another subculture within the same cultural group, that is done or attempted by those in the healing roles may not be fully understood or correctly evaluated by those in the patient roles. Conversely, the response of those on the patient side of the interaction may not conform to the expectations of those on the healing side. To the extent that this occurs, the relationship may be unsatisfactory to everyone concerned."

The author describes, in considerable detail, the physical surroundings, the family history, and the culture of the occupants of an apartment house. Against this specific background, he describes the cultural chasm that exists between the Spanish-speaking people of the Southwest and those that are not of this culture. This chasm tends to be widest in what Saunders calls "healing ways." Some sixty pages of notes and demographic data provide excellent source material.

Both volumes conclude on an optimistic note. They recognize that it is only recently that medicine has recognized the importance of the individual's environment and culture, and that the social sciences have sought to apply their knowledge to the ill person. Now that a beginning has been made, they believe that the contribution of each discipline to the other holds promise for the welfare of the individual.

FRANCIS J. BROWN
American Council on Education

DUVALL, EVELYN MILLIS. *In-Laws: Pro and Con: An Original Study of Inter-Personal Relations.* Pp. viii, 400. New York: Association Press, 1954, $3.95.

This study was undertaken in order to contribute empirical data for a neglected area of family research. Dr. Duvall points out (and summarizes) the scanty literature on in-law relationships in the American family; describes the individuation that has caused the separation of such kin in the past; and gives an impressive list of factors in modern society that are tending to hold conjugal groups closer together, physically, psychologically and economically. For these reasons, Dr. Duvall feels that factual knowledge about in-law relationships is becoming an increasing need.

The book is divided into three parts. There is, first, an analysis of the comments and observations presented by 5,200 cases (1,337 through group interview; 60 of these by individual interview also; and 3,863 by a letter on "Why I Think Mothers-in-Law Are Wonderful People," solicited for a radio contest). The greater part of the analysis, therefore, concerns the mother-in-law and treats all of her changing roles from the time her children are of courting age until she becomes grandmother-in-law. Other chapters deal with father-, brother-, sister-, daughter-, and son-in-law. A second part of the book is interpretation—an attempt to explain *why* the cases felt as they did. Most of this interpretation is new and enlightening; some is challenging; a part does not seem to be supported by the data given. This last is probably an inevitable result of a study that is truly pioneering in nature, and in which all significant factors cannot be foreseen at the outset. For instance, there is no attempt to measure the intensity or frequency of contacts between the subjects and their in-laws. Yet, in the reading, this factor appears to be crucial in interpreting the feelings involved. The third part of the book suggests what to do about in-law relationships. The author's discussion, in this section, will be valuable to family members, counsellors, and teachers.

Out of long and practical experience in the field of family relationships in general and an intensive concentration upon the present particular aspect of them, Dr. Duvall has undoubtedly made herself the current authority in this area. She has written a book which should be consulted as the best obtainable not only as a guide to, but also as the starting point for further research in, relationships with in-laws.

University of Pennsylvania

KEVE, PAUL W. *Prison, Probation, or Parole?* Pp. 263. Minneapolis: The University of Minnesota Press, 1954. $3.75.

Mr. Keve's book is a welcome addition to the writings produced in recent years by probation and parole workers designed to give general readers the practitioner's eye view of these correctional procedures. Now Assistant Chief Probation Officer in Hennipin County, Minneapolis, Minnesota, the author describes his experiences as a probation-parole officer in the Arlington, Virginia area from 1943 to 1945.

Within the framework of descriptions of thirty-odd cases he supervised, Mr. Keve discusses the major principles and problems of in-community correctional work, and in addition considers certain less obvious problems confronting the officer and his clients: the conflicting roles of sentencing judge, prosecutor, and correctional worker; postprison sexual adjustment; probation work with white-collar criminals; and the difficulties found in supervising offenders whose crimes (for example, bootlegging) are not regarded locally as wrongdoing. The author's subjects dwelt mainly in small cities and rural areas; the court for which he worked was not overwhelmed by the great numbers of socially disad-

vantaged offenders who are usually, in the busy courts of large cities, handled with impersonal routine. Consequently, the atmosphere of *Prison, Probation, or Parole?* is one of more leisurely, personalized court proceedings and somewhat lighter caseloads than are usually described by writers on this topic. Mr. Keve saw little of the professional criminal, and most of the cases discussed are examples of "occasional" and "emotional" offenders—bigamists, sex deviants, abortionists, and embezzelers—who exemplify what the author calls "the ordinary little man who intends to live right."

Eight of the twenty-one chapters are devoted to cases involving abortionists, rapists, and psychopathic offenders. Without attempting a systematic treatment of these, Mr. Keve does assess the risks they present as probationers or parolees and concludes that the last two, together with *female* abortionists, have personality problems which exceed the resources available to most in-community correctional workers.

This book is refreshingly free from both moralizing and sensationalism; what little drama it contains inheres naturally in the cases themselves. While presenting no theory of causation, the author views crime and the treatment of offenders from a sociological frame of reference, emphasizing primarily the role of situational and attitudinal factors. The general reader will find *Prison, Probation, or Parole?* an absorbing account of work with other than run of the mill criminals; for the student and the novice practitioner, it will serve as an excellent informal introduction to the basic elements of in-community correctional techniques.

University of Pennsylvania

WOLFLE, DAEL. *America's Resources of Specialized Talent: A Current Appraisal and a Look Ahead.* Pp. xx, 332. New York: Harper and Brothers, 1954. $4.00.

The United States wastes much of its intellectual talent. Chronic shortages of scientists, doctors, engineers, teachers, and other professional specialists continue. Yet efforts to improve the guidance, education, and placement of gifted youngsters have been pitifully ineffective, and the services of many a talented adult are frequently misused or not used at all.

These are some of the findings of the report of the Commission on Human Resources and Advanced Training as reported by its director, Dael Wolfle. The Commission was financed by the Rockefeller Foundation. Its members were appointed by a board representing the American Council of Learned Societies, American Council on Education, National Research Council, and Social Science Research Council.

The study is focused on those of the nation's workers who labor chiefly with their heads instead of their hands. It is in no sense a special pleading for an intellectual elite. It is simply an effort to present some facts, heretofore not to be found in one place, about the people who master special portions of the growing body of knowledge upon which our complex industrial, military, scientific, and social machinery is based.

The staff of the Commission has rendered a notable service to manpower specialists by bringing together in an orderly fashion masses of data on college graduation trends since 1900; the occupational distribution of college graduates; supply, demand, and the potential supply in the specialized fields; characteristics of students entering those fields; and utilization of educated specialists.

Many more young people are capable of specialized training than receive it. College graduating classes could be twice as large as they are without loss of quality. Who goes to college and who doesn't are frequently determnied more by fate than by intellectual capacity. Thousands of the nation's brightest high school graduates fail to enter college each year because of lack of opportunity or motivation. Of those who finish, many have difficulty finding suitable employment even though shortages may exist in their particular fields. Talented women have especially serious employment problems. The services of older professional workers are frequently cut short by arbitrary retirement regulations.

The Commission believes that it is sound policy to encourage and help the ablest members of the young population to continue in school. However, each must be permitted to choose for himself the fields in which he wishes to specialize. Any infringement of this right would be inconsistent with democratic ideals. On completion of his training, the young specialist is deserving of much better placement assistance than exists at the professional level today.

Although this report has shed much light on America's resources of specialized talent, the author and his colleagues are impressed with the gaps in knowledge about their subject. They recommend that a public agency assume responsibility on a continuing basis for collecting specialized manpower information and making it publicly available. Their report will provide a splendid start for such a project.

CLAUDE E. HAWLEY
Washington, D. C.

DRESSEL, PAUL L., and LEWIS B. MAYHEW. *General Education, Explorations in Evaluation: The Final Report of the Cooperative Study of Evaluation in General Education of the American Council on Education.* Pp. xxiii, 302. Washington, D. C.: American Council on Education, 1954. $3.50.

Nineteen colleges participated through committee meetings, summer workshops, and local campus activities in this co-operative inquiry directed by the authors of the *Final Report.* Exploratory studies were conducted in six areas usually included in programs for general education: Social Science, Communications (oral and written English), Science, Humanities; and two "pervasive objectives": Personal Attitudes and Creative Thinking. As the authors explain, despite agreement in statements of objectives, general education programs differ greatly in practice, a primary cause of diversity being the difference in approach—whether "content-oriented," "intellectually-oriented," or "student-oriented." The exploration in evaluation was motivated by the hope of achieving greater unity through a reconsideration of the learning processes involved in general education.

In the final chapter, the authors state their conclusion that a positive integrating principle is the great need of the general education movement today. However, they reject the several current proposals. To make *Common Knowledge* the basis is considered impracticable in view of the vast and complex nature of contemporary knowledge. *Good Citizenship* is likewise adjudged inadequate because the idea of American democracy "is too frequently a provincial concept resting upon the assumption of the superiority of the cultural heritage of the Western world." *Education for Adult Life* they regard as unacceptable: "it threatens to become mere vocational and avocational education." Finally, *Values,* whether of a religious or of a humanitarian character, the authors think, cannot serve as a unifying basis because college faculties will not agree on a common core of beliefs. On their part, they propose "critical thinking" as a primary principle of curriculum organization. However, there seems to have been considerable skepticism among members of the working committees as to the validity of this proposal in view of the wide differences of opinion on the nature of critical thinking, its relation to specific subject areas, and its applicability to the creative arts and to moral issues.

There are important materials for consideration in the individual chapters recording the work on the various groups of objectives; the analysis of critical thinking is particularly good—better balanced than the usual statements in pedagogical literature. But the bland suggestion to make critical thinking—as equally applicable to all knowledge areas and value conceptions—the unifying factor in general education hardly entitles the *Report* to be considered "a guide to the pursuit of the high aims and ideals of the general education movement," the purpose for which the publishers offer it. Probably this reviewer's prejudice in favor of the principles that the authors reject accounts for his lack of enthusiasm.

I. B. BERKSON
City College of New York

AMERICAN COUNCIL ON EDUCATION. *University Education for Administration in*

Hospitals. Pp. xix, 199. Washington, D. C.: American Council on Education, 1954. $3.00.

This is the first report of the Commission on University Education in Hospital Administration and its special study staff headed by Dean Herluf V. Olsen of the Dartmouth School of Business Administration. By questionnaire, interview, and personal investigation they examined the need for a program to train hospital administrators, and here suggest a program to meet that need, discuss the limitations of existing graduate programs, and conclude with thirty-one broad recommendations.

The hospital administrator is described as operating a multitude of diverse services for clients in a peculiar stress situation. Many of the people whose activities he must co-ordinate live in a professional social world with its own ethos of status, duties, and values—a world over which the administrator has little control. The administrator finds himself legally accountable to an amateur board likely to be self perpetuating, but also informally responsible to many segments of the public which show increasing interest in his work. To supply the persons needed for such positions a program of recruitment, undergraduate and preprofessional study, graduate work and residency training, and postgraduate training is prescribed. Problems of pedagogy, university administration, and research are discussed.

On many points there will be general agreement. There certainly will not be unanimity on the report as a whole. For example, the commission recommends that experience not be a requirement for admission to the program. This would demand a change in many present policies which some consider quite reasonable.

More heated discussion will be provoked probably by the idea that hospital administrator training programs should be located in university schools of business. At the present time, seven of the twelve degree-granting graduate programs are in schools of public health; two are in schools of business; and the other three are in medical or graduate schools. The committee recommendation would stimulate controversy even if no forces other than bureaucratic empire building were at work. There is much to be said on different sides: for the business schools is their experience in teaching administration and their contact with commercial activities such as are important in hospitals; for the schools of public health is their ethos of service and medical programs. One can argue convincingly that it is easier to improve the administrative programs in public health schools than to induce the required atmosphere of social service motivation in schools of business. Certainly no single answer is likely to satisfy everywhere.

More educational programs need a report like this one—not for final answers it gives, but for initial questioning it provokes.

JAMES A. NORTON
Harvard School of Public Health

HODGSON, KENNETH W. *The Deaf and Their Problems: A Study in Special Education.* Preface by Sir Richard Paget, Bart. Pp. xx, 364. New York: Philosophical Library, 1954. $6.00.

This penetrating and timely book, written by an English author and educator was first published in England. It is approached from the point of view of the English schools, yet is relevant to the education of the deaf of all lands. The historical teachings of Luzerne Rae (who began editing the *American Annals of the Deaf* in 1847) used by the English teacher and writer Thomas Arnold in 1884 as a basis of his studies provides a connecting link with America. Mr. Hodgson, in the present volume, has drawn from this vast fund of knowledge and has not only dealt adequately with the deaf, but also with the contributing forces of early educational reformers working with hearing children.

After bringing the scattered data on the teaching of the deaf in Italy, Spain, England, France, and Germany into some kind of pattern, Mr. Hodgson builds his climax with the philosophical and scientific approaches which sponsored and formulated the medium of speech and manual language in the eighteenth century. By 1760 a school was started, and the deaf were no longer mainly instruments of experiment as they had been when Jerome Cardan, John Wallis, William Holder, and John Bulwer were intent upon producing "the miracle of speech" from them. Miracles gave way to facts, and when it was established that speech was acquired and not inherited, and that dumbness was a result of hearing loss, teachers of the deaf were making progress.

Almost simultaneously the Abbé de l'Épée in France (1760), Samuel Henicke in Germany (1772), and Thomas Braidwood in England (1783) founded schools and sponsored methods which "branded" schools of thought from then on out.

Sir Richard Paget, Bart., in his Preface sets the tone by his interpretation of the moral that "the opposition of oral and silent teachers should be allowed to die out and be replaced by a constructive and experimental effort on an international scale." The oralists have assumed a superior attitude toward hand language, much the same as rabid liberal arts advocates have toward their vocational brothers. Taken to extreme this annihilates the democratic approach to all teaching for it disregards individual differences.

Mr. Hodgson explains the ear per se. He also outlines the growth of interest and understanding, which were effects of social action toward the deaf, and the rise of national systems. The transition period came when America's Thomas Hopkins Gallaudet went abroad and brought back the "French System" of teaching the deaf, the sign language. With great wisdom he combined articulation and evolved the "Combined System" for American schools. His son, Edward Miner Gallaudet, used the Columbia Institution in Washington, D. C., to cradle the world's first (and only) college for the deaf, Gallaudet College, in 1864.

The first oral school came in 1867. Despite the controversy of methods, Hodgson points out that medicine and science have stepped into the classroom to clarify matters. Statistics show that more graduates of the combined schools go to college than do oral school graduates. This, alone, reveals on which side liberal education lies. As Hodgson asks: "is the aim to educate the deaf, or make them *appear* normal by speaking"? His whole economic, social, and political approach will be of interest to the layman.

MAXINE TULL BOATNER
Hartford, Connecticut

PEARSON, GERALD H. J. *Psychoanalysis and the Education of the Child.* Pp. x, 357. New York: W. W. Norton and Company, 1954. $5.00.

Pearson opens his book with a discussion of the relation between education and psychoanalysis in which he points out the failures of the early applications of psychoanalysis to education by describing personality difficulties that came out of permissiveness, open sex education, and progressive education. Through case histories he then presents the various disorders in which learning is and is not involved in the neurotic conflict. There follows an outline of psychoanalytic theory in relation to child development with applications in defense mechanisms, creativity, the reality principle, and the contributions of ego-psychology. A final section on the development of the moral sense treats of the super-ego, the development of the ego ideal, and the relations on the psychoanalyst to the educator.

The book though liberally documented with references to the psychoanalytic literature contains almost no references to the nonpsychoanalytic discussions of the same problems. For example, his theory of language development upon which there is a voluminous scientific literature is stated thus, "psychoanalytic research has proved that the development of language results from the ability of the child to learn to control his excretory organs."

A theoretical bias thus constrains the author from a scholarly approach to his problem. But even within his own system of thought, he fails to recognize that generalizations based on a small sample of emotionally disturbed children may not apply to all children and that principles have a hierarchial order and should not contradict one another. In the early part of the book he emphasizes hedonic principles as the primary forces in education, whereas later he explicitly states that identification is the primary force. In both the cases presented and the generalizations made the

adultomorphic fallacy continually appears, namely the reading into an earlier phase of development the feelings and reactions characteristic of later phases.

A major theoretical difficulty is a lack of recognition of the function of stimulation in the learning process. For example he states "the purpose of the learning process is to supply adequate systems of gratification as substitutes for elementary biological functions and products." And later he says "at best stimuli from the external world are not as pleasurable as those that arise from fantasy and therefore there is a constant tendency to look inward rather than outward." But it is clear from modern research that a complex organism depends for its very existence upon a tremendous input from the external world, and that curiosity and manipulation in the human being and the higher apes which seem to arise from primary and nonsatiable adient drives, gives to the organism a radically different developmental turn than holds for lower animal forms.

However, the author seems to be wiser than his theories in his practical approach to many of the problems presented by children. The book is more readable and more moderate in tone than many of the books written by psychoanalytically oriented persons. Nevertheless, one wonders what specific evidence supports some of the practical generalizations. Consider for example this statement "if the child has a strong exhibitionistic drive, materials (educational) should be presented through the medium of dramatics; if the child's drive is to peep, it should be presented through the medium of scientific research."

JOHN E. ANDERSON

SILVERMAN, HIRSCH LAZAAR. *Education Through Psychology: A Subjectivist-Idealist Format for Education.* Pp. 58. New York: Exposition Press, 1954. $3.00.

Despite the enthusiasm of a Foreword, a Preface, and an Introduction it is not clear why or for whom this book was written. It consists of platitudes stated in declarative sentences which are neither stimulating nor interesting. The author shows little familiarity with or insight into the modern literature of education, psychology or philosophy and refers mainly to the "grand old men." Samples of generalizations follow: (p. 27) "if teachers wish to develop thinking in students, they must give pupils material to think about"; (p. 43) "every teacher should formulate individual lists of attitudes to be taught, including a scientific attitude, a critical attitude, a problematical attitude, a tolerant attitude, a historical attitude, a patriotic attitude—in fine, a comprehensive philosophic attitude. Students must be made to *think.*"

JOHN E. ANDERSON
University of Minnesota

PHILOSOPHY AND RELIGION

MEYER, ALFRED G. *Marxism: The Unity of Theory and Practice.* Pp. xx, 181. Cambridge, Mass.: Harvard University Press, 1954. $3.50.

This, as the author tells us, is a critical essay; it is not a complete study of Marxism, but selects for exposition and criticism certain aspects of the theory that seem important to the author either as contributions to social science or because they express what is deepest and most characteristic in the Marxian attitude to the world. Of the contributions to social science, the one most fully discussed is the Marxian conception of society as a system of events functionally related to one another. Mr. Meyer maintains that, according to the better Marxian view (for he admits that Marx never got rid of his cruder "mechanistic" conceptions), the economic substructure does not create the superstructure, but has a negative influence on it, tending to prevent the emergence of features unsuited to itself. The Marxist attitude to the world is seen as consisting primarily in the conviction that class institutions distort and debase human nature (this Mr. Meyer calls "the theory of alienation"), in the faith that society is nevertheless moving towards a condition that must end this distortion, and in the belief that the proletariat are the only class who, as they become "class-conscious," acquire a true understanding of society and its historical progress, the understanding contained in the Marxian theory. It is in this sense that there exists, for the proletariat and for the Marxist (and for them alone), a "unity of theory and practice." The disintegration of Marxism in the West Mr. Meyer attributes to the spread among Marxists of double about this unity.

Though the author modestly says that none of the opinions and interpretations in his book may be new, the impression it creates is of quite exceptional freshness, vigor and thoughtfulness. It puts many points better than I have ever seen them put before; and some of them are new to me. The first and longer part of the book, the critical exposition of the doctrine, is the better of the two. Mr. Meyer has rightly been at pains to make as much sense as possible of Marxism, and on the whole has contrived to do it without reading more into the theory than is there to be found. He has perhaps exaggerated the extent to which Marx was thinking in terms of functional rather than direct causal relations; and has made too much of this distinction as a partial defence of Marx's economic determinism. Marx's critics have mostly been as unconcerned as he was about the difference between these two types of relations; and the gist of their criticism is valid whichever of the two we suppose Marx to have meant. Marx did not believe that economic determinism is one among several equally valid interpretations of social change; he thought it the only key to the true understanding of it, because he assumed that the economic factor is objectively fundamental in a way in which the "superstructure" is not.

The last chapter—as is the habit of last chapters—is the weakest. Among the "thorny and painful questions" put by Mr. Meyer on page 145 is this one: "Is pure science inevitably conservative or inevitably revolutionary?" There are in Mr. Meyer's own book several good arguments showing that questions like this are logically absurd.

J. PLAMENATZ
Oxford University
England

HAZARD, PAUL. *European Thought in the Eighteenth Century: From Montesquieu to Lessing.* Pp. xx, 477. New Haven, Conn.: Yale University Press, 1954. $6.00.

The most striking contrast between the eighteenth century and its predecessor was the cult of happiness. Lowering theological obsessions gave way to a confident rationalism; the new idea of progress became popular. This change was congenial to the late Dr. Hazard's brilliant, discursive mind. His far-ranging survey is spiced with the wit and urbanity of the French tradition in which he was bred and which still remains strongly derivative from that brilliant age. After the laborious team work to which we have become accustomed, this *aperçu* of a single mind is welcome and occasional reckless generalizations are offset by refreshing readability.

Dr. Hazard was concerned not with the folk-roots of culture, but with its aristocratic flower; not with massive economic and political upheavals, but with the intellectual changes destined to contribute to them. The "literature of social pleasure" was not, in his view, something to be deplored, and where Sorel scarified the limitations of the *salon,* Hazard applauded its verve. His book is divided into three sections, "Christianity on Trial"; "The City of Men"; and "Disaggregation"—a title which might have been better translated. It thus covers the rise, the apex, and the decline of the Enlightenment. Why, we may ask, did the decline take place? Because, Dr. Hazard suggests, the rationalism of Voltaire, Diderot, and D'Holbach satisfied neither the philosophers nor the men of feeling. The thought was too brittle, the emotional appeal too limited, the social ambient too circumscribed. Outside the *salon,* incalculable movements were under way. The sequel, after Rousseau, was something new in European history, the intellectual domination of the Germans.

But the romantic and revolutionary movements of the nineteenth century were to obscure the great achievements of the eighteenth. Dr. Hazard's book reminds us of its lasting influence. In the political sphere alone, Bentham and Saint-Simon were products of the Enlightenment. In

spite of the emotional reaction it provoked, the belief went on that the world could be changed and organized for the benefit of man. When de Maistre maintained that it was inevitably the scene of original sin and its punishment and nothing more, he showed a belated affinity with the theologians denounced by Voltaire. This belief in progress and perfectibility inspired both Mazzini and Marx, the two most representative exponents of liberal and collectivist ideas. The all-pervading triumphs of modern science, moreover, for all their empirical basis, derive from eighteenth century tolerance and common sense. Further, the Enlightenment was cosmopolitan. It crossed the oceans as well as the frontiers. The City of Men, after all, is what all governments—even the Indian—desire to build today. This sometimes mannered, but stimulating book serves as a lively reminder of our debt to the first age of modern European history in which man attempted to make himself.

JOHN BOWLE

Oxford, England

BOLGAR, R. R. *The Classical Heritage and its Beneficiaries.* Pp. viii, 592. New York: Cambridge University Press, 1954. $8.50.

The scholars of the Middle Ages and Renaissance lived in the shadow of their classical heritage. Their task was not to add to the sum of man's knowledge, but to comprehend and exploit this heritage. In attempting to do this they were beset by many difficulties. The works embodying the classical heritage were in tongues that were strange to them. Then the mere physical possession of these works in reasonably accurate form required a long, arduous struggle. But far more serious was the basic impediment of different outlooks on man, the world, and his purpose in it. The classical heritage was pagan while the medieval scholars were deeply Christian.

Mr. Bolgar's purpose is to show what part of the classical heritage was available to medieval scholars at various times, how they sought to use it to satisfy their needs, and to explain how these needs came into being. In the first two of these he is eminently successful. Mr. Bolgar depicts clearly and effectively the various types of learning such as grammar, rhetoric, or logic, needed at different periods and how the scholars sought them in the available part of the classical heritage. He is less convincing when he seeks in the general history of the Middle Ages the forces which give rise to these needs. Here he produces intriguing and stimulating suggestions, but a medieval historian can easily provide entirely different explanations which are equally plausible. For example, while there is undoubtedly a connection between the development of legal studies and the decline in feudal violence, few historians would accept the view expressed on page 132 that it was the establishment of order in the tenth and eleventh centuries that led to the enthusiasm for legal studies. Mr. Bolgar makes history far too simple and at times distorts it to suit his needs. Here and there, however, he has furnished shrewd insights into possible connections between political, social, economic, and intellectual history.

This book is not for the amateur. In fact most scholars will find it useful chiefly as a guide to further study. To comprehend it fully one must be a master of both classical and medieval learning. This reviewer found himself continually hampered by the fact that he had only the vaguest idea of the nature and content of many classical works cited by Mr. Bolgar. On the other hand Mr. Bolgar's discussion of the relation of Peter Lombard to the classical heritage will mean little to the classical scholar who has not read the *Sentences.* For Mr. Bolgar writes always in general terms and very rarely gives illustrative examples. But for anyone with enough background to grasp its broad ideas, Mr. Bolgar's book is extremely stimulating. It is likely to inspire the reader to acquire the necessary knowledge to understand fully at least part of his vast panorama of learning.

SIDNEY PAINTER

Johns Hopkins University

MONTGOMERY, JOHN D. (Ed.). *The State versus Socrates.* Pp. vi, 247. Boston: Beacon Press, 1954. $3.50.

The current resurgence of interest in the life and death of the great Athenian questioner and martyr is a sign of the times, deducible from our concern with loyalty oaths and with the meaning and limits of academic freedom. In these circumstances we may well expect any fresh discussion of Socrates to relate itself centrally to these issues. The present book by its very title, and still more by its subtitle, "A Case Study in Civic Freedom," promises to fulfil that demand.

The promise has been kept. In a spirit of judicial fair play which, however, does not exclude personal conviction and faith, Professor Montgomery has sought to present an historically accurate and sociologically balanced account of what he believes to be a perennially recurrent conflict between the necessities of social stability and the quest for truth. The method pursued is well suited to its end. The body of the book is composed of happily chosen excerpts from some eighteen writers, from Plato to Plato's most violent latter-day opponent, Professor Karl Popper, grouped under the captions, "The Background of the Case," "The Case for the Prosecution," "The Case for the Defense," and "The Appeal to History."

Of special interest is the section devoted to the prosecution, whose charges (with the capital exception of those brought by Winspear and Silverberg from the standpoint of the "class struggle") are not introduced merely *pro forma,* but are seriously considered, and acknowledged to bear some weight. In the Introduction, which sets forth Professor Montgomery's own conception of Socrates and of the degree of his guilt as charged, we hear that "Socrates may not have understood the role of the public in a democratic society," and that "he aroused speculation which might have ended in abrupt changes in the government and life of Athens." Even so, Socrates is acquitted; there was never any real doubt about that. The condemnation is declared to have arisen out of irrational fear and the willingness to sacrifice the long-term values of the search for truth to a transient and ultimately dangerous expediency. But Professor Montgomery's concern is not after all for Socrates, but for us and our cherished way of life. "The survival of that way of life requires that we refrain from a second and even more disastrous verdict against Socrates."

In looking back over this excellent volume I find two points at which I am prompted to raise a question. Professor Montgomery is, I think, a little surer than he has a full right to be that the historical Socrates was wholly secular in his outlook, motivated only by the human ideal of the rational search for truth. This is to set at naught the evidence of the *Apology,* with its reference to the "divine mission" and the conviction that life and death are known in their ultimate values "only to God." In thus secularizing Socrates our author appears to me to have taken one step into that most frequent quagmire of Socratic criticism, exemplified in many of his quoted authorities—the temptation to bring this significant ancient figure into closer conformity with a widely-held modern ideal, or (as does Nietzsche) with its antithesis. Also, in referring to the continued trial of Socrates, I could wish that our author's clear indication of the contemporary opponents of Socrates had been matched by an equally clear identification of those who today play the role of Socrates; in other words, that he had given us greater aid in our difficult task of drawing a clear line between the wholesome dissenter—whom we must at all costs allow to speak—and the outright menace to the state.

RONALD B. LEVINSON

University of Maine

BENTLEY, ARTHUR F. *Inquiry into Inquiries: Essay in Social Theory.* Edited with an Introduction by Sidney Ratner. Pp. xvi, 365. Boston: Beacon Press, 1954. $6.00.

Inquiry into Inquiries consists of twenty chapters, each comprising an article or note of which about two thirds have previously been published. Of the unpublished papers, several are unfinished, but have been included at the behest of friends. The materials are classifiable as (1) sociology (knowledge and society, new ways and old ways to talk about man, and sociology and mathematics) and (2) evaluations of vari-

ous philosophical and scientific theories (the Jamesian Datum, and the positive and the logical).

The editor explains the range of time (1910–50), topic, and occasion. Bentley applies his own reconstructions of the logic of the social sciences. Freed from private business affairs he turned to the philosophy of history, political science, psychology, mathematics, the natural sciences, and formal logic. Shade of Sir William Petty! But quite unlike the seventeenth century genius who, when the *Principia* was published, merely remarked: "as for Mr. Newton's book I would give 500 pounds to have been the author of it," Bentley sets to work. He heaps up pungent commentaries upon the writings of philosophers and scientists.

Vigorously he attacks weaknesses in language and errors of thinking. As to the latter, mentalism is one of his special targets. Stimulated by recent objective psychology he condemns various forms of psychistic constructions—for example, his criticism of Professor Lewis' article on the *Mental* (Chapter XI) and the piece entitled "Physicists and Fairies" (Chapter VII).

However often he hits the mark in this book, these critical efforts are not of its essence. In the first place, although the author commendably assaults mentalistic ways of thinking he only verbally departs from them, as when he labors mightily to naturalize James's mentalism. In the second place, he wishes mainly to present his philosophy—namely, a sociocosmological dialectic. Underlying every concrete situation he sees the fusion of knowings and the known. "We return to a status of world in the mind, yet mind in the world. We solve it by symbiotaxis. The world is in the mind socially taken as action (symbiotaxis). The symbiotaxium constructs the world—knowledge—i.e., it 'is' that world. The world (knowledge) includes mind (mind as psychological technique)" (p. 25).

Bentley's critics will undoubtedly interpret his dialectic as reducing things and events either to "full temporal and spatial phenomenality" (p. 36) or simply verbal symbols. This philosophy, with preferred terminology ("transaction"), Bentley believes is important for science. Others may find sociocosmic dialectics in sharp contrast with the scientist's analytic investigation of things and events.

J. R. KANTOR

Indiana University

MUMFORD, LEWIS. *In the Name of Sanity.* Pp. vii, 244. New York: Harcourt, Brace, and Company, 1954. $3.75.

In this collection of essays and lectures Mr. Mumford follows the current fashion of using the threat of the atomic bomb to re-emphasize points which he has been making for a generation or more. He states his theme in the opening chapter: "each of us must accept, as his own, the personal responsibility for safeguarding man's essential humanity. . . . We must uphold love and reason as more precious than life itself." The dangers are obsessive prejudices, fixed ideas, narrowed horizons, automatisms, moral numbness and inertia, psychotic malice, irrational violence, and delusional projections. In Mr. Mumford's familiar manner we are again warned of the dangers of mechanization and overreliance on technology. He portrays vividly various possible consequences of the threat of atomic war, and from an analysis of modern art he deduces new evidence of the dehumanization of man. Finally, he presents us with the necessity of using "the powers of Prospero" to check the "uprising of Caliban."

All this is done with characteristic vigor and deadly effectiveness. While Mr. Mumford yields to no one in his vivid apprehension of the horrors of a Communist triumph, he castigates us for employing the same weapons of fear and violence in an irrational effort to isolate ourselves from the real problems.

It is impossible to disagree with much of what Mr. Mumford says, and we can easily become frightened by the horrors which he reveals to us. On the other hand the book as a whole seems to let us down. The basic exhortation is, of course, not new, and Mr. Mumford's originality lies more along the lines of devastating criticism than of positive suggestion. Furthermore he distracts us by scattering his shots, and, in this single book at least, neglects to provide the theoretical basis for such major theses as the relation of a given style of painting to the particular period of civilization in which it makes its appearance.

It is perhaps one of the gloomiest confirmations of Mr. Mumford's general theme that it is becoming easier and easier to write books of this sort. Unfortunately, however, these books seldom succeed in carrying us beyond the point of demonstrating that new forms of moral and spiritual leadership are needed if our civilization is to survive. It is unfair to expect that, at their chosen level of analysis, they will provide that leadership themselves.

MASON W. GROSS

Rutgers University

OPPENHEIMER, J. ROBERT. *Science and the Common Understanding.* Pp. 120. New York: Simon and Schuster, 1954. $2.75.

Oppenheimer's lectures will be very highly valued by all those who are presently restudying the interaction of natural philosophy and human wisdom. There are available, I think, for the serious general reader better reports on the essentials of wave mechanics and on the logical nexus of scientific and value decisions. Nonetheless, a certain mood fuses the elements of Oppenheimer's exposition and it elevates a document which is essentially contemporary into a dramatic encounter with eternal issues. The author's sincere and alert vision brings him to the most splendid moral rediscoveries, re-creations rather than learned reminiscence. Unit after unit of his analysis and judgment is excellent, whether it deals masterfully with the paradoxes of individuality, and appreciation of the Enlightenment, the logical structure of atomic experimentation, the genuine objectivity of micro-physics, the maintenance of determinism in the macrophysical world, the meaning of brotherhood, the arrogance of Marxist pretensions, the compatability of motives of intellectual curiosity and the quest for power over nature, the triumphant continuity of scientific advance, and many other themes. I could only wish that in the recital of the achievements of such men as Rutherford or Chadwick, Oppenheimer had dwelt more on the friendly alliance between concept and practice in the procedures of the successful physical sciences.

Turning now to Oppenheimer's major theses, their integration in terms of complementarity is much less valuable than the treatment of particular problems. Complementarity is a set of limitations. Inherent limitations have a way of dissolving. Did not Diderot remind Europe that the inherent necessity by which light was only white was eliminated by Newton's prism, and has not De Broglie very recently challenged von Neumann's alleged proof that wave mechanics must be statistically indeterministic forever? Analogies from alleged inherent necessities are doubly vulnerable; their necessity may be specious and the analogy, if uncontrolled, is of course closely equivalent to a myth. No myth is more desolating than a myth of limitation. Oppenheimer's argument needs a far more adequate theory of the hierarchy of different forms of analysis, knowledge, and skill and a far more articulate theory of presupposition than it presently possesses.

Our author would be the last to conceive of science as a temple dedicated either to living or slaughtered oxen, or to busy beavers. Despite all his preoccupation with eternity, he does not conceive of science in terms of eternal progressive quests. Here the masters of the Enlightenment such as Condorcet and Kant, and even the much misunderstood Laplace, might be guides in the question so crucial for these lectures; whether natural knowledge in any region must be limited forever by the melancholy morals of complementarity. The general reader will not learn from any mention by Oppenheimer that among the physicists themselves, Bohm, De Broglie, Vigier, and others are at the moment following up the possibility that a recasting of wave-mechanical concepts may restore full causal description in place of the indeterministic wave-particle complementarity! Certainly, it is both sobering and invigorating to encounter antinomies, but the encounter is of itself neither instructive nor edifying. We must still ask whether antinomy as an inherent limtiation is specious and so the generator of myths of

limitation, or is it perhaps the definition of a task of transcendence? Heroism is of one piece, a mutual alliance of heart, head, and hand. Please, a little less Kierkegaard and little more Hegel!

HENRY A. FINCH
The Pennsylvania State University

KIRK, RUSSELL. *A Program for Conservatives.* Pp. ix, 325. Chicago: Henry Regnery Company, 1954. $4.00.

Russell Kirk is probably the leading spokesman of the New Conservatives, who are wheeling so formidably into position on our intellectual field. Two years ago, in *The Conservative Mind,* he honored his philosophical ancestors with a series of laudatory, discerning, and polemical essays. To the astonishment of author, publisher, and initial public, this scholarly—though often eloquent—work has rung up four printings. Now, he turns from the flanking maneuver of historical analysis to direct statement.

Mr. Kirk has chosen his enemy: secular, humanitarian progressivism; the current—paradoxical—variety of centralizing "liberalism," as we usually call it. And he attacks mercilessly. Most startly of all for a conservative, member of a philosophical clan that during our century has usually hugged close to the wailing wall, Mr. Kirk is so confident as to be cocky. He not only beats liberalism; he has the effrontery to pity it. "But why break a butterfly on the wheel? These illusions now are consigned to the dear, dead days beyond recall; the terrible events of our time have buried John Dewey and his generation deeper than any Pharaoh."

A Program for Conservatives does not present an itemized political platform. Ranging over the great political, social, moral, and religious issues that confront us, it throws on and around them the light of those conservative principles that Mr. Kirk finds most fully and finely expressed in Edmund Burke.

It is refreshing to come upon a style in which Burke's deep phrases like "unbought grace of life" and "contract of eternal society" are once more natural. Occasionally, there is an agrarian sort of crankiness in Mr. Kirk's animadversions. For the most part he moves in the main line. He is not only reviving the conservative tradition, but he is rescuing it: both from sterile reactionaries who have degraded it, and from verbalists who by paying out a few modish conservative phrases are at present trying to hitch a ride on the shifting Zeitgeist. Mr. Kirk's books are good meat, even for vegetarians.

JAMES BURNHAM
Kent, Conn.

HARKNESS, GEORGIA. *The Sources of Western Morality: From Primitive Society Through the Beginnings of Christianity.* Pp. xi, 257. New York: Charles Scribner's Sons, 1954. $3.50.

Human experience, by reason of variety and richness, is kind to interpreters. Especially does an appeal to history lend itself to favorite themes—if only the interpreter is allowed to select his evidence with a free hand. For an undertaking of this proportion Dr. Harkness has worked with high courage and a keen sense of responsibility. She has condensed the cultural span of Egypt, Mesopotamia, Greece, Rome, and of the early prophetic and postexilic Hebrews. The ninth chapter marks the beginnings of "Christian ethics" in the life and teachings of Jesus of Nazareth. All this is interestingly compacted within two hundred fifty pages.

At least four ideas set the stage. In eras of undifferentiated thinking, religion and morals are mixed together; the human mind has a penchant for seeking divine sanction for superior moral standards; notably with the Hebrews, literary sources are cast in a theological mold; and the author chooses to study "what has motivated the masses of the people when they were not trying to be ethical theorists at all." Adding these together, we come to the theme that religious faith is the source and sustainer of morally sensitive living. Faith undergirds moral principles—almost any kind of faith in any kind of a god.

Morality in this context appears to be identical with *mores* or morals. Such studies are valuable, but less adequate than they purport to be. Given "the concept of *a good God demanding goodness* [which] prevailed both in Hebrew culture and in Biblical interpretation, and Jehovah's moral qualities have through the centuries evoked morality in men." This hollow form tries to ignore the mass of Old Testament materials which testify to the contrary. Goodness in God came all too tardy, and even in the greatest of the prophets had not shed all of its provincial color. Moreover, Hebrew "morality," as with Amos, was hammered out in an actual situation and registered its achievements in revised ideas on God.

Confusing the issues of temporal and logical priority appears to be the rule with a theological ethics. But the seamy side of moral development cannot be hidden with good grace. Unless one sacrifices depth and quality in ethical thinking, a critique of hedonism does not stop at the level of "paradox" rather than at its repudiation of human dignity. Plato also taught that it is better to suffer injustice than to do it, that a superior kind of *eros* sought moral perfection in the beloved, and that the moral ideal is "to become like unto God so far as it is humanly possible." He repudiated religious sacrifice altogether as an immoral institution. We might learn from him and from others, if we surrendered the cliché about the superiority of moral insight among the Hebrews. At least, that step would prepare us to appreciate the moral integrity of Jesus, rather than push him down into an Hebraic messianic setting. In short, Dr. Harkness is too much impressed by current theological winds.

IRL G. WHITCHURCH
Kingfield, Me.

BODO, JOHN R. *The Protestant Clergy and Public Issues, 1812–1848.* Pp. 291. Princeton, N. J.: Princeton University Press, 1954. $5.00.

This is a superbly documented study of American political and social history interacting with a debate on church and state relationships which took place between the War of 1812 and the war with Mexico. The title is unfortunate because it obscures the more precise and special definition which Dr. Bodo gives to his work. It is a definition, incidentally (p. vii), which makes this reviewer wonder if the author has read modern Anabaptist historiography. In any case, a more accurate descriptive title would be: The Educated Calvinist Ministers of New England and Public Issues 1812–1848.

Essentially, the book starts where Alice Baldwin left off in her significant study, *The New England Clergy and the American Revolution* (Durham, 1928). Dr. Bodo used the same scholarly methodology, namely: a painstaking study of primary sources through a survey of sermons classified in the bibliography by denominations, reports of voluntary ecclesiastical societies (about which he makes a neat democratic point), contemporary periodicals, biographies, memoirs, and selected secondary writings. There are twenty-three pages in the bibliography of which seventeen are primary sources; hence, this work will shed much light in a field where Sweet, Mead, Gabriel, Perry, and the Niebuhr brothers have been laboring with real helpfulness for the understanding of the origins of American culture in relation to religion.

The story of the New England theocrats is tragic. Theirs was a corporate anti-individualist vision for the Christianization of American culture according to God's will as revealed in the Old Testament; for the affirmation of world outreach via missions against isolationism; and for interdenominational unity against fissiparous denominationalism. In a sense it was the last noble effort to realize the *Corpus Christianum* in the modern world, an effort doomed to failure by the separation of church and state, by religious pluralism, and secularism generally.

Moreover, the theocrats, like all aggressive sects (in the Troletschian sense) and all church-dominated states (in the *Corpus Christianum* sense), were forced to make specific judgments in political action. Here is where the book makes the reader wince: they endorsed the American Revolution, but preferred the pre-revolutionary social order; they looked askance at Irish and German Catholic immigration; they sought to solve the Negro problem by colonization in Liberia, and, on the Indian question, split between assimilation and colonization in the West; they resisted American political expansion with a mixture of moral

arguments and anti-Southern and anti-Western sentiments. The above judgments are documented with a series of brilliant, colorful quotations.

Inside the church the antitheocrats attacked this religio-political synthesis as incompatible with the New Testament, on the one hand, and as dubious politics on the other. For example, William Lloyd Garrison launched what Dr. Bodo calls an "almost unanswerable" attack on the Liberian colonization scheme (pp. 135–137). The antitheocrats were actually of two somewhat different types: the Channing party of Unitarianism and the Alexander Campbell type of separationist Biblicism. These religious forces merged with the Republican and Democratic politicians to create an individualism which choked off the covenantal theocracy of the rival party. This, of course, at the high price of what Dr. Bodo calls, "the sterile, secularized 'Americanism' of the nineteen-fifties."

There is something amazingly permanent about the issues framed by this book. The church is usually poised between a false union of the Gospel and some relative political good; and a church so separate from the state as to be irrelevant. The theocrats were right in seeking a corporate social Gospel. They were wrong in most of the answers they gave in that larger quest.

Dr. Bodo has made a real contribution with this rich thrust into primary materials. As a Presbyterian minister in the Calvinist stronghold of Princeton, he is emotionally involved in the debate but remains judicious throughout save for an anti-Catholic thrust at the end of Chapter III.

DON E. SMUCKER
Bethany Biblical Seminary

COMMONWEALTH OF NATIONS

EPSTEIN, LEON D. *Britain—Uneasy Ally.* Pp. 279. Chicago: University of Chicago Press, 1954. $4.00.

That any alliance should be uneasy need be a matter neither for surprise nor regret. Two communities with different traditions, different needs, different historical experiences, and different geographical situations may sincerely desire to work together for a common object, but it is unlikely that they will always think alike. In fact unless they are held together by the unhealthy relationship of master and satellite there are likely at times to be open disagreements. Such disagreements might well be of value to either party as affording an insight into another point of view, but unfortunately as far as public opinion is concerned they are more likely to excite a mood of ignorant resentment which can be exploited by those who desire to frustrate the objects of the alliance. Consequently, the work of reinterpretation is continually necessary and to that work this book, which is a sympathetic review of the movements of opinion in Great Britain since the war, makes a notable contribution. There are indeed two difficulties which are probably inherent in such a work. The first is that the views of foreigners presented currently by one who does not share them may be made to appear as psychological peculiarities to be tolerated rather than as rational opinions to be considered on their own merits. The author of this book, so it seems to an Englishman, sometimes falls into this error, as in his discussion of the difficulties presented to the allies of the United States by the division of powers in the American Constitution and consequently by the apparent possession by Congress of power without sufficient responsibility. It is not suggested that the British way of doing things is "right" or the American "wrong": such statements would be meaningless, but the matter is very important, and the British case could be stated more cogently than it is here. The other danger in presenting a chronicle of incidents and opinions is that of underestimating the force of public indifference and oblivion. Much of what is recounted may be significant as a symptom of the way certain people's minds have worked, but it should not be taken as informing the mind of the public at the present time. Probably, if a very little experience of political work in Great Britain is any guide, most people have been always much more absorbed in the pressing problems of the cost of living and the difficulties about housing than in understanding the very complicated series of international agreements which have followed the war, and, what they may have known about these from time to time, they have forgotten. To ask the author to take into account the very important feelings of the inarticulate would be to ask him to write a different book, which he has disclaimed his intention of writing; in reading his book however the point must be kept continually in mind. In general, however, his account is both sympathetic and well balanced, and he can be particularly commended for his careful analysis of the extremely muddled but nonetheless important belief that the United States is a "capitalist" power and the champion of a thing called "capitalism," a belief which is still likely to produce trouble. Three omissions from his account may be suggested. He ought probably to have emphasized the importance of the rape of Czechoslovakia and also of the blockade of Berlin, each of which provided proof of the aggressiveness and lack of scruple of Russian Comunism. He ought certainly to have made clear the quite devastating results of the reports of the activities of Senator McCarthy and others like him. British, and continental, opinion may have been misinformed on these matters, but the Amercian public ought to be frankly told how deep and disastrous is the impression they have made, or how seriously they compromise the anti-Communist cause. But he does emphasize what is the most important point of all: the great danger of the ignorant but natural fear that the United States, which has not suffered from war in the way that others have done, is more ready than other nations to start another. This sometimes only sits as a ghost on the threshold of the European consciousness, but it can always be brought from its lurking place by ill-advised words or actions, or conjured by the malicious for very sinister ends. It is dangerous both to us and to the United States, and it is very important that when Americans speak their minds they should realize what may be in the thoughts of those who are listening to them. For this reason may an English reviewer say that he hopes many of them will read this book.

G. KITSON CLARK
Cambridge University
England

NOTESTEIN, WALLACE. *The English People on the Eve of Colonization 1603–1630.* (The New American Nation Series, edited by Henry Steele Commager and Richard B. Morris.) Pp. 302. New York: Harper & Brothers, 1954. $5.00.

The full impact of Alice Duer Miller's lines, "were they not English our forefathers," is brought home when reading this second volume of The New American Nation Series. Professor Notestein in this admirably written and information-packed book has given us an insight into just what sort of people these forefathers were. Starting with a background of English history up to 1603, Professor Notestein calls upon his deep and thorough understanding of the source materials and the literature to give a penetrating thumbnail sketch of the English character and the intellectual and cultural influences that shaped it. Of special interest are the formative forces of the Bible and of Greek and Roman authors.

Professor Notestein has culled the dramatists and other literary figures in order to draw his composite portraits of noble, gentry, and yeoman, but offers little that is not already known to the specialist in British history. Nevertheless, what he has to depict is well drawn and will be of utmost value to the American historian. His chapters on the clergy, lawyers, physicians, and businessmen will be read with great profit and pleasure by specialists in all fields. Perhaps even more enlightening, and surely more entertaining, are the chapters on schools and universities for "when Englishmen went to the New World they were too poor at first to erect universities such as they had known, but in time they took over the English conception of how a university should be housed" (p. 130).

There are two quite ordinary chapters on Puritanism, but those treating with public officials ranging from king to churchwarden will be used by most students of the British Constitution, to which Professor

Notestein has devoted so much of his life. In these brief but thoughtful essays, the reader comes into contact not only with sheriff, justice, and constable but also the people with whom they dealt. With them he goes to the assizes, joins the justice and the constable in carrying out the king's justice, and works with the churchwardens on the problem of relief for the poor. With them he visits legal and illegal alehouses, prevents violence before it happens, and carries out a myriad of duties. Of special interest is the connection of the high constable with wages and that of the churchwarden with nonreligious activities. Professor Notestein has presented a panoramic view of the busy, lusty English officialdom about which he writes.

Space limitations necessitated a cutting of the book and undoubtedly such considerations prompted Professor Notestein to relegate to footnotes much relevant material which perhaps would have been better incorporated into the text. The index although not complete is adequate, but many readers would perhaps have preferred a fuller bibliography. Such are, of course, personal observations and are in no way intended to detract from what is a splendid addition to The New American Nation Series. Here indeed is a portrait of the Englishmen who supplied such a "goodly heritage" to the America that was in the making.

JOHN J. MURRAY
Coe College

GILMOUR, G. P. (Ed.). *Canada's Tomorrow: Papers and Discussion, Canada's Tomorrow Conference, Quebec City, November 1953.* Pp. vii, 324. New York; Toronto: The Macmillan Company, 1954. $4.00; $3.50.

This collection of oddly matched essays has as its theme "an attempt at sober prophecy as to what Canada may and should become in the next fifty years." The tone throughout is one of extreme caution, and, in the reviewer's opinion, of modesty overdone. This is a world of uncertainty and the risks of prediction are great, but this has always been so, and the times and the opportunities call for more than cautious self-examination and a sobriety verging on dullness. In short, the volume at many points leaves the impression of a lack of color and spontaneity in the Canadian scene, elements certainly not lacking in Canada's past. Hilda Neatby in a thoughtful essay on cultural evolution touches on the most underdeveloped area of Canadian life, yet even here there are indications of advances too strong to be held in check by such restraints as the necessity of "a conscious dedication to the good life." B. K. Sandwell, whose faith in the natural operation of economic laws remains unshaken through depression and boom, foresees a population of approximately thirty millions by the end of the century, a forecast which cannot be said to err on the side of optimism. In a very general survey of Canada's natural resource position, M. W. Mackenzie comes close to taking the life out of a lively and exciting theme. R. K. Stratford in his "Challenge to Science" draws attention to Canada's weakness in fundamental research and looks to sociology and "a vision, clear and bright" to overcome this deficiency. D. W. Ambridge sees the happiness of mankind as the ultimate purpose of industry and argues that we "should press for the establishment of a government department whose duty it would be to assist Canadian industry in a great national effort to lead the world out of the hopeless morass in which we presently wallow."

Maurice Lamontagne presents an analytical account of the role of government in Canada's development in the past and its likely role in the future. Although he leaves himself open to attack by historians and economists at many points, his reflections on the problems raised by bureaucratic expansion in a democratic society merit careful reading. On the educational front, N. A. M. MacKenzie succeeds in providing perspective on the present struggle between traditionalists and progressivists in Canadian education. D. G. Creighton's "Canada and the World" is at once the most provocative and the most scholarly essay in the book. In his illuminating discussion of the objectives of Canadian foreign policy there are few of the qualifications so popular among academics and no concealment of likes and dislikes. Writing as "An Outsider Looking In," D. W. Brogan is not at his best and his comments suggest the need for a closer look. The book closes with a useful digest of the discussions which followed presentation of these papers. This digest, along with A. G. Gilmour's first-rate Introduction, provides the frame for an assortment of writings in which rhetoric and appeals to fine sentiments mingle with genuine insights and scholarly interpretation in an experiment in prophecy, which, with all its shortcomings, might well be repeated at an early date.

W. T. EASTERBROOK
University of Toronto
Canada

AITKEN, HUGH G. J. *The Welland Canal Company: A Study in Canadian Enterprise.* Pp. ix, 168. Cambridge, Mass.: Harvard University Press, 1954. $3.50.

This is an almost aggressively modest book. The author has denied himself the luxury of purple passages, he refuses to rhapsodize over the personalities of the men connected with the Canal and has stayed carefully within the bounds set in his Preface—"to set down nothing which further inquiry or more penetrating analysis might prove to be false." Within those limits he has succeeded admirably.

As an economic project, the Welland Canal scheme has parallels in the history of a number of American states. The initial engineering investigation was so poor as hardly to justify the name. The capital costs were so high as to be beyond the means of any local body of capitalists; yet a new level of development for a great territory seemed to wait upon the completion of this one great work.

The differences were that the Welland Canal was only one link in a great through route to Europe for the export products of the interior of North America. A part of that St. Lawrence route lay within the province of Lower Canada (now Quebec). And, in any case, its success depended on the total costs to Europe, including the ocean haul from Montreal, rather than on the costs on any part of it. The full story becomes, then, part of the competition of the North Atlantic ports for the trade of the interior. To this was added the complication that the St. Lawrence route cut across the nearly inevitable nationalism of the United States.

In the working out of the project, the attempt to keep it under the control of British subjects forced it to turn for capital to an ever increasing degree to the Province of Upper Canada (Ontario), and it ended by becoming the public work which it has since remained.

The writer has told its story with care and competence. All the details are here and, in particular, the interplay between the governing aristocracy of the time and the rising entrepreneurs is clearly shown. The book is a valuable addition to the history of Canada in the nineteenth century and to the study of the relations between business and government.

JOHN L. MCDOUGALL
Queen's University
Canada

PATEL, GOVINDLAL D. *The Indian Land Problem and Legislation.* Pp. xvi, 534. Bombay: N. M. Tripathi, 1954. $5.00.

Dr. G. D. Patel studied the historical aspects of land tenures in Gujarat, northern part of Bombay State, at the Gokhale Institute of Economics and Politics, Poona, for his doctoral thesis. Later, as an officer in the Government of Bombay in charge of land tenures, Dr. Patel had to study similar tenures in other parts of the Bombay State. In this book he has examined in detail the features not only of the tenures in the Bombay State but also of the variety and shades of them under the Permanent Settlement in other parts of India, and has given complete information about the legislation and procedure for their abolition.

The reader will find that Dr. Patel has presented the legal and administrative details about the subject in an exhaustive manner. It is unfortunate, however, that, largely arising out of the limitations of his office, the author has avoided the examination of the flaws, legal and procedural, that have come to light in their working. Even more than this, what a discerning student of agricultural economics would welcome is the study of the economics of agrarian

reforms and a peep into their actual working, the degree of their success, which would have given him some inkling into the shape of things that are emerging. The supreme need is to avoid the pitfalls of the present system of land management and taxation and through radical land laws to evolve a healthy and wholesome pattern of ownership and use of agricultural lands leading to higher production per acre, capita, and man-hour. The value of the study would have been considerably enhanced even if Dr. Patel were in a position to pose questions on the problems and handicaps that emerged while implementing land reforms, such as the question of compensation and legal status, the extent of knowledge and awareness about tenancy and allied legislation, the extent of protected tenancy, evictions, the supplementary litigation that arises from these land laws and corrodes the rural social fabric and the grievous delays in the disposal of tenancy suits. If the book similarly had examined the requisite pattern of agricultural organization under existing conditions which could ensure higher productivity and tried to assess the land and tenurial laws accordingly, probably a truer picture of the efficacy of agrarian legislation might have emerged from his labors.

The reader will also fail to understand the relevance of an account of the 'Bhoodan' movement in the study, particularly in view of the fact that the philosophy is likely to controvert the purpose of some of the vital pieces of land legislation such as prevention of subdivision and fragmentation and consolidation of holdings. The significance of the human and psychological approach that is being brought to bear on the problems of land distribution and ownership should be appreciated. The author, however, could well have been fair both to 'Bhoodan' and its critics if along with its profound philosophy and the amount of land donations received, he had, for instance, compared the size and the quality of donations to the magnitude of the task, the implications of the technique on the existing pattern of land ownership, agricultural organization and productivity, the procedure and the factors governing allotment of land received under the silent social revolution, the legal squabbles and technicalities involved, the resource sanction behind the land allottees to ensure proper and systematic exploitation of land, the arrangement and provision to remedy this lacuna, and preventive steps to avoid the achievements of the movement from being nullified through large-scale land transfers after the stipulated time.

University of Bombay
India

WOLSELEY, ROLAND E. (Ed.). *Journalism in Modern India.* Pp. xii, 308. Bombay, India: Asia Publishing House, 1954. Rs. 7/8.

This is a much needed book for all of those who are concerned with the communication of ideas. It is by no means a definitive study of the press of India, but it is a very thoughtful and lucid description of the main contours of the Indian press. As such, it is invaluable to those who would make the pretense of understanding India, its foreign policy, and its people.

The literature of the press in India is scanty, and with the coming of age of this new nation as a great power, there is a need for more books of this kind which will throw light upon its multitude of characteristics. The need for the book is to be found in the fact that the last book of comparable scope was Margarita Barns's book in 1930, although a somewhat more formidable tome about Indian journalism was printed in the Marathi language in 1952.

As Professor Wolseley points out in his Preface, it is somewhat presumptuous for an American to edit a book on the Indian press, but the job needed doing and he has done an excellent one. He has assembled a very impressive list of fourteen experts on various phases of the Indian press and while inevitably there tends to be some repetition, this has been kept to a minimum by sharp editing.

An excellent beginning to this book, and, in fact, to any book on the press, is provided by A. D. Mani's thought provoking Introduction. It is all that an introduction ought to be and could well serve as a model for some time to come.

In addition to the Introduction the book is divided into five parts: "The Journalistic Scene"; "Writing and Editing Techniques"; "Related Fields"; "Educational Aspects"; and a "Forecast." The book also contains a bibliography of Indian journalism and a general bibliography of journalism books.

Professor Wolseley spent eighteen months in India as a Fulbright scholar on leave from Syracuse University School of Journalism where he is Chairman of the Magazine Department. All in all he has done an excellent job. The book is a useful addition to the library of any scholar who is interested in the field of press communications.

W. C. CLARK

Syracuse University

KORBEL, JOSEF. *Danger in Kashmir.* Pp. xvi, 351. Princeton, N. J.: Princeton University Press, 1954. $5.00.

Since 1947 the newspapers of India and Pakistan and the records of the United Nations have been full of the Kashmir dispute, but until recently clear and dispassionate accounts of the background and course of the dispute, and the basic issues involved in it, have not been generally available. At least four books published within the past two years, however, have presented the essential information in a concise and readable fashion. Two are highly personalized volumes by two Englishmen who had long years of service in India: *Horned Moon,* by Ian Stephens, former editor of *The Statesman,* and *India and Pakistan: A Continent Decides,* by Lord Birdwood, who held high positions with the British Army in India. An able young Canadian scholar, Michael Brecher, has published a painstaking and well documented record of *The Struggle for Kashmir,* with emphasis on the role of the United Nations.

Josef Korbel covers much the same ground as does Mr. Brecher, but his book has certain distinctive features aside from its attractiveness and readability. One is his emphasis on "the real issue," which he describes as one of principle and not of territory, "the uncompromising and perhaps uncompromisable struggle of two ways of life." Another is his inside story of the work of the United Nations Commission for India and Pakistan, especially in the first months of its existence, when he served as its chairman. Obviously, he does not share the view of Lord Birdwood that there is "little profit in following the detailed course of the Commission's inquiries in the first months of their survey."

A third distinctive feature of Mr. Korbel's book is his clear warning of the growing "danger in Kashmir." Already, he asserts, Kashmir has become "a veritable powder keg for the whole of Asia. . . . the internal political development gives reason for real international concern. . . . Kashmir is being subjected to a systematic process of communization," and a continuation of the dispute can only profit "the cause of Communism." He believes that the real situation has been constantly minimized or overlooked by Nehru and the United Nations, but not by the Communist Party of India or the leaders of the Soviet Union. In this grave warning is to be found the main thesis of the book and the justification for its title. In documenting this thesis he designates names and cites evidence. His discussion leads him far afield into a general treatment of Communist strategy and tactics in Asia and of the activities of the Communist parties of India and Pakistan.

Mr. Korbel has no sympathy with those non-Communist leaders, like Nehru, who try to follow a policy of "neutrality" under present world conditions. These leaders, he warns, "ignore the lessons of modern history." As an anti-Communist Czech, painfully aware of the fate of his own country, his attitude is quite understandable; but it leads him to misinterpret, and even largely to ignore, the mainsprings of India's present foreign policy and the limitations upon her policy of "neutrality." It is quite unfair to Nehru to assert that "he sees no danger to India from without" and "is not disturbed by present-day Communist policy."

In a Foreword Fleet Admiral Chester W. Nimitz, who was designated as plebiscite administrator for Kashmir, points out that

"a dispute that involves one-fifth of the world's population, and that can erupt into a world war, bears watching." Mr. Korbel, who has been watching Kashmir closely for some years, has written a readable account of the course of the dispute and a timely warning of the possible consequences of its prolongation.

NORMAN D. PALMER
University of Pennsylvania

BURNS, ALAN. *History of the British West Indies*. Pp. 821. London: George Allen and Unwin, 1954. (Distributed by the Macmillan Company.) $12.00.

Any book which attempts to make the impossible possible deserves the best wishes of the reviewer. This book steps courageously toward that end. The unbelievably minute factors of West Indian history, climate, wars, settlement, legislatures, and the ambitions of Spain, England, France, Holland in those waters, would long ago have been forgotten had they not been kept alive by the romance of buccaneering, piracy, and privateering, on one hand, and the rival drumbeats of imperialistic European powers on the other. Most of the vast battleground was occupied by these aggressive elements; the native, New World aggressions were contributed to West Indian history by the hurricane and the Carib Indian. These were American, and all the rest were of European origin. The author is far more impressed with the influence of the West Indian hurricane upon history and empire in that theater.

The book gets under way with large spirit and broad pen, only to find that in time, especially by 1900, one must bow before the inevitability of history and book publishing. As a result, the nineteenth century is hurried and nervous, and the twentieth century, although listed in the table of contents, turns out to be treated as a catalogue of dates and events (1901–52), handled in less than five pages. The history of the West Indies proved once again easier to manage for the seventeenth and eighteenth centuries than for the two modern centuries.

The book is clearly written and very well organized by this nonacademic historian, but the reviewer deserves the right to deliver an academic criticism for the author's failure to use the sources and perspective of Spanish historiography. Not that he is too partial to the English, since his treatment is cool and rational, but rather that this discrimination underplays the prior role of Spain in the Caribbean, the Spanish Main, and the history of the dotted sea which Spain claimed, populated, and patrolled. It is fair to add that for his purposes the English records, laws, statutes, and plantation diaries are ample.

There are twelve appendices, a bibliography, an index of persons, and a general index. For readers interested in the historical background of the area now included in most of the British Federation—from Jamaica to British Guiana—this book offers a unity which is nowhere else to be found. This gives it a unique reference character. There is little or no discussion of the British possessions on the Central American mainland, from Honduras down to the Mosquito Coast. Political, imperial, and legal history includes the concurrent developments in economic (sugar, trade), as well as social (negro and plantation) history.

LEITES, NATHAN, and ELSA BERNAUT. *Ritual of Liquidation; The Case of the Moscow Trials*. Pp. xi, 515. Glencoe, Ill.: Free Press, 1954. $6.50.

This is a definitive work on the three trials of the Old Bolsheviks which occurred between August 1936 and March 1938. More than half of the volume is composed of quotations, and the 103 pages of notes stand as an example of what highly financed research can accomplish.

The authors have painstakingly scrutinized the available stenographic reports of the trials and a mass of related (as well as some unrelated) data for the purpose of explaining the psychology of capitulation and confession and the motivation of the defendants. They assume that the charges were false and discount the role of promises, threats, and force. Their explanations are plausible and, for the most part, are well documented. The trials are related to Bolshevik doctrine very effectively and from it the authors have derived certain "rules of translation" to explain the extreme statements made by the defendants. Of special interest is Part III in which the various forms of denial and resistance are analyzed and profusely illustrated with examples. Many revealing quotations from classical Russian literature are employed—especially from Dostoevsky—ostensibly "to clarify some of the unexpressed content of Bolshevism." Yet Leites goes too far in the note to Chapter IV which contains twenty-two hypotheses regarding family relations among the pre-Bolshevik Russian intelligentsia "illustrated" by some rather incongruous passages from Russian classics. In any case, anyone bold enough to list twenty-two hypotheses should devote more than five pages to an explanation of them.

Recent Communist purge trials for which there are data—those of Rajk, Kostov and Slansky—are also treated here, and there is a brief postscript on Beria. However, other Communists who were liquidated without benefit of ritual in the late thirties, such as Zatonsky and the Politburo members Chubar and Kossior, are ignored in this study. One may also legitimately ask whether the ritual of confession and liquidation is less important now than previously and whether the Soviet public trial is not a unique event. The authors have stressed the ritual of liquidation but have not given adequate attention to the substance.

The lay reader who may want to read but one volume on the trials—and that quickly—would find it easier to read Victor Serge's brilliant novel, *The Case of Comrade Tulayev*, or Alexander Orlov's recent book. This is not to disparage the volume under review, but only to point out that its size and character will limit its use. At the same time it is evident that the authors have produced a volume which is both substantial and provocative.

JOHN S. RESHETAR, JR.
Princeton University

Europe: Nine Panel Studies by Experts from Central and Eastern Europe; An Examination of the Post Liberation Problem of the Position of Central and Eastern European Nations in a free European Community. Pp. iv, 146. New York: Free Europe Committee, 1954. $1.00.

Exiles from the satellite countries discuss European economic and military problems in this small volume, contributing reports on the Council of Europe, the Coal and Steel Community, European defense, power and energy, transport and telecommunications, finance and trade, agricultural integration, public welfare, and labor and social security. Each report, though brief, evidently attempts to serve several functions. It presents some empirical data on the subject in question; it urges that the exiles be given a consultative voice in the Council of Europe and other existing organizations to promote European integration; and it makes recommendations as to economic or military policy after liberation.

The information on conditions in the satellite countries and on the possibilities of functional integration with Western Europe, which all the panels favor, is necessarily quite superficial. What there is, however, is intriguing, though often intermixed with statements based upon guesses or hopes. Thus, the Panel on Public Welfare declares that mass Communist indoctrination "will have lasting effects which must be considered, as far as possible, with a view to countering them in the post-liberation period"; but two pages later it announces that "the captive peoples who have experienced Communism at home and have learned to despise it will not be in need of anti-Communistic education." The Panel on the Coal and Steel Community appears to have been the most detailed and careful.

That liberation will entail a sudden and complete shift of allegiance of the satellite countries in a world still embroiled in a cold war, rather than a gradual change in economic or diplomatic policies, is assumed and not discussed. Although the economic policy recommendations for the post-liberation era are usually couched in rather vague language, their highly conservative tenor on some key issues, notably

finance and farm ownership, suggests that the authors have little confidence in economic appeals to secure popular revulsion against Russia and friendliness for the West. This is not true of all the recommendations; but even the Panel on Labor, which urges eventual free unionism and free labor mobility, suggests that the right of free bargaining may have to be restricted during an undefined transition period.

Sponsorship of research on economic conditions is certainly one of the most fruitful things the Free Europe Committee can do; but this book is not a model of what such research should be.

MURRAY EDELMAN
University of Illinois

WESTERN CONTINENTAL EUROPE

MATTHEWS, RONALD. *The Death of the Fourth Republic.* Pp. 318. New York: Frederick A. Praeger, 1954. $5.00.

This book has the merits and defects of vigorous popular journalism. The author laments the *république pure et dure* of which the resisters dreamed; not until page 233 does he turn to the Fourth Republic of fact. His themes are the decadence of prewar France, the hopes of regeneration born in the Resistance, and their disappointment through Communist betrayal, socialist pettiness, and conservative inertia and blind selfishness. The depressing case is argued with force and pungency.

The work is chatty in style and slipshod over details. "No one liked it, the new constitution" (p. 227) is a typical sentence. French railwaymen retire at 55, not 50 (p. 295); the prewar parties number thirty-six on page 30, but thirty-two on page 204; Ribbentrop, Hindenburg, Baudouin, Robert Schuman, and Manila are misspelled (pp. 44, 57, 75, 245, 297). No authorities are cited. Controversial statements (for example, that the late Yves Farge was a secret Communist in 1944) are made without qualification or evidence (p. 151).

The judgments are often arguable and always pessimistic. Blum, de Gaulle, and Mendès-France are the only leaders whom Mr. Matthews approves. The Schuman plan is dismissed (p. 265) as a scheme to unload French social insurance costs onto German industry; the steelmasters's hostility to it is ignored. There are naive "might have beens"; even if Jules Moch's brother, by speaking more briefly at the 1944 Socialist Congress, had tricked the party into accepting subsidies to Catholic schools, it is unlikely that clericals and anticlericals would have permanently buried their feud in a united French labor party.

Yet, these faults concern trivialities. Mr. Matthews makes too much of his selected incidents, but they illustrate the right themes. The quarrel between socialists and progressive Catholics has indeed paralyzed the democratic Left. Mendès-France's fiscal plans in 1945 could have averted the later economic troubles. This shrewd account of what went wrong picks out unerringly all the main political conflicts and social problems from alcoholism to housing; the general reader will find no better guide to them. Yet, though acute, succinct, and lucid, it is only the prosecution's case. Writing in December 1953, Mr. Matthews naturally felt pessimistic; six months later the French people, as often before, showed themselves capable in a crisis of unexpected resilience.

PHILIP M. WILLIAMS
Oxford University
England

PARK, JULIAN (Ed.). *The Culture of France in Our Time.* Pp. x, 345. Ithaca, N. Y.: Cornell University Press, 1954. $5.00.

In the nine essays which constitute *The Culture of France in Our Time,* Julian Park and his six collaborators—French, American, and English—present the general reader with "an overview" of some aspects of French life and thought since World War II. The first five essays—on poetry, the novel, and the press; on art; the theatre; music; and philosophy—are primarily concerned with contemporary men, their ideas and productions, and the trends apparent in their work. The last four essays—on education, religion, law, and science—reach further into the past, into the Napoleonic era and earlier, in their treatment of the present. Culture, in this volume, is used in the limited sense as the authors are primarily concerned with critical descriptions and appraisals of cultural artifacts—novels, plays, paintings—and of some of the institutional means—education, the church—by which French culture, in the broader sense, is shaped and transmitted, rather than with the use of such materials for an interpretation of French life. Nevertheless, the several essays help to provide the American reader with some basis for thinking about France, and one at least, that on science by Jean Mayer, suggests the struggle through which Frenchmen are going to maintain in their own minds the sense of their intellectual preeminence in the contemporary world. Of particular value are the essay on education by Julian Park and the introductory section in the essay on science which is concerned with educational specialization, as these lead the reader through the unfamiliar maze of the educational system, and help him to grasp both the homogeneity and the diversity of French thinking.

In a volume of this kind, which does not attempt to create a synthesis, there are areas of overlapping and of apparent contradiction which are very provocative. Thus while Park's discussions of education and religion indicate the extent to which France has become not merely secularized but even de-Christianized, Barbara Beyer's analysis of contemporary art emphasizes the renaissance of church art. Discussion of the political system and politics as such is avoided in this volume, and some subjects—for instance, developments in the social sciences—are given extremely summary treatment. Even so, what the American reader can derive from this book, with its diversity of thought and direction, is some understanding of French culture in transition and of continuity in change.

RHODA MÉTRAUX
New York Hospital

TREVOR-ROPER, H. R. (Ed.). *The Bormann Letters: The Private Correspondence Between Martin Bormann and his Wife from January 1943 to April 1945.* Translated by R. H. Stevens. Pp. xxiii, 200. New York: British Book Centre, 1954. $3.75.

Born in 1900, and an early convert to National Socialism, Martin Bormann was fired from his first Party job in the office of the Reich Party Treasurer. Rudolf Hess then picked him up, and he became the indispensable assistant in the Party Chancellery. In 1941, with Hess' dramatic defection, Bormann became the head of the Party apparatus and confidential secretary to Hitler. By 1943, when this series of private letters begins, he was the least known but most powerful of the Nazi satraps in Hitler's entourage. Shunning publicity, he served Hitler with dog-like devotion and was rewarded with the Führer's complete trust and confidence. He remained with his master to the end, witnessed his marriage to Eva Braun as well as his last will and testament, and supervised the cremation of Hitler's and Eva Braun's bodies. He has been "missing" since May, 1945, when he led a small group of survivors from the Führer bunker in an unsuccessful attempt to escape from encircled Berlin.

In 1929, Bormann married the daughter of Walter Buch, chief of the Nazi Party disciplinary court. This volume contains about 250 letters, telegrams, and notes exchanged between Bormann and his wife between January 1943 and April 1945. They are intimate, affectionate, and unbelievably banal. Bormann's letters to his wife afford some interesting details of intrigue among Hitler's lieutenants, and they reflect the state of mind of the hierarchs as the Nazi Reich approached its end. But unless we can assume that they are typical of the correspondence between Nazi leaders and their thoroughly Nazified spouses, these letters possess slight historical significance. An exception is the copies of orders sent from the Party Chancellery to the Gauleiters in connection with the July 20 Putsch against Hitler and the regime.

The originals of these letters form a part of the Bormann papers which passed from Frau Bormann, who died in Merano in March 1946, through intermediaries to a Swiss citizen. François Genoud, the

present owner of the papers and the copyright, has written an Introduction in which he expresses the naive opinion that these letters will correct false impressions of Bormann and place him in a truer and more favorable light. H. R. Trevor-Roper, an English historian, provides a second Introduction, which gives a contrary but more acceptable evaluation of Bormann as the instrument of Hitler's will, who was "a devil for work," and executed his master's orders with ruthlessness and brutality.

ORON JAMES HALE
University of Virginia

SEABURY, PAUL. *The Wilhelmstrasse: A Study of German Diplomats Under the Nazi Regime.* Pp. xiv, 217. Berkeley and Los Angeles: University of California Press, 1954. $3.00.

This book is an excellent and well documented study of the careers and activities of the Wilhelmstrasse diplomats during the Nazi regime, based upon the voluminous documentary material, memoirs, and monographs now available. The author has drawn up criteria of analysis to discover the degree of loyalty of a state bureaucracy to a political regime, and specifically to Nazi Germany. Added interest is given to his analysis by his examination of the progressive disintegration of the old German diplomatic service and of the moral problems encountered by career civil servants of diplomacy when faced by the terrors and rewards of a revolutionary and police state.

The author regards Hitler's declared and undeclared foreign policy before 1933 as indeed explicit but primarily a propaganda weapon for seizing internal power. He estimates correctly the historical significance of Hitler's secret conference of November 1937 with his military and diplomatic chiefs, in which the Führer outlined his program for ruthless German expansion in Eastern Europe, and his assessment of the international situation arising out of the Spanish civil war. It was after this meeting that Hitler took over direct control of the army, the foreign office, and the national economy.

Joachim von Ribbentrop was the new foreign minister of the Third Reich, whose first task was to prepare the way diplomatically for the invasions of Austria and Czechoslovakia, and above all for the involvement of Nazi Germany in a major war. He maintained for a time the independence of the foreign office from party and state agencies trying to control foreign-policy formulation, nazified the Wilhelmstrasse, but in the end could not prevent the triumph of irregular foreign policy advisers including Goebbels, Himmler, Rosenberg and Bormann. Although Ribbentrop symbolized the 1939 diplomatic pact between Nazi Germany and Soviet Russia, he remained "Hitler's shadow" in the wartime Reich, a harassed foreign minister following the Führer in a wartime caravan. "Statesmen held responsible for the policies they engender and develop," writes Dr. Seabury, "invariably come to symbolize them as well."

In his concluding chapter on the vanishing diplomatist, the author summarizes the role of German professional diplomacy in the Third Reich. He points out that the career diplomats, with important exceptions, failed to perceive the demise of professional diplomacy, failed to act in time, and above all failed in moral courage. He quotes Anthony Eden to prove that "the conditions which the Diplomatic Service originally grew up to meet no longer exist unchanged in modern international affairs."

The idea of some old career officials that the bureaucracy could remain as a state within a state during public ideological struggles and terroristic revolutionary movements, influencing and shaping the policies of the chief of state and his lieutenants, did not prove true in the Nazi regime. In Europe, the historic technique for the autocratic control of bureaucracies was developed by the Empress Maria Theresa and her director of foreign policy, Count Kaunitz, in the diplomatic revolution of 1753. Said Max Weber, often quoted in this book, "politicians must provide the counterpoise to the rule of officialdom."

RALPH HASWELL LUTZ
Twentynine Palms, Cal.

HOETTL, WILHELM. *The Secret Front: The Story of Nazi Espionage.* Translated by R. H. Stevens. Pp. 327. New York: Frederick A. Praeger, 1954. $3.95.

The Secret Front is neither an account of the inner workings of a "secret service" nor a description of a "secret front." However, it is a firsthand tale by one who carved himself a niche of sorts in the Nazi intelligence structure. As such, it doubtless belongs in any contemporary library of the intelligence history of World War II.

Hoettl seeks to impart a personal flavor which the reader will find wanting. He has written a minimum of major events which can be substantiated, plus a smattering of hitherto unknown items which are sometimes interesting, but add little to our knowledge. I found most interesting the character sketches of personalities of the Nazi intelligence scene. The remainder of the book recounts results of political espionage in Eastern and Southern Europe, with some detail on actual intelligence operations in Italy. One feature—interesting though unrelated to intelligence—is the "Musings of a Dictator," presumably thoughts jotted down by Mussolini during the first weeks of his captivity.

Hoettl's book is not an exposé of secret intelligence operations; rather it recounts the struggle between the Secret Service and the Foreign Office as to which should be the proper instrument of political diplomacy and reflects the struggle with the Military Intelligence Services, which it absorbed in 1944. The success of the Secret Service in these struggles testifies to the monstrous capability which this machine contributed to Hitler's acquisition of absolute power.

Total absence of factual documentation is understandable since few records have been left to German military writers. Hoettl is outspoken in describing the arch-villains with whom he associated, but these are all silent in death, as are many others who could substantiate or refute Hoettl's statements, claims, or conclusions. One wishes Hoettl had written personal experiences of intelligence training, secret intelligence activities, actual operational planning, and personal conduct of intelligence operations. These are lacking.

In the Introduction, Ian Colvin and Colonel R. H. Stevens, formerly of the British Foreign Service, who translated the book into English, indicate that Hoettl makes the best of material at his disposal, and presents a factual, honest, and objective account unbiased by past loyalties or prejudices. The American reader will find this pill hard to swallow, for the book indicates how the great German Secret Service—of which the author was a proud member—plotted, schemed, lied, murdered, stole, and betrayed to support Hitler's mad plan of conquest. Americans will hardly believe that Wilhelm Hoettl, an illegal Austrian Nazi, Sicherheit Dienst member, and political intelligence agent, could ever be an impartial historian or commentator upon events involving Hitler's Third Reich. The book contains one gross error, surprising from this expert in Balkan affairs. On page 319 he describes Dr. Durcansky as a former Croat Foreign Minister. Dr. Durcansky is a Slovak, and was Slovak Foreign Minister in the Tiso regime.

Newspaper reports from Austria and elsewhere in recent years indicate that Hoettl still plies his trade. However, he has failed in all postwar attempts known to the West to gain any position of prominence in either political or intelligence spheres. He is still regarded by police authorities of Western governments as an intelligence fabricator and peddler.

GENERAL L. K. TRUSCOTT, JR.,
USA, Retired
Office of U. S. High Commissioner for Germany

ERHARD, LUDWIG. *Germany's Comeback in the World Market.* Edited by Herbert Gross. Translated by W. H. Johnston. Pp. 276. New York: Macmillan Company, 1954. $4.50.

In this book Professor Ludwig Erhard, Minister for Economics in the German Federal Republic, provides us with an enthusiatic portrait of Germany's phenomenal comeback in world markets. Germany's economic recovery has been most sharply evidenced abroad by her rapid export advances in European markets, and her replacement of Britain as the largest exporter to Central and South America after the

United States. One might cavil at the space devoted to the chaotic years before the currency reform. But this background does serve the purpose of emphasizing the extent of recovery. At the same time, as Minister Erhard himself points out in his Preface, it also permits the reader, the British reader in particular, to appreciate the inherent limitations on the continuation of the rate of progress experienced during the years 1948 to the present time. A great part of the recovery was simply the inevitable reassumption of its position in world markets by a nation that had long ago forged for itself the role of exporter of industrial goods to great industrial nations.

The book traces German trade relations geographically as well as through time. Chapters are devoted to relations with the sterling area, dollar markets, the Middle and Far East, eastern Europe, and Latin America. Interesting as this progress report undoubtedly is, American readers are likely to find themselves still more interested in the light the book throws on postwar Germany's international economic philosophy. It is Erhard's credo that a liberalized world trade is a prerequisite for mutual trust. But the difficulties are admitted; witness the author's regret that Sweden's desire for greater access to Germany's market for agricultural and industrial products could not be adequately satisfied.

Since Germany's recovery is reported in this book as of 1953, and from a particular point of view, the reader will want to remind himself of some of the underlying domestic factors that are bound to exert an important influence on the future course of German trade. West Germany has benefited greatly from a policy of low wages and long hours that has not been opposed by the unions. Moreover, no serious objection has been raised to the policy of favoring imports of raw materials and equipment over consumption goods. Thus capital formation has been stimulated, and costs have been kept down. But there is evidence that in the future German labor may contend more vigorously for a share in gains in productivity. Moreover, Germany has been spared the necessity of diverting resources to armaments. The present highly favorable export picture might suffer seriously from the inflationary effects of defense outlays amounting to DM 10–15 billion yearly and the withdrawal of half a million men from production to military service.

KENYON E. POOLE
Northwestern University

TAYLOR, A. J. P. *The Struggle for Mastery in Europe 1848–1918.* Pp. xxxvi, 638. Oxford: Clarendon Press, 1954. $7.00.

The volume by Professor Taylor of Oxford University, an impressive achievement above all by the lively way of its narrative, is the first volume of a new series to be called "The Oxford History of Modern Europe." This first volume deals with the history of international relations from the downfall of the system of Metternich to the end of World War I, when Woodrow Wilson on behalf of democracy and Lenin on behalf of totalitarian Communism announced the dawn of a new era in which the old concepts of power policy would no longer apply. Mr. Taylor's volume is to be followed by one by J. W. Wheeler-Bennett, dealing with international relations in Europe between the two world wars, while only later another volume will present the international relations in Europe from the outbreak of the French Revolution in 1789 to its repetition on a smaller scale in 1848. The author of this last volume has not been announced yet. In general the whole plan of the new venture of Oxford books seems tentative and not too clearly defined.

The first volume in the series marks, however, a promising beginning. Mr. Taylor writes with scholarship and wit, a not very frequent combination, which may attract a wider circle of readers to his book. His trend to overstress and overstrain, though it may not always please the critical reader, will certainly not displease the general public. The book has the defect which all diplomatic histories have: it tells us too little about the political ideas, the cultural trends and the social structure of the nations involved, of their inner tensions and parties, and as a result the international relations are left suspended in a vacuum. But with this reservation which concerns more the whole trend than the book itself, Mr. Taylor's work is the best presentation of the tangled web of alliances and alignments of the European powers in the second half of the nineteenth century at present available in any language.

Perhaps the title of the book is misleading. One cannot speak for the period which lasted from 1848 until 1900 of a struggle for mastery in Europe. All the great European powers of that time were much more concerned with preserving the balance of power than to become the masters of Europe. That is true even of Bismarckian Germany. Only at the beginning of the twentieth century Germany consciously though vaguely reached out for the mastery of Europe. In her attempt to unify Europe under her leadership, she destroyed the European balance of power and thereby Europe. In April 1917 the United States entered what had been until then the Great European War; in November 1917 Russia, which in the nineteenth century had been more and more integrated into Europe, turned her back upon Europe. The European balance of power which had preserved peace from 1814 to 1914 could no longer be re-established. In its place a world balance of power is slowly and painfully emerging after the defeat or containment of German, Japanese, and Russian struggles for world mastery.

OTHER COUNTRIES

THOMPSON, J. ERIC S. *The Rise and Fall of Maya Civilization.* Pp. xii, 287. Norman: University of Oklahoma Press, 1954. $5.00.

The history of Maya artistic and learned attainments has long been available to the student. Maya social and political history, philosophical orientation, personality structure, and general way of life are less accessible, but are of greater potential interest to the social scientist. It is this side of the Maya civilization that Thompson has tried to approach. The attempt is courageous; archaeologists feel safer when keeping to less inferential materials. The effort is necessary, since only by making it can the archaeologist provide data for the integration of his findings into the fields of history and social science.

Thompson's knowledge of Maya archaeology is unexcelled; and this background supports the large number of inferences made. The text is not organized for the presentation of a sequential history and description of the material culture of the Maya, but for the exploration of their customs and beliefs, their philosophical orientation, their daily lives. The processes of thought of the Maya are explored in sections on mathematics and astronomy, on engineering, on cosmology. The behavior and activities of the individual are re-created, and a chapter is devoted to short fictional sketches of life among the Classic Maya.

As may be seen, there are more data for the social scientist in *The Rise and Fall of Maya Civilization* than in more conventional archaeological texts. The manner of presentation is, however, closer to that used by writers in the humanities. Anecdotes and atmospheric descriptions are frequently used as devices in bringing the Maya to life. The text is also studded with comparisons between Maya and modern life and with quotations from European sources which suggest the large body of similar emotions and situations which confront men of all cultures. To the reviewer many of these, as for example a comparison of a Maya ceremonial center with the zoned skyscraper section of a modern American city, seem labored. The Maya civilization would seem to be more understandable in its own right.

The political organization of the Classic Maya has been the subject of much speculation among archaeologists. There is every evidence of constant interchange of knowledge among the priestly hierarchy and their dependent craftsmen. There is also little evidence of warfare and conflict among the religious centers. Thompson conceives the Maya to have been organized as city states or in units comprised of several neighboring religious centers with

their adjacent but dispersed agricultural populations. He suggests that any confederation between such states may have rested on blood ties between religious rulers as well as on the body of esoteric ritual, calendric, and literary knowledge shared by the priesthood.

Thompson's book is not easy to pigeonhole but is very much worth reading. Books of this sort by specialists aid in broadening and merging compartamentalized knowledge.

GEORGE W. BRAINERD
Southwest Museum
Los Angeles

HUXLEY, JULIAN. *From an Antique Land: Ancient and Modern in the Middle East.* Pp. 310. New York: Crown Publishers, 1954. $6.00.

This is a remarkably informative book by the learned former Director-General of UNESCO. It is based on travel notes which Mr. Huxley took before and after the general meeting of UNESCO in 1948 in Beirut. The antique land referred to here includes Turkey, Iran, nearly all Arab countries, Crete, and Cyprus. His official duties precluded his making extended journeys to any of these places, and everything he did had to be done in a hurry. For instance, to visit Petra from Amman he had to go "two and one-half hours by plane, two and one-half hours by car, two and one-half hours on horseback, and two and one-half hours roughish walking" (p. 119), and his stay in Jordan was just fifty-two hours. Yet, in his attempt to see all that remains in the cradle of civilization he missed hardly anything of importance. Baalbek, "the show-place of the Lebanon," Byblos, the "window of the dim and distant past," Aleppo, Damascus, and Bagdad, Ctesiphon, Luxor and Karnak, Cairo, Constantinople, and Isfahan, and of course Jerusalem, parade through his pages and are brought to life by his lively pen. The superbly produced plates from his photographs (in color and monochrome, printed in Holland) clearly testify to the artistic beauty of the past. The author's learned observations on such topics as the evolution of the alphabet (pp. 48–56), and the extent of the Mesopotamian flood plain in ancient times, are refreshing; and his remarks on various types of architecture certainly enlightening. Interesting and also intriguing are the sidelights he casts on bee eaters of Petra, wall creepers on the fortress of Aleppo, the hoopoes of Cairo and the golden hamsters of north Syria.

In writing a book such as this the author probably did not intend to add just another book of travel notes on the Middle East to the public. His is meant to be a purposeful work, and the grandson of T. Huxley seems to have shouldered a messianic task of propagating the idea of science and technology to humanity. By studying and illuminating the accomplishments and achievements of the past he means to demonstrate that what has been done in the past can be done again under the "evolutionary humanism" generated by UNESCO. To him the desert is a challenge to humanity. "If the ancients could make the desert blossom . . . as the basis for orderly and civilized life, what can we not hope from the proper application of our greater knowledge and higher technical skill?" (p. 30). He raises many stimulating questions and in at least one case he offers his answer. "Our generation," he says (p. 84), "has had the opportunity of making Jerusalem an international holy place. Yet today there is an Iron Curtain between the two halves of that city." Statements such as these provide the key to our understanding of our most difficult international problems.

A. O. SARKISSIAN
Library of Congress

MARLOWE, JOHN. *A History of Modern Egypt and Anglo-Egyptian Relations, 1800–1953.* Pp. 440. New York: Frederick A. Praeger, 1954. $6.00.

A History of Modern Egypt and Anglo-Egyptian Relations, 1800–1953 contains a straight chronological narrative of Egyptian history with special emphasis on Anglo-Egyptian relations. The story begins with the first British occupation in Napoleonic times and ends with the recent revolution. The author tells us little more than what is known from other books and contemporary issues of the *New York Times*. His bibliography contains only English sources, with one exception, a book in French. Some obvious publications are absent, while others are not unimpeachable sources. The United Nations, for instance, has published excellent material on this country. A book devoted to Anglo-Egyptian relations may be expected, in part at least, to be based also on Egyptian material. If the author has no mastery of the Arabic, he should have consulted Egyptian sources in French, and there are also enlightening publications on this subject in German and Italian. Also a book of this nature should contain at least one map.

It is not the reviewer's intention to imply that the author leans too much to one side in his appraisal of Anglo-Egyptian relations. Mr. Marlowe is an Englishman and he has enough of his countrymen's political maturity and sense of fairness to be critical, and sometimes highly critical, of England's actions. He is outspoken about what may be called Britain's "age of arrogance," when she assumed that what was good for London was also good for Cairo. Nor does Mr. Marlowe overlook the damage done to the two countries's relations by the highhanded and unimaginative policies and actions of English bureaucrats. He gives proper credit, at the same time, to such great colonial administrators as Lord Cromer, British Agent and Consul-General in Egypt, and Lord Kitchener, Sirdar of the Egyptian army and Governor-General of Sudan.

The author thinks little of the Arab League which Britain created in order to satisfy Egypt's *amour-propre* and pan-Arab aspirations. He rightly says that it has never developed beyond the paper-organization stage, and that its almost sole major preoccupation is anti-Zionism. In Mr. Marlowe's view, Palestine assumed a disproportionate importance in holding together the Arab States.

The author is no less critical of the Egyptian ruling class, which he describes as beholden to its own interests, regarding power as a means toward self-enrichment, self-aggrandizement, and a chance to dispense patronage among friend and kin.

The author does not go into the causes of the dethronement of King Faruk and the establishment of the military junta. We are not told much in this book about General Nâguib who at the time of writing of the book appeared to be the leading figure. Mr. Marlowe notes the plans of the military regime but he also notes that they have never blossomed forth into any sort of achievement. He is not sure whether the Egyptian revolution may not harden into a "wooden-faced and jack-booted authoritarianism or dissolve into a morass of fanaticism, xenophobia, and pseudo-Communism." The British government, he says, will have to make up its mind whether the Egyptian revolution was a signal of the rebirth of a nation or just another *coup*. Then, again, the author speculates that Egypt may be another corroboration of the wise French adage: *"Plus ça change, plus c'est la même chose."* Recent events that have occurred since the writing of this book leave the reader wondering too that they may be different faces of the same impenetrable Middle Eastern mystery.

EMIL LENGYEL
New York University

KIRK, GEORGE. *The Middle East, 1945–1950.* Pp. vi, 319. New York: Oxford University Press, 1954. $7.50.

This volume, essentially a continuation of the author's *The Middle East in the War* in the familiar format of the Royal Institute's Survey Series, deals with the principal developments in the Middle East from the close of World War II to the outbreak of war in Korea. In order to establish liaison with previous Royal Institute of International Affairs Studies and to provide a setting for a particularistic treatment of the events and issues through approximately half a decade of postwar readjustments, the account opens with a review of the interplay of policies in this strategic area which resulted in the "expansion over almost the whole region of that 'power vacuum' which, in the circumstances of the cold war, threatened the Western conception of global security. . . ." The two succeeding parts are devoted to "Turkey, Persia, and the U.S.S.R." and "The Arab Countries and the Western Powers."

This study everywhere bears evidence of

a great deal of painstaking research. Some of the themes treated did not have to be developed wholly from scratch, of course, since basic studies already existed for parts of the period covered by the survey relating, for example, to the conflict of Great-Power interests in Iran and to the struggle for Palestine. Nevertheless, the author has not failed to check these accounts against his own findings from the sources available to him—sources of a great variety from state papers to contemporary press reports—and so has produced a volume indispensable to a full understanding of the forces at work and of the situations resulting from their complementary or conflicting action.

The author's treatment of the British regime in Palestine and its degeneration into an Arab-Zionist struggle is particularly noteworthy in that commendable care has been taken to present with complete objectivity an analysis of events that seldom have been viewed dispassionately and placed in proper perspective. Yet it is only in this connection that the author's judgment may be called in question even lightly. He has devoted only a little less than half of the entire volume to events in Palestine culminating in regional war and the erection of the state of Israel, as contrasted with about one-twelfth of the whole to Anglo-Egyptian relations including Sudanese problems. It is true that, even on a global scale, some of the most striking events of the years 1945–50 occurred in the Palestine area, but that these were so much more significant than developments in other sectors of the Middle East is not immediately apparent. There can be no gainsaying, however, that the treatment of subject matter throughout the volume has been in keeping with the best scholarly traditions.

HALFORD L. HOSKINS
Library of Congress

HOSKINS, HALFORD L. *The Middle East: Problem Area in World Politics.* Pp. vi, 311. New York: The Macmillan Company, 1954. $4.75.

As Dr. Hoskins, already well-known for his contributions in the field of Middle Eastern history, points out at the inception of his current study, the strategic position of the Middle East at the intercontinental crossroads and the impact of developments in that area on the struggle between the great powers, including the United States, have focused international attention on the region since the end of World War II. Beginning with a survey of the contemporary Middle Eastern scene in its world setting, the volume plunges into a topical treatment of the major problems with which the Middle East has confronted the free world generally and the United States in particular—issues involving not merely questions of international politics, but the development of nationalism and the complex problems of an underdeveloped area.

Dr. Hoskins devotes a very useful chapter to the question of the Turkish Straits, with brief historical backgrounds, and brings the story down to date with the new American interest in the issue well highlighted. The next two chapters are allocated to the problem of another international artery, the Suez Canal, centering about the Anglo-Egyptian controversy recently settled in the agreement of October 19, 1954. A chapter is also devoted to the problem of the Sudan and the agreement of February 12, 1953. The two chapters dealing with Israel in the Middle Eastern complex and the aftermath of the partition of Palestine in 1947 are written with objectivity and understanding of the basic issues involved in the Arab-Israel controversy concerning the questions of the Arab refugees, Jerusalem, boundaries, and compensation. They are followed logically with a treatment of the development of Arab nationalism and the formation of the League of Arab States. The author then turns to the problem of Iran and provides a well-balanced account of that country's complex social and economic problems together with an analysis of the Anglo-Iranian oil controversy which reached a settlement in October 1954. Two full chapters are assigned to the "oil factor" in Middle East relationships and to the very significant "strategic aspects" of Middle East oil. The author's reflections on "the Point Four balance" and on the economic and social problems in this underdeveloped region are much to the point. The volume closes with a consideration of strategic questions in the Middle East and the search for situations of strength, in which alternative policies are discussed, if no special panaceas are offered.

As a whole, the volume is not only well-balanced, but well-organized, and well-written and throws much light on a host of problems. It should be widely read, not only by students of the area, but by all who seek a broad and intelligent understanding of the peoples and the problems of the Middle East. The volume contains six black and white maps and a very useful critical bibliography of major sources for a study of the area.

HARRY N. HOWARD
Arlington, Virginia

JONES, F. C. *Japan's New Order in East Asia: Its Rise and Fall, 1937–45.* Pp. xii, 498. New York: Oxford University Press, 1954. $6.10.

From 1937, the Japanese announced it as their fixed policy to establish a "new order" of things in East Asia. In place of the existing system of European domination, the Japanese proposed to end white colonialism and to establish a system of mutual co-operation among Asians under Japanese technical and moral leadership. This plan, which for a time stirred the imagination of many of the nationalist leaders of Asia, collapsed both because of the growing resistance of the nations embraced within the Greater East Asia Co-Prosperity Sphere and because of Japan's final defeat by the Allied Powers.

Professor Jones has given us what is without question the most distinguished and comprehensive analysis yet available of this phase of Japanese history. Drawing upon original materials, such as the proceedings of the International Military Tribunal, Professor Jones has painted a fresh and live picture. However monolithic Japan's expansionist policy may have appeared, any given policy adopted was in fact the outcome of the competition of many crosscurrents at war in Japanese society. We are given by Professor Jones a sense of the issues that lay between the war and the peace party, the business world and the military, the diplomatic service and the armed forces, the Army and the Navy, the junior officers with their populist nihilistic fascism and the senior officials with their statism.

Furthermore there was a basic ambiguity at the heart of the "new order" concept itself. For Japan, one of the imperial powers, the Co-Prosperity Sphere was simply a technique of rule; but for the Japan which felt its kinship with "exploited Asia," it was really intended as an association for the mutual benefit and protection of free and independent nations. The conflict between these two conceptions underlay much of the contradiction that was so evident in Japan's overseas policy: the alternate wooing and cracking down on nationalist movements, the brutal exploitation for her military needs, and the genuine support of national cultural revival.

In the end, the Japanese became the victims of what Niebuhr has called the "irony" of history: they reaped not only unexpected results, but results which were the contrary of their intentions. The experiment of the new order, which was to establish Japanese dominion in perpetuity, turned out to be merely an exercise in independence for the former colonial nations; it brought into existence the new forces which were heading for inevitable conflict with Japanese policy. By their very success in liberating Asia from the white man, the Japanese had very nearly turned it over to the Communists.

FOREWORD

Inevitably, in an atomic age, nuclear air power must be the sword and shield of freedom. By the same token, no aggressor can hope to conquer free society without a well-rounded atomic air capability as his primary strength. Nuclear air power thus has become the most portentous single fact of modern life, pregnant with evil and good. Without American air power, postwar Europe might have fallen an easy prey to Communism. Without this same power it would have been difficult, if not impossible, to forge the system of alliances uniting most of the world's peaceful and democratic nations. Atomic air power has given the free world a true and trusted defense.

But even more significant: Long-range air power has put an end to geographic inaccessibility. The remote bases needed to prepare, secretly, for destructive surprise attacks no longer are inviolate against retaliation. Henceforth the heartland is nearly as exposed as the periphery. With the express purpose of keeping a new military holocaust at bay, the American nuclear force for years has been pointed at the very core of incipient aggression. The free world's plan is to continue to employ American and British nuclear superiority as the chief deterrent to cataclysmic folly.

Whether nuclear air power will succeed in giving the world what it never possessed before, an effective tool for the prevention of war, depends on the presumptive aggressor's rationality. If he thinks reasonably, he will realize that he cannot defeat the United States except through a dislocating and disruptive nuclear attack and that he has little chance of forestalling even more devastating counterblows. However costly an atomic war would be to the free world and the United States, it would also spell disaster for Communism.

Aviation is far broader than air power. Just as military aeronautics could destroy the fruits of a million years of human effort, civil aeronautics might join a fractured world into a more co-operative society. The ability to fly for purposes of commerce, travel, recreation, research, health, and production is one of mankind's greatest current values. Once fully developed—and we are very far from aerotechnical maturity—aviation may modify profoundly our present urban structure and thus reduce our vulnerability to atomic weapons. As a commercial endeavor of many facets it is contributing to the transformation which society is presently undergoing. Air transport is helping in the development of backward areas. It has allowed a dramatic intensification of trade and travel and thus an ever wider distribution of hard currency throughout the world. As a result, it holds promise of making economic protectionism increasingly difficult. Psychologically, aviation is putting an end to national isolation and self-centeredness. Aeronautics, a tool of peace as well as of warfare, is thus one of the most creative forces of modern civilization.

Thus far scholars have given only limited attention to the problems of modern aviation. The failure of political scientists to deal more directly with the changes wrought in political relationships by the development of flying poses grave questions. Could it be that we are paying a penalty for leaving the life and death problems confronting modern statecraft in the hands of men who are not governed by judgment acquired through the scientific method? Could it be that the politi-

cal scientists have been scientific about all problems except defense and war? Could it be that political scientists have been overlooking one of the most promising methods of increasing co-operation among nations? The fact remains that the meaning of aviation has not yet been fully grasped by governments, military commanders, business leaders, scholars, or nations. They are frightened by the military threat, but remain unaware of the peace potential of aeronautics. Never before has a vital problem been so neglected and so blanketed by emotion, misinformation, muddledheadedness, ignorance, and plain apathy.

This issue of THE ANNALS is designed to illuminate the nature of air power and nuclear weapons and to bring out some of their impacts on modern civilization. Of the four sections into which the discussion is divided, the initial two address themselves to the problem of defining air power and assessing the relative strengths of nations in the air, with primary emphasis on the United States and the Soviet Union. The last two sections deal with current and future security problems created by air power. While most of these articles analyze defense within the American frame of reference, one discusses European attitudes toward air power and security.

Some of the important questions considered are: Has United States foreign policy in recent years placed undue reliance on atomic weapons, to the exclusion of other instruments of policy? Does the fear of atomic warfare in overseas countries reduce the effectiveness of the Western alliance system? How is it possible that the Soviet Union, an industrially backward country, should now be in possession of modern aerial weapons systems? Is there such a thing as a nuclear stalemate, and what would be the strategic implications for the United States of such a stalemate, should one occur? Is it really true that nuclear weapons can be used in only one manner, namely through "strategic bombardment," and that they necessarily must put at risk the survival of entire nations and continents?

Fifty years after its birth, aviation is still in a formative stage. Within the next generation enormous changes are likely to occur: nuclear propulsion with its unlimited range; rocket propulsion with its high-altitude and high-speed capabilities; a reduction of transport costs to the present level of cheap surface transportation or below; a lesser dependence on large airfields; aerial suburban communications; and perhaps mankind's first advances into space and, therewith, probably the most disruptive event of human history—the establishment of a link with the universe.

It is impossible to cover in one issue of THE ANNALS the total spectrum of these numerous problems. Our hope is that this issue will induce scholars to devote more attention to a development which should never have been ignored. The study of aeronautics is no less important than the study of diplomacy, politics, international law, or trade; in fact, it is indispensable if we are to get a full understanding of international relations. Let us become familiar with aviation and learn how to impress this extraordinary force into the service of defense, prosperity, and human progress.

ROBERT STRAUSZ-HUPÉ

The Geography of the Air

By STEFAN T. POSSONY and LESLIE ROSENZWEIG

STRATEGY and international politics are influenced strongly by geography. Since modern strategy, to a large extent, concerns itself with aviation, and since strategy and foreign policies are intimately interwoven, the study of aerial geography becomes a necessary step in the analysis of international relations. Aerial geography is as yet an infant science, and the political implications of its findings are far from clear. Yet the time has come for political scientists to take a look at that invisible sea in which we live, the air.

The term "geography of the air" is a linguistic misnomer for something which might more properly be designated by such words as "atmography," "pneumography" or even "aerography." But since the term "geography" has assumed a clear meaning in the English language irrespective of its etymological origins, it is thought best to retain it. The geography of the air, then, is the study of the physical differences of the air in various locations and altitudes. More specifically, it is the study of those differences which are most significant in regard to flying, and it attempts to bring out the implications which those differences have as regards human activities in the air.

CONVENTIONAL FACTORS

Naturally, many conventional geographical factors have aeronautical significance. Flying is influenced by conditions on the ground which include weather on airfields—fog frequency, wind intensity and direction, and temperatures; elevation of airfields (the higher the elevation, the longer the runway required); hardness of soil or of other surfaces such as snow and ice; topographical characteristics of airfield surroundings; the logistical and transport systems of airfields; topographical factors facilitating or impeding navigation; and electromagnetic anomalies interfering with the functioning of instruments. In terms of human geography, flying is influenced by such factors as population densities, availability of skilled manpower, trade relations, surface transportation systems, purchasing power, the availability or absence of navigational "airways," industrial potentials, and by a host of cultural, political, and military factors. Finally, flying itself can be the subject of a geographic analysis: How much flying is done in a particular country? What types of aircraft are being used? How are the flying activities organized? What are the production and maintenance systems? For what purposes are the planes kept in the air? How does flying influence the structure of a given society and its economy? And so on.

WINDS AND AIR MASS MOVEMENTS

Winds used to be objects of conventional "surface" analysis, but this has ceased to be true. Customarily, statements on wind directions have referred to winds on the ground and in the lower altitudes. Yet wind directions change with changing altitudes. It is important to get a clear understanding of "prevailing" and actual winds at *all* important altitudes and to keep close and constant checks on winds at all currently usable altitudes. For example, at 20,000 feet, there may be a westerly, at 30,000 feet a northerly, and at 40,000 feet an easterly wind, all different winds occurring at the same time—although

admittedly such a radical diversification by height may be rare.

Recently we have gone beyond the study of "winds" and have become interested in the movements of the atmosphere as a whole. The entire mass of the atmosphere carried by the earth weighs approximately 5 x 10^{15} tons, less than one one-millionth of the earth's weight. Each square meter of the earth's surface carries ten tons of atmospheric pressure. Yet this entire mass of air is constantly in flux. Winds and other weather phenomena appear to be governed by these gigantic air movements, which, according to theory, are caused by two primary forces, the rotation of the earth and the sun's radiation. The surrounding atmosphere is heated by the sun and spun around by the earth. As a result, the atmosphere moves from west to east in the Northern Hemisphere and from the southeast to the northwest in the Southern Hemisphere, while the hot air over the equator and the tropics flows partly to the poles and partly to the middle latitudes; at lower altitudes, cold polar air flows toward the temperature zones. These warm and cool masses meet at about 40 degrees latitude and form the vast unstable weather zone which is continually shifting according to the region and the time of the year. Within this zone, there are areas where certain types of weather occur with frequency and regularity. Many air routes have characteristic weather patterns.

An important example of the significance for aviation of air-mass collisions is the so-called jet streams, which reach velocities of up to 300 miles per hour. Jet streams have been discovered, at altitudes from 30,000 to 47,000 feet, in an area between 40 and 50 degrees north latitude; in winter they have been found at 25 to 35 degrees north. These seasonal fluctuations seem to follow a cyclic rhythm. It is not known whether the oscillations of the jet streams create weather patterns on the earth or simply reflect them. Once the nature of the jet streams is understood, it should become possible to use the extraordinary energy which they represent and, at least on some routes and at some times, increase flying speeds considerably.

There is a good possibility that a third basic air movement may be of importance. This movement is the aerial parallel to the ocean tides, and like them is caused by solar-lunar attraction. Existence of this movement has been deduced from the fact that the pressure on the earth's surface changes periodically on a twelve- and twenty-four-hour cycle. This could be the case only if the atmosphere expanded and contracted cyclically—if it were "breathing" in consonance with the changing positions of the sun. The magnitude of the semidiurnal change is so great, however, that it must be influenced by the effects on the atmosphere's temperature by the sun's radiation acting *in addition* to the tidal forces.

Air movements, moreover, are influenced by terrain features. Everywhere in the world, mountain ranges have their aerial replicas in the form of gigantic up and down draft envelopes. On the "prevailing" windward side of the mountains there is an updraft, and on the leeward a downdraft. The rising air cools, and as a result the air cascades down like a torrent, frequently at a speed of approximately 4,000 feet per minute. As the air hits the base of the mountains, it bounces off and rises again, five to ten miles away from the mountain wall, in a tremendous vertical updraft, forming a standing wave, which sometimes reaches altitudes of 60,000 feet or more. Glider pilots use this type of air crest to gain and hold altitude.

The strategic importance of wind patterns is very great. Suffice it to point out a parallel to the days of sailing vessels when windward positions conferred great military advantages: those in this position could sail to the enemy but the enemy found it difficult to attack their base. Similarly in the air age, the belligerent who has to buck prevailing head winds to reach his targets (and pass through highly turbulent areas) is at a disadvantage, especially if his opponent is able to utilize jet streams.

THE ATMOSPHERE

The discovery that there was such a thing as air was made comparatively recently, although the phenomenon of wind, of course, must have been known to the first generation of men. The Greeks talked about air (*pneuma*) as one of the basic elements and attempted to describe its characteristics. Useful knowledge of the air has been accumulated, however, only since the eighteenth century.

The fact that the chemical composition of the air is variable was suspected by Priestley and established in 1846 by Bunsen. We know that in higher latitudes the nitrogen content of the air is greater than at the equator, that oxygen content rises slightly with the latitude, and that water vapor goes down as we move from the equator to the poles. The air contains more "impurities" over land than over water, and considerably more over industrial cities than over rural areas. It is possible that the distribution of chemicals within the atmosphere is influenced by gravitation; for example, it is believed that at higher altitudes the helium content increases considerably while the argon diminishes. We are, however, as yet unsure of the frequency at various altitudes of hydrogen and ozone.

SPHERES

Biologists are interested in the atmosphere because it contains the oxygen which man can use freely without assistance from instruments. The lower half of the troposphere, the narrow zone that sets the stage for life on our planet, has been termed the physiological atmosphere or ecosphere. Depending on physical fitness and habitation, the hypoxic zone of the ecosphere starts at about 13,000 feet. At that point the decrease of oxygen pressure begins to have strong psychophysiological effects upon man. At this point too, aircraft engines begin to require supercharging. The anoxia zone has been established at approximately 52,000 feet, where man loses consciousness almost instantly upon exposure. This is the approximate altitude beyond which, in spite of the occurrence of free molecular oxygen in the atmosphere, oxygen no longer enters the lungs; instead water vapor and carbon dioxide fill the respiratory system. Above 52,000 feet molecular oxygen begins to vanish from the atmosphere. In so far as noninstrumented and unprotected man flying in nonpressurized cabins is concerned, the 52,000-feet line must be considered the rim of space.

With increasing altitude, the characteristics of the air change in practically all respects. Starting from the surface and proceeding upward, the lowest portion of the atmosphere is called the troposphere. This is the "weather zone" of cloud cover, precipitation, and turbulence. In it temperatures fall rapidly till we reach the upper limit of the troposphere, the tropopause, which, in the middle latitudes, is situated at about 33,000 feet, but at the poles is as low as 20,000 feet and over the equator as high as 50,000 feet. Immediately above is the stratosphere, rising to about 66,000 feet. Within the stratosphere temperatures probably remain constant. Above is the ozonosphere, which extends upwards to 115,000 feet.

In terms of temperature, it has been suggested calling the zone above the

stratosphere, which is characterized by sinking temperatures, the mesosphere; in it the low temperature of − 117° F. is reached at about 225,000 feet. The zone above the mesosphere has been named the thermosphere. It begins at about 330,000 feet and reaches to 1,320,000 feet and above, hitting a temperature maximum of 4,118° F. at that point. It has been conjectured that, as at lower altitudes, temperature differences cause turbulence, but whether this will be the case in a near vacuum remains to be seen.

At 400,000 to 450,000 feet, the distance between air molecules becomes as great as the length of the sound wave. This is the acoustical frontier of the atmosphere beyond which there is no sound, no sound barrier, and hence no speed which can be meaningfully expressed in Mach numbers.

The exosphere is the area where the atmosphere reaches interplanetary space. In it air particles which have collided with other particles often bounce outward; sometimes they are recaptured by gravity but sometimes they escape into the universe. The exosphere begins approximately at an altitude of 2,000,000 feet but may reach as high as 10,000,000 feet, roughly 2,000 miles.

High-altitude rockets already have reached the periphery of "space." The next significant border will be crossed where, with given speeds of flying machines, the earth's gravitation can be counterbalanced in an altitude where friction no longer impedes movement. Naturally, beyond this area there must come a zone where a flying machine would leave the gravitational field of the earth and enter "space" in the proper sense of the word, subsequently reaching the gravitational field of another celestial body. In fact, the gravitational influences of the moon may become noticeable relatively soon; after all, they make themselves felt on the earth itself. At the halfway mark between earth and moon, the attraction of the moon would be approximately eighty times less than that of the earth. The next "boundary" would be defined by the so-called "abaric point," where the gravitational pull from the moon equals that of the earth. This point is located at approximately 24,000 miles from the center of the moon and over 200,000 miles from the earth, and it is there that we shall have found the true terminus of our planet.[1]

LAYERS

In the higher altitudes, there occur the phenomena of molecular splitting and ionization. Nitrogen, which is the major constituent of the atmosphere, is split into single atoms and becomes a quite different kind of gas at 400,000 feet. Nitrogen, however, is largely an inert substance and although changing in form, is not expected to have any notable effect on high altitude flights. More important is that fact that oxygen, the two-atom type which man breathes, is being split in half by very short-wave ultraviolet rays. One half joins the two-atom molecule to form the three-atom molecule ozone which is poisonous to man; the other half of the oxygen remains free. These single oxygen atoms are highly corrosive and extremely active, and thus may have some effects on high altitude flights. There are, therefore, two "poison layers": the ozone layer, which occurs between 65,000 and 115,000 feet, and the layer of atomic oxygen, which is most prevalent around 350,000 feet.

The ionosphere, which lies above the stratosphere—like the ozonosphere, the mesosphere, and the thermosphere—is subdivided into the D, E_1, E_2, F_1, F_2, and G layers. The D ionized stratum

[1] The gravitational influences of the sun will make themselves felt during the entire trip to the moon.

reflects long-wave signals at approximately 180,000 feet. The E layer extends from 225,000 feet to 330,000 feet, reflecting medium radio waves below 3 megacycles (wave length of 100 m). The E layer has been subdivided into the E_1 and E_2 zones. The E_1, or lower layer, exists all the time, while the E_2 layer appears only in daytime, at the higher altitude. The F stratum hovers during the day at approximately 980,000 feet and is termed F_2. During the night the F_2 stratum descends to about 825,000 feet and then is called the F_1 layer. The F layers reflect short-wave emissions.[2] Initial observations have been made about a G layer situated above the F_2.

As might have been expected, these ionization phenomena produce difficulties of instrumentation. Long-wave broadcasting is dependent on the D layer, standard wave on the E, and short-wave on the F layer. Radar, television, and frequency modulation broadcasting waves are not reflected by these "walls" of ions but pass through them into space. The various layers, however, often act concurrently and may cause double or triple signal reflections. Signals, moreover, are subject to deflections. In addition to the question of accuracy and dependability, the problem of instrumentation at altitude falls into four distinct parts: communications between two vehicles or tactical employment of instruments from one vehicle against another, both flying within the same electronic "layer"; communications or tactical employment from one vehicle against another which is flying in a different "layer"; utilization of equipment from vehicles at high altitudes against the earth's surface; and employment of electronic equipment from the earth's surface against the high altitude vehicle. It is possible that the functioning of equipment will depend upon four sets of circumstances: on the constant electromagnetic characteristics within the various layers; on variable changes such as electromagnetic "storms"; on the geographic location of electronic equipment on the ground (or aloft in low altitudes); and on the power outputs of the various transmitters, which, particularly in so far as ground equipment is concerned, must be considerable.

In the upper regions electronic communications of all beams and wave lengths will be subjected to electromagnetic diffusion, solar interference, ionization reflections, aurora effects, and cosmic radiation, all of which pose obstacles that must be overcome before man can navigate, communicate, and operate successfully in the upper atmosphere.

At present the power outputs of very high- and ultra high-frequency transmitters are between 8 and 12 watts. Such outputs are satisfactory up to 25,000 to 35,000 feet. At higher altitudes far more power is required to neutralize the various types of interference. To overcome the initial barriers which appear at approximately the 35,000-foot level, power outputs must be squared. To break through the additional obstacles at still higher altitudes and to transmit reliably over growing altitude ranges, ever more substantial power outputs will be needed. Presumably these outputs must continue to rise as flights reach increasingly greater heights. Hence a vehicle at 500,000 feet may need communications equipment with kilowatt instead of watt power. Naturally this will pose considerable weight problems.

LIGHT, RADIATION, AND METEORS

Visibility changes with altitude. Higher above the ground the day lasts longer; at some times of the year and

[2] The E and F layers also are known as the Kennelly-Heaviside layer.

down to given latitudes, the sun does not set at altitude, like the midnight sun of the arctic. In daylight, as we ascend, there is always clear visibility above the tropopause but as we approach the 40,000-foot area, the color of the light changes, turning first into eerie blue and then into violet. Auroras—visible particles in the sun's radiation—make their appearance. Above 100,000 feet, there is "eternal darkness," a very somber pitch-black darkness with no visibility, yet in the daytime the surface of the earth should be plainly visible from that altitude, except for clouds. Needless to add, these light conditions will require adjustments on the part of the flying personnel.

The problems of vision increase with speed. At 300 knots per hour the pilot will have flown from 1,000 to 5,000 feet before he can complete his perception and start muscular action in response to a sight stimulus. Another 1,800 feet would be traversed before his movements are completed. At higher speeds these time delays become more critical. This problem is significant, since high altitudes can be reached only through very great speeds.

As to radiation hazards, it is not believed that in flights of relatively short duration (that is, several hours), ultraviolet and soft X rays would endanger human effectiveness and health. Reasonable wall thickness should provide adequate protection against all likely radiation dangers. However, there may be in the upper atmosphere other forms of radiation which have not yet been ascertained and which may be harmful.

Meteors constitute another threat to flight safety in high altitudes. It was found that below altitudes of 260,000 to 330,000 feet, the blanket effect of the atmosphere reduces the hazard of collisions with meteors to negligible amounts, even for prolonged flights lasting several months. At altitudes between 330,000 and 390,000 feet the probability of collision increases to 1 part per 1,000 per day. The probability may well be in error by a factor of 10 or more in either direction. It is likely that up to these altitudes flights of less than twenty-four hours' duration could be made with little danger from meteors. Engineering could take care of most of these meteoric threats. The danger from meteoritic collision might become serious, however, if prolonged excursions, lasting months or years, at altitudes greater than, say, 400,000 feet, were to be undertaken. Concerning the validity of such estimates based on "averages," it must be remembered that the frequency of meteors is greater on some orbits than on others, and that this frequency varies with the year's season. Moreover, the effective impact of the meteors is dependent upon the direction in which they approach the earth: it is far greater in case of "collision" than in case of "overtaking." It may be, therefore, that there are regions in the air which, at least during certain times, the traveler had better avoid, similar to the inhospitable areas on the earth—the deserts, tundras, icecaps, and the jungles in the rainy season.

LIFE IN THE CABIN

Flight in lower altitudes is possible without protective equipment. At somewhat higher altitudes, oxygen masks and pressurized cabins become necessary, to be followed at even higher altitudes by pressurized suits: at an altitude of about 60,000 feet, blood would be boiling.

At higher altitudes, the atmosphere becomes so thin that for all practical purposes, there is no air left. However, the requirement for air within the cabin remains. At altitudes below approximately 70,000 feet this requirement can be satisfied relatively easily by pressurizing outside air. But pressurization becomes increasingly difficult because,

as the air gets thinner, it would require ever larger power outputs and because the extreme pressure ratios would result in excessively hot temperatures. There also is the potential danger of excess ozone concentration in air compressed at very high altitudes. This triple difficulty probably must be solved by taking the required air along in the vehicle; but, obviously, the vehicle must then be built in such a manner that escape of the air will be prevented—not a mean task for future engineers.

Assuming that a hermetically closed cabin can be constructed, the additional problem will emerge that human exhalations like carbon dioxide, methane, and hydrogen sulphide must be eliminated. In their historical dive in the bathyscaphe—a hermetically closed cabin—Auguste and Jacques Piccard used chemicals to absorb the poisonous gases. In future, however, more effective solutions will be required. According to some German authorities, the "gas exchange" problem might be solved through the utilization of botanical plants (e.g., *Alga Chlorella*). As in open nature, these plants would produce oxygen and at the same time dispose of the dangerous substances.[3] The practical difficulties of carrying along a sufficiently gas-productive "garden" should be obvious.

Lack of outside air will influence the temperature within the cabin. High speeds in a relatively dense atmosphere will heat the vehicle's skin, and normal heat transfer will tend to overheat the inside temperature. To prevent such overheating artificial refrigeration of the conventional type will be needed; it should be usable to about 60,000 feet. At higher altitudes, the vacuum will preclude heat transfer. Thus heat will not flow by itself into the cabin, nor will it be distributed evenly there. Moreover, the vehicle no longer will be heated by friction but by radiation.

With increasing altitudes gravity will be correspondingly reduced. Lack of gravitation may change human metabolism and thus the thermal regime of the human body. It also may modify man's movements, perceptions, activities, psychological balance, and general effectiveness. There is a distinct possibility that machinery will be needed to produce artificial gravitation, for example by substituting rotary for the downward pulls. Thus, composite oxygen production and gas exchange, ventilation, refrigeration and heat, and possibly artificial gravitation systems will become necessary. These requirements will pose extremely difficult technological problems, not the least of which will be the necessity of reducing these various "life systems" in weight, so that they can be carried aloft.

ENGINES

The usability of engines changes with altitude. Piston engines can fly only at relatively low altitudes and give their best performances at a few thousand feet. In order to fly at high altitudes aircraft using air-breathing power plants must operate at supersonic speeds, not only to provide sufficient lift but also to obtain adequate thrust. Because the thinner atmosphere offers less resistance (while still providing adequate amounts of oxygen), turboprops, turbojets, and ramjets, which lose range at low altitudes, perform best in the 20,000 to 45,000 feet zone, and presumably somewhat above. Yet at some distance higher up, there is not enough oxygen for any of these engines to operate. At an altitude of 100,000 feet, for example, the required speed for ramjets may be as high as 5 Machs, which means that the incoming air would have a stagnation temperature of about 2,000° F.

[3] H. Strughold, "Weltraumaequivalente Bedingungen innerhalb der Erdatmosphaere," *Weltraumfahrt*, January 1955.

Since energy must be imparted through this air at even *higher* temperatures, the heat limitations of materials and fuel may rule out the use of air-breathing power plants for high-altitude and speed flying. Rocket vehicles which carry their own oxygen may reach higher altitudes. Presumably they might fly as high as 265,000 feet and ultimately reach speeds of 14,000 miles per hour (or 3½ times faster than rocket speeds attained heretofore). Throughout the altitude band of 100,000 to 500,000 feet, however, flights with propulsion systems that can be envisaged at present will be of short duration, an hour or so, probably less time than is required for one revolution around the earth. The development of nuclear engines, naturally, may solve the high-altitude range problem; but since nuclear engines may be very heavy and since they may provide only low thrusts (though prolonged acceleration), composite engine systems may become necessary: for example, rockets to get the vehicles to altitude, atomic engines to provide extended cruise capabilities, and possibly a third set of engines to allow controlled landings.

NONPOWERED FLIGHT

The difficulty of long-range operations at high altitudes will make it desirable to investigate the possibilities of nonpowered flight. Such flight is predicated on the neutralization of gravity. Under static conditions, that is, if we should put a body on a tower erected over one of the poles, the earth's attraction would be reduced to one-hundredth at an altitude of about 190,000 feet. Absence of static gravity, it is assumed, would be encountered only far in space. However, movement can neutralize gravitational pull at lower altitudes. The faster the movement, the greater the reduction of gravity. A moving body would continue to move if its inertia were not overcome by friction. If there is no friction, the movement continues indefinitely. In the air, friction is produced by the collision of the moving body with the atmospheric particles. Yet above 600,000 feet the atmosphere has thinned out to such an extent that it no longer creates friction. Above this "mechanical boundary of the atmosphere," to use an expression by Heinz Haber, various types of nonpowered flights might become feasible. Naturally, the courses of vehicles on such flights must be "inertial" or stable. They could not have the ubiquity capability of aircraft, but like railroads or ships on an inland lake would be restricted to preset courses—aerial rails, so to speak. It would be another handicap of such vehicles that deflective pulls (resulting, for example, from the lunar-solar tidal forces) as well as navigational errors and changes of course would require the application of power. Hence while nonpowered flying should serve to lengthen range and flight duration, it will be possible only during the intervals between the setting and the correction of course.

NAVIGATION

The determination of location by pilot and instruments within the high-altitude vehicle, or by instruments from the ground, is partly influenced by electronic complications caused by the various ionized layers mentioned before. Furthermore, determination of location is made difficult by the distances which militate against the precision of the instruments. Suppose we want to determine whether a vehicle is over point A or B, the distance between those points on the ground being 415 miles. If A' and B' (the points directly over A and B) are at 50,000 feet, their distance at altitude is 416; at 500,000 feet, however, their distance has grown to 425 miles. This change in distance may

make it "easy" to establish from the ground the precise position of a vehicle but must make it very difficult from the air. The speed of high altitude vehicles is bound to complicate this problem further. Naturally, this does not imply that navigation must be inaccurate at high altitudes. Suitable navigational systems can be adopted, for example, celestial navigation. The point to remember is simply that the stars which will be visible will be dependent on the vehicle's geographic location and that high-altitude flight requires a space or astronomical—and no longer a terrestrial—field of reference.

Two other points must be considered:

1. In order to reach really high altitudes, rocket propulsion is necessary. Rockets cannot rise except along a unidirectional curve, that is, they cannot go up in a spiral. Hence during ascent as well as during descent, they will have to cover many thousands of miles (in terms of ground distance) and may have to go halfway or fully around the globe. Moreover, it is quite probable that the navigational controls—and possibly most other controls—of such flights will have to be done from ground stations. If so, many high-altitude flights will require a network of control stations which must be strung around large portions of the globe, if not the entire globe.

We should add that, in high-altitude flight, it may not be meaningful to describe a position as just a point in space; it may be necessary to talk about a position which is being passed at a given speed in a given direction. Otherwise it will be impossible, in view of the speeds of high-altitude flying, to correct course, among other reasons because it will be necessary to execute maneuvers in such a way that g forces will not become too powerful. Correction of course will have to be undertaken in a very wide area, along circles with radii of many hundreds of miles, and it will not be possible to complete them before a considerable distance has been traveled. It follows that it will often not be possible to set navigational errors right without flying into areas situated above foreign territory.

2. In cases of vertical take-offs for really high altitudes, the movement of the earth itself becomes a factor. Suppose the vehicle rises over A and does not alter its course. Hence after a lapse of time it may find itself "over" a point B located hundreds of miles distant from A. In many cases A will be in another country than B. In present-day flying, we assume the earth to be a fixed point of reference; the location of the vehicle is determined in relation to "immovable" places on the globe.[4] In high altitude flight, we will have to deal with *two* moving bodies, the earth and the vehicle; the "location" of a vehicle on a "vertical" course, except for its altitude, will be dependent on the movement of the earth.

POLITICAL AND INTERNATIONAL IMPLICATIONS

Now the question arises as to what all this means with respect to political and strategic problems. The first point to remember is that the race is on for ever higher altitudes, although in the minds of military planners this race may be subsidiary to the race for greater speeds. The point is that speed and altitude are interrelated: to gain greater speeds, one must reach higher altitudes, and to attain higher altitudes one must travel at greater speeds. The air force which can reach and operate at higher altitudes and speeds will gain very considerable military advantages, including greater safety from counter-

[4] Long-range ballistic and conventional navigational calculations, however, always must be corrected for the Coriolis effect which is caused by the earth's rotation.

action. The master of speed and altitude will dominate the battle area and will be far along the road to air, and hence global, dominion. In the near future, military power will have to be applied in the 50,000 to 100,000 foot zone. This will be the area where the next really important breakthrough of aviation will have to take place, and this breakthrough probably will be quite difficult.

AIR BOUNDARIES

If we posit, then, that a race for altitude and speed is under way, other interesting complications arise. In the period of land warfare, nations when negotiating about frontiers used to compete stubbornly for so-called "commanding heights"—elevations which permitted a good look into the neighbor's land. The "observation frontier" has now been placed in the air. How high can one fly without affecting the relative military capabilities of one's neighbors through the conquest of altitude above one's own territory? Paradoxically, the quest for security drives men into altitude, but the advance into altitude contracts distances on the ground and eliminates safety zones.

We have seen that in order to reach very high altitudes, ascent and descent trajectories of thousands of miles and widely dispersed ground control nets may be necessary. In some cases, therefore, altitude flights cannot be made "over" one country alone; the vehicle must fly over foreign territory—and rely on control stations in foreign countries—or it never will attain altitude. If it is to be prohibited from using foreign "air space," high-altitude flying would not be practical.

But the question is: Where does a nation's air space or air sovereignty end? At what altitude are we in no man's air or in no man's space? Do we have "open air" like the "open seas," and where? It would be preposterous to claim sovereignty over the air where air no longer exists. As a carrying and oxygen-feeding medium air ends somewhere in the 50,000 to 100,000 foot zone, yet in infinitesimal traces, air reaches up to tremendous heights. The discussion has shown that the upper atmosphere can be subdivided into multiple "layers" and "spheres" and that by about 700,000 feet, most, if not all, of the conditions of "space" prevail. The future of flying is dependent, in part at least, on the freedom of flight in higher altitudes. But what should be the criteria for drawing upper boundaries? It is apparent that simple line frontiers cannot be delineated in the air.

In terrestrial geography we have been accustomed to distinguish between plains and mountains, brooks and creeks, navigable rivers, canals, lakes, seas and oceans. We know that for each of these surfaces (which undergo seasonal changes) different means of transportation are necessary. Similarly, the atmosphere and the adjoining space can be subdivided into distinct parts. Each of these "aerial" zones requires different vehicles and instruments, just as the river requires a rowboat or a ferry and the ocean seagoing ships. The various purposes of flying must be accomplished, moreover, in different altitudes: short-distance travel is best performed at low altitudes, long-distance travel at medium altitudes, and research and combat at high altitudes. There are, in addition, many other purposes for which man takes to the air.

Let us conclude with the remark that the continuing progress of flying cannot be halted. As man reaches upwards to the outer atmosphere, new political problems arise, the nature of which we are as yet unable to grasp. Heretofore the relations between nations took place on what in practice was a plane. During the time of low-altitude flying, the relations between nations and military forces were determined by the geometry of a spheroid's curved surface. This period of close-to-the-ground flying was, and still is, characterized by the "polar concept." Henceforth, international relations will be geared to the more difficult geometry of the interior of a large spheroid enveloping as its core a smaller and impenetrable spheroid, the earth.[5] But even more confusing: the radius of the outer spheroid—symbolizing the aeropause or the altitude which man has attained at any given time—is expanding. The technologically most advanced nation will operate within the highest aeropause, while the spheroids circumscribing the aerial capabilities of the more backward nations will have shorter radii.[6] Hence, in the future, the geometry of power will be described by several enveloping spheroids of different sizes. It will be a far cry from the geometry of the battles of Yorktown and Bastogne, or even from the aerial battles of World War II. Truly, a new *Weltbild* is emerging.

[5] To be really accurate, we should speak of "ellipsoids" instead of spheroids.

[6] Aerial capabilities can be described by spheroids only after global ranges have been attained. Before that time, these capabilities will be portrayed more accurately by spheroidal sectors. The sector with the longest radius and the longest circumferential arc will symbolize the range, altitude, and speed proficiency of the technologically leading air force. The geographic location of the sector also will be of significance. (Note: The military strength of an air force depends on numbers of aircraft, trained personnel, and facilities, *in addition* to technological proficiency.)

Some Fallacies Concerning Air Power

By Eugene M. Emme *

NO technological innovation in the long history of mankind has been more frequently misinterpreted than aviation as an instrument of national policy. Air power is not understood either as a weapon in general or restricted warfare, or as an agent of commerce and communication. Yet Americans can be said to be air-minded. The crucial race for air-atomic superiority, the heavy burden of military expenditures, and the threat of utter devastation hanging over the urban centers of North America—these are inescapable realities which readily appeal to both reason and emotion on all levels of society.

In determining the best means to support the genuine political interests of the United States in world affairs, air power commands universal attention. Americans are agreed on the paramount importance of air power. Yet this seeming unanimity succumbs to confusion when the capabilities and limitations of aviation are variously assessed by statesmen, humanitarians, politicians, military strategists, and popular opinion. When air power is evaluated in the democratic process of decision making, certain fallacies appear with monotonous regularity. Some of these fallacies derive from obsolete military doctrines or vested interests. Others are products of ignorance, real as well as self-imposed. These fallacies are harmful to the national interest, and thus also to the security of the free world.

* This article reflects the views of the author only and should not be construed as necessarily reflecting official views of the Department of the Air Force or of the Air University.

Perspective on Today

Thoughtful and prophetic speculations on the meaning of air power have not been lacking during the half century of the practical existence of aviation. Invented in an era of rampant nationalism and technically perfected in the crucible of wars, aviation has been primarily developed as a weapon. No nation, however, was prepared to exploit fully the capabilities of aviation as a weapon either in 1914 or in 1939. Likewise, the consistent failure of democratic nations to appreciate the role of aviation in the pursuits of peace, particularly in its maintenance, has been even more apparent.[1]

Early insights

Prior to World War I, high places of government did not abound in forward-looking opinions about aviation and its future. When Santos-Dumont was the first to get off the soil of Europe in a heavier-than-air craft in the fall of 1906, Lord Northcliffe, the British press magnate, fumed: "The news is not that man can fly, but that England is no longer an island." [2] The year before Louis Blériot's channel hop, H. G. Wells wrote in his novel *The War in the Air:*

> In the air are no streets, no channels, no point where one can say of an antagonist, "If he wants to reach my capital he must come by here." In the air all directions lead everywhere.[3]

Wells foretold that air power would revolutionize war as well as the social consequences of war. He considered air war to be a "universal guerrilla war, a war inextricably involving civilians and homes and all the apparatus of social life." In *The World Set Free* (1914), Wells foretold that air power would be raised to its ultimate decisive military role by atomic bombs. In 1909, an obscure Italian Major, Giulio Douhet, wrote:

> It must seem strange that the sky, too, is about to become another battlefield no less important than the battlefields on land and sea. But from now on we had better get accustomed to this idea and prepare ourselves for the new conflicts to come. . . . The struggle for the command of the air will be bitter; and the so-called civilized nations will strive to forge the most telling means to wage the conflict.[4]

And in 1916, a prominent American, Alexander Graham Bell, told the National Convention of the Navy League:

> We must realize that we are only in the infancy of aerial locomotion; that this is only the beginning of things. These are not matured machines that have developed their full offensive power; there is going to be further improvement, and if you will allow your mind to look ahead you can see that land power and sea power will ultimately be secondary in importance to air power.[5]

Impact on England

It was in England, the insular and spiritual homeland of sea power as well as of constitutional political tradition, that the revolutionary impact of aviation was to be first recognized. As diplomatic tension with Germany mounted during the "cold war" of 1912–14, German Zeppelins, massive in size but unproved in war, appeared as a "menace" in the eyes of the English populace. Rumors that German dirigibles had flown over England (possible in theory but pure fantasy in fact) aroused considerable concern. Ghostly flying machines were often observed after midnight. Because of aviation England had obviously lost the geographical immunity which twenty-odd miles of water had previously provided.[6]

During 1914–18, responsible leaders grappled with the realities of three-dimensional warfare. As First Lord of the Admiralty in 1914, Winston Churchill was charged with the defense of the United Kingdom proper. The British Army and its Flying Corps had been totally committed in the bloody deadlock of ground forces in France. Churchill foresaw that air warfare, even in this primitive period, did not possess clearly divisible categories such as offense and defense. He therefore immediately dispatched land-based naval aircraft "to deny the use of territory within 100 miles of Dunkirk to German Zeppelins." While the German Army and Navy fought between themselves over which Zeppelin service was to bomb England when the Imperial Chancellor raised the existing political

[6] A not dissimilar phenomenon perhaps occurred when "flying saucers" were to appear at the same moment the United States lost its isolated continental position in a shrinking world. On "Zeppelin Menace," see John R. Cuneo, *Winged Mars*, Vol. I; *The German Air Weapon, 1870–1914* (Harrisburg: Military Service, 1942), pp. 121–27.

ban on such action, aircraft of the Royal Navy based in France destroyed several German Zeppelins on their home bases in the name of air defense of the United Kingdom.

When Gotha bombers roamed over London in 1916–17, Lloyd George appointed a special committee headed by Field Marshal Jan Smuts to investigate the serious plight of British air defense. While German bombs were falling on London (often evaluated after the war as a mere nuisance), the Smuts Committee unequivocally recommended that an independent air force be instituted immediately. This official report, called by some the Magna Charta of British air power, concluded:

> The day may not be far off when aerial operations with their devastation of enemy lands and destruction of industrial and populous centres on a vast scale may become the principal operations of war to which the older forms of military and naval operations may become secondary and subordinate.
>
> It is important that we should not only secure air predominance, but secure it on a very large scale; and having secured it in this war [1914–18] we should make every effort and sacrifice to maintain it for the future. Air supremacy may in the long run become as important a factor in the defence of the Empire as sea supremacy.[7]

The Independent Air Force of Great Britain for the conduct of a bombing offensive against Germany proper came into being the same year.

Air power during peacetime

For twenty years after its founding in 1919, the autonomous Royal Air Force was known as the Cinderella of the British armed forces. The vanquished nations were disarmed in the air and the League of Nations was delegated the task of regulating the peace for the victors. Under Winston Churchill as Secretary of State for Colonies in 1920, the infant Royal Air Force was adapted to peacetime tasks of the Empire. RAF squadrons served as police forces in the British protectorates and mandates of the Middle East, developing a system for "air control of underdeveloped areas." As the range and reliability of aircraft increased with technical progress in the 1920's, "air parity" became a vital strategic factor for European nations, first appreciated in England. It was determined by the Salisbury Subcommittee of the Committee on Imperial Defense, immediately after the French occupation of the Ruhr in 1923, that the Royal Air Force should always be strong enough to protect England against air attack by the strongest Continental air force within striking distance. Yet governmental policy based upon the assumption that there would be "no war in ten years" (established in 1924) actually provided for a Royal Air Force only one-half as strong in 1934 as the Salisbury Committee had recommended a decade earlier. Until the eve of World War II, appropriations for the Royal Air Force, though rapidly increased after 1935, were less than that for the Royal Navy and the British Army. In 1938, Britain was humbled at Munich largely because of her deficiencies in the air. Eventually, in 1940, Britain was forced to fight alone in the air for her very life.

Threat of aerial bombardment during peacetime

The diplomatic significance of the threat of aerial bombardment during the cold war of the 1930's is even now not fully appreciated. A brief summary of this painful episode may help provide perspectives for the reorientation of American policy today.

[7] Great Britain, "Second Report of the Prime Minister's Committee on Air Organisation and Home Defence Against Air Raids," August 17, 1917.

Atomic bombs are merely the second chapter of the air power story for most Europeans. Weapons of mass destruction were highly publicized long before and during the Conference for the Reduction and Limitation of Armaments held at Geneva in 1932–33. Poison gas and bacteria rained down from aircraft conjured nightmares of what total war could mean in Europe. While Soviet Russia today propagandizes a desire to outlaw atomic bombs, there was an attempt made at Geneva in 1933 to outlaw all aerial bombing. In "air-forceless Germany" (to use Hermann Goering's expression), the political device of building air raid shelters and conducting civil defense exercises was used to consolidate the populace under the young Nazi government in 1933. While secret rearmament and public works solved unemployment and social discontent within Germany, Adolf Hitler and Air Minister Goering were forging a new diplomatic weapon, the *Luftwaffe*.

In March 1935, after the independent German Air Force was "pulled out of the hat" of secrecy in direct violation of the Treaty of Versailles, British diplomats hurried to Berlin. Hitler told them that Germany now possessed "air parity" with Britain. This boast—a brazen lie—shocked British public opinion and British leadership to the core. Widely disseminated statistics on Germany's "first-line aircraft" aroused in Britain a feeling of helplessness and a fear of air attack which thereafter were to congeal in British political appeasement of Germany until the blitzkrieg in Poland and in British military inactivity during the phony war until May 1940 when Hitler seized the military initiative in the West.

"The bomber will always get through" was not a quotation from a doctrinal manual of the Royal Air Force. It was a fatalistic statement made in rebuttal by Prime Minister Baldwin to one of Winston Churchill's regular attacks in the House of Commons upon the imperfect state of British air defenses in 1934. The Royal Observer Corps, the "Shadow Factory" scheme for widening the base of aircraft production, radar development, the Spitfire prototype, and the mass production of gas masks—all these were stimulated by the events of 1935–36. Yet Britain and France remained reluctant even at this late hour to rearm fully. The bombing demonstrations in Manchuria by Japan, in Ethiopia by the *Regia Aeronautica,* and in the Spanish Civil War by the *Luftwaffe* magnified popular revulsion against the horror which a general war would bring to all of Europe; likewise the boasts of Goering, the apparent expansionistic designs of the Nazi Reich, and the "shop window" tours of the *Luftwaffe* skillfully conducted by the Germans for foreign military observers. Anti-Communism, anti-Semitism, and prosperity in Germany were also not ineffective tools of Nazi statecraft in influencing public opinion abroad. Subtle suggestions and eventually intimidation, blackmail, and naked ultimatums backed by the threat of bombing held over the leaders of European nations characterized the increasingly prominent diplomatic role of the *Luftwaffe* between 1935 and 1939.

When in 1938 war was postponed at Munich, the belief held by British and French statesmen as well as their peoples that the German Air Force was an overwhelmingly powerful threat was of decisive importance in achieving Hitler's bloodless victory. Britain possessed only six Spitfires. In Paris there were not enough gas masks to go around. British and French leaders therefore recoiled before the inhumane evil of a horrible war. Virtually the last thing that Chamberlain said to Hitler at Munich was that he hoped that the *Luftwaffe* would not have to

bomb the women and children of Prague when the Third Reich absorbed the Sudetenland. It was thus that the threat of massive air attacks, albeit more inferred by democratic statesmen than explicitly advanced by the Nazis, proved to be of profound historical importance.[8] In March 1939, Goering pounded the table in front of the helpless Czech diplomats and stated that he would be chagrined to have to unleash his *Luftwaffe* to destroy the "beautiful city of Prague."

In the present day, the fate of the West seems to depend upon the response of peace-loving nations to the challenge of militant Communism with air-atomic power building up in its arsenal. The inherent vulnerability of democratic nations to threats of an atomic holocaust by an aggressor nation, not to mention the decisiveness of a surprise all-out atomic attack itself, only increases the urgency for collective security actions, adequate preparedness in the air, and, if and when necessary, the will to use decisive military force. This seems to be the harsh lesson taught by air power's contribution to the descent into World War II.

CONTRADICTIONS OF MILITARY DOCTRINE

Past miscalculation and fallacies with respect to air power are not confined to those revealed by the conduct of democratic governments faced by the threat of air attack by aggressive-minded nations during periods of relative peace. A brief consideration of theories on air warfare reflects the impact of aviation upon the meaning of warfare. It also clarifies the divergencies and vagaries of military doctrine.

Early theorists on the military role of aviation in some instances can rightfully be called prophets. Their views, like those of most prophets, were dogmatic and were distasteful to most of their contemporaries. Though "Billy" Mitchell, Hugh Trenchard, and Giulio Douhet were each guilty of overestimating the technical capacities of aviation in their own time, some of their most controversial thoughts seem to possess validity in the present day. Their exaggerations of the presumable effects of tons of trinitrotoluene dropped from aircraft were the result of miscalculation. Yet the demonstrated role during World War II of tactical air forces in land battles, the effective TNT strategic air attacks, and the subsequent addition of atomic bombs appear to have verified their conclusions based upon empirical reasoning.

Neither Douhet nor Mitchell were military thinkers in the realm of high strategy and national policy like Clausewitz and Mahan. Douhet did essay a framework of strategic concepts which fits air-atomic realities fairly well. His views of air attack as a decisive action for the demoralization of a nation seem well founded. Mitchell had a global view of American security in the air age (he pointed to the importance of Alaska and predicted the attack on Pearl Harbor), and he defined air power as a national instrumentality in its broadest economic as well as its military sense. Neither their theories nor their historical fame need be elaborated here. It is sufficient to point out that in 1921 they were one in believing that air power as a military force had revolutionized warfare because it brought the heart of industrialized and urbanized nations into the battlefield. This basic belief challenged the traditional purpose of armies and navies and questioned their

[8] The most recent account is in Viscount Chilston's "The Rearmament of Great Britain, France, and Germany down to the Munich Agreement of 30 September 1938," Veronica M. Toynbee (Ed.), *Survey of International Affairs, 1938*, Vol. III (London: Oxford University Press, 1953), pp. 460–603.

plans and structures. Douhet and Mitchell both insisted, at the cost of their careers (while Trenchard went to the House of Lords), that a nation should organize its aviation capacity in peace to assure "command in the air" in war.

The limited range and the unreliability of aircraft in the 1920's and early 1930's were not conducive to a rapid acceptance of air-age realities in a United States girded by broad oceans. With no more than five months' combat experience in World War I, a few American airmen nonetheless developed rich theories on a thin diet of meager appropriations and slow career advancement. By 1935, the United States had its four-engined B-17 (flying fortress) prototype in the air. In World War II, air armadas of four-engined bombers were to carry TNT war to German and Japanese cities. While both Germany and Japan began the war with startling employment of air forces, their leaders did not really understand the role of air power in war. Atomic air weapons reconciled the hitherto contradictory principles of "mobility" and "concentration of firepower." No longer are there any disputes about the decisiveness of strategic bombing in general war. No longer are there any disputes about the priority role of air forces in achieving "air superiority" over battlefields, in general or limited wars.

The Battle of Britain (1940) and the fate of Germany's air defense effort (1942–45), moreover, adequately demonstrated the crucial role of bombers in homeland air defense. The first raid of Bomber Command on Berlin altered decisively the course of the Battle of Britain—a fact not generally known. It caused an enraged Hitler to order the *Luftwaffe* to shift the attack from RAF bases and radar sites to the city of London. This was done at the most ineffectual moment of Fighter Command, which was also "their finest hour." The V-weapons failed to resurrect for the dying Reich any real hope of stemming the "air terror" of the Anglo-American bomber offensive. In the Pacific, the lack of range of Allied aircraft and the inaccessibility or unavailability of Siberian bases delayed the application of Allied air power to the task of obtaining the decision without an occupation of Japan by surface forces. The advent of atomic bombs merely underscored the revolutionary impact of air power upon general war. As one civilian military analyst recorded in 1946, the atomic bomb did not make air power more violent or more decisive: "A city can be as effectively destroyed with TNT and incendiaries—but it [the atomic bomb] will concentrate violence in terms of time."[9] The possible concentration in a general war of violence against an entire nation relegates military doctrine founded exclusively upon World War II or even upon the unique Korean experience to the realm of pure fallacy.

WELTER OF CONFUSION ON JOINT OPERATIONS

Questions regarding the role of air forces employed in joint operations with other military forces arouse the greatest confusion. Here, doctrinal traditions and service interests have been the chief source of fallacies both in the past and in the present. Military professionals have consistently thought of aviation in terms of their traditional war objectives. The airplane was tethered to surface forces. This was practicable during the infancy of aviation, but it affected adversely the organization and application of air power. A major intellectual road block raised by tradition-minded thinking in the

[9] Bernard Brodie, *The Absolute Weapon* (New York: Harcourt, Brace and Company, 1946), pp. 70–71.

past yet remains: so far, a comprehensive military theory of air power has not been elaborated.

The basic assumptions of conventional military thought as laid down by Clausewitz and Mahan remained impervious to the influence of air power until World War II. Admirals and Army generals viewed the airplane as eyes to protect their respective battleships or troops in the line until World War II, some until Pearl Harbor or North Africa. With aircraft ship based, naval airmen considered aircraft primarily as a weapon of sea power for sinking enemy battleships, and later for bombing U-boat pens and enemy aircraft carriers. Military air power, first with the piloted airplane and now with guided missiles, has been consistently regarded by Army and Navy authorities as range-extended artillery. Airlift provides increased mobility or logistical support for infantry. Air weapons, traditionalists reason, should thus be organically instituted within armies and navies.

Military capabilities of aircraft

The range, speed of penetration, and directness of air attack thus have been either totally ignored or, at best, limited in strategical or tactical significance to armies in the field and navies at sea. These unique military capabilities of aircraft and their military payloads, on the other hand, have been the stock in trade of professional airmen. The records of many lengthy and heated interservice debates, even though overtaken in detail by the pace of continued scientific advance, provide documentation for many contemporary controversies.[10] The more strongly the airmen voice their long-held views on the splintering of air power, particularly that of tactical and airlift units among the various American air forces, the more they appear to be charged with expressing their so-called "vested interests." The professional airman insists, in turn, that the only "vested interests" involved are those of the nation. Yet among the prominent political figures in the Western world only Winston Churchill took the pains in 1949 to repeat in timely and poetic fashion the fundamental assumption expressed by the Smuts Committee in 1917:

> For good or ill, air mastery is today the supreme expression of military power, and fleets and armies, however necessary and important, must accept subordinate rank. This is a memorable milestone in the march of men.[11]

Such words cannot be easily dismissed if one has read Churchill's memoirs of World War II and its cautious evaluation of the joint roles of the respective armed forces in that TNT war. Whereas airmen have been reluctant to press for the proper employment of armies and navies, their opposite numbers in the sister services have been quick to appreciate how air forces can provide powerful but ancillary support for surface forces.

The dynamic pace of technical progress indicates, with intercontinental aircraft and missiles a near reality (not to mention space vehicles), that even the earth's atmosphere is no longer the limit. All that the Congressional investigation of "Unification and Strategy" in 1949 could clearly record was that interservice differences with respect to the role of air power in military affairs "will continue because of fundamental professional disagreements on the art of warfare."

[10] See following reports (titles abbreviated): American Aviation Board (1919), Dickman Board (1919), Graham Committee (1919), Menoher Board (1919), Lassiter Board (1923), Lampert Committee (1924), Morrow Board (1925), Drum Board (1933), Baker Board (1934), Howell Commission (1934), Woodrum Committee (1944), Joint Chiefs of Staff Special Committee for Reorganization of National Defense (1944–45), Eberstadt Committee (1945), and the House "Unification and Strategy" Hearings (1949).

[11] From Churchill's speech in Boston, "United We Stand," *Vital Speeches*, Vol. 15 (April 1, 1949), pp. 380–84.

ORGANIZATION OF AIR POWER

Concern with the inadequate organization of the air power of the United States under the National Defense Act of 1947 and its amendments has been clearly manifested by the Navy attack on the B-36's in 1948 and the post-Korean campaign of the Army for tactical aviation. A reluctance of airmen to voice *their* own dissatisfaction may have been based upon the fallacy that they had finally in 1947 won "Billy" Mitchell's battle. The belated creation of an independent Department of the Air Force (three decades, no less, after the creation of the Royal Air Force) was, however, coupled with the creation of the Department of Defense over the three services. Thus, the United States became the only major nation in the world possessing the questionable luxury of four separate military air services: the Naval Air Force, the Marine Air Force, Army Aviation, and the United States Air Force. As one independent critic sympathetic with the latter air force has pointed out:

> The National Defense Act which purported to create a Department of Air, custodial of air power, conversely dispersed air power and invited continuous dispersement.[12]

One central issue most copiously documented by the "Unification and Strategy" investigation of the House of Representatives Armed Services Committee in 1949 was that revolving around the question of which American air force was to do what in the business of air power devoted to national security. There was no disagreement about the dominance of air power in national security. There was no disagreement about the dominance of air power in national military strategy or the requirement for "air superiority" in peace or varying degrees of war. Arguments over the feasibility of "strategic bombing" and how the inevitable "battle for the air" should be won revolved around the issue over which one of these several air forces could perform or should control this mission. These differences of opinion only compounded confusion on American air power as an instrument of national policy.

USAF

Neither the limited Korean experience and the creation of the prospect of future limited wars nor the announcement of the Soviet H-explosion in 1953 has appeared to cause any major alteration of America's basic organization for defense or the aviation tasks assigned to the various armed services as of 1947. All of the military services expanded during the Korean War. The United States Air Force (USAF) logically remains the primary military instrument of American air power. It is the American air service charged by statute with primary responsibility for the air defense of North America, as well as for maintaining what is not improperly called the "first line of national defense," the Strategic Air Command. It is also responsible for tactical aviation in joint operations with ground forces. Yet the Secretary of the USAF and the USAF Chief of Staff have no advisory seats in the National Security Council. The civilian Secretary of the USAF has no seat in the President's Cabinet. No airman from the ranks of the USAF has yet been named Chairman of the

[12] Gil Robb Wilson, "The Public View of the Air Force," *Air University Quarterly Review*, Vol. 6 (Winter 1953–54), p. 4.

Joint Chiefs of Staff. No ex-Secretary of the USAF has been raised to be Secretary of Defense. With the exception of the Alaskan and Northeast Air Commands, neither of which possesses significant commitments of land or sea forces, no USAF officer has yet been appointed commander of a major overseas theater command. Sheer time may rectify some of these matters which, outwardly at any rate, seem to reflect the fact that the realities of air power may not have been properly represented in the national organization for defense. But if counsel and judgment on major military matters involving air power are desired at the highest decision-making level of government (perhaps civil control itself) the organization for defense should logically reflect this in personal military and civil responsibility at the proper level. Political organizations and military commands remain, after all, human institutions. There is no substitute in a democracy for the virtues of personal responsibility and leadership.

General wars and limited wars

Governmental organization for defense should accommodate the prominence of air power in the air-atomic age, so that the nation's military interests may be best served. These basic military interests of the nation, all seem to agree, are survival by the prevention of an all-out general war, or, if war is forced upon us, the decisive prosecution of limited wars or, in the last resort, of an all-out war. In terms of these explicit and indisputable military interests of the United States, wishful thinking seems to be giving rise to the fallacious hope of turning the strategic clock back to 1945. This fallacy now is clothed in a political-military doctrine that would ban the discriminate use of air-delivered atomic weapons in small wars limited by political and geographical circumstances. Nothing perhaps could more encourage future Communist aggression. The nations of the North Atlantic Treaty Organization have apparently accepted the necessary role of air-atomic weapons in their defensive strategy. The decision not to use A-weapons in the Korean War appears to offer no precedent for future decisions concerning the prosecution of a limited war.

American military power is today committed to deter, or to fight if necessary, any Communist aggression supported by the implied threat or actual use of military forces be they guerrilla, conventional, or atomic. Appeasement of Communist aggression entails ultimate strategic disadvantages which might well approximate suicide for the United States and its allies. The lesson of British appeasement and military weakness and the decline of collective security in the 1930's (culminating in the temporary surrender at Munich, the fall of France, and the hairbreadth escape from defeat in the Battle of Britain) appear highly pertinent for today. Secretary of the Air Force Harold E. Talbott tersely expressed recently the crux of the matter as follows:

> I am afraid the new phrase, peaceful coexistence, means just that. You exist if you are too tough to tackle. You perish if you are weak and unready.[13]

The probability of World War III cannot be assumed. Such an assumption would only help to make it inevitable. But to organize and to plan military power for any less comprehensive contingency could be no less catastrophic. The only genuine deterrent to all-out war is the maintenance of retaliatory power as a means of punishment designed to fit that crime of aggression. The first Secretary of Defense, James Forrestal, formerly Secretary of the Navy, recorded in 1948:

[13] *New York Times,* November 28, 1954, p. E-1.

> . . . throughout my recent trip to Europe I was increasingly impressed by the fact that the only balance that we have against the overwhelming manpower of the Russians, and therefore the chief deterrent to war, is the threat of immediate retaliation with the atomic bomb.[14]

The Soviet possession of an air-atomic capability against the United States only increases the value of the deterrent role of the Strategic Air Command in American security. Yet there are those who appear to reason fallaciously that mutual capabilities for H-bomb destruction of the United States and the Soviet Union have eliminated the deterrent role of air power. The H-bomb deliverable by aircraft (including guided missiles) could be the greatest deterrent to general war ever known.

To organize and prepare military forces to fight *only* global general wars or *only* limited peripheral wars or *not* to fight at all, these are all fallacious concepts. Such fallacies merely point up the central dilemma of democracies in reconciling military and political means of survival. This is as true for the security of the United States itself as it is for the collective security of all free nations instituted in NATO or under the Southeast Asia Collective Defense Treaty. It is a serious fallacy to reason that air power can be suitably employed only in total war. Nuclear weapons are weapons of air power, not substitutes for it. Moreover, atomic weapons are no longer the exclusive weapons of air forces. There are many other weapons possessing a multiplicity of firepower effects which can be used with discrimination for a variety of decisive military results.

[14] Dictated memoranda after European tour in mid-November 1948, "Points for the President," the first one being on the atomic bomb. Walter Millis (Ed.), *The Forrestal Diaries* (New York: Viking Press, 1951), pp. 537–38.

No responsible airman in the last decade has asserted that air power can do everything by itself, or even anything entirely by itself. But the diversion to missions of limited war in support of ground and naval forces of tactical air forces inevitably weakens the strength of over-all air defense and the strength of strategic striking forces. This was demonstrated by the Korean experience. Tactical air forces are today long-range air forces and carry atomic weapons. Thus, tactical air forces should play an indispensable "close-support" role in both continental air defense and the strategic air offense in a general war. If there should be future Koreas or limited wars fought with air and naval forces, weakening of the ultimate military power of the Western nations must be minimized if World War III is to be prevented.

Unified air power

The "unity" of air power—incorporating all strategic, tactical, and defense air forces—must be considered, then, a prime organizational requisite for economic preparation for *both* World War III and such "brush fire" wars as American and allied military forces may be committed to. The requirement for homeland security appears of highest priority. Only unified air power satisfies the requirement of preparing to fight, if necessary, either general or limited wars. The rebuilding of North Korean airfields and the growth of the Red Chinese Air Force, for example, indicate the importance which Communists appear to give to "air superiority" in possible future localized conflicts. Air power was the military factor which shaped the nature of ground operations in Korea, a fact many seem already to have forgotten, since "air superiority" was primarily granted to United Nations forces by default. Properly uni-

fied, American air power could be hurt in limited wars, but it could not be destroyed.

After a detailed examination of the fate of the air arm of the United States Army prior to and during World War I, one cautious and dispassionate historian concluded:

> Thoughtful citizens, layman and specialist, politician, and staff officers, would do well to ask and ask again if the military establishment . . . is sufficiently well organized to develop and exploit . . . these newest weapons on the horizon [e.g., guided missiles]. Failing here, the nation will repeat the sorry pattern of the air weapon, wastefully groping forward with each innovation.[15]

Mobilization and power in being

The planning of national defense for future wars must be guided by the following axiom: In a future general war, the United States cannot again depend upon its allies for time to mobilize. The achievements in mobilization and production of the United States in two world wars offer no precedents for the solution of new problems posed by the threat of devastating air attack upon all major American cities within the space of a few days. The problem of strategic dispersal to meet the possibility of a wholesale atomic Pearl Harbor imposes a terrible burden upon the entire structure of our urbanized and democratic society. It is the problem of no less than dispersing an entire nation. This problem, whether it is posed in terms of a "long" or a "short," a "limited" or a "general" war, cannot be fully and completely resolved. Yet it must be faced squarely. One student of command and organization in modern war concludes as follows:

> The real danger of war to a democracy lies in the initial blow. Totalitarian nations, especially in this atomic age, are better fitted to plan and deliver a sudden and powerful assault than a democracy. If this trump card fails they become inferior to democracies, but the democratic state must be able to survive the first murderous blows. We must be defended by adequate and scientifically up-to-date forces. Our machinery for the higher direction of war must be capable of operating immediately under war conditions.[16]

To survive the "first murderous blows" presents problems which can only be clarified in terms of home-front battlefield realities. Their solution, like that of the entire problem of civil defense, rests with all the American people. There is obviously nothing economic or inexpensive about the strategic problems created by air power, either in terms of dollars or blood. No responsible airman has yet said that air power was a "cheap" way to prevent or to fight World War III or to fight even a limited war. The terrific pace of scientific advances and the rapid obsolescence of aircraft and weapons preclude "cheapness" in the face of the requirement for maintaining effective military forces-in-being. Realistic preparedness of an industrialized society for war prohibits fallacious thinking. It remains primarily a question of how much the nation can afford *not* to spend on readiness and dispersion, a figure which may best be determined by assessing the actual military threat and intentions posed by the potential enemy.

NATIONAL SECURITY AND AIR POWER

The relationships between politics and technology in this age of global-ranged air vehicles and their A-bomb payloads present highly delicate questions when one speaks of fallacies. Yet it seems that the capabilities of air power have been improperly evaluated throughout the whole period of its evolution, first exaggerated in immediate importance by its frustrated champions, then reluctantly and incompletely accepted by its jaundiced critics.

The decisions and actions which must be taken concerning air power today and tomorrow present a crucial challenge to democratic statesmen. It was possible for peaceful Britain to err in the 1930's and yet, with horrible cost and difficulty, survive in 1940. Now one aircraft with global range and one bomb may accomplish with ease more destruction than a fleet of TNT bombers were able to accomplish with difficulty in 1945. It would be a fallacy to assume that the existence of an intercontinental ballistic missile with a hydrogen war head changes the basic strategic problem of 1955 for the United States. A so-called "IBM" would merely be able to do more easily and more quickly what ordinary aircraft can be made to do now.

After tracing the decline and fall of the Roman Empire, an eighteenth-century historian held the comfortable view that the invention of gunpowder had so complicated the art of war that "barbarians" would have to become civilized before they could conquer. To Edward Gibbon, technological progress and moral growth were reciprocal developments. He could not foresee a time when man's scientific prowess would far outrun his political genius. Today, the entire world is influenced by a struggle between Western nations and militant Communism, and by the emergence of vast underdeveloped nations spurred on by nationalistic fervor. The United States stands as the leader of the Western nations in the struggle for the creation of a more perfect peace. Air power is the new military factor which has given to the most aggressive-minded nation decisive force with which to exploit the initiative. With the implied backing of force aggressors can exploit the political initiative with the subtle or naked *threat* of devastating force or, if they choose, the decisive *use* of overwhelming force. Instant or massive retaliation becomes meaningless if an aggressor air force can destroy with surprise devastation the total capacity or the will of a nation to retaliate.

Purposes of military power

Admiral Mahan clearly pointed out in his time the important distinction between the military offensive and the political initiative, which, he said, was one fundamental to any intelligent program of military preparedness. Mahan explained:

> A navy for defence only, in the *political* sense, means a navy that will only be used in case we are forced into war; a navy for defence only, in the *military* sense, means a navy that can only await attack and defend its own, leaving the enemy at ease as regards his own interests, and at liberty to choose his own time and manner of fighting.[17]

With respect to air power, these words might well be recalled when the terms "retaliation," "initiative," and even "air defense" are used without precise relation to political or military circumstances. The defensive political role of the United States air-atomic offensive capability, as well as the dominant but not exclusive role of air forces employed in wars that are limited politically, must be clearly defined both in terms of political objectives and of *all* available military means. The United States and its allies have no claim to that initia-

[15] I. B. Holley, Jr., *Ideas and Weapons: Exploitation of the Aerial Weapon by the United States During World War I* (New Haven: Yale University Press, 1953), p. 178. Particular commendation here should be given Professor Holley's superb accounting of the sparseness of analyses of air power problems by serious scholars; see pp. 179–209.

tive in international politics which the Soviet and neutral powers of the world can exert at will, regardless of what the United States and its allies may do.

Air power employed with its full military capability should make the price of general world war virtually, though perhaps not totally, unacceptable. This seems particularly valid if one holds that man's ideas are of ultimately higher importance than man's machines of destruction. George Catlett Marshall reasoned:

> We have before us the greatest task ever faced by any generation of men in the fight to preserve peace. War, I say again, is no longer an evil. In this age, it seems intolerable. There is nothing to be said in favor of war except that it is the lesser of two evils. It is better than appeasement of aggression, because appeasement encourages the aggression it seeks to prevent; and it is far better than submission to tyranny and oppression, because without freedom and respect for human dignity, life would not be worth living.[18]

Traditionally, the purpose of military power of democratic nations has been to provide time for moral ideas to bring on peaceful change rather than to achieve change by force of arms. Weapons are not the sole means of determining national policy. Peace and war, however, are no longer absolute conditions. The threat of an atomic holocaust is here to stay. Communism continues to thrive and to threaten. At the moment of this writing, the best hope of mankind is that, whatever the role of force in the future, the most potent political ideas and military instruments, as well as the will to survive, may be on the side of the most peacefully inclined nations.

Eugene M. Emme, Ph.D., Montgomery, Alabama, is professor of modern European history and international politics at the Air University and research adviser on the Air War College faculty. During World War II he was a civil flight instructor for the Army Air Forces and later a naval aviator and historical officer. He is author of studies and articles, and is completing a book on Luftpolitik: German Air Power, 1919–1939.

The Scope of United States Air Strategy

By THOMAS D. WHITE

THE United States Air Force is an instrument available to the American people for their common defense and for the advancement of their national interests. The often awesome achievements of science have made that instrument one of unprecedented power: the jet-nuclear Air Force of today constitutes the most potent assembly of organized military strength in history. Air power is a strong and ready tool of United States policy. It is the principal military means with which the American people can meet the perils of an age of danger. It seems worth the time of any American to consider how the United States air power can be used to reduce our common jeopardy, which is persistent and growing.

Air power is a component of the total national strength wielded by the President in an effort to achieve national security. The national program for security embraces many elements in addition to air power. The political, the economic, and the psychological factors play essential parts. Surface forces of the United States and the military capabilities of allies add their contribution. Requirements for national security pose vast and complex problems. There are no quick and easy solutions, no miracle cures. Air power is not *the* answer: it is but one of many vital components which must be employed in a co-ordinated fashion to bring us closer to our goal of national security, and in the process protect our basic freedoms.

In January 1955, President Eisenhower described his concept of the scope of United States air power as it was given to us by the facts of the atomic age. The President set forth the following fundamental propositions:

> We should base our security upon military formations which make maximum use of science and technology in order to minimize numbers of men.

Though the President did not call attention to the fact explicitly, it is true that air power, using modern technologies, can bring greater force to bear on an enemy at less exposure of United States personnel than can any other military force available to the United States. Science has given us nuclear munitions which permit *one* aircraft to deliver more explosive power on hostile forces than has been released in all wars since the invention of gunpowder. Not only can United States air power bring such volcanic devastation to the battlefield at small direct exposure of American manpower, but by doing so air power reduces the exposure of friendly surface forces to the full strength of the enemy. The enemy division destroyed deep in hostile territory by our air power is a division that will wreak no casualties on friendly troops. Of perhaps greater importance is the fact that the enemy bomber blasted to oblivion by our air power while it is loading a cargo of death will not deliver that cargo on our own personnel, civilian or military, nor on our cities.

AIR POWER AS DETERRENT

To continue with the President's conclusions:

> Due to the destructiveness of modern weapons and the increasing efficiency of long-range bombing aircraft, the United

States has reason, for the first time in history, to be deeply concerned over the serious effects which a sudden attack could conceivably inflict upon our country.

Here the President has put his finger on the monstrous capabilities of nuclear air power. These capabilities in the hands of the enemy pose the possibility of unprecedented damage, almost unthinkable damage, to the industrial heart of our nation, as well as to the true base of our strength—our nation itself. In all the wars of our history the American nation has suffered less than 600,000 men killed. In these wars, damage to the basic industrial plant and to the cities of the United States has been slight. Such effects of war as did occur, for example in our early wars, were inflicted on the United States over a period of years. Today and hereafter, however, full use of the nuclear capabilities possessed by our enemies could produce *in one hour* millions of deaths among our citizens and indescribable destruction of our national industry. To be sure, such damage to the United States is only a fraction of that which would be inflicted upon our enemies by our own counterattacking air forces. To say this is not to suggest a sour satisfaction that the enemy would suffer more grievously than we. Rather, it is to suggest that the enemy may be persuaded not to deliver the attack which would invoke our withering counterblow.

The next conclusion of the President is related to the preceding one:

> Our first objective must therefore be to maintain the capability to deter an enemy from attack and to blunt that attack, if it comes, by a combination of effective retaliatory power and a continental defense system of steadily increasing effectiveness. These two tasks logically demand priority in all planning.

To deter an enemy from attack, one must pose a consequence of aggression so grave that the potential attacker dares not provoke it. The simple fact is that the United States possesses only *one* military capability *in being* which poses a deadly enough threat to our enemies. That capability is expressed in nuclear air power. There is another important facet of an effective deterrent —*immediacy*. A deterrent influence is at its greatest effectiveness when the consequences of invoking it are immediate rather than delayed. Here again, nuclear air power constitutes the only capability available to the United States by which a potential aggressor could be confronted instantly with the consequences of his aggression—consequences which would be most likely to be disastrous to him.

RETALIATION

If by misfortune our deterrent should fail to restrain our enemies, we must be prepared to deal with the ensuing deadly events. As the President has said, this problem requires a combination of effective retaliation and aerial defense. To be effective, retaliation against an attacker engaged in efforts to deliver nuclear weapons on American cities must virtually paralyze the aggressor and do so quickly. Such retaliation must destroy the bases and facilities supporting nuclear attacks against the Western Hemisphere, eliminate the systems of communications and controls within the aggressor country through which the assault is being directed, and break the industrial structure which provides the sinews of war to the enemy forces. This must be done with maximum speed. We dare not risk being hit by one avoidable hydrogen bomb for want of urgency in our reaction. If there is a military means of accomplishing these results rapidly other than with nuclear air power, I do not know what it might be.

Equally powerful and effective must be our operations to halt the movements of enemy forces into areas such as Western Europe and free Asia. In the past, air forces limited to trinitrotoluene munitions have found the task of dealing with, or stopping, advancing ground forces exceedingly difficult. The limited destructiveness of TNT explosives required great accuracy for any effect, and the small lethal radius of these explosives limited the results of even bull's-eye shots. With nuclear munitions, however, concentrations of enemy forces can be obliterated. Whether a nuclear bomb explodes five hundred feet to the right or left, over or short, will be of only statistical interest. It seems clear, therefore, that nuclear air power should be capable of denying to concentrated surface forces access to any area, by land or sea. This fact is the greatest single element of security for our allies.

CONTINENTAL DEFENSE

The President stated our need for a continental defense system with steadily increasing effectiveness. As it exists today and as it is planned into the future, our continental defense system rests primarily on the capabilities of the United States Air Force. Our Canadian neighbors have made and will continue to make substantial contributions to the defense of North America. Yet they will not judge it unreasonable when I say that the United States Air Force provides the primary elements of such defense.

Research and development continue apace in the field of antiaircraft missiles. But the manned combat aircraft remains our principal defensive weapon and will so remain for many years to come. None of our defensive-weapons systems have yet achieved such sureness that the offensive bomber can be prevented from reaching its target. Using every means of air defense available to the United States, and using them well, we can exact serious losses from the attacking bomber fleets. The odds remain with the attacker, however. Only by the establishment of defenses in depth and by exploiting fully the cushion of time afforded to us by our far-flung strategic deployments can we hope to reduce these odds.

New, and even more effective, methods of air attack are in the offing. One of the most formidable of these new weapons is the intercontinental ballistic missile. When this missile is added to the arsenal of an attacker, defending forces will be faced with a whole series of new and even more difficult problems. Today there is no known defense against it. Countering this weapon has been likened to tossing needles from opposite ends of a darkened hallway, with the hope they might collide.

Thus, the present substantial advantage of the air offense over the air defense may be widened to unbridgeable dimensions. Antimissile defense is, at best, a most difficult business. Advantages of initiative, surprise, and diversified methods of attack weigh heavily on the side of the offensive force. Accordingly, we must attach these very offensive advantages to our own cause by utilizing long-range air power to cripple the attacker at his launching bases before he can complete the destruction of the United States. Timeliness in this action is supremely important.

SUPPORT OF INDIGENOUS FORCES

The foregoing are the areas of military action in which the President has marked out crucial roles for air power. There are additional tasks which United States air power can and does perform. The President alluded to one of these as follows:

> To provide for meeting lesser hostile actions—such as local aggression not broadened by the intervention of a major ag-

gressor's forces—growing reliance can be placed upon the forces now being built and strengthened in many areas of the free world. But because this reliance cannot be complete and because our own vital interests, collective security, and pledged faith might well be involved, there remain certain contingencies for which the United Nations should be ready with mobile forces to help indigenous troops deter local aggression, direct or indirect.

Thus the President contemplates the need of assisting indigenous troops in their efforts to meet aggression. The immutable facts of geography place the United States at vast distances from those free world countries which might be threatened by an aggressor. If United States forces are to come to the aid of such countries before it is too late, great speed of movement is required. Because many friendly overseas countries are weak and because the potential aggressor is militarily strong, American assistance must not only be moved rapidly over thousands of miles; it also must display true effectiveness once it has arrived on the battlefield. The qualities of mobility and strength can be offered best from nuclear air power.

It is also true that the indigenous forces maintained by potential overseas victims of aggression are largely ground forces. The costly and complicated factor of military air power must be contributed in substantial part by the United States.

WITHIN THESE LIMITS

The President stated: "We will never commit aggression but we must always be ready to defeat it." This American philosophy of not exercising the strategic initiative imposes great handicaps to our military posture. Our American armed forces must stand prepared to deal with the hostile acts of a powerful and deceptive enemy whenever, wherever, and however he may attempt to strike us. Through bitter experience we have learned that the enemy's action may be sudden and surprising, as in Korea, and that it may be carried forward with the shock effect of overtly employed armed forces. Again, the enemy's acts may be slow burning and camouflaged in the false garb of spurious "civil war," as in Indochina. Or the enemy may strike in the political field, his actions being devoid of widespread violence, as in Hungary, or, lastly, he may employ his armed forces for blackmail, forcing decisions through the patent threat of their nearness, as in Czechoslovakia. Thus we are confronted with a deadly variety of Communist strategics. Yet we must be prepared to defeat Communist aims, despite the apparent handicaps imposed upon us by our own philosophy.

A normal reaction to such a difficult problem as given to us by our aversion against striking the first blow would be to strengthen our armed forces far beyond Communist strength, and keep increasing them as Communist capabilities for aggression increase. We should do this, I suppose, were we unmindful of a related proposition set forth by President Eisenhower: "True security for our country must be founded on a strong and expanding economy, readily convertible to the tasks of war."

Here is a quarrel with any concept of unlimited expansion of United States armed forces. What irony, to build our armed forces and the monumental burden of their support to such proportions as to collapse our economy! What price military strength, if that strength itself were to become the cause of a fatal erosion of our vital institutions?

Taken together, these last two considerations cited by the President mean that our United States armed forces must be capable of timely and effective reaction to enemy aggressive intentions, but at the same time must not be excessively burdensome on our economy. Thus we are constrained to support only those military forces which offer the greatest all-round utility and effectiveness against possible enemy actions. Moreover, we must support military forces which inherently possess great mobility, great effectiveness, and—above all—speed. It can hardly be doubted that such qualities are most apparent in nuclear air power.

SCOPE OF AIR STRATEGY

What, then, is the scope of air strategy in this nuclear age? Its scope is that of the slow-burning conflict smouldering around the divided earth. Its scope is that of our current and future national peril, which is greater by far than any ever before known. The scope of air strategy embraces the steady effort of the United States, with ready strength to deter war; it ranges from the lesser tragedies of local conflicts to the dread collision of continents in arms. With all Americans, the United States Air Force prays that there shall never be a time when the United States must use the instrument of air power in all its inhuman fury. Yet, should that time come, American air power will make of it a last, fleeting moment of frustration to those who plunged the world into disaster, an instant of realized error before they are enveloped in the fiery shrouds of our nuclear retribution. Such is our final strategy of survival, a retaliatory threat poised in the belief that its existence will prevent our enemies from taking the ultimate gamble of total war. Under the protective mantle of this fierce restraint upon aggressors, the United States is able to pursue many types of action contributing toward national security. American air power is a sharp and tested tool of American and world security. It stands ready to help shape the volatile stuff of these tense times into a just and stable peace.

General Thomas D. White, Washington, D. C., is Vice Chief of Staff, United States Air Force. In the Air Corps since 1927, during World War II he was Deputy Commander of the Thirteenth Air Force in the South Pacific (1944–45) and Commander of the Seventh Air Force (1945–46). He served subsequently as Chief of Staff of the Far East Air Forces, Commander of the Fifth Air Force in Japan, Director of Legislation and Liaison, Office of the Secretary of the Air Force, Air Force Member of the Joint Strategic Survey Committee in the Office of the Joint Chiefs of Staff, Special Assistant to the Deputy Chief of Staff for Operations at Air Force Headquarters, Director of Plans, and Deputy Chief of Staff for Operations of the Air Force.

Air Strength of the United States

By Elton C. Fay

ONE American heavy bomber today can drop a single missile on an enemy with explosive energy surpassing that carried in all the planes of all the air forces, Allied and Axis, of World War II.

American air power began, however, by being too little and too late. Its early armament was a grenadelike bomb. World War I produced high hopes and low output: a call for 22,000 aircraft in the first year after American entry; an actual production of 13,894 in two and a half years, with the war long since ended. But the disillusioning experience paid. When two decades later the next war loomed close the United States objective was an annual production of 50,000 planes. The 1944, peak-year production of military aircraft was 96,318.[1]

Out of that first world conflict, too, came the rudimentary tactics and organization which today are American air power, deployed globally, armed atomically. Never before in the ancient history of war has a single force possessed the destructive power and the ability to deliver it which repose in the air arm of the United States military service.

World War I

There were valid reasons for the disappointing production at the inception of American military aviation.

When the United States entered World War I, the airframe and aircraft engine industry hardly warranted the name. There were no reservoir of skilled aircraft labor, no specialized machine tools, and nothing comparable to the materials priority system of World War II. Wood and fabric did not lend themselves to the high-speed processes of the next war, with metal extrusion, heavy presses, and multiple assembling gadgets. Even the automobile industry, from which had to come the cadre of skilled aircraft production workers, was itself tiny by the measure of the giant of these latter years.

In personnel, the picture was brighter. When World War I began, the aviation section of the Army consisted of about 130 officers and 1,000 men; at its conclusion there were over 195,000 officers and men. Virtually all of them, however, were citizen-soldiers, and when the war was over they went home.

Accordingly, American air power entered the first years of peace with a handful of career fliers of the regular military establishment, a collection of aircraft of which about 3,200 DH-4 planes were combatant, if obsolete, and an industry deflated immediately by contract cutoff. There also remained as surplus a really sizable fleet of trainer aircraft—an element to be helpful in the lean years ahead.

The war left another heritage. From it there had been gleaned the elementary facts of air warfare, weighted heavily to tactical support of ground forces. The doctrine of strategic air war still awaited the Douhets and Arnolds and Le Mays. Although most of the pilots left planes never to enter again except as passengers, a few took with them back into peacetime life the enthusiasm and skill of the war. They became the pioneers, the barnstormers, the early air-mail fliers and—a few—the men who emerged as leaders in today's air transport and manufacturing industries. These—the little band of airmen of the regular military establishments and the civilians who continued flying—were the men who kept the nation's spark of interest alive.

[1] *Aviation Facts and Figures, 1953* (Washington, D. C.: Lincoln Press, 1953), Chap. II, p. 16.

Civilian Aviation

When the war ended, the average civilian retained at least a mild curiosity in aviation, although he might have been cool to talk of more war and planes and pilots to fight it. The cow-pasture fliers, the stunt men, the wing walkers eventually lured him into the airplane. He came to watch their antics, then returned to fly twice around a field for three dollars. One day he found it was faster and not too much more costly to get to the next city by hiring a pilot and his open-cockpit, war-weary plane to fly him there. It was primitive and unorganized, but there was a lot of it. In 1925, still using war-surplus aircraft with a smattering of new models, the flying services accumulated 6,823,730 passenger miles. An air transport industry was being born.

The manufacturing industry, starving and all but nonexistent for a half decade, began to revive. New planes and, equally important, new designers appeared. Military aviation benefited. The research and development efforts of civilian aircraft designers were grist for the mill of aeronautical design. By 1926 the scheduled airlines were well established and in that year carried 6,000 passengers—a modest beginning but the forerunner of a year when 34,000,000 domestic and overseas tickets would be sold—the 1954 figure.[2]

[2] Air Transport Association, *Air Transportation Progress Report* (Washington, D. C., 1953), p. 3.

The Military and the Legislators

Nevertheless, the take-off and climb to altitude of American air power was slow and there was turbulence.

Many of the foremost military commanders of the country, who had helped win a great land war, still looked upon the airplane essentially as a handy device for battle-line observation, with occasional diversion to troop-support assignment. Successful tests of bombing against ex-German warships in the early twenties sharpened the civilian's attention to air power, but they also sharpened tempers within the military family.

Until this era of cold war, funds allocated by Congress to the military during peacetime were modest, even inconsequential. It would have been less than realistic if the land- and sea-service chiefs had not insisted that the great bulk of money go to the established branches rather than to a weapon so new and so little tried in war as military aviation.

With what they could get, the army and navy airmen managed not only to keep flying but to design and build a handful of new aircraft and work up new techniques. The Army's air service produced a heavy bombardment aircraft, a six-engined triplane. It was not a glittering success. The most remarkable feature was that the big and heavy airplane succeeded in staying in the air at a top speed of only 61 miles per hour.

Progress in the Twenties and Thirties

The progress of military aviation made a big jump in the latter twenties. Charles A. Lindbergh flew a single-engined monoplane from New York to Paris. Two army pilots flew a military plane from the United States to Hawaii.

There were round-the-world flights and endurance flights by military aircraft.

Those flights established the reliability and range of airplanes, pointing the way to strategic air warfare. If bombers could strike far, there was corollary need for countermeasures. The original, basic function of the airplane as a strafing, troop-supporting weapon broadened. The "pursuit" plane evolved and then mutations of that model. Although the bomber strategists of the 1930's might not have foreseen the requirement, even the stoutly armed B-17's and B-29's of the coming war would need escort protection on deep-penetration missions.

The first two years of the thirties brought the B-9 all-metal bomber with two 600-horsepower engines, the A-8 all-metal attack monoplane, and the B-10 bomber with 200-mile-per-hour speed.

The Army Air Force asked for a large, long-range aircraft to bomb from high altitude—a true strategic weapon. The design for the B-17 was ready in 1933. The first test plane flew in 1935. The first delivery to an operational unit was March 1, 1937. With big air power had come another problem, lead time—the months and years between the stating of a requirement and delivery of the first combat model. This was a factor which grew in importance with the growing complexity of aircraft, and one with direct bearing on the timing of decisive air campaigns in the next world war, in Korea, and, latterly, in making ready to meet the Soviet threat.

Army aviation had expanded to the point where it no longer could function as a mere adjunct of the Signal Corps. The office of Chief of Air Corps was created, primarily responsible for procurement and training. Then in 1935 the Army decided its air arm needed a special, operational command, and General Headquarters Air Force was formed. The tactical units were brought under command of GHQ, but the other, quasi-separate, office of Chief of Air Corps continued, with its responsibility for procurement and training—an arrangement productive of friction and administrative complications. The solution, not easily attained, was organization of the Army Air Forces in June 1941—an over-all air arm combining the functions of the Air Corps and GHQ.

When Pearl Harbor came, the United States Army Air Forces had 12,000 planes, 275,000 enlisted men, 23,000 officers, and 16,000 cadets. At peak strength, the AAF was able to put 13,000 planes in combat and had a personnel strength of over 2,411,000.

American plane designers and tacticians saw a prelude to modern air power in 1936. Germany and Russia sent planes and pilots to the Spanish Civil War, for actual battle test of aircraft, men, and maneuvers.

World War II

For fifteen months before World War II encompassed the United States, the designers and tacticians could assess the application of air power to the battlefield and its approaches. This was the advent of the Stuka dive bomber and its relatives, of fighter planes to attack dive bombers, of the precise timing and deployment of planes and masses of planes to pinpoint fixed and moving targets.

In the first phase, true strategic bombing was potential, even moderately applied, but it remained generally in leash while Hitler strove for quick victory with armor and tactical aviation. But the application of strategic air warfare followed fast. The Americans still were left a little time to observe before they were committed.

They did not agree with all tactics. They believed that all strategic bombing need not be under cover of darkness, that with the visual aiming then used daylight made for better bombing, and that "boxes" of bomber formations could with their own gunfire protect themselves against interception. They were right about daylight bombing, wrong about unescorted bombers.

Facets of Modern Air Power

When modern air power arrived for the United States it had many facets. Total air power is a complex of production, of huge bases scattered over the face of the earth, of supplies by the hundreds of thousands of tons, of personnel, of strategic and tactical bombing, of interception, of antiship and antisubmarine warfare, of transportation.

World War II established a pattern of commands which in large measure prevails today, with modifications and additions.

The Eighth Air Force of the European theater and the Twentieth Air Force of the Pacific were the wartime antecedents of today's Strategic Air Command—the medium and heavy bombers and long-range strategic reconnaissance aircraft. The Ninth Air Force of the European theater of operations and its Mediterranean and Pacific counter-parts evolved into the present Tactical Air Command of light bombers and fighter bombers. Developing partly as an offshoot of overseas tactical organizations and partly from the special requirements of continental security is the Air Defense Command—the jet interceptor force and its related radar warning and aircraft control system.

The Navy's primary mission is control of the sea and the air column above it. It applies its own air power in a variety of ways. One segment of naval aviation is attack—carrier-based aircraft assigned to detection and destruction of enemy combatant and merchant shipping and naval targets presented in bases and shipping ports. A second is antisubmarine operation, conducted both by land-based aircraft and carrier-based hunter-killer planes and helicopters. A third is long-range patrol—the search for targets for the attack planes and surface and subsurface fighting ships. The naval air force, including marine aviation, has a fourth function exactly like that of the air force's tactical outfits—the support of land troops in ground combat on or near coastlines. A fifth function is collateral support of strategic bombing, an assigned mission which has engendered interservice argument.

Military air transport

World War II gave rise to an element of air power which had existed neither in World War I nor in the interim, a world-wide system of military air transport. In practice, the system was two networks, the AAF's Air Transport Command and the Naval Air Transport Service. Under the service unification program of 1948 they were combined into the present Military Air Transport Service.

The motivation for the wartime development and swift expansion of a military air transport system was obvious. With war in two hemispheres, critically needed equipment and manpower had to be distributed quickly. Half of the less than four hundred aircraft of the commercial airlines were taken over, and the air force contracted with almost all of the seventeen scheduled lines to fly military routes. Simultaneously, the military services placed orders in large volume for their own transport aircraft, including designs bigger and of longer range than any operated by the commercial carriers.

Today's C-124 cargo plane, with its 25-ton load lift, and tomorrow's turboprop C-132, to carry 80 tons in trans-

oceanic operation, are the long-legged, weight-lifting descendants of the C-47, C-46, and C-54.

In the latter phase of World War II there arose another requirement for large-scale, although short-haul, transport. The American and British armies adopted airborne operations from the earlier limited but successful application of that adaptation of air power. However, paratroop planes and gliders used by the United States to put ground forces down in "airheads" behind enemy front lines were the specially equipped, specially manned aircraft of the overseas tactical air commands instead of the conventional military transport services.

Unification

The objective of the 1948 service unification program was to bring together under comprehensive top administrative and operational direction the three major military services, ground, sea, and air. In the process of unifying, the Army Air Forces acquired autonomy and coequal status with the Army and Navy, becoming the United States Air Force. The primary components of air power were thus brought into a single, co-ordinated force under central direction.

Curiously, one of the exponents of this doctrine is a man neither American nor an airman, Field Marshal Lord Montgomery. That soldier and strategist states:

> Air power is indivisible. If you split it up into compartments you merely pull it to pieces and destroy its greatest asset—its flexibility.[3]

Flexibility is indeed the pattern of American air power. To meet commitments abroad and duties at home, it must be prepared to head forth instantly on one or many missions in many places. The task assigned may be to annihilate munitions cities and military bases of a major power with fission and thermonuclear weapons. Or it may be another unwanted but unavoidable bush war where the air power needed is tactical support of ground warfare. And always there is the vital assignment, air defense of the continental United States.

[3] Lecture by Field Marshal Montgomery at Royal United Service Institution, London, October 21, 1954.

PRESENT STRENGTH

American air power at present (May 1955) is composed of about 120 wings. When in June 1957 it attains 137-wing strength its forces are programed as follows:

Strategic, 54 wings. Of these, 11 will be B-52 heavy bombers, supported by jet tanker planes; 28 wings of medium B-47 jet bombers, also with supporting tanker planes; the balance will be reconnaissance units, long-range supersonic strategic fighters with atomic capability, like the F-101, and fighter units for defense of Strategic Air Command planes and installations.

Air defense, 34 wings. These are to include present subsonic interceptors and a high percentage of supersonic aircraft, among them the F-100 and F-102, the latter a delta-winged design intended for stratosphere interception. The Air Defense Command presently has slightly over 2,000 aircraft, all of them jets, operating in about 23 wings.

Tactical, 38 wings, a force built around jet fighter-bombers and light jet bombers. Within this command is the F-84G fighter, capable of carrying tactical nuclear fission bombs, and the B-47 and B-66 light bombers, all jet-engined. The nominally limited range of the F-84G is extended by in-flight refueling.

Airlift, 11 wings or the equivalent thereof in separate squadrons. These are the personnel and cargo carriers, to move heavy tonnages of high priority military cargo. Going into the airlift force now are the fast, long-range C-130 turboprop transports.

STRATEGIC AIR WARFARE

The air force judges strategic bombing its primary mission under present international conditions, on these grounds: (a) *deterrent,* a weapon maintained at such a state of readiness and with such instant and massive retaliatory capability as to make it military folly for an aggressor to attack; (b) *defensive,* a weapon to reach and destroy homeland bases from which enemy air attacks are being launched or through which they are staging.

In its less precise moments, the air force has called its present heavy bombers—the B-36 and the new B-52—intercontinental or global. They are that only with certain operational assists—forward staging bases offshore or overseas to serve as stepping stones or mid-air replenishment of fuel from flying tankers taking off from advanced bases and making rendezvous with the bombers near an enemy frontier. The combat radii of the two planes would not allow strikes from North American continental bases at targets in inner Eurasia nor even many outer zones unless the above-mentioned aids were used.

Even from bases in Canada and Alaska the distances to potential targets are impressive despite great-circle, high-latitude courses. From Goose Bay, Labrador, to Moscow is about 3,600 miles; to the oil-producing region around Baku, on the Caspian Sea, 4,700. A bomber taking off from Ladd Air Force Base, Alaska, and aiming for Irkutsk, the Soviet atomic center in the Lake Baikal area, would have 3,500 miles ahead of it.

Overseas bases

But start the bombers out on the final leg of their strikes from bases up near the top of the world or in North Africa or Spain, if English and German airdromes are too dangerously close: From Thule, on the northwest coast of Greenland, the route down over the roof of the globe to Moscow shortens to 2,500 miles. From Sidi Slimane, of the USAF complex of fields in North Africa, the mileage to Baku's petroleum farms is 3,100; to Stalingrad heavy industry, 2,700.

The B-36, currently the only heavy bomber in operational use by the Strategic Air Command, has a combat radius of approximately 4,500 miles with a five-ton load. Its speed, with six piston engines developing 3,800 horsepower each and four turbojets each producing 5,200 pounds thrust, is given officially as over 435 miles per hour. Practically, its cruising speed and probably its maximum speed are somewhat less.

The air force classes an aircraft as obsolescent when it is outmoded by the known advances of the enemy in development of counterweapons. On this premise, the jet interceptors of the Soviet air force have rendered the comparatively slow B-36 obsolescent.

The B-52, without using the in-flight refueling for which it is designed, has a present combat radius of about 2,500 miles, a range of 6,000. Air force officials say they hope to increase the range to 10,000, which would give a combat radius of about 4,000 miles. Powered with eight turbojets, the B-52 has been described by the air force as being faster than the B-47 jet medium bomber for which there has been a reported speed of 656 miles per hour.

It is evident, by comparison of target distances with radii of operation, that overseas bases are essential to the waging of strategic air war now—and will

remain essential for several years to come.

Definition

The Defense Department's definition of strategic air warfare is this:

> air combat and supporting operations designed to effect, through the systematic application of force to a selected series of vital targets, the progressive destruction and disintegration of the enemy's war-making capacity to a point where he no longer retains the ability or the will to wage war. Vital targets may include key manufacturing systems, sources of raw material, critical material, stock piles, power systems, transportation systems, communications facilities, concentration of uncommitted elements of enemy armed forces, key agricultural areas, and other such target systems.[4]

This official definition was written originally in 1948 and reflects some of the strategy of conventional weapons in World War II, including the delivery of standard high explosive and incendiary bombs by masses of bombers.

Thermonuclear bomb

Into a B-36 or B-52 bomber of today can be loaded a hydrogen bomb.

The test of a thermonuclear bomb in March 1954 produced power unofficially estimated at between 15 and 17 megatons (the equivalent of 15,000,000 to 17,000,000 tons of conventional trinitrotoluene explosive). Theoretically, the magnitude to which a thermonuclear bomb could be scaled up is virtually unlimited; practically, the possible ceiling might be on the order of 30 to 50 megatons.

The thermonuclear bomb is an area-destroying weapon. For more selective bombing of defined targets, the standard nuclear fission bombs, of magnitude up to about 50 kilotons, are available. They are weapons for the bays of medium bombers such as the B-47 and B-50.

Speed and altitude

The six-jet B-47 medium has much of the potential long-range characteristics of its bigger B-52 brother, being equipped for in-flight refueling from tanker aircraft. Its speed and high-altitude capabilities fit it for matching against jet interceptors: speeds well above 600 miles per hour, bombing altitudes well above 40,000 feet. Range of the B-47, without refueling, is over 3,000 miles. In a test using three aerial refuelings, a B-47 has flown slightly over 12,000 miles in 24 hours, dropping a dummy 10,000-pound bomb at the halfway point of the flight.

Under development is a supersonic medium bomber, the B-58, presumably to be capable of carrying nuclear bombs.

The speed of bombers, Soviet as well as American, has posed a profound problem of location and interception.

An air force official describes it in this manner: A jet bomber is approaching at 50,000-foot altitude at a speed of 600 miles per hour. The jet fighter heads toward him at the same speed. The combined or closing speed of the two aircraft is 1,200 miles per hour or twenty miles a minute. This is too fast for the human mind or muscle to work against. So the fighter is given electronic instruments to find the enemy bomber, aim at him, and fire the guns at the correct instant. There is only one pass. If the fighter misses, a great city may be destroyed by the bomber.[5]

The IBM

The problem (or advantage) of the jet bomber is a mere prelude to what is on the way—the intercontinental ballistics missile, short-named the IBM.

The prototype of those missiles, used by the Germans more than a decade ago, attained terminal speed of more than 3,500 miles per hour at the end of high trajectory flight. For intercontinental use, the zenith of the trajectory course would be several hundred miles high—beyond the range of any existing radar detection system. With existing detection and tracking equipment and with even the fastest currently operational or projected jet fighter types, the task of locating and intercepting would be hopeless. It is described as akin to two men standing at opposite ends of a hall and pitching needles at each other, in the hope the needles might collide. The search for countermeasures now is directed toward some vastly improved form of detection and tracking, using electronic computors to produce detection and aiming coordinates in split-second timing.

It may be assumed that the race for IBM's is being pushed by both the Soviet Union and the United States. Reports of a new Soviet rocket motor with the fantastic thrust of 264,000 pounds at sea level give a note of urgency to the contest.

FUTURE PROSPECTS

How soon will true intercontinental missiles appear, to make obsolete both the long-range strategic bomber and the jet interceptor? The guesses by men who might know have been in the early 1960's.

The ability of present jet bomber forces to strike suddenly with overwhelming atomic weight—and the looming prospect of intercontinental missiles with the same destructive power—raises questions about the value of stand-by production facilities for use after the outbreak of war.

There is one school of thought, numbering among its members many of the best air strategists, which holds that the next war will be determined by the weapons on hand at the hour of its inception. These men contend that there will be no time to get an industrial backup into operation, if indeed the reserve production facilities survive the first hours or days of war.

There is another side to the coin. The thought that hydrogen weapons have become so all-destructive that no belligerent would be so suicidal as to use them because of retaliation in kind was first expressed in philosophical circles. But this idea is now getting serious, calculating attention by the airmen whose business it is to plan for many possible forms of war. If thermonuclear weapons indeed cancel each other out of use, air warfare may not recede as far as the conventional high explosive and incendiary bomb but might be restricted to utilization of "standard" nuclear weapons—the fission bomb.

This could put massive strategic air power into a status of reserve and promote tactical aviation as the foremost weapon—the position it held when air power came into being almost forty years ago.

Elton C. Fay, Washington, D. C., has been since 1924 an Associated Press staff writer on governmental and political matters and beginning with World War II on military affairs in the United States and overseas.

The Foundations of Soviet Air Power: A Historical and Managerial Interpretation

By Ramsay D. Potts, Jr.

In 1952, Lieutenant General Thomas D. White, then Deputy Chief of Staff for Operations, United States Air Force, revealed to the American public that the Soviet Union was in possession of about a thousand bombers of a type similar to the United States B-29 Super Fortress. General White added:

> From bases in the northeast of Siberia or in the Arkhangelsk-Murmansk areas [these Soviet bombers] are capable of making one-way attacks on any city in North America. By [aerial] refueling . . . the Soviet bombers could carry out two-way operations.

President Truman, President Eisenhower, and various chairmen of the United States Atomic Energy Commission have repeatedly informed the world that the Soviets are acquiring nuclear weapons, which presumably these bombers or their successors could carry. Long-range atomic-air power thus has emerged as the greatest single military strength of world Communism; the only real strength, in any event, with which the Soviets can jeopardize the security of the United States.

Ironically, this most important threat to the American way of life and the values for which it stands is little understood outside very small professional circles. This reluctance to keep informed about the major danger to our country sets the stage for Soviet air power to do its most damaging work.

Sources of Information

Ignorance about Soviet air power often is explained on the grounds that little good information is available in public print. The very opposite is true, although, no doubt, documentation is somewhat scattered and by no means complete; nor is it necessarily accurate in every detail. The point is, however, that the most important facts of Soviet air power can be determined, at least in their broad outlines, exactly in the same way as our scholars have been able to bring out the salient features of Soviet economics, politics, ideology, and military doctrine. In 1950—and the documentation has improved since—Asher Lee, a noted English student of air power, stated that available literature on the Soviet air force was sufficient to disclose "a pattern which enables it to be assessed reasonably well, and permits of fairly confident prediction of future trends." [1]

Information about Soviet air power has been made available by the German, French, English, Swiss, Swedish, and American governments over a period of many years. American congressional and English parliamentary defense hearings reveal important data. Sources of pertinent information include furthermore a few, fairly representative, writings by knowledgeable Soviet defectors; numerous Soviet and German documents now in the various libraries of the Western countries, including libraries of several study centers specializing on the Soviet Union; frequent discussions in Western military publications; and, probably most important, uninterrupted and excellent news coverage of about a dozen English and American aeronautical trade journals.

[1] Asher Lee, *The Soviet Air Force* (2d ed.; London: Gerald Duckworth & Co., 1952), p. 1.

Preconceptions and Actualities

American lack of interest probably is due in part to an ineradicable skepticism concerning the ability of the Soviets to produce modern technical equipments, advanced jet bombers, and such complex devices as hydrogen bombs. To many, this Soviet air threat is a twentieth-century version of Potemkin's villages. Why, Russian industry is way behind American industry, Russia's national income is much lower than that of the United States, and there are no more automobiles in the Soviet Union than in the state of Massachusetts, or less than there were in the United States in 1915—forty years ago! Would it be unfair to suggest that such preconceptions can be dispelled only through extensive and objective research?

It may be granted that, at first glance, the existence of a first-rate long-range air force in an industrially underdeveloped country appears to be something of a paradox.[2] Yet a study of the historical antecedents of the present Soviet air threat reveals that the emergence of Soviet air power as a major factor in world politics was not a case of spontaneous generation. It is true that postwar aviation progress in the Soviet Union was amazingly fast, but Soviet air power as presently constituted is neither a miracle nor a fraud. It is the result of a long period of methodic and extensive efforts.

From its inception, Soviet aviation has been the creature of a state born in violence and eager to engage in permanent conflict, a state in which the alternative destinies foreseen for its future are "destroy or be destroyed." But the revolutionary purpose of the Communist government was only *one* condition making possible the development of Soviet air power. The other was the fortuitous circumstance that this government found the men to carry out its designs, or rather that there were experts so dedicated to the cause of aviation that they prevailed on the Communist leaders to give them a free hand.

The history of Soviet air power can be broken down into three general periods: the years between World War I and the great political purge in the thirties; the period of 1938–45, including the climactic experiences of World War II; and the period after 1945.

First Period of Soviet Air Power

In 1918, Andrei Nikolaevich Tupolev and Nikolai Y. Zhukovsky joined forces to become the founding fathers of Soviet air power. These technicians persuaded Lenin to set up the two organs which have dominated Soviet aviation to this day: TSAGI, the Central Aerodynamics and Hydrodynamics Research Institute, and the Zhukovsky Air Academy,[3] the "Massachusetts Institute of Technology" or the educational arm of TSAGI (which offers a five-year postgraduate course). G. A. Tokaev, a graduate of the Zhukovsky Air Academy, recently described it as follows:

> It is a vast university which provides facilities for study and research at the highest level, and specialises in aeronautics just as European universities used to specialise in the humanities. It is no longer regarded as practical in the U. S. S. R. to have the many subjects necessary for the technology of aviation studied piecemeal,

[2] Russian achievements in the construction of tanks should convince skeptics that the Soviets are quite capable of producing complex weapons which are the equal of similar weapons produced in the West.

[3] G. A. Tokaev, *Betrayal of an Ideal* (London: The Harvill Press, 1954), p. 188.

as they still are in some countries; they are a 'world' of study and research in themselves. Indeed, they are so abstruse that students are admitted to the Zhukovsky Academy as a rule only after they have had a normal university preparation. The Academy, in other words, is a postgraduate university in the old sense. No doubt elsewhere the same higher studies and research are pursued, but the institutions where such work is done are not so centralised as in the Soviet Union, nor are they given such distinguished status.

Tupolev was appointed head of TSAGI. With an interruption during the purges, he has been the dean of Soviet bomber designers for over thirty years, thus assuring a continuity unparalleled elsewhere.

Tupolev and Zhukovsky went about their business methodically. They attempted to preserve the aeronautical know-how of czarist Russia, laid the groundwork for a native Russian aircraft industry, initiated the exploitation of foreign science and technology, set up training programs for designers and skilled workers, started systematic experimentation schedules, and, interestingly enough, embarked on a campaign to make the peoples of Russia air-minded.

Foreign assistance was of key importance. It was obtained largely from Germany. In 1922, Professor Hugo Junkers supervised the construction of a large aircraft factory near Moscow and shortly afterwards experimented with Tupolev in building one of the world's first all-metal aircraft. German air officers unable to function openly in disarmed Germany used Soviet schools to circumvent some of the stipulations of the Versailles Treaty but at the same time provided staff training to the inexperienced Soviet aviators. German concepts gained wide acceptance, and to this day Soviet aviation reflects this early German influence.

By 1923 sufficient progress had been made to establish the first squadrons of the Soviet Air Force. Simultaneously, a massive campaign of air education was undertaken. Hundreds of aeroclubs were organized, often attached to high schools, to provide the youth of Russia with semimilitary training in glider flight, simple aerodynamics, power-plant engineering, aircraft maintenance and navigation. This educational system has remained unique among the air-minded nations of the world, and it has given Soviet aviation a solid human base from which to draw its fliers, navigators, designers, engineers, technicians, and mechanics.

Decentralization

A five-year plan for the aircraft industry was announced in 1928. It marked a real step forward on the road toward the creation of genuine air power. As happens so often in Russia, accomplishments were not up to the level of planning. Progress was unsatisfactory, partly because TSAGI was overburdened as the central planning, designing, and managing authority. Quite undogmatic in fields where there are few doctrinal commitments, the Soviet government discovered that centralized planning was not, in the field of aviation, a particularly potent organizational device. Hence, by 1930, the government began to delegate and decentralize some of TSAGI's functions: within TSAGI, separate experimental and developmental departments for aerodynamics, engines, propellers, and hydroplanes were created; a separate aircraft trust for civil aviation was established; and a new institute, TSAMI, was given the complex and difficult task of engine development. In 1932, VIAM was set up as the central organization to supervise the quality of aircraft design and production. Under this organization, the Soviets produced their first

generation of native military aircraft.[4]

It was not long before the Soviets discovered that decentralization at the top level was not adequate and that actually downright competition was needed to assure continuous progress. This was quite a discovery in a state dedicated to "planning." Individual enterprises were allowed to set up their own design staffs outside the TSAGI monopoly. A Communist equivalent of a "capitalist" competitive structure arose, and it was through this new and unusual setup that the Soviet Union's air force rose to world prominence.

Second Five Year Plan

The period of the Second Five Year Plan, 1933–39, coincided with Hitlerian and Japanese saber rattling. Probably the most dramatic result of this effort was that the Soviet Union managed to re-equip its air force by 1936. Unfortunately for the Soviets, the German *Luftwaffe* did not complete its rearmament program until about four years later. Soviet timing had been "out of phase," and when the war came to the Soviet Union, by the time of the German attack their air force was obsolescent.

Soviet failure was especially marked in the heavy bomber field. The Soviets had been the first to attempt the establishment of a heavy bomber force, and they certainly were the first to place the heavy bomber fleet under the direct orders of the highest command echelon, making it "independent" of ground commanders. While General A. N. Lapchinsky, the USSR's first top theoretician of air doctrine, envisaged the "air armies" for ground force support which were adopted in World War II, he was also a bomber advocate. As early as 1926, he was calling for the creation of a separate bombing force.[5] There was emerging a gradually stronger preference among many Soviet officers for bomber aviation. Under General Khripin, commander of the Soviet air forces during the mid-thirties, the proportion of heavy bombers to other aircraft became much higher than in other countries. Tupolev was building his TB-1, TB-2, and TB-3 series of bombers at this time.

Aircraft engines

During this period, too, the Soviet Air Force made significant progress in the important field of aircraft engines. At the outbreak of the Spanish Civil War, Soviet aircraft still were powered by crude copies of French Lorraines, U. S. Wright Cyclones, French Gnome-Rhones, and Hispano-Suizas. To overcome this dependence, a few promising native designs were standardized and improved systematically. The Soviets learned to build a strictly limited number of engines well and fitted these to bomber, fighter, and reconnaissance aircraft. At the same time—if we are to believe sources such as the noted rocket expert Willy Ley, Asher Lee, and Colonel Tokaev, a former officer of the Soviet Air Force—rocket research got under way within the Soviet Union. By 1937, TSAGI had established rocket development centers in Moscow, Leningrad, and Kazan. On a visit before World War II, Hermann Oberth, the "father" of German rocketry, found a thriving rocket research industry in the Soviet Union.[6]

[4] It is interesting to note that at approximately the same time the U. S. and Great Britain were experiencing great difficulties with their aeronautical organization, and particularly with aero-engine development. The American solution was the establishment of the *National Advisory Committee for Aeronautics*, better known as NACA, which, in some ways, is a parallel to TSAGI.

[6] Asher Lee, *op cit. supra* (note 1), p. 205.

PURGE

But at this point a catastrophe happened: the gradual growth of Soviet air power was disrupted significantly when Stalin purged some of his best air generals and dismissed some of the key aeronautical designers. There are indications that this reduction in influence of the Soviet "air enthusiasts" was caused partly by the purge craze and partly by a misreading of the tactical lessons learned from the Spanish Civil War, a misreading similar to that which was applied to Soviet tanks and which paralleled no less fallacious deductions made by Western strategists.

As a result, the Soviet Union lost its most effective and experienced bomber advocates. General Khripin was purged. Tupolev was temporarily shelved, and his advanced TB-6 and TB-7 heavy-bomber prototypes were delayed, arriving too late for World War II. The purge trials also took a heavy toll of the USSR's rocket technicians. The development of parachute forces and civil aviation[7] suffered similar retrogression, and only fighter aviation enjoyed continued high level support.

WORLD WAR II

At the time when Hitler got ready for his attack, the Soviet Union was producing over a thousand military aircraft per month. It had an operational combat force of well over six thousand combat aircraft, probably at that time the world's largest air establishment. The Soviet air force was supported by a large industrial base of aircraft and component factories, geographically dispersed in depth and operated by competent managers, engineers, and technicians. It was soundly organized into armies, divisions, and regiments, and designed as tactical air force with the primary mission of supporting surface battle. Lieutenant General A. Galland, one of the *Luftwaffe's* World War II aces, recently commented that as an "integral part of the Red Army," the Soviet Air Force "was perhaps better organized and suited to its purpose and better employed in action than the Luftwaffe. . . . We never managed to prevent the Red Air Force from doing this [giving support to Army] despite our superiority."[8] Many marked deficiencies remained, however. Relatively little progress had been made in electronics, radio aids, and navigational devices; fighter and reconnaissance aviation was still below German standards; and numbers and effectiveness of bombers did not meet requirements at all.

Many volumes could be written about Soviet air operations in World War II. The organization of a strategic bomber force as the core of future Soviet air power was initiated in the spring of 1942.[9] General A. Golovanov, a Civil Air flier, was placed in command of the Long Range Air Force. While its showing in the war was extremely poor, the Long Range Air Force nevertheless constituted an important beginning. Independent even of the Soviet Air Force command, it was placed directly under the Ministry of Defense. This diversion of effort in the midst of a deadly war provides an interesting clue to Soviet intentions.

With Malenkov as an expediter, aircraft production was increased greatly.

[7] This disorganization of Soviet transport aviation was overcome to a certain extent when Boris Lusinov, a Soviet engineer, was able after two years of study at the Douglas aircraft plant in Long Beach, California, to duplicate and produce in large numbers the famous Douglas DC-3 (C-47) twin-engine transport.

[8] Adolf Galland, *The First and the Last: The Rise and Fall of the German Fighter Forces, 1938–1945* (New York: Henry Holt & Co., 1954), p. 80.

[9] A parallel decision was made in the field of armored warfare, the results of which became noticeable by 1944 and 1945.

The industrial base again was expanded and extended in depth, hundreds of thousands of technicians were trained, aircraft performance was improved, the aerial methods of the Allies were studied, and extensive battle experience was gained. But perhaps the greatest advantage which accrued to the Soviet high command was that it learned how to handle large numbers of aircraft. Despite heavy aircraft losses and the wholesale destruction of aeronautical factories which occurred during the early years of the war, the Soviet Air Force by 1944 was putting as many as 6,000 combat planes into the air. By the end of the war, the Soviets were producing over 3,000 combat aircraft per month and were manning 19 air armies comprising more than 600 combat regiments.

However, due to the loss of tempo suffered from earlier mistakes, support and fighter aviation dominated air operations throughout the war and relatively little experience was obtained in long-range strikes. Despite strenuous efforts, only insignificant progress was made in the all-important field of electronics. Nevertheless, defeated in 1941, the Soviet Air Force was a victor in 1945. The Soviet Union had become a regional, although not yet a global, air power.

Yet by 1945–46, the Soviet Air Force was getting ready to embark on the most revolutionary growth the history of air power has seen to date.

SOVIET DOCTRINE

What are the Soviet doctrines on the use of air power? In the field of armored warfare there has occurred a similar doctrinal dispute: Is the tank an infantry support or an independent "strategic" (or as the Germans and Russians call it, "operational") weapon? The Soviets made a Solomonic decision: The tank is *both*. Hence they allotted a tank regiment and a mobile gun detachment to each infantry division, and established several heavy-tank regiments, to be used as reserves and reinforcements of infantry in battle. But *in addition*, they created two types of armored divisions especially designed for "operational" missions: large-scale attack and breakthrough, pursuit and deep penetration.[10]

Needless to say, the adoption of such a double-barreled doctrine requires a huge industrial and training effort which, with respect to tanks, the Soviets apparently were able to undertake. The question is, Can a similar effort be successful in the far more exacting field of aircraft production? Perhaps not. But it is a fair presumption that a parallel doctrine guides the destiny of Soviet military aviation: bomber aircraft are needed *both* to support ground forces *and* to carry out independent strategic operations.

By the end of World War II, the strategic requirements of the Soviet Union had changed vastly. The enemy nearby had been eliminated; but a new "threat"—of a more illusionary type, to be sure—was developing at a distance of 5,000 miles. It is hard to see how the Soviets could have failed to conclude that the development of a strong and genuinely global air capability must become the highest priority objective of their military preparations. In any event, ever since 1946 or so, they have acted as though, indeed, such has been their objective. There exists a wealth of evidence to confirm the nature of the Soviet response to the new strategic challenge.

PRESENT SOVIET AIR POWER

The results were not slow in coming. Modern jet engines were developed;

[10] N. Galai, "Geschichte der sowjetischen Panzerwaffe," *Ost-Probleme*, January 21, 1955, p. 107.

medium and possibly heavy bombers were built; large air defense forces were set up; a massive and capable electronics industry came into being, thanks largely, presumably, to German assistance; and research work on guided missiles, both long- and short-range, was initiated. Since 1950 or so, the Soviet Air Force has displayed one modern aircraft after the other. There are disturbing signs that the Soviets are making good—and accelerating—progress toward the attainment of their goal. As of today, air power has rejuvenated Russian imperialism and re-created it as a global threat.

What are the expectations for the future? The story of Soviet aviation is not one of technological genius. The Russians still are only competent imitators, and they have only a few inventive pioneers. But their strength lies in their uncanny ability to utilize technological advances made in other countries, to carry on in their own plodding way systematic research with endurance and singleness of purpose, to devise solutions of expediency, and to design matériel which is well adapted to the general backwardness of the country. They aim to use sturdy and simple weapons which can be produced in large numbers and be maintained without difficulty.

SOVIET AERONAUTICAL DESIGNERS AND ENGINEERS

Air power is created by the application of brains and resourcefulness rather than only by industrial productivities. Soviet aviation is the child of a small group of aircraft designers and builders. From the early days of the Soviet regime, the aeronautical engineers, designers, and industrialists have been perhaps the most influential professional group within the Soviet Union. Their longevity attests to their political influence. By comparison with their American and British colleagues, they exercise enormously more authority. All of them hold high military rank coupled with substantial seniority. Many have had direct access to the Politburo. Together, they ensure considerable continuity and enviable coordination between political and military strategy, and between strategy and industrial production. They wear the triple hat of the scientist, the industrialist, and the general officer—a redoubtable combination of power. And even this description does not quite explain their position. These men compete against each other, and their competitive ardor is stimulated by a system of incentives far more "persuasive" than any in the West. The incentive comes in the form of wealth, living standards, status privileges, rank, and power, as well as—in the case of failure—demotion, punishment, and ruin.

Let us look at some of these capitalistic soldiers of Communism. Lieutenant General Tupolev is the leading Soviet designer, a topflight scientist and also the happy survivor of two purges. He has operated as the brain of TSAGI —except for short periods of disgrace— as main contact with German aviation specialists, and as a proponent of heavy bombers. He designed his first bomber in 1922 and since then allegedly has been responsible for over thirty aircraft designs, mostly in the bomber class. Under his direction, the Soviets reproduced the United States B-29 medium bombers in record time.[11] This duplicate, the well-known TU-4, is presently the main weapon of the Soviet Long Range Air Force. But Tupolev's career is not over yet: his staff reportedly designed the large jet bombers displayed publicly in Moscow in 1954.

[11] The equally rapid reproduction of German and British jet engines speaks highly of the effectiveness (though not the originality) of Soviet industrial engineering.

Ilyushin

Sergei Vladimirovich Ilyushin is Tupolev's counterpart in the light bomber field. He is best known as the designer and builder of what presently is the numerically largest fleet of light jet bombers, the IL-28, which presumably can reach most targets on the European continent, and in Japan and Alaska. He is a strong partisan of simple and rugged aircraft designs. (Having begun his career as an aircraft mechanic, he learned how to read and write when he was eighteen, while a common laborer at the Moscow airdrome.) As commanding officer of TSAGI's experimental factory, he is reported to have tested almost every Soviet aircraft when it was still in the experimental stage. He designed the IL-4 twin-engine bomber, the backbone of Soviet bomber aviation during World War II. But his greatest fame rests on his development of the IL-2, better known as the *Stormovik*, the well-nigh indestructible scourge of the German army. Allegedly, this design resulted from a dispute with N. N. Polikarpov and other "white-collar designers" who were unable to produce a suitable ground support plane. Challenged to do better, Ilyushin is said to have designed the *Stormovik* in three weeks. His air-power doctrine may be gleaned from a speech which he made in 1942, and which Asher Lee quoted as follows: "We have always thought that the main role of aviation was the support of ground forces." This "line" of the Ilyushin school is, almost certainly, at variance with the line of the Tupolev school. There is nothing "monolithic" about Soviet aviation. The USSR's obsession with rugged, simple, and easily produced and maintained aircraft becomes more understandable when viewed in the light of Ilyushin's career and the maintenance environment of Soviet aviation. It also cautions against measuring Soviet performance against United States standards.

MIG's

Together with Mikhail I. Gurevich, one of Russia's outstanding mathematicians and structural engineers, General Artem I. Mikoyan (brother of the First Deputy Prime Minister, Anastas I. Mikoyan) designed the well-known MIG group of fighters. The progression has gone from the MIG-1 (1940) via the MIG-5 (1944) and the MIG-9 (1945) to the powerful MIG-15 of Korean notoriety, and thence presumably will go to even better models. The MIG-15 is, historically, one of the most successful airplanes and, by and large, not inferior in performance to some of the best American fighters. The late General Hoyt S. Vandenberg, then Chief of Staff of USAF, commented in 1951 that the MIG's engine "is superior to any jet engine we have today in operational combat planes."

Lavochkin

Semyon A. Lavochkin participated in producing, together with Gudkov and Gorbunov, the LaGG series of fighters which were used during World War II. After the war, Lavochkin produced a string of piston and jet fighters and at present is reported to be working on an all-weather interceptor. His great strength lies in his unusual ability to select and manage design teams. Among German repatriates, he is noted for his successes in picking their brains.

Yakovlev

General Aleksander Yakovlev is fairly well known in Western aeronautical cir-

cles as a deputy minister of aircraft production and as designer of the YAK series of piston and jet fighters.

Ideology

These, then, are some of the typical leaders of Soviet military aeronautics. Each top designer controls, directs, and manages large competitive complexes of aircraft factories and laboratories. As such, they are without counterpart anywhere in the aircraft industries of the free world. Lest they be regarded as "pure and nonpolitical" scientists, it should be remembered that "there is not a single aeronautical engineer or specialist in the USSR who has not had a radical Marxist-Leninist-Stalinist grounding. Here is the fundamental difference between Western and Soviet experts." [12] The Soviet regime has treated its aeronautical elite with kid gloves. No wonder that these designers in general have been utterly dedicated to the aggressive aims of Soviet Communism—as well as to the future of Russian aviation.

THE NEW GENERATION

But these men are growing old now. Under their tutelage, a new generation of designers is emerging. Hence, the most significant question referring to the future of Soviet aviation is this: Will the Soviet regime treat the up-and-coming designers as it has treated the present generation? Will it continue to deviate from its normal behavior pattern? Will it allow them freedom of action and again place them at the top of the privileged classes in Soviet society?

It is too early to answer this question. There is no doubt, however, that the Soviet government has recognized the fact that technological superiority in the air rests, in the last analysis, on designers and engineers as its foundation. Hence, technological training has been vastly accelerated and has become one of the unique long-term elements of strength in Soviet aviation. While the United States has been turning out far more university *graduates,* the Soviets between 1928 and 1953 have graduated 150,000 *more engineers* than the United States. In 1928, the Soviets had some 26 institutions offering engineering training. Today, there are approximately 175 schools offering *training in engineering exclusively.* Their enrollment numbers about 300,000 students. By comparison, some 210 United States colleges offer engineering courses with an enrollment of about 194,000 students.

Progress in Soviet aeronautical engineering training is no less sobering. Since 1951, the Soviets have been graduating at least 1,200 to 1,400 aeronautical engineers per year. In 1954, the United States graduated 645 aeronautical engineers. The quality of Soviet instruction is very high by United States standards: the students get considerably more education in the general sciences, and especially in mathematics. Morale within the educational system is very high, too, owing to considerable incentives in the form of honors, better pay, better treatment, and greater promise for a future career with substantial rewards.[13]

POLITICAL LEADERSHIP

Behind the designers and scientists, however, stands a political leadership which gives unstinting attention to the development of military aviation. One can hardly imagine members of the United States or British cabinets holding long meetings to discuss aircraft and missile research, development, and production. Yet there is much evidence that for many years Russia's top rulers have assumed just such a direct role in support of aeronautical developments.

An ex-colonel of the Soviet Air Force —whom Sir David Kelly, formerly British Ambassador in Moscow, calls "the most distinguished of the 'Defectors' who have sought refuge in the West" —cites an interesting example of the Kremlin's direct interest in military aviation. G. A. Tokaev, formerly Chief of the Aerodynamics Laboratory of the Moscow Military Air Academy, was called to the Kremlin from his post in Berlin on April 13, 1947, in order to discuss the exploitation of German aeronautical science. Present were Stalin himself, Malenkov, Bulganin, Voznesensky, Vershinin (then Chief of the Soviet Air Forces), Artem Mikoyan, and Major General Lukin (Deputy Minister of Aviation Industry). Tokaev reports that Malenkov remarked to General Khrunichev:

"I was in Noginsk the other day and saw them trying to make V-2's," said Malenkov. "I was not impressed. The work is going very slowly, and anyway, the flying bomb is an outmoded weapon now. . . . We must complete it, but not to the detriment of work on more modern weapons. . . . The point is that the V-2 is good for 400 kilometers, and no more. And after all, we have no intention of making war on Poland. Our vital need is for machines which can fly across oceans." [14]

CONCLUSION

What conclusion must we draw from the widely known facts of Soviet air power development? Simply this: The major threat to our security is coming from the air. As Soviet atomic air power continues to grow, the United States and its political institutions are in ever greater jeopardy. We can ill afford to disregard this most deadly threat in our history.

Ramsay D. Potts, Jr., Washington, D. C., is an attorney, a colonel in the Air Force Reserve, a member of the Hoover Commission Advisory Committee on Department of Defense Passenger Transportation, and president of Independent Military Air Transport Association, a commercial group of air carriers specializing in airlift for the military services. During World War II he served as squadron and group commander of heavy bombardment units and as director of bombing operations in the Eighth Air Force. Later he became chief of staff of the Military Analysis Division of the United States Strategic Bombing Survey. Mr. Potts's military and government career included a tour of duty as executive officer and special assistant to Secretaries of the Air Force W. S. Symington and T. K. Finletter.

A Steel Ring for the Iron Curtain: An Appraisal of Air Power in Other Nations

By EDWARD W. S. HULL

AIR power today is essential. It is a weapon which no one wants to use but which must always be ready for instant use. It is not preventive war but preventive mobilization. Directly, it does nobody any good. But indirectly, history may later record it as the guarantor of peace, the policy and the power that prevented the last war between men—the war of massive self-destruction—from ever occurring. Air power is the focal point of a counterbalancing power complex designed to force into peaceful accommodation a world sharply divided.

The current mission of Western air power is to make prohibitive to an aggressor the cost of attack. Its potential is military. It means ability to hit back hard in any local wars that break out, getting and holding local air superiority. But basically it means constant readiness to meet nuclear warfare by immediate counterattack in kind.

Western air power is built around the following:

The United States Strategic Air Command—over a thousand high-speed, high-altitude long-range jet bombers.

The incipient British Strategic Bomber Command.

A nuclear arsenal capable of destroying every military target in Russia within thirty days.

High-speed A-bomb-carrying F-84's based in Europe and the Far East.

A world-wide system of over two hundred air bases in addition to those within the United States.

More and more interceptor, fighter-bomber, transport, and reconnaissance squadrons.

An elaborate network of communications and support facilities in nearly every country of the free world.

A combined aircraft industry of vast and growing capacities.

It is not a paper plan. It is an existing, working complex—a gun that is loaded, cocked, and aimed, ready to fire, should Russia pull the trigger. For, in the final analysis, the decision that controls the trigger finger will be made in the Kremlin or Peiping, not in the White House or Whitehall.

The basic assessment of air power in other nations is this: The current state of readiness would not have been possible without their consent and cooperation. To build preventive air power from the resources—geographic, economic, and human—of the United States alone would be impossible.

NETWORK OF BASES

The crux of the West's preventive strategic concept lies in the global network of bases. Today, atom bombers by the hundreds can attack any part of Russia simultaneously from all points of the compass, taking off from the United States, Greenland, Britain, North Africa, Okinawa. Over target, if low fuel supplies preclude returning to base, they can keep on going to friendly airfields on the other side.

Not only is this system preventive in the simple enormity of its threat. In addition, the more A-bomb bases there are in the West, the bigger the effort needed to knock them out. Russia would not launch an atomic attack on the West's cities and industries without first trying to prevent retaliation.

As Russia knows from the chess her people play so well, the West also has the advantage of position. Russia is a single target, albeit a large one. She can be hit from all directions. She can attack the United States from only one.

To strike at United States industry, Red aircraft would have to fly thousands of miles across the polar cap and northern Canada even to reach the United States border. They would face the possibility of detection and interception all the way. Innermost Russia is a maximum of 1,500 miles from her nearest boundary. Most industrial centers are much closer. Her only buffers are the thin line of Eastern Europe and the bulge of China. Aerially, most of her perimeter is wide open. Her detection and interception problems are immense; those of the West, relatively easier. It is easier to watch a single point than it is to watch the whole world.

Outside of the United States and Canada, free world air power is strongest in West Europe. Under the North Atlantic Treaty Organization, it is the most highly integrated. It is the best equipped, is spending more of its own money, has received the largest share of American aid, and has the greatest resources of industry and manpower. It is also an area that is very conscious of the danger that lies to the East.

NATO

Including North America, NATO covers some 400 million people, and nearly a quarter of the world's land and sea area; it ranges across the Atlantic to Iceland and Norway, down through West Europe and North Africa, and around to Turkey. The European line of defense alone is 4,000 miles long. It includes 200 million people, a dozen different languages, as many different sets of national customs and local political problems. Yet within five years, NATO has been built into a highly efficient fighting alliance, with the first emphasis on air power.

All told, over 5,000 fighters, fighter-bombers, light bombers, and reconnaissance and transport aircraft are available to NATO. Some 4,000 are specifically assigned, under direct NATO command. These totals do not include the 200-odd United States Strategic Air Command B-47's operating from Britain and North Africa. Nearly all NATO's front-line aircraft are jets, including over 2,000 subsonic F-84 Thunderjets, over 1,000 transonic F-86 Sabers, growing numbers of British-made Hunter fighters and Valiant bombers, about 600 twin-jet Canberras, over 400 French-made Ouragan and Mystère fighters, as well as obsolescent Meteors, Vampires, and Venom fighters.

On the ground to support these aircraft are eighty new bases built to NATO requirements with 7,000-foot runways, as well as eighty more old bases brought up to NATO standards. Of the 160, most were built jointly with common "infrastructure" (term for NATO support facilities) money to which all fourteen member nations contribute proportionate shares. About three dozen were built specifically by the United States, Britain, and France.

Deficiencies

In recent NATO exercises, deficiencies have shown up mainly in communications, modern air-power logistics, air transport, and quick achievement of air superiority. These troubles were not unexpected nor are they basic flaws.

The communications problem is largely mechanical. Too much reliance had to be placed on civilian telephone systems and jammable radio circuits. The remedy: a line-of-sight microwave network now being built which obviates

the need for telephone wires, precludes tapping and jamming, and minimizes the likelihood of sabotage.

Logistical troubles stem from changing concepts. To keep fuel flowing to NATO's jets—one 75-plane F-84 wing in operation consumes 100,000 gallons a day—nearly 4,000 miles of pipeline, pumping stations, and tank farms have been built.

But there is a growing body of opinion that, in the Age of the Atom, an increasing amount of supplies, if not all, should be airborne. Part of NATO's air emphasis is on the ability of ground support, interceptor, and bomber squadrons to move from one base to another, hardly missing a day's operations. That takes air transport and lots of it—not trucks, trains, and ships.

Only the United States has a large military air transport system. Though some C-119's are occasionally lent to Britain, for paratroopers' practice, this lift is assigned primarily to United States forces.

Actually, 100 per cent air mobility is an ideal goal rather than a practical expectancy. It is certainly not a formal NATO target at present. Efforts are being made, however, to raise abilities above present levels.

Air bases, communications, radar networks, pipelines, and so forth (but not transport aircraft) are all part of the infrastructure program. This has already cost close to two billion dollars, with the United States paying 55 per cent and other NATO countries the rest. Total European defense expenditures, 1949 through 1954, top forty billion dollars. The annual rate has tripled. The comparable United States total is about 200 billion dollars.

It is a statistical fact that in a European war, the biggest air power problem would be to achieve air superiority. It is a weakness that can only be remedied by more and better aircraft. The present total is too low, and too many of that total are obsolete. Both volume and quality, however, are rising.

Military co-operation

An important factor in West European air power is the relative smoothness and ease with which the different contingents work together. Obviously so many different nationalities cannot be developed into a flawless machine overnight. Military co-operation in the field is still far from perfect. But many of the men working together today fought together in World War II, Korea, and Indochina. Techniques and procedures are being standardized. There is the basic knowledge that "we've got to work together." And, as a result, in the air at least, the fourteen NATO countries work as an effective fighting entity.

Planes in combat readiness

With the exceptions noted above and the fact that Europe's aircraft production is still too low, NATO's general air power level is good. There are 185 tactical air squadrons deployed along the Eastern front. They are in combat readiness both to intercept and to give close ground support. Most aircraft are jets, but not all are the latest models. Not all are a match for the Russian MIG-15 and its successors. But the standard of air matériel rises daily. Once Europe's aircraft industry, particularly Britain's, finds its pace, the rate of improvement will accelerate.

European production

Right now the bulk of first-line aircraft are made and/or designed in the United States. But efforts are being made to make Europe more self-sufficient. Some F-84 parts and engines are being made in Europe. There are assembly plants in Italy, Belgium, and Holland. The Dutch are tooling for

full-scale F-84 production. Britain's Hunter seems free of bugs at last. Performance of this aircraft compares favorably with both the United States F-86 Saber and the Russian MIG-15, but it is appearing in squadrons four years later. Earlier this year, total orders for the Hunter came to only about 1,500, including Royal Air Force orders, 120 for Sweden, and about 1,000 for NATO forces, the latter partly paid for by the United States. Most orders are to be filled by the three production lines in Britain; the rest by two lines in Holland and Belgium.

About 600 Canberras of all types are already in service as high-speed light bombers, night interdicters, and reconnaissance planes. More are on order abroad and others are being built under license in the United States. As a light bomber its fighting ceiling is 45,000 feet; in reconnaissance roles, 45,000 to 50,000.

In France, Mystère II's and IV-A's are both in production for the French Air Force, but the order is limited to 350. The IV-A is a 700-miles-per-hour, 40,000-foot interceptor. It carries two 30-millimeter guns and fifty-five internally mounted rockets, besides thirty-eight rockets slung in two wing pods (or two 500-pound bombs for close support work) and two wing-mounted fuel tanks. France has completed an order for 350 jet Ouragan MD-450's. For an aircraft industry that hardly existed in 1945, this is not a bad record.

However, compared to the number of prototypes that have been made, few European designs are in operational production. West Europe is far from building aircraft in sufficient volume even to keep current forces up to date, much less to effect an expansion. It is a major weakness. The big job of NATO's aircraft industry is to build preventive strength now, not fighting strength after a war has started. For the chances are that either the war would be over before production got rolling or the industry would be knocked out in the first few days . . . probably both.

NATO's light fighter-bomber design competition is also aimed at getting Europe's aircraft industry out of the doldrums. It calls for a fast jet aircraft with an operational weight of less than 8,000 pounds. It must be able to fight in the same ring with today's heavies. Above all it must be simple—simple to fly, simple to maintain, and simple to build with labor and machinery already in being. It should also be able to double as an emergency interceptor. If the program works out, it could be the answer. But evaluation, design finalization, spreading of contracts through many countries, all take time. Any immediate solution must come from getting current models into production.

Britain

The largest single contribution to Western air power outside the United States and Canada comes from Britain. This is owing partly to the fact that she came out of World War II with a large air force and supporting industrial capacity very much intact. It is also owing to the fact that she has been able to take her postwar responsibilities more seriously than some others.

Since 1948, the Royal Air Force has boosted its strength from under a thousand to over five thousand planes of all types. RAF manpower now totals 270,000. Included in this aerial line-up are 375 Canadian and about 100 United States–supplied Sabers. Most of her equipment is British made, though old. Until the Hunter reached squadron service, there was not a British aircraft in operation to match either the Saber or the MIG. Much of the RAF's material is still "second string." Supersonic

fighters with capabilities of over 50,000 feet are not even near production.

Original RAF plans called for over a thousand Hunters and Swifts to be in operational service by this June. There are perhaps three hundred Hunters and no Swifts.

All told, Britain has half a dozen fighter and fighter-bomber designs with impressive subsonic performance claims, either as prototypes or struggling through early production stages. There is also one prototype fighter, the English Electric P-1, that has gone supersonic in straight and level flight. England has three V-class long-range atomic bombers, the delta-wing Vulcan, the Victor, and the Valiant. Only the Valiant is in operational production.

Britain's NATO contribution on the Continent along with Belgian and Dutch units is the Second Allied Tactical Air Force, equipped largely with Sabers and Venoms. Her radar network is ahead of schedule. And though nothing is yet in operational production, work on air-to-air and ground-to-air missiles shows signs of catching up.

By present-day standards, there is virtually no British military air transport command. There are no plans for either the massive movement of heavily armed ground forces or for materially improving the air mobility of RAF squadrons. Whitehall does, however, place some stress on the rapid air movement of lightly armed troops to any part of the Commonwealth and has ordered V-1,000 jet military transports for this purpose.

There is also a British effort to build a Strategic Bomber Command. The force now bearing that name is equipped with Canberras, and British-made nuclear weapons have been going into munitions dumps for about a year. For certain kinds of missions (tactical, mostly), it is an important and useful force, but right now it is only the shell of a strategic air force.

It does not have the right planes, or training. It also lacks many of the necessary supporting facilities for long-range strategic bombing. Britain first developed in-flight refueling, but she has no tanker squadrons nor are any in sight. Neither are there enough of the little black boxes, the radar so necessary to long-range high-altitude bombing.

There are now perhaps two squadrons (22 aircraft) of Valiants in service. If the aircraft existed in large numbers and were supplied with the same facilities, combat equipment, crew training, experience, and so forth, it would probably be a better aircraft than the B-47. But they are not, and supplying them takes much time and money. Suggestions have been made that Britain's efforts might be better directed towards building up its tactical power, or at least by building proven United States bombers under license.

British aircraft industry potential is considerable. At peak World War II production in 1944, British factories turned out 26,461 aircraft, of which 5,507 were heavy bombers, 2,396 medium bombers, and 13,669 light bombers and fighters for the RAF and Navy. It added up to 208 million pounds of airframe weight, as compared to 9 million in 1938. In 1953, the total was 15 million pounds. Employment in the industry today is 230,000.

There are a number of reasons—some more important than others—why output is so low. One certainly relates to procurement methods. All buying is done by the Ministry of Supply. To date, the Air Ministry has had no direct control over aircraft contracts. It has not been able to halt a program that has gone sour, as it would like to have done much earlier in the case of the

Swift. This aircraft should have been in service over a year ago. In the United States its troubles would have been righted within a reasonable period or the contract canceled. It is one reason Britain's Prime Minister, Sir Winston Churchill, seriously considered reestablishing the wartime Ministry of Aircraft Production.

Other problems include:

The reluctance (due perhaps to pride) of some British manufacturers to accept technical advice and help from the United States on specific aerodynamic problems. The Swift interceptor and the Javelin all-weather fighter are both cases in point.

Too many different types of aircraft under development and too few prototypes of each.

The practice of placing production orders before the aircraft is proven.

An apparent unwillingness to freeze design at appropriate intervals in order to go into production.

Perhaps, also, there may be too much emphasis on aircraft for commercial export, though this can be strongly supported for economic reasons.

None of these reasons apply across the board, nor do all ever apply in one instance. But it is an admitted fact that the British aircraft industry has not been doing the job it could. Its contribution to Western air power is still below par. However, succeeding months should see gradual improvement.

Britain's lead in jet-engine design and development seems safe for a few years yet. But the United States will continue to supply volume production for use in aircraft "today" and "tomorrow."

In the long run, the most dramatic development in British air power is the abandonment of the balanced forces concept, with the scales tipping in favor of the RAF. For an island country that has been for centuries a major sea power, the change poses political problems. But the conscious decision has been taken, and succeeding budgets will see more money for air power, at the expense of other forces if need be.

France

France as an air power suffers primarily from the fact that with the end of the war there was no French Air Force as such. What is more important, there was virtually no aircraft industry. And what there was had to ask Britain for a glossary of terms before it could even talk in the jet age. It was a case of starting from scratch. Its growth has not been helped by the failure of the French government, largely through force of circumstances, to appropriate enough procurement money to warrant going into efficient production. Winning NATO's light fighter competition could do much to put the industry on its feet.

France has not yet watered down her effort by trying to build a strategic bomber force.

In the French Air Force, there are fewer than 2,000 first-line planes, of which 1,200 are contributed to NATO; between 150 and 200 are transports and the rest miscellaneous. France's transport command gained valuable experience in Indochina.

Her main contribution to Western air strength is bases—supplying the sites and helping to build and man them. There are forty-five NATO air bases in France alone. The four or five assigned to the United States Strategic Air Command in North Africa are of vital importance.

Other air forces in Europe taken individually are not impressive. Most of the countries are small. But collected together as they are under NATO they make a good showing.

West Germany

The real unknown, of course, is West Germany. Now admitted to NATO and urged to rearm, she will certainly supersede France as an air power and may, in time, come close to matching Britain. Officially, the West German air rearmament target is 1,200 fighters, 300 transports, reconnaissance aircraft, helicopters, and so forth, but no strategic bombers. However, as the mass of German industry, technical know-how, and trained military manpower bring the program close to these levels, there is repeated historical basis for assuming the target will be expanded. Basic plans were laid for a new German Air Force even before French ratification of the London agreements. The United States is supplying many of the aircraft to start. Development will be rapid, and the present program completed in early 1957.

Other NATO countries

The rest of NATO Europe, eight countries—the Netherlands, Belgium, Norway, Denmark, Italy, Greece, Turkey, and Portugal—account for half the NATO bases and half the assigned air strength, some 2,000 aircraft. These break down into about 300 F-86's, about 1,200 F-84's, and the rest older models. Perhaps another 1,000, though not assigned, are available to West European air defense and co-ordinate well with regular forces during NATO war games.

Though none of these countries has reached the stage of developing a family of home-designed aircraft, several production lines for making foreign types—F-84's, Hunters, Vampires—have been set up and are convertible to later types as they become available. Also jet engines are being made under license, as well as a wide range of spare parts and components. Personnel of these air forces is about 140,000.

SWEDEN

Sweden, not in NATO, has 1,200 fighter aircraft, including many jets (mostly Swedish-built Vampires). She has Hunters on order, and deliveries of her own SAAB-32 Lensens have begun. Her aircraft and engine industry is small but efficient, and is working on a new supersonic fighter. Should Sweden be drawn into another war, this force, if not destroyed first, would almost certainly be fighting on the side of the West. Her defenses are spread too thinly, and alone she could not protect herself.

SPAIN

Spain's main contribution is four—perhaps more later—strategic bomber bases populated with United States B-47's and later types as they come into service. Spain now has little more than an "internal" air force, made up mostly of old World War II German aircraft. However, she does have over 2,000 trained pilots who could fly jets, which will probably be supplied by the United States.

THE EAST

From the Eastern reaches of NATO, on through Asia to Korea, Japan, Okinawa, and Australia, there is virtually no air power. There are various national units for handling local troubles, but nothing that could really be considered an important contribution to free world defense. United States aid and bases in Pakistan may make this country an important outpost, but this program, held up by procedural problems, is just starting.

Except for Middle Eastern oil, which is covered by NATO air power in Turkey and British units in the area, there are few strategic air targets worth Rus-

sia's efforts. And land assault is almost precluded by the severest mountain range in the world, which separates Russia from southern Asia all the way from Iran to China.

The West's Far Eastern air power is primarily from the United States, with well-equipped units stationed more or less permanently in Japan, Okinawa, Korea, and the Philippines.

Nationalist China's Air Force on Formosa is good for little more than hit-and-run raids along China's mainland coast and for harassing Red shipping. But there are about two thousand well-trained pilots, many with jet experience, whom modern United States jets could turn into a substantial force. They have been trained to United States Air Force standards. In a nonatomic war, the United States Seventh Fleet and its jet-manned aircraft carriers remain an important element.

Australia's Air Force is a peacetime operation, a small, highly trained, well-equipped nucleus that could be quickly brought to strength in an emergency. Much the same is true of her aircraft and engine industry. For a country with fewer than nine million people, Australia's effort is "up to standard." She has assembly lines working on small production orders of Avon-powered Sabers, Canberras, Vampires, and a number of jet engines. She developed on her own and has in production the Jindivik, a high subsonic medium-range pilotless aircraft. She is working on a delta-wing rocket—speed Mach 3—to intercept high-speed guided missiles. An important contribution is the rocket-testing station at Woomera, which is available to Britain. Another point is her isolation from the potential enemy; her factories and airfields would probably be the last to get hit in an atomic war.

Japan, like Germany, is still a potential air power. But that potential is great. She had one of the largest aircraft industries in the world. Contracts have already been signed with United States firms to build United States planes and engines under license. Her industry already has considerable experience in modern jets as a result of its repair and maintenance work on Allied aircraft during the fighting in Korea.

With her resources and manpower, she could build the third largest air power in the world, after the United States and Russia. It would take a lot of United States aid, however, as she has no raw materials of her own, and her balance of payments is precarious at best.

CANADA

Canada is an air power out of all proportion to its population of 14 million. It has twelve squadrons (300 F-86E Canadian-built Sabers) in Europe. It has contributed several hundred more to NATO as foreign aid. Its massive Northern wilderness is a vital element of North American defense. An extensive radar network is in being. Its air base program is moving at top speed. The high-performing CF-100 Canuck is Canadian designed and in volume production. On defense, the United States and Canada work together.

THE WEST AND RUSSIA

This, then, is the line-up in the West: a free world organized into a massive and growing display of air power—chinks, faults, and failings in the armor, but, over all, a formidable array. In terms of aircraft in combat units, the Reds have more: over 20,000 in Russia; 2,000 in East Europe; and another 2,000 in China. Most are tactical aircraft. The instance of jets is high and mounting. There are also large numbers of Il-28 twin-jet medium bombers, capable of carrying A-bombs over 1,800 miles.

Russian interest in strategic air power began almost as early as the West's. Development has been slower, but she does have about 700 Tu-4's (B-29 copies) and perhaps a couple of hundred Tu-200's, six-turboprop versions of the B-36. A four-engine turboprop bomber is also in production. She has at least one prototype of a four-jet swept-wing heavy bomber, with a total thrust of over 60,000 pounds, and swept-wing twin-jet bombers in squadron service. Late fighter models may be supersonic—the MIG-17, for example.

On the average, Russia's first-line aircraft probably perform just about as well as those in the West. But their operational availability appears to be lower; nor are they as well equipped with special combat gear. Her strategic air arm is no match for the West's either in volume or quality, but its ability to achieve some penetration to distant targets is a compulsory assumption. And "some" penetration with hydrogen bombs would be too much.

The Red aircraft industry has a tremendous capacity, though quality control in some important instances seems poor.

The West relies on quality, technological superiority in all phases of air power. Each aircraft, jammed full of armor, armament, electronics gear, skilled crews, and reliability under extreme conditions, stands a good chance of carrying out its mission. Authoritative opinion in Washington, London, and, apparently, Moscow is that these factors continue to maintain the air power balance in the West's favor, despite Red superiority in numbers.

Keeping this lead requires constant effort—tremendous expenditure on the best of technical manpower, research, industrial capacity, natural resources, and the lives of the men who, today, first fly tomorrow's service aircraft.

The future—peace or chaos—is man's choice. Within one hour of detecting Red bombers in free-world skies, the West's nuclear-armed strategic bombers would begin taking off from bases all over the world, hundreds of them, with one destination—Russia. Attacking Soviet aircraft would find the West's bases empty. No international conferences, not even a quick general staff meeting. The gun is loaded. It is as automatic as pushing a button. It could take even less to set it off; an accident, for example. An unavoidable risk.

This is the ability of the West. It is costly. It is unavoidable. For until the politics of reason finds the way to peace in the world, the politics of power is the only known means of a stalemate. The central force of that power today is air power.

Edward W. S. Hull, London, is bureau chief of McGraw-Hill World News. Educated as a physicist, he was a pilot with the United States Marine Corps during World War II. He was for three years a correspondent in McGraw-Hill Washington News Bureau, specializing in raw materials, all forms of transport, and military budgeting. Prior to going to London just over a year ago, he was for three years associate editor of the Whaley-Eaton Service, and during his last year there edited the Foreign Letter.

The Psychological Impact of Air Power

By Lewis S. Thompson

MOST of us can chronicle the development of air power. Not always so apparent, however, are the changes that it has made in the communication of ideas, international commerce, geographical isolation, and the waging of war. Man is a creature of the earth, and his perception, limited by this narrow environment, tends to view the world in linear planes. Even the dramatic displacement by aircraft of armies and battleships as symbols of national power and prestige has become circumscribed by traditional habits and concepts of warfare. The technical evolution of air power has made it a factor in the economic, political, military, ideological, and social development of every nation. Its extreme flexibility, range, mobility, and speed as a means of transportation; its capability for rescue and communication operations; and its destructive power have added a new dimension to personal and national security. The world that once was measured in terms of land mass and seas should now be conceived in terms of a boundless, borderless air mass. The interaction of these concepts and forces has created the psychological impact of air power.

There is probably no word that has been more abused and confused than "psychological." Loosely it can be defined as dealing with the mind—as a thing perceived or experienced. While this is an almost all-embracing definition, in relation to the word "impact" we are defining our subject as the force communicated or perceived through the medium of air power. And by air power we mean the aggregate of men, aircraft, weapons, air bases, facilities, and the industrial and technical resources that sustain flight. In other words, air power is the ability of a nation to fly, and we are discussing this ability in terms of its influence on human behavior.

In the velocity of our projection into world affairs through the development of air power, the United States has made most of the natural mistakes to which we are entitled, both by our youth as a nation and our enthusiasm as a people. With the world rapidly shrinking in time and space, international differences have assumed a new significance and are almost as personal and immediate as family quarrels. Commercial and diplomatic relations that once were conducted in leisure are now consummated on a global basis in minutes or hours. With two competing industrial systems producing nuclear weapons of terrific lethality, a new timidity is introduced into world affairs. If the Communist bear should sneeze in Moscow, a *Gesundheit* echoes around the world. Even our concepts of personal security and property are disturbed by the frustrations and fears concerning an adequate defense against aerial attack. But before discussing the reactions to air power, let us examine some of the reasons why people act like people.

Basically all human behavior is governed by "natural laws." The first of these laws or principles is that the strongest motivating force of individuals is instinct—survival (either spiritual or personal), hunger, sex, and so forth. People are secondarily motivated by emotions—love, friendship, hate, fear, greed, and so forth, and only thirdly is man motivated by reason. Imposed upon and modifying this biological behavior, however, are the society in which

an individual lives and the circumstances that surround a certain action. Human behavior is not haphazard and obstinate, but is generally systematic and purposeful: man attempts to maintain a state of equilibrium both internally and with his external environment. While this is an oversimplification of human behavior, it is in this framework that air power is particularly significant to our times.

The mere presence of a hostile aircraft is often conceived as a threat to the personal security of every individual in a community, and the emotional response to these weapons has often obscured reason and created distrust of United States motives or objectives. The presence of United States military forces overseas conflicts with the basic desire of the local population to control and direct their own destiny. In wartime these frictions are generally accepted as necessary to the accomplishment of a common goal. In peacetime this same mutuality of endeavor or interest must be established. Reason, which might be used to establish this community of interest, is often subordinated to prejudice and suspicion. It is these facts that often complicate understanding, but it is in consonance with these principles of human behavior that air operations must be planned and implemented.

Today we live in an age in which force has become the determining factor in international relations. Wars that once were considered a contest between professional groups and forces suddenly have completed the evolution to total war between civilizations. Air power has broken down cultural and national barriers and becomes increasingly important in everyday life. While air power is indivisible by peace or war, to identify the psychological impact of this technical revolution we have divided our subject into two parts: the impact of air power in warfare and its impact in times of peace. This arbitrary division should not be construed as making these psychological reactions mutually exclusive. The characteristics of one operation influence the other, and even the difference between peace and war has become almost academic in the current world crises.

Developing Techniques of Aerial Warfare

The introduction of air power into warfare during World War I was in itself a psychological as well as a physical factor in the waging of war. While the role of airplanes in those early days was primarily that of a reconnaissance platform and an incidental propaganda delivery agent, these uses did lead to the development of new tactics and strategy in exercising military forces to achieve political objectives. Aircraft extended the range of firepower, exposed key secrets and secured vital intelligence, and forced the development of mobility, dispersion, and camouflage in conventional forces. Even at the initiation of war, air power exposed to attack all of the resources of a nation that make war possible.

During World War II, the tactics which had been largely just ideas became established facts. Air power's efficacy as a weapon system was dramatically proven. During this period air attacks became not only the concern of military commanders but of the people as a whole. Aerial warfare created an attitude of hopelessness and defeat as community life was disrupted, as health and welfare organizations collapsed, and as essential utilities and key economic services were destroyed. Air power became identified as the *only* force that could attack and destroy *all* of the weapons of warfare—in the air, on land, or at sea. It could destroy the industrial resources that sustain an enemy's

war-making capacity. This flexibility of air power made it the dominant force in modern warfare.

As these tactics were refined, as aircraft increased their bomb loads and their range and speed, military strategists were developing the techniques to make aerial warfare a precision instrument of destruction. The concise formulation of objectives and the optimum employment of air power have made it one of the most rational and discriminate of military weapons. It is this development that has been largely unrecognized by the public. Haphazard, indiscriminate bombing is now recognized by military commanders as vandalism, extravagant of the most expensive resources of a nation and unprofitable in terms of the ultimate objective of war—peace. Aircraft are not employed to destroy a population but primarily to disarm a foe by destroying his industrial resources or his military forces in being. Killing is only incidental to the strategic purpose of air attack, not the objective. The claim that aerial warfare is inhuman and that the employment of atomic weapons is morally indefensible is without foundation in fact. With precise target selection and the instant ability to destroy the military, industrial, social, and psychological forces supporting war, aircraft and their atomic punch may well introduce a new humaneness into warfare—and a quick resolution of international conflicts. An emotional emphasis on the weapons of war should not distract us from the causes of war and should not be used to complicate the relations of military forces with the people they are designed to protect.

Analysis of Psychological Effects

At the conclusion of World War II a detailed survey was made in Germany and Japan to analyze the psychological effects of aerial attack. While no attempt was made to formulate definitive conclusions, the United States Strategic Bombing Survey did establish the general pattern of reaction. One significant conclusion was that the psychological effect of the atomic attack on Hiroshima and Nagasaki did not differ in any substantial way from those produced by other types of bombing. In general, the reaction to bombing attacks followed this pattern: (1) temporary loss of inhibitory control, actions seeking survival but not particularly antisocial actions; (2) fear, emotional excitement, trauma induced by casualties; (3) anxiety produced by grief and personal loss; (4) worry produced by disruption of normal community life; (5) fear of repetition of attack; (6) motivation (within twenty-four hours after evacuation) to return to search for relatives, friends, and possessions; (7) survivor guilt; (8) apathy and/or resignation acquiescent acceptance of the inevitable consequences of war.

The primary reaction of all individuals to air attack was *fear*. In the atomic attacks on Japan that fear rarely led to unqualified terror, but the sheer horror, destruction, and suffering witnessed and experienced by the survivors had, surprisingly, a second reaction of admiration for the power and technical skill that produced such an awesome weapon. A third reaction, anger, was exhibited by only a small percentage of the survivors, and most of this anger was directed toward the regime for their failure to provide adequate warning or protection against such a disaster, and was not directed against the attacker.

Beside the psychological effect of the moral and material losses caused by aerial bombing and the variance caused by time (night or day) and intensity of attack, there are certain ancillary results from such operations that have a psychological influence. Among these are the following:

1. The destruction provides the opportunity for criminal acts and impairs the moral code to make it easier to commit them.

2. Under aerial attack the conditions for a strict enforcement of economic controls deteriorate rapidly. Money becomes less important as barter for essential goods increases. Living quarters have an inflated value. The disruption decreases the supply of consumer goods, increasing competition and prices for them. Loss of water, lights, and other utilities creates new economic needs and disrupts the economy.

3. People become jealous and suspicious of those who have not suffered an equal loss or deprivation.

4. The disruption of the communication media accelerates rumors that radiate from the area of disaster. Starting from conjectures on the weapons or causes, facts are magnified into rumors concerning the blame for such an occurence.

5. The social displacement creates tensions and anxieties that are emphasized under aerial attack.

6. Discriminate attacks on war industries, communication centers, and symbols of the ruling power are generally accepted as the "natural consequences of war" and often involve a personal dissociation from the regime.

Psychological Warfare and Propaganda

The mechanism that manipulates the above reactions in time of war is generally described as "psychological warfare." Psychological warfare can be quite simply defined as a method of communicating ideas. In the broad sense it applies psychology to the conduct of international relations, and in the narrow sense it is the planned use of psychological strategy and tactics in support of military forces. The word "propaganda" is often confused with psychological warfare and is sometimes considered synonymous. Propaganda is actually only planned persuasion by the written or spoken word—leaflets, broadcasts, posters, pamphlets, and so forth. It is only one part of psychological warfare, which embraces also actions or things that can be utilized to communicate ideas. It is in this more encompassing context that the psychological impact of air power can make a substantial contribution to the achievement of our national objectives.

The program to gain our objectives must be a continuous operation, indivisible by either peace or war. It is waged before, during, and after a war. But it is not controlled by the laws, usages, and customs of war; and it cannot be defined in terms of stockpiles, order of battle, or named engagements. Success or failure is often known only months or years after the execution of the operation. Yet success, though incalculable, can be overwhelming; and failure, though often undetectable, can be mortal.

U. S. Objectives

Basically, the objectives of the United States that affect these psychological warfare activities can be stated as:

a) To maintain a government under God that ensures the basic freedoms, dignity, and responsibility of man;

b) To secure the peace and security of our citizens through the maintenance of our economic strength, political liberties, social philosophy, and our institutions, principles, and leaders;

c) To gain understanding and support for U. S. policies, ideology, and objectives by the people of the world.

Conversion

Conversion is one of the most effective techniques which nations can employ to achieve their political objectives. A people can be converted from one

belief to another if given the choice between conversion and loss of personal status, stubborn individuals being exposed, scorned, and rooted out. A change in belief can also be accomplished by the peaceful development of social consciousness and responsibility. But to effect an initial conversion, participation in the public ceremonies and formal language of a new faith is generally required. Sustained counterintelligence must remain alert against backsliders, but formal acceptance will become genuine if the new faith conforms to the natural instincts, desires, and needs of a people.

If immediate wholesale conversion should require military or political operations that were too extensive or severe, the same result could be secured more gradually by toleration of the objectionable faith combined with the issuance of genuine privileges to the new, preferred faith. The conquered people are left in the private, humble enjoyment of their old beliefs and folkways; but all participation in public life, whether political, cultural, or economic, is conditioned on acceptance of the new faith. In this manner all the uprising members of the society will in a few generations move over to the new faith in the process of becoming rich, powerful, or learned; what is left of the old faith will be gutter superstition, possessing neither power nor respect.

It is this contest to convert people to Communism or democracy that is being decided today. To assure a favorable outcome we must understand and utilize the psychological impact of air power. The international Communist conspiracy is seeking to achieve a conversion by force which they cannot win by reason. And they are backing up this force with a propaganda program that costs them almost one and a half billion dollars a year. This application of force and persuasion requires an equal utilization of the forces of the free world—military, political, economic, social, ideological, and psychological.

To its adherents, Communism generally offers prestige and opportunity. Communist propaganda has been quick to exploit any differences or dissension between the United States and the rest of the free world and has consistently and viciously attacked United States policies, principles, and activities. Communism purportedly offers to the "have-not" people of the world Western science and technology, a professed political democracy, popular education, freedom from familial or religious control, and other coveted aspects of Western culture. All this is wrapped up in an initial nationalism that is particularly attractive in many areas of the world. At the same time, the discontented and dispossessed of the world are offered membership in what the Communists describe as an inevitable and status-raising world revolution against the decadent aspects of Western civilization.

Lessons of Communist Propaganda

There are also a few lessons from Communist propaganda that deserve careful consideration in the formulation of our own psychological warfare operations. Communist propaganda is centrally planned and has long-range objectives. It is diversified in the channels through which it flows and is individually tailored to suit the audience to which it is addressed. It is unscrupulous in its methods and merciless in the exploitation of the weaknesses and shortcomings of its opponents. The themes of its propaganda may change—sometimes provocative, sometimes almost conciliatory—but the machinery, the operation does not. It has adopted and perverted the language of peace and aspiration. Communist propaganda is seasoned and professional, dependent on a powerful police state at home and on uneducated, underprivileged, or emotionally ill fanatics abroad, except for those few countries where Communism is so stable as to attract ambitious or practical men. And even in those countries, it relies on propaganda to prohibit dissent and control dissatisfaction.

Rules of Psychological Operation

Since most psychological operations, either Communist or democratic, are directed to the subtle niceties of thought by which people maintain their personal orientation and balance in an unstable, impersonal world, there is no substitute for common sense combined with detailed technical knowledge and accurate scientific information in planning or carrying out psychological operations. The propagandist must use the language of the mother, the schoolteacher, the lover, the bully, the policeman, the actor, the ecclesiastic, the buddy, the newspaperman. And propaganda analysis, in weighing and evaluating these persuasive actions or methods, must be even more discriminating in determining whether the propaganda is hitting its mark. The selection of approach or appeal to be addressed to a hostile or neutral people generally follows certain rules:

1. Psychological operations are a function of command.
2. Psychological warfare must avoid promises that may not be kept.
3. Propaganda must contain a simple, concise, objective statement of facts that appeal to the instinct, emotion, or reason of its target audience.
4. Almost all good propaganda is true. It uses truth selectively.
5. Propaganda must influence or persuade to some action.
6. Morale and the vulnerabilities of an enemy to our psychological operations are often identifiable through an analysis of the media of communication.
7. Basically people are interested in one thing—themselves. The most credible propaganda must be confined to simple, factual, and plainly honest statements on things affecting that individual. Pompousness, intricacy, and bad taste generally defeat their own purpose.
8. Propaganda is like news—it has to be timeless or brand new. In between, it has no value.

While the above is a compendium of the rules affecting psychological operations, it does indicate a few of the basic truths which may govern effectiveness. We cannot spout platitudes in a vacuum, nor permit our political and military operations and objectives to be maligned, distorted, and used against us. We cannot permit the natural aspirations of all people for peace to destroy the military power of the United States that prevents aggression. In time of war, air power must be utilized in consonance with the psychological reactions toward it, and our psychological operations should provide purpose to an individual's activity: control over the chaos of war and reason for personal sacrifice.

Air Power Is Peace Power

While the psychological impact of aerial attack and the techniques of psychological warfare are primarily the concern of military strategists, air power in time of peace has much broader implications to an almost universal audience. The combat capability of aircraft is multiplied in time of peace, by destroying the artificial barriers between nations, as an instrument for the peaceful development and prosperity of all nations. Represented by the theme "Air power is peace power," it demonstrates the unique capability of air power to serve humanity with its aircraft, air bases, facilities, and personnel.

AIR TRANSPORT

In the short span of three decades, commercial aviation has grown into a billion dollar business carrying more people overseas than ocean liners and increasing its volume of air freight over two hundred times since 1945. Air express, air freight, and air mail are now considered necessities for a modern, technological society—speeding communication as well as essential, critical, or perishable goods to every corner of the globe. But while this new mode of transportation has assisted economic development, it has also provided the machines, men, and skills necessary to political and psychological action.

In 1948, in an effort to remove Western influence, the Soviet Union imposed the blockade of Berlin. The Berlin airlift was one of the most dramatic examples of utilizing air power to wage a political and moral battle. It affirmed the determination of the Western nations to support Berlin as an island of freedom. It proved to the world our determination to resist aggression, to make no compromise of principle with Communist force and tyranny. The C-54's of the Military Air Transport Service (MATS) became symbols of United States friendship and support to a grateful German people. The airlift demonstrated the swift capability of air power to support a great city logistically. It reaffirmed to our Western allies that the U. S. was willing to commit its military forces in peacetime to support the free people of the world.

Another example of air power's ability to satisfy a spiritual need and serve a political objective was the Mecca airlift of September 1952. Muslim pilgrims were stranded at Beirut, Lebanon, while making a pilgrimage to their holy city of Mecca. The "infidel" United States that had often been the whipping boy for the nationalistic angers of Muslim leaders became a hero. Upon the recommendation of Mr. Harold B. Minor, United States Minister in Lebanon, thirteen C-54's of the United States government provided a magic carpet for the pilgrims. A total of 3,763 Muslims became friends of the United States, as pilgrims from Turkey, Syria, Iraq, Iran, and North Africa gained a personal experience with which to counter Communist slander.

GOOD WILL

While we emphasize air power as a deterrent to aggression, and the chief weapons system for defense and attack, beneath this shield it has significantly contributed to the free flow of information in the world. And with this swift communication has been established a basis for mutual understanding and respect. Via the boundless airways, American tourists have immediate access to the remotest corners of the world; foreigners, often only vaguely understood, become people of diverse nationalities and races, known in person. One of the most significant employments of aircraft for this purpose was the good-will tour of Latin America, January–February 1954, conducted by the United States Air Force.

This "Wings for the America's" tour by fifteen jet fighters and five supporting aircraft visited eleven countries. In the initial press release announcing the tour, Air Force Secretary Harold E. Talbott stated:

> Latin American countries have an abiding interest in problems of hemispheric defense and they have informed us of their desire to view some of the aircraft which the United States has produced to meet the threat of aggression in the hemisphere and in other parts of the free world.

But far beyond his expectations for this demonstration of United States air power was the enthusiasm exhibited by the hundreds of thousands of people who were given their first opportunity to see jet aircraft and the huge air transports of the United States. A technological development had captured the imagination of the youth of Latin America. With almost unprecedented enthusiasm, Mexicans threw their hats and coats in front of the taxiing jets; Peruvians and Chileans waved their handkerchiefs by the tens of thousands; Argentineans carried the pilots on their shoulders, and President Perón embraced and personally escorted their Commander; Nicaragua renamed its new airport at Managua and issued a series of postage stamps honoring one of the fliers. United States airmen were everywhere mobbed by autograph seekers. Far more than an exhibit of jet acrobatics and aircraft, it was a dramatic and effective operation showing United States partnership with Latin America in defense and technology. It indicated new horizons for the economic development and unity of the Americas.

RESCUE AND DISASTER RELIEF

Aircraft have also played an increasingly important role in international disaster relief and rescue. Their ability to surmount physical barriers, particularly with the development of the helicopter, has been proven over and over again. The gratitude and affection with which these activities have been received are creating a new attitude; the psychological impact of air power has a new warmth and depth.

The North Sea floods that inundated areas of Great Britain and Holland in 1953 graphically demonstrated the application of air power to humanitarian purposes. In a world in which air piracy and international banditry are common Communist practices, the United States Air Force's participation in this disaster relief was a convincing affirmation of our principles. In 1954, the Far East Air Forces evacuated about a thousand indigenous people for medical relief, airlifted medical personnel and supplies to Pakistan, and provided an emergency facility to every country in the area. The Caribbean Air Command flew seventy-nine missions for rescue, search, evacuation, and other purposes of mercy. Our Air Rescue Service rescued and airlifted foreign nationals within minutes after an avalanche in the Austrian Alps and from floods in Panama, Costa Rica, Guatemala, Haiti, and Honduras. An Eskimo was evacuated to a hospital in Labrador; 1,440 underprivileged West Berlin children were airlifted for a summer vacation in West Germany. The psychological significance of these acts cannot be measured in terms of people and property saved, but in the ever increasing dependence on air power as a friend.

PUBLIC SERVICE

There is another aspect of air power which usually makes no headlines but which is securely integrating itself into our way of life. Aircraft are now used in agriculture to seed, to exterminate insects, to seed rain clouds, to provide meteorological services, and to ensure the marketability of produce. They are used by our national forest service for fire surveillance and fire fighting. Aircraft are often the quickest, easiest, and most accurate means for mapping and exploration. All of these activities are contributing to the restructuration of societies by eliminating isolation, by developing backward areas, reducing urban concentrations, increasing productivity, and creating a freer, richer life. The psychological impact of this development can be measured only by future scholars, but it has created a new perception of unlimited markets, uses, and opportunities. Air power has reduced the psychological distances between individuals, peoples, and cultures, and minimized the significance

of national and geographical frontiers. While this is perhaps a mixed blessing, ignorance sometimes being construed as bliss, it seems better to face the frictions of living together than to retreat to the ignorance and suspicion that have bred so many wars in our past.

LONG-RANGE TECHNIQUES

While air power has emerged as the most powerful instrument of war, it is also being identified as the most effective tool to achieve our long-range objectives of peace and security. The only limits to its employment are the barriers of poverty and the artificial barriers of suspicion and fear. In the future we should look forward to a closer co-operation between nations—with realistic and not arbitrary regulations on the use of air space, with a new era of international co-operation in commerce. The psychological impact of aircraft has provided us with a new source of power to achieve these long-range objectives.

To utilize air power in this rather unconventional manner requires an increasing emphasis on sociological and psychological research. The industrial and technological facts of the world must become meaningful to all people. Nuclear weapons must be assimilated into our social environment and be understood and accepted. A new scale should be devised for evaluating public opinion, appeals, and responses. Social and anthropological research is needed to identify the goals of a society and to identify values and practices that can produce or destroy empathy between peoples. We need research to identify the dynamic forces within an individual and within a society which have formed and which are continuously modifying the determinants of human behavior. Data is needed on the ways and means that can be utilized to change the individual's perception of that environment. Psychological antipathies between nations and individuals must be catalogued. The art forms, symbolism, printing type faces, composition, color preferences and prejudices, and all the other myriad techniques and means that persuade people to action must be analyzed, documented, and then simply and concisely stated.

Some of these problems are now being met by research sponsored by governmental agencies and services in order to carry out their mission. Other research data have often been effectively utilized to support governmental programs. It is generally recognized that our knowledge and understanding of the world must keep pace with our international commitments. The recent London agreement, the Southeast Asia Collective Defense Treaty, and our alliance with Nationalist China further emphasize our interest in and knowledge of world affairs. It is to the task of making these agreements effective that so much of the resources of our nation are consigned, and it is upon the co-operation of science with government that our national and personal survival depends. As the President of the United States recently stated, our objective is ". . . to find the way by which the miraculous inventiveness of man shall not be dedicated to his death, but consecrated to his life."

Lewis S. Thompson, Washington, D. C., is Deputy for Mutual Security Assistance Affairs in the United States Air Force. Previously he served as president of Research Associates, Inc., was associate director of the Eisenhower-Nixon Research Service, and in the Central Intelligence Agency. During the war he was in the Office of Production Management as a dollar-a-year man and went to London in 1943 as executive officer for the Mission for Economic Affairs and representative of the United States on the Combined Production and Resources Board.

Obstacles to the Development of American Air Power

By W. BARTON LEACH

"AIR power is the dominant factor in modern war"—this is the common currency of strategic discussion. But in this second decade of the atomic age, five years after the first Soviet nuclear explosion, the theoretical dominance of air power has not been realized in American force in being. It is well that we should examine the political, economic, professional, and administrative pressures that have repeatedly reduced and delayed the realization.

Actually the above quotation is incomplete. In its usual form there is an additional word: *but*. The *but* may appear in the same sentence, the following paragraph, three pages later, or next week's press conference. Yet appear it will. "Air power is the dominant factor in modern war . . . ***but*** we also need a navy second to none and an army adequate to fight all kinds of war, large and small; . . . *but* since there is no single year of crisis we must build in an orderly way for the long haul; . . . *but* the aircraft we buy must be the ones we need, not those that will be obsolete before we get them; . . . *but* in building our military power we must not undermine our economy and thus allow Communism to achieve its greatest triumph without firing a shot; . . . *but*, and so forth.

These *but* clauses are always unimpeachable verities. And each in its own way is a factor retarding the growth of national air power. Thus far the *but* clauses have had far too much success. Land power and sea power, at least since 1951, have had forces in being at the levels approved as the nation's strategic need. *This has never been true of air power since V-J Day.* Instead the country has been assured that "new emphasis is being placed on air power" and "our air power is greater than ever before in peacetime history." But the standard of evaluation must be the strategic requirement of the present, not the gross inadequacies of the past.

A QUESTION OF DEFINITION

In this article United States air power is defined as the United States Air Force—not because of its name or any theoretical concept that air power must be unitary but because of the military tasks that have been assigned to the Air Force, that it is organized and prepared (given the means) to perform, and that will not be performed at any significant level of effort except by the USAF. To avoid oversimplification some discussion of this definition now follows.

Broader terms have recently come into fashion in defining air power. National air power, it is said, is not only the Air Force but also the air elements of the Army, Navy, Marines, and Coast Guard, our civilian airlines, and our incomparable aircraft industry.

Such a definition can be of some occasional use in pointing out the multiple uses of the air space in modern war. But it blurs the focus and can lead the unthinking to equate the organizations listed in the definition and conclude that a deficiency in the Air Force is cured by abundance elsewhere. It offers an anodyne for the agony of decision—the hard task of putting first things first, second things determinedly second, and third things out the window. It lets one say, "Of course, we all agree

that air power is the dominant factor in modern war. But all these things are air power. So we can give something to everybody—they are all so sincere and persuasive—and let each build air power in his own way." This is surely the pathway to self-delusion, perhaps to disaster.

If we are to surmount the perils that face us we would be well advised to sharpen the focus of our definition as follows: United States air power is military air power in being to (1) deliver massive attack upon any enemy anywhere as ordered, (2) defend the United States against enemy air attack, (3) provide tactical air power, the air component of the ground-air fighting team, and (4) provide global airlift of men and matériel for all military purposes.

These four military tasks are primary missions of the United States Air Force. With regard to each of them certain plus values may be contributed by others, but it is well that these should be precisely understood to avoid false inferences that if the Air Force is not given the means to do these jobs someone else will do them.

Massive attack

The massive attack capability—the deterrent to big war and a major war-winning factor if big war comes—is the job of Strategic Air Command. This does not mean that SAC hugs a monopoly to its bosom. It does mean that no other military force has the capability of delivering massive attack at the required level of intensity and continuity. Further, no other military force has indicated any willingness to accept firm responsibility for any defined part of the job. This appears to include carrier-based aircraft, which must be considered a plus value available fortuitously if at all.[1]

Air defense

The air defense of the United States is the job of Air Defense Command in so far as fighter aircraft and early warning systems on land are concerned. The Army contributes antiaircraft fire, especially ground-to-air missiles such as Nike. The Navy contributes seaward extensions of the radar early warning lines. Possible contributions of fighter aircraft by the Navy and Marines must be considered indeterminate plus values, unlikely to materialize owing to the necessity of building an air defense system around firm commitments, assigned responsibilities, and integrated training. If ADC does not have the means to provide fighter defense of the United States, this country has no fighter defense.

Tactical air support

Tactical air support of ground troops —protection against enemy air attack, interruption of the flow of enemy supply and reinforcement, attack upon battlefield targets—is in a somewhat different category. Basically it is the job of Tactical Air Command and the overseas tactical air forces. But the three Marine Air Wings (equivalent in total to about nine TAC wings) do much the same kind of job, tending to specialize in attacks upon battlefield targets. Marine Air and TAC units are usable together, the presence of the former reducing plane-for-plane the requirement for the latter, as in Korea. In some circumstances—notably, as in Korea, where the battlefield is near a coastline and the enemy does not employ submarines and attack aircraft—carrier-based aircraft may fill a need for tactical air forces. But this plus value is limited in quantity and, more important, in continuity. Nothing approaching a plane-for-plane reduction in land-based air requirement is produced by the carriers; under the best circumstances the air complement of a carrier replaces less than half its number of land-based aircraft (Marine or USAF). Field Marshal Montgomery has made it clear that tactical use of carrier-based aircraft has no significant part in North Atlantic Treaty Organization plans.[2]

Air logistics

The air logistics mission is basically the job of Military Air Transport Service (a joint command operating USAF and USN aircraft, the former in much greater quantity than the latter) and the troop-carrier units of TAC. There are supplementary sources of airlift, notably the Fleet Logistic Air Wings, the civilian airlines, and private transport aircraft. However, it is well to note that in a general crisis—as contrasted with such local crises as the Berlin blockade and the Korean War—there will be multiple demands for airlift, and a transport unit that is itself overtaxed will not have resources to send to the aid of its equally overtaxed neighbor.

Summary of USAF responsibility

To summarize: As to massive attack capability and continental air defense against enemy attack, American air power is for practical purposes synonymous with the United States Air Force. As to tactical support of United States ground troops American air power is synonymous with the United States Air Force to about the same degree that American land power is synonymous with the United States Army—the Marines add air wings and divisions to each. On each of these three missions carrier-based aircraft may provide plus

[1] Thomas K. Finletter, *Power and Policy* (New York: Harcourt, Brace & Co., 1954), pp. 203–5, 224. Mr. Finletter, former Secretary of the Air Force, is an unimpeachable witness as to what decisions have and have not been made. He states (p. 203), "Now the point . . . is not that a wrong decision has been made as to the respective roles of the Air Force's land-based planes and the Navy's carrier-based aircraft, but that no decision at all has been made." It is a matter of common knowledge that the word has been passed in the Pentagon that there are to be no "interservice squabbles" and this is construed as forbidding a member of one service to express doubts as to the capabilities of weapons of another service. Mr. Finletter himself apparently felt that under this rule even the mild statement above quoted could not be made while he still held public office. In this country neither the Congress nor the public gets the benefit of the informed conflicts of opinion that are considered essential to sound decision in other aspects of national life; and Mr. Finletter's guarded statement suggests that a similar suppression of productive controversy governs the secret councils of the Pentagon. Almost certainly the suppression of Navy doubts as to atomic bombardment as a strategy and the B-36 as a weapon was responsible for the so-called "Revolt of the Admirals" in 1949, a matter in which the present writer believes that the Navy personnel were fully justified in placing their views before the public. See *The National Defense Program—Unification and Strategy,* Hearings before House Armed Services Committee, Eighty-first Congress, First Session (October 6–21, 1949). No such gag rule applies in England. See Field Marshal The Viscount Montgomery of Alamein, "A Look Through the Window at World War III," *Royal United Services Institution Journal,* Vol. 99 (November 1954), pp. 512–13; Marshal of the Royal Air Force Sir John C. Slessor, *Strategy for the West* (New York: William Morrow & Co., 1954), pp. 95–104.

[2] Lecture before the Royal United Services Institution, October 26, 1954, reported in *Royal United Services Institution Journal,* Vol. 99 (Nov. 1954), p. 507. It is inconceivable that this lecture could have been given without the concurrence of the Field Marshal's superior, General Alfred M. Gruenther, Supreme Allied Commander Europe.

In a land action such as that of the Korean War why should not the attack aircraft of the carriers be land based, thus eliminating the heavy requirement for air defense and antisubmarine defense of the carriers? If such action were taken the Navy could provide a plane-for-plane reduction of USAF-Marine tactical air requirement. But this question seems not to have been asked, much less answered. It is possible that both the Navy and the Air Force, for different reasons, would frown upon this suggestion.

values when the fighting starts, but do not reduce by as much as a single wing the USAF requirement. As to military airlift the picture is more complex, but the USAF must carry the major burden.

Thus, obstacles to the growth of the United States Air Force are obstacles to the growth of American air power in a straight-line relationship. Put it this way: If obstacles to the development of the United States Air Force are removed, the nation will have the air power it needs. Otherwise not.

DEVELOPMENT OF USAF BEFORE AND AFTER 1951

Prior to 1951 the national need in air power had never been determined, much less programed, by the Department of Defense. The Finletter Commission and the Brewster-Hinshaw Committee, reporting respectively to the President and Congress, had stated a *peacetime* requirement of seventy wings as of 1948. But the Joint Chiefs of Staff had annually been restricted to the exercise of dividing among their services a progressively reduced total defense budget—15 billion dollars, then 14, 13, and 12. This, in the days of Secretary of Defense Louis Johnson, was known as "cutting fat without cutting muscle." It is useless to bemoan the inadequacy of the resulting forces and the invitation to trouble they presented; the Korean War is its own best witness. But it is worth while to point out the folly of starting with a dollar sign and restricting our military professionals to the job of dividing the pot. This could happen again,[3] and it could have the same result.

[3] ". . . a balanced or reduced budget—long a goal of the present Administration—is a very major factor in the 'New Look.' Secretary of the Treasury George Humphrey probably had more to do with service force levels than did the Joint Chiefs of Staff." Hanson W. Baldwin, *The New York Times*, February 6, 1955.

In 1950–51 this country was apprehensive, and rightly so. In September 1949 we detected the first nuclear explosion in the Soviet Union. And in June 1950 the Korean War showed us what happens when we drop our guard. So, for the first time since V-J Day, the Chiefs of Staff were directed to state what forces the country needed—all forces, land, sea, and air. The process was started in January 1950 and completed in a National Security Council decision on October 1, 1951. The agreed and approved requirement was 21 divisions for the Army, 409 major combat ships for the Navy, 3 divisions and 3 air wings for the Marines, and—here mark well—143 wings for the Air Force to be achieved by June 30, 1954, and to be manned by 1,200,000 military personnel. These forces represented relatively small percentage increases for the Army, Navy, and Marines, but more than a doubling of the Air Force. For the first time military and civilian planners, accorded full opportunity to state the military need, had given real substance to the precept that "Air power is the dominant factor in modern war."

As all know, 143 wings never materialized and 1954 disappeared as a target date. The hard facts of the fiscal year 1953 budget produced a stretch-out to 1955. Then in the "Truman" budget for FY 1954 another stretch-out to 1956 was programed. The "Eisenhower" budget for FY 1954—the only one that really counted for that year—cut 5 billion dollars out of the Air Force, adopted an "interim" 120-wing program, and left the whole thing to a re-examination by the new Chiefs of Staff, all of whom were to be changed in the summer of 1953. The new Chiefs, operating with a problematical freedom of action, found that security airwise could be attained with 137 wings to be achieved by 1957 and to be manned by

975,000 military personnel.[4] The manpower figures are striking: someone discovered that with "better utilization of manpower" the Air Force could get:

in 1955	120 wings	with 970,000 men
in 1956	127 wings	with 975,000 men
in 1957	137 wings	with 975,000 men (*sic*).

That is where matters stand today. What happens now will depend upon how insuperable the obstacles, herein described, prove to be.

THE OBSTACLES

Obstacle One: The Air Force is in process of growth, having never achieved its planned strength. When a policy maker wants to reduce total Defense money and manpower—and this is a constant state of mind—it is far easier to cut back planned future force than to disband existing military units, scrap existing weapons, and discharge personnel already on the job. The fact that the planned future force is indispensable and the existing present force dispensable is not always a sufficient reason for building the former at the expense of the latter. The reluctance of Secretaries of Defense to accept split papers from the Joint Chiefs of Staff and to insist on JCS "agreement" loads the dice in favor of the status quo; if unanimity for change is unobtainable the situation tends to remain unchanged—existing forces stay; new forces are reduced, delayed, or both.

Obstacle Two: Air Power is expensive. Aircraft cost a lot and become obsolete fast. Take for example the B-36, the ten-engine intercontinental bomber. It cost 3 to 5 million dollars a copy, and it will probably pass into the junk pile before it ever sees action. Many find it difficult really to accept the principle that the B-36 has performed its mission—and can only perform its mission—if it never has to drop a bomb. Sir Winston Churchill can say, "It is certain that Europe would have been communized and London under bombardment some time ago but for the deterrent of the atomic bomb in the hands of the United States." But this concept of an international revolver-in-the-cop's-holster is elusive. A battleship or a carrier is different. You can see it, even visit it on the Fourth of July. A division is different too; it marches—with guns. But a B-36 flies above visual observation, nobody is permitted to board it, and its crew is unimpressive in a parade.

Obstacle Three: Air power is the victim of a cultural lag. The end of the last paragraph could be the beginning of this, for they are related. Anyone will find ways to afford expensive things if he understands them well enough to be convinced of the need. Men now of mature age were boys when military force meant soldiers and sailors, ships and guns; these early impressions leave their mark—"the anachronistic power of saber and broadside."[5] Few have ever operated an aircraft; fewer still have flown in combat. Fortunately at the time but with unfortunate consequences now, Americans have never had the experience of living or fighting un-

[4] Quantity of air power is usually stated in numbers of wings, but this can be delusive unless other factors are taken into account. Principal among these are personnel, appropriations, and base structure. A reduction from 143 wings to 137 is a matter of 4 per cent; but if, concurrently, planned military personnel are reduced from 1,200,000 to 975,000 (19 per cent), the annual rate of appropriations is reduced from about 16 billion dollars to about 12 billion (25 per cent), and if a plan for dispersal over a larger number of bases is discarded, the reduction in national air power is much greater than 4 per cent. Managerial improvements may occasionally reduce manpower and money without reduction in strength; but experience suggests that such harmless reductions are likely to be in very small percentage figures.

[5] W. W. Haines, *Command Decision* (Boston: Little, Brown & Co., 1947), p. 109.

der skies controlled by an enemy. In the Great Debate of 1951, the subject was *"troops* to Europe." Discussions of rearming Germany deal with "twelve *divisions."* If air power is mentioned at all in these contexts it is in the second or third paragraph, and perhaps between parentheses. This is not ignorance; when reminded, all acknowledge that we must have air power—too. Rather it is a lack of instinctive understanding, that quality of the recesses of the mind that goes deeper than knowledge. Why does this lack of understanding persist? That leads to . . .

Obstacle Four: The military commentators were brought up in the older services. Compile a list of writers and broadcasters on military affairs arranged in the order of their influence on national thinking. Then see how far down the list comes the first who can wear silver wings on his chest. Wings on the chest are not requisite to a realistic belief in air power; both in this country and in England some of the firmest supporters of the Air Force have never flown a plane, and this includes some writers of national reputation. But too often the military writer, long familiar with the problems and command personnel of the older services, speaks in understanding, vivid terms of big ships and infantry tactics, reserving the *but* clauses and the confidence-sapping doubts for air operations.

Some readers of this article may be surprised that the present writer voices dissatisfaction with the development of United States air power. Readers of the daily press could easily get the impression that current policies lavishly nourish the Air Force while starving the other services. Some military critics feel a poignant sympathy for the "squeeze" upon the Army, Navy, and Marines produced by lowered budgets and manpower levels. But as to the Air Force they tend to focus on the single fact that Air Force manpower and money are programed at slightly increasing figures, ignoring the "squeeze" implicit in a directive to increase wing strength from 120 to 137 (14 per cent) with a manpower increase from 970,000 to 975,000 (one half of 1 per cent). All forces are squeezed by current policies—the surface forces by being directed to operate existing (or slightly lower) forces with men and money lower than existing levels, the Air Force by being directed to operate much larger forces with men and money increased only slightly. If a military writer recognizes the squeeze in the former case and not in the latter, his readers (who may well include key members of Congress) are to that extent given an unbalanced analysis.

Obstacle Five: The Air Force lacks representation in the Office of the Secretary of Defense. The key civilians in OSD are the Secretary, Deputy Secretary, and nine Assistant Secretaries. None of the men now holding these positions has any Air Force background —and this has been true, with a single exception, since the first Secretary of Defense took office in 1947. The Army is only a little better off. Men with an orientation toward the Navy have consistently held most of the important posts, a legacy from the days when Secretary of Defense Forrestal simply imported his staff from the Navy Department. The all-important office of the Comptroller of the Department of Defense is essentially a Navy office containing no responsible personnel with Air Force background. These civilian officials are not prejudiced against the Air Force, nor are they unwilling to learn. But an instinctive understanding of Air Force problems is not in their blood; they do not naturally seek the association of Air Force people; and when the chips are down it too often happens that the Air Force gets the short end of those very important decisions that are controlled by the staff of the Secretary of Defense. Attention has been repeatedly called to this imbalance of personnel, but appointments continue to be made which perpetuate it.

The single exception above referred to was Robert A. Lovett, Deputy Secretary, then Secretary of Defense from late 1950 to January 1953. Mr. Lovett, a naval aviator in World War I, served as Assistant Secretary of War for Air in World War II. It was during his regime in the Department of Defense that the 143-wing Air Force was authorized and the precept of equal division of money between the services temporarily discarded. But Mr. Lovett had not been out of office three months before the Office of the Secretary of Defense had shelved the 143-wing Air Force and cut 5 billion dollars from the Air Force share in the FY 1954 budget —all without consulting the Joint Chiefs of Staff, the statutory "principal military advisers" of the President, the National Security Council, and the Secretary of Defense. It is unlikely that this could have happened if men with Air Force background had been included in OSD personnel, particularly in the Comptroller's office.

For the most part OSD has been staffed with able men. But ability is not enough. A Supreme Court comprising the nine ablest lawyers in the country would not be acceptable if it turned out that all nine came from the Wall Street firms. Nor can any President choose a Cabinet without reference to geographical distribution and diversification of career background. Those who are led, governed, or judged must have confidence that all aspects of a matter under decision are understood and objectively evaluated.

Obstacle Six: The Congressional relations of the Air Force are inferior to those of the other services. In Great Britain the military services have no such relationships with Parliament as are commonplace between United States services and the Congress, and as an abstract proposition much can be said for the British practice. However, any such reduction of military-legislative contacts must take place across the board. If the Corps of Engineers, the Marines, the Reserve Officers Association, and the Navy have the number of watchful supporters in Congress they now enjoy, another service lacking such supporters will surely not be treated as "the dominant factor in modern war." The record of the Air Force in this matter is spotty. There have been periods when staunch support came from both parties in both Houses of Congress—for example, when in 1951 a greatly expanded Air Force was jointly sponsored by Senator Henry Cabot Lodge, Jr. and Representative Carl Vinson. There have been other periods, notably in the budget proceedings of early 1953, when Air Force support came from a few Democrats alone. More than a score of Air Force veterans were then in Congress; yet during this 1953 episode when General Vandenberg was subjected to a bullyragging never before inflicted upon a senior general officer and when 5 billion dollars were being cut out of the Air Force budget, no Republican veteran of the Air Force came to its support and some delivered denunciatory speeches on the floor. At the present time any observer of the Hill can identify Democrats who, with a firm understanding of air power, have backed the Air Force against all comers including a Democratic President and Secretary of Defense. But among the Republicans it is difficult to find those who can be counted Air Force supporters in the same sense that a dozen in the House of Representatives and a half dozen in the Senate can be counted Navy-Marine supporters.

Obstacle Seven: The Air Force is really the silent service. Its senior commanders do not write books and articles. As to the war in Europe there are books by Eisenhower, Bradley, Montgomery, Patton, and a host of junior commanders, but none by Spaatz, Doolittle, Vandenberg, Eaker, Twining, Norstad, Weyland, Anderson, or Quesada—and as a result, ten years after, several of these names are not even remembered by the public. No Air Force officer has recounted the strategic bombing effort that brought Japan to its knees—the first time in history when air power was a principal factor in causing a nation to surrender before its homeland was invaded and while its armed forces were intact. The same pattern appeared in the Korean War—some ten books about the Army, five about the Navy, four about the Marines, and one about a single squadron of the Royal Australian Air Force. But not one book about the United States Air Force. Those responsible for the development of national air power have not made use of the basic instrumentalities of information and enlightenment to get the public behind them.[6]

Obstacle Eight: The Air Force has been the most serious victim of stop-and-start planning. Air Force wings have been successively programed at 66, 55, 48, 42, 95, 143, 120, and 137—all in a period of about six years. No business in the world could operate under these conditions, nor can any government department. Dislocations are frequent, and when they appear, those who have been responsible for the forced reprograming often take the lead in criticizing the Air Force for the difficulties caused by the reprograming itself. Base construction has first been held up and then ordered forward on a crash basis. Everyone knows that money and time cannot be saved concurrently. Yet when the waste appears, the flood of criticism breaks forth. Sooner or later someone says, "If the Air Force can't use money any better than this, then we should cut their appropriations"—as if the money were going to the generals for their personal use.

Obstacle Nine: The Air Force appears reluctant to state its full case. The overriding national priority of the air-atomic power of Strategic Air Command has survived for a long time as these things go. But it has been under steady attack, and the integrity of SAC has not always been assured. Under these conditions the Air Force is understandably hesitant to make claims for additional force that might have to be satisfied out of SAC planes, money, and men. Let us suppose for the moment that, as serious commentators have suggested, the difference between adequate and less-than-adequate strength in the Continental Air Defense Command represents an additional 3 billion dollars a year for five years. The Air Force in deciding whether to request such a sum must ask itself where the money will come from. Certainly not from an addition to the total Defense budget; Secretary of the Treasury Humphrey is much too influential to permit any such dislocation of plans for a balanced budget and a 1956 reduction in taxes.

[6] That credit may be given where due, it is noted that the following Air Force generals published World War II memoirs: H. H. Arnold, George C. Kenney, Lewis H. Brereton, and Claire L. Chennault. However, no Air Force general has produced a volume on the principles of air power or on global strategy. Compare Marshal of the Royal Air Force The Lord Tedder, *Air Power in War* (London: Hodder & Stoughton, 1947); Marshal of the Royal Air Force Sir John C. Slessor, *Strategy for the West* (New York: William Morrow & Co., 1954). The excellent articles in *Newsweek* written by General Carl A. Spaatz since his retirement have the advantage of being current and the disadvantage of being fragmentary.

Certainly not from the Navy, which is much too firmly entrenched in positions of power in the Department of Defense. How about the Army? The Army has already been programed for a cut of some 300,000 men; and serious resistance in Congress and in the press has appeared. A further Army cut would not seem likely. So it appears that the funds would have to come from the Air Force. A cut in Tactical Air Command would be resisted by the Army, which could logically point out that a smaller army will need greater supporting air power to make up for its own reduced firepower. So, by a process of elimination, one suspects that the cut would come out of Strategic Air Command. Still fresh is the memory of that episode in 1948–49 when the Air Force, having performed the incredible feat of airlifting all supplies for Berlin through an entire winter, was congratulated—and told to pay most of the bill out of its own pocket. Some of that money came from SAC, and the same thing could happen again if big additional investment was required in Continental Air Defense Command. Strategic Air Command is no "mania of the bomber generals"; but SAC's ability to fight—and deter—is their responsibility, and they cannot look with indifference on a threat to its integrity.

OBSTACLES AND LEADERSHIP

Obstacles are things to be overcome, or to be proffered as excuses.

The obstacles here listed pose problems of leadership—some at the national level to be met by the President and Congress, some at Departmental level to be met by the Secretary of Defense, and some at Air Force level to be met by its civilian and military leaders. All of them put heavy demands upon determination and courage. Persuasive reasons for inaction or delay sprout in every file cabinet and blossom in every staff conference.

But air power is an instrumentality to be entrusted to men of war-leader stature with a wartime sense of responsibility and urgency. Under these conditions each of these obstacles, and all of them together, can be overcome.

W. Barton Leach, LL.B., Cambridge, Massachusetts, is a professor at the Harvard Law School and the Harvard Graduate School of Public Administration. Having served in the Army Air Forces as Chief of the Operations Analysis Division, he now holds a commission as Brigadier General, United States Air Force Reserve. He was a member of the War Department task force that presented the case for unification of the services in 1945–47 and was director-co-ordinator of the Air Force presentations in the "B-36 Hearings" of 1949. In collaboration with Harvard colleagues he now conducts a graduate seminar in Defense Policy and Administration in the United States. He has published numerous books and articles on his legal specialties in Property Law.

Air Power and Foreign Policy, Especially in the Far East

By Thomas K. Finletter

OVERNIGHT, on August 6, 1945, atomic weapons joined air power in a team of destructiveness which was to revolutionize the world position of the United States. Until this dreadful partnership came into being the United States could not be directly attacked by an enemy. After it came into being a direct attack of the most serious kind on the United States homeland became possible.

A foreign policy based on the military premise that no enemy can attack the United States homeland—and such was the pre-1945 premise—is one thing. A situation in which we must face the fact that Russia and China are now able, or soon will be, to deliver a most violent blow to the United States, and even to defeat us in war if we are not properly prepared militarily and politically, calls for quite another set of foreign policies. We are in the process of creating these policies. United States military power, and particularly its air power, will play a leading part in the final product.

Air power thus has heavy responsibilities; but it also has its limits. Air power brought this new set of problems to the United States; it is for air power to do what it can to solve them. And it can do much. But air power must not pretend to be able to do more than in fact it can, and it must not allow others to say it can do that which in truth it cannot.

In one part of the world, the Atlantic area, these responsibilities and limits are well defined. There the problem is simple and dangerous. It is to sustain and strengthen the political cohesion of the Atlantic community which the Communists are trying so hard to break. It is to defend this community militarily by presenting to the Russians a solid politico-military front which they cannot break through. By far the most important element in the military part of this front is the complex of forces whose purpose is to nullify the Russian air-atomic power, that is, to make the Russians realize that it would be a grave mistake for them to start a general war or allow one to start. Air power is the core of this military complex.

The responsibility of air power in this role is enormous. We can build an air power capable of meeting it. We can have an air power which will make any intelligent government, and the Russian government is intelligent, reach the conclusion that at all cost general war with the United States and its North Atlantic Treaty Organization allies must be avoided.

We are lagging in building this air power. Very largely because we have been living in a time of United States monopoly or overwhelming superiority in atomic weapons and the aircraft to deliver them, and have not yet made our plans on the premise of the tremendous and highly dangerous air-atomic power the Russians will have in a year or so, we are continuing to load our military establishment with weakening compromises. As a result our air power is at too low a standard. But I shall not discuss the planning failure in this article, which is concerned with the political problems in which air power is involved rather than with the details of the power itself.

NATO—Political Solidarity and Air Power

Air power is one of the two indispensable actors on the NATO stage. If the NATO community fails to hold together politically, it will be Balkanized, and the United States will be backed into an enclave in a disordered and largely Communist world, and strains which may prove unbearable will be put on our American system of freedom as we busy ourselves getting ready to shoot it out with our backs to the wall.

The other actor on the NATO stage also is indispensable. It will do little good to have political solidarity in the NATO community if we fail to build an air power so overwhelmingly defended and capable of such an overwhelming counterattack that the Russians will not dare attack it or those whom it defends. Imagine what the Russians and the Chinese might do if their military experts were in a position to say to them that the Russians could knock out enough of our air power to make it possible for the Russian state to bear the resultant counterattack. The political position of the United States and the solidarity of the NATO community could not survive such a collapse in United States military power in the decisive weapon.

Western Powers and Asia

When we leave the NATO area we find a radically different set of conditions and therefore the need for radically different policies. The problems of the West in Europe are dangerous (because Russia has atomic weapons) but, in the broad line of the policies immediately required, simple. In the non-NATO area, the issues, as long as they involve only China, are not directly dangerous (China has no atom bombs of her own) but are of the utmost complexity and difficulty.

Thus in the area of NATO, as we have said, the political solidarity of the countries defending themselves and their homelands against Russia is vital. But, in the long line of contact between the free world and Communism outside the NATO territory there is little solidarity between the Western states and the indigenous peoples to lose. There may be friendship or respect or both, in some cases, but there is no common agreement among the peoples of the East and the Western powers to stand together against Communism, as the NATO countries have done in the Atlantic area. Indeed there are certain fundamentals which make very difficult, indeed almost abnormal, such a common front between the peoples of Asia and those of the West. It is the reverse of the condition in NATO, where a common society and a common tradition of long standing make it normal for European countries and the United States to stand together in the face of a threat from outside their own society. We of the West, who often do not understand this, are baffled when the Eastern peoples do not welcome us as brothers in a common fight against the Communist menace.

It is not just because East and West are of different societies and different races that it is hard for them to work together. It is also because until recently, and to some extent still, the West has been using its superiority in firearms to extend Western influence in Asia. The resulting bitterness makes it almost impossible to achieve a solid front of Asian peoples and Western powers, even when the purpose of such a front would be not at all to extend or perpetuate Western influence in Asia but to help the Asian peoples defend themselves from the new colonialism coming down upon them from China and Russia.

Note that it was this superiority in

weapons which made Western colonialism possible. Colonialism is one form of the imposition of the will of one political unit on the people of another. It is a form of conquest and is therefore based on military superiority. A colonial conquest is usually achieved without large-scale wars because colonialism assumes a high order of weapons superiority in the colonizing power. It is necessary to understand this fact if one is to study recent United States foreign policy in the Far East and to consider the role of military power in our future policy for the Far East.

OUTMODED POLICIES

The recent confusion and bafflement in United States policy in the Far East come in large part from a nostalgic devotion by some Americans to policies which were good enough in the time of overwhelming Western weapons superiority but are quite inappropriate for the present relative armaments of East and West. During most of the nineteenth century and well on into the twentieth, the types of weapons of the Western powers were so much more advanced than those of the Eastern peoples that the West was irresistible. Small demonstrations of naval power or the march of a small Western ground contingent to the capital of China could make the weak Manchu Empire and other peoples of the East yield to the demands of the militarily superior Western powers. Japan alone, for a while, wholly excluded foreigners, and armed rapidly on Western lines when she finally reverted to her earlier policy of allowing foreigners within her borders. But China, potentially the most powerful of the Eastern countries, was not only backward militarily but also was in one of those rare weak periods in her history, a weakness due in great part to her military inferiority.

This made for a pattern of Western policies toward the East which has survived into the present when the conditions which made these policies possible have radically changed.

During the days of Western weapons superiority and of the resulting colonialism, the attitude of the United States was different from that of the other Western powers. For various reasons, one of which was that we had a huge continent of our own to develop, and also, I think it may be said, because we decided against colonialism on its merits, we did not join in the scramble for colonies and did not use the weapons superiority we shared with the other Western powers to extend our influence in the East or anywhere else much beyond our own continental limits. We even got rid of as much of the territory we took in the Spanish-American War as we could, as fast as we could. Our anticolonial record was good. We got into trouble only quite recently, in Indochina and Formosa, and then not because we were trying to get something for ourselves but because we wanted to stop Communism from expanding. But we got into trouble just the same, because we acted on the false premise that the West still had the weapons superiority it used to have in the prosperous days of colonialism, and that therefore with practically no effort on our part and at very little cost we could use our Western military power to make the Easterners do what we wanted them to do.

Conditional battle cry

This fallacy, that we still have a weapons superiority which in fact we have not, corrupts our Asian policy. Tradition dies hard in such matters. In the past, United States as well as other Western thinking has always assumed, correctly, that it was much safer to be tough in the East than in Europe where, if we got into war, it would be against people as well armed as ourselves, or better. This is why many Americans who are isolationist-minded toward Europe are the most bellicose about China: it is safer, they believe, to risk war with China which has no atom bombs than with Russia which has them. It is why men talk of easy victory if we have to fight the Chinese. For you will note that those who want the toughest policy against the Chinese Reds always promise an easy victory at little cost to the United States. It would be an act of folly, which never could be thought of, they have often assured us, to send American ground troops to the continent of China. There is no substitute for victory, we are told; but there is a string to this stirring slogan. It is a conditional battle cry, and the condition is that victory is to be had with the utmost ease, with air and sea power alone. Elmer Davis says that only ground troops have mothers, which is a way of saying that American opinion knows that when the ground troops fight it is a tragic and bloody business on a mass scale; and the people of the United States will not take kindly to anyone who gets us into that kind of sacrifice of our young men unless the cause is extremely important. So if you are not only promising to be tough with the Chinese Reds in speeches but planning to beat them militarily if they challenge us, then you have to provide that they can be beaten quickly and inexpensively by a few flips of the wings of American air power. You have to promise, in short, that we still have an overwhelming weapons superiority over the Chinese Reds such as we used to have in the old days.

Atomic weapons

This of course brings us to the question of the use of A- and H-bombs by the United States as a part of its Far Eastern policy. Plainly, without using atomic weapons, it would be a difficult operation for us to bring the Communist Chinese regime to the point of surrender. If we could be sure that Russia would not intervene, we could win local victories, usually with TNT (trinitrotoluene) and incendiaries only (we could have won at Dienbienphu had we thrown in enough United States air power). We could do considerable damage to Chinese airfields and other military installations, and could destroy Chinese cities without using A- or H-bombs, provided, as I said, that the Russians did not come to the help of their Chinese allies.

But even if we could count on Russia's not helping China, an air and sea operation against China would be expensive; the attacking bombers would take considerable losses; the United States and other United Nations troops in Korea would be open to attack by the formidable Chinese Communist air force (which is one of the most modern large air forces in existence) and by the powerful Chinese ground armies; and Okinawa and United States naval forces in the area would also be open to attack from the Chinese Red air force. It is likely, if this kind of fighting once got started, that at some point along the line we should be driven to use atomic weapons. Then the damage to China would be beyond estimating.

Conditional weapons superiority

So one must conclude that as a strictly military matter we do still have a conditional weapons superiority over China, the conditions being that Russia will not interfere with us and that we are willing to increase substantially the likelihood of general atomic war.

And there is another condition, perhaps the most limiting of all. United States public opinion and the United

States government apparently believe that there ought to be some other way of carrying out our foreign policy in the East than by a mass killing of this kind. You will note that when it comes to making the hard decisions, the United States so far has shown a restraint which seems almost out of character when looked at against the background of the speeches and declarations of policy of our governmental officials.

So air power as it tries to find the role it is supposed to play in the Far Eastern policy of the United States has to give heed to what its government does even more than to what it says.

U. S. POLICY IN ACTION

The Korean War was a special case, and air power can learn little therefrom about its future role in United States foreign policy in the East. Korea was a collective operation under the United Nations in which, despite our preponderating role, we were acting under the juridical principles of the UN Charter. The purpose was to stop the aggression where it started, at the 38th parallel. There was therefore a substitute for victory in the Korean operation, if by victory we mean the unconditional surrender of Red China. The substitute was to give vitality to the commitments we had made in the UN Charter. And, since the principles of the Charter limited the UN's political objective, air power was limited accordingly. It was not air power's function to destroy the Red Chinese state or to bring the Chinese to unconditional surrender; nor was air power supposed to extend, petulantly, the war to the Chinese mainland unless this was necessary to accomplish what we were fighting for, namely to throw the North Koreans and Chinese back of the line where the aggression had started. Indeed a limited bombing of the Chinese mainland, say of the Chinese airfields over the Yalu, as was so strongly urged by some, would have hurt us more than it would have hurt the Communists, for it would have provoked Chinese air attacks on our UN sanctuary, namely all of South Korea, no part of which was attacked by Chinese air power at any time during the war. If this United Nations sanctuary had been hit by the Chinese the war then would have changed its character. We of course would have hit back hard and the war would have become general, certainly with China, perhaps with Russia as well. Air power was properly under wraps in Korea.

Korea, however, was unique. In no other part of the Far East has the fighting with the Chinese Communists been under the aegis of the United Nations. The resentment of the American people at the heavy casualties in Korea, intensified by the injection of the war into domestic politics, killed the possibility of limited wars of the collective security type under the United Nations, at least for the moment.

Massive-retaliation policy

A series of announcements by the United States government followed the truce in Korea in July 1953. If the Chinese Reds started the fighting again in Korea we would not continue to limit our air action to the Korean peninsula, the Reds were told by the unanimous declaration of the sixteen nations fighting in Korea; we would hit at the Chinese mainland itself. If the Reds moved into Indochina (this time the French and the United States alone making the threat) we would not hit back in the territory of Vietnam alone but would strike at the Chinese mainland with our air power. Finally (the United States speaking alone this time, with no ally joining in the declarations), we told Mao Tse-tung, the Russians, and the whole world that we would hit any further Communist aggression in Vietnam (the immediate danger spot) or anywhere else, whether the aggression was by overt military invasion or by covert aid, with all the force necessary. The United States would strike at such an aggression in a massive retaliation at times and at places of its choosing. The counterblow would be anywhere from the area of the local fighting to the communications, industrial, governmental, and population centers, and the weapons used could be anything from light convential ones up to and including the most destructive of the fission and fusion bombs.

Had this been the policy that United States air power was supposed to get ready to carry out, some important changes in Air Force and Navy planning would have been needed. An air operation against China might have been short and decisive, with the Chinese capitulating before the awful destruction which an all-out atomic attack would have wreaked; it might on the other hand have been a long-drawn-out affair with nonatomic weapons and with considerable attrition to United States planes; it might have spread to war with Russia as well as with China, and the United States might have been alone in that war, since the massive-retaliation policy had not been accepted by any of our allies. We thus would have had to increase our air power substantially to be ready for all these possibilities. We would have had to build a special air fleet for the East (since our present force levels are designed almost wholly to counter the Russian threat in the West), and we would have had to remodel and substantially increase our strategic air force in view of the possibility that we might find ourselves fighting the Russians without the aid of our NATO allies and without the availability of our strategic air bases located in NATO territory.

Dienbienphu

Apparently the massive-retaliation policy came near being put into action at Dienbienphu. We shall not know the full facts until history is written, but we do know that the Chinese Reds put our policy to the test when they sent into the Vietminh enough artillery and other equipment, plus technicians, to capture the French garrison at Dienbienphu. Apparently deliberately, they put themselves within the letter of the American threat; they knocked the chip off the shoulder of the United States. Naturally the temptation to hit back, massively, was strong, and there was much highly placed opinion in the United States government that we should do just that. We still had the old weapons superiority of the colonial days in the form of the atom bomb; why not use it, especially as we had said we would? But calmer counsels prevailed. There was talk of "united" action, that is, of consulting our Western allies. There also was some talk of blaming these allies for refusing to go along with our tough anti-Communist policy; we were ready to act, but our allies (whom we had not consulted about the steps which had led up to the difficulty) were delinquent, it was suggested. History will probably show that it was touch and go. We were close to something—whether to a quick surgical victory for the Vietnam, the French, and the United States, to World War III, or to something in between, one can only speculate. All we do know is that there was no retaliation by us, massive or otherwise, as the French garrison was conquered; that the Red Chinese exulted at Geneva in their sensational victory over French colonalism and its supporter, the most powerful nation of the West; and that United States air power was left considerably confused as to what it was to

get ready for in its planning for the Far East.

Formosa

No sooner had the Vietnam situation begun to settle down than Formosa stirred up all the same problems again.

The Red Chinese seem to be in a highly charged state of mind about Formosa, the Pescadores, and the inshore island groups of Quemoy and Matsu. The Chinese Communist government has announced that it intends to take Formosa and its appendages within the year 1955. They already have attacked Nationalist-held islands near the Chinese mainland. The effect of all this has been to reinstate the United States policy of massive retaliation, which had been practically dead after its collapse at Dienbienphu. Our policy relating to Formosa is not called massive retaliation, but it comes to the same thing. Again it is the United States alone, without the support of its Western allies, using the threat of massive air and sea action against the Chinese mainland, with the commitment to the American people not to use ground troops if we do become involved in war. Again there is the question whether in fact we have weapons superiority over the Chinese, whether, that is, we can be sure that if we use our atomic weapons the Russians will stand aside and not come to the support of their Chinese allies with their own A-bombs.

At this writing the same dangerous possibilities we had in the Vietnam are in the Formosan situation. There is, however, this difference: the warning by the United States to the Red Chinese that it *will* fight if they attack Formosa and the Pescadores and *may* fight if they attack any of the other Nationalist-held islands has been made in a peculiarly formal manner. It is not the executive branch alone which has told the Chinese of our intention to hold the islands (as was the case when the Chinese took over northern Vietnam) but the executive branch plus both Houses of Congress, the latter acting after a full debate. Moreover, the physical circumstances around Formosa are such that it will be difficult for the Chinese to take Formosa and the Pescadores (this is not true of the Matsu and Quemoy groups) without clashing with United States military forces. The Chinese cannot invade the main islands unless they have air superiority over the Formosa Strait. They therefore are not likely to attack the islands except after having tried to take air superiority over the Strait from the United States by attacking the United States Seventh Fleet and any United States carrier- or land-based planes flying in the area. In Vietnam the Chinese were able to defeat the French without taking part in the war themselves and therefore without fighting United States military units. It does not seem possible that they can repeat this in the Formosa-Pescadores area. They therefore should not attack the islands unless they have decided to make war against the United States.

A tense situation

Perhaps the Chinese Reds have decided on war with us, or perhaps they mistakenly think they can repeat their triumph of Dienbienphu in knocking the chip off the U. S.'s shoulder. Their official pronouncements sound that way; and if that is what they have decided on there is no way of avoiding the war which some of our enthusiasts want. But even if the Chinese have not decided to provoke a general war with the United States, the situation in and around Formosa is so sensitive that there is much danger that the contending forces will blunder into a war unwanted by either side. The Chinese

held Formosa for many centuries, and the Chinese Communists are whipping up a jingoistic sentiment to get it back; the United States has drawn a line a few miles off the Chinese mainland and has told the Chinese not to step over it; and the powerful Chinese Communist Air Force, the United States Seventh Fleet, and the United States Air Force's land-based planes are about in the area. American air power obviously has to assume that something may happen and get ready for it.

What is this something which may happen? As in the Indochina crisis it runs all the way from local action in the vicinity of the contested area, through a "limited war" with conventional weapons only which may last a short time or a long one, to atomic fighting which may or may not involve the trading of atomic blows by Russia and the United States.

As long as the Formosan problem is not settled, American air power has, in military parlance, a heavy "requirement" to be ready for what may come out of it. And, although this article deals with air power alone, I add that as long as the United States and Chiang Kai-shek on the one side and the Chinese Reds backed by Russia on the other stand glaring at each other across the Formosa Strait, the chances of general war are so substantial as to increase the "requirements" of all the United States services, including the Army as well as the air services. No one can tell what kind of a war it is we have to be ready for. For all our hopes to the contrary, once the fighting starts, it may involve United States ground troops on the Chinese mainland.

OTHER PARTS OF THE EAST

The responsibilities of air power in the rest of the East seem to come down to the need to be ready for general war, of some kind or other. An attack by China or Russia on Japan presumably will precipitate general war by the two Communist partners against most of the free world. The Communist advance, if there is to be one, in Indonesia, South Vietnam, Laos, Cambodia, Thailand, and Burma is more likely to be by subversion than by military invasion by Chinese Red armies. In Malaya the British have sole responsibility, as the French did in Indochina. If it is to be United States policy to use our military force to stop Chinese expansion in Asia, whether the expansion be in the form of subversion or of orthodox military invasion (and it may be that this is our policy), United States air power will again be in the position it was in in Indochina. It may be called on to fight anything from a local engagement up to a general atomic war.

RESPONSIBILITIES OF AIR POWER

Air power thus is wholly unclear as to what it may be called upon to do in aid of United States foreign policy in the East. One fact only seems to be well established: United States foreign policy is relying for its military support in that area entirely on air power. The ground troops are to be kept out of the fighting at all costs.

Now in many parts of Asia the United States is acting alone, without allies, and the burden on United States air power is thereby made even heavier. Until the Southeast Asia Collective Defense Treaty was signed recently at Manila, the United States was acting alone throughout all of Asia except Korea. The chain of Pacific treaties (singly by the United States with Australia and New Zealand, the Philippines, Japan, Korea, and now Formosa) was in essence only commitment by the United States to defend the respective signatories; the treaties do not require

the other countries to help the United States in fighting outside the area of the particular treaty. There has been talk of combining the several treaties into one over-all arrangement of collective security, but until that happens the Pacific treaties still leave the United States acting alone.

The Southeast Asia Treaty Organization has, however, relieved the go-it-alone position of the United States. The eight signatories of the Treaty (United States, United Kingdom, France, Australia, New Zealand, Philippines, Thailand, and Pakistan) have carved out an area in Southeast Asia where they have agreed to act together to resist further Communist advances. But the Southeast Asia Treaty is not self-executing as the North Atlantic Treaty is, and the United States will have to get the agreement in each case of its co-treaty-members before collective action can be taken.

Also SEATO is as yet embryonic. Defense planning for SEATO has scarcely begun. SEATO may sometime evolve into an effective collective organization for the defense of the limited area with which it deals. But if it does it will be United States air and sea power which will do it. "It is only the existence of powerful American naval and air forces in southeast Asia which can give SEATO any reality," a recent leader in *The Times* (London) pointed out.

Further, SEATO leaves vast areas of the East where there are no multilateral arrangements (other than the general collectivism of the United Nations, which has not been used in Indochina and Formosa and cannot be relied on, without regional arrangements to sustain it, to relieve the United States and the other Western countries from their piecemeal resistance to the Communist advance). The United Kingdom, Australia, and New Zealand have a collective arrangement of their own for Malaya, called ANZAM. But there are no multilateral agreements for the great area of Japan, Formosa, Indonesia, Burma, Nepal, and India. If the Communists increase the pressure in any of those areas and the United States determines to use its military power to stop them, it will do so on its own, with such allies as it can pick up *ad hoc,* and relying apparently entirely on the might of its air power.

This is a signal honor which has been given to air power, and it will do its best within the appropriations it is given to be ready to carry out these difficult tasks. It is, however, the duty of air power to point out to those who make our foreign policy what it needs to perform the duties the foreign-policy makers are putting on it. It would be a serious error to have a foreign policy based on our having a certain military strength, if in fact we did not have it. This would be a policy of bluff and necessarily would be disastrous.

So air power must say and do what it can to have it understood that present United States foreign policy calls for a two-front air power—one for the NATO area, charged with the vital duty of nullifying the Russian air-atomic threat, and another to back up our Far Eastern policy. Air power must at the same time point out that we have not yet built the strength we need for the NATO front. We are still several billion dollars short of the amount we ought to be spending exclusively for the air power we need to handle the threat from Russia in the NATO area. The present United States military establishment, although almost wholly designed for the support of United States foreign policy relating to Russia, is not strong enough for that task, let alone for an additional deployment against China. There is nothing like enough air power in our present United States military force levels to back up our foreign policy in the Far East.

Nor can we safely borrow air power from the NATO area and send it to the Far East either on permanent deployment or from time to time when crisis occurs. The most important point of our strategy in the NATO area is that United States air power be poised, in position, ready to go at a moment's notice, so that the Russians will not think they can deliver a surprise knockout blow against the United States and the rest of the NATO countries. It would be a major Russian victory if we could be trapped into diverting to the Far East against China some of the air power which ought to be defending us against Russia in the Atlantic area.

And yet apparently this is what we are planning to do. Indefinite as our Far Eastern policy, perhaps necessarily, is, two points about it do seem to stand out: (1) That our political arrangements with our Western allies and the indigenous countries of Asia are embryonic; that because of this we are relying on United States military strength almost exclusively to block Communist expansion in the area; that this policy may involve us in some form of war which may be anything from a small local operation up to atomic war with Russia and China together; and that so far as our present plans go nearly all the burden of supplying this military strength in the Far East has been put on United States air power. (2) That we are not building a second-front air power for the Far East and accordingly, if the Chinese Communists put our policy to the test, we shall have to strip our striking power against Russia in the West and send to the Far East that air power which is so vital to the safety of the NATO community, including our own American homeland.

This is obviously not satisfactory. For it reveals a serious discrepancy between United States foreign political policy and United States military planning.

Nothing we could do would close this gap overnight, because it takes a long time to build operational air power. And in fact, as the present military budget shows, there are no present plans to build this second-front air power. Why is this? Is it that thought is being given to a change in our Far Eastern policy? For there are two ways in which this gap could be closed: one by building the additional air power needed, the other by bringing our foreign policy into line with our military capabilities.

IS U. S. POLICY CHANGING?

There is some evidence that, except in the special case of Formosa where our policy of defending the islands is clearly stated, U. S. foreign policy is evolving toward this latter alternative. The signature by the United States of the Manila Pact (creating SEATO) converted a United States go-it-alone line into a multilateral policy for an important part of Southeast Asia; and a multilateral policy in that part of the world will necessarily increase the emphasis on political and economic measures to resist Communism as against military measures. Our allies of the Manila Pact have much less confidence than we in military force as the principal means by which to block Communism in Asia. Also, it is being borne in on us by events and by our increasing understanding of the nature of the Far Eastern revolt against Western influence that military measures by the Western powers in Asia have a backlash unless they are carried out in such a way as to be wholly free from any taint of the old Western colonial attitude. The UN intervention in Korea should have been, and largely was, acceptable to the free states of the East, because it

was juridically sound (being based on the principle of collective security in the UN Charter which so many Eastern countries had signed) and because it was obvious that no Western power was seeking to feather its own nest in Korea. The situation of the United States in Indochina was something else. There was no juridical basis at all for United States support of the French and Bao Dai. Our motives were in fact noncolonial in that we were seeking no aggrandizement of our own position but only the blocking of further Communist advances. But we were supporting French colonialism just the same; our hard-won reputation for noncolonialism was badly hurt and United States prestige in the East went sharply downhill. Then followed the Formosan crisis and again we were seeking nothing for ourselves. We were, though, trying to dominate the domestic affairs of an Eastern country with United States military might; and this attempt, following as it did on the heels of the Indochina affair, looked to Asians painfully like the old Western colonialism. In the meantime the countries which the Western powers had left alone and had not tried to save by Western military help were doing well in their struggle to resist the Communist expansion and to remain free—namely, Thailand, Burma, and Indonesia.

The impact of all this on United States foreign policy was to point the lessons: (1) that we shall do better in the East by acting multilaterally instead of in the old go-it-alone fashion; (2) that talking of almost nothing but military measures as the means of combating Communism in the East makes the Easterners think we still have the old colonial attitude toward the East and therefore is largely self-defeating; and (3) that the United States and other Western military forces can be effective in Far Eastern policy—unless we go to general war against Russia and China—only if there is first established the principle that the major responsibility for resisting Communism in the Far East must come from the Far Easterners who are still free, preferably acting collectively, and having been convinced that Western military power will no longer be used to perpetuate or revive the old domineering colonial attitude of the Western powers toward the peoples of Asia.

These lessons have not become a part of declared United States foreign policy. It will indeed be difficult to accept them, since they run counter to so many of the principles we have heretofore announced. But they may be in our official calculations more than the announcements indicate. If they are, they would point to the conclusion that United States policy in the Far East must now concentrate in its next phase on achieving the necessary political understandings with the countries of the East, including India and Japan on the two extremities, and that United States military requirements for local or partway wars against China should wait until these basic political arrangements are in fact in being. If this is or is soon to be our policy in the East, then it also is the explanation of our failure to provide the necessary air power to back up the policies we have been following to date in Asia. There is indeed no other satisfactory explanation.

Thomas K. Finletter, LL.B., New York City, lawyer, was Secretary of the Air Force from 1950 to 1953. He was minister in charge of the Economic Cooperation Administration Mission to the United Kingdom (1948–49), chairman of the President's Air Policy Commission (1947–48), consultant to the United States delegation to the San Francisco Conference (1945), and special assistant to the Secretary of State (1941–44). He is the author of Can Representative Government Do the Job? (1945), Power and Policy (1954), and works on corporate reorganization.

Collective Security in the Air Age

By ROBERT D. MURPHY

THE principle of collective security represents the keystone of American foreign policy. It is sometimes difficult, however, for persons not intimately acquainted with the events of the last two decades to appreciate the extent to which this constitutes a revolutionary transformation in American thinking. If one had been asked, fifteen years ago, to select the single document which best characterized the foreign policy of the United States, it would have been natural to choose the Neutrality Acts, under which this country not only asserted its determination to avoid involvement in foreign quarrels but went so far as to prohibit the sale of military supplies to friendly nations for hard cash. If one were given a similar choice today, it would be reasonable to select the Mutual Security Act, under which the American taxpayer provides vast quantities of military and economic aid to other free nations without asking any recompense other than that these nations participate in the common effort to maintain their freedom intact. It is doubtful that the history of mankind has ever recorded so fundamental a shift in any nation's policies in so brief a period of time.

HUMANITARIANISM OR SELF-INTEREST?

Despite this thoroughgoing transformation in the American world outlook, there is some evidence that popular understanding of the basic premises of collective security is not so widespread as the overwhelming popular support for collective security might indicate. There are still many Americans who believe that collective security is good but not essential. In resigning themselves to the burdens of world leadership, many of our citizens have been guided more by an instinct of humanitarianism than by a profound appreciation of national self-interest. For example, it is probable that many Americans supported the Marshall Plan because of their sincere wish to help starving Europeans and had no more than a vague realization of the relationship between European economic health and American security.

It would be a mistake to regard the premises of our collective-security policy as a matter of purely academic interest. Actually, the premises we accept make a great deal of difference in terms of our policy choices in particular situations. In a true international crisis, those who believe that United States participation in collective-security arrangements is founded primarily upon a moral obligation, with others reaping the principal benefits, are likely to reach conclusions quite different from the conclusions reached by those who recognize the extent to which our own national survival is dependent upon these arrangements. Thus, it is clear that one of our continuing problems in maintaining a sound and consistent foreign policy which will have the unified support of the American people over an indefinite period of years is the fact that many of our citizens who are genuinely devoted to the principle of collective security nevertheless retain the belief that American air power and nuclear capabilities offer the United States the choice of "going it alone" in any situation where co-operation with allies is inconvenient.

It is possible, of course, to imagine cir-

cumstances in which the United States might be compelled to stand alone in defense of its freedom and its existence as a nation. Even if the remainder of this planet should pass under the control of an aggressive Communist dictatorship, it is virtually certain that the people of the United States would remain determined to wage a fierce battle for survival, however great the odds against them might be. The goal of our policy is to avoid such an unhappy situation. For all practical purposes, the policy of collective security is a *necessity*, and is more clearly so in the air age than ever before.

It is easy to see why this is true. Man's conquest of the air has made the American homeland vulnerable to attack and devastation in a manner that would have been inconceivable fifty years ago. When we remember that the air age has become the atomic age as well, and also that it is an era in which the techniques of economic and psychological aggression have been developed and refined to a point unprecedented in history, the proportions of this vulnerability become even more apparent. Finally, when we consider the vast human and material resources that have already been enveloped within the inflated Communist empire and visualize how the seizure of additional territories and resources, if not prevented, would add steadily to Communist capabilities for aggression, we can understand why the United States no longer can afford to be oblivious to events even in the most remote corners of the world.

Massive Retaliation

The notion that the circumstances of the air-atomic age offer special security advantages to the United States—that they permit us to rely exclusively upon our strategic air force and our nuclear capabilities and to minimize our dependence upon other nations—is both a gross misconception of United States policy and a naïve oversimplification of fact. It is indeed true that our superiority in long-range air power and nuclear capabilities, both strategic and tactical, constitutes the principal deterrent to an attack upon the United States and other parts of the free world. We must maintain at all costs our capacity for massive retaliation against aggression. While references to massive retaliation have unpleasant connotations, these connotations are not nearly so frightening as would be the case if present capabilities were reversed—if the Soviet bloc held clear-cut superiority in modern weapons and the means of delivery. For the foreseeable future, American strategic capabilities will represent the sine qua non of world peace and security.

But it is also important to avoid the fallacy that reliance on our strategic air power and nuclear capabilities offers a possible substitute for collective security. In the first place, it is quite obvious that the capacity for massive retaliation does not exist in a vacuum. It is a composite of many assets—mineral resources of various types, bases and other facilities for delivery, scientific and technological skills, trained military personnel, electric power and other forms of energy, and over-all industrial capacity. The United States has no monopoly on any of these underlying elements of power. We depend upon other free nations for many of the things we need. In the long run, moreover, our ability to maintain superiority over the Communist empire in the production and facility for employment of modern weapons of all types will depend very largely upon whether the people, the territories, and the resources of the rest of the non-Communist world remain free or whether they are enslaved by the Communist bloc and harnessed to the Soviet war machine.

Even more important is the fact that we cannot in any case rely upon massive retaliation as the exclusive means of deterring or defeating Communist aggression. No such reliance has ever been implied by the United States leaders. It is unfortunate that the doctrine of massive retaliation, as enunciated by Secretary Dulles and other official spokesmen of the government, has been sometimes read out of context. Insufficient attention has been given to the Secretary's reminder that local defenses will always be important, and to his repeated emphasis upon the multipronged nature of the Communist threat —to the tactics of political, economic, and psychological aggression and subversion and the need for appropriate means of countering all these tactics.

Varied Means of Defense

In a military sense, the key principle of our present strategy is that the free world must be able and willing to respond to aggression vigorously at places, at times, and with means of its own choosing. The power of choice obviously requires the existence of real alternatives. Secretary Dulles has already pointed out clearly that modern weapons possess such immense destructive power that "even the most reckless will pause before taking action which would bring modern weapons into play." He has declared further that our policy

> does not mean that any local war would automatically be turned into a general war with atomic bombs being dropped all over the map. The essential thing is that we and our allies should have the means and the will to assure that a potential aggressor would lose from his aggression more than he would win. This does not mean that the aggressor has to be totally destroyed. It does mean a capacity to inflict punishing damage.

So long as the Communist empire maintains its huge capabilities for pursuing its imperialist designs by a multiplicity of techniques, it would be highly dangerous for the United States or its allies to place sole reliance upon any single means of defense. President Eisenhower, with his vast experience as both warrior and statesman, clearly expressed the military aspect of this proposition when he said: "We must stay alert to the fact that undue reliance on one weapon or preparation for only one kind of warfare simply invites an enemy to resort to another." Our air-atomic capabilities are priceless assets, but this fact makes it all the more important that they be used to assure our country's safety and not become its "Maginot Line."

It is unnecessary to analyze in detail the numerous elements of power that are required to supplement and reinforce strategic air power and nuclear capabilities. They include the more conventional army, naval, and air forces, facilities for resisting and countering subversion, various kinds of economic capabilities, political and psychological instruments. The United States is far from self-sufficient in these supplementary elements of power and can achieve reasonable assurance of self-protection only by combining its own strength with that of other parts of the free world. For example:

1. Most of the world's land area still lies outside the Communist orbit. In many of the areas, bases have been established through U. S.–allied co-operation which serve not only to defend the immediate locality but the United States as well. In Communist hands, additional territorial gain would represent a potential base for attack upon the United States and its allies.

2. The human being is still the most priceless asset in any power ratio. He remains the most flexible and most ef-

fective of fighting machines. All economic production stems from his energies, and his brain is the source of all technological and scientific advancement. All hopes for peace and progress rest upon the unlimited potential of the human soul. Of the human beings on this planet, only 6 per cent live in the United States. More than 60 per cent live in other parts of the free world. The ultimate fate of both the United States and the Communist empire depends upon what happens to these people, what strength they possess and what choices they make.

3. The United States is increasingly dependent upon the economic resources of other free nations. We import substantial quantities of more than fifty vital commodities that are essential alike to our peacetime industry and to our defense system. Not a single ship, tank, or bomber has been produced without commodities that we are compelled to import.

4. Despite the vast industrial power of the United States, the factories, laboratories, and technical facilities of other nations cannot be regarded lightly. As allies, the industrial power of such countries as the British Commonwealth nations, the nations of Western Europe, Germany, and Japan greatly supplements our own. With these nations under Communist control, the ratio of industrial power would be turned against us. The seizure of Western Europe alone would give the Communist bloc the means of attaining industrial superiority over the United States.

5. Many of our friends and allies maintain sizable armed forces. The combined military forces of our European allies in the North Atlantic Treaty Organization, for example, are larger than those of the United States. At present, our military aid programs are helping to maintain many divisions in various parts of the world. These forces represent a significant addition to the deterrent and defensive capacity of United States military forces.

The foregoing facts are not new. They have been cited many times, and are well known to a large number of Americans. Unfortunately, they are sometimes forgotten in controversies over particular issues of foreign policy. It is well to remind ourselves that the Communist leaders never forget them. In fact, the entire cold war may be described as a persistent effort to accumulate and exploit these basic elements of power for Communist purposes.

Purposes of Collective-Security Arrangements

In elemental terms of United States national interests, all collective-security undertakings in which the United States has engaged may be described as an effort to make sure that the human and material resources of the free world remain free and continue to serve the cause of freedom. These undertakings have assumed different forms, of course, and have been designed to serve various purposes. Some, such as the United Nations, have aimed at providing instrumentalities through which peace and progress can be pursued on a global basis through which all nations may resolve their differences and co-operate in common ventures to protect their security and enhance the well-being of their peoples. Others have been developed to meet specific problems or threats in particular regions. Some arrangements, like NATO, have involved the development of elaborate programs for creating and maintaining concrete means of joint defense. Others have depended for their deterrent effect primarily upon the pledges which the parties have given to take common action against aggression. Some have been concerned chiefly with the danger of direct military attack, while others have directed attention largely toward the threat of internal subversion.

One of the most significant differences among our different alliances is the wide disparity in the defensive capabilities of particular allies. While none of our allies could stand alone against the massive military power of the Communist bloc, some are capable of making a substantial contribution to their own defense and to the defense of the free world as a whole. Others are so weak at present, militarily and economically, that they can contribute little or nothing. It has sometimes been asked why the United States should pledge its word and expend its resources in defense of areas which, in terms of their physical capabilities, represent liabilities rather than assets. There are two answers to this question. First, it is well to remember that a given area may be a liability as a United States ally and nevertheless be a potential asset to any regime as ruthless and devoid of human considerations as the Soviet dictatorship. The Communists are past masters at squeezing blood from turnips and have no compunctions about exploiting the local population to extract a profit from an area where the United States would feel obligated to provide assistance. Second, the American people retain a strong moral interest in helping to preserve the freedom of any people who sincerely desire freedom, regardless of their physical capabilities or potential. The elements of power needed for the ultimate protection of the United States are spiritual as well as physical, and the role of Pontius Pilate is wholly foreign to the American character.

Implications of Collective Security

It is difficult to generalize about the various collective-security arrangements in which the United States participates. However, in adopting the course of collective security as the cornerstone of our policy, we find that certain general implications necessarily follow. If this course is to be successful, it is necessary for us to understand and accept these implications.

Working partnerships

First, it is important to recognize that the policy of collective security involves much more than a series of commitments to take action under certain hypothetical circumstances. Our collective-security arrangements are working partnerships, some of them involving immediate action on many fronts. They offer opportunities for peacetime co-operation to foster and maintain the conditions which will help to perpetuate peace, and also to pursue other objectives which will serve the common interests of American and allied peoples.

Long-term basis

Second, it is necessary to appreciate the long-term nature of our collective-security policies. They are not designed to meet an emergency situation but to protect American and allied interests in a nerve-racking cold war which may continue for fifty or a hundred years. We cannot participate in alliances successfully on an "in and out" basis, nor can we offer leadership one day and withdraw it the next. In some instances, consistency of policy is almost as important as its substance. More than a billion people in the free world realize that their destinies may depend upon decisions made by the United States government, and it is natural that these people should place great stress upon the need for a fundamental continuity of American policy. This does not mean that we can never change our mind, seek improved approaches to problems, or tailor our actions to fit changing circumstances. It does mean

that our claim to leadership requires that the key principles of our policy remain relatively constant and predictable, so that our friends in other lands can safely rely on these principles in planning their own policies and programs, both foreign and domestic.

Costs

Third, we must accept the fact that our collective-security policies cost a great deal of money and probably will continue to be costly for a long period of years. Contrary to the popular proverb, very few of the good things in life are really free—freedom least of all.

To date, our collective-security undertakings have involved the deployment of a large number of American military forces abroad and have also involved the expenditure of large sums for military and economic aid. It is important to note that the United States has not, in any instance, entered into a treaty which makes such actions a legal requirement. The need for an immediate commitment of this country's human and material resources has stemmed, like the treaties themselves, from an awareness of our own self-interest. It would be possible, without violating any of our obligations, to retain all American troops in this country and to eliminate all the economic and military assistance which we are giving. But it would not be possible to do these things and, at the same time, realize the benefits we seek from these collective-security arrangements. As is so often true, what the American people get out of such arrangements depends largely upon what they put into them. Our interests would not be served by waiting until a particular country or area had already been subjected to Communist attack before giving attention to its danger, nor by ignoring a nation's internal weaknesses until it had reached a stage of economic and political paralysis that left it teetering on the brink of collapse. Our hopes for preventing war, for checking Communist expansion, and for attracting enslaved peoples to freedom all depend upon the strength which the free world as a whole is able to develop and maintain.

It has sometimes been asserted by critics of collective security that American commitments of men and money to other nations have been designed "to buy friendship." This is an utter fallacy. It is more correct to say that they have been designed to buy strength. It is not enough that our allies remain free and remain friendly —our own interests as well as theirs demand that they be politically, militarily, economically, and spiritually strong. In some areas, where a limited expenditure of American resources enables an allied country to build and maintain military forces of much greater size and effectiveness than could be obtained by the expenditure of an equivalent sum in this country, such an expenditure by the United States is simply a matter of common sense. This point is well demonstrated by the development of the NATO military forces in Europe, where allied countries have spent three dollars of their own money for every dollar given them by the United States, and where the military vacuum that existed five years ago is steadily being converted into a position of genuine strength. The dividends we receive from our economic and technical assistance are not so readily demonstrable, perhaps, but they are no less real. It is an indisputable fact that there are many areas where a relatively small outlay of American resources can make the difference between a rising and a declining economic outlook for the entire population. And this difference, in turn, can make the difference between a nation able and willing to defend its own freedom and eventually to contribute to the security of the free world as a whole and a nation whose domination by Communism is only a matter of time.

The costs of collective security cannot be taken lightly. President Eisenhower and Secretary Dulles have repeatedly emphasized their determination to hold these costs to a minimum—to achieve maximum security for the least possible amount of money. This determination has already been translated into substantial reductions in expenditures. But our leaders have also recognized that it would be foolhardy to cut our expenditures and commitments without regard to the consequences. All of the military, economic, and technical assistance which we have given to the entire world since the end of World War II has cost less than the cost of six months of World War II, and the cost is probably smaller than would be the cost of six weeks of an all-out thermonuclear war.

Requirements of leadership

Still another important implication of our collective-security policies is the nature of our relationship to our allies. The role of leadership in the modern world involves neither the domination of others nor the possibility of a complete freedom of choice for oneself. The requirements of leadership are complex and strenuous, and the essential requirement is a profound understanding of the obligations of partnership. In its dealings with allied nations, it will never be possible for the United States to have everything its own way. Nor is it possible, if the system of collective security is to survive, for the United States to "take its dolls and go home" whenever it encounters difficulties in achieving agreement with its allies. Our alliance can endure only on the basis of co-operation, mutual understanding, and mutual respect. Secretary Dulles made this point strongly and succinctly when he said:

> It is to our interest to assist certain countries. But that does not give us the right to try to take them over, to dictate their trade policies and to make them our satellites. . . . We do not want weak or subservient allies. Our friends and allies are dependable just because they are unwilling to be anyone's satellites. . . . To maintain a co-operation of the free is a difficult and delicate process. Without mutual respect and friendship it would be impossible. We do not propose to throw away those precious assets by blustering and domineering methods.

An equally important requirement of leadership is the quality of patience and restraint. The cold war which the Soviet bloc has thrust upon the world is largely a war of endurance. The problems which we and our allies are endeavoring to solve do not have easy solutions. Some of them will not be solved this year or next. However difficult they may be, the United States government is fully aware that the answer does not lie in warfare. As President Eisenhower said in 1954, there is no such thing as a "preventive war." Instead, he called upon his countrymen "to have the courage to be patient, tirelessly to seek out every single avenue open to us in the hope even finally of leading the other side to a little better understanding of the honesty of our intentions."

NOT TO DESTROY

Admittedly, the path of collective security involves many difficulties. These difficulties are intensified by the fact that the Communist bloc, by its very nature, has certain undeniable advantages in waging its relentless attack upon the free world. It is able to expand its power not by solving problems but by creating them—not by

helping others to obtain peace and plenty, but by fostering conflict and misery. And it is usually easier to destroy than to build.

In another sense, however, this fact represents what may prove to be one of America's principal long-term assets. Whatever difficulties we face, we can take comfort in the fact that our security policies are in fundamental harmony with our moral principles and spiritual inheritance. The preservation and promotion of our national interests do not require us to do injury to others. Neither our prosperity nor our safety depends upon efforts to keep neighboring lands weak and insecure. On the contrary, both are greatly enhanced by the ability of our friends and allies to maintain their freedom, to preserve political and social stability, and to move forward toward a better life for their peoples. In pursuing the course of collective security, therefore, we have good reason for confidence in the eventual triumph of our cause. We can move forward with profound faith that a nation whose deepest self-interest is on the side of humanity will ultimately be able to withstand any challenge.

Robert D. Murphy, LL.M., Washington, D. C., is Deputy Under Secretary of State. He served as United States Ambassador to Japan (1952) and Belgium (1949–1952). Previously he was United States Director of the Office of German and Austrian Affairs, Department of State (1949) and United States Political Adviser to Germany (1944).

Europe and Air Power

By RAYMOND ARON *

IN the current debate on air power, two phenomena, logically and factually distinct from each other, are being frequently mistaken for one another. The first consists of the rise of military aviation, which has modified the role of the two traditional arms, land army and navy; the second consists of the invention of a new explosive, atomic energy, which multiplies the firepower available for combat on land, at sea, and in the air.

The confusion can be explained easily: the two bombs dropped on Japan were launched from the air. Then public opinion, struck by the example of Hiroshima and Nagasaki, concluded spontaneously that nuclear weapons would be employed principally against urban agglomerations in the very heart of the enemy country and, therefore, brought to the target by strategic bombers. Now it has become plain that technological progress has invalidated this hasty conclusion. It is probable that, in a future conflict, nuclear weapons will be employed not so much against urban populations (a strategy which would issue in a kind of mutual annihilation) but rather against military objectives (airdromes, ports, launching sites of guided missiles and of strategic bombardment aviation). If one of the contending parties succeeded in depriving the other of the means of retaliation, it would have scored decisively: the threat of nuclear and thermonuclear bombardment would suffice to complete the surrender of the other party, which, having lost its retaliatory capabilities, would be at the mercy of its opponent.

Nuclear explosives need no longer be confined to large bombs. Technical progress has perfected lightweight bombs which fighter planes and fighter-bombers can carry, and nuclear projectiles which can be fired from large-caliber guns. Finally, there is a trend towards the substitution of electronically guided missiles for pilot-guided airplanes as a means for reaching targets situated at great distances from the likely theater of ground combat. This necessary distinction, however, should not lead us to a complete separation of the two phenomena: We speak of the "air age" and of the "atomic age." We should focus our attention upon the consequences which flow from the development of aviation in the atomic age and from the development of nuclear power in the air age, and thus emphasize the real relationship, as distinct from the erroneous identification of the two phenomena which are at the root of the military revolution of our times.

Europeans shared equally with Americans in the theoretical and applied research that resulted in the manufacture of the first atomic bombs, as well as in the efforts that went into the expansion of air power during two world wars. It was only in the Second World War that the United States hit its technological stride. Western Europe succumbed, in 1940, to German occupation, and the German research organization fell apart upon the collapse of the Third Reich.

EUROPEAN MEMORIES

The memories which the peoples have stored up from preceding conflicts and the presentiments which they now harbor as regards a future conflict account for the profound difference between the

* Translated by Robert Strausz-Hupé.

American and the European consciousness. For the United States, the two wars of the twentieth century were colonial wars. They were waged—especially the second one—according to the unwritten law of the American economy, namely, the reduction of human costs by the increase of expenditure on machines. A type of combat that does not count the costs of matériel in order to save the lives of soldiers will certainly not be squeamish about the destruction of enemy lives and property in theaters of operation. Such a war of matériel whenever it is being waged upon foreign soil will be waged efficiently, without scruples and without hesitation. It poses some pressing questions for these peoples whose countries serve as battlefields.

In World War II, Britons and Americans did not perhaps take the initiative in launching strategic bombing. The bombing of English cities by the *Luftwaffe,* interpreted by the British as an initiative, was intended perhaps by the Germans as a retaliation against the first "indiscriminate" attacks against the cities of the Ruhr basin. To be sure, the Germans were, at that time, in a position to extend this type of warfare. The British allocated to strategic aviation a large part of their resources, probably a larger one relatively than any other country at war. What was the effectiveness of strategic bombing during 1940–44? This question is of merely historical interest, given the novel kinds of explosives now available. It is a fact, however, that German war production increased in the face of constant and increasingly heavy bombing.

The systematic destruction of German cities—of residential sections as well as industrial plants—has seared the consciousness of the peoples of Europe. It is possible to argue that total national mobilization of economic and military resources, as practiced in World War I by all European belligerents, led logically to the selection of the sources of economic strength (towns and factories) as legitimate military targets. Furthermore, it can be argued that, in any case, the very lack of precision of air bombing effaced the distinction between military and civilian objectives and that the morale of a population constitutes a legitimate as well as a vulnerable target.

LIMITED WAR AND TOTAL WAR

The weight of these arguments notwithstanding, the peoples of Europe resented profoundly the disproportion between human costs of air bombing to those who practiced it and the human costs of air bombing to those who had to suffer it. Britain and the United States, following the traditions of sea power, engaged relatively small complements of men, equipped with expensive matériel, in order to obtain far-reaching results. But this evolution leads to a stalemate. The British people now see themselves as being exposed to the same dangers as the peoples of the Continent, and the American people, in their turn, are beginning to suffer the same anxieties. Every civilization known to the ages experienced the tribulations of war. But the *limitation of war* appears to have been one of the preconditions of the prosperity and the very survival of civilization. Neither Athens nor Sparta ever recovered from the Peloponnesian War. The religious wars, culminating in the Thirty Years' War, instilled in the combatants an abiding distaste for theological controversies conducted with firearms. The fall of the French monarchy closed a long epoch of limited wars—wars for limited objectives, conducted with limited resources and with weapons of limited destructiveness and by belligerents who scrupulously observed a common code of good manners. The French Revolution opened a quarter of a century of ferocious battles. In the nineteenth century, a happy conjunction of circumstances barred the geographical expansion of conflicts and the all-out mobilization of nations. The one conflict that came closest to being a total war in the modern sense occurred in the United States and figured as a civil war. Europeans, contemplating the employment of air power in World War II, believe that air power, reinforced by nuclear weapons, has guided mankind into a fatal path which must lead to the ultimate destruction of one or all of the belligerents.

Perhaps Europeans are wrong in assuming that nuclear and thermonuclear weapons constitute so original a departure from older techniques of warfare. After all, the most primitive weapons sufficed to annihilate Carthage. (It should be noted, however, that thermonuclear bombs represent not only a mere increase in firepower but also, if we accept the opinions of certain scientists, an unprecedented genetic threat to the human race.) Although the total destruction of cities may not be a novelty, there has occurred an essential change that sets off war waged with air and nuclear weapons from the warfare of the past: A war that issues in immeasurable destructiveness ceases to be a "reasonable" means for settling conflicts between political units and leads us back to the primitive struggle for simple survival.

The Americans are probably right when they remind us that there is, in the atomic age, one alternative which is worse than war, namely defeat. But Europeans are not wrong when they hold that, in this age, avoidance of war is better than victory. Nor are they wrong when they question the worth of a strategy which places greatest emphasis upon the preparation of that kind of war which would be so horrible that no one will dare start it—except as a last gesture of desperation.

EUROPE'S SMALLNESS

Western Europe cannot fail to develop an air and atomic outlook that differs significantly from that of the United States. In Western Europe, that is, Europe west of Berlin, distances are not so large as to permit aviation to modify radically man's awareness of space and the conditions of collective life. In 1954, one could—not counting political restrictions—travel overnight from Paris to Berlin by rail just as one could travel overnight from Paris to Nice. No doubt air travel saves many hours on the routes from Paris or London to Rome and Athens. But air travel does not change, within any national territory of Western Europe, the rhythm of human relations between region and region, and even relations between country and country are altered only slightly by air transportation. In the United States and the Soviet Union, aviation has made possible commodity exchanges and human communications which would have developed, had they depended on means of surface transportation, either much more slowly or not at all. This is not the case in France.

The political units of Europe are not designed to the scale of air warfare. This discrepancy between the technology of the twentieth century and the traditional politics of Europe manifests itself in three ways. Because of its inadequate "depth," no European country can defend its air space. If a bomber travels at the rate of 650 miles, then Paris lies within less than forty-five minutes' travel time from Soviet air bases in Eastern Germany. All European countries contain areas of human and industrial concentration which are essential to their existence as political and economic powers yet are ex-

tremely vulnerable to air-atomic attack, such as the Ruhr in Germany, the Paris region in France, and the London agglomeration in England. The density of European populations becomes an anachronism if the air age becomes the age of atomic wars. Lastly, the nations of Europe no longer possess the financial and industrial resources required for the development of a great aviation industry and a great nuclear power industry. Great Britain has allocated relatively large resources to both. She possesses a productive potential that exceeds substantially her financial capacity. The aviation budget of France has risen to about 750 million dollars and includes the entire research expenditure of the aviation industry. A European nation that seeks to maintain a large aeronautical industry must develop export markets—as does Great Britain.

Europeans cannot modify the natural limitations of their environment. Financial and economic limitations, however, need not be final. The lowering of production costs may enable small nations to manufacture nuclear weapons. Just as certain cheap weapons (bazookas and land mines) tend to neutralize expensive weapons (tanks), so certain types of missiles, manufactured at relatively low costs, may conceivably take the place of the extremely costly bomber. At present, the costs of scientific research and of weapons are very high; consequently, the big have a considerable advantage over the small. But this phase may be of short duration. When Switzerland and Sweden, too, are able to produce atomic bombs and electronically guided missiles, then science will be able to reduce the margin between smallness and bigness.

MONUMENTS

To the above considerations another one, albeit a trite one, must be added. All Europeans—Frenchmen, Germans, Italians, and Englishmen—are more deeply attached to old stonework than Americans. For most Americans, cities are tools—complexes of technical devices for ensuring human existence against climatic rigors. European cities are either themselves monuments (Venice and Bruges) or contain a large number of monuments, heirlooms of the ages. A kind of war that, even though most human beings could be supplied with safe shelters, blots out the accretions of the past horrifies the cultivated European.

AMERICAN PUBLIC OPINION

American public opinion is aware of these motives which shape European attitudes—quite unreasonably from the American point of view—towards air power. The vulnerability of Europe, lack of space, and the unique value of monuments—all these conspire to prevent the allies of the United States from viewing objectively the facts of the atomic age. Six years ago, Europeans dwelt upon the risks, if not the quasi certainty, of invasion and occupation in the case of a general war. The spokesmen of the Old Continent argued that American strategy would abandon Rome, Paris, and Frankfurt to the Soviet hordes, while confining itself to the destruction of Moscow, Kiev, and Kharkov. What would there be left to "liberate" after years of occupation, mass deportation, and the liquidation of the elite? Since 1950, American strategy, to still these protests, has erected a barrier in Europe itself. Several batteries of American atomic canons stand between the Iron Curtain and the Rhine. The spokesmen of Europe now profess themselves dissatisfied with that arrangement and denounce the weakness of the American barrier (which will be overwhelmed by the Soviet tide) and the ruthlessness of future land battles, fought with atomic weapons, which will leave nothing in their wake that is worth keeping.

American commentators rightly underscore the contradictions of these successive or simultaneous arguments. If one relies entirely on air power, one must reconcile oneself to the temporary occupation of territory close to enemy power. If one proposes to secure Europe against invasion, one must put large armies into the field or employ tactical atomic weapons. Since it was impossible, from 1950 to 1954, to obtain French consent to German rearmament and since, therefore, the effectives available to the North Atlantic Treaty Organization remained inferior to the minimum estimate of the General Staffs, opinion shifted inevitably to the inclusion of atomic weapons in military planning. Five years ago, it seemed reasonable to assume an eventual stalemate of atomic power, once both sides had accumulated large nuclear stocks, and hence an eventual return to conventional techniques of warfare. Today, this assumption has been replaced by another: Whenever and wherever war is waged between the Atlantic alliance and the Soviet orbit, it will be atomic. Again, Europeans raise their voices in protest: After such a war, there will be survivors, no victors. To win, must one lose the reasons for winning?

It is true that Europeans convey the impression of being equally hostile to each of the three possible strategies of the Atlantic alliance: concentration upon air power at the risk of the occupation of marginal zones; mobilization of a larger army in order to forestall atomic war; and the general use of nuclear weapons in order to offset Soviet superiority in conventional weapons and effectives. It is true that there seems to be no feasible fourth strategy. But it is no less true that American public opinion will be not much less reluctant than European public opinion to elect any of these strategies once the United States has to face up, on its own account, to the consequences of that strategy.

The strategy that staked everything upon strategic bombing was readily accepted as long as the Soviet Union lacked nuclear war heads or the means of delivering them onto American cities, or, in other words, as long as Europe, invaded and bombed, would have served the Soviet Union as hostage. On the day when American public opinion concluded—rightly or wrongly—that American cities would be struck no less severely than Russian cities, it displayed no greater enthusiasm for this kind of all-inclusive war than did European public opinion.

True enough, American public opinon consented to the expansion of ground forces, 1950 to 1954. This effort was not greater, measured by American resources, than that made by Europe. But American public opinion did not relish land battles fought with conventional weapons, and pressed for an armistice in Korea, although victory had not been won and cessation of fighting in Korea risked hastening the advance of Communism upon Southeast Asia. At this moment, American public opinion accepts readily enough the use of nuclear weapons in land warfare, since this strategy makes possible, for the time being, a reduction of the size of the Army and the Defense budget. Americans would hardly favor such a strategy were it to choose their own country as the theater of operations.

PRESENT SITUATION

I will be told that I am guilty of European "negativism" and that I refuse to take things as they are. This, I trust, is not the drift of my argument.

I do not venture to propose a strategy [1] in place of the one which the General Staffs have elaborated. I confine myself, here, to the description of the situation to which the development of air power and of nuclear explosives and the rivalry between the West and the Soviet empire have given rise.

This rivalry belongs to the species of great conflicts between sea powers and land powers which mark the course of history. Athens could not interdict Sparta's incursions upon the hinterland of the great trading port; Sparta could not interdict the attacks of Athenian triremes against the coastal towns and shipping of the Peloponnesus. Similarly, from 1945 to 1950, Soviet armies could occupy Europe, and American bombers could ravage the cities of Russia.

In 1950, the Korean War raised the specter of a general war, for then no one knew whether that war was merely a marginal conflict or the beginning of a world war. Then Europe became aware of her vulnerability. With American help, a barrier on land was lowered against the East. Yet for a variety of reasons that barrier remained fragile; the manpower superiority of the Soviets was too great and totalitarian government could always impose heavier burdens upon its peoples. But now the Soviet Union made up for its late start in the race for nuclear weapons and strategic air power, just as Sparta and her allies built ships in order to meet Athens at sea. The Atlantic camp, threatened from the air by Soviet progress and inferior on land despite its efforts, has sought to forge its defensive superiority from a tight integration of air power and land power, each endowed with nuclear weapons. This strategy represents a reasonable step in the dialectic process that flows from the relationship between land power, on the one hand, and sea or air power, on the other hand.

This evolution will be fraught, in the near future, with two consequences: it will make total war between the two coalitions less and less likely; it will make it impossible for both sides to employ the threat of total war as a political-diplomatic weapon. It follows that those regions where conflict cannot be localized will be relatively secure (Europe) and that, by contrast, those regions where the stakes do not warrant a general war will be relatively unsafe. Nothing will happen in Europe, because war could be fought with thermonuclear bombs, whereas, in Asia, Communism can advance unhindered, because neither Laos nor Cambodia nor Thailand constitutes a *casus belli atomici*.

The pressing question which this state of affairs poses is how to define a strategy suitable for the waging of a conflict that must not be settled by resort to total war. What arms can be employed effectively in local hot wars? What are the chances of the West's preventing Communist expansion in times of cold war?

This is the immediate question. The long-range question is graver still: Is it possible to go on indefinitely preparing for a war that will never take place? If we prepare for a kind of war that can be waged only by striking with the most terrible explosives at all the sensitive points of the enemy country, are we not entering upon a path that has no other ending than common catastrophe?

The above reasoning may run into one formidable objection. We assumed, in each instance, that the loss of life and property will, in a future war, be due to the intervention of air power. This proposition has not been verified. Can one not argue that it is inconsistent with experience? Is lengthy trench warfare not more ruinous for the belligerents than aerial operations of brief duration, yet of decisive consequences? I do not maintain that air power as such increases the costs of war. The war in France in 1940 was relatively cheap for the victor as well as for the defeated. Weapons that permit the application of a strategy of annihilation, that is, the rapid destruction of enemy *armies* and the enemy's will to resist, tend to reduce the costs of battles. This result accrues to the use of air power whenever the belligerents are unequally endowed with matériel, even when—as, for example, in Asia—the inferior party seeks to retaliate by recourse to another form of combat (guerrilla warfare). It is the indiscriminate attack against cities which, in the case of an approximate equality of air forces, increases immensely the costs of war. Since two atomic bombs were dropped upon cities the world awaits, perhaps wrongly, the repetition, in the case of total war, of these horrible massacres. It is difficult to imagine an atomic world war without envisaging the destruction of the civilization which we know.

[1] For one thing, this is not the place to explore what kind of strategy the West should choose.

THIS DANGER ZONE

It is possible to compress our findings into the following general statements: Strategies aimed at whole populations, and not merely at armies, have increased tremendously the terrors of war. Secondly, war threatens the very life of civilizations when it is conducted with means of destruction that are vastly superior to available means of construction, and when it effaces the traditions and withers the feeling of security underlying the existence of the human community.

We cannot rid ourselves of the dismal feeling that we have entered this danger zone. Are Europeans more deeply convinced that history has reached a crisis than are the American people? Perhaps. The nearness of danger often distorts judgment; it also sharpens awareness of the essential.

Raymond Aron, Doctor of Letters, Paris, is professor at the Institut d'Études politiques and the École Nationale d'Administration. He is contributing editor of Le Figaro and author of Le Grand Schisme (1948), Les Guerres en Chaîne (1951; published in the United States as The Century of Total War), and other works.

The Role of NATO's Air Forces

By Alvin J. Cottrell

THERE is little doubt that at the present time the prime deterrent to a Soviet sweep to the Channel is the possession by one of the North Atlantic Treaty Organization powers—the United States—of superiority in nuclear weapons and delivery systems. Soviet policy in the postwar years has been concerned most of all with neutralizing this disparity. United States policy has been directed at the maintenance of a substantial nuclear advantage and at the reduction of the Soviet advantage in conventional weapons. The debates on disarmament in the United Nations Disarmament Commission reflect the conflicting views of the two countries. The Soviets have consistently urged that disarmament begin with the more "sensitive" areas (nuclear stockpiles) and proceed to less "sensitive" weapons (ground forces). The United States has just as consistently supported a reverse course. Thus each of the two great powers clearly recognizes the area of its own superiority.

In a war for the Communist domination of the world, happily still hypothetical, Western Europe would presumably be the area of first contention if not of final decision. But how is Western Europe to be defended? Under the rules of traditional or conventional warfare the role of the NATO tactical air forces would be to interdict the enemy's air and land power and so reduce the disparity between Communist and anti-Communist strength in the air and on the ground. NATO's air forces, which on paper number over five thousand planes, would thus serve as a screen which—it is hoped—would diminish the enemy's initial striking power to the extent that his forces penetrating the West's defense perimeter would at most equal in strength those of the Allied Air Command in the NATO area. But in view of the possible use of nuclear weapons would the tactical air forces still play the same role?

Nuclear or Conventional Warfare?

An objective analysis of the state of NATO's defense organization makes it obvious that sufficient conventional forces to defend Western Europe from a Soviet invasion do not now exist under NATO's command. At the present time, Europe must be defended by nuclear weapons, else it cannot be defended at all. This view can be stated more precisely as follows: Either atomic-stockpile discouragement of large-scale attacks by the Communists will be successful, or the West's nuclear stockpiles will be required to destroy Communist predominance achieved by conventional weapons once war has broken out. In either case the decisive factor will be the relative strength of nuclear stockpiles.

A point might be reached in the nuclear race at which the supremacy heretofore held by the United States in air-nuclear power would be neutralized by the Soviet Union. At this point the anti-Communist states and especially the United States would be faced with a most important decision: If the Soviets move their forces either westward to the Channel or southwestward into the rimlands of the Mediterranean, should the United States attempt massive retaliation with nuclear weapons,

knowing full well that such a course would invite atomic destruction to her own shores? An answer in the affirmative might eventually save Europe and perhaps most of the world from enslavement, but the price might be a fearful one. American policy in the Korean and Indochinese conflicts suggests a negative answer, but on those occasions the blue chips were not down. Nevertheless, these two recent crises, particularly the Korean one, deserve some careful thinking. The United Nations action in Korea was an instance of limited warfare. As Bernard Brodie has pointed out, "It is noteworthy that narrow limits were imposed, and that it was obviously the stronger Power which imposed them and made them stick." [1] He adds that "these facts render dubious some of the easy generalizations of our time concerning the inevitable totality of modern war" and "the inexorable necessity to achieve total victory rather than more limited and modest goals." [2] The writers of our time are far too much inclined to hold to the inevitability of atomic warfare. In Korea, both sides restrained their power. Perhaps the Communists have revised their Marxist-Leninist doctrines to meet the world situation as itself revised by the development of nuclear weapons. They may now well settle for less than the world. They may settle for what has heretofore been an intermediate objective—the possession of Western Europe.

The policy of the Soviets is now one of slowly maneuvering the United States into a war with weapons of the Soviets' own choosing, that is, conventional weapons, which they would be certain to win. This implies an atomic stalemate, or rather an atomic-stockpile stalemate. The possibility of this has been stated by Dr. Robert Oppenheimer:

> I may, however, record my own casual, perhaps too rough guess as to how the U.S.S.R. stands in relation to us in the field of atomic munitions. This does not refer at all to other elements of armament. I think that the U.S.S.R. is about four years behind us. And I think that the scale of its operations is not as big as ours was four years ago. It may be something like half as big as ours. . . .
>
> The very least we can say is that looking ten years ahead, it is likely to be small comfort that the Soviet Union is four years behind us, and small comfort that they are only about half as big as we are. The very least we can conclude is that our twenty-thousandth bomb, useful as it may be in filling the vast munitions pipelines of a great war, will not in any deep strategic sense offset their two-thousandth. . . .[3]

If Professor Cecil F. Powell, British 1950 Nobel Prize winner in physics, is correct, a degree of neutralization in atomic weapons has already been reached. Addressing a meeting sponsored by the London Co-operative Society, Profesor Powell said that the United States had a stockpile of about four thousand atomic bombs and the Soviet Union one of about one thousand.[4] Perhaps the price the West and the United States must pay will be the loss of West Europe, for the neutralization in nuclear weapons returns the issue to conventional armaments.

NATO's Armed Strength

On paper, where no battles are really won, NATO's strength is not unimpressive. It possesses approximately 60 divisions (both infantry and armored) and upwards of 5,000 tactical airplanes. Only approximately 12 of the 60 di-

visions are fully equipped and adequately manned to do battle with the Soviets. Russia's standing army reportedly consists of some 175 combat divisions, including 80 mechanized and tank divisions as well as 50 artillery and antiaircraft divisions. She has 20,000 combat planes. The combat divisions can be doubled in strength on short notice. Thirty of these present combat divisions, 20 of them motorized and armored, are held poised in the Soviet East German occupation zone as the possible first wave in any action in Western Europe. They are supported by 3,000 planes and backed up by approximately 70 satellite divisions.[5] Among its 5,100 tactical aircraft, NATO has fighters, fighter-bombers, light bombers, and reconnaissance planes. But the weaknesses of the NATO air forces may be seen by taking a look at the Royal Air Force contingent. Of the 1,500 aircraft marked for NATO by the Royal Air Force—next to the United States contribution the largest available to NATO—many units are still equipped with outdated Meteor and Vampire jets. Until these are replaced by Swift, Hunter, and Javelin fighters, the RAF contingent will remain short of its clear potential.[6]

IMPORTANCE OF GROUND FORCES

The most recent test of conventional tactical air action has been in Korea. At that time the United States probably did not possess tactical atomic bombs, but it did possess strategic bombs. They were not used. It is ridiculous to argue, as did some officials in high office, that the use of these bombs could not have brought China to her knees. Hiroshima and Nagasaki attest to the fact that atomic bombs contributed greatly to breaking Japan's will to fight. In Korea, the bombs were not used because of diverse nonmilitary considerations. At that time America's superiority was probably more massive than at the time of the Hiroshima and Nagasaki blasts, when two bombs were all that she possessed. The lessons in Korea are worth studying, for they are relevant to any discussion of the role of tactical air power in the defense of Western Europe. While the Korean War amply demonstrated that control of the air is an essential precondition for successful large-scale military operation, it emphasized even more significantly the primary importance of ground forces. Total impotence in the air does not prevent armies from fighting offensively. The Chinese proved this in Korea, and later Dienbienphu fell though the Vietminh had no planes. Germany fought long and well on Italian, French, and finally on German soil in the face of overwhelming tactical and strategic air superiority. These are significant facts for those who would rely primarily on air power or who would stress air power above all other kinds of military power. Tactical air forces in Korea carried out well their mission, but it must be emphasized that numerical and qualitative superiority on the ground was not in the same unfavorable ratio as that which would be faced by the NATO forces.

TACTICAL AIR FORCE

The great difficulty in gauging the role of NATO's tactical air forces involves the question as to whether NATO's defense area can be protected long enough to afford these forces sufficient time to execute their mission. In World War II, despite the shortages of petroleum brought about by the Allied strategic bombing, first on Ploeşti and

[5] Axel von dem Bussche, "German Rearmament: Hopes and Fears," *Foreign Affairs,* Vol. 32 (October 1953), p. 70. The author is a former major in the German armed forces.

[6] Drew Middleton, "NATO Changes Direction," *Foreign Affairs,* Vol. 31 (April 1953), p. 43.

then on the Leipzig refineries, the Germans still possessed in the late stages of the war sufficient tactical aircraft to delay the Allies as they penetrated deeper and deeper into the Reich. In many instances, however, the swiftness of the American armored advance caught these planes before they were able to take off.

Part of the mission of the tactical air force in Korea was to drive from the skies the small North Korean air force. Although political decisions placed Manchurian targets beyond the reach of the United Nations air forces, sound tactics enabled them to prevent MIG's from approaching within seventy-five miles of the battle line. Along with its mission of driving from the skies the North Korean air force, the tactical air force was used in attacks against concentrations of supplies, matériel, and personnel deep in enemy territory. These tactics were highly successful, owing to the fact that it is much more feasible to deal with these elements when they are in rear positions than when they are dispersed and ready for battle.[7] Thus, barring a nuclear war, it appears that the mission of tactical air forces would remain what it was in World War II and in Korea: defense, counterattack aimed at blocking off the theater of operations, and tactical cooperation with ground units. The NATO air forces would provide close support for ground armies and launch an offensive action against enemy forces in the field and against enemy supply lines. This offensive could be carried out with either conventional or atomic tactical bombs. While the mission of tactical air force has not changed greatly, its relative effectiveness has been altered by the new instruments of warfare, by the development of new techniques, and—in Europe—by geography. The use of tactical atomic bombs, however, would in all likelihood lead to full-scale nuclear warfare. This prospect would tend to discourage their use.

DEFENSE OF WEST EUROPE

An active defense may not be effective against a surprise attack. The NATO defensive organization could be caught completely unprepared and thus rendered unable to carry out its mission in subsequent operations. Furthermore, the entire area could be effectively paralyzed by the use of nuclear missiles in a relatively short period of time. Airfields, communications, supply depots, and ports of debarkation all lie crowded together on a narrow strip of land where they are continuously vulnerable to attack by the Soviet air force. If West German territory were denied to the West the NATO forces would be reduced to a completely inflexible defense, a situation which would be even more disastrous under modern strategic concepts than under earlier ones.[8]

It is a fundamental tenet of anti-Communist strategy that West Europe should be defended as far to the East of the Rhine as possible. Hence geography, though frequently obscured because of the headlines given to German fighting units, has as much to do with the United States insistence on a German contribution to NATO as does Germany's economic and demographic resources. Soviet policy has not only been directed against the rise of a German army; it has also sought to neutralize Germany in order to diminish still further NATO's shallow area of deployment. Here again the lessons of

[7] Brigadier General James Ferguson, United States Air Force, "The Role of Tactical Air Forces," *The United States Air University Quarterly Review,* Summer 1954, pp. 31–32.

[8] Erich Dethleffsen, "The Chimera of German Neutrality," *Foreign Affairs,* Vol. 30 (April 1952), p. 369. The writer was a general in the German Army.

World War II are helpful. In order to absorb the initial German blow and prepare her own victorious comeback, the Soviet Union relinquished an area greater in size than the one the NATO forces are presently assigned to defend. There are now no natural barriers—the Rhine is not an effective antitank ditch against a Western thrust of Soviet forces.

The role of NATO's tactical air forces is theoretically clear, but their ability to execute their mission is doubtful because of the narrow base of operations and the inadequacy of the ground forces they will be required to support. Theoretically, Strategic Air Command, by a deep interdiction effort, would be cutting off the enemy ground offensive from its supplies and reinforcements while the NATO air and land forces would be charged with the responsibility for erecting an air barrier against the advance of enemy ground units and at the same time participating in mopping-up operations directed against advanced Soviet elements. Should the NATO tactical air forces be unable to sustain constant all-weather operations in conjunction with ground forces the NATO area could be swiftly overrun. Men who fought in the Battle of the Bulge, December 1944, as did this writer, will never forget that the Germans most nearly achieved a breakthrough when snowstorms grounded the tactical air forces.

OFFENSIVE CAPABILITIES

The anti-Communist states are on the defensive. Their only offensive capabilities have a twofold character: (1) to deter aggression by posing a threat which will make aggression too risky, and (2) to counter an attack. In the days when conventional bombs were the only ones available there was little difference between attacking and defending forces. While the opponents may have been in different states of readiness, once the initial assault had been absorbed it was possible to mobilize manpower and industrial resources to counterbalance the capabilities of the aggressor. This fact represents a fundamental difference between World War II and future wars. In World War II the United States had nearly two years to mobilize fully. It was nearly three years after Pearl Harbor before the United States was able to leapfrog its way across the Pacific to within striking distance of Japan. Future conflicts will not likely again afford such leisurely recuperative opportunities. In the next war the period of mobilization may be measured in hours. In World War II tactical aircraft operated with a range of 300 miles and an average penetration of enemy territory slightly over 200 miles. But "progress" has brought new achievements: recently a squadron of Thunderjets flew nonstop to England from United States bases nearly 4,000 miles away. Nuclear bombs delivered by air can shrink weeks or months of blitzkrieg into a few days or even a few hours of atomic exchange.

It is nearly impossible to determine the "absorptive capacity" of any nation today; and it is even more difficult to determine the "absorptive capacity" of nations of the size of Russia and China. Ten or twenty well-directed hydrogen bombs could make "ordinary organized life impossible" in Great Britain.[9] This judgment would also apply to a country like Japan. Without absorptive ability, an air force cannot get off the ground. Nor can the most formidable of armies stand off an enemy. NATO could lose World War III in a single attack. An unnamed high NATO official describes the urgency of the situation in the following manner:

[9] Cecil F. Powell as quoted by Drew Middleton, *New York Times*, February 27, 1955, p. 1.

At present, even if NATO force requirements were fully met, substantial portions of those forces, if deployed in conventional manner, would be destroyed or disrupted before they could be brought to bear against the enemy.[10]

What conclusions can we derive from these observations as they relate to the role of tactical air forces in NATO? Those forces are primarily a counter-attacking and not an offensive weapon. In carrying out their mission they suffer the disadvantage of operating from too narrow a base of operations against an enemy who is too close. The Iron Curtain descends at one point less than a hundred miles from the Rhine. This means that the period of alert vouchsafed to NATO would be practically nil. The ground forces which the tactical air forces are to support are inadequate for resisting the Soviet advance until such time as tactical air forces could go into action. Technologically, tactical air force is relying on too much outmoded jet equipment. The interceptor aircraft in service are better suited to defending areas a considerable distance from the enemy offensive air power than for close support of ground forces. These strictures pertain only to conventional warfare, for it is the contention of the writer that Europe is indefensible anyway in nuclear war.

DEFENSE THROUGH DETERRENTS

Sir Winston Churchill's hydrogen bomb speech in the House of Commons on March 1, 1955, hints at what Sir Winston believes is the only way by which Western Europe can be defended. The Prime Minister called the policy of his Conservative government one of "defense through deterrents." This, in fact, has been the West's defense throughout the five-year period of its atomic hegemony. But that deterrent is rapidly being neutralized by the ever growing Soviet stockpile of atomic and thermonuclear weapons. The West can be defended only if the deterrents are so formidable that they need not be used. Atomic weapons in the possession of the West have thus far served this purpose. Now, however, conventional weapons must be made equally formidable. While the Soviets have made a tremendously successful effort to better their nuclear position, West Europe has made little progress in improving its position against the Soviets in conventional armaments. The policy of the United States since 1950 has correctly placed its emphasis upon conventional armaments as the means for redressing the military balance of power in Western Europe. The United States will probably soon have enough deterrents in the form of atomic bombs, since it is possible in an atomic stockpile race to reach a point of diminishing returns. The primary race in the nuclear field will then be in the development of delivery systems.

The control of Western Europe would greatly improve the Soviet Union's delivery capabilities vis-à-vis the United States. America's decision to rely primarily on "massive and instant retaliation" at times and places of its own choosing was apparently prompted by the realization that unless the Western European nations contribute more conventional forces to NATO there is little use in trying to build conventional forces sizable enough to deter the Soviets if they intend to invade Western Europe. Certainly the twelve German divisions which have been the source of so much American-French tension will not be sufficient to redress the imbalance of conventional forces which at present so overwhelmingly favors the Communists in Europe. NATO's tacti-

[10] Robert Kleiman, "First Blueprint for Atomic War," *U. S. News and World Report*, February 25, 1955, p. 27.

cal air forces will in all likelihood acquit themselves well once NATO's other components have reached the stipulated levels of strength. They will still be at a geographic disadvantage, but little can be done to alter this fact without provoking the war which NATO strategy seeks to avoid. The demographic and economic structure of Europe could tolerate much larger ground forces than the European nations have thus far been willing to contribute. The risks of war must be made too great as regards not only nuclear but also conventional warfare. The only sound policy of "defense through deterrents" is to be strong in both kinds of weapons. If the NATO powers continue on their present course they will be at the mercy of the Soviet Union, and the rulers of that nation have no mercy. The West's only hope then for survival would rest on the unlikely contingency that the present struggle for power within the Soviet Union will prevent its rulers from taking advantage of the dilemma into which their diplomacy is so skillfully maneuvering the West.

Alvin J. Cottrell, Philadelphia, Pennsylvania, is instructor of political science in the University of Pennsylvania and research assistant in the University's Foreign Policy Research Institute. Air Power in the Modern Middle East

By PAUL M. A. LINEBARGER

IN a world increasingly troubled by the specter of strategic bombardment while at the same time more keenly conscious of the tactical limitations of air power, the problem of the Middle East is indeed an interesting one.

It is possible to guess at the strategy of the future and such a guess can be as scientific and valid as any estimate about a strategy that has been elaborated theoretically but not applied practically. The strategy of the past, though valid in many fundamental respects, has been modified irreversibly by the appearance of atomic and thermonuclear weapons.

Considered as an area, the Middle East [1] presents three outstanding and significant characteristics with respect to air strategy. First, it is a passive area. Second, it is a zone for air bases. Third, it is a petroleum source.

The Middle East is still a passive area in a world of air strategy. Though press reports from time to time indicate that Egypt is planning to undertake the manufacture of aircraft with the aid of German technicians, at present no Middle Eastern state has undertaken the manufacture of military or civil aircraft. Limited aircraft manufacture is probably feasible in Turkey. Israel possesses, at the least, the human and technological resources for the production of aircraft. But neither in these countries nor in Egypt nor in the more backward Arab states are aircraft actually being produced or likely soon to be produced. For the present and the near future air power will not really originate in Middle Eastern territory.

Whatever air power may be exercised will be exercised by air frames, engines, and weapons produced either in the free world or in the Communist world. In some cases the aircraft may operate under the actual name, flag, and legal ownership of the producers, whoever they may be. In other instances the title may be transferred to Middle Eastern states and the aircraft in turn be employed by those states. Such a dependence on externally produced aircraft does not augur the playing of independent roles as air powers by the Middle Eastern States.[2]

Secondly, the Middle East is an important forward zone of the free world. Possession of this zone is, resources apart, a vital element in the early-warning and forward-support-point tactics requisite to free-world strategy in the event of a conflict with Soviet power. The Middle East cannot be called a buffer zone if none of it is in Soviet hands and if its neutrality is a neutrality essentially unfriendly to the Soviet Union.

Radii of 1,000, 2,000, and 5,000 kilometers drawn from the major air bases of the Middle East comprise many of

[1] For the purpose of this discussion the Middle East comprises the Arab states of Arabia proper and the Persian Gulf, together with all the states of the Levant, including Turkey, Israel, and Egypt.

[2] The recent seizure of Burmese Spitfires by the Lebanese authorities is a case in point. The Israeli had allegedly sold the Spitfires because they had obtained more modern jet fighters and were able to secure a good price from the government of the Union of Burma. The government of Lebanon seized these Spitfires pending a clarification of their precise title and an examination of the military value to Israel of such a sale.

the most sensitive targets of the modern world in both the Soviet and free-world spheres of influence.

Third, the Middle East is vital to the interstrategy period of air power because of its role as a massive, even a decisive, supplier of petroleum.

RECENT MIDDLE EASTERN STRATEGIES

Western discussions of international affairs often overlook the fact, tragic for the peoples and leaders involved, that the Far East and Middle East lost their last pretenses to autonomous strategic existence only in the very recent past. For example, the final death of China as a great power can be marked either from the shocking destruction of the suicidal wooden fleets at Foochow by the French ironclads on August 23, 1884, or the arrival of the international army in Peking on August 14, 1900. In the Middle East, Turkey held on even longer than China and survived as some kind of a power on the world scene until the conclusion of the armistice at Moudros on October 30, 1918. At the end of World War I Turkey's strategic position underwent a profound change when the Ottoman Empire collapsed along with her ally, the German Empire, and dissolved at the same time as her ancient enemy, the Czarist Empire.

In the Far East, China collapsed in the very decades that Japan made a unique effort to reaffirm political and strategic independence by modernizing the Japanese weapons systems and their industrial and human bases. In a sense, therefore, the modern Far East has never been without some kind of a potential great power of local origin—first, China; then as China fell, Japan; then after the fall of militarist Japan, China once more, this time under Communist control. The Japanese defeated the Russians in 1905, the Japanese defeated the Americans in 1942, and then (in Chinese eyes) the Chinese defeated the Americans in 1950–53. The Far East has always had some kind of local military power in operational existence.

Middle East since World War I

No close parallel exists to this situation in the Middle East, even though Turkey and Persia alternated as centers of power for the Middle East in the centuries following the European Renaissance. The collapse of the Ottoman Empire and the appearance of the Arab states marked the very real end of an era. At the most, the Middle Eastern states might have exercised a feeble degree of influence on local strategy in the years between World War I and World War II. Their influence was never more than feeble and in no sense decisive on the world scene. When Rommel and Alexander fought historical battles which settled the fate of North Africa the Egyptians were scarcely more than bystanders, despite the notable assistance which many of them as individuals offered to the British Eighth Army.

The unfortunate attempt of Rashid Ali al-Gailani to bring Iraq into World War II on the side of the Axis provided only a limited and inconclusive test of the limits to which an air perimeter could be pushed.

It will be remembered that Hitler's Reich tried to support the anti-British Iraqi through Vichyite Syria, but that the German air lanes were too thin and the British sea lanes through the Persian Gulf too heavy to permit German air to do more than delay the inevitable victory of British surface forces.

Perhaps Hitler made a basic miscalculation by not regarding the Middle East as a double fulcrum for his global strategy. He might have tipped the balance of petroleum supplies in his own favor by attacking and conquering the Middle East down to Palestine and over to the Persian Gulf; the same physical terrain which would have given him almost unlimited oil supplies would at the same time have completed his encirclement of the European territories of the USSR. Both logistically and geographically, he lost a great deal by holding back from the Middle East and attacking Russia instead.

Even in the years that were crucial for Germany the leaders of Turkey, the Arab states, and Iran were unable to bargain effectively with the contestants in World War II precisely because these states did not have the strategic independence, measured by the possession of massive weapons of their own, with which to bargain. Their part of the world was held too closely in the Allied grip to give these leaders anything more than a nuisance value.

PRESENT-DAY STRATEGIC CONSIDERATIONS

A sharp distinction must be made between strategic considerations which apply entirely within the Middle East and those which apply to the Middle East from the world outside.

Within the Middle East all other political considerations are subordinated to the unfinished (and perhaps unfinishable) war between the Arab states and Israel. This unfortunate political and military phenomenon has been frozen by a United Nations armistice arrangement, leading to a condition of neither war nor peace.

On Israel's side considerations of defense are, of course, paramount. The territory of the new state is not well designed for maximum strategic security. An adjustment of frontiers reducing the size of Israel would not be one which would appeal to the Israeli people or their leaders, while an extension of Israel's present frontiers would be certain to cause further difficulties with the Arabs.

On the side of the Arab states, there is a profound and often inarticulate resolution to do incompatible things. From a serious Arab point of view Israel is the latest of many European invasions of Asia. The Arabs have weathered other invasions in the past. Given time, they can weather this one. Such an approach causes them to take the "long view" of the situation and actually induces a considerable moderateness of behavior. Unfortunately a contrary view also applies which can be summarized in this way: The existence of Israel is an outrage to the Arab world; the Palestinian Arab refugees call for vengeance or for justice (depending on which Arab is speaking).

The minimum Arab program is a military assault against Jewish injustices and invasion, but there is an enormous difference between an assault which should take place next year and one which might just as well be planned for A.D. 2455.

All three of the local strategies just mentioned have their corollaries in air-power requisites.

Israeli air power

The Israeli position requires a peculiar and interesting adaptation of the air strategy of the small power—an adaptation reminiscent of Chiang Kai-shek's dominating the air space over continental China in 1930 with about 135 planes, precisely because his antagonists did not have more than one to five planes apiece and therefore did not dare fly opposing aircraft at all. As long as the Arab states have small or inadequate air forces it is only necessary for Israel to remain one step ahead of them, whatever that step may be, in order to retain air superiority and with

it an effective prevention against heavy surprise land attack and a corresponding potential of interference with an open land attack.[3]

Arab attitudes

An Arab strategy of the "long view" would involve substantial Arab postponement of the economic and financial burdens of supporting air power until the coming of an Arab version of *der Tag*. To a Sun Tzŭ or a Machiavelli it might seem wise for the Arabs to do nothing until a few generations or centuries have passed—on the assumption that as the destiny of all mankind changes the Arabs are sooner or later bound to find themselves once again in a very favorable political and strategic position.

Unfortunately, ordinary human beings are rarely constituted with the classic kind of patience so often attributed to the Vatican or to the Forbidden City in Peking. Though Arab leaders may be confident of an ultimate victory, most of them cannot forego the demands of honor, conscience, or opportunity requiring a present struggle.

Irregular or guerrilla warfare against Israel has been forestalled by the exchange of bestialities between the Israeli and the Arabs, each of whom profited by the use of terror and atrocity against the British and dropped such measures against each other only when they were met in kind.

Arab air-power potential

The worst unbalance between the Arabs and the Israeli today lies in the matter of air power, both actual and short-run potential. Immediate struggle on the part of the Arab states means that the Arab states with all their handicaps must develop their own power in the air. The first requirement for any kind of air power is ground personnel capable of maintaining the aircraft and the required ground installations. If civil aviation is any criterion, the Arab states have already made a beginning. The next requirement is participation in the expensive and nerve-racking competition of air readiness: the purchase and maintenance of more and better aircraft than those possessed by one's potential antagonists.[4] In this respect the Arab states are faced by a lamentable anomaly. Those states which through their possession of oil and the resulting bonanza from oil royalties can most afford to expend the surplus capital required for a modern air force are precisely those which have the fewest modern Arabs ready to go into service as mechanics, electronic engineers, airfield service crews, and pilots. The Arab states which are already modern to a high degree—Egypt, Lebanon, Syria—do not have the surplus income necessary to support air forces superior to those of Israel.[5]

Furthermore, it would be difficult for the Arabs to know at what point they had really outstripped Israel. An armaments race in jet fighter-bombers can become inordinately expensive. Arab use of "an ocean of men" tactics such as those developed by the strategists of the "Chinese People's Volunteer Forces" in the recent Korean War would offset part of a putative Arab inferiority in aircraft, but the humanitarianism of Islam might flinch at the sacrifice of one's own soldiers which the brutal Russian and Chinese Marxist dictatorships have been able to accomplish.

The outside world

Finally, it must be said that the internal strategy of the Middle East is virtually a playroom in an adult world. None of the Middle Eastern states possesses atomic armaments or the faintest immediate prospect of acquiring them. No local strategy makes sense unless it is based on the premise that the great atomic powers in the outside world would actually permit the local powers to fight the Palestinian issue to a conclusive finish.

Without a capacity to retain the advantages secured by war neither Israeli nor Arabs would be wise in undertaking one. While it is obvious that the Western powers would not permit intervention by Soviet military forces in the area, it is not at all obvious that the Soviet Union would obstruct the Anglo-Franco-American use of UN machinery to prevent either the expansion or the extirpation of Israel. Neither the North Atlantic Treaty Organization powers nor the Soviet bloc have anything to gain by tolerating a purely local war in Palestine. Although the United Nations possesses no military forces of its own, it has at its indirect command a degree of military force which, so far as the Middle Eastern area is concerned, can be considered overwhelming. Opportunity for a conclusive decision for either side in the Palestine situation can be found only in a deadlock between the NATO and Soviet groups more complete than any deadlock thus far seen.

OUTSIDE STRATEGIES AND THE MIDDLE EAST

Anyone who has traveled recently in the Middle East will be impressed by the comforting reassurance that Middle Eastern air space still lies comfortably within the strategic territory of free world air power.

From Abadan and Dhahran in the east to Addis Ababa in the south, from Cairo in the southwest to Istanbul in the northwest, the area is traversed by military and civilian air lanes which provide an undisputed demonstration of existing corridors of Western civil and military air power. For the greater part the commercial aircraft are American or European in ownership and almost without exception they are American in origin. Military Air Transport Service planes are as common a sight in the Middle East as they are in many parts of the United States. (Local disturbances can at any time shut down any of these airports, but it is improbable that simultaneous local disturbances could close down all of them at one time.) For the time at least the Western world is predominant in Middle Eastern air.

What use can the West make of Mid-

[3] In any Arab-Israeli conflict the Arabs would be fighting along relatively long lines of communication for two-thirds of the distance around Israel; their lines to modern urban supply zones, seaports, and repair shops would be short only to the north in the direction of Damascus and Beirut. While sharp, short Arab raids could not be prevented by Israeli aircraft, anything in the way of a real Arab invasion could be hampered, if not interdicted, by Israeli possession of somewhat more modern and somewhat more numerous aircraft—providing, of course, Israeli land forces remained efficient and modern to make up for their shortages of number and breadth of defensive perimeter.

[4] When allowing for Arab weaknesses the Americans should not tip the scale too far. The ancestral memories of Americans include Old Testament images as well as novels of the Romantic period which make of the Near East a panorama of caravans, nomads, horsemen, and camels. The extensive motorization of a great deal of the everyday life of the Middle Eastern states is already an accomplished reality. Much of this could be transformed into motorized military power, providing the Arabs at least one of the ingredients of mobility necessary to offset Israeli superiority in the air.

[5] An organic union of all the Arab states or, at the least, an organic union of Saudi Arabia and Egypt would of course remedy this situation. Short of an organic union even a close and dependable alliance might turn the trick. There are rumors of close cooperation between Saudi Arabia and Egypt, but nothing substantial enough to affect the Middle Eastern balance of power has as yet been forthcoming.

dle Eastern air? Three basic points can be observed:

Oil

Foremost, Western air power in the Middle East can deny to the Soviet world the opportunity for a land grab which would tip the world balance of petroleum resources, both actual and reserve, in favor of the USSR. It is possible at any time for the Soviet forces to start a war in this area; it is virtually certain that such an enterprise would meet with strong initial success; equally is it certain that a Soviet attack would gain the USSR nothing worth having as long as the West possesses deployable strategic bombers and the atomic weapons to destroy anything of value which the Soviets might obtain. No one has yet claimed to have invented the unbombable oil well or the invisible petroleum refinery.
