The temple is made of stone-bricks chiselled out from the neighbouring hillock whose stone is durable for building purposes. The stone slabs were first levelled and chiselled on the hill and were taken therefrom to be used as we notice, while walking on the hillock, at several places. These stone slabs are joined with each other by mud plaster.

In the inner side of the temple there are four massive stone columns, one in each corner supporting the ceiling or we may call it the roof. These columns measure nearly 36 feet in height and 7 feet in circumference. On the uppermost portion of these columns are to be found winged figures facing each other. But due to our misfortune at the time of our visit these figures were covered by bee-hives and we could not identify them.

The ceiling in between these columns is in gradually diminishing circles making the Shikhara hollow. The ceiling is carved out in intersecting geometrical and other designs of a masterhand. But as was ordained nothing has survived in the centre.

In the centre of the *sanctum* there is the Argha of the *lingam* made of a single massive stone block on which rests the *lingam*, the object of worship. The *lingam* is of massive cylindrical stone inserted in the Argha. There are many *lingams* in India having one Mukha to four Mukhas but the *lingam* of reference is not of any Mukha. The height of Argha and *lingam* is about 14 feet. The measurement of the *lingam* alone is approximately 7 feet in height and the circumference can be measured by stretching the arms of four persons joined together as we did at the time of our visit. Facing the door are to be found two lines one smaller than the other joining together making a figure like A as it may be seen in the photograph of the *lingam*.

The jambs of the door are made of stone slabs. There are seven jambs on each side of the door

making the symmetry. On these jambs figures of human beings and foliage are carved out in low relief. But Nature did not like to see the beauty of the jambs and she did not allow to stand some jambs of the left side. Thus Nature has made these beautiful jambs ugly.

The fallen stones of the Shikhara are lying by the right side of the temple. A large number of stone bricks have been taken away by the village people to build the walls of their *kuncha* houses. The remaining stone bricks are being taken away by the people of the village as the place is unguarded. It is fortunate that the Archaeological Department of Bhopal has taken it under its protection as we come to learn later.

Jambs of the right hand of the door

In front of the temple there is a small hut in which a *pujari* or priest of the temple dwells. This priest looks after the temple and the object of worship, the *Lingam*. Still now the people of the locality come and offer their prayers to get their desires fulfilled through the mercy of the Lord Shiva.

The department of Archaeology has taken it under its protection and due publicity will help in attracting people of different classes to visit this sleeping memorial of a glorious past.

HELEN KELLER—A NEW STAR OF HOPE

By PARIMAL CHANDRA MUKHERJEE

"THE more hazardous an enterprise becomes, the greater thrill and confidence I feel in myself." With these significant words Dr. (Miss) Helen Keller not only expresses her delight and fearlessness in air travel, but also indicates her faith in the 'generous beams of science' which she wants to follow without fear and plead to the world 'the wonders of co-operation and brotherhood which grows and flourishes through human

Helen Keller—A sketch

influence.' No, it is a step further, it marks the triumph of human spirit over odds posed by Nature. This faith has not only sustained her but has also made her conquer despair and made herself a living message to the handicapped, nay, to the humanity at large. This is how she expresses herself:

"I did feel sad and discouraged on certain occasions, but that was not because I was blind and deaf; the human miseries and sufferings only made me feel sad and despondent. My factual relief is that if they (the handicapped) put faith in themselves and reject all gloomy views of blindness, their problems and difficulties will flee before them as the night before the morning."

Her patience, perseverance and aspirations since she lost her sight and became deaf and dumb, at the age of her eighteenth month, have brought her to this unshakable state of mind. She is majestic yet humble to-day. Like a devotee her modest words will leave little room of doubt as regards her sincerity:

"I have seen thousands of brave people who have overcome handicaps greater than that I have known unfolding their resources of will-power. When I think of these persons, I feel very humble indeed."

This will-power has made her a guiding light marching along the paths of peace. Yes, it is real peace that she has discovered and peace that she stands for. That is why, while ordinary hazards of life only add romance to existence, the Atom and H-Bombs reveal to her as great terrors "which if unleashed could spell ruination and devastation."

Although it is amazing, no, a miracle to think about her life and achievements, yet if we sit quietly and pause for a moment it will not be difficult for us to discover that every single human being suffers from one handicap or the other—some from physical while others from mental. While many strive and rise above them, others succumb and surrender for so many reasons, important of which are lack of trust in themselves and will to rise above what they are. All great men and women bear testimony to this, and Helen Keller is no exception to that. Through almost complete seven decades she has studied, worked and travelled without any rest, without indulging in any personal effects whatsoever, with one single aim and that is to lay a treadable road, if not a straight and smooth one, for those who are, and will be afflicted with darkness! She never hesitated, never stopped—in fact she fell in love with and married her aim. And such is the depth of this love that her mind could never respond to the call of marriage union without *his* being converted to the same ideal. Who could be! Strangely enough, it proved to be none, in spite of the fact that she is a "gracious, compassionate woman of singular intellectual attainment and compelling personal charm" and that she has won friends in all parts of the world by her sparkling sense of humour, vitality and, last, though not the least, the warmth of her hand-clasp!

Yes, these palms alone are more than our eyes, ears and tongues. It is through this medium only that she received her first lesson which gradually rather in a very short while helped her to grow into a full-grown super-intellectual, writing, addressing, travelling throughout the length and breadth of the world, enjoying music, motion pictures and all arts and crafts. All sounds and music which are nothing but vibrations cannot by-pass her. She catches them and it is no wonder that you will find her in theatres and motion-picture shows while a companion spells the plot into her hands.

HELEN KELLER—A NEW STAR OF HOPE

387

Her beginning in this world of darkness, her meeting with her teacher are as much surprising as her achievements. Who can say that it was really not a good luck to the world that she was born in a well-to-do family with a loving father!

A born genius and source of inexhaustible perseverance, she was growing restless, whimsical, expressing her wants by signs up to the age of six; nothing could be taught. But soon she meets her "guardian angel" Miss Anne Sullivan, a gifted though young teacher from Perkins Institution in Boston, a famous American School for the blind, who happened to be her constant companion for the next 50 years of her life. This lady, Miss Sullivan, for whom no tribute as teacher is too much, soon realized that the education of this child will be a distinguishing event of her life. Soon the entire nation came to know about this "mental prodigy" and had been watching the progress with great interest. The meeting of Miss Sullivan and Helen Keller can almost be compared to that of Shri Shri Ramakrishna and Swami Vivekananda who immediately saw in each other the personification of each other's object, and worked both together toiling, labouring, and achieving things which are little short of miracles.

Helen Keller, even as a child in spite of all possible worldly comforts, was pining for light and love. The day she met Miss Sullivan, she discovered her home too.

The moment she came to know the means of methodical learning, she "spent almost every waking hour with her teacher, to know more and more. In addition, her family and household was quite a large and busy one. Quite a good number of adults, children and servants, constant visits of guests of all types and shades, provided her ample resources to have a dip into the human character. To this were added the farm activities, the animals, the flowers, orchards, woods, fields, and streams. All these together provided ample materials for her awakening mind; and soon she came to know what they are.

This practical touch with all aspects of human life made her a woman and not a scholar away from the daily life of common men and women and their sufferings. Her good education and better taste have not only brought her up, but has made her taste what life is. And it is her earnest desire that every single human soul deprived of sight or any other handicap should be brought out of that sense of inferiority and taught to forget their difference.

That is why she did not stop when her academic career came to a close. Waves of the silent call of the handicapped-humanity made her restless. She started an active life and visited Japan, Korea, and Manchuria, for and on behalf of the blind.

At the cessation of World War II, the stories of the war blind sent her across from Britain to France, from there to Italy and Greece to study first-hand their problems and what really can be done for them.

Later on, in 1948, she travelled through India, Pakistan, Australia, New Zealand, Japan, the Philippines, Korea, China, and the Middle East. All this was with one single aim and that is to help formulate policies and programmes for the handicapped.

Quite at home with Dr. Radhakrishnan

In her travel from one country to another, she not only feel the difference by the atmospheric touch and smell, but even the approach of mountain is obvious to her and she fully appreciates the thrills and adventures of height, hazards, and awe-inspiring majesty. A flint stone brought from the top of the Everest was touched by her and she remarked:

"When I touched the stone I felt a wonderful thrill of the Everest looking down upon the world through a mist of greatness."

Being deaf she had no idea as to what sound was but nothing could stand on her way. There was day, there was night, and she had the energy to work ceaselessly. The result is, she can speak to-day. It took her twenty-five years to develop this power of speech although it is not always very distinct. Having no idea about the immediate reaction of the audience her speech sometimes runs faster than could be understood. At such moments Miss Thompson, her constant companion, has to caution her for a slow speech. Her concentration for reception is so perfect today that in spite of her being completely deaf she can hear if one speaks to her slowly and clearly.

Even as a student at Radcliffe her career as a literary figure started. At the end of the second year she wrote her first book *The Story of My Life* which not only made her known to the world, but at once made her one of the most inspiring figures in public life. Since then, she has written many other books including *The World I Live in*; *Out of the Dark*; *My Religion*; *Mid Stream*; *My Later Life*; *Peace at Eventide*; *Helen Keller in Scotland*; and *Let Us Have Faith*.

Like everything else she is exacting in her writing too. She writes and revises them over and over again till they meet her standard. Although she can use both ordinary typewriter and a Braille writing machine, as she cannot read what she types, her composition naturally is slow. But steady she is and success is hers therefore too.

Her palms are her eyes and ears

She is not only a scholar, and an author, but also an artist in the truest sense of the term. And that is why when she travels she tries to discover the soul and expression of the country. She intends to visit the Tajmahal and feel its exquisite beauty of arts and crafts for two reasons; one, because she thinks that this is not only a great heritage of India, but an essential expression of her (India's) soul too; secondly because, she wants to carry this feeling with her to spread it to all the handicapped through their language. This desire is like ours to carry a good thing for our near and dear ones. To her the humanity she represents is near and dear.

She does not want to miss any opportunity to popularise and further her aim. Based on her life story a documentary film, *The Unconquered*, has been made. She has played the heroine herself. Nothing could be more realistic.

To have praise for one and to follow him or her is quite a different thing. Although Americans had been watching her progress with great interest, yet she did not have a smooth way for aiding legislation for the handicapped. She had to fight an untiring battle appearing before the US Congress and State Legislatures.

Throughout the length of her seventy-five years she has met many great persons. Most of them considered it a great honour to be able to meet her. In the course of her four months' tour of the Far East in 1955 sponsored by the American Foundation of Overseas Blind, in co-operation with the Indian Ministry of Education, she did not fail to meet Sri Nehru, Dr. Rajendra Prasad and Dr. Radhakrishnan. She touched their faces and foreheads and found Sri Nehru "undoubtedly a very great man" . . . "was much impressed by his nobility, upward and inward qualities embodied in the dome of his forehead." She was also "touched by his gentle and thoughtful manners." She sincerely believes that "Sri Nehru is working mightily hard for peace . . ." Greatly spiritual as she is she did not fail to discuss the Bhagvatgita with Sri Nehru and took important clues to good translations which she intends to study.

The President Dr. Rajendra Prasad reveals himself to her "a darling, not only a fine personality but a great soul."

The history of life has presented rows of kings and emperors, Prime Ministers and other temporal Heads with all their pomp and grandeur the earth can produce, but rarely has it produced souls who by their work and faith lifted the humanity from dust, to march along to a peaceful and prosperous life. Amongst such immortals Helen Keller has stepped into by her undaunted spirit and an unshakable faith. The depth of this faith can only be understood in her own words so simply and clearly expressed:

"Faith is a safeguard to me against cynicism and despair. After all, faith is not one thing or two or three things; it is an indivisible totality of belief that inspires me—belief in God as infinite goodwill and all-seeing wisdom whose everlasting arms sustain me walking on the sea of life. Trust in my fellow-men, wonder at their fundamental goodness and confidence that after this night of sorrow and oppression they will rise up strong and beautiful in the glory of morning."

This is she—a new star of hope in the dark horizon emitting the light of joy to the millions of the handicapped. She has won many awards both from private as well as State sources, but are these enough? No. The greatest that this world can present her is a pledge to work ceaselessly till that day when no man or woman remains to be called as handicapped.

It is known that in one corner of the lawn of her residence there stands a Japanese stone lantern, eight feet high, with a constantly burning light—not to go out while she lives. This light in fact should be kept burning till that day when every single individual be a she or he becomes a self-respecting, independent citizen and the word 'handicap' (as understood today) disappears completely.

THE KHASIS

BY PRINCIPAL JOSEPH MINATTUR, M.A., LL.B., J.D.

THE Khasis who are in the van of the movement for a separate 'eastern hill state' are a very interesting people. They inhabit the United Khasi-Jaintia Hills District in Assam. There are 230,326 Khasis in Assam, 113,109 male, 117,217 female. Women exceed men considerably, 1036 women to 1,000 men. Literacy is higher among women than among men.

The Khasis are a handsome people with light olive-brown complexion. They are short and sturdy and have slightly depressed noses, black straight hair, and black or brown eyes that are almost almond-shaped. Their highly developed calves are considered an addition to their beauty, especially for women. Some women are very fair with wild-rose cheeks.

The Khasi men in Shillong have adopted European dress. The men in the villages wear a sleeveless cotton shirt, a loin-cloth or a dhoti, and a turban. On festive occasions they wear a silk loin-cloth or dhoti, a finely embroidered coat and a silver chain across the chest.

The Khasi woman is probably the most modestly dressed woman in the world, with the exception of *pardanashins*. Her dress reminds one of a Carmelite nun's religious habit. Even the religious habit stands second to the Khasi woman's dress in point of modesty.

The woman of the interior rural areas still wears the original Khasi dress. She wears next to her skin a piece of cloth called *ka jympien*, wound round her body and fastened at the loins. Over this is worn a long piece of cloth, usually of silk, called *ka jainsem*, which hangs loosely down to the ankles without being caught in at the waist and is kept in position by knotting it over both the shoulders. (In Shillong these days two pieces of cloth are used, one for each shoulder). Over the *jainsem* is worn the gay-coloured woollen *ka jainkup* which is thrown over the shoulders with its two ends knotted in front. It hangs down the back and the sides to the ankles. A woollen wrapper called *ka tapmohklich*, usually of some bright colour, is worn over the head and shoulders fastened around the neck. The skirt and the blouse or the frock and the chemise worn nowadays by the women in the towns are recent innovations induced by Western influences.

On ceremonial occasions the Khasi woman does not cover her head; she adorns her hair with jewellery or with flowers. She wears necklaces of coral and gold beads. The gold bead is a hollow globe filled with lac.

Both men and women carry a bag of cloth or leather with them for odds and ends. The commonest contents of the bag will invariably include a few pieces of the ever-needed betel-nut. The women of the town carry a leather bag slung across the shoulder.

The Khasi woman's dress has no parallel in India, except among the Syrians of Malabar. The Khasi dress strikes one as a wise adaptation of the Syro-Malabar woman's dress to suit the climatic conditions of a wind-

swept hilly region. The main difference seems to be that in place of the *tapmohklich* and the *jainkup*, the Malabar woman wears a long shawl which serves the purpose of both in a warmer climate. The shawl is worn over the head and shoulders and is allowed to flow down over the chest crosswise and is now and then kept in position or held intact with the hand.

The Khasi language has no script of its own. It is written in Roman script which was introduced by the Welsh missionaries who gave the tongue a written character.

THEIR ORIGIN

The origin of the Khasis is as misty as one of Shillong's wintry nights. They are probably Proto-Australoid, in spite of a few Mongoloid traits noticeable in their physical features. These traits may be later acquisitions due to their contact with the Mongoloids of the neighbouring areas.

Khasi children in dance dress

The Khasis speak a tongue which is related to the Mon-Khmer group belonging to the Austro-Asiatic branch of the Austric family of languages. The Munda speech of Chhota Nagpur is also related to the Mon-Khmer group. The Pnars or Jaintias (also called Syntengs) who inhabit the Jaintia Hills speak a tongue which is not very different from the Khasi language. The Pnar speech is very often taken to be a dialectal variation of Khasi. The Pnars are darker in complexion and follow the matrilineal system more rigorously than the Khasis. They probably constitute a link between the Mundas and the Khasis. They, like the Mundas, were more in touch with the Dinaric races of their neighbourhood while the Khasis felt the impact of the Mongoloid and the climatic condi-

tions of a higher plateau on their complexion, physical features and cultural outlook. It would appear that the Jaintias who still occupy the territory of their ancient residence are the parents of the present Khasis of the high hills and the War and Bhoi countries.

Khasi women

It is probable that the Mongoloids who effected a change in the physical features of the Khasis adopted the language and customs of the latter, especially because of the rigorous matrilineal social system of the Khasis. The Austric temper, in spite of a casual sprinkling of occasional abandon has in it great respect for convention. It is seen even now that the westerner or the man of the plains who marries a Khasi woman usually adopts the Khasi language and social usages including matriliney. Even if he does not, his children born of the union invariably take to the customs of their mother's community. An exception is sometimes made in regard to metonymy.

The Austric language is spoken, according to Schmidt, over a large area of the globe, extending from the Panjab in the west to Easter Island off the coast of South America in the east. Jean Przyluski thinks that the Austric linguistic zone extends further to the west of India. He sees in the Sumerian speech of Chaldea a language allied to the primitive Austric. The many parallels observed between the Khasis and the people of Malabar, especially the Chaldean Syro-Malabar community, are probably due to an ancient kinship in language and culture perhaps also in blood. The necklaces worn by the ancient Sumerian woman, as understood by Sir Leonard Wooley and others who conducted excavations at Ur in Mesopotamia, are exactly like the ones used by the Syrian Christian girls in Malabar and

the Khasi girls in Assam. Sir Leonard refers also to the gay garments of bright red woollen stuff worn by the Sumerian women. The parallel in dress between the Sumerian, the Syro-Malabar and the Khasi, women may appear far-fetched; but it becomes important when so many other points of affinity are also considered, for instance, the art of pottery, which would appear to have been unknown to the Negritos who were in all probability the earlier inhabitants of India.

It would appear that the Hebrews in the early days traced relationship, through the mother. We find Abraham marrying Sarah, a half-sister of his through his father's second wife, because Sarah belonged to a different clan. Though in a later period the Hebrews were definitely patrilineal, it is interesting to note that some of the patriarchs and their wives had matrilineal residence. Jacob, Moses and Samson were living with their fathers-in-law. From the Pentateuch of the Old Testament we gather that the naming of children was a right enjoyed by Hebrew mothers in the early period.

The Proto-Australoids are supposed to have been the original speakers of the Austric tongue. They were a very ancient offshoot of the Mediterranean race. It is therefore probable that the Proto-Australoids in their trek to India left some of their tribes on their way or that some kinsmen of those who migrated to India went to Mesopotamia and settled down there.

The stream of migration of the Austric-speaking Proto-Australoids seems to have started from the extreme western end of the entire tract, whether it is Chaldea or the Panjab, and to have worked eastwards and southwards. It is almost certain that it was from India that the Austric speech spread into the lands and islands of the east and the Pacific.

There might have been back-washes of immigration into India of the Austric-speaking Polynesians and Melanesians. It was probably the Polynesians who introduced the outrigger canoe and the coconut into India. It is intriguing to find that the Dravidian-speaking Malayali calls his land 'Kerala' (the land of coconut palms) and the southern part of his country 'Vanchinad' (the land of canoes).

THEIR CHARACTER

The Khasi, like his Austric-speaking brethren in other land, is given to cheerful hard work, sturdy gaiety and kindly simplicity. Even in the midst of strenuous, back-breaking labour, cheerfulness comes to him as naturally as flight to a bird. He is pre-eminently gregarious. He is fond of simple music. A bottle of *kiat*, a snatch of song and a girl-friend beside him can make him happier than a similar assortment of worldly goods could have made Omar Khayyam.

Many a Khasi woman who works day and night in the kitchen and the fields is so cheerful and is heard so merrily singing that one is apt to take her for a live wrap of wool surrounded by a song.

The Khasis have an infinite capacity for fun at work as well as at play. One could with eyes misted with

loving curiosity notice them coming to Shillong from neighbouring villages on a Barabazaar day. Crowding an ancient bus to double its capacity, they sit in one another's lap and laugh and joke among themselves. Someone, very often a pretty honey-coloured girl in her teens, starts singing a snatch of song, in which all join, with laughter for its burden. They seem to have a cool sense of the real values of life. "If we could only be a little like that!" whispers a spectator to himself.

The Khasis are possibly the world's sweetest-tempered people. Though they are easily offended, even for imaginary reasons, one does not often find them lose their temper.

They are well-ordered in their spirit. They are stubbornly honest. They have an instinctive aversion to humbug. They do not seek high rewards through guilt hypocrisy; nor do they court anything that is not within easy and honourable reach. A Khasi's principle of life is to live his life in such a way that he can look any man in the face and tell him to go to hell.

The Khasis have poise and polish. Every one of them is very polite without being servile; every one speaks to a visitor 'spicy little words with sweetness beneath.' Every one has a natural dignity without a shadow of arrogance. On the road the Khasi women carry all kinds of loads on their back—baskets of potatoes and dried fish, bundles of firewood, heaps of laundry, and babies in cloth-cradles. They move gracefully and with dignity among the crowds, oblivious of the women in silk *mekhalas* and gorgeous *saris*.

Hospitality is sacred to a Khasi and he offers what he has. At Cherrapunji a visitor may be overwhelmed by the golden oranges he is offered by the generous local people. It would seem that there is an unwritten Khasi law that no one may withhold help from anyone who is in need of it.

The Khasis are keen traders. Many of them, even old women with time on their hands and faces, earn their living by travelling from market to market with their heavy loads of goods.

Literate and diligent, with an easy susceptibility to new ideas that continue coming to the hills like electric pulsations, the Khasis have distinguished themselves in all walks of life. There have been Khasi cabinet ministers in all governments formed in Assam. One of them was a highly educated lady with University degrees in arts, law and education.

The Khasi's food is sparse in nutritive contents. It consists generally of rice and dried fish. How he manages to do hard work like carrying heavy loads must puzzle dieticians. Those who can afford, and they are not many, take pork, beef and any kind of game. The indigenous liquor called *kiat* made from rice or millet is the luxury and solace of the common man. Continual chewing of *pan* has become, for a Khasi, one of the necessities of life.

In some parts of Shillong, Khasis who know the gnawing of poverty huddle together thicker than sea-

birds on their rocks, in slums of medieval squalor. In Dawki and other areas bordering East Pakistan, Khasis live mainly on God's good air and green grass. Still they keep afloat the bubble and foam of happiness; they cherish an intense love of life and colour and sunlight. One watches them in a spirit of marvel unable to understand the spontaneous joy of the moment which is so natural to them and which all the motor cars, palatial houses and gadgets of big cities fail to call into existence.

A Khasi girl with sun-shade

THEIR CHILDREN

One of the most fascinating scenes in Shillong is the merry morning procession of children to school. With his chubby face, wild-rose cheeks and innocent eyes, Sobenshon proves that "heaven lies about us in our infancy." There is an angelic prospect about Serlymon with her white frock flowing down over her little tummy and her elfin light-blue head-dress framing a sweet, ruddy face, a few wavy locks showing on the forehead.

The Khasi child has endearing manners. Binola is always polite, gay and charming. She has a certain sense of *noblesse oblige*. She gets so much love from *kmie* and *kpa* and her tender relatives that she feels she must be responsible to it. As her mother has to go out for work, she learns to adjust herself to circumstances. She does not make either a silent or a screaming demand

for a baby-sitter. She finds comfort in the company of her elder brothers and sisters or of the children of the neighbouring house. It is fair that she should develop this sense of responsibility and accommodation even when very young, for, consider for a moment how tiring and tedious a job *kmie* does, as she goes on making, for hours on end, dancing movements with her whole body to lull to sleep the little Binola carried in a cloth-cradle on her back.

Linsimai in her infancy is fondled and kissed and hovered over not only by her parents but also by all their friends, relatives and visitors. She seems to be quite happy in her own warm loving household and does not seek frequent adventures outside.

In memoriam U Tirat Singh, Syiem of Nongkhlaw. One of his descendants is seen standing at the monument

Jren Manik is treated with so much loving kindness and constant anxious attention that occasionally for a change he is inclined to take the reins of household government. He starts a reign of terror for a brief while through his innate, infinite capacity for wild innocent wailing. The independent Khasi, for all his democratic traditions, submits himself for the moment to the minority rule of the child. But such occasions are very rare. The Khasi child is usually too good and too polite to be embarrassingly mischievous.

Khasi children are not problems. Bilrimai is seldom scolded and less often spanked. Still she grows up good and polite. Spare the child and toil the Lord was

spoken of the Khasi child. The Lord keeps her good and sweet and wise.

THEIR POLITICAL INSTITUTIONS

Khasi states remind one of Buddhist republics in ancient India. They were aristocratic republics. Though they had a mixed constitution with elements of monarchy, oligarchy and democracy, the prevailing note in many states was democratic, in some seemingly oligarchic and in none monarchic. Custom required that the Syiem or chief should be elected from the Syiem family. It was again customary to elect the brother in some states and the eldest son of the eldest uterine sister of the deceased chief in most states and the brother of the deceased chief in some other states. But he was to be elected by an electoral college. In some states, as in Langrin, all the adult male citizens formed the electoral body. In some others when the hereditary electoral college consisting of priests or headmen or both could not come to a unanimous decision, the entire body of the people exercised a right of referendum. Thus the ultimate power was vested in the people; the headmen and the priests who constituted the electoral college and those who sat on the durbar were representatives of the people. It is true they were not elected; but the avocations they followed in life gave them the status of a representative and when they, as heads of clans or priests, elected a chief or helped the chief decide a dispute, they were doing so as representatives of the people.

In the Khasi matrilineal society the rule of succession to syiemship was different from the rule of succession to real property. As in the royal families of Malabar, the customary right to succeed a Syiem went to the brother or the eldest son of the eldest uterine sister; but inheritance to real property was a right enjoyed by the youngest daughter of the family. In the absence of sons to the eldest sister, a Syiem was succeeded by the son of the next eldest sister. Thus by what has been called 'knight's move,' the right to succession rested with the son of the sister or niece of the deceased chief.

Though this was the customary rule of succession the electors could, when the situation demanded it, select a worthy chief from the Syiem's family or any other family, regardless of the claims of the brother or the son of the eldest sister. It is interesting to remember that in the Rig Vedic era, the *visah* (common people) who constituted the *rashtra* (national unit) exercised the same right of selection.

The Syiem in durbar conducted the affairs of the state. The *durbar* consisting of the *mantris* was an executive council. It had judicial powers too. The Syiem was not permitted to perform any act of importance without first obtaining the approval of the durbar.

The durbar, it would appear, corresponded to the *sabha* of the Vedic age. At the *sabha* consisted of the elect, that is, the *purohits* and the rich patrons, the durbar was constituted of the *lyngdohs* (priests) and the heads of the clans.

As God and Caesar were considered cater-cousins in early societies, conduct of the government by a council of elders was not considered undemocratic in principle. "The *gana* leaders," says the Mahabharata, "should be respected, as the worldly affairs depend to a great extent upon them. The spy and the secrecy of council should be left to the chiefs, for it is not fit that the entire body of the *gana* should hear those secret matters." Lord Buddha who adopted a democratic constitution for his religious organisation, following probably the example of Lichchhavi and other republican states of the period spoke of the Vajjians that so long as they met together in concord and carried out their undertakings in concord, acted in accordance with their ancient institutions, and honoured and esteemed and revered and supported the Vajjian elders and held it a point of duty to hearken to their words, they might be expected not to decline but to prosper. Thus hearkening to the elders as a point of duty was insisted upon in the republics of ancient India. It seems, therefore, that the membership of the durbar enjoyed by priests and headmen did not derogate from the basic democratic principle of the Khasi states.

The timeless piece of advice from the sacred lips of the Enlightened One that so long as the Vajjians carried out their undertakings in accord, they might be expected to prosper, is invested with an unfading freshness and timeliness all its own.

The democratic Khasi was never familiar with the conception of nomination by a higher authority and that is why the present-day Khasi does not take very kindly to the idea of nomination of members to the District Council, whether they be Khasi or *dkhar* (Khasi term for one from the plains).

The Syiem's main sources of revenue were the *pyushok* (contribution) voluntarily paid by the clans, the tolls levied from the various markets and judicial fines which were divided between him and the durbar.

There were twenty-five Khasi states. Khyrim, Mylliem, Cherra, Nongstoin and Nongkhaw were the most prominent among them. Shillong is within the territory of Mylliem; but the municipal area is administered by the Government of Assam and the Cantonment by the Union Government.

The *dolois* of the Mawlong syiemship and of the Jaintia Hills in their powers and duties corresponded to the *dalavas* of Travancore. In Travancore as also in the other royal families of Malabar, the rule of succession to kingship was almost the same as in the Khasi Hills.

The British came into contact with the Khasis in 1824. The Khasi chiefs gave permission to the British to construct a road through their territories connecting the Assam plains with Sylhet. But when they suspected that British roads and arms would not come all alone with no strings attached, they attacked the Europeans. This led to a series of engagements between the two powers. Warfare continued vigorously until in 1833 U. Tirat Singh, the Chief of Nongkhaw, was treacherously

captured and imprisoned. The British entered into a number of treaties with the Khasi chiefs and the states were granted many of the rights and privileges common to native states in British India.

The Sixth Schedule of the Constitution of India provides for an autonomous District Council for the United Khasi-Jaintia Hills District. The District Council was inaugurated in June, 1952. The syiemships with vague undefined powers continue to exist. They are now lorded over by three other democratic institutions—the District Council, the Government of Assam and the Union Government. The average Khasi who does not interest himself in the technicalities of Constitutions and schedules feels that he has too much democracy at his expense and to his cost.

THEIR RELIGION

The Khasi uses the word 'miam' to denote religion. It is a loan-word from Assamese or Bengali, meaning rules of conduct. The idea implied in the use of the word in the sense of religion may be that the Khasi's customs and manners are regulated by religion or that his usages form the bed-rock of religion.

The Khasi, by temperament and choice, is a highly religious person. Before he does anything important, it is customary for him to ascertain the will of God through some form of divination, usually through egg-breaking. The Khasi Presbyterian Christians seem to observe Sabbath more strictly than the Welsh Missionaries who converted them and who are themselves strict observers of the day.

The Khasi religion is monotheistic. God, called U. Blei in Khasi, is the creator and preserver of life, lord and master, omnipresent, omniscient and the ultimate cause (U. Blei U. Nongstoin) to Whom all homage is due. God (U. Blei) as Creator and Master is thought of as a male, U. being the definite article for the masculine gender, and God (Ka Blei) as preserver and controller is conceived of as a female, Ka being the definite article, denoting the feminine gender. It is noteworthy that at the marriage ceremony God is addressed U. Blei-Ka Blei, probably suggesting the union of the couple which should be a reflexion of the unity of the godhead, though spoken of in duality. This division of powers and duties between godhead as conceived of as male and godhead as thought of as female may be due to the matrilineal system in which there is a division of powers between the uncle and the youngest niece. It can also be the other way about, that religion influenced the working out of details in the social set-up.

The Khasi neither makes nor worships any image of the divine, nor does he have any temple or place of worship.

To him material existence upon this earth is a life of temporary encasement (Ka ruh shong bynda); and the earth itself is a place of temporary abode (Ka pyrthei shong besa).

He believes in an immortal soul which leaves the body at death and goes to the house of God the Creator or to His garden where there are groves upon groves of betelnut palms. A departed soul is usually referred to as one who is eating betelnut in God's house. To eat betelnut ceaselessly is considered extremely pleasant for a Khasi and the eating of betelnut in God's house may be an expression in human terms of the idea of supreme happiness in heaven. It may also mean that U. Blei has taken the departed soul to Himself and is entertaining him with betelnut.

The Khasi believes in a myriad of spirits, all under the control of U. Blei. When man commits sin, God permits evil spirits to visit him with ailments or calamities in punishment for his transgression. Then through some divination it is ascertained which spirit is causing the trouble and how he has to be propitiated. If such attempts at propitiation fail, the Khasi believes that it is the will of God that he should suffer. He is aware of the seriousness of sin, a transgression against the law of God. Sin is a *sang*, that which is gaping, that which cannot be bridged, that which keeps man away from God.

The Khasi idea of the expiation of sin is strangely Christian in its character. Experts at 'egg-healing' repeat the formula, "I man have sinned." The cock who appears as a mediator between man and God is described as "the son of God (*Ka Blei*) who lay down his neck (life) for me man." In one prayer God is asked not to forget the covenant (agreement or promise): "O God, do not forget the covenant, arise oh man." The idea seems to be that man has offended God by committing sin but God is expected to spare him according to the agreement and accept in his place the cock who is styled "the son of God," horn of the female quiddity. All this is reminiscent of the promise in Eden and the expiation of the sins of the world by the son of God.

The spirits of those who die in sin (*sang*) are obliged to wander about the earth in various forms.

The Khasis do not worship the dead. The giving of food (*ai bam*) to the spirits of the departed ancestors is to win their favour and blessing. These spirits being in the house of God are in a position to intercede for the living before God and secure His help and protection for them.

The dead are cremated and the bones placed in the sepulchre of the clan. Huge stone monuments are erected in honour of the illustrious dead. These are cenotaphs and not tombstones, as the tomb in which the bones are deposited may be at some distance from the monoliths.

Some Khasis are believed to propitiate with human sacrifices a snake called *U Thlen* who rewards them with wealth and happiness on earth.

With the concept of monotheism and expiation for sins in their own religion, to many Khasis, Christianity might have appeared strangely familiar. That is probably why a large number of them took to Christian-

ity as readily and delightfully as they take to sunshine in winter. It is possible that the mystery of the Holy Trinity in the Christian conception of God is easily acceptable to a people who have an imageless concept of *U Blei-Ka Blei*, the one deity in the aspect of two.

THEIR SOCIAL CUSTOMS

The Khasi community is composed of a number of exogamous clans. A clan comprises all the descendants of one common ancestress. A Khasi is forbidden to take a wife from his clan or sub-clan. A Khasi of the Diengdoh clan, for instance, should not marry a Khasi of the same clan or a Phar of the Lalu clan. For the lineage of the Diengdohs and the Lalus is traced to the same common ancestress and they, therefore, belong to the same clan.

A Khasi cannot commit a more heinous sin than to marry within the clan. To do so will entail the most serious social and religious consequences. The couple will be excommunicated, funeral ceremonies will be refused at their death and their bones will not be placed in the sepulchre of their clans.

Like the people of Malabar with whom they have many things in common, the Khasis follow matriliney. In a Khasi family it is the youngest daughter who inherits the family property. The other daughters are given some share at their mother's death.

Men are more respected in the matrilineal Khasi society than they generally are in a patrilineal society. In communities where patriliney prevails, a man is regarded with respect in his own family only; in a matrilineal social system he is esteemed in two families, as brother and uncle in his mother's family and as husband and father in his wife's family. His youngest sister who holds the family property in consideration of her responsibilities for the performance of the religious rites of the family seeks his advice in all matters of importance.

The matrilineal system does not affect a woman economically if a marriage turns out to be a failure. Such a failure by itself is a calamity. Why should a social system add to it an economic disaster as is done in the patrilineal society? And why should the children be left unrequited for and almost destitute? If matrilocal residence of the bride is customary as it is among the Jaintias and as it used to be among the Nayars of Malabar, matrilineal marriages are happier for the bride, as she has not to adapt herself to the ways of a generally unsympathetic mother-in-law. Among the Khasis matrilocal residence of the bride is insisted upon till a child is born to the couple; after that the husband and wife may have a home of their own. An exception is usually thought of for the youngest daughter, who, because of her special responsibilities, has to live in her mother's house.

Most things run smoothly in the Khasi society. Even divorce is no exception. One has not to devise schemes for colluding without collusion or accuse one's partner of cruelties he or she never even imagined. One

has only to tell the Syiem in durbar why the partners cannot get along together. And if the couple are determined on a divorce, the Syiem grants it. But divorces are not so common as in some of the western countries. The percentage of happy marriages in the matrilineal Khasi society seems to be much higher than in the patrilineal societies in India. And what adds a glittering halo to these marriages is the fact that they are held together until death do the partners part, not by the fear of the adverse economic or social consequences which may appear in the wake of a divorce, but by sheer genuine affection.

It is probably these circumstances that have tended

—:O:—

GANDHI, THE CHAMPION OF DECENTRALISATION

By BUOYLAL CHATTERJEE

MAHATMA GANDHI had not yet become a world figure. He was leaving for Natal. His friend Mr. Polak had come to the station to see him off. He left with him a book to read during the journey. It was Ruskin's *Unto This Last*. Gandhiji writes in his autobiography:

"The book was impossible to lay aside, once I had begun it. It gripped me. Johannesburg to Durban was a twenty-four hours' journey. The train reached there in the evening. I could not get any sleep that night. I determined to change my life in accordance with the ideals of the book."

When Gandhiji reached Durban his life had already been transformed by the tremendous ideas of a master-mind of the modern world. A great thinker changes the whole system of our organised perceptions. When Ruskin wrote *Unto This Last* perhaps he knew that a day would come when the power of his mighty thoughts would open before the eyes of a young Indian barrister in South Africa a new version of the world, a new path to truth. It was intended by Destiny that a man who would usher in a most magnificent new era in the benighted life of an unhappy nation should be fully equipped with revolutionary ideas that would give him courage and determination to fight for political and economic democracy for over half a century.

Many years ago I read a book by Bernard Shaw in which I came across the following lines:

"I have met in my lifetime some extremely revolutionary characters; and quite a large number of them, when I have asked 'Who put you on to this revolutionary line? Was it Marx?' have answered 'No, it was Ruskin.' Generally the Ruskinite is the most thorough-going of the opponents of our existing state of society."

And again Shaw remarks:

"It goes without saying of course that he was a communist."

to make the average Khasi girl more open-minded and straightforward in her behaviour than her sisters elsewhere. She moves in society naturally and gracefully without any lurking fear that her conduct may be liable to criticism.

Because of the matrilineal system, children are not adversely affected if their father dies or when there is a separation or divorce between their parents. They are very well looked after and educated in their mother's home.

If pursuit of happiness is the motif for a social set-up, the Khasi system seems to be one of those best suited for the purpose.

Shaw had no doubt that Ruskin was a communist.

Gandhi, a Ruskinite, was certainly a thoroughgoing opponent of our existing state of society. In his *Constructive Programme* Gandhi wrote that Working for Economic Equality was 'the master-key to non-violent Independence.' The valuable booklet contains the following thought-provoking lines:

"A non-violent system of government is clearly an impossibility so long as the wide gulf between the rich and the hungry millions persists. The contrast between the palaces of New Delhi and the miserable hovels of the poor labouring class cannot last one day in a free India in which the poor will enjoy the same power as the richest in the land."

Regarding the significance of 'Working for Economic Equality' Gandhi writes:

"It means the levelling down of the few rich in whose hands is concentrated the bulk of the nation's wealth on one hand, and a levelling up of the semi-starved naked millions on the other."

It was because Gandhi was a Ruskinite in the true sense of the word and was a firm believer in economic democracy that he advocated the principle of decentralisation of economic and political power. His distrust of the State in economic reform was based on the belief that even representative Governments are too easily dominated by the holders of economic power. He wished to see society organised so that it should be malleable to the general will. His advocacy of Charkha and village industries amply demonstrated his living faith in decentralisation of economic power. George Russel, popularly known as A.E. wrote in *The National Being*:

"It is by a predominating idea that nations achieve the practical unity of their citizens, and national progress becomes possible."

And when starving millions cry for food the only dominant idea that can influence their minds is the idea of democratic control of the economic life of the nation. I think it is G.K. Chesterton who wrote:

"If a ship is being wrecked, we organise a life-boat; if a house is on fire we organise a blanket; if half a nation is starving we must organise work and food."

Gandhi saw India was starving and he organised work and food. He placed before us Khadi. It meant decentralisation of the production and distribution of the necessities of life. Gandhi wrote:

"Khadi to me is the symbol of unity of Indian humanity, of its economic freedom and equality, and, therefore, ultimately, in the poetic expression of Jawaharlal Nehru, 'the livery of India's freedom'."

But Gandhi was a practical idealist. He recognised the value of heavy industries and knew that they would be necessarily centralised. Only such centralised heavy industries should never be controlled by private capitalists. They had to be nationalised. And Gandhi wrote:

"Heavy industries will necessarily be centralised and nationalised. But they will occupy the least part of the vast national activity in the villages."

Gandhi, the disciple of Ruskin, stood for economic freedom of the masses and he saw clearly that such economic freedom would remain an impossible dream unless the idea of democratic control of the economic life of the nation was a reality. Gandhi had little faith in centralisation of economic and political power. The production and distribution of the elementary necessities of life, such as food, clothing and shelter could not be left in the control of the Government. For in the struggles between rich and poor, between capital and labour there was every possibility that the holders of economic power might capture the political power and use that power to enhance their own interests. Gandhi, therefore, exhorted us to find all the necessities of life in India and that too through the labour and intellect of the villagers.

Aldous Huxley has rightly said:

"Our basic trouble is that, in spite of everything that has happened, everybody thinks that he is right."

We are seeing before our very eyes that 'in modern industrial societies vast numbers of men and women pass their whole lives in hideous cities, are wholly dependent for their livelihood upon a capitalistic or governmental boss.' They have no root in the soil and no property of their own. Further they perform manual or clerical work that is mechanical and monotonous in character. Huxley, one of the greatest of modern thinkers, thus writes in his *Science, Liberty and Peace*:

"My own view, which is essentially that of the Decentralists, is that, so long as the results of pure science are applied for the purpose of making our system of mass-producing and mass-distributing industry more expensively elaborate and more highly specialised, there can be nothing but ever greater centralisation of power in ever fewer hands. And the corollary of this centralisation of economic and political power is the progressive loss by the masses of their civil liberties, their personal independence and their opportunities for self-government."

"Man as a moral, social and political being," says Huxley, "is sacrificed to *homo faber*, or man the smith, the inventor and forger of new gadgets."

Such sacrifice is a crime against man and God. This craze for labour-saving device, this infatuation for progressive technologies is making one insensible to the dignity and worth of human life. Ruskin's immortal ideas opened before us a new horizon. His books did one great service to thinking men and women throughout the world. He made us see that the life in a person is something that has worth, dignity, delicacy and nobility. Gandhi, the Prince of the Decentralists, accepted the principle of decentralisation in both economic and political spheres of national life, from his limitless reverence for human personality. May God give us love and understanding to appreciate the greatness of Gandhi's personality and the historic mission for which he lived and died.

—:O:—

"WHAT DO YOU EXPECT OF INFORMATION?"

It is on the subject-matter "What do you expect of Information?" that the two-yearly meeting of Evian (France) will be held, from 13th to 16th June next.

This reunion is placed under the high patronage of the President of the French Republic. Its honorary Committee is composed of thirty-four French and international professional organizations. It will follow up the International Days of the Press which gathered representatives of all the continents in 1951, 1952 and 1953. H. E. Sardar Hardit Singh Malik, Ambassador for India in France, was in 1951 one of the chief guests of honour.

The opening speech will be made by Professor Andre SIEGFRIED of the French Academy. Many people of consequence in the Press, literary men, scientists and economists will take part in the discussions.

The two-yearly reunion of Evian is not only open to the professionals of Information. It is also meant for all persons interested in the problems of public opinion and news diffusion.

All particulars may be asked from now on from "Conseil permanent de la Kiennale d' Evian," 122, rue de la Boetie, Paris, (8^e), France.

POLITICAL PHILOSOPHY OF TAGORE

By NARAYANI BASU, M.A.

REALITY AND LIFE

TAGORE is a philosopher whom it is not difficult to classify. In his ideas he is very near to the illustrious contemporaries, Tolstoy and Gandhi. Like them he is a humanist to the core but cast in the mould of a poet. He has a strong passion for art. He is more an artist than a dialectician and has expressed himself mainly through colourful poetry which naturally made a wider public appeal than pure philosophy. This medium makes him deeply human. For him life is not a prison to be escaped; it is to be lived and enjoyed in its largest relations and affinities.

"Deliverance is not for me in renunciation. I feel the embrace of freedom in a thousand bonds of delight."

But these bonds do not tie him down to a static reality. The earth for him is an eternal flux of change where life is in tune with the rest of universe.

"The same stream of life that runs through my veins right and day runs through the world and dances in rhythmic measures. It is the same life that shoots in joy through the dust of the earth in numberless blades of grass and breaks into tumultuous waves of leaves and flowers."

Tagore's metaphysics has a close affinity with that of Bergson. The flight of the ducks in the poem 'Balaka' symbolises a vibration of life pulsating all around which recalls the surge of the *elan vital*. Like Bergson again, Tagore sees that Spirit is struggling unceasingly to break the shell of matter and bursts out in a sweep of creative force. Thus in 'Nirjharer Swapnabhanga' (Awakening of the Mountain Spring):

"I know not what stirs my life today;
I hear the surge of the ocean from afar.
Ah, I feel a dark prison around me,
I must hit and hit and knock it down.
What a melody the bird has sung today
And what a piercing light is come!"

This dynamic spirituality is the essence of Tagore's humanism. Life is a ceaseless flow towards the Spirit which is implicit in the vast ocean of humanity.

HUMAN EQUALITY

Like all other philosophers of modern India Tagore began his public life as a staunch nationalist and revivalist. He threw himself headlong in the

Swadeshi movement during the days of the partition of Bengal. He felt the necessity of political freedom in order to liberate humanity from suffering and hence he immortalized the revival of Maratha, Sikh and Rajput nationalism in his ballad poems (*Katha O Kahini*). But soon he discovered that his nationalism was not of the common variety. He found that the real problem of India was her social degradation wrought by poverty, ignorance and caste rules.

"Oh my cursed Motherland . . .
Those whom you have deprived of human rights,
Kept standing before you yet did not have your lap for them.
In degradation you shall be equal made."

When India was fighting for political liberty Tagore saw that real emancipation will never come if she builds upon the quicksand of social slavery. Thus he writes in 'Ebar Phirao More' (Take me back from the Ivory Tower):

"The dumb millions who stand there downcast, the sorrow of centuries written on their face, who transmit the burden of their miseries to their sons, never blame anybody, neither man nor God, who know not where to seek redress . . . In those mouths dull, dark and dumb, I have to give voice; in those tired, dry and broken hearts I must raise the thrill of hope."

Indian nationalists showed a woeful indifference towards these basic needs. And so Tagore recoiled from politics and devoted himself to the work of education and social uplift of his people through the institutions of Santiniketan and Sriniketan.

It is significant that Tagore realized much earlier than many fire-brand Indian nationalists the incipient class differences which have rent society into twain.

"All over the earth, since the beginning of history, we find that one class of men prosper at the expense of another class. They establish their class domination upon the slavery of the other class. For a long time man has been doing this. Still, I must say that this is not human. Man's greatness cannot endure on his dependence upon slaves. This is injurious not only to the slaves, this destroys the masters too. Those whom we insult and trample under foot are hardest obstacles to our steps forward."

Tagore makes the same observations in *Russiar*

1. *Geetanjali*, Macmillan and Co., Ltd., London 1919, No. 73.
2. *Geetanjali*, No. 69.

3. *Geetanjali* (Bengali).
4. "Tagore on Gandhi, 1933," *Mahatma Gandhi* (Bengali), Vijnan-Bharati, p. 32.

Chithi (Letters from Russia). He welcomes the solidarity which the poor and the oppressed are forging among themselves. He was struck by the success of Russia in her campaigns against illiteracy, poverty, frustration and social servitude. He agrees that the cultivator and not the landlord is the real owner of land, that land to be productive must be brought under collective farming. But he is against uprooting the human instinct of property by force as the Soviet State is doing. He wants property to remain but would curb its enjoyments in the interests of society.⁵ The only solution of the conflict between the claims of the individual and the society is co-operation, i.e., the co-operative system in every form of economic enterprise.⁶

In the USSR, Tagore found a light in darkness to solve India's age-old problem of social inequality.

NATIONALISM

Tagore is a lover of that kind of nationalism which helps a people to stand on their feet and to attain freedom from tyranny and exploitation. His nationalism is the antepode of the Hegelian variety preaching supremacy of the world historical nation and generating a feeling of hatred towards the weaker people. Society as such has no ulterior purpose except the development of human ideals in co-operation with one another. A nation, on the contrary, is nothing but the political and economic organization which is intended to keep politically inferior people in bondage.

"A nation in the sense of the economic and political union of a people is that aspect which a whole population assumes when organized for a mechanical purpose."⁷

It is "the organized self-interest of a whole people where it is least human and least spiritual."⁸

The consciousness of a national feeling develops only when the living bonds of society are breaking up and giving place to merely mechanical organization. The West is under the grip of this type of nationalism. It has forged a tremendous machine of greed and power. The natural thread of morality which holds society together is snapping and the moral man is giving way to professional man.

The nations of the West are trimming their minds, regulating their thoughts, manufacturing their feelings and welding themselves into one uniform mass through their governments. The no-nations like India and China have been victims of their greed. Western nations have become a terror to humanity and to themselves. This organization of politics and commerce whose other name is the Nation is like a father who has become a gambler. The gambler risks his family for chances of game. The nation risks the

community for chances of success. A nation's wisdom lies in distrust. It lives in perpetual fear of others. Fear brings out all that is base in man. Jealousy, theft, robbery and lies become virtues for a nation.

This accounts for the chronic maladies with which society is infected today. The only reason for anarchist movements is that "power has become too abstract—it is a scientific product made in the political laboratory of the nation through the dissolution of personal humanity."⁹ As to the reason for the endless economic war between capital and labour:

"What but that the wealth-producing mechanism is incessantly growing into vital stature, out of proportion to all other needs of society,—and the full reality of man is more and more crushed under its weight?"¹⁰

The West has developed its weapon but has lost its soul. The real power is not in the weapons but in the man who wields them, in the soul. The West has borrowed from science its motto of 'survival of the fittest' which means 'help yourself and never heed what it costs to others.' It ignores to its own cost the fact that men are closely knit together and that when you strike others the blow recoils on yourself.

The history of Europe is not merely a history of conflict for power and preparation for scientific development. During the mediaeval period, the natural man tried to reconcile the struggle between the flesh and the Spirit. Both the material and the spiritual forces acted strongly upon her nature. Europe owes all her greatness to that period of moral discipline. Then came the age of intellect. Intellect is an impersonal abstraction. At this stage man attains power and freedom in the material world. He attains the rapidity of pace but in spite of all these advantages the moral man lags behind because intellect does not deal with the whole reality but only with the laws of things which are impersonal. "Thus man with his mental and material power far outgrowing his moral strength is like an exaggerated giraffe whose head has suddenly shot up miles away from the rest of him, making normal communications difficult to establish."¹¹

Nationalism is sweeping like an epidemic over the West. Unlike India Western countries have no problem of social adjustment. Their only problem is to overcome obstacles in their physical surroundings or the menace of their powerful neighbours. Hence, they have organized power for defence and aggression. Thus in the West the nations have become powerful at the cost of higher social life. National feeling has converted a living people into an automaton led by the power of greed.

5. *Russian Chithi* (Bengali), *Viveka-Bharati*, p. 48.

8. *Ibid.*, p. 15.

9. *Ibid.*, p. 11.

10. *Ibid.*, p. 11.

10.A *Ibid.*, p. 35.

Some would say that the exploited people should form themselves into nations and resist encroachment. But that is no remedy. "An endless bullfight of politics" is no remedy against exploitation. Tagore is sure that this reckless craze of the machine is bound to break into a crash.

"Whenever power removes all checks from its path to make its career easy, it triumphantly rides into its ultimate crash of death. Its moral brake becomes slacker everyday without knowing it, and its slippery path of ease becomes its path of doom."¹²

Tagore is confident that people who are politically weak, who are not nations, shall live. Man will be reborn in the freedom of his individuality.

"I assert that man's world is a moral world not because we blindly agree to believe it but because it is so in truth which would be dangerous for us to ignore. And this moral nature of man cannot be divided into convenient compartments for its preservation."¹³

BONDAGE AND FREEDOM

Nationalism militates with the spirit of the West. Europe too has spiritual strength which is the fountainhead of her creative art and literature, her great quest for knowledge, her deep love for freedom. The nation is mechanical, but the Spirit is creative, it lives in freedom.

"While the Spirit of the West marches under its banner of freedom, the Nation of the West forges its iron chains of organization which are the most relentless and unbreakable that have ever been manufactured in the whole history of man."¹⁴

It obstructs the free flow of the inner life of the people and exploits it for its own power.

"In the so-called free countries the majority of the people are not free, they are driven by the minority to a goal which is not even known to them. This becomes possible only because people do not acknowledge moral and spiritual freedom as their object."¹⁵

This centralization of power is multiplying fast and the cry of the oppressed spirit of man is in the air which struggles to free itself from its grip.

Political freedom does not give any freedom unless the mind is free.

"Those of us in India who have come under the delusion that mere political freedom will make us free have accepted their lessons from the West as the gospel truth and lost faith in humanity."¹⁶

Today Europe has lost her soul in the mad pursuit of wealth and power. She is a prisoner of her own vanity:

"Prisoner, tell me who was it, that wrought this unbreakable chain?"

"It was I," said the prisoner, "who forged this chain very carefully. I thought my invincible power would hold the world captive leaving me in a freedom undisturbed. Thus night and day I worked at the chain with huge fires and cruel hard strokes. When at last the work was done and the links were complete and unbreakable, I found that it held me in its grip."¹⁷

Hence, with all his praise for Russia, Tagore did not approve of her regulation of the mind. He did not approve of the suppression of opinion. He observed:

"With the education system they have made a mould. But manhood cast in a mould can never last. If the truth of a living mind is not adjusted with the truth of education then either the mould will break one day or the human mind will be stultified or it will be converted into a marionette."¹⁸

Dictatorship spoils both the ruler and the ruled. Freedom is possible only through a true synthesis of the individual and the society.

The freedom which Tagore seeks for his country and for his people, is the freedom of the mind and of the soul.

"Where the mind is without fear and the head is held high

Where knowledge is free;

Where the world has not been broken up into fragments by narrow domestic walls;

Where words come out from the depth of truth;

Where tireless striving stretches its arm towards perfection;

Where the clear stream of reason has not lost its way into the dreary desert sand of dead habit;

Where the mind is led forward by thee into ever-widening thought and action

Into that heaven of freedom, my father, let my country awake."¹⁹

FUTURE: JAPAN AND U.S.A.

Europe is undoubtedly great. But she has stopped half-way in her journey because of her pride of power and greed of possession. Her nationalism is poisoning the fountainhead of humanity. It has infected the East. Eastern Asia which was pursuing its own path, evolving its own civilization based upon the deeper relations of humanity is overtaken by Western nationalism. In this crisis Tagore puts faith on two quarters, on Japan in the East and on USA in the West.

Japan is not a mere replica of the West. She does not indulge in crude display of power and

11. *Ibid.*, p. 22.

wealth. Everywhere in Japan there are emblems of love and beauty. She has shown her genius not by acquirement but by creation, not by dominating nature from outside but by realising it in her own life. Hence, he has a mission to fulfil.

"She must infuse the sap of a fuller humanity into the heart of modern civilization."¹⁹

But Tagore has his fears about Japan. He is afraid that from the rude pressure of political ideals of the West she may lose her own. He warns Japan that her acquiring of modern weapons should not go beyond the need of self-preservation.

"My brother, when the red light of conflagration sends up its crackle of laughter to the stars, keep your faith upon those stars and not upon the fire of destruction."²⁰

Japan did not heed and fell grovelling in the dust.

America is a projection of the Western civilization. But while Europe has grown old America is still young and is making experiments. As yet she has come to no conclusion. But in future she will contribute something to the ideal of human unity.

"America is destined to justify Western civilization to the East. Europe has lost faith in humanity and has become distrustful and sickly. America, on the other hand, is not pessimistic or blase."²¹

After thirty-six years of his writing Tagore's words are still a cry in the wilderness. In his expectation that America is the land of future progress Tagore comes close to Hegel. Of course, the outlook of Tagore differs basically from that of the Western philosopher. Hegel thought that in the ages that lie ahead the burden of world's history will reveal itself in America. With her vast economic resources, mechanical power and atomic weapons, she really seems to be playing the role of Hegel's world historical nation. But the fulfilment of Hegel's prophecy is the burial of Tagore's hopes. Is it through the travail of another World War and laborious international reconstruction after that, that humanity will step forward towards the goal of spiritual unity as visualised by Tagore?

DOCTRINE OF SPIRIT

Oriental institutions are built upon a deeper reality than political. That is why they have a longer longevity. While the political civilizations of ancient Greece and Rome lie dead and buried, the civilization whose basis is society and the spiritual

ideal is still alive in China and India. There is the complaint that the East is static, it does not move; but the West is dynamic, it moves fast. It must be remembered that speed and movement are not the criteria of progress.

"If the office cannot wait, or the buying and selling, or the craving for excitement, love waits and beauty and the wisdom of suffering and the fruits of patient devotion and reverent meekness of simple faith. And thus shall wait the East till her time comes."²²

The East has viewed politics and business in the larger framework of life. The West and the modern man cultivate the falsehood that business is business and politics is politics. "We must know that man's business has to be more than mere business and so should be his war and politics."²³ If man is to be saved from the madness of national selfishness, pride and greed which is fast leading to a suicidal conflagration "man will have to exert all his power of love and clarity of vision to make another great moral adjustment which will comprehend the whole world of men and not merely the fractional groups of nationality."²⁴

"Some of you may say that such a doctrine of spirit has been in its death throes for ever a century and is now moribund; that we have nothing to rely upon but external forces and material foundations. But I say, on my part, that your doctrine was obsolete long ago. It was exploded in the spring-time of life, when mere size was swept off the face of the world and was replaced by man, brought naked into the heart of creation, man with his helpless body, but with his indomitable mind and spirit."²⁵

Life based on mere science has its glamour which attracts the people as insects are drawn to fire. The effect of such life is fatal to man's nature. It not only deadens his moral sympathy but also his intellectual sympathy which is necessary for the understanding of different races. At the time of her making, Europe had never to face the recurrent incursion of new races. Hence, it easily constituted itself into national states. Europe is one country made into many. India, on the contrary, was naturally many, yet adventitiously one. She had to absorb new races coming again and again on her soil in a vast social organism. Accordingly, she suffered from the looseness of diversity and feebleness of unity.

"The tie has been as loose as possible, yet as close as the circumstances permitted. This has produced something like a United States of a

social federation, whose common name is Hinduism."²⁶

But Europe's solution of race problem was different. She colonised America and Australia after exterminating the original settlers. Thereafter, she has shut the doors there against foreigners, or has accepted them as menials.

Thus India has shown her enormous capacity of Spirit to adjust different races within one body. Through the caste system, she evolved a social unity within which all the different peoples could be held together. As her problem was the problem of the world in miniature she has offered a model to the world with her solution as to how a synthesis of races and nationalities may be achieved.²⁷

But while recognizing difference and seeking unity in diversity, "She has made grave errors in setting up the boundary walls too rigidly between races in perpetuating in her classifications the result of inferiority; often she has crippled her children's mind and narrowed their lives in order to fit them into her social forms."²⁸

She has ignored the law of mutation which is the

law of life. India is to make amends for this mistake and regain her spiritual vitality.

So Tagore, with all his praise for Russia and his hopes on Japan and USA, looks back again to India of hoary antiquity, loaded with heaps of dust and dirt accumulated through centuries, who has to purge herself of these accretions by means of a spiritual revolution. He warns his countrymen again and again not to imitate the West, not to seek to pay evil with evil, not to forget her own and follow other peoples' history.

"When we show nails and teeth we thereby only salute those who fight with tooth and nail. Scorn them, do not imitate."²⁹

"We must show those who are over us that we have in ourselves the strength of moral power, the power to suffer for truth."³⁰

So Tagore's testament to the country is as follows:

"Be not ashamed, my brothers to stand before the proud and the powerful,
With your white robe of simpleness
Let your crown be humility, your freedom the freedom of the soul."³¹

—:O:—

UNIVERSITY EDUCATION IN INDIA

By DR. AMARESH DATTA, M.A., PH.D.,
University of Saugar

UNIVERSITY education has been a craze in our country for a long time now and it still persists. What was once a matter of prestige and economic advantage, has now become a mere habitual pursuit, followed by students and encouraged by guardians without any definite aim and purpose. This is why every year a large number of boys are being sent to the universities because their guardians cannot find any other occupation for them, and what is worse, no smaller number of girls is receiving the same education either because they could not be otherwise engaged or because their guardians believe they acquire better prospects of earning or matrimony by being educated in this fashion. So long as we could financially afford this luxury or so long as it helped us in getting even tolerable jobs, the policy of higher education on a large scale without any reference to the capabilities or aptitude of the students, could somehow be accepted on grounds of expediency, but times have now changed and not only a new orientation in the method of education but a definite attitude a propos of our present conditions should be forthwith adopted if we want education to be individually and nationally useful. University degrees these days do not help our young-

men so much in their search for a living, and even prestige, whatever it was worth, is now being usurped by the aristocracy of wealth or political power. And yet we complain of the over-crowding in the universities, inconvenience of many shifts, unwieldy structure of the system and the rest of it. Why does this craze still so blatantly manifest itself in spite of practically no prospects at all? Is it one for a pure love of knowledge? An affirmative answer to the question would be very flattering indeed, but a very real travesty of truth. The reason for this, I think, may be found at least partially in a social complex which we have been cultivating since the very beginning of university education in India.

Educated men in our country are mere degree-holders and our universities have been the constant suppliers of these degrees since their inception. Indeed this has been their most significant function which has also been very efficiently performed. Therefore men without these credentials to sophisticated society are looked down upon not only by the so-called educated, but also by the masses of the people. That knowledge may be acquired without working for degrees or follow-

ing the university syllabuses, is an idea which appeals, if it does at all, to very few in this country. So a Bachelor of Arts or for that matter of Science on the expiry of four years of adventuring in the college or university, begins to consider himself infinitely superior to a man who has undergone say, ten years of arduous training in music or painting under a renowned master. And since these degree-holding bourgeoisie form the intelligentsia of the society and influence, guide and mould the minds of men in general, such fantastic notions continue to prevail. The effects, of course, are obvious: that we are almost Quixotically proud and exhibit about our degree and we have accepted the theory that the only criterion of judgment regarding a man's worth is his academic qualifications. Universities have the right to confer their degrees, but if they send out men to society with a new caste-consciousness, it will be harmful both to the cause of higher education and democracy about which we speak so ecstatically these days in and from all possible places. Yet alas, this is what has actually happened. A university-educated man, generally speaking, is not only boastful and superiority-conscious but also loathes manual labour, suffers constantly from a false sense of prestige, disregards all that is old and past but does not possess any vision of the future, is suspicious of new ideas, worried about an uncertain future but still remains a child of passing fashions—in other words, he is one who has come out of an institution where he did not go impelled by an intrinsic urge or where life to him was either a long holidaying or a term of dreary detention.

Needless to say, this attitude of the average student towards university education has been created by the peculiar need and purpose of higher education in this country and fostered by his circumstances. If he is brilliant in examination, he considers the poetry of Wordsworth or the law of thermodynamics useful and important only for passing the civil service examination; if he is a rich man's offspring, he goes through the course, aided sufficiently by help-books and private tutors for a degree just because he wants to attain a status in his circle of friends and brethren and if he is of the middle class and indifferent in studies, he feels he is wasting his time over Plato's philosophy or Shakespeare's plays because these will not assist him in his work in the Government secretariats or private firms. There may be many such similar motives but the one that should actuate all higher education—the one of pursuit of knowledge for its own sake and for the development of mind and character, is conspicuous by its absence. If our grandmothers thought that higher education was not necessary for a man if he had sufficient means of living to see him through life, we think it is necessary either for securing respectable jobs or for realizing our dream of respectability in society. If the academic attainments of a man bring him rewards in terms of a decent appointment—that is what it should be, but be it remembered that education is neither the

process of fitting the students for professions nor the one of unfitting them for the same. In other words, education has, really speaking, little to do with a man's profession, for only a few hours are given to the means of living, but education is meant for all the hours of his life.

This is the background of higher education in our country; and since it is so vulgarly commercialized, there is, for obvious reasons, no academic or intellectual atmosphere in the university. Faculties are water-tight compartments, and students in their compulsory straying into the university are thrown into these different folds, each keeping as far away as possible from the others except on occasions of general strikes and each growing dogmatic about his subject of study as well. Thus a student and even a teacher of Arts usually fell either inferior or too confident about the scope of his subject of study while their counterparts in Science take pride in their ignorance of subjects which, they think, breed dreamers of idle days. This is why our educated men are not necessarily cultured men and are at best only half-developed. This is why, again, we do not feel the influence of the university at home, in the drawing room or in the parliament. Education is only creating and fostering rigid types and one feels bored with the other.

Then there is the strange notion about scholarship. Whereas in other countries scholarship is judged by the merit of a work, here it is judged by degrees which may be acquired by various methods. Whereas again, in other countries after the minimum requirement is obtained, degrees are conferred as marks of distinction for efficient and original work, we cannot even begin our career without somehow obtaining them. So our scholarship lies buried in the pages of unpublished theses which are usually mere collections of data or other men's views. And therefore we find it difficult to work on a subject without the lure of a degree at the end. But a professor of Cambridge or Oxford will find it difficult even to conceive of such a mentality.

If this is what university education has been or what it has meant to us, we should review the whole situation in the light of our present needs and circumstances, because much will depend upon the universities in the regeneration of our country. To my mind the remedy of all these maladies seems to lie in the proper understanding of the function of higher education and in the rearrangement of the educational structure so as make it possible for higher education to achieve its purpose.

I think it will be admitted that university education should not be universalized, because it is not really meant for all. This is, of course, no reflection on any other type of education—it is merely a statement of fact. So some restriction on the basis of merit or aptitude or potentiality will have to be imposed for entrance into the higher courses of study. But this will be possible only when new avenues and opportunities are made available to our young men, and what is more important, when there is a change in the policy of employment,

governmental and private. At present and for quite some time past employers have been able to insist, owing to a superfluity of graduates, on university degree for posts ranging from those of clerks to those of higher officials for none of which universities provide any special training. Consequently young men are forced to take degrees or adopt all possible means for acquiring them. Academic standards, therefore, go down, education loses its purpose and significance, and universities turn into factories where clerks are produced or training centres for civil servants, which was perhaps originally the function of the universities established by a foreign power for their administrative convenience. Psychologically also this has a very harmful effect: Four years of aimless flirting with books, loss of money (for education is indeed very expensive) and energy, fear of examination and high expectation from life and at the end either unemployment or a negligible job breed a type of cynicism in the young men which is dangerous both for themselves and for the nation as a whole. It has also been noticed that the kind of education that these students receive makes them unrealistic in their approach to life and so when the cosy complacency of the class room is over and they get involved in the struggle for existence, they begin to falter for a power which they have not learnt to find either in themselves or in the world outside. It is indeed gratifying that our Government have become conscious of these anomalies and thinking on the lines suggested above, are trying to introduce the much-needed reforms.

The commercialization of education, therefore, may be stopped if the policy of employment is modified and the employers look for special training in a work for professional purposes and not for university degrees. General knowledge in all important subjects and fairly good educational and cultural background may be obtained from the higher secondary stage of education if it is made self-sufficient and a proper standard is maintained and established, as it is done in other countries. Here also this has been the considered opinion of the commission set up for framing a new policy of higher secondary education. However, if this practice is a little scrupulously observed by the employers, then a student, for instance (it is an actual case) may not be forced to take a degree in Science for entering into subordinate police service, just because he finds Science graduates getting more favour from the selection board than degree-holders in Arts. Needless to say, for all important and responsible professions that demand wide interests, a basic sense of values and discipline of mind and intellect, higher secondary education should be enough, provided of course the standard is raised higher than what it is today. And then for vocational training separate institutions will have to be established. It needs no saying that the responsibility of making this policy effective will ultimately depend more on public establishments than on the Government.

This will certainly give a new direction to higher education in our country. We will have more serious students and more enthusiastic teachers with whose co-operation our universities—the lighthouses of culture—will quietly but steadily show ways of progress which we have yet to make.

It is often argued that the situation was not very much different in the past and yet the academic standards were definitely higher. How could one account for the rapid deterioration of standards in our days? Will a change in the policy of employment or in the system of education solve our problem of falling standards? I think even in the past our standards left much to be desired. A few cases of exceptionally brilliant scholars or a greater earnestness on the part of the students do not speak much about the attainment of higher education in any stage. Pioneer work even on our literature, history, philosophy, etc., has been mostly done by Western indologists. Indian scholarship is still uncertain and our greatest achievements in the modern age have been in fields other than academic. Then, conditions, not only political but social, economic and cultural as well, are basically different in spite of their apparent similarity and it will be unwise to expect similar results from different circumstances.

We should realize that we have now to frame our own policy of education for a free country and keep constantly in mind our peculiar needs and requirements. It is time we gave higher education a chance to come by its own and helped to create conditions in these centres of learning for a disinterested pursuit of knowledge.

Nowadays a new danger in the shape of a popular demand for new universities is raising its head in different parts of the country. It is fashionable to cry for a new university for one's own province or even district town. For this purpose we sometimes indulge in statistical calculation to find out how many universities are there in the United Kingdom or the United States on the basis of their population and cry for more universities just because by foreign standards our ratio is not adequate. But we forget that this comparison stretched further will go against us and that the establishment of new universities will almost inevitably mean a repetition and perhaps a perpetuation of the same folly. The expenses of a full-fledged university may maintain about a hundred schools of different kinds and there is no denying the fact that at the present moment they will be more useful than new universities of the existing type. The ones that we have will easily serve our need if they prefer to become true centres of higher knowledge.

Whatever be the system or medium of instruction, so long as the purpose is not defined and the ideal is vague, nothing substantial is going to be gained. But when we know what we want and need, our ingenuity will not fail to devise methods or systems to achieve it.

MAHARSHI DEBENDRANATH TAGORE

By SUDHANSUMOHAN BANERJI

RABINDRANATH TAGORE once said :

"I love India not because I cultivate the idolatry of geography, nor because I have had the chance to be born in her soil, but because she has saved through tumultuous ages the living words that have issued from the illuminated consciousness of her great sons—Satyam, Jnanam, Anantam, Brahma—He is Truth, He is Wisdom, He is Infinite. Santam, Sivam, Advaitam—Peace is in Him, Goodness is in Him, He is the Unity of all beings. Thus we have come to know that what India truly seeks is not a peace which is in negation or in some mechanical adjustment but that which is in goodness, in the truth of perfect union. She does not enjoin her children to cease from Karma but to perform it in a spirit of detachment with the pure knowledge of the spiritual meaning of existence. This is the true prayer of Mother India and

He is who is one, who is above all colour distinctions, who dispenses the inherent needs of men, who comprehends all things from their beginning to the end, let him unite us to one another with wisdom which is the wisdom of goodness."

This is the message we are in need of today in an age of inward as well as outward crisis, in every department of our life, mental, moral, social, political, religious and economic. In these days of storm and stress, chaos and confusion we stand to gain, by a revaluation of values which we can only achieve with reverence, questioning and service, the messages and the great lives of the Masters before us. These great teachers are beacon lights to a storm-tossed world and let us in all humility take refuge in them. In these days of scientific and rationalist outlook on life we need not perhaps be dogmatic or pragmatic but the eternal values, the fundamentals are the same and do not change. It is the words that count, the way of life that counts, not the particular 'ism or creed.' It is reverence that counts. What have we done to keep the torch burning, we who are the common inheritors of a fulfilled renown. Year in and year out we may have met on occasions like this and waxed eloquent over his greatness and his towering personality, but have we searched our hearts for a skeleton in the cupboard or paused to stay for an answer unlike a Jesting Pilate?

In the inevitable collapse of creeds we need not perhaps be keen about sounding a new scheme of the Universe, a new dogma of philosophy or policy but about teaching a new sense of duty, an inward change of the heart, a system of self-culture which will not demand an evasion or ambiguity which will reconcile the ideal with the real, satisfy our whole being, our critical intelligence as well as our active aspiration which will impart a gentle quality of equilibrium in our mental and spiritual make-up and poise. Mankind today in one of its rare moods is shifting its outlook. The mere compulsion of tradition has lost its force. It is our

business not only to recreate and re-enact a vision of the world including those elements of reverence and order without which society lapses into riot but to pursue it with unflinching rationality.

Before we take stock of what Maharshi Debendranath stood for and his contribution to it, it has to be realised that he belonged to an epoch in Bengal when old ideas and ideals were having its first shock from the impact of Western civilization and it was Rammohun's and then Debendranath's and their followers' greatness that while accepting the change they irradiated it with a genuine Indian touch and rediscovered its greatness. Though new wine was being poured into old bottle the stirring within was transmuted mainly through a progressive outlook towards a creative idealism not divorced from the basic trend of old achievements yet accepting the new. That was the great contribution which the nineteenth century Bengal made under the inspiring guidance of its stalwarts. Though as a movement it reached the intellectual classes only the fundamentals it preached, the aspiration it brought about, the inspiration it gave, the unity in outlook it forged among the progressives, the bulwark it framed against a complete sweeping and swamping by a vigorous and dynamic West, gave breathing time to India to rethink and to reshape herself.

Maharshi Debendranath stands as one of the beacon lights of this torch race of Indian renaissance. His father Prince Dwarkanath was a name to conjure with in his days. He was a real aristocrat in taste, in intellect, in equipment and when he died young abroad leaving a huge debt, it was young Debendranath who took upon himself voluntarily all his father's debts more than sixty lakhs of rupees and scrupulously repaid every pie of it though not legally required to do so. He stinted himself, the big joint family lived like commoners, simple, austere and resolute. It was in these days when he was mentally unhappy he came across that famous text of Upanishad in a torn leaf:

"God pervades everything. It is by renunciation that you can enjoy. Don't be greedy. Don't hanker after others' wealth."

That was the great Mantra which he got and which he realised in his life.

In more than one sense his great son Rabindranath was not merely a chip of the old block but was a real fulfilment of the Maharshi in a more spiritual and aesthetic way. Maharshi got this olympic torch from Rammohun and he handed it over to his great son in an inspirational way. We read in Abanindranath's "Story of Two Searchers":

"It was a blazing hot summer noon. Maharshideva was proceeding along Birbhum uplands in a palanquin. The bearers had got tired. They placed the palanquin at a particular spot. Maharshideva

found before his eyes a vast rugged expanse of a prairie-like meadow. We do not know what he saw under that spreading Chatim tree. Did he see the one who stands alone like a giant tree? From his innermost depth came the words which are inscribed on the multi-coloured glass temple which he erected there: 'He is the comfort of my life, the solace of my mind, the peace of my soul'."

The second searcher also strove through verse and rhyme, through song and deed to find the same synthesis—where the world becomes one nest, and the abode of peace Santiniketan flowered into Visvabharati with aims:

"To study the Mind of Man in its realisation of different aspects of Truth from diverse points of view, to seek to realise in a common fellowship of study the meeting of the East and the West . . . free from all antagonism of race, nationality, creed or caste and in the name of the one Supreme Being who is Santam, Sivam, Advaitam, the All Peace, the All Good and the One."

Abanindranath the master artist gives us in his inimitable style pen-pictures of Maharshideva as he saw him from day to day. This intensely human document, interesting as it is, shows Maharshi the man. I quote Abanindranath's without embellishment (Translation published in the *Hindustan Standard Annual*, 1950):

"I remember my great uncle sitting on a cane chair, his body taut and straight, a cane foot-stool beside him, which he sometimes used and on a three-legged table a volume of Hafiz and a *Brahmodharma*, a few sweet-scented white flowers on a saucer and a fresh white handkerchief. Whenever he drank a sip he would wipe his mouth with his handkerchief and drop it on the floor whence his servants would pick it up and put a fresh one in its place on the table."

In these few words we get the complete picture of the great man all at once and we can visualise him without a conscious effort.

We are reminded of Rabindranath's own description of his father when as a boy he accompanied him to Dalhousie:

"Stars in the dark dim-lit sky, faint flicker of a misty dawn silhouetted in the background, Maharshi in deep meditation facing the east seemed to be one with that serene atmosphere of calm and peace."

Again we learn from Abanindranath:

"Iswar Babu told me how once Maharshi became Kalpataru. The whole household gathered round him and he said to them, 'Take away from my possessions whatever you wish.' In no time the room was empty even the furniture. The Kalpataru sat alone deep in meditation in the empty room."

His last days were aptly described by him. It was a fitting epilogue to a great life. Maharshi's habit was to look at the morning sun and pray. Even on the day when life was ebbing away, his mental serenity and strength overcame his physical ailment, he walked to the terrace, sat erect, watched the sun and prayed softly. He came back, lay calm and quiet. I quote:

"He inclined his head as if he wanted something to be recited to him and Rabi-ka took *Brahmodharma* and read quietly and softly,
From Untruth unto the Truth
From Darkness to Light
From Death unto Life."

"He lay quiet, took in every word intently, his face lit up. Then suddenly he asked for more air and said, 'I am going home . . . I am going home . . . ' as if he was a small child whom the great Mother was beckoning and as the clock struck twelve he breathed his last and slipped into an ocean of peace, as fresh and serene as ever in his eternal sleep."

Though Maharshi did not actually discard ritualism as such and rather simplified and purified it, he believed that spiritual salvation lay more in those silent hours of self-communion which help us to control our character and build up our personality. By it we cleanse our thoughts, purify our emotions and let the seed of spirit grow in quietness, action in non-action. That is still the appointed way to close the gap of opposition between our conscious duty and our inclinations buried deep in the unconscious what the psychologists call conflict and complexes. Heaven is lost or found in the inner self. We brood and build. We energeise and we create. *Tapo Brahmo*. He believed that a dip into the Silence every-day was a great spiritual experience. As Sri Aurobindo says:

"Into the silence, into the silence
Arise O Spirit Immortal
Out from the Silence, out from the Silence
Carrying with thee the ineffable substance
Joy unimaginable, ecstasy illimitable
Knowledge omnipotent, might omniscient
Light without darkness, Truth that is dateless."

There are other aspects of this great life, the doyen of that great family which dominated the intellectual life of Bengal for more than a century. Prince Dwarkanath, Maharshi Debendranath, Bardada Dwijendranath, Visvakavi Rabindranath, and his equally gifted nephews Gaganendranath and Abanindranath—you could get the history of a nation in making in that Dwarkanath Tagore Street, the pulsation of a resurgent national life which had its being there in art, literature, religious reform, social activities, intense nationalism, music and a realisation of a dynamic urge in a static society. The patriarch Maharshi Debendranath was the living embodiment of that urge but who had realised in his life a lofty spiritual detachment which did not mean this or that, not a maimed life of monastic seclusion but a living inspiration of *joi de vivre* where each will meet with each, country with country, race with race, knowledge with knowledge, endeavour with endeavour.
Where the mind would be without fear
And the head would be held high
Where knowledge would be full
When the world would not be
Broken into fragments by
Narrow domestic walls.
Where words would come from the depth of truth
Where tireless striving would stretch its arms towards perfection
Where the clear stream of reason would not lose its way into dreary sand of habit
Where the mind would be led by thee into ever-widening thought and action
Into that heaven of freedom my father let our country awake.

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.

EDITOR, *The Modern Review*.

ENGLISH

HOUSE OF SHIVAJI (Studies and Documents on Maratha History of the Royal Period): By Sir Jadunath Sarkar. Published by M. C. Sarkar and Sons, Calcutta-12. 1955. Third Edition. Greatly enlarged. Pp. iv + 343. Price Rs. 5.

When this *Modern Review* was born 49 years ago Prof. Jadunath Sarkar contributed a series of original sources on Shivaji, the great national hero from our very first number. Many of those articles have been preserved in book-form in this *House of Shivaji*. Our readers will probably smile to find that this book (in its greatly enlarged third edition now on our table), bridges the gulf of time from our first number, by including the aged author's latest reflections on the Maratha national character and the place of the Marathas in Indian history first printed in a daily paper in 1952, under the caption, "What Maharashtra Teaches Us."

Three other added chapters are,—Why Shambhuji rebelled against his father (a curious historical repetition of the story of Dasharatha declaring Bharat his heir). The Maratha Court and Government in the Eastern Karnatak under Rajaram (1689—1694), when Aurangzeb was occupying and devastating Western India which was kingless, and How the Tantrik Cult from Bengal found a short-lived ascendancy and royal patronage in Maharashtra under Shambhuji. This book, as its Preface claims, is an indispensable supplement to its author's standard biography *Shivaji and His Times* and a source book, of original historical materials not available elsewhere in one place or in English.

J. C. B.

THE GLAMOUR ABOUT THE GUPTAS: By K. M. Shembavnekar, M.A., Professor, St. Xavier's College, Bombay. The Bombay Historical Society, Bombay. 1953. Pp. 72. Price Rs. 3-8.

This is a polemical work written with ability and originality and in a vigorous style to combat the generally accepted characterisation of the period of the Imperial Guptas as the Golden Age of Ancient Indian History. It consists of three papers entitled *Samghas in Panini and Kautilya*, *A Puzzle in Indian Epigraphy*, and *The Date of Kalidasa*, contributed previously to well-known Indological journals in this country and a new opening chapter called *A New Review of the Gupta Epoch* claiming to present "a comprehensive and radical survey of the whole epoch" (Preface, p. 1). In the space at our disposal it is only possible to offer a few remarks. In the first chapter the author pointedly refers to the significant silence of all writers of classical Sanskrit literature

(including even Varahamihira, admittedly a contemporary) about the Imperial Guptas, which is in striking contrast with the mention "from the earliest times down to the latest of the association of learning with royal patronage, wherever it was magnificent" (p. 10). We know, however, that the courts of the Gupta Emperors and their feudatories were graced by such accomplished poets as Harishena, the author of the *Allahabad Prasasti* of Samudragupta and Vatsabhatti, the author of the *Mandasor Inscriptions* and further that Samudragupta was sufficiently reputed for his poetic talents to deserve the title of "King of poets." The author (pp. 6-7) takes Alberuni's reference to the Guptas as "a wicked people" to be a clear proof of the fact that "the Guptas so far from being patrons or champions of a Brahmanical revival, were only odious in the eyes of the learned men with whom the Arabian scholar came into contact." This statement not only lays undue stress on a general observation made by a foreign visitor five hundred years after the event, but it also ignores such evidence as that of performance of the horse-sacrifice ceremony by Samudragupta and his grandson. According to the author, the view that the Puranas were finally recast in the Gupta period "can scarcely stand a critical scrutiny" (p. 12) and "the so-called Puranic Hinduism is considerably older than the first century of the Christian era, and therefore, *a priori*, much older than the Gupta period" (p. 23). We should, however, remember that Dr. R. C. Hazra has recently given good grounds for distinguishing between two main stages in the development of the Smriti material in the existing Puranas, the first stage (3rd—5th century A.D.) being occupied with the narratives of rites and customs after the early Smritis and the second stage (post 6th century A.D.) being filled with the addition of new material relating to pilgrimages to holy places, popular worship and religious vows and so forth. Again, the extreme antiquity claimed for Puranic Hinduism by the author is unwarranted by his evidence. As "a clear proof of the indifferent attitude of the Guptas towards the powerful sects and creeds of their time" the author (pp. 13-15) observes that while the Chalukyas and the Paramaras (of whom the first were "certainly as old" as and the latter were "even older" than the Guptas) are stated to have sprung from the sacrificial fire kindled by the sage Vasistha on Mount Abu, "the Guptas, though their names appear in some Puranas, are not at all invested with any kind of glory." Now apart from the fact that authentic history does not extend the antiquity of the Chalukyas and the Paramaras so far back, it has to be remembered that even the Sungas and the Kanvas and the Satavahanas who were, according to the author, "far more favourably inclined towards

Brahmanism than the Guptas" are not credited in the Puranas with a superhuman origin. The legend of the four Agnikula Rajput clans to which the author refers does not occur in the Puranas but is found practically for the first time in the late (16th century?) work called *Prithviraja-raso*. The author's comprehensive survey of the Gupta epoch is completely silent about the development of art and architecture which is generally held to be one of its chief glories.

In the second chapter the author rightly rejecting the late Dr. K. P. Jayaswal's interpretation of *samgha* in Panini in the narrow sense of a republic, explains the term generally to mean "monarchic clans bound together by ties of federation" (p. 27). This ignores the clear evidence of the Pali and the Sanskrit Buddhist texts about which the author is completely silent. In the third chapter the author (pp. 32-36) has done a good service by correcting the mis-translations of the phrases *Malava-gana-sthiti* and *Malavaganamnata* used in the oldest records of the Vikrama era. But his argument for placing Vikramaditya, the founder of the era in the first century B.C., which rests upon the evidence of the late *Kathasaritsagara* would have gained in weight by his mention of the valuable and much earlier Jaina tradition on the point. In the last chapter dealing with the internal evidence for placing Kalidasa in the first century A.D., the author's arguments are ingenious and valuable but they are not always convincing, as in his explanation (pp. 67-68) of the river-name Vamkshu and the ethnic name Hunas mentioned in the story of Raghu's Digvijaya in Canto IV of Kalidasa's *Raghuvamsam*.

U. N. GHOSHAL

THE ANNEXATION OF ASSAM (1824—54): By Dr. Rebati Mohan Lahiri, D.Phil., Calcutta. Published by the General Printers and Publishers, Calcutta. Pp. 250. Price Rs. 12.

This monograph consists of five informative chapters, besides a Prologue and an Epilogue. For the period of the history of Assam chosen by the author for his field of research this book is an improvement on the treatment of the same by Sir Edward Gait in his *History of Assam*, though no novice can hope to excel the masterly presentation of that illustrious historian. Dr. Lahiri has corrected several errors of fact committed by Sir Edward Gait and supplied fuller details missing in Gait's general survey.

The author has displayed commendable skill in making out a very readable narrative out of obdurate materials. His introductory sketches of character and institutions of peoples of Assam are graphic. The Brahmaputra valley and the hills of Assam provide a museum of political institutions ranging from primitive democracy to constitutional monarchy, from federal republic to slave-owning oligarchies; and no less of religions too, from Animism to Buddhism and Vaishnavism. Dr. Lahiri brings home to the students of history that the annexation of Assam to the British Indian Empire was no enslavement of a free people but their only escape from chaos and ruin. We fully agree with his conclusion: "The dark age of trouble and violence was over and an era of peace and prosperity returned."

We regret very much that a detailed notice of the merits of this learned work is debarred by the limit of space. It is sufficient to say that his method and approach have been scientific, and that his style has a restraint and grace of its own.

K. R. QANUNGO

BOOK REVIEWS

407

KASHMIR THROUGH THE AGES: By G. L. Kaul. Chronicle Publishing House, Srinagar. Pp. viii + 287. Price Rs. 10.

The above monograph is a hand-book that offers a sketch of the Kashmirian history from remote antiquity to the present times. The author who is a journalist introduces the book by quoting the pleasing lines:

"Welcome to the Happy Valley where the world comes to an end and the paradise begins . . ."

and evokes the readers' interest in the first two chapters by an enlivening chapter on the early history and Kalhana's contribution, but the account of the medieval and modern times is anything but a bald list of kings and their regnal years. In such a design of Kashmirian history, the citation of the full text of the *President's Order on Kashmir under the Delhi Agreement* of 1952, and the *Text of Agreement on the Lease of Gilgit* entered into between the British Government and Maharaja Hari Singh, appears to be a very curious insertion and renders a portion of the account incoherent.

The author loves Kashmir with all the ardour of a native of the land and perhaps intended to produce such an impression in the readers' mind. Such a purpose has failed altogether, because of the lack of any plan in the preparation of this work.

N. B. ROY

CENTURY DIGEST OF STATUTORY NOTIFICATIONS, 1854—1954 (in 3 Volumes): By B. L. Goswamy. Jupiter Publications, Delhi. Vol. I. Price Rs. 21-3.

The volume of legislation, both Central and State, has increased of late, and is increasing. Besides the legislation by the Parliament and the State Legislatures, there is an ever-increasing mass of what is called subsidiary legislation by rules, regulations, bye-laws, and notifications. We read the Act, and it is stated there that it shall come into force on such date as the Government by Notification in the official Gazette may put into force. Has it been brought into force? The Indian Trade Unions Act of 1926, for example, has been extensively amended by Act XLV of 1947. But the amending Act is to come into force on such date as the Central Government by notification in the Gazette may appoint. Has it been brought into force? An interpellation in the Parliament was necessary to elicit the information that it has not yet been brought into force. Then again the rules are often amended piecemeal; and it is very difficult to find the amendments, or to know whether they have been amended at all. Rules were framed under the Defence of India Act, 1939, about requisitioning houses or parts of houses. A house was requisitioned. The owner of the house made a gift of it to his two sons. In the meantime a rule was added that any transfer of such houses without the permission of the requisitioning authority shall be void. It came into force only a day before the execution of the deed of gift. The defect being noticed later on the gift had to be re-executed. The loss and trouble to the parties can be imagined. What would have happened if the parties were strangers, or if the father had changed his intention in the meantime.

Sri A. N. Bhandari, Chief Justice of the Punjab High Court in his Foreword, has justly noted that: "It is often a matter of some difficulty to find one's way through the intricate mass of statutes repealed, partially repealed and re-enacted in whole or in part,

but this difficulty is accentuated a hundred-fold when a person is called upon to trace a particular notification out of the myriad of notifications which have been issued under the various enactments—notifications "as multitudinous as the sea and as numerous as the leaves of the tree."

In the volume under review Mr. Goswami has endeavoured to put systematic references to all the notifications which are likely to be required by the members of the legal profession. The author has placed the legal profession under a deep debt of gratitude by digesting not only very old notifications, but also superseded notifications since a few of them are revived later, while a good few retain a posthumous importance for a long time since litigation regarding them drags on in Courts for several years. Rights have to be determined as on the date of cause of action or when an alleged offence was committed. For these a reference to the superseded notification is necessary.

The scheme of the book is to digest Central Government Notifications in 3 volumes. Every year a new part will be added to each of the 3 volumes, and a revised consolidated index shall replace the one in use. State supplements will give notifications issued by those States under the Central laws as also under the State laws.

The printing of the book is good; the types are clear and easy to read even under an oil lamp. The binding is of the loose-leaf system of the latest and most suitable type so that Parts and Indexes subsequently issued may be easily accommodated. This will keep down costs and permit easy manipulation.

We hope every bar-library, every busy lawyer, every big company or firm should purchase a copy. It will amply repay the investment.

JATINDRA MOHAN DATTA

SWADESHI AND SWARAJ: By Bipin Chandra Pal. Published by Yugayatri Prakashak Ltd., 41-A, Baldeopara Road, Calcutta-6. Pp. x + 295. Price Rs. 6.

The publication of this volume containing selected writings and speeches of Bipin Chandra Pal, one of the foremost leaders of the Swadeshi Movement, will be welcomed by all interested to know the great awakening and birth of Nationalism in India as a result of partition of Bengal by the Government of Lord Curzon. Bipin Chandra was not only a great fighter for Indian independence but a philosopher with a vision and a man of literature whose contribution to Bengali prose is considerable. As an orator he was a worthy lieutenant of Surendranath Banerjee. But as a speaker in Bengali he was second to none in his time. He was no visionary and his speeches and writings will show that his 'Swaraj' was complete independence for India and not 'Dominion Status' desired and advocated by Moderates of his days. Bipin Chandra suffered for his views and extremes. His differences with Gandhian methods in politics cost him loss of leadership. He stood alone in his brilliance and never submitted to anything short of his ideal.

These speeches and writings during 1902-1907 cover one of the glorious periods of the rise of 'New Patriotism' as Bipin Babu called it. His fine Madras speeches on "The New Movement" republished in this volume were first published in 1907. We congratulate the publishers for bringing out this inspiring volume which deserves to find its way to every public library for benefit of its readers.

A. B. DUTTA

SANSKRIT

KRITYAKALPATARU OF BHATTA LAKSHMI-DHARA (Vol. VI, Vratākanda): Edited by K. V. Rangaswami Aiyangar. Gaekwad's Oriental Series, No. CXXIII. Oriental Institute, Baroda. Price Rs. 17.

The present volume brings to light a very important and interesting section of monumental work, which was practically unknown to the world of scholars. It is edited on the basis of two manuscripts belonging to Junior Bhonsle Raja's Library at Nagpur and the Scindia Oriental Institute of Ujjain. Much help has also been derived in this connection from the Vratākanda, of the *Chaturvarga-chintamani* of Hemadri, which has a good deal of matter, common with the Vratākanda of Lakshmidhara. The publication of the volume under review finishes about three-fourths of the entire work. We hope the remaining portion will come out soon completing the huge and valuable work running through the press for the last fifteen years or so, the first part being published in 1941 (noticed in these pages in December 1946). The volume deals with 175 *vratas* most of which are unknown in this part of the country. All-India festivals like *Jannastami* and *Sivaratri* are, however, conspicuous by their absence here. A comparative study of the festivals as mentioned here along with those found in works of other parts of the country will be helpful in investigating the history of the religious and cultural life of different parts of this vast land.

CHINTAHARAN CHAKRAVARTI

BENGALI

JATIYA ANDOLANE NARI (Women in Our National Movement): By Jogesh Chandra Bagal. Visva-Bharati Granthalaya, 2, Bankim Chatterjee St., Calcutta. Price eight annas.

Here is another important addition to the Visva-Vidya-Samgraha Series. Sri Bagal has been compiling, with singular devotion, the history of our national progress in all spheres since the beginning of the Nineteenth Century.

This brochure competently deals with the contribution of Bengali women to the Indian National Movement. The first Bengali women to attend the National Congress as delegates were Swarnakumari Devi and Kadambini Gangopadhyaya. They had first attended the Congress as visitors in its fifth session in Bombay in 1889.

Since that time till the August Movement of 1942 many women dedicated themselves at the altar of Freedom during the different phases of our political struggle. The author has carefully collected all available materials and presented them in a compact form. The young heroic souls of the Chittagong Armoury Raid and Matangini Hazra, the brave old lady of Midnapore, find their deserved place in this short but interesting chronicle. The presentation is attractive and thoroughly systematic. The alphabetical index at the end will prove helpful to the readers.

D. N. MOOKERJEE

HINDI

MUDRA-SHASTRA AUR BANK SHASTRA: By Kedarnath Prasad. Pp. 295. Price Rs. 6.

VYAVASAK SANGATHAN: By the same author. Pp. 333. Price Rs. 6.

Both available from Pustak Bhandar, Patna-4.

The author, who is a Professor of Economics, has to be congratulated on the writing of these two books which deal with the complex subjects of Money and Banking and Business Organization respectively, informatively and lucidly. He has drawn upon a large number of standard works in English on these subjects, thus carrying to the very door of the Hindi-knowing reader, factual wealth from far and near. His is, indeed, a highly commendable venture.

SANTATI NIGRAH: By Raghunath Prasad Pathak. Arya Sahitya Sadan, Shahdara, Delhi. Pp. 112. Price Re. 1-4.

In these days when so much propaganda is being carried on in the country, in favour of contraceptives as a desirable check on the population-pressure, the author has done well to present the other side of the shield and to lay rightful stress on the ethics of self-control for achieving the same purpose. He has written both with courage and conviction.

G. M.

GUJARATI

NADIO ANE NAGARO (Rivers and Towns): By Yashodhar N. Mehta. Published by the Gujarat Sahitya Sabha, Ahmedabad. 1950. Illustrated. Paper cover. Pp. 64. Price Re. 1.

The son of a distinguished writer, the late Diwan Bahadur Narmadashanker Mehta, Shri Yashodhar has sprung into literary fame first by his *natak* called *Ranchhodlal* and then by this little book which describes

the course and career, so to speak, of the four largest rivers in the world, the Danube, the Tiber, the Nile and the Saraswati. They were radio talks, but with a leaning towards literature and imagination. The Tiber, for instance, has been immortalised by Macaulay in his *Horatius* thus:

"O Tiber, Father Tiber, to whom the Romans pray, A Roman's arms, a Roman's life, take thou in charge today."

While the Romans worshipped their Rivers as Father, we worship our Rivers as Mother. We call our rivers as Loka-Mata. The last article in the book is a first-hand description of the Kumaon Hills, the Kurnachal or Uttar Pradesh, of our ancient books. It is a most interesting and informing little book.

SAHITYANE CHARANE: Addresses delivered by the late Dr. Hariprasad V. Desai. Published by the Gujarat Sahitya Sabha, Ahmedabad. 1950. Paper cover. Pp. 338. Price Rs. 2-8.

The late Dr. Hariprasad filled many parts in his life-time. A keen follower of Gandhiji, with whom he went to jail, a Doctor, a Congressman, a Legislator and a public citizen of Ahmedabad, a Municipal Councillor and last but not least a lover of literature, which he has enriched by his writings and addresses, he was the life and soul of the Gujarat Sahitya Sabha. The Sabha has done the proper thing, in discharge of the debt it owed to him in publishing this collection of his addresses, which range over a variety of subjects, spiritual, material, scientific and social.

K. M. J.

TO THE YOUTH OF INDIA

By

SWAMI VIVEKANANDA

The object of this publication is to bring within the easy reach of our student population a small, cheaply-priced yet representative selection of the Swami Vivekananda's message to the sons and daughters of India.

INDIAN PERIODICALS

Possible Links Between Indian and African Cultures

In an article in *The Aryan Path* N. Court puts forward an extremely interesting thesis, the first part of which is given below :

Many of the happiest years of my life were spent in missionary labours among Indian and African peoples. I have thus been in the favourable position of one able to glean first-hand information in a native environment. Add to this two decades of very close study of history, ethnology, philosophy, mysticism and comparative religion, and it will be appreciated that what I am about to put forward as a theory is the outcome of careful and deep research and not mere guesswork or wishful thinking.

Students of Indian sacred literature are more or less agreed that there are points about the *Iliad* of Homer and the *Ramayana* which indicate a common source for both. The same applies to the *Odyssey* and the Northern European mythologies. We cannot deny the fact, now generally accepted, that the Aryan culture, which had both an Eastern and a Western (European) aspect and manifestation, is responsible for the cult of the great nature-gods of sky and sun, fire, wind, storm and water, of which Thor, the Nordic god of thunder, and the Roman and Greek deities were developments. India is sufficiently akin to be grasped by the English mind and at the same time possesses enough of the elements of another and alien mystic system (of Dravidian and pre-Dravidian origin) to be a source of fascination to us.

Satisfied in my own mind that Western Europe and India are akin, not only linguistically and racially, but culturally as well, I now turn to a deeper and far more subtle relationship, that between India and Africa—not yet fully recognized or appreciated as the European-Indian kinship is, but nevertheless, in the face of the facts, as real and as tangible. This relationship between Africa and India has been the subject of years of painstaking research and, as a result of it, I am firmly convinced that the African culture generally, and the Bantu culture in particular, have both an Aryan-Dravidian and a pre-Dravidian background on which is superimposed a Hamitic and possibly, even probably a Semitic culture.

To make such a sweeping statement needs substantial proof and the proofs are not lacking. Let us set out on an imaginary trip down the continent from Cairo to the Cape and conduct an investigation of its peoples.

North of the Sahara, Africa is inhabited by peoples not markedly different from the South Europeans and the Levantines. The North African may safely be included in the Mediterranean group—a branch of the great white race which is often referred to by the designations Caucasian or Aryan. When we reach the Nubians, however, and enter Egypt, the land of the Copts, and also both Ethiopia and Abyssinia and pass

through Somaliland, the ethnic group we come across is hybrid—a mixture of Hamitic or Caucasian and Negro elements.

To the south and west of these peoples are the woolly-haired group, which includes the Negro, the Bantu, the Hottentot and the almost extinct Bushman. Incidentally, the woolly-haired people are not all black—coloration ranges from the deepest and shiniest ebony to light brown and yellow.

The little yellow man, the Bushman, was at one time the unchallenged master of all Africa. His race is the only one that has the right to proclaim itself aboriginal. All the rest, including the Negro and the Bantu, were immigrants, although much Bushman blood flows in their veins and the early animist religion of the Bushmen and the Hottentots became absorbed by the new arrivals. As in India the Aryan culture took unto itself, as it were, most, if not all, of the earlier civilization, so in Africa Semitic and Hamitic, and, as I believe, Dravidian and pre-Dravidian, influences became superimposed upon the religious beliefs of the autochthonous inhabitants.

We have now reached the area known today as the Central African Federation and we are in the heart of the Bantu world. Here we find the Mashona, Matabele and Barotse nations. The Zulus further south in Natal are an offshoot of the Matabele people even as the Xosas, further south still, are a branch of the Zulus considerably modified as a result of the absorption of Bushman and Hottentot blood, as their language clearly indicates.

In this region are the ruins of the Great Zimbabwe, a prominent structure in the Sabie Valley where over 400 other ruins are to be discovered. Somehow or other it seems to be connected with Mesopotamia, Phoenicia and Palestine. The writer is quite convinced, as a result of personal research work over many years, that Semitic culture is also responsible for structures such as Stonehenge on the Salisbury Plains of Wiltshire; the quoits and cromlechs of Lanyon and Penzance in Cornwall; the Great Zimbabwe in Rhodesia, and the ruins at Tiahuanaco in Bolivia. Professor Frobenius, in his investigations in 1929, came to the conclusion that these ruins have a remarkable resemblance to those at Hampi in Southern India, which, together with Zimbabwe, he ascribes to Mesopotamian culture. It is also of interest to note that the whole structure and layout of the buildings in Rhodesia very much resemble those of certain ruins to be seen in ancient Syria, the combination of place of worship and fort being manifest in both instances, and this fact seems to strengthen the belief which some hold that Zimbabwe was the citadel of a Hebrew colony, and the old mines in the vicinity are thought to be the source of King Solomon's wealth. Reflecting on these old mine workings, which have within living memory been reopened after possibly millenniums of disuse, reminds me that not so many years ago a bronze image of an Indian

deity was ploughed up in the Waterberg district in Southern Africa.

The Zimbabwe ruins were probably built c. 1000 B.C., so we must not be tempted to look upon them as the work of the Bantu, as these latter were at that time nowhere in the vicinity and probably not in Africa. It is thought by some that the Bantu people found their way as far south as Rhodesia only about 1500 A.D., by which time the structure was already in ruins, and the newcomers considered it to be the work of the Devil.

The Bantu race spread right into Cape Colony, now the Cape Province of the South African Union, and its territory includes practically all Africa from Kenya southwards.

It must be remembered that, although the Bushman and the Bantu share a common continental home, they differ from each other a great deal physically. The Bantu and the Negroes are on the whole a tall race, black-skinned and physically well-proportioned. The Bushmen, on the other hand, are a very short, yellow-skinned race, with very broad noses and high cheekbones, and their short hair, which the Negro-Bantu immigrants either acquired from them through interbreeding or else received as a heritage from their Melanesian adventures, grows in tiny woolly tufts, often of a rusty hue, here and there on the skull, giving it a patchy appearance. The Bushmen are often characterized by Mongol-like features (the face in many cases having a flat appearance commonly observed among the Chinese) and by their hands and feet, which are of a peculiar smallness and gracefulness. The eyes of these people are often small, deep-set, black and beady. They are long-skulled, as all Africans are. Today the remnants of this people are estimated to number less than 3,500 in all Africa. They are fast dying out.

It is a most suggestive fact—to those concrete thinkers who demand a physical proof of Karma—that the lowest races of men are now rapidly dying out; a phenomenon largely due to an extraordinary sterility setting in among the women, from the time that they were first approached by the Europeans. A process of decimation is taking place all over the globe, among those races, whose "time is up"—among just those stocks, be it remarked, which esoteric philosophy regards as the senile representatives of lost archaic nations. It is inaccurate to maintain that the extinction of a lower race is invariably due to cruelties or abuses perpetrated by colonists. Change of diet, drunkenness, etc., etc., have done much; but those who rely on such data as offering an all-sufficient explanation of the crux, cannot meet the phalanx of facts now so closely arrayed.

Thus writes Madame H. P. Blavatsky in *The Secret Doctrine*, Vol. II, pp. 779-780. Then she quotes the materialist Lefevre as saying :

"Nothing can save those that have run their course It would be necessary to extend their destined cycle." . . . The peoples that have been most spared Hawaiians or Maories, have been no less decimated than the tribes massacred or tainted by European intrusion." ("Philosophy," p. 508).

As has already been hinted, the Bantu is certainly not African in origin. "What! The African not an African?" I hear you exclaim. But this ought not to surprise us. Europe today is inhabited by peoples whose original homes were in Asia. My British and Anglo-Saxon forefathers have been traced to the Caspian Sea and the Black Sea areas. The Norwegians, Swedes and Danes are not aboriginals of Scandinavia. The true native of the North is the Lapp, a race short in

stature, with high cheekbones and snub noses, quite different from the tall, blond, blue-eyed Nordics. With regard to the Bantu people of Rhodesia and South Africa, who are also in the main the racial stock from which the American Negro traces his origin, the numerical factor alone in the populations is evidence against their long sojourn in that area. Anthropologists and statisticians recognize the people as the most prolific race on earth. Had they been in this area during all the centuries that are claimed for them, they would most certainly have been much more numerous. The average number of children—five or six to each mother—indicates a people who, if they had resided in a given area for 1,000 years, should number at least 80,000,000 in South Africa alone instead of around 8,000,000 as they do.

From where then came the ancestors of the Negro and Bantu peoples? Does tradition have something to say? What does history reveal? The voice of history supplies a valuable clue which is worthy of our consideration in this study. Abul Masudi, an Arabian traveller, who may with some justification be termed the Marco Polo of Africa, informs us in his travel records that by A.D. 900 (mark this date) the Bantu were spread as far south as Sofala, which is an area in the modern Portuguese colony of Mozambique (East Africa), a territory on a latitudinal level with the southern part of Southern Rhodesia. Another interesting point brought out in Abul Masudi's writings is that these Bantu were called Makalanga and were a people who had, during the course of their southward march, mixed with the Persians, Arabs, Indians and the Greeks. The true unmixed Bantu followed after them. From whence did they come?

These Makalanga possess an interesting tradition which may be the key to the riddle of the black man's past. They appear to have travelled to the Malay Peninsula from India, which, according to Professor Schwartz, was their home land, and from there to the Pacific archipelagoes, where they intermarried with the woolly-haired Negritos and were the progenitors of the frizzy-haired Melanesians. (Incidentally, many of the Cape coloured people, who are a mixture of Africans and Europeans, tend to have the same fuzzy hair.) Endeavouring later on to make their way back to India, they were forbidden, and then sailed along the Malabar coast, and finally down the African coast, eventually landing on the shores of that continent. Some settled in Madagascar, where they remained free from the ethnic

Ayurvedic Treatment of Cancer

By Rajvaidya Kaviraj Pranacharyya

DR. PRABHAKAR CHATTERJEE, M.A., D.Sc.

This is an epoch-making book of a far-reaching significance. It is the first of its kind in English language in India. It has been very highly spoken of by all veteran physicians of India as an indispensable guide to teachers, students and physicians alike. Price in India Rs. 10/-, foreign priced Rs. 16/-.

To be had of—

172, Bowbazar Street, Calcutta-12

influences and mixing with the Bushmen and Hottentots, who, both racially and linguistically, affected those who settled on the mainland.

Madame Blavatsky in Volume II, p. 328, of *The Secret Doctrine* says:

Funnily enough, Haeckel, in his fantastic *Pedigree of Man*, considers "the Australians of to-day as the lineal descendants, almost unchanged (?), of that second branch of the primitive human race . . . that spread northward, at first chiefly in Asia, from the home of man's infancy, and seems to have been the parent of all the other straight-haired races of men. . . . The one, woolly-haired, migrated in part, westwards" (i.e., to Africa and northwards to New Guinea, which countries had then, as said, no existence as yet). . . . "the other, straight-haired, was evolved farther to the north in Asia . . . and peopled Australia . . ." (p. 81). . . . Prof. Haeckel must also have dreamt a dream and seen for once a true vision!

It seems rather likely that this theory is the correct one when we consider Tasmania, whose almost extinct black people differed very little from the Negro and the Bantu. They may have been a branch of the race that made their way eastwards in those early days of our era.

Background of the Split of Surat

Ramesh Prasad writes in the *History and Political Science Journal, Agra College*:

Crisis in political organisations is a natural phenomenon. Institutions, the creatures of human activities, must suffer change; otherwise, they stagnate and die out. Whenever change is obstructed the inevitable result is a crisis. Organisations claiming a national character can ill-afford to neglect popular aspirations and reactions. The split which took place in the Indian National Congress at Surat in 1907 was one such crisis which mundane institutions have to face.

THE LEADERSHIP OF MODERATES

Ever after its inception in 1885, the Indian National Congress held its sessions from year to year in different cities for a score of years. The course of the Congress was a peaceful march devoted to the voicing of public grievances, suggestion of reforms and making entreaties and appeals to the British sense of justice and righteousness. The object of the Indian National Congress had been "to draw attention of both the people as well as the Government to all the grievances from which the country suffered, and which were its avowed objects to remedy by constitutional means and methods." (*Indian National Evolution*: A. C. Mazumdar, p. 98). The Congress annual sessions, at different places, all over the country were like the sessions of a large annual debating society. Long speeches were made and the sessions adjourned after the adoption of numerous monotonous resolutions, copies of which were, however,

despatched to government for favourable consideration.

No effective campaign was organised and no remarkably constructive work was done during the twelve months of a year, on the expiry of which the Congress met for the next annual session. Even a moderate of Gokhale's brand was not fully impressed by Congress methods. "Very few of us" he observed, "have really faith in the work we are doing. When men take up work in a mechanical spirit, without believing in it, you should not be surprised, if no great results are achieved." (*Indian Review*, August, 1904, p. 550). Similar dissatisfaction was expressed by G. Subramania Aiyer. "To some extent," remarked he, "it has even departed from the features that marked it in the earlier days. . . . But it does little more than that at present. The fourth of the objects of the Congress, as stated by its first President, namely, 'the determination of the lines upon and methods which during the next twelve months it is desirable for native politicians to labour in the public interests,' has now gone out of its sight." (*Indian Review*, December, 1905, p. 830.)

Though the advent of the twentieth century witnessed a remarkable change in Congress attitude towards the government, the leadership of the Congress had remained the same and the men at the helm of affairs were fully confirmed in their favourable views towards the British character and their sense of justice. They tried to understand British character from British literary creations. These Indian leaders of the Congress, of whom history takes note as 'Moderates,' were the product of Western culture and education. "They had their Wordsworth and their Browning societies." (*Indian Unrest*: V. Chitrol, p. 24.) They went to all lengths in praising the British nation and British character. Muhammad Rahimat-ullah Sayani, President of the 12th Indian National Congress declared in unambiguous terms that "a more honest and sturdy nation does not exist under the sun than this English nation." (*The History of Indian National Congress*, Vol. I, P. Sitaramayya, p. 61.) Similarly, the annulment of the partition of Bengal "led to a gushing praise of the British Government, a renewed faith in its sense of justice and a sense of profound gratitude expressing itself in unmeasured flights of oratory." (*Ibid*, p. 62.) Thus, in spite of the repeated acts of injustice and atrocities, committed by the Britishers in India and the regular draining of its resources, the 'Moderates,' who had been nurtured by Western traditions never faltered in their professions of faith in the nobility of British character. Sri Pherozeshah Mehta was expressive enough when he remarked, "I have no fears but that English statesmanship will ultimately respond to the call." (*Ibid*, p. 103) and concede the Indian demands. S. N. Banerjee even declared, "We plead for the permanence of British rule in India." (*How India Wrought for Freedom*: A. Besant, p. 357). They believed that to get redress for her grievances, "what India wanted was a lucid and balanced presentation of her case before Englishmen and their parliament." (*History of Indian National Congress 1885-1935*: P.

Sitaramayya, p. 97). They even "loved to parade their loyalty." (*History of I. N. C.*, Vol. I: P. Sitaramayya, p. 62.)

EXTREMISM IN MAHARASHTRA AND BENGAL

Opposed to this set of moderate leaders, were the patriots of Maharashtra and Bengal. The young men of Maharashtra and Bengal, well educated and fully conversant with Western education and culture were principally "inspired by Indian ideals and were proud of their heritage. In an open letter to his countrymen, Aurobindo Ghosh proclaimed the superiority of Hindu over Western civilization. "We reject" he writes, "the claim of aliens to force upon us a civilization inferior to our own or to keep us out of our inheritance on the untenable ground of a superior fitness." (*Indian Unrest*, Note 2, p. 337).

Lokmanya Bal Gangadhar Tilak was the pioneer of this re-awakening in Maharashtra. "He was a born fighter and a typical Marahatta. The passion for freedom was the ruling motive of his life." (*Indian Politics Since the Mutiny*: C. Y. Chintamani, p. 81). He organised Ganpati festival in 1893 and Shivaji festival in 1895. He also started Hindu Lathi club and carried propaganda against cowkilling. Maharashtra nationalism could be roused only by such activities. These festivals were utilised for political purposes. He also carried on vigorous propaganda against the British government through his organ, *Kesari*. In the eyes of the Moderates, his programme was dangerous. But the following of Tilak was increasing day by day. He was acting as a man of the land, to which he belonged, deeply touched by the sufferings and miseries of his fellow countrymen. He voiced what people felt. Maharashtra was ablaze.

In Bengal, the partition project led to a serious outbreak of public feeling, against the Government and dissatisfaction mounted with its repressive measures. *Yugantar*, *Sandhya* and other journals, preached revolutionary ideas and roused the public to action. Though they all acknowledged the debt of Tilak, local leaders of renown were not wanting in efforts. Men, like Bipin Chandra Pal, Aurobindo Ghosh and Ashwini Kumar Dutta, were actuated by the desire of liberating the country from foreign yoke. Religious feelings were roused in Bengal and Shakti-Cult was revived and popularised.

The Extremists were ardent and relentless. They "smarted under a sense of wrong and . . . kept up an agitation through the columns of their papers as well as upon the platforms decrying the Congress and preaching the utter futility of Congress propaganda." (*Indian National Evolution*, pp. 103-104). They had devised new weapons of Swadeshi and boycott and they became very successful in Bengal during 1905-11. The Indian National Congress had also upheld the movement of Swadeshi in its Calcutta Session of 1906. (*Resolution VIII: How India Wrought for Freedom*, p. 460). It would not be judicious to call the work of the Bengal patriots as destructive. A. C. Mazumdar's statement that "theirs was apparently a work of destruction and not of construction" (*Indian National Evolution*, p. 104) is hardly based on justice. The political methods of the extremists were surely surcharged with religious fervour. But they were constitutional and peaceful in action. Mr. Pramatha Nath Bose observed in 1907 that "the Extremist is not such a dreadful creature after all, and so far as the safety of the British rule is concerned, is as prosaic and harmless as being as the orthodox congressman is now understood to be." (*Indian Review*, April 1907, p. 252).

YOUR INSURANCE

Life Insurance is not a fair-weather friend, but a friend in need. It is a protection against the rainy day—a safe and sure coverage for future eventualities. It guarantees security to those who avail themselves of its benefits. And you can as well enjoy these benefits by placing YOUR INSURANCE with the HINDUSTHAN which is your own Company. It has a tradition of 48 years' dependable service to the nation.

Buy a Hindusthan Policy—It is the best buy that you can secure for a small expense.

The growth of extremism was not an overnight phenomenon; it took years to mature and many factors contributed to it—the famine of 1896-97 and the plague of 1898; the Anglo-Indian feeling of racial hatred and their attitude of arrogance towards Indians, and the work of religious reformers.

THE VICEROYALTY OF LORD CURZON

But the immediate reason for the flaring up of national feelings was the Viceroyalty of Lord Curzon. He undertook feverish activities and suffered from a zeal for reforms. His hand was everywhere and there was hardly any department which did not feel the impress of his personality. The Calcutta Corporation Act of 1899 and the Official Secrets Act of 1904 were passed and adopted under this enthusiasm for reform, against popular protest. His Indian Universities Act of 1904 turned the universities of India into "the most completely governmental universities of the World." (*Life of Lord Curzon Vol. II: Ronaldshay, p. 193*). The partition of Bengal proved to be the greatest blow to Indian sentiments. In spite of the clear manifestation of public opinion, Lord Curzon carried it through. But it released dormant potentialities and created a wave of indignation throughout India. "No other event in the history of national movement in India gave a more powerful incentive to her political consciousness and awakening than the partition of Bengal." (*The Muslim League: Its History, Activities and Achievements* by Dr. Lal Bahadur, published by Agra Book Store, 1954, p. 54). These and other official measures of Lord Curzon coupled with the expedition to Tibet and the policy towards Afghanistan gave rise to much popular resentment. Besides, Indian troops were also sent out to China and South Africa. "Indians strongly resented the employment of their troops to further British imperialistic designs." (*Landmarks in Indian Constitutional and National Development, Vol. 1: G. N. Singh, p. 144*). For all these acts of unpopularity Curzon paid the price. He "departed unhonoured and unsung." (*Indian Review, May, 1904, p. 308*).

EVENTS OUTSIDE INDIA

Moreover, continuous news of maltreatment of Indians in South Africa were pouring in the country. Mahatma Gandhi was waging a non-violent war against the atrocities and inhumanity of rules there. The Indian sense of self-respect was deeply wounded. The Indians felt that without independence at home it was not possible for them to get fair treatment at the hands of other people. Nor were other inter-national happenings wanting. The defeat of Russia at the hands of Japan in 1904-5 put self-confidence and courage in the hearts of the people of Asia. "Almost for the first time in the history of the world an Asiatic power, hitherto somewhat despised.....humbled a huge European power....." (*Indian Review, January, 1905, p. 1*).

DISCONTENT MANIFESTED

Therefore, when the twenty-first Congress met at Banaras on 27th Dec., 1905, the two wings of the Congress were sharply divided over the resolution of welcome to the Prince and Princess of Wales, which was ultimately carried, extremists absenting themselves from the meeting. The extremists were further disappointed by the absence of the word 'Swaraj' from the presidential address of Gokhale. Much disgruntled, they met in an open session (mostly young delegates) to form the New Nationalist Party, which, however, did not dissociate itself from the Congress.

The differences between the extremists and the moderates had become so alarming that an open breach was feared at the Calcutta session of 1906. To avoid this, Dadabhai who was 82 was invited from England to preside. When he accepted the invitation, the relief was so great that S. N. Banerjee wrote to him, "you have saved us from a crisis." (*Dadabhai Naoroji: R. P. Masani, p. 497*). Dadabhai could conciliate the extremists by declaring that "self-government is the only chief remedy. In self-government lies our hope, strength and greatness." (*How India Wrought for Freedom, p. 447*). A resolution on self-government, which extremists paradoxically called the Swaraj Resolution, although the word 'Swaraj' did not figure in it, was adopted. Such an attitude, however, saved the situation for the time being. But it could not save it permanently. The discontent was real and it made the split inevitable. What happened, therefore, at Surat in 1907 does not surprise us.

Political Writing and Public Passions

In this essay, Sir Norman Angell reflects on his unusual career, which spans more than six decades and numerous countries. Sir Norman, of course, is the author of *The Great Illusion*, first published in 1908 and since then reprinted and translated into twenty languages. For his lifelong fight against war and militarism, he was knighted by King George V in 1931 and received the Nobel Peace Prize in 1933. Among his score of other books are *The Story of Money* (1929), *Preface to Peace* (1935), *Let the People Know* (1943) and *The Steep Places* (1948). For a dozen years, Sir Norman was a member of the Council of the Royal Institute of International Affairs, and from 1929 to 1931 he also served in the House of Commons. This article reflects his painfully acquired distrust of nationalistic passions, more dangerous in the masses than among small groups:

Any man who has been writing on public affairs for more than sixty years, as I have, ought to take stock and ask himself what events have had to say to the ideas he has propounded. And if he has corrections or recantations to make, he should make them, as an obligation to those who may have read him. I undertook some such stock-taking a year or two ago in the form of an autobiography. But, since then, events have emphasized certain points and clarified others. Since both emphasis and clarification bear on today's most urgent problem, that of defense against Communism without atomic war, a word or two in that context may be in order.

What follows will be better understood if I explain that the sixty years just referred to have been divided about equally among the United States, France and Britain; that the twenty years in the United States included seven (the first seven) as a manual worker, farm hand and what not; that the French period included a year or two on the staff of a French paper, to which I contributed a daily article on international politics; and that the British period has included candidacy in four Parliamentary elections, membership in Labour party committees, and a year or two in the House of Commons on the Labour party benches. There were, of course, other activities, but they need not come into this story.

How does it all add up, in the light of subsequent events? The political and economic prognostications made in books, particularly in the matter of military victory as a means of solving our major problems, have generally stood the test of events. In that connection, there is not much to correct. Yet, I want to avow much failure in the main purpose I set myself more than half a century ago. The story and cause of the failure should be of service to younger political writers grappling with a task

upon the success of which our sheer physical survival now depends.

It was my early life in the United States, that is, among workers on farms and ranches in the West toward the end of the nineteenth century, which planted the seeds of the purpose I was later to follow. Leaving a Swiss university at 17, I became an emigrant to the United States. I had not been in the country long before I was the helpless witness of the beginnings of a lynching: the gathering of crowds, the rumbling of a vague, surly clamor, the increasing domination of the confused and uncertain mob by the most violent and least rational elements with it, the frightening process by which individuals, at other times decent and humane, shed those qualities and any sense of responsibility for the monstrous and evil thing about to be committed.

A year or two after that experience, I was to witness something similar on a national, and, still later, on an international, scale. President Cleveland's virtual threat of war against Britain in his Venezuelan message aroused a violent outburst of Anglophobia in the United States. The U.S., one learned from nearly all the big-circulation newspapers and much of Congress, was suffering intolerable wrongs at the hands of Britain, and American freedom would be put in mortal jeopardy if a British colony in a South American jungle extended its frontier even a mile or two. (An unfortified British frontier, not in distant South America but right alongside the United States for 3,000 miles, had existed for generations without provoking any such fears). My fellow workers were as angry and passionate as the newspaper writers and Congressmen. But not one of them could tell me what the wrongs were, or in what way their country was so threatened by Britain as to justify war. This failure to find an answer made not the slightest difference to their angry patriotism, except, perhaps, to increase it. In a letter to a relative in England at the time, I wrote: "Here is the spectacle of a whole nation moved by sheer hallucination, by delirium."

True, the mood passed because an American ship was sunk in Havana harbor. Then, almost overnight, Spain became the malevolent enemy whose power had to be destroyed and the "British peril" was for a time completely forgotten in the passionate demand for war with Spain, which, in this case, duly came.

When the observer of these events found himself in a French newspaper office in Paris during the Dreyfus affair, he was confronted by what seemed to him a startling phenomenon. The French newspapermen wrote almost exactly as the Hearst newspapermen had written: the Deputies in French Chamber talked almost exactly as the Congressmen had talked. France, too, it would seem, was in deadly peril from the machinations of foreigners, particularly the British, who were plotting with the Jews to undermine the French Army. (French anti-Semitism then had a daily newspaper, *La Libre Parole*, anticipating Hitlerite Germany by thirty years or more).

How came this resemblance in circumstances which were so different? The French case concerned a mis-

carriage of justice. Such errors occur in every country. It was the business of the French judiciary to set things right. Why, then, did the affair dominate French politics for almost a generation? Because it precipitated collective passions of fanatical partisanship—passions which, whether they take the form of nationalism, race prejudice, ideological (i.e., religious) differences or party loyalty, can blind men to the simplest objective fact beneath their noses. In some respects, the emotional epidemics in France were more mischievous than the American kind, because they were much more destructive of Government stability. Political partisanship in France are such that the country is at times unable to agree on any government at all. Quite small groups, though unable to create a government themselves, can make it impossible for any other group to do so, all to the greater weakness and instability not only of France but of the West as a whole.

On the heels of the Dreyfus affair came the jingoism of the Boer War in Britain. The two little Boer republics had to be suppressed as a measure of security for the two British colonies of the Cape and Natal and for the British position in Africa generally. (He talked glibly then of a British railroad from the Cape to Cairo). There were a dozen good reasons for believing that the conquest of the two Boer republics would not add at all to the security of Britain's position in Africa. But to state these reasons in public was as much as a politician's life was worth, as Lloyd George, escaping in policeman's disguise from a Birmingham mob determined to have his blood, soon found out.

Time has now given its verdict on the policy so passionately demanded by the British electorate of that day. The two Boer republics were conquered and extinguished with the result that the whole of South Africa, including the erstwhile British colonies, has become a Boer republic—virtually so today, formally so tomorrow, as the Boer Prime Minister of the Union of South Africa has just announced. The emergence of a new republic might of itself be something at which we could rejoice. But the new republic not merely rejects the last vestige of British authority, but, as part of the heritage of bitterness left by defeat, it rejects also all that is best in the British tradition. And it is substituting a policy of ferocious racial discrimination that may result in the whole of Negro Africa being plunged into chaos and bloodshed.

Thus, at the turn of the century, the three great liberal powers of the world were caught in the grip of fierce, irrational emotions of the mass mind, manifested here as nationalism, there as imperialism, elsewhere as anti-Semitism or racialism or doctrinal fanaticism. This writer found the spectacle frightening. If such passions continued to dictate the policies of nations as politically mature as the United States, France and Britain, then it was the end of democracy or of much hope for any form of society which was stable, free and humane. Perhaps the most frightening aspect was the general unawareness of these forces which threatened to destroy us. The volcano of irrational passion rumbled deeply enough, but no one seemed to hear.

This writer gave expression to his fears in a book (his first) entitled *Patriotism Under Three Flags: A Plea for Rationalism in Politics*. Published in 1903, it had virtually no sale at all, though a good many reviews. Several critics took the line that a people ought to be irrational, impulsive and passionate in defense of its national interests, and that any nation that did not thus act instinctively and "think with its blood" would almost certainly go down before more virile people. Others took the familiar line that there can be no such thing

as "general" madness. If it is general, it is not madness but normal human nature, and "you can't change human nature."

Thirty years after the publication of *Patriotism Under Three Flags* came events which threw light on its main theme and tragically confirmed it. By 1933, no non-German had any doubt whatever that a whole people could be seized by collective madness or hallucination. For by then we were witnessing the spectacle of the most highly educated, cultural nation in the world, one eminent in technology, administration, industry, philosophical speculation and music, preparing for the systematic, efficiently organized extermination of millions of men, women and children for the sole offense of belonging to the race of Jesus Christ, His mother and Apostles, to the people from whom Christendom has taken its religion and its ethos.

Now if we saw a benign, kindly *pater familias* pushing little children and old women into a gas chamber and cremating them for the kind of offense just described, we would have no hesitation in applying the appropriate term to the spectacle. We would say that here was madness, insanity, hallucination, delirium. We will miss the whole significance of the vast Hitlerian episode, the Nuremberg Laws, the Belsen and the Buchenwalds, unless we can face the fact that the individual German is, in the ordinary situations of daily life, as kindly, humane and compassionate as the members of any other nation. And that is precisely the kind of point we have systematically evaded in our interpretation of events of this last half century.

We in Britain usually explained those aspects of German policy which have cost Germany and the

Do not

CALCUTTA**

world such misery by saying that they are all due to "Germanism," that only Germans could be guilty of that kind of abomination, and that if we took measures to clip their power, to "destroy German militarism," disarm Germany, then the world would be safe.

But this conclusion itself involved closing our eyes to obvious objective fact. To the east of Germany there was a state more powerful than Hitler's building up a system as savage, cruel and inhumane as that which Hitler tried to build (the Arctic slave camps yield nothing in barbarity to Belsen and Buchenwald) and much more dangerous. For the Communist state has a weapon Hitler never had: a doctrine which has infected groups in every country of the world, which are prepared to act as the *avant-garde* of Moscow's domination. The arms used in Soviet conquests are not in the first instance military. Russia's conquest of China's six hundred millions has been achieved without the sacrifice of a single Russian division. She has conquered by the exploitation of just those irrationalisms and fanaticisms to which my book in 1903 tried to call attention, the self-same irrationalisms and fanaticisms which she is still exploiting and by which she hopes to triumph. For, of course, they are the source of that lack of unity in the West—the disunity within each nation created by the conflict of rival parties and the conflict between states provoked by the emotions of nationalism—which makes a common policy for Western states so difficult. This disunity arises from, and further stimulates, psychological forces with which military power cannot deal. If a French or Italian Communist party manages to block inter-Allied agreement, it is not going to help matters to drop American bombs on Paris or Rome.

We know from the facts of history that the psychological forces under discussion are neither inevitable nor unmanageable. The wars of religion between the Christian sects which once devastated Western Europe (they would have destroyed it utterly if the antagonists had possessed the nuclear weapons we possess) have come to an end. Heretic and orthodox have learned coexistence. The Christian churches now confer together to discipline, by understanding, the passions that once sent them at each other's throats. Other factors have entered, including the correction of the theologian by the layman.

As much can be done for the passions of opposing political ideologies. But the first condition of dealing with any problem is to recognize that it exists. The usual attitude in democracies is to deny even the existence of the destructive spiritual forces present within each of us—even within that Common Man whose century this is supposed to be. Yet, we flourish such slogans as "A hundred million people can't be wrong" and "The voice of the people is the voice of God." If we give such slogans the meaning so often given, then nothing more can be said or done. One does not presume to correct the voice of God.

We will never make democracy workable until we accept the hard truth (which we asserted often enough when we passed judgment on the voice of the German people) that the voice of the people can often be the voice of Satan. Then we may set seriously to work in the radio....to overcome the Satan of modern politics and improve the character of those collective judgments upon which our future depends.—*The New Leader*, February 14, 1955.

First Lesson...

Care of the teeth by the NEEM HABIT from childhood helps in building up fine teeth and healthy gum and in keeping better health throughout the life.

Neem has been recognised for its wonderful antiseptic and astringent properties all over India from time immemorial.

NEEM TOOTH PASTE contains the active properties of Neem together with other ingredients beneficial for teeth and gums.

It cleanses the teeth and gums thoroughly, prevents acid-forming bacteria, makes breath pleasant and brings with its freshness that lasts long after use.

Available in small, medium and large tubes.

Illustrated Dental folder are sent on request.

THE CALCUTTA CHEMICAL CO., LTD. :: CALCUTTA-29

Nylon and Perlon

Walter Theimer writes the interesting history of the invention of the above-mentioned two substances in *Deutsche Korrespondenz*, March 19, 1955, as follows:

"Nylon" and "Perlon" are world words. No politician and no ideology can dream of ever equalling them in popularity. These synthetic fibres are now the principal materials for ladies' stockings, often just termed "nylons" or "perlons" but men's socks, shirts, and many other things are made of them likewise. Production value in this field has reached astronomic figures. And yet it is only a short time ago that the ideas which gave rise to this colossal industry sprang from the brains of a few research chemists, in part almost simultaneously in Germany and in America—and that is the story we are going to tell. Scarcely one among the fair wearers of "nylons" and "perlons" is aware of the dramatic battle that was fought at the cradle of perlon, fortunately ending in reasonable compromise.

Du Pont, the huge American chemical manufacturers, launched nylon about 1935. Chief chemist Carothers, one of the world's leading authorities on synthetic fibres, had invented it. Dr. Carothers was the first man to make fully synthetic fibres. Rayon had dominated the scene before. But rayon is still a semi-natural product; it is processed cellulose, coming from wood. Its real home is in the forest. The truly synthetic fibre, however, is born in the factory. It is made from chemicals. Carothers synthesized the "polyamides," which are compounds with a structure remotely resembling proteins and, therefore, natural silk (which is a protein). The principal polyamide, nylon, was tremendously successful.

STAUDINGER AS PIONEER

As most synthetic fibres and plastics, nylon is based on the theories of macromolecular chemistry, the new science pioneered by Professor Staudinger of Freiburg, who was awarded the Nobel Prize for it last year. Small molecules are synthesized and joined together to form larger ones, known as macromolecules. The processes of uniting them are known to scientists as "polymerization," "polycondensation," etc.

Now the same ideas guided Dr. Paul Schlack, a German research chemist then with I.G. Farbenindustrie, the chemical combine dissolved after the war, and led him to discover a process known as lactame polymerization about 1937. From a simple cyclic hydrocarbon, cyclohexane, a compound named caprolactame may be made. When heated under some pressure, the molecules

of this substance polymerize. They link up to form perlon. The treasured stocking material is a "high polymer" of caprolactame, which in turn may be made from a hydrocarbon found in petroleum. Perlon is a polyamide and, therefore, a relative of nylon.

PATENTS EXCHANGED

Hence it is not surprising that American chemists had in the meantime developed a similar process. It turned out that Du Pont had filed a patent for perlon one nose-length earlier than the Germans. It was not for the first time that an important invention was made in several countries simultaneously though independently. This was not a question of national pride, but millions of dollars were at stake. An ugly patent dispute raised its head between the two chemical giants on either side of the Atlantic. Yet reason won the day, and shortly before the last war the two companies agreed to exchange their patents. I.G. Farben was authorized to make both nylon and perlon in Germany. Nylon was at the time,

called "Perlon T" by German makers, a name dropped long since. "Perlon proper was known as "Perlon L". The general licence agreement is still valid, and German makers of perlon pay a small licence fee to America. The successor companies formed from I.G. Farben after its dissolution continue to make the fibres.

As materials for hosiery, nylon and perlon keep competing with each other, but their makers no longer compete. They have reached agreement long ago, and leave it to the ladies to decide which fibre they will choose. Perlon is of even greater tensile strength than nylon, but the latter is said to possess some other advantages. Elastic "curled" variants of nylon seem on the advance at the moment, at least in the German market. On an overall evaluation, both fibres may be regarded as equals. Men's socks made of these materials, such as 100 per cent perlon socks, rarely need darning, and have almost done away with an age-old problem that has vexed countless generations of housewives and bachelors, the latter even more so. There are other uses for perlon, incidentally: ship's ropes are made from it, for example.

THE SUIT WAS GONE

Perlon had a German precursor, known as perloran. Like perlon, it was resistant to acids, but sensitive to high temperatures. A young chemist of Hamburg, just working on his doctor's thesis, ordered a lab. suit of perloran, and was delighted to be spared acid splash holes in his trousers henceforward. But one winter day, when he was leaning against the radiator and talking to his colleagues in the lab, he saw their eyes widening. He looked down his body the fine perloran suit was gone! The young scientist was standing in his undies. The heat of the radiator had quietly melted the perloran which had agglomerated into a few small balls. Today's perlon will stand 220 degrees centigrade, and there is no need to fear a repetition of such pioneer-day incidents.

Experts know a group of plastics which used to be called "Perlon U." It is no real perlon. The habit of calling three quite different classes of substances by the common name of perlon and distinguishing them by initials has been abandoned. It was again German-American patent rivalry that stood at the cradle of "Perlon U." I.G. Farben resolved to make something far outside the patent province of Du Pont's in order to avoid further patent quarrel. Professor Otto Bayer, today a leading chemist in a large successor company to I.G. Farben at Leverkusen, synthesized a new class of compounds known as the polyurethanes. These substances are chemically very different from both nylon and perlon, and are made by quite different processes. These "little brothers" of perlon quickly grew into fairly big brothers. They are industrial

materials rather than textile fibres, their domain being plastics, aerogels, rubber-like materials, varnishes, and adhesives.

NEW PLASTICS

Urethanes are chemical compounds akin to urea. Production starts from de-isocyanates, a class of compounds little used in industries before. In Professor Bayer's process, these compounds are reacted with various alcohols. By suitable choice of the other reagent, the properties of the resulting compound may be controlled. Long, chainlike macromolecules may be made—these straight-chain compounds are like fibres. By changing the other reagent and altering the conditions of the reaction, interlacing macromolecules may be made. These are very strong, owing to their net-like structure, and give good resins, varnishes, and adhesives. The degree of interlacing, and hence strength and elasticity, may be chosen at will. So hundreds of different substances are made by applying the same basic principle. The new class of plastics has proved extraordinarily versatile.

The initial materials are mixed at a temperature of 200 degrees centigrade. Urethane molecules form, and immediately polymerize at this temperature. No fewer than 10,000 of them link up to form a macromolecule. Interlacing polyurethanes are known as "Desmophen" and "Desmodur" respectively, and much used for industrial purposes. They do not melt at any temperature and are not dissolved by any solvent. Desmophen varnish solidifies so fast that the usual process of "shooting" the varnish on to the object cannot be applied. It would harden in the air. So the appropriate chemicals are placed on the object, and the varnish is synthesized in position by heating. It is practically indestructible. The new varnishes form hard, soft, or elastic covers on the objects, and other materials can be impregnated with them. Adhesives made from mixtures of the new synthetics are extremely strong. They will cement metals and rubber. One interesting polyurethane is "Vulcollane," a highly elastic, rubber-like substance differing in chemical structure from both natural rubber and "Buna" the well-known synthetic.

World Bank Grants \$10 Million Loan to Indian Corporation

Washington, March 15—The International Bank for Reconstruction and Development (World Bank) yesterday entered into a formal agreement to lend \$10 million to the Industrial Credit and Investment Corporation of India formed to assist India's industrial growth.

The new corporation, sponsored by private investors of India, the United Kingdom and the United States, will make long and medium-term loans to industrial enterprises; purchase shares of industrial enterprises; underwrite new issues of securities; guarantee loans by other investors; and help industry to obtain managerial, technical and administrative advice and assistance.

The loan documents were signed for the bank by Eugene B. Black, its president. G. L. Mehta, India's Ambassador to the United States, signed for his government.—*USIS*.

Conquest of the Desert

The 15th March, 1955 will certainly be remembered as a red-letter day in the history of Sind as on this day the Governor-General, Mr. Ghulam Mohammed, performed the opening ceremony of a prize project which is destined to turn some three million acres of waterless waste of the province into smiling fields.

The construction of this gigantic barrage, which is now known as Ghulam Mohammed Barrage was taken in hand on 12th February 1950, and Pakistan engineers and workers deserve full credit that within a short span of five years in spite of the hindrances caused by unforeseen events, this barrage which is a vital link of a bigger project, has been successfully completed.

The advantages accruing from this Barrage project are manifold. It will provide assured, adequate and timely supply of water to the districts of Hyderabad, Dadu and Thatta. With this uninterrupted supply not only an area of 1,650,000 acres which is receiving uncertain supplies of water through the inundated canals will be continuously irrigated but also an additional area of about 1,100,000 acres waste land will come under cultivation.

Another important benefit of this project will be that for the first time in the history of the tract, an appreciable area will come under Rabi crops—vegetables, tobacco, sugar-cane invited the attention of authorities concerned to the important point that in distributing the land great care should be taken to give these lands to those who have small holdings and to refugees who have elected to make Sind their home. He uttered prophetic warning that if we will repeat the mistake of distributing these lands among the big landlords, we will be only adding to our difficulties.

"The common man whether the refugee or a local," he said, "is the core of our nation and all our schemes and projects must aim at ameliorating the hardships of his day-to-day life."

It is in the fitness of things that this gigantic project which is bound to contribute abundantly to the prosperity and welfare of the common man has been named after the Head of the State who holds the welfare of the nation's downtrodden millions very dear to his heart.—*Pakistan Today*, April 1, 1955.

WHO Develops Exchange of Medical Publications

Medical libraries throughout the world, which previously offered their surplus publications to other medical institutions for free distribution and exchange through UNESCO, will now offer them through the agency of the World Health Organization's Headquarters, in Geneva.

According to information received this week from Geneva, WHO will inform medical libraries in its Member States concerning the availability of medical books and periodicals offered by libraries. It will not itself collect and make shipments of such material, but will act as a central information service for medical libraries wishing to exchange and distribute material.

All shipments of publications will be made directly from one medical library to another, after agreement has been reached on the exact items required and on the question of transport costs.

WHO, through its Library and Reference Section, is already in touch with a great many medical libraries throughout the world, but will be glad to receive from new medical libraries offers of exchanges, accompanied by lists of the most-needed books and particulars of periodicals.—*WHO Press Release*, February 7, 1955.

Paul Claudel

The great French writer Paul Claudel died in Paris recently.

He was born in 1868 and belonged to that generation of Frenchmen which has given to the world such writers as Paul Valery, Andre Gide, Romain Rolland and Colette, such painters as Henri Matisse, such politicians as Jaures and Leon Blum and such scientists as Pierre Curie and Paul Langevin.

In his youth he was a great admirer of Rimbaud in whom he found the master enabling him to escape from a materialistic world. Suddenly, he awoke to the consciousness of his Catholic faith, which he professed to the day of his death.

He had taken up the diplomatic career (he was Consul in Shanghai, Minister Plenipotentiary in Rio, and later Ambassador in Tokyo and in Washington), and he composed most of his works in the course of his stay abroad: *l'Otage* (1911), *L'Annonce faite a Marie* (1912), *L'Echange* (1912), *Le Soulier de Satin* (1929).

His full and impetuous lyricism is free from all the constraint of classical French poetry: he has preferred to express himself by means of the verse imitating the verse of the Bible.

All his writings, whether poetry or drama, are guided by his Christian mysticism, in regard to which he chooses his subjects, and it is the conclusion of *L'Annonce faite a Marie* which seems to be the key to his work: "The aim of life is not to live but to die, it is not to shape the cross but to ascend it and to give what we possess with a smile."—*News from France*.

THE MODERN REVIEW

JUNE

1955

Vol. LXXXVII, No. 6

Whole No. 582

NOTES

Scape-Goats and Escapism

Sixty-four amiable members of Parliament sent representation to the Congress Working Committee regarding the desirability of stricter censorship of Indian and foreign films. Cinema, they said, was a 'social industry'—whatever may that connote—and if it tended to create an anti-social atmosphere "something would have to be done about it." Evidently by "something" was meant this representation and that having been done, the sixty-four *incognitos*, or it may be *incognitas* as well, went back to their quarters, well-satisfied at the fruits of their labours and well-content that they had earned the lasting attitude of the forty-eight millions that had provided them with the sinecures at New Delhi.

We give the newspaper report that appeared in the *Amrita Bazar Patrika* elsewhere, but here we have to address a few words to Shri Shriman Narayan, the Congress General Secretary.

We do not know anything about the sixty-four members of Parliament. For aught we know they might be as wise as Solomon or Chanakya, or again they might be of the average run, that is to say the usual lazy yes-man and woman of no consequence beyond party representation. We have still less to say about Dr. Keskar as we have not been able to make up our minds, as to whether he is in charge of the departments concerned or whether those departments have taken charge of him.

But Shriman Narayanji has grown in stature in the shadow of Bapu. He might not be a super-Brahmin of Sarvodaya, with all its austerities, fanticisms and shibboleths, but all the same he has breathed the incense and drank the *madhu-parka* at Gandhiji's feet for years. He has listened to the sermons and has served at consultations with the Father of the Nation. And therefore we expect that he would at least keep the Congress, weak, effete

and infested with profit-seekers as it is, reasonably free from attempts at cheap publicity. For that is what we see in every line of the subjoined report. If it be incorrect, then it should be corrected.

Does Shriman Narayanji really believe that any Censor-Code imaginable would really improve matters? There were laws in England which punished smoking and tobacco-chewing by chopping the culprit's limbs off. Did that stop it? Is there no drunkenness in Bombay, where a mother with an ailing child has to move heaven and earth to get an ounce of absolute alcohol to sponge the child's sores? In the United States of only a few decades back, women used to be fined ten dollars if they exposed a few inches of their legs above the ankle, while getting down from the bus or the tram. What was the effect?

Can the sixty-four members name a dozen or even a half dozen films, produced in impeccable taste and free from all the carnal evils, that have not been financial failures? We can name a dozen that were impeccable, but totally unprofitable.

Does Shriman Narayanji know that sublime passages and ennobling scenes from the pens of Rabindranath and Saratchandra have to be bowdlerized and totally inverted in places before the public would take it?

We know that the Cinema today is a social problem. But that problem is not so easy of solution as the dauntless sixty-four or Shri Shriman Narayan imagine it to be. The real trouble is with the total loss of moral values amongst the majority of our people, cinema-goers and others. The Congress has done nothing and is doing nothing about it. It is useless making a scape-goat of the cinema, for in the book-trade and in fiction magazines we have the same shameful story. Shriman Narayanji should cry *Peccavi* with all of us and then proceed with such conferences.

We are not going to give a detailed criticism of

the Working Committee's opinions or of the representation of the sixty-four guards. They are too absurd for detailed consideration, in the form we have perused. We append the extract from the *Amrita Bazar Patrika* below:

The Congress Working Committee has expressed the view that rules and regulations regarding censorship of films should be more strictly enforced to check degeneration of public morale and prevent exhibition of unhealthy films.

The Committee expressed this view at its meeting on May 4 after considering a representation by 64 Members of Parliament regarding the desirability of stricter censorship of Indian and foreign films together with a note on the subject by Dr. B. V. Keskar, Union Minister for Information and Broadcasting.

Communicating the views of the Working Committee in a letter to Dr. Keskar, the Congress General Secretary, Mr. Shriman Narayan, has said it was also suggested at the meeting that censorship should be appointed at the script stage to avoid unnecessary complications and wastage of money at a later stage. It was also pointed out that members of the Censor Boards should be selected more carefully so that they might constantly keep in view the probable effect of films on the morale of the people, particularly those of young men and women.

The Members of Parliament in their representation had stated that in India and America the tendency of film producers appeared to be to try to exploit films for the greatest amount of profit regardless of social consequences. The result had been that a deliberate programme of preparing films extolling crime and sex incitement was going on. 'The effect on impressionable young minds of over-sexed stories or crime pictures depicting bloodshed, brutality and violence need not be described. It will not be an exaggeration to say that present-day cinema has been one of the important unsettling factors of our school and University student's life.'

Cinema, the representation said, was a social industry and if its activities tended to create an anti-social atmosphere, something would have to be done to check it. 'There is an overwhelming public opinion that the cinema, more especially in a country like India with an objective of a Welfare State based on socialistic pattern should be controlled and guided more effectively so that it serves the purpose of social and artistic progress.'

Dr. Keskar, in his note, was understood to have generally agreed with the views of the M.Ps. Certain types of films he felt had 'definitely anti-social aspect'. Preparation of such films in increasing numbers had posed a very ticklish problem both from social point of view and from the point of view of national solidarity and security, Dr. Keskar said.

The Kashmir Princess

The world knows now about the Bandung Afro-

Asian Conference. And it also knows of the narrow escape of Chou En-lai and party who were to have flown in the ill-fated Air-India Constellation plane. 'Murder will out' is a cliché, but fairly true nevertheless, at times.

It is no secret that a great many Americans did not like the Conference. That was well-understandable. But what is un-intelligible to most sane persons is the vicious attitude of some reputed journals of the U.S. to all matters pertaining to India.

In this matter of the *Kashmir Princess* crash the *Time* of Chicago, U.S.A., in its April 25 issue came out thus:

"Murder!" cried the Red Chinese government. "Murder deliberately engineered by secret-agent organizations of the U.S. and Chiang Kai-shek!" Retorted the U.S. State Department: "Preposterous."

The Chinese Communists had chartered an Air-India plane (fee \$20,000) to take part of their delegation to the Bandung Conference in Indonesia. The four-engined Constellation flew in to Hong Kong from Bangkok on a regular flight, disembarked its passengers, and refueled. During the 80 minutes it stood on the airfield, it was ringed with security guards. Then the charter passengers were whisked in past customs directly to the plane. Chief among the three Chinese delegates were Huang Tso-mei, head of the official New China News Agency in Hong Kong and rated one of the Communists' top agents by Hong Kong police, and Shih Chih-ang, No. 2 man of Peking's chief foreign purchasing agency. Among other passengers five listed as Chinese newsmen were actually (according to Western intelligence) unsung but important Communist propaganda and intelligence agents.

The plane took off. A few hours later, it crashed into the South China Sea 250 miles east of Singapore.

Without waiting for details, India's Prime Minister Nehru despatched a message of concern to Peking: "This disaster has some very unusual features. Something must have happened suddenly. There must be a full inquiry." Peking did not wait, either. Even before the delegation left, said the Foreign Ministry, the government had learned of a "sinister plot . . . to assassinate the members of the Chinese delegation, headed by Premier Chou En-lai and to sabotage the Afro-Asian Conference," and had warned the British to take special precautions. The Communist government charged the British with "heavy responsibility." The British formally rejected the charge, insisted that they had been warned only against the possibility of Nationalist demonstrations, not sabotage. Therefore no special measures had been taken to guard the plane itself, which was serviced by the regular Chinese crews at the airport. But, the British contended, the possibility of sabotage was "extremely remote."

Only three survivors, all Indians, were fished out of the sea. Engineer A. S. Karnik, taken aboard the British frigate *Dampier*, gave the first authentic explanation of

the crash: a hydraulic fire in the port wing. The plane broke into three pieces when it hit the sea.

This sounded more like a common accident than sabotage. In their first broadcast, long before any survivors had been picked up, the Communists had said that the plane exploded in mid-air—the same kind of wild report that crash investigators on the world's airlines encounter after most crackups. But Peking, which knows a propaganda windfall when it sees one, grabbed its chance, without even waiting for the facts to be established." Thus far the *Time*.

It will be noted that actual facts have been distorted. Of course there is no expression of sorrow at the loss of life of innocent people. That would be too much to expect of the filthy newshound who wrote that propaganda splurge.

We append the communiques and news reports that followed the enquiry.

"New Delhi, May 27.—The explosion of 'a timed infernal machine,' placed in the starboard wheel-well of the aircraft, resulted in the crash of the *Kashmir Princess*, which was carrying Chinese delegates to the Bandung conference on April 11, according to the findings of the committee of inquiry appointed by the Indonesian Government. A summary of the report, released simultaneously in New Delhi and Djakarta today, says there is positive indication of an explosion having occurred in the wheel-well of the starboard undercarriage. This evidence consisted of—

1. The bulging outward of the skin and strut members in the immediate area;
2. Deep pitting by shrapnel of the skin and structural members facing the explosion; and
3. A hole blown inwards into the No. 3 fuel tank.

"The recovery of four parts of a twisted, burnt and corroded clockwork mechanism, which has no relation to any equipment or structure of the aircraft, found in the same area where the explosion took place, 'provided irrefutable evidence of an infernal machine having been placed in this area.'

"The findings of the committee are as follows:

1. The aircraft was airworthy and properly certified;
2. The crew was experienced and held valid licences;
3. The aircraft was properly loaded and had sufficient fuel for the flight;
4. The take-off from Hongkong was normal and the flight uneventful for the first five hours;
5. An explosion occurred on board the aircraft when cruising at 18,000 feet over the sea. A fire broke out in the starboard wing and spread rapidly, causing failure to the hydraulic and electrical services;
6. A rapid descent for ditching was immediately commenced and the emergency procedures were carried out efficiently and calmly by the crew members under extremely difficult conditions;
7. The aircraft hit the water with the star-

board wing-tip while under partial loss of control and broke up on impact, and

8. An inspection of the wreckage revealed positive evidence of an explosion in the starboard wheel-well of a timed infernal machine, parts of which were still in the wreckage. This explosion caused puncturing of the No. 3 fuel tank and a fire which spread rapidly and could not be controlled.

"The Constellation took off from Hongkong under the command of Captain Jatar. Routine messages were exchanged by the aircraft with ground stations and the flight was entirely without incident until approximately five hours later, when the aircraft was cruising at 18,000 feet over the sea. At this stage a muffled explosion was heard on board. Smoke began entering the cabin through the cold air ducts and a localized fire was detected soon after on the starboard wing behind the No. 3 engine nacelle.

"Rapid descent for ditching the aircraft was resorted to and distress signals were broadcast. In spite of the fire-fighting action, during which the No. 3 engine was feathered, the fire spread very rapidly and caused failure of the hydraulic system, followed by failure of the electric system as well. During the final stages of the descent, executed in extremely difficult circumstances, dense smoke entered the cockpit, reducing visibility to almost nil.

"Only three crew members survived the accident. The aircraft was destroyed.

"Salvage operations to recover the wreckage from the sea-bed were begun on April 25, 1955, and lasted for ten days, during which period nearly 90 per cent of the wreckage was recovered. An inspection of the wreckage revealed confirmatory evidence of a fire having started in the area referred to by the surviving members of the crew."

"New Delhi, May 27.—A search is now being made for a man in Formosa who, according to irrefutable circumstantial evidence, is believed to be responsible for the destruction of the *Kashmir Princess*. It is learnt on excellent authority that the alleged saboteur, a K.M.T. Chinese, is closely implicated in the planting of the time-bomb in the ill-fated Air India International plane and that he has escaped to Taipei.

"Meanwhile, the Government of India is refusing to say anything in the matter beyond the statement that those found guilty must be punished. The full report of the inquiry is still awaited."

The Hongkong Government made the following statement to *Reuter*:

"The report of the Committee of Inquiry appointed by the Government of Indonesia establishes that an explosion in the wing of the Air India International aircraft *Kashmir Princess* which caused the plane to crash into the sea on April 11 whilst on a flight from Hongkong to Djakarta was due to sabotage.

"It seems probable that the explosive device employed was placed in the aircraft at Hongkong. Although it would not be in the public interest at this stage to publish results of the Hongkong police investigations so far made, the Hongkong Government is determined to make every effort to ascertain the facts. If it is established that the outrage was committed at Hongkong it is determined to do all in its power to bring those responsible to justice.

"In a statement issued by the Hongkong Government on April 13, it was stated that it had been informed that the Chinese Ministry of Foreign Affairs had received information that trouble might be made by Chinese Nationalist sympathizers for a group of journalists leaving for the Bandung conference by an Air India International aircraft on April 11 and it had been asked to take appropriate precautions.

"There was no suggestion in the message from the Ministry of Foreign Affairs, or from any other source, of possible sabotage of the aircraft. The precautions taken were therefore directed to protection of the passengers from molestation at the airport. Had the possibility of sabotage been mentioned, specified action would have been taken for its prevention, including detailed search of the aircraft, and, if necessary, its detention for a suitable length of time.

"Immediately after news of the crash was received, inquiries were begun as soon as possible. These covered a wide field, including arrangements made for the transport of passengers and their baggage, servicing and fuelling of the aircraft and interrogation of all those that had been in any way connected with the arrangements in Hongkong.

"More than 100 persons were interviewed by the police and statements were taken from all of them. Although there was no evidence at that time to point to sabotage, the investigation was carried out on the assumption that sabotage had taken place.

"As soon as the wreckage of the aircraft had been raised from the sea and had been examined by technical experts, including the Director of Civil Aviation, Hongkong, and the Chief Investigating Officer of Accidents of the British Ministry of Transport and Civil Aviation, the Hongkong Government was informed that the crash had almost certainly been caused by an explosion in the starboard wing and that this had been caused by a device placed in the wing behind No. 3 engine.

"In view of the time factor (that is because the normal type of time-bomb is set to go off within 12 hours), it seems most likely that this device had, in fact, been placed in the aircraft during its stay in Hongkong.

"This information enabled the field of inquiry to be narrowed, and it was therefore possible to concentrate investigations on those persons in Hongkong

who might have been in a position to place such a device in the Indian aircraft.

"This investigation has been and is still being pursued with the utmost vigour."

According to a message from London the Foreign Office said that the statement issued in Hongkong had the full authorization of the British Government.

The A.I. Radio

In the April Lok-Sabha reports, we had the following item. We are putting it on record.

New Delhi, April 4.—Encouraged by weak criticism in the Lok Sabha's debate on the Information and Broadcasting Ministry's demands, Dr. Keskar today proceeded not only to defend Ministerial interference in the working of A.I.R. but made it clear that there would be "more and more" of it in future.

An officer who wanted no interference, he stated repeatedly, had no place in the organization.

Dr. Keskar said it was the Ministry which was responsible to Parliament for the working of A. I. R. and not the Director-General or any other officer of the organization. It "was utterly presumptuous" for any officer to believe that his work was not open to interference.

He saw no reason for A.I.R. to be treated differently to other departments and failed to make any distinction between supervision and interference.

The importance Dr. Keskar gave to A.I.R. was evident from the fact that he devoted 50 minutes of his hour's speech to it.

It was proposed to distribute 25,000 community listening sets in rural areas in the next two years. The range of medium-wave transmitters had been increased so that they would be picked up by small sets over a wide area.

The reorganization of permanent staff was practically complete. Questions of permanency were being taken up urgently with the Home Ministry.

A. I. R. was giving patronage to more musicians since he had taken over. Songs produced by the light music unit were proving popular.

The quality of programmes had improved and more variety provided. Specialists were being appointed to effect further improvements.

The Akali Morcha

"Ludhiana, May 22.—While the Akali morcha may continue in Amritsar, the chances of its intensification in or extension to other parts of the Punjab appear remote. With most of their leaders and organizers arrested or under detention, there is now an unmistakable sense of bewilderment among the mass of Akali workers. The few leaders who have not been detained are mostly theoreticians with only a limited capacity to organize a movement.

"The Punjab Government's swoop last Sunday in which over 60 Akalis were detained was most unexpected. Not many Akali leaders anticipated that the State Government would act so quickly and firmly."

This seems to put a period to Master Tara Singh's dreams.

Krishna Menon's Mission

We put on record the progress of the mission of hope, so far.

"Peking, May 20.—The Chinese Prime Minister, Mr. Chou En-lai, and Mr. V. K. Krishna Menon concluded their talks on Formosa tonight on a note of optimism, cables PTI's special correspondent in Peking. Earlier in the evening, the Chairman of the Chinese People's Republic, Mr. Mao Tse-tung, received Mr. Menon. Present at this meeting, which lasted half an hour, were Mr. Chou and the Chinese Vice-Premier, Mr. Chen Yi.

"After tonight's talks Mr. Chou said: 'We can look to the future with hope.' Mr. Menon said: 'I have spent a useful time here.' No communique was issued at the end of the talks, which lasted about 30 hours, spread over 11 days."

India's Balance of Payments

In 1954 India's exports and imports were higher in volume and value than those of 1953. The total value of exports was Rs. 563 crores, which was Rs. 31 crores higher than in the previous year. The volume of exports of practically all commodities was higher in 1954 than in 1953, the only major exceptions being in the case of manganese ore and tea. But in the case of tea, although the volume of exports declined by 51 million lbs., the value of exports was higher by Rs. 28 crores than that of the previous year. In the case of cotton textiles and jute manufactures, there was a fall in export prices; but the increase in the volume of exports more than compensated the decline in prices, and the total value of exports was higher by Rs. 10 crores than in 1953 in each case.

In 1953 the total value of imports stood at Rs. 587 crores and this was higher by Rs. 6 crores than in the previous year. While the import of foodgrains declined by Rs. 31 crores than in the previous year, the bulk of the increase was industrial raw materials like metals, mineral oils, dyes, chemicals, cotton, etc. Further, the prices of imports were generally lower than in 1953. The volume of imports was, therefore, greater than the figures of value would indicate. Owing to the comparatively stable foreign exchange position reached during the previous year, it was found possible to continue and expand the policy of removing or reducing the restrictions on the import of several essential commodities and to diversify the pattern of the import trade. As a result the import of a large range of industrial raw materials and semiprocessed goods increased considerably in value and volume.

The adverse balance of trade was reduced in 1954 to Rs. 22.35 crores from Rs. 54.26 crores in 1953. In post-war years, chronic deficits have been a feature of our foreign trade, the year 1950 being an exception. The foreign exchange position had shown an improvement; sterling balances stood at the end of March 1955 at Rs. 732 crores. Import licences were liberalised and 33 new items of import were added to the liberal licensing scheme. Imports of industrial raw materials rose from Rs. 288 crores to Rs. 329 crores in 1954. Essential consumer goods cost Rs. 159 crores of foreign exchange in 1954 as against Rs. 188 crores in 1953. The import of plant and machinery declined in 1954 by Rs. 8 crores to Rs. 76 crores. Notwithstanding a liberal import policy, the import of essential consumer goods declined in value by Rs. 29 crores. Although lower prices are partly responsible for this decline, the pattern of trade is being shifted towards an increase in imports of industrial raw materials and plant and machinery.

The United Kingdom and the USA continued to be India's principal buyers and suppliers. In 1954, the distribution of India's imports by countries of origin were as follows (1953 percentage being within brackets): UK 24.5 per cent (15.7 per cent); USA 12.5 per cent (15.7 per cent); Burma 7.5 per cent (3.2 per cent); Egypt 4.3 per cent (3.8 per cent) and other countries 51.2 per cent (52.6 per cent in 1953). The decline in imports from the USA, Canada and Australia are on account of greatly reduced imports of wheat from these countries in 1954. The distribution of India's exports by countries of destination was as follows: UK 31.7 per cent (28.2 per cent) and USA 15.3 per cent (16.2 per cent). While exports to Burma and Japan declined in 1954, exports to West Germany and Australia increased considerably.

In 1954 the balance of trade with the dollar area improved by Rs. 4 crores to Rs. 21 crores in India's favour. The export of tea, jute and cotton piece-goods accounted for 58 per cent of India's export earnings. Tea tops the list bringing in Rs. 147 crores on an export of 459 million lbs against Rs. 102 crores on 471 million lbs in 1953. The export of jute goods increased by 74,000 tons to 852,000 tons; earnings rose by Rs. 10 crores to Rs. 124 crores. The export of cotton piece-goods increased by 45 million yards to 815 million yards. Exports of raw cotton were permitted to the extent of 3 lakh bales as compared with 1.75 lakh bales in the earlier cotton season. Exports to South-East Asian countries fell sharply from Rs. 120 crores in 1952-53 to Rs. 72 crores in 1954-55. Although there was a higher level of production in the light engineering and chemical industries, export earnings declined from Rs. 70 crores to Rs. 64 crores.

The Reserve Bank of India's figures for our exports and imports are different. It places India's imports in 1954 at Rs. 624.5 crores and exports at Rs. 548.8 crores, leaving an adverse trade balance for Rs. 75.7

crores. The higher imports in 1954 were entirely on account of commercial imports, since those on Government account declined considerably. After taking into account of Official Donations and Government and Private Invisibles, there was a surplus of Rs. 4 crores on current account. But it should be remembered that official donations and invisibles are by way of compensatory official financing which constitute mainly loans and grants and they are not strictly speaking export earnings. Therefore, the current account surplus is apparently a misleading figure, the adverse trade balance being a recorded fact. A happy feature of our foreign trade in 1954 was that India had a surplus of Rs. 4.7 crores in her trade with Pakistan. In 1953, India had a current account deficit of Rs. 2.2 crores with Pakistan. Invisible receipts fell in 1954 by Rs. 18.4 crores to Rs. 79.4 crores. This was mainly attributable to the decline in official donations (i.e., mainly aid received under the Indo-American Technical Co-operation Agreement, the Colombo Plan and the Ford Foundation) by Rs. 13.4 crores to Rs. 5.0 crores.

* Second Five-Year Plan

With the first Five-Year Plan drawing to its close, the second Five-Year Plan is being envisaged. The outlines of the second Five-Year Plan still remain undefined, but its overall objectives have been clearly stated to be as follows: (1) An increase of 25 to 27 per cent in national income during the five-year period, or about 5 per cent per year, and (2) provision of employment for 10 to 12 million people during this period. The detailed Plan is yet to be drawn out. The broad outline is based on three papers prepared by economic experts. Briefly, there will be a total outlay of Rs. 6,300 crores, of which the share of the public sector will be Rs. 4,300 crores and that of the private sector Rs. 2,000 crores; in the public sector is included an expenditure of Rs. 900 crores on non-development purposes. Importance will be given to the development of basic heavy industries for the manufacture of producer goods to strengthen the foundations of economic independence. The development of heavy and capital goods industries will reduce India's dependence on foreign countries for the supply of essential machinery. Emphasis will also be laid on small-scale, cottage and home industries, in order to increase the output of consumer goods and provide employment in rural areas. Large-scale factories producing consumer goods will not be given much importance. Irrigation and agriculture will receive due prominence, but the emphasis will be on medium-sized projects and regional balance. Rural electrification, community projects and National Extension Services will be rapidly expanded.

The second Five-Year Plan will aim at obtaining a rapid growth of the national economy by increasing the scope and importance of the public sector and in this way to advance to a socialist pattern of society. The Joint Paper of the experts makes the following observations: "The economic development of the country

must conform to the broad social objectives in hand. The development of a socialist pattern of society has already been enunciated as a basic objective before the country. In formulating the second plan emphasis must be placed on the extension of public ownership or control over the strategic means of production, on greater equality of opportunities, on bringing the gap between the haves and the have-nots and on the protection and enhancement of the well-being of the weak and unorganised sections of the society. Men do not give of their best in the absence of a secure and fair share in the fruits of their labour and achievement of social justice is a necessary condition for releasing the productive energies of the people."

If the first Five-Year Plan was mainly agricultural, the second Five-Year Plan is rightly going to be mainly industrial. The Russian economic plans give emphasis to the development of heavy industries and the recent struggle for power in that country accused the opponents, now displaced, of having indulged in the development of consumer goods industries. The authorities in India seem now to have realised that Industrial development is the *sine qua non* of economic planning. Special attention is therefore to be given to the production of machinery to be employed in the other producer goods industries. India possesses the richest iron ores in the world and there is no reason why India should not try to develop herself as one of the foremost countries in the production of machinery. With the establishment of three new steel plants India's capacity of steel production will be expanded to 30 million tons in next 10 to 15 years. Emphasis should also be given for the development of synthetic petrol and this would reduce imports and serve as a nucleus for the development of several other industries.

A suggestion has been made that to increase the production of consumer goods, the household or hand industries should be utilised as far as possible. This is said to attempt at a nice balance between the labour-intensive schemes that constitute household and hand-industries and the capital-intensive schemes that comprise the heavy industries. While recognising the labour-intensive aspect of small-scale and village industries, the experts make it clear that once the economy gets going, employment opportunities become more plentiful and investible surpluses increase, it would be possible and also desirable to introduce more efficient methods of production in the consumer goods industries as well. Indeed, the ultimate justification for developing producer goods industries lies in the need for modernising the production of consumer goods and making it more efficient. Although part of the output of capital goods may be exported or used for further expansion of producer goods industries, a part must be absorbed in the modernisation of consumer goods industries. Thus, the development of heavy capital goods industries is consistent with and requires modernisation of methods of production in other sectors over a period of time. The strategy of balancing the develop-

ment of producer goods industries at one end with encouragement of capital-light methods of production at the other end is justified in the immediate future only because it is hoped that at a later date our savings would rise sufficiently to permit the adoption of capital-using methods over a large area without starving the rest of the economy for capital and without creating unemployment.

In the opinion of the experts, it should be possible to obtain a rise in national income of 5 per cent per annum, with a wise planning and an investment of Rs. 5,600 crores (excluding obviously the non-development expenditure). Doubts are being cherished whether it would be possible for the authorities in this country to raise such a huge amount for the next plan. It may be pointed out that in the first three years of the first Five-Year Plan, only Rs. 860 crores, or 40 per cent of the expenditure proposed over the Five-Year Plan period, were invested. In the last year of the first Plan, a sum of Rs. 710 crores is proposed to be spent, while in the fourth year Rs. 541 crores were scheduled to be spent. It is to be seen whether this large amount could be spent in the last year of the Plan. If the proposed expenditure under the second Plan is to be realised, it will be necessary for the State alone to make investment at the rate of Rs. 860 crores per annum on an average, which was done in three years under the first Plan. To accelerate the rate of expenditure, technical knowledge and strategic materials must have a continuous flow, otherwise the pace of expenditure will be halted. India lacks technical knowledge and for that she has to depend on foreign experts whose supply is limited.

In the second Five-Year Plan, 10 per cent of India's national income will be invested. In the first five-year Plan, 4 per cent of the national income was saved and invested on an average. Therefore to achieve the target of 10 per cent saving, larger efforts have to be made both by the State and the people. At the end of the first Plan, our national income will come to nearly Rs. 11,000 crores. Ten per cent of this will mean Rs. 1,100 crores per year and this will aggregate about Rs. 6,000 crores over a period of five years, assuming a progressive increase of 5 per cent per year in our national income. The policy of heavy taxation which is being followed by the State will discourage private saving and as a result the State shall have to take upon itself the sole charge of creating savings in the public sector. The private sector will be assigned with the task of raising Rs. 2,000 for investment during the five years of the second Plan. This is too optimistic an estimate. During the first Plan, the private sector could not raise by way of saving more than Rs. 20 annually and to jump from this paltry sum to the height of Rs. 400 a year requires too bold an imagination. The private sector will hardly have capacity to invest Rs. 400 a year in the immediate future. The scope of foreign aid is limited and although larger sums have

been estimated on account of foreign aid to be available during the second Five-Year Plan, India shall have to depend mainly on her internal resources for the successful operation of the second Plan.

Another point should not be lost sight of. It is good that the authorities are giving greater prominence to heavy industries. But heavy industries by themselves alone will be fruitless if simultaneous efforts are not made to establish and encourage those industries which can use products turned out by the heavy industries. Consumer goods industries must simultaneously be established so as to absorb the output of the heavy industries. It would be a folly to give too much prominence to heavy industries and ignore the consumer goods industries, leaving them to be developed by small-scale and cottage industries. That would create a condition of unbalanced economy.

Trend of Banking in 1954

Expanding resources and greater activity were, according to the Reserve Bank's latest Annual Report on the Trend and Progress of Banking in India, the main features of banking in India in 1954 in contrast to the relatively quiet year that preceded it. The higher level of banking activity arising mainly from the broadening of overall economic activity was reflected in the rising trend of bank deposits, on the one hand, and of advances and investments, on the other. The increase in advances was particularly noteworthy as it occurred in the wake of declines in the previous two years. Bank credit recorded an expansion of Rs. 57 crores in 1954, as against a fall of Rs. 66 crores in 1952, and Rs. 10 crores in 1953. Though credit demands were at a higher level in 1954 and though the credit contraction in the slack season was not commensurate with the seasonal expansion in 1953-54, there was no reason to believe, states the Report, that speculative influences were significantly at work; the expansion in bank credit is to be related to the sustained increase in production and business activity, though with a generally declining wholesale price level.

In meeting the increased credit demands, banks had to supplement their increased resources by availing themselves in substantial measure of the facilities for borrowing from the Reserve Bank and in fact, in 1954, the financial assistance provided by the Bank stood at a record level. The annual volume of the Reserve Bank's advances to scheduled banks at Rs. 148 crores under the Bill Market Scheme, whose scope was enlarged during the year 1954, was well over double the 1953 total, while the volume of advances for general purposes was also the largest to-date at Rs. 189 crores.

In 1954, deposits of scheduled banks recorded a sharp rise of Rs. 91 crores, compared with the relatively small increase of Rs. 8 crores in 1953. The rising trend of deposits, the Report points out, confirms the observation made in the Report for 1953 that the post-Partition decline in deposits has been arrested and

that, in fact, a phase of deposit expansion seems to have begun. The rise in deposits consisted of an increase of Rs. 80 crores in deposits with Indian scheduled banks and of Rs. 11 crores with exchange banks.

The trends in investments of commercial banks also indicated, as in the case of advances, a greater utilisation of bank resources in earning assets. Despite the sizeable accretion to the total, the distribution pattern of scheduled bank investments at the end of 1954 hardly showed any change as compared with a year ago. Investments in Government securities formed 86.4 per cent of the total investments as compared with 86.7 per cent in 1953 and the small rise in the proportion of Central Government securities was offset by an almost equal decline in State Government securities. Among other domestic investments, fixed deposits showed a small rise. Foreign investments accounted for 5.8 per cent of the total, of which a little over one-third was held in Pakistan.

The distribution of scheduled bank advances under the main groups does not indicate any marked changes over the year. Industry continues to claim a little over one-third and commerce about one-half of the total. Production credit for agriculture which was at Rs. 12 crores at the end of 1953 declined even further to Rs. 5 crores at the end of 1954; exchange banks, the major purveyors of credit for this sector (which includes plantations), accounted for the largest decline; personal and professional and unclassified advances registered a moderate increase. The profit and loss account of 18 larger Indian scheduled banks (each with deposits of Rs. 5 crores and above) reflects the increase in the turnover of banking business in 1954. Gross earnings of these banks registered a rise of Rs. 2.6 crores to Rs. 31.2 crores, over two-thirds (Rs. 1.8 crores) of this being accounted for by the rise in interest and discount earned. The rise in total expenses of Rs. 2.2 crores was made up of an increase of Rs. 1.2 crores in interest paid on deposits, borrowings, etc., Rs. 0.7 crore in establishment expenses and Rs. 0.3 crore in other expenses. Consequently, net profits went up by Rs. 0.4 crore to Rs. 5.3 crores in contrast to the fall of Rs. 0.3 crore in 1953.

In 1954, 17 banks went into liquidation or were ordered to be wound up. All of them were non-scheduled banks. Of these, 8 banks went into voluntary liquidation; 4 of them in the Bombay area, 3 in the Madras area and one in the Trivandrum area. Some of the more prominent defects in the working of the banks, as observed by the Reserve Bank during inspections of banks, have been inadequate reserves, meagre liquid assets, over-extended advances, relatively large unsecured advances against immovable property and a large proportion of bad and doubtful debts. It will be realised that the process of developing sound banking methods has not been an easy one, since there were no indigenous traditions in regard to modern banking

methods, and a large number of mushroom banks were started by persons who had no experience of banking whatever during the years 1942-47, when ample funds were available. As a result of the guidance and the instructions given by the Reserve Bank, most of the banks have begun to take steps for the realisation of unsatisfactory investments and the recovery of doubtful advances. The Report also makes a reference to the steps taken by the Reserve Bank in assisting co-operative credit institutions and augmenting industrial credit facilities. In conclusion, the Report draws attention to the role of banking in the process of development. While credit expansion to meet the growing needs of the economy would be permitted and encouraged, the Reserve Bank, states the Report, would necessarily have to keep the situation under observation to prevent any undue credit inflation and to ensure the goal of development with stability.

India and Foreign Aid

For some time past controversy is going on whether India should accept foreign economic aid. Foreign aid is provided in the form of outright grants or as loans at low rates of interest to the underdeveloped countries for the purpose of raising their living standards. In the post-war period the USA emerged as the generous donor to the war-devastated and economically underdeveloped countries. Originally Marshall Aid was given to European countries ravaged by the second World War. Now there has come a shift in outlook and the American aid is being directed towards the underdeveloped countries of Asia. Mr. Eisenhower pointed out that free Asia contains 770 million people, one-third of the world's population. He said:

"Most of them are citizens of newly independent States. Some have been engaged in recent war against Communists. All are threatened. Capital is very scarce. Technical and administration skill is limited. Within the area, however, abundant resources and fertile lands are ready for development."

He however stressed that the major responsibility for economic progress must lie with the countries themselves and foreign aid and capital can only launch or stimulate the process of creating dynamic economics. Describing the economic philosophy of the aid, he observed:

"The other free nations need the US and we need them, if we all are to be secure. Here is a clear case of inter-woven self-interest."

Mr. Eisenhower adds that the US economy cannot be strong and continue to expand without the development of healthy economic conditions in other free nations and without a continuous expansion of international trade. He concludes:

"Neither can we be secure in our freedom, unless elsewhere in the world, we help to build the

conditions under which freedom can flourish by destroying the conditions under which totalitarianism can flourish—gross poverty, illiteracy, hunger and disease."

During the first three years of the Plan period, that is, 1951-54, the total foreign aid received by India amounted to Rs. 131.9 crores, and in 1954-55, the budget figure for external aid was placed at Rs. 48 crores. These include loans from the International Bank, Technical Co-operation Assistance Scheme, grants under Colombo Plan, Ford Foundation Scheme, etc. For the year 1954-55, a sum of \$60.5 million was authorised by the US Government as development assistance to India. About 50 per cent of this assistance is being utilised in obtaining agricultural commodities like wheat and cotton. Out of this sum of \$60.5 million, the Government of India agreed that a sum of \$45 million or its rupee equivalent should be a loan.

The Government of India is now hesitant to accept loan from the USA in view of the critical attitude taken by the American public of the foreign policy pursued by India. Of course, the American opposition to loans being given to India is not general but limited to some sections among the people. In view of this opposition from the American people, India voluntarily reduced free gift to about 25 per cent, treating the balance as loan. The sum provisionally earmarked by the USA for India to be given in 1955-56 is \$85 million. Out of this sum, \$70 million are for economic development and \$15 million for technical assistance. Pakistan, which is only one-fifth of India, has been allocated a higher sum of \$92 million, that is \$7 million more than the sum allocated to India. The sum earmarked for Pakistan is divided as under: \$63 million for defence (economic) support; \$20 million for direct forces support; and \$9 million for technical aid.

Outright grants by the USA for the economic development of India have been very limited. The total of such grants utilised during the first three years of the Plan being only Rs. 22.6 crores, including the money allocated by the Ford Foundation Schemes. The total sum allocated for this purpose was, however, higher at Rs. 84 crores. The total outright grants utilised by India comes to only 2.6 per cent in relation to the sum of Rs. 860 crores spent during the first three years of the Plan. The foreign aid issue is being viewed in a different perspective by a section. In the early period of colonial development, India, China and other colonial countries were exploited by their Western masters for their own industrial development. The plunder of Bengal helped the industrial revolution of Britain and the cost of transformation of the British mercantile economy to a highly industrialised one was paid mainly by the people of India in the form of famine and death and unemployment. It is now suggested that

the Western nations, including the USA, have now a moral obligation to redeem their debt to the Asian countries, and this view finds a supporter in Mr. Chester Bowles, the former US Ambassador to India.

India has not much objection in principle to receive foreign assistance provided it comes without any political strings. For an underdeveloped country like India, foreign aid brings plant and machinery and technical know-how from industrialised nations of the West. Barring the question of moral obligation of the Western world towards the underdeveloped countries, it may be asked whether India can afford to dispense with outright grants and gifts. In the second Five-Year Plan, the help from the USA will form an insignificant percentage of the total outlay and India will not be a loser if she refuses such grants. Sri Rajagopalachari poses the question that in time of war, India shall have a moral obligation to side with the benefactor countries. Outright grants are to be viewed as aids in the preparation for cold war among the big powers and the receipt of such grants may entangle India in the power politics of the world. Although this point need not be overlooked, it need not be, in our view, much enlarged.

Rashtra Bhasa

New Delhi, May 5.—The Home Minister, Sri G. B. Pant today announced in the Lok Sabha the appointment of Sri B. G. Kher as Chairman of the proposed Hindi Commission.

One of the terms of reference of the Commission would be the preparation of a time schedule according to and the manner in which Hindi may gradually replace English as the official language.

Sri Pant was making a statement on a motion of Sri S. N. Das calling attention of the Government to the provision in the Constitution for appointment of a Commission for the official language. This is mentioned in Article 344.

Sri Pant said the Government of India proposed to constitute a Commission on Hindi consisting of a Chairman and other members representing different languages specified in the Eighth Schedule of the Constitution.

It was hoped that the Commission would be able to make their report as soon as possible within a year, the Home Minister added.

In making their recommendations the Commission shall have due regard to the industrial, cultural and scientific advancement of India and the "just claims and interests of persons" belonging to non-Hindi speaking areas in regard to public services, Sri Pant said.

The Home Minister said the terms of reference of the Commission were likely to be to make recommendations as to (1) progressive use of Hindi language for the official purposes of the Union (2) restriction on the use of English language for all or any of the purposes of the Union; (3) language to be used for all

or any of the purposes mentioned in Article 348 of the Constitution; (4) the form of numerals to be used for any one or more specified purposes of the Union; (5) the preparation of a time schedule according to which and the manner in which Hindi may gradually replace English as the official language of the Union.

We would lay special stress on the *just claims and interests of non-Hindi-speaking areas*, which the protagonists of Hindi are so eager to violate.

English vs. Hindi

Surat, May 1.—Mr. S. K. Patil, President of the Bombay Pradesh Congress Committee, said here today that the study of English should not be hindered in the interest of international good, greater knowledge and progress.

Declaring open the new building of the Preparatory English School of the People's Education Society here, he characterized the Bombay Government's policy regarding English as foolish.

"The national language cannot be improved by suppressing English or any other language," he said.

"Every one should be compelled to learn the national language and education must be as far as possible in the mother tongue. But to suggest suppression of English for improving Hindi is an argument that could come only from the uneducated."

Mr. Patil was of opinion that English was not a foreign language. "Like the English system of judiciary, the English language is an asset we have acquired. We have to be thankful to the English for these two legacies as well as the democratic thinking they inculcated into Indians," he said. Indians need not be ashamed of these assets.

Mr. M. K. Dixit, President of the Education Society, said, neglect of English would mean destruction of a national asset.

Sri Patil has not understood the real urge behind all this outcry for the suppression of English and the immediate substitution of Hindi for it in all fields. It is that the Hindi speakers would gain an immediate and immense advantage over the non-Hindi speakers.

Untouchability

Delhi, May 2.—With rare unanimity, the Rajya Sabha on Monday agreed to the Home Minister's Bill to prescribe punishment for the practice of untouchability, as passed by the Lok Sabha.

The Bill which is a penal measure, will now go to the President for his assent.

The Deputy Home Minister, Sri B. N. Datar, who piloted the measure said that even now there were people who believed that untouchability was a part of the religion. Scheduled Caste people were not still allowed to enter to some of the sacred Hindu temples.

Later, replying to the debate, he assured the members that the Government would take strong action against public servants who would be found guilty of discrimination in the discharge of their duties.

During the debate, members stressed the necessity of economic upliftment of the Scheduled Caste people. The Government were also requested to make distinction in the matter of punishment between those who practise untouchability not so much from the consciousness of a wrong doing and the landlord classes who tried to perpetuate untouchability for exploiting the poor.

Moving the Bill, the Deputy Home Minister Sri B. N. Datar, said it was a penal measure and not one for the purpose of giving rights, as such, because all including the Scheduled Castes have been given rights under the Constitution.

Sri Datar said the offences under the Bill were made cognizable as otherwise it might lead to results that would make the provisions negative.

At long last the Government has taken a firm step in this matter.

Buddhism and Ambedkar

Poona, May 13.—An all-out bid to lead en masse his scheduled caste followers in the country to embrace Buddhism, on the occasion of the 2,500th birth anniversary of Lord Buddha, which will be celebrated all over the world in July next year, will be made by Dr. B. R. Ambedkar, President of the All-India Scheduled Castes Federation.

It will be recalled here that only recently Dr. Ambedkar has announced his decision to embrace Buddhism on the occasion of the 2,500th birth anniversary of Lord Buddha next year.

Work on the Marathi translation of the tenets of Buddhism from the original in Pali is being done in Poona. A Marathi Press has also been set up to print the copies.

It is understood that Dr. Ambedkar is planning to undertake a country-wide tour to preach and propagate and persuade and prepare his followers for embracing Buddhism next year, when he himself will embrace the religion. An organisation, called the Bodhi Jan Sangh, has already been formed for the purpose.

And thus it may be that millions whose forefathers were penalised by the Brahminists for their faith in Buddhism, would go back into the fold.

Telephones and Democracy

It seems telephones are a source of worry and anxiety even in the U.S.A., as the following extract from the *Worldover Press* shows:

"Telephone talk has never been completely private. This reporter has been in foreign areas where you have to shout so loudly into the mouthpiece that if the person you're talking to is no farther than 20 miles away, you might as well go out into the street and bellow. And if you're on a party line in some sections of the United States, you know that the juicier morsels of conversation are likely to become immediate topics for kitchen conferences throughout the neighborhood."

"Actual wire-tapping, as we have come to know about it, is, however a very different thing. If it can't be stopped by legislation—which seems rather doubtful—the best alternative might be to have the telephone companies fix things up so any of us can listen in at any time on anyone we want to. Then at least we'd all be more discreet."

"Laws will not work unless those charged with enforcing them set an example by scrupulous obedience. Yet everyone understands by now that the Department of Justice at Washington, aware that wire-tapping is criminal, can't go after the wire-tappers because it has been violating the law itself for many years. It can't bring into court the findings from its wire-tapping because the illegality would ruin its cases. It does, nevertheless, wire-tap to secure leads that can be followed up by a search for evidence more legally found."

In a democracy this has a startling sound. We know how Hitler played back recordings of private conversations to a flustered British diplomat. We've heard the story of the American delegation settling into a Moscow hotel and commenting upon the cleanliness of everything except the corners of the meeting room—whereupon, in less than 20 minutes, in came an agitated maid to attack those corners with a broom.

"What you say may not matter. Many of us are so openly outspoken there is no gulf between what we'd say with the world's ears to hear. But can you control what someone may say to you? If the talk at the other end of the wire should be of a suspicious nature, you yourself are apt to be involved. The first sentence ever used over his experimental wire by Alexander Graham Bell was a somewhat peremptory order to his assistant: 'Mr. Watson, come here, I want you.' If we can't stop this sneaky, anti-democratic wire-tapping somehow and soon, a summons almost like Bell's may one day reach your eardrums from some Commissar-like Big Shot. For along with suspected thieves, race track touts and subversives, thousands of innocent people, somewhere between Satan and Santa Claus, have already been made victims."

We are somewhat safe in this matter. Not that our official sleuths would stop at wire-tapping. On the contrary. Our safeguard lies in the difficulty of obtaining a telephone connection and maintaining an undisturbed talk of over a minute.

First of all the telephone directories are so designed as to be of minimum service to any one below the rank of a super V.I.P. Then the question of getting the number is complicated where there is a dial system, and a total gamble where it is manual. If you get the number you may find three others have also joined the party.

Hindu Marriage Bill

At long last this bill was passed. It is curious that in the public opposition names came out which showed that mere rank, position, political record, or

University education is no guarantee against mediaevalism of the most degenerate type. All's well that ends well, however, and we put the news on record:

"New Delhi, May 5.—The Hindu Marriage Bill was passed by the Lok Sabha today with a degree of unanimity which contrasted sharply with the controversy it has raised in recent years. When put to vote, only one lonely 'no' from the Hindu Mahasabha member, Mr. V. G. Deshpande, could be heard among the chorus of 'ayes'. Since the Bill was adopted in the same form as it was passed by the Rajya Sabha, it now requires only the President's assent to become law."

"As expected from his unremitting support to the Hindu Code, Mr. Nehru made it a point to take part in the third reading. He saw the Bill as the first attempt to shake up the rigid structure of society and said it was essential for social freedom to be integrated with political and economic freedom."

"The Prime Minister paid high tribute to the women of India. He was very proud and had faith, he said, in their 'sense of duty, grace, charm, shyness, modesty, intelligence and spirit of sacrifice.' He was not afraid to allow them to go forward."

"Earlier, the House passed the clause giving the right to claim alimony to husbands as well as wives following an assurance by Mr. Pataskar that he would review it at the first suitable occasion."

Freedom for Austria

We have given a detailed editorial elsewhere. We append below the comment that conveyed the news:

"Vienna, May 15.—Austria became a free independent nation today for the first time since Nazi troops goose-stepped in her territory in March, 1938."

"Church bells pealed the liberty message in every town and hamlet, calling on seven million citizens to pray in thanksgiving before rejoicing with music and flowing tankards."

"The Foreign Ministers of the U.S.A., Russia, Britain and France closed a turbulent era in Austrian history by putting their names to the long delayed State treaty restoring Austrian sovereignty. Their occupation troops will withdraw from landlocked Austria within 90 days of ratification and in any case not later than December 31 this year."

"Soviet concessions after ten years of intermittent argument enabled the four Powers to reach agreement on the State treaty last Thursday. In return for the concessions Austria will follow a neutral path in the East-West conflict."

Eden back in Power

The subjoined news-item was the first communique on the victory of the Conservative Party in Britain:

"London, May 27.—Sir Anthony Eden was firmly back in power as Britain's Prime Minister tonight

with the strongest House of Commons majority a Conservative Government has commanded for a quarter of a century. His party, pledged to 'prosperity through free enterprise,' won a solid vote of confidence in the General Election held yesterday.

"The nation's verdict means that the Conservatives can govern for the next five years, secure in a majority over all other parties of at least 54. For the past three and a half years since they scraped into power in 1951 they have never had a bigger margin than 13.

"Sir Anthony Eden told cheering supporters in London that he believed that the younger generation had influenced the result. 'There is no doubt that younger people felt there was a national job to be done for their country and they were not much in sympathy with the class hatred on which some people have fought the election. We shall do everything within our power to fulfil worthily the trust of the country, which has treated us with such generosity and also with such confidence'."

The British Labor Party

The Conservative Party of Britain has won the Parliamentary elections with a far more comfortable majority than in the last elections.

The abject defeat that Labor has suffered is explained by various commentators in various ways, the most common being the success of the Tories in the building of a real Welfare State, and the intransigence of the strikers in essential spheres. The following comments, taken from the *Worldover Press* for April 8, gives a vivid background to the Labour debacle:

London (WF).—The British Labor Party has entered the most critical phase of its existence. The immediate threat is not of lost votes, and recent maneuvers—such as Clement Attlee's vote in the Executive that barely kept Aneurin Bevan from utter Party banishment—have postponed any final split. But the whole Party has been made aware of inward and spiritual disintegration. Mr. Bevan has done nothing more effectively than demonstrate how delicate is the substance which holds the labor movement together.

The British labor movement has always contained a contradiction. The most numerous element in it, led by the trade unions, has never been keen on socialism. It has only wanted to get the best for the working class members of a capitalist society. The most vocal element, dominant in constituency parties, has wanted to get rid of capitalism and introduce socialism. These two groups could work together well enough until 1950; then the very success of the Labor Government brought the conflict to the front.

The trade union element now wants no more socialism at any price. The other element does not quite know what it wants. The whole Party was in

fact profoundly relieved when the Tory Government succeeded it, and since 1950 it has failed to agree upon, or even to discover, a vital program for the next election.

Bevan had what looked like a program. On the home front he demanded more socialism. What he meant by "socialism" was not clear, but the emotional appeal of his eloquence covered that up. On the foreign front he had a more definite policy, neutralism. It is still neutralism of sorts which holds together the so-called "left wing" of *The New Statesman, Tribune, Crossman, Driberg, Foot* and the rest.

But even neutralism has come to seem like a moth-eaten policy since Sir Richard Acland broke away on the hydrogen-bomb issue. Acland has a policy that is a straightforward moral repudiation of the Bomb. But what must still be called the "Bevanite" policy is not at all straightforward. It is based on a dislike of the United States, coupled with a fear of Russia, and it recalls the quasi-pacifism fashionable in the 1930's—a refusal to prepare for war combined with a refusal to accept the full implications of non-violence.

The Attlee policy is a more rational one: that of full alliance with America. The trouble is that the Attlee policy is identical with the Conservative policy, and the Conservatives have shown themselves more accomplished in its execution. What is even more awkward for Attlee is that the Conservatives have also shown themselves, to many liberal-minded people, more skilled at administering a welfare state than the Labor Party was.

A majority in both parties now stand for the welfare state, the mixed (part capitalist, part socialist) economy, and the alliance with America; and although the Labor Party introduced the welfare state and the mixed economy, it can no longer offer them as its own platform to the electorate. It has got to persuade people it can run a mixed economy *better* than the Conservatives or invent a new platform—which it has not yet succeeded in doing.

The repudiation of Bevan is a repudiation not only of a "demagogue," but a repudiation of socialism. The left wing of Labor is no longer the most optimistic. Fabians like Crossman are disillusioned with the Civil Service state, because it has decayed into a form of technocracy. The old moral spirit has gone. Ten years ago it would have been unthinkable that trade unionists should try to introduce a color bar, but this is now happening in several places. Gambling, once condemned, is now an accepted source of Party funds.

It is very conceivable that the British labor movement may develop a future on American lines; many trade unions are as pro-capitalist as the big U.S. unions, and the Labor Party may forget socialism as the Democratic Party has forgotten states rights. The machine of the Party is more powerful and efficient than it has ever been. But it has never been so destitute of policy.

Literature, Films and Society

The *Statesman* reports on May 22 that the Government of India had decided to ban the "horror comics." Although the Government already had powers under the Press (Objectionable Matters) Act to take action on the matter, yet, with a view to placing the matter beyond dispute, the Union Government was reportedly considering legislation on the lines of the recent British Act to ban the "horror comics."

This is a very welcome news. The harmful effect such literature exercised over the adolescents is pointedly exposed by the following news from New York. *Reuter* reports: "A 14-year-old boy accused of butchering his seven-year-old playmate with hatchet and knife, said, he got the idea 'from reading those horror comics,' police alleged here.

"Dr. Douglas Kelley, a psychiatrist said, the accused boy, David Drew, was avidly fond 'of comic books that depicted torture and throwing people off cliffs.' Police at Oakland, California, said on May 19 that Drew admitted intentionally killing Stanley Frank there on Tuesday. Earlier he had claimed the killing was accidental."

M.P. Anti-Corruption Board

The Government of Madhya Pradesh recently announced the setting-up of a Complaints Board for the purpose of enquiring into complaints of corruption against Government servants. If the Board found *prima facie* grounds for further enquiry, it would either undertake an enquiry itself or forward the complaint to the head of the Department for making an enquiry and communicating the results thereof to the Board. The Board would then submit its report to the Minister-in-charge of the Board, the *Hitavada* reports.

In an editorial article on the 14th May on the constitution of the Board, the *Hitavada* writes that the notification announcing the setting up of the Board was one of the "most curious which we have read in the *State Gazette*." The preamble of the announcement was not well-worded or sufficiently explanatory.

The newspaper writes that while a case of a policeman taking a few pice from a rickshawpuller in exchange for condoning the latter's breach of traffic rules might be termed technically as corruption it was not that kind of corruption that caused public concern. "It is the corruption in high circles that has spread an eczematous scar on the face of public life in Madhya Pradesh." In this perspective the decision to exclude Ministers from the purview of the Anti-Corruption Board is regretted by the newspaper according to which, without the power to investigate cases of corruption among Ministers "the Board will be ineffective and will be regarded by the public as simple white-wash."

The Central Government bill for the amendment of Indian Penal Code to give protection to Government servants in the matter of defamation was so worded as to give protection to the Ministers also. The *Hitavada* writes: "Ministers cannot have both ways; they cannot claim protection as public servants in one sphere but in the matter of inquiries into corruption claim that as they are not Government servants they should be immune from the investigation of any special machinery set up to investigate cases of corruption."

The newspaper also criticizes the composition of the Board which was proposed to consist of four persons chosen from retired high ranking Government officers to be appointed by the State Government. "There is strong and wellfounded objection to any retired officer being appointed whether he is high ranking or low ranking. The retired official hankering after jobs has become a pathetic spectacle, courtesying and flunking to all and sundry for a job which may help him to augment his slender pension such men, as a general rule, not taking exception into consideration, will not have the courage to stand up to the Ministers or take an independent line which might place their chances of continuing and fruitful employment in jeopardy."

The newspaper suggests that the Board should be composed of a functioning District Judge as the Chairman who was to be appointed on the recommendation of the High Court, another judicial officer chosen by the chairman, and two police officers still in service.

The suggestion for inclusion of two police officers is explained by the fact that they as police officers could take suitable action against persons bringing false accusation against Government servants. The judicial members of the Board would function as the committee authority with the help of the two police officers.

The newspaper writes that every year "a full summary of the Board's recommendations in every case of corruption against Government servants must be placed on the table of the Vidhan Sabha for the scrutiny of the members" and if there was a case of corruption against a minister, "it should be obligatory on the ministry to publish in detail the results of the investigations conducted by the Board together with a report on the action taken."

We are in full agreement with the *Hitavada*. The same remarks, re corruption, would apply to almost all States.

India-Pakistan Talks

A delegation of the Government of Pakistan led by the Prime Minister, Mr. Mohamed Ali, visited New Delhi during the middle of May for talks with the Government of India over the solution of the Kashmir problem. The Pak Premier was accompanied

by the Minister of Interior, Maj.-Gen. Iskander Mirza. Details of the talks between the representatives of the two Governments were not published. The communique issued after the conclusion of the talks said that the talks were "cordial and full" and would be continued "at a later stage after full consideration has been given by both Governments to the various points that had been discussed in the course of these meetings."

Discussing the motives of the Pakistan Prime Minister in visiting New Delhi now, the *Vigil* writes in an editorial article on May 21 that the Pakistan Government, least of all, could have any illusions about the practical use of the talks in moving the Kashmir question from its present position. The necessary initiative lay with the Pak Government. But the Pakistan Government, the newspaper continues, could not take any step, whether it be forward or backward, because "in either case the hazards would be too great for the present Pakistani Government to incur in view of the precariousness of its own moral and political position internally." The Pak Government could not endanger the position by taking a forward step which would necessarily exacerbate their relations with India. Neither they could take any backward step which might look like giving up any previous stand or claim. "So the talks," writes the *Vigil*, "could be nothing more than an operation of marking time. The concurrence of the talks between the two countries' Education Ministers on the disposal of the India House Library and those between the Indian Home Minister and the Pakistani Minister for the Interior on steps for the protection of temples and shrines in both countries and for the prevention of border incidents has somewhat served to hide the emptiness of the note which was allotted to Shri Mohammed Ali to play."

Yet, the newspaper holds, the "play" was not without a purpose inasmuch as it yielded some prestige to the tottering Pak regime. The situation was rather paradoxical. "It is because the position of the Pakistani Government has become politically insecure and that of the Pakistani Prime Minister especially so that the honours of a foreign visit were so desperately sought." In view of the uncertain future of the Pak Government it was not wise to any Government to make any far-reaching agreement or settlement with Pakistan depending on the word of its present Prime Minister who had no popular backing and might lose his present titular position any day in a political reshuffle. "But in a situation like this a show of being received with honour in another country, of carrying on important discussions, etc., is expected to be an aid and a prop to tottering prestige. To impress public opinion at home proofs of being respected and taken seriously by other countries are assiduously sought. It was possibly for this reason that the Governor-General of Pakistan was himself

so anxious to visit India sometime back and would certainly have come if illness had not intervened."

Referring to the political-constitutional tangle in Pakistan the newspaper remarks that the Pakistan Prime Minister's position was the most ludicrous one. "The Constituent Assembly was dissolved on October 24 last on the ground that it had lost its representative character and could no longer function and on the night before the Prime Minister had stated that the Constituent Assembly was functioning quite satisfactorily and was to pass the Constitution of Pakistan by December 25. So much for Mr. Mohammed Ali's authority and sense of responsibility. What prestige can accrue to Pakistan through a channel like this?" the *Vigil* concludes.

We would ask another question. What useful purpose do such talks serve, beyond giving scope to the rulers of Pakistan for bluffing their own people. After every such talk all reports and remarks in the Pakistani press vary from the official hand-out in India, to an astonishing degree.

Nekowal Incident

Twelve persons—six armymen and six civilians—were killed on May 7 when Pakistani police opened fire from across the Jammu border without the slightest provocation from the Indian side. According to a spokesman of the Indian Ministry of Defence, the incident was one of the most serious since the ceasefire in 1948. Most of the horrifying details of the incidents were deliberately withheld from the public by the Government of India. But whatever little was known left no doubt the hideous nature of the crime committed by the Pakistani police.

Major S. R. Badhwar, a spokesman of the Government of India, said, they had been supervising the ploughing of land in Nekowal—a village on the Indian side of Jammu-Sialkot border which was surrounded on three sides by Pakistan territory—accompanied by five civilian tractor drivers and four other civil employees when Pakistani police had opened fire from all sides using a variety of weapons including light machine guns. In self-defence, the Indian Army escort had then returned the fire. After the arrival of the local UN observer team, the firing had stopped at about 5-30 p.m. resulting in twelve deaths. This had happened on May 7.

The Government of India immediately on receipt the news of the incident lodged a strong protest with the Pakistan Government over the incident. The Pakistan Government, at first, though not denying responsibility, attempted to put the blame on the victims themselves. However, Mr. Mohammed Ali, on his arrival in New Delhi, fully regretted the incident and assured of ample steps for the punishment of the guilty and for the prevention of the recurrence of such incidents. The UN observers' team also reportedly put the blame on Pakistan authorities.

The *Vigil* in an editorial note says: "One of the

ready benefits, for the Pakistani Government, of news agency. *Antara* adds: "The coincidence of the Mohammed Ali and his party's visit to New Delhi signing of this treaty and the Bandung Conference was the curb it induced on the expression of Indian feeling over the ghastly affair of Nekowal."

Referring to the initial Pakistani complacency, the newspaper expresses some doubt if the Pakistan Government would accept adverse report of the UN observers' team as final. It fears that no action would be taken unless India pressed for it with vigour and determination. "Speedy action in this matter is necessary not only for the redress of a past wrong but for the prevention of incidents like this in future which spell a grave menace to the people on both sides of the border. If nothing is done about the Nekowal affair soon enough there will be little confidence felt in the agreement just concluded between the Home Minister of India and his Pakistani counterpart on steps to minimise chances of border clashes."

India Blamed for Dispute

Interested quarters in Pakistan are, apparently, trying to put the blame at India's doors for Pakistan's trouble with Afghanistan. This, however, is no departure from customary practice of the rulers of Pakistan. A news-item published on May 23 in the *Star*, a weekly news magazine published from Lahore is significant. The newspaper reports:

"*Star*-man reliably understands that the trouble in Afghanistan has been fomented by Britain and India as a counterblast to American influence in this region. The anti-Pakistani propaganda is being conducted under the joint auspices of these two countries who have in recent months toed the same line and showed unanimity on a number of international problems. This war of nerves, it is understood, is part of a cold-war to weaken U.S.-Pakistan front recently forged for certain common purposes. The suggestion that Soviet Russia is backing Afghanistan is ruled out by the experts as, according to them, it is unimaginable that Kabul rulers who dread even a semblance of political democracy and social justice should flirt with a rabid Communist country."

The Id message of Miss Fatima Jinnah may also be construed to be in harmony with the above. Only she goes further and even accuses her own government.

Sino-Indonesian Treaty

One of the most notable by-products of the Afro-Asian Conference at Bandung was the conclusion of a treaty between the People's Republic of China and the Republic of Indonesia on the dual nationality of the Chinese in Indonesia (already briefly reported last month). In this treaty, signed at Bandung on April 22 by Mr. Chou En-lai and Dr. Sunario, "the basis has been laid for a better understanding between Indonesia and the Chinese People's Republic and several other South-East Asian countries with a large Chinese population," writes *Antara*, the Indonesian

news agency. *Antara* adds: "The coincidence of the signing of this treaty and the Bandung Conference has been generally seen as a demonstration of China's desire to establish and maintain good relations between that country and its neighbours."

The Agreement contained a preamble and fourteen articles a summary of which is given below:

By the treaty the two countries agreed that a person possessing at the same time the citizenship of the Republic of Indonesia as well as the citizenship of the People's Republic of China should choose between the two citizenships on the basis of his or her free will in two years' time after the coming into force of the agreement.

"Persons considered of age under this agreement are those who are full eighteen years of age, or those who are not yet full eighteen but already married."

Anybody with dual citizenship wishing to retain his or her citizenship of one of the two contracting countries should under the agreement notify his or her desire to abandon the citizenship of the other country to the Government of the country whose citizenship he or she wished to retain.

"Provisions for choosing the citizenship laid down under this Article (3) basically also apply to persons with dual citizenship as mentioned under Article 1 residing outside the territory of the Republic of Indonesia and the People's Republic of China."

A person who once indicated his or her choice of the citizenship of one of the two countries would automatically lose his or her citizenship of the other country.

Anybody with dual citizenship who did not express the choice of citizenship within two years would be "considered to have chosen the citizenship of the Republic of Indonesia when his or her father's side is of Indonesian descent and shall be considered to have chosen the citizenship of China when his or her father's side is of Chinese descent." When the relation of such a person with the father was uncertain the citizenship of the person would be determined by the descent of his or her mother from the mother's father's side, e.g., if the mother of such a person was of Indonesian descent from her father's side, the person would be deemed to be of Indonesian citizenship and vice versa if the mother from her father's side was of Chinese descent.

Persons not yet of age at the time the agreement came into force should choose their citizenship within one year after coming to age. If within that time such persons failed to express their choice they would be considered "voluntarily to have chosen the citizenship hitherto adopted while still under age."

If a person after adopting the citizenship, say, of China, left that country and settled permanently outside its borders and regained the citizenship of Indonesia then that person would automatically lose

his or her Chinese citizenship. Similarly the other way round.

The citizenship of the children born within the two countries would be determined according to the citizenship of their parents or of the father. A child citizen of one country, legally adopted by a citizen of the other country while still under fifteen years of age would be deemed to have lost his original citizenship and have become the citizen of the country of his foster parent.

Article 10 says: "When a citizen of the Republic of Indonesia marries a citizen of the People's Republic of China each respectively shall retain his or her citizenship before the marriage unless one of them by his or her own will applies and obtains citizenship of the other. When he or she obtains the citizenship of the other, automatically he or she loses his or her original citizenship."

Each of the parties pledged to urge its citizens residing in the territory of the other party "to abide by the laws and customs of the State in which they reside and not to participate in political activities of the country in which they reside."

The treaty would come into force from the date of the exchange of ratification to be held in Peking and would run for twenty years "and shall continue to be in force unless one of the contracting parties desires to annul it" and notified such desire in writing one year before its proposed termination.

Both the Chinese and Indonesian texts would be equally valid.

Diplomatic observers have already pointed the great significance of the treaty as a basis for the solution of the "Chinese problem" of a number of South-East Asian countries.

Mr. Aziz of the Ceylon Democratic Congress recently urged the adoption of the underlying principles of the Sino-Indonesian Treaty for the solution of the problem of the people of Indian descent in Ceylon.

Mr. Ho Hsiang-ning, Chairman of the Overseas Chinese Affairs Commission of the Government of China, says in a statement published in Peking *People's Daily* that the Sino-Indonesian treaty reflected China's desire to solve the problems of Chinese overseas and her consistent policy not to interfere in the internal affair of the countries where the Chinese were residing.

He said: "In accordance with Premier Chou En-lai's instructions we are now considering solution of the dual nationality question with other countries through diplomatic channels on the basis of friendly negotiations, first and foremost, with those South-East Asian countries that have diplomatic relations with China."

He, however, warned those Governments who were persecuting Chinese residents and were attempt-

ing to deprive the Chinese of their right to education in their own language and to pursue their economic activities without being persecuted, and said that China would not give up her responsibility to protect the legitimate rights and interests of Chinese residents abroad leaving them to be persecuted. "Resorting to force like this to solve the question of dual nationality cannot lead to any solution," Mr. Ho Hsiang-ning adds.

Austria Regains Independence

Austria regained her independence as a democratic sovereign state after seventeen years, when the Austrian State Treaty was signed in Vienna on May 15 by the representatives of USSR, USA, UK, France and Austria. As agreement of the Powers on the proposed treaty was announced by the Vienna Radio on the 12th May the Viennese shouted and danced on the streets of the capital city, reports *Reuter*.

The treaty followed closely the draft of the Austrian Treaty agreed to by the USSR, UK, USA and France, in 1949, when agreement had been reached on all but five of the 59 articles. Since then however no further progress was made though in the meanwhile the Western Powers and the USSR protested their eagerness to reach agreement.

An Austrian delegation headed by the Federal Chancellor Julius Raab and Vice-Chancellor, Dr. Adolf Schall visited Moscow during the first fortnight of April, 1955 at the invitation of the Soviet Government. Discussions were held between the representatives of the two governments from April 12 to 15, 1955 at the conclusion of which a joint communique was issued indicating their agreement on the terms of a State treaty re-establishing an independent Austria.

The Austrian Delegation gave an assurance of Austrian neutrality and non-alignment to any military bloc as also of her intention not to allow the establishment of military bases on Austrian territory.

The Soviet Union also agreed to transfer to the withdrawal from Austria of the occupation forces of the Four Powers after the entry into force of the Austrian State Treaty, and not later than December 31, 1955. They also agreed to accept deliveries entirely in Austrian goods the equivalent of 150 million dollars which the USSR was entitled to receive under Article 35 of the draft State Treaty of 1949.

The Soviet Union also agreed to transfer, to Austria, immediately upon the coming into force of the State Treaty, the property of the Danube Shipping Company for compensation. It also signified its readiness to cede to Austria its rights, held under Article 35 of the State Treaty, to the oil fields and refineries in exchange for deliveries of crude oil in quantities to be agreed upon.

The Soviet Government also acceded to the

request of the Austrian Government for the release of Austrian war prisoners detained in the USSR.

On April 19, the Soviet Foreign Minister in identical notes invited the Foreign Ministers of the USA, UK and France to a conference in Vienna for the examination of the question of the conclusion of a State Treaty on Austria. The Western Governments accepted the invitation and meetings were held between the Foreign Ministers of the Big Four with the Austrian representatives culminating in the signature of the State Treaty on May 15.

The restoration of Austrian sovereignty is undoubtedly an event of great international significance, and will help lessen the atmosphere of tension pervading the international scene. It shows that given goodwill on all sides agreement on the solution of international problems is not after all an impossible thing. As an instance of agreement between the USSR and the Western nations it will be highly welcomed by the peace-loving peoples of the world.

Commenting on the Austrian Treaty *Pravda* writes on May 16: "The conclusion of the State Treaty is an important event both in the history of the Austrian people and in the development of the relations between the States of Europe. Peace and security in the European continent will be re-inforced by the agreement reached on the Austrian problem, which will help to ease international tension."

The newspaper notes with satisfaction the declaration of the Big Four of their readiness to respect Austrian neutrality and expresses the hope that other States would adopt the same course. Austria would make a declaration which would impose upon her an international commitment to adhere to a permanent status of neutrality on the model of Switzerland.

The Treaty also guaranteed Austria's economic independence, adds the newspaper. The former German assets had been made the property of the Austrian State. The Treaty contained a provision binding Austria not to transfer to foreign subjects the rights to the former German assets, oil fields and to the oil refineries turned over to Austria by the Soviet Union. Another provision guaranteed against the transfer to German capital of the former German enterprises in the Western zones of Austria. "This settlement of the problem of the former German assets is all the more important since it has been fully agreed upon by the Four Powers and by Austria," writes *Pravda*.

Another very important provision of the State Treaty bound Austria to refrain from discrimination in her trade with other countries.

The *News Chronicle* (London) writes under the heading "They Waltz in Vienna" on May 14 that with Austrian independence regained a new page of history opens for that country. "All the world knows the treaty has been made possible by a change of

Soviet policy," but had it not been for the refusal of the Russians to agree to what they had now accepted the treaty would have been signed ten years ago, comments the newspaper.

"The Russians were careful, first, to ensure that although Austria's outlook is Western, she should be made a neutral State, unable to join the Western European union. Next, the Russians created an Eastern NATO, which enables them to withdraw their troops not many miles to legally-occupied bases in satellite countries. The West simultaneously withdraws over the Alps, the West is placed much further away.

"So, having taken no chances, Russia frees Austria; and there is waltzing again in Vienna," the newspaper concludes.

The *Manchester Guardian* writes on May 14 that the Western Powers and the USSR had taken only four weeks to agree on what had kept them at odds for nine years.

The newspaper notes that the four-Power guarantee of Austrian neutrality would not be written into the treaty but would be so worded as to protect rather than to fetter Austria. She would be flanked by members of the Atlantic alliance to the north and south, and she would have a long, uncomfortable frontier with Communist States to the east. "But unless the general European climate should worsen, she can have a free and not unpleasant life. She has learnt in the hard school to fear the dictatorial embrace, wherever it comes from," adds the *Manchester Guardian*.

President Rajendra Prasad in a message congratulated the people of Austria on the achievement of their freedom.

U.S. Aid Policy in Asia and Elsewhere

President Eisenhower in a message to the Congress on April 20 requested authority and funds amounting to 3,530 million dollars to carry out the Mutual Security programme during the fiscal year 1956 beginning from July this year.

Mr. John Foster Dulles, U.S. Secretary of State, in his testimony before the U.S. Senate Foreign Relations Committee on May 5 urging congressional authorisation of the amount recommended by President Eisenhower, defined the policy the U.S. Government proposed to follow in regard to granting of economic and military aid to other countries.

All U.S. aid would henceforth be distributed through the Department of State—all the affairs of the Foreign Operations Administration, so long headed by Mr. Harold E. Stassen, being transferred to that Department except for certain military functions which would be administered by the Defence Department in close co-ordination with the Department of State.

Of the total fund of 3530 million dollars requested

under the M.S. Program, approximately one-half or \$1717.2 million was intended to be used directly to maintain and build up the military forces of Governments friendly to the USA. In addition to that a further sum of \$1000.3 million, about a quarter of the total, was designed for what was called "defence support."

"By direct military aid and 'defence support,'" Mr. Dulles said, "there is made available for the defence of the free world far larger military forces than would be available if the same amount of money was spent on our own military."

Direct military aid and "defence support" thus accounted for approximately 75 per cent of the total fund. The remaining 25 per cent, or \$812,500,000 was designed "for programs unrelated to military purposes." The principal items were: \$337,000,000 for economic aid to Asia, of which \$200 million was for "special fund for regional development." There were funds for technical co-operation in the amount of \$172 million. And \$100 million was designed as a contingent fund for the President. Distribution of the non-military aid would be as follows: Europe (chiefly West Berlin) \$21m., Middle East \$179m., Asia \$337.5m., and others including contingency \$222.5m.

Mr. Dulles said that there was a shift of emphasis from Europe to Asia in the proposed program. "In addition to continuing and in some case increasing present programmes in the free countries of Asia, particularly, the technical assistance programmes, the President has requested a special fund for discretionary use in Eastern and Southern Asia," he added. The United States had joined the sessions of the consultative committee of the Colombo Plan for Co-operative Economic Development in South and South-East Asia but Mr. Dulles made it clear that "the United States would retain full control over the use of the fund just as we do in the case of the country programmes."

In a question and answer period following his above testimony, Mr. Dulles told the committee that the U.S. Government had abandoned an earlier policy of earmarking funds in advance on a country-by-country basis. He reminded the committee of the necessity at times to meet acute unforeseen needs.

Mr. Harold E. Stassen, Director of Foreign Operations Administration, in his testimony before the committee on May 6, pointed to the "basic shift of emphasis away from the highly developed areas of the world towards other critical areas," in the programme.

He said: "Asia is the focal point of present Communist pressure and the area whose future direction, either towards domination by Communism, or freedom and independence, will be crucial in the long-range struggle of freedom, against oppression. In

addition to direct military assistance in the form of weapons and training, funds are requested in the Mutual Society Program in the amount of \$1,317,000,000 to meet the defence support and direct forces support needs of countries in the area which are under the constant threat of overt Communist aggression as well as internal subversion. A major part of these funds is proposed for programmes in Korea, Formosa, Cambodia, Laos and Viet Nam, all of which are confronted with situations of extreme crises. Funds are also included within this amount for similar types of support to Pakistan, Thailand, and the Philippines, who have firmly and courageously taken their stand on the side of freedom against aggression and are members in the Manila Pact Organisation."

Mr. Stassen said: "An important new element in the proposed Mutual Security Programme for the coming year is the President's Fund for Asian Economic Developments, a new concept of assistance towards helping to meet the critical needs of all of free Asia for orderly, long-range economic growth."

\$200 million was earmarked for the President's Asian Economic Development Fund. Funds were also provided for the continuation of development assistance to other Asian countries, principally India.

India was to get aid totalling \$85m.—\$70m. being earmarked for economic development and \$15m. for technical assistance.

Recently a ten-nation conference of Asian members of the Colombo Plan consultative committee was held at Simla at the invitation of the Government of India "to consider certain aspects of the problem of utilization of external aid, notably U.S. aid," the participating countries being Cambodia, Indonesia, Japan, Laos, Nepal, Pakistan, Thailand, Viet Nam and India. Malaya, Singapore, North Borneo and Sarawak had a common representative. Ceylon refused the invitation to attend the conference. Burma did not attend.

The conference after discussion of a Japanese proposal rejected the idea of an intermediate regional organization for the utilization of foreign aid and recommended that all additional foreign aid, including U.S. aid, should continue bilaterally as at present and strengthened as far as possible.

The suggestion for the creation of a regional organization for the utilisation of U.S. aid, it may be remembered, was originally put forward by Mr. Harold Stassen during his Asian tour a few months ago.

The conference also pointed to some, mainly procedural, difficulties which had arisen in the utilization of foreign aid. "The aid has to be used within a specified period, but there are problems of the aid not being sanctioned in time or difficulties created by shifting conditions and regulations, on account of which the aids lapse."

Regarding the question of setting up a special regional fund to meet balance of payments difficulties and promote intra-regional trade on the model of the European Payments Union, the conference, while recognising that counteracting the instability of export prices of the products of the region was one of the basic problems, "considered that action can usefully be taken to solve it only when there are clear indications that substantial sums required for the purpose of setting up such a fund are forthcoming."

The rejection by the Asian nations of the suggestion for an intermediate regional organization for the utilization of foreign aid resulted in a hardening of the opposition in U.S. Congress to President Eisenhower's \$200 million Asian Economic Development Fund, *Reuter* reports. According to Senator John Sparkman, a democratic member of the Senate Foreign Relations Committee it was possible "that Congress will either eliminate this fund or cut it substantially."

East European Treaty Organisation

An East European Treaty Organisation formally came into being on May 14 with the conclusion of a Treaty of Friendship, Co-operation and Mutual Assistance by eight European nations supported by the People's Republic of China.

In November-December, 1954, a conference of the eight European nations with an observer from China was held in Moscow to consider their attitude to the Paris Peace Treaties. The Moscow conference opposed the ratification of the Paris Treaties, and declared that in the event of their ratification the participating countries would adopt joint measures of defence. It was further declared that the conference nations would meet again to consider concrete measures for a joint defence command.

Accordingly, after the ratification of the Paris Treaties, the eight countries—Albania, Bulgaria, Czechoslovakia, Eastern Germany, Hungary, Poland, Rumania and USSR—which took part in the Moscow Conference, met in Warsaw, capital of Poland, for four days from May 11 to 14, and after discussions concluded a Treaty of Friendship, Co-operation and Mutual Assistance and decided to set up a joint command of the armed forces of the State signatories of the treaty. Each country's delegation was headed by its Prime Minister. Mr. Peng Te-Huai, Deputy Prime Minister and Minister for Defence of the People's Republic of China, attended the conference as an observer from China.

The unified command of the armed forces of the eight countries would have its headquarters in Moscow and would be headed by Marshal of the Soviet Union, I. S. Konev, whose name became famous during the Second World War. The Defence Ministers or other military leaders of the signatory countries were appointed Deputy Commanders-in-

Chief and given command of the armed forces assigned to the unified armed forces by each respective signatory country. The question of participation of the German Democratic Republic in measures pertaining to the armed forces of the unified command would be considered later on.

The Treaty made in four languages contains eleven articles and a preamble.

The preamble while reaffirming the desire of the contracting parties "to establish a system of collective security in Europe based on the participation of all European States" states their conviction of the necessity of taking measures "to safeguard their security and maintain peace in Europe" in view of the ratification of the Paris agreements envisaging the formation of Western European Union and remilitarization of Western Germany.

By Article 1 the parties undertook "to refrain in their international relations from the threat or use of force" and to solve their problems by peaceful means.

The countries declared their readiness sincerely to co-operate in all international actions aimed at safeguarding international peace and security and at the general reduction of armaments and production of atomic, hydrogen and other weapons of mass destruction.

They would discuss among themselves matters of common interest and would hold mutual consultations for joint defence and the maintenance of peace whenever there was a threat of armed attack on one or more of the signatories.

In such cases of armed threat the signatories would render all help including military help individually and jointly to the State or States thus threatened and would immediately hold mutual consultations regarding the joint measures necessary to be taken to restore peace. The measures thus taken would be communicated to the UN Security Council and would be terminated immediately upon the adoption of any measures by the Security Council for the restoration and maintenance of international peace and security.

Under Article 5, the parties "agreed to set up a unified command of their armed forces," and would also "take other co-ordinated measures necessary to strengthen their defence capacity" for protection against aggression.

Article 6 provides for the setting up of a "political consultative committee, in which each State signatory to the treaty will be represented by a member of the government or another specially appointed representative to effect the consultations" between the signatory States under the treaty and to discuss problems of implementing the treaty.

The parties undertook not to join any coalition, alliance or treaty which ran counter to this treaty and declared that none of their international commitments were against the treaty.

They would promote mutual co-operation for the consolidation of economic and cultural relations among them.

The treaty was open for accession to other States "irrespective of their social and State systems which will express readiness through participation in the present treaty to promote the pooling of efforts of the peace-loving States in order to safeguard peace and security of the nations," says Article 9.

The Treaty would come into force when all the signatory States had deposited their instruments of ratification with the Government of the Polish People's Republic.

The Treaty would remain in force for twenty years at the first instance and, unless notice of denunciation was given by any party to the Polish Government one year prior to the expiry of that term, for another ten years.

Article 11 adds: "In case a system of collective security is established in Europe and a general European treaty of collective security is concluded to this end, for which the contracting parties shall steadfastly strive, the present treaty shall lose its validity on the day when the general European treaty enters into force."

All four texts—Russian, German, Polish and Czech—would be equally valid.

At the time of the signing of the Treaty, the Prime Minister of the German Democratic Republic, Herr Otto Grotewohl said that the conclusion of the treaty would help the German people in their struggle for the peaceful and democratic reunification of Germany which he declared to be the main task of his Government. "In signing this Treaty of Friendship, Co-operation and Mutual Assistance," Herr Grotewohl said, "the Government of the German Democratic Republic proceeds from the premise that a unified Germany would be free of the objections assumed by one or the other part of Germany under the military-political treaties and agreements concluded before its reunification."

Tass says, "The conference received with full understanding and took note of the aforesaid declaration of the Government of the German Democratic Republic."

The observer from China, General Peng Te-Hwei endorsed on behalf of China the decisions adopted by the conference and said: "I declare on behalf of the Government of the People's Republic of China that the Government and the six hundred million people of China fully solidarize themselves with and support the newly signed Treaty . . . We are convinced that the success of the present conference will promote the further unity of the peace-loving countries and peoples and will make a substantial contribution to strengthening peace and security both in Europe and throughout the world."

The Soviet newspaper *Pravda* editorially writes

on May 15 that it was difficult "to overestimate the positive influence which the decisions of the Warsaw Conference exert and will be exerting on the international situation." According to the newspaper, the treaty was a defensive one. The setting up of the political consultative committee envisaged in the treaty would be an important step towards strengthening friendship and mutual understanding. It also provided for increased economic and cultural co-operation among the parties.

"In contrast to the closed military alignments formed by the imperialist powers, the eight-power treaty is open to other States regardless of their social and political systems. This feature of the treaty also testifies to its defensive nature as well as to the defensive nature of the organisation which is created on its basis," remarks the *Pravda*.

The London *Times*, in an editorial article on the eve of the Moscow Conference writes that the meeting was political rather than military.

Discussing the implications of a unified command of the armed forces, the newspaper writes that the immediate purpose of unification appeared "to give legal standing to the presence of Russian troops in the satellite countries to allow the East German police to emerge openly as an army, thereby producing a reply to West German rearmament, and to provide the Russians with a diplomatic bargaining counter."

"Now that the West has ratified the Paris agreements, Russia can say, as Marshal Zhukov has already said, that extra steps to guarantee the security of Russia and her allies have to be taken. The Warsaw meeting is, indeed, political rather than military." (10th May).

The *Manchester Guardian* of the same date writes: "The conference at Warsaw, like that in Paris, stands outwardly for the division of Germany and of Europe. Marshal Bulganin will be there to dot the 2's of the 'division'."

"Yet a new Eastern alliance may also enable M. Molotov to make concessions of the great powers ever got down to real bargaining over the mutual withdrawal of power from Central Europe. The proposal might run: 'If you will dissolve West Germany's military alliance with you, we will dissolve East Germany's military alliance with us,' and so on."

"So far as formality went, both sides would then be able to give up equivalent positions of strength. Of course, formality does not mean much. A settlement, if it comes, must make for a real withdrawal of power, not the tearing up of pieces of paper. But formality sometimes helps, especially when prestige is at stake."

Speaking about the significance of the Warsaw Conference one might refer the fact that it was the first occasion since the Potsdam Conference of 1945 that a Soviet Prime Minister travelled out of his country to attend an international conference.

THE EDUCATIONAL MOVEMENT IN INDIA

By RAJANI KANTA DAS, Ph.D. and SONYA RUTH DAS, D.Litt. (Paris)

THE most important social movement in modern India is that of education. Education attained a very high degree of development in the Vedic, Buddhist, and early Hindu periods. But with the decline of Hindu civilization and especially during the periods of foreign invasions, conquests, pillage, and destruction, there reigned chaos and confusion in the country. Most of the educational centers and universities declined and deteriorated and were even destroyed by the invaders. With the rise of Moghul rule, there was a general revival of culture, especially in arts and crafts, architecture, painting, dancing and music. But between the decline of Moghul rule and the rise of British rule there was another period of chaos and confusion which was followed by the decline of both Hindu and Moslem educational systems. "At the beginning of the 19th century, after a long period of foreign invasions and internecine wars, Indian learning was at low ebb, . . . and there were hardly any printed books either in the classical languages or in the vernaculars."

ENGLISH EDUCATION

The elevation of the educational system from this low level became an outstanding problem of India in the very beginning of British rule. Attempts were made by several organised bodies, especially the Orientalists, the Missionaries, and the Anglicists, to reconstruct India's educational system on a sound and solid basis:

The Orientalists: In spite of great external changes, there had still existed in India a network of indigenous educational institutions coming down from time immemorial, such as the *Tols* or higher Sanskrit institutes for education of the Brahmin students in philosophy, science, and literature and also the *Pathshalas* or elementary schools for the education of the lower castes. Similar educational institutions also developed in India under Moslem rule, especially during the Moghul period, such as the *Madrasahs* for higher education of the Moslems, including Arabic and Persian languages and the Koran, and the *Makhtabs* or the lower schools for the education of the masses. Some of the higher educational institutes in the north are still to be found in Nabadwip, Mithila, and Banaras for the Hindus and in Murshidabad, Patna, Agra and Delhi for the Moslems. After the victory at Plassey in 1757 and the assumption of the Dewany of Bengal in 1765, the East India Company practically acquired the economic control of Bengal and did everything possible to win the goodwill of the people, both Hindus and Moslems. Warren Hastings founded a *Madrasah* at Calcutta for the Moslems in 1781 and Jonathan Duncan, the British

Resident, founded a Sanskrit College at Banaras in 1792 in order to secure trained Moslem and Hindu scholars to serve as assistants to British Judges. Moreover, the East India Company's Act of 1813 provided Rs. 100,000 a year for education, which the Governor-General could spend for the revival of the old learning in Sanskrit, Arabic and Persian.

The Missionaries: Several groups of Christian missionaries have made great contributions to the development of education in modern India. The first group to visit India was the Roman Catholic Missionaries under the leadership of Francisco Xavier (St. Xavier, 1506-52), collaborator of Ignatius Loyola (1491-1556), founder of the Jesuit Order (Society of Jesus), who followed the Portuguese military forces, traders and settlers, and founded schools for Portuguese and Eurasian children. With the decline of Portuguese military power and influence, their settlement and educational influence also declined. The second important group of missionaries were the Danish Settlers at Tranquebar near Madras, who learned Tamil and other Dravidian languages, translated the Bible in Tamil, and opened schools for the children of their converts. They were also the first to introduce teaching in English. Early in the 19th century, their schools came under the control of the Church Missionary Society. The third and the most important group of missionaries were the Baptists at Serampur, especially those under Carey and his colleagues, who introduced popular education and vernacular language, though English was also taught. The missionaries were responsible for introducing a new system of teaching with broader curriculum including grammar, history, geography and other subjects; printed text-books for the various classes; well-defined hours and days of instruction, including Sundays and holidays; and also education in religious tenets.

The Anglicists: The most earnest group of advocates for English education was, of course, the Anglicists including such historical personages as David Hare, the humanist and founder of Calcutta High School, which still stands in the centre of Calcutta University buildings; Rammohun Roy, the founder of the Brahma Somaj and father of modern India; and Radhakanta Dev, a progressive Hindu reformer. They also took the lead in founding the Hindu College in 1817, which was followed by the foundation of the Serampur College in 1818 and the Bishop College in 1820. That the Orientalists were still very influential was indicated by the fact that a Sanskrit College was founded in Poona in 1821 and another in Calcutta in 1824. For this Orientalistic policy, Rammohun Roy made a bitter attack, in a letter, on Lord Amherst, the Governor-General of India, for his retrograde step of founding a Sanskrit

1. *Interim Report of the Indian Statutory Commission*, September, 1929; Cmd. 3407, p. 9.

College, which was calculated to keep India in darkness. The country as a whole followed, however, the policy of the Anglicists, who established Elphinstone College at Bombay in 1827, Wilson School (now College) also at Bombay, in 1834, and Madras Christian College at Madras in 1837. In the meantime, professional schools began to rise and Lord Bentinck himself established the Calcutta Medical College in 1835 and similar institutions were also established in other provinces later on. English education was thus well-established through private efforts in different parts of India early in the nineteenth century.

The controversy regarding the medium of instruction between the Orientalists and the Anglicists required the decision by T. B. Macaulay, the legal member of the Executive Council, who sided with the latter and submitted the famous Minutes to Lord William Bentinck in 1835 and also to Lord Auckland in 1839, endorsing his policy, i.e., "to form a class who may be interpreters between us and the millions whom we govern, a class of persons Indian in blood and colour, but English in tastes, in opinions, and in intellect." Lord Bentinck accepted the Minutes of Macaulay and made the following proclamation in 1835:

"His Lordship directs that all the funds which these reforms leave at the disposal of the committee be henceforth employed in imparting to the native population a knowledge of English literature and science, through the medium of the English language."²

The most important step in the establishment of English, especially as the medium of instruction in India, was the parliamentary enquiry undertaken as a preliminary condition to the renewal of the Company's Charter in 1853. The evidence submitted to the committees of the Houses of the Lords and Commons formed the basis of Sir Charles Wood's Educational Despatch of 1854, which imposed upon the Government of India the duty of laying down a solid foundation of education in India from the primary school to the university. The despatch prescribed the following measures:

- (1) The constitution in each presidency and lieutenant-governorship of a separate department of education with an adequate system of inspection;
- (2) The institution of a university in each Presidency town;
- (3) The establishment of institution for training teachers for all classes of schools;
- (4) The maintenance of the existing government colleges and high schools, and the increase of their number whenever necessary;
- (5) Increased attention to vernacular schools,

both for secondary and primary education; and

- (6) The introduction of a system of grants-in-aids.

The despatch was immediately followed by the establishment of Departments of Public Instruction, the founding of the Universities of Calcutta, Bombay and Madras in 1857, and the rapid growth in number of schools and colleges, governmental and private.³ The Secretary of State for India sent a despatch in April 1859, which made possible the establishment of Canning College, Lucknow (1864); St. Xavier's College, Bombay (1869); Oriental College, Lahore (1870); Muir College, Allahabad (1872); Metropolitan Institution, Calcutta (1873); and Anglo-Mohammedan College, Aligarh (1879). The Punjab University was established in 1882 and the Allahabad University in 1887.

The Education Despatch of 1854 by the British Government to the Government of India formed the corner-stone of India's intellectual development in modern times. English language and literature opened for the first time the vast cultural heritage of the West in general and of England in particular. While India's younger generations began to receive education and training in the newly established colleges and universities for various professions and services, some talented and enterprising young men joined Oxford and Cambridge and Inns and Courts and achieved learning and recognition. Coming in close contact with a young and virile nation in its various administrative and cultural aspects, India found her own self, and began to evaluate her glorious past and to realize the potentialities of still more glorious future. To awaken India into her own self or to help her to do so, was the greatest contribution of England to India. India has thus become the mistress of her own destiny and begun to reconstruct herself in the light of modern science, philosophy, art and technology on the basis of her own intellectual, aesthetic, ethical and spiritual values. The most important part played in this national awakening is the higher education as imparted by the universities. Although rather few in number and limited in scope at the beginning, these universities widened their cultural interests and gradually introduced almost all the branches of learning in art, literature, philosophy and science, and have now become great intellectual and educational centers. Advanced learning has liberated the mind of the people from the thralldom of antiquated traditions and helped in the rise of new social values, ideals, aspirations, and aims.

RISE OF THE VERNACULARS

The rise of the vernaculars or languages of the people, on whom depends the stability and develop-

ment of modern democracy, is still another important factor of India's cultural development. Vernaculars in India are very many, but only a few of them have reached the literary stage and may be classified under the following groups:

- (1) The Indo-Aryan, consisting of Sanskrit, Hindi, Bengali, Bihari, Marathi, Rajasthani, Gujarati, Kashmiri, and Oriya;
- (2) The Dravidian, consisting of Tamil, Telugu, Kanarese, and Malayalam; and
- (3) The miscellaneous, consisting of Assamese.

A most important factor in the development of vernacular languages and literatures in India is the religious movement. In ancient times, Buddhism and Jainism, both of which are proselytising religions, utilized the dialects of the people and developed them as languages and literatures. In the Middle Ages, when these religions lost their vitality and spirituality, Vaishnavism took their places and supplied the needs of the people for personal God, such as Rama and Krishna, incarnations of Vishnu, to whom they could offer their love and devotion. Vaishnavism flourished through the teaching of Ramanuja in the eleventh century, of Ramananda in the fifteenth century, and of Chaitanya in the sixteenth century. All of them utilized the languages of the people for the propagating of their creeds. During the period of from the thirteenth to the sixteenth centuries, Moslem rule became predominant and oppressive, Hindu civilization declined, and Sanskrit was discouraged and suppressed. The vernaculars found ample opportunity for development. Some Moslem rulers even encouraged the growth of popular languages for the benefit both of Hindus and Moslems. Nasir Shah, King of Gauda for instance, patronised the translation of the Mahabharata into Bengali.

In modern times, there have appeared several new factors in favor of the vernaculars: First, the rise of Christianity, which undertook pioneer work for the development of the vernaculars in most of the provinces. As in the case of the Buddhist and Jain missionaries, the Christian missionaries were interested in reaching the masses, for whom they not only translated the Bible and the hymns into popular languages, but also developed these languages by establishing public schools, writing their grammars, compiling their dictionaries, and founding printing presses. Second, the foundation of the Fort William College in Calcutta in 1800 for teaching British civil servants the history and languages of India, which gave a new impetus to the learning of the languages of the people. Third, the founding of the Hindu College in Calcutta in 1816 which became a centre of culture. Young Bengalis began to learn the principles of Western civilization, including its social values and social institutions under such distinguished persons as William Carey, David Hare, and Rammohun Roy, already

mentioned, as well as professors H. L. V. Derozio and D. L. Richardson. They all realized the need of social and religious reforms in India and utilized vernaculars to bring their ideas to the people.

Among the more immediate factors of the development of the vernaculars must be mentioned: First, the conferment of the freedom of the press in 1835. The vernacular press which, in spite of the restrictions put on it afterwards by the British Government, thrived rapidly and, with its journals, periodicals, and annuals, not only helped in the dissemination of knowledge and information, but also in the development of their languages and literatures. Second, the Renaissance and other social movements, such as those relating to religion, reform, education, politics and industry, have also served as driving forces for the development of the vernaculars, both as languages and as literatures. Finally, the substitution of the vernaculars for Persian in lower courts in 1837 and the introduction of vernaculars as the medium of instruction not only in the primary and secondary schools, but also in high schools, colleges, and even in universities. That the mother-tongue should be the medium of instruction stands to reason, inasmuch as it facilitates the understanding of the deeper meaning of a subject and assimilates it into the personality of an individual much quicker than a foreign language. Moreover, the vernacular adds to the dignity and prestige of a group of people, who feel proud that they can derive their knowledge through their own mother-tongue.

The last, but not the least, important factor in the development of modern vernaculars is their contact with European, and especially English, languages and literatures. Their contact has been established in several ways: First, English as the official language and medium of instruction and the predominance of English in the public press in British India. Second, most of the vernacular writers are well-versed in English language and literature, the style and idioms of which they have introduced in their mother-tongues. Finally, the translation and adaptation of European and especially English classics and other works in literature, science, philosophy, and art into vernaculars. As a result of this close contact, all forms of the English language, such as essays, poems, dramas, novels, short stories, criticisms and even punctuations have materially influenced practically all the vernaculars of India. Moreover, new social values, such as nationalism, social justice, democracy, and social progress, have also been permeated through these vernaculars. In short, in contact with the languages of modern and progressive nations of the West most of Indian vernaculars have attained a high degree of excellence both in style and literature.

A most important step in the development of the vernaculars is recognition by the new Constitution of fourteen languages, including two classics,

Sanskrit and Tamil, as national and State languages. Sanskrit is extremely rich in vocabulary and grammar as well as in literature, and serves as the source to all Indo-Aryan languages. Sanskrit may thus help in the co-ordination and integration of most of the Indo-Aryan languages into one or two great national languages, such as Hindi and Bengali. In spite of the 24.8 million population of West Bengal, it must also be pointed out that Bengali remained the mother-tongue of 42 million people of East Pakistan. Tamil may help similarly in the co-ordination and integration of all Dravidian languages into a second great national language. They may thus simplify the problem of the multiplicity of languages.

The rise and growth of important vernaculars in India may be described as follows:⁴

Hindi: India's premier vernacular is Hindi, both because it is spoken by the largest group of the people, and because it has been selected as the national language. The origin of Hindi has been traced back to the Apabhramsa, a common language of the people in the second century B.C. It derived both its grammar and vocabulary from Sanskrit. But it took its literary character from the lays of the bards maintained by the Rajput chiefs at their courts to chant the poems about the glorious deeds of their patrons as well as of their clans. The earliest Hindi author was Chand Bardi, known for his famous poems on Prithvi Raj Raso. He was followed by Sur Das, the blind poet of Agra. But its greatest contributor was Tulsi Das who translated the Ramayana into Hindi in the seventeenth century, bringing new outlook into Hindi literature. Another important writer of Hindi was Kabir, a weaver of Banaras who attempted at the unification of Hinduism and Mahomedanism. Among other writers mention must be made of Davananda Saraswati, the founder of the Arya Samaj, and B. H. Chandra, who wrote as many as 175 books and treatises in Hindi. As the national language, Hindi has the best chance to develop both as a language and literature, representing about one-seventh of the world's population.

Bengali: Bengali is spoken by the second largest group of Indian people (before Partition) and is India's most highly developed language and literature. The origin of the Bengali language has been traced back to Magadhi Prakrit in the eleventh century. The earliest writers of Bengali were the Buddhist priests, but the founder of Bengali poetry was Chandi Das in the fourteenth century. Bengali literature began with the translation and adaptation of Sanskrit literature. The modern period in Bengali language and literature began in 1800 when Fort William College was founded for training Indian Civil Servants in Indian history

4. Of all the references consulted on the subject, the most important are: O'Malley, L.S.S., Editor: *Modern India and the West*, New York, 1941; Carruth, C. T.: *Legacy of India*, Oxford, 1937.

and languages. Of the various factors leading to the development of Bengali, both as a language and literature are, first, the Renaissance and other social movements since the beginning of the nineteenth century; second, the rise of the Bengali Press, especially such periodicals as the *Tattabodhini* of Akshoy Kumar Dutt and *Bangadarshan* of Bankim Chandra Chatterjee; and Sanskrit grammar and vocabulary, with which it is closely related.

Among the founders of Bengali, mention must be made of Rammohun Roy, the founder of Bengali prose, who translated the Upanishads into Bengali and used Bengali for the propagation of the Brahmo Samaj and other social reforms. Iswar Chandra Vidyasagar, the founder of classical Bengali prose, and author of many Bengali text-books for higher education, who also used Bengali for the propagation of his widow remarriage reform; Madhusudan Dutt, who introduced blank verse into Bengali poetry and modern drama; Bankim Chandra Chatterjee who introduced a new concept of novels into Bengali; Rabindranath Tagore, one of the greatest literary geniuses of modern times, who wrote his short stories and novels and his immortal lyrics, the *Gitanjali*, and won the Nobel Prize in Literature in 1913; and lastly, also Sarat Chandra Chatterjee, another great Bengali novelist.

Tamil: Tamil is a classic rather than a vernacular, rendering the same service to the Dravidian culture as Sanskrit to the Aryan culture. It developed as a language long before the Christian era and there were three *Sangams* or academies of scholars and critics devoted to literature at Madura, the capital of the Pandya Kings, in the second century B.C. Like Sanskrit, Tamil grammar is highly synthetic, but its literature is more virile and responsive to foreign influences. Tamil grammar *Tol-Kap-Piyam*, appeared in the first century A.D. But Tamil literature began with Kural, didactic poems and sacred books in the South like the Vedas in the North, which appeared in the fifth century A.D. Tamil also made considerable progress in religious literature for recital in the temples in the Middle Ages. The European contact with Tamil began in the seventeenth century, when the Christian missionaries learned Tamil and brought the gospel directly to the people. The Reverend Robert de Nabile (1606-56) published several prose works in Tamil; Father Gonsalvez of the Spanish mission printed the first book in Tamil in 1677; and Father Beschi (1680-1742) contributed several works of high rank both in verse and prose. They were followed by Indian authors some of whom began to translate famous works of literature, science and philosophy into Tamil and others made original contributions. Revitalized in contact with Western languages, especially English, Tamil has made great progress in prose, poetry, drama, fiction and vernacular press.

Telugu: Telugu is another important vernacular of the Dravidian peoples. Its origin has been traced to the first century A.D., but its literature began with the translation of the Mahabharata into Telugu in the eleventh century A.D. With the Mahabharata as the foundation, there grew two kinds of literature: (1) The Puranas, the translations of which were highly poetical; (2) the Prabandha, which were highly romantic, i.e., dealing with love and marriage. By the end of the eighteenth century, the life of Christ and doctrines of Christianity were published in Telugu and they made tremendous effect upon the people, bringing new thoughts and ideas into Telugu language. The English education and the public press brought Western culture close to the people. Mr. C. P. Brown, a Civil Servant, made real contribution to the Telugu language and literature (1817-55) and even prepared a dictionary of Telugu language between 1845 and 1853. Modern Telugu language and literature began in 1880, when K. V. Pantulu brought his deep learning to Telugu, founded Telugu prose, wrote the first novel in 1878 and laid the foundation of modern Telugu literature. Dr. C. R. Reddy wrote a critical analysis of the works of a great poet in the Middle Ages and introduced the methods of interpretation into Telugu language. Like other vernaculars, the English language has profound influence upon the structure of Telugu.

Marathi: The origin of Marathi language and literature has been traced to the twelfth century, when they consisted mostly of poems, ballads and chronicles. It attained the literary value through the composition of illustrious songs by Tukaram in the seventeenth century, some of which are sung in many parts of the country even today. The most important factors in the development of Marathi are, first the work of the Christian missionaries who established primary schools, translated the Bible into Marathi, compiled Marathi grammar (1805) and helped in the growth of Marathi prose. Second, the translation and adaptation of European especially English classics into Marathi (1810-74). Third the publication of a series of essays entitled *Nibandh Mala* (1875) by V. S. Chiplunkar, who entreated his countrymen to love their country, history, religion and language. He was followed by a number of other writers, such as B. G. Tilak and N. C. Kelkar in different branches of modern Marathi language and literature.

Urdu: Urdu has its origin in a dialect of Western Hindi spoken near Delhi and Meerut for several centuries. It has been based on Hindi grammar, but the vocabulary has been derived mostly from Persian. Other languages, such as Arabic, Portuguese, French and especially English have also contributed to its vocabulary. It began to develop its prose by the middle of the nineteenth century. Dr. John Gilchrist, Principal of the Fort William College at Calcutta, wrote

its grammar and compiled its dictionary. The foundation of standard Urdu was laid by Ghalib of Delhi and its super-structure was constructed by the Delhi and Lucknow schools of Urdu literature. The literary character of Urdu has been established by such men as Muhsinul Mulk, Maulvi Nazir Ahmad, Maulvi Altaf Husain and especially by Sir Muhammed Iqbal, a recognized Oriental scholar. It must also be mentioned that Urdu has been adopted by the Osmania University of Hyderabad as a medium of instruction and also by Pakistan as the national language.

Miscellany: Of other vernaculars mention must be made of the following:

(1) **Gujarati** is derived from Prakrit and is an intermediate language between Saurastri and Sauraseni. There is no dialect of Gujarati, but there is a gradation in pronunciation of the languages spoken by different classes of the people. It attained its literary character through the works of Narasinha Metha and the translation by Rewa Sanakar of the Mahabharata.

(2) **Punjabi** or Gurumukhi, is an ancient Hindi dialect, the vocabulary of which has been supplemented by Persian and Arabic words. The best part of Punjabi literature is the Sikh Granth. There are several dialects but modern literature has scarcely begun.

(3) **Malayalam** was originally derived from Tamil in the ninth century, and differs from it now both in idioms and pronunciation. It appeared in 1150 A.D. and the inscriptions of the rulers of Kerala from Travancore derived their literary character from *Ramecharitam*, written in the thirteenth century, and the oldest poem. Another important old publication is a collection of 1000 proverbs in 1868.

(4) **Kanarese** is another language of the Dravidian people. It was represented in the sixth century by the Bijapur inscription written in an alphabet similar to that of the Telugu language and is a highly developed language of an ancient civilization.

(5) **Kashmiri** is an ancient Sanskrit language, but has absorbed many foreign words, especially from Persian and Arabic languages. It is rich in folklores and mythologies. Christian missions have translated the Bible and the Hymns with the old Persian Alphabet, but it still lacks literary maturity.

REVIVAL OF ART AND MUSIC

From the earliest time, India has devoted herself to the development of architecture, sculpture, painting, dancing, and music. Under the influence of the Indian renaissance, some of the arts, especially painting, dancing, and music have been revived; they have made considerable progress almost all over the country.

Since the beginning of the present century, there has arisen a new school of painting under the leadership of Abanindranath Tagore, a Vice-Principal of the

Calcutta School of Art and founder of the Indian Society of Oriental Arts. Tagore picked up "the broken threads of Indian Pictorial tradition" and gave "true interpretation of Indian spirituality" (Havell). Other prominent members of this school are Gaganendranath Tagore, Nanda Lal Bose, and Surendranath Ganguly. Among its outstanding productions "The Flight of Lakshmi Sen" and "Exiled Yaksha" (the hero of Kalidasa's *Meghaduta*) are regarded as masterpieces both in India and outside.

The revival of dancing is still another achievement of the Indian renaissance. Dancing was practised by respectable women in ancient times but in the course of time, it was taken up first by Devadasis or the women of questionable character in Hindu temples and then by professional women of loose morals, and hence lost its respectability. Rabindranath Tagore took the lead in restoring dancing as a respectable art and it has already become popular. Dancing in modern times has taken three different forms:

- (1) Classical dancing, for which there are special schools both in North and South India;
- (2) Folk dancing, which has been revived by Guru Saday Dutt through what is called the Bratachari movement in Bengal and other provinces;
- (3) Ballet dancing, a combination of Indian classical dancing and music under the influence of the Russian Ballet, which Uday Shankar, a former pupil of Madame Pavlova, has introduced in India with great success.

Music has always been a part of Indian life, both spiritual and recreational. But Rabindranath Tagore gave a new turn and a new meaning to Indian popular music. He combined the lofty divine concept of the Upanishad with the deep devotional love of Vaishnavism, first in his lyrics, such as *Gitanjali* and *Gardener*, and then in his songs, both patriotic and divine, including the present national anthem and some of the congregational prayers. Since the beginning of the present century India has passed through such revolutionary changes as the partition of Bengal, the struggle for national liberation, partition of India, achievement of national independence, and establishment of a democratic republic, all of which affected national emotion and gave rise to patriotic and other songs in the various languages all over the country.

MISCELLANEOUS EDUCATION

Closely connected with institutional education mentioned above, there have also developed other educational systems, both organized and unorganized, by which dissemination of knowledge has been taking place among the people. Of those systems, the most important are the following:

- (1) Scientific and educational organisations, such as those of physics, chemistry, biology, economics, politics, medicine, agriculture,

and education, which meet annually in different centres of the country and discuss various problems on the basis of expert knowledge;

- (2) Social, political, industrial, labor, agrarian, and similar movements that carry on propaganda work in regard to their special interests;
- (3) The press, both English and the vernacular, since the beginning of the nineteenth century;
- (4) The libraries, both circulating and otherwise, which have been increasing in number;
- (5) Theatres, moving pictures, and the radios that have also been reaching an increasingly large number of people all over the country; and
- (6) The platform and the pulpit, which have been propagating various doctrines and ideals to an increasingly large number of population.

GENERAL CONCLUSION

In conclusion, it may be pointed out that as the prime factor of mental development, education has rendered an immense service to the progress of modern India: First, as the medium of instruction, the English language has educated India in modern science, philosophy, art and technology and opened to her the vast resources of Western civilization in general and British civilization in particular and helped India to find herself, which is the greatest contribution of England to India. Secondly, the establishment of various universities and of other higher institutes of education has prepared Indian people in the social, political, and economic thinking and reconstruction, the best example of which is India's Constitution, a monumental edifice to popular democracy. Thirdly, secondary education, both academic and vocational, as supplemented by high schools and similar other institutions, has begun to stabilize the rising middle classes in modern social order as the custodian and carrier of cultural heritage from generation to generation. Finally, free and compulsory education for all children up to the age of 14, instead of a few scattered primary schools as at present, is a measure of supreme importance for developing the literate electorate and intelligent citizens of India's democratic Government. It must also be added that India must also preserve the legacy of the English language, which the British introduced over a hundred years ago for imperial purposes and which has now become the most important international language. Like her State-language and the national language, India needs also her international language so that she may perform her duties and responsibilities in the international organizations, the number of which has been increasing as the time passes on.

VIVEKANANDA—HIS INFLUENCE IN THE AWAKENING OF MODERN INDIA*

By G. L. MEHTA,
Ambassador of India to USA

THERE is, indeed, urgent need today for a better appreciation of the ways of life of different countries, for tolerance between peoples and for mutual recognition of our common aspirations. But in no case is such understanding more essential than between India and the United States as on their co-operation and harmony depend the future of democracy in the East and the peace of the world.

The Ramakrishna Mission which conducts several Vedanta Centers in this country is a vital institution that seeks to combine the religious and cultural tradition of India with the gospel of social service of modern times. This Mission was established in Calcutta in 1897 by Swami Vivekananda to honor the memory of his guru or preceptor and master Shri Ramakrishna Paramahansa.

In order to evaluate the contribution which Swami Vivekananda has made to the evolution of New India, it is necessary to remind ourselves of the times in which he lived and worked. India was then in a state of ferment. Vivekananda was born only six years after India's first revolutionary movement of independence in 1857. The national upsurge, however, was much wider than the political struggle. The second half of the nineteenth century was marked by activities of social and religious reform. Some reformist movements like the Brahmo Samaj in Bengal laid emphasis on the unity of God and discarded idol worship; it carried on a crusade for removal of social evils and for elevating the status of women. Others like the Arya Samaj in the north sought to go back to the pristine purity of the ancient scriptures and strove to attain the ideal of an Indian nationality. The Indian National Congress which became the spear-head of the national struggle for independence was also established during these days.

It was in these times of turmoil and unrest that Vivekananda came under the influence of Shri Ramakrishna Paramahansa, a poor priest in a temple near Calcutta, and became in due course the standard-bearer of the master's teachings. Shri Ramakrishna had scarcely any formal education and led an intensely spiritual life in splendid isolation. He had deep faith in the inherent truth of all religions and tested his belief by performing religious exercises in accordance with the practice and usage not only of different

Hindu sects but also of Christianity and Islam. His broad catholicity, mysticism and spiritual ecstasy attracted considerable attention of the people. But he lived and died a lonely spiritual devotee, unknown except to small groups of disciples and followers.

But Vivekananda was not only a disciple, he was an exponent and interpreter. His learning, eloquence, zest and energy and his wonderful personality gathered round him a band of followers which included the rich and the poor, intellectuals and the illiterate, his own countrymen and foreigners.

Sixty-two years ago, when America was still an unknown land to most people in India and India seemed a distant, perhaps a semi-barbaric country to many in the West, Vivekananda overcoming all the hardships of travel and without adequate financial support came to this country and, indeed, to this city, where on September 11, 1893, he addressed the World's Parliament of Religions. His speech, extempore and brief as it was, created a profound impression on the audience; overnight, he became a celebrity in this country. The keynote of his address was universal tolerance and human brotherhood. Indeed, Vivekananda was the first spiritual and cultural Ambassador of India to America. Sister Christine who heard Vivekananda for the first time in a Unitarian Church in Detroit in 1894, says:

"The power that emanated from this mysterious being was so great that one and all but shrank from it. It was overwhelming. It threatened to sweep everything before it. This, one sensed even in those first unforgettable moments. . . . He was barely thirty, this preacher from far away India. Young with an ageless youth and yet withal old with the wisdom of ancient times."

And, in parenthesis, may I mention what impression Vivekananda himself had of America. In a private letter from Chicago, dated 2nd November, 1893, Vivekananda wrote:

"There is a curiosity in this nation such as you meet with nowhere else. They want to know everything, and their women—they are the most advanced in the world. The average American woman is far more cultivated than the average American man. The men slave all their lives for money, and the women snatch every opportunity to improve themselves. And they are a very kind-hearted, frank people. Everybody who has a fad to preach comes here and I am sorry to say that most of these are not sound. The Americans have their faults too and what nation has not? But this is my summing up. Asia laid the germs of civilization, Europe developed men, and America is developing women and the masses. It is a paradise of the woman and the laborer."

* This is the text of a speech delivered by Ambassador Mehta at the First Annual Vivekananda Memorial Lecture in a series designed to promote the fostering of cultural relations between India and the United States of America, at the University of Chicago, on Wednesday, 20th April, 1955. The lectures are provided for by a fund at the University of Chicago, established by Taraknath Das Foundation.

In Vivekananda, patriotic and religious impulses aroused a supreme desire to uplift the manhood of India with a view to restoring India to a self-respecting place in the comity of nations. He believed that India had a definite contribution to make to the peace and progress of the world but before she could do so, she had to win recognition from other nations by raising her own status. India could co-operate for the common good by eradicating poverty, by redressing social wrongs and by developing her inherent strength. For this purpose, the people of India had to draw their inspiration from her ancient heritage. For the first time in the modern age, he boldly proclaimed before the world the cultural tradition and the spiritual qualities of Hindu civilization, the greatness of her past and the aspirations for her future. Instead of being apologetic or exhibiting a sense of inferiority which marked the attitude of many Indians in those days towards Western culture and civilization, a refreshing courage and a consciousness of innate strength marked Vivekananda's utterances. This, combined with a burning patriotic zeal, made him an embodiment of the ideals of a resurgent Indian nation. He was, in the words of Sir Valentine Chirol, "the first Hindu whose personality won demonstrative recognition abroad for India's ancient civilization and for her new-born claim to nationhood."

Vivekananda was not a politician. He did not fight any political battles nor did he participate in civic and legislative bodies. He was primarily a religious reformer but he propounded the fundamentals and emphasized the verities which years later were reinforced by Mahatma Gandhi and became in many ways the beacon lights of the national renaissance. As Prime Minister Nehru has observed:

"Vivekananda was one of the great founders of the modern national movement of India, and a great number of people who took more or less active part in that movement later on drew their inspiration from him."

It is not easy to determine the way in which Vivekananda has influenced modern India nor to detail the spheres in which his influence has been felt. Such influence as a man like Vivekananda exercised was subtle and imperceptible, for the work of a spiritual teacher is concerned with the minds and hearts of men, not with institutions and laws. The footprints which a great man leaves on the sands of time are not always visible to the naked eye. Nevertheless, Vivekananda's inspiration and work abide. I shall attempt to deal only with some aspects of the impact of his personality and work.

The national movement of India, particularly after Gandhiji became its leader, has been not merely national in its aims and temper but also democratic and social in its outlook. From 1931, when the Indian National Congress in its session at Karachi laid down the broad principles on which the Constitution of

India was to be framed until its recent session at Avadi in Madras in January this year, the emphasis of the Indian movement has been on the building up of a Welfare State through improvement in the condition of the masses and the evolution of an equalitarian society by democratic means. And here is what Vivekananda, known as the "cyclonic Hindu," had to say on this subject:

X "The only hope of India is from the masses. . . . He who sees God in the poor, in the weak, and in the diseased really worships Him. He who has served and has helped one poor man, seeing God in him, without thinking of his caste, creed or race, or anything, with him God is more pleased than He is with the man who sees Him only in Temples. . . . Do you love your fellow men? Where should you go to seek for God—are not all the poor, the miserable, the weak, Gods? Why not worship them first? . . . I consider that the great national sin is the neglect of the masses, and that is one of the causes of our downfall. No amount of politics will be of any avail until the masses in India are once more well-fed, and well-cared for."

Again and again, Vivekananda said that religion had to be translated into our daily life and practice, that it should remove tyrannies and privileges and barriers. He firmly believed that the noblest way to serve God was through the service of men, that temples should not become ivory towers. The term *Daridra Narayan* (to signify the dignity of the poor) which Gandhiji popularized was Swami Vivekananda's expression; it embodied his faith in and compassion for the weak, the humble and the lowly. The most practical form which Vedanta should take, said Vivekananda, was the uplift of the mass of people. In this he was truly the forerunner of Gandhiji. "An empty stomach," Vivekananda once remarked, "is no good for religion." It was he, too, who observed that "God comes to the poor in the form of Bread." I think we should constantly remind ourselves of these words now when we are involved in conflicts of creeds and wars between rival "isms." We have to act up to the ideals of a true democracy, we have to rid the world of dire poverty and want, we have to bring some ray of hope and cheer in countless lives immersed in squalor and misery. And this we have to do irrespective of Communism or Capitalism. The world can no more be half-starving and half-slave. A "free world" cannot be based on hungry stomachs, ignorant minds and idle hands. To meet Vivekananda's challenge in constructive terms is the supreme task of statesmanship today.

India's political system and constitutional structure are squarely based on principles of secularism. The Fundamental Rights laid down in the Constitution prohibit discrimination against any citizen on grounds only of religion, race, caste, sex, place of birth and prevent the imposition of any disability or

restriction on such grounds. Complete religious freedom is assured to all citizens of India. This is the corner-stone of new India. Hindu-Muslim unity was one of the ideals for which Gandhiji strove and, indeed, it was in vindicating this ideal that he sacrificed his very life. Throughout his life, Vivekananda laid stress on brotherhood and tolerance. In his famous address to the Parliament of Religions in Chicago, he said:

"Sectarianism, bigotry and its horrible descendant, fanaticism, have long plagued this beautiful earth. They have filled the earth with violence, drenched it often and often with human blood, destroyed civilization and sent whole nations to despair."

Indeed, he realized that social barriers could not be sanctioned by religious tenets.

"India's doom was sealed the very day the caste system was invented and stopped free communion with one another. . . . No man, no nation can hate others and live."

For, he believed like his great master that different religions are but diverse ways leading to the same goal. As the writing on the walls of the Vedanta Centers in this country proclaims:

"He is one but the sages describe Him differently."

Although a true nationalist, Swami Vivekananda was not narrow in his outlook or parochial in his approach. It is remarkable that over sixty years ago he had what we today call an international outlook.

"Even in politics and sociology, problems that were national twenty years ago can no longer be solved on national grounds only," he observed. "They are assuming huge proportions, gigantic shapes. They can only be solved when looked at in the broader light of international grounds. International organizations, international combinations, international laws are the cry of the day. There cannot be any progress without the whole world being based on Truth and Justice. It is becoming every day clearer that the solution of any problem can never be attained on racial, national or narrow grounds. Every idea has to become broad till it covers the whole of this world, every aspiration must go on increasing till it has engulfed the whole of humanity—I am thoroughly convinced that no individual or nation can live by holding itself apart from the community of others. Colonialism breeds exclusiveness. This is the main cause of the degradation of Man today. All nations must get back into the world-current. Motion is the sign of life."

How true these words are today so many years after they were spoken! With Vivekananda, however, internationalism was not a slogan or an instrument of power politics but an expression of his innate sense of human brotherhood.

It is of interest to note that long before Gandhiji, Vivekananda emphasized not only the vital impor-

ance of truthfulness in all human activities but also stressed the need of fearlessness and even the principle of non-aggression. When Gandhiji returned to India from South Africa in 1915, what pained him most was a lack of moral strength among people; he was oppressed by the atmosphere of cowardice and fear. Gandhiji thought this to be the worst evil of the foreign rule, worse even than economic exploitation since it corroded the souls of men and women and robbed them of their human dignity: he, therefore, tried to instil fearlessness among his people so that they might stand erect and upright before social tyrants, oppressive landlords and arrogant rulers.

But it is not only individual fear that matters. We live today in an age of fear; the richer are more afraid than the poorer, the more powerful nations are in greater terror than the weaker ones. Measures of security seem only to increase the feeling of insecurity all round. Atomic power accentuated our apprehensions, bringing the whole world under a shadow. Fear is at the root of much of the world's troubles today and has involved us in a terrible race in production of nuclear weapons which, if we are not prudent, can only end in universal disaster. Vivekananda proclaimed:

"Be not afraid of anything. It is fear that is the great cause of misery in the world. It is fear that is the greatest of superstitions. It is fear that is the cause of our woes. And it is fearlessness that brings heaven in a moment."

So, too, about non-aggression. He once said:

"There is no virtue higher than non-injury. Non-injury has to be attained by him who would be free. No one is more powerful than he who has attained perfect non-injury."

This, indeed, has been the teaching of all great religions. This conception of non-aggression was later translated by Gandhiji into the principle of non-violence and its wise application in the international sphere is the only hope for human survival.

Apart from these teachings and tenets, Vivekananda gave an institutional expression to the principles expounded by him. In the tradition of the Buddhist monks or Bhikkhus who went to distant lands carrying Buddha's message of goodwill and love and brotherhood, he travelled abroad and came to this country twice. It was to preach and practise the positive faith and gospel of social service that the Ramakrishna Mission was established. The Mission which has several activities—religious, cultural and social—has been steadily expanding them in various directions. It runs hospitals, dispensaries, industrial and agricultural schools, libraries and publishing houses. And at the occurrence of flood, famine, earthquake, epidemic or any other natural calamity, its members render assistance and give relief. It observes no distinction of caste, creed or religion in this work. The Mission has remained a monastic order, disse-

minating reformatory ideas and engaging itself in social service. It has placed in the forefront of its program the idea of social work not as mere charity or philanthropy but as an essential discipline for religious and spiritual life, as a social obligation which we all owe to those less fortunately placed in life.

The first Vedanta Center in this country was founded in this city soon after Swami Vivekananda's visit in 1893. There are today eleven centers in this country where Vedanta philosophy is studied and

expounded. These Centers do not preach a set of rigid doctrines or seek to convert people.

Vivekananda died at the young age of 39. The fire that raged in his mind and heart and which expressed itself in eloquent and ennobling language eventually consumed it. It has been said: "Those whom the gods love die young." But if the gods had spared Vivekananda to live the full span of his life, he would have contributed still more to the cultural renaissance of his country and to the spiritual regeneration of mankind.

—:O:—

THE MISSION OF BANDUNG

By PROF. SHRIMAN NARAYAN

THE Twenty-nine-Nation Asian-African Conference, which commenced its work on April 18, at Bandung in Indonesia has, undoubtedly, made history. In the words of Shri Jawaharlal Nehru, work done by the Conference was a "considerable achievement." Although there were certain initial setbacks and hurdles, the wisdom of all the Delegates assembled at the Conference made it possible to achieve complete unanimity on all issues. The 5000-word communique issued by the conference at the end of its seven days' work is a document of far-reaching significance. (It shows that the Continents of Asia and Africa are now determined not to be camp-followers or "yes-men" of the Western powers but to meet together and chalk out their own destinies through mutual consultations and co-operation. In the course of his concluding address the Prime Minister of India made it clear that the Conference had not been convened in any spirit of ill-will or hostility towards any nation of the world. He, however, desired that like India, Asia and Africa should not get entangled in any of the Power Blocs and should behave as free and independent nations. Shri Nehru hoped that "in future there would be no yes-men in Asia and Africa.")

In the course of his inaugural address to the Conference, the Indonesian President Dr. Soekarno made a fervent call for "surrender to peace" and declared that Asia and Africa were united "by a common determination to preserve and stabilize world peace and by a common detestation of colonialism and racialism." "No task," declared President Soekarno, "was more urgent than that of preserving peace." He wanted the principles of "live and let live" and "unity in diversity" to be the mottos of the Conference, and hoped that "the Conference would give guidance to mankind and prove that Asia and

Africa were reborn." The Prime Minister of Indonesia, Dr. Sastromidjojo observed that "those who fostered the illusion that the stock-piling of atom and hydrogen bombs could bring about peace rather than the sponsors of co-existence were unrealistic day-dreamers." The Conference pledged its support to the basic principles of human rights in the U.N. Charter. During the proceedings of the Conference, India expressed the view that "the best foundation for friendship between nations was not political alliances but understanding and respect for the culture, mind and heart of one another." The Communique of Bandung Conference recognizes "the urgency of promoting economic development in the Asian-African region, and the general desire for economic co-operation among the participating countries on the basis of mutual interest and respect for national sovereignty." It also emphasises "the particular significance of the development of nuclear energy for peaceful purposes for Asian and African countries." It "deplored the policies and practices of racial segregation and discrimination which forms the basis of Government and human relations in large regions of Africa and in other parts of the world." "Such conduct is not only a gross violation of human rights but also a denial of the fundamental values of civilization and the dignity of man." The Conference was of the view that "disarmament and the prohibition of production, experimentation and use of nuclear and thermo-nuclear weapons of war are imperative to save mankind and civilization from the fear and prospect of whole destruction." The Conference declared that "colonialism in all its manifestations is an evil which should speedily be brought to an end." The Bandung Conference was, therefore, in more senses than one, an unqualified success in serving the cause of peace

and good-will among the nations of the world. (The prominent part played by the Prime Minister of India and China went a long way in ensuring the success which the Conference ultimately achieved. We particularly welcome the assurance given by the Chinese Prime Minister Mr. Chou En-lai that China would not encourage Communists in or from other countries, particularly the Five Colombo Powers. This assurance would go a long way in resolving conflicts in the South-East Asian countries.)

It was a happy coincidence that the 18th April was observed throughout India as the day of dedication to the cause of a peaceful and non-violent social and economic revolution through the Bhoodan movement. It was on April 18, four years ago that Acharya Vinoba Bhave got the first instalment of 100 acres as land gift in Pochampalli village in Telangana. During the last four years the Bhoodan movement has spread throughout the country and has rightly become the symbol of a peaceful socio-economic revolution in India. This movement has attracted world-wide attention because of its unique nature in conformity with the innate genius of India. Acharya Vinoba now desires to intensify this movement during the next two years so as to be able to achieve the target of 5-crore acres of land by the end of 1957. Thousands of people must have taken the solemn pledge on the 18th April to rededicate themselves to the cause of Bhoodan and Sarvodaya and for the promotion of world peace and co-operation. It is indeed inspiring to know that on the same day, 29 nations of Asia and Africa also dedicated themselves to the cause of world brotherhood and goodwill. (India believes that real peace should be established only if individuals and nations solemnly resolve to eschew social and economic exploitation, work for maximum self-sufficiency and bring about a bold decentralization or diffusion of political and economic power through the organisation of village communities. The best way to preserve world peace is to decentralise and disperse power rather than to centralise and concentrate it in the hands of a few individuals or nations.) The Communists believe in the "withering away" of political power but begin by centralizing authority in the hands of a small section of the population. The Sarvodaya philosophy preached by Gandhiji, on the other hand, believes in Panchayat Raj on the basis of self-governing and self-sufficient rural communities or Panchayats. The Bhoodan movement symbolizes this urge and ideal of a non-violent and decentralized

democracy for India and other nations of the world. Instead of bringing about a social and economic revolution through the coercion of the State, Bhoodan or Sarvodaya places more faith on the conversion of the minds and hearts of the people through a process of mutual love and co-operation. Prime Minister Shri Nehru re-affirmed the same faith at the Bandung Conference by asserting that India had accepted the Gandhian ideal which taught the lesson of self-reliance on one's own inner strength. Shri Nehru spoke with "faith in the people of India and not in the big bombs.")

("India was neither Communist nor anti-Communist; whatever the great powers did, India would rely on herself.") It was also a strange coincidence that the world-renowned scientist and humanist Dr. Einstein also passed away on the 18th April. He was responsible for giving to the world the key to the secrets of atomic energy, but firmly believed in the principle of non-violence and world brotherhood. He had deep faith in the inherent goodness of humanity. When I had the privilege of meeting him some years ago in his cottage at Princeton, he gave us a message that "nothing was more important to man than man." He also expressed his full faith in the ideals preached and practised by Mahatma Gandhi. In the words of Shri Nehru he died as a "beacon of light in the world where shadows darken." We also learn that in the course of his last letter Dr. Einstein advocated the philosophy of "passive resistance" for the defence of a minority. Born as a great scientist who gave to the world the Theory of Relativity and the secrets of atomic energy, Dr. Einstein passed away as a great humanist who sincerely believed in the cause of world peace and friendship.

April 18, 1955, was, therefore, a memorable day, indeed. It was on that day that India re-affirmed her faith in non-violence and world brotherhood; it was on the same day that nations of Asia and Africa resolved to work unitedly for resolving international conflicts and bringing about world co-operation, and it was on this very day that one of the greatest scientists of the age passed away quietly in a hospital with a burning faith in the goodness of man and the futility of atom bombs and other instruments of destruction. We earnestly hope that the mission of Bandung, the inspiration of the Bhoodan movement and the faith of Dr. Einstein in passive resistance and non-violence would usher in a new era in the history of the world.

FOUR YEARS OF BHOODAN YAJNA

By SURESH RAMABHAI

Four years ago today was offered the first land-gift in a small village in the Nalgonda district of the Telangana region of the Hyderabad State. How it so happened at all there, is not only very interesting but also immensely significant. It was nothing like a random donation to gratify a poor mendicant or a subtle action performed with an eye for a name in this world or for a good place in the next. It occurred in an area where the objective conditions were as follows:

- (i) The gulf between the rich and the poor there is wider than perhaps anywhere else in the country;
- (ii) The rich had lost all balance of mind and ran away to big towns for safety;
- (iii) The poor were in such a helpless state as to lend their credulous ear to any one who held out any hopes to them, however mirage-like;
- (iv) The official machinery (both Provincial and Central) had spent about five crores of rupees and taken every step, military or otherwise, to quell the situation and restore peace, but signally failed;
- (v) The political workers adhering to the democratic method could see no possibility of easing the tension between the people;
- (vi) Those believing in the dictatorial technique had, in spite of their unremitting labour of several years, only been able to create a sort of terror but could not at all succeed in their objective of socialising the ownership of land or letting the landless enjoy a secure possession of the same;
- (vii) As people were being ground down mercilessly between the two stones, i.e., by the agents of the official authority in the day and of the violent totalitarian activity at night, they knew no end of their plight, human ingenuity seemed to have totally foundered and all belief in democracy, non-violence, peace or human brotherhood was on the point of collapse.

When the happy event came to pass on 18th April, 1951, it was characterised by some signal facts:

- (i) The most down-trodden people of the village, viz., the Harijans unanimously demanded eighty acres of land to make their ends meet;
- (ii) The demand was not made to any landlord, official authority, politician or power-monger but to Vinoba, to one who had passed literally every moment of his past thirty-five years in humanity's service, had led a strenuous life of restraint and silent meditation and unwearying village work, had never sought for any post or office in any public or private concern or party, and had attained such a supreme control over his nature as to harbour no desire or will to do or undo this thing or that;
- (iii) He had reached the place on foot, walking down all the way from his Paramdham Ashram to Hyderabad and then again to that village;
- (iv) He invoked the goodness of the land-holding people of that village and inquired of

them whether they themselves were not prepared to do something for their needy neighbours;

(v) A young zamindar came humbly forward with an offer of no less than one hundred acres of his fertile land in response;

(vi) The Harijans gratefully promised to make use of that land in a homely manner and lead henceforth a family life of sturdy self-reliance;

(vii) Touched by this amazing drama, Vinoba saw in it a manifestation of the Divine Hand and feeling that Providence had chosen him as His instrument for accomplishing this process, he resolved that very night to take up the new mission and set out upon it from the next day, which he has persistently continued with a sun-like regularity down to this day.

Such auspicious beginnings leave little doubt for the ceaseless progress of the Bhoodan-Yajna. It has now taken the splendid form of the gigantic Ganga sweeping far and wide with tributaries joining it now and then. During his 51 days' tour in Telangana, Vinoba encamped at 51 villages, passed through some 200 villages, settled about 500 village disputes, addressed some two lakhs of people and received 12,201 acres of land for the landless.

Vinoba's endeavour in Telangana was to "bring about," as he said in a mass meeting at Warangal, "a silent ideological revolution in our social outlook by asking the rich to donate lands to the poor. This Bhoodan Yajna is an application of non-violence; an experiment in transformation of life itself. I am only a tool in the hands of Him who is the Lord of all ages, like even those who give and those who will receive the gifts. It is a phenomenon inspired by God."

Vinoba returned to his Paunar Ashram on 27th June. On account of the rains he stopped there for two months. Meanwhile he received an invitation from Pandit Jawaharlal Nehru, the Prime Minister of India, to come to Delhi in order to discuss the Five-Year Plan framed by the Government. Vinoba decided to go to Delhi on foot and left Paunar on September 12, 1951.

Reaching Nagpur on September 15, he observed:

"Till God keeps strength in me I shall tour the country and beg for land for the landless."

At another place he remarked:

"Those who do not donate land today will do so tomorrow. They cannot help giving the same. In India there is none who would turn down my request for land."

On October 2, 1951, he was at Saugar, a University town in Madhya Pradesh. Addressing the workers there, he placed before the country his demand for five crore acres of land by 1957. He declared:

"Though my own stomach is very small, that of the *daridranarayana* is very big. So if any one asks me what my demand is, I say 'Five crores of acres of land.' I mean thereby cultivable land. If

FOUR YEARS OF BHOODAN YAJNA

453

there are five sons in the family, I want to be considered the sixth; if four, the fifth. Thus I claim one-fifth or one-sixth; of the total cultivable land in the country."

On bended knees he implored:

"I appeal to all of you to contribute your mite for the worship of *Daridranarayana*. This is real Yajna—sacrifice. I, therefore, beseech every one to come forward and put his shoulder to this task. This will usher in an unprecedented and mighty revolution in the country. I can, even as I stand here, behold it taking place before my eyes."

Passing through Madhya Pradesh and Vindhya Pradesh as also parts of Madhya Bharat, Rajasthan and Uttar Pradesh, Vinoba entered the capital of India on November 13, 1951. During the 62 days he took in coming from Paunar to Delhi, he obtained 19,436 acres.

Vinoba introduced himself to Delhi's populace as the proverbial *Vaman* who covered the earth in three steps. So also he affirmed:

"What I want the people to do is, first, to part with some of their land. Secondly, they should engage themselves in the service of others. Finally, in their service they should give up all and voluntarily sacrifice everything. This is the path into which I want to initiate the people."

After reaching Delhi, Vinoba met for three successive days the members of the Planning Commission as also its Chairman, the Prime Minister. In the words of Vinoba:

"During these three days of discussion I placed my idea before them. They promised to consider my suggestions . . . However, there is a difference between their approach and mine, though they have also the interest of the country at heart."

After eleven days' stay in the capital in a hut near Gandhiji's *samadhi*, Vinoba left it in the early hours of the morning of November 24, 1951 and launched upon a walking tour of Uttar Pradesh. According to his demand of one-sixth of the entire cultivable land in the country, Vinoba wanted one crore acres of land from the U.P. As a first instalment, however, the constructive workers of U.P., meeting at Mathura on first November and during Vinoba's presence (when he was on his way to Delhi), resolved to collect five lakhs of acres within one year. Except the Almora district, Vinoba covered one district after another of the U.P.

In April, 1952, Vinoba encamped at Sevapuri Ashram for more than a week in connection with the Sarvodaya Sammelan held there on April 13, 14, 15 and 16. This Sammelan registered a landmark in the growth and development of the Bhoodan movement for it was here that constructive workers from all parts of the country decided to collect twenty-five lakhs of acres within two years as a first instalment to fulfil Vinoba's demand of five crores, in order to establish a classless and exploitation-free society on

the basis of truth and non-violence. A quota was fixed for every province. There was thus a clear-cut programme before the workers. The ideology of Sarvodaya had now taken a concrete shape.

On May 8, when Vinoba reached Lucknow, the capital of U.P., it happened to be the Buddha Jayanti Day (Birth Anniversary of Lord Buddha). There he declared:

"I ask people to give the land they have . . . And I have come to believe that God is using, weak though I am, to complete the task which He had commenced through the Buddha."

"The work I am made to do is the continuation of the *Dharma Chakra Pravartan*—revolving the wheel of Dharma, which Buddha had started. And mark what I pronounce with the same commanding voice as that of the lion which drowns all other smaller voices and rings clear across the forest: *The land has already come to me, it has already gone to the landless*. It remains for you only to choose the manner of effecting the transfer."

Then he pointed out:

"The equal sharing of wealth is the cry of the age and it will come to be. Land will have to be redivided. I have no doubt that it can be done peacefully. I can see it quite clearly and this is why I speak so confidently about it; and this is why I ask you to wake up, for as Tulsidas sang to Rama: 'The day is dawning and the birds on the trees are chirping merrily, and it is time when gifts should be made to the poor; so awake, Oh Ram!'"

On 4th July, 1952, Vinoba re-entered Benares city after walking through 48 districts of the U.P. In Benares, he encamped at Kashi Vidyapith for 70 days to pass the rainy season. There he also gave a call for the *Swachha Bharat* (Clean India) campaign. On 11th September, on the occasion of his 59th birthday, he made the resolve not to go back to his Paramdham Ashram until the land problem of the country was solved.

During his stay in U.P., Vinoba encamped at 257 places, covered 3,750 miles and obtained 2,95,028 acres. In June, 1952, was made the first offer of all land in a village—Mangroth in the Manipur district of U.P. The total land collections in the country amounted at that time to a little less than four lakhs.

On September 14, 1952, Vinoba crossed the Karamnasa river and walked down from Uttar Pradesh into Bihar. Entering the precincts of Bihar he said:

"As a pilgrim goes to a *Tirtha*—pilgrimage for God's *darshan*—so also I have come out on Bhoodan pilgrimage. I have a desire that the land problem of Bihar should be solved during my stay here. But the far more important thing is working the non-violent method. If we are able to solve the land problem by the method of love and peace, it would earn credit for non-violence. Could non-violence succeed in attaining economic

revolution, what else would it not be able to achieve?"

On 23rd October, he declared at Patna the great resolve—resolve not to leave Bihar until its land problem was solved. Next day, he placed before the people the idea of *Sampattidan Yajna*. He said:

"As the work of Bhoodan progressed it became increasingly clear that the idea behind the movement could not be fulfilled unless we went further and asked for a portion of wealth and property. And hence, I made up my mind that I must also ask for a share of wealth and property from the people. I have now done it and placed my demand at one-sixth of it; but it is up to the people to decide what they can and will give me."

Vinoba entered the Gaya district on 28th October. Three days after he declared that he wanted one lakh acres from this district of Buddha Bhagwan. As Vinoba later said:

"When I entered the Gaya district, I resolved that this district, which was the scene of Lord Buddha's austerities and which is sacred to crores of Hindus as the place for offering *Shradha* to their forbears, should be asked to collect one lakh acres as the first instalment. I expressed this feeling to the workers who approved of it and accepted to work for it."

Thus it was that Bhoodan work was taken up in Gaya district on an intensive basis. On 13th December, 1952, Vinoba entered the Manbhum district in a very weak state of health. On the 14th, he came to Chandil and his condition so much worsened that it was impossible for him to move. He had, therefore, to camp at Chandil for several months to regain his health. The fifth annual session of Sarvodaya Samaj was, therefore, also convened at Chandil on March 5, 6, and 7, 1953, Sri Dharendra Majumdar presiding. The highlight of this gathering was the declaration of Sri Jayaprakash Narayan that he would henceforth devote himself mainly to Bhoodan work. He said:

"Despair had seized our heart after the attainment of Independence. But Vinobaji dispelled our illusions. As the light of Bhoodan Yajna spread out the clouds of doubts and darkness disappeared. Today everybody has accepted that land is the mother of one and all and each has equal right upon it. One who labours to produce from land has the first right. This is the intellectual revolution that has taken place within the last two years. Now the task before all of us is to give this revolution a practical shape, make it a reality and accomplish this mission."

Vinoba placed some very striking ideas before this Sammelan. He urged upon the necessity of building up what he called in his inimitable language स्वतन्त्र जनशक्ति (*Swatantra Jan-Shakti*). He said:

"Our work should proceed on the basis of—one, Vicharshasan (विचार शासन) or peaceful conversion of people to our view by making them think about it, and two, Kartritva-vibhajan, (कर्तृत्वविभाजन) or distribution of work among the individuals without creating an administrative authority."

To achieve this objective, Vinoba placed the four-fold programme: (i) Integration of constructive work institutions into one homogeneous unit, (ii) collection of five crore acres of land in Bhoodan Yajna by 1957; (iii) Sampattidan Yajna; and (iv) Yarn offering.

On 12th March, 1953, Vinoba restarted on his Bihar trek.

On 18th September he encamped at Baidyanath-dham, Bihar's most important pilgrimage centre. He also stayed there on the 19th on account of the meetings of workers from all over Bihar. In the evening of the 18th, he was requested by the head priest of the temple to pay a visit to the holy shrine. When he was told that Vinoba could enter a temple only if Harijans were also allowed to have the *darshan*, he gave his consent to Harijans accompanying Vinoba. Accordingly, on the evening of the 19th, Vinoba, accompanied by some Harijans and his colleagues, went into the temple. But hardly had he gone a few steps the *pandas* of the temple fell upon Vinoba and the party with *lathis* amidst cries of "*Dharm ki jai ho! Adharm ka nash ho!*" (Long live religion! Down with ir-religion!). Members of the party surrounded Vinoba, but he was slightly injured at the ear. Calmly and quietly he came out. Some members of the party were seriously hurt and beaten. Next day when he reached Pardi in Bhagalpur district, Vinoba issued a statement to the press in the course of which he said:

"I would like to say at the very outset that those who have indulged in this act of assault did so only out of ignorance. That being so, I do not want them to be punished for this. Those who indulged in the assault were seized with anger, so much so that they made no distinction between man and woman. I trust this will prove to be the last curse of Bhedasur, i.e., the devil in man that discriminates between one man and another."

"I have already said that I do not want anybody to be punished. But the constitution of free India has been clearly violated. Small retributive measures cannot make up for that violation. What is needed is to provide against any recurrence of such incidents in future. This is an age of science. Every faith is being tested on the touchstone of reason. If our society keeps this in view and behaves accordingly, everything will go on well."

Passing through the districts of Purnea, Saharsa, Darbhanga and Muzaffarpur, Vinoba reached Patna

On 10th January 1954. Addressing the Patna citizens he observed:

"Land problem would be solved in one way or the other all over the world. Hence I do not worry about how much land I get. My only concern is the depth to which the right thought finds place in the heart of the people."

From 30th January to 4th May, Vinoba toured the Gaya district. On April 18, 19, and 20, 1954, was held at Bodh Gaya the sixth Annual session of the *Sarvodaya Samaj*, presided over by Srimati Ashadevi Aryanayakam. The most important event of this Sammelan was Sri Jayaprakash Narayan's address on the 19th. As a Bihari, he expressed his regret at the said fact that Bihar had not yet fulfilled Baba's (as Vinoba is known in the countryside) demand. He felt certain that Bihar could do it. But neither the members of the Congress party nor those of the Praja Socialist Party, both of which had passed resolutions supporting Baba's call for 32 lakhs of acres, had taken up the work with proper zeal and spirit. He added that personally his faith in the efficacy of the movement was growing day by day. Law would not unite hearts. Nor could any party pass a law making land a social property. Of course, that could be done by the sword, but the sword gave rise to more problems than it solved. Sri Jayaprakash pleaded for speedy action as urgency was essential and time waited for none. He said that the paramount need was to dedicate one's whole life to this cause and he called upon his countrymen, specially the youth to come forward and donate their life to it, Jiwan Dan or gift of life. He closed with the solemn announcement of offering himself for the cause.

Next day, the president announced that Sri Jayaprakashji had sent her two letters—one his and the other from Vinoba. She read them out. Sri Jayaprakash's letter said:

"I enclose a letter received from Baba. I have no words to comment on the donation of life to a small fry like me by a man who has inspired us all. I shall say only this that I am totally unfit for accepting such an invaluable donation. On the contrary, we have to donate our life in the name of God to Baba himself. Yours in humbleness, Jayaprakash."

Vinoba's letter was:

"In response to your call of yesterday here is the offering of my life for a non-violent revolution based on Bhoodan-Yajna and with village-industries as its mainstay.—Vinoba."

Then began to flow the Jamuna of Jiwandan-Yajna. One after another, men and women offered themselves. About 500 names came then and there. Then followed the only resolution of the Sammelan, read out by Sri Shankarrao Deo. Expressing joy at the collections of 26,15,101 acres from 237,022 donors within two years, the resolution asked all those who

were anxious to establish human values in the society to come ahead and devote themselves to make the movement a success. In his valedictory address, Vinoba appealed to all political workers to forget their differences and take to producing *Jan-Shakti* through the common medium of Bhoodan. He claimed that the same would result in changing the whole administration, convert our power politics (*rajniti*) into popular politics (*loka-niti*) and help in the establishment of *shasan-mukta* (State-free) society.

During the rainy season of 1954, Vinoba covered the flood-ravaged districts of North Bihar—Darbhanga, Saharsa and Muzaffarpur—and waded through knee-deep and chest-deep waters, using a boat only when inevitable. In spite of the floods his meetings were crowded and often they attended the prayer as also his speech in showers. How deep a place has Bhoodan Yajna found in the heart of Bihar peasantry can be gauged from the fact that at one village in the district of Purnea they received Vinoba with a song at once original and unique:

"Sita Sita Ram Bolo!

Sab Koi Bhoomidan Dedo!"

At another village, in the Santhal Parganas district, they greeted him with the words:

"Baba, Zamin Lo! Zamin Lo!"

In the closing week of 1954, coal-miners of Bihar donated some 15,000 tons of coal for manufacturing bricks required to prepare wells on the Bhoodan lands distributed to the landless. Vinoba remained in Bihar up to 31st December, 1954. During his stay of 839 days he was donated with 22,32,474 acres of land.

In the small hours of the morning of the New Year's Day, 1955, Vinoba stepped out from the Bihar of Buddha and Mahavir into the *Vihar Bhoomi* (pilgrimage-land) of the Vaishnava saints and seers. It was his first visit to Bengal, the land of devotion and piety, of music and dream. He spent there 25 days, eleven in the Bankura district and fourteen in the Midnapore district, labouring to go deep into Bengal's soil and sow the thought-seed. He made it absolutely clear that Bhoodan sought to transform the whole society and was nothing short of *Dharma Chakra Pravartan*. He stirred Bengal to its very depths by calling upon it to supplement its legendary *Bhakti* with *Ahimsak Karma-Yoga* (non-violent activity). For *Bhakti* without *Karma* was bound to lead to inertia and *himsak karma* (violent action) was alien to the genius of her soil. Hence the paramount need of the Bhoodan Yajna for Bengal.

On 26th January, 1955, when Vinoba set his foot on the Orissa soil, he was presented with about a lakh and a quarter acres of land as also 93 villages donated in toto. Accepting the gift, Vinoba pointed out the great task to be accomplished in Orissa. He remarked:

"The work to be done now is that of *Bhoomi*

Kranti (Land Revolution). Merely giving land to the landless is not sufficient. Private land-ownership has to be abolished. Land can only be God's or of the society. If the people at any place live this idea, it would amount to the *poornata* (completeness) of Bhoodan Yajna. Thereafter the work of obtaining five crores and distributing it would become very long. I, therefore, expect a *paripoorna darshan* (wholesome view) in Orissa."

He also added:

"My hope from Orissa is not small. I am quite confident that now when the Bhoodan current has flowed on to this place, it would widely expand even as is done by your Mahanadi near the sea. I learn that Sri Mukund Deva tried to bring the Ganga to Orissa. Perhaps, he failed to earn the prestige. But you would now earn it. This, Bhoodan Yajna's current is the Ganga's. May you march with it right to the sea, the sea of humanity."

These days Vinoba's *yatra* goes on in Orissa. On 2nd February, they donated him 22 contiguous villages. On February 26, when he was at Manpur—a village which has been entirely dedicated in the Bhoodan Yajna by its people—he expressed the hope that the Bhoodan Yajna movement would make the land-revolution a living reality in the whole of India.

On March 25, 26 and 27 last, Vinoba was at Puri where was held the seventh Sarvodaya Sammelan. Therein he, giving a clarion call for land-revolution, called upon all public workers to donate two years for the Bhoodan Yajna. He appealed to them:

"Let all of you put your shoulder to the wheel for two years. This call of mine is not addressed to the people of India alone or merely to Sarvodaya devotees, but to one and all. I urge upon the whole world to leave no stone unturned for two years so that an arms-free society may come into force by 1957."

He further declared:

"It is not only a matter of tackling the land-issue. We have, in fact, to wipe out all Governments the world over for they cannot succeed in limiting the sphere of armed activity. We have to found non-violence. I ask for land-gifts for the sake of world-peace."

Thus has the Bhoodan-Yajna movement grown up during the last four years. About 37 lakhs of acres of land from more than four lakhs of donors have been so far offered in it as also some 150 whole villages. Also about 1500 workers, hailing from different parts of the country, have offered *Jivandan*. What is far more important, however, is the new enthusiasm the movement has created as also the energetic forces it has released. Persons belonging to various shades of life and subscribing to different political ideologies are participating in it. One of its no less considerable achievement is the great opportunity it has provided for our womenfolk to come out and play their part in the building up of India of the morrow,

The new awakening brought about by Bhoodan Yajna can also be gauged by the rising sale of Bhoodan and Sarvodaya literature. Weeklies or fortnightly in this connection are appearing in the twelve important languages of the country. Another evidence of the cultural and spiritual awakening that the movement is bringing about is the inspiration that it is providing to our poets and men of letters. Folk-songs and popular *Bhajans* in the various languages and dialects are a common feature. Also it has attracted wide attention abroad.

In fine, Bhoodan Yajna is not merely a movement for land distribution but for sharing of life as such. It recaptures, as Dr. S. Radhakrishnan puts it, 'the social order as the family writ large.' Virtually it aims at re-discovering the dormant quality of man and make the same a social force with wide wings. Bhoodan is a march in the further evolution of the human kind. It is just paving the way for the quicker and greater development and prosperity of the society. It is an endeavour to direct man's course from the rails of distrust, aggression and bloodshed to those of trust, self-suffering and love. Bhoodan's is to set up a new world, to create a new man. It has a message for every country, for every citizen of the world.

Old times are changed. Old order is crumbling. A new one has to take its place—but if it be done on a weak and false foundation more harm would be done to our people during the next one or two decades than has been done during the last two or three centuries. The lines of the new order must be the same as suit our genius and are native to our soil. Needless to state that 'plans' or 'projects' depending on foreign capital and experts or internal combines shared by foreign interests would result in throwing us all from the frying pan into the fire. India has to be built from below. But how? I can only reproduce what a seventy-eight years old Kisan in Darbhanga district told me. When I asked him what, according to him, could actually help us at the present juncture, with a beaming face he replied:

"Bhoodan is the way to *Sachcha Swaraj* (or true freedom) and I want to assure you that I would refuse to die until *Sachcha Swaraj* is established."

This is the voice of our India, real India, and Bhoodan Yajna is the way to build her truly as also to uphold world peace. It is just in keeping with the path chalked out for us by Gandhiji who led us to political freedom. It opens the door for economic liberty and social equality. May we, the youth of India, rise to the height of the occasion and march together on the noble path with steadfast and devoted steps to mould new India and a new world and establish *Ram Raj* or the *Kingdom of God* on this very earth!

THE YUGOSLAV CULTURAL HERITAGE

By M. PANIC-SUREP

For centuries, one part of Europe could only be discerned through a haze of smoke and conflagration. Since the 14th century, only the cries of insurgents and the wails of victims were heard, while for the past 150 years or so an uninterrupted and unquenchable struggle against the Turkish Sultans, the Austrian Habsburgs, the Bulgarian Koburgs, the German Hohenzollerns, Hitler, Mussolini, Horthy, culminating in the resistance to Stalin was waged on Yugoslav soil. It would seem as if fate had decreed that all European dictators and conquerors should break their spears against the same bastion. That is why there are countless families in Serbia and Macedonia where natural death among men is just as rare as drownings of peasants in the sea. To be killed in battle was regarded as a natural death for a man.

And when the smokes of war dissolve, does one only find charred ruins and crops in these regions? Apart from innumerable and deep scars, these areas will show us one of the most wonderful surprises of our civilisation. European culture, particularly in the field of arts sometimes marked its highest achievements here. And, however paradoxical it may seem, these masterpieces actually survived all ravages and depredations.

Little is known of these Yugoslav treasures abroad. This is also understandable. The liberations of 1804 and 1918 were only partial. The greatest part of the people, the workers and peasants were forced to continue the struggle for their most elementary rights, while efforts of the ruling class were concentrated on the exploitation of the people and preservation of its privileges so that the entire cultural heritage remained in the dark.

The pattern of the material monuments of Yugoslav spiritual culture is no less vivid, varied and colorful than that of countryside mountains and rivers. These monuments stem from the earliest stages of mankind, from its pre-history. The Krapina site near Zagreb (*Homo sapiens Crapiensis*) is doubtless one of the most important in the world. This site gave science decisive data on the diluvial man in Europe, his physical characteristics and the tools he used in his fight for subsistence. His fireplace with the remains of ten human skeletons speaks of the fire on which the future master of Nature was created and tempered. Other Paleolithic sites have also been discovered in Yugoslavia; another such site was found in a cave near Kragujevac only two years ago.

The man of the Neolithic era has left countless traces and relics in this country. Some of these are unrivalled in Europe, as for instance, Vinca and the Starcevo site near Pancevo. While the former is famous for its numerous human and animal statuettes, the latter won universal distinction with its painted earthenware with beautiful black and white ornaments on a red background; both together represent the earliest fruits of creative inspiration, the quality which sets man apart from the other beings.

With the advent of metals the number of human settlements increased notably. Over 2,000 have been registered so far in Serbia alone, of which hardly twenty have been systematically studied and explored. Groups of archaeologists are now enabling sunlight to penetrate into ancient homes, thus lifting the veil from the life and work of their inhabitants. The Illyrians and Celts were once masters here: their memories are preserved with respect.

The Yugoslav territory gave several emperors, statesmen and great men to the Roman Empire. Let us mention only Probus of Sremska Mitrovica, Diocletian of Solin, Constantine the Great of Nis, Justinian of Carcin Grad. They mounted the Roman thrones as representatives of territories distinguished by an extraordinarily intensive cultural activity and economic prosperity. We find evidence of this throughout the country. The walls of the fortifications of that time, the foundations of palaces, temples, theatres, mosaics, sculptures make their appearance from day to day, and testify to the efflorescence of these regions.

But all this intensive life in the remote past was to be overshadowed by the Yugoslav cultural achievements in the Middle Ages. The Dalmatian ornaments, the reliefs on the Bosnian-Herzegovinian stecci (tombstones) and above all, the Serbian and Macedonian mural paintings, mark the triumph of a mature and advanced medieval culture which, as an integral part of the European heritage, is impressive by its originality and the strong imprint of its ethnical milieu. If the Gothic style marks the culmination of the art of that time in sculpture, the Serbian 13th century frescoes are certainly the highest achievement in the field of paintings. The refined and sure draughtsmanship, the rich and mellow colouring, and the constant warm human quality of these murals, made some people speak of a Renaissance on the Balkans which preceded that in Italy by a century or so. However such an affir-

mation is far from true. Studenica, Zica, Milesevo, Sopocani are no initial steps, but the mature fruits of the century-old activity of a people whose achievements culminate in these monuments. They were contributed to the treasury of civilisation by the feudal era as its most precious gems. The Italian Renaissance will be the herald of the next chapter in History. Architecture, particularly literature, developed parallel with the monumental Serbian paintings. This is not a case of exceptional giftedness of a period and a society for any particular branch of spiritual life; on the contrary, they have proved themselves consummate artists in all fields. Whether this is realised depends only on the interest and sympathies of the successive generations.

Brilliant rays of light often prevent us from noticing the warmth of hues and the unassuming beauty of other secondary features which ensure the entity of the main work. Therefore, the exclusive focussing of one's attention to mural paintings could easily lead to neglect and a superficial attitude as regards the architectural symphonies of the Serbian monasteries, the monumental medieval fortresses which seem an integral part of the surrounding landscapes, particularly the overwhelming beauty of the small objects in treasuries. How many icons, miniatures, fabrics, metal ornaments, carvings each of which represents a masterpiece in itself! On this occasion they can only be indicated as a numerous ensemble which gave birth to and is at the same time overshadowed by the genius of the main protagonist.

For the first time in history, the immense cultural heritage of the Yugoslav peoples is systematically studied, selected and classified today. Particularly important work is being done on its conservation. Although destroyed and plundered through the cen-

turies, during the numerous invasions of the national territory, it remained essentially indestructible. Its creators, the people, even uncouth warriors, knew to preserve and defend what was most important. Unfortunately they did not know or were unable to preserve it in the best condition. The prime task of the present generation is therefore to restore it.

What strange tricks fate played with some of these monuments! Imagine, for instance, that the windows and portals of Charters or Versailles had been built in, that new alien parts, say a minaret, had been added to the building, and that all had been covered by yet another thick coat of plaster which completely concealed even the minutest detail of the original reliefs and decorations. Imagine also that these barbarian acts were committed so long ago as to have fallen into oblivion. This is exactly what happened with St. Peter's Church near Novi Pazar (8th century), St. Sophia in Ohrid (9th-11th centuries), the Ljevinška Madonna in Prizren (15th century), and also partly with Studenica, the Pec Patriarchy, Diocletian's Palace in Split, and others. The Yugoslav conservation experts are performing genuine heroic feats in liberating these works of art from their stone veils. During the past two or three years alone, over a thousand square meters of old frescoes have been brought to daylight again, while the wonderful reliefs of the old styles again gladden the eye of the observer. If the medieval man believed in resurrection, this belief has been partially fulfilled in this case. His works are really coming to life again after many centuries of the mildew and darkness of the grave.

All these delicate and expensive works have been made possible only by the fact that the country's cultural heritage is at present the concern of the whole social community. We consider time as a link in the long and powerful chain of human life and progress.

—O:—

JOURNALISM FOR GIRLS

By SANTOSH KUMAR BANERJEE

JOURNALISM as a career is very much fascinating for anybody and specially for a girl. In these days of advanced civilization and culture journalism plays an important part in the daily life of an average man or woman. In Western countries journalists of different categories, such as Reporters, Sub-Editors, Editors, etc., have secured for themselves a high status in society. In our country also people are gradually realising the part played by journalists in educating the masses, building their national character and improving their general standard of living, and the degree of esteem and honour shown to them is consequently increasing. Up till now

very few educated girls have been attracted to the profession of journalism in our country where there is a great scope and possibility for their employment and better conditions of service. Recently Calcutta University has started a course in journalism which a girl student after her graduation can join. Of course, the best training which she can get is from a newspaper or a news agency office where working side by side with experienced journalists of long standing she can gather a fairly good knowledge, both in theory and practice, of the particular branch of journalism in which she is more interested.

To be a good journalist the first qualification needed is that a girl should have a good general knowledge with a background of some acquaintance with the social, political and economic developments of the countries of the world. She must have a fair knowledge of geography and history of her own country as well as those countries in particular which get "news prominence" in the pages of daily newspapers. She should not be affiliated to any political party or group as in that case there might be a possibility of the news items from her pen being influenced by her own thoughts and ideas and thereby lose the quality of independent and impartial news. Above all, she must be smart, tactful and courageous and must possess presence of mind and ready wit to face a difficult situation and can avail of a "news scoop."

In order to be a Reporter it will be to the advantage of a girl if she possesses knowledge in Stenography. If she has got a workable speed in English Short-hand and Typewriting she can somehow manage taking down important points of the proceedings of a meeting which she is required to attend, even if the proceedings are conducted in any other language than English, such as Bengali and Hindi, if of course she knows these languages. It will be comparatively easy for her to approach a leader or a prominent person and get an "exclusive interview" on behalf of a paper she represents as in modern society more courtesy is shown to a girl and naturally a girl reporter can get the advantage of it. She has an additional advantage of coming into closer contact with this leader or prominent person if she is a lady herself and the girl reporter can secure more news for the paper she represents. If she requires any detailed personal information about a particular leader, she being a lady can come in touch with a lady member of his family and can get material for writing an account of that gentleman's nature, habits, temperament, etc., which is not possible for a male reporter to gather so easily without causing annoyance and trouble to the leader himself.

In another branch of journalism, viz., sub-editing, a girl journalist's proficiency in the language of the newspaper will be of great help to her. Of course, in addition to this proficiency in the language of the particular newspaper to which she belongs, she must have a good knowledge in English, which is still occupying and will occupy, perhaps for many years to come, an international position of advantage. In a news agency or a newspaper office if she is engaged as a Sub-Editor under training, she has got to go through a large volume of press telegrams and news letters from correspondents. She needs patience to go through each one of them very carefully and minutely and insert the 'articles' or 'verbs' that are wanting and correct the

grammatical errors, if any, or re-write a particular portion if it lacks its full explanatory nature. If of course she is under training in the office of a weekly or monthly magazine her task is comparatively easy as she gets more time to go through the articles or stories of which she is expected to make preliminary editing before these are finally checked by the Editor. With the increased appreciation of readers of the newspaper or weekly or monthly magazine her work will also be appreciated more and more by the Editor. This will no doubt lead to her promotion in rank or increment in pay as a matter of course without much delay.

There is another independent field of journalism, viz. 'Freelance,' where a girl can secure a position for herself by her own industry, perseverance and originality. In this branch of journalism she has got to labour hard to improve her knowledge in different subjects and got to maintain her patience at the beginning of her career when she may find unexpectedly poor appreciation to her writings. However, her continued writings on a subject liked by her most, such as stories, articles, etc., will no doubt bring reward to her at not a very distant future. Besides the fame which she will attain as a writer will bring to her a great mental satisfaction and secure for her an honourable position in society.

Either as a Reporter or a Sub-Editor a girl will enjoy her profession of journalism more than any other profession because whatever passes through her in manuscript stage will ultimately appear in print and when she will read these herself she will feel a sense of satisfaction and contentment, which she cannot get in any other profession of life. This joy and satisfaction can be compared with that of a teacher or a professor when he finds his own student succeeding in life or that of a Director when he finds the artiste he coached doing very well on the stage or in the picture he has produced.

The emoluments at the beginning which a girl can expect to receive in this profession of journalism either as a Reporter or a Sub-Editor will in no way be less than the emoluments she can earn from any other profession. Besides, she has the great possibility of becoming one day an Editor of a weekly or monthly magazine or a daily newspaper, as the case may be, and thereby get fame and money all at a time, which she can never expect so quickly and easily in any other profession, provided she is honest in her labour and can keep her head high above party squabbles. Lastly the service she can render to the society and the country through this profession is not inconsiderable. Through her writings she can guide her countrymen, specially the youth, to the right path of attaining progress and prosperity to cope with the development of other free countries of the world.

AN ANALYSIS OF SALES-TAX

By M. MANIKYESWARA RAO, M.A.

THE Indian Taxation Enquiry Commission's Report has been recently released. While reading the detailed summary in newspapers I paused over the summary chapter on sales-tax.

These days sales-tax has come to be the mainstay of States' finances especially because of the inelasticity of other sources of revenue. It has well-developed in Part A and B States. Land revenue has paled into insignificance. With the abolition of Zamindari system agricultural income tax has gone down. States' excise duties are also becoming less important as the States are embarking on policies of prohibition. The States today shoulder many responsibilities for ameliorating the socio-economic conditions of the people with such poor finances. The States consequently found a good source of revenue in sales-tax.

Sales-tax falls into the tax jurisdiction of the States. Sales-tax in our Constitutional phraseology means a tax on sale or purchase of goods other than newspapers. Even the Government of India Act, 1935, assigned the taxes on sale of goods to the provinces but the sales-tax then corresponded to excise, a central subject. In view of the powers conferred on the provinces, the C.P. passed the sale of Motor Spirits and Lubricants Taxation Act 1938. The Central Government made a reference to the Federal Court which gave its opinion that the Act of the C.P. was not *ultra vires*. For the first time this decision opened up a new reliable source of revenue to the provinces. Gradually all the States imposed this tax.

Two varieties of sales-tax have come into existence; General Sales-tax and Selective Sales-tax. Selective sales-tax was first introduced in 1938 in C.P. But soon after general sales-tax came into vogue. This was divided into multi-point and single point sales-tax. Almost all the States now conform to either of these models. Single point and double point taxes were usually levied at high rates. In the multi-point system, the rate is relatively low and exemptions are few. Even the list of exemptions vary from State to State. Most States levy high rates on luxury goods. The schedule of these goods and the rates vary considerably. Thus there is an utter lack of uniformity in rates and exemptions. This has led to the necessity of all-India co-ordination. Certain States in their anxiety to tap more revenues interpreted the term 'sale' in various ways. Some of these measures involved taxation of raw materials and goods entering into inter-State trade more than once. Our Constitution says that the legislature of a State is prohibited from imposing or authorising the imposition of a tax on the sale or purchase of any goods where such a sale or purchase takes place in the course of

inter-State trade or commerce. This Article 286 with its sub-clauses opened the flood gates of controversy. The levies of sales-tax by certain States were questioned in Courts of Law. In two cases—The State of Bombay *vs.* The United Motors (India) Ltd., The Travancore-Cochin Government *vs.* The Cashewnuts Factory—the Supreme Court gave its judgment on 30th March, 1953, that in case of inter-State sales transactions only that State in which goods had been delivered for consumption had the power to such sales. The administrative complexities involved in such a judgment were seriously thought of by all States. To circumvent these difficulties various proposals were put forward of which the introduction of purchase tax was one. But nothing tangible resulted. Public attention was focussed on it. Suggestions ranged from enlarging its scope to its virtual abolition.

The Taxation Enquiry Commission having examined various views submitted their recommendations. It has been pointed out that the future of the system of sales taxation demanded decisions on major issues of policy. The States cannot do without sales-tax and the sales-tax cannot do without the Union. There is an insistent need to give a place to the Union in the system. The Commission lays the broad considerations of policy as basic for the future development of sales-tax as follows:

- (1) The power and responsibility of the State must end and those of the Union begin when the sales-tax of one State impinged administratively on the dealers and fiscally on the consumers of another State.
- (2) Inter-State trade should be the concern of the Union.
- (3) Sales of goods should be divided between those not in the course of inter-State trade and commerce and those in the course of such trade and commerce.
- (4) The Union's power of levy and control should be so exercised that there is no avoidable duplication and there is incentive for co-ordination between the States; subject to this each State should be free to evolve the system of sales-tax best suited to its conditions.

Inter-State trade becomes a subject of Central Legislation. The Commission points out the various legislative and administrative details and vests the Inter-State Council with recommendatory powers in matters that call for a clarification. For raising substantial revenues they recommend to the States a general sales-tax with a low rate and a multi-point system.

They admit that in the administration of sales-tax there is a constant need for exchange of information

AN ANALYSIS OF SALES-TAX

461

between one State and another. The Report says that the Inter-State Taxation Council (to be created) should undertake the task of introducing as much uniformity as possible in matters of sales-tax laws, regulation, procedure, exemptions, etc.

They say that with the growing importance of public finance in the national economy it is important to develop an integrated national approach to problems of taxation and of expenditure. For this purpose they recommend the setting up of an All-India Taxation Council. It is a correct appraisal of basic economic policy for any modern State. But it is not understood why the Commission rejected so easily the suggestion of centralising the sales-tax and distributing the proceeds between the States on an agreed basis. The grounds on which they reject the suggestion are: (1) The sales-tax has become an integral part of the States systems which would be dislocated if so important and flexible a source is taken away. They observe that centralisation is inconsistent with its elasticity. (2) They point out that there is an enormous difficulty in administering the tax from a central place.

These objections do not seem to be very serious. They suggest a system which by no means is less difficult. It would have been better had they recommended the centralisation of the tax. The Central Government can administer effectively inter-State and intra-State sales-tax by making a list of important commodities for such taxation. The tax should be a single point tax with varying rates, luxuries and semi-luxuries being taxed heavily and necessities lightly. The Central Department need not concern itself with all commodities. It is enough if they take into consideration only commodities of importance capable of yielding large revenues. This becomes almost a system of selective sales taxation. This eliminates all duplication of work, confusion of tax jurisdiction whether the sales of goods should be included in inter-State jurisdiction or not, imposition of the tax by the Central Government and delegation of powers of assessment and collection to States, etc. The collections of the tax can be distributed among States on an agreed formula keeping in view a national economy consistent with programmes for an even development of the country.

Superficially this suggestion hampers the revenue yielding capacity of the tax. As it has been suggested that the Central Sales-tax authority should concern itself only with selected commodities the States can be allowed to devise purchase taxation. This cautious blending of sale and purchase taxes put the States in good stead. Much care has to be bestowed to see that serious cases of double taxation do not arise and that this taxation does not impinge heavily upon poorer sections of the society. This proposal is pro-

ductive and eliminates tax evasion to a large extent. The Central Government can declare different sets of commodities as essential for different States. The Central Government may advise the State Governments with regard to levying of purchase tax on goods on which sales-tax has been levied by it. Thus a sort of selective sales-tax by the Central Government and a general purchase tax by the States would overcome many difficulties.

As the Commission says there is a good case for the creation of an Intelligence Section for maintenance of statistics, pattern of trade, consumption, etc., in the State and assist in checking evasion of the tax by getting the necessary information from railway authorities. This would be possible only under the Central Government.

From this analysis it follows that sales-tax would work well under Central Government. In formulating the general economic policy for the entire country they lay emphasis on a co-ordinated and an integrated approach and when it comes to a question of centralising sales-tax they emphatically refute it on the one hand and entrust the administration of inter-State sales-tax to the Central Government. Thus there is an air of artificiality about their refusal. The Commission points out that all the States are up against the tax being centralised. The Commission seems to be imbued with this peculiar complex that the States may have to lose their autonomy in fiscal affairs. India is a federation. The orthodox theory of federalism, "the rights of the Centre *versus* the rights of the States" has gone to winds. People like Wendell Wilkie emphasise upon the unitary and co-operative spirit of federalism. I very much agree with persons like Prof. R. N. Bhargava when they characterise present-day federations as co-operative federations. Our federation certainly conforms to the spirit of present-day theory of federalism. There is much truth in Prof. K. C. Wheare's statement that our State is a unitary State with subsidiary federal features. The proposition to centralise sales-tax is made not shutting the eyes to the currents of time, time that is craving for a thorough decentralisation of administrative set-up. This is suggested only to help foster a spirit of co-operation and endeavour to take a correct interpretation of State's autonomy in a federal set-up. The real significance of federalism is lost when co-operation finds no place in it. Administrative decentralisation there must be for the dispersal of democratic ideals but it can follow with a bit of centralisation in financial matters. No fears need be nursed that the State may become an "Hobbesian Leviathan." Instead this new pattern in fiscal relationships in a federation points out the possibility of plasticity of an orthodox concept of federalism.

AN ECONOMIC INCONGRUITY

By AROON KUMAR GHOSH

THE outstanding fact in the Indian economic situation today that strikes even a casual observer as most queer and baffling is that although the air is thick with talks about increase in production, the economic condition of the people does not show the least sign of improvement. The common man seems tottering under the burden of the mounting cost of living. Even by drawing upon his little fund of past savings, he finds it a tough job to make both ends meet. He hears a lot about the Five-Year Plan and the grandiose schemes undertaken by Government, but these big promises sound like empty stunts in his vacant ears as they do not give him any relief from the worries and anxieties of the morrow. There is no doubt about the fact that there has been a remarkable fall in the purchasing power of the people which accounts for the low effective demand resulting in slumpy condition in trade and business. The question, therefore naturally arises, if business outlook is dull, and there is low purchasing power while production has increased as is claimed by Government spokesmen, why the price-level is not showing a downward trend. On the other hand, if production index has registered a rise and the price-level is high, why there is business stagnation and unemployment. As Dr. John Mathai, Chairman of the Taxation Commission (Enquiry), posed the question on August 28, 1953:

"No period since the end of the war has presented economic trends so difficult to determine and to interpret as the past twelve months. Although the level of purchasing power and consequently the demand for goods is lower, and although industrial and agricultural production has not merely been maintained but has increased, the price movement is showing an upward trend. That rising prices and increased production would presume better employment, but instead unemployment was increasing."

Referring to prices the former Finance Minister said that if purchasing power was lower, it must be presumed that the effective demand for goods was weaker. But the estimated production of food-grains in 1952-53 showed a substantial increase. "If the demand is less, and the supply is greater, how does it happen that the prices of food-stuffs have risen?" It seems that the economic facet has presented a puzzling conundrum. How to solve this paradox of poverty in the midst of plenty?

THE DIAGNOSIS

There is no gainsaying the fact that the present situation is a legacy left by the war. During the war, the Government in order to meet the war-expenditure had to resort to excessive note-issue. This over-issue of currency inflated the credit structure in the market, and brought about an all-round inflation. In the aftermath of the War, Government took measures to

counter the inflation, and the situation to some extent improved. The present economic situation is, however, fundamentally different from the phenomenon experienced during the War. Due to the abnormal rise in effective demand caused by War expenditure and its multiplier effect, business recovered from the pre-War depression, and unemployment was greatly reduced. If inflation then was considered as a curse by the fixed income-groups, it also proved to be a boon as it gave jobs to all, and removed business stagnation. But the present economic situation shows different economic trends. Though the price-level shows no sign of falling and production is rising, business outlook is not at all bright, and there is unemployment. To look at the picture from the other angle, it would seem paradoxical that although the production is rising and there is fall in effective demand due to the weakening of the average purchasing power of the people, the consumer price-index shows no downward trend. The cause of the malady, therefore, should be sought elsewhere than in the fact of inflation brought about by the last War.

DEFICIT FINANCING AND PRICE BEHAVIOUR

Some people think that the present high level of prices is maintained by the policy of deficit financing pursued by the Government. Under certain circumstances deficit financing may boost up the price-level, but this is not always true. Let us briefly consider the effects of deficit financing on price behaviour.

Deficit financing literally means incurring expenditure in excess of income, the resulting deficit being met by borrowing. During the last Great War, Government indulged in deficit financing in order to meet inflated defence expenditure. Surplus budgeting, on the other hand, means restricting expenditure within the revenue in such wise that it leaves a surplus. The real sense in which these two terms are understood in Economic Science is, however, different. Deficit financing as an instrument of economic policy means levelling up of public expenditure so as to stop the gap in private spending (both on consumption and investment) which has caused a deficiency in effective demand resulting in business stagnation and unemployment. Similarly, surplus budgeting means framing the budget in such a way that the public expenditure is retrenched so as to remove an excess in private spending raising the effective demand above the optimum par, and leading to boom and inflation. The level of prices, income and employment in a particular community at a particular time shows the state of effective demand, and is a barometer of action for the Government. Thus we see that deficit financing may be resorted to by Government, temporarily to offset a depression, or permanently to compensate a deficiency in private

FODDER: THE HEADACHE OF THE DAY

403

spending on consumption and investment as a contra-cyclical fiscal policy. This latter policy is also known as the policy of pump-priming. Deficit financing may lead to a rise in prices if the funds spent on investment does not yield a proportionate return in the shape of higher production, and the time-lag involved in the process of production is long. If, on the other hand, the amount spent on capital formation quickly yields a rich harvest in the shape of higher production, income and employment and the time-lag is short, and no wastage occurs in the process, deficit financing does not prove inflationary. Where deficit financing brings about a rise in prices it proves that either the funds have not been properly utilised, or that there is bungling somewhere, or wastage occurs which has prevented the increase in production from materialising, thus frustrating the very purpose for which deficit financing was resorted to. Where deficit financing proves successful there may be a rise in prices in the short run due to time-lag, but in the long run such price fluctuations smoothen out.

In the implementation of the Five-Year Plan, the Government of India had to resort to deficit financing, and this may raise the price-level in the short run until the target of higher production is reached. This may, therefore, be considered as a contributory factor in maintaining the price-index at the present high level, but this is not the whole picture of the situation. Moreover, already agricultural and industrial production have been stepped up, and this might have the natural effect of reducing the price-

level, but the rise in price-level still persists with dwindling purchasing power of the people and mounting unemployment.

THE REAL CAUSE

The cause for the malady has, therefore, to be sought elsewhere. The real cause is to be found in the presence of anti-social elements which are thwarting the operation of the normal economic laws of demand and supply, and are creating conditions which make competition imperfect with a view to maintain their margin of super-profit. This evil is difficult to root out because it is inherent in the capitalist system and until the economic framework is changed, the trouble-shooters will continue to spread their tentacles so as to paralyse any attempt of the Government to ameliorate the condition of the masses. This is why many people are still pessimistic about the success of the Five-Year Plan or any plan whatsoever, within the capitalistic framework.

CONCLUSION

We may, therefore, conclude that the present high price-level and inflationary condition in spite of increase in agricultural and industrial production are partly due to the policy of deficit financing pursued by Government in the implementation of the Five-Year Plan, and partly due to the anti-social activities of racketeers and black-marketers, and unless Government takes an iron hand in the matter, the corruption and moral degeneration which are eating into the vitals of our body politic cannot be eradicated.

FODDER: THE HEADACHE OF THE DAY

By JYOTIRMOY RAY, M.A.,

Economic Research Section, Indian Central Jute Committee

THANKS to the Government of Pandit Nehru that our struggle at the food front has almost been brought to a successful termination. But every picture, however nice, has its two sides. Victory at the food front has simultaneously placed us face to face with the scarcity of fodder and in an agricultural country like India this is undoubtedly a serious problem.

Even a casual visitor in the village, particularly in the north-eastern region of India, must have noticed that thousands of cattle roaming on the scorched fields with their emaciated bodies searching for a mouthful of green grass in every possible and impossible corner. The first talk he may expect from an intelligent farmer is how to feed the bovine population—an indispensable partner to our agricultural economics. The writer of this article who is a student of village economics has often been accosted by his farmer friends as to the way of a gainful approach in this direction but alas he is no Messiah for them! What the writer has to say is incorporated in

this article with the hope that it may be of some use to his friends who have no direct access to him.

Mechanisation of agriculture is no reply to our query. For years to come India must adhere to labour-extensive ways of planning if she really desires to tackle her enormous and ever-increasing unemployed and under-employed resources. You can replace the cattle by tractors overnight only to your peril.

There is no denying the fact that these dumb millions were never well cared for in our land. Gandhiji, the Father of the Nation, characterised the Indian cow as a poem of pity. While distributing the prizes at the All-India Cattle Show held in Delhi in 1948, Pandit Nehru remarked that

"India is a strange country where people worship the cow, but nowhere is she so much neglected as in this country."

The partition of the country has farther aggravated the situation. With the influx of the unceasing streams of uprooted humanity from behind the borders, the already

existing food problem assumed a gigantic dimension. The "Grow More Food" campaign was launched without paying any heed to other considerations whatsoever. The result was as could be expected. Besides converting the fallows and the jungles to agricultural purposes, the long-standing practice of giving the fields rest at every alternate year was totally abandoned. The problem of fodder was never pressing so long there existed fallows, jungles and uncultivated plots. Again, if the withdrawal of these pastures could be counteracted by a proportional reduction in the number of cattle, it is obvious that the question of fodder would never be a headache as it is now. But in actual practice the contrary has happened. When a reduction in the bovine population was desirable, the number actually increased to cope with the vigorous exertions to produce more food and other cash crops. This was possible by the transfer of cattle from areas which now form Pakistan as well as by the lesser incidence of death as a result of the spread of general knowledge in veterinary science among the general public. Decrease in the intake of beef, etc., as human food has also some say in the matter.

Food crops, of course, supply a good quantity of dry fodder, but that is barely 50 per cent of our requirements. Assuming the average weight of a cattle to be 5 mds. (a not very unrealistic assumption) the food requirement per head comes to about 81lbs. of dry stuff per day. For hard-working and milch animals, an increased quantity is necessary. Let us now see if this required quantity is available from the dry fodder at our disposal. It has been estimated that India possesses about 215 million heads of cattle and she produces only 15,54,90,470 tons of dry fodder. An easy calculation will show that this provides only 4.4 lbs per capita thereby leaving a deficiency of about 45 per cent of this stuff alone. This deficiency must be covered by green grass if the maintenance of cow, etc., is to be made an economically sound proposition.

A good quantity of hay, etc., is used by the low income groups in the villages for making their dwellings and it is, therefore, desirable that a good substitute for the purpose should be found out and made available to the villages at a nominal cost so as to release the fodder for more essential purpose, namely, subsistence for our bovine population, who cannot be banished from our economics for generations to come. Though no accurate statistics is available, yet there are reasons to believe that straw etc., also forms an important item in the packing of our bottled industrial produces and other fragile objects. This quantity can easily be withdrawn without any hardship.

Again it is a known fact that more than 20% of our cattle are unserviceable and do no other good but consume a huge quantity of fodder in exchange of which they, of course, provide us with a certain amount of manure. In the interest of the efficiency of our farms these lives should be destroyed or deported to the inaccessible regions of the country thereby minimising the

burden on our too acute fodder problem. There should be no place of sentiments in economics. Moreover, the skins and bones can be more profitably utilised for other purposes.

The writer is far from advocating that the above measures are sufficient to solve our problem. What is necessary is that over and above all these, we must take active interest in the cultivation and propagation of green grass for our cattle as we are keen in producing more food for our increasing population.

Napier, Makai, Guinea, Barseem, etc., are the most common species of green fodder having quick-growing and heavy-yielding capabilities. They are nutritious too. In this country, however, Napier is the most well-known variety and its propagation is found to be encouraged by some enlightened State Governments including the Government of West Bengal. There is no reason why it should not be extensively grown by all and sundry once they are told of its importance and given demonstrations as to the actual process of its cultivation.

Assuming that it may be of some use to the readers of this journal, I may venture to lay down briefly the salient features in this respect. Vigorous-growing Napier is a perennial crop. It can be sown any time preferably excepting the winter days when its growth remains dormant. Monsoon months are ideal for sowing but it must be remembered that though extremely fond of water, Napier cannot stand water-logging. High alluvial or loamy soils are well suited for its purpose. Heavy manuring—about 80 mds. of cow-dung per bigha—in a well-pulverised soil is necessary to yield the maximum result. Plants grow as high as 10,12 feet and for fodder the first cutting can be obtained within 3 months of the sowing when the crop assumes a height of 3½ feet. One can expect 5 or 6 cuttings a year in a well-cared-for plot giving an yield of about 600 mds. per bigha.

It is, perhaps, known to all that Napier looks like sugarcane when matured in view of its having hard stem and prominent nodes and internodes. Its propagation is also like sugarcane done through stems cut into sets. It can, however, also be propagated by roots without any inconveniences whatsoever.

To reduce operational costs, it should be sown in rows so that the subsequent inter-cultures can be given with a simple hand-driven appliance called the wheel-hoe. Frequent inter-cultures benefit the plants abundantly. Every cutting should preferably be followed by hoeing, manuring and irrigation when possible. Raw cow-dung can also be used at this stage without causing any harm to the plants.

If the average body weight of a cow is about 5 mds. the per capita requirement of grass cannot then exceed 16 srs. a day. It is, therefore, obvious that per capita requirement of food is 144 mds. (16×30×12) for the whole year. Now if the average yield of Napier is 600 mds. per bigha, one can conveniently feed more

than 4 heads of cattle from a tiny patch of land comprising an area of 33 acres if only proper planning is done beforehand. As the sowing can be extended till October, a section of the idle labour forces—both human and cattle—at the end of jute harvesting and paddy (Aman) transplanting can be most profitably utilised for the purpose.

No sane man will disagree when it is told that

in the present economic set-up of India, Cattle is indispensable for our agricultural operations and there is hardly any indication to show that the situation will be otherwise in the near future. So it is high time that we should look earnest in the matter of improving the health and vitality of these dumb partners of ours. The slogan of the day should be not "Abolish Cow-slaughter" but "Improve our Cattle Wealth."

—O—

WAY BACK FROM DARJEELING

By A. N. SEN, M.A., B.Sc. (Glas.), M.I.E. (India)

DARJEELING district I have visited often enough but whenever I go to that side I make it a point to go to Darjeeling town and peep at Kanchanjanga if weather permits, and a short rest at the Mall in the hope of meeting old acquaintances follows as a matter of course. The conquest of Everest, which is invisible from here, and a reference to Tensing are yet interesting topics. I had been to Kurseong for a change and visited Darjeeling on the last day of my stay. I moved about a lot but rather early in the day and long before a bus was due to start I took a seat beside the driver for a comfortable journey down. But at the last moment, an Anglo-Indian girl asked me to give my seat to her. The tortuous journey would make her sick and a side seat would be handy for her. Although old myself, a sense of chivalry prompted me to move in. But the excuse was only a pretext. She carried on a lively conversation with another girl in the second row of seats—no sign of sickness. I purposely abstained from any conversation but when I heard that it was her father, who constructed the admirable railway line from Siliguri to Darjeeling through hard rocks and precarious slopes, I could not check myself. Could she only in her teens, have a father active in 1870, when the line was built? I blurted out that I had heard that same story at least twice before, as indeed I had. I hoped that this would put a stop to further wild talk. But I was mistaken. In two or three minutes I learned that she was preparing for Senior Cambridge at Bombay and that she devoted her spare time as an apprentice with the Salvation Army for the good of the country. In the long speech that followed, the word "Gentleman" escaped her and I came to the conclusion that she was doing her work well and had a good memory to repeat her usual lecture. I felt relieved, at Kurseong, when I got down at the foot of St. Mary's Hill.

St. Mary and Dowhill on the hills of Kurseong are very quiet but are close to Darjeeling. People

fond of company or society prefer Darjeeling, where in close residential quarters they flock during the two milder periods of the year, when heat scorches the plains. But I enjoy such delights only occasionally and prefer Kurseong where one may take a morning journey to Darjeeling and return by evening.

Tensing, conqueror of Everest

Kurseong is situated to the north of the level plains of Bengal. The south winds from the seas, after traversing 300 miles of flat terrain suddenly meet the rising hills here and moisture they contain condenses into water particles from the cold and falls as rain. The annual rainfall here is about 170 ins., which is rather heavy compared to Darjeeling's 126 ins. and Calcutta's 62 ins. A similar situation at Cherapunji in Assam with abrupt higher hills nearer to the sea gives the place the highest rainfall in the world—over 400 ins. The regular South wind from the sea during the summer months is one of the precious gifts of nature to Bengal, which in the plains, as in Calcutta is very pleasant towards the evenings. Water takes longer to heat (than land) when cold and longer to cool when once heated. During the day the

air in contact with the earth gets heated by sun's rays, becomes lighter and flows upwards. This occurs more slowly over water than over land. So the comparatively cooler air from the sea moves towards the land by the afternoon to take the place of the air moving upwards there in large quantities. It is evident that during early mornings, the contrary happens and cold air flows from the land towards the sea.

The city of Darjeeling, Kanchanjanga in the background

One hundred years ago, the whole region on this side was a vast wild. Darjeeling area with a portion of the plains belongs to the Raja of Sikkim. The site of Darjeeling was first sighted by General Lloyd in 1828 during an expedition to settle differences between Nepal and Sikkim. For decades there had been invasions by Nepal Gurkhas reaching as far as Sikkim and Darjeeling areas and culminating in war with the East India Company in 1814. The Company restored the territory to the Raja of Sikkim, all under the paramountcy of the Company. Lloyd and Grant had been urging Government to start a sanatorium and established a military outpost at Darjeeling. In 1834, the Raja again received help to counter a Lepcha inroad into Sikkim. This was followed by a deed of gift of the region between Darjeeling and Siliguri, against a yearly tribute of Rs. 3,000, subsequently raised to Rs. 6,000 (to save face!). Dr. Campbell, the British Resident in Nepal, was transferred to Darjeeling as Superintendent in 1839. He developed the district by opening out roads including the military road from Pankhabari to Kurseong and on to Darjeeling over the Sinchal hills between 1839 and 1842. He established law and order in the then lawless country. There were only 100 inhabitants in Darjeeling but in ten years the number swelled to over 10,000, as refugees crowded into the place from Nepal, Sikkim and Bhutan, when slavery was prevalent. Then the rise slowed down; by 1869, there were 22,000 souls.

The vast tea industry is based on Campbell's

experiments with acclimatised China stock from Assam. Twenty years later, one of his plants had developed to 20 ft. high and 50 ft. girth. The tea industry was established commercially by the year 1856 and drew individual Europeans. In 1861, for convenient transport, the old military road to the hills being narrow and steep the ingenious cart road was hewed out of the rocks. The Ganges-Siliguri Road was also constructed by 1866. So long it involved a long tedious journey in boats, horses, palanquins bullock carts, etc. The railway was built in 1881. The tea industry grew by leaps and bounds; there were 38 gardens in 1865, which increased to 170 by 1900. At first it had to be kept in check to prevent reckless deforestation. It is today restricted owing to over-production. With the introduction of machinery and large demand of timber for packing and fuel, there was a great influx of labourers, mechanics, and the population grew enormously, fully two-thirds being employed in tea. There was general economic development but the expansion necessitated Company management, individual purses being insufficient. Only small unpretentious concerns under Indian management started later nearer the malarious plains.

Zigzag railway, Darjeeling

So, Dr. Campbell had not experimented in vain. Cinchona experimental plantations were started in 1864 at Mangpu, east of the Sinchal hills. Since quinine was indispensable and foreign products were costly, it was continued as a Government concern, although it was not lucrative. Coffee, tobacco, rubber, camphor have also been tried and abandoned.

There was trouble in 1850. Dr. Campbell was held in detention in Sikkim but was soon restored after a punitive expedition. Full administration of the area up to Sikkim Doars was taken over by the Company. Difficulties however arose again but were finally settled in 1860 on the Sikkim side. But in the early sixties, inroads from Bhutan started another war and resulted in annexation of Kalimpong and adjacent hills and Doars in the plains.

Darjeeling has always been a part of Bengal, though for 6 years of the Bengal Partition, Darjeeling was tagged to Bhagalpur Division, Rajshahi Division had been made a part of East Bengal and Assam. Bihar had no separate existence as a Province any time before 1912. It has always been the summer resort of high officials and pleasure and health seekers.

A looper in the Darjeeling-Himalayan Railway

A school for girls, St. Mary's College and an Industrial School for boys were started at Kurseong in 1889. Much earlier in 1846, the Loretto Convent at Darjeeling, the first missionary institution there and a seminary were established but the living and lodging conditions there were so severe that it is said that a lady committed suicide. The St. Paul's School at Calcutta, after many vicissitudes had been transferred by Government in 1861 to Darjeeling for the education of the children of Government servants. The Dowhill School was started in 1879 by Government also for the same purpose at Kurseong. For education in a suitable climate on the lines of the English schools, many well-to-do people now-a-days send their children to the schools here. Near about Kurseong, catering for over 600 boarders and day-scholars there are the Dowhill, Victoria, St. Helen's and Goethal schools of a high standard.

The history of missionary activities in this area practically started in 1879, when Dr. Goethal, Archbishop of Calcutta, purchased Woodcot, not far from Kurseong from a planter and gave it over for the use of sick and tired missionaries. It was occupied in 1884. Loretto Convent at Darjeeling, as already stated was started in 1846. On the question of jurisdiction, whether Bengal or Bihar should control activities, further expansion was held over for long years, in spite of individual enterprises for promoting education. At the time, visitors from Calcutta (1861) were urging Government to open a sanatorium and a college at Darjeeling ("remarkable for its strange beauties"). The Roman Catholic Fathers were also urging higher authorities to get the mission under the Calcutta Archbishopric. Administration of Darjeeling

District was transferred from Bihar to Bengal in 1881. St. Joseph's Seminar was taken over after acquiescence of authorities from the Capuchins (a Roman Catholic Order) of Patna in 1886 and is now widely known as "North-Point."

In the year 1887 the Maharaja of Burdwan, in need of money, sold 117 acres of land near Kurseong for Rs. 3600 to the Roman Catholic Fathers. It was not a bad bargain. It stands on an incomparable site known as St. Mary's Hill in a building which has been added to from time to time; the extension of central and two side wings were undertaken for much needed expansion as well as a measure of protection from earthquakes. The fine Grotto close to the College begun in 1897, was finished in 1924 with great care under difficulties. The mansion Woodcot has also kept pace with the improvements of the College. The College may be said to have started in 1889 when the scholastics from Asansol were transferred to this cooler place.

Farmhouse attached to St. Mary's College

The College number about 100 teachers and students in all. They come from Bombay, Madras and other different States in India, as well as from foreign countries, having severed all connections with their homes. They do not like to discuss their previous history on principle. They are graduates of Indian, European and American Universities in various subjects: literature, philosophy, science, mathematics, etc. All have undergone after leaving their homes, at least ten years of training, before starting the Divinity course which lasts for four years here. After ordination, they become priests and begin educational and religious work. If necessary, these graduates are sent to various places for even further studies. In this way the scholars are specialised in different subjects. After ordination, they go out to Calcutta side (St. Xavier's College, for example), to Patna, Ranchi, Madras (Loyala College), Trichinopoly and many other places. By 1939, 587 left the college as teachers' priests and missionaries, of whom 275 were in Bengal

and Ranchi, 169 in Madras and the rest distributed throughout India. The incomparable library of the place, containing mainly the sacred books of all religions for study, has a varied collection, including complete works of Rabindranath, Bankimchandra, Saratchandra and other writers in Bengali and covers the various subjects of philosophy, science, history, mathematics, geography, etc. There were 20,000 volumes in the library in 1939 and the present figure is 48,000, the yearly addition being roughly about 1,500.

St. Mary's College, Kurseong

The farm connected with the institution is wonderful. About 50 cows, 100 pigs and 200 fowls are well-lodged, cleanly kept and well fed. Some foreign cows give as much as 20 to 25 seers of milk per day. They live in a spacious shed and the maintenance cost is Rs. 3 per head. Fowls of selected breeds are kept segregated within separate enclosures with open grounds. The eggs are bigger than ducks' eggs. In spite of their dirty habits, the pigs are cleanly kept. In adjoining grounds, various vegetables are extensively grown. The produce is utilised in the kitchen of the Institution and any excess is accessible to the public. All these are under the whole-hearted superintendence of Brother Smidth, a hard-working, experienced Brother, who left his home in Tito's country, 27 years ago.

The social work for improving the standard of living of the local people excites admiration. The old Doctor Brother Buysse would be often seen tramping down the hillsides at dead of night to succour needy people. Patients flock from distant parts, including Darjeeling to consult him. He left his home in Belgium over 50 years ago. He is known in the bazaar as the great man of St. Mary's. The maintenances of the establishment, such as building new structures or repairing the old and the running of the institution are all carried on by the members themselves with occasional engagement of local people. The example of simple life and sense of dignity of

labour, ought to be an eye-opener in this country. Beyond various kinds of help the Fathers are rendering, their work is aimed at raising the standard of life. If one or two are converted to Christianity in this connection there is nothing to grudge in this land of neglected humanity, handicapped by caste restrictions. The Hindu Gita recognises all religions as paths for salvation as opposed to forcible conversions which were often accompanied by unspeakable horrors in olden times. After all, the record is rather poor. The first Baptism of two took place at Kurseong in 1876 and by 1905, 200; by 1932, 300 altogether were converted. For the background of the education and culture derived from this source, we should be grateful. There is no fear of missionary first, trade next, followed by occupation and exploitation. Was there not, in no very distant past, mass conversions in East Bengal and Southern India through the influence of the ruling power? This was easy owing to suppression of humanity from a Brahmin superiority complex. Yet the conversions did not produce complete social equality as was professed. But the present village squabbles and communalism and trek towards towns owing to partition are inevitably levelling the social inequality.

Poultry reared in the farmhouse

As an institution of Missionaries vowed to poverty and celibacy, women are not allowed inside the compound of the college, except the family of highest officials, e.g., the Governor. After many years our present Governor's wife paid a visit to the institution last year.

For me it was a problem to distinguish between Fathers and Brothers for a long time, though it was evident that Brothers were not sons of Fathers. Now it has been clear that Brothers undertake all kinds of secular work in running the institution, while Fathers study and preach on the religious side. To obey superiors without question, obedience is a cardinal principle of the Roman Catholic Church. The Pope

of Rome is the supreme Head, the representation of God on earth. Matters are not decided by democratic vote in religion but there is ample scope for expression of honest opinion. If Jesus Christ had to take votes for religious tenets, there would have been no Christianity, which would have been a calamity for the world.

T. B. Sanatorium, Kurseong

As to the industrial school, various attempts had only been preparing the ground, which Father Wery as Parish Priest of St. Mary's gave a practical shape in 1932. During an official inspection about 20 years ago, the writer visited a tailoring class of Father Wery in a room in St. Alphonsus' Primary School, below the college, opened in 1905. Father is an old enthusiastic worker in whose hands with the help of Brother Robin, the huge establishment of the St. Alphonsus' (1937) Industrial School and High School has grown up, year by year on the site of the old Clarendon Hotel, where, earlier in life, the writer had stayed for a while. It was through Father Wery that he settled here and became known intimately to the Fathers and Brothers, for which he is ever grateful.

Parish work at St. Mary's consists of looking after the welfare of the local Catholics, over and above running an Orphanage School. After the removal of St. Alphonsus School to the town of Kurseong a primary school continued under the name of St. John's School. Originally looked after by Fathers of the college the combined work became too heavy and Father Wery was succeeded by other Fathers, Henrichs, Daly and Farrell, the present incumbent. The writer is a next door neighbour and is indebted to all of them for their kindness.

The famous T.B. Sanatorium at Kurseong was started by Sri S. B. Dey on the hills over the railway station in 1937 with his large contributions in land and buildings. In 1942, Government granted further land for extension of the institution at a nominal revenue and up to 1951 donated over 5 lakhs of rupees for further expansion. The total amount spent was over 9 lakhs, the balance being secured from the public. To the original 20 beds and subsequent additions in cottages, 111 more were available in a new

commodious building. At present there are 172 beds and the long waiting lists show that many more are in demand. Some beds are maintained by public bodies and others by the Sanatorium including 25 free beds, at the instance of the Government, for the poor local patients, who are specially liable to T.B. There are also 7 more free beds and 15 half-free beds; besides help of various kinds is given to sufferers. The patients come mostly from Darjeeling and Jalpaiguri districts and some from Calcutta. Provinces outside Bengal also send patients. About 300 patients are treated yearly under the competent and undivided attention of Dr. Guha and each patient lives on the premises for 9 months on the average. About 90 per cent fully recover now and the percentage is rising. Most gratefully the patients leave with a new lease of life. Even in this healthy station, fresh and strengthening diet is essential and so the overall expenditure per patient reaches nearly Rs. 100 to Rs. 275 per month. The usefulness of the institution and the necessity of enlarging it should be realised by all, as we constantly hear of the extending inroads of the fell disease.

The Kurseong Industrial School

My friend the late Kiron Shankar Roy was instrumental in starting this institution. I remember an incident in the early years of his life, when he, after referring to the friendship of our two families for three generations, claimed my vote in the Council elections. Shouts of "vote for Kass Roy" from a crowded lorry still ring in my ears.

From Kurseong, we get a good view of the plains, of which the main feature is the Teesta valley. The Teesta starts from Kanchanjangha and flows for over 100 miles through Tibet and Sikkim and then along the boundary of the latter. The little Rangit river, as can be seen from Darjeeling to the West and North, turns round and falls into the great Rangit, north of Darjeeling. The combined waters then run into the Teesta between Darjeeling and Kalimpong, almost east of Darjeeling, on its way south to the plains. The last gorge 300 ft. broad at the Coronation

bridge at Sevoke widens to 800 ft. within 700 yards at the new Sevoke bridge and to 4500 ft. or 6 times within a mile from the bridge. The Teesta then divides into several streams and flows south-east to the distant Brahmaputra by Jalpaiguri.

Flood in Cooch-Bihar

The name Teesta is derived from *trishna* (thirst) or from *trisrota* (three streams). While a mythological story that it was brought down from the Himalayas by Mahadeva, as was the Bhagirathi or Ganges, to quench the thirst of a demon, one of his favourites, fighting with Parvati, is based on the former, the actual course points to the latter. In no distant past, this wide river was frequented in its lower reaches by trading and pleasure boats, when its banks were thriving. Bankim's *Devī Choudhurani* gives some idea of the past prosperity.

There is a railway station called Mahanadi about five miles to the east of Kurseong. The Mahanadi river rises close to this place but instead of running towards the Teesta nearby, to the east, turns west and flows between the new and old stations of Siliguri. It meets the Balasan river a little to the south and west of the situation. From Kurseong is seen the Balasan river before it falls into Mahanadi, running its circuitous course and separating Kurseong and its western hills, just as the Mechi river on the other side of those hills separate Bengal from Nepal. The Mechi also meets the Mahanadi further south above Kishengunge referred to later. Known as Mahananda, it flows by Maldah and falls into the Ganges near Godagari, almost opposite to the source of Bhagirathi as it flows past Murshidabad, Navadwip and Calcutta to the sea.

After spending the night at Kurseong, it was convenient for me to take lunch at the Station and to wait for the afternoon train. Most unexpectedly there arrived my old friend, Mr. Sudhir Sen of Messrs. Sen-Raleigh & Co., and his talented wife

with two foreign experts for a short visit to Darjeeling for a glimpse of the snows. They also took their lunch and proceeded upwards. And downwards by the long tortuous railway line along the hill-side I duly reached the new Siliguri Station at dusk. The first journey on this line is most fascinating for a visitor. The waterfall known as Paglajhora excites admiration amongst the varied scenery all along the way. Although eternally in a state of repairs, owing to constant landslides during the rains, the road is wonderful with several loops and zigzags, by which considerable amounts of altitudes are negotiated. There is a story that the Engineer in charge of first laying down the line was in despair at a certain point, when he could not proceed further. His wife rather pleasantly said, "why not go back" and this gave him the idea of zigzag. After the glorious snows at Darjeeling these somewhat lose their charm.

Before the Partition of Bengal, three narrow (2 feet between line) and one broad (5 ft. 4 ins.) railway lines terminated at Siliguri. The narrow lines

Sri Jawaharlal Nehru and Dr. Bidhan Chandra Roy discussing Cooch-Bihar flood

were from Darjeeling, from Kalimpong bridge and from Kishengunge (where the former Oudh and Tirhoot line terminated). The other ran straight from Calcutta through present Pakistan. There was also another line, the Bengal Doars Railway (constructed in 1902) of intermediate width (1 metre, nearly 40 ins.) from the east up to Bagrakot within 22 miles from Siliguri, the river Teesta obstructing junction with Siliguri. From the necessity of becoming independent of Pakistan, consequent on the sudden partition of Bengal and for direct connection between two parts of West Bengal and also with Assam, the present Assam Link (metre line throughout) was constructed in a record time of 2 years replacing the narrow line from Kishengunge to Siliguri and filling up the gaps

for a direct route to Assam. It was projected towards innumerable streams descending from high hills on the end of 1947. Construction started in 1948 and one side of the line, (ii) Geological formation of hills trains ran by 1950. It may be noted that the narrow —the fragility of the hills on one side of these hills.

New Assam Link. North Bengal under flood

line to Darjeeling remained as it was and a metre line replaced the old broad line of 25 miles to Jalpaiguri and extended 13 miles to Haldibari on the Pakistan border near Parbatipur. Formerly the route from Bengal to Assam was through Parbatipur and Lalmonirhat and branch lines ran north from Lalmonirhat. One such terminated on one side at Bagrakot already mentioned, near the Teesta, and on the other side at Madarihat on the Torsa (another difficult river for bridging) from Tibet through the Bhutan hills after its 160 miles course. Another branch went through Cooch-Bihar and Alipur Doars to beyond Hashimara. The steep banks of the Teesta, narrow inside the hills, and suddenly widening in the plains made the construction of a bridge difficult. Difficulties and dangers to which the Assam Link Railway Mahanadi to Sevoke and 8 miles from Sevoke (Teesta is susceptible are: (i) Periodical breaches caused by bridge) to Bagrakot as well as 5 miles from Madarihat

The Tista river

Difficulties and dangers to which the Assam Link Railway Mahanadi to Sevoke and 8 miles from Sevoke (Teesta is susceptible are: (i) Periodical breaches caused by bridge) to Bagrakot as well as 5 miles from Madarihat

(Torsa bridge) to Hashimara had to be made to complete the line, which is unique in that within a few miles of most of the line at an elevation of about 400 ft., the lower ranges of the Himalayas rise to 8 to 10 thousand feet high.

The area, 60 miles long and 20 miles broad between Teesta and Torsa at the foot of the hills is known as the Bengal or Western Doars, thriving in tea industry. Owing to the difficulty of access, it is not widely known in Lower Bengal. In this area lies the famous educational centre of Cooch-Bihar, the sphere of activity of Professor Brojendra Seal; a place where poor, but eager and meritorious students used to flock for a rather inexpensive higher education.

The population of Siliguri (784 in 1901) numbered 20000 in 1948 and rose to 45000 by 1950. At present it is much higher, the place expanding in various activities.

Among passengers from different directions, i.e., Darjeeling, Assam, Bihar, North and West Bengal, I entrained at Siliguri for Moniharighat. Though my seat was reserved, newcomers without reservation had to be accommodated by negotiation (according to our highest authorities) although after some altercation, at the price of some unwilling self-sacrifice. In the course of the conversation it was soon known that we were all refugees from East Bengal and this aroused considerable sympathy. As the conversation went on, we learnt that not only were we co-villagers but were also relatives. Dispersions from our original homes had made us complete strangers. Now followed an welcome seat distribution at willing self-sacrifice because realisation of relationship endears one creating a desire to please and be pleased. I have had similar experience at least twice in my life when as an official I had to do much travelling. Perhaps, I was over-insistent on my rights in resisting encroachment.

Due West, Bagdogra, the famous airport of North Bengal, was reached after 7 miles and Naxalbari after another 7. This is within a mile of the Nepal border. The line then turns south and after 14 miles

passes Galgalia, less than 2 miles from Nepal and after a slight bulge to the east reaches Thakurgaon. 7 miles to the south-west. Here the line runs parallel to and inside the boundary of Bihar, now subject to a controversy. Mount Everest is visible from here. Had it been clear and daylight I would have attempted a peep. A branch of the Tagore family is said to have once settled here, whence the name. The place, on a plateau, overlooks Mahanadi in the south. The dense Nepal forests are on the west and the *terai* starts from the north. Thirty-one miles to the south-west lies Kishengunge where as already stated, the O. T. Railway terminated. Now all is the same railway. Barsoi junction lies 35 miles below. In pre-partition days the railway connection with Assam, of Central Bengal lay east from Barsoi, 33 miles inside Bengal, through Dinajpur, Parbatipur, Rangpur and Lalmonirhat.

We reached Moniharighat early in the morning. The actual crossing of the Ganges in the steamer takes less than an hour but the transshipment of the mails, goods, etc., involves four hours. This delay forcibly reminds one of the former overnight journey from Calcutta to Siliguri. The steamer was rather crowded but offered a chance for a good wash and tea. After crossing, a fellow passenger, to whom another was complaining of the delay, very aptly expressed surprise at his eagerness to taste the smoke and heat of Calcutta, instead of the pure air of the Ganges. As, many passengers were bathing in the Ganges, I also had a dip. While not exactly admitting the efficacy of the Ganga bath, I felt much refreshed after the crowded night travel.

Almost along the route taken by Mir Kasim, the last of Bengal Nawabs to leave Marshidabad, we reached Bolpur by 1 P.M. My relation there, previously informed, treated me to a sumptuous meal and once more I paid a visit to Santiniketan to offer my homage to the world poet Rabindranath's place. The evening train brought me to Calcutta and nothing special happened in this familiar journey.

KUMARI CHANDRALEKHA AND HER ART

By HARINDRANATH CHATTOPADHYAYA

A new star has arisen on the horizon of South Indian Classical Dance. Kumari Chandralekha, in the course of a few years, has suddenly leaped into fame and is already considered one of the few fine dancers who possess an enviable mastery over some of the most intricate numbers of Bharata Natyam. And the credit is the greater since, while she does not belong to the South she has yet so steeped herself in its culture and its art, that it is difficult, both in her daily life as well as on the stage, to believe that she was not born and brought up in the South and its great traditions.

A rare personality, vivacious and brimming over with grace, she combines high culture with remarkable modesty which have won the hearts of thousands of admirers and well-wishers not only in her own country, but in countries outside India. Besides being an outstanding danseuse, destined for greater and greater achievements with time and continued work, she is a serious student of literature, law and politics, a fine hostess and brilliant conversationalist. But her chief interest in life is the dance which she considers most urgent in the life of the nation. She believes in using her art in the service of her people and dreams of working new creations out of old traditions, dances touching the life and problems of the people and interpreting them. During her tour in China, hardly a year and a half ago, she danced the theme of War and Peace, an item which won great applause from Chinese audiences and which still lingers in their memories. She won a prize two years ago at the International Dance Competition held in Berlin at which a hundred and four countries competed: and her art brought her encomiums from thousands of people in the Soviet Union including artists, painters, musicians and dancers. She received a beautiful gift of old Uzbek jewellery from no less a dancer than the world-famous Tamara Khanoum, in appreciation of her rare art.

Kumari Chandralekha danced at the Rashtrapati Bhavan recently. It was a performance at which the elite of Delhi were present, including the President himself, the Vice-President, the Prime Minister and other high officials of the State. Both her *guru*, Ellappa Pillai, and herself received great praise and appreciation as also medals from the President.

In Kumari Chandralekha's art we see a great tradition at work in its purest form; at no point of her dance do we find any attempt at mixing it with lesser forms in order to make it popular—an unfortunate habit which one finds creeping into the dances of several fine artists who hardly realise the damage they thereby do to classical tradition.

What Chandralekha has already achieved is unique achievement, thanks to her own genius and hard work, as well as to the meticulous training which she has

been undergoing under the guidance and care of her *guru*, Sri Ellappa Pillai of Conjeevaram, who hails from a family of well-known Tanjore *Nattuvannars*. Ellappa's *guru* was the famous Kandappan, Balasaraswati's *guru*; unfortunately, he died early in life, but fortunately for him, he has left behind him at

A dancing pose of Chandralekha
Photo: Yash Pal Khanna

least two worthy exponents of his art: Balasaraswati and Ellappa Pillai who, in turn, are doing their best to preserve it through younger artists like Chandralekha who promise to fulfil the ambition of their respective *gurus*. Yet, it is not every day that one comes across genius which is again different from talent. Talent may achieve what the average cannot achieve; while genius achieves what talent cannot. And it is obvious that Chandralekha must be classed in the latter category.

There is a difference in style between the Pandanallur school and the Kandappan. The former is represented by Rukmini Devi and Shanta Rao and the latter by Balasaraswati and Chandralekha. In the

former we see broad movements and severe sculptural poses; while in the latter there is intricate footwork

Another dancing pose of Chandralekha

Photo: Yash Pal Khanna

and rhythm-pattern combined with breath-taking tempo. Both these styles, however, occupy their

distinctive places in the great art of Bharata Natyam.

Chandralekha's repertoire is rich and varied; she dances Alarippu in more than one rhythm, several Varnams, Tillanas . . . Natanam Adimar is one of her most successful and breath-taking numbers. Padams in Telugu, Tamil and Canarese are rendered by her with grace born of individuality. But her greatest numbers are Useni Swarajati Varnam and Tana Varnam which she renders with almost enviable mastery.

Useni Swarajati Varnam was first danced at the court of the Chola Kings in the ancient Tanjore style, since when it had been lost and forgotten. It was revived by Sri Ellappa Pillai and taught to Kumari Chandralekha who danced it a few months ago in Madras, before a large and distinguished audience of artists and critics, including Musiri Subramania Ayyer, E. Krishna Iyer and Balasaraswati who gave her unstinted praise and blessings.

Useni Varnam is a long and intricate dance-number. All told, it covers about two hours and covers, as well, the seven difficult *talams* of Carnatic music, which, with lightning speed, change from one to another with the quality almost of a spiritual feat! One such number is enough to establish any dancer in the realm of the classical dance, and there is no doubt left in the minds of those who had the privilege of seeing Chandralekha rendering it, that she is already a danseuse who has to her credit great achievement and a great future.

—O—

SULPHUR SPRINGS OF VAJRESWARI

By ANTHONY ELENJIMITTAM

MINERAL waters, thermal springs, spas and geysers of Europe, America, New Zealand, Japan, Tibet, India and other countries are of vital interest for geologists, hydrotherapists and millions of patients suffering from rheumatism, arthritis, synovitis, gout, high blood pressure, skin diseases and very many other ailments. Volcanic regions like Japan, New Zealand and Italy abound in mineral springs, hot and cold. Thermal springs are found not only in volcanic and mountainous regions, but also in icy cold regions like Iceland, Tibet and the snow-capped Pyrenees, Alps and the Himalayas.

The most cosmopolitan thermal spring in the world today is Karlsbad, a city located 116 miles north-west of Prague in Czechoslovakia where over 1,000 doctors go to study and practise balneotherapy every year, and millions of patients throng to receive water treatment for various rheumatic, muscular, cutaneous and nervous affections. When Emperor Karl of Austria visited those hot springs, some 200

years ago, it was a negligible village of about 200 persons. But today this classical hydrotherapeutic centre has a floating population of half a million, and permanent population of about 30,000. Pistani spring is the second best in Czechoslovakia.

Although today the word "Spa" is used for any hot mineral spring where treatment for diseases is carried out, the original "Spa" is situated in Belgium, in Leige Province. The French, the Italians, the British and the Americans so fully developed their mineral water resources that they usurped the name of "Spa" to their own watering centres. Today "Spa" means any hot mineral spring used for treatment.

India's mineral spring resources, compared to her big size and also compared to most other countries, are poor. On the Indo-Tibetan border, in the Punjab and Sind, in Gujarat and Maharashtra are found hot mineral springs. But India's No. 1 mineral spring for therapeutic use is the two groups of sulphur springs at Vajreswari which is destined to become something

SULPHUR SPRINGS OF VAJRESWARI

like the Karlsbad of India. This superb mineral spring resource in Maharashtra, lies at a distance of about fifty-three miles north-east of Bombay city, about seventeen miles east of Bassein Road Station on the B.B. & C.I. Railway and twenty-seven miles north of Thana on the Central Railway. From Bassein Road or from Thana one can reach Vajreswari by Bombay State Transport bus. All those who cannot afford the luxury of a private motor car or taxi avail themselves of the bus service to reach Vajreswari. Literally thousands of visitors, sick people, tourists and holidayers throng to Vajreswari at the week-ends and holidays.

Sulphur springs in front of the Vajreswari Temple

BATHING TANKS

Vajreswari sulphur springs are situated inside or on the banks of the river Tansa which winds round from the Tansa Lake at Vaitarna. If Tansa Lake is the reservoir for Bombay and its suburbs for drinking water, then Vajreswari sulphur springs inside Tansa river is the hydrotherapeutic healing centre for the whole Bombay State,—nay, for the whole Indian sub-continent, as there are patients coming from distant U.P., Madras, Bengal and other parts of India to undergo water treatment there.

There are eighteen hot springs in the area, eight of which are at Vajreswari proper, and the other ten at Ganespuri, which is only two miles west of Vajreswari. The hot springs, slow-winding Tansa river and the picturesque hillocks and jungles all around make the villages of Vajreswari, Akloli, Ganespuri and Vajrakund, a nice little holiday resort, a first class Spa and also a place of pilgrimage for devotees. Tansa river is almost dried up in the area of the springs, except during the monsoon when its shallow water begins to swell drowning all the twelve springs in its ravaging rush. During the rainy season only the six springs near the river banks are used for bathing.

The chief bathing tanks are the two large pools in front of the Siva Temples at Vajrakund and Ganespuri, the *Surya-kund*, *Chandra-kund* and *Subhas-kund*, at Vajreswari, and the two large ponds formed

Bathing in Puspa Kund

by the gushing hot waters of the *Agni-kund* on a raised plot of ground, inside the Tansa river, near Ganespuri. The rich and the poor, the sick and the healthy, Indians and foreigners, the young and the old sit around these tanks to bathe. Only the tanks in front of the temples are large enough for about sixty persons to get in and bathe at the same time, as the temple tanks are about 30 feet long and 15 feet wide and 3 feet deep. There are two partition walls of the tank which keeps the same water of the same spring at three different temperatures, the hottest pool

Large temple tanks

in the temple tank being about 110 deg. F, the second tub at 107 deg. F. and the third at 99 deg. F. *Agni-kund* which is the hottest of all the Ganespuri group of springs is 142 deg. F. at the surface, while its temperature at the immersion point is 150 deg. F. It is so hot that one cannot keep his hands for more than a few seconds inside.

The temperature of the springs varies from day to day and from season to season, as also the quantity of the water they give out. The thermal springs range

from the lowest temperature of 98 deg. F. in *Subhas-kund* to 126 deg. F. in the *Surya-kund* and 146 deg. F. in the *Agni-kund*. Some of the springs give out one gallon of water per minute, while some others give out fifteen to twenty-five gallons of water per minute. The Geological Survey of India on February 7, 1955, estimated that the *Agni-kund*, the hottest among the springs, give out 15 to 20 gallons of water per minute.

Tansa River at the Vajreswari sulphur springs

and that its temperature at the point of immersion, on that particular day, was 140 deg. F. *Surya-kund* which is the second hottest in the group gives out over 10 gallons of water per minute. But both the quantity of water and the temperature are both variable according to atmospheric and lithospheric conditions.

CHEMICAL ANALYSIS

The curative power of the Vajreswari springs, as, indeed, of all mineral springs throughout the world, is derived from its radioactivity, its mineral salt contents and high temperature. German scientists have conclusively proved that the source of all thermal springs could be traced to 15 miles down the earth which has a crust of about 50 miles deep. The temperature at 15 miles is well over 3000 deg. F. where everything is in a molten state. Some geologists and scientists have tried to prove the link of such thermal springs with some volcano, active or extinct. Certainly, some geysers and concentrated sulphur springs in Japan are definitely of volcanic origin, while thermal springs like those we have got at Vajreswari are outlets from high gaseous and liquid pressure inside the earth, carrying with them waters with radioactive powers, impregnated with mineral salts and high temperature useful for healing purposes.

The medicinal value of the Vajreswari springs is derived from the presence of mineral salts like sulphates, carbonates, chlorides and phosphates of calcium, sodium, magnesium, iron, lithium, potas-

sium, etc. The hydrotherapeutic clinic, the only scientific water treatment of its kind in India, conducted by Dr. M. R. Kothavala and Dr. Mrs. J. M. Kothavala, after a long experience of the last 25 years, has proved that the Vajreswari and Ganeswari group of sulphur springs are even better than most European 'Spas', because of the better quality of sodium present here. While in all the public tanks and *kunds* at Vajreswari the primitive method of sitting together, at times under unhygienic conditions, continues, it is at the hydrotherapeutic clinic of Dr. Kothavala at Ganeswari that one gets purest sulphur water, canalised into hygienically constructed tubs, each with a capacity of holding 80 gallons of water, with four taps for hot, cold, lukewarm water and for shower bath. Certainly, the pioneering research and experiences of Dr. Kothavala can be of great help when the Vajreswari sulphur springs will be developed by the Bombay Government as is envisaged in India's Second Five-Year Plan.

Any natural thermal water containing hydro-sulphuric acid is generally called sulphur water. Although pure sulphur springs are to be found only in Japan, a certain quantity of sulphurated hydrogen is found in Vajreswari springs for which reason they are to be classed among the sulphur springs of the

Dr. M. R. Kothavala and Dr. Mrs. J. M. Kothavala, the two Indian pioneers in Hydrotherapy

world. The very smell of the Vajreswari thermal springs bespeaks of sulphides of sodium, calcium and magnesium which are of great medicinal value when combined with radioactivity. The chemical analysis also reveals that the Vajreswari springs contain gases like sulphurated hydrogen, chlorine and carbondioxide and some other gases which act upon human body as curative elements.

TREATMENT

Bath treatment or balneotherapy, and water treatment or hydrotherapy, like heliotherapy or sun treatment and dietetic treatment, are all parts of Nature Cure. The specific treatment for all types of rheumatic pains, including lumbago, arthritis, synovitis, whether

they are of metabolic or of toxic origin, is always bath in sulphur springs at Vajreswari. Many cases of paralysis, neuritis, skin diseases of all kinds, including eczema, gout, high blood pressure, locomotor ataxia have been cured radically or partially relieved at Vajreswari springs. In all organic and functional diseases at least 10 per cent improvement is always guaranteed in hydrotherapy.

As radioactivity of the sulphur springs is the main curative power, great care should be taken to take bath under hygienic conditions. Any contamination or impurity diminishes the medicinal quality of the sulphur springs. Even moss, dilution with the river or rain water, and impurities diminish or neutralize the radioactive power of pure natural sulphur springs.

At present the hygienic conditions at the sulphur springs are miserably poor, except at the spotlessly clean scientific clinic of Dr. Kothavala. Instead of allowing patients with infectious or contagious diseases to enter the tank, the spring water should be canalized into bathing tubs fixed in bath rooms, where water used by one patient may not be used by a second person. If the existing eighteen springs of Vajreswari are canalized, there will be enough water for several hundreds of patients to be treated daily in fresh sulphur water.

Ignorant and superstitious people now take bath in the sulphur springs for an hour or two or even more, and that sometimes four times a day, little knowing that prolonged baths in too hot sulphur springs wash away their vitamin deposits from the skin, adversely affect heart and kidneys. Too much of even the best things is always bad. Bath should not exceed 20 to 30 minutes. The temperature should be the body temperature or a little above, up to 100 deg. F. In the cases of rheumatism and allied ailments needing heat application the temperature of the water could be raised to a maximum of 110 deg. F. While for rheumatism two baths a day are sufficient, skin diseases may need three, while high blood pressure need only one. All these mean that treatment of various patients at the sulphur springs must be carried out under medical experts and hydrotherapists, and not to be left to the wild fancy and vague imagination and hearsay information of ignorant patients.

Now that the Bombay Government have taken in their hands the task of developing Vajreswari sulphur springs by building sanatoria, baths, roads and clinics in and around the sulphur springs, we may reasonably look forward when Vajreswari will become the Karlsbad of India, a blessing to the citizens of Free India and a soothing balm for the suffering millions.

—:O:—

PUERTO RICO EXEMPLIFIES DEMOCRACY

By EDWARD TOMLINSON

GOVERNMENT in Puerto Rico today is an answer to Communist and other extremist charges of American imperialism in the Western Hemisphere. This island of nearly 2,000,000 people, which enjoys more autonomy than any territorial possession of the United States, is an eloquent example of the fact that, given intelligent leadership, this island's people are eminently capable of maintaining self-government and progressing under it.

On January 2, 1949, the Puerto Rican people inaugurated Luis Munoz Marin as their first elected island-born Governor. The island's new chief executive was chosen in a contest that was as democratic and peaceful as a gubernatorial campaign in any State in the United States. Eighty percent of all the eligible voters, men and women, went to the polls and cast their ballots.

In Puerto Rico officials and leaders are out to woo American capital, industries and factories from all parts of the United States. They hold out every kind of tempting inducement. Any manufacturer who will come to Puerto Rico, establish a business, employ Puerto Ricans and pay reasonable wages will be free of all taxes for 12 years. Puerto Rican banks will help him

to finance his machinery and equipment. The insular Government will even erect factory buildings and other facilities and rent them to him for a nominal sum. Almost everything is being done to create work and production for Puerto Rico and its people.

The man who conceived and sponsors many of these ideas and policies is one of the most interesting personalities, in the entire West Indies today. Luis Munoz Marin is the son of Luis Munoz Rivero, known as the George Washington of Puerto Rico because he helped to ease the transition from Spanish to United States rule after the Spanish-American War. Munoz Marin, or "Don Luis," as he is known to the jibaros—the mountain folk and little farmers of Puerto Rico—and most of the other people on the island, is a graduate of Harvard University. As a young man he spent most of his time in the United States and went through all the stages of youthful radicalism. For a while he toyed with Marxism, eking out a precarious existence as a radical poet and writer for leftist magazines in New York City's artistic and literary colony, Greenwich Village, until mental and spiritual maturity set his feet on other paths.

With this out of his system Munoz Marin returned to Puerto Rico and entered politics, or rather into conflict with the old, existing parties, finally building his own political organization in the Popular Democratic Party. Today Munoz Marin is Puerto Rico's leading exponent of a moderately liberal, slightly right-of-center democracy. He is a huge man, with a sagging black moustache, raven hair, an almost dreamy, kindly expression and great patience and tolerance.

Luis Munoz Marin, the first elected Governor of Puerto Rico, who took office on January 2, 1949, addresses an audience in San Juan, the capital of Puerto Rico

When the writer reached San Juan, the capital city of Puerto Rico, recently, Munoz Marin and his family were up the mountains in the very center of the island, where he was enjoying his first vacation in more than 10 years. As the founder and active head of the Popular Democratic Party and as president of the Puerto Rican Senate, he has fathered and personally championed most of the island's progressive legislation since 1936. Day and night his office in the Capitol Building and his small suburban bungalow in San Juan are crowded with political leaders and jibaros, rich and poor, farmers, carpenters and others from all walks of life. The jibaros often tramp all the way across the island to pour their troubles into Munoz Marin's sympathetic ear, and they are never turned away without an attentive hearing.

To relax and rest for a few days before taking over the governorship, Munoz Marin chose a cottage in one of the most remote parts of the island and on the very top of a mountain. There Munoz Marin talked to the writer of the past, and of his party's plans for the future welfare of the people in his island homeland.

Munoz Marin has led the Puerto Ricans through periods of acute economic distress and sheltered them from political extremists of all stripes. Communists tried to bore from within, to infiltrate various labor groups and political parties, including the Popular Democratic Party. Munoz Marin maneuvered them into organizing their own party and coming out into the open. "There, at least," he said, "we could show them up and make them ridiculous in the eyes of people." In the recent campaign they

The kilns and storage elevators of the Puerto Rico Development Company Cement Plant in Catano, Puerto Rico

turned their guns against him and the Populares. As Munoz Marin phrased it, "We not only disowned them, but made them disown us, which is what we wanted."

Most Puerto Ricans do not want any drastic changes in their present political ties with the United States. The recent elections demonstrated that. The two chief opposition parties and candidates asked for clear-cut, definite and immediate action along these lines. One party insisted that the island be made a full-fledged State of the Union, with all the responsibilities and obligations of a State. The other advocated complete independence, and with them voted the Communists. But the people turned both factions down for the middle-of-the-road policies of the Popular Democratic Party and Luis Munoz Marin.

"Why," Munoz Marin asked, "be compelled to seek either independence or complete statehood, instead of something else, say, the status of a commonwealth?"

Why not travel a step at a time, making sure of what we are doing as we go along? We are not interested in paper freedom; we want freedom in the everyday lives of people. First we want freedom from fear and want; freedom to think, to say what is in our minds and hearts, freedom to elect our own administrators."

The San Antonio housing project in San Juan

The island has enjoyed steady progress toward political freedom and self-rule. As early as 1900, two years after the Spanish-American War, Puerto Rico was authorized by the United States Congress to elect representatives to the lower house of the insular government. This was followed by the right to send elected Commissioners to the U.S. House of Representatives in Washington, D. C.

Since 1917 the Puerto Rican people have had their own bicameral legislature, a Senate as well as a House of Representatives. Meanwhile, they were granted the full rights of American citizenship. In November 1948, they elected their own Governor. The democratic processes have been put into practice gradually, until today the only island officials who are appointed by the President of the United States are members of the Puerto Rican Supreme Court and the auditor of Puerto Rico,

Besides granting the Puerto Ricans increased freedom and the right to run their own affairs, the taxpayers of the United States have supported the island generously. Direct Federal aid extend to the island between 1898 and 1945 amounted to \$580,000,000. Puerto Rican veterans have enjoyed all the benefits and opportunities accorded those on the mainland. The U.S. Veterans Administration has paid out \$100,000,000 to more than 60,000 Puerto Rican ex-servicemen. Thirty thousand Puerto Rican student veterans have received more than \$50,000,000 in GI Bill of Rights (Veterans Rehabilitation Act) benefits. Some 50,000 veterans have received medical advice or services, and more than 30,000 have received treatment in government hospitals.

"All this," said Munoz Marin, "the United States has done here in Puerto Rico at a time when Americans were being called political and economic imperialists in nearly every part of the world."

In keeping with his policy of step-by-step self-government Marin asks only one further political concession from the United States at this time: The right of the people of the island to write their own constitution

just as any State of the Union has the right to do. Munoz Marin feels that a constitution drafted by responsible Puerto Ricans would differ very little from the present one. "But," he believes, "it would be the people's own constitution. It would be another demonstration of self-government in a community of American citizens."

"We are making progress," Munoz Marin went on. "We are building more schools, gradually extending rural electrification and irrigation. We are bringing about healthier conditions among the people. Vigilance in sanitation is becoming a popular habit. Between 1940 and 1947 our population increased 14 per cent, but our total production rose 30 per cent in the same period. That is a substantial gain anywhere."—From *The (Washington) Sunday Star*.

ERNEST HEMINGWAY

Nobel Prize Winner

By Prof. P. P. MEHTA, M.A.

THE thrice-married tough-guy Hemingway seems to be a man with the proverbial nine lives. From his youngest days to the present day, he seems to have the knack of intentionally walking into tough spots, and still escaping death. During the last days of the First World War he was wounded while he was cycling from his canteen to the frontline trenches. At that time he received two hundred and twenty-seven separate wounds from the mortar, over and above being hit simultaneously in the leg by a machine gun round. He has described this experience when he wrote to his family from Milan:

"My feet felt like I had rubber boots full of water on (hot water), and my knee cap was acting queer. The machine gun bullet just felt like a sharp smack on the leg with an icy snow ball." Later on, many years later he wrote:

"When you go to war as a boy you have a great illusion of immortality. Other people get killed; not you. . . . Then when you are badly wounded the first time you lose that illusion and you know it can happen to you. After being severely wounded. . . . I had a bad time until I figured it out that nothing could happen to me that had not happened to all men before me. Whatever I had to do men had always done."

Since then he has led a colourful life and many legends have been told about the physical courage and hardihood of Hemingway. There is one told by John Groth which can bear repetition. "On the way back to the farmhouse we stopped at a regimental command post. The colonel was briefing his officers at dinner. With more men and material coming up, the outlook was good. There was warm food; they had been on K rations. It was pleasant inside. Pictures had been enough by Hemingway, and they were being passed around when an explosion battered through the window, breaking it, and cutting loose the lamp from the ceiling. Eighty-eights were coming in. When candles were lighted we were all—officers and correspondent—on the floor, making ourselves small and groping for helmets. All, that is, except one: Hemingway was still seated at the table, his broad back to the window, helmetless, eating."

Thus Hemingway has a habit of poking his nose into dangerous corners. The climax of it came when his aeroplane crashed in the African jungles. A second relief plane which came to pick him up also crashed and for one day the world had taken Hemingway for dead. Some of the papers actually featured stories

on his life, but he escaped alright though fairly badly wounded. Thus this tough American has lived dangerously and has revelled in dangerous tasks. In fact, he is scarred from head to foot.

This rough tough fighting literary man was born in 1898. He was the son of an Illinois doctor. At the age of 15 he bade farewell to books and studies, led a wandering life and once was a dish-washer in a hotel. He has described his boyhood in Michigan woods in his first book *In Our Time*. Then he joined the staff of the Kansas City *Star* as a cub reporter. There also he was a man bubbling with energy. He could turn out more copies than any two reporters. From there he managed to get into an ambulance unit in the Italian army and thus served with the Italian units where he was wounded. About the need of war experience to a writer he writes:

"I thought . . . about what a great advantage an experience of war was to a writer. It was one of the major subjects and certainly one of the hardest to write truly of and those writers who had not seen it were always very jealous and tried to make it seem unimportant, or abnormal, or a disease as a subject, while, really, it was just something quite irreplaceable that they had missed."

Hemingway was not so lucky in his career as an author as he was in getting badly wounded in Italy. His stories were more or less sent back with rejection slips and success like a shy bride was slow in coming to him.

These are the days in which so much is being written that it is difficult for a writer to achieve distinction in the field of letters. Commonplace subjects do not easily attract public attention, but Hemingway had cut this gordian knot by putting his stories in stupendous and bizarre backgrounds. He has avoided, as Mr. Cunliffe says, "the orthodoxies of the American scene," has put his characters in the atmosphere of war, sometimes in the world war first stories and sometimes in the war-torn mountains of Spain. Thus his stories have a different flavour, a different context and so they have sometimes jarred the nerves of the critics.

His earlier stories "In Our Time" (1924); "Men Without Women" (1927); "Winner Take Nothing" (1933); and others clearly showed his remarkable gifts and so much was his influence upon other writers that many imitations of Hemingway were produced. His real break came with his famous novel *A Farewell*

to Arms which really made him world-famous. In this book he had drawn upon his war experiences to provide a background for this story of love and war. "It is a novel of great power by an extremely talented and original artist." (*The Times Literary Supplement*). Its ending is quite unforgettable in its pathos. Its nihilism is a convincing statement of the mood of war of the post-war years. His first important novel is *Fiesta* (1926) in which war is treated as a disaster which nobody cared to talk about. The characters in the book—Jake Barnes or Lady Brett or Rover Cohen or Mike are living mouth-pieces of Hemingway who love and hate and treat their disasters in a light way.

In the post-war years Hemingway met Ezra (Pound) and Gertrude (Stein) in Paris. These two had a lasting impression in shaping the style of Hemingway.

Hemingway is a writer who believes in loading his stories with violent love, violent action and very often, violent death. *The Sun Also Rises* (1926) is a story in which the frustration and disillusionment of the lost generation are portrayed. *Death in the Afternoon* (1932) and *The Green Hills of Africa* describing big game hunting are full of brave deeds of matadors and hunters. But his most famous novel is *For Whom the Bell Tolls* (1940) in which is described a fine portrait of an American intellectual Robert Jordan who goes on a dangerous mission in Spain and joins the Spanish partisans in the days of the Spanish Civil War. Here he shows himself the master writer, describing gripping situations in a realistic way. Pablo Anslemo and other guerrillas are beautifully portrayed. But a very touching character is the close-cropped girl, Maria, who had a bad time at the hands of General Franco's mercenary soldiers. The powerful end of the story in which Robert Jordan, badly wounded, leans upon the machine-gun and waits for the enemy cavalry to fight and die is a powerful and magnificent ending for the great novel. His clipped dialogue and his treatment of the subject had reached maturity in *For Whom the Bell Tolls*. Then came a period of relapse for Hemingway. His book *Across the River and Into the Trees* (1950) was poorly received by critics, who began to consider him a back number. But Hemingway does not accept defeats like that. He staged a classic comeback by his short novel *The Old Man and the Sea* which won him the Pulitzer prize in 1953 and Nobel prize for literature in 1954. *The Old Man*, in fact, is a small novel in which Hemingway describes a Cuban fisherman who is a simple soul. His fight with a great fish is an epic of description. It is a work of freshness and perfection. Its plot is quite straightforward and there is only the sub-theme of a fisherman who sailed to catch a giant marlin, but ultimately the sharks ate away the marlin except for its spine

and tace on the way back. It is a struggle in which the old fisherman defeats the great male fish after a prolonged fight. John Arkins considers this little book to be "Hemingway's essay on human understanding."

Once Hemingway had told an interviewer:

"In writing I have moved through Arithmetic, through plane Geometry and Algebra and now I am in Calculus."

It sounded arrogant at that time, but *The Old Man* has justified his pride. Hemingway does not worry about art or artifice, though he actually submits himself to a rigid professional discipline. He emphasizes clarity, fidelity to realism, authenticity and immediacy in writing. About writing he once said:

"You have got to see it, feel it, smell it, hear it." "This is how I would do (it). For instance, I knew I always received many strong sensations when I went into the gym to train or work out with boxers. I didn't know what the things were that made the sensations, so I would think when I was wrapping my hands and remember. First there was the smell of wintergreen in the liniment where guys were being rubbed. Then there were the different sweat smells; the smell of the crowd that paid two bits ten to watch the workouts and the smell of individual people like Eddy McGoorty, Tommy Gibbons, Johny Wilson, Jack Dillon, Greb and others. Then the sniffing that tightens the gut that boxers make as they shadow box. Then the noise of the rosin crunching under foot in the corner as you scuffed your shoes on it and the squeak it made against the canvas. When I would get back from the gym, I would write (the sensations) down."

"Clearly he was not merely indulging in comforting talk when he told Don Wright that a writer must see it, feel it, smell it, hear it." (Atkins).

A good writer must know as near everything as possible. He has no sympathy with critics or criticism. It may be that critics have not been very kind towards him and that critics have not given him his due. Once Arthur Koestler said:

"Don't underestimate your Hemingway. It is banal, but he is still the greatest living writer."

And to-day John O'Hara has called him the outstanding author since the days of Shakespeare. About critics Hemingway says:

"If they believe the critics when they say they are great then they must believe them when they say they are rotten and they lose confidence. At present we have two good writers who cannot write because they have lost confidence through reading critics. If they wrote, sometimes it would be good and sometimes, not so good and sometimes it would be quite bad, but the good would get out. But they have read the critics and they must write masterpieces. They weren't masterpieces, of course. They were just quite good books. So now they cannot write at all. The critics have made them impotent."

This certainly is not likely to be appreciated by the big highbrow critics.

All the novels of Hemingway are a great saga of human endurance, human bravery and human courage. Like tragic heroes the characters of Hemingway fight although very often the dies are heavily loaded against them. But they stand unbowed beneath the blows of fate. Death to them is not a very sad experience but is a natural and so a brave epic that is called life. Hemingway thus is a natural man who enjoys bull fights, hunting and war though they may involve death.

Some writers complain that Hemingway is an unsatisfactory alternative because he reduces the human figure to a muscular jelly of principles without values. He is also called an anti-intellectual, an intellectual who has renounced intellectualism.

Hemingway does not like politics and therefore he has no political attitude. He can think of the only political philosophy and that is the philosophy of bread. Everywhere his characters are realists who know that their main concern is "to eat as long as anybody eats." His hero, Robert Jordan fights because he loved Spain and believed that a Fascist victory would make life unbearable for those who believed in the Republic. But he had no political doctrine. Mr. Atkins describes one incident about Hemingway:

"Anyway, whether Hemingway was an intruder in the dust or not he is said to have raised \$40,000 on personal notes to buy ambulances for loyalist armies, and paid for them by newspaper work in Spain."

Such was the generosity of Hemingway. He himself said in an interview:

"All the contact I have had with it (politics) has left me feeling as though I had been drinking out of spittoons. The self-confessed patriot, the traitor and the regulator of other people's lives, beliefs, etc., and the regimentator all run in a photo-finish. The Senate may develop the picture if they can find a photographer who can photograph a photo-finish."

When Mr. Atkins asked Hemingway something about the future of sensibility, he replied:

"There is a future for little else except the fundamental conception of individual freedom and liberty and the universal brotherhood of man."

This even today is the opinion of Hemingway.

Hemingway is a novelist who is corrupt in his values to the extent that his age is corrupt. He faithfully tries to represent the modern society with all its defects, its war-weariness and its disillusionment. He proves that many of the poor are vicious simply because they are poor. In his story "To Have and Have Not" he has given a very disgusting picture of society, which is nauseating in general. That novel is an utter picture of "brutality and fear of a society on the edge of an abyss."

Hemingway is lucid, frank and does not hesitate to call a spade a spade. To him money is the only thing without which a man can be in real despair. The following dialogue taken from "A Clear Well-lighted Place" illustrates the point:

"Last week he tried to commit suicide," one waiter said.

"Why?"

"He was in despair."

"What about?"

"Nothing."

"How do you know it was nothing?"

"He has plenty of money."

Hemingway does not theorise. He merely shows man fighting in action against the enemy, against poverty, against animals and against his own sexual lust.

The style of Hemingway is unique inasmuch as it truly carries conviction to our mind. His dialogue is always clipped and witty. We never come across a single dull sentence in Hemingway's stories. Even the descriptions are well planned and there is never any feeling of strain, e.g., in the "Snows of Kilimanjaro" he describes a dying man and says, "Death has come and rested his head on the foot of the cot and he could smell its breath." Here is his amazing imagery that has raised him above his contemporaries. He uses words to bring about subtle effects.

There is one peculiarity about Hemingway and that is that Hemingway can please the learned readers as well as the unlearned readers. John Lehmann wrote that you do not need a university education to get a full flavour from Hemingway. He writes from the senses and his words make us see and hear.

Hemingway's characters are alive and clearly distinguished. Yet it must be admitted that characterisation has never been Hemingway's strongest point. All his heroes talk the language of Hemingway, have the same nonchalance of Hemingway and are prepared to face great dangers, like Hemingway. They are, in fact, Hemingway himself more or less. Hemingway himself admits:

"When I wrote the first two novels I had not learned to write in the third person. The first person gives you great intimacy in attempting to give a complete sense of experience to the reader. It is limited however and in the third person the novelist can work in other people's heads and in other people's country. His range is greatly extended and so are his obligations. I prepared myself for writing in the third person by the discipline of writing *Death in the Afternoon*; the short stories and especially the long short stories of "The Short Happy Life of Francis Macomber" and "The Snows of Kilimanjaro." In "The Snows of Kilimanjaro" I put in and deliberately used what could have made many novels to see how far it was possible to concentrate in a medium."

Hemingway in a smooth running style notes

minute things, smells and sees even the colour of clothes—all with the end of breathing the spirit of life into its characters. Hemingway's characters are not averse to sex. He does not believe in love, he does not believe in sex, but he believes in love based on sex. He knows men as they are and does not quarrel with fate because they are not superior or ideal human beings. He is not, led away by cheap idealism and allows his characters to have their full quota of sex and love. His attitude to sex is very realistic, e.g., in his story "An Alpine Idyll," a peasant's wife died; the body could not be taken out for burial because of snow. When the farmer worked at nights, he hanged his lantern from the mouth of the dead wife. This may appear horrible to us. The peasant did love his wife but when he wanted to hang the lantern and looked down for a place, it did not occur to him that he was outraging his wife's body by hanging the lantern from her mouth. About love Hemingway makes his characters speak in his story: "To Have and Have Not":

"Love is just another dirty lie. Love is ergo-pil pills to make me come around because you were afraid to have a baby. Love is quinine and quinine and quinine until I'm deaf with it. Love is that dirty aborting horror that you took me to. Love is my insides all messed up. It's half catheters and half whirling douches. I know about love. Love always hangs up behind the bathroom door. It smells like lysol. To hell with love."

It may be remembered that Hemingway himself was thrice married. He married Hedlev Richardson in 1919 and was divorced from her in 1926. In 1927, he married Paline Pfeiffer and divorced her in 1940 and then he married Martha Gellhorn in 1940. Hemingway is not overawed by sex and is not a green lover idolising love. He is a matter-of-fact realist who looks upon love and sex for whatever they are exactly worth.

Hemingway is essentially a writer of war and his novels have given some of the best war literature. It is true that his stories are quite different from a novel like *The Cruel Sea* or *The Young Lions* but if a really big artistic pattern of war is to be seen, we have got to turn to Hemingway's war classics. He has written about war because he loved war, loved the smell of powder, the noise of bursting shells and the thrill of fear that it brings. Perhaps, he also loves war because the real emotions of man come out from under the veneer of civilization, when man is face to face with death. Hemingway thus shows the naked man, the real man, under situations of stress in his novels. That is why his men make love freely, use abuses freely, and fight each other freely. Mr. Bishop has written that Hemingway has portrayed the disappearance of human soul.

"The chorus of approval reaches its peak with John O'Hara who calls Hemingway 'the outstanding author since the death of Shakespeare.' Without considering that, we may at least consider his status as a literary personality, owing less to his actual written work than to the legend that has accrued. . . ."

Hemingway belongs to those few spirits like Trelawney, Wilde, Shaw and Byron whose personal myths have overshadowed their work. A public discussion of Hemingway's work is impossible; unless it is confined to the privacy of the study we are certain to be disturbed by the intrusion of the "Big Game Hunter and War Correspondent." The spread of the legend, resulting in an expanding reputation among people who never read his books, really dated from the Spanish War and came to full status during the World War.

There is one more aspect of Hemingway's work and that is the basic sensation of fear—fear when death is looking straight in one's face, the fear which you would have in the ring with a bull. Fear also is an emotion under which man shakes off every external false feeling and becomes the natural elemental man. It is, like war, an emotion which shows man in his true colours.

Fear and war, the two elements which give the real glimpses of death naturally bring out the best in man and thus stories of such struggles are stories of abounding interest and when such a story is handled by an author of the calibre of Hemingway it becomes classical literature.

Hemingway himself is more or less like his own heroes—brave, fearless, tough guy with a knack of stirring up the hornet's nest. Mr. Atkins has described Hemingway thus:

"... he is a big man with the kind of body that can be used for busting through tough spots. His body is enormous and oddly proportioned. Most of his 215-odd points are in his upper torso and extremities. His legs are thin to the point of being delicate, but his barrel chest, shoulders and arms are huge. So are his hands; shaking hands with Hemingway is a good deal like bumping into a door. A boxer named Harry Sylvester with whom Hemingway used to spar told John McCaffery that he was the strongest man that he had ever known. He used to box at 199 pounds. He has become known as a fisherman, not of small fry but of giant marlin and tuna."

In his life he has faced more hazards than the heroes he has drawn. He has been a good boxer and had once his nose broken in a boxing contest. He does not easily despair. In fact, in his teething period as a writer, he had received many rejection slips from various editors to whom he had sent his stories. He enjoys his 'damned good life' and he thus is a great chronicler of the great moments of life.

In spite of the two air crashes, Hemingway is still strong enough to write and still enjoys life and thus we have reason to believe that many more books of the calibre of the *Old Man and the Sea* will come from his pen. He is reported to have said that he wrote *The Old Man* because he was broker, which may not be literally true. He has already about four novels in stock which he has locked up in the safe deposit vault of a bank. According to his habit, he will polish them and re-polish them before he releases them for his publishers. He is thus an artist who takes pains over his words and sentences. He very often reads out his dialogues to anybody upon whom he can thrust them and very often asks, "Is that the right way to speak?" etc. This is the keynote of the spontaneity, realism and freshness of his dialogues.

It may be argued that most of the novels of Hemingway are the works of the hour and the works of topical interest. This will be a misleading slant on Hemingway's ability. He uses no doubt the events

—:O:—

WARREN HASTINGS AND THE ADALAT SYSTEM OF BENGAL

By P. C. RAICHOUDHURI, M.A., LL.B., W.B.C.S.

INTRODUCTION

THE bitter invectives of Burke, the poisoned calumnies of Mill, the cruel extravagance of Macaulay, the arrogant misjudgments of Beveridge and perhaps the inexorable verdict of history have tarnished the memory of the first Governor-General of Bengal almost beyond recovery. The celebrated works of Stephen, Strachey, Trotter, Lyall, Malleon, Forrest and others have by their searching examination of the different aspects of the life of this great 'Man of Action' vindicated him to a great extent, but the over-all picture is perhaps still the same. Through their pages one can see Hastings in all his moods, follow him in almost all his public actions, mark his policy of conquest and aggrandisement and note the events that eventually led to his recall, impeachment and ultimate acquittal; but in none of them can one have a clear and faithful account of his contributions to the law and justice of the provinces placed under his charge.

LAW AND JUSTICE WHEN HASTINGS CAME

The general practice is to look to the regime of Lord Cornwallis for the beginning of the legal system of modern India. It is difficult to find fault with it, but then justice requires that Hastings' share in its evolution must as well be properly appreciated. The grant of the Dewani in 1765 marked "a turning point in the Anglo-Indian history" not only from the

of the hour but they are not trivial events. They are the events like the World War or the Spanish Civil War or the bull fights where his heroes stare straight in the face of death and out of those critical situations arise suspense and interest. They are the events of great catastrophes in which the fate of nations is decided. Thus these events are not topical or temporary but are eternal, if not actually historical.

In the last analysis, even his worst critics admit that Hemingway's stories are powerful, gripping, stirring, stories of breathless suspense. They are stories superbly and artistically told by a man who almost draws from his personal experience and so in spite of the critics, Hemingway is great. His novels describe human beings, grappling with death, fighting for life and surely our sweetest songs are those that tell of saddest thought. Hemingway is thus a chronicler of human greatness, human endurance, and human nobility.

political but also the legal point of view. In that year as many as seven Courts were functioning in the Presidency town of Calcutta, but the administration of justice in the Mofussil was in a most wretched condition. Might was right and justice remained with whoever had the power to enforce obedience. The eighteen months of Clive's administration witnessed no judicial reform; indeed, tackling with such a problem was no forte of the founder of the British Empire in India. The criminal justice in Bengal, Bihar and Orissa remained with the puppet Nawab of Bengal and, in spite of some sort of loose supervision by the Company's servants, it continued to be mismanaged till 1790 by his deputies and other officers of justice. The Dewani, however, put the civil justice in the hands of the English, since it was closely connected with the collection of revenue. Yet for the first three years nothing was done. In 1768, some writers in the Company's service were appointed 'Supravisors' (Supervisors) in some Mofussil towns for superintendence of collection of revenue and administration of all sorts of civil justice. Their control was, however, not effective. The chaos continued and the Committee of Secrecy found the administration in a deplorable condition (1770).

FOUNDATION OF THE ADALAT SYSTEM

When in 1772 Warren Hastings became the Governor of Bengal the Company had already

announced their intention "to stand forth as Dewan." In order to enable Hastings to carry it into effect a Committee was appointed. One of the results of the deliberation of that Committee, (consisting of the Governor and the four members of the Council), was the adoption of a plan by the Government (1772). The Supervisors of the former administration became the Collectors of the several districts into which Bengal, Bihar and Orissa were divided. In each district there were established a Dewani and a Faujdari Adalat, names which still subsist. The Dewani Adalat was to decide

"all disputes concerning property, real and personal, all cases of inheritance, marriage and cast (caste) and all claims of debt, disputed accounts, contracts and demands of rent."

It was presided over by the Collector who was assisted by the Provincial Dewan and other officers of the Collectorate. The Faujdari Court tried

"all cases of murder, robbery and theft, and all other felonies, forgery, purgery, and all sorts of frauds and misdemeanours, assaults, frays, quarrels, adultery and every other breach of the peace or violent invasion of the property."

The Provincial Qazi was the President of this Court and Mufti the expounder of law. The Collector of the district was

"to attend its sittings and see that the decision was passed in a fair and impartial manner, according to the proofs exhibited."

These Courts were placed under the control of two superior Courts, the Sadar Dewani Adalat and the Sadar Nizamat Adalat. The Sadar Dewani Adalat consisted of the President and Council, assisted by Indian officers and was to be the final Court of appeal in all civil suits. The Sadar Nizamat Adalat was to consist of a Daroga appointed by the Nazim and assisted by a Chief Qazi, a Chief Mufti and three Maulvis; its duty was to revise all proceedings of the Provincial Criminal Courts in capital cases and those involving fines exceeding Rs. 100 and "to refer the former with reasoned approbation or disapprobation to the Nazim for sentence."

A CAUTIOUS MEASURE

Hastings was thus careful enough to maintain the authority of the Nazim, although no one knew better than he that the latter wielded no real power having practically abdicated it by the agreement of 1765. This he did out of policy, as any violent change might jeopardise the territorial and commercial interests of the Company. Indeed, he was cautious and would not go very far. The administration of civil justice, too, still remained mostly in the hands of the Indians and the Pargana's Courts, presided over by Head Farmers (Zamindars), were not disturbed at all. Only the general supervision vested in the Collec-

tor of the district. This union of the fiscal and judicial authority in the same officers did not, however, conduce to justice in many cases. In those days of all-pervading corruption, difficult communication and general ignorance of the ways and habits of the people it was next to impossible for the European Collectors to exercise effective control. When in two years' time these functionaries were withdrawn and the supervision of civil justice was vested in the six Provincial Councils set up in Calcutta, Dacca, Burdwan, Murshidabad, Dinajpore and Patna, the condition further deteriorated. Criminal justice was left to the Darogas, Faujdars, Thanadars and the like without any supervision from district headquarters.

DIFFICULTIES ENCOUNTERED

To add to the bewilderment and miseries of the people the Supreme Court of Calcutta frequently directed their processes against these Mofussil Judges whose authority the Court was little disposed to recognise, far less honour. According to the Judges of that Court, the Indian Magistrates appointed by the Provincial Councils had no legal existence and were liable to damage in suits of persons affected by their proceedings. This led to clashes with the executive and the acme was reached in what is known as the Cossijurah Case. In utter consternation the British inhabitants of Bengal sent to the authorities in England a petition, couched in the strongest terms, requesting interference.

"Unless relief was given," it was said, "the Company would have ports without trade, possessions without revenue and laws without inhabitants."

The relief came in 1781 through the Act of that year (21 Geo. III.c. 70) but before it did, Hastings devised and executed an arrangement for reconciling the differences. Sir Eliza Impey, Chief Justice of the Supreme Court, was appointed the Chief Judge of the Sadar Adalat on a proposed salary of Rs. 6000 a year. It was thought that this would be the means of lessening the tension and an instrument of conciliation. It was a master stroke of policy but the authorities in England rejected it as being against the very spirit of the constitution of the Supreme Court. Blind adherence to tradition triumphed over reason for the moment but time and circumstances were to show that Hastings was right. For the time being a patchwork was made; the powers of the Supreme Court were curtailed and all civil causes in the Mofussil were made cognisable by the Dewani Adalats whose authority was recognised by the Parliament. Eighteen such Courts were set up in different parts of the country. Except in four districts the functions of the Judges of the Dewani Adalats were separated from those of the Collectors, and even in those districts where the Civil Judge and the Collector were one and

the same person, they held the posts in distinct capacities. Thus the foundation was laid of the modern Adalat system. Efforts were made in later years for betterment of the system but the basic principle was never abandoned.

LAWs ADMINISTERED BY THESE COURTS

When Hastings assumed the reins of government the laws administered by the few subsisting Courts in the Mofussil were very uncertain and perplexing. On the civil side, the Hindu and Mahomedan Laws applied to the vast majority of the inhabitants of the Presidency, and the *fatwas* and *vyavasthas* of the Maulvis and Pandits were the only guide of the Judges who were mostly laymen. These opinions were most often unreliable because the sources of law were varied and intricate and to this must be added the natural infirmities of the propounders. On the criminal side, the Mahomedan law was the law for both the Hindus and Muslims and the *fatwas* of the Maulavis were the guide. This law was cruel, antiquated and sometimes inconsistent.

In the Presidency town of Calcutta, the English criminal law prevailed with all its technicalities and age-old rigours and that was extremely galling to the Indians. For example, in 1762, an Indian detected one of his wives in an act of infidelity. He, therefore, punished her by cutting off her nose. When arraigned at the Calcutta Sessions he admitted the fact but pleaded that

"He had done nothing to offend the laws and customs in which he had been educated; that the woman was his property; that by such custom he had a right to set a mark upon her for the infamy; and that he had never heard of the law by which they tried him."

"Do you believe," he asked, "if I had known the punishment to be death, I would ever have committed what you now call a crime?"

The man was, however, hanged, for "if the Courts possess jurisdiction they must proceed according to the English laws." Six years later Radhacharan Mitra, grandson of Holwell's old enemy, Govindram, was sentenced to death for forgery;

"but so extravagant did the sentence appear, where experience had never suggested the principle, such was the disproportion in their eyes between the punishment and the crime, that the principal inhabitants of Calcutta expressed their astonishment and alarm in a petition to the Governor and Council and upon a proper representation, Radhacharan received a pardon."

The position of civil law was still more anomalous. The Charter Act of 1753 having declared that the suits and actions of the Indians should be determined amongst themselves unless the parties submitted them to be tried by the Mayor's Court, their civil justice was brought to a stand-still.

HASTINGS' LEGAL REFORMS

Notwithstanding these anomalies the prevailing opinion of the Europeans was that

"For the peace and prosperity of the country the laws of England in so far as they did not oppose prejudice and usages . . . should prevail."

Hastings, however, saw the distinct advantage of ruling the Hindus and Mahomedans as far as practicable with their own laws. His plan provided that in the provinces the Hindus and Mahomedans were in certain matters to be governed by their own laws, namely, those relating to inheritance, marriage and caste and other religious usages and institutions. In furtherance of his plan he wrote to the Court of Directors in March, 1773:

"In order to render more complete the Judicial Regulations, to preclude arbitrary and partial judgments and to guide the decisions of the several Courts, a well-digested Code of Laws, compiled agreeably to the laws and tenets of the Mohametans and Gentoos and according to the established customs and usages in cases of the revenue, would prove of the greatest public utility."

Again in a subsequent letter, covering a specimen of the Hindu Code drawn up at his instance and sent to the Directors, he observed:

"From the labours of a people, however intelligent, whose studies have been confined to the narrow circle of their own religion, and the decrees founded upon its superstitions, and whose discussions in the search of truth have wanted that lively aid which it can only derive from a free exertion of the understanding and an opposition of opinions, a perfect system of jurisprudence is not to be expected. Yet if it shall be found to contain nothing hurtful to the authority of Government or to the interests of society and is consonant to the ideas, manners and inclinations of the people for whose use it is intended, I presume that on these grounds it will be preferable to any which even a superior wisdom could substitute in its room."

These are pregnant words uttered by one bent upon doing what he felt was in the best interest of the country. The Plan as well as the spirit behind it received the sanction of the Court of Directors.

ACTS OF ENLIGHTENED POLICY

It was a momentous step and the substance of this Plan regulates even to this day the greater part of India. Although the principles of English laws have since struggled into our Codes it is because they are of the essence of any enlightened jurisprudence. The repudiation of English law brought upon the Governor-General censure of observers like Alexander Dow and John H. Harrington but Hastings stood firm and the wisdom of the step he took was recognised even before the beginning of the nineteenth century, the great Sir William Jones being one of the upholders of his policy.

Another act of enlightened policy was that the Hindu and Mahomedan laws were placed upon the same footing, a thing which the greater part of India never saw during the preceding five hundred years. In course of time, these laws, found scattered in numberless treatises, were compiled and translated into English for the benefit of the English Judges. Thus there came the works of Baldaeus Halhead, Charles Hamilton and others: though not quite satisfactory they did, yet, make those laws more intelligible than before.

A third act of wisdom was that Regulations were issued from time to time mitigating the rigours or removing the angularities of the Mahomedan criminal law which still, and for many years to come, remained the general law of the land. The uncertain title of the Company made Hastings slow to effect any far-reaching change in the criminal law; but in exercise of the powers conferred on the Governor-General and Council by the Regulating Act of 1773 and the Act of 1781 some Regulations were passed for more "effectual and regular administration of justice" in the Mofussil Civil Courts. Lastly, at his instance, the civil procedural laws for those Courts were framed by Sir Eliza Impey during his short incumbency as the Chief Judge of the Sadar Dewani Adalat. These were in 1781 issued as a revised Code.

REFORMS IN POLICE ADMINISTRATION

Closely connected with the criminal administration were the Police in those days, as they are now. Before the time of Hastings the Zamindars were responsible for public safety and maintenance of public roads. This did not prove satisfactory; as a matter of fact, many of the officers of the Zamindars were proved or suspected to be in collusion with the breakers of law; therefore, in 1772, the Faujdari jurisdiction of the Zamindars was taken away and vested in the Adalats. Two years later Hastings divided Bengal for Police purposes into fourteen districts. These were placed under Thanadars and the landholders were directed to assist them. Faujdars

were appointed to apprehend all offenders against public peace. A few years' working showed that this system too was a failure. Therefore, in 1781, it was abolished and the Judges of the Civil Courts, as Magistrates, were given the power of apprehending the offenders in their districts. For punishment they were forwarded to the nearest Daroga who presided over the Nabab's Court. By special permission the Zamindars were sometimes vested with similar powers. This arrangement did not last long and, like the Adalat system itself, was remodelled by Lord Cornwallis. It nevertheless shows Hastings' anxiety to maintain law and order by all means.

HIS PLACE IN LEGAL HISTORY OF INDIA

No legal or administrative system is unalterable and has remained unchanged for ever. As society progresses, law tries to keep pace with it. Sometimes it is tardy and then comes the accusation, "Law is the everlasting malady of mankind." But in every progressive society the malady is eventually removed. So it was in India under the Company. In the hands of Hastings' successors his Plan and the Adalat system received all necessary treatments, and their regime is, therefore, justly important in the legal history of India. They had, however, an advantage over Hastings. They were not trammelled by scandalous disagreements of their colleagues in the Council. A Francis, or a Clavering or a Monson could make no history during the times of Lord Cornwallis and his successors; none but the Court of Directors and the Parliament could undo the plans of those Governor-Generals. Such was not the privilege of Hastings who was buffeted by storms from all directions. In spite of that it was he who first knocked at the prejudices of a tottering past and laid a sure foundation of the great edifice of modern law and justice in India. His was the work of a pioneer and it had the inevitable defects of such a work. Even then it was great and deserves being remembered by those who are interested in it.

WATER AND THE COUNTRY-DWELLER

By A. SAYOUR,
Director, "Comité Hygiène et Eau," Paris

In France, during the last 25 years, water supply systems have been provided for 8,000 rural communes, bringing to 14,000 the number of those which are as well served as the towns in this respect.

Much however remains to be done, for 20,000 communes with a total of around 12 million inhabitants still have no public supplies. This figure does not include the three million people scattered in remote parts of the country who depend for their water on their own individual installations.

Our time is rich in contrasts. When jet planes bring the most distant continents closely together, it is paradoxical that in the countryside over which they are flying peasants are still engaged in the ancient task of fetching water. The problem of water for drinking has not yet been satisfactorily solved in many rural areas. This situation has many unfortunate consequences especially in the field of public health.

WATER AND HEALTH

As shown in a study by M. Baccino of the National Institute of Hygiene (France), when the mortality rates from typhoid and paratyphoid fevers in 1913 and 1934, and the general mortality rates in 1913 and 1936 are placed side by side with figures showing the growth of water supply systems, it is immediately evident that the considerable drop in the mortality figures in every department of France is in direct ratio to the percentage of the population supplied with potable water.

Similarly, Dr. P. Chassagne, head of the epidemiological section of the same body, made certain observations following the recrudescence of epidemic typhoid which occurred in France in 1949. Dr. Chassagne showed that out of 7,000 cases of typhoid fever recorded in France during 1949 and preceding years, more than half could be traced to the consumption of polluted water.

Consequently, in order to prevent the return of the epidemic, Dr. Chassagne advocated that

"Every consumer should be provided with a water supply subjected to frequent and strict bacteriological tests, he should be given a supply suitable for drinking and—another important precaution—for the washing of vegetables eaten uncooked, for butter-making, etc. Indeed, it would seem that more than one epidemic has been due to the consumption of butter washed with contaminated water."

Hydro-geological surveys carried out by the rural engineering service have shown that the mortality rate in a locality without a drinking water supply system is, on the average, two to three per cent higher than the corresponding figure in communes which have been suitably equipped for some years.

Let us now consider the case of India, the main breeding ground of cholera, whence epidemics have spread throughout the world, causing frightful ravages.

We quote below the conclusions of a study published in December 1947 in the periodical *Eau* by Dr. M. Monnerot-Dumaine, of the Institut d'Egypte:

"A study of the Indian epidemics shows that they proceed upstream along the watercourses and not in the direction of the current. Consequently, running water does not play an important part. On the other hand, well-water is dangerous. In villages in the endemic zones of India, the wells which supply the drinking water for the inhabitants regularly contain *koch vibrios*. When wells were dug along the Ganges so that the local inhabitants could draw their drinking water from them instead of from the river, the ravages of cholera rapidly increased, and the wells had to be hastily filled in. One of the conditions favourable to cholera is satisfied wherever the people drink well water or any standing water. On the contrary, water which is collected in accordance with the classical rules of hygiene cannot harbour the vibrios."

Another striking example is that of Egypt, where the last cholera epidemic, in 1947, was particularly deadly in the rural areas whose population drew drinking water from canals and the Nile. On the other hand, the large cities, such as Cairo and Alexandria, supplied with purified water, escaped the epidemic.

It will be felt, no doubt, that these observations illustrate sufficiently well the importance of a drinking water supply system for the health of the rural population.

Of course, in the more advanced countries, a satisfactory water supply represents only a contributory factor, the decrease in mortality being also due to preventive measures and advances in treatment. Nevertheless, it plays a by no means negligible role.

In the less developed countries, drinking water supply systems together with vaccination, occupy an important place in the control of epidemic diseases.

The provision of an ever-increasing number of suitable installations will make it possible to reduce mortality rates, as part of the programme of work undertaken by the great international organizations.

THE COST OF SAFE WATER

The health aspect of a rational water policy in the rural areas is not the only one worthy of attention. Mention should also be made of the arguments in favour of such a policy from the economic viewpoint. A supply of safe water may indeed be considered as an essential part of the equipment of a farm, because of the saving in time it makes possible and the improved output, particularly as regards milk production and stock-raising. Although it is doubtless wise not to place too much reliance on statistical estimates, nevertheless the financial benefits which may be expected from the generalization of water supply systems throughout the countryside in France are of considerable interest.

According to these estimates, the increase in milk production would bring in an additional 15,000 million francs per year, and the increase in meat production an additional 22,000 million francs. Thanks to the use of running water in washing out stables and cowsheds, nitrogenous products to the value of 3,000 million francs could be recovered. The increase in market-gardening output would be equivalent to 8,000 million francs. To these sums must be added those resulting from the saving in time from better organisation of fire-fighting measures, and from the development of anti-parasite treatments. All these savings have been calculated and come to a total of 80,000 million francs a year.

If, instead of this overall picture, a single agricultural undertaking is considered, then the results are just as conclusive. Let us suppose that the nearest water point is 30 yards from the farmhouse (an average distance in the case of many farms). Then the water carrying necessary to supply a family of six persons, would involve, in one year, a total weight of 51 tons, a total distance covered of over 95 miles and a loss of eight full working days. As regards livestock, the daily watering of four cows, two calves and two horses would result in the loss of 36 working days per year.

When it is remembered that it is the wife who must generally fetch the water for the family it will readily be seen that the removal of this burden would enable her to devote more time to the children and to look after them better, without mentioning the additional comfort for all the occupants of the farm.

WATER AND THE COMMUNITY

These above considerations logically bring us to

the third aspect of the water problem, namely, the social aspect.

It is clear that by improving the living conditions of the country-dwellers water supply systems play a large part in maintaining the balance of population between town and countryside and slowing down the exodus towards the cities. This balance cannot but foster increased exchange between industry and agriculture, and contribute to the general prosperity which is a feature of socially privileged countries. In addition to this, a rural population in good physical and moral health is a factor in maintaining the vitality of a people.

THE PLACE OF HEALTH EDUCATION

At the conclusion of this brief outline of the problem of water supply in the rural areas, the question arises as to how the present position can be remedied, and how collective water supply systems can be improved.

It is here that the importance of health education becomes clear. Not a day goes by without some mention of the investments necessary to put new life into the national economy. Part of these investments are devoted to building, in which water supply finds a place, unfortunately an all too modest one.

Public opinion must be convinced that this policy is sound. This requires appropriate civic education, stressing the part which the rural water supply systems must play in a balanced economy.

Although such health education is already given by many bodies on the international or national level, even greater efforts are called for. In particular, fruitful work could be done in the country by social workers, who are specially qualified to inculcate healthy and hygienic habits among the rural inhabitants.

People should also be made to understand that nothing can be achieved without paying for it and that a financial effort is necessary, either by direct participation of the users through a loan, or by a tax, or by paying a fair price for the water.

In short, what is required is a substantial effort in information and propaganda work. This cannot fail to reinforce the universally expressed desire of country-dwellers for better conditions, more comfortable and healthier housing, and the lightening of needlessly burdensome household tasks. It should not be forgotten that in the many surveys carried out the women questioned were almost always the first to be in favour of a domestic water supply.

Everything possible should be done to develop and multiply the water supply systems, which help to improve hygiene, to give a fresh impulse to agricultural production, to raise the living standard of the farmer and to attract workers to the land.

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.

Editor, *The Modern Review*.

ENGLISH

BULLETIN OF THE BARODA MUSEUM AND PICTURE GALLERY (Vol. IX, Parts I-II, 1952-53): Edited by V. L. Devkar. Published by V. L. Devkar for the Baroda Museum and Picture Gallery, Baroda. March, 1955. Pp. 96. Price not stated.

The present number of this well-known periodical maintains the high standard of the previous issues. Among the seven papers comprising this number the place of honour belongs to the very valuable article of Dr. H. Goetz entitled *The Early Oudh School of Mughal Painting: Two Albums in the Baroda Museum*. Introducing his paper with a short critical account of the evolution of Mughal painting from the "Classic Age" through the "Aurangabad period" to the times of the later Mughals, the author describes two sets of miniatures originally forming as many albums with separate book-covers which "shed a most revealing light just on the critical transition period from the last years of Muhammad Shah to the reign of Asaf-ud-daula of Oudh." The description consists of a detailed examination of the miniatures under two heads, namely, the older miniatures and the copies and the miniatures of the early Oudh type arranged in five groups, and it concludes with a survey of the general characteristics of the pictorial art of the times. "The Oudh School under Shuja-ud-daula," the author sums up, "represents the last Golden Age of Mughal painting, a late, second-hand mannerism but of a greater decorative effect than the classic style of the 17th century, and with a genuine contribution both in the symphonic composition of complicated scenes and in the romantic interpretation of nature. The Baroda albums show its genesis . . . its flourishing . . . and even its decay." In another paper, Dr. P. H. Pott of the Ethnological Museum, Leyden, gives us a bird's eye view of the Tibetan and Nepalese collections of the Baroda Museum, dividing his subject-matter under six heads, namely, the Tibetan painted scrolls (*thangkas*), the three-dimensional Mandalas, the bronze figures of gods, saints, and demons, the sculptures in stone, wood and ivory, the industrial arts, the decorative panels from Nepal. A set of the Ramayana illustrations of the Pahari School representing scenes from the Rishya-Sringa legend which agree curiously enough with the Bengali version of Krittivasa, forms the subject of another interesting paper from the pen of Sri O. C. Ganguly. A group of seven Jaina bronzes unearthed from a site in the Panch Mahals district is dealt with by Sri U. P. Shah. Of more general interest are the papers of Sri V. L. Devkar entitled *A Scheme for the Municipal Museum of Amreli* and of Sri B. L. Mankad called *Different Modes of Exhibiting Coins in*

Museums. These are followed by the report on the working of the Baroda Museum for the year 1952-53. In between the last two we have a list (which is singularly inappropriate for a first-class journal of this nature) of the opinions of visitors as well as those of scholars and the Press on the activities of the Museum. The frontispiece and the concluding pages are adorned with a number of superb illustrations which add greatly to the value of this issue.

U. N. GHOSHAL

LAND REFORM IN NEW CHINA: By Dr. B. N. Ganguli. Published by Ranjit Printers and Publishers, Delhi. Price Re. 1-8.

People's China has been making history almost from its birth in October, 1949. The Agrarian Reform Law promulgated on June 30, 1950, is one of its most remarkable achievements. The Law does not abolish landownership as such. It abolishes "the land-owning system of feudal exploitation by the landlord class" (Article I). China's land policy is not a blind imitation of Soviet Russia's. Fortunately for the former, her new rulers are not lotus-eaters. They are, on the contrary, matter-of-fact realists endowed with a sturdy common sense. They "seem to be anxious to avoid blind mass action which had led to economic chaos and dislocation and destruction of property, agricultural equipment and livestock in the Soviet Union."

Land reform is but the first step towards the reorganisation of agriculture. The peasantry must pass through various stages "in order to reach higher and higher levels of per capita productivity as the result of more and more intensive co-operation." These stages are those of (1) Temporary Mutual Aid Association, (2) Permanent Mutual Aid Association, (3) Agricultural Producers' Co-operative and (4) Collective Farming.

Surplus agrarian population is the basic problem of China's rural economy. The problem is being tackled by (a) the removal of technical handicaps to progressive agriculture, (b) the creation of better employment opportunities, and (c) the absorption of the surplus agrarian population in the tertiary sector of the economy and in occupations which offer supplementary employment to farmers. Results obtained are encouraging.

Prof. Dr. B. N. Ganguli, the author of the volume under review, has placed the reading public under a deep debt of gratitude by producing a readable volume on New China's land policy, its character and its goal.

SUDHANSU BIMAL MOOKHERJEE

THE BOATMAN BOY AND FORTY POEMS: By Sochi Raut Roy. Published by Prabasi Press, 120-2 Upper Circular Road, Calcutta-9. December, 1954. Pp. 158 + x. Price Rs. 6.

It is only poetry that can stir the hearts of people. Gandhiji was a poet, not of words in the usual sense of the term but of action. And it is because he was a poet that his words which came out of the depth of his heart could call forth response in the breasts of the millions.

We have seen a movement of modernism in literature. It is a reaction against the ideas and ideals of the nineteenth century, against the smug self-satisfaction of the Victorian period. The modernists are in revolt against romanticism and idealism. They try to be objective and realistic. Their approach to any subject is more or less intellectual.

This movement of modernism has found its way from West to East. The modernists of India are almost a replica of those in Europe, though the condition of the country at the time modernism was imported into India was very different from that of Europe. India has indeed suffered tremendously from, but was only indirectly hit, by the world-wars. A great revolutionary movement was in the offing and India was trying to break the shackles of a tyrannical foreign rule.

As a result of the two world-wars, there was almost a complete change in the outlook of life. The modernists were cynical and satirical. They were against tradition. They were against social evils. They were against the social system that tended to oppress the poor and the down-trodden. The old order of society must be changed, and they were speaking of new values in life and literature. The modernists of India were up against everything, but the strangest part of it was that the political struggle that was going on in the country and reaching a climax could not arouse any corresponding feeling in their heart. The literature that the modernists produced at the time, with some rare exceptions, will bear witness to the fact. It was rather the romantic poets who sang of the wonderful revolution that was going to make India free and establish her in her pristine glory.

Sochi Raut Roy hails from Orissa. "He has spent so many years of his creative life in Bengal that he is a veritable adopted son of Bengal," Dr. Kalidas Nag writes in the Introduction. "Raut Roy is interpenetrated with the genius of Bengal while he remains the outstanding Oriya poet of the new age." Sochi writes in the language of the people, in Oriya, the language of Orissa. He also composes poems in Bengali. Dr. Nag observes, "Such bilingualism is very rare amongst modern writers." As is evident from this book of verse. Sochi also writes in English. Hence, he may be said to be trilingual.

There is also an introductory note to the first section of the book, "The Boatman Boy," by Harindranath Chattopadhyay, under the caption of Translator's Notes. Sri Chattopadhyay holds some strong views about poetry and the mission of modern poets. Wordsworth had his opinion about poetic diction and the subject-matter to be dealt with in poetry. Wordsworth was a great poet in spite of his theory. His theory has been exploded but his poetry remains. Harindranath Chattopadhyay has his own opinion about the new values and false values of art. Whatever views and opinions he may have of art, he is a real poet. The poet-leader, as Dr. Kalidas Nag calls Harindranath in the Introduction, greets Sochi as "a young bugler of art."

The shooting and bayonetting of Dhenkanal boatmen, who were carrying on a peaceful and non-violent agitation for the assertion of their elementary civil rights, took place in 1938. Baji Raut, a boatman boy of barely twelve, born in the Native State of Dhenkanal, Orissa, fell a victim to British bullets. Sochi sang of this young martyr, and "this song," in the words of Harindranath, "caught on—even as flames catch on in a forest—lighting up all the night with its lurid glare."

The poems celebrating the martyrdom of the Dhenkanal boatmen from Roy's books *Baji Raut* and *Ahijan* were rendered into English by Harindranath Chattopadhyay. The volume published in 1942 under the name *The Boatman Boy and Other Poems* introduced Sochi Raut Roy to the wider public of India. These poems form the first section of the book. The poems included in the sections 'Pandulini,' 'Abhigyan' and 'Apocalypse' were rendered into English by B. Sinha, and two other poems were translated by Protap Bonnerjee. The book under review contains Raut Roy's original poems in English as well as these translations.

Growing up in an age of disillusionment Sochi Raut Roy speaks in the accent of modern times. He breathes the modern spirit, but he is not wholly a modernist, even as Harindranath Chattopadhyay is not wholly a realist. The latter sees the vision of a new humanity, and an idealist must have an undercurrent of romanticism in his poetry. It is good that a poet should identify himself with the common suffering man, but it is the way he expresses himself that makes him a poet. It is not because he deals with such subjects as 'Bread,' 'Food' and 'Gallows' that Sochi Raut Roy is a poet, but because he writes such lines of poetic intensity as the following that he is a poet:

I stand and dream of the day to come
When men shall rise out of martyrdom,
Rise in the dawn of freedom when
A new red sun and my poet's pen
Shall sign the charter of Man for Man.

In his 'Ode to Man' he sings:

All hail!

Greetings of the Dawn.

I sing the epithalamium of darkness and light,
To man I inscribe my muse.
His ardent love of man and nature makes his
poems instinct with beauty. In 'Overture' he writes:
Over distant tree-tops

come the sweet strains of the new rains;
In sudden bursts of the crashing drums,
cymbals untold, clanging,
an overture that tugs at the heart.

'A Crossing Over' is a poem with beautiful imageries:
We are a shooting star,
From earth catapulted
Faster and yet faster

To a new horizon,
A bigger life.

A dream unravelled.

The poet brings in a new vision of life in 'Cloud-burst.' In 'Apocalypse' he says:

I wait for the diapason word.

The Signature—

Soham.

I am He and Everything.
The origination and the end.
The seed, the fruition eternal,
Alpha and Omega.

Symbolism is a trait of his later poems. Like other modern poets Roy makes use of symbols very skilfully. His poetic philosophy of life and death has been expressed through symbolism. His love-poems border sometimes on the sensuous, sometimes on the sublime. His emotive power makes his poems pulsate with life. His phrases are sometimes very exquisite. He does not generally twist language to make his phrases vivid.

The liquidness of diction and the rhythmical throb in such lines as

The angling merlin's silver call
drops from the dark blue heaven
Like pearls falling into a deep dark well,

Or
In the ballet of moonlight and midnight-shade
The tree murmurs,
Whispering notes in low octaves,
will easily enchant the reader's heart.

Such pieces as 'A Crossing Over,' 'Apocalypse,' 'Cloud-burst,' 'Cloud-symphony,' 'The Fisherman,' 'Overture,' 'Music of the Spheres' and 'The Joy of Living' have poetry enough in them to satisfy any fastidious connoisseur of poetic art.

Sochi Raut Roy is already regarded as a leading poet of Orissa. Through these verses he will find an international recognition of his poetic talent.

SAILENDRAKRISHNA LAW

TALKS ON JNANAYOGA: By Swami Iswarananda. Published by the author from Sri Ramakrishna Ashram, The Vilangans Trichur, Cochin. Pp. 123. Price Rs. 1-8.

Swami Iswarananda is a learned and thoughtful monk of Sri Ramakrishna Mission and the present President of the Mission Centre at Trichur. Many years back we lived together for a pretty long time as members of the Philosophical Study Circle at Sri Ramakrishna Ashrama, Mysore. There we noticed that he is very fond of philosophical thinking and values thinking much above reading.

The book under review is his maiden work and contains a series of talks on the rational interpretation of the Jnanayoga. The author confesses in the Preface that he presents the Upanishadic Brahma-Vidya shorn of the mystical and theological accretions. There is a school of thinkers in Mysore and other parts of South India who hold that *mula avidya* or original nescience ceases to exist in *sushupti* or dreamless sleep. The present author belongs to this school and attempts to show in this book that *sushupti* and *samadhi* are identical and supports his statement by suitable quotations of the Upanishads with commentaries of Shankara thereon. The Brihad-aranyaka, Chhandogya, Taittiriya, Prasna and Mandukya Upanishads are repeatedly quoted to prove that *sushupti* and *samadhi* are similar states of non-dual experience of the Absolute or Brahman.

The book is divided into two parts. The first part contains twenty-one expository talks on the subject and the second one supplies profuse quotations from the five Upanishads mentioned above. The quotations are given in original Sanskrit followed by English renderings to enable the readers to understand the textual significance. There is an apophoristic statement in the Chhandogya Upanishad which means that the philosophy of deep sleep is the key to the realisation of Brahman. In the lengthy introduction to my English translation of the Brihadaranyaka

Upanishad published by Sri Ramakrishna Math at Madras, I have clearly shown that Sankara and his worthy disciple Sureswara both hold that ignorance does exist in deep sleep in the seed-form.

We may or may not agree with the author, but we must admit the novelty of his interpretation and the boldness of his presentation. Even the orthodox scholars will hold their breath to challenge him and will hesitate to contradict him. It is left to the readers to read the exposition and speculate for themselves. The book is sure to stimulate philosophical thinking in a quite new way.

SWAMI JAGADISWARANANDA

INTRODUCTION TO CIVICS AND POLITICS: By S. K. Lahiri and B. N. Banerjee. Published by A. Mukherji and Co. Ltd., Calcutta. Pp. 151. Price Rs. 2-8.

This is the sixth edition of the book with additional sections based on the Constitution of Free India and the Charter of United Nations. Civics and politics are now very popular subjects with the students of our Universities. Many text-books have been written on these subjects. The present book unlike ordinary text-books deals with the subjects in a manner suitable for studies by persons other than students as a preliminary study to understand and interpret current political trends including international affairs. The book contains twenty-three chapters and touches about all aspects of political thought and theories from individual and society to world order—the United Nations. We would commend this book to the public interested in politics.

A. B. DUTTA

BENGALI

DESHER KATHA: By Bimal Chandra Sinha. Published by Apurbakrishna Chatterji, 59, Barrackpore Trunk Road Calcutta-2. Pp. 174. Price Rs. 3.

The author in six chapters, viz., 2nd October (Mahatma's Birthday), 26th January (Independence Day), Congress Bengal and the Bengali, Our Draft Programme of Work and Gandhism, and Hindu-Muslim Problems, discusses various burning topics of the day. India today, particularly West Bengal, has a good many problems to tackle and solve but many attempts have failed to arrive at solutions. But there must be solutions if the nation is to survive and march ahead with other progressive nations of the world. Although a Congressman, the author is not blind towards the faults of the Congress, be it ideological or organisational, but he deprecates any attempt which confines its activities to criticism only. He discusses every problem as a realist and wants people not to be satisfied with adverse criticism of the present but to apply themselves to work and activities so as to improve the condition of the masses. He tries to bring an impartial mind to discuss and decide all burning political and economic questions now facing the country and its people. The author, though young, has already taken his place among the builders of Free India and his contribution to literature is happy and the present book maintains his popularity and reputation as a thinker of young Bengal. Printing and get-up of the book are excellent.

A. B. DUTTA

TO THE YOUTH OF INDIA

By

SWAMI VIVEKANANDA

The object of this publication is to bring within the easy reach of our student population a small, cheaply-priced yet representative selection of the Swami Vivekananda's message to the sons and daughters of India.

ADVAITA ASHRAMA

4, WELLINGTON LANE, CALCUTTA-13

GUJARATI

PRALAYA: By Ramanlal V. Desai, M.A. Published by R. R. Sheth & Co., Bombay-2. 1950. Illustrated jacket. Thick card-board cover. Pp. 433. Price Rs. 5-8.

Shri Ramanlal Desai has two dozen novels to his credit. The one under notice adds one more to it. It is concerned with the coming annihilation of the world (*pralaya*). The first Global War of 1939 gave him the idea and his imagination based on National and International Policy—he calls it *Idiocy*—leads him to forecast wholesale destruction of humanity if we are to proceed at the present rate. The International background is a new element introduced in the novel-writing craft of Gujarat. Whether it takes on or not is a question, as few writers study these matters so well as Shriji Desai has done.

BRAHMA ATITHI: By Prof. Hasit Buch, M.A. Published by Jayadev Brothers, Baroda. 1947-1950. Paper cover. Pp. 42. Price Re. 1.

Prof. Buch has struck out an original path in honouring the Kavi Nanalal, the premier Poet of modern Gujarat who died a short time ago. He portrays a conference of souls of all writers of eminence, old and new, in the court of Brahma, where Nanalal is sent for twice, but the messenger returned with the message that he said that he had yet to complete his *magnum opus* and is not ready to come to Paradise. The third call, however, was successful and he came to the conference, never to return. It is a promising and a unique work for a beginner and deserves great credit.

K.M.J.

GITA-PRAVOCHANO: By Vinoba Bhave. Published in translation from the original in Marathi by Navajivan Prakashan Mandir, Ahmedabad-14. Pp. 12 + 292. Price: Unbound Re. 1, Bound Re. 1-8.

Vinoba has sought, as none else except Jnaneshwar, to reach the Gita to the common man. And he has succeeded eminently. His is a commentary for the lay man. But none the less original, none the less erudite. He has avoided scriptural terminologies as far as has been possible without sacrificing the scriptural approach. Vinoba has given *vikarma* a meaning other than the accepted one. All the recognized commentators have interpreted *vikarma* as *pratisiddha karma* or prohibited work. Vinoba interpreted *vikarma* as *vishesh karma* or tuning the inner man with the external action. The interpretation is unique as it is revealing.

Take Slokas 24, 25 and 26 of Chapter VIII. "This allegory baffles many," writes Vinoba and then proceeds to give an illuminating commentary. It satisfies reason. It gladdens heart. Vinoba's key is not tuned to a particular note. Life to him is not a single-stringed harp. He does not subscribe to *keval-vad* or 'Only'-this view. He says, "I don't like subscribing to the view that regards life only as action, only as devotion or only as realization. . . . I would rather say, 'What is action is devotion, and what is devotion is realization'."—Chapter XVI, paragraph 11.

I may not multiply such instances. That is for the curious to seek, find and enjoy or reject. The book is nowhere heavy and reads like a romance. It gives the soul peace and tranquillity—lasting peace and tranquillity. A great book. The translation is faithful and printing tidy.

BIRENDRANATH GUHA

RECORD RETURNS

FOR 1954

Built and developed all these years as a national institution, the HINDUSTHAN has now gained even greater stature, acquired new laurels and has established a glorious record of teamwork in the service of the country. This has been achieved because of its triple foundation in—

Jagaddala Monastery

A SEAT OF LEARNING IN MEDIAEVAL INDIA

Mahesh Kumar Moondhra writes in *The Indian Review* :

Taxila, Nalanda, Valabhi, Vikramsila, and Jagaddala were some of the most distinguished seats of learning in ancient and mediaeval India. Having a reputation for their high academic activities in the contemporary world these monasteries attracted the students and scholars from every nook and corner of our vast country. Even the students from abroad also visited these institutions.

The rulers of the Pala dynasty of mediaeval Bengal and Bihar were great patrons of art, literature, and education. They patronised a large number of monasteries of the Buddhists which included, apart from Nalanda and Vikramsila, Traikutak, Devikota, Sannagar, Phullahai, Pattikeraka, Vikrampuram, Jagaddala and many others.

In the year 1897, the late MM Pandit Haraprasad Sastri discovered in Nepal the manuscript of *Ramacharita* by Sandhyakara Nandi. This work was written during the reign of Madanapala Deva, the second son of Ramapala Deva. It helps us to know the history of Bengal and Bihar between the years 1070 and 1120 A.D. Sastri edited the manuscript for the first time and the Asiatic Society of Bengal published this work in 1910. Afterwards in 1939 a new edition of it was published with English translation and notes under the joint editorship of three competent scholars, viz., Drs. R. C. Mazumdar, R. G. Basack, and Pt. Nanigopal Banerji, by the Varendra Research Society, Rajshahi.

According to Sastri, Jagaddala monastery was situated in the town Ramavati. But other scholars hold that according to *Ramacharita* (8/7) the monastery was at Varendri. It has been maintained that Ramapala Deva, the famous ruler of Pala dynasty, had established this monastery. As regards the period of his reign scholars hold different views. The date which is now generally accepted by the authorities is that he ascended the throne in the year 1077 A.D. and his death occurred in the year 1120 A.D. when he was about seventy years old. Thus he ruled for nearly forty-two years.

The Palas were the followers of the Mahayana sect of Buddhism and had close relations with Tibet. The art and literature of this period is stamped by the Tantrism which prevailed in the land of the Lamas. Scholars of both the countries crossed the frontiers frequently. The Jagaddala monastery under the royal patronage became one of the centers of gravity for the scholar and the student alike who wanted to study the Mahayana philosophy and Tantrism specially. Many books were translated in this monastery from Sanskrit into Tibetan.

The scholars of Jagaddala were famous for their writings on various subjects. Among the large number of professors who worked there four names are out-

standing—Danasila, Vibhootichandra, Mokshakar Gupta, and Subhakar Gupta. Their fame was not limited within the frontiers of our country but it spread far and wide. These scholars earned a great reputation even in Tibet. Short sketches of the activities of the four great pillars of Jagaddala monastery are given below :

(1) Acharya Danasila : Acharya Danasila was a resident of Bhagal in the eastern part of India. Mahapandit Rahula Sanskritayana, a modern scholar, holds that Bhagal was the modern Bhagalpur. The mediaeval writer Taranath in his famous work *History of Buddhism in India* has expressed that Danasila hailed from Kashmir and was a contemporary of Mahipala. However, it is beyond doubt that he lived and worked at Jagaddala. He was honoured by the titles of Mahapandita, Upadhyaya, and Acharya. He had a good command over Sanskrit as well as Tibetan. He is said to have translated nearly sixty books into Tibetan which had greatly influenced the Buddhist religion in that country. His translation also included a small book named *Pustak-Pathapaya* in which was shown the way of starting reading.

(2) Mahapandita Vibhootichandra : He was another famous scholar at Jagaddala. He received the famous book named *Jnan-chakshu-sadhan-nama* from Sakya Srihadra, the reputed logician of Vikramsila, who after the destruction of that monastery sought refuge at Jagaddala. Having stayed there in the monastery for a short period, he went to Tibet, probably accompanied by Vibhootichandra who had a good knowledge of Tibetan language. Vibhootichandra translated many important works into Tibetan.

(3) Bhikshu Mokshakar Gupta : He had to his credit the titles of Bhikshu as well as Mahapandit. He was at home in logic and wrote a book entitled *Tarka-Bhasa* in Sanskrit which was translated into Tibetan later on. Perhaps this Bhikshu Mokshakar Gupta is the same person who had annotated *Doha-Kosha*, an Apabhramsa book.

(4) Subhakar Gupta : He is said to have been the teacher of Sakya Srihadra. He wrote *Shiddhayakavira-tantratika* which was rendered into Tibetan also.

The successors of Ramapala Deva could not enhance the cultural activities any more. About 1203 A.D. the monastery was destroyed by the Moslem invaders.

Thus we see that Jagaddala monastery could continue its activities nearly for a century only. But the work done by its giants and jewels which it produced are more than enough to maintain the glory of the monastery in the annals of Indian letters and culture.

African Cultures

Possible Links Between Indian and

The concluding portion of the suggestive article of N. Court in *The Aryan Path* is published below :

Students of anthropology believe that in early times the Negroes lived in southern Asia, between Indo-China in the east and Persia in the west. They were agriculturists by occupation. As time went on other people notably the Aryans—of the great white race who came from the Middle East—entered the area, bringing with them that culture which is still, except where it is affected by Dravidian influences, the heritage of India. Hindi and many other Indian languages are related to European ones, Sanskrit being accepted by many philologists as the mother tongue, as it were, from which the languages of the West—Teutonic, Celtic, Latin and Slavonic—are derived. It is also believed that there is a strong link between English and Hebrew, and Welsh and Hebrew, especially the latter.

The Negroes, or rather their remote ancestors, were pushed out to east and west, when the great Aryan drive southward took place. One branch, it is believed, proceeded to Melanesia (the Islands of the Black People) in the Pacific Ocean and to New Guinea; the other, to Africa. Were these people Dravidians or pre-Dravidians? I am inclined to the belief that they were pre-Dravidians who had for some considerable period lived in a Dravidian environment. This is evident from a study of comparative religion in India, where we observe that pre-Dravidian theology or mythology, call it what you will, became absorbed quite naturally into the Dravidian culture. After the Aryan invasion, this new combination, which in the course of centuries had become blended as it were, wedded itself to the faith of the conquerors to produce the Hindu system as it is today.

In support of the Indian (pre-Dravidian) origin of the African we have a fair amount of ethnic proof, e.g., little groups of Negro-like people known as Negrillos and Negritos in Malaya and the islands in the Indian Ocean exist as separate and distinct entities to this day. This fact alone ought to set us thinking.

I would state here that two significant facts indicate the non-African origin of the Negro, namely, that there is not extant among the paintings of the Bushman or pre-Bushman peoples of Africa one single portrayal of the Negro; and it is known that, before 3000 B.C., there were no Negro burials except in Egypt, where the body of one, said to have lived 5000 B.C., was discovered by the side of a lake. It is believed that groups of Negroes became mixed with the Mediterranean peoples living in north Africa, giving birth to

the Bantu (the name means "The People"), who, on moving gradually south, broke up into tribes, until they met and clashed with the early European colonists in the Cape territory.

In the folklore of the Southern Bantu people there are several very significant animal personalities possessing divine or devilish potentialities. One of these *Impundulu*, a bird which, besides its sadistic inclinations, is alleged by Africans to be the most powerful carrier of witchcraft. Having the ability to change its appearance at will, it is also able to make itself invisible on occasion. It often, more often than not, associates with *Tikoloshi*, the god of witchcraft, described as a dwarfish little man with short limbs and a powerful, thick-set body. This mythical creature is said to ride through the sky on *Impundulu's* back, carrying in his hand the *Ingumbane* (evil snake) and the *Uganya* (charmed snake), collectively called *Inyoka* (snake).

Now, it seems that *Impundulu* is the counterpart of the Indian divine bird *Garuda*, the attendant of Narayana, on whose back Vishnu rides. *Garuda* belongs to that older and more "childlike" mythology of the earlier inhabitants of India, a culture steeped in symbolism, in which the animal largely figured. *Garuda* seems to have been either Dravidian or pre-Dravidian in origin. In Indian sacred art, which I deeply appreciate, *Garuda* is portrayed as a man-bird in whose one hind claw is grasped the snake. As Jehovah, the Lord God of Israel, is spoken of in *Psalms* 18, 10 and 104, 3 as moving on the wings of the wind, the great God of the Hindus, Vishnu, "clad in yellow robes, bearing mace, discus and conch," is described in the *Ramayana* as riding upon *Garuda*.

MAN IN INDIA. It is far from the traditional text books which give bewildering details about kings, dynasties and battles.

INDO-ASIAN CULTURE...Author's mode of treatment of the subject is refreshing.

TRIBUNE...presents in a simple and lucid style an account of India's great part, of the unique spiritual achievement of the people, their influence in the East and West, and their discoveries in the realm of science, medicine, chemistry and the other sciences.

INDIAN NATION...The much neglected aspect of Greater India has been dealt with in a light that is entertaining and instructive.

MODERN REVIEW...Deserves full credit.

INDIAN REVIEW...A book of absorbing interest revealing the depth and breadth of Indian thought in ancient history.

TRIVENI...a remarkable achievement

BHARAT JYOTI If one has the necessary patience one is apt to be rewarded in reading through the book.

HINDU...Devoted special chapters to scientific development.

ARYAN PATH...The materials packed within the book reveal the long and arduous work undertaken by the author.

INDIAN EXPRESS. The aim of the author is amply fulfilled.

L. RENO, France You have succeeded in giving a comprehensive survey of every element of importance contributing to the greatness or singularity of Indian Culture.

JOHN NOBLE, Germany. The chapters on Indian Science and Indian Culture abroad are very useful as these subjects have been neglected in many histories of India.

W. KIRFEL, Germany...Contains many matters which are not narrated elsewhere in this clearly arranged manner.

VORA & CO. PUBLISHERS LTD.

3, Round Building, Kalbadevi Road,
BOMBAY 2

In *The Secret Doctrine* (I, p. 421, a likeness between Vishnu and Jehovah, the Lord God of Israel, is brought out. Madame Blavatsky in Vol. II, p. 253, asks the pertinent question:

"Were the highly philosophical and metaphysical Aryans—the authors of the most perfect philosophical systems of transcendental psychology, of Codes of Ethics, and such a grammar as Panini's, of the Sankhya and Vedanta systems, and a moral code (Buddhism), proclaimed by Max Muller the most perfect on earth—such fools, or children, as to lose their time in writing fairy tales; such tales as the Puranas now seem to be in the eyes of those who have not the remotest idea of their secret meaning?"

Vishnu's and Krishna's vehicle, the great bird *Garuda*, the cherub of Jehovah, the *Impundulu* of the Bantu, have a significance of universal application.

Now, the Secret Doctrine furnishes a key which reveals to us on indisputable grounds of comparative analogy that *Garuda*, the allegorical and monstrous half-man and half-bird,—the *Vahan* or vehicle on which Vishnu (who is Kala, "time") is shown to ride—is the origin of all other such allegories. He is the Indian phoenix, the emblem of cyclic and periodical time. . . . (*The Secret Doctrine*, II, p. 564).

The Bantu "dowry" system known as *Lobola* establishes the truth that the woman is loved and cherished by the African. In India the Mother Cult is well known, and I shall refer to it presently in another connection.

The rite of circumcision amongst the Bantus, known as the *Abakweta* or Male Initiation Ceremony, has elements of Hamitic and Semitic customs as well as those of the ancient Phallic religions known as the Nature Cults. But curiously enough a link with pre-Aryan India seems to be indicated in the *ubulungu*, a necklace made from the long hair of the cow's tail which is placed round the neck of each initiate. It is regarded as a charm against evil because it comes from the cow, the emblem of purity, health and virility. As the cow is symbolic of motherhood also, the Bantu believes that the possession of this token will ensure his sexual potency when at this ceremony he reaches manhood. Need the writer mention in much detail what the cow means to the Hindu? All the world knows this. By many millions God is worshipped as the Mother and all these worshippers speak of God as She. Says Shankaracharya of her with whom Shiva seeks shelter:

It is She,
Whose words are sweet,
The Destructress of ills,
Ever and in all places pervading,
Tender creeper of intelligence and bliss.
The Mother exceedeth a thousand fathers in the
rite to reverence, and in the function of teacher.
(*Manu*)

Whosoever has seen the feet of woman, let him worship them as those of his teacher. (*Kubjika Tantra*)
In both the Hindu-Indian and the Bantu-African cultures, then, women are regarded as worthy objects of respect and reverence.

I am quite unaware whether or not any other exposition of this theory has ever been put forward, but that Africa is as much linked to India as western Europe is, is my conviction based on a study of ethnology, mythology and comparative religion for many years. I present it for what it is worth, dedicating it to my Indian and African friends.

Mountainous India

C. Vishwa Nath writes in *Careers and Courses* :

The mountains in India can be classified into (1) mountains of Peninsular India, and (2) mountains of Extra Peninsular Region. The mode of origin in either case is different. Starting from the south let us go ahead in our survey.

RANGES OF PENINSULAR INDIA

The mountain ranges of the Peninsula comprise the following :

- (1) The Western and the Eastern Ghats,
- (2) Aravalli mountains,
- (3) Vindhyan ranges,
- (4) The Sethpurus.

The *Western Ghats* flank the western shores of India, and run in an unbroken range of hills to the south of Malabar, where they merge with the Nilgiris. Their mean elevation is 3,000 feet above sea level and are formed out of the Deccan lavas which poured forth over nearly half a million square miles towards the close of the middle ages, or about the beginning of the later ages of the earth's history or about the same time when the Himalayas were first uplifted from the bed of the sea. These hills present a "ghat-like" or landing-stair aspect and build flat-topped hills so generally seen in Madhya Pradesh and elsewhere.

They have a very important influence on the climate of the western shores of India. They help to precipitate most of the moisture present in the south-west monsoons blowing from the Arabian Sea during summer. Consequently, this coast has very heavy rainfall and its forests therefore are evergreen. The plateau of the Deccan, which is situated on the leeward receives much less rainfall, just enough in certain places to support grasslands.

Eastern Ghats : They flank the eastern coasts of India and are a much lower range of hills which are broken at places and are irregular. These, unlike their Western counterparts, have a broad coastal plain fringing the hills. The lowly region is, however, more than fertile, where groundnuts, rice, cotton, tobacco and other crops are grown creditably. In fact, on this plain depends the prosperity of the States of Madras and Orissa.

Aravalli Mountains : The Aravallis are three-fold mountains which were elevated to existence in the early ages of the earth's history. They stretch towards north-east for about 400 miles in Rajasthan. Their general altitude ranges from 1,000-3,000 feet above the sea, the highest peak being Mount Abu within an elevation of 5,650 feet lying in the south-west extremity. These hills are generally bare with scanty population. Large areas, that is, the intervening valleys are covered with sandy deposits. Rocky ridges are to be observed near Alwar, Jaipur, etc. Their northernmost extension is to be found in the low isolated quartzite hills seen in the environs of Delhi.

Vindhyan Ranges : The Vindhyas form an interrupted range of hills 2,500 to 4,500 ft. in height. They go to form the northern part of Madhya Pradesh and separate the gangetic basin from the plateau of the Deccan. On the west they rise in Gujarat and fringe the southern edge of the Malwa plateau. They extend further in the Kaimur range and terminate in the Ganga Valley near Banaras. They are composed mainly of sandstones of red and other hues, which are largely used in architectural structures of all dimensions in India. The beds are a little disturbed; on some places they are almost horizontal.

The Satpuras : The Satpuras literally seven folds, form a range of hills between the Tapti and the Nerboda in Central India. The high plateau of Amarkantak is the starting point and the range continues in a westerly direction along with the West Coast. The average elevation is above 2,500 feet above sea, but the Amarkantak plateau is 3,500 feet high above sea. Some of the places however, are still higher. The rail from Bombay to Jabalpur runs through a break in the range just east of the famous hill fort of Asirgarh, the range here is as low as 1,248 feet above sea level. They are about 600 miles long and are composed partly of Deccan lavas and partly of granite etc.

THE HIMALAYAS

Starting from the Naga and Lushai Hills in the east and ending in the Baluchistan range of hills on the west is indeed one mighty chain of mountain ranges.

They are not a mountain chain in the ordinary sense of the word. Immediately to the north of the plains of India, there rise the highest ranges of the world. The southern position of this mass is represented by the Himalayas, while Keunlun represents its northernmost range. In between these mountains is enclosed the bleak plateau of Tibet, about 15,000 to 16,000 feet above sea.

The Himalayas proper are a mighty chain over 2,000 miles in length and 150 to 200 miles in breadth. It has already been remarked that this chain of mountains was first upheaved towards the beginning of the later ages of the earth's history. These mountains were raised by stresses acting from the Tibetan plateau in the north. The slopes of the mountains facing the plains are therefore steep, while those facing Tibet are gentle. These stresses in the form of waves were checked by the Deccan Plateau, the Aravallis and the Salt Range. These ranges actually have been responsible for the bending of the Himalayas. Our knowledge of these mountains is still quite imperfect though in recent years the various Everest and other expeditions have greatly helped in unravelling the geography and history of their evolution.

In general, the Himalayas are a series of parallel but converging ranges intersected by Valleys and big plateaux. It is noteworthy that the Eastern Himalayas rise abruptly from the plains and peaks like Mount Everest and Kinchinjunga are visible from there.

The Western or the Panjab Himalayas rise gradually from the plains and the high peaks being so distant, are hidden from view.

The Himalayas are geographically classified into :

(1) *The Great Himalayas* :—This chain comprises the highest portion of the Himalayas with an average elevation of 20,000 feet. It is therefore, always snow-covered. The highest peaks in this region include the Mount Everest (29,040 feet); Godwin Austen (K 2), Kinchinjunga, etc.

(2) *The Lesser Himalayas* :—The Lesser Himalayas or the middle ranges, which occur below the great Himalayas, comprise the ranges whose elevation does not exceed 15,000 feet above the sea.

(3) *The Outer Himalayas* :—This range of hills, lying between the Lesser Himalayas and the plains, is also called the Siwalik hills which form low foot-hills of the Himalayas, 3,000 to 4,000 feet in elevation above the sea level.

It is very remarkable that the Himalaya possesses a great variety in climate, vegetation and natural products and its inhabitants include different, interesting and varied hill-tribes possessing customs, manners and cultures of their own.

4. *Trans-Himalaya* :—A fourth size still, that is the Trans-Himalaya, is recognised by some geographers. It was discovered by Sven Hedin in 1906 and its central part is 140 miles in width which lessens to about 20 miles at the eastern and western ends. Its length is 600 miles. S. Hedin stated that the mountain ranges are ill-defined and confusing. This region forms the watershed draining into the Bay of Bengal and those flowing to the north into the enclosed drainage depression. It is crossed by a number of high Passes, their average altitude being 17,500 feet, although Ding La is higher than 19,000 above the sea.

WATERSHED

It may be noted that the highest peaks occur on the southern side of the watershed between India and Tibet and are about 100 miles from the plains. The average elevation of the watershed is more than 18,000 feet above sea, whilst the passes linking India with Tibet about 16,000 above sea level.

Himalayan Valleys :—The Himalayan chains are separated by longitudinal valleys, sometimes hardly 3,000 feet above sea. Thus from the valleys at about that altitudes almost with tropical heat to cross with perpetual snow exceeding 25,000 feet above sea level, is stretched a complete range of vegetation of the world from the tropics to the polar regions. From these valleys a panoramic view of some of the stupendous peaks of the Himalayas, about 25,000 feet or more in elevation and unexcelled in the whole world, is to be had. Two valleys, in this connection deserve special mention : (1) The beautiful vale of Kashmir, and (2) the valley of Kathmunda in Nepal. They are extensive fertile valleys both in length and breadth, and especially in the case of Kashmir it is surmised that it originally represented a lake, the waters of which have desiccated in recent times the shrunken remnants of which are represented by the Wular and the Dal Lakes.

REGIONS OF THE HIMALAYAS

Sir Sidney Burnard has sub-divided the Himalayan range into the following four regions :

(i) *The Assam Himalaya* :—from the Tista to the Brahmaputra river. This comprises the region between the peak of Namcha Barwa, 25,445 feet above sea in the Mishmi country, where the Brahmaputra forms a bend to cut across the Himalayas and the Tista river. It is 450 miles in length and includes the Kula Kangri

group of peaks 24,784 feet above sea and the Chano Lhari, 23,997 feet only. The geological and structural features indicate that the Himalayas extend beyond Namcha Barwa and take a sharp turn to continue southwards into Burma. It is noteworthy that the Assam Himalayas have a very rapid rise from the plains; the foot hills are narrow and the Sub-Himalayan region is comparatively lower than in the west.

(ii) *The Nepal Himalaya* :—This region extends for a length of about 500 miles and represents the portion between the Tista on the east and the Kali on the west. It includes some of the notable peaks like Kinchinjunga (28,146 feet), Mount Everest (29,040 feet), Makabe (27,790 feet), Annapurna (26,992 feet), Gosainthan (26,291 feet) and Dhaulagiri (26,795 feet) above sea level. It is noteworthy that the Great Himalayan range has a southward curvature and Kinchinjunga makes the southern most point of the Nepal Himalaya trend to the W.N.W. while to the east of it, the bend of the Assam Himalaya is E.N.E.. At the Brahmaputra, the trend almost becomes north-easterly. Near Dhaulagiri the range bends and bifurcates and a branch extends towards the north. Near Nampa there is another bifurcation of the ranges. It may be stated that in all the other Himalayan bifurcations, the more northerly extension has been considered as the continuation of the great range, but in this case, the southerly branch with the peaks of Nanda Devi and Badrinath has been regarded as the Great Himalaya, while the northerly branch with Kamet and Riwa Pharyul has been called the Zaskar range.

(iii) *The Kumaun Himalaya* :—The region has a length of 200 miles and is bounded by the Sutlej on the west. The range bifurcates at Badrinath and at the Sutlej, and the highest peak is Nanda Devi, 25,645 feet in altitude. It includes the well-known districts of Naini Tal, Almora and Garhwal. It is said that once this region had about 360 lakes, some of which have completely or partially desiccated. There certainly seems to be some truth in the legend because even today, a number of well-known lakes like the Naini Tal and Bhim Tal occur. Some of the well-known peaks of this region comprise Nanda Devi 25,645 feet, Badrinath 23,190 feet, Kedarnath 22,770 feet, Trisul 23,360 feet, Mana 23,862 feet, and Gangotri 21,700 feet above sea level. The Dhauladhar range constitutes the southerly bifurcation of the Kumaun Himalayas. It is in this region that some of the noteworthy and sacred rivers of Northern India like the Bhagirathi, the Yamuna, etc., take their source.

(iv) *The Punjab Himalayas* :—This portion lies between the Sutlej and the Indus and is about 350 miles

in length. Owing to curvature the Kumaun and the Punjab Himalayas do not follow the same trend. Towards the west of the Sutlej the altitude of the range diminishes. To its east there are peaks like Kedarnath and Badrinath, both 22,000 feet in altitude. The Sutlej cuts across the Himalaya at its southernly branch named the Pir Panjal bifurcation, to follow its course in the plains. There are few peaks exceeding 20,000 feet in altitude in this portion and the Zoje La Pass is only 11,300 feet above the sea. It is noteworthy that the northern slopes of this range are bare and rugged and enclose plateaux with lakes while the southern slopes are covered with forests and do not enclose any high plains. The Punjab Himalayas are comparatively much dry and consequently the snow-line is much higher. The Jhelum, after following through a very deep gorge, cuts across the Himalayas and follows a somewhat remarkable southerly course through the Potwar plateau. The Himalayas appear to end here in the Indus Valley, but recent researches have shown that they continue across the Indus into the ranges of Afghanistan and Baluchistan. The formation on either side of the bend, too, prove the same.

The Snowline—The snowline is a summer isother of 32° F and marks the lowest limit of perpetual snow. Its height depends on (i) temperature and (ii) amount of precipitation, i.e., the greater the snowfall, the lower the line. The study of the snowline is important because it is the snow which replenishes glaciers, and they are economically important to mankind.

The height of the snowline in different parts of the Himalayas facing South is given below: (A) The Nepal Himalaya 14,700 feet, (B) The Kumaun Himalaya 17,500 feet (C) The Punjab Himalayas 17,000 feet.

THE INFLUENCE OF THE HIMALAYAS

It is certainly true that if these mountains had not existed the Indo-Gangetic plains, which constitute some of the richest parts of India, would have been a desert. It is the Himalayas which intercept the moisture-laden winds coming from the sea and bring about the precipitation of moisture in the form of rain and snow. The latter gives rise to gigantic glaciers which constitute the source of some of the important rivers of Northern India and make them perennial. For the same reason the snowline on the southern slopes is much lower than on the northern slopes of the same mountains. Very little snow will be found in the summer even at an altitude of 20,000 feet on the northern slopes as the air is so dry that no snow can be precipitated, while on the southern slopes the altitude of snowline varies from 14,700 feet in the Eastern Himalayas to about 17,000 feet in the Western Himalayas. But for these mountains, the economic geography of Northern India would have been entirely different. In fact, it would not at all be inapt to remark that just as Egypt is styled the gift of the Nile, the Indo-gangetic plains may be called the gift of the Himalayas and its rivers.

Except on the north-west, the Himalayas form practically an impassable barrier between India and the rest of Asia. With the exception of the north-west, the Himalayas have offered protection to India along her lengthy frontage of about 2,000 miles. Without the Himalayas, the bitterly cold winds blowing from the plateau of Tibet and Central Asia in winter, which happens to be one of the coldest regions of the earth at this time of the year, would have swept over the plains of Northern India. Had it not been for the Himalayas, India would have experienced an extremely cold climate in winter.

MIRACLE MAN WITH UNRIVALLED POWER

Highly Appreciated By George VI King of England.

JYOTISH-SAMRAT PANDIT SRI RAMESH CHANDRA BHATTACHARYA, JYOTISHARNAB, M.R.A.S. (London) of International fame, President of the world-renowned Baranashi Pandit Maha Sabha of Banaras and All India Astrological and Astronomical Society of Calcutta has won unique fame not only in India but throughout the world (e.g., in England, America, Africa, Australia, China, Japan, Malaya, Java, Singapore, etc.) and many notable persons from every nook and corner of the world have sent unsolicited testimonials acknowledging his mighty and supernatural powers. This powerfully gifted greatest Astrologer & Palmist, Tantric can tell at a glance all about one's past, present and future and with the help of Yogic and Tantric powers can heal diseases which are the despair of Doctors and Kavirajias, redressing the pernicious influence of evil stars and planets can help to win difficult law suits and ensure safety from impending dangers, poverty, prevent childlessness and free people from debts and family unhappiness.

Despaired persons are strongly advised to test the powers of Panditji

WONDERFUL TALISMANS

Dhanada Kavacha Or The Rothschild Talisman—for vast wealth, good luck and all round prosperity, honour and fame in life. Price Rs. 7-10. Special Rs. 29-11. Super-Special Rs. 129-11. **Bagalamukhi Kavacha**: To overcome enemies it is unique. Gets promotion in services and in winning civil or criminal suits and for pleasing higher officials it is unparalleled. Rs. 9-2. Special Rs. 34-2. Super-special Rs. 184-4. **Mohini Kavacha**—Enables arch foes to become friends and friends more friendly. Rs. 11-8. Special Rs. 34-2. Super-special Rs. 387-14. **Nrisingha Kavacha**—It cures Barrenness and all sorts of female diseases and saves from devil and evil spirits, etc. Price Rs. 7-5. Special Rs. 13-9. Super-special with lasting speedy effects Rs. 63-9. **Saraswati Kavacha**—Success in examination and sharp memory. Rs. 9-9. Special Rs. 38-9. Detailed Catalogue With Testimonials Free on Request

A wonderful Astrological book in English "MYSTERY OF THE MONTH YOU ARE BORN" by Jyotish Samrat—Deals month by month exhaustively Rs. 3-8.

The Problem of Evil

Leo Hirsch gives the reader ample food for thought and reflection in the following article in *Unity*, January-February, 1955:

Why should there be evil in the world? Why should there exist evil impulses in the human heart? Why should the world be the playground of good and evil forces? We know that there is kindness on this planet but there is also cruelty. The important question is: what can we do about it? Criminologists tell us that many a person commits evil and does it deliberately, knowing that it is evil; that the most wicked crimes are committed with a full realization of the horrible consequences to the victim.

Man, from the time he attained reason and conscience, was deeply concerned with the problem of evil. All the old scriptures have remarkable examples of how seriously man probed and studied this problem and tried not only to find an answer to that riddle but what humans could do about it.

The classic tragedy of Job is an outstanding portrayal of a man who suffered all the tortures of physical pain, loss of material treasures, and the pain of spiritual confusion and instability. He could not understand the loss of health, of his earthly goods, and the loss of children and friends. Job, as interpreted by orthodox thinkers, is a man who was tormented by Satan at God's behest, so that he would learn something about life and, in the end, be rewarded for his suffering. There are passages in the Book of Job that go deep into the soul because they express with magnificent finality thoughts about evil that have always harassed the mind. During his anguish he cursed the day of his birth and complained of life in general. It was not until he clearly realized the challenge of evil, accepted life with all its conditions and responsibilities in a spirit of humility and reverence that he was able to emerge into a state of wisdom and faith.

Christ gave us new insights in regard to evil in man's nature. Christ warns his disciples to be humble and harmless; to avoid offenses and not to despise little offenses. He taught them how to deal with offenders when they offend us and how to forgive them. To him, forgiveness was a supreme virtue.

There is nothing more despicable than the evil displayed by a person who deliberately and coldly betrays his country or a benefactor or a friend.

Much of evil in man's nature can be explained by a lack of development of his spiritual faculty. When man will be granted the fullest freedom of thought and expression and equal opportunity in his political and economic life, then much of that recalcitrant nature will be eliminated.

Euripides, the great Athenian dramatist, wrote tragedy because he saw the eternal conflict between good and evil in the lives of men. He expressed his faith in man by his belief that man in the very nature of his being had the ability to conquer the evil in his breast. In probably one of his greatest choruses he symbolized that faith by "the apple tree, the sunshine, and the gold."

In all periods of great crises, evil is brought to the surface and becomes more violent. We see cruel types of characters and situations, human and social relations, which appear abnormal and subhuman. These events and the men who dominate them generally end in catastrophe.

Men of genius and spiritual insight who lived in these soul-trying times invariably made some contribution to bolster the morale of mankind.

The finest minds in every period of man's life on this planet were concerned with the problem of evil and bore a kind of prophetic relation to the situation of the time. These spiritually minded men recognized as clearly as we do that at times evils multiply in our world and threaten from moment to moment to engulf us—the evils of violence, tyranny, persecution, hatred, bigotry, lust.

From this we may readily infer that the moral order, as we know it, was not revealed to man as the myths of religion declare. Man found his way to the moral order haltingly, by the stern method of trial and error. He discovered through his experience that there are lines of conduct which are good insofar as they made for health, happiness, and life, and other lines of conduct which are evil insofar as they create disease, disintegration, despair, and death. It is through trial and error, through infinite painful experience, that we have learned the intrinsic importance of the individual, of human dignity, the conception of human freedom, the conception of spiritual and moral values. From these hard-won concepts, we have learned that evil in its ethical meaning is to offend against the worth attached to human beings. To deny this worth in man is to deny religion, democracy, and the moral law.

The moral law in the spiritual world, like the law of gravitation in the physical world, is the law which reigns throughout the spiritual universe and is universal in its jurisdiction. Our duty as human beings is to apply more and more the universal spiritual law in our human relations and thus enlarge our destiny and our culture.

In the United States there have been many leaders who were deeply concerned with the problem of evil.

Ayurvedic Treatment of Cancer

By Rajvaidya Kaviraj Pranacharyya

DR. PRABHAKAR CHATTERJEE, M.A., D.Sc. This is an epoch-making book of a far-reaching significance. It is the first of its kind in English language in India. It has been very highly spoken of by all veteran physicians of India as an indispensable guide to teachers, students and physicians alike. Price in India Rs. 10/-, foreign priced Rs. 16/-.

To be had of—

172, Bowbazar Street, Calcutta-12

Some attacked evil in the religious field and some attacked evil in the political and economic areas. Such men as Ralph Waldo Emerson, Theodore Parker, William Ellery Channing, Wendell Phillips, Lincoln Hawthorne, Henry George, Veblen, and others made valuable contributions to this perplexing problem. Phillips and Lincoln had a profound influence in destroying the institution of slavery. Henry George, through his *Progress and Poverty*, left an indelible impression on the American mind for the need to remove poverty from the democratic scene.

Then, too, we must not forget Herman Melville. In *Moby Dick*, Melville took the problem of evil and placed it within the environment of nature and within the framework of industry. He recognized that there were certain cruelties in nature that disregarded the worth in man and that there were certain dictatorial types of men in industry that made of human relations a hollow mockery.

As against these positive forces that have combated evil, America has produced a paradoxical religious movement which denies the very existence of evil. I refer to the Christian Science Movement whose central thesis is that sin does not exist, that there is no such thing really as moral evil, that moral evil, too, like bodily disease, is mere appearance, a mere illusion, and that it, too, can be expunged by stout negation. The same position which the mental healer takes with regard to sickness he likewise takes with regard to sin or moral evil.

If this faith were to spread, it would prevent the mitigation of moral evil in the world, just as their attitude toward disease would prevent the possible cure of physical ills. We ought to recognize that just as there is a medical science based on the assumption that physical disease has physical causes and that these causes may be known and understood, so there is a moral science based on the conviction that moral evil has causes and that by scientific investigation these causes may be ascertained and thus removed. The mental healing method would lead to the abandonment of the medical profession as well as of the social sciences, and to the ignoring of this causal side and it would hinder the most important efforts that can be made for the moral betterment of the world. It is not right to say that moral evil does not exist. Moral evil does exist; it is real, as matter is real, and you cannot get rid of it by denying it.

The cure of the evils of the world, the evils of the slums and poverty, racial discrimination, the religious bigotries, the hatreds, the lies and cruelties cannot be achieved by denying their existence. The Christian Science Movement denies what to me is undeniable: that matter is real and that moral evil is real, and hence all such religious movements are socially

dangerous, unproductive, and sterile on the side of social reform and impede human progress.

We live today in a period which has much in common with the Dark Ages—with its chaos, ceaseless wars, its nightmarish fears, its unbelievable cruelties, its horrible bigotries, its homeless men, women, and children. In one respect we surpass the horrors of the Dark Ages because man has succeeded in creating the most fiendish weapon of destruction in the history of man. It is the therefore of the greatest importance to know and understand who generated the enmity, the hostility that poisons the atmosphere in which we live and is deliberately aimed to destroy the democratic way of life that has been won over a long period of time and at tremendous suffering and sacrifice.

The defiant, self-proclaimed enemy thus far has been the Soviet Communist party. Under Stalin's regime, he was the supreme, absolute ruler, and the Politburo was the principal source and channel of the decisions which

demanded and commanded the blind obedience of the hard core of loyal Communist Party members everywhere in the world. These Communists have absolute despotic political power in Russia and in other parts of the world through their fifth columns. Their method and technique thus far to achieve world domination have been fraud, terrorism, violence, the big lies, and any other diabolical means to promote their ends. Stalin's recent death brought a new dictator into power, viz., Malenkov. He and his advisors have decided on a new course and a new strategy. They have launched new peace gestures. Are they sincere? We have to take these peace gestures at their face value until we ascertain what they mean by them. To the writer they seem to be booby traps deliberately set so as to lull the democratic peoples into a sense of security and thus entice them to lower their guard, decrease their defense measures and their aid to the allies, and thus create a world-wide economic depression that will enable the Russians to deal a death blow. A leopard cannot change his spots and Communism will not overnight change its plans to destroy democracy. The Russians are the victims of their dogmas, their cruelties, their crusading fanaticism, and these cannot shed easily. The habit of men's indoctrinated minds is not easily changed and overturned. Nothing short of a cataclysmic upheaval from within can bring about the drastic changes that will bring world peace.

Soviet Russia is our enemy without. Within our nation we have plenty of enemies who threaten to destroy our way of life by ignoring individual rights and concentrating their activities mainly on material privileges and profits.

In the recent steel strike, we have had evidence of the power of these disintegrating and disorganizing elements. They showed a complete indifference to our boys fighting in Korea, to the stability of our economic structure and to the welfare of our citizenry. From the very beginning, it was known that the major issue in the strike was the price of steel. Management for months pressured the government and its stabilization agencies to accede to industry's demands for higher prices, regardless of the fact that the increase they demanded would let loose another spiral of inflation. They cared little what effect such a strike would have on our economy and our defense program.

Management also created the false issue of the union shop. The union shop was the issue on which the steel magnates chose to hold ground until they had received the assurance of higher prices. Labor and government fell into this trap.

Labor, too, is not entirely guiltless; they, too, ignored the rights of millions of other workers by forcing them into unemployment. They, too, were indifferent to the survival of our economy or the welfare of our soldiers. They could have passed up their demand for the recognition of the union shop until a calmer and more favorable atmosphere prevailed. So the steel strike

was lost by labour, by the government, and by the consumers, and won by the superior power and shrewdness of the steel magnates.

As long as labor and management distrust one another, so long will collective bargaining fly out of the window. Labor through its economists realizes that management is opposed to labor organizations and is unwilling to have labor accountants or government accountants go over their books to reveal to stockholders, workers, and government the exact situation so as to be able to determine profits, prices, and wages. As long as all accountants are not placed under government license, so long will accountants fail to abide by ethical standards. Prices, wages, and profits must always be in equilibrium. When profits are made paramount at the expense of wages and prices, so long will you have strikes and discord. The same applies to labor when it demands a wage at the expense of fair profits and the additional cost to consumers. Human relations must be made the paramount issue.

A democratic labor organization must repudiate its right to paralyze a whole industry and the entire nation by coercive measures. The paralyzing power now exercised by the union should not be possessed by any minority group. That holds true with management as well. In a democracy, ownership and management must not be permitted to paralyze the entire industry because it is determined to force labor to accept its arbitrary decree. In the final judgment, the 160 million Americans ought to decide what is right or wrong in industrial relations.

The democratic idea demands that we distrust great power, whether of an overwhelming majority or an aggressive minority, or the power of an overwhelming concentration of wealth. The democratic idea demands that justice must be the basis of the good life. Enlightened Americans recognize that a new era in industry must replace the traditional conflicts of the past; that strikes and ceaseless warfare must be replaced by co-operation and teamwork.

Strength does not come from physical capacity or material power. It comes from an indomitable spiritual will to do the right. The spirit lies dormant in the brute, and he knows no law but that of physical might. The dignity of man requires obedience to a higher law—to the strength of the spirit. It is this permanent, spiritual element in human nature which counts no cost too great in order to find full ethical expression in our human relations. It is because Soviet Russia recognizes no such spiritual nature in man that it completely ignores moral law. To them the material world is primary. To them individuals have no inalienable rights, and the individual personality has no sacredness. Dictatorship in the modern world is a monstrous, hideous evil, whether it resides in the Politburo or industrial management or in undemocratic labor organizations. Dictatorship rests on a sea of blood, an ocean of tears, and a world of suffering. How can fear, force, lies, and misery

make a better world? Morality consists, above all, in respect for means, man, and truth.

Another enemy within our borders is the racist, the isolationist, the hater of a foreign people. This enemy respects neither law nor life. He rejoices in seeing people of different color segregated and compelled to accept low standards of living. He fails to recognize the sacredness of human life and its interdependence. Such individuals cannot by any stretch of the imagination be Americans or internationalists or advocates of world government based on law.

To state these evils does not mean that we must become pessimistic or fatalistic or to assume that nothing can be done about them. In a world where "cold" war is exterminating human liberty and where "hot" war might be waged with atomic bombs, fatalism or complacency is criminal. The recognition of these evils should act as a challenge to urge us to the utmost effort to counter and control them.

To meet Soviet Russia's challenge, we must become and remain militarily strong and at the same time have faith in our spiritual resources and work with the utmost dedication to strengthen the United Nations.

At present, we are aiming at an intensive preparedness to meet the emergency and then hoping to relax that effort. It seems to me that it would be wiser to have a military program that could be maintained indefinitely without in any way undermining our economy or our basic freedoms. All this does not mean a third World War but it does mean convincing Soviet Russia that a third World War could not be won by anyone; that it is beyond the strength of any nation to conquer, subjugate, and annex the entire world; and that such an attempt would only mean the annihilation of the civilized world.

Russia's political rulers are deadly afraid of the spread of the democratic idea among her people, and they need the constant prodding of the U.N. to aid them to do away with totalitarianism; and we of the democratic West need to see ourselves in the false and exaggerated eyes of the Russians to keep us up to the mark of our democratic ideals.

So, in the final analysis, evil whether on the international or domestic scene, is the compelling force that challenges us to create finer human beings and thus build a nobler civilization. To the individual, evil is a foil that develops and sharpens his moral fibre, his spiritual nature. Good affirms itself through evil.

It has been said that man is born into trouble, as the sparks fly upward. Humans are so constructed that they cannot grow and develop without suffering, without sorrow and frustration, without the challenge of evil.

Man's effort to overcome evil with good is simply an effort to project the infinite into the finite; an attempt to substitute the perfect for the imperfect; an attempt to fulfill the moral law and thus to carry out the spiritual relations in finite terms. The spiritual gains thus achieved are incalculable and make way for spiritual freedom.

BBC Records Wild Life

Now that the recording of the voices of wild birds and animals has become almost a commonplace, people

can stay comfortably at home and listen to the results of other men's labours in the field. In Britain this job is ably done by the BBC's Natural History Recording Assistant, Eric Simms, and his accompanying engineer Bob Wade, and the two of them have lately experimented with a new method of recording.

Sound recording of the voices of birds and animals is comparatively new and really began for B.B.C. listeners when Ludwig Koch introduced them to his recordings. He used the wax disk method, far more laborious than the modern techniques now adopted, and took his heavy gear into a selected spot and waited there for his subject to turn up, cutting numerous disks, each lasting from four a half to five minutes, while he waited, sometimes for days. On some occasions the bird was obliging but often it failed to co-operate and Koch had to start work all over again somewhere else.

The next method was to use the magnetised tape which recorded every sound a bird or animal made over a period of thirty minutes, and if nothing of value had been 'said' the tape could be quickly demagnetised and used again. The tape recorder worked from batteries in the recording van which lasted for a maximum of two hours but when it was possible to link the van to a mains supply of electricity recording could go on indefinitely. A length of cable had to be run from the microphone to the van and four hundred yards was the maximum that could be safely used, a drawback which greatly limited the choice of site.

The newest method of all is to broadcast the bird's voice by means of a portable transmitter and record the broadcast in the B.B.C. van, either using the batteries or linking it to the mains. With a small portable transmitter strapped to his back Simms recently broadcast the sound of his own voice to Wade, who recorded it in the van at a distance of two hundred yards. The second test was made when he took the transmitter over several badly waterlogged fields to where wild geese were flying in to feed: a magnificent broadcast of their cries was recorded in the van nine hundred yards away. The third experiments was to broadcast the sound of a mixed flock of finches and buntings to the van lying more than a mile off. With three successful recordings made over progressively greater distances the time has now come for Simms to take his transmitter to many places that were previously unapproachable and the B.B.C.'s library of recorded sounds of wild creatures should be proportionately increased.—B.B.C. London Letter.

Circulation of French Daily Newspapers

The circulation of the French daily newspapers is not as large as those in Great Britain or the United States, but it is still very large. The following figures indicate the average circulations between June, 1945 and June of 1954.

Aurore: 425,811; Le Croix: 152,153; L'Echo: 476,641; France-Soir: 1,072,526; France-Tireur: 1,087,765; Humanite: 168,056; Liberation: 126,801; Le monde: 167,820; Parisien Libere: 652,042; Paris Presse: 158,599.—News from France.

NOTES

Planning for the Future

The First Five-Year Plan is coming to a close and there is a great deal of active drafting for the Second Five-Year Plan.

Much has been said about "substantial achievements" in terms of progress of the First Five-Year programme, and masses of statistical figures have been put forward in support of that claim.

But measured in the terms of relief to the suffering masses and in the lowering of the strains on the man in the street, the results as yet are lacking in concrete substance. The index of cost of living—in itself a deceptive and illusory figure—does not show any substantial decline, nor do the vital statistics show any hopeful signs. Unemployment has increased very substantially, which is the most disturbing factor in all assessment of progress.

In the terms of yards, tons and cubic yards of ferro-concrete, and likewise in the astronomical figures of money spent, we are asked to accept the tokens of progress. That is all very well for those who can afford to live in "Ivory tower" isolation, away from the misery that is apparent on all sides, and from the ignorance that is permeating the very soul of the masses, resulting in the lowering of moral values all round. We cannot afford to do so.

The First Five-Year Plan has meandered along, for four years and more, amidst blunders, waste and muddle and has come at last near its very modest, inadequate and disjointed targets. Much of the muddle and waste has been sought to be justified on the grounds of lack of statistics and survey facilities on the one hand and tremendous pressure on the Government's time and resources due to acute shortages of vital necessities.

In reality most of the blunders were due to ignorance on the part of those who were at the head and slackness, dishonesty or inexperience on the part

of the senior executives. As a result very moderate progress can be recorded up to now. So moderate that the common man can hardly feel the effects thereof.

The Plan, or plans, for the next period is still in a nebulous state. Rough approximations have been made to date, regarding the balances of supply and demand for electricity, coal, steel, cement and heavy chemicals. In all other items there is nothing more than guess-work. That such approximations and guess-work do not constitute real planning, need not be emphasised. On the face of it, it is apparent that if the targets be blurred and misty, the actual work would be erratic, wasteful and inefficient.

Then comes the question of the actual plan of work. So far the Planners have exercised their brains—and that along hypothetical or rule-of-thumb methods—on the question of money, and money alone. From all sides it is apparent that this Plan is also an exercise in theoretical economics, lifeless, soulless and abstract. If anything comes out of the nebulae, it may be taken as a gift of the gods.

Are the Planners taking the Nation along with their schemes, on the upward path of progress? No, most emphatically no! The man in the street and the man in the field, with their families and dependants must wait and see. If the Planners succeed, after ten years of blundering, then, like good little children who have taken the castor oil of patient suffering, they might have the sweets. The unemployed might become employable, factory labour might become even more efficient, ignorance might assume catastrophic proportions, but we must possess our souls with patience and hope for the miracle.

As yet we see no Second Five-Year Plan, in concrete shape, nor do we see the assemblage of knowledgeable persons who constitute the body that could get on with the actual work.

VASAKA-SAJJA NAYIKA

By Ram Gopal Vidyavargiya

Prabasi Press, Calcutta.

Nehru in Moscow

An editorial with the above caption appears in the *New York Times* international edition Weekly Review of June 12. We append a fairly full extract as being indicative of sober American opinion:

"Moscow has never gone in for public demonstrations for foreign statesmen. Visiting dignitaries generally are whisked from the airport to their official residence in a Zis limousine through back streets. The populace often learns about the visit only after it is completed.

"Last week Moscow drastically changed the script. Huge throngs greeted Indian Prime Minister Jawaharlal Nehru as he rode through the capital in an open car at the beginning of a two-week State visit. Children deluged the Indian leader with flowers, trained white doves wheeled overhead, bands played, and the entire top hierarchy of the Soviet Government turned out for the occasion. While it was evident that careful planning had preceded the demonstration—for example, school children and factory workers had been given time off to attend—Moscow observers said the enthusiasm for Mr. Nehru as a symbol of hope for peace was unmistakably genuine.

"The Kremlin's efforts on Mr. Nehru's behalf were clearly a new chorus in the serenade it has been playing lately to the 'neutrals.' But the Russians quickly made clear that it also had significance beyond that. At a dinner for Mr. Nehru Thursday night, Soviet Premier Nikolai Bulganin paid special tribute to the Indian leader's efforts to mediate between the United States and China in the Far East. He said:

"The Government of the Chinese People's Republic together with our Government is taking all possible measures to ease tension off the east coast of China. . . . Lately the news has come to us of the representations made by the Indian representative Krishna Menon. Let us hope that our joint efforts ease the tension."

"This fresh evidence of close co-ordination between Moscow and Peiping on Far East policy underlined some of the problems that may soon face the United States in that area. The Formosa Strait conflict, which less than two months ago seemed on the point of explosion, has become stabilized. Secretary of State John Foster Dulles said at a press conference last week that it was fair to describe the situation in the Formosa Strait as a *de facto* cease-fire. He said further that this may be the most that can be achieved in the way of a settlement at the moment and that 'things might best be left as they are'."

The Nehru-Bulganin Declaration

The Special Representative of the *Statesman* commented as follows, regarding the joint declaration:

"New Delhi, June 23.—By laying emphasis on economic co-operation, the Five Principles, admission of China to the U.N., the importance of the Bandung Con-

ference and the need for disarmament, the joint declaration, signed by Mr. Nehru and Marshal Bulganin, comply with the views already expressed by both Prime Ministers.

A few phrases of the text, released simultaneously here and in Moscow this morning, indicate, however, that the Soviet Government has pledged itself to non-interference in more specific terms than had been anticipated.

The principle referring to non-interference in each other's internal affairs has been significantly amplified by 'for any reasons of an economic, political or ideological character.'

Though few observers here believed the reports that an explicit abandonment of the Cominform would be included in the declaration, the express assurance of ideological non-interference can be interpreted in this way."

The following is the full text of the joint statement:

At the invitation of the Government of the U.S.S.R., Shri Jawaharlal Nehru, Prime Minister of India, has paid visit to the Soviet Union. During his stay in Moscow he had several talks with M. Bulganin, Prime Minister of the Soviet Union, and other members of the Soviet Government.

The relations between the Soviet Union and India happily rest on a firm foundation of friendship and mutual understanding. The Prime Ministers are resolved that these relations shall continue to be informed and guided by the following principles:

(1) Mutual respect for each other's territorial integrity and sovereignty; (2) non-aggression; (3) non-interference in each other's internal affairs for any reasons of an economic, political, or ideological character; (4) equality and mutual benefit; and (5) peaceful co-existence.

The Prime Ministers are convinced that these principles, which have lately received an increasing measure of recognition, are capable of wider application and that in the observance of these principles by nations in the conduct of their mutual relations lies the main hope of banishing fear and mistrust from their minds and thus of lowering world tensions.

The wider acceptance of these principles will enlarge the area of peace, promote mutual confidence amongst nations, and pave the way for greater international co-operation. In the climate of peace thus created it will become possible to seek peaceful solutions of international questions by the methods of negotiation and conciliation.

Both Prime Ministers recognize that in various parts of the world there is, on the part of the smaller and weaker States, a vague and possibly unreasoning fear of bigger Powers. They feel that it is essential to dispel this fear in all possible ways. Here again the best remedy is to adhere unflinchingly to the principles of co-existence enunciated above.

The Prime Ministers acclaim the results of the

Asian-African Conference held at Bandung in April last. The conference was of historic importance as being the first of its kind at which independent nations of two continents with differing political and social systems, met together for the common purpose of devising ways and means of achieving fuller economic, cultural and political co-operation.

The results of the conference have been noteworthy and are of deep significance not only to the participating countries themselves but generally to the cause of world peace. The Prime Ministers wish to commend in particular the declaration on the promotion of world peace and co-operation adopted by the conference, which embodies and elaborates the concept of peaceful co-existence.

The Prime Ministers recognize that there have been signs of improvement in the general international situation. In particular they welcome the lessening of tension in the Far East, the advent of Austrian independence, the improved relations between the Soviet Union and Yugoslavia, the keener and more general appreciation, now discernible everywhere, of the dangers of war in an atomic age. Nevertheless, in large areas fear and suspicion dominate the minds of men and nations and vitiate international relations. In the Far East while there has been a lessening of tension, the causes of tension still remain.

It is the earnest hope of both Prime Ministers that it will be possible by peaceful means to satisfy the legitimate rights of the Chinese People's Republic in regard to Taiwan. At the same time the Prime Ministers wish to reiterate their conviction that the continued refusal to admit the Chinese People's Republic to the U.N. lies at the root of many troubles in the Far East and elsewhere.

They consider it essential that the Chinese People's Republic should be given its rightful place in the U.N., whose role as an authority would thereby be enhanced. They also think it important that all States qualified for membership in terms of the Charter should be admitted to the U.N.

The Soviet Union as the country which provided one of the two co-chairmen of all three international commissions in Indo-China has undertaken special responsibilities in connexion with the implementation of the Geneva agreements. These agreements constitute a notable example of the use of the method of negotiation for solving international conflicts and the degree of success achieved in the practical implementation of these agreements will be regarded as a measure of the value of the method of negotiation as a means of resolving international disputes.

The Prime Ministers, therefore, gave special consideration to the situation in Indo-China. In spite of difficulties which have occasionally been of a grave character, the implementation of the agreements has on the whole so far, been satisfactory. The progress of

implementation is now in some danger of being obstructed by new and unexpected developments.

The Prime Ministers desire to exhort the Governments concerned with the carrying out of the provisions of the agreements, to do their utmost fully to discharge their obligations so that the purposes of the agreements may be completely achieved. In particular they would strongly urge that where elections are to be held as a preliminary to a political settlement the efforts of the Governments concerned should be directed to the full implementation of the provisions of the agreement.

Of the international question of deep concern to nations, none is more pressing or fraught with graver consequences to the issue of war and peace than that of disarmament.

The tendency to build up arms and armaments, conventional as well as atomic, has increased the prevalent fear and suspicion among nations and has had the effect of diverting national resources from their legitimate purpose, namely, the uplift of the people.

In the opinion of the Prime Ministers nothing should be allowed to stand in the way of the imposition of a complete ban on the production, experimentation, and use of nuclear and thermo-nuclear weapons of war. At the same time they consider that there should be simultaneous and substantial reduction of conventional armaments and that effective international control should be established and maintained. To implement such disarmament and prohibition in this connexion, the recent Soviet proposals on disarmament were acknowledged as a substantial contribution to peace.

The Prime Ministers believe that under the aegis of the Five Principles enunciated in the statement, there is ample scope for the development of cultural, economic and technical co-operation between their two States. The fact that each country is following a system which is moulded by its own genius, tradition and environment should be no bar to such co-operation.

Indeed, the essence of true co-existence, in which both Prime Ministers have profound faith, is that States of different social structure can exist side by side in peace and concord and work for the common good. Already aided by a trade agreement concluded some time ago there has been a marked development in co-operation between the two countries in the cultural and economic spheres. The recent agreement in regard to the construction of a steel plant in India with the assistance of the Soviet Government is a notable example of such co-operation.

The two Prime Ministers, taking note of the mutual benefits of such co-operation, will seek to promote and strengthen the relations between their two countries in the economic and cultural fields, as well as in that of scientific and technical research.

Both Prime Ministers are gratified at the opportunity they have had of personal discussion and exchange of views on matters of mutual interest to them and are confident that the results of their talks and the friendly

contacts which have been established will further strengthen and develop the relations between the two countries and their peoples and will serve the interests of world peace.

Signed by: Chairman of the Council of Ministers, U.S.S.R., and Prime Minister of India.

The "Kashmir Princess" Sabotage

The long-awaited statement of the Hongkong Government, has been released, regarding the sabotage of the ill-fated Indian air-liner.

Mr. A. C. Maxwell, the Police Commissioner of Hongkong, said in an official statement issued today: "It has been established beyond doubt that the 'Kashmir Princess' met its end through an explosion caused by some form of time-bomb. It is regrettably almost equally certain that this time-bomb was placed aboard the aircraft in Hongkong.

"No effort is being spared to bring to justice the perpetrators of this ghastly crime which must offend the conscience of all humanity.

"The Hongkong police are dealing with this case as one of carefully planned mass murder. All our investigations, which we have been patiently and steadily pursuing ever since news of the loss of the aircraft first reached us, point this way. We have now arrived at a stage when we must ask the help of the public to complete our investigations. We believe that there must be members of the Hongkong community who, if they will only come forward, can assist the police in their inquiries.

"I am therefore asking anyone who thinks he has any information, no matter how seemingly trivial or unimportant, which may throw light on the case to let the police have it.

"A personal letter addressed to myself or the Director of my special branch, will be treated entirely confidentially."

The Hongkong police today offered a reward of \$ (H) 100,000 (about £6,250 or approximately Rs. 83,000) for information leading to the arrest and conviction of any person responsible for the crime. The offer of the reward and Mr. Maxwell's statement is being advertised in all Hongkong newspapers tomorrow under the heading "Sabotage."

Usually reliable sources said the police have established that the disaster had been caused by a sabotage ring working in Hongkong. The police believed the person (or persons) who put the time-bomb in the Constellation was not the "brains" of the ring but probably a lowly worker of little intelligence who might not have realized the implications of what he was doing.

One police theory was that the sabotage ring included a People's Chinese informer. They said this might explain how the Chinese had two days before the disaster been able to warn the Hongkong Government vaguely of the plane's possible sabotage.

The absence of specific details in the warning appeared to indicate that the informer was not an important member of the ring and knew few details.

One unconfirmed report said that after the disaster a Chinese stowaway on an airliner had reached Formosa. This report has been denied by the K.M.T. Government.

What Asians Ask

In the *New York Times* international edition of June, Mr. Carlos P. Romulo, the noted Philippine leader, gives a very clear exposition of the problem facing Americans regarding their attitude to Asians and Africans:

"To see Asia through Asian eyes and Africa through African eyes—that is the prime requisite for American policy toward Asia and Africa. You cannot assume that a policy which works satisfactorily in Europe will work equally well in Asia and Africa. Nor, on the other hand, can you do one thing in Asia and Africa and then cancel that by promptly doing something contradictory in Europe. There must be a judicious adaptation of methods and parallel planning that will avoid discrimination, confusion and waste.

"The American tendency to brand any nationalist movements whatever in Asia and Africa as communistic rests on another of those assumptions which urgently need to be examined. There are unquestionably nationalist movements in Asia which are Communist-led or which are abetted by the Communists. But this fact does not necessarily invalidate the intrinsic quality of the genuine nationalist movements in the region.

"What has often happened is that those movements, though originally sprung from a people's natural aspirations to freedom, were subsequently taken away by the politically sly and ruthless Communists from the hands of the timid and confused liberals who lacked prompt and effective support from their friends in the United States and the rest of the Western world. We lose battle this way by default, and will continue losing them until we stop condemning all those movements indiscriminately and dissociating ourselves from them.

"Time has assuaged the bitterness which colonialism has bred among the Asian and African peoples. The Bandung conference has shown that.

"It is also true that we of Asia and Africa would rather keep our old friends than risk new ties with strangers. The peoples of Asia and Africa must be shown, however, that the old friends are friends indeed. And they must be shown this against the background of the irreversible march of nationalism in Asia and Africa and against the insistent clamor of their peoples for more decent standards of living."

How the lower type of American thinks about these problems is clearly indicated by the following piece of special news to the *New York Times*. It concerns a "brave" murderer of Africans fighting for their birthright:

"Nairobi, Kenya, June 7—An American who has been fighting the Mau Mau terrorists of Kenya is under State Department pressure to return to the United States.

"William W. Baldwin, 28 years old, has been told by United States Consular officials here that his activities have caused the United States Government considerable embarrassment. They want him to go home. So far he has not gone.

"The State Department has informed Mr. Baldwin, and its representatives have announced publicly here, that his membership as a combatant in the Kenya Police Reserve must be classed as unwarranted participation in the affairs of another State."

Communist Organisations in Vienna

The Communist-dominated World Federation of Trade Unions (WFTU) has caused the Austrian Government considerable embarrassment (according to agency reports from Vienna) by applying for legal registration as an association.

The WFTU set up its headquarters in the Soviet sector of Vienna in 1952, after its expulsion from Paris. But the move to Vienna was made without Austrian consent. The present application for registration has, presumably, been made in order to legalize the WFTU's position in view of the imminent end of the occupation of Austria.

London observers note the Austrian Government's fears that its neutrality might be prejudiced by the continued presence in the country of an organization whose real intention is to promote labour discontent, and that if other international Communist-dominated organizations (similarly established in the Soviet sector of Vienna without Austrian consent) follow suit, the Austrian capital might remain a centre for Communist propaganda.

Other organizations with headquarters in Vienna are: the World Peace Council, the International Federation of Resistance Fighters, the World Federation of Teachers Unions, the Committee for the Promotion of International Trade and the World Congress of Doctors. All are active, London observers point out, the World Peace Council being the organizer of the "World Peace Assembly" now meeting in Helsinki, Finland.

The Future of Indian Shipping

The scheme for the expansion of Indian Shipping in the Second Five-Year Plan, was given in *extenso* by Sri Lal Bahadur Shastri in his speech before the Indian National Steamship Owners' Association at Bombay. We append the full report for record:

Bombay, June 21.—Mr. L. B. Shastri, Union Minister for Railways and Transport, today told the Indian National Steamship Owners' Association here that the Government of India was confident of achieving its target of a million tons for Indian shipping in the second Five-Year Plan.

Mr. Shastri said: "There can be no two opinions about the imperative need of a far more rapid pace of tonnage expansion, specially in the overseas trade.

"Planning must, however, take into account financial resources and the time factor necessary for the consolidation of new routes."

The Minister said that the recommendations of the study group appointed by the Consultative Committee of Shipowners were well balanced and could be attained. He hoped they would be included in the final framework of the second Plan.

The study group, he said, contemplated a net addition of 72 ships totalling 445,000 tons gross of shipping at an estimated outlay of Rs. 80 crores. The private sector would contribute Rs. 10 crores and the balance would be advanced by the Government.

Mr. Shastri assured the shipowners that the Government would give the fullest consideration to the question of making attractive loans to shipping companies to ensure the targets are achieved.

On overseas trade, Mr. Shastri said that the completion of the first Plan, India's overseas tonnage was expected to reach 280,000 tons. The second Plan envisaged a net addition of 37 ships totalling 270,000 tons gross to this fleet.

He said: "Fears have been expressed about the possibility of securing full employment for the increased tonnage to be acquired. Apart from loans at a concessional rate of interest for the acquisition of new fast ships, Government assistance has taken the form of sponsoring the companies for admission to various conferences, of helping them to secure a reasonable share of cargoes owned and controlled by the Government and of providing suitable clauses in trade agreements with foreign countries to ensure that a proportion of cargo arising out of such agreements moves in Indian ships."

He said that although Indian shipping companies have been operating in the overseas field for only about seven years, these companies had gained a "stable footing" in important overseas routes.

He, however, expressed disappointment at the decision of "one of our oldest companies" to withdraw from the India-U.S.A. trade and passenger-cum cargo services on certain other overseas routes. He hoped that this company would reconsider its attitude in regard to these services and re-enter them with more suitable tonnage for which, of course, "it can legitimately expect the Government to grant it necessary loans."

"I am also hopeful that our Indian companies will not only be able to give more regular and faster services on existing routes but also expand the area and scope of their activities, and I wish to take this opportunity of extending the assurance that the Government will continue to render all possible and necessary assistance and support towards the achievement of these objectives."

"FLAG DISCRIMINATION"

On the question of Government cargoes and flag discrimination, he said that the Government would continue to assist Indian overseas ships by allotting to them as much Government cargo as feasible.

"I am aware that in foreign shipping circles, this assistance has been sought to be dubbed as 'flag discrimination.' The same circles have also taken exception to our trade agreements under which we seek to assist Indian companies to secure part of the cargoes that are exported or imported under such agreements.

"I feel there is a genuine misunderstanding of our position regarding this matter, and the misunderstanding arises entirely from the difference in approach as to what constitutes 'flag discrimination.' Throughout, our attitude has been that the Government of India does not favour any form of flag discrimination against foreign ships. The Government cannot, however, forego its right to nominate ships for cargoes moving on its own account—a right which is enjoyed by all shippers.

"We do not accept the proposition that the exercise of this right is an instance of flag discrimination, nor can the clauses in our trade agreements be characterized as constituting flag discrimination. Our ports are open to ships of all flags and they receive the same treatment and facilities as Indian ships.

"No one can accuse us of resorting to any devious methods to put foreign shipping in a disadvantageous position as compared with Indian shipping. It is somewhat surprising that, leading maritime nations which carry, or aim to carry, 50% or more of their national trade in their own ship, should complain of unfair practices by India when our shipping carries less than 50% of the country's overseas trade, in spite of the so-called discriminatory measures.

"On the other hand, Indian companies have just cause for complaint that commercial conferences discriminate against them in the matter of participation in various intermediate sectors in the routes over which they ply their ships."

He hoped that the various foreign shipping conferences catering to the overseas trade of this country would take a realistic view of the aspirations of the Indian shipping industry. They have held a dominating position in the trade of this country for decades, and they may continue to do so. "We do not wish to place any impediments in their way, and all that we seek is the opportunity to carry a reasonable share of the trade from and to this country in our own ships."

Referring to discriminatory freight rates charged by foreign shipping lines, the Minister said that serious allegations were made from time to time by Indian shippers that foreign shipping followed a discriminatory policy and charged higher freight for cargoes shipped from Indian ports than for similar cargoes to the same destination from other countries. Several instances were cited to prove these charges.

The Government of India has appointed a special

officer to study the specific cases of alleged discrimination.

"If these investigations do establish that there is any substance in the charge, the Government will have to take serious notice of the position and to devise measures to combat this unfair practice."

On the question of imposition of surcharge threatened by overseas shipping conferences, Mr. Shastri said the Government felt it was not right that responsible bodies like shipping conferences should have come forward with threats of surcharges on freight at a time when the Government itself was taking all possible steps to improve working conditions in ports.

He was glad to note that the India-U.K. Conferences had since decided to call off the surcharge, while the U.S.A.-India Conferences had merely deferred consideration of the matter until July 15.

Award on Bombay Port Labour

The Special Representative of the *Statesman* gives the following report on the first part of the award given by the Industrial Tribunal appointed by the Government of India to go into the disputes relating to the Bombay dock labour. It is of very great significance, being fully illustrative of the attitude of labour unions regarding the responsibilities of labour.

"New Delhi, June 13.—The failure of the existing wage and incentive bonus scheme to secure a fair output and quick turn-round of ships in Bombay Port is due to various factors, such as indifference of labour to work, unauthorized absence of workers during duty hours, a tendency on the part of workers at times to work on two shifts or excessive overtime instead of turning out adequate work in one shift, and the system of paying "speed money" to certain workers.

This is the conclusion of the Industrial Tribunal appointed by the Government of India to adjudicate the disputes relating to the Bombay docks. The first part of the award was announced today, and Mr. M. R. Meher, President of the Bombay Industrial Court, who constituted the one-man tribunal, proposes to deal with the question of providing amenities for dock workers in the second part of his report to be published later.

"GO-SLOW POLICY"

The Tribunal has concluded that there was strong evidence that Bombay dock workers had been going slow and, at times, they adopted an "intensified go-slow policy." The contention of the trade unions that the fall in production was due to such factors as congestion in sheds, defective cranes, change in the tally system and delays in customs examination had little substance in view of the fact that new sheds had been erected and conditions in the docks in regard to storage and clearance had greatly improved.

The Tribunal maintains that a large number of electric tractors, mobile cranes, electric cars and forklifts have been installed and the equipment of ships

has been improved to facilitate quick loading and unloading of cargo.

It rejects the unions' argument that lower production and unauthorized absence of workers during duty hours was due to the absence of adequate amenities like canteens. It agrees with the Bombay Port Trust that the time-rate system of payment has resulted in slowing down work.

As regards wages of Port Trust workers, the Tribunal is of the view that it would not be justified in increasing the time-rate. But assuming that, under a piece-rate system, workers would be reasonably efficient and punctual, the Tribunal has processed piece-rates on the basis of an increased time-rate and has fixed piece-rates for various categories of workers.

Adequate safeguards have been laid down while fixing the piece-rates. Payment would be made on the time-rate basis in case labour was rendered idle on account of circumstances beyond their control. Workers reaching 90% of the datum line would be entitled to payment at not less than the time-rate. For production in excess of the datum line, payment would be at double the usual rates. Besides, certain minimum wages at a rate higher than those provided by the Minimum Wages Act have been guaranteed; workers, whose output could not be measured, would be paid at these rates.

The Tribunal hopes that with the increase in wages given in this award and the opportunities for earning premium under the piece-work system, the method of paying "speed money" to crane drivers and certain other categories of workers would eventually disappear.

It has directed the appointment of a committee (consisting of an equal number of representatives of employers and employees, with an independent chairman, for the proper administration of the piece-rate system and for the settlement of disputes. It has also recommended that the Port Trust Act should be amended to provide for such a committee. Until the Act is amended disputes should be settled mutually or by reference to the Central Conciliation Officers.

The Tribunal has rejected the demand of the Transport and Dock Worker's Union for the framing of a scheme for the decasualization of workers in the lines of the Bombay dock workers' (regulation of employment) scheme which is at present applicable to stevedore workers only. The matter will be examined by the committee appointed by the Central Government for the purpose."

Rehabilitation of E. Pakistan D.P.

The following report appeared in the *Amrita Bazar Patrika* for June 28. We append a comprehensive extract below, as the problem is exceedingly complicated. We do not think it will ever be solved unless the authorities concerned take a firm attitude towards the disturbing elements, consisting of rapacious and dishonest fake refugees, who have been making capital of human misery all these years.

NOTES

However the scheme in itself is intrinsically sound.

An objective approach in assessing the magnitude of the rehabilitation problem in the eastern region, while keeping in view the sporadic nature of the influx from East Pakistan and the element of uncertainty inherent in the situation in dealing with an essentially human problem, was advocated by the Central Rehabilitation Secretary, Sri C. N. Chandra, in his presidential address at the two-day conference of Rehabilitation Secretaries of six Eastern States which commenced in Calcutta on Monday.

Sri Chandra revealed that the Rehabilitation Ministry had already succeeded in securing nearly 5,000 acres of cultivable land in a compact area with fairly congenial climate and surroundings in Hyderabad State, by the side of the Godavari river, where nearly 1,000 Bengali displaced families would be rehabilitated on a planned basis.

In addition, Sri Chandra stated, a large number of displaced families would also be settled on land near Chota Nagpur in Madhya Pradesh when the land was made available for development. Displaced agriculturists would also be resettled on a huge block of land covering an area of nearly fifty square miles in the Araku Valley in north Andhra and South Orissa. Government were also exploring the opportunities available for locating lands in Mysore, Madhya Pradesh, Vindhya Pradesh and certain other States. State Governments, he added, were fully co-operative in these negotiations for making the planned dispersal programme a success during the next year.

This was the result of a decision taken by the National Development Council to send a team of officials representing the Planning Commission, the Union Rehabilitation Ministry and the West Bengal Government to discuss the question of dispersal of Bengali refugee families in other States outside West Bengal, and to create congenial surroundings with agricultural and employment opportunities for them in close co-ordination with local authorities. This team, consisting of Sri S. V. Ramamurti of the Planning Commission, Sri A. D. Khan, Relief and Rehabilitation Secretary of the West Bengal Government and Sri C. N. Chandra, had already visited Hyderabad and will be visiting other States towards the end of July.

Outlining the mode of estimates of expenditure to be incurred on rehabilitation during the Second Five-Year Plan, as initiated by the Central Rehabilitation Ministry, Sri Chandra referred to the difficulties in drawing up a plan with precision in view of uncertainties inherent in visualising the exact nature of developments after a few years. There were many fluid factors connected with influx, dispersal, administration and the psychological set-up, with the result that the outlines of the structure of financial involvements had to be drawn up with the utmost care and objectivity, while taking into account all relevant factors and the

over-all urgency of speeding up physical as well as psychological rehabilitation of the three million refugees who had already come from East Pakistan.

Sri Chandra said that the changing pattern of the blue-print of rehabilitation programme was indicated by the fact that they had urged the Planning Commission to make more provision than of Rs. 10 crores in the Second Plan for setting up new industries in order to absorb displaced persons and to stimulate subsidiary economic activities for expanding employment opportunities, especially in refugee townships and colonies. Again, in the matter of house construction also a policy of direct construction of tenements as well as Government-sponsored colonies was being increasingly favoured.

In conclusion, he hoped that it would be possible to prepare workable estimates of the expenditure involved in getting under way the various schemes of rehabilitation in the eastern region during the second Five-Year Plan period, for holding high-level consultations with the Planning Commission and the Ministry of Finance at a later stage.

Rise in Industrial Production

The year 1954 witnessed a substantial increase in India's industrial production. The general index of industrial production, which stood at 135.3 in 1953, rose to 145 in 1954, while the general index of prices dropped from 399.6 in January 1954 to 367.8 in December 1954. In cotton textile and cement industries, the target set out in the Five-Year Plan was exceeded. Steel production reached an all-time record of 12,26,000 tons of finished steel. The only major industry which recorded a decline in production was sugar. In the engineering industries, 56 out of 62 industries achieved a substantial rise in production. The chemical industry recorded an all-round increase in production. In 1954, 110 licences were granted under the Industries Development and Regulation Act for the establishment of new industrial undertakings and 226 licences for the expansion of existing ones or the taking up of new lines of manufacture. In 1953, 182 licences were granted for the setting up of new undertakings.

Special measures were adopted for the development of small-scale and cottage industries including the production of Khadi. Following the recommendation of the Ford Foundation Team, four regional institutes of technology for small-scale industries were set up. A Marketing Service Co-operative and a Small-scale Industries Corporation have also been set up. A Small-scale Industries Board, under the chairmanship of a Development Commissioner, has been set up to co-ordinate the activities of these institutions and also to carry out a programme of development.

In 1953, controls over distribution of cotton textile industry were lifted and prices were decontrolled. As a result, the industry returned to a state of normalcy, and production continued to rise progressively. In 1954, the total production of cotton textiles was 5,000 million yards of cloth and 1,560 million lbs. of yarn. The pro-

duction of cloth by the handloom and power loom industries in 1954 was placed at about 1,600 million yards, giving a total availability of over 6,000 million yards. Consumption of textiles increased considerably and so also the exports thereof. Exports of cloth continued to be freely licensed and in 1954 805 million yards of mill-made cloth were exported as against 593 million yards in 1953. The UK is the largest single buyer of Indian cotton textiles. In October 1954 a Cotton Textile Export Promotion Council was set up with a view to promoting exports of Indian textiles, studying our markets abroad, laying down quality standards, etc. A scheme has been introduced by the Council for the inspection of textiles for export. Many of the present textile mills are handicapped with worn-out machinery and as a result they suffered loss and some of them had to close down. The Working Party on the cotton textile industry had taken a survey of the obsolete machinery in the textile industry and stressed on the need to rehabilitate old machinery. In order to compete with world market, rationalisation on modern lines is imperatively needed, but the Government of India is still undecided on the point.

The production of paper has gone up by nearly 50,000 tons over the past four years. The production of paper in India in 1954 was 1,55,328 tons, as against 1,08,907 tons in 1950. The requirements of paper in this country have been placed at 2,00,000 tons per year and the balance has to be imported from abroad. In the near future, however, India is going to be self-supporting in paper production. Following the implementation of the expansion schemes of existing units and the setting up of new ones, the capacity of the paper industry will exceed 2.87 lakh tons by the end of 1956. The paper industry at present employs over 26,000 people, including 2,100 as technical personnel. The block capital invested in the industry is estimated at Rs. 21.72 crores. A further capital of Rs. 14.3 crores is going to be invested with the implementation of new schemes and the expansion of the existing ones. There are at present 21 paper mills in India; seven of them are in South India, five in Bombay and Madhya Pradesh, three in the Punjab and UP area and six in West Bengal, Bihar and Orissa. A paper and pulp expert of the FAO, Mr. Sundelin, recently came to India and surveyed the industry. He has estimated that the demand for paper, including newsprint and board will increase to 4,81,000 tons by 1961-62.

The Indian jute industry had a stable year in 1954. The demand for Indian jute goods in world markets improved and exports reached up the high figures of 8,42,000 tons as compared with 747,000 tons in 1953 and 736,000 tons in 1952. By the export of jute manufactures, India earned Rs. 120 crores of foreign exchange in 1954. In order to meet the growing overseas demand for jute goods, the working hours in the jute mills in the membership of the Indian Jute Mills Association were raised from 42½ hours to 48 hours a week. The output of jute manufactures increased from

9.05 lakh tons in 1953 to 9.49 tons in 1954. But on account of increasing offtake, stocks with mills considerably decreased. The USA continued to be the largest single consumer of Indian jute goods by taking over 180,000 tons. Although Argentine curtailed her purchases of Indian jute goods, our exports to the UK, Canada, Australia, Indonesia, Burma, Cuba, Egypt and Nigeria considerably increased. A notable feature of the export trade in jute goods is the higher offtake of sacking. But India need not be over-complacent over her jute exports on the present prospects. Japan is coming out as a formidable rival in this respect and she is already challenging the supremacy of Indian burlap in US markets. The manufacturers in France, Holland and Belgium have formed a federation of European Jute Manufacturers and Germany is also expanding the capacity of her jute industry. The Government of India and the Indian jute industry are, however, alive to this danger and they are taking appropriate measures to maintain India's overseas markets. Two representatives of the Indian Jute Mills Association have already left for the USA with a view to retaining existing markets in that country and developing new contacts.

Chemical industry has made a considerable headway in recent years. The installed capacity of heavy chemicals—as for example, sulphuric acid, soda ash and caustic soda, fertilisers, sheet glass and dyestuffs, was increased in 1954. Sheet glass (10-12 oz. gauge), penicillin, chloromycetin, glacial acetic acid and acetic anhydride and bismuth salts were produced for the first time in this country during the past year. Efforts are being made to manufacture chemotherapeutics and dyestuffs from basic raw materials rather than from intermediates. A scheme for the manufacture of sulphuric acid from gypsum made progress during the last year.

As regards the small-scale industries, the National Small Industries Corporation was set up in February 1955 with an authorised capital of Rs. 10 lakhs, divided into 10,000 ordinary shares of Rs. 100/- each, to be subscribed entirely by the Government of India. For its working capital requirements, the Corporation will receive loan from the Government of India. The main objects of the Corporation will be to assist, promote, finance and protect small-scale industries. Industries ordinarily employing less than 50 persons working with power, or less than 100 persons working without power, and having capital assets not exceeding Rs. 5 lakhs, will come within the scope of the Corporation. It will secure a reasonable share of Government orders for small-scale units by accepting contracts from procurement departments of Government and issuing sub-contracts to small-scale units. The small-scale units will receive loans and technical assistance from the Corporation for the purpose of fulfilling such orders and for the manufacture of articles of the type and standard required.

The tariff policy played an important part in promoting industrial developments, either through increase of import duty on foreign articles competing with indigenous products or through reduction of duties on imported raw materials and components utilised by domestic industries. During 1954, consent was given for the issue of capital aggregating Rs. 94 crores, and of this Rs. 84 crores related to industrial companies. Of this amount, non-residents have been permitted by the Government of India to invest Rs. 26 crores.

What we would like to emphasise is that the consumer in India has not benefitted an iota as yet, in spite of all this expansion. Paper has been taxed in a most inconsiderate fashion, to the serious detriment of all educational schemes.

Investment and Financial Resources

In the first Five-Year Plan, two concepts were used to denote the size of the Plan, namely, net investment and developmental expenditure. Thus, the net investment in the public sector was expected to be of the order of Rs. 1600 to Rs. 1700 crores, whereas the developmental expenditure which includes outlay of a capital as well as current nature was initially estimated at Rs. 2,069 crores. Since outlay on the Plan included only a portion of the outlay on certain developmental heads such as health and education, an additional concept of total developmental outlay (as distinguished from that included in the Plan) has also been used at times to indicate the size of the Plan. In the case of 42 organised industries in the private and the public sectors, the first Plan considered the requirements of gross rather than the net investment, inasmuch as allowance was made for part of depreciation, replacement and modernisation. Similarly, the requirements of working capital were taken account of in the case of industries, but not for other sectors.

The tentative framework for the second Five-Year Plan as prepared by the Planning Commission envisages total outlay of Rs. 5,600 crores for the achievement of the targets. This estimate is made up by aggregating wherever possible, the capital requirements of the individual targets. However, this procedure cannot be adopted uniformly for two reasons, because the targets do not cover all the items of production. And in several important sectors, particularly in agriculture, investment is multi-purpose in the sense that only a complex of products can be related to a complex of investment.

Non-monetised investment is not, therefore, included in investment by the Planning Commission. In a predominantly rural community of self-supporting persons, a significant amount of investment must be done by the application of personal labour and by using locally available materials. With the efforts to mobilise voluntary labour for various nation-building activities, such as flood control, investment in non-money terms must play an important part. In view however of the highly con-

ectural nature of the imputed value of such investment the Planning Commission proposes to disregard it at his stage.

There are two distinct aspects to the question of raising financial resources needed for the second Five-Year Plan. First, the savings needed for the capital formation envisaged must be available in the aggregate. Secondly, the financial resources must be available and utilised by each sector and for each purpose in accordance with the priorities set out in the Plan. This second aspect requires a policy of directioning investment.

If net investment of the order of Rs. 5,600 crores is to be realised over the next Plan period, savings of the same order must be forthcoming. With increased incomes, the volume of savings is bound to increase. For initiating a process of higher investment and higher incomes by fuller utilisation of unemployed and under-utilised resources, it is not necessary that savings come first and only these are invested later. Credit has to be taken in advance for the additional savings that are likely to arise, as incomes and investment increase. Some initial credit creation, therefore, is an essential part of a development programme. The Planning Commission is however cautious and warns that if planned investments are to be realised without generating serious inflationary pressures, the initial credit creation must be limited with reference to what savings are likely to be available, or can be created by suitable policy measures.

An investment programme of Rs. 5,600 crores for the second Plan cannot be carried through without a considerable increase in the rate of savings in the community. Assuming that sterling balances can be drawn down by some Rs. 100 to Rs. 150 crores and foreign assistance of the order of Rs. 500 crores is available during the second Plan, domestic savings of the order of Rs. 5,000 crores must be available. The Taxation Enquiry Commission has estimated that total savings in India in 1953-54 and total net investment (at home and abroad) amounted to some 7 per cent of national income. Their concept of net investment is not strictly comparable to the one used by the Planning Commission in arriving at the net investment of Rs. 5,600 crores for the second Plan. Thus, unlike the Taxation Enquiry Commission, the Planning Commission has excluded non-monetised investment. At the same time, the Commission has made some allowance for investment in stocks and in small enterprises which have been disregarded by the Taxation Enquiry Commission. Again, a sizeable increase in public investment is expected for the last two years of the first

Plan. On the other hand, the Taxation Enquiry Commission's estimate of net investment abroad of Rs. 70 crores in 1953-54 must be regarded as rather exceptional. Normally, the Planning Commission would expect a deficit in our current balance of payments (not taking credit for donations), with the result that the total investment in the country must be higher than domestic savings. Taking these considerations into account, it is reasonable to expect that, comparable to the figure of Rs. 5,600 crores or the second Plan, net investment in the country in 1955-56 would be of the order of 6.75 per cent of national income and corresponding domestic savings of some six per cent of national income. On this basis, the growth in investment and savings over the second Plan would have to be somewhat as follows, so suggests the Planning Commission:

The phasing over the five years of savings and investments given below is intended to be illustrative. The essential point is, says the Planning Commission, that in order to achieve a total investment of Rs. 5,600 crores, the rate of investment must increase from 6.75 per cent of national income in 1955-56 to 11 per cent of national income in 1960-61, and domestic savings from 6 to 10 per cent over the same period. If foreign resources are not available on the scale envisaged, the savings effort at home would have to be correspondingly greater.

Whether an increase in the rate of domestic savings from 6 per cent in the beginning of the next Plan period to 10 per cent by 1960-61 is likely to take place in response to a voluntary increase in savings resulting from additional incomes cannot be judged in advance. The increase in savings envisaged here is not very large in relation to the rates achieved in other countries. But considering the current low rate of savings and the large margin of unsatisfied needs, the Planning Commission assumes that savings of the order required would not be forthcoming without special and persistent effort at restricting consumption through fiscal and other devices.

In an underdeveloped economy, where there are idle resources, increased investment need not imply a reduction in current consumption, according to the Planning Commission. It would however imply austerity, that is, preparedness to hold down consumption, especially of luxuries in the face of rising incomes. A check on the consumption of non-essential commodities, domestic as well as imported, is necessary in order to release additional resources for the production of essential goods. Shortages of essential goods are

(In crores of rupees)

	1955-56	1956-57	1957-58	1958-59	1959-60	1960-61	2nd Plan 1955-57 to 1960-61
National Income	10,800	11,300	11,825	12,375	13,000	13,700	62,200
Net Investment	730	810	930	1,060	1,300	1,500	5,600
Domestic Savings	650	680	800	930	1,170	1,370	4,950
Foreign Resources	80	130	130	130	130	130	650

dealt with better in this way than by direct limitation of consumption. However, if resources released through restriction of luxury consumption are not of much use for increasing the supplies of essential goods, controls over consumption of essentials would become unavoidable. The Planning Commission thinks that the question of controls must in other words, be judged in terms of the particular real resources, which are in short supply. Foreign exchange resources have to be conserved with particular care, in that they can be converted into whatever commodities became scarce within the country. In the present world situation in regard to food and cotton, the Planning Commission hopes that a plan of the magnitude contemplated can be seen through without having to impose controls on necessities like food and cloth.

The above contentions of the Planning Commission, have much fallacious premises and may give rise to much misgivings. How could they assume that reduction in consumption would automatically lead to larger investments? There are many slips between falling consumption and rising investments. The falling consumption may lead to the rise in price level, in so far as austerity will be enforced by rationing and price control. With the dreadful memories of rationing and price control during the war period and thereafter, one should most certainly be reluctant to think that a reversion back into the hands of the black-marketeers and profiteers could again be contemplated by the authorities. In that case they would be playing into the hands of the anti-social elements, as they did until recently. The simple truth should not be overlooked. The huge amount that is going to be spent in the period of the second Plan is bound to generate inflationary conditions and unless consumption goods are available in a rising proportion, inflation will take away much of the expected savings. One man's expenditure is another man's income and forced savings imposed by compulsory curtailment of consumption will compel the larger money incomes of the community to run after the limited supply of consumer goods, resulting in an upward spurt in the price level. Higher prices would automatically increase the cost of investment and so also the cost of Planning. Increased consumption will encourage larger investments, both in consumption goods industries as well as capital goods industries. Unless consumption is stepped up, industrial prosperity cannot be expected to rise, notwithstanding much vaunted expenditure on Planning. It is another fallacy to distinguish between essentials and the so-called luxuries. What is a luxury to one, may be an essential to another. There can hardly be any clear distinction between these two types of needs, saving a few ones.

The Planning Commission admits that up to a point, the emergence of some inflationary pressures or a sellers' market is necessary, since the object of the Plan is to push ahead as far as possible in the direction of utilising our resources. Essentially, inflationary

pressures—or insufficiency of savings—arise as a result of inelastic supplies of goods against which people direct their demand. The elasticity of supply is not equally great in the case of all commodities. With effort and organisation, it can be altered favourably at least in selected sectors. The Planning Commission thinks that if we are to stop at the first bottleneck in supplies for fear of a rise in prices in that sector, even though supplies in other sectors are elastic to some extent, we are likely to stop short of the full potential for expansion of the economy. Short supplies in some commodities shall have to be tackled, and in doing so, whether we would be able to prevent a general and cumulative rise in prices depends, obviously upon the measure of shortage and the organisational efficiency in dealing with it. In an expanding economy, the efficiency of savings cannot be predicted in advance, but, since the overall suggested by the Planning Commission is not excessive and is required for making an impact on employment, the practical problem is one of watching overall economic trends and of correcting, through fiscal and other measures, any shortages in resources in particular sectors as they rise.

From the standpoint of finding resources for the public sector of the second Plan, the Planning Commission observes that it is necessary to consider not only the outlay on the Plan but also on the total outlay. Expenditure outside the Plan has an obvious significance to the realistic appraisal of the financing of the Plan. The outlay on the Plan in the public sector includes, first of all, all expenditures which result in the creation of new capital assets (directly in the public or indirectly in the private sector). In addition, it should include that part of the current expenditure on specific developmental heads which represent an increase over the level reached at the end of the first Plan. This would give a clear idea of the lift the authorities would give to the developmental effort during the next Plan. This is the concept which has been kept in view in arriving at the Plan outlay of Rs. 4,300 crores in the public sector. As a rough approximation, the budgetary position of the Centre and the States combined may be outlined as follows:

(In crores of rupees—estimates)

	1955-56	1960-61	Over Second Plan 1956-57 to 1960-61
Outside the Plan—			
Non-developmental	625	725	3,400
Developmental	200	225	1,100
Sub-total	825	950	4,500
On the Plan	600	1,100	4,300
Total	1,425	2,050	8,800

It is assumed that public outlay on the Plan will increase from Rs. 600 crores or so in 1955-56 to Rs. 1,100 crores in 1960-61, that is by about 80 per cent in order to make up a total of Rs. 4,300 crores over the Plan period. Expenditure outside the Plan is assumed to increase by 15 per cent over the five years

or by Rs. 25 crores every year. The total outlay on developmental heads is envisaged to be of the order of Rs. 5,400 crores—Rs. 4,300 crores in the Plan and Rs. 1,100 crores outside the Plan. The question is how a total Government outlay of Rs. 8,800 crores (Rs. 4,500 crores outside the Plan and Rs. 4,300 crores on the Plan) is to be financed. Assuming that the Government takes some 8.5 per cent of national income in taxes and in non-tax revenue as has been the case on an average over the past four or five years (7 per cent in taxes and about 1.5 per cent in non-tax revenue) the total revenue receipts would amount to about Rs. 5,200 crores. Borrowing from the public may possibly yield another Rs. 1,000 crores (about Rs. 600 crores from loans and Rs. 400 crores from small savings). Contribution from railways may be put at Rs. 200 crores over five years. These items aggregate a total sum of Rs. 6,400 crores, leaving a deficit of Rs. 2,400 crores.

As against the gap or deficit of Rs. 2,400 crores, the Planning Commission assumes credit for some Rs. 400 crores of foreign assistance. (In addition, foreign assistance of Rs. 100 crores is envisaged for the private sector). The remaining gap of Rs. 2,000 crores cannot be filled up by deficit financing or creation of money. As a first approximation, the Planning Commission assumes that such money creation can be resorted to to the extent of Rs. 1,000 to Rs. 1,200 crores by Government. Allowance must also be made for credit creation by banks for the needs of the private sector, say, Rs. 400 crores, or so, bringing total credit creation from Rs. 1,400 to 1,600 crores. A part of this credit would be withdrawn from the system as our accumulated sterling balances would be used up. Making an allowance for a decline in our foreign exchange reserves by some Rs. 150 crores, the Planning Commission assumes that even then, total money supply in the economy might increase by some Rs. 1,300 crores during the second Plan. A larger money supply will be needed as the monetised sector expands relatively to the non-monetised sector. Even then, with a 25 to 27 per cent increase in national income, an increase in money supply by some Rs. 1,300 crores on a base of some Rs. 2,000 is regarded by the Planning Commission as a sort of outside limit. If then, for the reasons just stated, deficit financing by the Government must be restricted to some Rs. 1,000 to Rs. 1,200 crores, it would be necessary to raise at least Rs. 800 crores by increased taxation, or by compulsory borrowings, or through increased profit of Government enterprises. In fact, a combination of all these will be called for.

Water Supply in India

Reports of acute distress caused by the shortage of drinking water which pour from all parts of our great country remind us of the utter inadequacy of water supply in our country. According to the statement of Rajkumari Amrit Kaur, Union Minister for Health, only 10 per cent of the total number of

towns in India had protected water supplies serving only 6.15 per cent of the total population of India or 48.5 per cent of the urban population. About 80 per cent of India's population lived in the rural areas and they relied mostly on an unpiped water supply from wells, tanks, springs and streams. As could be expected under such circumstances, cholera, dysentery and diarrhoea, which were mainly water-borne diseases, claimed annually 220,000 lives in between themselves. The total number of deaths from all causes in India was 38 lakhs.

The much appreciated recommendations of the Environmental Hygienic Committee appointed by the Government of India went largely unimplemented on account of financial stringency. In April, 1954, the Health Ministry put forward a proposal for a National Water Supply and Sanitation Programme which was approved in principle by the Planning Commission. Both the urban and rural parts of the programme were eventually sanctioned and communicated to the State Governments by September, 1954. The Union Government sanctioned a loan of 12 crores of rupees for the urban schemes and an outright grant of 6 crores to meet 50 per cent of the cost of sanctioned urban schemes of the State Governments. Most of the schemes sent in by the State Governments were approved by the Union Government.

Commenting on the condition of water supply in India and the Government of India's policy in that regard "M.P." writes in the *Harijan*, June 11:

"Is this not one of the items of topmost priority in the eyes of our planners? It is a matter of national shame indeed to learn that India under Swaraj does not still provide clean potable water to her citizens. Big talks of bunds and electrification pale into insignificance before this state of affairs."

West Bengal Municipalities

Sri Biswanath Basu, General Secretary of the West Bengal Municipal Association, discussed a number of problems facing the municipal administrators in the State in his report to the 18th session of the West Bengal Municipal Conference, held at Calcutta on April 16 and 17, 1955, shortly after the passage of the Bengal Municipal Amendment Bill by the West Bengal Assembly.

Referring to the passage of the West Bengal Municipal Amendment Bill he regretted the fact that while introducing vital reforms in the constitution of the local bodies Government had not thought it proper to consider the views of the Association—the only representative body of the Municipalities of the State. The passage of the bill, Sri Basu said, had bade good-bye to the "elementary democracy that was still existing in these local bodies." Moreover, although in the statement of objects of the bill reference had been made to the financial difficulties

faced by the municipalities "no attempt whatsoever was made in the Bill to solve these difficulties."

Sri Basu then proceeded on to examine specifically some of the charges commonly levelled against the Municipal Administration, one was the charge of poor collection. Of course, the percentage of collection was poor if the total demand was taken to include arrear demand as well. "But the percentage is not really unsatisfactory when the annual demand alone is considered." Even the Government could not always maintain a record of good collection, Sri Basu pointed out and added that "as regards Income-tax and Sales-tax where only the richer section of the community are concerned, the percentage of collection on the total demand does not, in any year, exceed 50 and often as low as 25." The Municipal ratepayers were mostly members of the poorer section of the community. "So," Sri Basu said, "such default in payment is due to our existing financial crisis, low purchasing power and national character as well. With increasing purchasing power, education, self-consciousness, and growth of the community spirit, things are bound to improve."

Sri Basu partly admitted that in some cases there might be low assessment but for that it would be wrong to put all the blame on the Municipal Administrators. "Let our national character rise and municipal finances improve and these evils will vanish."

Another charge against the municipal authorities was that expenditure under conservancy exceeded the receipts under that head. "It is actually so and will remain so as long as the present Act endures and labour conditions continue. Amenities in the shape of conservancy service are peculiar to the municipalities and constitute the most expensive part of the administration costs. Even then, the amenities actually offered to the rate-payers are far short of what these should be. Let our well-wishers examine the matter fully and try to solve the problem in the right way," Sri Basu said.

Out of a total population of two-and-a-half crores in West Bengal about one crore or forty per cent of the people lived in the congested municipal areas. But Government spent very little for their welfare. Much of the apparent inefficiency of the Municipalities could be properly ascribed to their poor financial conditions. The Local Finance Enquiry Committee had also admitted that Municipalities in West Bengal suffered mainly from bad finances due to meagre sources of revenue. The Committee's recommendations for allocation of shares of certain State revenues such as from Sales-tax, Electricity duty, Amusement tax, etc., to the Municipalities had however remained unimplemented. The Taxation Enquiry Commission also had made recommendations on the lines suggested in the recommendations of the Local Finance Enquiry Committee.

There was the case of the Motor Vehicles tax. Out of several crores of rupees realised as M. V. tax, a sum of only about rupees one to two lakhs was distributed amongst the eighty-two municipalities in West Bengal. "It is curious indeed that while the municipalities bear the burden of maintaining and improving the roads, all revenues that are realised from vehicles using these roads and damaging the same are taken over by another authority," Sri Basu pointedly said pleading for a just re-allocation of the tax between the Government and the Municipalities.

In the matter of the establishment of Free Primary Schools also the municipalities had failed to get just treatment from the Government. "Even the few free primary schools which had been started in some municipal areas under 'Biss Scheme' with the assurance of fifty per cent State aid, are, at present receiving not more than thirty per cent of the actual expenses and thereby a heavy burden is thrown upon the municipalities concerned . . ." Moreover, it was another regrettable fact that no portion of 2200 crores of rupees spent under the First Five-Year Plan had been allotted for the development of municipal areas. The West Bengal Municipal Association had submitted to the State Government some schemes for the development of municipal areas but none of them had been forwarded to the competent authorities for inclusion in the Second Five-Year Plan.

The settlement of refugee colonies in municipal areas without consultation with the municipal authorities came in for sharp criticism in the General Secretary's Report who said: "How injudicious has been the selection of the colony areas by the authorities concerned will be apparent from the fact that in Hooghly-Chinsurah, Government acquired a portion of the municipal trenching ground without even the knowledge and consent of the municipality and thereby stopped further trenching in that ground without making or helping to make any alternative trenching arrangement. The consequence of such indiscreet action on the part of local officers can be well realised and needs no description."

Sri Basu then referred to the unusual attitude displayed by the State Government in rejecting the representation made by the people in some municipalities, where the river Bhagirathi had been causing damage to municipal and other public and private properties by erosion, for Government help for protection of the river banks, on the ground that no Government property was involved.

Sri Basu also referred to the desirability of reducing red tape by doing away with undue insistence on trivial technicalities in urgent and important matters. He referred to complaints received from certain municipalities that schemes for augmentation of water supply initiated in accordance with plans and estimates prepared by competent Government Depart-

ments, and approved by Government, could not receive the statutory financial assistance on the 2:1 basis on the flimsy pretext of technicalities having not been observed in full.

He also urged for the appointment of a few liaison officers between the Government and the local institutions with a view to improving their mutual relations. He also appealed for a change of mental attitude on the part of Government officials and pleaded for greater co-operation with the municipal authorities.

At the same time the Municipal Commissioners also were reminded of their great responsibility.

We would like to know the standpoint of municipalities in other States, regarding the points raised by Sri Basu.

Institute of Public Administration

The Indian Institute of Public Administration was formally inaugurated on the 29th March, 1954 with Sri Jawaharlal Nehru as its President. The importance of establishing an institution for a systematic study of public administration had been recognized for many years by academicians and administrators. With the advent of independence, and the inauguration of the constitution necessitating wide transformation of the administrative set-up, and the introduction of national development plans, the need for such a systematic study became all the more urgent. Under the circumstances the Deputy Chairman of the Planning Commission, Shri V. T. Krishnamachari, convened an informal meeting on the 29th October, 1953 in which decisions were taken to establish in India an institute of public administration. Professor D. G. Karve, the well-known economist, was chosen as the Director of the new institute.

The principal objects of the Institute were to provide for the study of public administration and allied subjects by organising study and training courses, conference and discussion groups; to undertake research in matters relating to public administration and the machinery of government; to publish periodicals, research papers and books on Indian administration; and to serve as a forum for exchange of ideas and experiences and a clearing-house of information on public administration in general.

The Institute's membership was open to all actively interested in or concerned with the study or practice of public administration. The minimum annual subscription for individual membership was Rs. 25/-. There was also provision for corporate membership.

From the first annual report submitted by Prof. Karve, the Director of the Institute, it appears that the Executive Council of the Institute approved of the broad outlines of a scheme of a School of Public Administration providing a two-year course to students admitted on the strength of a qualifying degree and an entrance test.

The membership fees of the Institute were approxi-

mately Rs. 12,500. The Government of India sanctioned a total grant (recurring and non-recurring) of Rs. 7.71 lacs for the year 1954-55, thereby considerably easing the financial difficulties of the Institute. Efforts were being made to obtain support from State Governments and private endowments. The Ford Foundation agreed to donate a sum of \$350,000 over the first three years. The first year's instalment of \$166,666 was received. The total expenditure over the first three years was likely to be about 50 lacs of rupees including the cost of land, building, initial library and the establishment of the School of Public Administration.

The Institute formulated a regular programme of fellowships for providing facilities for higher studies and specialized training in public administration. The first batch of the Institute's fellows would soon proceed abroad for higher studies and training.

Prof. Karve adds: "The source materials, reports, text-books, case-histories, etc., bearing on Indian conditions which are needed for adequate and fruitful study of public administration are for the most part lacking. The Executive Council has, therefore, set up a Central Committee of Direction for arranging to have such materials prepared with as little delay as possible. The Committee has already selected a list of topics for study and research."

The Institute started publication of a quarterly journal from January-March, 1955 with Shri S. B. Bapat as the editor.

Medium of Higher Education

A conference was held at Madras on June 18 to consider the question of adopting Tamil as the medium of instruction in educational institutions including colleges, and preparation of a list of suitable technical terms for such higher studies, reports the *Hindu*. The conference, attended by the Vice-Chancellors and other educationists, was presided over by the Madras Minister for education, Mr. C. Subramaniam.

Mr. Subramaniam detailed the steps taken in the past to promote the use of the regional language as the medium of instruction at the school stage and invited the views of the educationists and others in particular on the question (a) of making a beginning in the introduction of Tamil as the medium of instruction in colleges and (b) as to whether a Committee or other suitable organisation might be set up for preparing scientific and technical terms in that language.

Dwelling on the importance of imparting college education in the mother tongue of the students the Minister pointed to the difficulties faced by the students in following instruction given in English in the colleges after having studied non-language subjects in the regional language in high schools. But it was not easy to effect a change. When back in 1938 the first Congress Government had introduced education through the mother tongue in schools even then objections had been raised against that on the ground of want of suitable text-books in the regional languages. About

four years ago a conference of State representatives of the Southern region and Vice-Chancellors had been held. Though the intention of those who had participated in that conference had been clearly to encourage the use of regional language, immediate steps could not be taken for want of facilities for the purpose of imparting such education with the regional language as the medium of instruction.

Shri Subramaniam also referred to the steps being taken for the preparation of scientific and technical terms in Hindi by the Board of Scientific Terminology, set up by the Government of India in 1950.

The Board had decided that international scientific and technical terms should be used in all books written in Hindi and other principal languages of India. The preparation and publication of authentic terms in Hindi would be done in nine stages. The stages were, to quote Shri Subramaniam:

"In the first stage, a collection of all necessary English terms for each subject is made.

"In the second stage, the exact connotation of each English word is determined with the help of standard works of reference and in consultation with technical experts.

"After this, the finding of suitable Hindi equivalents for the English terms begins in the third stage. The most important work is that of evaluating each possible equivalent in respect of its exact meanings, significance, etc.

"In the fourth stage, tentative lists of English terms with their proposed Hindi equivalents for each subject are put before an Expert Committee for that subject. The Committees consist of eminent scholars and experts. The Committees make a detailed and exhaustive examination of such lists and suggest changes and alternatives and then provisionally approve the lists.

"In the fifth stage, the lists thus approved by the Expert Committees are printed as provisional lists and submitted to the Board of Scientific Terminology which examines them again and makes its own suggestions.

"In the sixth stage, these lists are circulated to various State Governments, Universities, Research Institutions, Ministries of the Government of India, Language Experts and various other individuals and bodies, for comments.

"In the seventh stage, comments and opinions received are put before the respective Expert Committees which assess them and revise the lists in their light.

"In the eighth stage, the lists are again submitted to the Board for final approval.

"In the ninth stage, these lists are submitted to the Government for final approval. After the Government has accepted these lists, they are printed as standard and authentic lists of technical terms in Hindi."

Molestation of Girls

The *People*, June 26, refers to a recent incident in Lucknow when a girl was molested by students in a

bus and invites the attention of the guardians and teachers so that such shameful occurrences came to an end. It was all the more regrettable, the paper notes, that even college and university students should often be found guilty of such shameful conduct. The guilt was not of the students alone, the guardians and teachers had also a great measure of responsibility.

The *People* continues: "The present-day society is a hotch-potch of the modern and old. As such it is a period of uncertain transition. It is also correct to say that the effect of temptation from the other side should also not be minimised. Still to molest innocent girls in the streets, in the tramways or buses, is nothing short of a barbaric act and no amount of explanations can exonerate the crime. A very serious view should be taken of these outrages."

We thoroughly agree with the *People*. The guilty parties should be severely dealt with in future. It is about time people were made to realise that liberty and libertinism are not synonyms.

Hyderabad State Bank Affairs

The *Spectator*, a weekly news magazine, published from Hyderabad, in its issue of June 16 comes out with serious charges against the State Bank of Hyderabad with a demand for public enquiry into the Bank's affairs.

Shri P. N. Bam in an article in the magazine of even date writes that the recent downward trend of the shares of the State Bank of Hyderabad was an indication of the markets' opinion about the working of the Bank. As a fully paid-up Bank share with no reserve liability it should fare much better and ought to be considered a good catch at 120-125; but No! Investors do not care to touch the shares with a pair of tongs. What is really wrong?

According to Shri Bam, who had also addressed an open letter to President Rajendra Prasad over the affairs of the State Bank, the reckless lending policy followed by the directors of the State Bank of Hyderabad had led the Bank to heavy financial loss. It had been freely rumoured for a long time that "an amount of three to four crores out of the total advances was found to be not recoverable at short notice or on due date and that a tussle had started between the creditor Bank and its debtors wherein the latter had the upper hand."

Shri Bam writes: "There may be several debtors whose total assets put together (even including those of the Sureties) may not be found sufficient to realise the debt owed by them and whose total income from property, interest, dividends and business earnings may not be sufficient to pay the periodical instalments . . ." and that consequently around two crores of rupees would have to be written off as irrecoverable.

He continues: "A comparison of the credit limits during the years 1952, 1953, 1954, enjoyed by the

defaulting parties will bear out that the limits of advances to certain parties progressively increased in spite of huge debits standing to their accounts."

The Hyderabad State Bank came into being with the passage of Hyderabad State Bank Act, 1941, with guarantees from the Government for payment of interest at 3 per cent to the depositors. Until recently it had been acting as the Bankers to the Government of Hyderabad. Sometime ago the Inspection Branch of the Reserve Bank of India held an inspection of the Hyderabad State Bank, though it was not a Scheduled Bank.

The *Spectator* urges upon the Reserve Bank of India to publish the reports of inspection of the State Bank of Hyderabad reviewing the findings of that inspection. "It seems that only having two directors on the Board of Directors of the Bank is not enough to exercise sufficient check. There must be one or two checking officials on the executive staff if matters have to improve."

With reference to the impending nationalisation of the Bank the newspaper writes: "The Reserve Bank and the Government of India may now be asked whether they can afford to be so charitable as to shoulder at the very inception of the National Bank the heavy burden of the bad debts of the Hyderabad State Bank which run into several crores, the full recovery of which is extremely doubtful and whether for the future working of the Hyderabad Branch of the Indian State Bank they can safely rely upon the present set of executive officials and directors who have proved that they act irresponsibly and without the least regard for their duty as trustees of public money entrusted to their care."

Governmental "Efficiency"

The subjoined report published in the weekly *Spectator* in its issue of June 16, 1955, is highly illuminating:

"Trivandrum.—The Travancore-Cochin Government recently sanctioned maternity leave asked for over a year ago by a woman official of the Public Health Department.

"The child born to the official is now over ten months old.

"The leave was granted four days ago by the Chief Minister, Mr. P. Govinda Menon, to whom was finally forwarded a voluminous file from the Health Department containing the application. The Chief Minister has returned the file to the Secretary of the Department with a two-and-a-half page note calling for an explanation of this 'quick disposal' of the leave application."

No comment is necessary, we hope.

Rajasthan Punishes Corrupt Officials

The *A.I.C.C. Economic Review* welcomes the action of the Government of Rajasthan in summarily

suspending four Executive Engineers, an Assistant Engineer and two overseers of the State Public Works Department (PWD).

The suspension followed reports of negligence shown in the construction of a school-building at Ganga Nagar of Savai Madhopur district. "It was found that (i) roofs were leaking; (ii) as against the cement required to be used, the walls and the floors were plastered with a local soil variety; (iii) in many parts of the school building, the plaster had given away and fallen down; (iv) the walls in the school building had cracked at number of places." Nevertheless, in spite of warnings, bills of contractors were being regularly passed. Recounting the events leading to the action of the Rajasthan Government, the newspaper writes in conclusion: "It need hardly be emphasised that PWD's are among the most corrupt sections of our administration, and it is high time that this most important branch of the administration be corrected and improved as soon as possible. The best way to do this is to administer summary justice to the dishonest officials and contractors."

World's Tiniest Tribe

The *Weekly West Bengal* describes the measures adopted by the Government of West Bengal for the uplift of the tiniest tribe in the world, the Totos, who lived secluded in the Himalayan Tarai, the entire race living in just one hamlet. The Totos numbered only 314 and lived at Totapara, on Totapahar, Thana Madarihah in the Jalpaiguri district. The hamlet had an area of three and a quarter square miles of which about two-and-a-half miles were covered by thick jungles.

The Totos were well-built with broad and flat features, tanned skin, small and oblique eyes. They were a friendly people, shy and reserve but very intelligent, and wore fewer clothes but more ornaments than other tribes.

Indian Cultural Delegation to China

An Indian Cultural Delegation led by Shri Anil Kumar Chanda, Deputy Minister for External Affairs of the Government of India, was currently touring China. The Delegation was given a warm welcome by the Chinese Government and people. From reports in the Chinese press it appeared that the delegation scored a great success in popularising Indian art and culture among the Chinese people and in cementing the age-long friendship of the two peoples.

The organ of the Central Committee of the Communist Party of China, *The People's Daily* of Peking, in an editorial article on June 14 characterised the visit of the Indian Cultural Delegation as a "great event in the growth of friendly ties and cultural exchange between China and India."

The *Kwangming Daily* urged upon Chinese artistes to make a serious study of the Indian art music and

dancing. "From Indian art," the paper said, "indomitable strength of the Indian nation, its creativeness and abundant optimism can be clearly observed."

"To improve our own music and dance, it is important and necessary to learn from our Indian friends."

Ten Years of the United Nations

Ten years ago, on June 26, 1945, representatives of fifty nations signed the Charter of the United Nations expressing their determination "to save succeeding generations from the scourge of war which twice in our lifetime has brought untold sorrow to mankind" and to create conditions for peaceful promotion of social progress and better standards of life in larger freedom. The signatories pledged to practise policies which were now expressed by the words "peaceful co-existence."

However, almost immediately after the signing of the Charter schism appeared among the United Nations and the cold war began followed by occasional interludes of "hot" war, in Indonesia, Kashmir, Korea, Indo-China and other places. None of the vital international questions referred to the UN could be settled by that body, because of the underlying power-political relations dividing the Big Five on whose unanimity the whole edifice of the United Nations rightly stood. The experience of ten years thus demonstrated more pointedly the indispensable need of the organization since in so far as the world could not survive a third atomic world war that war could hardly be prevented unless the Great Powers agreed on a policy of co-existence and peaceful competition of their wars. An organization like the United Nations was the ideal one to provide for the framework of such Big Power co-operation.

The main spring of the strength of the organization lay in its universality. If certain countries willing to subscribe to its aims and objects were debarred admission on the whims of one or other State, the organization could hardly fulfil its functions. The war in Korea, in Indo-China and in the Taiwan area exposed the utter ineffectiveness of the United Nations in Far Eastern affairs without the co-operation of China.

The eleventh year of the United Nations opened with good augury. No 'hot' war was raging anywhere in the world. The conclusion of a State Treaty on Austria, China's softened attitude on the Taiwan issue and the release of imprisoned airmen and the prospect of the Big Four meeting, considerably lessened the international tension.

Britain Retains India's Library

The India Office Library in London was one of the greatest oriental libraries in the world having 280,000 printed books and 20,000 rare and valuable

manuscripts in the English and oriental languages. The library contained, among other things, the business papers of the East India Company and its successor, the Board of Control and the Secretary of State for India, papers relating to the first surveys of the country and a valuable collection of manuscripts and printed books on all aspects of Indian life.

The question of the transfer of the library from London to India was first raised in 1947 when Premier Nehru assured of the Government's attention to the matter. Some preliminary steps were taken indeed but after some time the matter was allowed to drift until this year it was again taken up by the Union Ministry of Education. During the Pakistani Premier's talks in Delhi, discussions were held in May this year between the Pakistani Minister for Education, Colonel Abid Hasan, and the Union Minister for Education, Maulana Abul Kalam Azad, over the future of the Library without any final decision being arrived at.

A joint communique was, however, issued recording the agreement between the two Ministers on the fact that "the Library belongs to the present Governments of India and Pakistan as successors to the Government of undivided India, and the question of the disposal of the Library is the concern of the two Governments and is to be settled by them."

After those discussions Maulana Azad left for Britain to negotiate with the British Government for a final settlement of the question of the transfer of the library to India. But before Maulana Azad's arrival the British Commonwealth Secretary, Lord Home, declared in the British House of Lords on June 13 that the British Government would not allow the Library to be divided or to be shifted outside Britain. "In the U. K. Government's view, the right course is that the Library should remain intact and in this country (Britain)," Lord Home said.

"But we would, of course, readily consider any suggestions that the Governments of India and Pakistan may wish to make to us as regards the detailed administration of, or access to the Library."

As regards the historical records that were the archives of the East India Company and the India Office, which were now in the custody of the Commonwealth Relations Office, the British Government's policy was to retain those in Britain, added Lord Home.

The *Vigil* (June 18) reports: "Recently the Committee of History of the Freedom Movement in India stated that historical records were not made available by the India Library authorities in London to authorized scholars and research workers."

Even before the recent declaration of the British Government, the New Delhi correspondent of the weekly *New Age* wrote on May 22 after summing up

the attitudes of the British press that the British Government would not be willing to give back the India Office Library. The correspondent wrote:

"The British authorities, it is feared, will raise every legal issue they can get hold of to retain the Library—including a 19th century precedent established by France and Germany over Alsace-Lorraine—and they would try their best to complicate the issue further by declaring that even Burma must have a say in the disposal of the Library (as one British paper has already done)."

Quadianis are not Muslims

A UPI report from Lahore, dated June 6, published in the *Bombay Chronicle*, says that the District Judge of Campbellpur, sitting at Rawalpindi, upheld the judgment of the Rawalpindi Civil Judge that Quadianis were not Muslims—and a Quadiani woman could not remain wife of a Muslim according to the Islamic *shariat*.

The report adds:

"This observation was made in a judgment on the application of the wife of Captain Naziruddin, for payment of dowry (*haq-mehr*).

"Captain Nazir and Umat-ul-Karim could not live happily and the woman went to her parents.

"Naziruddin divorced her on the plea that she was a Quadiani.

"She sued him for *haq-mehr*.

"The District Judge said: (1) Muslim theologians agree that Prophet Mohammed was the last prophet and no prophet was to follow him; (2) Muslim theologians also agree that whoever does not believe that Mohammed was the last prophet was outside the pale of Islam; (3) Muslim theologians also agree that Quadianis do not believe the 'last-hood' of the Prophet and are therefore non-Muslims."

The question remains, where stands Sir Zafrullah Khan, the champion of Pakistan at the U.N.?

Salk Vaccine

It is reported that the Government of India was considering the import of salk vaccine for anti-polio inoculation in India.

Over the salk vaccine ensued a controversy in the United States of America, the country of its origin, which unfortunately is not yet over. In view of that controversy and in the light of Britain's reported decision not to import salk vaccine now, some more consideration before deciding on bulk of imports of the vaccine would suggest itself as the best policy for the Government of India to follow.

In this connection the following comments of the British weekly, *Lancet*, reproduced in the *Bombay Chronicle*, is quite significant.

The *Lancet*, a famous journal, said that there was a small but definite risk in using the salk vaccine as a preventive against poliomyelitis or infantile

paralysis. The risk might be reduced very much by improved tests but there would still be fear that the tests might have failed to reveal the presence of every live virus and the occasional highly susceptible child might be given the disease by a vaccine which had passed the most vigorous testing.

"This risk must be weighed against the benefits, which at the moment seem to be a three or four-fold reduction in the chance of getting paralytic poliomyelitis in the year following vaccination—with presumably some protection for a much longer period, although the extent and duration of this are not yet known.

"In addition, there is the risk of unknown dimensions that repeated injection of the vaccine prepared from monkey kidney may eventually sensitise the child in some harmful way.

"This could conceivably have more serious consequences than accidental infections on which attention has naturally been fixed so far."

Indian Doctors in South Africa

The *Indian Opinion*, the weekly news magazine published from Natal, in its issue dated the 22nd April relates the story of two Indian doctors having been refused permission to practise in Orlando Native Township. The Minister of Native Affairs of the Union of South Africa, Dr. H. F. Verwoerd, said that it was contrary to the policy of the Union Government to permit non-Natives to practise in Native areas.

The two doctors, Dr. A. B. Kazi and Dr. Z. E. Asrat, however, had earlier obtained permission in terms of the Urban Areas Act from the Johannesburg City Council to practise in the township but the Minister refused to grant such permission.

The *Indian Opinion* writes: "At a recent meeting of the Orlando Advisory Board the Native members complained that doctors were badly needed in the township. They passed a resolution asking the City Council to reconsider the decision. The Medical Association is investigating the matter."

Such is the way of democracy in the mid-twentieth century white civilisation of the Union of South Africa.

Indian Shops and Barbed Wire

The *Indian Opinion* writes on the 29th April: "The following report appeared (with a diagram) on the front page of the *Rand Daily Mail* on April 23. The newspaper deserves praise for giving full publicity to this case of rank injustice.

"A sturdy, three-hundred-yard-long barbed wire fence was put up at Badplaas this week. It has the effect of making it difficult for Whites to deal at two Indian shops near the Government Mineral Baths.

"At the same time the Transvaal provincial authorities have gazetted a notice proclaiming the road from the shops to the baths closed and opening a new road on the other side of the fence.

"The business of the Indians has fallen, but there is

still a trickle of buying over the fence. Even nine strands of barbed wire has not stopped that. The fence cuts across the road that used to serve the shops and passes within two feet of one of them. Now orders are shouted over the fence and the goods brought out.

"The building of the fence, in a way, also operates as a kind of 'Group Areas Act.' The Act could not be applied to the Indian shops at Badplaas, and no applications similar to those in other Transvaal towns, had been brought against them. The reason is that the Indians are nearly half-a-mile from the town on privately-owned ground.

"The first shot in the campaign came two years ago, when the main road from Barberton was rebuilt, skirting the Indian shops and allowing access to the baths by a new road. But business went on.

"A year later the Mineral Baths Committee erected corrugated iron road blocks on the old road. They were removed by the owner of the land, and no dispute was raised. This week the fence went up. Business is still going on.

"Since the new road was made eight people have been killed in motor accidents on the sharp turn, almost right angled, into the town itself—five Europeans and three Natives.

"The old gently curving road into the town had stood for 70 years. It was included in the farm when President Kruger donated Badplaas to the Transvaal Government. The shops were built in 1931 and have done substantial business with Europeans.

"Mrs. C. M. Cross, a well-known farmer in the area for the past 55 years and a customer at the store of one of the Indians since her arrival in the district, said that the erection of the fence was rather like the erection of a prisoners-of-war camp. "I now have a mile-and-a-half detour for my shopping and to collect goods offloaded at the store by the railway bus. I think this action is absolutely ridiculous. It is unnecessary and of no advantage to anybody."

Russo-Yugoslav Rapprochement

After seven years of strained relationship between the Soviet Union and Yugoslavia is became normal again with the signing in Belgrade of a joint declaration by the representatives of two Governments.

With the expulsion of the Communist Party of Yugoslavia from the Information Bureau of the (nine) Communist Parties of Europe (commonly alluded to as the Cominform) in June, 1948 for the "crime" of differing from the orthodox Soviet views on the development of socialist agriculture in Yugoslavia, the relations of Yugoslavia with Soviet Union as with other Eastern European democracies, even on a purely diplomatic and commercial level, had become untenable, as a result of which all intercourse amongst the nations had completely ceased. The relations became unbelievably hostile and recriminating. After Stalin's death however some changes in Soviet attitude toward Yugoslavia became perceptible and the present rapprochement was the result.

The Leader of the Soviet Delegation to Yugoslavia for normalization of the relations between the two countries admitted in a speech at the Belgrade airport on May 26 that the treatment accorded to Yugoslavia had been all wrong and apologised for the injustice done to Yugoslavia. The Soviet leader Mr. Khrushchev ascribed the bad relations to the machinations of the late Laventri P. Beria and others. He said:

"It is our profound conviction that the time when our relations were clouded has gone. On our part we are willing to do everything necessary to remove all obstacles impeding the complete normalization of relations between our states and the consolidation of friendly relations between our people."

The *New York Times* Moscow correspondent writes that Western observers in Moscow were astonished by Mr. Khrushchev's statement. The reasons for the surprise, according to him, were:

"The completeness of Mr. Khrushchev's apology to Marshal Tito for what happened in 1948 when Yugoslavia was expelled from the Cominform was unexpected.

"The declaration that Laventri P. Beria, the former Soviet security chief who was executed in 1953, and his henchmen were responsible for the bad relations that developed between the Soviet Union and Yugoslavia was completely unexpected. Nothing of that kind had ever been suggested before."

The joint declaration noted the "spirit of friendship and mutual understanding" in which the discussions had taken place. It spoke of the agreement of the two governments to take further measures for normalizing their relations and said that the two governments had proceeded from the principles of:

"Respect for sovereignty, independence, territorial integrity and equality between the states in their relations and in relations with other states;

"Recognition and development of peaceful co-existence between nations, irrespective of ideological differences and differences in social systems, which implies co-operation of all states in the sphere of international relations in general and economic and cultural relations in particular;

"Mutual respect and non-interference in internal affairs for any reason—economic, political or ideological—, inasmuch as questions of the internal structure, difference in social systems and difference in concrete forms of the development of socialism are exclusively a matter for the peoples of the respective countries;

"Development of bilateral and international economic co-operation and the elimination of all the factors in economic relations which hamper trade and impede the development of the productive forces in the world and within the bounds of national economies;

"Discontinuation of any form of propaganda and misinformation and other actions which spread mistrust and in one way or another hamper the creation of an atmosphere for constructive international co-operation and peaceful co-existence among the nations;

"Condemnation of any aggression and any attempt to establish political and economic domination over other countries ;

, "Recognition of the fact that the policy of military blocs aggravates international tension, undermines confidence between the nations and increases the danger of war."

Economic ties between the two countries would be strengthened and economic co-operation expanded for which necessary steps would be taken. A cultural convention on cultural co-operation would be concluded with a view to developing cultural relations. A convention would also be concluded regarding an information service, which would ensure accurate and objective information to the people of the two countries, "in the spirit of the resolutions of the United Nations and on the basis of reciprocity as regards the status and privileges of the agencies of this service on the territory of each contracting party."

The Declaration also contained the agreement of the two governments to establish mutual co-operation in the peaceful uses of atomic energy.

A treaty would be concluded with the object of settling questions of citizenship or correspondingly of repatriation of citizens of one of the contracting parties who were on the territory of the other party. The governments further "agreed on the necessity of guaranteeing the rights and protection of the citizens of one party on the territory of the other, understanding by this also the right of citizens to retain the citizenship which they had prior to the arrival on the territory of the other contracting party."

The U.S.S.R. delegation to Yugoslavia consisted of M. Nikita S. Khrushchev as the leader, Premier N. A. Bulganin, Deputy Premier, Anastas I. Mikoyan, M. D. T. Shepilov, editor-in-chief of the *Pravda* and Chairman of the Foreign Affairs Commission of the Soviet Nationalities of the Supreme Soviet of the USSR, Deputy Foreign Minister A. A. Gromyko and the Deputy Minister of Foreign Trade, P. N. Kurnykin.

Yugoslavia was represented by President Tito, Edward Kardelj, Alexander Rankovic and Svetozar Vukanovic-Tempo, all the three being Vice-Chairmen of the Federal Executive Vece (FEV) and several others.

On the eve of the Soviet-Yugoslav negotiations President Tito reiterated Yugoslavia's desire for continued co-operation with the West. Apparently on Yugoslav invitation representatives of the three Western Powers, Britain, France and the U.S.A. held discussions with Yugoslav Government in Belgrade from June 24 to 27. The discussions were on the ambassadorial level and discussed mainly aims and methods of Russian strategy in Europe.

Survey of American Economic Life

The United States had a productive economic system easily capable of attaining by 1960 a total national output of \$414,000 million, making possible an

average family income of more than \$6,000 per year, reveals a five-year economic study entitled *America's Needs and Resources: New Survey* by J. Frederic Dewhurst and Associates.

Among the findings of the survey were the following, the *USIS* reports:

"American productivity is increasing so rapidly that if present rates continue in another century, the U.S. will be able to produce as much in one seven-hour day as it now produces in a forty-hour week.

"During the past century the U.S. rate of output has risen so fast that the average worker today produces nearly six times as much in an hour as the average worker did in 1850.

"At the present rate of growth, the United States will have a population of 177 million by 1960.

"While American productivity has steadily gone up, working hours have steadily gone down, from an average of 70 hours per week in 1850 to the forty-hour week of today.

"Leisure time for recreation for the average employed American has nearly doubled since 1900 and seems likely to increase still further."

The total manufacturing capacity of the United States had roughly doubled since 1940 and continued to expand.

The study concludes with the following words:

"The fabulous increase in output per man-hour over the past century and the marked lead which the United States holds . . . have not been achieved by working harder or more skillfully. The causes have been the steady expansion of our productive plant and our technological progress in devising superior techniques and processes and more and better machinery to multiply human effort through the use of vast amounts of inanimate energy."

There was, however, a decline in the national income of the United States in 1954. Compared with \$305,000 million in 1953 the national income in 1954 stood at \$300,000 million. Wage-earners and salaried employees of business and industry however continued to get a larger share of the national income. Their share reached a record high of 69.1 per cent in 1954.

The following table gives a percentage distribution of U.S. national income in 1929, 1939, 1953 and 1954:

	1929	1939	1953	1954
	%	%	%	%
Compensation of employees	58.2	66.1	68.6	69.1
Unincorporated business and professional men	10.2	10.2	8.6	8.6
Farm proprietors	6.8	5.9	4.0	4.0
Rental income of persons	6.2	3.7	3.5	3.6
Corporate profit before taxes	11.5	7.8	12.6	11.7
Net interest	7.1	6.3	2.7	3.0

Total	100.0	100.0	100.0	100.0

WHITHER UNIVERSITIES?

By Dr. P. J. CHAUDHURY, M.A., Ph.D.,

Department of Philosophy, Presidency College, Calcutta

A study of the history of the Indian universities reveals their progress in three directions. First, towards assuming responsibilities of teaching, especially higher courses (B.A. Honours and Post-graduate) and of organising research work; secondly, towards freedom from State control in the matter of internal administration of the finances, appointment and promotion of the staff and of general policy; thirdly, towards greater democracy with more powers coming to be vested in the teachers. Now these features are encouraging from several aspects and it is expected that they will reach their perfection in a few years. This seems to be the only natural course for our universities to follow and it is of no use to find fault with it. Yet one cannot forbear pointing out certain clear defects of this course of development. These defects may be overbalanced by the virtues of this irresistible movement, still an acquaintance with the former side may sober down one's excessive jubilation over the latter side. A correct representation of the state of affairs and a just estimation of it is necessary at any event, at least for the sake of truth and mental clarity if not for any practical gain. With this attitude of mind we proceed to lay our fingers on some of the more glaring defects of the present course of development in the universities.

The first feature of the universities is their assuming responsibilities of teaching and organising research besides examining. This certainly is a good feature. But in the manner this responsibility has been actually realised so far by the several universities it ceases to be an unmixed good. So far as a university has taken up direct responsibility of the Honours and Post-graduate teaching and of research work in the science subjects and so far as it supervises to some extent the teaching in the affiliated colleges it is good. But so far as it takes up teaching of arts subjects in the higher classes and so far as these classes are big (as is the case of the universities of the big cities) its performance is not all for the good. The reasons are the following:

First: The students do not develop any sense of joy and responsibility of corporate life and loyalty to some ideal embodied in some concrete shape unless they belong to an institution for at least four years at a stretch and unless their number is such (below a certain limit) as to give each student a feeling that he really counts and belongs to it. In a big university

college these conditions are seldom realised. The students, in such an institution, therefore, do not imbibe any spirit of responsibility and loyalty and this tells upon their character and conduct and also explains their frequent indisciplined outbreaks. This does not generally happen in the case of science students whose number is usually less and who grow a team-spirit through their practical-work in the laboratories where they have ample opportunity to know one another, their teachers and their privileges as well as obligations. In any case the university cannot be blamed for its organising central teaching in science at the higher stage for this has to be done; the cost of laboratory equipment is too large to advise having more than one college in a city for this teaching.

Secondly: In teaching arts subjects like literature, philosophy, economics or history the teacher has to use more of his power of clear thinking and expression to be really helpful to the students. Teaching of science subjects is easier in this respect for these matters are more or less clear to start with, science being more or less descriptive and systematic. So that a big class in arts subjects at the higher stage is not advisable and it means much waste in communication. A teacher who has to shout while lecturing tends to be mechanical and the students too in such circumstances sink into a low state of intellectual sensitivity. Moreover, they cannot ask questions in the class and discuss intricate matters with the teacher. An arts class of the senior students should not contain more than fifteen of them to ensure effective teaching. Science classes are usually small, the limit to their capacity being exercised by the amount of laboratory equipment. So the problem usually does not arise there. And then it is possible to teach effectively a much bigger science class than an arts one as indicated above.

Thirdly: Centralising teaching of higher classes in one institution only, generally under the direct management of the university, denies a good many bright young teachers in different colleges the experience of teaching these classes, and, so, the full opportunities of developing themselves. The central teaching is managed mostly by the veterans who, no doubt, deserve this monopoly; but in certain respects the younger group might be more helpful to the students. Most of them have more vitality and

human interest in their work and are popular with the students. The veterans, with their superior wisdom and experience, usually tend to be a bit mechanical in their teaching. This is but natural when we consider the circumstances, that they, as a rule, teach the same subject year after year for fifteen to twenty years and generally do not refresh their knowledge with a study of the new developments in the particular subject. With age most of them become increasingly suspicious of anything new and, so, back-dated and cynical in the eyes of their youthful students and junior colleagues. Then the fact that the students cannot go over to other teachers to learn the same subject which he alone teaches in a big city and that they have to attend his class for 'percentage' as well as for notes and suggestions (for he is one of the examiners) helps his indifference to his subject and students. We, however, must point out that our generalisations are only rough. We are well aware that there are some veterans who keep up their vitality and human interest in their work and students all along while a good many young teachers do their jobs in a very mechanical and cynical fashion quite unworthy of them. For youth is spontaneity itself and a certain amount of idealism is its peculiar luxury.

What is needed then is to give a better opportunity to the deserving youthful teachers to teach higher classes and, so, to draw them into the teaching line and not drive them away from it by giving them only junior classes and, incidentally, a small pay. Most of them are lured away by the administrative services; the drudgery and hardship of a lecturer shouting to very big crowds of junior students for years together before they might have a chance in the central university to teach higher classes is too much for the idealism of many bright scholars. There should be some competitive examinations for direct recruitment of higher grade university teachers like those for administrators if we hold the education of the country as important as its administration. Teaching experience and research work should not count very much as qualifications for admission into the university as senior lecturers. For one's quality of the intellect is most important in this matter and by the time one gets a doctorate degree and gains several years' experience of teaching junior classes one may lose much of his original brilliance and zest for life and knowledge. And it is a fact that a good many scholars do not go in for a doctorate or publish books so readily as others do. To provide a good portion of our promising young teachers we should have higher teaching in more than one institution in a large city. Instead of packing all the students in one big class let them be distributed over two or three small classes in different colleges. That will also ensure better quality of teaching and also better discipline and other character-building virtues for the students, as shown before. The extra cost involved in

this procedure will not be wasted, it will give good return and at least will maintain some scholars whose number should increase in free India if she is to show some real work in the field of knowledge and culture. A free nation is judged ultimately by its contribution to knowledge and culture; a good administration and economic sufficiency are not enough for her though these are essential.

We next consider the other two features of the development of the universities, viz., their freedom from State control and their democratisation. The combined result of these has been to give more power in the hands of the teachers themselves. This is good in one respect but bad in another. For, teachers now are busy forming parties and canvassing votes and doing other things that these naturally involve. This is a distraction for them but, urged by love of worldly power and fame, many begin to love it and lose thereby their distinctive character and prestige as scholar-teachers. Thus says the *Radhakrishnan Report* (Vol. I, p. 70):

"With the introduction of democratic control and of elections in our universities there has grown a tendency among teachers to interest themselves more in the administrative affairs of the university than in their legitimate duties. We are told that in several cases teacher-politicians have succeeded better in their careers than teachers who have devoted themselves to teaching and scholarship. The success of teacher-politicians who manipulate elections and get for themselves influential and lucrative positions in their own or sister universities is largely responsible for the deterioration of the morals of teachers and of academic standards of the universities."

Teachers certainly gain some prestige in managing their administration, their finances, appointments and promotion, and of course they should be managing them in a democratic manner for greater justice, yet the price they pay for self-government and democracy is rather too heavy for them. The price is their distraction from their studies, loss of mental equanimity and of prestige in the eyes of the society which loves to think of them as a class apart, wise and just, and a bit above worldly interests. Forsaking all worldly gains and power the scholar-teachers, like the Brahmins of ancient India, can realise their peculiar riches and power. The modern university teachers are compromising their position and perhaps they should themselves hand over their new responsibilities to their administrators whom they may help as advisory experts in technical matters. "One man one job," said Plato, and the job of a scholar-teacher, if taken seriously enough, is literally endless, at least much too heavy to allow him to dabble in administration. Some teachers, if they find in them administrative abilities, may take up educational administration after their retirement from teaching but they should not, either directly or indirectly, get them

selves interested in these extra-academic matters. The separation of the teaching and the educational administration, such as is to be found in some cases (e.g., West Bengal Government Colleges) is healthy in many respects. The teacher has not got to involve himself in the business of manipulation of elections for his promotion and preferences and in party-politics which are the gifts of democracy.

We have finished our review and we can imagine how odd it may sound in the ears of the progressive readers, particularly if they are teachers themselves. But, as we have said at the outset, we do not contend that the defects of the modern movement outweigh the virtues or that we have to fight it. We have only pointed out what we feel are the defects and the

generalisations we have made in the course of our discussion are all rough and tentative and open to correction. We have spoken for having smaller classes in arts subjects at the higher standards, for giving better scope to bright scholars in higher teaching and for the separation of the administration of higher education from the influence of teachers who are increasingly getting involved in extra-academic matters. We only request the educationists to consider our points and though matters may have to be allowed to take their natural course, for there may be many other factors to be considered which we have not done here, yet the points may still hold and have their value in clarifying relevant issues.

—:O:—

IS OUR PLANNING BECOMING TOTALITARIAN

By PROF. SHRIMAN NARAYAN

THE Planning Commission have recently published some preliminary papers relating to the "tentative frame-work" of the Second Five-Year Plan, for eliciting public opinion and inviting constructive suggestions on different aspects of the proposed plan. In one of the papers, Prof. Mahalanobis, Director of the Indian Statistical Institute and the Statistical Adviser to the Government of India, has submitted his "draft recommendations" for the formulation of the Second Five-Year Plan. In another paper, the panel of economists headed by Prof. D. R. Gadgil, have published "basic considerations" relating to the "plan-frame." While these tentative discussions and proposals have been welcomed in general, a few sections of public opinion have vehemently criticised the "basic approach" of Prof. Mahalanobis and other economists including Dr. V. K. R. V. Rao. *Freedom First*, which is the Organ of the Indian Committee for Cultural Freedom, has dubbed these economists as Communists or "fellow travellers" and expressed great concern over the so-called totalitarian trends in the preparation of the Second Five-Year Plan. "This highly centralised totalitarian kind of planning," writes the Organ, "is now slowly taking place behind closed doors" with the help of "experts from the Iron Curtain countries." It is pointed out that emphasis on the building up of heavy industries would necessarily lead to "the merciless exploitation of the people and rise of the Police State." The Organ has also criticised the recent amendment of the Indian Constitution relating to the Article 31, on the ground that "the Fundamental Right to property which was enshrined in the Constitution has been destroyed." Although the writer takes note of a number of recent utterances of Prime Minister Nehru to the effect that "India would not sacrifice democratic

institution at the altar of economic progress," he ends on a note of suspicion that "the dark activities of communist and near-communist statisticians, and economists have an uncanny way of finding easy access to his (Prime Minister's) ear and mind."

It is true that Planning in modern times tends towards over-centralisation of political and economic power resulting in the curtailment of individual liberties to a considerable extent. In fact, there is a school of thought led by Prof. Hayek which regards economic planning as a "road to serfdom." But this is, surely, an extreme view. We should not lose sight of the fact that India has taken upon herself one of the greatest challenges of modern times, namely, to plan out her social and economic life under a democratic set-up through peaceful and non-violent methods. The Prime Minister has reiterated this view a number of times beyond any shadow of doubt or confusion. After his visit to China, Shri Nehru, in the course of several speeches, made it abundantly clear that although he was deeply interested in the progress of China there was absolutely no question of imitating the political and economic organisation of China. India was wedded to the methods of peace and democracy, although she did not want to interfere with the systems prevailing in other countries.

"I think that in the long run," observed Shri Nehru, "the democratic and peaceful method is more successful even from the point of view of time and much more so from the point of view of results."

The Avadi resolution on the Socialistic Pattern, while emphasizing the role of the public sector, made it amply clear that "the private sector will continue to have importance," because the private sector in India

would necessarily include agriculture and small-scale and cottage industries. This point has been further clarified in the course of a recent speech of the Prime Minister in the Congress Parliamentary Party in connection with the nationalisation of the Imperial Bank. At the A.I.C.C. Session at Berhampur, Shri Nehru emphatically declared that the slogan of "nationalisation" was not going to solve India's economic problems. The basic or mother industries have to be nationalised, of course; but the consumer goods industries should be decentralised on a very wide scale in the form of co-operatives.

As the Berhampur resolution on the Second Five-Year Plan pointed out, it will be necessary to organise for a "great development of small-scale and village industries which have to play a role of crucial importance both in relation to providing fuller employment and for the purpose of ensuring an adequate supply of consumer goods." The tentative frame-work of the Second Five-Year Plan, as published by the Planning Commission, visualises co-operative effort and not collectivisation and nationalisation in the important sectors of land and village industries which would naturally constitute a substantial portion of India's economic development for many years to come. The fears regarding totalitarianism and centralisation are, therefore, unfounded and should not be allowed to cloud our vision.

We are, indeed, extremely surprised to find that the Organ of the Indian Committee for Cultural Freedom has attacked the recommendations of the "statisticians and economists" on the ground that the Second Five-Year Plan proposes "to reserve the new production of consumer goods for hand and cottage industries and to prevent any further expansion of factory production in that sphere." "The net result of the decision," writes the Organ, "will be the smothering of free enterprise, a famine of consumer goods and the tying down of millions of workers to primitive and soul-deadening techniques." This opposition to small and village industries makes the position of the Indian Committee for Cultural Freedom very untenable and even ludicrous. On the one hand, they oppose large-scale production

on the ground that it would result in regimentation and totalitarianism, and, on the other, they condemn village industries because their development would leave very little scope for large-scale factory production in the private sector. This clearly shows that the Indian Committee is mainly interested in the well-being of the private sector of the capitalists in the country. They are opposed both to the nationalisation of key industries as well to the expansion of small and cottage industries and desire to raise the bogey of "totalitarianism" in order to create confusion in the public mind.

Let me repeat once again that the mind of the Congress and the Government of India is not a communist or a semi-communist or totalitarian mind; it is also not a capitalist or American mind which always thinks in terms of private enterprise and regards private property as sacrosanct. India is determined to follow the path of peace, non-violence and democracy, as chalked out by the Father of the Nation. We desire to abolish poverty and unemployment from this country within the next ten years through large-scale planning of small, village and cottage industries with the active help and co-operation of village Panchayats and local bodies. It is gratifying to know that the Community Projects Administration has recently decided to strengthen their activities through the organisation of Gram Panchayats as basic units of administration and planning. Our objective, therefore, is to conquer hunger and unemployment by a process of bold decentralisation of political and economic power and not by following totalitarian or regimented methods of socialist or communist countries. That is why we purposely avoided the terms "Socialism" in the Avadi resolution and used the new phrase "Socialist Pattern of Society." Our socialism would be of the Gandhian or Sarvodaya type and not of the Communist pattern. The Congress has not wanted to exploit a high ideal and a noble word for political purposes. But there is no doubt whatsoever that our ultimate ideal is the Sarvodaya Pattern of Society and not the highly-regimented and totalitarian type of State. Let there be no mistake about it.

SOME ASPECTS OF OUR CONSTITUTION

(VI) Fundamental Rights: Right to Freedom (Continued)

By D. N. BANERJEE,

Surendranath Banerjee Professor and Head of the Department of Political Science, University of Calcutta

I

In our preceding article¹ in this series we have chiefly discussed, by way of an introduction, the general question of personal freedom *vis-a-vis* social control, with special reference to the position in this regard in the United States of America and England. We shall now begin, in the light of this discussion, the consideration of the nature and extent of our Fundamental Right to Freedom as guaranteed by Articles 19, 20, 21 and 22 of our Constitution.

II

We shall first take up Article 19 of the Constitution. This Article is rightly regarded as one of the most important Articles in the Constitution. As, however, the Article is a long one and comprises as many as six clauses, we propose, for the sake of convenience, to deal with it clause by clause. But we may indicate here the plan of the Article. Clause (1) of the Article is a statement of seven specific rights of the Indian citizen. It runs as follows:

- "19. (1) All citizens shall have the right—
- (a) to freedom of speech and expression;
 - (b) to assemble peaceably and without arms;
 - (c) to form associations or unions;
 - (d) to move freely throughout the territory of India;
 - (e) to reside and settle in any part of the territory of India;
 - (f) to acquire, hold and dispose of property; and
 - (g) to practise any profession, or to carry on any occupation, trade or business."

These rights, however, are not absolute: they are hedged about with qualifications. And Clauses (2), (3), (4), (5) and (6) of the Article, to be quoted hereinafter as occasion arises, specify the limits up to which the abridgment of the rights may be permitted and their exercise may be lawfully allowed. Thus they circumscribe, as it were, "the field of permissible restrictive legislation." As Das J. of the Supreme Court of India has stated:²

"If there were nothing else in Article 19 these rights would have been absolute rights and the protection given to them would have completely debarred Parliament or any of the State Legislatures from making any law taking away or abridging any of those rights. But a perusal of Article 19 makes it abundantly clear that none of the seven rights enumerated in Clause (1)³ is an absolute right, for

each of these rights is liable to be curtailed by laws made or to be made by the State to the extent mentioned in the several Clauses (2) to (6) of that article. Those clauses save the power of the State to make laws imposing certain specified restrictions on the several rights. The net (sic) result is that the unlimited legislative power given by Article 246 (of the Constitution) read with the different legislative lists in the Seventh Schedule (to the Constitution) is cut down by the provisions of Article 19 and all laws made by the State, with respect to these rights must, in order to be valid, observe these limitations. Whether any law has, in fact, transgressed these limitations is to be ascertained by the Court and if in its view the restrictions imposed by the law are greater than what is permitted by Clauses (2) to (6) whichever is applicable the Court will declare the same to be unconstitutional and, therefore, void under Article 13⁴ (of the Constitution). Here . . . there is scope for the application of the 'intellectual yardstick' of the Court. If, however, the Court finds, on scrutiny, that the law has not overstepped the constitutional limitations, the Court will have to uphold the law, whether it likes the law or not."

III

We shall now, first, deal with Clause (1)(a) of Article 19 which declares, as shown before, that "all citizens shall have the right to freedom of speech and expression." The exercise of this basic right of individual freedom, however, is subject to the requirements of Clause (2) of Article 19, which, as it stands today, lays down:

"Nothing in sub-clause (a) of Clause (1) shall affect the operation of any existing law, or prevent the State from making any law, in so far as such law imposes reasonable restrictions on the exercise of the right conferred by the said sub-clause in the interests of the security of the State, friendly relations with foreign States, public order, decency or morality, or in relation to contempt of court, defamation or incitement to an offence."

Now, what does the expression "freedom of speech and expression" in Clause (1)(a) really mean? Does it also include what is compendiously referred, to as the "freedom of the Press"? As will appear from what follows, it does. There was an interesting discussion of this point in the Constituent Assembly of India when Article 13 of the Draft Constitution of India, corresponding to Article 19 of the Constitution of India, was considered by the Constituent Assembly.⁵ It was held by one member⁶ of the

1. Published in *The Modern Review* for May, 1955.

2. See *A. K. Gopalan v. The State of Madras*, *The Supreme Court Reports*, 1950, Vol. 1, Parts II & III, April and May, 1950, p. 294.

3. Of Article 19.

4. See in this connexion my article in *The Modern Review* for November, 1954, pp. 377-82.

5. See the *Constituent Assembly Debates* of 1st and 2nd December, 1948.

Assembly that Article 13, as then worded, appeared "to have been clumsily drafted," that it made "one significant omission" and that was "about the freedom of the press"; and that it seemed "desirable and proper, therefore, that the freedom of the Press should be mentioned separately and explicitly." Another member was "amazed" that such "a very glaring omission" had taken place in the Draft Constitution of India as "the leaving out" of the expression "the freedom of the Press." He could not imagine why the "draftsmen, so experienced and so seasoned, should have felt it desirable to leave out the freedom of the Press, and leave to the charity of the administrators of the Constitution when occasion arose to include it by convention or implication, and not by express provision."

This criticism appears to have been based on a misconception of the expression "freedom of speech and expression" in the Draft Constitution. As it was rightly pointed by another member,⁶ "freedom of expression" also meant the freedom of the Press. And Dr. B. R. Ambedkar clenched the issue when he said:⁷

"The Press is merely another way of stating an individual or a citizen. The Press has no special rights which are not to be given or which are not to be exercised by the citizen in his individual capacity. The editor of a Press or the manager are all citizens (*sic*) and therefore when they choose to write in newspapers, they are merely exercising their right of expression, and in my judgment therefore no special mention is necessary of the freedom of the Press at all."

As we have seen before,⁸ this is also, in effect, the position of the Press⁹ in English constitutional law.

We also find a virtual endorsement of the view of Dr. Ambedkar in the Report of the (Indian) Press Commission, 1954.

"The expression 'freedom of the Press,' says the Report,¹⁰ 'has been understood in various senses' by different persons. It has not been defined or referred to in the Constitution. Article 19 of the Constitution deals with one of the fundamental rights, viz., right to different kinds of freedoms, and Clause (1)(a) thereof says:

'All citizens shall have the right—(a) to freedom of speech and expression.'

"This freedom is stated in wide terms and includes not only freedom of speech which manifests itself by oral utterance, but freedom of expression, whether such expression is communicated by written word or printed matter. Thus freedom of the Press, particularly of newspapers and periodicals, is a species of which the freedom of expression is a genus. There can, therefore, be no doubt that freedom of the Press is included in the fundamental right of the freedom of expression guaranteed to the citizens under Article 19(1)(a) of the Constitution."

And we find in the judgment of our Supreme Court in *Romesh Thappar v. The State of Madras* that "there can be no doubt that freedom of speech and expression includes freedom of propagation of ideas, and that freedom is ensured by the freedom of circulation."¹¹ The Supreme Court approvingly quotes in this connexion an extract from an American judgment¹² to say:

"Liberty of circulation is as essential to that freedom¹³ as the liberty of publication. Indeed, without circulation the publication would be of little value."

Thus the expression "freedom of speech and expression" has a much wider meaning than what appears on the face of it.

Before, however, we deal with Clause (2) of Article 19 as it stands today, we should like to say a few words about its history. Originally it did not exist in its present form. It was substituted, with a retrospective effect, by Section 3 of the Constitution (First Amendment) Act, 1951, for the original Clause 2 of Article 19, which ran as follows:

"19.(2) Nothing in sub-clause (a) of Clause (1) shall affect the operation of any existing law in so far as it relates to, or prevent the State from making any law relating to, libel, slander, defamation, contempt of court or any matter which offends against decency or morality or which undermines the security of, or tends to overthrow, the State."

It may be noticed from this provision that the permissible legislative restrictions on the right of freedom of speech and expression were originally, as the Press Commission has rightly pointed out,¹⁴ only "in respect of libel, slander, defamation, contempt of court, offences against decency or morality, and offences against the security of the State." The replacement of the original Clause (2) by a new Clause (2) was, it appears, necessitated by certain judicial decisions¹⁵—particularly by the judgments¹⁶ of

our Supreme Court, delivered on 26th May, 1950, in *Romesh Thappar v. The State of Madras* and *Brij Bhushan and Another v. The State of Delhi*, as well as by the (majority) judgment¹⁷ of the Special Bench of the Patna High Court, delivered on 13th October, 1950, in the matter of the *Bharati Press*. As a result of these judicial decisions, certain laws, or certain provisions of certain laws, however valid they might have been before the Constitution of India came into force, became unconstitutional and, therefore, null and void as they were found to be inconsistent with some of our Fundamental Rights.¹⁸ Thus, for instance, in the *Romesh Thappar* case the Supreme Court declared on 26th May, 1950, Section 9(1-A) of the Madras Maintenance of Public Order Act, 1949, as "wholly unconstitutional and void."¹⁹ Further, the Supreme Court made a clear distinction in this case between legislation for "the maintenance of the security of the State" and legislation for the "maintenance of public order."²⁰ In delivering the judgment of the majority²¹ of the Judges in the case, Patanjali Sastri J. stated,²² among other things:

"The Constitution (of India), in formulating the varying criteria for permissible legislation imposing restrictions on the fundamental rights enumerated in Article 19(1), has placed in a distinct category those offences against public order which aim at undermining the security of the State or overthrowing it, and made their prevention the sole justification for legislative abridgment of freedom of speech and expression, that is to say, nothing less than endangering the foundations of the State or threatening its overthrow could justify curtailment of the rights to freedom of speech and expression . . . The differentiation is also noticeable in Entry 3 of List III (Concurrent List) of the Seventh Schedule, which refers to the 'security of a State' and 'maintenance of public order' as distinct subjects of legislation. The Constitution thus requires a line to be drawn in the field of public order or tranquillity marking off, may be, roughly, the boundary between those serious and aggravated forms of public disorder which are calculated to endanger the security of

the State and the relatively minor breaches of the peace of a purely local significance, treating for this purpose differences in degree as if they were differences in kind. It is also worthy of note that the word 'sedition' which occurred in Article 13(2)²³ of the Draft Constitution prepared by the Drafting Committee was deleted before the article was finally passed as Article 19(2) . . . Deletion of the word 'sedition' from the draft Article 13(2) . . . shows that criticism of Government exciting disaffection or bad feelings towards it is not to be regarded as a justifying ground for restricting the freedom of expression and of the Press, unless it is such as to undermine the security of, or tend to overthrow, the State."

"Thus," continued Patanjali Sastri J., "very narrow and stringent limits have been set to permissible legislative abridgement of the right of free speech and expression, and this was doubtless due to the realization that freedom of speech and of the Press lay at the foundation of all democratic organisations, for without free political discussion no public education, so essential for the proper functioning of the processes of popular government, is possible. A freedom of such amplitude might involve risks of abuse. But the framers of the Constitution may well have reflected, with Madison who was 'the leading spirit in the preparation of the First Amendment of the Federal Constitution,' that 'it is better to leave a few of its noxious branches to their luxuriant growth, than, by pruning them away, to injure the vigour of those yielding the proper fruits'.²⁴"

"We are therefore of opinion," said²⁵ Patanjali Sastri J. finally, "that unless a law restricting freedom of speech and expression is directed solely against the undermining of the security of the State or the overthrow of it, such law cannot fall within the reservation under Clause (2) of Article 19, although the restrictions which it seeks to impose may have been conceived generally in the interests of public order."²⁶ It follows that Section 9(1-A) (of the Madras Maintenance of Public Order Act, 1949), which authorises imposition of restrictions for the wider purpose of securing public safety or the maintenance of public order falls outside the scope of authorised restrictions under Clause (2) (of Article 19), and is therefore void and unconstitutional . . . Where a law purports to authorise the imposition of restrictions on a fundamental right in language wide enough to cover restrictions both within and without the limits of constitutionally permissible legislative action affecting such right, it is not possible to uphold it even so far as it may be applied within

16. I.e., freedom of speech and expression.

17. *Report of the Press Commission*, Part 1, 1954, para 966.

18. In *Romesh Thappar v. The State of Madras* and *Brij Bhushan and Another v. The State of Delhi* (the Supreme Court of India); *Master Tara Singh's case* and *Amarnath Bali v. The State*

the constitutional limits, as it is not severable. So long as the possibility of its being applied for purposes not sanctioned by the Constitution cannot be ruled out, it must be held to be wholly unconstitutional and void. In other words, Clause (2) of Article 19 having allowed the imposition of restrictions on the freedom of speech and expression only in cases where danger to the State is involved, an enactment, which is capable of being applied to cases where no such danger could arise, cannot be held to be constitutional and valid to any extent."

This judicial pronouncement along with the judgment³⁰ of the Supreme Court in *Brij Bhushan and Another v. The State of Delhi* which was materially influenced by its judgment in the *Romesh Thappar* case, had far-reaching legal implications as, under Article 141 of our Constitution, the law declared by the Supreme Court is "binding on all courts within the territory of India." Thus we find Sarjoo Prasad J. observing in the course of his judgment in the matter of the *Bharati Press*³¹ referred to before:

"I am compelled to observe that from the above discussions of the Supreme Court judgments (in the *Romesh Thappar* case and the *Brij Bhushan* case), it follows logically that if a person were to go on inciting murder or other cognisable offences either through the Press or by word of mouth, he would be free to do so without impunity inasmuch as he would claim the privilege of exercising his fundamental right of freedom of speech and expression. Any legislation which seeks or would seek to curb this right of the person concerned would not be saved under Article 19(2) of the Constitution and would have to be declared void. This would be so, because such speech or expression on the part of the individual would fall neither under libel nor slander nor defamation nor contempt of Court nor any matter which offends against decency or morality or which undermines the security of or tends to overthrow the State. I cannot with equanimity contemplate such an anomalous situation but the conclusion appears to be unavoidable on the authority of the Supreme Court judgments with (sic) which we are bound. I, therefore, wish that my decision on the point would sooner than ever come to be tested by the Supreme Court itself and the position re-examined in the light of the anomalous situation pointed out above."

Ramaswami J. also stated³² in the course of his judgment in the case under consideration that, although the different categories of offences in Indian criminal law did "overlap to a certain extent," yet "it is plain that the offences of murder and of violence form a distinct category from offences which tend to overthrow or undermine the security of the State."

30. Judgment, again, of the majority consisting of Kania C. J., Patanjali Sastri, Mehr Chand Mahajan, Mukherjea and Das JJ., Paul All J., dissenting.

31. See A.I.R. (38) 1951, Patna 12, Special Bench.

32. See *ibid.*

A substantially similar view was expressed later on by Dr. B. R. Ambedkar, Minister of Law, in the Parliament of India. Referring to the situation created by the judicial decisions we have mentioned above, Dr. Ambedkar said in Parliament on 18th May, 1951:³³

"What I want to ask the House to consider is, what is the effect of these decisions of the Supreme Court and the various High Courts in the States? . . . Under the decisions of the Provincial High Courts to which I had (have?) referred it is now open to anybody to incite, encourage, tend to incite or encourage, the commission of any offence of murder or any cognisable offence involving violence. The one question that I would like the House to consider is this. Is it a satisfactory position that any person should now be free to incite or encourage the commission of offences of murder or any cognisable offence involving violence? I want the House to consider this matter dispassionately. Is it a desirable state of affairs that our Constitution should leave us in this desperate position that we could not control the right of free speech which has been granted by Clause (1) of Article 19 and it should be so unlimited that any person should be free to preach murder or the commission of any cognisable offence? I have tried to put the matter in a nutshell. That is the position."

He added:

"The same thing has now occurred with regard to the public safety laws or the laws made by the various States for the maintenance of public order, because they also have been held by the Supreme Court to be not open to any limitation by virtue of the Constitution. The Supreme Court has made a distinction between the security of the State and the maintenance of public order. They say that it may be open for Parliament to make a law for the security of the State, but it is not open to Parliament to make a law for the maintenance of public order. There again I wish the House to consider the matter seriously. Is the House prepared to allow the right of freedom of speech and expression to be so untrammelled, to be so unfettered, that any man can say anything and go scot-free, although such speech creates public disorder? If the judgments of the Supreme Court and the High Courts stand as they are, then the only consequence that follows is that we shall never be able to make a law, which would restrict the freedom of speech in the interests of public order and that we shall never be able to make a law which would put a restraint upon incitement to violence."

In view of what we have shown above, there should not be any reasonable doubt that there was, after the judicial pronouncements we have referred to before, a very strong case for the amendment of Clause (2) of Article 19 as it originally stood. But

33. See *Parliamentary Debates* (India: Official Report), 18th May, 1951, pp. 9008-9010.

whether the amendment should have taken the exact form it actually did, is a matter on which there may be some legitimate difference of opinion. Before, however, we deal with this point, it may perhaps be interesting to note here the remarks of the Supreme Court on the observations of Sarjoo Prasad J. which we have quoted before. The decision of the majority of the Special Bench of the Patna High Court in the matter of the *Bharati Press* which had allowed the application of the petitioner Sm. Shailabala Devi³⁴ against the Chief Secretary to the Government of Bihar, had been carried by the State of Bihar to the Supreme Court by way of appeal. In the course of this judgment in this appeal case in which Patanjali Sastri, Mukherjea, Das, and Bose JJ. concurred, Mahajan J. remarked,³⁵ with reference to the observations of Sarjoo Prasad J. mentioned before:

"These observations—I speak with great respect—disclose a complete lack of understanding of the precise scope of the two decisions of this Court referred to above (i.e., the decisions in the *Romesh Thappar* case and the *Brij Bhushan* case). . . . It is plain that speeches or expressions on the part of an individual which incite to or encourage the commission of violent crimes, such as murder, cannot but be matters which would undermine the security of the State and come within the ambit of a law sanctioned by Article 19(2) of the Constitution. I cannot help observing that the decisions of this Court in '*Romesh Thappar's* case' . . . and in '*Brij Bhushan's* case' . . . have been more than once misapplied and misunderstood . . . The deduction that a person would be free to incite to murder or other cognizable offence through the Press with impunity drawn from our decision in '*Romesh Thappar's* case' . . . could easily have been avoided as it was avoided by Shearer J."³⁶

With all due deference to His Lordship, we find it rather difficult to agree with this view. On the other hand, we feel that there is a good deal of force in the following remarks³⁷ of the majority of the Press Commission of which Sri Justice G. S. Rajadhyaksha was the Chairman:

"It has been argued that the Constitution (of India) was amended in somewhat 'indecent haste'—without waiting to see whether the Supreme Court

upheld the view of the Patna High Court in the *Bharati Press* case, and that if they (sic) had so waited, there would have been no necessity to amend the Constitution, as the Patna High Court view, which was the immediate occasion for taking up the amendment of the Constitution, was rejected by the Supreme Court. We are not sure that this argument is altogether correct. It is true that the Supreme Court did disapprove the observations of Sarjoo Prasad J. Their Lordships said that their earlier decision in *Romesh Thappar's* case . . . and *Brij Bhushan's* case . . . had been misapplied and misunderstood and proceeded to observe: 'It is plain that speeches or expressions on the part of an individual which incite to or encourage commission of violent crimes, such as murder cannot but be matters which would undermine the security of the State and come within the ambit of law sanctioned by Article 19(2) of the Constitution.' Having already drawn a distinction between the 'security of State' and 'public order' and having stated that 'nothing less than endangering (the) foundation of the State or threatening its overthrow could justify curtailment of the right to freedom of speech and expression,' it is difficult to see, with the utmost respect to their Lordships, how incitement by any individual in a remote village to commit a violent crime, such as murder, out of personal spite, is likely to undermine the security of the State . . . (Their) interpretation, though it may have granted constitutional validity under the original Article 19(2) of the Constitution to legislation restricting freedom of speech with regard to 'aggravated forms of prejudicial activity' or even 'commission of a violent crime like murder which would undermine the security of State,' . . . still left uncovered the large field of 'public order' and incitement to other and not so aggravated forms of crimes which did not endanger the security of State—such as incitement to the commission of offences of robbery, dacoity, rioting and a host of others. In our opinion, therefore, the decision of the Supreme Court in *Shailabala's* case would not have dispensed with the necessity of amending Article 19(2) of the Constitution. Indeed, in the (?) *Shailabala's* case itself the Supreme Court has finally relied³⁸ on the retrospective effect given to the new amendment in upholding the validity of the Indian Press (Emergency Powers) Act, 1931 . . . The Supreme Court judgment does not do away with the necessity for the amendment."

We agree with this view³⁹ of the majority of the

34. Keeper of the *Bharati Press* at Purulia. On 8th September, 1949, the Governor of Bihar had, in the "exercise of the powers conferred" upon him by the Press (Emergency Powers) Act of 1931, ordered Sm. Shaila Bala Devi "to make a deposit of Rs. 2000 with the Deputy Commissioner of Manbhum."—A.I.R. (38) 1951 (12): Special Bench.

35. A.I.R. 1952 Supreme Court 329: *The State of Bihar, Appellant v. Shrimati Shailabala Devi, Respondent*.

36. Shearer J. of the Patna High Court did not agree with the judgment of the majority of the Special Bench (Sarjoo Prasad and Ramaswami JJ.) in the matter of the *Bharati Press*.—A.I.R. (38) 1951 Patna 12, Special Bench.

37. See the Report of the Press Commission, Part 1, 1954, paras 969 and 931.

38. Reference here is to the following observation of Mahajan J. in *The State of Bihar v. Shailabala Devi*: "Be that as it may, the matter is now concluded by the language of the amended Article 19(2) made by the Constitution (First Amendment) Act (151) which is retrospective in operation, and the decision of the High Court on this point cannot be sustained."—A.I.R. 1952 Supreme Court 329.

39. I.e., the view held by seven out of eleven members of the Press Commission.

Press Commission, and not with the view⁴⁰ of the minority of the Commission that "the decision of the Supreme Court in *Shailabala* case knocked out the major premise for Government's case for amending the Constitution." As we have indicated before, we feel that the judgments of the Supreme Court in the *Romesh Thappar* case and the *Brijbhushan* case created some big—and we may add, dangerous—lacunae in our system of laws, and much mischief might be committed if these lacunae were not duly filled up by a suitable constitutional amendment. Herein lies the main justification of the amendment of 1951 so far as freedom of speech and expression was concerned.

Let us now analyse the new amendment. It may be noticed that under it, as compared with Clause (2) of Article 19 as it originally stood, the additional heads in respect of which legislative restrictions can be imposed on the right of freedom of speech and expression are (1) 'friendly relations with foreign States,' (2) 'public order,' and (3) 'incitement to an offence.' We shall first deal with the heads 'public order' and 'incitement to an offence.' In a sense these two heads are mutually complementary. Some persons have objected to the use of the expression 'public order' on the ground⁴¹ that it is capable of a multiplicity of interpretations, or 'of the widest possible definition.' We are unable to agree with this view fully, although we admit that there is some force in it. According to our Supreme Court, 'public order' "signifies" that state of tranquillity which prevails among the members of a political society as a result of the internal regulations enforced by the government which they have established." This meaning of 'public order' substantially agrees with a view of Order we find in John Stuart Mill.⁴² "Order," he has said, "means the preservation of peace by the cessation of private violence. Order is said to exist where the people of the country have, as a general rule, ceased to prosecute their quarrels by private force, and acquired the habit of referring the decision of their disputes and the redress of their injuries to the public authorities." Order in this sense is a prerequisite of good government and a condition of progress. No civilised society can properly function without this peace or order. It is also worthy of note here that the expression 'public order' has occurred in Clauses (3) and (4) of Article 19 of our Constitution from its very commencement on the 26th of January,

40. I.e., the view held by four out of eleven members of the Press Commission. See paras 1141-43 of the *Report of the Press Commission*, Part 1, 1954.

41. See para. 1145 of the *Report of the Press Commission*, Part 1, 1954; also *Parliamentary Debates*, India, 16th May, 1951, p. 8843.

42. *The Supreme Court Reports*, 1950, Vol. 1, Part VI, August, 1950, p. 598.

43. See his *Representative Government*, Chapter II.

1950. Besides, in some other civilised countries like, for instance, Eire and the Union of Burma, the exercise of what is deemed as fundamental rights is generally subject, directly or indirectly, to the requirements of public order and morality. In some countries, again, as in Mexico, the term actually used is 'public peace.' There is, however, hardly any difference, in essence, between the implications of the two terms 'public peace' and 'public order,' although the latter appears to be an expression of wider connotation. Moreover, in our preceding article in this series we have seen the position in law, so far as the right to freedom of speech and expression is concerned, in the United States of America and England. As the majority of the Press Commission have rightly observed, the Supreme Court of the United States "would uphold any law which purported to punish utterances inimical to public welfare, tending to incite crime or to disturb the public peace."⁴⁴ And, finally, we find in Article 29 of *The Universal Declaration of Human Rights* proclaimed by the General Assembly of the United Nations on 10th December, 1948:

"Article 29. (1) Everyone has duties to the community in which alone the free and full development of his personality is possible.

(2) In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and the general welfare in a democratic society."⁴⁵

Thus we find that 'public order' or 'public peace' is a generally accepted juristic expression. We, therefore, do not think that there should be any serious objection to the retention of the expression 'public order' in Clause (2) of Article 19 as it stands today. Nor do we think that the substitution⁴⁶ of the expression "for the prevention of public disorder" for the expression "in the interests of public order" in the said Clause (2) would be an improvement upon the present position. It would then create the problem of defining the word 'disorder' as a legal term.

44. See para. 985 of the *Report of the Press Commission*, Part 1, 1954.

It may also be noted in this connexion that in the following States of the United States of America a citizen may freely speak, write, or publish whatever he wills on any subject, being, however, responsible for the abuse of this liberty: Maine, Rhode Island, New York, New Jersey, Pennsylvania, Delaware, Maryland, Ohio, Iowa, Nevada, Illinois, Indiana, Wisconsin, Minnesota, Oregon, California, Kansas, Missouri, Nebraska, Arkansas, Florida, Georgia, North Carolina, South Carolina, Alabama, Texas, Virginia, Colorado, and Kentucky.—See Cooley, *Constitutional Limitations*, 7th Ed., pp. 596-99n.

45. The italics are ours.

46. See *Parliamentary Debates*, India, 1st June, 1951; also *Report of the Press Commission*, Part 1, 1954, paras. 988, 1145, 1162, and 1526.

We shall now say a few words about the expression "incitement to an offence" in the amended Clause (2) of Article 19. It may be interesting to note here that it had been suggested⁴⁷ in our Parliament that the expression "incitement to an offence involving violence" should be substituted for the expression "incitement to an offence" in the proposed amendment. What Dr. B. R. Ambedkar stated in this connexion is worthy of note here. He said:⁴⁸

"I will now deal with the question of confining 'incitement' to violence and I want my friends, Dr. Syama Prasad Mookerjee and also Pandit Kunzru to pay some attention to what I am saying and I will take some very particular cases. First of all, I would like to know whether they are in a position to give a precise definition of the meaning of the word 'violence'. What is 'violence'? Is it to be confined merely to physical violence? . . . Have they been able to give us any precise definition which would enable the legislature and the court to know that this is violence and this is not violence? I cannot find any . . . I come now to specific instances. Supposing, for instance, there is trouble—I am giving some concrete cases which have happened—and there is trouble between the Scheduled Castes and Caste Hindus in a particular village and the Caste Hindus conspire together to proclaim a social boycott on the Scheduled Castes, preventing them from obtaining any kind of supplies, preventing them from going into the fields, preventing them from going into the jungles to collect fuel, then I want to know from Dr. Syama Prasad Mookerjee and Pandit Kunzru whether they want this, as an offence, to be regarded by the State as such or not . . . I shall give another illustration which was recently reported in Bombay. In a place near Thana there was trouble going on between Caste Hindus and the Scheduled Castes over the taking of water from a particular well. With the help of the police the Scheduled Castes there were able to secure their right to take water from that well along with the Caste Hindus. The Caste Hindus did not like the matter. They wanted the well to be exclusively used by them. Two days ago there was a report in the Bombay Press wherein it was stated that some Caste Hindus incited some of their men to drop into it some kind of poisonous weeds. The result was that the whole water was poisoned and some of the Scheduled Caste people who drank the water suffered from the effect of the poison. I want to ask both of them whether they would limit their definition of incitement to violence, or whether they would extend it to cover where one community does something in order to harm and injure another community."

In view of this lucid statement of the Minister of Law, it would have been unwise to replace the expression "incitement to an offence," by the expression "incitement to an offence involving violence."

47. See *Parliamentary Debates*, India, 1st June, 1951.

48. See *ibid.*, pp. 9867-68.

We shall now pass on to the third additional head in the amended Clause (2) of Article 19, namely, "friendly relations with foreign States." So far as this head is concerned, there has been a sharp difference of opinion amongst those who have given a serious thought to it. This is natural. The expression "in the interests of friendly relations with foreign States" in the said amended Clause (2) is rather too wide and too elastic in its implications. And it has been apprehended that the power of legislation under this provision may be abused or misused with the help of an oblique party majority in the legislature. Both in our Parliament and before the Press Commission it was, in effect, urged⁴⁹ that "under the guise of maintaining friendly relations with foreign States restrictions" could be imposed on the "legitimate expression of views on questions of foreign policy or on the presentation" of the points of view which might 'run counter' to the policy of the "Government of India or its friendly relations with foreign States," and that such restrictions might not be consonant with the true concept of freedom of speech and expression. And the majority of the Press Commission also agree⁵⁰ that

"It is undoubtedly true that in a democracy there should be freedom of expression with regard to the foreign policies of the Government in power and that such criticism should not be prevented under the specious plea that it would endanger the friendly relation of the Government of the day with foreign powers."

"At the same time," they have added,⁵¹ "one has to bear in mind that persistent and malicious propaganda against a foreign power which has friendly relations with India may cause considerable embarrassment from the point of view of the nation even though the security of the State may not be involved. Parliament must, therefore, have power to deal with such kind of criticism and if the words 'friendly relations with foreign States' were not there in Article 19(2) of the Constitution, Parliament would have no power to legislate in that regard . . . When the Constitution was amended in 1951, there was considerable opposition to the introduction of the words 'friendly relations with foreign States' in Article 19(2) of the Constitution. At that time the Prime Minister pointed out that this was merely an enabling clause which empowers Parliament to frame legislation, in case the necessity arises, and gave an assurance that it was not the intention of the Government to promote legislation which would prevent discussion of the foreign policy of Government. This assurance has been faithfully observed and there has been no legislation in this

49. See *Parliamentary Debates*, India, 16th, 17th, 18th, 29th May, and 1st June, 1951, and the *Report of the Press Commission*, Part 1, 1954, para. 939.

50. *Report of the Press Commission*, Part 1, 1954, para. 939.

51. *Ibid.*, paras. 989 and 991.

respect placing fetters on the freedom of expression."

What Dr. B. R. Ambedkar, Minister of Law, and Prime Minister Nehru said in our Parliament in support of this provision, is also worthy of note in this connexion. Dr. Ambedkar said⁵² on 18th May, 1951:

"We have at present on our statute book a law enacted in 1932 dealing with friendly relations with the foreign States. It is true that that law has not come for any adjudication before High Courts or the Supreme Court and it has so far not been declared to be *ultra vires*. But the fact remains that in view of (the) rules of interpretation adopted by the Supreme Court that nothing is within the capacity of Parliament unless that particular head of legislation is mentioned in Clause (2) and as 'friendly relations with foreign States' is not mentioned in Clause (2), I do not think it requires an astrologer to predict that when that question comes before the judiciary they will follow the same line of interpretation. And it is for that reason that we have thought it necessary to include in the new heads this head of friendly relations with foreign States. My friend Dr. Mookerjee⁵³ asked whether there was any country where such a law prevailed. Well I have searched for a precedent and I can tell him that I find no country which has not such a law. In the case of England it is a rule of Common Law. No statutory law is necessary. The Common Law is operative not only in England but in all the Dominions. Therefore that same rule prevails there. In fact, the Common Law rule has been amended and made more stringent by a statutory provision in Canada."

Further,⁵⁴

"What does (the) maintenance of friendly relations imply? Most members are under the impression that if this category was added, they would not be in a position to criticise the foreign policy of the Government. I like to say that this is a complete misunderstanding and a misconception. The underlying principle of this category, namely, maintenance of friendly relations with a State, is nothing more than an extension of the principle of libel and defamation, that you shall do nothing, you shall say nothing, you shall circulate no rumour, which will involve a foreign State in any kind of ignominy. Beyond that there is nothing in this category. Even the English Common Law is based upon this, namely, that it is a part of the law of defamation—that you shall not defame a foreign State which has a friendly relation with this (?) country."⁵⁵

And Prime Minister Nehru said⁵⁶ on the same day:

52. *Parliamentary Debates*, India, 18th May, 1951, pp. 9015-9016.

53. I.e., Dr. S. P. Mookerjee.

54. *Parliamentary Debates*, India, 18th May, 1951, p. 9016.

55. Dr. Ambedkar obviously meant England here.

56. *Parliamentary Debates*, India, 18th May, 1951, p. 9076.

"In regard to foreign powers, so far as our policy goes, which this House has approved of on many occasions, it is a policy of friendship with other nations. Now, because it is a policy of friendship with other nations it becomes all the more necessary that we should not encourage activities which lead to injury in regard to our relations with other powers. . . . There is no question of stopping criticism or even strong language. But times may arise when it overshoots the mark and there is danger of disruption or a break or danger to international interests or to our relations with those powers. And so we shall have to come in there. In what way we come in or in what measure we come in will be a matter for Parliament to determine because there is no law at the present moment to stop these things."

Again⁵⁷ on 29th May, 1951:

"The House will remember—a fact that has been repeatedly stated—that this amendment is an enabling . . . law Naturally when you give an enabling power, it is given in slightly wider terms Exactly what would amount to a danger to friendly relations is so difficult to state; you cannot specify. You may, of course, put down one thing or the other. You may say 'defamatory attacks' as we sought to say at one time 'defamatory attacks on the heads of foreign nations or others' but in effect if once you have a check to see that it is not done unreasonably, it is best you use gentle language (*sic*). . . . So far as I am concerned and so long as I have anything to do with it, I can assure you that you can criticise to your heart's limit and extent the foreign policy that my Government pursues on the policy of any country; to the utmost limit you can go. I cannot dislike your criticism; nobody will be allowed to come in their (*sic*) way. But suppose you do something which seems to us to incite to war, do you think we ought to remain quiet and await the war to come? And if it is so, I am sure no country would do that. We cannot imperil the safety of the whole nation in the name of some fancied freedom which puts an end to all freedom. Therefore, it is not a question of stopping the freedom of criticism of any country and naturally we should like not to indulge in what might be called defamatory attacks against leading foreign personalities. That is never good, but in regard to any policy you can criticise it to the utmost limit that you like, either our policy or any country's policy, but always thinking in terms of this, that we are living in a very delicate state of affairs in this world, when words, whether oral or written, count: They make a difference for the good or for the bad. A bad word said out of place may create a grave situation, as it often does."

Finally⁵⁸ on 1st June, 1951:

"It is perfectly true that the phrase we have put in—friendly relations—is a wide phrase. We put it in because we thought it might serve our pur-

57. See *ibid.*, 29th May, 1951, pp. 9629-30.

58. *Parliamentary Debates*, 1st June, 1951, p. 9873.

pose and any other phrase it seemed to us not quite proper in the sense that it was far better to talk about friendly relations here and lay stress on a positive aspect of policy rather than the negative of it that we shall stop that and so on and so forth. I can assure the House that in regard to foreign affairs there has been and there is going to be, so far as I am concerned, not the slightest interference with any expression of opinion or criticism of our internal policy or external policy or the policy of any other (?) foreign power."

The majority of the Press Commission also observed⁵⁹ in 1954:

"The framers of the Constitution thought that the world conditions existing in 1951 and the non-alignment policy which India was pursuing made it necessary to invest Parliament with the necessary power in case an emergency arose. If we now examine whether the history of the world during the last 3 years has made it unnecessary that the Parliament should have such reserve power, the answer is clear. There is more disequilibrium in world conditions now than there was in 1951, and the policy pursued by India, her geographical position and her relations with foreign States have become far more important than they were in 1951 when the amendment was made in the Constitution. We do not, therefore, think that any clear case has been made for depriving the Parliament of the power to legislate in case of necessity, placing restrictions on the freedom of speech and expression in the interest of friendly relations with foreign States."

But they added,⁶⁰ after referring⁶¹ to the position in this regard in some other countries:

"Although we are in favour of the Parliament having this reserve power, we think that the words 'in the interest of friendly relations with foreign States' are of a wide connotation and may conceivably be relied upon for supporting any legislation which may restrict even legitimate criticism of the foreign policy of Government. It would be difficult to devise a formula which would define the scope of the legislation by Parliament in this regard. The Constitution can at best merely indicate the topics in respect of which there may be reasonable restrictions on the freedom of speech and expression. It must be left to the wisdom of Parliament to define the precise scope of those restrictions and to the impartiality of the Supreme Court to pronounce upon the reasonableness of those restrictions. We recommend that, whatever legislation might be framed in the interest of friendly relations with foreign States, it should be confined in its operation to cases of systematic diffusion of deliberately false or distorted reports which undermine friendly relations with foreign States and should not punish any sporadic utterance or any dissemination of true facts although

they may have the tendency of endangering the relations with foreign States."

We have shown above the official point of view on the third additional head in the amended Clause (2) of Article 19. We have also referred to the views of the majority of the Press Commission in this connexion. We may even mention here in support of the official position that in the United States of America also the publication of "injurious charges against a foreign prince or ruler" is, under common-law rules still in force, "punishable as a public offence" as it tends "to embroil the two nations (concerned), and to disturb the peace of the world."⁶² Nevertheless, we are constrained to observe that the expression "in the interests of friendly relations with foreign States" in the said amended Clause (2) is rather too wide and too elastic in its connotation. Even, as we have seen before, both Prime Minister Nehru and the majority of the Press Commission have admitted this. Herein lies the danger, notwithstanding the repeated personal assurances of the Prime Minister, of abuse of power, with the help of an obliging Parliamentary majority, by an unscrupulous Executive, or by an Executive under the influence of an unscrupulous foreign power.⁶³ That is to say, under this provision in our Constitution, but subject, of course, to what is stated hereinafter regarding the power of judicial review provided for therein, such legislation may be enacted by our Parliament, thanks to the implications of the modern party system, as may seriously interfere with our freedom of speech and expression, and, particularly, with what is generally known as the freedom of the Press. We sincerely hope, however, that this will not happen and that the advice of the majority of the Press Commission as quoted above will always be scrupulously followed by the Government of the day.

IV

We have so far dealt with the three additional heads in the amended Clause (2) of Article 19. We may also state here that the expression "in the interests of the security of the State" in the amended Clause (2) is much wider in its implications than the corresponding expression in the original Clause (2), namely, "any matter which undermines the security of, or tends to overthrow, the State." Although, therefore, there is some danger of abuse of power in the interests of the security of the State, yet, as shown below, that danger is to a large extent minimized by the provision in the amended Clause for a judicial review of legislation enacted under it, or of any existing law relating to any matter within its ambit. There is another point worth noticing in this connexion. When

59. See the *Report of the Press Commission*, Part 1, 1954, para. 991.

60. See *ibid.*, para. 993.

61. See *ibid.*, para. 992.

62. See Cooley, *Constitutional Limitations*, 7th Ed., pp. 608-609.

63. Also see in this connexion the view of the minority of the Press Commission in Para. 1146 of the *Report of the Press Commission*, Part 1, 1954.

the Constitution (First Amendment) Bill was before our Parliament, it was repeatedly urged by Prime Minister Nehru and the Minister of Law that the proposed Amendment to Clause (2) of Article 19 was only "an enabling measure" which armed Parliament with the necessary power of legislation. This view was only partially correct. The amended Clause (2) is both an "enabling" measure and a "reviving" measure. It not only enables our Parliament and other competent legislative authorities in India to enact laws which they could not otherwise lawfully enact but for it, it has also brought back into force, provided they are in conformity with the requirements of the amended Clause, those laws of our country which had become unconstitutional and void as a result of the judicial pronouncements referred to before. It thus serves a double purpose.

We shall now refer to the safeguard against any misuse of power under any provision of the amended Clause (2) of Article 19. This safeguard is provided by the words "in so far as such law imposes reasonable restrictions," etc., in the amended Clause. The implication of the safeguard is that any law made under any provision of Clause (2) of Article 19 as it stands today, or any law existing from before the commencement of the Constitution and relating to any matter in the said clause, is *justiciable*. This further means that if any such law is found by a competent Court of Law in this country as not fulfilling the test or requirements of reasonable restriction on the freedom of speech and expression, then it will be declared unconstitutional and invalid. What the Supreme Court of India declared on November 8th, 1950, in the course of its judgment in a case⁶⁵ involv-

ing Clause (1) (g) and Clause (6) of Article 19, is equally applicable to a case involving the amended Clause (2) of the Article. The declaration of the Supreme Court was:

"The phrase 'reasonable restriction' connotes that the limitation imposed on a person in enjoyment of the right should not be arbitrary or of an excessive nature, beyond what is required in the interests of the public. The word 'reasonable' implies intelligent care and deliberation, that is, the choice of a course which reason dictates. Legislation which arbitrarily or excessively invades the right cannot be said to contain the quality of reasonableness. . . . The determination by the legislature of what constitutes a reasonable restriction is not final or conclusive; it is subject to the supervision by this Court.⁶⁶ In the matter of fundamental rights, the Supreme Court watches and guards the rights guaranteed by the Constitution and in exercising its functions it has the power to set aside an Act of the Legislature if it is in violation of the freedoms guaranteed by the Constitution. We are, therefore, of opinion that the impugned statute⁶⁷ does not stand the test of reasonableness and is therefore void."

Of course, the Supreme Court will deal with a case of this nature only when it is judicially brought before it. At any rate, herein lies a great safeguard against any abuse of power under Clause (2) of Article 19 as it stands now.

In our later articles we propose to deal with the other aspects of our Fundamental Right to Freedom as guaranteed by our Constitution.

66. This reminds us of what the Supreme Court of the United States of America declared in 1923 in the course of its judgment in *Meyer v. Nebraska* (262 U.S. 390). It said:

"Determination by the legislature of what constitutes proper exercise of police power is not final or conclusive but is subject to revision by the Courts."

DEFICIT FINANCING IN A DEVELOPMENT PROGRAMME

By Prof. N. G. GUJAR

DEFICIT finance assumes importance in the development expenditure in a community since development expenditure is large—much larger, in fact, than the normal expenditure undertaken by the State. The taxation or other sources of current revenue can be expected to meet the normal requirements of the Government. But when these requirements increase, as they do in any planned development, to a large extent an increase in taxation cannot be depended upon to yield sufficient revenue. The increase in the taxation-rates as well as coverage would be so great that it would adversely affect the psychology of private entrepreneurs.

But the deficit finance and the creation of money are not one and the same. The State may borrow money, that is, it may use the savings of the community. The public debt, thereby, increases. Strictly speaking this should not result into inflation except through increasing liquidity. When the public debt increases, debt holdings by persons, firms and banks increase; that is, there is the addition to the liquid assets. Increase in the liquid asset is likely to lead to a higher consumption expenditure out of current incomes. If the banks find that their liquidity is increased, as the proportion of the bonds in their portfolios increases, they will be willing to give more credit to the business community. Except this eventuality nothing like inflation would follow due to public borrowing. But if an important place is given to the private sector in the development programme, the State borrowing deprives the private sector of capital to a large extent. At least the private sector will find it difficult to raise capital, and its cost of borrowing is bound to increase. Only if the amount of savings increases, this possibility to some extent would decrease. Still the competition between the public and private sectors for securing capital cannot be avoided, unless, of course, the rise in saving is spectacular. Of course, due to the development programme itself the per capita income may increase, which may be expected to result into some rise in savings. But this increase in saving cannot be substantial. The reason lies in the fact that the development programme will always be accompanied by welfare measures. In any development programme, the emphasis will be on the redistribution of wealth. That is all to the good. Moreover, this emphasis is necessary if the co-operation of the public is sought. The point is, increase in income due to the development programme is bound to find its way in the pockets of the masses. The standard of living of the masses is already so low that any increase in their income is bound to be utilised for increased expenditure. In this connection, it is to be noted that

the total volume of savings available in a relatively poor, economically underdeveloped community is bound to be very small as compared with its requirements for development purposes, however the people may be persuaded to tighten their belts.

In the eventual competition for securing the capital, the private sector will be the worse sufferer. It may find either the capital market dried up by the public borrowings or will be compelled to offer inducements in the form of higher rates of interest with all the evil effects upon its capital structure.

Deficit finance with the help of public loans, and more so with the help of the creation of money, expands the relative power of the Government, vis-a-vis the citizens paying the taxes since with the help of loans the Government can acquire resources without encroaching, immediately, upon private incomes. The economic power of the Government is bound to increase. The private sector is bound to decrease. If public loans can be resorted to for carrying on public expenditure, very likely the public sector may more easily expand than it may do if taxation or current revenue is the only means of raising funds required for Governmental expenditure.

Deficit finance with the help of the creation of money seems to be inevitable in the development programme of a backward economy. Deficit finance, this way, leads to inflation in two ways. Government expenditure makes net contribution to the effective demand. Secondly, additions to money supply contribute to inflationary pressure.

Unless there is a corresponding increase in production, the creation of money by adding to the effective demand increases price-level. Surely the Government creates money for the very purpose of increasing production. But there is bound to be a time-lag between the Government expenditure and the results of the Government expenditure. In all probability, because of this time-lag, public expenditure is bound to create the inflationary gap. This inflationary gap is very likely to be continued if the tempo of development is accelerated, as it must. The public expenditure devoted towards development cannot be evenly spread throughout the plan-period, simply for the reason, that the even distribution of development expenditure through time means too large an expenditure in the initial period, as compared to the absorptive power of the community, unless, of course, the total development expenditure is meagre. The inflationary gap is bound to lead to rising prices. If the inflationary gap is continued for some time, the inflationary spiral—the chasing of prices and cost—is sure to be developed. In this

general rise of prices the Government estimates of development expenditure are very likely to be under-estimates, since the costs are bound to mount up. The estimates must be revised in the upward direction if the development plans are not to be left half-completed and there will be a further pressure on Governmental resources calling for further creation of money.

Secondly, the additions to money supply, due to Governmental spending, leads to the additions to bank reserves, which may encourage commercial banks to create further bank credit. Increase in the liquidity of banks, it may be argued, should be welcome when there is a general scarcity of funds. But we must sharply distinguish between funds and capital. Banks can create money and not capital. And in the face of the scarcity of capital the increased liquidity of banks is likely to be an inflationary potential, unless it is accompanied by countervailing measures.

The constant increase in the price is correctly described as currency deterioration, since increase in prices is nothing but decrease in the purchasing power of money; that is, money deteriorates in real terms. If the central banking technique is properly developed then the deterioration in the currency may not be so harmful, purely from the monetary view-point. The loss of confidence in the currency or the fear of currency becoming worthless, may not be of such importance nowadays, still, and this must be pointed out, how to stop a run-away inflation may become a headache to the monetary authority. But the currency deterioration is dangerous due to at least two reasons. Inflation acts, and naturally, as a discouragement to saving. If the major part of the saving is to be so channelled that it finds its way in Government bonds, which at maturity time are realised in fixed monetary amounts, the propensity to consume is bound to be increased during the inflationary period; and it is definite that an increasing proportion of savings in the community will be taken by Government for its development purposes. During the development period what we require is an increased volume of savings. It is an elementary theory in Economics that inflation leads to a decrease in the volume of voluntary savings.

Apparently it can be argued that inflation can be utilised as an instrument of forced savings. Indeed that is what it amounts to when the development funds

are not secured by voluntary public savings or taxation (or in the form of other current revenue of the Government). But forced saving is not justifiable. Firstly, this way of getting capital is not available to the private sector. Secondly, this method of realising capital hits hard the private sector in that it finds its cost structure constantly increasing.

But the most important reason is, and this is the second reason why currency deterioration is dangerous, inflation works indiscriminately. Inflation is a concealed form of taxation, but it is, perhaps, most regressive in character. In countries where the standard of living of the masses is already low, inflation is bound to hit them hard. Indeed getting capital at their cost is cruel. Apart from this can the authorities expect to get public co-operation in their development programme, when the programme does not result in any visible gains? The common mass cannot be enthused much by dangling before their eyes the long-term interest of the community. It should be expected that in communities where the aim of welfare state is accepted, the emphasis would be on the redistribution of wealth; and inflationary finance which is regressive, and this emphasis upon redistribution of income, are at variance.

Deficit finance and the creation of money, it can be argued, are unavoidable in any development programme in a developing economy. Surely, one cannot expect the entire programme to be given up simply because without inflationary finance it cannot be carried. The point is that inflationary finance is a delicate instrument. It must be resorted to with all its implications in mind. There should be a limit beyond which no creation of money is allowed. The estimates of Government expenditure have the nasty habit of proving under-estimates. That must be avoided. Secondly, it is not the amount of money but its effective use that matters, (that is, what in economic parlance is called amount of money multiplied by its velocity). It is no use merely making provision for the creation of money since it is necessary in the budget for the development programme, but this inflationary finance must be related to some objective measure like the price-level besides the actual quantity of money. And lastly, inflation, when it is started, is very difficult to check.

of the Pope's power of excommunication.¹² Fourth, the laws of the realm are divine, since, they originate from a supernatural object. Thus, the Jewish Polity was governed according to the laws of Jehovah's Book.¹³ The Muslim theocracy was governed in accordance with the laws as enunciated in the Koran.¹⁴ During the days of the Catholic theocracy the temporal law was distinguished from the canon law but where they came into conflict the former had to give way.¹⁵

II

SECULAR STATE

Strange though it may seem, a definition of secular State does not occur either in any of the standard dictionaries or in any of the more well-known encyclopedias. In recent times some authors in India have, indeed, given definitions which are not only unsatisfactory but are also ambiguous, inaccurate and incorrect. The term occurs here and there in certain standard works¹⁶ but no scientific attempt is made to define the concept. To the best of our knowledge, only R. H. Tawney gives an *en passant* definition in his *Religion and the Rise of Capitalism*. "By the end of the 17th century," says he, "the secular State, separate from the churches, which are subordinate to it," had come into existence.¹⁷ This is the best definition available and can be accepted for further elucidation for arriving at a clearer understanding of the concept.

The phrase 'separate from the Churches' in the above definition implies that in a secular State the State and the Church are separated. The expression 'the State and the Church are separated' has caused confusion in the minds of certain scholars and, therefore, needs clarification. It is no doubt, deceptive since it sounds as if it implies the mutual independence of the two societies. Starting their examination of their relationship with this assumption they come to the inevitable conclusion that their separation is not possible. Thus, Giacometti, Italian jurist Mario Falco, German Ulrich Stutz and President Maravik of Czechoslovakia insisted that their complete separation was not possible.¹⁸ Ruggiero endorses their view when he says:

"Separation has a contingent character and a merely approximative significance; because two institutions cannot in practice be distinguished from one another with formal precision".¹⁹

17. p. 20 (Pelican Edition).

18. Bates, Searle, *Religious Liberty—An Enquiry*, p. 312.

19. *History of European Liberalism*, p. 404.

Searle Bates gives the above view a confirmatory seal.²⁰ If, then, the separation of the State and Church is not possible what is the secular State? Is there nothing like a secular State?

The answer to this question can be found, as has been pointed out above, in the fact of misinterpretation of the expression as meaning the mutual independence of the two societies. They, in fact, cannot be independent of each other. They are composed of the same individuals and are constantly competing to command their loyalties. And let the philosophers and the jurists, again and again, develop systems of a clear demarcation of their respective spheres, in actual practice, there always remain certain spheres of man's life, e.g., marriage, divorce, education, etc., that are common to both. This gives rise to conflicts and consequently, according to Ruggiero, "there can either be a State oppressing a Church or a Church oppressing a State."²¹ This seems to be rather an exaggerated view, since, their relationship may not be necessarily that of oppression. But it is reasonable to conclude that as a result of their struggle, one of the societies has to accept a status of subordination to the other. If the Church subordinates the State, the latter loses its secular character. In a secular State, therefore, the Church is subordinated to the State. There cannot be any situation where their relationship is that of mutual independence. What the expression means is that, unlike the medieval polities, the State does not accord to any Church a privileged status. The following statement of Heinrich Rommen clearly reveals the significance of the expression:

"In the United States we find, from the beginning of its formation, that separation of the State and the Church in the constitutional provision that there shall not be an established Church."²²

The essence of the secular State, thus, lies in the fact that it does not accord to any Church a privileged status. To this may be added a feature implicit in it. Since it does not identify its interest with those of any one church, it follows that, the sovereign power in it does not originate from a god, a cult or a religion. A secular State may, therefore, be defined as a State which does not have a divine sanction behind it and which treats the various churches, which are subordinate to it, on religious grounds,²³ impartially and indiscriminately.

The following points emerge from the above definition: First, the State does not have a divine sanction and derives its authority from a secular (worldly) source. Thus in the U.S.A. which is a brilliant example of a secular State, the sovereign power flows

21. *op. cit.*, p. 397.

22. *op. cit.*, p. 598.

23. The State may discriminate among the various Churches on other than religious grounds. For instance, if a Church is anti-national, it may be curbed while other Churches are allowed to exist. Such a discrimination will, however, be on political grounds.

from the people as indicated by the preamble to the Constitution. The Supreme Court, too, in one of its decisions, held that

"There is no mysticism in the American concept of the State or of the nature or origin of its authority. We set up government by the consent of the governed...."²⁴

Second, the State does not discriminate among the various churches or the individuals of religious grounds. The First amendment to the U.S. Constitution, thus, ordains that "Congress shall not make law respecting an establishment of religion." Third, from the above deduction follows the conclusion that the Church is subordinated to the State. For, if the State is subordinated to a church, it shall be associated with one and shall cease to be indiscriminate in its relationship with the churches. Fourth, since it does not derive its authority from a god, cult or a religion, it is none of its business to perpetuate any one cult or religion. It retires from any intervention in the spiritual sphere and becomes indifferent to and disinterested in the religious convictions of its citizens. Religion, thus, does not form the basis of its citizenship.²⁵ It does not persecute or proselytize. In it there is room for any church as long as it is prepared to subject itself to the limitations imposed by law on all churches. Thus in the U.S.A. not only there exist the various Christian sects, even a foreign religious movement like the Ramakrishna Movement is flourishing and making impact on it.²⁶ Fifth, the fundamental postulate of a secular State is that it does not discriminate among the various churches. From this it follows that if it patronises all churches equally, it shall not be a violation of its postulates. The State in the U.S.A., while not discriminating on religious grounds has adopted to religion a friendly, sympathetic and encouraging attitude. The attitude manifests itself in many ways, e.g. the recognition of the importance of religion by reciting prayers at public functions and in certain government institutions; by the employment of chaplains in the Army and Navy and by the enforcement of Anti-Evolution and Sunday Laws.²⁷ Under the

24. *West Virginia State Board of Education vs. Barnette*, 319 U.S. 624, 1943.

25. Art. VI of the U.S.A. Constitution provides that "no religious test shall ever be required as a qualification to any office or public Trust in the United States."

26. Ross Floyd, H., Professor of World Religions, University of Southern California. See *American Reporter*, New Delhi, Vol. III, No. 25, p. 5.

27. These acts of the State apparently seem to be departures from the basic qualifications of the secular State. In fact, they do not amount to any discrimination since the U.S.A. for all practical purposes is a Christian nation. Property belonging to all churches is tax-exempt. (Burslein, Abraham, *Laws concerning Religion in the United States*, See Chapter 1). Prayers are non-sectarian. The enforcement of Anti-Evolution Laws does not amount to a religious discrimination: "We are not able to see how the prohibition of teaching the theory that man has descended from a lower order of animals gives preference to any religious establishment or mode of worship... Belief or unbelief in the

care of the State, religion has become one of its biggest businesses. The Church membership is increasing. Sixth, the laws of the realm originate from a secular source as is the case in the U.S.A. where the laws emanate from the Congress elected by the people.

III

ANCIENT INDIAN POLITY

Having discussed the salient features of both a theocracy and a secular State we now pass on to an examination of the ancient Indian State. Ancient India had a multitude of forms of government. There were the Kulas (where the sovereign power is wielded by a family), the selfgoverning clans, and the Ganas (republics). Such States were, however, rare. Not only that, their existence is sometimes disputed. On the other hand, it is generally agreed that the normal form of the State in ancient India was monarchical. We shall, therefore, deal with the monarchical State only.

Kingship: An analysis of the position of the Indian king clearly reveals that he was in no way a prototype of the theocratic kings. Neither did he derive his authority from a divine source nor was he in absolute control of his people. Here and there, certain passages occur in the ancient Indian literature which attribute divinity to kingship. Thus, to the question, 'how is it that the king who is one rules over so many subjects,' *Aitareya Brahmana* states that "the gods and demons fought with one another, but the gods were defeated. The gods said: 'It is because we have no king that the demons defeat us, so let us elect a king'. They elected a king and through his help obtained a complete victory over the demons".²⁸ Again, we find some kings claiming divine status for themselves. Thus in the Rigveda a hymn is attributed to the Puru king Trasadasya who exclaimed: "I am Indra, I am Varuna... On me (the god) bestow those principal energies (that are) characteristic of the Asuras".²⁹ Such utterances have led some to believe that the sovereign power of the ancient Indian king originated from a god. The fact is, however, that the secular literature of the Age (particularly Vedic) has not been preserved.³⁰ Our source of information is mainly religious literature. And it is but natural that in it secular ideas are explained in terms of divinity and the

theory of evolution is no more a characteristic of any religious establishment or mode of worship than is belief or unbelief in the wisdom of the prohibition laws. (Scopes Vs. State, 154 Tenn. 305, 289 S.W. 363, (1927)). The enforcement of Sunday Laws does amount to discrimination in the case of Jews, Mohammedans, atheists and even certain Christian sects (Bates, *op. cit.*, p. 90). But their enforcement has been justified on the ground that a preponderant majority of the Americans so wish it. (Burslein, *op. cit.*, p. 36). Moreover, there is a growing inclination to accord the other religious sects right to observe their own Sabbaths. (See Court's ruling in *Thomason's Case*, Burslein, *op. cit.*, p. 40).

ANCIENT INDIAN POLITY

Theocratic or Secular?

VED PRAKASH LUTHERA, M.A.,

Research Scholar, Department of Political Science, University of Delhi

THE question whether ancient Indian Polity was theocratic or secular still remains disputed. Some scholars maintain that it was theocratic; others believe that it was secular; and still others assert that it was none of the two but something in between. The object of this paper is to enquire whether the ancient Indian Polity was theocratic or secular, or, if none of the two, what were its theocratic and secular elements. Before we examine the same we shall first state briefly the salient features of both a theocratic and secular State.

I

THEOCRACY

Theocracy has been defined "as a tribe or a state that claims to be governed by a god or gods". In it "the laws of the realm are divine commands rather than human ordinances." The priesthood is the promulgator and the interpreter of the divine commands, and is in absolute control of every phase of the life of the inhabitants. The State and the Church are merged into one.¹

The following deductions can be made from the above definition: First, since the ultimate sovereign power is vested with a god, it follows that the Head (we shall call him a king) of such a State is a mere spokesman, a representative, or a deputy of God, appointed by Him to govern on His behalf. His function is only that of a mediator between God and His (God's) subjects. He is believed to be in communication with God, as were the kings of ancient Israel,² and then conveying to the people what he has been told by Him. "Thus saith the Lord" is his watchword. His office is the creation of God's will (divine sanction) and, therefore, he is responsible to Him alone.

In other words, he is in absolute control of the people he governs. They render him unquestioned obedience and have absolutely no say in the conduct of the public affairs. Second, such a State is the Kingdom of God. And from this may be deduced the principle of the unity of the Faith, i.e., the principle that only His worship is the 'true' form of worship.³ The other gods are false and fallen. The king derives his authority from God and, therefore, is charged with the duty of perpetuating his cult or religion. A theocracy is, thus, unless the circumstances otherwise warrant, an active proselytiser and persecutes the 'unbelievers' to bring them within the 'folk'. Thus when Mohammad founded the Muslim theocracy, the Caliph was primarily concerned with the defence of the Faith. Those who

believed in Islam were nothing but brothers. But those who did not were to be subjected to astringent antagonism. It was obligatory upon the Caliph to wage *jihad* (holy war) against the 'heretics'; to kill them unless they repent and join Islam.

"I swear by Allah," said Mohammad, "that marching about to fight for religion is better than the world and everything in it."⁴

In Catholic theocracy, too, the heretics were persecuted with a variety and barbarity of tortures which earned for Christianity the cognomen of being the biggest enemy in history of religious freedom.⁵ The Jewish theocracy also carried on an assiduous offensive against the rival cults of Palestine and Syria, Assyria and Babylonia.⁶ In a theocracy, therefore, there is religious discrimination. All those living within its jurisdiction must conform to the rituals of the cult or religion of the God whose domain it is or suffer penance, not unusually, to the point of extinction. Third, the king's function of conducting the public affairs becomes an aspect of his function of perpetuating the cult of the God.⁷ To put it in other words the temporal power (State) is subordinated to the spiritual power (Church). Either the former is supposed to be one with the latter, as in ancient Israel and the Muslim theocracy, or, if they are distinguished, as in Catholic theocracy,⁸ the former occupies a status of subordination to the latter. Thus, in the Middle Ages it was usual to explain their mutual relationship with reference to the moon and the sun. Just as the moon has its light from the sun, so does the State derive its authority from the Church.⁹ They were believed to be the two aspects of the same society, Christendom. But while the State was at best an institution necessitated by the wickedness of man, the Church was a perfect society established by God. The latter being the final interpreter of the Divine Will¹⁰ it was the duty of the former to execute its commandments. The State was, thus, reduced to the status of an office of the Church—its secular arm.¹¹ The tenure of the king depended upon the discretion of the Church in view

political theories are discussed in terms of gods. But, as V. M. Apte maintains, "no great stretch of imagination is required to interpret them as equally, or really, applying to human affairs."³¹ Dr. Beni Prasad, therefore, aptly remarks, while commenting on the answer of the *Aitareya Brahmana*, that what it signifies is the theory of the origin of kingship out of military necessity, deriving its validity from consent.³² Similarly, the claim of Trasdasya, remarks Dr. Apte, can "be explained as an expression of personal vanity rather than the formulation of a political theory."³³ That the king, in fact, derived his authority from the people is well-illustrated by many actual historical instances of the king's election by the people. In the Mahabharata we read the election of Santanu as against Devapi, of Pandu as against Dhritarashtra, of Yudhishthira as against Duryodhana.³⁴ In the Ramayana is described how the king Dasaratha proposed the name of his eldest son, Rama, as his successor and sought the approval of an assembly of the people. The king declared his intention to abdicate the throne and enquired of the people assembled if Rama was acceptable to them as their king. The people willingly agreed but Dasaratha, doubting that their approval might be a mere acquiescence, requested them to give reasons of their acceptance of him.³⁵ After the demise of King Dasaratha we find people of Ayodhya petitioning for someone on the throne.³⁶ In later times, too, many cases of king's installation to power by the people are found. In the 2nd century A.D. Rudradaman was elected to kingship "by all the orders of the people": in the 7th century A.D. Harshavardhan was elected "by the ministers, magistrates and the people"; and in the middle of the 8th century a commoner Gopala was elected to kingship by the people of Bengal. Similarly, Brahmapala was elected by the people of Assam; Nandivarman Pallavamalla was raised to the throne by the *mula prakritis*.³⁷

Some writers would have us believe that the election of the king by the people was a mere formality. Thus, Geldner, for instance, asserts that the passages referring to the election indicate a purely formal approval rather than an election in all seriousness. Such a view is completely misfounded in view of the power of the people to inflict punishment on the king to the point of his expulsion from office or even the kingdom. Many cases of such banishments are recorded. The Srinjayas expelled their king Dushtarita Panmasyana from the

kingdom; king Dirghasravas was banished from his kingdom as was also king Sidhuksit.³⁸ At one place we find people rejecting the nomination of his younger son as his successor by an outgoing monarch and electing his eldest son as their king.³⁹ At another place we find King Rama banishing his beloved wife Sita, to meet the demand of his people.

Not only did the king derive his authority from the people, his powers were severely curtailed by the existence of some other political institutions. The Parishad, and the popular Assemblies, Sabha and Samiti, acted as a definite check on the king making it impossible for him to become absolute.⁴⁰ They exercised an effective control even on his person. The coronation oath (*pratijna*) bound the king to the people and subjected him to the law of the land.⁴¹ Although wielder of Danda he was himself subject to it.⁴² The protection of the people was his foremost duty. He was not the owner of the land. He was just an official of the State getting remuneration for his services in the form of taxes.⁴³

It is apparent from the foregoing that, whatever might be the claims of the kings or the methods of political speculation, in actual practice, the people were the fountain of the sovereign power. They could remove the king from the office and, therefore, he was responsible to them. In view of this it seems reasonable to conclude, contrary to the opinion that his election was a mere formality, that the king's claim of divinity was a matter of mere formality. Indeed, the attribution of divinity to kingship or the king's claim of divinity to kingship or the king's claim of divinity was much akin to the spirit of a modern practice of formally acknowledging the existence of God in the State-Constitutions. Article 6 (1) of the Irish Constitution says: "All power of government, legislative, executive and judicial, derive, under God, from the people...." The preamble to the Brazilian Constitution establishes a government "under the protection of God" but the sovereign power flows from the people. Similarly, the preamble to the Swiss Constitution begins with the words, "In the name of the Almighty God" although Article 3 of the Constitution declares that the sovereign power originates from the cantons. Just as these references to God, for all practical purposes, amount at best, in view of the people or the cantons being sovereign, to His mere formal recognition, and do not render these States a divine sanction, so did the Indian king's claim of divinity amount to a formal

acknowledgment of God, in view of the people's right of expulsion. In other words, the king did not have a divine sanction behind him. He derived his authority from a secular source.

The State and the Church: There was an intimate relation between the State and the Church in ancient India as signified by the close association of the King and the Royal Priest (Purohita). But it was essentially different from the relationship existing between them in theocracies. In theocracies the temporal power (State) is subjected to the spiritual power (Church). In India, however, the direction of the flow of the power was from the king towards the priest. Here the king was not a secular arm of the Church. On the contrary, the Purohita was an official of the king acting in a purely advisory capacity.⁴⁴ The king was expected to, and he generally did, pay heed to the Purohita's opinions. But, if he so chose, he could reject his viewpoint and follow his own course. The Purohita willingly submitted to the limits of his power, which enabled the king to maintain a general political control over the former. The priest could not interfere in the administration of both temporal and spiritual affairs as a matter of right.⁴⁵ The king had the power to dismiss his Purohita⁴⁶ which clearly indicates the subordination of the Church to the State.

This is, however, not to say that religion was not diffused with politics. It shall be rather too much to expect of the ancient Indian State which existed in an Age when religion had a firm hold on men's minds throughout the world. Religious considerations had a good deal to say in the determination of the State-actions. The important point to be noted, however, is that the Church was never allowed to swallow the State. The former could not use the latter as a sword which it could wield to persecute the 'heretics'. On the other hand, religion in India served the ends of the State. Thus we find, something which was inconceivable in the ancient and medieval West, an ecclesiastic, the greatest of the Purohitas, Kautilya, glorifying the State, giving a scientific view of it, solely by the conduciveness to its welfare, prescribing what would lead to its material prosperity and to its increasing power, expressing his views frankly without considerations of morality and thus earning for himself the nick-name of "Indian Machiavelli."⁴⁷ Their admixture was, therefore, to play an essentially different role from what it did in the ancient and medieval West. There it resulted in the identification of the State with a Church resulting in religious persecutions and religious wars, etc. Here, as

B. K. Sarkar has pointed out, the total effect of the diffusion was the *moralisation* of politics and therefore, serving as a check and restraint on the king.⁴⁸

Religious Policy: The independence of the State from the Church manifested itself in the absence of any religious discrimination on the part of the former.⁴⁹ It did not enforce any religion.⁵⁰ It patronised all religions equally. The choice of religion was left to the individual. None was persecuted on religious grounds. The absolute tolerance of the Hindu Polity has been thought by certain writers⁵¹ as only for Hinduism. Such a view is misfounded although, one might say, taking this for granted, that even that was a remarkable feature of the polity in view of the nature of religious discrimination as existing in some of the Western countries. In these countries there exists discrimination against sects within Christianity. Thus the United Kingdom has an official church which enjoys certain privileges over the other Christian religious bodies. The British Crown, according to the Act of Settlement (1700) cannot be held by a Roman Catholic. Article 5 of the Act of Constitution of the Kingdom of Denmark debar persons not belonging to the Evangelical-Lutheran Church from holding the Danish Crown. Article 6 of the Charter of the Spanish People accords to the Catholic Religion "official protection" and prohibits the "external ceremonies or manifestation" of religious beliefs excepting those of the Catholic religion. Similarly, Article 1 of the Fundamental Principles of the Government of Afghanistan forbids any person professing any other faith than Hanafi religion from holding the crown thus according a privileged status to a sect within Islam. The incorrectness of the above attitude, however, is clearly proved by the attitude of the ancient Indian State towards Syrian Christianity. At the time (52 A.D.) when Christianity was being persecuted in the land of its birth, St. Thomas visited India to spread the Gospel. He established churches and converted the local people to Christianity freely.⁵² The "ancient rulers of Kerala allowed the Christians with other religionists freedom to worship God as they liked . . .".⁵³ Not only that, the State patronised

46. Law, N. N., op. cit., pp. 40-1.

47. Machiavelli was one of the Western philosophers who pleaded for the emancipation of State from the Church. In this context the comparison of Kautilya with him is significant.

Christianity, as it did in the case of other religions, by giving aid in the form of land and cash.⁵⁴ Further, in the later period of the polity are to be found non-Hindus in the employment of Hindu monarchs.⁵⁵

The ancient Indian State, therefore, did not discriminate among the various churches. There occurs, however, an exception to this general rule. The State in the reign of Asoka became actively missionary. After his conversion to Buddhism vast resources of the State were pressed into its service. Missions were sent to foreign countries to propagate Buddhism. Within the Empire, too, special officers were appointed to look after matters pertaining to Buddhism. This was, of course, a departure from the strict postulates of a secular State. But it may be pointed out that the missionary activity in the reign of Asoka was not akin to the missionary activities of the ancient and medieval polities of the West. There the State persecuted and compelled the heretics to join a particular faith. Here the guiding principle was *persuasion* rather than *compulsion*. In spite of the privileged status of Buddhism other religious bodies like the Brahmanas, Ajivikas, and Gosalas were fully honoured.⁵⁶ Use of harsh language against these was forbidden. The State never became their enemy and continued to shower gifts on them.⁵⁷

Laws: The legal system in India, too, was remarkably at variance with the theocratic legal system. In theocracies the realm is governed by the rituals of the cult or religion of the god whose domain it is. The priests, specialists in the religious law, are the final law-givers. Thus, the Jewish theocracy was governed by Jehovah's Law. And when a dispute arose about it the case was referred to the priests⁵⁸ whose decision was final. In the case of India, the religious tracts are, no doubt, listed among the sources of the laws. Manu, Kautilya, Yajñavalkya, Narada, Brihaspati, Katyayana, and Vyasa, all include religious tracts among the various sources of the law. But these constitute only a part of the legal system. Laws originating from secular sources, e.g.; custom, contract, and royal commands also formed an essential part of the system.⁵⁹ As to which shall supersede in case of a conflict between the two bodies of the laws the opinions of the writers differed. But the majority view was that the latter precedes the former. Manu, Yajñavalkya give precedence to the religious laws.⁶⁰ Narada, Brihaspati, and Katyayana give precedence to the latter body of laws.⁶¹ Kautilya gives a revolutionary dictum about the relative importance:

54. *Ibid.*, Daniel, *op. cit.*, pp. 22-30.

55. Sarkar, B. K., *Hindu Political Philosophy*, *op. cit.*, p. 428.

56. Thus an edict of Asoka reads: "The King beloved of the God honours every form of the religious faith." (Arnold, T. W., *op. cit.*, p. 361).

57. Raychaudhuri, etc., *op. cit.*, pp. 108-9.

58. Smith, C. Ryder, *op. cit.*, p. 287.

59. Majumdar, etc., *op. cit.*, Vol. II, pp. 335, 336, 345, 348. Sarkar, *op. cit.*, p. 274.

60. Majumdar, etc., *op. cit.*, pp. 335, 345.

61. *Ibid.*, pp. 348, 354; Vol. III, p. 357.

"Whenever," says he, "the sacred law is in conflict with the rational law, then reason shall be held authoritative."⁶²

The superiority of the State over the Church is further revealed by the actual administration of justice. Unlike the Jewish theocracy the Indian priests were not the final interpreters of the laws of the realm. The king headed the judiciary and himself administered justice.⁶³ His was the final decision.⁶⁴ The Purohita was, no doubt, invariably a member of the royal court. But he was only one of the many officers (judges, ministers, assessors, accountants, scribes, etc.) of the court. Since the king could overrule his opinion, it follows that the religious law was, ultimately, enforced as interpreted by the king. In other words, religious law was enforced to the extent it had a sanction of the king.

IV

CONCLUSION

Perhaps something can now be said by way of conclusion. The foregoing discussion shows that the ancient Indian Polity was far from being theocratic. It did not have a divine sanction; did not discriminate on grounds of religion or enforce any; the Church was subordinated to the State; and the religious laws were enforced to the extent those had a sanction of the king. These characteristics are a direct negation of the theocratic ideals. On the other hand, the ancient polity almost qualified the basic tenets of a secular polity. The influence of religious considerations on the conduct of the public affairs was, of course, a departure from the rigid principles of the secular polity. But, as has been said already, the motivating force of their diffusion was quite different from what would render it theocratic. Mere contact of State with religion does not render it non-secular. They have got to be in contact with each other. The cardinal principle to be noted is as to which of these is controlling the other. During the Middle Ages the Church performed certain secular functions. Its officials served as Ambassadors, Lord Chancellors, Lord Treasurers, etc.⁶⁵ Yet it did not lose its theocratic character, since, it kept its essence intact. Similarly, the mere performance of certain religious functions by a State, which otherwise preserves its essence, will not ipso facto render it non-secular. Moreover, it is well to remember, that the political institutions are distinguishable not because a single principle exhausts them but because some one is dominant. The Jewish Polity had democratic elements;⁶⁶ the British constitution has monarchical elements; and the U.S.S.R. economy has certain minor capitalistic elements. Yet these cannot be styled as anything but theocratic, democratic and socialist States. A perfect secular State, perhaps, like Plato's Ideal State remains a 'pattern set in Heaven' ever to be envied by human beings but never to be attained by them. Even the modern secular

States only approximate to the 'pattern'; they do not identify themselves with it. The departures in the case of U.S.A. have already been mentioned. Similar departures, are to be found in the case of other modern secular States. In spite of the minor deviations, therefore, the ancient Indian Polity was essentially secular.

—O—

THE ETHICS OF COEXISTENCE

By ELEUTERIO SOARES

THERE is no denying the fact that India's policy of peaceful coexistence is today one of the most significant factors in international relations. Subtly but decisively its influence is being felt on world political trends and with a growing number of nations favourably responding to its appeal India's role as the acknowledged mediator between the East and the West is becoming more and more sharply defined. Although embodying nothing spectacular or essentially revolutionary the policy of coexistence rings with a note of reassurance and a message of hope amidst the encircling gloom of world tensions and the ever-growing threat of nuclear warfare.

There is, nevertheless, both among the critics and eulogists of India's foreign policy, a considerable degree of misunderstanding over what this country means by peaceful coexistence. (More often than not our efforts to promote international accord and harmony are assessed without full appreciation of the motives that induce India to undertake such missions and a clear vision of the goal she is striving to achieve. To a very large extent these misconceptions spring from a failure to appraise our foreign policy in the proper context of the historical and contemporaneous forces that have shaped it and the values from which it derives its moral sanctions.)

Viewed in this perspective coexistence is neither an exclusively Indian or even a modern innovation. The vision of all the nations of the world living together in peace and friendship, notwithstanding the inevitable political and ideological differences between them, has inspired men from time immemorial and continues to be a cherished dream of all men of goodwill. (Apart from logically pursuing her policy of non-alignment India has merely given this age-old concept the form and substance of a definite programme, partly because it is in tune with the teachings of Mahatma Gandhi, a way of life which is true to the temperament and genius of the Indian people, moulded in the crucible of centuries of history, and partly because in the light of the rapid development of nuclear weapons, the only alternative to coexistence is co-extinction. Idealism and the compelling force of circumstances blend together to make the policy of coexistence not a matter of choice but of necessity.)

This is no idle fancy, for the supreme lesson that

emerges from the bitter experiences of the past is that wars solve no problems but only create them. A war, however serious the problem or righteous the cause that provokes it, is unjustifiable both from the practical as well as the ethical point of view, and much more so would be a war that spells total extinction of life and civilisation, a lesson for failing to learn which mankind has paid and continues to pay very dearly and which in the face of existing circumstances can no longer be overlooked. The very survival of the human race demands an emphasis on peaceful and constructive efforts to solve international problems and the renunciation of violence. To realise the dream of lasting peace men must give up the ways of war.

Considered in this light the theory of "peace through strength" and the belief that the saturation of armaments is the best guarantee against war, which dominate the international scene today and find practical expression through the hectic armament race now in progress and other military preparations, are contradictions in terms. Accumulated strength always seeks an outlet and the ultimate result of an armament race can, by the operation of the inexorable laws of nature, only be a war and not the realisation of the hope that a balance in armaments, if it is possible to achieve it all, would prevent a conflict by making war unprofitable for all nations. Even if it were possible to avert such a catastrophe, the atmosphere of mutual fear and suspicion, the unavoidable accompaniments of the so-called "situations of strength" would hardly be conducive to international peace.

The same applies to the military pacts and alliances, designed ostensibly to promote collective security but which in practice constitute provocative measures, adding to existing tensions and accentuating the elements of discord. A cold war is not the path to peace for the means must always be in conformity with the end sought. Mankind therefore can no longer afford to ignore this unambiguous warning and persist in its attachment to the cult of the bomb, except at the cost of courting virtual suicide.

However the mere rejection of war would not constitute coexistence nor would a reduction in armaments or a ban on nuclear weapons bring the world closer to peace. These are certainly important factors but the peace that is envisaged in the concept of peace-

ful coexistence would be a reality only when human society is remolded to conform to the ideals of justice and tolerance and international relations are reshaped on the pattern of universal brotherhood. It is a long and arduous process, demanding all the patience, perseverance and ingenuity that men can command, but negotiations, however well-meant and skilfully and sincerely carried on, will always lack a sense of realism and the necessary driving force, if war is not totally outlawed. An irrevocable renunciation of war is indispensable to create confidence in negotiations, a method for the settlement of disputes, on the effectiveness of which the entire structure of the policy of coexistence rests.

This extraordinary emphasis on peaceful methods for the settlement of disputes however does not imply surrender to evil or injustice and the acceptance of the status quo. Far from it, coexistence is a dynamic policy that seeks to revolutionise international relations by proclaiming the supremacy of moral values over expediency and exploiting to the fullest man's constructive genius and his nobler instincts. Not only does it stand for a just and fair settlement of international problems but it endeavours to dispel the atmosphere of mutual fear and suspicion so as to create the necessary climate for their peaceful settlement, by assuring through the *panchshila* the minimum guarantees indispensable for friendly relations between one nation and another. The "five principles" are not an end in themselves but only the means for the evolution of a pattern of collective security, as prelude to a constructive and peaceful approach to world problems, by binding together nations not to oppose or fight another group of nations but to respect mutual rights and co-operate for the common good.

And that brings us to the accusation made in some quarters that coexistence is a pro-Communist stunt. The warm support which the Communist powers have accorded to the *panchshila* is perhaps mainly responsible for giving rise to such a suspicion. The Communists, of course, may or may not be sincere in their attitude to India's programme for peace, but the issue does not reflect on the intrinsic merits of the policy of peaceful coexistence. Certainly, taking a realistic view of the prevailing situation, the policy of coexistence must take cognisance of the indisputable fact that Communism is

a vital force which governs the destinies of millions of people all over the world. The concept of coexistence is also based on realisation of the fact that Communism cannot be countered by getting tough with the Communists of planning to bring about the downfall of the political powers in Russia or China, for the consequences of such an approach, even if it does not culminate into a war, would be the creation of just those conditions in which Communism thrives. Communism can only be conquered with moral force and coexistence aims at achieving just that end by creating conditions in which the Communist countries would be compelled to honour their commitments and fulfil their international obligations. It seeks to reform the Communist powers through persuasion rather than threats.

Apart from that the policy of coexistence, considered as an integrated whole, seeking as it does the application of democratic values to the wider field of international relations, is by itself neither pro-Communist nor anti-Western. It is on the contrary an antidote as much to Communist expansionism as to colonialism, racialism, economic subjugation and everything that smacks of exploitation of one nation by another, and offers an affront to the honour and dignity of any nation, however small or insignificant. Its object is to evolve conditions of genuine peace, to lead nations along the path of mutual goodwill and understanding to the goal of universal brotherhood and it is imperative that its primary objective should be to eliminate, through peaceful means of course, all obstacles, whether of Communist making or resulting from the actions of the Western Democracies, impeding progress towards the desired goal.

It must undoubtedly be admitted that the policy of coexistence is not easy of achievement but then all good things must be sought the hard way, and it would be an insult to human intelligence to aver that men cannot conquer their deficiencies and shortcomings and rise to a higher level of constructive endeavour. Indeed, any debate on the practicability or otherwise of coexistence is redundant. The issue has long since been decided by the interplay of numerous forces and the mission before all peace-loving people is to strive ceaselessly to translate the ideal of peaceful coexistence into a concrete reality.

BHUVANESVARA—THE SITE OF SILENT SHRINES

By Prof. BRATINDRA KUMAR SENGUPTA, M.A.

BHUVANESVARA, in Orissa, is an ancient site of architectural monuments which sweep our imagination in admiration and wonder. It is quite in the fitness of things that this ancient capital of Orissan Kings under whose lavish patronage these wonder temples were erected here, is going to be the new metropolis of Orissa. In a decade this deserted and desolate site bearing testimony to the old glory will grow up into an ideal modern town as the administrative seat of Orissa.

The wall of Mukteswara Temple

This site still possesses some ancient shrines in their pristine glory besides the relics of some others, either desecrated or worn out by ravages of time. These monuments have been divided chronologically by scholars and have been assigned the period between circa middle of 8th Century A.D. to circa middle of 13th Century A.D., thus covering a period of incessant artistic and architectural creations in this part of India. The finest specimen of this architectural craftsmanship is the famous shrine of Lingaraja, standing in height and magnificence as the most marvellous monument of this belt. Besides, there are the shrines of Kapileswara, Brahmeswara, Parasurameswara, Ananta Vasudeva, Vaital (Lankeswari), Mukteswara, Siddheswara, and Kedareshwara which are still standing in their old magnificence.

Chronologically speaking, Percy Brown in his *Indian Architecture (Buddhist and Hindu)* has divided these temples into three groups. His division, however, seems to be based more on stylistic grounds than on clear historical details. Deva Prasad Ghosh (*Orissan Temples* published by Thacker's Press and Directories, Ltd.) has also studied this chronology and the topo-historical questions. However, when that division is not open to challenge from any opposite point of view, we may accept their chronology as a working hypothesis. Ananda Coomaraswamy in his *History of Indian and Indonesian Art* (p. 115) also remarks: "The most complete series illustrating the development of the Nagara Temple from

the eighth to the thirteenth centuries is found in Orissa, at Bhuvaneshwara, Puri, and Konarak."

The Orissan temple-architecture is a peculiar form of curvilinear (*rekha*) design with a series (commonly 4) of structures completing the whole shrine. The main structure where the *sanctum sanctorum* is situated is known as the *deul* or the *vimana**, while the structure just contiguous from where the pilgrim can have a view of the idol is known as the *jagamohana*. Nirmal Kumar Bose in *Orissan Temples* (Thacker's Press and Directories, Ltd.) opines that this *jagamohana* is of the *bhadra* order, i.e., a pyramidal structure of stepped roofs in clerestoric divisions. But besides that there are two other structures, the *bhogamandira* and the *natamandira*—the offering-sanctuary and the dance-sanctuary respectively—which also represent to some extent a less exaggerated form of pyramidal clerestories. These four structures are the common features of the Bhuvaneshwara temples, except some earlier ones like the *Parasurameswara* or the less elaborate ones like the Vaital Deul which have a complete shrine in the *deul* and the *jagamohana* taken together.

Another view of the wall of Mukteswara Temple

We need not enter into details here as to the architectural designs and measurements of the Bhuvaneshwara group of temples under review. Suffice it to say that *vimana* or the main icon-sanctuary is an elaborate structure of rock-cut paraphernalia of a tapering type. The superstructure is from without a huge mass of rock that has been given a rhythmic form with the chisel by the Orissan *sthapatis* (architects and sculptors). The *bada* or the ground-plan is often a square and flat surface like a quadrangular *verandah* running around the

* "Vimana is the name of the temple built according to tradition (*Sastra*) by the application of various proportionate measurements or various standards of proportionate measurement. The nodule is either purely architectural, or being taken from the Linga or image in the Garbhagriha is, in principle, common to the building, the main object of worship and the builder." (Kramrisch, *The Hindu Temple*, Vol. I, p. 133).

vimana. Next is the *pida* or the first structure on which the whole gigantic super-structure is rested and which contains carvings of figures all around. Nirmal Kumar Bose (*ibid*) has given special names to the parts of the figure-inlaid portions of the wall below the curvilinear tower. His *pida*, however, is an extension of the *bhadra* structure, but Percy Brown (*ibid*) has made the *pida* a generic name. Be that as it may, the elaborate inlays and carvings on the outer walls of the structures are really masterpieces of Orissan architecture. Deva Prasad Ghosh (*Orissan Temples*) has shown that this decorative impulse of the Orissan *sthapatis* was the outcome of rare genius. "They transformed," he observes, "the cold and bare surfaces of the walls into a glowing mass, with carvings of intricate variety and delicate fancy." The linear spire that rises up towards the dome in a tapering measurement is often called the *amla* in the Bhuvaneshvara group of temples, and the metallic (originally golden?) emblem resting on a lotus-like circular cap on the *amla* is called the *kalasa* or often the *ghantakalasa*. This in a nutshell is the plan of the Bhuvaneshvara temple.

Animal-faced Deity at Bhaskareswara Temple

The Bhuvaneshvara temple is rich in decorations and the iconographic studies are an interesting one. The main icon in the *garbhagriha* (*sanctum sanctorum*) is always a *Linga* but in the Bhuvaneshvara *Linga* we find two religious cults meet. The *Linga* is always the representation of a two-icon deity called *Harihara* of which we shall have occasion to speak below. The outside decorations and the iconographic specimens are varied and not only are the main deities of the Hindu pantheon represented in bold relief but there are also male and female figures, epic-representations, *naga-naginis* and profuse floral or ornamental decorations. Yajna Datta Sharma (*Orissan Temples*) has opined (*contra* Mano Mohan Ganguly, *Orissa and Her Remains*) that "it would be better perhaps to view the temple ornament from two separate but allied angles, (i) architectural and (ii) sculptural." His endeavour to restore from oblivion names in the local art-school

of various motifs on the walls, pillars, cornices, clere-stories and ground-plans is laudable.

Let us give an idea of the ornamental motif on the outer walls of the Bhuvaneshvara temples. The *bada* of the Muktesvara temple is rich in floral decorations and the lotus-motif is very prominent as being present in a row of decorative balustrades (see Fig. 1). Moreover, the Muktesvara *bada* has a human-motif and there is a superb representation in a peculiar posture of two human figures lying one upon the other but giving two more postures from a different angle, thus giving four human figures though two are actually carved (see Fig. 2).

A rare specimen of symbolic Orissan decoration is found in a figure in an obscure shrine just at the outskirts of the town, viz., the Bhaskareswara temple. It is the three-handed figure of a human body with an animal mouth† with a *nijamurti*-figure (of a female-nymph) on the left-hand side holding in a dancing posture a resting-place for the left arm of the statue—a rare specimen indeed (see Fig. 3). The standing figure has *kundalas* (ear-ornaments) and *upavita* (the sacred thread around the neck and chest) and holds a weapon in his right hand.

The Parasurameswara temple in Bhuvaneshvara which is hailed as the specimen of earliest Orissan temple-architecture is a two-structured shrine still standing in its pristine purity. The *jagamohana* is of a simple clerestoric fluted disc with figures inlaid on the *pida* walls. There are *mahalakshmi* images with a pronounced sexual relief as representation of a symbolic divinity of fertility. In Orissan temple-architecture we believe, the

The figure of Kartikeya at Parasurameswara Temple

artist was trained to a sort of erotic representation representing the symbol of Life. Be that as it may, a very fine *Kartikeya* image, though somewhat mutilated, is to be found on the outer wall of the *vimana* of this Temple.

† It is difficult to identify the image—the face being somewhat like a lion's (or better a tiger's) puzzles us in correctly identifying it. Is it the *narasimha* incarnation of Vishnu? But that will tell against the stylistic representation of the image. Or, is it that the famous *kirttimukha* (lion-mask) is here superimposed on a deity, though the *kirttimukha* is only a symbolic decoration on the niches of the walls?

The serene face of the god with one of his feet and a weapon resting over a couchant peacock, his carrier, is an exquisite representation of earliest Orissan temple-sculpture (see Fig. 4). Then the *Ganesha* image is a common iconographic representation on the outer walls of the *vimana* or the *jagamohana* of Bhuvaneshvara Temples. Leaving aside the famous huge black-stone *Ganesha* image in the Lingaraja shrine, we have an exquisite specimen on the *jagamohana* wall of the Siddhesvara temple at Bhuvaneshvara (see Fig. 5). It

Ganesha image of Siddheswara Temple

is a *Ganesha* standing on a lotus-pedestal with four hands, having the four kinds of things that he is wont to carry (a rosary, a pot of *nadus*—a favourite sweet with him, etc.), together with a fat mouse, his carrier, standing on a pedestal.

Now we shall speak a few words about the artistic representations and the architectural designs of a few specimens of the Bhuvaneshvara temple-group. The Vaital Deul in the town is a gabled structure reminding us of the Buddhist *Chaitya*-type architecture. It is a new

Gateway of Vaital Deul

type, and strange to say, the Konarak *Surya* in his celestial car is represented here in miniature in a medallion and there is a fine *Nataraja* on the *bho*-projection of the *jagamohana* clerestory. An exquisite *Mahishamardini* figure on the outer wall of the gabled

vimana is a rare specimen of Orissan sculpture. Moreover, outside the boundary-wall there is a miniature gateway probably erected later (see Deva Prasad Ghosh in *Orissan Temples*), which is nevertheless a beautifully artistic one with fine beads and floral and animal designs with a *Kirttimukha* on the top-centre (see Fig. 6). This gateway is, however, not so artistic as the one at Muktesvara temple which contains human figures and other vegetation-designs in a more artistic and symbolic representation. The Rajrani (King and Queen) temple at Bhuvaneshvara with no icon in the *garbhagriha* is, to us, the finest specimen of Orissan sculpture. Its walls (see Fig. 7) with exquisite figure-works and ornamentations, its rich niches with pendant floral and necklace-like strings and its general tone and temper lend to it an aura of grandeur. A part of any wall takes hours to study fully and it is all around inter-set with such decorations. There is a local tradition that a certain native prince built it not for any religious purpose but for taking delight in seeing his subjects' keenness of execution in sculpture. Hence, perhaps, there is no icon and the name is like that. Be that as it may, the walls contain figures of *nartaki*, *nagini*, *dvarapala*, and *yoddhri* (dancing girls, serpent-girls, gate-keepers and warriors respectively). Some incidents are also recorded in bold relief. Besides that there are floral

Figures in the wall of Raja Rani Temple

and bead designs, fine lattices and decorated pilasters—all of which are lavishly executed. The Ananta Vasudeva temple in Bhuvaneshvara is the only Vishnu temple there and it is also a grand one. The dome of the *vimana* (see Fig. 8) containing human figures in pairs and converging towards the *ghantakalasa* is a masterpiece of architecture. The tapering dome or *amla* of the Bhuvaneshvara temples contains, besides *Kirttimukhas* referred to above, the peculiar *gajasimhas* (couchant lions on prostrate elephants) of the Orissan School. These may be said to be the guardians of the temples, as not only in the *amla* but even at the gateways these are prominent.

The Lingaraja—undoubtedly the most magnificent of Orissan temples—is an enormous plan within a huge

courtyard containing many other smaller temples. The four-structured shrine of the presiding deity of the town with its *jagamohana* and *vimana* containing celestial figures, human figures, animal figures and narrative-figures from the Epics, besides the *gajasimbas* and *kirtti-mukhas* and all kinds of designs, makes the spectator stand amazed. Besides, the Brahmesvara and the Kapilesvara temples at the two outskirts of the town are huge and grand structures. The two-structured Brahmesvara is *panchayatana* in plan, i.e., four other

The dome of Ananta Vasudeva Temple

smaller shrines at the four corners of the same compound are existent along with the main shrine. The Kapilesvara temple is a four-structured one with many smaller shrines within the compound. The covered *verandah* or corridor connecting the *bhogamandira* with other parts is a majestic one with figures illustrating narratives from the Puranas inlaid on its walls. It is strange that Percy Brown in his book referred to above has not noted this grand temple of this belt. The Brahmesvara temple is also rich in narrative decoration.

A few words on the *Harihara* cult of Bhuvanesvara should be said. The presiding *Lingas* or even figures on the outer walls (as two such beautiful figures are to be found in the dilapidated Ramesvara temple) are Siva-Vishnu according to the cult of this belt. The Ramesvara figures show that in the same image the characteristics of both these deities are preserved (half Siva and half Vishnu). Therefore in these temples the offerings are purely vegetarian for the association of Vishnu. Parvati, the consort of Siva, and Lakshmi the consort of Vishnu, are given equal status. This Siva-Vishnu cult is a particularly Orissan one and we suppose that Orissa was the meeting-ground of not only artistic but also religious cults. The strong Saiva current of the North and the Vaishnava current of the South might have met and mingled here on the congenial soil of peaceful Orissa.

RAM GOPAL VIJAYVARGIYA AND HIS ART

By MANOHAR PRABHAKAR, M. A.

A few miles away from the important town, Sawai Madhopur, in Southern Rajasthan is a village with dense forests, pretty hills, tall trees and scattered houses known as Baler. This is the native place of Shri Ram Gopal Vijayvargiya, the celebrated artist of India, who was born here in November, 1906 with silver spoon in his mouth and grew into manhood with brush and colours in his hands. His worthy father, the late Shri Bhanwari Lal, was a successful businessman as well as the *Kamdar* of the Baler estate. From his very boyhood, Vijayvargiya had a natural aptitude and a strong attraction for drawing and painting. But his father wanted to see him as a high Government official. That was why he was very often rebuked whenever his father found him engaged in sketching and drawing. Despite all these difficulties and obstacles, his practice could not be discontinued.

ON THE PATH OF PUBLICITY

In the year 1930, *The Modern Review* was the first journal to publish his painting, captioned *Water Carrier* in which three Rajasthani ladies carrying water-pots on their heads were portrayed. After that all the leading journals of the time came to appreciate his artistic talents by publishing his paintings in prominent

places. *Prabasi*, *Vishal Bharat*, *Saraswati*, *Madhuri*, *Chandr* and *Hans* were the magazines in which his paintings used to appear very often.

Lovers

EXHIBITIONS AND HONOURS

In the year 1932, the first exhibition of Vijayvargiya's paintings was held in Calcutta which is considered to be the main centre of paintings of modern style. Here, the paintings of Vijayvargiya captivated the attention of reputed Bengali artists and art-critics. Dr. Suniti Kumar Chatterjee writing about his art in the *Advance* expressed that some of Vijayvargiya's artistic creations reminded him of Ajanta paintings. Just after a year of this exhibition, the Fine Art Institute of Calcutta honoured Ram Gopal by awarding him a certificate of high proficiency. In 1934, in the Delhi Art Exhibition his

influenced by the Oriental school of painting developed in Bengal and also by the Rajput school of painting. He independently experiments his own original style.

SUBJECTS OF PAINTINGS

The subjects of Vijayvargiya's paintings are rich and varied and they possess great emotional power. On the one hand his brush portrays the romantic scenes full of voluptuous beauty and exuberant youth, on the other, he takes delight in depicting the supermen of epics and history.

Fruit-seller

work was very much appreciated and he was rewarded by His Highness the Maharaja of Patiala. Since then his fame began to grow and spread not only in India but abroad also, and today he occupies a unique position among the well-known artists of India. The museums of London, Allahabad, Banaras and Jaipur have the proud privilege of possessing his masterpieces in their sections of fine arts.

ORIGINALITY OF STYLE

Artist Vijayvargiya does not follow any particular style. However, it may be remarked that he is deeply

On the way to market

Vijayvargiya has intensively studied Persian and Sanskrit, and has taken his themes from the *Kadambari*, *Abhijnan-Shakuntala*, *Meghadoot*, *Kumar-Sambhava*, *Geeta-Govinda*, *Raghu-Vansha* and *Rubaiyat of Omar Khayyam*. He has also painted folk life. For such paintings, he has derived his inspiration from indigenous sources.

CHOICE OF COLOURS

Painter Ram Gopal prefers soft, delicate washes of two or three colours in their graded shades. Sky-blue is one of the pet colours of Vijayvargiya.

CONCEPTION OF ART

Vijayvargiya has always given his recognition to the principle of 'Art for art's sake.' But at the same time he does not ignore the utilitarian viewpoint of art in life.

Women carrying pitchers

AN OUTSTANDING POET

Anyone who has availed himself of the opportunity of being personally acquainted with Shri Vijayvargiya will vouch for the fact that his outward appearance give the impression rather of a poet than a painter. Fair complexion, middle height, smiling lips and curling hair are the distinguishing characteristics which lend him the personality of a poet. As an outstanding poet Shri Vijayvargiya has contributed 'Alkavali' 'Chingariyan' 'Shatdal' and 'Nisha Abhisar' to Hindi literature and enriched its treasure. His recent publication entitled

Rajasthani Chitra Kala will also be regarded as the most informative and the best book on Rajasthani styles of painting.

PRINCIPAL AND MEMBER OF N.A.F.

Passing through the forty-eighth year of his life Shri

Toilet

Vijayvargiya is working as the Principal of the *Rajasthan Kala Mandir*, a Government Institute of art-education for girls. He is also the head of the department of painting in *Lalit Kala Sansthan* at Jaipur. He has also been nominated as a member of the National Academy of Fine Arts from Rajasthan.

CONCLUSION

Artist Vijayvargiya is one of the top-ranking artists of our country. He has a style of his own and his best paintings will ever remain alive in the mind of man.

PICTURESQUE KOVALAM

By K. P. PADMANABHAN TAMPY, B.A.

The most alluring beauty spot which lies nearest to Trivandrum is Kovalam situated in a seaside village and nestling amidst dense palm groves. Ten miles to the south of the city is this popular week-end resort and shrine. The temple is situated amidst picturesque surroundings and the Karamana river winds its way close by. The peculiar gable style of architecture, the wood carvings and stone sculpture in the temple are of especial interest. Orthodox Hindus perform *shraddhas* (religious rites in honour of their departed relatives) at Thiruvallam and worship at the temple.

A view of the canal leading to Kovalam

sanatorium. Kovalam is a pretty hamlet consisting of thatched cottages scattered over a vast area on and nearabout the sea-shore and hiding as it were in the midst of luxuriant tropical vegetation. The shimmering sea and the picturesque rocky cliff lend rare enchantment to this region. With a landscape richly blessed with fragrant hilly pastures and delightful hills, Kovalam, the favoured goal of tourists, offers a wealth of attractions and experiences to the visitor who is seized with curiosity and longing to examine the contrasts of landscape presented here. Few spots on earth are better calculated to give an idea of Nature's infinite grandeur. The drive from Trivandrum to Kovalam is particularly beautiful. The principal charm of a trip to Kovalam is its complete restfulness and the entire absence of bustle, while something interesting is always within sight. Villages slip past and extensive paddy fields stretch flat to a distant horizon.

On the way to Kovalam, just four miles from Trivandrum, you cross the Karamana river at Thiruvallam. At Thiruvallam is a famous and sacred temple dedicated to Sri Parasurama. Nowhere else in the

whole of India is another temple dedicated principally to Sri Parasurama other than at Thiruvallam, and this unique feature adds to the importance of this shrine. The temple is situated amidst picturesque surroundings and the Karamana river winds its way close by. The peculiar gable style of architecture, the wood carvings and stone sculpture in the temple are of especial interest. Orthodox Hindus perform *shraddhas* (religious rites in honour of their departed relatives) at Thiruvallam and worship at the temple.

Leaving Thiruvallam the drive is across a typical rural area. A short detour from the main route to Kovalam leads to Vellayani. Splendid views over the sea are obtained on this country road which cuts across the countryside. The Vellayani Kayal is a fresh-water lake surrounded by dense cocoanut plantations and green paddy fields. At Vellayani is an old Bhagavati temple!

A view of the river which empties itself into the sea at Kovalam

As you approach the outskirts of Kovalam, the dry wind changes into a cool and balmy sea-breeze. The first and at once enthralling glimpse of Kovalam is across the cluster of sheltering palms lining the sea-front, and the undulating valley of green. At certain points the sea seems to stretch almost parallel

to the road. The whole region is undulating. Every inch of arable ground is covered with tapioca, the principal food of the poor and the labouring classes. Coconut, mango and jack trees and different varieties of luscious plantains are also seen in abundance. The car glides right down to the end of the well-laid-out road, to the sands and you stand face to face with Kovalam.

Kovalam has deservedly become the most popular week-end and holiday resort owing to its proximity to the town. This charming spot which is reached from Trivandrum by car in half an hour can also be reached by the Karamana river which empties itself at Kovalam into the sea. Kovalam can also be reached by the sea from Trivandrum in a *vallam*, country boat, or the distance can be walked along the sandy sea-shore. In any case, the trip is pleasant.

A view of the quiet countryside on the way to Kovalam

A beautiful piece of low-level land terminating in a cape higher than the contiguous coast, Kovalam comprises two promontories in between which is a sheltered bay. There is a very small village port with a lovely bay which affords tolerably safe landing in fine season. On the southern boundary of the bay is the picturesque rocky cliff with black rocks of varying sizes and diverse shapes piled one over the other in wild and chaotic disorder. The cliff is austere, imposing and magnificent. A view from the crest of this cliff offers one of the finest sea-views in the world.

At Kovalam there is a mysterious cave around which time has woven many interesting legends. This wonderful cave is in common parlance called *Udayar Vazhy*. A furlong to the interior of the picturesque rocky cliff is a precipitous and narrow pass. The cave is at the farthest end of this pass. Weird sounds are

caused when sea water rushes into this deep and dangerous cave. It is not possible to see clearly water rushing in, for the mouth of the cave is partially hidden by a huge globe-like stone towering six feet above the sea level. It is said that if this black rock is blasted away, the interior of the cave would be fully visible. To the right of the narrow pass visitors could stand and look round. The left side presents the appearance of a small forest. To obtain the best possible view of this strange cave one should embark either a catamaran or canoe and take a position facing the cave. Of course, this is a difficult and irksome task full of thrill. The interior of the cave is broad. The figure of a person seems to occupy the centre of the cave. When the rays of the setting sun reflect inside the cave, two eyes of flame are noticed there. One hears the noise of the sea water flowing into the

recesses of the cave. The sea water, however, does not flow back into the ocean. Legend avers that this awe-inspiring cave has its terminus at the foot of the Mookunni Malai, a small mountain range about 20 miles to the interior. Aged people who inhabit the coast say that terrible sounds emanate from the cave before the outbreak of the monsoon. It is believed that such sounds indicate an imminent monsoon.

Legend says that many many years ago when Kovalam was occupied by Pandarams, a section of the Saivites, one of their priests or *Udayars* as they were called, used to observe penance inside this cave. The *Udayar* who was a saint was in the habit of praying inside the cave for days together at a stretch without coming out or partaking of food. At last he informed his disciples that

he had determined to take up his permanent abode inside the cave and commanded them to close the mouth of the cave. The dutiful disciples rolled down a huge stone to cover the mouth of the cave but the stone failed to serve the purpose. The *Udayar* did not again make his appearance outside the cave. Religious belief asserts that in places where such saints attain *samadhi* (casting off their mortal coil), *Siva Lingams* (Phallus consecrated as God Siva) occur. It may be that the figure which appears to occupy the interior of the cave is either a *Siva Lingam*, or the body of the *Udayar* himself turned into stone!

Another interesting sight is the balancing rock on the southern side. There a huge oval-shaped black rock of ominous appearance rests upon another equally huge rock maintaining a sort of precarious balance. When the gales blow, the balancing rock

swings gently and this sight is awe-inspiring. This place though fraught with danger affords ample scope for the experienced and daring rock-climber to enjoy a bit of strenuous rock-climbing. To the eastern side there is a huge black rock which resembles a big elephant in a crouching posture. This rock in common

On clear mornings and evenings when the sun shines, when the picturesque rocky cliff and the emerald green meadows close to the shore are clothed in majestic splendour the tourist should hike along the contiguous coast and then will behold a magnificent sight. Land and sea seem to merge into one another till he hardly knows where the earth ends and the waters begin. A riotous carnival of colours greets his vision.

To witness on a summer evening sunset at the Kovalam beach is to see an indescribable spectacle of beauty, majesty and charm. What wonderful colours for the artist's palette this bewitching scene conjures up! The luminous glories of colour that creep into the sky are simply enthralling. The glorious arch overhead, of a deeper blue than the sky ever was, is lavishly embellished with patches of sheeny clouds tinged with the deepest and softest hues of infinite variety. The clouds themselves are of all shapes changing every moment, both in form and decoration

Kovalam bathing beach

parlance is called *Anappara* (Elephant Rock). Tradition and legend aver that many many years ago an elephant which had set its foot on the particular spot (where the rock now stands) was all of a sudden transformed into a rock and there the unfortunate beast stands petrified even to this day!

The perfection of the beautiful unfolds itself to the gaze of the visitor at this lovely spot. See Nature's pranks and her splendour at Kovalam. The beach gleams. The pretty rocky cliff on one side of the Kovalam beach rises in delicate curves, imposing and lovely. Thirty and more feet above the visitor's head the feathery leaves of the coconut palms wave gracefully. They have no community of action, but blow this way and that at their pleasure only protesting unanimously

if the breeze annoys them with full-volumed force. When the air is calm the palms converse with graceful gestures beckoning with suavest invitation. Warm breeze, gentle and invigorating, caresses the entire area. Colour and light enliven the landscape. Here beauty is everywhere in hill and dale, sea and river, nature and art, land and ocean, all joined together in the imperishability of the sublime.

The picturesque rocky cliff at Kovalam Beach. The P.W.D. Bathing Shed is also seen

through the varied effects of light and shade. On all sides as far as the eye could reach is the blue ocean, the sheltering palms lining the coast, the luxuriant foliage and the sparkling white sands. The bright sun shows his broad and crimson disc through an aperture of the light clouds and the abundant glories which fall in torrents in divergent pencil rays render the place lovely and romantic beyond description. The

setting sun leaves behind a whirl of pink opal where the clouds jostle against each other. To the east the sky is topaz, lemon and turquoise while the sea assumes myriad tints and the palms are dark green. The glassy casements of the P.W.D. Camp Shed which stands silhouetted against a flaming sky blaze in the crimson light due to the magic of the vanishing Sun-God. Birds chirp and dash fast to their nests. Fishing boats are launched into the ocean by the daring fisherfolk. All is quiet and mysteriously solemn. To sit on the Kovalam beach and watch this gorgeous natural phenomenon is to witness and enjoy one of the most colourful and thrilling sights of the earth. The sands themselves glitter and sparkle in the fading red light of the setting sun and there is a glorious shimmer on the surface of the rolling sea. The tiny lamps burning in the hovels of the fishermen give forth a reddish yellow light and add to the charm of the scene.

To stand on the rocky cliff and see the fiery red ball of the setting sun leaving multi-coloured luminous streaks on the horizon as it sinks into the sea, is a thrilling sight, clothed in a halo of mystery. The waters of the turbulent sea dash into the grottos with tremendous fury shooting up powerful sprays. See Kovalam at dusk when the heat no longer reflects off the mounting sand, when the cool ozone-bearing night breeze hisses across the palm-fringed shores with lovely sand dunes, when the tide booms against the shores throwing up sprays and the sea takes an unearthly glow.

Kovalam is an incomparably beautiful paradise for camping, picnic, sea-bathing, angling, fishing, swimming, surf-riding and yachting. In dug-out canoes and catamarans, quaint little crafts constructed by the dexterous fisherfolk who inhabit the coast, they brave the heavy surf and venture far out into the sea in pursuit of their livelihood. This familiar sight at Kovalam beach at the break of dawn and close of day is thrilling. It is a pleasure to be rowed into the sea on a catamaran in the evening and from there to gaze into the immensity which stretches itself

before the visitor and to spend a pleasant hour beneath the blue summer sky.

Seated on one of the rocks buttressing into the sea, one can try his hand at fishing. Buoyant fisherfolk striplings with but a semblance of dress comprising a loin cloth tightly drawn over the waist can be seen standing over the slippery rocks and fishing with rods and tackles for hours together without knowing any fatigue or losing patience. Or one can wade into the sea, stand in the waist-deep water and enjoy a game of angling. To observe agile fish and crabs darting across and hiding in the abundant creeks is an interesting sight.

When evening shadows cast their mystic spell of secrecy and soft murmurings and whispers emanate out of the sea, enjoy a sea-bath at Kovalam. The bathing beach here is one of the most delightful beaches in the world. The shore is rapturous with the unending music of the waves over the rocks and the sand dunes. The sea in the ample embrace of pretty bays, or clear and limpid in narrow creeks, is always charming. Bathing at the swimming place at Kovalam is safe and most refreshing.

Kovalam on a moonlit night is simply bewitching. The silver moon hangs in the air shedding her rays on the ripples, waves, rocks and sands making them all the more lovely. The scene then seems like the Throne of the Invisible sentinelled by a galaxy of bright stars. On such a night when the land lies lovely beneath the moon it is a great experience to enjoy a sea-bath at Kovalam and watch the grand panorama which unfolds itself before us.

The splendours of Kovalam have remained unchanged; only things have been made more convenient for those who wish to enjoy them. It is in this lovely and unspoiled scene where nature and mankind are so coalescent that the profound sublimity of Nature can best be appreciated.

"Ah, what pleasant visions haunt me
As I gaze upon the Sea!
All the old romantic legends,
All the dreams come back to me."

THE HINDU COLLEGE, PREDECESSOR OF THE PRESIDENCY COLLEGE

The Story of Its Foundation

By JOGESH C. BAGAL

THE Presidency College has just completed its hundred years. This has given occasion for the centenary celebrations of the institution. The College started work on the 15th June, 1854. It formally opened on the same date a year later as the Presidency College, Calcutta, after the approval and sanction of the Court of Directors reached the country. But the College was not altogether a new thing. Its predecessor, the Hindu College, was split up into two separate and distinct institutions in 1854. Its senior department formed the Presidency College and junior department the Hindu School, and the scholarships and bursaries were divided between them. The Hindu College had a chequered career. Its contribution to the progress of the country can never be over-estimated. It is but meet to discuss the history of this pioneer institution not only in Bengal, but in the whole of India as well. I propose to give here in brief the story of its foundation only.

The importance and far-reaching effect of the instruction imparted in the Hindu College, attracted the notice of the publicists and authors even in the thirties of the last century. *The Calcutta Christian Observer* gave a running account of this institution, based on contemporary evidence, in its first three issues—June, July and August, 1832. James Kerr, Principal of the Hindu College (1843-48), devoted a considerable portion of his book, *Review of Public Instruction in the Bengal Presidency* (1851), to the history of the Hindu College. Rajnarain Bose of hallowed memory traced the origin and progress of the Hindu and the Presidency College on the occasion of the first College Re-union in early 1875. *Presidency College Register* was compiled and published under official auspices in 1927. In an important

paper* on Indian education of those days by Brajendra Nath Banerjee, much new light was thrown on the origin and foundation of the Hindu College. The present writer discovered, two decades ago, the *MSS. Proceedings* of the Hindu College Managing Committee, written in detail from 1816 to 1832, and in brief from 1833 up to 1850 in the family library of Rajah Radhakant Deb. He also contributed papers at that time on the Hindu College, in its first phase, based on these *MSS.* records and supplemented by the contemporary newspapers. The present article is also mainly based on these materials, in *MSS.* and in print.

II

The educational policy of the East India Company took a definite shape after 1813. This year the Company's Charter was renewed, and it was stipulated in one of its Clauses that the Company's local government should spend one lakh of rupees annually on education. There was no question of English education at the time in spite of the far-fetched construction of the Clause by Thomas Babington Macaulay twenty years later in favour of English education. The sum of one lakh was to be spent exclusively for oriental studies—Sanskrit, Arabic and Persian. And this was for two reasons: (1) The official language, including the language of the Courts, was Persian, and (2) The Company's local authorities thought that official encouragement of studies other than oriental might alienate the sympathy of the

* "Rammohun Roy as an Educational Pioneer" in *Journal of the Bihar and Orissa Research Society*, Vol. XVI, Pt. II. Mr. Banerjee has quoted the letter of Sir Edward Hyde East, dated 18th May 1816, in full in this paper. I have occasion to refer to it in this article.

people towards British rule. The former was the main reason that those versed in Persian found employment in the Government as *Sadar Ameens*, corresponding to the modern Munsiffs, and other similar posts. The English-educated youths were not given employment worth the name in any government department till the renewal of the Company's Charter in 1833.

But the Indians had already come in contact with the British officials and non-officials. Necessity of learning the English language was keenly felt by even the rank and file for their constant intercourse with the British businessmen. Some schools had been started for giving the Indian boys rudimentary instruction in English. Radhakant Deb, Dwarkanath Tagore and Ramcomul Sen, who rose to eminence in after life, took their first lessons in English in these *pathshalas*. Drummond's Dhuramtollah Academy was an institution of a higher type. It was here that the famous Derozio studied in his early life. But the gentlemen named above as well as a good many others acquired proficiency in English language and literature by private study and began to appreciate their values. Raja Rammohun Roy preceded all of them in acquiring sufficient knowledge in English. But it is not on record that he received English instruction in any school or *pathsala* then in vogue. Even the *pundits* or the learned Sanskrit scholars heard of the richness of English literature through their compatriots and favoured the idea of imparting instruction in this lore to the younger generation.

The idea was already there. But it was left for David Hare, the watch-maker, to give it a concrete shape. He envisaged the prospects and possibilities of English education in India. He mooted the subject at a private meeting at Rammohun Roy's house. When the credit for the foundation of the Hindu College was sought to be divided between Sir Edward Hyde East and Dr. Horace Hayman Wilson in 1830, a bitter controversy started in the newspapers, and it was agreed by almost everybody that the 'originator' of the College, truly speaking, was David Hare, because the idea of such an institution at first originated with him. It was also David Hare who prepared the plan for the Hindu College. It was on the basis of this plan that subsequent efforts were made. We have the following recorded in the June, 1832 issue of *The Calcutta Christian Observer*:

"The late Mr. Derozio, who, from his intimacy with David Hare and the Native community, as well as from his knowledge of the proceedings of the College, certainly had good grounds for the assertion which he so resolutely maintained, that 'previous to the aforesaid meeting being held (on the 14th May, 1816), a paper, both author and originator of which was Mr. Hare, and the purport of which was, a proposal for the establishment of

a College, was handed to Sir Hyde East by a Native for his countenance and support.'"

This point was elaborated in the July (1832) issue of the *Observer*. Here we find that a few persons assembled at Rammohun Roy's house when David Hare made the above proposal. This proposal received general approbation from those present there. Hare subsequently prepared a plan for the same, and Dewan Baidya Nath Mukherjee was deputed to collect subscriptions. Rammohun Roy was in the know of the proposal made at his house and in his presence, as well as the plan for founding a well-organised English seminary. The *Observer* writes that 'this circular was put into the hands of Sir E. H. East, who was very much pleased with the proposal, and after making a few corrections, offered his most cordial aid in the promotion of its object.'

From other contemporary or nearly contemporary sources it is clear that Rammohun Roy was closely associated with David Hare and some of their common friends in communicating the plan of the College to their opulent as well as learned countrymen. It may be presumed that the weighty support of no less a distinguished person than Rammohun was responsible for its being publicised in so short a time. It is, therefore, difficult to appreciate the view of those who say that Rammohun had no connection whatsoever with the foundation of the Hindu College.

III

Sir Edward Hyde East, Chief Justice, Supreme Court of Calcutta, was held in high esteem by the members of the Hindu and the European community. Invitations were sent in his name to the leading members of both the communities, to assemble at a meeting in East's house. As scheduled, the meeting was held there on 14th May, 1816. The Hindus necessarily predominated. This meeting is very memorable, because it is from here that the history of modern education in India properly begins. We have two accounts of this momentous meeting, one very brief in the *MSS. Proceedings* of the Hindu College, and the other in considerable details in the letter of Sir E. H. East, written only four days after the meeting took place. The account in the *Proceedings* tallies substantially with that given in the letter, and is inserted as follows:

"A very respectable meeting of the Hindoos assembled at this meeting by individual invitation at the house of the Hon'ble the Chief Justice, for

* Vide "A Sketch of the Origin, Rise and Progress of the Hindoo College" in the June, July and August, 1832, issues of *The Calcutta Christian Observer*.

† The sources referred to are: (1) Sir E. H. East's letter to J. H. Harrington, written on 18th May, 1816; (2) *Samachar Darpan*, 8th July, 1831, (3) Peary Chand Mitra's *A Biographical Sketch of David Hare* (1877), p. 6, besides *The Calcutta Christian Observer* (1832).

the purpose of subscribing to and forming an Establishment for the liberal education of their children.

"The business of the day was opened by the Chief Justice, who addressed the meeting as to the object for which they were assembled and as to the benefit that his Lordship considered would be derived by the country at large from forming an establishment for the education of their youths.

"The proposal was received with the unanimous approbation of all the natives present including the most eminent pundits, who sanctioned with their express support, and recommendation.

"A large sum of money was immediately subscribed by most of those present, and it being understood that there were many Hindoo gentlemen who were not present, that were anxious to become subscribers to the Institution, another meeting was by the consent of the Chief Justice appointed to be held at his Lordship's house on Tuesday the 21st of May, when a committee might be chosen for preparing details of the plan, and taking measures for proceeding to a project and place for the College proposed to be erected. The Meeting was therefore adjourned till Tuesday 21st May and subscriptions appointed to be received in the meantime by W. C. Blaquiere and J. W. Croft, Esqrs."

In his above-mentioned letter Sir E. H. East noted some 'singularities' of this important assemblage. In his words, 'One of the singularities of the meeting was, that it was composed of persons of various castes, all combining for such a purpose, whom nothing else could have brought together; whose children are to be taught, though not fed, together.' East was struck with the enthusiasm of the prominent pundits, Sanskrit scholars, for the introduction of Western literature and science. He writes that 'when they were about to depart, the head pundit, in the name of himself and others, said that they rejoiced in having lived to see the day when literature (many parts of which had formerly been cultivated in this country with considerable success, but which were now nearly extinct) was about to be revived with greater lustre and prospect of success than ever.' According to the letter, the subjects to be taught in the proposed institution, were:

"The cultivation of the Bengalee and English languages in particular; next, the Hindostanee tongue, as convenient in the Upper Provinces; and then the Persian, if desired, as ornamental; general duty to God; the English system of morals . . . ; grammar, writing (in English as well as in Bengalee), arithmetic (this is one of the Hindu virtues), history, geography, astronomy, mathematics; and in time, as the fund increases, English belles-lettres, poetry, etc., etc."

A few things are to be noted. In both the accounts, the name of David Hare, the 'originator of the plan,' did not occur. Hare never liked to come to the forefront. In the letter of Sir Edward, Ram-

mohun Roy came up prominently. The orthodox pundits objected to his having any connection with the proposed institution. One of them went so far as to say that he would have nothing to do with it, if they accepted subscriptions from Rammohun Roy. Rammohun retired, even before the foundation of the College was formally resolved upon.

IV

At the second general meeting held on 21st May, the proposal took a definite form. Some resolutions were accepted. By one the establishment of the institution was resolved upon, and its name was to be

Gopee Mohun Tagore

"Hindoo College." By another resolution, a General Committee was appointed for the realisation of this object. This Committee consisted of ten Europeans and twenty Indians, representing the elite and enlightened of both the communities. It should be noted that amongst the Indian members, as many as five were the most prominent pundits, or Sanskrit scholars. Joseph Barretto, the famous businessman and philanthropist, was appointed treasurer.

Subsequent meetings of the General Committee were also held at East's house and under his chairmanship. At the meeting on 27th May, Lt.-Col. Francis Irvine of the Military Department and Dewan Baidyanath Mukherjee who had taken keen interest in the matter from the very start, were appointed European and "Native" secretaries temporarily. Some tentative rules were framed on this

occasion, and the members were requested individually to give their opinion on them. They might also make some rules themselves and send them to the Committee. A Select Committee was formed 'to take measures for providing a proper place for the site of the intended College as well as to procure a temporary building for the purpose of commencing institution in the Bengalee and English language as soon as possible.'

The General Committee again met on 11th June. After the formal business was finished, the European members withdrew in a body, never to take any active part in the proceedings. Even Sir Edward Hyde East and J. H. Harington, two very ardent supporters of the cause, were to be regarded as private friends. The reason of their withdrawal is that even in 1816, the local authorities believed that co-operation with the Indians in such matters might be construed as governmental interference. The actual lines of the *Proceedings* in this connection are:

"The English gentlemen of the Committee desire to relinquish their right of voting on any question which may come before the Committee, though they will always be ready to assist the Native committee with their advice in any matter in which they may consult them.

"Sir Edward Hyde East and Mr. Harington desired to be considered as private friends to the Institution in common with the rest of the English gentlemen, to assist the gentlemen of the Native committee, but without making any honorary appellation to themselves."

Henceforward the Committee worked almost single-handed, though the venue of its meetings was the same. In its sitting on 25th June, a sub-committee was formed to prepare a digest of the rules and plans received heretofore from individual members. The General Committee did not meet for the following two months. The Sub-committee held its sittings during this period and thrashed out a digest of fundamental rules after mature deliberations. The local newspapers noticed the progress of the work of the General Committee and its Sub-committee from time to time. *The Calcutta Gazette* of 11th July, 1816 commented on the work of the Sub-committee as below:

"While the greatest unanimity of sentiment has prevailed with regard to many points, there are others which have excited much diversity of opinion among the subscribers. This diversity far from being a subject of regret, is only one out of many proofs of that zeal and animation with which the leading families and characters among the Hindoos have engaged in the design."

The *Gazette* of the same date informed the public of the large donation of Maharajah Tej Chand of Burdwan, amounting to rupees twelve thousand. It should be mentioned here that Gopee Mohun Tagore of Pathuriaghata subscribed rupees ten

thousand, and the Mullicks of Burrabazar, rupees twenty-five thousand. The *Calcutta Gazette* of 27th June had already referred to the amount and to the suggested ways of its expenditure:

"The amount of the subscriptions at present is Sa. Rs. 66,700, of which not less than 25,000 has been contributed by the Mullicks. Almost all the subscribers declare their resolution to add to their contributions as soon as a definitive plan should have been agreed on, which shall decide the mode and terms of the subscription. Calculations have in the meantime been made which purport to show, that one lac subscribed to a fund destined to remain at interest during the first year, afterwards to purchase ground and erect those buildings soonest required, together with half a lac constituting a fund, the capital and interest of which may be gradually expended, during the four years ensuing, on current expenses, will enable the managers of the institution to commence instruction, with every reasonable prospect of final success."

V

The Sub-committee, appointed for the purpose of preparing Rules for the College, finished its labours on 20th August 1816 and sent the printed copies of them to individual members of the General Committee. Both the General Committee and the subscribers met separately on 27th August at the house of Sir Edward Hyde East, to consider the Rules. The Sub-committee formally placed the Rules before both the meetings, which were passed unanimously, the pundits, too, giving their full consent.

The Rules were thirty-four in number, divided into three sections, namely, Tuition, Funds and Privileges, and Government. The object of the institution was described in the 1st Rule of the first section as "The primary object of the Institution is, the tuition of the sons of respectable Hindoos, in the English and Indian languages and in the literature and science of Europe and Asia." According to Rule 3, the College would include a School (*Pathshala*), and an Academy (*Maha Pathshala*). The subjects of study in both the divisions would be on the lines mentioned before. The work of the School was to commence first. Another Rule in this section is very interesting, and may be followed with profit even today. The Rule lays down:

"The English language shall not be taught to boys under eight years of age, without the permission of the Managers in each particular instance."

The second section, Funds and Privileges, consists of sixteen rules (10-25), forming the pivot of the constitution. There should be two distinct funds for the College: (1) 'College Fund' and (2) 'Education Fund.' The object of the College Fund is stated to be "to form a charitable foundation for the advancement of learning, and in aid of the Education Fund. Its ultimate purpose will be the purchase of ground, and construction of suitable buildings there-

upon, for the permanent use of the College; as well as to provide all necessary articles of furniture, books, a philosophical apparatus, and whatever else may be requisite for the full accomplishment of the objects of the Institution." In the meantime, until the buildings were constructed, house-rent and other current expenditures would be paid out of this fund. The amount subscribed to the "Education Fund" would be appropriated to the education of pupils, and expense of tuition.

According to the amount of subscription, paid on or before the 21st May, 1817 (being the anniversary of the day on which it was agreed to establish this Institution), the subscribers should be placed in different categories. The highest single contributor would be designated the "Chief Founder"; those paying Rs. 5,000 or upwards, the "Principal Founders," all other subscribers, "Founders of the College." The "Heritable Governor of the College" should be one who would contribute Rs. 5,000 or upwards, to the College Fund, before the aggregate sum of a lac and a half of sicca rupees might have been subscribed to that Fund. Members of the Managing Committee, called in the Rules, as 'Directors' or 'Managers' would be elected annually from amongst subscribers of a certain amount. This is clearly expressed in the following Rule:

"Subscribers to the College Fund, who are not governors, and whose joint or separate subscriptions to it, (made before a lac and a half of sicca rupees shall have been contributed to it), shall collectively amount to 5,000 rupees, shall be entitled to elect anyone of their number to be a Director of the College."

Privileges of the subscribers have been described in some other rules. The Directors would determine their privileges when they would meet after their election.

The third section, "Government," contains nine Rules (26-34). The government of the College would be vested in a Committee of Managers, consisting of 'Heritable Governors, Governors for Life, Annual Directors, or their respective Deputies.' The Managers should 'possess full powers to carry into effect the whole of the Rules now established. They shall pass also additional Rules.' They would be the trustees of both the College and the Education Fund. The Committee of Managers would be the appointing authority in all cases. Three Managers would form a quorum in the committee-meetings, and all affairs would be decided by a majority of votes. The thirty-fourth Rule lays down the compulsory convention of an annual general meeting of the subscribers, 'at which a Report shall be made to them of the state of the funds and of the progress of the Institution.'

VI

In accordance with the Rules, the Managing Committee of the proposed Hindu College was consti-

tuted with two Heritable Governors—Maharajadhiraj Tej Chand Bahadur of Burdwan and Gopeemohan Tagore of Pathuriaghata, Calcutta, and five Directors or Managers, namely, Ganganarain Das, Radhamadhab Banerjee, Joykissen Singh, Gopeemohan Deb and Harimohan Tagore. Tej Chand very rarely attended the Committee meetings. The Committee began their work immediately. The first meeting of the Committee of Managers was held on the 4th December, 1816, at the house of Sir E. H. East. Five members attended the meeting, the absentees being

Joykissen Singh

Tej Chand and Harimohan Tagore. The Committee appointed James Isaac D'Anselme of Chandernagore, Head Master, on a salary of Rs. 200 per mensem. Lieut. Francis Irvine was appointed at this meeting European Secretary and Superintendent with a monthly salary of Rs. 300 subject to the permission of the Local Government, and Baidya Nath Mukherjee, Native Secretary, Superintendent and Accountant on a monthly salary of Rs. 100. The next meeting of the Committee came off at the same place on the 12th December. Several other teachers and monitors were appointed and formal matters transacted. The Committee approved of the draft of a letter to be sent to the Governor-General seeking his permission to allow Francis Irvine to serve the Institution. The letter was sent to the proper quarters.

The Committee held two subsequent meetings,

one on the 6th and the other on the 13th January, 1817, and finalised the way in which the College was to be founded. The site for the College was selected at No. 304, Chitpore Road, the house of Gorachand Bysack, on a monthly rental. Thirteen "free" scholars were ready for admission on account of the subscriptions to the Education Fund by some gentlemen. Francis Irvine was permitted to serve in the College in a letter written on behalf of the Governor-General to the Committee. The letter, however, expressly stated that in signifying "his Lordship's permission to accept the office of Secretary and Superintendent of the Institution, his Lordship desires it to be fully understood that his acquiescence implies no sanction of the exercise of European interposition or influence in the selection and appointment of the officers of the Institution." The formal opening of the College in its school department was fixed on 20th January, 1817.

Now we come to the end of our story. The formal opening of the Hindu College came off on the scheduled date. There were only twenty students on the Roll. But the enthusiasm of the Indians, the gentry as well as the Pundits, was the uppermost. Some Europeans also attended the opening ceremony. *The Calcutta Gazette* of January 23, 1817, gave a detailed account of the opening day of the College, which runs mainly as follows:

"During the whole or part of this day were present the following members of the College, viz., Gopee Mohun Thakoor, a Governor of the Hindoo College, Baboos Radhamadhub Banorija, Joykissen Sing, Gopee Mohun Deb, and Hurry Mohun Thakoor.—Many opulent natives, who were in general the parents or patrons of the scholars—Ragoomonee Bidyabhoosun, Chaturbhuj Nyaeerutnu, Sooba Sastry, Mirtoonjoy Bidyalunkur, Tarapersaud Nyaeebhusun, Ramdulal Turkoochooramonee Bhattachari, Subhanund Bidyabagis, and other Pundits; besides Mohunpersad Thakoor,

Baboo Radhakant Deb, and other literary natives. . . . Among those (English gentlemen) who came, were the Honorable the Chief Justice, Mr. Harrington, Mr. Loring, and Mr. Barnes.

"Teaching commenced, and was carried on under various disadvantages. Although everything had been avoided, which might assemble numerous spectators, their number and curiosity were sufficient to cause inconvenience. The teachers and scholars had no previous acquaintance or communication; and the proficiency of the latter, on which their distribution into classes depended, was to be ascertained on the spur of the occasion. Those present, however, expressed themselves to be much pleased with the economy of the school, and exertions of the teachers. Some of the natives were much struck with several of the practices of the new method—the monitors pointing with rods the use of a large card for a whole class, and the sand-writing. They observed that this method was quite unknown when they were scholars; and they doubted not that it will cause their children to make such a more rapid progress than they had done.

"Most of the scholars having previously been in other seminaries, or received instruction at home, were found to possess some knowledge of English reading and writing. Their parents and friends observed that they had taken them from under other teachers, in the confidence that in this institution, expressly intended for the liberal education of the Hindoo children, their progress would be more rapid and their ultimate proficiency greater. The pundits testified greater satisfaction on this interesting occasion; and said that that day they witnessed the beginning of what they hoped would issue in a great diffusion of knowledge. A learned native expressed his hopes that the Hindoo College would resemble the Bur, the largest of trees, which yet is at first but a small seedling."

From this humble seedling the Hindu College certainly grew into a *Bur* or huge banyan tree within twenty years of its existence.

THE RIDDLE

By SANGITACHARYA TARAPADA CHAKRAVARTY

Why this wealth of love, this warmth of endearments
in a world girdled around by wreaths of death?
Why on earth this blossoming of timid hopes,
the hopes of union in a blasted heart
brimful of the pains of languishment?
Right from the dust and the grassy green
all things move and have their being,
just for a fruitless chase of the ignis fatuus.
Tears, unending tears blind the eye,
and yet we laugh our heartiest laughs.
Gnawing away the river's shores the waves roll on,
not feeling for their agonies, neither looking back

And lo, the shores would fain clasp that flowing tide
in their loving embrace!
Loose are the ties, and broken in a moment's time.
How merrily do birds build their nests of woe
on the boughs of trees!
The ship sails adrift tossed over the unfathomed deep:
where lies the port?
Wilder and wilder be the raging storm
man would rear his home none the less,
and birds their nests evermore.*

* Translation of a song from his book *Sura-Tirtha* in Bengali.

HOW THE INDIAN BORDER STATES SHOULD BE REORGANISED

By MAJOR. B. N. MAJUMDAR

INTRODUCTION

THE Butler Committee in its report some 30 years ago observed:

"Politically there are two Indias, British India governed by the Crown according to the statutes of Parliament and enactments of the Indian Legislature, and the Indian States under the suzerainty of the Crown and still for the most part under the personal rule of the Princes. Geographically India is one and indivisible, made up of pink and yellow. The problem of statesmanship is to hold the two together."

A glance at the map will however show that India is geographically one and indivisible. The Provinces and the States are so interspersed and dovetailed that these territories overlap and that the States had enclaves in the Provinces and *vice versa*. The Indian States Finance Enquiry Committee in 1948-49 has aptly remarked in their report:

"Provinces and States lie interspersed all over the continent, the boundaries being in most cases artificial and not representing any natural divisions; and all parts of the country are interlinked."

In actual fact the political division of India into two parts by the foreign ruling power was artificial and was an unwanted legacy of the Moghul period. This fact has been rightly observed in the White Paper on the Indian States:

"The geographical set-up of the Indian States did not coincide with any ethnic, racial or linguistic divisions. The people of the provinces and the States had suffered alike from the waves of foreign invasions and foreign domination. Close ties of cultural affinity, no less than those of blood and sentiment, bound the people of the States and the Provinces together."

How then India came to be divided into two parts? There were two reasons—the historical factor that the States had not been annexed and the political factor that the States maintained the "traditional monarchical form of government."

With the rise of nationalism considerable changes in the whole world came about and India also underwent important political transformation. After the attainment of independence in 1947 the whole outlook changed. The Princes readily realised the necessity to fall in line with the changing political aspirations of their people and consented voluntarily to remodel themselves. They surrendered their "legalistic stand on time-worn treaties or their anachronistic prerogatives and powers."

In spite of this change in attitude it took considerable time and effort of the authorities to consolidate this reorganisation. Difficulties faced were complex and many.

"It was inevitable that the profound change that has come over the States should bring in its wake a crop of difficult administrative problems. Local affiliations and political habits die hard; not all the newly established units, therefore, could be

expected to settle easily in the new mould. A radical change-over from an autocratic set-up, which had been maintained for a century and a half, to a democratic order and task of piecing together into a co-ordinated pattern the diverse administrative systems of integrated States could by no means be easy," observes the White Paper.

A complete change came over after the Independence of India Act. Under Section 7 of the said Act the "Suzerainty of His Majesty over Indian States" lapsed, and many States acceded to the Indian Union or executed "Stand-Still" agreements to maintain their existing "Codes" with regard to the subjects of common concern till such time a political set-up was devised.

Soon further tremendous changes were brought about "by a process of twofold integration, firstly, consolidation into sizeable and viable administrative units, and, secondly, growth of democratic institutions and responsible governments," observes the White Paper.

Of late, however, there has been a fresh wave of public opinion to reorganise the States in manners more suitable to the needs of the people and the country. While agreeing to the desirability of such a step, it is necessary to trace the historical setting of the whole problem, how it came about, why it was necessary and what principles were borne in mind at the time of the initial organisation of the present units. Only after this survey we shall be able to know how far the requirements of national security and defences were kept in view.

HISTORICAL REVIEW

Even though the States had studied the map of India from the dawn of modern history, it was mere accident that the present problem was inherited by Indian government after independence. The legacy had been so deep-rooted after 130 years of British rule that it was then thought that nothing substantial will be achieved without a fierce revolution. However these fears were unfounded and a remarkable change-over took place which astounded even many optimists.

The States in their present form came into being since 1819 when their existence and continuance were recognised by the various treaties and "sanads" which they negotiated with the paramount power of India. By the various policies of subsidiary system (Wellesley), subordinate isolation (Hastings), and annexation (Dalhousie), the British consolidated their position vis-à-vis the Princes, in the country.

The Indian mutiny of 1857 proved the far-sighted statesmanship of the British when the Princes gave active support and enabled them to crush the mutinous army. In 1858 Queen Victoria proclaimed, "We shall respect the rights, dignity and honour of native Princes as our own." Thus the two Indias were completely isolated and grew up independent of each other.

World War I brought about a radical change in

the outlook. During the war the need for common policy and action between the Provinces and the States gathered force as the entire resources of the country had to be mobilised. This involved co-ordination and closer co-operation of administrative machineries of the Provinces and States. Thus the two component parts of the country were brought together by chance and sowed the seeds for that attitude of mind which became so pronounced during the period of partition.

Gradually the people were also politically awakened and clamoured for popular government and better economic conditions. These aspirations of the people of the country were recognised and Montagu made the historic announcement when he said about the acceptance of "gradual development of self-governing institutions with a view to the progressive realisation of self-government in India as an integral part of the British empire." This was, however, not to the liking of the Princes who wanted to hang on to their gains and neutralise the growth of Indian nationalism. The Butler Committee recognised certain demands of the States in that their rights and obligations will not be transferred to any other Indian authority without the agreement of the States. Thus there were the following categories of States :

- (a) States, the Rulers of which were members of the Chamber of Princes in their own right. (108 States).
- (b) States, the Rulers of which were represented in the Chamber of Princes by 12 members of their Order elected by themselves (127 States).
- (c) Estates, Jagirs and others (327 in number).

All these States had varying degrees of relationship with the Crown.

"It was based on Treaties, Engagements, Sanads as supplemented by usages and sufferance and by decisions of the Government of India and the Secretary of State embodied in political practice. The rights that the Paramount Power claimed in exercise of the functions of the Crown in relation to the States covered matters, both external and internal," observes the White Paper.

In other words the British exercised their paramountcy under conditions suitable and beneficial to them. The Indian States Committee of 1927 viewed this as :

"Paramountcy must remain paramount; it must fulfil its obligations, defining or adapting itself according to the shifting necessities of the time and the progressive development of the States."

Further changes in the reorganisation of the States on a federal basis took place under the Government of India Act of 1935. Even though the accession of the States to the federation was voluntary and was to be conditional on the basis of the Instrument of Accession, it was an important step towards unity and co-operation. This change could not be tried out properly as World War II broke out soon after and the scheme was abandoned in 1939.

During the war the Cripps Mission arrived to solve the Indian political complications. But it was

a failure and this gave a new turn to India's political struggle.

After the war the Cabinet Mission arrived in India in 1945 to make another effort to solve the political deadlock. This time the efforts were successful and India was divided. This division of the country completely broke the geographical coherence of the country and hence active efforts were made to solve the problem of the States.

After partition it was vitally necessary to retain the "unity of what remained as India" as it was "most essential not only for the political strength, full economic development and cultural expression of the Indian people but also for facing the aftermath of partition," remarks the White Paper. This point has been further ably substantiated by Coupland when he says :

"An India deprived of the States would have lost all coherence. For they form a great cruciform barrier separating all four quarters of the country. If no more than the Central Indian States and Hyderabad and Mysore were excluded from the Union, the United Provinces would be completely cut off from Sind. The strategic and economic implications are obvious enough."

After various negotiations the States eventually agreed to join in the Indian Union under the "Standstill Agreement." Thus the first phase of fitting the States into the constitutional structure was achieved.

The next step of integration took the following three forms :

- (a) Merger of States in the Provinces geographically contiguous.
- (b) Conversion of States into centrally administered areas.
- (c) The integration of the territories of the States to create viable units as Union of the States.

These various forms of integration had been based on the following : (a) Sizeable and viable units, (b) Geography, (c) Linguistic and Cultural affinity, (d) Man-power and wealth-power, (e) Economic potentiality.

With the reorganisation of the States, the relationship with the Centre was based on the following principles :

- (a) The Union Government have authority in the reconstituted States over the same range of subjects as in Provinces.
- (b) The Union Government exercises its functions in States through its own administrative agency as in Provinces.
- (c) The States contribute to the finances of the Union on exactly the same basis as the Provinces and receive grants and other forms of financial assistance on the same basis.

The reorganised set-up as it exists today has brought about many benefits. It has given the people a stable, popular and democratic government; effected economy in governing agencies, pooling of resources and national wealth; enabled people to have modern amenities of life and benefits of social welfare schemes; improved communication system; given the people

justice and law; in the new set-up there should be no room for special privileges of classes, immunities from taxation, judicial and quasi-judicial privileges, and other feudal practices," remarks the White Paper.

Even under the Constitution of India the States are as much a part of the country as the Provinces and there is no discrimination on this account. The whole system is operating efficiently with the exception of a few states whose political future has yet to be decided. These are Jammu and Kashmir, Hyderabad and Junagadh.

Under the new constitution, the constituent units are of three classes :

- (a) *Part A States*
These are former Governor's Provinces.
- (b) *Part B States*
These are Unions of States, Hyderabad, Mysore and Jammu and Kashmir.
- (c) *Part C States*
These correspond to the former Chief Commissioner's Provinces.

Thus the distinction of Provinces and States has vanished and that those States which had merged with the Provinces have lost all vestiges of existence of separate entities. Henceforth the word "State" has its proper shade of meaning and not as coined by the British.

Thus under the new set-up,

"The Union of India will conform to the pattern of other Federations and function with the same rights and obligations throughout the country, and that all the units will likewise have equal rights and obligations. Only so can the Union of India make an effective contribution to the solution of the difficult economic problems that face India, meet the strains and stresses of the post-war world and maintain the national unity," sums up the Indian States Finance Enquiry Committee.

After a study of the historical background it will be seen that the present set-up requires some changes though small, to conform to the organisation of the growing and vital needs of the security and defence of the country. In most cases all the salient factors were considered before merging and forming unions. But in the case of border states other factors should not have outweighed the security and defence aspects. It is, therefore, now for consideration as to what principles of reorganisation should be particularly applicable in the case of border States of India. Before we enumerate these principles let us first consider the salient requirements of national defence.

REQUIREMENTS OF NATIONAL DEFENCE

War in modern times has a totally different scope.

"Modern war is total, involving every branch of national life. All phases of the national war effort are inter-dependent, from the fields and the factory to the front line"—*Conduct of War* by War Office.

Today the strength of a nation is not measured in terms of the number of the armed forces. It is much more than that. All aspects of national life have to contribute their best to the adequate and efficient defence of the country. Even work, in connection with

the defence of the country is closely inter-related with others and thus make up a gigantic and a strong single national war machine.

The nature of war of the by-gone days has passed into history and oblivion. Today war engulfs every individual in the nation and depends for its success on the unbending will of the people as a whole. Soldiers may win any number of victories in the front line but if the home front collapses, the successful prosecution of the war may be jeopardized.

Every branch in a nation—the Government, the armed forces, the civil administration, the farmer, the labour, the factory worker, the businessman, and every other individual, whatever his work in life may be, is an important member of the team and has an important part to play. All components of the national effort are thus geared to the ultimate goal of successfully defending the nation at war.

What then are the basic factors on which the national strength is based? These are : (a) A strong national character and indomitable will to fight, (b) Economic stability, (c) Industrial and self-sufficiency, (d) A high national physical standard.

How can these conditions be achieved and developed? It is only by national unity and creating adequate opportunities for the people to enable them give out their best in times of war. All these points are closely interlinked with the suitable grouping of the states, so that all concerned can develop their spheres of contribution under a congenial atmosphere.

From a study of the principles underlying the organisation of the various states it will be noted that certain points have been considered but some are yet to be given their due weight and importance. This emphasis on the principles will vary in each state but the border states need a different consideration. It is felt that under the present set-up, the States on the border of India, need reorganisation. The problem will be considered in detail in the succeeding paras.

THE BORDER STATES

The present border of India is vulnerable. It has not been based on defensible features but only on political factors. India's border, therefore, requires a more stable and secure governmental organisation than the other States of India.

India has a very long border with the adjoining countries, with all of whom relationship is not very cordial.

The border States are : (a) Jammu and Kashmir, (b) Himachal Pradesh, (c) Assam, (d) Manipur, (e) Tripura, (f) Saurashtra, (g) Rajasthan, (h) Kutch.

The geographical position of the above states will reveal that these border States are situated on India's vulnerable portions and therefore should be organised on a different level. With the exception of Jammu and Kashmir, Assam, Saurashtra and Rajasthan all the other States are centrally administered. There are at

present a few other States, such as Bilaspur, Bhopal and Bindhya Pradesh, which are also centrally administered. The main points for such a step are backwardness of the area, economic wealth, nodal points and location of vital natural resources. These may have some importance but not to the extent admitted. In a vast country like India there are many other places which have equally and even more important items essential for the very national existence but it is not possible to have all of them centrally controlled and administered. A line must be drawn somewhere for the demarcation.

It is therefore for consideration as to which of the states on the border of India are strategically important from the national defence point of view? All the border states are not so placed as to be important but some are. These States have already been indicated in the foregoing paras. The principles to be followed should be the following:

- (a) Political and military importance of the State.
- (b) Location of strategic communication system.
- (c) Existence of strategic industrial and natural resources.
- (d) Vital points in India's defence system.

These principles should be borne in mind in the case of the States only on the border. But other States may have some or all of these items and it is not necessary to give them special consideration.

The defence requirements are many. Already the main points have been enumerated and for successful conduct of defence of a country the salient requirements are political and economic stability. The forces operating in that part of the country should never be hampered by disrupted or disorganised conditions in their rear. Then, distances being vast they have to depend on local resources for their maintenance and this the area must be able to give to the troops stationed there. Similarly, the will of the people inhabiting must be strong so that they can stand up to all kinds of stress and strain.

During the process of organisation of the States the Government took into consideration the wishes of the people, their desire to have unions on linguistic, cultural and ethnic considerations, geographical proximity, economic factors and such other matters akin to them, but in the case of border States these may not all be taken notice of. The over-riding and primary considerations of defence and security must influence the decisions in the case of border States.

The units as they exist at present are already constituted according to the wishes of the people who want to be together, but the question that has to be decided relates to the governmental responsibility of these States. Also all border States have not been considered

previously. Hence, it is necessary to review the problem of reorganisation with special reference to defence requirements. Other requirements of integration will have to be considered but the overriding importance should have to be given to the points essential and vital for national security.

All the border States should be centrally administered. The appointment of the chief should be held by an able soldier statesman. This will ensure efficiency and stability of government, continuity and uniformity of administrative procedure, co-ordination of national defence programme between military and civil requirements and adequate and efficient consideration of defence requirements of the State. Direct Central control is necessary not only for adequacy of measures but also for implementing defence measures which is a central subject and is formulated and controlled at the highest level of the government.

CONCLUSION

In view of India's geographical position, defence considerations are of vital importance to the country. Under the present set-up the Centre has little or no control in the internal affairs of the States on the border of India which are not centrally administered. All the border States are not under central control and therefore many important defence requirements might be overlooked. To carry through any proposal, powers to implement and control the machinery must exist. And to bring about such a control it is necessary to reorganise all the important border States which are considered vital in India's chain of defence set-up. As the subject of re-organisation of the States is already under consideration the question of border States should also be carefully gone into.

It will be noted from the historical evolution of the States to the present day, the existing organisation had followed certain principles but in all cases economic factors were given more importance. This might have been so in some cases but not in all. The border States should have been viewed with a different outlook.

It has to be admitted that the present set-up of the States is the best that was possible under the circumstances and the speed in which it was done. But it was not the last answer in all aspects. It could have been better and it is now the opportunity to do so.

Whatever might have been the basis behind the organisation of the other States in India, it is considered that these should not be made applicable in toto to the border States. Some factors should be omitted in preference to the requirements and necessity for defence and national security. This fact has been rather regrettably missing and is vital to our national solidarity and independence.

"JIBANDEBATA" CONCEPTION IN RABINDRANATH'S POETRY As Seen in the Light of Sri Aurobindo's Philosophy

By SANTOSH KUMAR BRAHMA, M.A.

VERY few people will disagree if we say that Rabindranath was a poet-philosopher. Now philosophical poetry, like poetical drama, is a peculiar genre composed of warring elements. And one naturally asks where poetry ends and philosophy begins.

But one thing is certain. Poetry is not the same thing as philosophy. Poetical experience and philosophical concept are different things. Philosophers look behind and after and find that "all is right." But poets sing in a different tune. Poets when they look before and after pine for what is not. There is always an element of sadness, an undefinable yearning, in the poetic mind. No one can miss this longing whether he reads the love-laden lines of Keats or the lovely lyrics of Shelley.

The conception of *Jibandebata*, be it poetic or philosophical, has aroused much controversy among the critics of Rabindranath. One school of thought led by Prof. P. C. Mahalanobis argues, not without reason, that *Jibandebata* is personal. In the words of Prof. Mahalanobis:

"*Jibandebata* is personal—the presiding deity of the poet's mind—not quite that even—the Innerself of the Poet, who is more than this earthly incarnation."

The other school goes the other way in suggesting that *Jibandebata* is impersonal. It suggests the idea of Universal Godhead. As against these conflicting views we have the opinion of the poet which on the authority of Dr. Thompson runs as follows:

"The idea has a double strand. There is the Vaishnava dualism always keeping the separateness of the Self and there is the Upanishadic monism . . . when the *Jibandebata* came to me I felt an overwhelming joy—it seemed a discovery, new with me—in this deepest self-seeking expression . . . Today I am on the same plane as my readers. I am trying to find what the *Jibandebata* was."

The words of the poet even do not carry us far. To his mind the conception of *Jibandebata* is at once personal and impersonal.

Rabindranath like Sri Aurobindo is opposed to the doctrine of the monistic spirituality. In a famous lyric the poet has condemned in unmistakable terms what Sri Aurobindo has called "the great Refusal of the Ascetic" to recognise the material world. The poet and the philosopher are at one in regarding both Matter and Spirit as real. As Sri Aurobindo says:

"But there is also this other indubitable experience that the Divine is here in everything as well as in all things, that all is in that and is that when we go back from its appearance to its Reality."

Sri Aurobindo goes further and makes the disquieting reflection that the Divine descends into the world of matter. So it is possible to realise the Divine, however imperfect that realisation may be, in the material world. One need not get completely beyond the world of senses to catch fleeting glimpses of the veiled Divine which we can get in the "Overmind stage." This leads us to the conclusion that Rabindranath's *Jibandebata* is a partial realisation of the Divine or Absolute Spirit in the world of Matter. It is not the Supreme Being of God which can only be realised, in Sri Aurobindo's words, on the Supramental stage.

The first thing to note about the idea of *Jibandebata* is that it is an experience of the poetic mind. No less a person than the Poet himself has said in his "Kamala Lectures" on the Religion of Man that

"All that I have tried to speak about *Jibandebata* is an experience of the poetic mind."

Any attempt to philosophise on them will lead us wrong. The second thing that strikes us is that we do not find in the poet's conception of *Jibandebata* that decisive experience or spiritual certitude that characterises a spiritual aspirant who has realised God. Hence, the poet has called it by various names.

The conclusion seems irresistible that the *Jibandebata* in Rabindranath's poetry is an experience of the poetic mind and not a philosophical concept as some learned professors and critics of Rabindranath make us believe.

—O:—

THE SPELL OF AMERICA

By DR. MATILAL DAS, M.A., B.L., Ph.D.

Round the world!

Yes, I went as a pilgrim in quest of principles that should guide human life in modern times. I went to give what Indian culture has to offer to the world and the world has to offer India. My job was to find out a harmonious relation between scientific knowledge and the art of life and to preach the world-view given by our ancient seers.

Alas, how many can say that he has spent his time as he will like to recount it. I am not surely in that favoured group. But still I am proud of my travel-experiences. The days I spent in foreign land will remain unforgettable for their varied experiences on the world-background.

Among the many countries I visited, I liked America the best and I shall try to analyse the spell

of that mighty country to the best of my power.

What strikes a foreigner on his first arrival in the United States of America is the wonderful living democracy in that wide and beautiful country.

In a letter of June 8, 1783, the first President, George Washington, wrote:

"The foundation of our empire was not laid in the gloomy age of ignorance and superstition, but at epoch when the rights of mankind were better understood and more clearly defined, than at any former period. The researches of the human mind after social happiness have been carried to a great extent; the treasures of knowledge acquired by the labours of philosophers, sages and legislators, through a long succession of years are laid open for our use and their collected wisdom may be happily applied in the establishment of our forms of government."

This boast is amply justified by the achievements of the American people in the domain of politics.

America is the *oldest* republic on the face of the earth. The American people is world-conscious. Its people is conscious of its peculiar role on the face of the earth. It wants to voice forth the hopes and aspirations of the whole human race upon the wilderness environment of a new country—it wanted to build a new history and it has not failed to fulfil this destiny. It is because of this feeling that the American people are very hospitable, without much introduction I was able to live as guests in different American homes.

America is the great melting pot of races where individuals of different nations, speaking different languages and having different customs and manners are changed into a new nation by the alchemy of two powerful forces, puritanism and democracy, to become the great American nation. The average American is frank and cordial and he is generally hospitable and affectionate. He has no prejudice against you. He, therefore, soon becomes an endearing friend and remains so for your life, for, he has an abundance of the warmth of heart and ardent enthusiasm. I remember meeting a young divorced wife and her mother coming to listen to my lecture. Thereafter they invited me to have a round of the beautiful San Francisco city in their car. In our journey, the old mother talked with me in a very friendly manner and divulged to me the secrets of their personal lives. In no other country on the face of the earth such intimacy can be found. It is the frankness and brave attitude of a brave people.

I remember also the many conversations I had with one of my pupils. She wanted to read the Vedas with me but unfortunately she was the only student I got and the Dean stopped my classes. But I shall never forget her eagerness to learn about the great mysteries of India. She invited me to her flat and had deep discussions on the intricate problems of life. When I

had to leave San Francisco, she invited her friends into a small meeting and asked me to give a little talk so that she and her friends may offer me something for my lecture.

America is a favoured land. Because of its vast natural resources and its wonderful human enterprise, America is the land of plenty. It gives chances to young men and women to make something of life. But this abundance, this plenty does not make them idlers. Even the richest man in America could find nothing wrong in driving his car nor could his wife deem it a dishonour to look after the home-affairs. The dignity of labour is not a copy-book maxim in America—it is the general practice. I loved America because of this.

I was the guest in the riverside drive of Manhattan of a very respectable professor of the Columbia University. He used to wash his own dishes after dinner and I tried to help him to the best of my power and ability.

I had occasion to criticise the love problems of America in some of my lectures. My listeners listened to my pungent remarks with good graces. But still the problem remains and every third marriage in America ends in a divorce. In spite of Hollywood pictures which give many the idea that America is the land of poetry and passion, the fact is that America has the largest number of divorces. But one of the many reasons for it is that an average American woman looks out for glamour in his marital life and it is for this reason that she seldom bears with maladjustments in life's partnership.

Success is the keynote of American life. Everybody is working hard for achieving success. Millions of men are daily panting and sweating to make a success of something or other. There is endless effort to make things work perfectly. The average American is a man with great faith. He believes that there is a keyword which would solve all the intricate puzzles of life and some one or other knows it. Because of this national conviction, everybody is moving and moving.

This speed, this hurry, tires our eastern conceptions of life but it is part of the American life. Along with this, there is always tall talk and self-glorification. Everything of America seems to the Americans to be of the superlative degree. In this brag, there is a childish joy of a new nation which does not hurt you.

The Americans are directly a commercial people. Dollars influence their outlook in life. To many wealth and not the enjoyment of wealth, seems to be the principal aim of life but still they are the most generous people on the face of the earth. The charitable institutions of all descriptions bears gifts from the wealthy classes in profuse numbers. This charity is not simply confined to the four corners of America.

The Sanskrit maxim that to the high-minded the whole world is kith and kin is true to American character than to our own.

Matthew Arnold did not find elevation and beauty in America but I cannot agree with his view. There is a deep earnestness in the American character and they are the most ardent lovers of beauty. An American is eager to identify himself with world-wide and age-long adventure of mankind.

America today is a leader of nations. I found everywhere from the gleaming Pacific to the wide Atlantic, peoples of the different states eager to know more of India. I personally believe that we should gain much if we can have the friendship and love of America, for, America will help without expecting any obligation on our part.

—:O:—

THE MOSCOW KREMLIN

In the centre of the Soviet capital, on the largest of its seven hills, stands the Moscow Kremlin, the greatest memorial of Russian culture. It houses the Soviet Government, is the venue of Congresses of the Communist Party of the Soviet Union, plenary meetings of the CPSU Central Committee, sessions of the Supreme Soviet of the USSR and the Supreme Soviet of the RSFSR, and all important conferences.

The gates of the Kremlin are hospitably open to excursions of the working people and to numerous foreign guests. In 1954 alone it was visited by over half a million excursionists including delegations from Britain, France, America, Bulgaria, Hungary, Poland, Japan, Rumania, Finland, China, Korea, Albania, Belgium, Sweden, Israel, Norway, Germany, India, Czechoslovakia, Denmark and other countries.

The Moscow Kremlin is a magnificent architectural ensemble which has been developed and added to over a number of centuries.

Of great historical value are the superb collections of applied and decorative arts kept in the State Oruzheinaya Palata, the oldest museum in the country, which make it possible to trace the development of almost all the branches of Russian applied arts. Especially well represented there are metal handicrafts, articles of carved bone and wood fabrics, gold and silver embroidery.

Most of the art valuables collected in the museum are closely linked with Russia's history beginning with the eleventh century and, specifically, with the history of the Moscow Kremlin. These articles testify to the high level of Russian art. Under Soviet power the Oruzheinaya Palata collections have been replenished by the more historically important treasures from Russian palaces and the patriarchic vestry.

The Moscow Kremlin is rich in architectural monuments. To them belong the Uspensky Cathedral dating back to 1479, the annunciation (Blagovesh-

The dramatic and picturesque expansion of America will be an inspiration to Free India. The spirit of freedom and enterprise which characterises the American nation when mingled with our depth of spirituality will usher in a far more glorious India.

George Warrington Steevens wrote about the American:

"You may differ from him, you may laugh at him; but neither of these is the predominant emotion he inspires. Even while you differ or laugh, he is essentially the man with whom you are always wanting to shake hands."

I must agree with him wholeheartedly when I remember with gratitude the many friends I made in America and their courteous and warm friendly services.

chensky) Cathedral erected in 1489 by Moscow and Pskov architects, and the Archangel Cathedral built in 1509.

Each of them contains a large number of painting memorials. The Blagoveshchensky Cathedral, for instance, is decorated with works by Andrei Rublev, Feofan Grek and Prokhor of Gorodets. To better preserve these memorials the Cathedral has been air-conditioned. Restoration of 17th century frescoes and paintings is nearing completion in the Archangel Cathedral.

Visitors to the Kremlin can see some magnificent samples of the art of foundry, such as, for example, the tsar cannon, cast in 1586 by the Russian master Andrei Chokhov. This 89 centimetre piece of ordnance weighs forty tons and is five metres thirtyfour centimetres long. It was built to defend the Kremlin against a Tatar invasion at the end of the 16th century. The enemy never reached Moscow, however, so that the cannon was never used though it has all the necessary requisites.

A no less interesting monument of the art of casting is the tsar Kolokol, standing near the Ivan the Great belfry. This giant bell, 6 metres 60 centimetres in diameter and weighing over two hundred tons, has no equal in the world either in weight or the quality of work. It was cast by the Russian master Ivan Motorin and his son Mikhail. After the casting it was raised on scaffolding for further treatment. During the great fire of 1737 the scaffolding collapsed and the bell, heated by the flames, fell into a ditch with cold water. The metal cracked and a piece weighing 11.5 tons broke off. The bell lay in the ditch one century, and it was only in 1836 that it was raised and placed on a granite pedestal.

The architectural memorials and other structures in the Kremlin underwent restoration last year.—Tass.

THE ALEXANDER-VON-HUMBOLDT FOUNDATION

THE Alexander-von-Humboldt Foundation was originally established in 1925 and reconstituted in 1953 by Chancellor Adenauer to commemorate one of Germany's greatest scholars, scientists and diplomats. Alexander von Humboldt was a friend and contemporary of such figures as Goethe, Schiller, Bunsen, Gauss, and others. Primarily a naturalist and botanist, his voluminous writings were based on an amount of personal exploration, which would have been remarkable even today, but which, in the eighteenth century, was nothing short of phenomenal. In addition to his native continent, von Humboldt's explorations led him through large parts of North and South America and Asia. His name is immortalized by such discoveries as the Humboldt Current in the Pacific Ocean, which flows down the west coast of South America, and by rivers and mountain ranges in many parts of the Americas. His whole life was devoted to bringing spiritual values of classical idealism into harmony with the newly emerging spirit of the natural sciences. That he combined both spirits in himself is best proven by the fact that in addition to his achievements as a naturalist, he had a notable career in diplomacy, serving his country at embassies and legations in France, England and Denmark.

It is perhaps only fitting that in keeping with the great tradition embodied in its name, the Humboldt Foundation today has as its chairman the internationally famous physicist and Noble Prize winner, Professor Werner Heisenberg of Goettingen University.

The Humboldt Fellowships are awarded on an international basis, i.e., there are no fixed number awarded to any one country. The holders of Humboldt Fellowships may therefore rightfully be considered members of an international elite. The fact that many Indians have held Humboldt Fellowships in the past is a tribute to the high level of Indian education and to the respect which her scientists enjoy in the eyes of the world.

* * * * *

Dear Sir,

I take great pleasure in informing you that applications may again be made for the Alexander-von-Humboldt Fellowships for the academic year 1955/56. As you are perhaps aware, the Humboldt Foundation makes a limited number of fellowships available each

year to enable a select group of specially qualified foreign students and scientists to pursue their studies and research at Universities and Institutes of Technology in Germany. The fellowships normally have a duration of ten months, but in special cases can be extended for a further 10-month-period.

To qualify for an Alexander-von-Humboldt Fellowship, the applicant must be the holder of a post-graduate degree who intends to make a career of university teaching or research, or who may be expected to hold a leading position of some other kind after leaving the university. Only highly qualified and particularly well-recommended applicants will therefore be considered.

During the period of his fellowship, the holder receives a stipend of 350 DM per month, of which his room rent will amount to about 50 to 75 DM and his food to approximately 175 DM. All tuition fees, as well as transportation costs from the German border to his place of study and return, are paid by the Foundation.

The applicants must possess an adequate knowledge of the German language. The letter of application should be handwritten in German, and contain a statement of the reasons why the applicant desires to study in Germany. The accompanying application forms should be completed in triplicate and forwarded, together with three photographs, to this office prior to March 1, 1955.

A memorandum stating the terms of the fellowship in detail, together with application forms, is enclosed. Selections are made by the Fellowship Committee in Germany, the result of which will be announced by July 1st.

While the number of these fellowships is naturally limited, we would very much like to see a high percentage of them awarded to qualified Indian students, and would therefore appreciate it if you would circularize this information at your institution as widely as possible.

Should additional application forms be required, the Consulate General will be happy to supply them upon request.

Yours sincerely,
H. M. Schafhausen

Vice-Consul, the Federal Republic of Germany

GURU GOVIND SINGH AND THE KHALSA

By NAGENDRA KUMAR GUHA ROY

GURU NANAK was the founder of the Sikh religion which had to make its way through organised opposition and tremendous difficulties. At the time of his appearance (1469—1539 A.D.) India was groaning under the tyranny of the Moslem rulers. The nine succeeding Gurus kept the spiritual lamp lighted by Nanakji burning in the midst of tempest. The advent of Guru Govind Singh, the tenth and the last Guru, in the latter part of the seventeenth century, opened a new chapter in the annals of Sikhism and the Sikh nation. During the period Aurangzeb, the orthodox Moghul autocrat, was the ruling Emperor. His bigotry, fanaticism and unscrupulousness reached their zenith due to which the sufferings of the non-Moslem subjects knew no bounds. His sole motive was to convert the non-Moslems to Islam by any means fair or foul and failing that to cow them down or to turn them into a race of helots. That very policy, pursued by Aurangzeb with much hope and zeal, not only proved abortive but also brought about the downfall of the great Moghul Empire built by Akbar, a far-sighted Emperor and statesman, who followed a reverse policy.

When Guru Govind had to take his seat as the tenth Guru he was only ten years old. He decided to live the life of a recluse in a solitary and safe place for the purpose of gathering strength both temporal and spiritual through *sadhana*, devotion, meditation and study. He retired to the Siwalik hills in the Nahan State of the Punjab where he spent about two and a half decades. He appointed several reputed scholars and poets with whose assistance he learnt Sanskrit, Hindi and Punjabi. He made a deep and extensive study of Pouranic, epic and scriptural literature of the Hindus. The young Guru was deeply impressed by the message conveyed through Sanskrit literature that when righteousness would face decay due to the domination of unrighteousness, a divine saviour would descend to the earth from time to time for the revival of religion by rescuing the righteous and destroying the unrighteous. Guru Govind came to believe that God the Almighty had ordained him to discharge the noble duty of the deliverer by emancipating the good and the oppressed and annihilating the bad and the oppressors. He mentioned this in his autobiography *Vichitra Natak*. He may be said to have inherited his poetical gift from his forefathers. He developed a style of his own in composing Hindi poems through which heroic sentiments and martial

spirit found expression. It was Guruji who introduced blank verse in the Punjabi literature. His poems, which were extensively read, infused a new spirit into the hearts of the Sikhs.

During the period of his seclusion Guruji evolved a new scheme of regenerating the Sikhs and with a view to shaping it he directed them to rally on the first of Baisakh, 1736 Sambat (1699 A.D.) at Anandpur in the district of Hoshiarpur. About eighty thousand Sikhs assembled on the occasion. They eagerly waited to have a *darshan* of their Guruji and to listen to the message to be personally delivered by him. The people assembled were astonished when they saw Guruji coming out of his camp pitched nearby with an unsheathed sword in his hand. Addressing the congregation he said that they had gathered there at a time when the Sikh religion and the Sikh nation were in a critical position. Never before the Sikhs had to face such a crisis. If they wanted to save their religion and nation, they would be required to sacrifice their lives. Then he asked whether they were prepared to do that. None responded. Then he repeated his question for the third time. In response thereto a Sikh proceeded to the rostrum and standing before Guruji with his head bending in reverence said: "I shall feel blessed if Guruji orders me to lay down my life." He was forthwith taken to the tent wherefrom Guruji came back alone after some time holding that unsheathed sword as before. His call for sacrifice was heard by the mammoth gathering for the second time with rapt attention. Another Sikh appeared before him and offered himself for sacrifice. In this manner when the fifth Sikh offered himself as sacrifice there, was no further call. After some time Guru Govind Singh with his flashing sword in hand appeared before the congregation accompanied by those five Sikhs all of whom were dressed in new clothes. Some of the people got unnerved and slipped away from the gathering.

Guru Govind called those five disciples *panch piyara* which means the Five Beloved Ones. They were baptised by him. He sprinkled baptismal water with the pointed portion of his sword to the accompaniment of *Gurbani*. He then requested his five followers to administer baptism to him in the same way. His request having been complied with he told them that he was their Guru and collectively they too were his Gurus. They were called the *Khalsa* which

means pure. Guruji laid down a two-fold doctrine for the Khalsa:

"Blessed is he who repeateth God's name and is ready for war for a righteous cause."

The conversion into Sikhism was hereafter to be performed jointly by five Sikh devotees. Guruji gave this message to his co-religionists:

"Where there are five Sikhs there is God."

It was on this auspicious day of first Baisakh known as Baisakhi about 256 years ago Guru Govind, the far-sighted spiritual leader of the Sikhs, inaugurated the Khalsa through which not only a brotherhood of faith but also a brotherhood of arms was built up. His Khalsa which subsequently turned into an invincible army, fought the oppressive Moslem rulers, faced death as martyrs in defence of their faith and liberated their land of birth, the Punjab, from Moslem domination. Maharaja Ranjit Singh, the famous Sikh warrior, himself a devoted member of the order of the Khalsa, conquered Lahore, Kashmir, Jammu, Dera Ismail-Khan and other important places and turned out the Moslem rulers from the Punjab and the adjoining places. He founded a Sikh State extending from the banks of the River Jamuna up to the Khyber Pass.

Along with the inauguration of the Khalsa Guruji introduced some changes in the customs of the Sikhs. The word Sikh was replaced by the word Singh as title. In Punjabi, the word Singh means a lion and this title was used only by the Rajput Kshatriyas. He wanted the Sikhs to be as fearless as lions. The form of salutation by touching the feet was dropped; in its place the custom of folding hands for saluting or exchanging greetings was introduced. Furthermore, while greeting each other the Sikhs were to utter this couple of sentences, *Wa Gurujika Khalsa, Wa Gurujiki Fateh*, which means victory of the Khalsa

is victory of God. He made it mandatory for every Sikh to carry a *kripan* (sword) with him as his constant companion. He asked his followers to give equal preference to the cult of *bhakti* as well as to the cult of *Shakti*. The Khalsa brotherhood did not recognise caste system and untouchability. Every human being is a son of God and service to humanity is service to God—this universal truth, propagated by Guru Nanak, was again placed before the Sikhs by Guru Govind with an appeal to follow it with devotion. "The Fatherhood of God and the Brotherhood of man" is the *summum bonum* of the Khalsa brotherhood.

Guru Govind was not a visionary but a man of action. He himself did what he asked others to do and this was the characteristic of the Sikh Gurus. He himself fought battles and encouraged his sons to fight like a true Sikh. Four of his sons died in the battle-field. His family had a glorious record of martyrdom which was a source of inspiration to him. His great grandfather Guru Arjun Dev was charged with treason and executed by Jahangir (the grandfather of Aurangzeb); the grandfather Guru Har Govind was clapped in prison by Shah Jahan (the father of Aurangzeb); and his father Guru Tegh Bahadur was executed under Aurangzeb's orders. Guru Govind had unswerving faith in his religion and deep love for his mother-country and the nation to the service of which he dedicated his life.

Through unflinching devotion to the leader, sacrifices and sufferings for the sacred cause of religion and national freedom, and death-defying courage and spirit of martyrdom, the great Khalsa of Guru Govind created a tradition of its own which has no parallel in history. This glorious tradition inspired the Sikhs to fight gallantly in our national struggle for liberation from British imperialism. They played a significant role in the Azad Hind Foj—the I.N.A. of Netaji Subhas Bose.

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.

Editor, *The Modern Review*.

ENGLISH

THE CALL OF THE VEDAS: By Abinash Chandra Bose. *Bharatiya Vidya Bhavan, Bombay 1954. Pp. 278. Price Rs. 1-12.*

This is one of the most important monographs that have appeared so far in the *Bharatiya Vidya Bhavan's* Book University Series. It consists of quotations of single verses, numbering three hundred in all, selected mostly from the *Rigveda Samhita* and partly from the *Atharva-veda Samhita* and the *Vajasaneyi recension of the Yajurveda*. The quotations with appropriate titles are accompanied with English translations and short commentaries. In his Preface the author claims to have limited his choice to the texts about which there is no divergence of interpretation between the orthodox scholars and the [Western] Orientalists, but in explaining their spiritual and religious significance, he has drawn upon "Indian sources (including the work of Indian spiritual leaders)," instead of following "the anthropological approach" of the Orientalists. The three hundred verses have been grouped by the author after his own system of classification under five sections representing different spiritual attitudes in the manner of the *Bhagavada-Gita*. These are (a) the Path of Devotion (*Bhakti-yoga*), (b) the Path of Knowledge (*Jnana-yoga*), (c) the Path of Mysticism or Spiritual Realisation (*Raja-yoga*), (d) the Path of Splendour (*Vibhuti-yoga*), and (e) the Path of Action (*Karma-yoga*). The fourth Path in this list is, in the author's opinion, "the most characteristic of the Vedas with their poetic approach to the Divine." The author's long introduction (pp. 1-75) is specially valuable for his very thorough and critical account of Vedic theism differing alike from monotheism and polytheism and conveying a wider connotation than henotheism (the term coined by Max Muller for this religion), as well as his detailed analysis of the basic principles of the Vedic religion comprising truth, order, consecration, austerity, prayer and ritual. The introduction ends with an estimate of Vedic Realism, collectivism and universalism.

The above analysis will help the reader to judge the nature of contents of this work. On some points (e.g., in the author's system of classification, admittedly based upon the late *Bhagavad-gita* and in the relative paucity of the texts quoted from the *Atharva-veda* and the huge literature of the *Yajur-veda*, which is utilised here only in its shortest recension), there may be legitimate grounds for criticism. The present reviewer again finds it difficult sometimes to follow the author's interpretation, as when he makes the sweeping assertion (p. 260) that "the word Brahmana does not imply a caste in the Vedas," nor again is he convinced that the Path of Splendour is "the most characteristic" attitude of the Vedas, in view of the prominent part played by

charms, spells and incantations especially in the *Atharva-veda*. These minor defects of omission and commission however do not detract from the high value of this monograph alike for the general reader and the scholar.

U. N. GHOSHAL

INDIA—1955: *Publications Division, Ministry of Information and Broadcasting, Old Secretariat, Delhi-8.*

We have received a copy of *India—1955*, a "Reference annual compiled by the Research and Reference Division of the Ministry of Information and Broadcasting of the Government of India."

This year's annual shows a distinct advance on the previous years. The arrangements are more compact and the range of sections slightly wider. The reference value, as seen with a cursory glance through the pages, has also increased due to the inclusion of comprehensive tables and statistical data.

Two sections are wanting in this publication as in the previous ones. Firstly, there should have been a survey of efficiency in the services, public utilities and industrial production. This would have given a better idea of real progress than mere bald figures of moneys allocated and spent and structures erected. Secondly, there should have been a comprehensive bibliography of official and other authoritative publications, wherein there is more detailed information about the various sections included. Nevertheless the publication is useful and handy.

K. N. C.

STRUCTURE AND WORKING OF VILLAGE PANCHAYATS: A survey based on case studies in Bombay and Madras: By A. V. Ramm Rao, M.A., Ph.D. *Publication No. 28. The Gokhale Institute, of Politics and Economics, Poona-4, (India). 1954. Pp. 218 + iii. Price Rs. 7 or 11s. or \$1.50.*

The volume is a consolidated report on the structure and working of Village Panchayats in Bombay, Kolhapur, Amudh and Madras. It sums up the results of investigations carried out by Dr. A. V. Ramm Rao as the Recent scholar at the Gokhale Institute of Politics and Economics, Poona, during the years 1946 and 1947. As Sri D. R. Gadgil says in his Foreword, "... the study was directed towards obtaining field data regarding the working of Panchayats. It was planned as a series of case studies of a selected sample of Panchayats from different administrations."

In the report Dr. Rao has first of all described the administrative and legislative position of the Panchayats on the eve of enquiry. Next, he has analysed the facts revealed by the survey under four heads: (a) Structure, (b) Finance, (c) Functions, and (d) Supervision and Control. Lastly, he has made

his own observations. On the whole, Dr. Rao's report with its factual material, comparative data and intelligent *obiter dicta* is a very useful publication.

Village Panchayats as units of self-government and schools of citizenship have appeared and re-appeared in Indian history. In the first decade of the 20th century, the Decentralisation Commission appreciated their vitality and recommended their revival. But practically nothing was done till 1920. Since then experiments in democracy in rural areas have spread and these 'little republics' have proved their worth. Indeed, Village Panchayats will play an increasingly important role in the near future. Organisation of Village Panchayats is one of the directive principles of State policy. Article 40 of the Constitution of India may be referred to. The Planning Commission visualizes Village Panchayats as agencies for carrying out rural development programmes. Thus the more the citizens of New India know about Village Panchayats, the better for the country. Against this background the importance of Dr. Rao's book is to be judged. It will serve as a valuable guide to our understanding of perhaps the most interesting sector of public administration in the India of tomorrow.

NIRMAL KANTI MAJUMDAR

RUSO-AMERICAN RIVALRY IN ASIA: By *Hector Abhaya-Vardhan*. Published by *Vora and Co. Publishers Ltd., Bombay-2*. Price Rs. 4-8.

Mr. Abhaya-Vardhan's *Ruso-American Rivalry in Asia* is a well-written study of what is perhaps the most important international problem of our age, viz., the relation between the U.S.A. and the U.S.S.R. and their rivalry in Asia.

In Part I, comprising eight chapters, the author surveys the former's policy in and attitude to Asia in general and China in particular during the last one hundred years. American policy in Asia, the author holds, aims at the subordination of Asia to American capitalism and imperialism. The objective is to be achieved by peaceful means, if possible, and by war, if necessary.

The nine chapters comprising Part II survey the Soviet foreign policy. The aims of this policy too, the author contends, are the subordination and exploitation of China and the rest of Asia. Hence, the rivalry between the U.S.A. and the U.S.S.R. The gulf between them widens and our planet draws nearer the edge of the precipice.

The eight-page epilogue (pp. 175-82) of the volume under review is in the nature of the peroration of a prosecution counsel's argument, the U.S.A. being the prisoner in the dock.

The author, it is true, does not openly champion either the Russian or the American cause. Yet it is evident that he is anti-American, more anti-American than anti-Russian, at any rate. His work is however on the whole, an honest, "critical and non-partisan narrative and analysis of the Foreign policy of the U.S.A. and Russia" in Asia and merits a perusal. All his conclusions need not be accepted.

SUDHANSU BIMAL MUKHERJEE

A HANDBOOK OF SAIVA RELIGION: By *Subramaniam Katesu*. Second Edition. Published by *G. A. Natesan & Co., Madras*. Pp. 114. Price Rs. 2-8.

The author of the book under review is a retired lawyer and law lecturer of Ceylon. He has half a dozen books on Ceylon law and Saiva religion. The

Tamil Telegraphic Code invented by him is a distinct mark of his genius.

This small book treats within a brief compass the essential features of Saiva *siddhanta* mainly prevalent in the Tamil province and Ceylon. It is shorn of technical terms and pedantic discussions and meant for English-educated devotees and students. That is why the University students of Ceylon have taken to it as an introduction to their deep study of Saiva *Siddhanta*. Sivagnana Bodham and Sivagnana Siddhar, the two foundational scriptures of Saiva *Siddhanta*, are summarised in the third chapter. The last chapter gives a descriptive list of the scriptures and sacred books of this school of Hinduism.

Kashmir school of Saivism is another important branch of Hinduism and is different in several aspects from Saiva *Siddhanta*. The sacred books of the former sect are in Sanskrit whereas those of the latter are in Tamil. Thus various aspects of our religion and philosophy have to be studied and broadcasted as widely as possible in this age. This is needed to enliven the cultural revival necessary for the preservation of our Swaraj.

SWAMI JAGADISWARANANDA

THE GREAT SECRET (Six Monologues and a Conclusion): By *the Mother*. Published in 1955 by *Sri Aurobindo Ashram, Pondicherry*. Pages 27, 6½"×7½". Price 8 annas.

In it six world-famous men—The Statesman, The Writer, The Scientist, The Artist, The Industrialist, The Athlete—have been thrown together in a life-boat where they took refuge when the ship carrying them to a World Conference on Human Progress sank in the middle of the Ocean. When there was no hope and death was a certainty they narrated the stories of their lives, and expressed utter disappointment in their ultimate achievements. There was an Unknown man in the boat who was so long taken to be a negligible quantity. Now he rises full of serene power and opens before them a new meaning of life. Further he advises them to invoke the intervention of Grace. On invocation, Grace descends upon them and leads them out of destruction to salvation and new life. These Monologues can be staged with profit by students of both schools and colleges.

SATI KUMAR CHATTERJI

SANSKRIT STUDIES: By *M. Hiriyanra*. Kavyalaya Publishers, Mysore. Price Rs. 4 or 6s.

We have here a collection of nine 'papers of a general nature relating to Sanskrit literature and language of the late Prof. Hiriyanra.' In a simple and attractive style they mainly seek to focus the attention of readers on the characteristic features of Sanskrit literature with special reference to Kalidasa and a number of works of Bhasa and Bhavabhuti. In the last paper on the study of Sanskrit valuable advice is given as to the way in which a serious student of Sanskrit should proceed in his studies. The book occasionally gives a new insight which will interest and benefit the students.

CHINTAHARAN CHAKRAVARTI

YESTERDAY AND TO-DAY: By *Rao Bahadur Prof. A. Chakravarti, M.A., I.E.S.* Printed at the *Diocesan Press, Madras*. Pp. 104. Price Re. 1-8.

The author of the book under review is a veteran educationist and a retired member of Indian Educational

Service. For very many years he served as a distinguished Professor of English in several Government Colleges in Madras Presidency.

This small volume is a collection of ten articles written by the learned professor in different times and is prefaced by Sri C. S. Mallinath, ex-editor of the *Jaina Gazette*, Madras. The first seven of the ten articles appeared in the *Jaina Gazette* between 1919 and 1933 and the last one was specially written for this booklet. The philosophical, political, social, economic and other aspects of Indian culture are generally dealt with in these essays. Rightly Sri C. S. Mallinath observes in the preface that the views of the author are as true to-day as when they were originally written. The present generation of students and youths will be immensely benefited by a perusal of these suggestive and readable articles. But it is strange how a professor like him can pass such a perverted opinion about the dominant religion of India. In his extreme exuberance of appreciation of the Jaina practices he has gone so far as to call 'animal sacrifice of the Hindus a barbaric act' without trying in the least to realise its underlying significance. There is a number of cases which can be cited from the booklet where the writer has unjustly attacked Hinduism from an irrational outlook. We expected from the learned professor a more sober and dispassionate view of our religious practices. If the book were free from this limitation, its value would have been greatly enhanced.

SHIBANI PRASAD MAITRA

COMMERCIAL FRUITS OF INDIA: By *G. S. Cheema, D.Sc., I.A.S., Fruit Development Adviser to the Government of India, S. S. Bhat, M.Ag., Horticulturist to the Government of Baroda, and K. C. Nauk, B.Ag., M.Sc., Ph.D., Fruit Specialist, Madras*.—It bears a foreword of *Mr. Ronald G. Hatton, Director, East Mailing Research Station, East Mailing, Kent, England* and a preface from *Sir R. C. Allan, Commissioner of Agriculture (retired), Baroda*.

The book is the fourth in a series of authoritative manuals prepared for the Indian Council of Agricultural Research on subjects relating to agricultural and horticultural research and practice. It deals in considerable detail with the culture of banana, mango, orange and allied citrus fruits, guava, pomegranate, papaya, grape, sapota, fig and ber. And these ten fruits have been dealt with in about 400 pages, and this alone will indicate how exhaustively the culture of each fruit has been described and discussed. In fact all available literature, whether it is a leaflet or a pamphlet or a treatise has been consulted and useful information relating to each fruit has been embodied in it. A bibliography has been annexed with regard to each of the fruits dealt with in the book. And it has to be admitted that the authors have spared no pains to present an authoritative treatise on the ten fruits (they have chosen for their book. And it will indeed be very valuable to those who are interested in the cultivation of fruits—whether on a large or a small scale.

Messrs. Macmillan and Co. have printed and published the book. Its get-up is excellent and it contains a good many illustrations. It is priced at Rs. 18 only. A treatise of this nature in vernaculars is likely to be more popular and useful towards the development of culture of fruits in the country.

DEBENDRA NATH MITRA

JUSTICE AND PEACE FOR ALL: By *Abdul Hasanat*. Published by *Pakistan Co-operative Book Society Ltd., Chittagong*. Price Rs. 7-8.

There is something about law and justice that at once attracts and repels. In this book the author wades through the intricacies of law, as it prevails in India and Pakistan, to see if justice, peace and normal living bliss can be had more cheaply and expeditiously. The book is full of practical suggestions for improvement of our laws and the instruments through which they are administered; but how far they will appeal to our rulers is a different question. For example, the author calls our Jury system, and we think rightly, a farce, but in India, at least, it is going to be put on a firmer basis.

Reform of the police is a baffling task; yet an account of the author's own experiments (and he is one of the Police Chiefs of East Pakistan) in this behalf at Chittagong seems to be encouraging. It will, I hope, attract the serious attention of those who have the police reforms in view.

On other cognate subjects, namely, the civil and criminal laws, the judges, the lawyers, the litigant public and the like, the author's constructive criticisms are also thought-provoking. But we miss in his discussions a systematic treatment. Perhaps the author was thinking of the possible dimension of the book if he entered fully into those subjects; but then he might save much of his space if he had reserved an account of his own experiments for a separate monograph. We hope that in the next edition the author will devote more pages to the reform of other agencies of the administration of law.

Law's delay, at least, should have received fuller attention from the author who has, unlike many similar other writers, vast practical experience added to learning and good sense. In Chap. XX relating to factors vitiating administration of justice the author might, for greater effect, cite Indian cases instead of American.

On the whole, the book is an original contribution to our not very copious literature on law and as such it will, we hope, be welcomed by all who are interested in the study of law and legal institutions.

P. C. ROYCHOUDHURY

RECENT TRENDS IN INDIA'S FOREIGN TRADE: By *Dr. R. N. Poduval, Ph.D. (Lond.)*. Premier Publishing Co., Fountain, Delhi. Pp. 83. Price not mentioned.

The book contains two lectures delivered by Dr. Poduval at the Madras University in February 1950. In the first lecture, the author discusses the changing pattern of India's foreign trade. Since the beginning of the Second World War and after its close India's foreign trade has passed through several stages. A further development commenced since 15th August, 1947, when two independent Dominions emerged as a result of the partition of the country. Emergence of India after the Great War as a creditor country had new implications in her trade relations with the outside world. Birth of Pakistan has made trade relations between India and her neighbour foreign. Division of India has made one portion mainly producer of raw materials and the other industrial, thus breaking the economy so far enjoyed by the whole Indian Empire. Devaluation by India and non-devaluation by Pakistan of their respective currencies in respect of Dollar have created complications whose result it is not possible to foretell in all its aspects but it may be stated without fear of contradiction that these actions are sure to be disastrous to economies of both, apart from unfriendly political relations already in existence.

The second lecture discusses the commodity balance of trade before, during and after the War, visible and invisible trade, trade balance with Pakistan, effects of devaluation on Indo-Pakistan trade—Disequilibrium—Balance of Trade Problem in International context. The treatment of the subjects is illuminating even to a layman.

A. B. DUTTA

HINDI

GANDHI AUR SAMYAVADA: By Kishorlal Mashruwala. Published by Navajivan Prakashan Mandir, Ahmedabad. Pp. 132. Price Re. 1-4.

SARVODAYA SIDDHANTA: A Symposium. Published by Navajivan Prakashan Mandir, Ahmedabad. Pp. 74. Price twelve annas.

There is a fundamental difference between the ideology of the Communist and that of the believer in the principles of Sarvodaya or Gandhism, though both avow that their sole objective in pursuing their particular path of reform or revolution is the creation of a classless society. For, violence or non-violence as a means to this end makes all the difference between the two ideologies. Shri Mashruwala brings this out clearly in his book while the symposium on Sarvodaya, to which Gandhiji, Vinobaji, Shri Narhari Parekh and others have contributed, only helps to confirm this difference, emphasising at the same time that justice must be assured "unto this last."

G. M.

GUJARATI

VIJNAN MANDIR: By Prof. Dr. Kantilal C. Pandya, M.A., Ph.D. Published by N. M. Tripathi

& Co., Bombay-2. 1950. Thick card-board. Pp. 438. Price Rs. 4.

Dr. Pandya has served for a long time in St. John's College at Agra as the Professor of Science and is therefore naturally interested in spreading the knowledge of scientific subjects and of scientists in his own mother tongue. He is a practised and known writer connected with literary families both on the paternal and the maternal sides. Biographies of famous scientists of both hemispheres and of India have been set out in easy language, with narrations of the works turned out by them and their discoveries. A thoroughly valuable work.

KALBHOJ: By Ramanlal V. Desai, M.A. Published by R. R. Sheth & Co., Bombay-2. 1950. Illustrated jacket. Thick card-board cover. Pp. 345. Price Rs. 4-8.

Kalbhoj who is identified with Bappa Raval of Mewad (A.D. 734-753), was a king who valiantly withstood the coming onslaughts of Muslim invaders of India, and reigned over a country glorious in every way: a sort of golden age in the history of old Bharat. The practised pen and the splendid vision of this unique novel-writer of present Gujarat, has recreated the state of society prevalent then and presented an enchanting picture of the times which leads the reader into believing as if he was living in those times. It is a novel which will live.

INDIAN PERIODICALS

Draft Second Five-Year Plan (1956-61)

Science and Culture writes editorially:

The draft Plan-frame of 17 March 1955 as prepared by Professor P. C. Mahalanobis seeks to supply a logical foundation and a consistent frame-work for the formulation of the Second Five-Year Plan 1956-61. The chief aims are:

- (a) to increase the national income by 5 per cent per year, that is, to double it in about 14 years; and
- (b) to create opportunities of work for about 11 million persons during the plan-period.

This is sought to be done, on the one hand, by large investments in the heavy industries and construction, and on the other hand, by expanding the household and industries to the fullest extent. The development of heavy machineries, iron and steel, coal, irrigation and electricity, cement, heavy chemicals, etc., would lay a sound foundation for rapid industrialization in future. The expansion of hand industries would create a large volume of employment and increase the production of consumer goods to meet the increasing demand caused by large investments in the heavy industries.

Tentative targets of production have been given in the draft Plan-frame. It is not claimed that these are final. In fact, the chief object of the Plan-frame is to have the targets revised as necessary by detailed examination at a technical level. The Plan-frame emphasizes, however, that the targets are related to the rate of increase of national income and the volume of new employment sought to be created during the plan period. Secondly, there are technological connections between the different items; a change in one item may require consequential changes in other items. Finally, the targets of production obviously are related to capital investments. The targets are thus basically inter-connected and also related to the rate of investment, the rate of increase of national income, and the rate of creation of new employment.

The chief merit of the draft Plan-frame lies in the attempt to give a coherent and logical structure to the second plan. This is why great emphasis has been laid on the consistency between different objectives and targets of the plan and balances between supply and demand at every stage.

It is interesting to observe that this type of planning requires thinking at a physical level. In fact, at one time there was a good deal of controversy about the alleged conflict between physical and financial planning. The fact of the matter is that a financial counterpart can always be arranged for any programme which is physically realizable but the converse is not true. The draft Plan-frame has clearly pointed out that the physical and the financial approach are but two aspects of the same reality.

Some of the basic ideas of the new approach were given by Professor Mahalanobis in two papers in 1952 and 1953, in which he reached the conclusion that for a satisfactory growth of the national economy it would

be necessary to have an average rate of investment of at least 10 or 11 per cent and that a large part of such investment should be allotted to the heavy industries. Both these ideas have found expression in the draft Plan-frame.

Work on this subject in the Indian Statistical Institute was more systematically organized when basic studies on planning for national development were inaugurated in the Institute by the Prime Minister in November 1954. Since then there was rapid progress.

We understand that the Central Statistical Organization (which works under the technical guidance of Professor Mahalanobis) has been closely associated with the studies on national income from the beginning. From December 1954 leading economists in the Economic Divisions of the Planning Commission and of the Department of Economic Affairs, Ministry of Finance, began to work with the statistical group and the draft Plan-frame of 17 March 1955 represents much of this joint thinking. The group was also helped in many ways by exchange of ideas and experience with a large number of foreign economists and statisticians who worked as visiting professors in the Indian Statistical Institute during the cold season of 1954-55.

It is important to notice that the draft Plan-frame is not a copy of any foreign model. In the economy of more advanced industrial countries there is a conflict between consumption and investment. It is usually stressed that investment can not be increased without tightening the belt, that is, without reducing consumption. In the draft Plan-frame, the strategy is to increase both consumption and investment at the same time. In fact, it is the surplus production of consumer goods in the hand industries which would enable large investments being made in the heavy industries.

The draft Plan-frame proposes to restrict further expansion of factory production of such consumer goods as would be competitive with hand-made articles until unemployment has been eliminated. This emphasis on the use of hand products is in keeping with the cultural traditions of the country. However, once the fear of unemployment is eliminated, it is proposed to expand the factory production of consumer goods to attain a continually increasing level of living in future.

Although much-needed emphasis has been given to industrialization, the draft Plan-frame has taken into full consideration the need of expanding agricultural production and giving increasing attention to rural welfare through Community Projects and other measures.

It is also worth noticing that the draft Plan-frame does not contemplate nationalization of organized industries on ideological grounds. In fact, its emphasis is on the expansion of hand and household industries which are all in the private sector. It advocates the use of electricity to supply power for small-scale and household industries and is in favour of a wide disposal of industrial production.

The pattern of economic growth visualized in the draft Plan-frame is thus quite different from develop-

ments in U.S.S.R. and the socialized countries. The present approach has its roots in Indian traditions, is suited to Indian conditions, and has been the outcome of some hard thinking on the part of Indian scientists.

As far as we can judge the proposals made in the draft Plan-frame would be of great advantage to the agriculturists, artisans, the labouring classes as well as to the intelligentsia. There would be no nationalization on ideological grounds. The public sector would expand at a faster rate, and the private sector would have an expanding and assured market. The only basic change would be a restriction on the unlimited expansion of big business which is inescapable in the context of the Avadi resolution of the Congress party affirming its faith in progress towards a socialistic pattern of economy in India.

The draft Plan-frame of 17 March 1955 is accompanied by a supporting paper of 21 March 1955, giving more detailed information about targets and the financial position, prepared by the Economic Divisions of the Planning Commission and of the Department of Economic Affairs in consultation with the Central Statistical Organization and the Indian Statistical Institute. The draft Plan-frame and the Secretariat working paper represent much joint thinking and are consistent with each other but not identical. The draft Plan-frame is more comprehensive, and covers a wide range of questions of economic policy and administrative and constitutional changes.

The draft Plan-frame of 17 March 1955 and the supporting Secretariat paper of 21 March 1955 were considered by the Panel of Economists (consisting of 17 leading economists of India with Shri C. D. Deshmukh, Minister of Finance, as Chairman and Professor D. R. Gadgil as Vice-Chairman) of the Planning Commission on the 8th, 9th and 10th April 1955. The Panel of Economists submitted a Memorandum on the draft Plan-frame which also has been released by Government. This Memorandum (which is practically unanimous with only one note of dissent) gives general approval of objectives of the draft Plan-frame and strongly supports the broad lines of policy. At one time there was some controversy between statisticians and economists which now seems to have had a happy ending with practically complete agreement about the present approach to planning.

The three papers were considered by the Standing Committee of the National Development Council on the 5th May and by the full Council itself (which consists of the Central Cabinet, the Planning Commission and the Chief Ministers of all the States) on the 6th May; and the draft Plan-frame was accepted as a basis for detailed formulation of the second plan. It is intended to get ready a draft outline of the second plan by October or November of this year, and the plan itself by March 1956. The Prime Minister, who presided at both the meetings, desired that wide publicity should be given to these papers.

The most important feature of the present approach to planning is its emphasis on the need of detailed technical work to ensure the internal consistency and the balances of the plan. It is fully recognized that the work of planning itself would call for a large staff of economists, statisticians, scientists, engineers, technologists and administrators (Chapter 6, 1.3). The draft Plan-frame emphasizes the need of a large scale organization for the training of technical personnel; and stresses the importance of re-orienting scientific and technological research to serve the needs of national development (Chapter 2, para 16). It also gives a

warning that the existing administrative machinery of Government may prove the greatest obstacle to the implementation of the plan, and emphasizes that such a bold plan, roughly twice the size of the first plan, can be undertaken only with the full support of the general public.

In view of the importance of the subject it is hoped that every one interested in the future progress of the country would make a serious study of the new approach to planning and offer constructive criticisms.

Whatever changes may be made in the targets and other details, the draft Plan-frame can give a definite direction to economic thinking and scientific and technological research in this country.

The readers of *Science and Culture* will find it of interest to note that more or less similar points of view were expressed in a series of articles on 'Rethinking our Future,' which appeared in this journal early in 1953. These articles were the result of a special study on planning by Professor M. N. Shaha and were later published by the Indian Science News Association in the form of a booklet, *Rethinking Our Future*. The following may be quoted:

"It is clear from the foregoing sections that the economic laws which any Plan for a country has to follow are:

(a) that the existing productive machinery of the country (the word machinery is used in a figurative sense to include all means of production) must be maintained at full strength by the compulsory provision of adequate depreciation (or amortisation). This is not being done in India in many industrial groups (jute, coal, tea, cotton, chemicals, iron and steel etc.).

(b) There must be large new net investments in new productive enterprises which should be geared to the natural resources of the country. For India, if we want really an increase of national income, and if the per capita income has to be increased within a reasonable period (doubling of per capita income in 10 years) we must have $a=20$ i.e., invest annually two thousand crores for the next 5 years in national enterprises. The amount should go on increasing as the national income increases.

(c) The investments should be such that they yield large over-all dividend i.e., large B.

(d) In an overpopulated country like ours the rate of population growth should be kept down as far as practicable.

It does not appear possible that the Government can take much active steps in (d), except by propaganda and education. This must be left to "God" for the present, as one of the Bombay planners said to Professor A. V. Hill.

The conclusions (a), (b), (c) emerge as consequences of the general laws of economics which are of universal application, and are independent of any type of political ideology. But the political ideology can certainly affect all the three factors (a), (b), and (c) either favourably or adversely, as is apparent from the analysis of planning in the three countries given above.

Mahalanobis's FYP has taken $a=12$, and insured for large B by accepting Prof. Saha's advocacy of heavy, or producer goods industries.

It is a happy augury that the Planning Commission and the Government of India have now a large measure of agreement with the patterns of planning which Professor Mahalanobis and his able workers of the Indian Statistical Institute have indicated in their studies. We hope that the Second Five-Year Plan will be based on these principles and lay the foundation of solid economic well-being of India's 370 millions.

Some Aspects of Life in the U.S.S.R.

Professor Dr. B. C. Guha, writes in the *Bulletin of the Ramakrishna Institute of Culture*:

On the invitation of the University of Moscow, a delegation of six Professors and twenty students from six Indian universities visited the Soviet Union last autumn. I went as a delegate from Calcutta University, with three students whose respective subjects were history, law, and applied mathematics. The delegation represented also other subjects including economics, political science, languages and literature, chemistry, medicine, pharmaceuticals, etc. While that delegation visited some general institutions like libraries, museums, and art galleries, different members of the delegation had also ample opportunity to visit the institutions and departments of studies, to which their own activities were related. It was therefore in no sense a 'conducted tour,' as has been alleged. Because of our regrettable ignorance of the Russian language, it was, of course, necessary to have interpreters with us, but these interpreters belonged to Moscow University and were not professional. Our students moved freely in Moscow and actually travelled on their own by bus and the underground railway to different places including the Indian Embassy. Where the Russians could speak English or any other language known to us, such as French, German, Bengali, Hindi, or Urdu, interpreters were not needed and conversation went on freely.

We spent a considerable part of our time in the different departments of Moscow University according to our specializations. The new thirty-two-storeyed Moscow University building on the Lenin Hills is indeed an architectural beauty. It combines massiveness with refinement. It houses not only the teachers and their families, but also seven thousand students, of whom fifty-one per cent are girls. Each student has a cosily furnished single-seated room, and every two rooms have an attached bath-room. I do not think there is in any other country such a gigantic residential university with such amenities.

In the Faculty of Chemistry alone there are one hundred and ten teachers including thirty-six professors. This indicates the scale on which the different departments are staffed. The pay of professors is as high as eight thousand roubles a month. In fact, in the entire Soviet Union professors and similar intellectuals are very well, perhaps too lavishly, looked after. Over ninety per cent of the students of Moscow University receive stipends varying from two to eight hundred roubles a month. This is sufficient, as the monthly room rent in the University is twelve roubles and food may cost five roubles a day. The University course is of five years' duration after the school-leaving examination, which the students take when generally they are seventeen years old. In the last year of the course, they have to do a certain amount of research. After they pass out with a diploma from the University, they may take employment or may choose to be 'aspirants' and pursue a research career. After three years' research they are eligible for the *Candidate's* diploma. After this, they can proceed for the doctorate degree, for which some more years of research work are necessary.

The universities cater for fundamental subjects, such as literature, history, economics, chemistry, physics, botany, zoology, etc. The institutions for applied subjects, such as technology, engineering, medicine, and agriculture, are not under the universities, but are directly controlled by the Ministry of Higher Education with the exception of medical institutions, which are controlled by the Ministry of Health.

In discussion with the Vice-Minister of Higher Education, it was revealed that the Minister of Higher Education was a metallurgist and gave regular lectures at a metallurgical institution, and also the Vice-Minister of Agriculture was an agricultural geneticist and gave lectures in an agricultural college. He said that in this way the ministers 'kept contact with both teachers and students. They do not believe in an 'administrative caste.' People go into different fields of employment

according to their ability and aptitude. The system is flexible, and it is clear that this arrangement ensures unity between administration and the people and prevents the administration from degenerating into a bureaucracy.

The scale on which science is supported in the Soviet Union is indicated by the fact that the Soviet Academy of Sciences has an annual budget of one billion roubles, with which it runs one hundred and ninety institutions. Besides the Academy of Sciences, there are several other academies, such as the Academies of Agricultural Science, Medical Science, Fine Arts, Architecture, Pedagogy. All these are financed by the State, and they all run numerous institutions. Besides these there are smaller academies in the constituent republics. Altogether there are about one hundred thousand research workers in the different institutions of the Soviet Union. The universities of the Soviet Union, including those of the constituent republics, are financed by the Centre. A comparatively small university like the Stalin University of Tbilisi (capital of Georgia) receives an annual grant of about thirteen million roubles. We had also occasion to visit the Lenin University of Tashkent (capital of Uzbekistan), which was also generously financed by the Soviet Government. All the scientific institutions I visited in Moscow, Leningrad, Stalingrad, Tbilisi, and Tashkent had modern equipment, and quite a few of them used electron microscopes and radio-active isotopes—all manufactured in the Soviet Union. Their progress, particularly in some applied fields, appears to be revolutionary. In Tashkent it was found that phosphatic fertilizers sprayed on the leaves of cotton plants were better utilized than fertilizers applied to the soil. In this work they are using the most modern isotopic and radio-autographic techniques. Agricultural scientists in Russia have shown that high yields of crops are obtained from a plot of land if it is ploughed only once every three or four years, though sowing is done every year. This builds and maintains the structure of the soil and also eliminates the labour of annual tilling. A plough developed by Maltsev has been very useful in this regard. In the hydrobiological laboratory in Leningrad University they have succeeded in the artificial fertilization of millions of fish eggs in ordinary vessels with fish sperm, both being obtained from male and female fish by means of hormone injections. In the laboratory of Academician Engelhardt in the Bach Institute of Biochemistry in Moscow, further research is proceeding in the successful rearing of these fertilized eggs. This is a method which promises to give enormous yields of fish, if suitable conditions are worked out.

The exchange of professors and students between

India and Soviet Union has been discussed. It seems probable that in future such an exchange relationship may be established. This will be of great mutual benefit to our two countries.

As regards the general aspect of life in the Soviet Union, one cannot say much, as our visit lasted only about a month. But, generally speaking, people are happy and are working hard to build up a new life. Seriousness in work was found in all walks of life. Even children queue up for entrance into the children's section of the Lenin Library and that in the evening after school hours. Highly technical books are sold out in a few days after publication.

Construction is going on apace. In Stalingrad where only ten buildings were said to have been standing after the great battle, so many thousands of houses have been built, and also new theatres, avenues, parks, etc., that it is difficult to find traces of the battle. Both buildings and roads are constructed by mechanized methods and the progress is extremely rapid. One of the members of our delegation said that she had gone over a very rough road in a car in the morning and returned in the evening on the same road which had meanwhile been concreted! To widen roads, huge buildings are put on rails under the foundation and moved. I have no doubt that in technical efficiency the Soviet Union is pre-eminent and we should learn the method of fast construction from them as soon as possible.

Religion, as is well known, is not encouraged by the State. On the other hand, citizens are free to practise the religion they like. Churches and monasteries are left as properties of the believers, who pay for their maintenance, elect the synods that manage them, and appoint the priests. Churches are fairly full and monasteries have considerable numbers of young men who are being trained as monks. In the Central Asian Republics there are mosques but religion is not a force among the people.

The dominating feature of life in the Soviet Union is people's love for peace. The word 'peace' is on every body's lips. Children in schools sing hymns of peace. The big Kirov stadium in Leningrad carries the slogan *Mir miro*, Peace to the world, in huge letters. Talk of war is punishable under the law. The accusation that such a country has aggressive designs does not tally with these facts. If peace is maintained in the world, the Soviet Union will attain unprecedented peaks of production in record time. It is clear that the paramount necessity before the Soviet Union and the entire world is the maintenance of peace, for which unremitting efforts have to be made.

FOREIGN PERIODICALS

Age-Old Ties

Lev Aspensky, Soviet writer, writes in the *News and Views from the Soviet Union*, June 7, 1955:

Russians have long known India. True, many people don't know how ancient and firm are the ties that link our two peoples. That is something well worth dwelling on.

A thousand years ago swarthy, enterprising Indian merchants unrolled before the admiring eyes of Northern beauties luxuriant, colourful Eastern fabrics in the market-places of Greater Novgorod, freedom-loving Slav republic. Through the Khazar town of Itil, on the broad Volga, caravans of Russian goods—honey, wax, saffron, and clear amber from the Baltic seaboard—flowed down to the Caspian and from there along peaceful trade routes across the Himalayas into India.

Since that time there live in Russian folk songs, tales and legends delightful images connected with that distant land of sunshine, a land of wonderful treasures and dark-faced people. "India the rich."

The hordes of Genghis Khan divided the world of the time into two, cutting off the peaceful ties of the North with the South. But the Russians did not forget India: they remained filled with determination to renew their friendship with her.

In the 15th century, some thirty years before the rapacious beaks of Portuguese caravels first plunged into the golden sands of the Malabar coast, a Russian appeared in India. He had made his way there by land and by sea, and his name was Afanasy Nikitin, merchant and traveller, a man of intelligence and kindness. He spent several years wandering about the Indian markets and temples, living in towns and villages, studying the unfamiliar world with eyes that were keen and sympathetic. Reverently, without a trace of arrogance or superiority, he noted and recorded everything that he saw, like a true friend. For centuries afterwards his words were read and re-read in his snow-covered native land, arousing an undying interest in the sultry land of the south. The years flew by, the decades marched past, the centuries elapsed. Not only the people but the Moscow government itself began to show a far-sighted interest in the life of their distant southern neighbour. Hardly had the great turning-point in Russian history that is bound up with Peter I begun when the Embassy of Semyon Malenky departed for India. Shah Aurangzeb received the "Muscovites." For five years Russians lived and traded peacefully beneath the blue skies of India. When they departed for home they bore with them a strange gift from the friendly land, an elephant, an animal never seen before in the north.

Again Indian merchants appeared in Russia. Entire settlements of Indians had sprung in Astrakhan, beside the Caspian, by the beginning of the 17th century. Indians made their way up to Moscow along the Volga, and proceeded even farther north, to Yaroslavl.

All these, of course, were no more than separate, rare meetings between two great and powerful peoples.

In the 18th century these meetings grew more frequent. Now, as in times past, resourceful, brave Northerners found their way to the alluring lands of the East. Filipp Efremov, the Atanasov brothers, and Rafael Dolibegov laid new paths in that direction. A lively interest in Indian languages and the culture, art and literature of the country crystallized and grew steadily among our scholars.

At the turn of the century Karamzin, a well-known Russian historian of the time, enriched our literature with a treasure of Indian letters when he translated scenes from the *Shakuntala*. Karamzin spoke with admiration of the pearls of poetry, not inferior to Homer's that were scattered through Kalidasa's immortal work. At about the same time he found among a bunch of old manuscripts a work by Afanasy Nikitin written three centuries before, his *Travels Beyond Three Seas*. "The Indians heard of Russia before they knew about Portugal, Holland or England", Karamzin wrote with justifiable pride.

Finally, modern times. During the 19th century Russians learned more about the life, the joys and sufferings of the industrious, freedom-loving Indian people, weighed down by the unbearable yoke of foreign occupation. A hundred years have already passed since our children first read in Zhukovskiy's brilliant translation the touching, wise story of the love of Nala and Damayanti. The Mahabharata has become as familiar to us as the Odyssey and the Iliad, as one of the finest productions of antiquity.

In these one hundred years no little water has flowed down the Volga and the Ganges, but our eyes still drink in with eager curiosity the wonderful monuments of Indian art, from the cave temples of the Ajanta to that miracle of miracles, the Taj Mahal, and we think to ourselves: there is something elusively similar between Indian architecture and the masterpieces of old Russian architecture, in the flight of Indian mortar and the fantastic laciness of St. Basil's Cathedral, the most beautiful of Moscow's old churches.

We listen attentively to the majestic strains of Sanskrit verse, and our Russian ear detects many familiar sounds, while dwellers in Central Asia and the Transcaucasus find familiar roots in it as well. The lace of the carved temple of Madura, and the sonorous verses of the Ramayana, and the marvellous lines of the portico of the Kondana chaitya grew more and more dear to us. But dearer than the marble and porphyritic tombs, more alluring than the beauties of Bengal roses and tall palms, is the friendship of those who sculptured and wrote, raised and created all that, those who mined the rubies and sapphires for the altars of the grim gods of old, friendship with the tireless architect, ploughman, songwriter, sage and fighter, with our wise and noble brother, the common man of India.

For years our boys and girls have suffered the sorrows of the Indian people. Among all the characters in Jules Verne our children have chosen for their

favourite Captain Nemo because he fought for India's freedom.

Generations of Russians have studied with wrath and indignation the magnificent painting of our Vereshchagin in showing British guns aimed at the backs of the Sepoi heroes of 1857. Women gaze at the painting with anguish in their eyes, men with clenched fists.

In the 19th century we heard about India, but we heard it from alien lips. At the beginning of the 20th century India first spoke to us herself through the great Tagore. Her voice moved and captivated us. But only in recent years have we and you had the opportunity freely to stand shoulder to shoulder in mankind's peaceful endeavours, and, stretching out our hands looking straight into each other's eyes, to say: greeting, brother!

The last few years have brought us Soviet people great joy: India has come to visit us!

In Moscow and Leningrad and Kiev people have stood from morning till night waiting to view the work of India's artists. Huge crowds jammed the cinema houses where the unfortunate owners of "Do Bigha Zamin" collapsed from exhaustion, Raj Kapur struggled and triumphed in "Awara", the downtrodden characters in the "Andhivan" died. Soviet men and women were delighted by the age-old art of Gopinath, admired the tender liteness of Tara Choudhary; with bated breath they listened to the voices of your peasants and the chords struck from instruments unknown to us. In all this they persistently sought what is most important: the life of a great people, their joys and hopes.

What joy in the consciousness that although thousands of kilometres, dozens of degrees of latitude separate us, although the histories of our countries are so dissimilar, and our cultures different, your artists draw tears from our eyes, and your songs go straight to our hearts! We are brothers! If we really understand this no evil force on earth can oppose us.

When tender birch leaves are beginning to burst in our groves, wreathing the distance in a faint greenish haze, cool, transparent and acridly fragrant, your eternally burning sun pours down its rays on trees and grasses unfamiliar to us....

Everything in our two countries is different, individual. But both here and there we, the people, are the same, exactly the same on Cape Comorin as on Cape Chelyuskin, with the same desire to live, not die, to rejoice, not suffer, the same desire freely to inhale free, human happiness.

That is why the same human thoughts, hopes and desires live in the Madras jungle and the Siberian taiga, in Bombay and in Leningrad, and the same passionate words—peace, joy, friendship of nations, freedom—ring out.

Man is weak when he goes into battle alone. But together with his friends he can overcome all enemies. United, the peoples of the world can do anything; they

are invincible in the struggle for peace; there is no force capable of standing up against them.

Bhoodan Called Typical of Free World Spiritual Forces

Washington, May 26—Bhoodan Yagna, led by Vinoba Bhave, has been cited as an outstanding example of current spiritual movements that differentiate the free totalitarian societies.

Columnist Malvina Lindsay, writing in the *Washington Post and Times-Herald* today says, "This Gandhi disciple" is stepping up by voluntary means the distribution of land to the landless.

Miss Lindsay says further that "Vinoba's band of followers describe their activities as 'looting with love.' The movement is spiritually akin to that of the Abbe Pierre in France, who is crusading for a 'roof for every Frenchman!'"

"The Indian movement, which is demonstrating that 'Bourbons' of any nationality can experience a change of heart, also has an analogy in the distribution of land by the Shah of Iran.

"Young Briton, Hallam Tennyson, great-grandson of the poet, who travelled for a while with Vinoba's band, believes that *bhoodan* is largely the answer to India's need, to hasten economic change by democratic methods."

Miss Lindsay recalls that Tennyson recently lectured in Washington on his book *India's Walking Saint*. Tennyson, the columnist says, pointed out to Washingtonians that "many if not all of India's 100 millions landless eventually will cultivate 5-acre tracts on a life tenure and have a new purpose in life, as a result of Vinoba's efforts."

Describing the scope and success of *bhoodan*, Miss Lindsay says it is "giving Indian peasants more confidence in the future."

Such confidence, she said, "is synonymous with the 'sense of progress' that Chester Bowles, former Ambassador to India, recently told U.S. Senate Foreign Relations Committee was especially needed by peoples of industrially underdeveloped areas of the world."

Miss Lindsay concludes: "If *bhoodan* can materially increase the tempo of India's land reform, it will have great importance on the entire democratic world. For India's results in bringing about economic improvement by democratic means are being measured by all Asia against those of China, where totalitarian techniques are being employed.

"But the success of the *bhoodan* crusade—and of the other spiritual movements now under way against economic distress—would even have greater significance in demonstrating that the heart is mightier than the ukase."—*USIS*.

Dr. Jonas E. Salk, Discoverer of Anti-Polio Vaccine

To millions of American parents, the name of Dr. Jonas E. Salk now means freedom from an annual summer-time worry: Is there danger of my child contracting poliomyelitis this season?

The announcement earlier this week that the vaccine developed by the 40-year-old University of Pittsburgh researcher is 80 to 90 percent effective has brought comfort to people throughout the world. Regarded as the first great advancement in the fight against the crippling disease, the Salk vaccine is also being hailed as "one of the greatest events in the history of medicine."

What of the man behind this momentous discovery? Jonas Salk was born in Manhattan, New York City, in 1914, the eldest of three sons of a women's wear manufacturer. He was a precocious youngster with unusually neat and tidy habits and equally precise ways of classifying ideas. At 16 he graduated from Townsend Harris High School and at 19 from the City College of New York.

After a period of internship, which followed his passing from New York University's Medical School, Salk was already so interested in research that he did not even consider going into routine practice. Instead, he won a National Research Council fellowship for work on viruses, and went to the University of Michigan to work under his one-time professor, Dr. Thomas Francis, Jr. It was Dr. Francis who was in charge of evaluating the success of the mass Salk vaccine tests made last summer.

In 1947, Dr. Salk with his wife and two young sons (there is a third now) went to the University of Pittsburgh to start a virus laboratory. For the first few months he stuck to his first love, the influenza virus; but soon he decided to "look into this polio problem to see what it was about."

Under a grant from the National Foundation for Infantile Paralysis, Salk started work in 1949 classifying the various known strains of polio virus. The task took three years and cost \$1,370,000. And by this time Salk and other scientists had found that all known strains of polio virus could be classified into three types, which meant that any successful vaccine would have to protect against three different viruses.

Of great value to Dr. Salk's research was the earlier work done by Doctors John F. Enders, Thomas H. Weller and Frederick C. Robbins, who had found a way to grow polio virus in non-nervous tissue kept alive in flasks and test tubes. This discovery brought the three scientists the 1954 Nobel Prize in Medicine and Physiology.

Step by painstaking step, Dr. Salk made experimental vaccines and tested them in monkeys. In June 1952 he was satisfied he had a vaccine safe enough to be given to human beings. Still, for utmost safety, he decided that the first subjects should be those who had already recovered from polio. Thus they should be immune to further disease, but he could measure a rise in their antibody level if the vaccine produced, as he expected, a booster effect. It did.

Salk's vaccine consists of viruses of all three types of paralytic polio, with a solution of formaldesyn to make them harmless. When injected, the vaccine induces the human body into setting up a defence against polio virus invasion by producing antibodies.

In 1953, Dr. Salk described his encouraging results in a nation-wide radio broadcast, and—though fellow

scientists were still sceptical—by this time he had gained the confidence of the officials of the National Foundation for Infantile Paralysis.

The National Foundation last summer financed the gigantic project, involving altogether approximately 1,830,000 American school children. Of this number 440,000 were actually inoculated with the Salk vaccine, the remainder being given injections of a placebo (which has no effect) or merely serving as controls.

In all, there were 113 cases of polio among the vaccinated children, with 71 of the cases resulting in paralysis. One child who had been inoculated died of polio, but it was found that there were special and unusual circumstances in this case. Among the children under observation, but not vaccinated, there were 750 cases of the disease, of which 445 involved paralysis.

The evaluation report on the mass tests revealed that even when paralytic polio struck, the severity of paralysis was lessened by the vaccine and chances of complete recovery were improved.

Dr. Salk himself said the tests showed him how to make the vaccine even more effective—by giving the third "booster" shot seven months after the first two injections, instead of giving all three in a five-week period as was done in the tests. He believes the booster injection should have the effect of extending polio immunity for an indefinite period, perhaps years.

The success of the anti-polio tests sets in motion a U.S.-wide programme of immunisation against the disease, which will inoculate nearly 60 million American children. Already six U.S. pharmaceutical firms have started distribution of the vaccine, and the U.S. Government announced that validated export licences will be granted for shipping the vaccine overseas. One pharmaceutical firm has announced that it plans to export 10 percent of current production of the vaccine through established commercial channels.

While the National Foundation, which has a Salk vaccine stockpile for 9,000,000 vaccinations, will carry out an extensive immunisation programme in 1955 in U.S. schools, its participation in the production, distribution and administration of the vaccine will cease after this.

It is well to remember that the entire cost of developing and testing the Salk vaccine was paid by the American people through their voluntary contributions to the National Foundation's annual "March of Dimes" fund-raising campaign.

To Dr. Salk, his success brings no near-fortune, as the vaccine is an unpatented product. His reward is the satisfaction of serving mankind. But to the man who, when asked why he devoted his life to research, said: "Why did Mozart compose music?", this is reward enough.—*USIS*, April 15, 1955.

Another Anti-polio Vaccine

The Press has already pointed out, in connection with the discovery of an anti-polio vaccine by Doctor Salk, the existence of another anti-polio vaccine discovered in France, by Professor Pierre Lepine.

Jean Diwo writes on this subject in the French Weekly *Paris-Match*:

"This vaccine is identical in its principle with that of Dr. Salk and differs from it only in a few technical details: it is particular through a composition more appropriate to the fight against poliomyelitis such as it is observed in Europe and through its preparation from chickens' embryos instead of Rhesus monkeys' kidneys.

As for Pierre Lepine the problem is not posed in the same way as for his famous American fellow-scientist. "We must not forget," he recently stated, "that in France at least 85% of the children get spontaneously immune."

Indeed, through a curious paradox, polio is the unexpected counterpart of hygiene. The disease takes various forms in countries where children are not naturally immune from it, because they live in almost perfect conditions of cleanliness: such is the case in the United States and the Scandinavian countries. Hygiene in the country, actively pursued in America, has developed exactly in the same proportions as poliomyelitis.

"If all children would rub their slice of bread and butter against the walls before eating it, there would be much less polio," a specialist of the Pasteur Institute declared recently. It was of course a sally, but there was some truth in it. For one serious form of poliomyelitis there are 99 others which disappear and leave no more trace than a cold in the head would. We catch them without even noticing it, but they are miraculously useful to us: they vaccinate us against the acute form of the disease."

Professor Andre Lemaire writes in his turn in the journal *Le Monde*: "It is not really a question of discovery. (1) The general principles of vaccination have been known for a long time. Pasteur had clearly defined them and he knew, according to the cases, how to use germs, killed or only attenuated. (2) For a long time formol has been used in the preparation of vaccines. Formol is an energetic germ-killer and is used as such in the preparation of "killed" vaccines. It is also an agent for the denaturation for proteins, thanks to which the doctors Ramon and Zoeller were able to transform cer-

tain toxins into antitoxins, that is to say prepare very simply efficacious and safe vaccines, which were very soon used the world over.

Formol has the same denaturing effect on certain virus which it transforms into anavirus free from pathogenic power but capable to confer to the organism a specific immunity. According to Dr. Ramon the anti-polio vaccine is an anavirus.

(3) Anti-polio vaccination is not summed up in this sole vaccine made with formol and killed. They have made experiments with live vaccines but attenuated, viz., containing living virus capable of giving immunity without giving the disease. Experiments are proceeding.

These principles having been known for a long time, why have they waited so long to perfect an efficacious vaccination? It is because the means of obtaining the necessary quantities of virus have been known only for a few years. There lies the true discovery made by Dr. Enders who received for this the Nobel Prize. The principle is simple: as the virus develops only on living cells, the question is to use, as breeding place, a culture of tissue or tissue kept alive in a proper nutritive fluid.

Starting from this principle, numerous workers became interested in the making of virus and of vaccine in every form, killed or attenuated, injectable or ingestible. And in this competition French scientists were not the last, since from the very beginning of 1953 the Doctors Blanc and Martin of the Pasteur Institute in Casablanca have vaccinated in that town, with attenuated ingestible virus, 5699 children.

Admitting that the vaccine of Dr. Salk gives proofs of its capacity, must one make use of it everywhere, in France in particular? Nothing is more unlikely, for poliomyelitis is not exactly the same in all the countries of the world. Thus the distribution of the three stocks of virus, source of the disease, is not the same in America and in Europe. On the other hand, the disease is more spread and more serious in the United States than anywhere else. Finally, one should know what is the duration of the immunity given by the Salk vaccine.

For all these reasons, Professor Pierre Lepine, who has long been engaged in the research of an efficacious vaccine, thinks that at least in Europe the latter must be different from Dr. Salk's vaccine, and he has perfected a particular technique of preparation. But he deems that only after a series of most strict checkings, and when sufficient proofs have been gathered on the innocuousness and efficacy of the vaccine and as to the degree and the duration of immunity given by the vaccine, the latter can then be placed at the disposal of the medical profession."

International Short Feature Film Festival Held in Tokyo

The success of the International Short Feature Film Festival held recently in Tokyo attests to the tremendous interest in this type of motion pictures.

Short features from eight nations were shown at the Yamaha Hall in Tokyo on November 18, 1954, and drew an overflow crowd with more than 500 people turned away.

The festival was arranged by the Educational Film Producers' Association of Japan, sole organization of short feature motion picture companies, which boasts a membership of more than 100 production outfits.

The purpose of the festival was two-fold: To improve the quality of short feature motion pictures; and to stimulate an understanding of international problems in this field.

FILMS FROM 8 NATIONS

Among the films screened were the following:

Ski Sport Bariloche (Argentina), *Australia Today* (Australia), *Dozere Mondragon* (France), *Darjeeling* (India), *Primavera Sull Etna* (Italy), *The White Continent* (England), and *Art of Japan* (the United States).

Darjeeling especially won tremendous acclaim with its magnificent colour and excellent arrangement winning the admiration of all concerned. The success achieved by the festival demonstrated the strong desire among the ordinary people for knowledge of foreign affairs through this medium. Furthermore, it was strongly urged that this type of film festival should be continued in the future and should be held at least two or three times a year.

JAPANESE SHORT WIN PRIZE

A Japanese short feature, *Life in the Railway*, won second prize in the documentary film section of the 1952 International Film Festival held in Venice. This gave impetus to the production of short feature motion pictures in Japan.

At the same time, the use of motion pictures for educational purposes has gained wide popularity.

In 1951, 233 short features were produced in Japan. The following year, the number jumped to 304. Last year, 350 shorts were made, and indications are that production will exceed 400 this year.—*Information Bulletin*, Japan.

NOTES

Home and the World

The Geneva Conference marks a new phase in the World Relations of all nations. The tension between the two armed camps, that were engaged in the "cold war" for the last six years and more, has been considerably lowered and a reasonable attitude is marked in the higher executive of the two great Powers. The press has stopped sabre-rattling in Russia, and a slightly moderate tone is found in the more sober of the U. S. papers, though as yet the infantile craze for invective persists. But all the same, so far so good, where peace is concerned. Goodwill may come in a decade or so when power-drunkness passes with the realisation of the true significance of Nuclear Warfare. Scientists have made unequivocal statements regarding the logical consequences of letting loose the hellish fury of atomic fission on humanity.

Pandit Nehru's mission of peace in China and the U.S.S.R. has borne fruit, as the world realises, despite ungracious and exceedingly stupid statements of certain personages in the West. The cold records of history will no doubt prove to posterity where credit was due. But Gandhism lays no stock on credits, as the *Gita* definitely says that there should be no desire for credit for a good action, "*Ma jaleshu kadachana*." And so we are not concerned about credit, let lesser spirits hanker and argue about that.

So much for the world. We have now to consider affairs that are vital for the well-being of our own people. Pandit Nehru may be well-satisfied about the results of his endeavours regarding the establishment of peace and goodwill amongst the peoples of the world, but can he deny that these world-wide perambulations, and long-distance *pourparlers*, have led, as an inevitable consequence, to the gross neglect of urgent and essential work at home? Campaigns for Peace, as in campaigns of War, demand a heavy price, when executed on the scale attempted by Pandit

Nehru, in terms of stress and hardship on the Common Man, whose well-being, mental, moral and physical, is left in charge of inefficient and incompetent party-hacks, while the really great are pre-occupied with issues that lie outside the home-precincts.

Is it not time that Pandit Nehru remembered that he is not merely in charge of Foreign Relations? Is it not time that all of us came down to earth? What matters if we get all the credit for establishing the spirit of Gandhism abroad, if at home we became a *C₃* nation, morally degenerate, mentally decrepit and physically weak?

The First Five-Year Plan is coming to a close. It has achieved a little, in the terms of bare necessities of life, though we are very far off as yet, where sufficiency in protective diet and raiment and adequacy in shelter is concerned. We stand where we were in education and literacy, or rather in ignorance and illiteracy, and our progress has been remarkably and lamentably downhill in moral values and mental rectitude.

Various utopian schemes are in a formative stage in the framing of the Second Five-Year Plan. Academic controversies are being engaged into on the lines of warfare in mediaeval China, where great armies won or lost battles without striking a blow. Mass employment is being planned without taking into consideration the most essential factors that govern the relations between the job and the worker, namely, training, fitness and efficiency. Increment of income is being planned for—or rather hoped for—without taking into consideration the inevitable and steep rise in the cost of living, if mechanical production is primarily frozen and replaced by manual work. And finally decisions are being sought on the basis of shibboleths and abstract hypotheses, while the entire nation is groaning under the stress and strain of inadequacy in all spheres of life, on the basic principles of

Big Four Conference

The "summit" meeting of the "Big Four" Powers was held in Geneva in the neutral territory of Switzerland from July 18 to July 23. The participants were: From the U.S.A., President Dwight D. Eisenhower and Secretary of State, Mr. John Foster Dulles; from the United Kingdom, Prime Minister Sir Anthony Eden and Foreign Secretary Mr. Harold Macmillan; from the Union of Soviet Socialist Republics, Prime Minister Nikolai Alexandrovitch Bulganin, Foreign Minister M. Vyacheslav Molotov, Defence Minister Marshal Zhukov, Communist Party leader Nikita Khurshev and Deputy Foreign Minister Andrei Gromyko.

This was the first occasion since the end of the War in 1945 that the executive heads of the Four Powers were meeting together for mutual consultations. The subjects for discussion in the meeting were, in the order of discussions held, reunification of Germany, European Security, Disarmament problem and the development of East-West contact.

The conference concluded with an agreement that the Foreign Ministers of the Four Powers should meet in Geneva in October next to consider the directives of the "Big Four."

Under the directives the Foreign Ministers were instructed to consider various proposals for the purpose of establishing European security and the solution of the German problem. Accordingly, among other proposals, the Foreign Ministers would consider:

"A security pact for Europe or a part of Europe including provision for the assumption by member-nations of an obligation not to resort to force and to deny assistance to an aggressor.

"A limitation, control and inspection in regard to armed forces and armaments.

"Establishment between East and West of a zone in which the deposition of armed forces will be subject to mutual agreement."

The Heads of the Four Governments also agreed that the settlement of the German question and the reunification of Germany by means of free elections shall be carried out in conformity with the national interests of the German people and the interests of European security. The Foreign Ministers will make whatever arrangements they may consider for the participation or for consultation with other interested parties.

The Directives further recorded the agreement of the Big Four "to work together to develop an acceptable system of disarmament through the Sub-Committee of the United Nations Disarmament Commission."

The Big Four proposed that the next meeting of the Sub-committee be held on August 29, 1955, in New York and instructed their representatives on the

Sub-committee to take account of the views of the Heads of the four Governments.

The Four Heads of Governments instructed their Foreign Ministers "to take note of the proceedings in the Disarmament Commission, to take account of the views and proposals advanced by the Heads of Government at this conference, and to consider whether the four Governments can take any further useful initiative in the field of disarmament."

The Foreign Ministers were further instructed to study measures, "by means of exchange," to bring about a progressive elimination of barriers interfering with free communications and peaceful trade between peoples and to "bring about such free contacts and exchanges as are to the mutual advantage of the countries and peoples concerned."

In conclusion the directives said: "The Foreign Ministers of the Powers will meet at Geneva during October to initiate their consideration of those questions and to determine the organisation of their work."

The British and American spokesmen said after the conference that agreement had been reached on all points. The Soviet spokesman said that the conference had "come to a victorious end."

President Eisenhower told the final session of the conference that "the prospects of a lasting peace, well-being and broader freedom are brighter and the dangers of the overwhelming tragedy of the modern war are less."

The President added: "If our peoples in the months and years ahead broaden their knowledge and understanding of each other as we during this week have broadened our knowledge of each other, further agreement between our Governments may be facilitated. May this occur in a spirit of justice. May it result in improved well-being, greater freedom and less of fear or suffering or distress for mankind. May it be marked by more of goodwill among men. These days will then indeed be ever remembered."

Marshal Bulganin said in his concluding speech: "There is no doubt that the present meeting in Geneva of the Heads of Governments of the Four Big Powers has a positive meaning for the easing of tension in the relations between the Governments and for the inevitable increase in confidence between them."

"Despite the fact that on some questions, our points of view did not coincide, on the whole the meeting proceeded in an honest atmosphere and was marked by the efforts of its participants to achieve mutual understanding."

They all recognised the importance of the decisions made in Geneva, Marshal Bulganin added: "These decisions will have a positive meaning also for other countries and for the strengthening of world peace."

If the spirit of co-operation displayed in the

Geneva parleys was "shown by all of us," Marshal Bulganin continued, "this will be reliable pledge that the noble goal of the maintenance of peace will be achieved and the peoples will be able to look calmly towards the morrow."

The conference was presided over by the Four Heads of Governments by rotation.

The Western Powers led by the U.S.A. presented a compact front. They concentrated their emphasis on the solution of the German problem as the key to the overall question of peace in Europe and ultimately of the peace of the world.

Marshal Bulganin on the other hand accorded the German problem only a secondary place, emphasizing that the German question would be automatically solved if a general system of European security was established.

The *Statesman's* special correspondent in Geneva, Shri Prem Bhatia, adds: "Unlike the Western spokesmen who were totally silent on the subject, the Russian Premier reminded the conference of the importance of Asian problems, and in enumerating the causes of relaxation of world tension mentioned Mr. Nehru's visit to Russia."

The omission of all reference to the Far East in the agenda, *Reuter* says, was a distinct gain for the Western view.

Marshal Bulganin proposed a two-point European security plan beginning with the "freezing of NATO and its Eastern counterpart at their existing strengths." The second phase envisaged the progressive dismantling, and eventual liquidation, of both the 15-nation Western alliance and the 8-nation alliance set up in Warsaw in May last. He also called for the withdrawal of all foreign forces from Europe.

The Soviet Union had decided to demobilise the troops withdrawn from Austria, Marshal Bulganin said and called upon the Western Powers to do likewise. He rejected President Eisenhower's assertion that international communism was a subject for the Four-Power meeting. The conference had been convened to discuss the problem of inter-State relations, not "the activities of some or other political parties in various countries or relations between those parties."

Marshal Bulganin said that his Government had decided to contribute to the international pool of atomic materials of the International Atomic Energy Agency an appropriate amount of fissionable materials as soon as agreement on setting up the Agency was reached.

Referring to the levels of armaments of the Powers, Marshal Bulganin said: "It would be a fact of great importance if this conference were to come out in favour of an international agreement embodying our common consent to establish the level of the armed Forces of the USA, the USSR and China

at 1 to 1½ million men for each, and of Britain and France at 650,000 men, and to limit the levels of the Armed Forces for all other States to 150,000 to 200,000 men."

He further said that in the opinion of the Soviet Government, the present conference should not wait for the conclusion of a general international convention, which might take a certain amount of time, but should reach agreement on obligations which France, Great Britain, the USA and the USSR would assume not to be the first to use the A- and H-Bombs against any country and to appeal to all other States to join that declaration. An exception might be allowed exclusively for purposes of defence against aggression, when the Security Council would take a corresponding decision.

He said that conditions were not yet ripe for the reunification of Germany and rejected a British proposal for a non-aggression pact guaranteed by the Soviet Union, the West and a United Germany.

Marshal Bulganin proposed a 50-year treaty embracing all European States irrespective of their political systems, and the "two Germanies." The USA could also join such a pact.

Reuter says that Marshal Bulganin's proposal for a new security pact for Europe was based on a plan put forward a year ago, but amended to permit existing mutual aid treaties to continue until the expiration of an agreed time limit.

According to the news agency, the modifications were: (1) The preamble of this draft plans said its aim was to facilitate an early settlement of the German problem; (2) the pact now envisaged U.S. participation; (3) it contained references to economical and cultural contacts between East and West; (4) it referred to Chinese observers on any organizations which might be set up within the framework of that pact; and (5) it contained the two-stage concept put forward during the Geneva talks by the USSR.

Launching the historic conference President Eisenhower called for starting "diplomacy in a new spirit." He said that the West was ready to consider "reciprocal safeguards which are reasonable and practicable" to achieve German unity. But "the American people feel strongly that certain peoples of Eastern Europe, many with a long and proud record of national existence," had not been given the freedom promised in the war-time agreement.

He referred to the threat presented by international communism and said: "For 38 years now its activities have disturbed relations between other nations and the Soviet Union. Its activities are not confined to efforts to persuade. It seeks throughout the world to subvert lawful governments and to subject nations to alien domination."

There was the overriding problem of armament

which was "at once a result and a cause of existing tension and distrust. Contrary to a basic purpose of the United Nations Charter, armaments now divert much of man's effort from creative to non-productive uses. We would all like to end that.

Mr. Eisenhower continued: "Surprise attack has a capacity for destruction far beyond anything which man has as yet known. So each of us deems it vital that there should be means to deter such attack. Perhaps, therefore, we should consider whether the problem of limitation of armament may not best be approached by seeking—as a first step—dependable ways to supervise and inspect military establishments, so that there can be no frightful surprises, whether by sudden attack or by secret violation of agreed restrictions. In this field nothing is more important than that we explore together one challenging and central problem of effective mutual inspection. Such a system is the foundation for real disarmament."

The President said: "Let me repeat I trust that we are not here merely to catalogue our differences. We are not here to repeat the same dreary exercises that have characterised most of our negotiations of the past 10 years. We are here in response to the peaceful aspirations of mankind to start the kind of discussions which will inject a new spirit into our diplomacy, and to launch fresh negotiations under conditions of good augury."

In a subsequent statement before the conference on the question of disarmament, President Eisenhower said on July 21 that no sound and reliable agreement could be made unless it was completely covered by an inspection and reporting system adequate to support every portion of the agreement. "The lessons of history teach us that disarmament agreement without adequate reciprocal inspection increase the dangers of war and do not brighten the prospects of peace."

He said that as no effective method of inspection of the "true budgetary facts of total expenditures for armament," had yet been invented he proposed that the Big Four should immediately conclude an agreement "to give to each other a complete blueprint of our military establishments, from beginning to end, from one end of our countries to the other. Lay out the establishments and provide the blueprints to each other."

"Next, to provide within our countries facilities for aerial photography to the other country—"

The British and French Premiers readily accorded their wholehearted approval to the Eisenhower "Exchange of Blueprints" plan.

Soviet spokesman said that while the Soviet Union did not doubt the sincerity of the U.S. President, it was not satisfied with the suggestion for the exchange of blueprints of military establishments and for aerial inspection of each other's territory because the Eisenhower proposal bypassed the basic

disarmament issue—the prohibition of nuclear weapons.

Giving the impression the Eisenhower proposals created in Geneva, Shri Prem Bhatia writes in *the Statesman*: "To another section of opinion in Geneva—and this was far from confined to the Cominform—the American offer was unfortunate because it was unrealistic and impracticable. It belonged to the realm of phantasy."

"Inasmuch as the Eisenhower plan was regarded as incapable of implementation, it did no service to the cause for which the Big Four conference assembled, but on the contrary, had encouraged an amusing game of competitive argument."

The French Premier, M. Edgar Faure presented the conference with a "Butter for Guns" plan. His plan for an "International Fund for Equipment and Mutual Aid" envisaged the use of the savings made by arms reductions to help industrially underdeveloped areas.

He suggested that the Big Four should take initiative in facilitating free cultural information and economic relations among nations, as the best means for ending the cold war. Another suggestion he made was that Western Germany should give Russia, as it had given the signatories of the Paris Agreements, an assurance that it would not use force to obtain the reunification of Germany or modification of the present frontiers. He considered the reunification of Germany was the key to the solution of all other problems.

The British Prime Minister, Sir Anthony Eden, said in his opening speech that his Government was prepared to participate in a "security pact of which those around the table and a united Germany might be members." He also put forward a suggestion for examining the possibility of a remilitarized area between the East and the West.

"Charted at Geneva"

The international edition of the *New York Times* in its issue of July 24, gives under the above caption, a summary of the results of the "summit" talks of Geneva. We reproduce the relevant portion below, in order to record the reaction of the informed and more sober part of the U. S. press:

Out of six days of talk last week at the summit of the Big Four there emerged these broad conclusions:

First, after ten rancorous years, direct communication was established among the heads of government of East and West on terms approaching cordiality and goodwill.

Second, the Russians nevertheless showed no sign of yielding on the hard issues that cleave the free and Communist worlds.

Third, President Eisenhower asserted the American will for peace with a force that left a deep impression in much of the watching world. He appeared to have gone far toward undermining the recurrent Soviet propa-

ganda theme—that the U. S. and the security system it has erected against communism are the chief dangers to world peace.

The nature of the Geneva conference was evident in the pattern of action that unfolded during the six days. At the summit there were plenary sessions in which the leaders for the most part exchanged pledges of good intent and put on the table proposals—some old, some new, some modest, some bold—that at no time came into detailed debate.

Below the summit the diplomatic workmen—the foreign ministers—came to grips with what proved to be the chief question Geneva had to settle. This was: How to negotiate in the future on the hard issues between East and West? The chief stumbling block was the perennial of Germany. As the week wore on the ministers seemed to be wrangling and lawyering in the familiar cold-war fashion.

Yesterday they passed the question up to the summit. Last evening came the agreement: The Foreign Ministers will meet in October in Geneva on all the major issues in dispute. Discussion of disarmament in the United Nations will be given new impetus. The directives from the summit take account of the proposals brought forth in Geneva.

Narrow though this agreement was, it was no less than any of the Powers had led the world to expect. Nevertheless, Geneva made plain that diplomatic trouble is ahead on the issue of Germany. It demonstrated that Big Four agreement on German unification is remote. The pressures on Chancellor Adenauer to deal directly with the Russians on unification in conversations projected for September have multiplied.

The prospect of dealings between Bonn and Moscow holds dangers for the West. Still, the feeling is that Geneva has represented a turning for the better in East-West relations—if only because the conciliatory atmosphere they themselves helped create and the spiking of some of their propaganda guns have limited the Russians' field for maneuver.

When Sir Winston Churchill first proposed the summit meeting on May 11, 1953, it was not with the expectation that the heads of government could quickly reach "hardfaced agreements" on the vast array problems that lay at the bottom of the frozen antagonism of East and West.

Rather he hoped to find out whether the slight thaw in Soviet policy following the death of Stalin was indeed genuine, and also to capitalize on the war-weariness of mankind, the world-wide fears engendered by the appalling spectre of atomic war.

It was with this aim in mind—that somehow the leaders of nations by the very fact of coming to know one another better could inspire a mutual trust that would act as a solvent for problems in later negotiations—that Churchill proposed an intimate meeting, not overhung with a ponderous and rigid agenda.

As it turned out, the Geneva conference did not in

all respects follow the Churchill formula. There was an agenda. There was an array of experts—"Sherpa guides," as one British wit put it, behind "the mountaineers" at the summit.

Nevertheless, the Churchill idea was not lost sight of in the arrangements for the conference. Thus the first day of the conference was given over to statements by the leaders. The plain intent and hope was that their opening statements should set a note of conciliation, optimism and resolve.

Thereafter, the foreign ministers met each morning at eleven, the heads of state at four in the afternoon. In this way the working level—the level that is likely to prove acrimonious—was kept apart from the level of good intent and high purpose. Then late each afternoon, to facilitate those "intimate contacts" on which Churchill had set store, there was a buffet where the principals moved about, making small talk.

U. S. and Nehru's Tour

Sardar J. J. Singh, the President of the India League of America and the writer of the subjoined letter, has sent it to us. In view of the conclusion of the Geneva talks this letter is of interest:

TO THE EDITOR OF THE NEW YORK TIMES

The United States press, radio and other media of information have been quite critical of Nehru's visit to the Soviet Union. Your own editorial was quite severe. Americans were not happy either to hear that Nehru had invited Premier Bulganin to visit India. Above all, they were quite annoyed that a joint statement was issued by Nehru and Bulganin.

I venture to suggest that Nehru's visit to the Soviet Union, especially in long-range terms, will be very beneficial and helpful to the cause of the free world.

Those who have had the opportunity of watching Chinese Premier Chou En-lai at Geneva last summer and later at New Delhi and Rangoon and again early this year at the Bandung conference maintain that contacts with the outside world, and meeting people like Eden, Mendes-France, Nehru, U Nu and other Asian and African leaders at Bandung, have left a deep mark on Chou En-lai. It is hoped that Bulganin, too, may learn a lesson or two in the free atmosphere of a democratic republic like India.

In the deluge of criticism of the joint statement issued by Premier Bulganin and Prime Minister Nehru, one very important point went unnoticed.

Prime Minister Nehru has unequivocally declared that the activities of the Cominform represent interference in the internal affairs of other countries. Not only has Nehru come out against the Cominform, but the Congress party, the ruling party of India, has officially denounced the activities of the Cominform.

Yet Prime Minister Nehru got Marshal Bulganin to sign a statement in which one of the clauses provides for "non-interference in each other's internal affairs for

any reason, either of economic, political or ideological character." Informed sources in India believe that as a result of the Nehru-Bulganin joint declaration the Cominform is likely to be dissolved. If that happens, it will be most welcome and excellent news. We all know that the danger of overt aggression by the Communists has been greatly lessened, but not the danger of subversion.

It is true that even if the Cominform was dissolved, subversive activities could be continued. But having agreed to non-interference in the affairs of other countries in a joint declaration, if the Communists surreptitiously continue their activities, they will be doubly condemned. Then Asians, too, will lose all faith and trust in the written promises of the Communists.

One more point: The headlines and interpretive writings have created the impression that the joint statement of Prime Minister Nehru and Premier Bulganin took the "extreme" position on Formosa of handing it over to Communist China. This is not correct.

The clause on Formosa in the declaration reads as follows: "It is the earnest hope of both the Prime Ministers that it will be possible by peaceful means to satisfy the legitimate rights of the Chinese People's Republic in regard to Taiwan" (Formosa). The operative word in this sentence is "legitimate." Who is to decide what are the legitimate rights of the Chinese People's Republic in Formosa? The Prime Ministers did not say that in their opinion the "legitimate rights" of the Chinese Communists are that Formosa should be handed over to them.

It is obvious from this statement that the question of the "legitimate rights" must be negotiated, perhaps at a round-table conference, under international auspices. This is not much different from the British or the American position.

And what is even more important is the fact that Prime Minister Bulganin agreed to a settlement of the Formosa question by peaceful means.

Finally, one need have no fears that Prime Minister Nehru was "taken in," during his visit to the Soviet Union, or that he is so naive as not to see the difference between dictatorships and free countries. Nehru is one of the greatest living champions of the democratic way of life and the dignity of man. He has fought for these principles all through his life, and he will die fighting for them. And, what is more, his faith in democracy is so complete and intense that he has no cringing fear of communism.

Vandalism in Vietnam

The world witnessed an unprecedented spectacle when on July 20 Government-supported rioters in South Viet Nam attacked the headquarters of the International Truce Supervisory Commission for Vietnam at Saigon with the police looking on silently. The demonstrators, according to *Reuters*, "entered the Hotel Majestic, the biggest in the city, and ransacked the

rooms of the Indian, Canadian and Polish delegates to the Truce Control Commission.

"Papers and personal property of the Control Commission's Indian Chairman, Mr. M. J. Desai, were thrown from the window of his hotel room; the public rooms were also ransacked.

"Mr. Desai and other Indian, Canadian, and Polish members of the Commission lost in their belongings in the attack. A civilian member of the Commission for Laos, who was on leave in Saigon, was injured."

Demonstration against the Commission was organised all over South Viet Nam. However, the mobile teams of the Commission in outlying areas escaped injury.

Mr. M. J. Desai, Chairman of the Commission, lodged a strong protest with Mr. Ngo Dinh Diem, the South Viet Nam Premier.

Reuters adds: "The Chief of Staff to the Commission, Brigadier B. S. Bhagat of India, said that the Commission could not operate unless it received co-operation from the Government. 'How can it continue with its work if the safety of its members is not assured?' he asked.

"A French spokesman said General Jacquot, French Commissioner-General in Indo-China, told Mr. Diem today (July 20) that he was 'astounded' to hear of the excesses after he had the strongest assurances from the Government that the security of the International Truce Commission members would be guarded."

The International Truce Supervisory Commission in a resolution asked for effective security measures for its personnel and headquarters and stated that the Commission could not function without those safeguards. At the request of the Commission the resolution was forwarded by the Government of India to the two co-chairmen of the last year's Geneva Conference, which ended the war in Indo-China, Sir Anthony Eden and M. Molotov.

The Government of India, on receipt of the reports of the happenings in Saigon, informed Sir Anthony and M. Molotov of the situation that had arisen and requested them to issue necessary directions to the parties concerned. The two statesmen are reported to have endorsed the anxiety expressed by the Government of India over the incidents in Saigon.

The Soviet Government condemned the riots and handed a Note to the British Charge d'Affaires in Moscow urging Britain to join the Soviet Union in asking France and South Viet Nam to ensure the security of the International Commission.

That the attack on the members of the International Supervisory Commission was premeditated and had the backing of the South Viet Nam Government could hardly be questioned. A few days before

the violence was organized the South Viet Nam Government in a unanimous resolution had decided upon "elimination of Polish and Indian pro-Communist elements" in the Truce Supervisory Commission. On the day, the disturbances occurred, the South Viet Nam Government was to open talks with the Government of North Viet Nam for holding elections in the country according to the terms of the last year's Geneva Agreement. The South Viet Nam Government did not try to conceal its reluctance to take part in those talks and the day (July 20) was declared as a "day of mourning" for the people of South Viet Nam. *Reuters* reported from Saigon on July 19 that Police Headquarters in the city had called on all dance halls, theatres and cinemas to remain closed on July 20. Reiterating the South Viet Nam's Government's unwillingness to take part in talks with the North Viet Nam Government on elections to reunify the country Mr. Diem said in a broadcast on July 16: "We have not signed the Geneva agreements, we are not bound in any way by these agreements, signed against the will of the Vietnamese people."

What was more striking however was the fact in his broadcast after the disgraceful happenings in Saigon Mr. Diem as head of a Government did not consider it worthwhile to offer an apology for the outrage. He only warned the people against "misplaced gestures." *Reuters* reports: "He (Mr. Diem) made no apology for the riots. He said that during the demonstrations, 'which constitute clear proof of the determination of the people to combat Communism, some regrettable incidents occurred.' He said that of the 100,000 demonstrators, who showed 'far-sighted nationalism and the strictest discipline, a small number of about 100 people entered two hotels where officers of the Viet Nam liaison had been seen in recent days'."

Mr. Diem continued: "Contrary to certain erroneous press reports, only some material damage occurred in an atmosphere of general excitement. The Government has decided to repair these damages."

The Foreign Minister of South Viet Nam, Mr. Vu Van Mau, it is reported, told Mr. M. J. Desai that the demonstration had been against Communists and not against the International Commission. But Mr. Desai rejected that explanation and pointed to the fact that the demonstrators had systematically wrecked rooms belonging to Commission members and that police had stood by without interfering.

The *London Times* writes in an editorial article on July 21, the day following the disturbances in Saigon: "The mob's attack seems to have been vicious and well prepared and have already been severely condemned by the British Government among others. But after protests have been made and the Government in Saigon rightly condemned

for failing to prevent—even if it did not actively stimulate—the riots the intractable problem of what is to happen next remains."

Referring to Mr. Diem's assertions that as he was not a signatory to the Geneva Agreement of July 21, 1954, he was under no obligation to hold talks with the North Viet Nam Government for holding elections for the reunification of the country, the *Statesman* writes editorially on July 20:

"Mr. Diem's case can, even on the best interpretation, hardly bear scrutiny. He loudly proclaims he did not sign the cease-fire agreement on July 21, 1954. This seems to be totally irrelevant, since the provisions for elections are not contained in that agreement but in the eight-nation declaration of the previous day, which was signed by the Viet Nam Delegation at a time when he was Premier . . ."

Election Prospects in Indo-China

For some time past signs of anxiety could be visible about the prospects of holding elections in Indo-China for the reunification of the country, according to the terms of the Geneva Agreement, 1954. The attitude of the U.S.-backed Diem Government of South Viet Nam was particularly unhelpful in this connection. While on his recent European tour Pandit Nehru discussed this matter with the Soviet and British Governments whose representatives were the two co-Chairmen of the Geneva Conference. So far all persuasions have failed to convince the government of Mr. Diem the reasonableness of holding discussions on elections. The "Big Three" Western Powers—Britain, the U.S.A. and France—have reportedly asked the Diem Government to open immediate talks on elections.

The future is still uncertain. If Mr. Diem yields to the pressure of the "Big Three" it would mean a complete repudiation of his stand so long. Observers have pointed out that Mr. Diem's course of action would be largely determined by the attitude of the U.S.A. "He can defy Britain and France without suffering much but if the U.S.A., which has buttressed his government through a year of often precarious existence, should threaten to withdraw support, his position as Prime Minister will be untenable."

Nehru on Vietnam Riots

Pandit Nehru's statement in Parliament is as follows:

"July, 27.—Prime Minister Nehru told the Lok Sabha on Wednesday morning that the South Vietnam Government had offered to pay compensation to the International Truce Commission for the damages done during the Saigon riot of July 20.

"It was a matter to be dealt with by the Commission. The Government of India did not come into the picture. Sri Nehru who was replying to a short-notice question

put by four members of the House, said and added that it was for the Commission now to decide how to deal with it.

"The Government of India," Sri Nehru said, "undertook the chairmanship of the International Commission on the clear understanding of protection and co-operation of the Governments concerned. It is clear that the International Commission cannot function unless there is full safety and protection for them."

"The International Commission proposes to continue to work in the hope that the efforts of the two co-Chairmen will succeed and their directions will be heeded," he added.

"Referring to his message to the two co-Chairmen of the Geneva Conference, Sir Anthony Eden and M. Molotov, the Prime Minister said that both of them had condemned the incidents and assured them that they were taking steps to ensure adequate protection to the International Commission in the discharge of their duties.

"The two co-Chairmen had conferred with each other and also consulted representatives of the United States of America and France and it is understood that all those Four Powers had strongly urged the South Vietnam Government to take all necessary action for the proper functioning of the International Commission as well as for steps to be taken to organise elections in terms of the Geneva agreement.

"It would appear that these demonstrations and attacks against the International Commission," Sri Nehru said, "had been planned previously. As there had been some previous demonstrations, the Commission had, on July 13, drawn the attention of the authorities to the need for maintaining law and order and adequate security. Apparently, this request was not heeded" he added.

"I should like to record our Government's appreciation of the courage and determination shown by all the members of the International Commission in the difficult situation that suddenly confronted them," said Prime Minister Nehru who read a statement to give details about the July 20 riot in Saigon."

Eisenhower-U Nu Statement

As is known widely U Nu, the Premier of Burma, paid a visit to the U.S.A. recently. At the end of his visit and after the talks with the President of the U. S., a joint statement was issued, which is given in the subjoined news item:

"Washington, July 2.—President Eisenhower and the Premier of Burma, U Nu, said in a joint statement today that they had reviewed, together the problem of the eleven United States fliers imprisoned in Communist China. The two leaders also had a 'frank discussion' of the major point of difference between Rangoon and Washington, the fact that the United States had been shipping surplus rice to countries in Asia that normally imported it from Burma.

James C. Hagerty, White House press secretary,

declined to elaborate on the language of the joint statement when he was asked whether the heads of government had taken any decisions on either the rice or the prisoner problem."

Following is the text of a joint statement by President Eisenhower and Burmese Premier U Nu:

"The Prime Minister of Burma, His Excellency U Nu, has visited Washington for three days at the invitation of President Eisenhower. The President and the Prime Minister discussed many matters of common concern and exchanged views on current international problems.

"The Prime Minister, the President and the Secretary of State reviewed problems of peace and security in Asia. They had a frank discussion of the complex economic problems arising from the existence of substantial surpluses of exportable rice both in Burma—one of the world's leading rice exporting countries—and in the United States.

"Note was taken of the salutary influence of religion as exemplified by the sixth Buddhist Synod presently being held in Rangoon and attended by leading Buddhist scholars from many nations.

"The problem of imprisoned American fliers in Communist China was reviewed.

"These talks have been of special value in increasing mutual understanding between Burma and the United States. There is a wide area of agreement and a traditional friendship between Burma and the United States resting firmly upon certain noble concepts to which both countries subscribe. Our two peoples, those of the United States and the Union of Burma, share two fundamental goals, a peaceful world and a democratic way of life.

"They reaffirmed their dedication to the ideal of peace and friendly co-operation amongst nations founded on international justice and morality. Both countries are deeply concerned with a subject that is predominant in the minds of all responsible world leaders today—problem of achieving peace with justice, a peace based upon the liberty of human beings and the security of nations.

"Such a peace can best be achieved by loyal steadfast support for the Charter of the United Nations. That is the surest and most practical avenue along which to seek peace with justice in this world. A patient striving to uphold the fundamental, moral and religious beliefs underlying the Charter provides the best hope for the fulfillment of mankind's aspirations.

"The Prime Minister, the President and the Secretary of State deplored the conditions which force the peoples of the world to divert their energies and talents from a singleminded effort to improve and expand those cultural and economic opportunities by which men can raise the levels of their existence. They renewed their own determination to uphold the principles of the United Nations in its unceasing effort to save mankind from the scourge of future war."

Nehru in Belgrade

Pandit Nehru's statement at Belgrade is of interest as it foreshadowed the Big Four talks at Geneva. We adjoin the news summary:

"Belgrade, Yugoslavia, July 2.—War is out of the question in this age, Prime Minister Jawaharlal Nehru said today in an address before the Yugoslav Parliament.

"The Indian leader, who received an ovation, asserted that war was 'a relic of a barbarous past.' The only alternative to it, he added, is peaceful coexistence between nations and an attempt to solve problems peacefully through negotiation.

"Such a policy, he said, is neither neutrality nor an attempt to build up a third bloc but a dynamic participation in world events.

"Discussing East-West relations, Mr. Nehru said an Iron Curtain did exist.

"Five days ago in Vienna the Indian leader hesitated to give his impression of the Soviet Union. In response to questions then, he exclaimed: 'What Iron Curtain? I never noticed any curtain, iron or otherwise.'

"Today, Mr. Nehru said: 'We often hear of the Iron Curtain. I think there is some truth in this.'

"But he added, the 'greatest Iron Curtain of all' is the Iron Curtain of the mind.

"This seems to be an allusion to the West perhaps more than to the Soviet Union. The Iron Curtain of the mind, said Mr. Nehru, bars people from seeing the most obvious facts about the major problems facing world statesmen. He said these problems were the Far East, Germany and disarmament.

"There is the great country of (Communist) China, which is denied admittance in the United Nations," said the Indian Prime Minister. 'Anything more absurd than this seems to me difficult to imagine.'

"Mr. Nehru's speech was well received not only because he identified his and the Yugoslav policies but because he affirmed the Indian Government's aim in pursuing socialism."

"Mr. Nehru said he had no 'easy remedy' to suggest for the hatred and lack of security that many nations felt, but he offered the following code in which he believes:

"Freedom and independence of his own and other countries.

"Freedom of the individual and the democratic system of working.

"Recognition that suppression of a nation is an 'evil thing and prevents its growth.'

"The necessity of opposing evil and of not willingly tolerating it, but doing so not with greater evil or violence.

"Nearly two thousand years ago, it was said by a very great man that 'those who take to the sword shall perish by the sword,' said the Indian Prime Minister.

"However, Mr. Nehru sharply criticized the use of the word peace as a slogan.

"There is danger that even good words and good ideas might lose their value by the wrong use," he declared. 'Peace should be peaceful. It should not shout or use the language of threat or condemnation.'

Currency and Finance in 1954-55

The Reserve Bank's Report on Currency and Finance for 1954-55 consists, as usual, of a brief survey of international economic developments in Part I, as a background for a detailed review of the Indian economy in Part II. It also contains a wealth of statistical material, in the form of tables and graphs, setting out the data for the Plan period from 1951-52 to 1954-55.

International economic developments: According to the Report, world economy in 1954, assisted by the lessening of international political tensions, gained in strength and continued to be relatively stable. Production was well maintained, prices were generally stable and the international payments position recorded a further improvement. The relatively mild 'inventory recession' that took place in the USA between the summer of 1953 and the spring of 1954, was followed by a recovery, particularly in the last quarter of the year. Monetary and credit policies continued to be flexible in several countries during 1954 as in the past few years, and tended to be liberal for the greater part of the year. Towards the end, however, and particularly in the first quarter of 1955, they were tightened in some countries with the emergence of inflationary symptoms. In the UK, for instance, while monetary policy for most of the year was directed towards easing and cheapening Bank credit, the Bank rate was raised twice within a month in January and February, 1955, from 3 per cent to 4½ per cent—the highest rate since 1932—to correct the weakness of the pound sterling and the inflationary upsurge in the internal economy. In the USA also, the monetary authorities continued their policy of 'active ease' until towards the close of the year, but with the moderate recovery in business conditions and the unprecedented boom in the stock market, the authorities moderated their policy by a shift from active ease to one of less active ease. Trends in the capital market in the leading countries generally reflected the internal economic stability and the prospect of continuing economic growth in those countries, rather than international developments and speculative activities. Gilt-edged ruled, on the whole, firm; equities were buoyant and the new issue market was more active than in 1953.

Budgetary policies in the advanced countries were generally directed towards increasing the tempo of economic activity, while, in the underdeveloped countries, they continued to reflect the need to raise larger revenues to finance development programmes in the public sector and at the same time to stimulate savings and investment. In the sphere of trade and balance of payments, economic developments in the USA, along with the continuation of its defence and economic aid, led to an increase in the reserves of other countries, particularly of Western Europe and the sterling area.

This strengthening of the foreign exchange position together with an improvement in the volume and balance of world trade enabled a number of countries, especially in Western Europe, to relax generally their restrictions on trade and payments, including some against dollar imports, and made the climate more favourable for further efforts in the direction of currency convertibility.

The US Congress in 1954 did not give its consent to the President's liberal trade programme, drawn in the light of the Randall Commission's recommendations, and voted for only a year's extension of the Reciprocal Trade Agreements Act. In February 1955, however, the Reciprocal Trade Agreements Bill was narrowly passed by the House of Representatives without any amendment. The Bill seeks, among other things, to extend for three years the Reciprocal Trade Agreements Act with amendments to empower the President as follows: (1) to reduce present tariff rates on individual commodities by as much as 5 per cent per year in each of three years of the new Act, (2) to reduce tariff rates in greater degree in the case of products now imported in negligible volume, and (3) to reduce to 50 per cent any rate in excess of that level.

Indian Economy: Against the background of these international developments, the Report proceeds to review the major economic and financial developments in India during the year ended March 1955. Economic developments, the Report observes, were marked by a considerable expansion in industrial output, a substantial increase in money supply and a decline in prices along with enlarged budgetary deficits, a small surplus on the external account and a better flow of savings. The growth in budgetary deficits of the Central Government and the States indicated the quickened pace of developmental expenditure, which partly made up for the relatively slow progress in the preceding three years. Nevertheless, there was no evidence of an emergence of inflationary pressures and the economy made considerable progress during the year with a measure of overall stability.

Two disquieting features were the sharp fall in agricultural prices and the continued seriousness of unemployment. Over the year, while the general index of wholesale prices showed a decline of 10 per cent, the group index for food articles fell by as much as 20 per cent. The fall in agricultural prices may not continue indefinitely, for, the supply position in 1954-55 was assisted by a run of three good monsoons, which is unusual, and by dishoarding which followed the virtual elimination of controls over foodgrains early in the year. To some extent, the recent decline in prices appears to be a corrective to the earlier high levels; and a lower level of foodgrain prices provides a better base for rapid economic development. But a steep decline, such as tended to occur in some commodities, is liable to cause widespread distress, and particularly if it is due to temporary causes, to lead to some avoidable distortions in the production pattern; it called for State

intervention to smoothen extreme fluctuations in the prices of a few agricultural commodities. To meet the problem of unemployment, labour-intensive schemes were added in 1953-54 to the original Five-Year Plan, while during the year, special steps were also taken to stimulate the expansion of small-scale and cottage industries.

Industrial production in 1954, the Report states, was 8 per cent higher than in 1953, which was itself 5 per cent higher than in 1952. Since the inauguration of the Plan, industrial output has increased by about 40 per cent. Among the factors contributing to the uptrend during 1954 were greater availability of raw materials, better export offtake and continued improvement in labour management relations. Agricultural output also showed a record increase in 1953-54, the estimated output of foodgrains surpassing the target fixed for the Five-Year Plan by nearly 4½ million tons. For 1954-55, total agricultural output is expected to be around the peak level reached in 1953-54.

In line with higher output, the need for larger private finance on the relaxation of controls and the increasing tempo of economic development, money supply, figures for which have been revised to take into account the circulation of *Hali Sicca* currency, showed a substantial rise of Rs. 124 crores or 7 per cent during 1954-55; in the previous year, it had risen by Rs. 72 crores. The increase stemmed mainly from two factors, namely, the Union Government's budgetary deficit and the growth in bank credit. Net borrowings by the Government from the Reserve Bank amounted to Rs. 104 crores; this along with the net decline in cash balances makes a total of Rs. 110 crores reflecting the impact of the budget deficit on money supply. Open market operations of the Reserve Bank, however, tended to curtail money supply to some extent. During the greater part of the year, there was a general broadening of the demand for funds, which was met by banks without any undue strain on their resources on account of the appreciable growth in bank deposits as well as the larger volume of seasonal finance made available by the Reserve Bank. The expansion in the resources of the banking system would indicate that the post-Partition trend of deposit contraction has probably given place to a new phase of expansion under the impetus of development expenditure and deficit financing. The decline in prices would indicate that the expansion in money supply in 1954-55 was far from being inflationary.

In the field of rural finance, a significant event during the year was the publication of the General Report of the Committee of Direction of the All-India Rural Credit Survey. As part of their integrated scheme of rural credit, the Committee recommended the establishment of a State Bank of India, which would take over the Imperial Bank of India and certain State associate banks. Government accepted this recommendation and have since enacted the necessary legislation and set up a State Bank, which has, in the first instance, taken over only the Imperial Bank of India. The State

Bank will provide much more liberal and extensive remittance facilities and embark on a scheme of considerable branch expansion.

The capital market in India, the Report observes, reacted well to the general improvement in the country's economy. The gilt-edged ruled firm in spite of considerable borrowing by the Central Government, while the industrial share market was also buoyant for the greater part of the year. The new issue market experienced increased activity, the amount of consent granted by the Controller of Capital Issues during 1954 at Rs. 111 crores being the highest since 1948.

Reviewing Government finances, the Report states that during 1954-55, the budgetary position of the Central and State Governments showed a perceptible change from the previous year towards larger overall deficits, stemming from the rising momentum of expenditure in the public sector. In the revenue account of the Central Government, a deficit of Rs. 5 crores replaced a surplus of Rs. 8.5 crores in 1953-54, while in the combined revenue account of Part A and Part B States, the swing was wider still with a deficit of Rs. 33 crores instead of a surplus of Rs. 5 crores in the previous year. Excluding the net increase in receipts estimated under floating debt and adjusting for the net changes in investment reserves, the overall deficit of the Central Government in 1954-55 (Rs. 260 crores) was more than twice that in 1953-54 (Rs. 87 crores). In the case of Part A and Part B States, there was an adjusted overall deficit of Rs. 36 crores as against a surplus of Rs. 19 crores in 1953-54—a swing of Rs. 55 crores. For 1955-56, revenue deficits of the Centre and the States (after tax changes) are placed at Rs. 17 crores and Rs. 66 crores, and the adjusted overall deficits at Rs. 327 crores and Rs. 65 crores, respectively.

An event of special significance during the year was the submission to Government of the Report of Taxation Enquiry Commission, which contains far-reaching recommendations for widening and deepening the tax structure. A beginning in the direction of implementing the Commission's recommendations was made this year, with a provision for increases in taxation totalling about Rs. 13 crores in the Union Government's budget for 1955-56.

The balance of payments position showed a smaller surplus on current account of nearly Rs. 4 crores during the calendar year 1954 in comparison with Rs. 59 crores in 1953, but at a much higher level of trade. This sizeable reduction in the payments surplus was mainly a consequence of the larger volume of imports following the intensification of the rate of development, and occurred despite an 8 per cent improvement in the terms of trade. Region-wise, while the surpluses with the sterling area (excluding Pakistan), the dollar area and the rest of the non-sterling area other than the OEEC were reduced, the deficit with the OEEC countries widened further. With Pakistan, the last year's small deficit turned into a moderate surplus.

Control of Private Sector

In his address to the Central Advisory Council for Industries on July 22, the Union Minister for Commerce and Industry, outlining the industrial policy of the Government of India, said: "Broadly speaking, the industrial policy statement of 1948 still holds the field. It is the emphasis on different aspects of the policy that has now been clarified." He explained that industries included in the public sector would be the definite obligation of the State and development in these industries in the future by bringing into being new units would undoubtedly be the responsibility of the State. If, he added, the entrepreneur showed no enterprise, clearly the State must take the initiative itself. He further pointed out that it was neither correct nor reasonable to consider that the private sector and the public sector were two water-tight compartments and the State could not trespass into the former or that the State could not invite the co-operation of private enterprise in regard to industries in the public sector.

"We do not view with favour the concentration of wealth in a few hands," he added. There were few countries which had such contrasts between the levels of income of the poor and of the rich as India. While the solution of this problem lay in raising the incomes of the poor and their main attack was on poverty rather than wealth, the State had to ensure not only greater production of wealth but also its equitable distribution. Quite apart from this wider social purpose, the several limitations of their resources and the ambitious nature of their planning made it necessary for them to ensure that there be a careful husbanding of resources and that they were canalised into fields most essential for national development.

The private sector must, therefore, accept regulation by the State. In fact, he added, such a regulation existed even now, and the Government should claim without exaggeration that its regulatory powers had not been used to the detriment of the legitimate interests of the private sector. The Union Minister referred to the statements of the Prime Minister in which he had said that there was no desire to resort to nationalization for the mere sake of nationalization. Pandit Nehru indicated in those statements that there were plenty of fields open in which the Government could usefully invest its resources and strengthen the national economy instead of acquiring existing units owned by the private sector.

But these statements and assurances to the private sector should not be taken in their face value, but should be read in between the lines. Evidently, the Government of India has deviated considerably from its industrial policy as was enunciated in 1948. The Industries Development and Regulation Act, 1951, as amended in 1953, has undoubtedly modified the industrial policy of the Government as was defined in 1948. The Act provides for a degree of regulation and control of industries in the private sector which were quite unforeseen in the initial stage. Under this Act, the

Government of India has been empowered to take over the management of any industrial concern if it fails to carry out the directives of the Government. Further, the Industrial Policy Resolution gave assurance that the existing industries in the private sector would not be nationalised in the coming ten years. But a series of nationalisation has belied this assurance. The nationalisation of the Indian airways communications, the Imperial Bank, a few railways, and the reported decision of the Government of India to nationalize the Kolar Gold mines are just instances of the modification if not violation of the 1948 industrial policy. The nationalization of the Reserve Bank should, however, be viewed as a national imperative.

The affairs of the Sholapur Spinning and Weaving Mills Company raised great misgivings in the minds of the private industrialists. Under an Ordinance of 1950, the Government of India took over the administration and management of the Company, removing the managing directors. The Supreme Court, however, came forward to control the executive power of the Government which amounted in effect legislation for the deprivation of property without payment of compensation. This is the case of *Dwarkanadas Shrinivas v. The Sholapur Spinning and Weaving Co., Ltd.* (1954 S.C.R. 674). The Supreme Court observed that in promulgating the Ordinance, the Government had not merely taken over the superintendence of the affairs of the Company but had in effect and substance taken over the undertaking itself. In the situation the contention had no force, the Court added, that the effect of the Ordinance was that the Central Government had taken over the superintendence of the affairs of the Company and that the impugned legislation was merely regulative in character. In the present case practically all incidents of ownership had been taken over by the State and nothing had been left with the Company but the mere husk of title and in the premises the impugned statute had overstepped the limits of legitimate Social Control Legislation and had infringed the fundamental right of the Company guaranteed to it under Article 31(2) of the Constitution and was, therefore, unconstitutional.

The Supreme Court held that Article 31 is a self-contained provision delimiting the field of eminent domain and clauses (1) and (2) of Article 31 deal with the same topic of compulsory acquisition of property. Article 31 gives complete protection to private property as against executive action, no matter by what process a person is deprived of possession of it. In the opinion of the Supreme Court, it is a narrow view that "acquisition" necessarily means acquisition of title in whole or part of the property and cannot be accepted. The word "acquisition" has quite a wide concept, meaning the procuring of property or the taking of it permanently or temporarily. It does not necessarily imply acquisition of legal title by the State in the property taken possession of.

In an earlier case, the Supreme Court also held a

similar view. This was the case of *The State of West Bengal v. Subodh Gopal Bose*, (1954 S.C.R. 587). In that case Mr. Justice Das, however, tried to distinguish between, clauses (1) and (2) of Article 31, by holding that the former relates to the police power inherent in a State in taking over the property of private persons, and the latter relates to the power of eminent domain of the State under which compensation must be paid in case of acquisition for national purpose. This contention was overruled by the majority decision of the Supreme Court which held that there is no scope of "police power" of the State in the matter of acquisition of private property. The Supreme Court held in this case that Article 31 protects the right to property by defining the limitations on the power of the State to take away private property without the consent of the owner. Clauses (1) and (2) of Article 31 are not mutually exclusive in scope and content, but should be read together and understood as dealing with the same subject, namely, the protection of the right to property by means of limitations on the State's power referred to above, the deprivation contemplated in clause (1) being no other than the acquisition or taking possession of the property referred to clause (2). The main effect of these two decisions is that the State cannot acquire private property without payment of compensation, no matter whether the property was taken temporarily for management or permanently by acquisition.

However, these two important decisions on the State's right of acquisition of private property have been rendered nugatory by the fourth amendment of the Constitution. The fourth amendment has amended Article 31 and Article 31A of the Constitution to the effect that the State can take over the management of private property without acquiring it and in that case no compensation need be paid. The new Clause (2A) of Article 31 states that where a law does not provide for the transfer of the ownership or right to possession of any property to the State or to a corporation owned or controlled by the State, it shall not be deemed to provide for the compulsory acquisition or requisitioning of property, notwithstanding that it deprives any person of his property. Article 31A (b) provides that the taking over of the management of any property by the State for a limited period either in the public interest or in order to secure the proper management of the property shall not be deemed to be void on the ground that it is inconsistent with, or takes away or abridges any of the rights conferred by Article 14, Article 19, Article 31.

With the fourth amendment in operation, the industrial policy of the Government envisages larger control by the Government over the industrial concerns of the country than was contemplated under the industrial policy resolution of 1948.

Industrial Finance Corporation

When the Bill for amending the Industrial Finance Corporation came up before the House of the People for consideration on July 27, members belonging to all

parties strongly criticized the working of the Corporation. Charges of nepotism and favouritism were levelled against the Corporation in the matter of granting loans. The main allegation was that industrial concerns directly or indirectly connected with the former chairman of the Corporation, and also with several other directors were granted loans, while many industrial concerns genuinely being in need of funds were rejected any financial assistance. After the Report of the Industrial Finance Corporation Enquiry Committee was submitted to the Government, the chairman of the Corporation resigned and that was quite expected of him. Undoubtedly his was an evil influence that shrouded the working of the Corporation and stultified its growth. It was common knowledge that a large portion of the loans granted by the Corporation went to the industrial concerns connected or allied with those of the chairman and in sanctioning such loans his dominating influence was evident. But what about the managing director? He too failed in his duty and failed miserably to pilot the affairs of the Corporation to the satisfaction of all concerned in the fate of the Corporation.

The Inquiry Committee also proved to be an incompetent body because it failed to find out the real corruptions that were solely responsible for the defects in the working of the Corporation. Now some of the members of the Inquiry Committee have become vociferous in denouncing the former managing director. The chairman of the Inquiry Committee belonged to the opposition party and it may be asked why she simply "dittoed" to the findings of the majority of the Committee. She was plainly utilised for serving as a rubber stamp to the findings of the Committee that exonerated the Corporation of all major charges that were brought against it, save a few minor irregularities. Now it is no use crying over opportunities lost and missed to prove to the hilt the irregularities of the former chairman and managing director of the Corporation. It was openly alleged that they were guilty of gross misconduct and it was left to the Inquiry Committee to prove that, but it white-washed the situation.

The most glaring fault on the part of the Industrial Finance Corporation was to make an advance of several lakhs of rupees to the Sodepur Glass Works which closed its doors shortly after the money was received. The Resolution taken by the Government of India over the findings of the Inquiry Committee in this connection states: "Government agree with the view of the Enquiry Committee that the capital requirements of the projects were not properly assessed either originally or on the subsequent occasion when a re-appraisal might have been made, and that this was a major contributory cause for the difficulties met with by the Company. In the opinion of Government, though the primary responsibility for this failure must rest with the Company, the Corporation, having become involved in the fortunes of the undertaking by the grant of the loan and in default by the Company, must also bear a

measure of responsibility for such failure. The Corporation should have made a correct appraisal of the Company's needs before sanctioning the loan."

The Akali Morcha

On July 12 the Punjab Government lifted the ban on the shouting of slogans in Amritsar "to mark the great occasion of Premier Nehru's triumphant return" home. The withdrawal of the restrictive orders was followed by the decision of the Shiromani Akali Dal to suspend the 64-day-old Morcha against the government ban on linguistic slogans. Though the ban was lifted, Government did not contemplate the release of Master Tara Singh and other Akali leaders, said Shri Bhimsen Sachar, Chief Minister of Punjab. He said that law would take its own course and all law-breakers would be tried.

According to the *Statesman* correspondent in Amritsar, about 8000 odd prisoners were jailed in connection with the Morcha. The correspondent writes: "The Congress, Hindu Mahasabha, Jan Sangh and other Maha Punjab supporters are disappointed at the withdrawal of the ban; only today [July 12] they had demanded firmer action. But in the city there is general relief though anxiety still exists about future developments."

Commenting on the action of the Punjab Government in withdrawing the ban on raising slogans in support of 'Punjabi Suba' the *Kashmir Post* writes: "The explanation given by the Punjab Government for withdrawing the ban—to mark the great occasion of Mr. Nehru's triumphant return—does not, to say the least, make a convincing reading. It appears that this is just an excuse to save face for a decision, which, it is feared, would have been liable to be misunderstood."

The newspaper writes that whatever might have been the reason for the withdrawal of the ban, "the fact remains that the Punjab Government were caught on the wrong foot in connection with the Akali Morcha. The completely untenable stand taken by a large number of Hindus on the question of the Punjabi language has created a lot of bad blood among the vast masses of Sikhs."

The Akali, quickly grasped that opportunity, it continues, and capitalised that disgruntled feeling for their own power tactics. With the vast resources of the Gurdwaras at disposal they went all out to measure strength with the Congress-dominated Punjab Government. "Since the Akali were abusing the Gurdwaras as their base against the Government the whole thing assumed the colour of a fight against the Gurdwaras and large numbers of illiterate and innocent Sikh masses were duped into taking the agitation for the preservation of the sanctity of the Gurdwaras."

The newspaper refers to the fact that the Akali Morcha had not been called off but only suspended temporarily so that the fundamental question still remained as it was. But the Government would get an

opportunity to reconsider the steps. To bring back complete normalcy, continues the paper, the Government would need to take two steps. The first was a more rational and reasonable attitude towards the language question in the Punjab. The second was that the Government should not confine its fight against one brand of communalism only. So long it had sought to counter Akali communalism but had done nothing to curb the spread of subtle Hindu communalism. But it was largely due to the communal activities of the Hindu that the Akali had been able to command such large-scale support among the Sikhs, the *Post* concludes,

Teachers Asked to Recruit Students

Strange things are happening in this vast land of ours. Last year we had a governmental edict in Bombay prohibiting use of fountain pens by school students. Now comes another report of comparable ingenuity.

According to the *People*, the English weekly from Lucknow, teachers in degree colleges in U.P. were reportedly asked by the authorities to bring in students if they wanted to keep their jobs. Recently with many degree class students turning to the Universities there was a thinning of admission in the degree colleges there. And the authorities followed up with their directives to the teachers.

Commenting on the episode the *People* writes that the fact which "makes it an intriguing question is how could the admission touch such a low when at least hundreds of students—the overwhelming numbers of third divisioners—have been refused admission by the University."

"However, it sounds odd that due to thinning admission queues at degree colleges, the teachers should be asked to make up for the lag. It needs an enquiring into the matter, whether the problem in these colleges is really so acute."

The keen competition among teachers for recruiting students to their colleges the *People* notes, led the teachers in many cases to denounce other institutions. "This results in mud slinging, calling each other names and what not. In this perspective one can only appeal to the good sense of the Management who are responsible for bringing things to such a pass. We have had enough of making education a football of self-interest. It is time some one put a stop to this sort of game which has reduced education to nothing better than a commodity," the magazine concludes.

Unfair Practices of Tourist Agencies

The unfair practices adopted by certain tourist agencies in Kashmir in duping unwary tourists comes in for much criticism in an editorial article of the *Kashmir Post*.

Referring to certain cases where outside tourists were subjected to harassment and exploitation by un-

scrupulous tourist agencies the paper urged upon the State Government to take adequate steps to stop such evil practice in the State. "Besides being unfair to the individual tourists who are cheated in this manner it also affects the popularity of Kashmir among the tourists thus damaging the trade."

As a preventive to such malpractice the paper suggests that no travel agency which was not on the approved lists should be allowed to function and no agency should be put on the approved list unless it deposited a cash security with the Government to enable it to compensate the aggrieved tourists and unless it maintained the necessary establishment and possessed adequate resources to conduct the business to the satisfaction of the Government. "Easy-money-seekers and adventurers should have no place in this trade. Tourism is too important for this state to be allowed to be ruined by unscrupulous businessmen," the *Kashmir Post* writes.

Slums in Delhi

Shri Brijkrishna Chandiwala, who has made a personal study of the problem, focusses attention on the miserable plight of the Delhi slums in an article in the *AICC Economic Review*.

There were an average of ten slums in each of the fifty electoral constituencies of the Delhi Municipal Committee. The conditions in which people lived there beggared description. A survey recently conducted in the Jamuna Bazar area disclosed that nearly 6000 persons were living in 470 houses or huts and there was no arrangement for sanitation. "This *Basti* looks like a hell in the capital. The condition of all other such localities is similar," writes Shri Chandiwala.

Shri Chandiwala classifies the slums into four categories; (i) those coming under the Improvement Trust, (ii) those under the Municipal Committee, (iii) those owned by the Custodian (Evacuee Property), and (iv) those which were privately owned.

There were various efforts in the past for ameliorating the distress of *Basti* dwellers. But nothing tangible resulted. The Improvement Trust itself was formed with the object of improving slum areas among other things. But little progress was made in that direction. The record of the Municipal Committee also was not much better. "The worst difficulty is encountered while tackling the problem of *Katras* which number nearly 500 and the Municipal Committee is unable to do much there. The custodian also does not seem inclined to spend anything to improve the condition of *Bastis* under his jurisdiction."

The inhabitants of the *Bastis* came mainly from the small craftsmen, such as shoe-makers, carpenters, potters, sweepers, blacksmiths, washermen, *bhisthis* and other labourers. The only change that occurred in the life of the *Basti* dwellers after independence was the fact their names "have been written on the electoral lists and they

are approached during the elections" with promises of turning their hells into heavens in just a few days' time. "But nobody turns up after the elections."

According to the writer two measures could be helpful in solving the question of the improvement of the slum areas. Those measures were (1) the setting up of a Corporation and (2) the establishment of a development board for dealing with the problem. Moreover the inhabitants of the slums also had an important role to play. "It is necessary that they should unite and make their demands known."

In conclusion Shri Chandiwala writes: "Next Five-year Plan is being framed. It is high time that the attention of Planning Commission be attracted towards these slums and a demand of clean Delhi be made. Delhi is the capital of India and thousands of foreigners visit these slums of Delhi and take their photographs with them. It is a matter of disgrace for us. . . ."

Gaffar Khan and Pakistan Politics

For about eight years Khan Abdul Gaffar Khan, Red-shirt leader, lived in detention and exile from his home province because of his refusal to obey the orders of the Pakistan rulers. But popular pressure apparently became too much for the present rulers of Pakistan and they were forced to lift all restrictions on his movements though only a little while ago the Pakistan Minister for Interior, General Iskander Mirza had categorically declared that restrictions would not be lifted for international reasons, because Kabul Radio had reportedly been using in anti-Pak propaganda the statements of Gaffar Khan against the "one-unit" plan.

After his release Gaffar Khan was accorded a royal reception on his entry into the Frontier Province. Reports spoke of unprecedented jubilation of the people at the return of their beloved leader.

Khan Abdul Gaffar did not try to conceal his opposition to the "one-unit" plan for West Pakistan. In his view the adoption of the plan would be prejudicial to the national interests of the Pakhtoon people. Before the lifting of the restrictions on his entry into NWFP he said, referring to Government charges that his statements were being used for anti-Pakistan propaganda by Kabul Radio: "The ruling group in Pakistan has been using Kashmir to stifle public opinion on vital matters. But now since it is no more a live issue, it has come out with Afghanistan stunt."

Recently the Pakistan Minister for Interior, General Iskander Mirza and Dr. Khan Saheb, elder brother of Khan Abdul Gaffar Khan and Minister for communication in the present Pakistan Cabinet, who has been nominated to be the first Chief Minister of the proposed one-unit of West Pakistan, went to Peshawar with a view to bringing Gaffar Khan over to the idea of "one-unit" for West Pakistan. Gaffar Khan flatly rejected their suggestion and reiterated his earlier views about the harmful nature of the plan.

Thereafter a campaign of vilification was let loose

upon Gaffar Khan with General Mirza as the leader of the attack. Gaffar Khan was reportedly told by the Central Government that if he continued his 'disruptive activities' he would be "severely dealt with."

Addressing a 40,000 strong rally on July 26 in Mardan in NWFP, Khan Abdul Gaffar Khan refuted all charges made against him by General Iskander Mirza. He said, "It does not behove people who themselves, and whose forefathers, have supported throughout their lives their British masters to brand me as a self-seeker and the Red-shirt organization as a band opposed to independence when it was only this party of ours which fought a non-violent battle for freedom. The only difference between us and the present rulers is that they have adopted ruinous policies for the country while we ask for a programme which will assure the people's prosperity and national construction."

Mohammed Ali and the U.S.S.R.

"Aress" writes in the *Kashmir Post* on July 9: "There is a touch of comedy in the request of Mr. Mohammed Ali to the Soviet Union for an invitation to visit Moscow. It appears that the Pakistan leaders are in the grip of such a terrible inferiority complex that they can never decide on their own what is good and what is bad for them."

In this connection the writer recalls that in 1949 the U.S.S.R. had extended an invitation to the then Prime Minister of Pakistan, Mr. Liaquat Ali Khan, to visit Moscow. Mr. Liaquat Ali had accepted the invitation and had even fixed up an approximate date for his journey to the Soviet Union. "In the meantime the Nehru visit to the United States matured and the tremendous impact made by Mr. Nehru on the American people came as a shock to the Pakistanis. They begged the Americans for an invitation which they, of course, got. . . . Nawabzada Liaquat Ali Khan deferred his proposed visit to the Soviet Union and instead took the American journey. There he fell in line with the American way of thinking and agreed to be a loyal supporter of the Americans. After this there was no question of the Russian visit coming off and quite understandably it was ultimately shelved."

The writer is of the view that this time it was the unprecedented success of the Russian tour of Shri Nehru that has induced the Pakistan leaders to have second thoughts about their policy and position.

Bandung

The *Worldover Press* gives the liberal American viewpoint on the Afro-Asian Conference in the excellent commentary given below:

"Bandung.—Months will pass before all the end products of the new contacts established in Bandung among the various delegations will manifest themselves. Important to the sponsors was the complete

failure by 'conscious and unconscious agents of other forces'—to use Nehru's pointed words—to 'turn the Conference into a tea party.'

"Yet there was an almost total absence of vitriolic attacks on the West. In commenting on this, the Negro author Richard Wright remarked here that the delegates were more interested in getting Westerners off their backs than in promoting a revengeful counter-racialism. A Negro college instructor from the States, writing for a New York weekly, added that the widely published predictions of a 'hate-America' motif were largely a reflection of the West's guilty conscience.

"This is not to say that the U.S.A. and its allies emerged unscathed from the Conference deliberations. Nehru's slashing criticisms of NATO as 'an aggressive pact' and 'a protector of colonialism,' his 'What about Guatemala?' challenge to Turkey and Iraq when they wanted to condemn the Communist brand of subversion, his avowed determination not to become a 'camp-follower' of any other nation—all these were statements both of India's policies and to a great extent of other unaligned delegations. But by and large there was almost a studied indifference to the big Western powers—and, in the two public speeches by Chou En-lai, a couple of brief, contemptuous references in passing. *The Conference theme was a positive Asianism and a budding Africanism, rather than a negative unearthing of historical grievances, against which India, citing Gandhism, and Indonesia, as host, both warned.*

"Even with this accent on the positive it would be accurate to state that the policies cherished by Washington and regarded here as inflexible, lost out at the Conference—though in ways not generally anticipated. Chou En-lai emerged as the biggest man in Asia while carefully sidestepping the popularity contest with Nehru which American editorial writers had neatly planned for him.

"The magnetism of the Conference pulled the American-oriented Philippines into a closer relationship with the Asian community—to such an extent that Carlos Romulo, chief Filipino delegate, has now urged President Magsaysay to cancel a trip to the U.S.A. and to tour Asia instead. Most observers expect Romulo himself eventually to accept Chou's invitation to visit China. By skilfully wooing the Moslem delegations, Chou probably assured China of *de facto* recognition by at least some of the Arab governments.

"The contact established at Bandung between the delegations of North Viet Nam and Laos led to a 'non-interference' agreement which is bound to bestir anxieties in official Washington. Indonesia and China will soon send trade missions to Cairo as a result of extra-Conference talks, and the signing at Bandung of the Indonesia-Chinese treaty to settle the problem

of dual nationality for overseas Chinese living in Indonesia was cited by Chou as a precedent for similar treaties with other South Asian governments.

"By openly admitting that his country is 'backward,' and by stressing the internal development problems that it faces, Chou En-lai, despite ideological differences, aligned China with his similarly overburdened neighbors who have no time for war.

"Enjoying a greater diplomatic freedom *vis-a-vis* Israel than do his opposite numbers in the Kremlin and the State Department, Chou was in a position to support without qualification the vigorous Arab demands in Palestine. China also lined up solidly behind the nationalist movements in Morocco, Tunisia and Algeria—thus spotlighting anew the fence-sitting policies of Washington towards explosive North Africa.

"The importance of Palestine in Conference deliberations focused attention on the re-emergence of El Hussein, the pro-Nazi Grand Mufti of Jerusalem, who arrived unexpectedly at the Conference and was immediately accredited by the delegation from Yemen.

"The inarticulateness of the African delegations—Ethiopia, the Gold Coast, Libya, Liberia—occasioned considerable comment and prompted Richard Wright (who has recently written a book on the Gold Coast) to express 'disappointment.' It was not until the last minute, Kojo Botsio of the Gold Coast told this correspondent, that his delegation was even sure of coming to Bandung, and then they came only as observers.

"The tight British control of the Gold Coast's external affairs meant that Botsio and his fellow-countrymen had to absent themselves from the final plenary session when 13 pages of resolutions—termed a *communiqué*—were adopted.

"It is generally agreed here that Nehru's insistence on welcoming China into the community of nations was justified at Bandung by the week-long course of events. *For the non-Communist Asian and African statesmen left here with the firm conviction that the Conference had exerted a moral restraint on Chou En-lai—culminating in his public avowal of friendship for the American people and his offer to negotiate with Washington.*

"The initial cold reaction from the State Department, insisting on the unacceptable condition that Chiang Kai-shek sit in on any negotiations, met with a profoundly hostile reception among nearly all the delegations. In dismay and perhaps also in despair at reducing tensions through normal diplomatic channels in Washington, Burma's Premier, U Nu, publicly suggested that President Eisenhower come to Asia and be briefed on the facts of life by Asian leaders who have a one-track will for peace. The speedy reversal of this blunder, when Washington saw the

damage it had done, was useful; but as so often in such cases, the original wounds were slow to heal.

"At the conclusion of the Conference, during which Mohammed Ali praised the 'moderation' of Chou, another Pakistani delegate said privately that his government was facing intense internal pressures against close ties with America and SEATO.

"Four months ago, the most far-reaching result of the Conference was confidently predicated by India's unchallenged spokesman when he observed that 'such conferences set in motion ideas which affect peoples' minds.' No one can measure with exactitude such long-term intangibles. But to one with memories of the huge barefoot throngs of cheering, illiterate Indonesians standing outside the Conference halls in heat and tropical rains can doubt this intuitive knowledge on Nehru's part, of what quickens the pulse of resurgent Asia."

China's 1955 Budget

Mr. Li Hsien-nien, Vice-Premier and Finance Minister of China, presented the budget for 1955 to the National People's Congress on July 6. He said that the keynote of the budget was to increase production and practise economy in order to accumulate capital for economic construction, especially the construction of heavy industry.

The total revenue in the budget was estimated at 31,192.5 million yuan, 6.91 per cent larger than in the preceding year. The total estimated expenditure was 29,736.7 million yuan, 20.72 per cent over that of 1954. The budget thus showed a surplus of 1,455.8 million yuan.

Of the allocations in the 1955 budget about 60.67 per cent would go to economic construction, and social, cultural and educational services. Defence expenditure accounted for 24.19 per cent of the expenses.

The revenue would be derived from the following sources in the proportions indicated: 69.47 per cent from the State sector of the economy, 11.76 per cent from the peasants and the balance from others.

Giving an account of the receipts and expenditure in the 1954 State budget, the Chinese Finance Minister said that the total estimated receipt in 1954 was 30,745.83 million yuan. The actuals totalled 26,236.83 million yuan. Taken with the surpluses brought forward from the balances of previous years, the total actual receipt amounted to 4,509 million yuan—113.15 per cent of the estimates. The income from State enterprises including taxes made up 65.24 per cent of the total budgetary income.

Of the total State expenditure of 24,632.44 million in 1954, 50.17 per cent went to economic construction. Total investment in all fields of capital construction in 1954 registered an increase of 15 per cent over 1953.

Production of the State enterprises increased 27 per cent in 1954 compared with the preceding year. The proportion of State industry, co-operative industry and joint State-private industry in the total value of industrial production amounted to 75.1 per cent and that of the privately owned industry fell from 36.8 to 24.9 per cent.

U.K.-South Africa Naval Agreement

The British Prime Minister, Sir Anthony Eden, announced in a statement before the House of Commons the conclusion of the naval agreement between the Governments of the United Kingdom and the Union of South Africa. The agreement followed talks between the representatives of the two Governments over a number of years.

Under the agreement close contact would continue to be maintained between the services of the two countries. A new naval command was being set up to strengthen the defence of the sea routes round the Cape. "This is to be based on a maritime strategic zone approximating to the present South Atlantic Station, and will contain an area under the command of a South African flag officer. In a war in which both countries are involved, the whole zone will be under the Supreme Command of a Royal Commander-in-chief.

"A joint maritime war planning Committee is to be set up to ensure satisfactory planning in peace. . . ."

South Africa would expand her navies and had agreed to place orders for ships to the value of £18 million in the United Kingdom. The existing base of the Royal Navy at Simonstown would be handed over to South Africa which had so long no properly constituted naval base. The Royal Navy would however continue to enjoy all the facilities available to it before the present agreement in peace time as well as during any war in which the United Kingdom was involved. The facilities would be available in such a war both to the British navy and to the navies of allies of Britain even though South Africa might remain neutral.

The agreement would continue in force unless otherwise decided by the two Governments by mutual agreement.

Sir Anthony said: "Discussions about regional defence are set out in the first exchange of letters in a White Paper. The two Governments recognize that while the internal security of the countries of Southern Africa must remain a matter for each of individual country concerned, Southern Africa and the sea routes round South Africa must be secured against aggression from without.

"They are further agreed that the defence of Southern Africa against external aggression lies not

only in Africa but also in the gateway to Africa—namely, in the Middle East.

"Finally, both Governments have agreed jointly to sponsor a conference to develop the planning already begun at the Nairobi Conference in August, 1951 on the improvement and security of the lines of communication around Southern Africa and between South Africa and the Middle East."

Mr. Clement Attlee, Leader of the Opposition in the Parliament said: "Generally speaking, this would seem to be a satisfactory settlement of a very difficult question which we have been discussing for many years."

In reply to questions the Prime Minister, Sir Anthony Eden added that the base at Simonstown would be available to Britain and her allies in wartime even if South Africa remained neutral in that war. The agreement would result in the saving of about £500,000 a year in naval expenditure. All Commonwealth Governments had been fully informed about the agreement.

The British newspaper generally expressed satisfaction at the news of the conclusion of the agreement between South Africa and Great Britain. They pointed out that South Africa's hatred of communism was a guarantee of her continued co-operation with the West even though the Union might choose to leave the Commonwealth and become a republic. The importance of the agreement lay in the fact that "South Africa under the South Atlantic Command Agreement, goes some way towards integrating herself in the NATO concept of defence organization," the *Glasgow Herald* points out. It was particularly significant in this context that the South African Minister of Defence, Mr. F. C. Erasmus, "should already have held discussions in Paris with the Supreme Allied Commander in Europe and the French Minister for Defence," it adds.

This Naval agreement affects us indirectly as the Indian Ocean will be controlled from one end by the combined fleet.

Kenya Commission Report

Mr. Fenner Brockway, Member of British Parliament, writes in an article in the *Vigil* that the recommendation made by the Royal Commission for East Africa for sending the reservation of the Kenya Highlands exclusively for European settlers and for opening it up for non-European settlement would evoke fierce opposition from a large section of the European settlers in Kenya. The Commission had met the argument that Kenya farmers would ruin the Highlands by incompetence by remarking that there were good African farmers and given opportunity, there could be more.

While Mr. Brockway welcomes this recommen-

dation and says that its implementation must not be allowed to be shelved he criticizes the general theme of the Report of the Royal Commission which had advised Africans to accept Western concept of the private ownership of property.

Mr. Brockway writes: "On this two comments can be made: First, that it is impertinence of the Commission composed of eight Europeans, only one African and not one Asian to lay down the pattern of the future life of territories in which there are 17 million Africans, less than 200,000 Asians and only about 50,000 Europeans. The social and economic order in East Africa cannot be determined until the people have the right to determine it themselves."

Secondly, the disruption of the deeply embedded African tradition of community ownership of land would arouse resistance and confusion, "And why should individual ownership be regarded as the last word in Western wisdom? In Britain we are moving towards the same principle of public ownership which the Africans have so long practised?"

Needless to say Kenya is a stronghold of British Colonialism of the worst type. The African was dispossessed of his birthright without any humane considerations being taken account of by the rapacious British colonist. The African launched a forlorn hope campaign, after generations of virtual slavery. The result was inhuman slaughter and a campaign of one-sided slander of the voiceless dispossessed. The Royal Commission is the consequence.

The New Burma

In view of U Nu's recent visit to the U.S., the following account in the *Worldover Press*, by Dr. Frank Trager, former Point Four Director in Burma, is of great interest:

"New York.—You start a conversation about Burma, and some of your friends interpolate, 'Oh, yes, Nehru is certainly kicking up a fuss.' Then patiently, you explain that you are talking about Burma, not India, and you begin all over again.

"For Burma, among the newly independent nations of Asia, is a *terra incognita*, an unknown land to many Americans. But she deserves to be known today for herself and her people, even better perhaps, than in the 19th century when Christian, mainly Baptist, missions regarded Burma as a shining example of American conversionary zeal.

"Despite the amazing work of Adoniram Judson and those who followed him to missions in Burma, that country is today an overwhelmingly Buddhist land. It is the *locus* for the present Sixth World Buddhist Council meeting in Rangoon, the capital city of Burma, from 1954 to 1956, commemorating the 2,500th year of the beginning of Buddha's cycle,

That this Council meeting is taking place in Rangoon; that to it have come outstanding representatives of Ceylon, Thailand, Laos, Cambodia and other leading centers of Theravada Buddhism, is one indication of the esteem for Burma felt by her Asian neighbors. To understand Burma, you must understand this Buddhism; to understand the Burmese leadership role in the epochal Buddhist revival, one must come to know Burma.

"Burma, in American terms, is about as big as Texas, and almost as self-content! Her 19 million people are mainly descendants of a Sinitic migration out of Tibet and West Central China, which began in the pre-Christian days and continued to the late 19th century. The language, like Chinese, is tonal and syllabary; the script is Indian and perhaps remotely Persian. Since Buddhism, an 'Indian religion,' dominates Burma, it can be accurately stated that Burma represents a culture combining features of ancient India and ancient China.

"The Burmans, the majority stock, come upon the threshold of recorded history in the 9th century. From the 11th to 13th centuries the first dynastic, unified Burman kingdom occupies the land; builds a magnificent architectural civilization, the ruins of which rival Indo-China's Angkor Tom or Egypt's Karnak. Marco Polo makes a record of it. But Kublai Khan—and his China Mongols—overthrow this first Burmese Kingdom. Since then a see-saw history of conflict with China marks the pages of the Burmese chronicles. There is no love for China in Burma, and there is some fear, highlighted by the 1,000-mile, unprotectable, and inadequately defined border between the two countries. *Chinese maps produced both by Chiang Kai-shek and Mao Tse-Tung show incursions into Burma.*

"Twice after the 13th century Burma achieved a grand and feudal unity. She succumbed to the march of imperialism in the 19th century. Beginning in 1824 England swallowed Burma in three bites, three wars which by 1885 incorporated Burma into Britain's Indian Empire. From 1886 to 1937 Burma lost even her 'identity' as a conquered 'nation.' She was a province of the British colonial administration of India, an ignominy which the Burmese deeply resented and resolutely 'paid back' by their decision to withdraw in 1947 from the Commonwealth when they at last achieved independence.

"The Burmese had never willingly accepted 'the English connexion'—as it is called by the English authors on Burma. What we call modern nationalism never disappeared in Burma. After the third, and final, Anglo-Burmese War of 1885 the Burmese were 'pacified' by the British—that is, forcibly put down by arms and by that devil's invention called the 'plural society.' This means the use of minority groups by the conquering power to put and keep

down the majority population. It is a devil's invention because it utilizes the typical drives of ethnocentrism and xenophobia, found in (almost) all peoples, to foment or to perpetuate racial, ethnic and national discord.

"The 'pacification' took about six to eight years. Shortly after that the Burmese, using imitations of the West's institutional arrangements, began to organize for national liberation. They formed the Young Men's Buddhist Association in 1906—the seedbed of subsequent nationalist moves.

"Thus Buddhism, and later Socialism—or at least the anti-imperialist sloganeering of Marxism—became the sources of Burmese inspiration. By the end of the 1930's the Burmese radicals sent their young men to Japan for training because Japan seemingly offered a *non-white* nation's hospitality to the Burmese anti-white and anti-colonial aspirations. When World War II began, the Burmese welcomed the Japanese as the liberators against the 'white man's burden.' Japan lost Burma and lost Southeast Asia in part because her slogan of 'Asia for Asians' was not sincere. It was Asia for the Japanese. So the Burmese turned against the Japanese, realigning themselves with the British *only* because they wanted freedom and independence.

"And they got it. On January 4, 1948, after discordant relations between Britain and Burma from 1945 to 1947, the Burmese re-won their freedom. Be it said to the everlasting credit of the then Labor Party government in Britain that it accepted this decision gracefully—and thereby, as in India, retained some Burmese regard for Britain. If only the British had thus acted sooner! France never learned this lesson in Indo-China, hence, in part, the defeat by Ho Chi Minh; the Dutch learned it in Indonesia only after they suffered defeat by force of Indonesian arms and world opinion.

"Burma regained her freedom in January, 1948; an armed Communist rebellion tried to take it away the same year. Other dissident groups joined in the revolt against the central government—including a remnant of the Kuomintang forced out of Yunnan into Burma. For a while the newly independent government was not sure of survival. It survived.

"It survived because its leadership, under the inspiration of a wonderful man—teacher, devout Buddhist, people's leader—was at the helm, supported by a majority of Socialist and peasant leaders who had fought as student rebels in the 1930's, fought with Japan in the early 1940's when they thought the Japanese would help Burma gain independence, then against them, and finally won independence by negotiation with the British. Prime Minister U (meaning honored Mr.) Nu led this coalition to victory in the Constituent Assembly voting of 1947 and in the

national, free elections of late 1951. His government is, along with the Indian and the Philippine, one of the only three democratically elected governments in South and Southeast Asia today."

South Indian Christians

The *Worldover Press* published the following account sometime back:

Trivandrum, South India.—Indian Christians no longer have to carry their churches on their backs. For many years, denominational barriers prevented members of one church from enjoying spiritual privileges with those of another.

People moving from one part of the country to another in which their own denomination did not operate were either compelled to remain aloof, or to enter into local communities "with many mental reservations." These reservations were caused by doctrinal divergence, organizational peculiarities, or orthodoxy lacking imagination.

Today, the same people may look forward to being received in "alien churches" without doctrinal differences damaging their spiritual peace. Over a large part of South India and for a million and a half non-Roman Catholic Christians, a new day is dawning. Mutual appreciation, recognition of each other's theological position, and above all, one's own shortcomings, have become a matter of common experience.

The emergence in 1947 of the Church of South India, comprising British, Continental and American episcopal and non-episcopal denominations, gave an impetus to union movements. Currently, two important church bodies are holding "conversations" with the authorities of the Church of South India, their most recent findings registering a larger appreciation and agreement on fundamental beliefs and practices. The two bodies are the 300,000-member Mar Thoma Syrian Church of Malabar and the 75,000-member Federation of Evangelical Lutheran Churches in India. The membership of the Church of South India itself is over 1,000,000.

The Mar Thoma Syrian Church of Malabar is one of the most ancient churches in India, indeed, in the world. It owes its founding (by tradition) to St. Thomas, the brother of the Lord. Its ecclesiastical head, Metropolitan Juhanon Mar Thoma Malabar, is one of the presidents of the World Council of Churches. Once a limb of the Jacobite Syrian Church of Malabar, under the inspiration of the Anglican missionaries it effected certain liturgical and organizational reforms, resulting in its having to sever from the parent body and forming an independent church. Since it has maintained full communion with the Anglicans in India, and since the latter body merged with the Church of South India, it may be said that, in principle, the Mar Thoma Syrian Church is "in communion" with its neighboring churches.

At the end of a meeting between the Lutheran

Federation and the Church of South India last March, held in Bangalore, the representatives came out with a declaration of their accomplishments, together with further plans. It was agreed: (1) that each church body will welcome members from the other churches, temporarily or permanently, offering them all the privileges and status they enjoyed in their home church; (2) each church will recognize the ordination to ministry in the other church, while free to judge each issue with regard to competence, experience, and the like.

Aborigines in Australia

The *Worldover Press* writes:

"Australian aborigines, along with many of their white defenders, have been increasingly stirred by a number of arrests and unnecessarily severe fines for minor 'offenses.' Three men from the Aborigines Reserve at La Perouse were recently sent to jail when they couldn't pay fines of seven pounds, accepting a 14-day sentence. They were charged with cutting mangrove trees, though the men said they cut only branches—in order to get 'elbows' for boomerangs ordered from America.

"Michael Sawtelle, government appointee to the New South Wales Aborigines Welfare Board, ex-coriated the action against the men. Asserting they were members of honest, hard-working families he added: 'Surely if we have one human sentiment left among us it should be to leave the aborigines alone. Over the years we have done our best to grind them down. We have subjugated these people to the point where they must rely almost entirely on handicrafts for a living. Now we are trying to take that away from them.'

East Germany Medical Students

The *Worldover Press* reports:

"East Germany, no less than West Germany, continues to reveal youth hostility to militarization. The *Kasernierte Volkspolizei* (People's Police in Barracks), which is the armed force being prepared in the Soviet Zone, is short of doctors. This in spite of the fact that some medical students have gone into the Russian Zone from the West in the hope of escaping conscription and to avoid the surplus of doctors in the West.

"To overcome the shortage, the Secretary for Universities and the chief physician of the *Kasernierte* went recently to the 700-years-old University of Greifswald and told the Dean that from September 1, 1955, only such young men would be admitted as students of medicine as agreed to become military doctors. The move brought an immediate and hostile reaction. Heated discussions took place in a series of student meetings and were followed by a student strike with classroom desertions."

HAROLD LASKI AND PROPERTY

By RANI MUKHOPADHYAYA,

Lecturer in Economics and Political Science, Hooghly Women's College

THERE has been a good deal of speculation among thinkers about the question of right to property. "Though the earth and all inferior creatures be common to all men," says Locke in connexion with the question of defence of private property, "yet every man has a 'property' in his own 'person.' This nobody has any right to but himself. The 'labour' of his body and the 'work' of his hands, we may say, are properly his. Whatsoever, then, he removes out of the state that Nature hath provided and left it in, he hath mixed his labour with it, and joined to it something that is his own, and thereby makes it his property." "For this 'labour' being the unquestionable property of the labourer," he further observes, "no man but he can have a right to what that is once joined to, at least where there is enough, and as good left in common for others." Even "the supreme power cannot take from any man any part of his property without his own consent." And when President Roosevelt declared on January 6, 1941, that "we seek 'everywhere in the world' the four old freedoms: freedom of speech and expression, freedom of religion, freedom from fear, freedom from want," Herbert Hoover, an ex-President of the United States, "called attention to the fact that there is a Fifth Freedom—economic freedom—without which none of the other four freedoms will be realized."

"To be free," the latter further observed, "men must choose their jobs and callings, bargain for their own wages and salaries, save and provide by private property for their families and old age."

Of course, he never used the term "Fifth Freedom . . . in the sense of *laissez faire* or economic exploitation."

"Exploitation," according to him, "is the negation of freedom. The Fifth Freedom does not mean going back to abuses."

Moreover, "the Fifth Freedom in no way inhibits social reforms and social advancement."

"Property is an institution," says the conservative thinker Lord Hugh Cecil, "required for the sake of the common good. . . . The owners of it, like other human beings, are entitled to be guarded against undeserved injury."

1. See Locke, *Two Treatises of Civil Government* (Everyman's Library, edited by Ernest Rhys), Ch. V, p. 130.

2. See *ibid.*, Ch. XI, p. 187.

3. See William Ebenstein, *Man and the State* (The Fifth Freedom—Herbert Hoover), pp. 359-361.

4. See Cecil, *Conservatism*, p. 158.

And Hobhouse, an advocate of liberalism, means by the right of property

"a system under which a man is free to acquire by any method of production or exchange within the limits of the law whatever he can of land, consumable goods, or capital; to dispose of it at his own will and pleasure for his own purposes, to destroy it if he likes, to give it away or sell it as it suits him, and at death to bequeath it to whomsoever he will."

To the idealistic thinker T. H. Green, "property is realised will." According to him, property is "a permanent apparatus for carrying out a plan of life, for expressing ideas of what is beautiful, or giving effect to benevolent wishes."

It is obvious from the views of these thinkers that the institution of private property has a moral basis and should not be wantonly interfered with even by the Government of a State without the consent of the owners.

Let us now turn our attention to the views of Professor Harold Laski on the question of private property. He admits the fact that the possession of property gives a man an initial advantage in life.

"The man of property," he says, "has a stake in the country. He is protected from the fear of starvation. He need not accept the work he does not desire . . . He can avoid the grim routine, and become an explorer in that intellectual hinterland where the creative faculties most readily discover their channels of self-expression. He can protect his children against the dread of want. He can develop in them the tastes which give them also joy in the life creative. He has direct and immediate access—should he desire it—to the social heritage of Western civilization."

But he never accepts the view that private property is an unmixed blessing to human society. On the contrary, a man with property often does not possess these things nor is a man without property "necessarily deprived of them."

"Those who have security," he says, "often luxuriate in a life devoid of meaning; and those who are poor can sometimes know the rarest things that life can offer. But the latter are exceptional men; poverty for most—and most are condemned to poverty—means a life passed amid mean things."

5. See Hobhouse, *Liberalism*, p. 94.

6. See T. H. Green, *Principles of Political Obligation*, p. 219.

7. See Laski, *A Grammar of Politics*, p. 173.

8. *Ibid.*, pp. 173-174.

with but a fleeting moment, like the first hour of love, when the creative impulse receives a full response. Those who have security may, in fact, live a life as solid and as pointless as the ugly mahogany with which they are surrounded."

He points out, however, the danger inherent in the present system of private property.

"Man", he remarks, "has developed an acquisitive faculty which now forms the basis of all western institutions. The world over, States are divisible into those who, out of that impulse to acquire, possess property which is a safeguard against the wants of the morrow, and those who, lacking that property, are uncertain whether the morrow will give them the means of life."

And "it remains historically obvious," he warns, "that a community divided into rich and poor is, when the latter are numerous, built upon foundations of sand."⁹

An analysis of the present social order shows, he next observes, that "the number of those in any community who own property enough to be significant is always small"; that "such ownership is not necessarily related to the performance of duties or the possession of virtues"; that "the ownership of property involves the control of capital"; that "in a regime of free enterprise the control of capital involves the power to direct the lives of those who depend upon the application of capital to production"; that "a regime of private property makes the State very largely an institution dominated by the owners of private property"; and that "it protects the will and purpose of those owners." In the absence of other considerations, he adds, "a political system in which rights are built upon property is one in which the propertyless man will have no rights."¹⁰ It is true that there are today some mitigating circumstances like the power of combination of the workers, the humanitarian sentiment of the owners of property, etc., which have prevented the owners from realising their rights to the full.

"But, fundamentally, the regime of private property," he declares, "in the background of industrialism, perpetuates the division into rich and poor, and separates the poor from the conditions which make possible their effective citizenship."¹¹

The result, therefore, according to Laski, of the present economic system is that the "production is carried on wastefully and without adequate plan."

"The commodities and services necessary to the life of the community," he further says, "are never so distributed as to relate to need or to produce a result which maximises their social utility."

We build picture palaces when we need houses. We spend on battleships what is wanted for schools We have a large class maintained in parasitic idleness whose tastes demand the application of capital and labour to the satisfaction of wants unrelated to human need. Nor is that class set apart from the rest of the community. Because it has the power to make demand effective it stimulates the slavish imitation of those who seek to join its ranks. To be rich becomes the measure of merit."

Moreover,

"Men may begin to acquire property to safeguard their lives from want, but they continue to acquire it because of the distinction which comes from its possession. It satisfies their vanity and their lust for power: it enables them to attune the will of society to their own."¹²

Laski next draws a grim picture of the modern society which results from such a situation.

Men "produce goods and services," he remarks, "not for use, but to acquire property from their production They will ruin natural resources. They will adulterate commodities. They will float dishonest enterprises. They will corrupt legislatures. They will pervert the sources of knowledge. . . . They may destroy the quality of political life. They may possess themselves, as in America, of the educational instruments of the community. They may even pervert religious institutions to the protection of their ideas. They do not, nevertheless, secure a well-ordered State."

A State so divided into rich and poor, according to him, "is compelled to use its instruments to protect the property of the rich from invasion by the poor." The question of true equality—the very foundation of democracy—can never arise in such a State.

"Political equality," he declares, "is never real unless it is accompanied by virtual economic equality; political power, otherwise, is bound to be the handmaid of economic power."

"Either the State must dominate property," he warns, "or property will dominate the State." The unequal distribution of property is the most common source of faction in a State. And men, "after a period, refuse to suffer quietly." "The concentration of property," he states in another connection, "other than labour-power in a few hands is fatal to the purpose of the State." Revolution "supervenes to alter the balance in the State."¹³

Although, Laski admits in the text of his *Grammar of Politics* that the present system of property is not altogether devoid of justification, yet, he does

not fully accept the psychological basis of property as an incentive to labour.

"Labour," he says,¹⁴ "only involves the good of the community if what is produced is related to that good and secures good in being distributed."

"Further the power to acquire property may defeat more incentives than it creates," as the fortune of a pre-eminently successful businessman may actually inhibit his descendants from working at all. Nor does Laski accept the so-called ethical justification of property that it is the return made to the individual for efforts, as "the fortunes of many who labour unceasingly never become other than insignificant." Thirdly, he dismisses the argument in favour of private property that "it is reward for abstinence." Fourthly, the justification of property as the nurse of virtues which are essential to society, is also not very sound according to him, as "these virtues have been present in persons who have never amassed property at all." Laski refutes Lord Hugh Cecil's idea that property is the "result of supplying effective demand," since the demand itself may often be morally inadequate. He thinks, however, that there is some truth in the historical argument which takes the regime of private property as a mark of progressive society and collective property as a foundation of backward societies. But the historical argument, too, is "fallacious if it regards the regime of private property as a simple and unchanging thing," as "the history of the rights of property is most largely the record of its circumscription."

"At no period," he emphasises, "have those rights been generally absolute. Political and religious philosophy is most largely the attempt to evolve maxims of control which will at least minimise the dangers which arise from a distinction between mine and thine."¹⁵

It is the industrial revolution and the revolution in France which led to the revision of the individualistic theory of property. "The one gave birth to economic socialism," he says,¹⁶ "the other to a view of rights conceived in terms of personality." And "property became conceived as a product less of individual exertion than of the total forces in society." A new outlook incompatible with the *laissez-faire* State began to emerge.

"The State," he observes,¹⁷ "which had begun the nineteenth century in the terms of *laissez-faire* began, as the twentieth century came into view, to search for a basis upon which it could compromise with socialism. And by socialism was meant the devotion of the productivity of the State to the fulfilment of the natural rights of men."

18. *Ibid.*, p. 177.

19. *Ibid.*, p. 179.

20. *Ibid.*, p. 181.

21. *Ibid.*, p. 182.

"The State," he further says,¹⁸ "had become an instrument for transferring income from the rich to the poor in the hope of making life adequate The survival of the fittest had been replaced by mutual aid."

Finally, Laski thinks that

"All property depends upon the sustenance of society, and its rights are therefore socially created. But rights socially created are relative to social needs. These are the needs of individual persons, and, in the modern State, the majority do not satisfy their needs."¹⁹

Laski is, therefore, anxious to have a theory of property which is morally adequate.

"The need was the more urgent," he says, "because the rapid growth of revolutionary communism had challenged at its root the whole structure of existing civilization. . . . The central issue of the generation was to discover a concept of property which satisfied the moral sense of men."

But in his attempt to remove the defects of the present social order, Laski also tries to avoid the dangerous implications of "enforced communism," the unavoidable consequence of present inequitable system of private property. Man should have material requisites in the degree that such a possession "enables him to be his best self."

"He can," he emphasises, "claim . . . such a share of the national dividend as permits him at least to satisfy those primary material wants, hunger, thirst, the demand for shelter, which, when unsatisfied, prevent the realisation of personality. The claim to such a share, the right to such property as that share implies, is, I believe, most usefully regarded as an individual and exclusive claim."²⁰

Laski supports the individual's claim to a minimum property—"the guarantee to the individual that the pressure of social forces will not leave him helpless and stranded."

But that right must be relative to duty. Laski strongly condemns ownership of unearned property, and says that no man "has a moral right to property except as a return for functions performed," and that "those whose property is the result of other men's efforts are parasitic upon society."²¹ These people enjoy property acquired by others and avoid their own contribution to the total productivity of society.

"They have legal rights," he says, "but because those legal rights are not born of their personal effort, they lack the moral penumbra which entitle them to respect."²²

22. See Laski, *Democracy in Crisis*, p. 36.

23. See Laski, *A Grammar of Politics*, p. 183.

24. *Ibid.*, p. 184.

25. *Ibid.*, p. 184.

26. *Ibid.*, p. 185.

He refers to the evils of the hereditary wealth which involves two things:

"(1) There is a class freed from the legal obligation to labour. (2) So freed, it is able to utilise its leisure in a way that taxes the productive effort of the remaining members of society."

A class which live by "owning" will have immediate access to the sources of political power and their "economic position involves a definite social predominance." The maintenance of such a class in a society means "not only the denial for them of the need to contribute to society, but also the insistence that society must contribute to their need." "Their position," he remarks, "is an accident of parenthood; and parenthood, however distinguished, is not entitled to levy a permanent tax on social effort."

"The result of our system of property," he points out, "is, in this regard, unrelated to any principle of justice. It cannot, therefore, be part of any theory of property which seeks to win the moral assent of men."²⁷

Laski permits, however, inheritance "where it means the provision of an income for widowhood, on the one hand, and the education of children on the other. But the retention of property beyond that period cannot be justified in moral terms."²⁸

Property is entitled to exist and it is rational when it is the outcome of function. And as it, Laski remarks, "comes from the fact that its possessor has fulfilled a station in society," he is not "a mere tax upon the effort of others."²⁹

Property so conceived, implies a theory of reward and a theory of industrial organization. Laski makes an analysis, in this connexion, of certain theories of reward. About the difficulties of the Communistic theory of equality of income, he says:

"There seems no justice in an equal reward for unequal effort. Nor does it seem just to reward equally where needs are unequal."³⁰

It is worthy of note here that Laski's view on this point is in agreement with that of T. H. Green who also supports inequality of property to a certain degree. As human beings are "variously gifted," says Green, "property must be unequal." "No less," he insists, "must it be so if considered as a means by which individuals fulfil social functions."³¹

Secondly, Laski does not fully agree with the view of men like Lord Hugh Cecil that remuneration should be fixed by the higgling of the market.

"Supply and demand," he observes, "would only be a true index to income if there was an

equal opportunity to apply for the post involved." Nor, "is the higgling of the market a morally adequate test of worth. It leaves one-third of the average industrial community on the verge of starvation. For them it means poor health, undeveloped intelligence, miserable homes, and work in which, broadly speaking, the majority can find no source of human interest."

"The higgling of the market," he further says, "is the apotheosis of inequality. It emphasises all the advantages the employer of labour has in the fact that the average worker cannot afford to wait. The competition involved is not a fair competition because its essence is that freedom of contract is absent. For freedom of contract . . . is present only where there is equality of bargaining power."³²

The third principle of reward that each should contribute to society according to his powers and should be rewarded by society according to his legitimate needs, seems to be more attractive to Professor Laski.

And, finally, "any principle of reward," he holds,³³ "must satisfy the two complex conditions, that it enables the individual to reach out towards his best self, while, simultaneously, it preserves and develops the necessary functions of society."

"Our basic condition," he adds, "must obviously be that every need related to the civic minimum, every need, that is, which, when unsatisfied, prevents the attainment of effective citizenship, must be satisfied before we deal with needs above that civic minimum."

"There is," he insists, "a primary level in remuneration . . . below which no person can be permitted to fall who is capable of acting as a citizen."

Nor can any person "be permitted to secure remuneration except on the condition of performing work recognized as useful."

But the justice in reward can never be secured if the present system of industrial organization remains unchanged. With the abolition of the system of hereditary property, the system of hereditary business enterprise also ought to be changed. The whole system of industry should be "professionalised." The owner of industrial capital should not be, as he now generally is, "the residuary legatee of industry, profiting by the special ability of management, or a rise in price, or the special privilege a monopoly can enforce."³⁴ "Wherever," he continues,³⁵ "functionless property is the controlling factor in industrial production, the abolition of its rights is the necessary path to justice." Of course, he admits, "the abolition

will be no easy matter," and "there is no direct high road to its accomplishment." But, he points out, "there is no birth without pain and those who would confront the prospect of a better life must not turn aside because there are dangers on the road."³⁶

It is evident from what has been stated above that Laski does not support the present system of property which is inadequate psychologically, morally and economically, and which does not enable many persons to "live a full life." Again, such a system often confers rights upon those who have done nothing to earn their property, and "it fails so to distribute the wealth it creates as to offer the necessary conditions of health and security to those who live by its processes." The present system of property "makes a part of the community parasitic upon the remainder." Nevertheless, Laski finds "nothing inherently wrong in the notion of private property."

But this property, he insists, must be "deprived from personal effort organised in such a way as to involve an addition to the common welfare . . . The more equal its distribution, the more likely is the contribution of the citizen to be judged in terms of its social value, to become implicit with purpose as the way to recognition."³⁷

Thus Laski gives a very realistic view on property. He is not a thoroughgoing individualist like Herbert Spencer,³⁸ nor, as the text of his *Grammar of Politics* shows, a thoroughgoing disciple of Karl Marx. He tries to give us a synthetic view on property.

But this synthetic view given by Laski in the text of his *Grammar of Politics* greatly differs from what he has stated in the introductory chapter of the fourth edition of this book published in 1938. There he appears to favour Communism.

"Broadly speaking," says Laski,³⁹ "The Marxian theory of the State has so defined its nature and functioning as to enable us to predict with assurance the course its operations will follow. As an index to the problems of our age it decisively, in my judgment, holds the field."

Kingsley Martin has analysed the reason for such difference between his earlier and later views.

"The essential difference," says Martin,⁴⁰ "between Laski, the Marxist in 1938, and Laski, the Fabian in 1925, was that between the two dates he had seen the great slump of 1929, the

36. *Ibid.*, p. 210.

37. *Ibid.*, p. 216.

38. It ought to be mentioned here that, although Herbert Spencer is regarded as a typical representative of the individualistic school of thought, he was really an enthusiastic advocate of socialism when he dealt with the question of ownership of land in a society. "The world is," he stated, "God's bequest to mankind. All men are joint heirs to it . . . Separate ownerships would merge into the joint-stock ownership of the public. Instead of being in the possession of individuals, the country would be held by the great corporate body-Society." (See Herbert Spencer, *Social Statistics*, Ed. 1868, Chap. IX).

27. *Ibid.*, p. 187.

28. *Ibid.*, p. 187.

29. *Ibid.*, p. 188.

30. *Ibid.*, p. 190.

31. See Green, *Principles of Political Obligation*, p. 221.

32. See Laski, *A Grammar of Politics*, p. 191.

33. *Ibid.*, pp. 195-196.

34. *Ibid.*, p. 203.

35. *Ibid.*, p. 208.

constitutional device of National Government of 1931, the rise of Fascism in Spain, and the triumph of Hitler in Germany. He had come to believe that democracy was a fraud, unless based on equality, that this equality could not be obtained through Fabian tactics, and that the individual and group liberties on which he placed so much stress in 1925 were unreal safeguards until socialist society had been brought into being."

However, there is some lack of consistency between the earlier and the later views of Professor Laski on property. But is it possible to abolish private property altogether? We feel that there is much truth in the view of the Greek political thinker Aristotle who says⁴¹:

"It is clearly better that property should be private, but the use of it common; and the special business of the legislator is to create in men this benevolent disposition. Again, how immeasurably greater is the pleasure, when a man feels a thing to be his own; for the love of self is a feeling implanted by nature and not given in vain, although selfishness is rightly censured."

Though the present system of property is at the root of much discontent and conflict in the modern era, yet, in practice, it is difficult to abolish it without an instinctive change in human nature.

"The socialization of property," as Miss Follett has rightly stated,⁴² "must not precede the socialization of the will. If it does, then the only difference between socialism and our present order will be substituting one machine for another."

Even in the communistic state of the U.S.S.R. the system of private property has not been totally abolished. There is a provision in the Constitution of the U.S.S.R. which explicitly declares:

"Alongside the socialist system of economy, which is the dominant form of economy in the U.S.S.R., the law allows small-scale private enterprise of individual peasants and handicraftsmen⁴³ based on their personal labour, provided there is no exploitation of the labour of others." (Article 9).

Further, the right of inheritance, too, has been supported by the same Constitution: Article 10 thereof lays down that

"The right of personal property of citizens in their income from work and in their savings, in their dwelling house and auxiliary husbandry, in household articles and utensils and in articles for personal use and comfort, as well as the right of inheritance of personal property of citizens, is protected by law."

41. See Aristotle, *The Politics*, p. 62.

42. See M. P. Follett, *The New State*, p. 74.

43. The italics are ours.

Perhaps a balanced view on private property has been given by the idealistic thinker T. H. Green who says :—

"The rationale of property . . . is that everyone should be secured by society in the power of getting and keeping the means of realising a will, which in possibility is a will directed to social good . . . property is held in a way inconsistent with its idea, and which should, if possible, be got rid of, when the possession of property by one man interferes with the possession of property by another; when one set of men are secured in the power of getting and keeping the means of realising their will, in such a way that others are practically denied the power. In that case it may truly be said that 'property is theft.' The rational property, in short, requires that everyone who will conform to the positive condition of possessing it, viz.,

44. See Green, *Principles of Political Obligation*, p. 220.

labour, and the negative condition, viz., respect for it as possessed by others, should, so far as social arrangements can make him so, be a possessor of property himself, and of such property as will at least enable him to develop a sense of responsibility, as distinct from mere property in the immediate necessities of life."

The view which Laski maintained previously in the text of his *Grammar of Politics* and the views held by Green and Hoover are both rational and justifiable. These views are in consonance with human nature. Private property should exist provided it is the product of a man's honest labour; is in proportion to the contribution made by him to the social good; and is not of such magnitude as to enable its owner to have an undue influence over the economic and social life of the community to which he belongs.

—:O:—

JOINT DECLARATION AT MOSCOW

By PROF. SHRIMAN NARAYAN

THE Joint Declaration by the Prime Ministers of India and the Soviet Union at Moscow, is, undoubtedly, an event of world importance and a document based on constructive statesmanship of the highest order. The Five Principles of "Peaceful Co-existence" or the "Pancha Shila" which were enunciated in the Nehru-Chou statement last year have been reaffirmed more precisely in the Nehru-Bulganin Declaration. The Prime Ministers have resolved that the mutual relations between India and Russia would be guided by the principles of mutual respect for each others' territorial integrity, non-aggression, non-interference in each others' internal affairs, equality and mutual benefit and peaceful co-existence. So far as the principle of non-interference is concerned, it has been made very clear that the two countries will not interfere in the internal affairs of another "for any reasons of economic, political or ideological character." This clearly indicates a definite change in the policy of the U.S.S.R. So far, there has been universal fear in the minds of different nations that the Soviet Union believes in the policy of subtle penetration of their economic ideology through various channels, particularly the Communist Parties functioning in various countries. We earnestly hope that the Joint Declaration at Moscow would now put an end to this fear and suspicion and the policies and programmes of the Communist Parties, specially of the Communists in India, would undergo a basic and visible change.

(The Joint Declaration also expressed the hope that "under the aegis of the Five Principles enunciated in the statement, there is ample scope for the development of cultural, economic and technical co-operation between the two States." "The fact that each country is following a system which is moulded by its own genius, traditions and environment should be no bar to such co-operation." It is evident that the basic economic and political ideologies of India and the Soviet Union differ radically in several respects. India is pledged to a peaceful and democratic way of life in accordance with the fundamental teachings of Mahatma Gandhi. She gained her political independence through non-violent struggle and she is now determined to attain social and economic freedom through peaceful and democratic methods. India has accepted one of the greatest, if not the greatest, challenges of the world in deciding to work out her National Plan of Development under a democratic set-up. No country in the world, so far, has ventured to try such an experiment. The First Five-Year Plan, which is now drawing to a close, has already achieved substantial results. The Second Five-Year Plan is now on the anvil. We are confident that the great experiment of democratic planning in India would not only achieve real success in this country but also demonstrate a new mode of planning to the rest of the world. The Soviet Union, on the other hand, has been planning her economic life on a different pattern. Her

economic and political system has been based essentially on a highly centralised and totalitarian organisation. There is no room in that country for different political parties professing divergent views and ideologies. There now appears to be some healthy change in this regard and we hope the Soviet Union would appreciate the system of economic planning in India. We are convinced that democratic planning is a much better method than totalitarian planning. But there is no question of interfering with or criticising each other's methods. We must try to learn the good points of one another and not waste our energies in indulging in bitter and unhelpful criticism. The Joint Declaration has succeeded eminently in creating a healthy atmosphere of mutual co-operation and goodwill and we sincerely expect that this friendly atmosphere would continue to grow with the passage of time.

In the course of his farewell speech at Moscow, Shri Nehru congratulated the Government of the Soviet Union on the several steps it had taken in recent months for lessening world tension. But he also declared in clear terms the economic and political goal of India. Shri Nehru observed :

"We believe in democracy and in equality, in the removal of special privileges, and we have set ourselves the goal of developing a Socialistic Pattern of Society in our country through peaceful methods."

(Shri Nehru paid a tribute to the leadership of "Great Lenin" in the Russian Revolution. But he pointed out that India pursued "a different path under the leadership of Mahatma Gandhi.")

"In spite of this difference in our methods," continued the Indian Prime Minister, "there was at no time unfriendly feeling among our people towards the people of the Soviet Union."

(The visit of Shri Nehru to the U.S.S.R. has been extremely helpful in renewing these ties of friendship between the two countries and we do hope that these bonds of mutual friendship and co-operation would ever remain unbroken.) In fact, India has always been eager to seek the friendship of all nations of the world, without any fear or favour. She has stoutly refused to align herself with any one of the power blocs. This policy is bound to continue in future. We are prepared to co-operate with any country on the basis of mutual help, mutual respect and peaceful co-existence.

There has been some criticism, and even apprehension, in some quarters that India's Second Five-Year Plan is being influenced by some experts from the Soviet Union or the allied countries. Fears are being expressed that Prof. Mahalanobis and his associates are trying to lend a "totalitarian touch" to our economic planning during the next five years. While it is true that planning does involve a certain amount of centralisation of policy and control, it would be wrong to think that the Indian leaders would give up so easily the basic principles of democracy and decentralisation which form the very basis of our Constitution. The Indian Constitution lays great stress on the need for organising village Panchayats in the country as basic units of administration and planning. It also emphasises the role of village and cottage industries for ensuring full employment and adequate means of livelihood to the people. The Indian National Congress has, time and again, made it abundantly clear that economic planning in India should be based on the fullest co-operation of the people through local bodies and Panchayats. Great stress is being laid on the organisation of a net-work of Industrial Co-operatives throughout the rural and urban areas in India under the Second Five-Year Plan. At the Avadi Session of the Congress, we coined a new term "Socialistic Pattern of Society" in order to avoid the obvious meaning and association of the term 'Socialism'. Both Shri Nehru and the Congress President, Shri Dhebar, have made it crystal clear in their recent speeches that the Socialistic Pattern is not the same as a highly centralised system of Socialism or Communism. In fact, India's Socialistic Society would necessarily tend towards Sarvodaya which expresses the quintessence of Gandhian thought.

Let it be clearly understood that India will not tolerate any type of planning which would run counter to the Gandhian ideals and push the country towards a totalitarian order. I hope Prof. Mahalanobis and his co-workers will also have no shadow of doubt in this respect. We are prepared to welcome helpful ideas in regard to economic planning from any quarter. It would be tragic to keep our minds closed to new suggestions. But our feet must be firm on our own soil, without giving up the basic principles which constitute the very Soul of our Nation. As Mahatma Gandhi himself observed, India should keep her windows always open for fresh breeze to enter. But she should not allow outside forces to sweep off the very foundations.

THE LAW OF THE INDIAN CONSTITUTION

By ARUN COOMAR GHOSH

In the Preamble to the Constitution of India the sole guiding principle adopted has been stated as to constitute India into a Sovereign Democratic Republic, and to secure to all its citizens justice, liberty and equality, religious, social, economic and political.

The chapters on the Fundamental Rights and the Directive Principles of State Policy are a direct vindication of the above principle. They constitute the treasure of our constitution, for the value of the constitution lies in them.

POWERS OF THE INDIAN PRESIDENT

In the Indian Constitution the position of the President has been made unique, and the powers given to him by the Constitution are almost unlimited, and are only comparable to those enjoyed by the President of U.S.A. He stands at the apex of the whole structure of constitutional framework like an all-embracing personality.

He is the executive head of the Union and the supreme command of the Defence forces is vested in him. He appoints the Prime Minister and other Ministers to aid and advise him in the exercise of his functions, and they hold office during his pleasure.

All high officials and dignitaries of the Union and the States are appointed by him. He appoints the Governor, the Supreme Court and High Court Judges, the Ambassadors and the Comptroller and Auditor General of India. This power of appointment is not subject to the approval of the Upper House as in U.S.A. where all appointments made by the President require approval of the Senate. He may require either House of Parliament to consider any matter by sending messages to it, and has the power to prorogue the Houses and dissolve the House of the People.

He also enjoys wide legislative powers. Every bill after it has been passed by both the Houses of Parliament require the assent of the President, and the President may give his assent to the bill, or withhold his assent therefrom. In this respect he enjoys veto powers analogous to those enjoyed by the American President. But there are limitations to his powers in this respect. Under Article III of the Constitution he cannot return a bill if it is a Money Bill. Secondly, when a bill other than a money bill is so returned and received back by the President for assent after being reconsidered and passed by the Houses with or without amendment, the President has no power to withhold his assent.

The President has also other legislative powers. Under Article 123 he has the power to promulgate ordinances when the Houses are not in session, and such

ordinances shall have the same force and effect as an act of Parliament.

The President has also been given power under Article 359 during a period of emergency like war or external aggression, or internal disturbances to suspend the enforcement of the Fundamental Rights conferred by Part III by issue of a Proclamation of Emergency.

Thus to say that the President of India is an executive officer, and has nothing to do with legislation is to "talk philosophy, not facts."

Theoretically speaking, these are very wide powers, and a vain man raised to such an eminence may act like a despot. But if we look below the surface, it will be evident that there are sufficient constitutional safeguards to provide against such a contingency.

Firstly, the President may be impeached for violation of the Constitution as is the case with the American President. Secondly, he is to hold office for a limited term of five years although he is eligible for re-election. The limited tenure of his office together with the provision for impeachment acts as a sufficient check on any misuse of his powers. But these are merely theoretical possibilities. Practically, such a contingency can never arise; for the Head of the Indian Union will be an elected Head although the method of election will be indirect unlike in U.S.A. where the President is elected by direct votes of the people. Under Article 54 of the Constitution the President of India will be elected by the members of an electoral college consisting of the elected members of both Houses of Parliament, and the elected members of the Legislative Assemblies of the States.

THE PRIME MINISTER AND PARLIAMENT

Although under the Law of the Constitution the President is the Executive Head of the Union, and all measures executive and legislative will be taken in his name, the real initiative in all matters executive and legislative rests with the Prime Minister and his Cabinet. So long as his party will command a majority in Parliament he can pilot the ship of the State safely according to the declared policy and programme of his party. In this respect the Indian Constitution verges more on the side of the British Parliamentary system of government than of the Presidential type of America. Thus, the Indian Constitution partakes of the character of both Parliamentary and Presidential type of Government, and is in a sense both rigid and flexible. It is rigid inasmuch as the Constitution is a written one, and the powers of the three organs of Government, the executive, the legislative and the judiciary are

clearly defined, and the rights of the citizens protected under it. It is also flexible because the Constitution can be amended by Parliament. Under Article 368 an amendment of the Constitution can be made when it is passed in each House by a majority of total membership of that House, and by a majority of not less than two-thirds of the members present and voting. Besides development of the Constitution by amendment there is also scope for its enlargement by judicial interpretation.

In this connection we may note the following characteristics of the Indian Constitution:

(1) The Constitution is a grant of powers. The powers of the Union and the States are clearly defined in part XL of the Constitution.

(2) The principle of checks and balances—the separation of three departments of Government, executive, legislative and judiciary.

(3) The doctrine of judicial supremacy, the Supreme Court acting as the interpreter of the Constitution. This is one of the fundamental features of the Indian system.

(4) The theory of constitutional limitation. Neither the Union Government nor the State Government is absolutely sovereign. It is sovereign only within the limits of the Constitution.

In the case of the British Constitution it is said that the British Parliament had always been and still remains the sovereign assembly, and it can make and unmake any law excepting making a man a woman and a woman a man. The same remark equally holds good in the case of the Indian Parliament which holds the key power of amending the Constitution to meet the changing needs of the country.

Some thinkers, however, look upon the supremacy of Parliament in a democratic country where there is a written Constitution and an independent judiciary as "archaic political philosophy." It introduces a sense of competition between the judiciary and the legislature, and this spirit of rivalry does the worst harm to the cause of constitutional progress. As Justice P. B. Mukherjee of the Calcutta High Court observes while speaking on "Aspiration of the Indian Constitution" at the Calcutta Rotary Club:

"In a nation governed by a written political Constitution it is vain to look for supremacy in Parliament. The supremacy was of the Constitution. The Constitution was the supreme verdict of the people, and all other organs must subserve that Constitution. If you want Parliamentary supremacy, you will have to scrap the Constitution. Those who think of Parliamentary supremacy in a written political Constitution are therefore thinking in terms of an outmoded political philosophy. It is the lesson of history that the most valued

liberties presuppose an independent judiciary. Indian Constitution had assigned specific functions to the legislature, executive and judiciary. It was the aspiration of the Constitution that each would respect the functions of the other. To the legislature no less to the Courts was committed the guardianship of deeply cherished values."

He emphasised that amendment of the Constitution should be the last resort, and not the first impulse to get rid of every obstruction.

THE SUPREME COURT

It has been rightly said that the Supreme Court has been established by the Constitution of India as the guardian of the liberty and rights of the people, to preserve, protect, and defend the Constitution. The Court is the paladium of justice, the bulwark of popular rights. The position of the Judges has been made secure under the Constitution, and no Justice is removable except by a process of impeachment. Also, the Constitution does not permit any discussion in Parliament or legislature regarding the conduct of any Judge of the Supreme Court or High Court. The Supreme Court has already begun to assert its authority as the guardian of the Constitution to invalidate laws passed by Parliament which contravene the provision of the Constitution. By so doing that Court has assumed a power which was not expressly given to it by the Constitution, a power which many think has created bottlenecks in the way of implementation of its social and economic policy by Government. The legislation providing for abolition of the Zamindari system in the States by giving compensation is a case in point. Under Article 31 of the Constitution this law was declared *ultra vires* by the Supreme Court, but although Government had to abide by the above decision, this ruling of the Court runs counter to the social and economic policy pursued by Government in accordance with the Directive Principles of State policy. Parliament had therefore to amend Article 31 of the Constitution, so that the laws passed by Parliament providing for land reform may not be invalidated by the Court.

Thus we see that by the power of amending the Constitution the Parliament can bypass any decision of the Supreme Court in cases where it conflicts with its social and economic policy, although the occasions necessitating such action should be few and far between. Barring the above, the right of the Supreme Court to declare laws unconstitutional is now beyond dispute. The action of the Court in thus asserting the right of judicial supremacy has proved beneficial as it acts as a great moral check on the Government. In so acting the Court has also ably played its part as the guarantor of the rights given by the Constitution.

A GLIMPSE INTO THE PROBLEM OF EMPLOYMENT AND INVESTMENT IN RURAL AREAS

By PROF. GOBINDA CHANDRA MANDAL, M.A.

THE present paper is based upon statistical data collected in course of an economic survey covering 843 rural households selected at random and spread over 20 villages in the Contai Subdivision, Midnapore, West Bengal. The survey was conducted by the writer under the auspices of the Economic Society, P. K. College, Contai, Midnapore, in May 1954. Out of 843 households, 639 constituting 75.6 per cent of the total were found to have holdings between 0 to 5 acres, 119 constituting 14.1 per cent of the total had holdings between 5 to 10 acres, 27 constituting 3.2 per cent of the total had holdings between 10 to 16 acres, 34 with holdings between 16 to 25 acres were 4.0 per cent of the total and households having holdings over 25 acres were only 24 constituting 3.1 per cent of the total.

When we apply our mind to the problem of unemployment we generally take in view the urban and middle-class unemployment. But the problem of employment in rural and urban sectors of the economy cannot be considered apart from each other. In the national economy like ours where its urban sector sustains itself mainly on the primary production of its rural sector, the well-being of the former cannot but be vitally related to that of the latter.

RURAL UNEMPLOYMENT

There are organizations like Employment Exchanges which are helpful in giving an estimate or indication of industrial or urban unemployment. But it is extremely difficult to measure rural unemployment which mostly exists in disguise. If an unemployed person is defined as one searching for a job without success, he will be rarely found in the rural areas. The Indian rural economy is rooted in self-employment and household-enterprise on the subsistence level. Even an agricultural labourer has got some land of his own to till however small it may be. Table I shows the extent of unemployment in the conventional sense of the term.

TABLE I

Distribution of "Unemployed" by Holding class		
Holding class (Acres)	Number of unemployed	Number of unemployed per household
0-5	123	0.2
5-10	5	0.04
10-16	17	0.6
16-25	9	0.2
above 25	9	0.3
Total	163	0.2

The above table indicates that the number of unemployed persons per household is 0.2. The total number of persons above the age of 14 years in all the households taken together is 3117. The unemployed persons constitute nearly 5 per cent of this population. Thus the incidence of unemployment is smaller than what is assumed, the largest being in the case of middle holders.

In such a set-up "unemployment" can be interpreted to imply lower demand and lower prices for the products of the rural households leading to lower incomes and lower production.

If there were any large-scale unemployment in rural areas in the conventional sense of the term, it would have been followed by a large-scale emigration. Emigration from rural areas is perceptible only in a small measure as shown in Table 2.

TABLE II

Distribution of Emigrants		
Holding class (Acres)	Number of emigrants	Number of emigrants per household
0-5	116	0.2
5-10	43	0.4
10-16	18	0.6
16-25	40	1.1
above 25	30	1.1
Total	232	0.3

Table 2 shows that the number of emigrants is larger and larger in the case of large holders. Small holders cannot afford to engage labour from outside and dispense with any services of their own household members. Members belonging to the families with small holdings stay in their own villages and supplement their own farm-earnings by working in the fields of others with larger holdings. Big holders, however, can afford to hire labour from outside and disengage services of some of the household members for larger income-creation. Insufficient work or underemployment is, therefore, the crux of the problem of rural economy.

Employment in rural areas can be expanded only through new investments in rural areas. The investible surplus in the rural economy is meagre. This is indicated by Table 3 relating to the extent of new investment in some selected items.

TABLE III

Investment per Household (1944-54)						
Items	0-5 acres class	5-10 acres class	10-16 acres class	16-25 acres class	above 25 acres (class)	
Reclamation of waste land	Rs. 17	Rs. 36	Rs. 119	Rs. 234	Rs. 1,618	
Excavation of ponds, tanks, etc.	53	215	208	320	1,168	
Installation of machine	2	15	68	10	416	
Construction of houses	156	312	282	745	2,387	
Business	28	165	522	160	616	
Ten years	256	754	1,204	1,468	6,205	
Total	25.6	75.4	120.4	146.8	620.5	

Thus investment per household in the case of households with holdings from 16 to 25 acres is nearly twice as much as in the case of 5-10 acres class. But it may be noted that the increase in investment is less than

A GLIMPSE INTO THE PROBLEM OF EMPLOYMENT . . .

115

proportionate to the increase in holding at least within the range from 5 to 25 acres. This is an indication of a high degree of consumption propensity in the lower holding group.

It is quite natural that poverty which is mainly due to smallness of holdings results in an investible surplus which is extremely small in comparison with the requirements of economic progress. The insufficient growth of investible surplus is responsible for insufficient growth of skill, business knowledge and enterprise and productive equipments or materials.

PATTERN OF RURAL INVESTMENT

Tables 4-9 are given below to indicate the pattern of investment in the selected items and its variation from one holding-group to another.

TABLE IV

Distribution of Investment (1944-54) as between Different Items (All Classes)

Items	Amount Rs.	Percentage to total
Reclamation of waste land	65,103	13.0
Excavation of ponds, tanks, etc.	1,04,192	21.0
Installation of machine	15,310	3.0
Construction of houses	2,28,623	46.0
Business	85,495	17.0
Total	4,99,723	100.0

TABLE V

Distribution of Investment (1944-54) in the case of Holding class 0.5 acres

Items	Amount Rs.	Percentage to total
Reclamation of waste land	10,777	6.0
Excavation of ponds, tanks, etc.	33,954	20.0
Installation of machine	1,090	1.0
Construction of houses	1,00,087	62.0
Business	18,114	11.0
Total	1,64,022	100.0

TABLE VI

Distribution of Investment (1944-54) in the case of Holding class 5-10 acres

Items	Amount Rs.	Percentage to total
Reclamation of waste land	4,285	4.0
Excavation of ponds, tanks, etc.	23,677	29.0
Installation of machine	1,900	2.0
Construction of houses	38,251	42.0
Business	19,631	23.0
Total	89,754	100.0

TABLE VII

Distribution of Investment (1944-54) in the case of Holding class 10-16 acres

Items	Amount Rs.	Percentage to total
Reclamation of waste land	3,229	9.0
Excavation of ponds, tanks, etc.	5,620	20.0
Installation of machine	1,950	6.0
Construction of houses	7,630	23.0
Business	14,100	42.0
Total	32,529	100.0

TABLE VIII

Distribution of Investment (1944-54) in the case of Holding class 16-25 acres

Items	Amount Rs.	Percentage to total
Reclamation of waste land	7,962	19.0
Excavation of ponds, tanks, etc.	10,891	20.0
Installation of machine	370	1.0
Construction of houses	25,345	50.0
Business	5,450	10.0
Total	50,018	100.0

TABLE IX

Distribution of Investment (1944-54) in the case of Holding class above 25 acres

Items	Amount Rs.	Percentage to total
Reclamation waste land	38,850	26.0
Excavation of ponds, tanks, etc.	28,050	19.0
Installation of machine	10,000	7.0
Construction of houses	57,300	38.0
Business	14,800	10.0
Total	1,49,000	100.0

Table 4 shows that the most important item of investment is construction of houses, the next item in importance being excavation of ponds, tanks, etc. Investment in business organization and reclamation of waste land come next. Investment in machine is very small showing that its impact upon the rural economic life is still insignificant. As houses in rural areas are constructed mainly for residential purposes, they come under the category of durable consumption goods excluding which productive capital formation in rural areas is reduced almost to insignificance.

Tables 5-9 indicate that investment in excavation of ponds, tanks, etc., is comparatively larger in the case of holding class 5-10 acres. In the case of other classes the proportion of investment devoted to this item is almost stable varying from 19 to 21 per cent.

This fact points to the future possibilities of further development of tank-fishing, irrigation and gardening for which there is a natural urge.

Investment in the reclamation of waste land has been naturally less important in the case of smaller holdings. It has been larger and larger in the case of larger holdings. This is obviously because large holders have got larger amount of waste lands at their disposal. Any increase in agricultural income due to rising price level may have served as an impetus to reclamation of waste lands in the case of larger holders. Both business enterprise and investment in machine are found to be remarkable in the case of households with holdings from 10 to 16 acres. Investment in machine is also appreciable in the case of households with holdings above 25 acres.

Data relating to sources of finance for investment are presented in Tables 10-14.

TABLE X
Sources of Finance :
Holding class 0-5 acres

Sources	Amount Rs.	Percentage to total
Self	1,58,480	72.4
Mahajan	52,997	24.0
Co-operative Society	4,707	1.6
Commercial Bank	—	—
Government	7,134	2.0
Total	2,23,318	100.0

TABLE XI
Sources of Finance :
Holding class 5-10 acres

Sources	Amount Rs.	Percentage to total
Self	84,190	80.0
Mahajan	11,140	11.0
Co-operative Society	2,055	2.0
Commercial Bank	500	0.5
Government	3,150	6.5
Total	1,01,035	100.0

TABLE XII
Sources of Finance :
Holding class 10-16 acres

Sources	Amount Rs.	Percentage to total
Self	23,610	92.0
Mahajan	1,608	6.0
Co-operative Society	—	—
Commercial Bank	400	0.5
Government	775	1.5
Total	26,393	100.0

TABLE XIII
Sources of Finance :
Holding class 16-25 acres

Sources	Amount Rs.	Percentage to total
Self	37,040	76.0
Mahajan	10,360	21.0
Co-operative Society	330	0.6
Commercial Bank	—	—
Government	1,200	2.4
Total	48,930	100.0

TABLE XIV
Sources of Finance :
Holding class above 25 acres

Sources	Amount Rs.	Percentage to total
Self	106,915	84.4
Mahajan	17,200	13.0
Co-operative Society	3,600	2.0
Commercial Bank	1,000	0.8
Government	180	0.2
Total	1,28,895	100.0

The above Tables indicate that self-financing plays the most important part in rural investments. The second largest source of finance is the village Mahajans. The part played by co-operative or Government or commercial financing is still insignificant. Possibly the

importance of self-financing has been largely due to the inflationary increase in agricultural income. This is to some extent corroborated by data relating to purchase and sale of assets presented in Table 15.

Holding class (Acres)	Asset purchased (1944-54) Rs.	Asset sold (1944-54) Rs.
0-5	93,458	1,05,073
5-10	27,830	9,419
10-16	39,600	9,800
16-25	40,850	24,200
Above 25	34,900	23,750

In almost all the cases except in the case of 0-5 acres class value of asset purchased has exceeded value of asset sold. The period in which this has occurred is a period of rising agricultural prices. In fact it was the agriculturists who were most adversely affected by the Great Depression, while the inflation of 1943-50 appears on the whole to have been helpful in expanding agricultural production and improving the economic condition of the agriculturists. The role of price-factor in agricultural planning is too important to be ignored in any case. A guarantee of fair agricultural prices alone would go a long way towards the achievement of agricultural progress in this country.

PROFESSOR MAHALANOBIS'S PLAN

There is a great deal of sense in Professor P. C. Mahalanobis's Plan where he emphasizes the need for expansion of handicraft and household industries for liquidating unemployment and provides a sum of Rs. 200 crores for the purpose. The plan naturally requires a freezing of the production of big industries at the present level. Another valuable point in the Plan is its stress on the expansion of heavy industries and investment output synchronized with the expansion of consumption-output. Investment-output is extremely helpful in generating purchasing power to demand and support the production of additional consumer goods—both resulting in a higher level of employment and social income.

The Committee of Direction for the All-India Rural Credit Survey (1954) has attached great importance to the need of combining rural-minded credit with rural-minded development of agriculture and rural-minded organization of marketing, processing, etc. In addition to this it is also necessary to integrate the programme of rural credit and that for capital construction in rural areas.

A very liberal public expenditure on the construction of inter-village roads, tank-improvement, small irrigation and construction of houses will go a long way towards the creation of finance for rural consumption and private productive investment, provided suitable organizations are built for the purpose. This will solve the problem of under-employment in rural areas. The rural prosperity in its turn will create fresh demand for urban products and lead to expansion of employment in urban areas.

EMPLOYMENT OPPORTUNITIES FOR THE MIDDLE CLASS IN THE SECOND FIVE-YEAR PLAN

With Special Reference to West Bengal

By R. N. BOSE, I.A.S.

THOUGH full employment is our national policy and though Government stands committed to attempt to solve the nation's unemployment problem by the end of the third five-year Plan by an investment expenditure at the rate of Rs. 1,000 crores per annum with effect from 1956, it is increasingly becoming clear that during the Second Five-Year Plan only a high and steady level of employment will be aimed at. It is important, therefore, that sufficient stress be laid on an aspect of this problem which has been so long and so insidiously with us that being used to it we are often apt to overlook its potentialities for danger.

Particularly after the first world war, this middle-class unemployment became rather acute and then many States set up Committees to look into the nature and extent of this problem. The reports of all these Committees showed that this was not a localised malaise but a chronic disease of an all-India character. It was further noted that

"As it affected the nation's intelligent manhood, it produced a general demoralisation which was cumulative in its effect and finally it struck at the very root of ordered progress inasmuch as the victims of this evil could not help nursing a strong sense of personal injury against a state of affairs for which they were themselves not responsible."

Until the second world war, there were long periods of trade depression with acute middle-class unemployment and only during the peak war years, under the stress of vast public expenditure, the educated youths had better employment opportunities. When the end of the war came, slowly the conditions worsened and the survey of unemployment in West Bengal, 1953 reveals that in the middle class the Bengalee males constituted 91.5 per cent of the total unemployed while in the Bengalee working classes they constituted 48.3% of the Bengalee working classes. It has also been revealed in the same report that in the Bengalee middle classes the percentage of unemployed matriculates to the total unemployed is 44%. In the city of Calcutta alone, out of a total population of 25 69 700, 17 77 200, are in the employable group. Of them, 8,58,800 are fully employed and of them only 4,34,600 are Bengalees. Of the total unemployed numbering 2,57,300, 1,85,300 are Bengalees and of these 1,28,200 come from the middle class. In the countryside the unemployment problem for Bengalee middle class is more acute and it would not perhaps be wrong to say that 75% of employable youths of middle-class families is unemployed.

Once it was held that this problem of middle-class unemployment was mainly one of education which was inefficient and cheap. Universities had been turning graduates of all descriptions on mass production lines and so middle-class youths who by tradition and temperament preferred salaried employment and occupations in distributive trades and services to more productive work suffered from this heavy incidence of unemployment.

Attempts have been made in reorganising educational system and to curb the tendency to mass production and there has been a stiffening of standards and of competitive tests. There has also been an improvement to a certain extent in the general outlook of our youths who instead of looking down upon manual work are now eager to acquire training for livelihood but unfortunately the problem of middle-class unemployment remains unsolved and in fact middle-class unemployment of all grades and shades has become more acute of late. It is now becoming clear that even our engineers and technicians are unable to find suitable jobs. On September 11, 1953, in his interview with the special correspondent of the *Eastern Economist*, Mr. T. T. Krishnamachari, Minister in charge of Commerce and Industries, Government of India, forcefully posed this problem when he said:

"We are starting new engineering institutions for training young men. After the war, Government sent up hundreds of people abroad for specialised training in the hope that they would be absorbed by increased industrialisation but the pace of industrialisation in the country has perhaps absorbed a third of the products of these institutions, leaving very nearly 2/3rd unemployed. One finds at least one technically trained man unemployed in every alternate or third urban middle-class family."

Thus, unemployment is the reflex of our economic backwardness and according to many, further industrial development can perhaps offer a partial solution, firstly, by starting of new industries stimulating a demand for educated men possessing technical and professional qualifications; secondly, by promoting small-scale and cottage industries which can be linked with large-scale factories where middle-class youths can be self-employed, and finally, by opening up opportunities of employment as traders and middlemen in the distributive trades.

The paradox of increasing production and growing unemployment among the middle class in recent years has led many to question whether in our present-day conditions which differ fundamentally from those that

obtain in the industrially advanced West, it will be possible at all to have the full employment policies developed by the Keynesians directly aiming at the full employment of capital and only incidentally leading to fuller employment of labour. Such policies, according to competent critics, are wholly inapplicable to a country whose root problem is lack of capital and where population is increasing in such a way that in India there will be demand for 10 million extra jobs in five years when population will increase by about 25 millions. It has been roughly computed that in West Bengal alone, after the second five-year plan another quarter million middle-class educated and trained youths will be employable and an investment of 250 crores or more would be required for finding jobs for this group only. So some economists point out diffidently that increase in total employment expected in the Second Plan will be exhausted by the extra needs and shortage of capital, wide-spread poverty leading to restricted demand in the home market and a large labour surplus will cripple all efforts for employment in an under-developed and over-populated country.

The mitigating suggestion is for multilateral expansion of industries into rural community for mutual exchange. It is pointed out that

"There should be a complete change in our orientation to small-scale undertakings if we realise these facts." . . . "We shall use our large-scale industry as a feeder to small-scale enterprises instead of the other way about" . . . "Trade and tariff measures, transport and communications, currency and credit movements would be all designed with the central purpose of nourishing small-scale industry." Some competent authorities have also suggested that

"Handicrafts and household industries where self-employed householder's work should be encouraged by freeing if necessary of production of certain industries competing with these handicraft and household industries. Their advice is to concentrate our limited resources of foreign exchange and essential materials on the setting up and expansion of heavy industries and economic overheads; while providing more employment opportunities for those who are already engaged in the small-scale and cottage industries and trying to find employment for the new additions that are being made to the labour force every year."

The fact remains, however, that these handicrafts and hand industries are technically inferior and cannot obviously face, unaided, the competition of factory industries. At the same time, the needs of development with its accent on increased productivity cannot be reconciled with the continuance of the present inferior technical level of the existing hand trades.

It is, therefore, necessary to have in the next Five-Year Plan a common production programme that will provide a secure market for the products of these industries and at the same time provide for gradual improvement of techniques and skills among the workers.

This may also help in bringing equilibrium in

relation between small-scale and large-scale industries in the field of consumption goods. There are conflicting views on this subject and while every attempt should be made to bring about the fullest possible utilisation of existing capacity in the factory-consumption goods-industry, it may not be wise for the second plan period at any rate to have any significant increase in their installed capacity.

It is exactly here that the chance for survival comes in for the middle-class youths with training and education. It is not perhaps too much to hope that small and medium enterprises employing less than 20 workers will function as links in the chain of national economy as in Japan. It may even be necessary for Government to sponsor some small and medium sized industries where self-employed middle-class youths acquire business training and where they are ultimately given ownership or partnership. This is becoming more necessary as the employment exchanges which could find employment for about 500 in a month in the past year in the city of Calcutta on an average is now able to find employment for only about 200 at the most as practically all the commercial and mercantile firms have either stopped recruitment or avoided recruitment through these exchanges. It is doubtful if the unemployed youths of the middle class can afford to wait patiently till the tempo of development rises and an effective population policy ensures a sizeable population. The reorientation of the educational system will also take time. Accelerated economic progress is necessary. This may be only possible if technically trained youths be organised and the industrial potential of the units so organised be taken in hand by the State till they are able to pay their own way. When these enterprises are managed properly by these trainees, gradually Government's responsibility may be withdrawn. Some employments for the middle class can also be secured by utilising the capacity of all big factory industries to the full. This will not be possible, however, unless the temptation to make the technical and supervisory staff work long hours be resisted. Some form of collective guidance of industry is essential in this connection as it is found that in many cases the managements are apt to by-pass the limitations of work set in the Factory Act under cover of Section 64 and the rules which provide for some exemptions. It should be noted by enlightened businessmen that overtime work does not always mean increase in production. Often overtime means increase in hours of work rather than productivity. In all advanced countries, matters affecting overtime have become increasingly improved and the demand is that the working of overtime should be voluntary. There is a persistent overtime resulting from shortage of supervisory staff in most of the important Indian industries and this should be rectified by employment of more staff. In any case, the extent of overtime now being worked by technicians in many factories is not at all a healthy feature of our industrial life. Moreover, it tends to shut

out many fully trained men who might have otherwise had employment opportunities.

A unified development scheme is necessary, however, in addition to creation of an adequate volume of aggregate demand for technical, clerical and supervisory personnel. Large expansion of public works with adequate total outlay in the promotion of health, education, housing and social services will be necessary. On a rough estimate, it is calculated that provision of social services by public authorities as well as private investments would involve a total outlay of about 1500 crores over the plan period, that is to say about 300 crores annually. It is not optimistic to hope that 10% of this outlay will filter down to the middle-class employees who act in a supervisory capacity.

Economics of our unused resources should also be tapped. Stimulation of foreign demand for export goods will be also necessary and this will in its turn require standardisation and quality control. These are essentially spheres for educated and trained men. The immediate employment target for the whole country in the Second Five-Year Plan must be the absorption of about 10 million workers of whom one million at least will be from the middle class. Considering that in addition some at least of the existing under-employed will have to be given fuller employment, employment target of the plan has to be higher. Agricultural and cottage industries together account for about 75 per cent of the working forces and carry a large amount of excess man-power. There is, therefore, little hope of any substantial absorption of the new increase in labour force in these lines.

Moreover, it should be our aim to withdraw from agriculture progressively increasing numbers into other occupations so as to relieve congestion in agriculture and improve the average productivity. Another important point to note is that employment in factory establishments which was 29.7 lakhs in 1950-51 is expected to increase by about 13 lakhs thus making a total industrial employment of 42 lakhs by 1960-61. Correspondingly, this will not create jobs for more than 3 lakhs in the factories for those who are in supervisory, clerical and other similar posts providing employment opportunities for the middle class.

New opportunities of the order of 10 or 12 million jobs will have to be created on the base of the labour force employed in the secondary and tertiary sectors. The plan has to provide for substantial investment in heavy industry where relatively greater emphasis will be necessary. In fact, nearly 65 per cent of the total investment in industries is scheduled to be in heavy industries which will augment capital bias of our country and provide fairly adequate opportunities of employment for technicians and trained personnel. Similarly during the course of the next five years heavy investment will

be necessary in the field of machinery manufacturing and this will open up employment also to our educated middle class as also will be the ancillary industries in metallurgical, mechanical and electrical engineering. In addition to providing direct employment these additional employments will be of the order of a little over 10 million in five years and a fair percentage may go to the middle class if effective steps are taken for training and recruitment in time. It has been said that for every additional person employed in manufacturing industries there are at least seven others employed in smaller enterprises, railways, communications, banking, insurance, other commerce and transport, profession and liberal arts and these are pre-eminently the avenues of middle-class employment. Thus it has been even contended that rationalization in other countries has been found to develop employment opportunities and each technical advancement designed to reduce man-power has been followed by an expansion of industry which results in increased production and employment. As an eminent industrialist has pointed out:

"Jobs in horse and carriage business replaced by automobile industry in making, selling and servicing cars ultimately create more employment opportunities and the trend is for employment at a higher level following mass car production by Ford and others providing machines, power, fuel, oil, metals, rubber and road building."

This theme has been further developed by the Employers' Association of Calcutta in a pamphlet, *How Large-scale Industries Help Indian Economy*. This has not, however, shown specifically the percentage of trained personnel absorbed.

The tree is lost in the wood and so the unemployed among the middle class may be lost in the crowd of Indians unemployed but there is just this danger that in the struggle for survival the middle class which is lacking the privileges of haves and the class-conscious collective approach of the have-nots may go under. Though middle-class employment may not be a forgone factor in our social planning yet it is open to question whether sufficient attention has been given to its many aspects. It may be doubted whether our planning should isolate any class and whether it would be in public interest to set up the claims of any section of the society but as employment opportunities are vital to the survival of the middle class especially in West Bengal where they are not participators in the distributive trade and business, it is necessary to focus attention on this problem. Surely, our social planning should safeguard the least class-conscious and therefore in some ways the most socially progressive section of our society which may not be vocal like big business interest and trade union federations but which face nonetheless the challenge of changing times.

THE HINDU MARRIAGE ACT—1955

By Mrs. SUSHAMA SEN, M.P.

AFTER Independence of India, amongst the many objectives and directives for the progress of the country the Indian Constitution promulgated equal rights for man and woman. The Hindu Law did not allow equal rights to both sexes, and it was obviously necessary to alter the one-sided provision as regards marriage and its indissoluble character for women. No country can go forward without the same rights and privileges for man and woman.

As a mark of the awakened conscience of Free India, and as the first step of Social Reform, it will be remembered that the Special Marriage Act, 1954, was passed by the Parliament in September last. It is a permissive measure, yet some dissentient voices were raised during its discussions to the effect that Hindu society was being jeopardised by this measure. So one wonders what an amount of opposition there must have been in the eighties of the last century. When the Special Marriage Act of 1872 was initiated by the social and religious reformer Shri Keshub Chunder Sen when the orthodox sentiments were stronger than now. It was passed in the teeth of opposition in the legislature. It laid down monogamy, restraint on child marriage, and permitted inter-caste, inter-religious marriage. Registration of marriages was introduced, so it has been called the Civil Marriage. That it was only a secular form of marriage, is a wrong notion, for together with the registration, there was laid down an elaborate religious ceremony, with the sanctity of vows taken by the parties to the marriage. Keshub himself was a believer in the sacredness and indissolubility of marriage tie. But the British Government then in power, had to insert the Divorce clause, as a corollary to the rights of marriage, according to the Indian Divorce Act. Thus the divorce system has existed for these 82 years for those married under the Special Marriage Act III of 1872, but the society as a whole adheres to the old Hindu ideals of sacrament of marriage, and save in exceptional cases of hardship and unhappiness, the cases of divorce in this society—the Brahmo Samaj, have been few and far between. Time has shown that the 'Civil Marriage' as it was called had benefited many, even those outside the Brahmo Samaj, and it had no demoralising effect on those families which married under it, because of the provision of divorce.

(1) The Special Marriage Act, 1954, has been made wider than the Parent Act. It will now apply to all Indian citizens, and a new clause of divorce by

mutual consent is added to the new act. The Special Marriage Act III has now been repealed and Special Marriage Act, 1954, has come into force from January 1st, 1955.

(2) Some other marriage laws containing provision of divorce were enacted during the British regime in India for different communities such as, the domiciled Europeans, Anglo-Indians, Indian Christians and Parsees. The Malabar Act of 1896 provided a clause of divorce by mutual consent. The Muslims are governed by the personal law, which permits divorce. There are vast tracts of Indian territory, who are governed by their customary laws and divorce is recognised by them. Altogether there is about 80 per cent of the Indian population who have divorce in their marriage laws, and compared to the vast millions of India's population cases have been negligible. So the argument that a provision for divorce either induces the couples to divorce each other or that it demoralises society is devoid of all force against the facts of history.

The next step of Social Uniformity in Free India, and a most important one, as it effects the whole of the Hindu community, was the Hindu Marriage Bill recently passed during the last session of Parliament. It has now had the assent of the President of Indian Union, and is an Act. The main questions involved in it are:

- (1) The abolition of caste as a necessary requirement of a valid marriage;
- (2) Enforcement of monogamy;
- (3) Divorce or dissolution of marriage on certain grounds;
- (4) Restraint of child marriage.

There is also to be registration of Hindu marriages.

The Hindu Marriage Bill is not an absolutely new or an abrupt piece of legislation, it has, on the contrary, gone through a long, tardy and laborious process of deliberations. It has been pending since 1939, and it has been mooted with necessary changes now and then in the Central Legislature for about 13 years. There have been Hindu Law Committees, and eminent lawyers and jurists have deliberated on this question. The Rau Committee was appointed to go thoroughly into the subject. The eminent jurist Shri B. N. Rau was its Chairman. The Rau Committee toured through the length and breadth of India, and recorded evidence from distinguished personalities of the country belonging to all shades

of opinion. There were conflicting views on the matter of codification of Hindu law. On the one side some leading men like the late Srinivas Shastri said that the codification and uniformity of Hindu Law throughout was possible and desirable. He said:

"I was astounded at some sensible people's objection to monogamy. I thought the pride of Hinduism was that although polygamy was permitted in theory, it was monogamy which was actually practised. It is, therefore, surprising that when monogamy was sought to be enacted as a rule of law, hands should be raised in horror."

On the other hand, Pandit Madan Mohan Malaviya, the staunch nationalist leader, said that codification was not desirable nor possible. Sir Tej Bahadur Sapru gave his opinion in favour of Hindu Code. Sir N. N. Sircar, while favouring the Code, added that it was subject to the majority of Hindus supporting it. Dr. Shyama Prasad Mookerjee, President of the All-India Hindu Maha Sabha, was definitely against codification.

On the vexed and thorny problem of divorce which was incorporated in the Hindu Marriage Bill, the Rau Committee observes as follows:

"It is clear that texts of Narada, Parasara, and Debala permit divorce in certain circumstances. We are unable to accept the view that these texts refer only to cases of betrothal (*vagdana*) and not to cases of completed legal marriage or *kanyadana*. Nor can we endorse the view that the texts apply to unapproved marriages or to *niyoga* connections. Orthodox opinion considers that the texts are Moiddha Acharya in the present age (*Kaliyuga*), but this seems to us only another way of saying that divorce is not now prevalent among the higher castes. There are, however, Hindu communities, particularly in the lower strata in which divorce does prevail even now as a custom except amongst the higher castes. A witness from Orissa said that in his province divorce prevails by custom except amongst the higher castes. Another witness from Bihar said that of a total Hindu population of 32.2 millions in that province, only 4 millions belonged to the higher castes and that the marriage sat rather loose on the 28.2 millions and that there was a valid custom of divorce amongst the lower strata. Although therefore, a Hindu marriage is in theory a sacrament, in practice it is even now regarded amongst large sections of communities as dissoluble. The statement that divorce is an idea which is absolutely foreign to the Hindu Law cannot be accepted as correct."

We find from the exhaustive report of the Rau Committee on Hindu Law, 1947, that one of the objections of the opponents of codification was that any change in the fundamentals of Hindu Law cannot be determined by the Central Legislature, which is not of a representative character, as there had been no election for a number of years (on account of the

Great World War II) and that the then Central Legislature was not competent to make law for the whole of India. This objection cannot hold good now, as the present Legislature—the Lok Sabha, is a truly and properly elected representative body. The Bill had been sent for circulation for eliciting public opinion from the best brains of the country, and opinions received, showed that a large measure of public opinion received was in favour of the main provisions of the Bill. After a full discussion in both the Houses, it was sent to a Joint Select Committee, and the Bill underwent some changes. It was then passed by the Rajya Sabha, and after a critical deliberation, finally passed by the Lok Sabha, practically unanimously, with only one lone voice of "No."

During the passage of the Bill, the opposition to the proposed measure came from the Hindu Maha Sabha members, and one member of the Ram Rajya Parishad. Their objections were that Hindu Shastras and Smritis were being infringed, although they admit that "there have been some minor changes in some places due to traditions, customs and usages." In the present Hindu Marriage Bill, they did not object to monogamy and said that no one was ostracised for inter-caste marriage, and that no one takes such marriages as immoral. Few quoted Shastras to justify polygamy. There is general agreement amongst all sections of the people, that although polygamy is on its last legs, yet it is time now when there should be express prohibition against polygamy. Regarding divorce, Shri N. C. Chatterjee, President of the All-India Hindu Maha Sabha, and some others, put in strong objections on the ground that it will destroy 'the sacramental character of Hindu marriage.' The Prime Minister, Shri Jawaharlal Nehru, significantly posed the question:

"Is it sacrament to tie up people to bite and hate each other?" He, however, conceded that "not only marriage, but all forms of human relationship should have an element of sacrament, more so, in the case of the intimate relationship of husband and wife."

He said:

"Manu and Yagnavalkya were great men in the history of India. They had shaped the destiny of the country in their time. But was it right to bring in Manu and Yagnavalkya to bear witness as to what should be done in the present day?"

Hindu Law is dynamic. It is broad and progressive enough to take into its fold every caste and all communities. It is not static; it has changed, and changes have taken place from time to time to suit conditions of the society and country. For instance, Hindu Law must have changed a great deal during the time of Manu, and the laws must have been altered. It is a well-known fact that in Ancient India women occupied a high place. She had co-ordinate

authority with man in religious, domestic and social spheres of life. She had the right to choose her husband—*svayambaram*. But as time went on, numerous circumstances, internal as well as external, conspired to deprive woman of the high position she enjoyed, and she gradually came to be regarded as a mere chattel. Thus the mal-practice of child marriage, *pardah*, female infanticide, *suttee*, plurality of marriages, etc., came into vogue.

The following quotation from Manu will prove the idea of superiority of man over woman. Would anyone agree with those sentiments in these days? Manu says:

"For a woman, the only vow, the only *dharma*, the only worship of God is to serve her husband obediently, whether he is impotent, poverty-stricken, diseased, old or badly placed, the wife must never leave her husband. His happiness is her happiness, his sorrow is her sorrow. A chaste woman always feels this way, whether in prosperity or affliction. A woman desirous of holy bath in pilgrimage, should drink the water in which her husband's feet are washed, because for her, her husband is a god, her Guru, and preceptor, her *dharma*, her pilgrimage, her avowed austerity, so she must worship her husband leaving behind everything."

In an article written recently by Acharya J. B. Kripalani on the Hindu Marriage Bill appearing in the *Hindusthan Standard*, regarding the Shastras, he says:

"It is true that Shastric injunctions are conflicting and anything can be proved or disproved on their basis by learned Pandits. A large section of Hindu Law therefore is based upon immemorial custom. It is through this that Hindu society as any other functioning society, has achieved some kind of equilibrium."

He sums up by saying:

"If, therefore, there is to be the right of divorce, let it be for the time being confined to women only. I am sure the Hindu menfolk will not object to this advantage to be given to their womenfolk as long as women are economically and educationally backward, and the State provides no security."

I wonder how many men or women would agree with his views! Women, as far as I know, would prefer no concessions, as they showed their spirit of courage and conviction during the last General Elections. They did not want reserved seats, and fought without any concessions with the men. The results for the first time, was quite satisfactory. During the Freedom movement also the Indian women showed their worth by going to prison along with the men, and they did not want any preferential treatment. But now all what they want is equal status with men, and the Indian Constitution has given her this right. Man occupied an advantageous position

during the past centuries, and it is time now that the Hindu law was changed. Under it polygamy was permitted and while the husband had the right to divorce the wife, the law permitted no suitable relief to the discarded wife.

The Law Minister, Shri Pataskar who ably piloted the Hindu Marriage Bill in Parliament strongly defended the rights of women. He said:

"First of all, I want to make it clear that this is a measure of social importance, we recognise it, conceived in a spirit of doing good to the country and to every section of it, in this case, the section of women, because men have been all along enjoying in such matters disproportionate rights as compared to women. We cannot in the name of preserving the sanctity of any ancient culture try to treat them in a different way in the present times and conditions of our country. To try to do so will be an anti-social act. And I would appeal to those who are trying to keep up to their privileges in the name of the so-called religion, to think of the consequences which would follow, if women who form half the population of our country, in whom this sovereignty rests according to our Constitution, were denied these privileges and kept out of them."

Shri Pataskar also confirmed by saying:

"Divorce was the target of some of those who opposed the Bill. But it is to be remembered that 80 per cent of the Hindus in the country had the customary right of divorce at present in some form or other. It is only of the so-called 20 per cent upper class of the vast population of millions of Indian people who have not the right of divorce."

The Prime Minister paid a high tribute to the womanhood of today. He said:

"I am proud of their sense of grace, charm, shyness, modesty and intelligence and their spirit of sacrifice. I think that if India can truly be represented, it can be represented by the women of India and not the men, while he could not say that every man who had represented India abroad had brought credit to the country, he could say that every woman who had been sent abroad had brought credit to the country. It was true that fewer women had been sent than men, but still everyone had the greatest admiration for India's womanhood, not merely the ancient ideals but the women of today. I have faith in them and in the solid foundation of their character. I am therefore not afraid to allow them to go forward. I am convinced that no legal restraint can prevent society in a certain direction today. If you put too much legal restraint, it does not bend but it breaks."

Shri Nehru referred to the oft-repeated references which were made in Parliament to the high ideals of Indian womanhood—Sita and Savitri. He said:

"Everyone admired these ideals of Indian womanhood and looked on them with reverence and affection. But were these ideals only for women? Why not for men also? I do not seem to

remember any reference to the ideal of Ram and Satyaban."

The Indian woman has from time immemorial earned for herself the reputation of ideal daughter, wife and mother through her inherent self-sacrificing spirit. She holds fast to the sanctity of matrimony. The idea of divorce would be more repulsive to her than to the man. Women as a matter of fact, in every part of the world, are too fond of their homes and their children—even in the Western countries, where I have had opportunities of mixing and knowing some of them, and I have formed great admiration for them. But no woman would ever think of breaking up her home unless forced by circumstances, when there is no hope of happiness due to estrangement between husband and wife, and in some cases where it is unsafe to be under the same roof. There are proofs of so many cases, where separation would prove a blessing for both parties for the fault of either the husband, or in some cases the wife also. There are of course exceptions, and good and bad man and woman can be found in every society. The right of divorce therefore is provided only in exceptional cases where the aggrieved party is without any other remedy. No woman, I can say safely, would ever face a divorce suit in the court, except as a last resort, because apart from sentiment of the sanctity of the home, it is repugnant for anyone to legally proving the grounds of divorce, and of the expense involved in litigation.

Clause 13 of the Bill laid down the grounds of divorce, and on commencement of the Act, marriage may, on petition presented to the District Court by either the husband or the wife, be dissolved by a decree of divorce, and certain grounds are:

- (i) He or she is leading an adulterous life,
- (ii) Has ceased to be a Hindu by conversion to another religion,
- (iii) (iv) and (v) deal with incurability of unsound mind, or leprosy, tuberculosis and venereal disease in a communicable form, etc.

When we are introducing the system of divorce in the Hindu society, to my mind immediate relief is necessary on grounds of (i) cruelty both mental and physical, and desertion of over one year. We know of so many hard cases on the above grounds. On the other hand, I am against divorce sub-clauses (iii) and (iv) dealing with divorce on grounds of disease and illness, except for venereal disease in a communicable form. With the advance of medical science almost all diseases including mental maladies, leprosy, tuberculosis are now curable. If the husband or the wife is afflicted with any such illness, is it not the bounden duty of either spouse to look after and arrange for treatment, instead of going in for a suit of divorce? It is one of the sacred duties to be by the side of the afflicted partner. Vows are taken at the time of marriage to

this effect. This idea of divorce certainly goes against the sentiments of an Indian wife, for she is prepared for every sacrifice and devotion to the husband, a loving husband too would not discard his wife if she unfortunately falls prey to any illness. I have known of mental aberration of a wife, who, after a period of 12 years got absolutely well and bore normal healthy children, only because she had a good husband who looked after and arranged for proper treatment.

In the controversy and heat engendered by the provision for 'divorce' in the Bill, some salutary and very important provisions of the new Hindu Marriage Act failed to secure the attention of the public. Under this category comes the provision for relief for pre-Act deserted wives, and legitimacy of children. The latter subject is of first rate political importance for the nation. The future of the nation always lies in its children. A nation is doomed if its children are neglected and uncared for. The new Act has taken children under its sheltering wings, and made provision for their status, maintenance and inheritance. This care of children did not exist under the old social order. The new Act lays down in Clause 16 (Legitimacy of children of void and voidable marriages):

Where a decree of nullity is granted in respect of any marriage under Sections 11 and 12, any child begotten or conceived before the decree is made who would have been the legitimate child of the parties to the marriage if it had been dissolved instead of having been declared null and void or annulled by a decree of nullity shall be deemed to be their legitimate children notwithstanding the decree of nullity.

Re Pre-Act marriages, the new law lays down that a marriage shall be null and void, if on a petition presented by either party thereto, be so declared by a decree of nullity if (a) a former husband or wife of either party was living at the time of such marriage or (b) the parties at the time of such marriage were within the degrees of prohibited relationship.

The ages of the bride and bridegroom have been fixed at fifteen for the bride and eighteen for the bridegroom. This is in conformity with the Child Marriage Restraint Act of 1929. Therefore the consent of the parent and guardian remains, in giving their consent to marriage as far as the bride is concerned.

No new enactment can be perfect, it is only time and experience that can make it perfect. Clause 9 of the Bill—Restitution of Conjugal Right, came in for strong criticisms from all parts of the House. It was described as "monstrous and barbarous." This seems a serious shortcoming of the Bill. The idea that one of the parties to the marriage being unwilling to live with the other should be forced to do so by the decision of the court is preposterous. It is indeed inhuman and immoral to compel two people

to live as husband and wife when one or both find it impossible to do so. The reason given for including this Clause in the Marriage Act, is that it is in the Civil Procedure Code. But this seems hardly a justification for putting it in this Act. During the discussions of the Special Marriage Act also this clause was greatly resented to specially by almost all the women members. The old Special Marriage Act II of 1872 did not have such a provision, and there was no inconvenience on account of it. In the fitness of the progressive idea of the Hindu Marriage Act this clause should be deleted, as we feel it would do no good.

The other clause which came in for protest from a great many members in the Lok Sabha was Clause 24 of the Bill—Maintenance Pendente lite, and expenses of proceedings. It says:

"Where in any proceeding under this Act, it appears to the Court that either the wife or the husband, as the case may be, has no independent income sufficient for his or her support and the necessary expenses of the proceeding, it may, on the application of the wife or the husband, order the respondent to pay to the petitioner the expenses of the proceeding, which may seem to the court to be reasonable."

It is a fact that women still suffer from economic dependence. Before giving her the full right of inheritance in equality with men it seems quite premature to enact a provision as above. It is a novel innovation in the field of legislation. Legislation is a part of social science, and this provision in actual working will lead to no end of hardship and even wickedness. It is inconsistent with this piece of legislation, and it is a retrogressive provision. When several of us objected to this clause, an assurance was given by the Law Minister that it would be amended.

It is rightly anxiously enquired on all hands, as to what would be the effect of these new innovations, such as the 'divorce' on Hindu society. India is a vast country, and comprises in its big sweep a large mass of humanity in all stages of human progress, advancement, culture and civilization. It is difficult to apply one yard stick to such a large mass of humanity. One has to prophesy, or go by results gained from experience. As has been pointed out divorce already exists in the country for 80 per cent of the population. So in reality it was only the 20 per cent of the so-called upper classes for whom the opponents of divorce spoke. The women of this class are now mostly all educated, and they are well able to take care of their own affairs, in fact, some of them are surprisingly intelligent, and they would certainly not misuse the right of divorce. We do not anticipate

that our men, with the social background of our country of which all are proud of, will take any advantage of the divorce provision, as men have had the advantage of divorce all this time, and it is nothing new for them. So it is to be earnestly hoped the new Law is all for the best.

The chief aim is to set our women free from bondage imposed on them by the old system. The new marriage laws should serve as a very effective remedy by abolishing the compulsory and arbitrary marriage system, prohibiting the extraction of money—"dowry," and providing that marriage must be based on the continued complete willingness of the two parties. It further establishes that mutual love and respect are the only ties which should continue to hold a man and woman towards marital relationship. The right of divorce for women on equal terms with men, will come to the realisation of their rights, and women would be in a position to build up happier and healthier homes.

One thing is certain however, that no piece of legislation can make a nation moral or immoral. If the nation is moral in its essence then this measure will afford relief in hard cases. If, on the other hand, the nation is wicked, then it would exploit it for immorality not because of the provision of 'divorce' but because of its inherent inclination to social injustice, as we find sometimes when the nation is power-drunk. We cannot, however, afford to be apathetic or passive in the matter. The carrying out of the new marriage law depends on the consciousness of the masses, and one must proceed to cultivate the consciousness of the nation for marital rectitude, marital faithfulness, gentleness and other virtues and bring about the proper social atmosphere for social justice both for man and woman. The new marriage law is like a bottle of medicine, which a healthy person is under no compulsion to take, so a morally healthy couple will not go in for divorce simply because the new marriage law has provided for divorce. It should be borne in mind that the new marriage law is not exclusively concerned with securing divorce to woman. On the contrary, it has cleaned the Augean stables by providing monogamous marriages, by removing barriers of caste, putting a further restraint on child marriage, etc. It may need further amendments to make the Hindu Marriage Act a perfect one, and the Parliament is ever vigilant to do so.

It is a historic social measure carrying within it the germ of great social reformation, and creating a healthy atmosphere for the future generation of our great country.

THE VELLORE MUTINY

A Reappraisal

By HARIPADO CHAUDHURI

THE discontent that had been brewing against British domination in India found its first mass expression in the Vellore Mutiny of 1806. It was the harbinger of the Great Rebellion of 1857; in fact, it was 1857 in miniature.

1806 AND 1857

Like the Great Rebellion, the Vellore Mutiny had its deep root among the masses of outraged people, but history was evidently on the British side. Due to lack of far-sighted leadership, proper cohesion and organisation, the genuine wrath of the people was misdirected and ended in a fiasco. Here the restoration of Tipu's family was the rallying cry which, in 1857, became the restoration of the Empire with Bahadur Shah, the last Mogul Emperor, as head. In 1857 religious prejudices over the question of cartridge became the bursting point; in Vellore Mutiny the starting point was the 'Turban' issue which, it was alleged, hurt the religious feelings of the Indian soldiers. In both the cases the peasants with the feudal nobles and priests as their leaders fought against the English Company.

But the difference between the two should also be noted. Firstly, the Vellore Mutiny did not spread over the length and breadth of the country as did the Great Rebellion. It looked like an isolated affair and did not overstep the limits of the barracks and enter among the masses of the people to give it a general character. Imperialist historians and administrators too were at great pains to paint it as an isolated event, artificially created by headstrong religious mendicants and other interested persons.

Secondly, and this is the most important point; the Great Rebellion occurred at a time when England had already been transformed into an industrial country; and export of manufactured goods became the dominant feature of English commerce. At the time of Vellore Mutiny this feature was not dominant, nay practically absent, as the industrial revolution, which had just happened, was not yet able to create the requisite transformation in the British economic structure.

Thirdly, the railway and telegraph, the great forces that bound the remotest corners of India closer by linking up the towns and villages, broke down the feudal isolation and subsequently paved the way for the birth of national resurgence, had been completely absent at the time of the Vellore Mutiny.

Keeping in mind these differences and similarities between the two we should proceed to study the Vellore Mutiny of 1806.

By 1806 the English of the East India Company had practically become the paramount power over nearly the whole of India. In the South there was practically none to stand against their aggressive designs. Tipu Sultan

was killed in 1799, his kingdom partitioned and a puppet ruler placed on the throne of new Mysore. His sons and relatives were safely kept imprisoned in the Fort of Vellore. The Nizam of Hyderabad had already become their pliant tool. In the Maratha country "the Peshwa was in abject, and the Bhonsla and Sindhia, in reluctant submission." The Carnatic was annexed in 1801, forcing the son of the late Nawab to abdicate.

GROWING DISCONTENT

But side by side with this growing power of the British, the bitterness and hatred, that were nursed against them, were also gradually rearing their heads. The corruption and brutality of the Company's servants, the ravages of armies moving through the country to extend the British power, the frequent raids of armed bandits, the new system of justice and revenue and the general lack of security of life and property added to the distress of the people.

In this connection what Mill wrote about the regime of Tipu Sultan may be mentioned:

"His (i.e., Tipu's) country was, at least during the first and better part of his reign, the best cultivated and his population the most flourishing in India; while under the English and their dependants the population of the Carnatic and Oudh hastening to the state of deserts, was the most wretched upon the face of the earth; and even Bengal itself, under the operation of laws, ill-adapted to the circumstances of the case, was suffering almost all the evils which the worst of governments could inflict."—*History of India*, Vol. VI, p. 150.

In fact, to the people in general the East India Company appeared to be like the devil that "blasted and destroyed everything that came within its pernicious influence." Discontent was widespread.

To this was added the menace of Christian missionaries who in their zeal "to civilise" the "uncivilised natives" were preaching the gospel of their "true religion" and with official support and patronage were riding roughshod over the religious sentiments of the people. The situation became desperate; only a spark was necessary to cause the explosion.

Fakirs and dervishes were active in scattering the seeds of revolt; astrology was called in to predict the downfall of the Christian and the ascendancy of Muslim power.

"These emissaries of revolt," wrote Lord Bentinck, "were not the commissioned agent of any one man or any party. They were self-created by the original cause which led all men to unite under the same banners, and made agents of the most enthusiastic in their several religious prejudices."

NEW MILITARY REGULATIONS

It was at this time that some innovations were introduced in the military regulations with regard to the Indian soldiers. It was ordered that the Indian soldiers were "to appear on parade with their chins

clean-shaved, and the hair on the upper lip cut after the same pattern; they were never to wear on their faces the distinguishing marks of caste or earrings, when in uniform." Changes in dress, tending to assimilate the uniform of the Indian army to that of the English, such as wearing of stocks and waist-coats, had already been introduced.

In April 1806 the order regarding the new Turban was notified to the Sepoys. According to this order,

"The Sepoys are to use a new form of turban; it was to be made, as formerly, of broad cloth covering an iron frame, with the exception of cotton tuit, made to resemble a feather and a leather cockade."

Sir John Cradock was then the Commander-in-Chief and Lord William Bentinck, the Governor of Madras. They approved this change and ordered its immediate introduction.

The men were already disturbed over the "shaving order" which they interpreted to mean that their whiskers were to be cut off. Now the new order regarding Turban set the ball rolling; the Sepoys, both Hindus and Muslims, took the new orders as a challenge to their religious custom and tradition. The new Turban became an object of hatred to them as a Christian hat.

EARLY SYMPTOMS OF REVOLT

Early symptoms of disaffection manifested themselves at Vellore and Wallajahbad. On the 6th and 7th May, 1806, the 2nd Battalion 4th Regiment refused to bow down to the new order re: Turban. Their conduct became so disorderly that it verged on being mutinous. Lt.-Col. Darby, Officer-in-Charge, had to take severe measures to force them to submission. Nineteen men were put under arrest, condemned to severe corporal punishment by a court-martial and dismissed from service. Later on, seventeen persons were reprieved and two persons, supposed to be leaders, received nine hundred lashes each.

At Wallajahbad a Subedar was summarily dismissed for "apparent connivance at the disorderly proceedings which had taken place," and three companies of British troops were sent there from Poonamallee.

In both the places apparently the calm was restored; but it was deceitful.

On the 10th July, 1806, when the official despatch containing the assurance of re-establishment of order and discipline at Vellore and other places reached the Government of Madras, the smouldering embers of discontent and disaffection burst out into a flame of mutiny at Vellore.

The Vellore Fort, 87 miles west of Madras, was at this time the prison-house of Tipu Sultan's sons and their families. The whole neighbourhood swarmed with persons sympathetic towards the imprisoned families. No fewer than 3000 Mysoreans, it is said, settled at Vellore and its vicinity and as a result the supporters of Tipu Sultan's Princes in the town and garrison of Vellore were numerically much greater than those of the Government.

THE RISING OF THE 10TH JULY

When the forces of the two opposing sides were thus drawn up, an event took place at Fort Vellore. The wedding festivities of Noorul Nisum Begum (Noorunnissa Begum), a daughter of Tipu Sultan and sister of Prince Muhiuddeen, took place on the night of July 9, 1806. On this day many Mysoreans assembled at the Fort. This event gave a fillip to the insurrectionists and the rising of the Sepoys took place in the early hours of the 10th July.

A sombre atmosphere marked the first hours of the night of Thursday, the 10th July. The wedding festivities had ended, the Princes and their guards had retired to their beds, the British troops and officers were enjoying their dreams of victory, when all on a sudden the booming of guns broke the stillness of the night. The first military insurrection against the British rule started.

Two English Companies were stationed at Vellore. The attack of the insurrectionists was so sudden and simultaneous that the English were taken aback. They were well-armed and advantageously posted, but the intense and fanatic firing of the Indian soldiers forced them to retreat. Col. Fauncourt, Officer-in-Charge of the garrison, hearing the gunshots, came out of his bungalow to ascertain the facts, but he fell almost at the commencement of the affray. The rebels broke into all the British Officers' quarters and murdered every one they found.

The flag of Tipu Sultan bearing "a sun in the centre with green tiger-stripes on a redfield" was hoisted on the garrison flagstaff amidst victorious shouts of "Deen"! "Deen"! The flag; it was alleged, was the property of Prince Moizuddeen, fourth son of Tipu Sultan, who supplied the same to the Sepoys.

The followers of the Princes, it is said, assisted the insurgent Sepoys in getting out the guns, in laying them, in encouraging the Sepoys to kill the English. Princes Moizuddeen and Muhiuddeen presented themselves before the Sepoys and ordered refreshments to be given to them. Prince Moizuddeen, further, was reported to have presented a sword to the son (then in British Service) of Tipu Sultan's Commandant Syed Gaffur and ordered him to take possession of the hill fort of Vellore.

When fighting was going on inside the fort, Prince Moizuddeen and his supporters expected that at least four to five hundred men from the Petah (township at the foot of Vellore Fort) would join, but with the passing of hours it was found that the Sepoys were more and more attracted towards looting than to the lofty ideal which goaded them to this action. The Mixed Enquiry Commission's report on this mutiny runs thus:

"The eagerness with which the Sepoys and men of the Palace (i.e., where the Princes were kept imprisoned) betook themselves to plunder the effects of the Officers, and to escape out of the Fort with their booty, tended in our opinion to weaken the general effect of the insurrection and to prevent,

happily, much of the consequences to have been apprehended."

As a result the Fort did not fall entirely into the possession of the Sepoys; and when one of the mutineers collecting a band of about three hundred persons, presented himself before Prince Moizuddeen and requested him to lead them, he refused to accompany so small a party; he was already overcome with utter despair and despondency.

Four hours after the commencement of the mutiny, news reached Col. Gillespie at the Cantonment of Arcot, 16 miles from Vellore. His troops consisted mainly of Britons who were immediately sent to the succour of the besieged. He himself led the 19th Squadron of Dragoons and a party of the 7th Indian Cavalry, and the rest were ordered to follow under Lt.-Col. Kennedy with the guns.

Col. Forbes, commanding the 1st Battalion 1st Regiment, who took refuge in the hill fort of Vellore with a number of loyal Indian troops and about 30 British refugees, was still holding out and the main gateway was still in the possession of the British guards of the 69th Regiment under Sergeant Brodie. "The presence of the guards on the gateway and the cavalry flanking it to the north allowed Col. Gillespie and his party to reach the first gate almost unmolested while the second was opened by some of the 69th who let themselves down with ropes."

The fourth or inner gateway was under the control of the mutineers. Col. Gillespie made an attempt to break it but lost several men. He then decided to wait for the arrival of the guns and when these reached at 10 A.M., the real counter-attack began. Orders were then given to blow open the gate.

After heavy firing the gate yielded and the forces of Col. Gillespie in conjunction with the new arrivals from Arcot launched their offensive. A hand to hand fight ensued which ended in almost complete annihilation of the insurrectionists.

About 350 mutineers fell in the battle and 600 were made prisoners at Vellore and in various other places to which they had fled. Number of deaths of British soldiers amounted to 113 including 14 officers.

MERCILESS REPRESSION

Merciless repression began. The self-styled Civilisers, mad with terror and rage, ravaged the country with fire and sword, hanging, impaling, or blowing from guns the innocent and guilty alike. Officially, it was said, 17 persons were hanged in connection with the Vellore Mutiny, but the number of unofficial killings, if ever discovered, is sure to mount to four figures.

The 1st and 23rd Regiments who had taken the lead in this insurrection, were wiped out either by cannon or by rope; their names expunged from the army list. The arrested persons were thrown to the prison and kept there without any trial till the arrival in 1807 of the next Governor-General, Lord Minto.

Col. Gillespie, the "rescuer" of Vellore, was in a mood to blow all the members of Tipu Sultan's family

from the cannons, but extraneous circumstances deterred him from taking this step. Though saved from immediate annihilation, the twelve sons of Tipu Sultan could not escape brutal punishment. Along with their families and other relatives they were removed from the orbit of their influence and banished to jungly and malarial Tollygunge near Calcutta, where the whole family remained interned for nearly 60 years. The fate of Prince Moizuddeen was worse; he was kept in strict confinement in the Harinbaree Jail in Calcutta.

Special orders were issued regarding the future recruitment in the army. Persons having any connection with Tipu Sultan were for ever debarred from service under the British Government. Instructions were also given to stop all recruitments, if possible, from the territories of Tipu Sultan. In short, anything connected with the name of Tipu Sultan became an anathema to the foreign aggressors.

The apologists of British Imperialism always try to justify this savagery by stories of frightful atrocities committed by the mutineers. But it should be remembered that the Britons could hardly expect any tenderness from the Indian people whom they had brutally crushed and exploited and yet except for isolated instances, they had been treated well and softly. An instance in support of this statement may be cited here: Mrs. Fauncourt (her husband was already killed) wrote, "He (a Sepoy) told us to go into Fowl House. . . . We were quite exposed to view till the same brought us an old mat, which we made use of by placing it before the door to hide ourselves, and afterwards the same Sepoy brought my little boy a loaf of bread to satisfy his hunger." Mrs. Fauncourt along with her son was afterwards rescued by Col. Gillespie's party.

Lord William Bentinck, the then Governor of Madras, too, noted in his minute, dated the 13th September, 1806:

"There were some instances of very great kindness on the part of the Sepoys to save the lives of Europeans"

VELLORE MUTINY BELITTLED

It should be mentioned in this connection that had it not been for the statesman-like policy of Lord Bentinck, the savagery of repression would have transcended all limits, the British Empire in India would have been doomed and Indian history would have been written in a different manner. The new regulations regarding Turban, etc., were revoked; proclamations were issued on behalf of the Government declaring in explicit terms the respect for the religious feelings of the Indians. Further, "all precipitation in punishment which might either have the appearance of revenge, or of rendering the cause of the Sepoys the cause of religion was studiously avoided."

Lord Bentinck fully realised the import of this mutiny and did his best to isolate this great event from the discontent of the people in general; instead of exaggerat-

BY PROF. HIRA LALL CHOPRA, M.A.

ing its importance he tried to belittle it and to divert the people's attention from this form of outburst of mass discontent.

We too have fallen a victim to this diversionary tactics of the Imperialist henchmen and have forgotten to take notice of this first militant outburst of popular discontent in its true perspective, for the latter events proved that the discontent was not limited to Vellore alone. Nundydroog, Bangalore, Chittoor, Wallajahbad, Bellary, Hyderabad and several other places were also shaken by this storm.

According to Sir John Cradock, the then Commander-in-Chief:

"The whole was planned with unequalled secrecy and concealment. The object was to destroy every European, and place a son of Tipu at the head of a Moorish Government. With this view letters were ready, or even were despatched to the Marhattas and to the disaffected chieftains at Cuddappa, in the ceded districts and Vancatigherry, in the Carnatic, to excite a general hostility."—*Report of the Commander-in-Chief to the Authorities in England, dated Oct. 25, 1806.*

GENERAL PLAN OF ACTION

A discussion about the general plan of action behind this mutiny is necessary, but it is very difficult to find out what it really was. The evidence of different persons before the Mixed Enquiry Commission and the confessions of some condemned persons throw some light on the matter, but taking into consideration the circumstances in which these were given, full reliance can hardly be placed on them. But as there is no other way to ascertain the true facts we are bound to depend on them. The following is a short summary culled out from different depositions:

Secret meetings and discussions were going on amongst the Sepoys for a long time and these got a new impetus and push with the issuing of the order regarding Turban, etc. The one held at the tomb called Ameenpir was the most important, where along with ordinary soldiers many commissioned and non-commissioned officers too participated. At this meeting one Jamadar Shaik Dewan took the lead and heartened everybody saying that others might lose their ideal, but they would not. Persons, supposed to be connected with the imprisoned Princes, were also active in inciting the Sepoys.

With the arrival of the new turbans at Vellore, secret meetings in groups became more frequent, the activity of Alla-o-Deen, a foster-brother of Prince Moizuddeen, increased as the medium of intercourse between the soldiers and the Princes, and as a result the contacts between them grew closer and closer.

Prince Moizuddeen wanted, it was said, that the Sepoys should take and keep the Vellore Fort for at least eight days and in the meantime he would collect some ten thousand men in arms with whose help he would be able to rouse up the people and rout the English. Letters from him were sent to different Chiefs and Sirdars in Gurrumeondah, Vencatigherry, Callastry and also to

different Sirdars, then in the service of the puppet King of Mysore. Moizuddeen banked on the calculation that once the Vellore Fort and the Pettah were captured, the people in general, specially the Indian troops, would come under his banner.

The participants in this plan were bound to the oath of secrecy. Groups of four or five met together and took the oath and Alla-o-Deen was always present. Except about half a dozen Indian soldiers and officers at Vellore all took the oath. Observance of secrecy, non-acceptance of the new turban and establishment of Prince Moizuddeen's rule—these were the three tenets of the oath-taking ceremony.

Many of the pensioned soldiers who understood the management of guns and gun-Lascars were won over to the side of the rebels and they promised all help. The people of the Pettah, many of whom were somehow or other connected with the Princes, knew too about the secret plan and stood in readiness for giving necessary help.

The date of the insurrection was twice changed. Before the admission of the 2nd Battalion 23rd Regiment into the secrets a date was fixed and later on it was changed. In fact, the rising took place sooner than was finally decided. The scheduled date was the 14th July (Monday), 1806, but due to the indiscreet utterances of one Jamadar Shaikh Hussain, it came about earlier. On the night of the 9th July, the said person being drunken, divulged the secrets about the insurrection. At about 9 P.M. a hurried consultation among the leaders was held at the barracks and it was decided to begin the insurrection that very night at 2 A.M. The decision was so late and taken so hastily that neither the people of the Pettah nor the Princes could be informed about it.

ROLE OF THE PRINCES

Regarding the role of the Princes, one fact should always be kept in mind, and it is that they were prisoners and when actually the premature mutiny was crushed, they had to find out means to destroy all kinds of evidence of their complicity in the insurrection. Hence all that is left to us is circumstantial evidence from which we are to reconstruct the actual position. We must, however, say that the Princes were not bold and audacious enough to take the lead; all that they wanted was to ride over the success, achieved by the soldiers and reap the full benefit thereof. They were quite unprepared and lacked the necessary courage and determination which alone might have turned the situation in their favour. Still we should give them, especially Prince Moizuddeen, the credit that is due to him for trying to take a stand against British Imperialism.

The Vellore Mutiny did not produce any Tantia Tope or Luxmibai or Azimullah Khan, but this does not make it in any way less important. Its nameless self-sacrificing heroes are the pioneers in showing the path of militant anti-British struggle whose noble tradition has been carried forward by thousands of others to bring it to fruition. Free India will ever remember them and offer her respectful salutes.

BAHAIS, the followers of Baha Ullah, are reported to have been persecuted in Iran once again since the month of fasting (Ramazan). They were forced to observe the fast like pious Muslims and on their refusal (as according to their own faith, the Bahais observe the fast from 2nd to 20th March for 19 days), their houses and shops were looted and the Bahai House for Worship, the *haziratulguds* was desecrated and demolished. Many Bahais throughout Iran were killed and plundered in the sacred month. The plunderers thought this action of theirs to be a great service rendered to the cause of Islam. It is a pity that this thing is continued even now spasmodically.

The Bahai faith has suffered persecutions since its very inception. It was a revolt against the orthodox Mullahs in Iran in the middle of the last century. According to Shia tradition, the hidden twelfth Imam Mahdi held intercourse with his followers through a succession of mediums, each of whom was called a Bab or door and Syed Ali Muhammad Bab claimed to be a door in that succession.

The Bab: Syed Ali Muhammad Bab was born on 20th October, 1819 in Shiraz and in 1844, at the age of 25, he declared himself to be the Bab or door saying:

"Whosoever wishes to approach the Lord his God and to know the true way that leads to Him, ought to do it through him."

His teaching was marked by a catholicity not yet known in Islam. He said, God is unapproachable: man can only approach Him through some appointed medium. For this purpose a Primal Will has spoken in the Bab, and will speak again in "Him whom God shall manifest."

Bab held discussions with various doctors of religion in Mecca and other religious places. He appointed 18 disciples and himself the 19th for the propagation of his views throughout the world. They were known as the "Letters of the Living" and among them was an Indian also, named Said Hindi, who came to Multan and influenced one Basir Hindi, a rich blind scholar, who propagated the Cause in India and Iran for which he had to suffer martyrdom in the end.

The teachings of Bab naturally aroused widespread opposition in the orthodox circles of Islam in general and in Iran in particular. Husayn Khan, the tyrannical Governor of Fars, undertook the suppression of the new faith. Bab had a long series of imprisonments, deportations, examinations before tribunals, scourgings and indignities which ended only with his martyrdom on 9th July, 1850, when he was shot dead by the Arm in the old barrack square of Tabriz.

One of Bab's ardent followers was the great Iranian poetess, Qurratul Ayn—"the solace of the eyes." The most beautiful lady of her own times, music flowing from her lips, she canvassed for the Cause, here,

there and everywhere. She discarded the *purdah* and had discussions with the most learned men of Iran and vanquished them. The Iranian Government took her prisoner; she was stoned in the streets, anathematized, exiled from town, threatened with death, but she never failed in her determination to work for the emancipation of women. She was strangled for her progressive views.

BAHAULLAH

When the Bab declared his mission in 1844, Bahaullah, then in his 27th year, boldly espoused the cause of the New Faith, of which he soon became recognised as one of the most powerful and fearless exponents. He had already twice suffered imprisonment for the Cause and on one occasion had undergone the torture of the bastinado.

Abdu'l-Baha

Mirza Hussain Ali, later known as Bahaullah, was born on 12th of November, 1817 in Teheran. His father, Mirza Abbas of Nur, was a minister of State. On the death of his father, the Government of Iran wanted to appoint Bahaullah as a minister, but this position he declined and chose for himself the thorny path of the new dispensation. For his progressive views in religion, Bahaullah was exiled to Baghdad, Constantinople and

Adrianople. In 1863, he declared himself to be the Light of God (Bahau'llah), about whose coming the Bab had foretold—the Chosen of God, the promised one of all the prophets. All the Babis recognised in him the prophecy of Bab being fulfilled. Bab, the John the Baptist of this new faith, was a fore-runner of "Him Whom God Shall Manifest" in the form of Bahau'llah. Bahau'llah suffered incarceration for nearly 50 years and during this imprisonment wrote several epistles to the ruling monarchs of the world, heralding to all, his own advent for the salvation of mankind and for the widening of man's outlook on religion. He formulated twelve

12. Recognition of the unity of God and obedience to His Commands as revealed through His Divine Manifestations.

These catholic principles were not acceptable to the orthodox sections of the Muslims and they continued to persecute the Bahais for this revolt in religion. The new dispensation of Bahaism, as propounded by Bahau'llah, had nothing to do with Islam. It was a clarion call to entire humanity and to all religions of the world to shake off superstitions and to pave the way for the uplift of the depressed and the oppressed sections of mankind. It is erroneous to label Bahaism as a sect of Islam like the Qaddyanis. Bahaism, according to the belief of its founder, is the fulfilment of all the religions. Prof. E. G. Browne, the eminent Orientalist of the Cambridge University, met Bahau'llah in 1890 and had 4 interviews with him. He was very much impressed with Bahau'llah's analytical study of the world's problems and their solutions.

Bahau'llah gave to the world a number of books written in prison, which his followers believe to have been revealed.

Bahau'llah passed away on 29th May, 1892 and his eldest son Abbas Effendi, later known as Abdul Baha, the servant of Baha, carried on the work of his father as his representative and the expounder of his teachings. Abdul Baha was born on 23rd May, 1844. He spent his life in jails along with his father and had his training under his father's direct care. After the death of his father, he took up the Cause and propagated it magnificently. He was in Turkish imprisonment till 1908, when he was finally released. He visited some Western countries also. He went to London in September, 1911 and came back to Egypt in December. He proceeded to the United States of America and reached New York in April, 1912 and travelled through the States for nine months. In Chicago, he laid the foundation-stone of the famous Mashriqu'l-azkar, the Bahai House of Worship, a Taj Mahal of the Western world, costing about one and a half million dollars and which has nine gates representing the nine great religions of the world signifying that anybody coming from whichever gate, shall ultimately reach the same beloved. A symbolic interpretation of the following verse of the Gita:

ये यथा मां प्रपद्यन्ते तांस्तथैव भजाम्यहम् ।

मम वर्तमानुवर्तन्ते मनुष्याः पार्थ सर्वशः ॥

Howsoever men approach me, even so do I accept

Major-General Batmanqilich, Chief of the General Staff of the Persian Army, inaugurating the work of demolition of the dome of the Baha'i Temple in Teheran

principles for the social and spiritual uplift of man which have more or less become the tenets of this faith. They are:

1. Unfettered search after Truth and the abandonment of all superstition and prejudice.
2. The oneness of mankind. All are 'leaves of one tree, flowers in one garden.'
3. Religion must be a cause of love and harmony, else it is no religion.
4. All religions are one in their fundamental principles.
5. Religion must go hand in hand with science. Faith and reason must be in full accord.
6. Universal Peace: the establishment of a federated international order.
7. The adoption of an international secondary language which shall be taught in all the schools of the world.
8. Compulsory education and useful training.
9. Equal opportunities for development: Equal rights and privileges for both sexes.
10. Work for all: No idle rich and no idle poor. "Work in the spirit of service, is worship."
11. Abolition of extremes of poverty and wealth; care of the needy.

them, for on all sides whatever path they choose in mine, O Partha. (IV, II).

Chicago is the fittest venue for such a Bahai House, as it was here in 1893 in the Parliament of Religions that Swami Vivekananda of blessed memory gave his message of universal love, peace and harmony. It was here in this august congregation that Pratap Chandra Mazoomdar, Mrs. Annie Besant and other delegates of the Indian faiths and cultures gave to the world a true picture of Indian catholicity and India's advance in matters religious, philosophical and cultural. This Bahai House in Chicago presents a symbolic fulfilment of that message.

After the first world war, Abdul Baha was knighted by the British Government. He died in Haifa on 28th November, 1921 and the mantle for the propagation of the Cause fell on the shoulders of his grandson, Shoghi Effendi, the Guardian of the Faith. It goes to the credit of Shoghi Effendi, the scholar of the Balliol College, Oxford, an educated and enlightened Guardian, that he translated into English all books written by Bab, Bahau'llah and Abdul Baha and also wrote himself quite a large number of books detailing the history of the Cause and in exposition of the main tenets of the Faith. It is really the present Guardian of the Faith who made available to the Western world all Bahai literature and enlisted sympathy of the entire world. His headquarters are at Haifa, Palestine. The Bahai administration given by Shoghi Effendi is working so efficiently that Bahais in all corners of the world are being properly watched by the Guardian. Today there are 7 lakhs of Bahais in Iran alone and a considerable number in the United States. Bombay and Karachi have also an appreciable number, who run good restaurants in these towns. Sincere, hardworking, conscientious and honest. Bahais are trusted everywhere.

Their present persecution in Iran has brought the Bahais in limelight once again. Iran has never reconciled itself with this faith. Though it is the land of its birth, yet Bahaism cannot get any literature printed in Iran. Fifty years ago, all literature used to be smuggled from India and in recent years the source has been the United States and other countries. The late Reza Shah Pahlavi was conscious of the piety, honesty and sincerity of the Bahais and in spite of the protests from the orthodox sections, he gave Bahais very important positions in the administration, particularly in the Finance department. It was considered that with the non-interference of the State in their religious affairs, the Bahais would one day get full freedom of expression and they built a *haziratulquds*, a rendezvous for their meetings in Teheran at a considerable cost. The Bahai House is neither a mosque nor a place where political conspiracies are hatched, but simply a Bahai House meant for the congregation of Bahais and it is a sad commentary on Iran's secularism that this House was tried to be demolished by no less an important person than the Chief of the General Staff of the

Persian Army, Major General Batmanqilich in the very presence of General Bakhtiar, the Military Governor of Teheran as will be evident from the photo reproduced here. It was later on occupied by the Persian Army.

Only two years ago, the father of Mr. Hooshman Fatch Azam, the Bahai professor of Persian in Visvabharati, Santiniketan, was murdered in Teheran on account of his being a Bahai.

Baha'i Temple, Wilmette, Chicago

It is through persecutions that the Faith got a good popularity in comparatively a short time. The founders as well as the adherents of this faith numbering in thousands had to suffer martyrdom for their convictions and the tales of their ghastly murders attracted a very large number of people into their fold. These desecrations and persecutions in the twentieth century, an age of science and reason, appear to be no less than an anachronism. The Bahais do not call themselves Muslims. Theirs is a separate Faith altogether. They believe in all the Divine religions and Islam is one of them; Muhammad is one of the prophets of the world and Bahau'llah also belongs to the same line, and yet they are persecuted for their convictions in no other place than the land of the birth of Bahaism. Iran should feel proud on that account as Bahaism is today universally acknowledged as a means to synthesise religion. Thousands of Bahais were done to death in the nineteenth century, but today there is no occasion for that. Islam has also changed considerably and its modern interpretation presents it as an advanced faith, catholic in outlook and tolerant in character, conforming literally to the saying of the Holy Quran:

"There is no compulsion in religion." (2:256)

Men like Tolstoy, Gandhi, Rabindranath Tagore, Radhakrishnan, Mudaliar, Sapru, Jayakar, Sarojini Naidu, Raja Narendranath and Lala Har Dayal have spoken very highly of this faith and in the opinion of all right-thinking men, it ill behoves the people and government of Iran to subject the Bahais to the persecutions reminiscent of medieval times. Moharram, a month of mourning for the Shias is going to set in soon and Shia'ism is the state religion of Iran. It is apprehended that there may be recrudescence of the trouble in that month and to avoid it, the Shah of Iran, a very enlightened monarch, is earnestly appealed to take every possible precaution and issue instructions to his government for the safety of the Bahais and their property throughout Iran.

"Is there any remover of difficulties save God? All are His servants and all are standing by His Orders."

BAB (The Herald)

"Glory is not his, who loves his native land, but glory is his, who loves his kind."

"Is not the object of every Revelation to effect a transformation in the whole character of mankind, a transformation that shall manifest itself, both outwardly and inwardly, that shall affect both its inner life and

external condition? For if the character of mankind be not changed, the utility of God's universal Manifestation would be apparent."

—BAHA' ULLAH (The Founder)

"His Holiness Baha'u'llah has revoiced re-established the quintessence of the teachings of all the Prophets.... These holy words and teachings are the remedy for the body politic, the divine prescription and the real cure for the disorders which afflict the World."

—ABDOL-BAHA (The Promoter)

"How vast is the Revelation of Baha'u'llah! How great the magnitude of His blessings showered upon humanity in this day! And yet how poor, how inadequate our conception of their significance and glory! This generation stands too close to so colossal a Revelation to appreciate, in their full measure, the infinite possibilities of His Faith, the unprecedented character of His Cause, and the mysterious dispensation of His Providence."

—SHOCHI EFFENDI (The Guardian)

"We spend our lives in trying to unlock the mystery of the universe, but there was a Turkish prisoner, Baha'u'llah, in Akka, Palestine, who had the key."

—COUNT LEO TOLSTOY (An Admirer)

—O—

THE HARLEM NOBODY KNOWS

BY ALEX HALEY

HARLEM, that roughly triangular six-square-mile section of New York City where lives the largest concentration of Negroes in the world—375,000—is pointed to by critics as a sinkhole of United States capitalism. Foreign diplomats and businessmen freely report that the greatest obstacle to friendship between the United States and the colored races who comprise two-thirds of the world's population is discrimination against the American Negro, seemingly typified by this overcrowded, dilapidated area.

These critics of our democracy would do well to take a closer look at the Negroes of Harlem today. Probably no community on earth has come so far so fast!

In this area where hardly a Negro owned property at the turn of this century, the collective Negro assessment in 1954 approaches \$300,000,000. One bank with four branches in Harlem reports \$20,700,000 in checking and savings accounts. The postmaster of New York reports \$72,000,000 in postal savings in the entire city, \$12,000,000 of it in Harlem.

Said an old pharmacist who moved to Harlem in 1905, "All we owned were our barbershops and beauty parlors and a few restaurants." Today his drugstore is one of 4,300 businesses which Negroes operate in Harlem. Elsewhere in New York City they own 2,200 more.

Three years ago a radio station conducted a survey for its advertisers. "Income of the average Harlem family has tripled since 1940," it informed them, "This

community, as an annual market, represents 1,000,000,000."

Before 1900, most of the Negroes in New York City were settled in a squalid colony in the middle Fifties. Then a Negro realtor, Philip A. Payton, persuaded several Harlem landlords to fill their vacancies with Negro tenants. A trickle of migration soon became a tide.

From the first, the new community was in economic trouble. At least half its population was unemployed. Having nothing but the labour of their unskilled hands to sell, they suffered from poverty and discrimination. In one city count of 9,561 apprentices in the trades, only 56 were Negroes. Thousands of families managed to escape the public dole only because Harlem's women found jobs as laundresses or household servants.

Manpower shortages created by World War I gave the new community a start. Hiring taboos relaxed, and soon Negroes worked in more than 300 occupations. Both the government and industry sent representatives into the southern states to recruit laborers. Harlem absorbed more than 100,000 southern Negroes; 25,000 others came from the British West Indies.

From churches came the first sign of financial stability. Abyssinian Baptist marketed its property in midtown and built in Harlem at a cost of \$350,000. St. Philip's Protestant Episcopal sold holdings near the site of Pennsylvania Station and hired a Negro architect to design its present brick church and parish house.

Soon afterward the church purchased a row of 13 apartment houses that it yet controls.

Hundreds of individual Harlemites capitalized on steady wages and a buyers' market to make down payments on homes. Hundreds more invested in small businesses. Spectacularly, "Pigfoot Mary" Dean, a popular Lenox Avenue vendor of pig's feet, fried chicken, and hot corn, bought for \$42,000 a five-story apartment building. In one year the number of licensed Negro realtors in the city rose from three to 31.

For the most part, however the efforts of Negroes to set down tap roots in the city went unnoticed by the general public. Harlem was gaining its prominence, instead, as a Mecca of Jazz. By the height of the 1920's, its cabarets and dance halls swarmed with revelers nightly.

In this manner Harlem met the depression. Few communities were so hard hit. Night life had supported flourishing businesses, provided an aura of intra-racial camaraderie—and suddenly both were gone. From the war-inflated pay-rolls, Negroes were the first to be fired—by the thousands. The race riots of this era made headlines around the world. But little notice was taken when the same forces—racial pride and the desperate fight for survival—subsequently were channeled in more disciplined ways to shape Harlem's future.

For example, consider the Harlem Businessmen's Club which was organized in 1931. One of its first acts was to circularize the slogan, "Don't Buy Where You Can't Work!" Negro employees above the level of porter were rare in Harlem retail stores. Then the

Amsterdam News, Harlem's largest newspaper, threw its power into the campaign. The slogan produced roughly the effect of a picket line: in a few months Negro clerical and sales help were more common.

The New York Urban League prevailed upon officials of government, unions, and private industry to widen the variety of jobs opened to Negroes. Simultaneously it urged Negroes to develop new talents and skills, and it has never relaxed its campaign.

In 1953 a spokesman for the powerful New York State Commission Against Discrimination said, "There is still not a job for every Negro, but more doors have been opened than there are Negroes qualified to enter." For those who are qualified, and for countless others willing to qualify, these doors lead to gratifying successes.

Amie Associates, Inc., is a family enterprise begun

in 1944 by brothers William, Errol, and Cyril Jones. With \$1,600 and some electronics equipment, they hired a loft and solicited government contracts. By the end of World War II they had hired 75 technicians and grossed \$200,000 for the design and manufacture of electronics devices for the U.S. Navy and Signal Corps and for subcontracts from Bell Telephone and Western Electric. Now Amie Associates, Inc., is making equipment for the U.S. Army and Robinson Aviation, in addition to servicing television sets exclusively throughout

H. E. Jack, a resident of Harlem, was sworn into office as President of New York City's Borough of Manhattan, centre of metropolitan business and industry

the city.

In 1938 Jimmie Adams got a job as shipping clerk in a downtown camera store; in 1951 he became its manager. In 1954 Mr. Adams and two friends raised \$20,000 and opened Uptown Camera Exchange on 125th Street.

Roy Mills moved from a Yonkers dairy to portering for a sports-wear firm. Today he is its national distribution manager and also has a Harlem cleaning business.

Lou Borders arrived in New York City in 1931 with 30 cents. He pressed clothes, studied at night and became the fourth Negro to join the Amalgamated Clothing Workers Union. In 1937 his local elected him treasurer; in 1942, president. Five years ago he bought a failing Harlem haberdashery business which is now worth \$150,000.

Harlem women, too, are forging ahead as dramati-

cally as the men. Barbara Watson, daughter of a municipal court judge, heads a downtown New York agency of nearly 200 Negro models, serving accounts for nationally advertised products.

Alex Haley, a well-known writer, started his writing career with articles published in the U.S. Armed Services Publications

Photo: U. S. Coast Guard

Louise Varona, a Hunter College graduate, took over her father's restaurant supply house when he went into bankruptcy. She resumed business with a very small amount of capital, paid off creditors and today has seven employees and two trucks, with customers in the Bronx, Brooklyn, and Manhattan. Last year her firm grossed \$140,000.

Olivia Stanford, an executive of the Young Women's Christian Association, and Rose Morgan, a hair stylist, in 1943 pooled \$7,000 savings. They leased a five-story Harlem brownstone house, and after four months of renovation and publicity put "Rose-Meta, House of Beauty" into a successful business. Today there is a second, larger salon, with branches in Brooklyn and Long Island. A total of 302 "Rose-Meta" personnel earn from \$55 to \$200 weekly.

Two blocks west of "Rose-Meta" is the Carver Federal Savings and Loan Association, an enterprise that many residents of the community view with a proud and proprietary air.

At the end of World War II, a group of Harlem business and professional people set out to establish the first Negro bank in New York State. For several years they visited homes, churches and civic assemblies, explaining the project and what it would mean for Harlem. Then they solicited pledges of deposit. Within three months after the bank opened in 1948, its tellers took in \$200,000.

In December 1953, the Carver bank marked its fifth anniversary, with savings accounts totaling \$3,000,000 and distributed \$200,000 in Yule Club checks, double the amount of 1952.

A special 1953 survey reveals that 8 percent of Harlem families have incomes about \$5,000 a year; 24 percent of American families in general earn this much. In Harlem 15 percent earn \$1,500 or less, about paralleling the national average. More than 60 percent of Harlem families have reached the \$2,000-to-\$5,000 level; nationwide, only 48 percent are in this bracket.

Harlem's appalling housing conditions have been shouted about in sensational exposes. During World War II one of Harlem's blocks was found actually accommodating 3,781 people. At this density the population of the United States could live in one-half the acreage of Greater New York City.

Slowly, however, the situation was improving. Since Harlem River Houses project was completed in 1937, a total of eight federal, state, and city projects have been occupied or are under construction. Altogether they represent 12,859 apartments. Riverton, Metropolitan Life

Manhattan Ville Neighborhood Centre, Inc. is one of the largest corrective agencies in a multi-racial area of the Harlem section of New York City

Photo: Manhattanville Neighbourhood Centre, Inc.

Insurance Company's private development, raised the number to 14,127.

At this writing, private investors have city authorization and Federal Housing Authority aid to clear 24 slum acres and build two housing projects, "Harlem" and "North Harlem," to contain approximately 1,100 apartments each. These will cost nearly \$30,000,000 and will raise to more than 14,000 the number of Harlem families able to move into new homes in the space of 20 years.

It is safe to forecast that many of the social corruptions which plague Harlem will dwindle with its congestion, which tends to nurture them. Gangs, delinquency, and addiction already are under the steady attack of a wealth of guidance and corrective agencies.

Exemplary among these, and one of the largest, is Manhattanville Neighborhood Center, Inc., which functions in a teeming, multiracial area of West Harlem. (Of the 436,000 people in Harlem, 61,000 are non-Negroes.) In the center headquarters, 51 professional and student social workers conduct adult and youth forums, supervise athletics and recreation, and teach arts, crafts, and dramatics. About 10,000 families are in the area served by this agency, whose chairman of the board of directors is Dr. Harry Emerson Fosdick, noted clergyman and author.

Public schools continue the pattern of progress for Harlem, whose ratio of slum backgrounds is only one of many staggering problems. Public School No. 133, for instance, serves an area of so many pupils that classes must be held in shifts. Yet it manages the distinction of being among the top five elementary schools in the

city. (Relief is in sight: the New York City capital budget for 1954 provides for the building of a new school six blocks away at a total estimated cost of \$2,730,000.) Over-all, more Harlem youths are enrolled in high schools throughout the city than at any point in history, and 10 times as many as 1940 are in college.

Harlem now contains nearly 400 churches, including missions, whose total replacement value has been estimated at \$21,000,000. Their role remains the same—a bedrock and potentially progressive force. Commented a young attorney: "Once our churches prepared you to die; now, they help you to live."

Julius J. Adams is the executive editor of Harlem's oldest newspaper, the *New York Age*. "Man for man, as a community, we are ready to be compared with other communities," he said. "What we need is a crusade of public relations. Harlem's biggest trouble now is that in too many minds the Negro remains a stereotype."

But minds are changing, fast. On New Year's Day 1954, Hulan Edwin Jack, a Harlem Negro, was sworn into office as president of New York City's Borough of Manhattan—the center of metropolitan business and industry, the richest island in the world. In a cornucopia of races, where Negroes are outnumbered five to one, this man, who already had risen from stock boy to vice-president of a manufacturing firm, was elected with the votes of 215,000 of his fellow citizens.

It happened in New York City, in America, in 50 years.—From *The Christian Science Monitor and the Reader's Digest*.

—:O:—

THE SIGNIFICANCE OF THE BHAJA RELIEFS

By PARESH CHANDRA DAS GUPTA, M.A.,

Asst. Curator, Asutosh Museum, Calcutta University

THE ancient cave-monastery of Bhaja lies to the south of Bombay amidst the hills of the Western Ghats. The *vihara*, which seems to have been a Buddhist monastery, is a very old one, and its chronology may be assigned with due precision to the early epoch of the Sunga period. The stone-reliefs at the entrance of the cave depict with extraordinary grace and charm the scenes of Hindu mythology bearing undisguised impress of the Vedic conception and imagination. Among the scenes and figures two large compositions are highly remarkable. One shows (Fig. 1) the sun-god Surya driving his celestial chariot in the sky as usual with his two consorts on two sides. He is trampling under his chariot-wheels a demon of awful proportions, which possibly represents nothing else than the mass of nocturnal darkness. The scene is remarkably aristocratic and the figures of the sun-god and his associates are drawn with a godly grace. Although, the technique closely follows the lines of the Bharhut railings, still the sculpture is distinct with a definite sublime and classical approach. Another relief-work of Bhaja (Fig. 2)

depicts the aerial journey of Indra, the king of gods riding on his favourite elephant *Airavata* accompanied at the back by a flag-bearer. The celestial elephant is depicted with an unparalleled grace and movement. The comparatively tiny figures below the elephant render unusual emphasis to the celestial and massive nature of the elephant and its riders. At the first look at the two scenes of Surya and Indra one is sure to comprehend that the ulterior motive of the artist was to reveal on cold stone not any royal or princely pageant of this mortal earth, but some superbly animated scenes of the high firmament. Unlike the aim of the sculptors of Bharhut which insists on accommodating the interesting and inspiring episodes of the lives of the enlightened Bodhisattvas amidst flowers and foliage on railings of stone, the chief aim of the artist is clearly to represent in some tangible form this heavenly glory and grandeur.

There is a natural difficulty in comprehending the true significance and meaning of these two sculptural depictions of the Bhaja cave. As the cave-monastery was most probably Buddhist, it is apparently strange

to mark the association of Hindu icons with it. Benjamin Rowland advances his opinion in the following lines:

"It might at first seem difficult to explain the presence of these Vedic titans in a Buddhist sanctuary. Actually, they are here, not in *propria persona*, but as symbols of the Buddha who has assimilated their powers. Surya and Indra are allegories of Sakyamuni, as Orpheus in early Christianity is an allegory of Christ. Surya is there to designate the Buddha as the sun and spiritual ruler of the universe, or Buddha as the sun that illuminates the darkness of the world. Indra, the chief of the Vedic gods, is here to designate the temporal power that the Buddha wields to maintain the stability of the universe."¹

But, here it is difficult to accept the view of the learned scholar on the ground that this type of symbolisation as well as regular deification of Buddha is improbable in the pre-Kushan days. Apart from this, if there was any such intention of the artist he could have easily taken recourse to the depicting of the *Jataka* stories as it had been so well done at Bharhut, Sanchi and Bodhi-Gaya in more or less contemporary periods. Coomaraswamy is also eager to explain the presence of Hindu motifs in the Buddhist sanctuary of Bhaja. He observes that

"This is rather a sample of non-Buddhist art which the Buddhists had to adapt to their own edifying ends; and it reminds us that much have been going on outside the limited range of Buddhist art properly so called."²

The scenes of Bhaja may, however, be explained after a study of the Rock Edict IV of Priyadarsi Asoka. In one place of the edict it has been stated as such:

"But now in consequence of the practice of

morality on the part of king Devanampriya Priyadarsin, the sound of drums has become the sound of morality, showing the people presentations of aerial chariots, representations of elephants, masses of fire, and other divine figures."

(*Ta aja devanampriyasa piyadasino rano dhamacaranena bherighoso aho dhamoghoso vimana-darsana ca agikhamdhani ca anani ca divyani rupani dasayipta janam, etc.*)³

The inscription makes it clear that Asoka in order to elevate the minds of his subjects, exhibited representations of celestial *vimanas*, elephants and figures, although we are not sure as to whether they were shown in actual processions or through sculptural decorations only. The term *agikhamdhani* is more likely to mean something like "radiant beings of another world," as it has been suggested by some eminent scholars, than simply "masses of fire."⁴ The practice of showing *vimanas*, *hastis*, etc., possibly constituted the curriculum of the pious kings of the Maurya and Sunga ages. From this perspective the Bhaja reliefs may be easily explained as to have been motivated for the propagation of religious ideas. Surya with his eternal resplendence and Indra with his celestial lightning are both *vaimanika Devas* and their ethereal characters have a natural enthralling effect. Again, *Airavata*, the vehicle of Indra, was *Eravana* of the Buddhists, which being the vehicle of Sakra with his thirty-three heads was symbolical of the heaven of the thirty-three gods. In short, the very terms *vimana*, *hasti*, *agikhamda* and *divyarupa* wonderfully harmonise with the stone depictions of Bhaja.

FIRST NATIONAL EXHIBITION OF ART A Review

By KAUNDINYA

THE Hon'ble President Dr. Rajendra Prasad opened on the 21st March last, at the Jaipur House, New Delhi, the First National Exhibition of Art, organised by the Lalita Kala Akadami. The show consists of 249 items, judge this "first" National effort by the highest standard of criticism and appraisal. And judged by such a standard, this national show has failed to hit the target and has failed miserably. India is producing in

Offering to goddess.
By V. A. Mali

Sleepless night
By M. B. Samant

of which about thirty pieces are specimens of sculpture, and about 40 cover examples of black and white works, etchings, wood-block prints and lithographs. The Selection and Judging Committees consisted of Dr. R. V. Layden, Dr. Mulk Raj Anand, G. Venkatachalam, Prof. Bishnu Dey and Sri Rai Krishnadas—none of them artists or art-practitioners, and they have come in for severe criticism in some of the Press Reviews, one of which put a pertinent query: "How is it possible that with so much of the better stuff of today, the selectors could admit a proportion of what only politeness prevents us from calling downright rubbish? There must be about 50 or 60 works in this show of 250 that do not deserve to be hung in any serious show: some of the works are infantile, some amateurish, some sentimental outpourings of second-hand feelings, imitative and based on no inspiration at all." These are hard words, indeed; but unfortunately too true. Arranged under the best auspices, liberally patronized by the Government, and supposed to be supported and nourished by the "best art-experts," one is entitled to

the different art-centres today much better works, which the Lalita Kala Akadami has failed or neglected to collect.

The most outstanding feature of the show is that it is dominated by pictures painted in the most spurious,

Puppet play from Rajasthan
By E. Brunner

servile, imitative modernistic matters, which number about 75% of the total items. This is also obvious in the room devoted to Sculpture, where not one of the exhibits could remind one that India has a sculptural

heritage covering 6000 years. No National Art could progress by totally repudiating its own heritage, its own traditions. And one is reminded of the admonition

Musician in the night
By R. D. Raval

Coconut-seller
By Bhabesh Sanyal

given by a distinguished French sculptor to Chintamani Kar: "Go back to India, we have nothing to teach you in sculpture". Yet this section of the show is full

of imitations of Henri Lawrens, Albert Moore, Archipenko and all other famous moderns of Europe. Could not one Devi Roychowdury be included to redeem this orgy of foreignism? Yet there are several distinguished pieces, e.g., Indumati Laghate's *Head of a Negro*, Chintamani Kar's *Dryad*, S. Chowdhury's *Mother Magnolia*, and a few others in spite of their deliberately un-Indian aims. On the whole, Girish Bhatt's *Toilet* has earned the prize, though Gajjar's *Fisher Woman* was equally good.

The pictorial items are the most provocative and challenge criticism on account of their aggressive "modernism" and their cult of ugliness and frightfulness, which is a negation of all recognized canons of beauty, as understood by ordinary mortals. In Europe, about the close of the 18th century, the spirit of man ceased to express itself in direct and original modes, leading to a series of revivals of style—the neo-Gothic,

Destiny
By Miss S. S. Anandkar

the neo-classic, the debased and barren eclecticism—ending in a general bankruptcy of the academic tradition, revealed at the end of the 19th century. This was followed by the Rebels of Modern Art, who set their back against all that has happened in the past with a search for a genetic concept of Art in the path of empirical methods, leading to eliminations and abstractions, which repudiated all forms of naturalism, similitudes or accuracy or scientific representation. But what was a logical sequence to art-history in Europe is a foolish irrelevance in India, where the current had never dried up nor ended in academic sterility. The modern Cubistic Art has been aptly contrasted with the old Cubistic Art (such as Celtic Art) of Europe. While the masterpieces of Celtic Art were produced spontaneously in response to some spiritual impulse shared by the community, its counterpart today is self-conscious, prompted by intellect, only appreciated by the intellect, with no appeal to the emotions. As Herbert Read has pointed out:

"There is no doubt that the modern artist, feeling himself no longer in any vital contact with

This eminent critic has omitted to point out that the majority of the Moderns of Europe have nothing to communicate to his fellow-beings. This is the tragedy

society, performing no necessary or positive function in the life of the community, retreats upon himself and gives expression to his own states of subjectivity, limiting himself to this expression, and not caring whether expression is also communication."

Farewell of Nityananda
By Kshitiz Mazumdar

which a group of Indian artists is attempting to transplant to India for no socialistic, philosophic or aesthetic reasons. But if some of our artists are on the mad race of servile imitations of all forms of "isms," that is no reason why unnecessary and wholly un-called-for emphasis should have been given on these slavishly imita-

Cheetah hunt
By K. Sreenivasulu

tive works on the walls of our National Gallery of Modern Art. An apology for this exaggerated emphasis on modernistic horrors is sought to be offered by including several examples of other "schools" of modern

Indian works—including several of the imitative, representative, and academic brands. But unfortunately they fail to balance the cargo. Even some of the "traditional" label, such as those by Khitin Mazumdar, Kripal Singh and Prosanto Roy do not count. A few items in the "primitive" and the "folk" manner are indeed pleasing drinks in this arid deserts of Abstractions and Cubistic puzzles. It is doubtful if any sober worshipper of beauty would support the Government's purchase of Hussain's *Zameen*—the winner of the first prize. Yet there are many bright patches in this puzzling show of

items of Graphic Art, somewhat badly hung is the strongest feature of the show with many works of great merit, of which *Sweet Morning* by Kalyani Chakravarty, *Love* by A. Kalam and Haren Das's *End of the Toil* are outstanding highlights. The outstanding question which the Delhi display provokes is what language these perverse moderns of India are attempting to use? Is it a language which the average man or even the educated man can hope to understand? Has India no language of form and colour of her own, after four milleniums of art-history? Have the so-called progressives attempted to learn the A.B.C. of Indian plastic art? The educated

Green Room

Marriage of Rajji Rathore
By Kripal Singh Sekhawati

pessimistic compositions, such as Pannikar's *Mother and Child*, *Girl Reading* by R. Balaraman in spite of its Van Gogh manners. Hebbbar's *The Thonn*, in spite of its superficial modernistic technique, pays a tribute to a fundamentally Indian motif. Anand Kar's *Destiny* is a creditable attempt to worship at the shrine of really Indian ideals. K. Sreenivasulu's *Green Room* is another obeisance to Asiatic traditions, reminding as it does, of the rich effects of emphatic lines and the mazes of Japanese colour-print designs. There are several good landscapes of the sober normal without any abstractions or distortions, of which Bimal Gupta's *Fishing* and *After Rain* deserve special mention. There are several good portraits, two of outstanding merit—Palsikar's *Miss Padma*, and Elizabeth Brunne's *Dr. Radhakrishnan*. An excellent study in genre of *Coconut-seller*, *Mahabalipuram* by Bhabesh Sanyal is a distinguished work recording a type in an enduring vision. The

Indian, steeped in irreligion and atheism, may have repudiated the traditional poetry of Tulasidas, Kabir, and Mira Bai. But have they abjured the language, in which these great sages and seers expressed themselves? When the English language is sought to be banned by declaring the language of Tulasidas as the future medium of communication in the Indian Union, can our artists insist in using a so-called medium of an International Esperanto by ignoring and repudiating the vernacular language of Indian Art? A cynic, a friend of ours of trained vision in Art, with liberal sympathies for all forms of art, drew this reviewer's attention to the 'Indian Civil Service'—which we repeated was not *Indian*, not *civil* and not *service* by any manner or means. He pointed out that on this old analogy, the present Delhi Show is not *Indian*, nor *National*, and much of it could not be labelled as *Art*, even by stretching its connotation to breaking points.

ABANINDRANATH AND HIS ART

By MANINDRA BHUSHAN GUPTA

THOUGH Abanindranath is not amongst us* his spirit remains to inspire us with his beautiful art and ideas. He set us thinking anew of the good old tradition of Indian art by opening the vast vista of Indian culture to all the artists of India as well as to all art-lovers. It is known to all that the Bengal School of Painting or the Indian School of Painting founded by him did an immense service towards the cultural regeneration of India. The language of art formulated by him has been accepted all over India, and the art which first originated in Bengal became in no time a sort of *lingua franca* of Indian painting. Different provinces of India have different languages, different dresses and different manners but the language of their art is one. Once an exhibition of the art of the different provinces of India was held in London. An English art-critic was surprised to see the grand unity of art in a country which was divided into many provinces and languages. The first exhibition of modern Indian paintings in Europe was held in Paris as early as 1914 and its account was published in well-known French art journals such as *L'Art decoratif* (February, 1914) and *L'Illustration*. Abanindranath Tagore became famous in Europe in one day. Art-connoisseurs acclaimed him as a great artist.

When Abanindranath first appeared before the public with his incomparable art, India was sunk in imitative art, her creativeness had been lost, but the genius of Abanindranath showed a great possibility in the matter of creativeness and furtherance of art. The advent of his art synchronising with the national awakening in Bengal caught the imagination of the people. A group of young and talented art-students came into close contact with him, and these enthusiastic artists carried on with the new experiment of the master, from whom they had got a new outlook of art.

Now a few words about the life-story of the master. He was born on 7th August, 1871. He was the

great-grandson of Prince Dwarakanath Tagore and the third son of the late Gunendranath Tagore. The Poet Rabindranath Tagore was his uncle.

Something must be said about the eldest brother of the master, the late Gaganendranath Tagore, because in originality and experiments he was also a genius in the field of art. Unlike his youngest brother he was untutored and his art was his own creation. He took up art rather late in life. Though his art had a Japanese inclination he experimented with the modern ideologies of European art, such as Cubism. His art was not an imitation of Pablo Picasso and others. It was entirely

Bust of Abanindranath Tagore in the Government College of Art and Craft, Calcutta

his own. He Indianised the modern "isms" of Europe and created an Indian fairyland.

Abanindranath had his education in the Sanskrit College of Calcutta. Afterwards he studied at home. He had art education under Signor Gilhardi, an Italian

* He died on 5th December, 1951.

artist of no mean repute. He learnt from him Life Drawing, Pastel and Oil Painting. He learnt Water Colour painting from Mr. Palmer, an English artist. The young artist had at that time no idea about the traditional Indian painting. Like the scion of a rich Zaminder family of Bengal as he was, he took to art more as a hobby than as a vocation. He endeavoured to be an artist in the European style. The young artist could not have imagined that soon a time would come when he would revolutionise the art of whole India.

It was a minor incident, or we may call it an accident, that changed the whole course of his artistic career. Young Abanindranath by chance came across an illuminated Indo-Persian manuscript in the library of Dwarkanath Tagore, and he was struck with wonder at its workmanship and fineness. An unforeseen realm of art flashed before his mind's eye. He thought he was taking a wrong course in his art and he resolved to paint in the Indian style. His first experiment in this new style was the Krishna-Leela series. He showed these pictures to his art-teacher, Mr. Palmer. The English artist was immensely pleased to see the work of his pupil, and told him that he had nothing more to teach him and henceforth he should work alone. Thus Abanindranath discovered his own path by mere chance. He was then twenty-three. Undaunted he marched on with his new experiment and techniques. It was a memorable day in the history of modern Indian art. The seed which the artist had sown in his younger days soon grew into a mighty tree known as the "Neo-Bengal School of Painting."

He collected masterpieces of Mughal and Rajput paintings and bronzes, which were studied by him assiduously. His collection of Indian art-works was of immense value, but it is a disgrace to the province that they all have gone to a mill-owner of Ahmedabad. Bengal has lost a great treasure. Such a fine collection of Indian art should have been kept here in a public museum.

We can see a little Japanese influence on his work. A batch of prominent Japanese artists who visited India, among whom Mr. Tai Kwan was well-known, resided in his house for some time as guests, and their technique enriched the master.

After ten years since he had worked out his new conception of Indian painting (i.e., the Krishnaleela series) Abanindranath became the Vice-Principal of the Government School of Art, Calcutta, where Mr. E. B. Havell was then the Principal. His first batch of students consisted of Nandalal Bose, Asitkumar Haldar and others. Thus a nucleus of art was formed under the able guidance of Abanindranath and Mr. Havell in the Calcutta Art School. Mr. Havell was a great devotee of Indian art, culture and philosophy. He did the pioneer work for the understanding and propagation of Indian art.

After he had retired from Vice-Principalship, Abanindranath was appointed as the Bageshwari Professor of Fine Arts in the Calcutta University. His lectures have been published in book-form. Abanindranath was not only an artist but was an art-critic of great importance. His other books on Indian art are *Bharatiya Shilpa*, *Alpona*, and *Artistic Anatomy*. He is a fine prose writer in Bengali. His children's books have a special place in the history of Bengali literature. With literary flavour he mixes an artist's imagination, thus his descriptions in words are but pictures in letters. His *Rajkahini* (Stories from Rajput History) is perhaps the most popular children's book. His reminiscences as embodied in *Jomsankor Dhare*, *Gharoa*, etc., are a treasure in literature. They are charming and fascinating in style.

There is not space enough to give a full description of his innumerable paintings which are well-known. Reproductions of some of his paintings have been published by the Visva-Bharati and the Calcutta Museum. Eminent art-critics have contributed on the various aspects of the art of the master in those two volumes.

I should say something about his technique. His works are generally in water-colour, but he has done a few pastel portraits and oil paintings. *The Passing of Shahjahan* and the *Exiled Yaksha* are done in oil on a wooden panel. The portrait of Rabindranath as a young man is in pastel. It is a fine realistic portrait-study of the poet. The personality and the expression of the poet has come out well. This portrait-study shows the artist at his best in European technique, and proves that he could have been a great portrait-painter had he chosen to stick to that.

Though the revival in Indian art has come through Abanindranath, the master as a painter cannot be termed "a revivalist." Sometimes his work is wrongly alluded to as reminding one of the Ajanta, the Mughal or the Rajput painting. His art was his own creation and he has given us a new technique and a new interpretation of art. If his art is analysed, different currents will be found in it. His main attachment was for Mughal painting but the other influences cannot be ignored. He adopted liberally the British and the Japanese water-colour techniques. But it will be wrong to say that he only borrowed, he gave more than what he took. He accepted everything with a spirit of happy eclecticism. Thus he can be called an eclectic artist rather than an Indian painter.

His technique of wash in different colours has given a new possibility in water-colour painting. Such painting in water-colour was unknown in India, Japan or in Europe. With a broad flat brush a Japanese artist gives wash with water only. Taking this hint from the Japanese, Abanindranath introduced successive washes of different colours over the whole

surface of the picture. Gamboze wash was his favourite, he used emerald green and other colours too in wash. The colour-washes gave a mysterious tone, a homogeneousness and colour-harmony to the painting of Abanindranath, and thus they enhanced the beauty of the picture and added to the great delicacy and refinement of his drawing. Washes were given again and again until the desired effect was reached. Unlike Indian painting, the background of a picture of Abanindranath was multicoloured and it sometimes gave a Rembrandesque effect.

Another peculiarity of his technique was to dip the picture completely in water. First, the design was drawn with every detail finely in pencil from memory. He never used any model. Every picture of his was from imagination. Then the first layer of colour was put after which the picture was dipped in water. When water dried, a wash in colour with Japanese flat brush was given. These successive processes of colouring, dipping in water and washing went on. Shading, finishing, and drawing the outline with fine precision of course was carried on. The picture was finished in drawing the outline with a fine brush and touches were given here and there to relieve the colour. He was a colourist.

In ancient Indian painting, such as the Mughal

or the Rajput painting, dipping the pictures in water was not possible, because those pictures were done in tempera. All the colours would have come out had they been dipped in water. The colours in all Mughal and Rajput paintings are clearly, neatly and definitely laid out. Those colours do not overlap each other as they do in the paintings of Abanindranath. We find this process of dipping the picture in water among the British water-colour artists, particularly the great artist Turner was very fond of this process. For this reason, I think some of the pictures specially the East Bengal landscapes by Abanindranath bear a close resemblance to the work of Turner. Such pictures cannot be classified with the Ajanta, the Mughal or the Rajput painting. On the contrary, when I see the water-colour paintings by Turner, Abanindranath comes to my mind. The mellowness and the mystery of colour in Turner has certainly some resemblance to that of Abanindranath.

I hope I do not minimise the genius of Abanindranath by showing the various influences which he has undergone. This shows only his great power of adaptability and synthesis. Did not the Great Raphael undergo many influences? Did he not sit under the feet of many masters as Mr. Berenson the eminent art-critic tells us?

—:O:—

EDMUND BURKE AND INDIA

By K. V. RAMAN, M.A.,

Research Scholar, Department of History, University of Madras

"Burke was one of the most human-hearted of our great men."—JOHN MACCUN
"If ever a single-minded and righteous anger burned in the breast of man it was in the case of Edmund Burke as he reflected on the wrongs and miseries of the natives of India. If a revolution took place in the whole spirit of the English Government it was due to the weight of that more generous public opinion which he did more to create than any one else before or since."—LORD MORLEY

It is one of those rare, happy and momentous historical accidents of history that Edmund Burke's active political career should have synchronised with the most formative epoch in the history of East India Company. The commercial company was fast metamorphosing into a territorial potentate. But this though a glorious period for the Company and its Servants, Directors and Proprietors was the most inglorious and cruel period for the Indian masses, for, as Cornwall Lewis said:

"No civilized Government existed on this face of earth which was more corrupt, more perfidious

and more rapacious than the British administration of India between 1765-1784."

But the Indian masses had neither the political consciousness nor the means to raise their voice of protest. Fortunately, they found in Edmund Burke their unelected but true and powerful representative who upheld the cause of India with all the resources of his mind and the brilliance of his eloquence. His

1. In the debate held in the House of Commons on the Bill which finally transferred the Government of India from the Company to the Crown.

severe criticism of Lord North's Regulating Act, his great service as a member of the Select Committee which investigated into the activities of the Company, his tireless efforts in exposing the faults of the Englishmen in India, his stout defence of Fox's India Bill which he believed would secure rice in the pot of every man in India,² and last but not the least his impeachment of Warren Hastings go to make him the 'father of the liberal tradition in India.'

But on that doughty defender of the down-trodden and the suppressed are heaped up all sorts of false motives by some English writers in order to cover up a historical fact, namely, the existence of the soulless administration of the British in India. They argue that his own need rather than India's motivated him to take an active interest. They say, that his thought towards India was turned only when his stock-jobbing operations failed. And lastly, Burke is said to have fallen a victim to Philip Francis's blackmailing tactics.

If these were the reasons that motivated one of the greatest statesmen of the times, one should get a poor opinion of British politics itself. On the other hand, it is not difficult to perceive that the motives attributed by these writers do not stand the test of actuality. But when one goes through Burke's epic speeches on the horrors of the misrule of the Company and its consequent effects on the Indian people one will inevitably come to the conclusion that humanitarian love, sympathy for the oppressed and hatred of tyranny, wherever they might be, rather than selfishness or cupidity, were the reasons that made Edmund Burke champion the cause of India. As Professor Harold Laski observed:

"There is nothing more noble attempt in Burke's career than to mitigate the evils of the Company rule in India. Research may show that he pressed his case too far; yet nothing has so far come to light to cast doubt upon the principles he there maintained."³

The fact that Burke was ready to resign from the Secretaryship when Rockingham mildly suspected him coupled with the fact that he flatly declined the East India Company's offer of a post and a pension go to show how Burke did not care for his personal profit or advancement.

But on the other hand, his strong criticism of the Company's misrule and support for the Indian people were fully in accord with his conviction and settled policy. As Morley said it was India itself that stood above all else in his mind. It had filled his mind and absorbed his time while Pitt was still

an undergraduate at Cambridge. And what kind of India did he have in his mind? It was the land of princes, once of great dignity and power, of an ancient and venerable priesthood, of a nobility of antiquity and renown . . . where might be founded almost all the religions of the world.⁴ Can there be a nobler service than his exhortation of his people and the power-drunk ministry to consider India not as a dark land of barbarous savages but as having a people "for ages civilized and cultivated—cultivated in the arts of polished life, whilst we were yet in the woods."⁵ When he realised that these 'venerable people' were subjected to a 'magnificent plan of universal plunder' and the land made 'a scene of woe, the like of which no eye had seen, no heart conceived, and which no tongue could adequately tell,' his passions were roused, his imagination fired and his power of eloquence kindled. Burke feelingly said:

"A ministry of another kind would have first improved the country . . . But they felt nothing for a land desolated by fire, sword and famine . . . their sympathies took another direction; they were touched with pity for bribery, for rapine and oppression."⁶

He even angrily addressed the members of the House of Commons thus:

"Figure to yourself the form and fashion of your sweet and cheerful country from Thames to Trent . . . emptied and embrowelled."⁷

These were not empty words coming from a power-drunk propagandist or a corrupt politician, but sincere words emanating from a deep sympathy with humanity, penetrating understanding and a courage of conviction. Burke pleaded for a better understanding of India. He insisted that the conquering race must abide by a moral law. According to him, England must be in India for India's benefit and not for her own. Thus he said:

"All these circumstances are not, I confess, very favourable to the idea of our attempting to govern India at all. But there we are: there we are placed by the Sovereign Disposer; and we must do the best we can in our situation. The situation of man is the preceptor of his duty."⁸

Professor Laski has rightly pointed out that there has never in any language been drawn a clearer picture of the dangers implicit in imperial adventure.⁹ Burke's was not a blind and uncritical my-country-

right-or-wrong patriotism. Thus when he saw "the cries of India being given to seas and winds to be blown about an unhearing Ocean"¹⁰ he did not hesitate to declare:

"I swear by this book that wrongs done to humanity in the Eastern world shall be avenged . . ."¹¹

What is this but the quintessence of humanitarianism and internationalism? Burke's race-consciousness embraced all mankind. His generosity transcended all barriers. In the words of Lord Morley, Burke had a veneration for all old and settled order, whether in the Free Parliament of Great Britain or in the ancient absolutism of Versailles, or in the secular pomp of Oude and the inviolable sanctity of Benares.¹²

Again, it is said that Burke's mind was poisoned by Philip Francis and that Burke's source of information was objectionable. This is as untrue as it is unbelievable. It would be more appropriate to say that the tortured mind of Philip Francis pictured to Burke the equally tortured minds of the Indian people groaning under 'tyranny sublimed into madness.' Philip Francis, it must be emphasised, was neither the first nor the only man who informed Burke about India. Burke had already met in a coffee club a run-away lad from Calcutta, Emin¹³ by name, who by opening his heart opened the eyes of Burke to the atrocities of the Company rule. From then on he devoted himself assiduously to a study of the conditions in India. He soon came to possess greater knowledge of Indian affairs than anyone else of his time. That knowledge, Lord Morley remarks, grows "from sedulous meditation of long years, directed by a powerful intellect and inspired by an interest in human well-being."¹⁴ Nobody was more conscious of it than Burke himself. He boasted, and justly too, that

"If I had asked for a reward, which I have never done, it would be for the sixteen years I laboured with the most assiduity and met with the least success—I mean in the affairs of India."¹⁵

Lastly, Burke's impeachment of Warren Hastings for "high crimes and misdemeanour" which was at once the most spectacular achievement of Burke and the most valuable service he did to India (for that acted as a permanent source of fear for the succeeding Governors-General) is now regarded by some as a result of personal enmity between him and Warren Hastings. English writers like Dodwell and Roberts, wholly forgetting the heart-rending misdeeds of Hastings spend much time in debunking the character of Philip Francis and "his too—Burke." Thus a writer remarks that the investigation was not instituted to ascertain truth, but to fix criminality. According to Roberts, "there lies a false and histrionic glitter" on the whole episode.¹⁶ It is when they view Warren Hastings only from the point of view of the growth of the British Empire that these writers err. Nobody can deny that Hastings was one of the founders of the British Empire, but Burke looked at him and his actions from quite a different angle, from the point of view of the welfare of India. Thus he thundered:

"I impeach Warren Hastings in the name of the people of India whose country he has destroyed . . ."

Lord Morley observes:

"That Hastings was acquitted was immaterial. The lesson of his impeachment had been taught with sufficient force—the great lesson that the Asiatics have rights, the Europeans have obligations . . ."¹⁷

And he even goes further and calls Burke as the "first apostle and great upholder of integrity, mercy and honour in relation between his countrymen and their humble dependents."¹⁸

Edmund Burke's name has taken a permanent place in the annals of British Indian administration as having been responsible for starting a liberal tradition. It is no wonder that his speeches and writings along with those of John Stuart Mill became the fountain-head of inspiration for our freedom-fighters.

THE PURPOSES OF THE UNITED NATIONS

By PROF. KHAGENDRA CHANDRA PAL, M.A.

Member, Executive Committee, Indian Political Science Association

The declared purposes of the United Nations are, briefly, four: first, maintenance of international peace and security; secondly, development of friendly relations among nations; thirdly, international co-operation for the solution of international problems of an economic, social, cultural or humanitarian character and for the promotion of human rights and fundamental freedoms, and, fourthly, co-ordination of all international activities.

These purposes have been enumerated in Article 1, but will be found also in other parts of the United Nations Charter including the Preamble.

According to Goodrich and Hambro:

"It is difficult to think of a single matter within the sphere of international relations or affecting relations between states which cannot be brought within the scope of these comprehensive purposes".¹

Maintenance of international peace and security is rightly placed at the head of the list of the objectives of the United Nations, for without peace none of its other aims can be achieved. The United Nations is entitled to take all "appropriate measures to strengthen Universal peace,"² and so Universal peace between and within nations is within the scope of the United Nations. Prof. Hans Kelsen categorically says, "The purpose of the United Nations is world peace."³ For in the first place, a civil war, or any other situation within a state, may be interpreted by the competent organ of the United Nations as a threat to international peace, in which case intervention on the part of the organisation is not prohibited according to the express provision of Article 2(7) which lays down the principle of domestic jurisdiction of nations; secondly, the United Nations Organisation is required to ensure that even states which are not Members of the United Nations Act in accordance with the principles laid down in Article 2 of the Charter "so far as may be necessary for the maintenance of international peace and security";⁴ and, thirdly, the preamble speaking of the determination of the peoples of the United Nations "to save succeeding generations from the scourge of war" expressly refers to "mankind."

Peace in all parts of the world is thus the first concern of the United Nations Organisation. With a view to maintaining international peace and security the United Nations will not only (a) "take effective and collective measures for the prevention and removal of threats to the peace and for the suppression of acts of aggression or other breaches of the peace", but will also (b) "bring

about by peaceful means, and in conformity with the principles of justice and international law, adjustment or settlement of international disputes or situations which might lead to a breach of the peace."⁵

Evidently, prevention and removal of war and any other threat to the peace, suppression of acts of aggression or other breaches of the peace, and solution of international disputes and tensions are all more or less negative steps in the interest of peace. But "to strengthen universal peace" the United Nations is also entitled to take definitely positive steps like developing "friendly relations among nations based on respect for the principle of equal rights and self-determination of peoples".⁶

It is obviously difficult to maintain peace and security in an atmosphere of suspicion, fear, resentment and jealousy. For removal of this difficulty it is essential that there should be a community of friendly nations through all possible means. The Charter refers to "the equal rights and self-determination of peoples" as a specific means for this purpose. This reference, however, does not involve a guarantee that the United Nations will alter the status quo in accordance with these ideas. The Charter of the United Nations seems to be very cautious in this connexion: it only enjoins that "respect" for these ideas should be the "basis" of friendly relations among peoples or nations.⁷

Peace and friendship among nations may be called the political purposes of the United Nations in view of their direct relation with the struggle for power among nations.

These political purposes, however, may not be effectively realised unless there be some conditions of stability and well-being among nations.⁸ This brings us at once to the economic, social and other purposes of the United Nations. Of course, these non-political purposes are not necessarily ancillary to the political purposes of the United Nations. Aims like greater economic stability, wider prosperity, more complete social justice, higher educational standard, relief against distress, human rights and fundamental freedoms may be pursued independently of all other purposes. But the interrelation between the political and non-political objectives of the United Nations, as of any other association, is too patent to be ignored.

A significant thing about the non-political purposes of the United Nations is that they speak specifically of

human rights and fundamental freedoms. Before the First World War, very little was said about them. But during the period between the two World Wars there had been wide and far-reaching attacks upon even some basic rights and freedoms of human beings on grounds of race, sex, language or religion. As a result there developed some sort of a world public opinion which condemned all such attacks. Discerning thinkers began to see that some of the tensions among nations were basically due to the discrimination practised by certain Governments against racial, religious, social and political groups. This led to an agitation for the international protection of human rights and freedoms and ultimately clauses regarding these rights and freedoms were placed in various parts of the Charter itself. But what are these human rights and fundamental freedoms? Generally, they seem to mean "those minimum rights of the individual which at any stage of civilisation are deemed to be inseparable attributes of the human person."⁹ They are by no means confined to the "four essential human freedoms" listed by President Roosevelt in his message to the Congress on January 6, 1941: (a) "freedom of speech and expression—everywhere in the world"; (b) "freedom of every person to worship God in his own way—everywhere in the world"; (c) "freedom from want—everywhere in the world"; and (d) "freedom from fear—anywhere in the world." Nor can it be said that they are exhaustively defined in the Universal Declaration of Human Rights proclaimed by the General Assembly of the United Nations on December 10, 1948 with the affirmative support of no less than 48 States. In any case, there is no unanimity of views regarding either definition of these rights and freedoms or their enumeration.

Just as the reference to "the principle of equal rights and self-determination of peoples" does not amount to a guarantee that the United Nations will alter the status quo in accordance with this principle, so also the reference to the human rights and fundamental freedoms does not involve a guarantee that the United Nations must enforce the undisturbed enjoyment of these rights and freedoms. The Charter of the United Nations requires the Organisation only to "promote" and "encourage" universal respect for and observance of "human rights and fundamental freedoms for all."¹⁰ The United Nations can do this by undertaking a study of these rights and freedoms in different countries, by attempting to find what may be called an L.C.M. of these rights and freedoms in them and by persuading them to adopt suitable international conventions in this connexion. As Bentwich and Martin say:

"To promote" is a word less powerful than 'to maintain,' the term which defines the Organisation's authority in matters of peace and security. So that the Organisation should be able to maintain peace,

Member States have agreed to serious inroads on national sovereignty, such as the delegation of executive powers to the Security Council and the renunciation of neutrality. No comparable concessions are made in the economic and social fields."¹¹

However, it need not be supposed that because such concessions have not been made by the members of the United Nations in respect of its non-political activities, the achievements of the Organisation are likely to be necessarily less in these spheres than in others. Far from it. As a matter of fact, the non-political purposes of the United Nations are developed and emphasised in different parts of the Charter of the United Nations; and elaborate bodies like the Economic and Social Council, the Trusteeship Council, the Specialised Agencies, Committees and Commissions and even non-governmental organisations have been working in these fields with lesser friction and greater success than the Organisation as a whole in respect of its political purposes.

It is, of course, not possible to make a clear-cut distinction between the political and non-political purposes of the United Nations. Those purposes of the United Nations which tend to restrain the struggle for power among nations have been called political and the rest non-political. Lurking behind many economic, social, cultural and educational matters, and even matters of health, there are often factors which are used by nations to develop their prestige and power.

The fourth purpose of the United Nations is co-ordination of international activities and is administrative in nature. It is, of course, not expected that all international activities in the political, economic, social, cultural and humanitarian affairs will flow through the United Nations. This is neither possible nor desirable. For, the world we live in is still more a multiverse than a universe. All that is intended is that the United Nations should be a forum for discussion and a clearing house for information in most international affairs. The Charter, therefore, cautiously speaks of the United Nations being only "a centre," and not "the centre" for harmonizing the activities of nations in the attainment of the common ends.

Of all the ends of the United Nations the political ends are the most important; and their priority has been recognised even in the drafting of the Charter. While international peace and security must be maintained by the United Nations, the Organisation is only expected to make "respect" for the principle of equal rights and self-determination of peoples the basis of friendly international life; and "respect" for human rights and for fundamental freedoms and their observance are only to be "promoted" and "encouraged." The very order of statement of the purposes of the United Nations, peace and security coming first, friendship among nations second, and others later is an

indirect emphasis on the political purposes of the United Nations. Indeed, in case of a threat to the peace, an act of aggression or any breach of the peace the first concern of the United Nations is not to enquire whether the status quo was in conformity with the principles of justice and international law. Its first move is for the suppression of all forms of breaches of the peace, and then "bring about by peaceful means," and in conformity with the principles of justice and international law, adjustment or settlement of international disputes or situations.¹² The ancillary nature of the non-political purposes is also evident from Article 55 which states that various social, economic, and humanitarian acts to be undertaken by the United Nations "with a view to the creation of the conditions of stability and well-being are necessary for peaceful and friendly relations among nations." Under Article 73 the obligation to promote the well-being of the inhabitants of the non-self-governing territories is accepted as a sacred trust only "within the system of international peace and security established by the present Charter." The first purpose of the trusteeship system is to further international peace and security,¹³ and Article 84 also requires that "It shall be the duty of the administering authority to ensure that the trust territory shall play its part in the maintenance of international peace and security." Again, under Article 2 (7), the United Nations acquires the right of intervention in the domestic affairs of a nation only when the Security Council takes enforcement measures for meeting threats to the peace, breaches of the peace and acts of aggression. Under Article 25, the Members of the United Nations agree to accept and carry out the decisions of the Security Council in accordance with the present Charter. But Article 56 only requires that all Members pledge themselves to take joint and separate action in co-operation with the Organisation for the achievement of the purposes in the non-political sphere; and this Article has been interpreted as having reduced the responsibility of Members in respect of socio-economic activities of the United Nations only "to giving separately or jointly, such support, as they think fit."¹⁴ Finally, a state can qualify for being a member of the United Nations by being first of all, "peace-loving" and may be expelled or suspended from membership of the United Nations for any contrary act in this connexion.¹⁵ But no similar emphasis is placed on the non-political aspects of the life of a nation in connexion with the recruitment of members for the United Nations or their suspension or expulsion.

Professor Hans Kelsen has pointed out a number of defects in respect of the wording of the provisions

in the Charter in relation to the purposes of the United Nations.¹⁶ (1) As there is little difference between "peace" and "security," the addition of the word "and security" may be treated as rather superfluous. (2) In case of a breach of the peace, the purpose of the United Nations cannot be to "maintain" it but to "restore" it, a terminological distinction which is made in Articles 39 and 51, but not in the Preamble and Chapter I. (3) It is difficult to understand why there should be "prevention and removal of threats to the peace," but only "suppression," and not "prevention" of acts of aggression and other breaches of the peace. (4) It is not only that "acts of aggression" have not been defined in the Charter used in association with the phrase "breaches of the peace," it seems to be even superfluous. (5) In Article I "breaches of the peace" has been treated as a wider concept including that of "act of aggression," for the wording here is "acts of aggression and other breaches of the peace." But in Article 39, where the wording is "the breach of the peace or act of aggression," the concept has been treated in a different way.

(6) If "effective collective measures" in Article I means enforcement measures determined by Articles 41 to 50, a threat to the peace cannot be "prevented" by such action, but only "removed," for under Article 39 such action is to be taken only if such a threat actually "existed." (7) The Preamble of the Charter uses a long phrase, "obligation arising from treaties and other sources of international law," which could be far more briefly expressed by two words, "international obligations." (8) Particular stress in the Preamble on the respect for treaty obligation is problematical when Article 14 authorises the General Assembly to recommend measures, including revision of treaties, for the peaceful adjustment of any situation. (9) It is evidently a purpose of the United Nations to secure international co-operation in political and other affairs. But what is "international co-operation in the political field" as stated in Article 13, Paragraph I (a)? The term "international" here might be regarded as superfluous, for by a treaty only international co-operation of states can be established. States may co-operate in the field of international as well as in the field of national politics. But it seems the authors of the Charter do not intend to treat co-operation in the field of national politics as 'political' co-operation. This explains the formula "co-operation in the political field" as used in Article 13 (i) (a) in contradistinction to "co-operation in the economic, social, cultural, educational and health fields" in clause (b). In the interest of clarity of thought the phrase "international co-operation in the political field" should have been replaced by such a simpler phrase as "co-operation in international politics."

(10) The Preamble of the Charter states that an 'end' of the United Nations is "to promote social pro-

gress and better standard of living in larger freedom" and a 'means' to this end is "to employ international machinery for the promotion of the economic and social advancement of all peoples." But the 'end' and 'means' seem to be more or less identical. (11) Article 1 (3) states that a purpose of the United Nations is "to achieve international co-operation in solving international problems of an economic, social, cultural or humanitarian character." But Articles 13 and 55 authorise the General Assembly to initiate studies and make recommendations for the purpose of promoting international co-operation in certain fields which may be both national and international.¹⁷ (12) After having specifically stated in Article 1(3) that the United Nations has a 'humanitarian' purpose, why the same purpose is not specifically mentioned in Article 13(1)b? (13) Educational and health fields are specifically mentioned in Article 13(1)b, but why not in Article 1(3)? (14) The term 'educational' in Article 13(1)b might be treated as superfluous, for the matter seems to be covered by the term cultural in the same Article. (15) Article 55 states that the United Nations shall promote "universal respect for, and observance of, human rights and fundamental freedoms." But why was the word 'observance' omitted in Article 1(3)? (16) In Article 1(3) "human rights" were treated as matters for international co-operation. But in Article 13(1)b the function of the Organisation with respect to human rights is not specifically characterised as comprised in the function of promoting economic and social co-operation. (17) 'Progress' implies 'development' and, as such, is redundant in the phrase "social progress and development" in Article 55(a). (18) What is meant by the phrase "larger freedom" in the Preamble? Does it imply the political freedom of democracy or only the economic freedom in the sense of liberalism? (19) Article 55(b) makes a distinction between promoting "solution of international economic, social, health and related problems" and promoting "international, cultural and educational co-operation." But surely solution of the problems referred to implies international co-operation, and international co-operation in the sphere suggested also implies solution of problems in that sphere. (20) Article 62 defining the functions of the Economic and Social Council is superfluous, for Article 60 has already stipulated that all the functions set forth in Chapter IX shall be performed by the Economic and Social Council. (21) Why does Article 62 make specific mention of the functions stated in 55(b) and 55(c) but not of that stated in 55(a)? (22) Why is the phrase "without distinction as to race, sex, language or religion" carefully maintained in Articles 1, 13 and 55, but dropped in Article 62? (23) The Preamble speaks of "fundamental human rights." There is no reason why the same idea should be covered in other parts of the Charter by the phrase "human rights

and fundamental freedoms." (24) The formula "human rights and fundamental freedoms," may be treated as incorrect, for freedoms are nothing but rights. (25) The Preamble proclaimed the principle of making no distinction as to sex. But why did it not speak also of the principle of making no distinction as to race, language or religion, a principle which has been established in later Articles? (26) Why "the dignity and worth of the human person" and "to practise tolerance" are mentioned only in the Preamble but not in other parts of the Charter? (27) It may be pointed out that the obligation stated in Article 2 (3) is not exactly in harmony with the corresponding function of the United Nations under Article 1 (1). As it is, Members are obliged to settle their disputes only, but the Organisation is also required to adjust situations which do not assume the character of a dispute. Besides, Article 2 (3) requires only that justice should not be endangered; but Article 1 (1) also requires that there should be, moreover, conformity to international law. (28) To speak of maintenance of justice and at the same time of respect for law is problematical. Either law is identical with justice or not. In the former case one of the terms is superfluous. And in the latter case, the question arises whether in case of conflict, the one or the other shall be maintained. But the Charter gives no answer to this question.

These and other similar defects in the statement of the purposes are not very important and might even be ignored as being almost natural in any document drawn up by different persons. But the purposes, as stated in the Charter, may be subjected to more serious criticisms.

In the first place, the United Nations is more concerned with peaceful status quo than with peaceful change. The emphasis on the political purposes of the United Nations, specially on the Organisation's role as a machinery for international peace and security, is unmistakable. In a sense, this is even justifiable on the ground that order comes before the law and that the United Nations, like any national state, must first act as a policeman, before it can act as an arbitrator. But there is a danger—and the danger was noted even at San Francisco—that this rigid attitude toward moral and legal foundation of peace might lead to unjustifiable settlement of the Munich type.¹⁸ In a dynamic world society like ours a greater emphasis should be placed on the necessity, methods and techniques of peaceful change on the maintenance of the existing status quo for the sake of peace only.

In the second place, though the Charter speaks of strengthening "Universal peace," the United Nations as an Organisation is not authorised to have anything to do directly with the problem of national peace. The primary objective of the United Nations is international

17. Kelsen: *Law of the United Nations*, p. 23.

18. Bentwich & Martin, *A Commentary on the Charter of the United Nations*, p. 66.

peace. National peace included in the idea of Universal peace is only its secondary objective. If peace in all its aspects was directly within the scope of the purpose of the United Nations, the Organisation could deal with a case like the Chinese revolution in 1949 which, when it occurred, was certainly a grave threat to the peace of a very wide area. As it is, the United Nations can deal only with international quarrels which, in some cases, at least, may be of a very minor importance as in the case of a dispute between, say, Uruguay and Paraguay. Thus some of the great problems of peace may be beyond the scope of the United Nations.

In the third place, even the problems of peace that are within the scope of the United Nations cannot be effectively dealt with by the United Nations. For in respect of international peace, the jurisdiction of the United Nations is not exclusive, but subject to the concurrent jurisdiction of the nations themselves. Nations have often played this role of peace-making by arming to the teeth, ostensibly for self-defence but actually in some cases for aggression. If international peace is to be an effective purpose of the United Nations, the authority of the Organisation must cut across the authority of the nation states in respect of peace, and have greater authority over nation states, making them subordinate, not co-ordinate, units of administration. The real weakness of the United Nations in this respect is seen in Articles 2(7) and 51 which speak of the vague principles of the domestic jurisdiction of the nations and their rights of self-defence.

In the fourth place, the purposes of the United Nations for maintaining peace and developing friendship among nations are backed up by some obligations on the part of the members of the United Nations. For instance, Members are required to settle their international disputes by peaceful means in such a manner that international peace and security and justice are not endangered; they must refrain in their international relations from the threat or use of force against the territorial integrity or political independence of any state; and they cannot take shelter behind the principle of domestic jurisdiction when the Security Council takes enforcement measures for peace among nations.¹⁹ But there is an influential opinion maintaining that there is no corresponding obligation on the part of Members in respect of the non-political purposes of the United Nations. As Hans Kelsen says:

"... the Charter does not impose upon the Members a strict obligation to grant to their subjects the rights and freedoms mentioned in the preamble or in the text of the Charter. The language used by the Charter in this respect does not allow the interpretation that the Members are under legal obligations regarding the rights and freedoms of their subjects. All the formulas concerned establish

purposes or functions of the Organisation, not obligations of the Members, and the Organisation is not empowered by the Charter to impose upon the governments of the Member States the obligation to guarantee to their subjects the rights referred to in the Charter. The fact that the Charter, as a treaty, refers to a matter is in itself not a sufficient reason for the assumption that the Charter imposes obligations with respect to the matter upon the contracting parties."²⁰

Some, however, maintain a contrary view. According to a Philippine delegate, for instance:

"Signature of the Charter involved the observance of the principle that there should be no distinction as to race, sex, language or religion. This was one of the fundamental principles of the Charter. Any member could call upon another to account before any appropriate organ of the United Nations for alleged infringements of that obligation."²¹

According to a resolution adopted on April 25, 1949, Article 1 (3) of the Charter binds all Members to encourage respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language or religion, and in Article 55 (c) the Members undertook to promote universal respect for and observance of human rights and fundamental freedoms. The Preamble of the Universal Declaration of Human Rights adopted by the General Assembly on December 10, 1948 also states that the Member States have pledged themselves to achieve in co-operation with the United Nations the promotion of universal respect for and observance of human rights and fundamental freedoms. In any case, however, the obligation regarding human rights and fundamental freedoms will not be backed by the binding decisions of the Security Council unless issues relating to these rights and freedoms endanger or threaten international peace and security.

In the fifth place, it may also be maintained that the organizational structure of the United Nations and its authority also are not adequate to the great tasks with which it has been entrusted. The General Assembly, the Economic and Social Council and the Trusteeship Council can only recommend measures, but cannot make binding decisions. The decisions of the Security Council are, of course, binding. But it can be paralysed at any moment through the principle of Great Powers' unanimity or veto. Besides, any enforcement action to be taken by the Security Council is based on the principle of the collective responsibility of the state guilty of the threat to, or breach of, the peace, and not on the principle of individual responsibility which alone can make such enforcement action really effective. The International Court of Justice consists of the most highly qualified judges. But the Court has no compulsory jurisdiction, but only voluntary jurisdiction in respect of disputes between States.²² Nor do the

organs of the United Nations approach in any way the democratic principle of individual as the unit of representation so far as their structures are concerned.

Finally, it may be said that these defects stem from the basic fact that the world today is not yet adequately prepared for world loyalty and world institutions over and above national loyalties and national institutions. The vast majority of mankind consider their nation states as the highest units of allegiance, and they act more for national peace and national prosperity and less for international peace and international prosperity. It will be agreed that national peace and national prosperity cannot be adequately maintained and developed if parties or groups within the nation are treated as of higher importance than the nation itself. But it is not yet duly realised that narrow nationalism which thinks more of the nation and less of the world is a danger or threat to international peace and security. The result is that while politics in a nation are a struggle for power among groups and individuals under the guiding influence of an ideal, politics among nations are essentially a struggle for power without the guiding

influence of any powerful ideal. Thus, power is more important than morality in international affairs; and the nations and their leaders do not feel much scruple to take shelter behind all vague provisions in the United Nations Charter and other international documents. The Secretary-General of the United Nations, Dag Hammarskjöld, once said to a religious gathering:

"The United Nations stands outside—necessarily outside—all confessions, but it is nevertheless an instrument of faith. As such, it is inspired by what unites, and not what divides the great religions of the world."²³ True; but if this instrument is to be effective for international peace, this faith of the United Nations, i.e., loyalty to a world-wide cause must be stronger than the modern religion of nationalism. Basically, this requires that the flag of mankind must be planted on the great psychological Everest of narrow nationalism which during the last few centuries has given cover to all sorts of human vices in all critical moments of history.

—O—

KANGRA VALLEY PAINTING

By Prof. O. C. GANGOLY

THE history of Indian painting, covering a long period of about five thousand years, comes to an end about the middle of the 19th century with the death of Molaram of Charwal, the last representative of the Hill Schools of Painting. Of the Hill Schools, the most brilliant representative was the short-lived School of the Kangra Valley, which reached its climax during the reign of Samsar Chand (1774-1823). This school, though a late development of the Hill School, has lent a valuable prestige to the last phase of the history of Indian painting through a series of amazing masterpieces, rich in their charming colour schemes, wonderful presentation of natural scenes and an enchanting gallery depicting the shy beauty of Indian women in diverse poses of love and devotion, and, above all, by their sublimated presentation of Krishna-lila heavily charged with a mystic devotion derived from the religion of the *Bhagavata*, popularized by a group of composers of love-lyrics in Hindi, of which Kesavdas, Beharilal and others were the stimulating inspiration for the masters of the Kangra School. Though first recorded by an early English traveller, Moorcroft (1800), the Kangra School was the brilliant discovery of Dr. Coomaraswamy, who first exhibited some specimens at the Allahabad Exhibition in 1910 and which he fully presented with a subjective and penetrating interpretation of their contents in his

epoch-making work *Rajput Painting* (2 Vols., Oxford 1916). The study and exposition of the beauty of Kangra masterpieces demonstrated the amazing vitality of Indian culture surviving in a living form even on the eve of the British conquest of India.

The highly aesthetic qualities of Kangra paintings, their flowing and rhythmic draughtsmanship, their attractive colour schemes and their charming techniques soon captivated the hearts of European and American connoisseurs, who ever since the publication of Coomaraswamy's monograph, have been acquiring and exporting out of India the rarest gems of the school, to the progressive impoverishment of the art-treasures of India, the nation being still unconscious of the great values of its spiritual heritage. Between the year 1916 and the following half a century, an enormous amount of the finest miniatures of this school have been exported out of India, the loss of which could not be covered by the acquisitions of a few private Indian collectors (Tagores, Ghosh, Treasurywalla, Ardesir and Sangram Singh). As things stand at present, the most outstanding masterpieces have found their ways into the European and American collections. The last great exodus was the transfer of the famous Manuk Collection of Patna to England. Even now the exodus of our art-treasures has not stopped, particularly, in respect of miniatures of our pictorial masterpieces.

Pious resolutions of the Government of India as regards acquisition and preservation of the surviving treasures of Indian painting in our National Galleries have not been practically implemented and the narrow and stingy rules of purchase are threatening the exodus of the few remaining masterpieces of pictorial art, now in the collection of private connoisseurs and collectors. Our nationalists with pretensions of higher education and culture are still impervious to the beauties of our old masterpieces and continue to neglect the study of their great artistic heritage. Equally perverse is the attitude of our modern exponents of art and the modern practitioners in India, who cultivate a pose of vanity and superiority complex, turning their backs on our old masters of painting and sculpture, pretending that they have nothing to learn from the Buddhist, Moghul, Rajput, and Gujarati Schools of painting, forgetting that their counterparts in Europe swear by and intensely study the old masters of European Schools, the Gothic, the Byzantine and the Italian Primitives, sometimes slavishly copying the manners and mannerisms of El Greco, Duccio and Margaritone.

Indian painting can never grow before modern artists and connoisseurs bend their knees before the old masters of India and assimilate all the lessons they have to teach to all our modern and future art-practitioners.

It is surprising to find what amount of earnest study and scientific research is being devoted by European scholars to the Hill Schools and the Kangra Valley paintings. The lead given by Coomaraswamy, half a century ago, has not been followed by any Indian connoisseurs (with the exception of Mehta and Mukandi Lal), but has been steadily followed by a group of foreign scholars, Goetz, Kramrisch, J. C. French, Basil Gray, William Archer, Irwin, and Tchoukine. It is therefore encouraging to find an Indian connoisseur taking up, in 1954, the serious study of the Kangra Valley School. Mr. M. S. Randhawa, I.C.S., the Development Officer of Chandigarh, has given us a new study of this school, generously patronized by the Information Division of the Government of India. The great merit of this book is the presentation of 40 examples in full-colour facsimiles (mostly unpublished before) at a very cheap price. The author has been able to tap many private collections in the Punjab and brought forward many new data for the study of this fascinating branch of Indian painting. Except that coarse-grain screens have been used by the Times Press, Bombay, the reproductions have on the whole given a correct colour translation of the originals. If finer screens were used, the strength and delicacy of the draughtsmanship could have been conveyed as in the reproductions of analogous specimens reproduced by Faber and Faber in their *Kangra Painting and Garhwal Painting* (London). In the matter of accurate colour reproductions Indian engravers are yet far behind their counterparts in Europe. And improvements in the standards of colour facsimiles are one of the chief necessities and conditions for the greater understanding and appreciation of Indian pictorial masterpieces by Indians.

Mr. Randhawa's Introduction and descriptive letter-press are somewhat disappointing, as he has denied us the benefit of an accurate iconographic study and documentation of the pictures with quotations from Hindi texts. Addressed primarily to Indian readers, his English descriptions of the subject-matters miss fire. We strongly recommend to the author a study of the popular book: *Love Poems in Hindi* (Little Books on Asiatic Art, Vol. 4, Calcutta, 1936) for citations from Hindi texts in support and explanation of the illustrations in his second edition. The *Bara-masia* pictures cited by him would have made greater appeal if accompanied by the corresponding texts from Kesavadas. The *Feast in the Forest* also called forth the well-known texts of the *Bhagavata*. As regards the *Elopement* (24), the identification of the story from the *Kathasarit-sagara*, was given long ago with citations of three illustrations of the topic (*Ostasiatische Zeitschrift*, Berlin, N. F. XII, Heft 6, 216-219). Some of the specimens reproduced have been known in earlier or better versions (7, 9, 10, 12, 14, 15, 20, 21, 29, 30, 34). It is a matter of regret that out of the 40 specimens cited, hardly more than 4 could be said to be outstanding specimens. This seems to suggest that the best masterpieces of the school have been combed out long ago and exported out of India. *The Fire in the Village* (28), though an unusual thing, has been 'spoiled' by the introduction of the divine pair Krishna and Radha borrowed from a well-known masterpiece. The *Suklabhisarika* (11) and the *Reverly by Night* (25) are two very rare and unusual illustrations. The *Lament of Separation* (15) is really a ragini motif, that of Todi, frequently illustrated. It is unfortunate that a second-class example, very much clumsy and involved in its composition, has been pasted on the cover. We could warmly congratulate the author for recovering the names of four, hitherto, unknown names in the Kangra School—Gursahaya, Kushanlal, Hastu, and Purkhu of whom future students may help to provide fuller particulars. The letter-press appears to have been done in a hurry in the midst of heavy administrative works. Several irresponsible and rash remarks have crept into the text. To say that "by the 8th century A.D., Buddhism had ceased to be an inspiration to the artist" is to ignore the great glory of the illustrated MSS. of the Pala School (10th to 13th century). To say that "the orthodox art of India declined rapidly after the 9th century" is to forget the monuments of Elura and of Elephanta which include the finest masterpieces not only of India but of the whole world (e.g., Hiranya-Kasipu panel, and the Tri-murti). In spite of these minor blemishes, this profusely illustrated tribute to a great school of painting will be of great help in winning new devotees to one of the finest phases of Indian painting.*

* *Kangra Valley Painting*: By M. S. Randhawa. Published by the Ministry of Information, Government of India, 1955. 18 pages text, 40 colour plates. Price Rs. 18.

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.

EDITOR, *The Modern Review*.

ENGLISH

PERSIAN RECORDS OF MARATHA HISTORY —II: Sindhia as Regent of Delhi (1787 & 1789-91): General Editor P. M. Joshi. Translated from the Persian with notes by Jadunath Sarkar M.A., Hony. E. Litt. Published by the Director of Archives, Government of Bombay. Pp. i-x + 1-63. Price Rs. 2.

The book, under review, is the second volume of the Persian Records of Maratha History series published under the editorial care of Shri P. M. Joshi. It contains English translations of Persian records preserved in the Salar Jang Library of Hyderabad and in the Bombay Record Office (Parasnis Collection). The Persian papers have been translated by our eminent historian Acharya Jadunath Sarkar.

The book, within its short compass, contains very valuable records which cover the years 1787 and 1789-91. These were crucial years in the career of Mahadji Sindhia and in the history of North India. In 1787, Mahadji invaded Rajputana and in the encounter with the Rajputs at Lalsot suffered a heavy reverse. In the end he was forced to beat a retreat. This famous Lalsot campaign is illustrated in the first part of the book. We can follow the events and discussions in Mahadji's camp with a fulness of detail and accuracy of reporting unparalleled by any other event in Indian history. The period 1789-91 is also of considerable historical interest as during it Mahadji was the actual dictator of the policy of the Delhi Empire. The copious Persian reports from Sindhia's camp covering the years 1789-91 have been published for the first time in the second part of the book. They shed much light on the character and capacity of Sindhia, on the inner workings of the Maratha camp in Rajputana in 1791, and on the growth and development of Sindhia's army under De Boigne. 'No biographer of Sindhia can afford to neglect this original source.' Our thanks are due to the Director of Bombay Archives for publishing this invaluable source-book of Maratha history.

TARIT KUMAR MUKHERJEE

ANCIENT HISTORY OF SAURASHTRA (being a study of the Maitrakas of Valabhi y to viii centuries A.D.): By Dr. Krishnakumari J. Virji, Ph.D. With a foreword by George M. Moraes, Professor of History, St. Xavier's College (Bombay). Published by Konkan Institute of Arts and Sciences, Bombay-1. 1952. Pp. vi + 354. Price Rs. 22-8.

This monograph which won for its authoress the degree of Ph.D. of the Bombay University in 1947 is a work of considerable painstaking research. The authoress has spared no pains in collecting her materials from all available original sources, literary, epigraphic and numismatic as well as books and

articles published by scholars working in this field so far. The work consists of three parts. Part I deals with the history of the Maitraka dynasty (5th-8th century A.D.) with a concluding chapter on the Valabhi era. Part II describes the social, the religious and the economic conditions as well as the state of learning and the administrative organisation in the country under Maitraka rule. It consists of additional chapters on coinage and epigraphy, this last containing a chart illustrating the development of the Maitraka script out of the original Brahmi alphabet along with complete lists of inscriptions of the dynasty as well as the names of donors, the objects of donations and the beneficiaries mentioned therein. Part III contains a list (illustrated with 2 maps) of place-names found in the inscriptions along with their identifications. The book is further enriched with two Plates illustrating the Maitraka seals and coins as well as bronzes. A comprehensive bibliography and a good index bring this useful volume to a close.

The above brief analysis is enough to demonstrate the high scholarly value of this work. In its admirably exhaustive and critical treatment of its subject-matter, it might well serve as a model for other regional histories. We propose to make a few remarks for consideration by the authoress when a new edition is called for. Instead of drawing upon the data from distant regions and times in our land the authoress would have been well advised in confining herself as much as possible to the material bearing immediately upon her subject. Some of her statements require considerable revision. Such are the references to Skandagupta's succumbing to the repeated attacks of the Hunas and his war of succession with his brother Puragupta (sic.) (pp. 22-23), to the Mauryan polity as "a loose consideration of several States established by the express consent of the constituent units" (p. 230), to the ancient Indian kings performing "religiously" "from a very early age all legislative, executive, military and judicial functions in the State" (p. 231), and to all land in the kingdom vesting in the king as State-property (p. 232). Of the same nature is the sweeping generalisation (p. 231) that "neither in ancient nor in mediaeval India was there any possibility of a despotic form of government." The faulty transliteration of Sanskrit texts (pp. 22 n, 253, etc.) and the unfortunately too frequent misprints of personal and place-names should be corrected. In the bibliographical list at the end the most scholarly and up-to-date editions of the original works where available should be mentioned instead of their reverse.

The paper, print and general get-up of the book are satisfactory.

U. N. GHOSHAL

CULTURE OF HARMONY: By Phanibhusan Roy, M.A., Ph.D., with a foreword by Dr. Mahendranath Sarkar. Published by S. C. Seal, M.A., LL.B., Hony. General Secretary, The Indian Research Institute, Calcutta. Price: Inland Rs. 10, Foreign 14s.

The work under review discusses in detail the Vedic and Post-Vedic ideas of Hindu civilisation in its various aspects. It embodies a critical study of the various systems of Indian thought including the philosophy of Buddha. Indeed, much has been said on the nature and implication of the concept of *Nirvana*. One cannot but admire the extent of scholarship revealed in the pages of the book and it must be said without any hesitation that the writer evinces a first-hand study of the original texts which have been the sources and guides of his deliberations. The view-point of the Purvamimamsa school which puts emphasis on the theory of *Karman* and does not deny the necessity of knowledge for the attainment of emancipation has been thoroughly discussed. The Naiyayika position, so far as the concept of God is concerned, has been nicely brought out. It is really interesting to study the positions of the Sankhya and the Vedanta thinkers on cosmic order which has been correctly analysed. It is gratifying to find the writer advocating the cause of the four-fold means of human existence. In his opinion neither rigid and austere asceticism nor absolute quietism for the attainment of *Nirvana* is suitable for the average man in search of happiness and tranquillity. A close and intensive reading of the work will undoubtedly convince the reader of the author's faith in Hindu ideals of life.

Notwithstanding the merits of the work mentioned above, it strikes a critical student that the author has not allowed his penetrating insight to discover and appreciate the depth of implication of the orthodox masters in many places. It is true that his study is extensive and helps one in understanding the original texts but it is equally true that the more curious student will miss a critical evaluation of the theories which have been discussed. It is also a fact that the exposition, in some cases, has been so literal that it is difficult for one who is not acquainted with the original texts to understand and appreciate the worth of the exposition. But it must be said at the same time that the merit of the book outweighs the demerits which do not always harass the reader or prove a stumbling block to a simple understanding of the original texts.

G. SASTRI

INDIA AND MALAYA: By Nedyam Raghavan. Published under the auspices of the Indian Council of World Affairs by the Orient Longmans Limited, Bombay, Calcutta, Madras. Price Rs. 2-12.

The charming peninsula of Malaya has been from time immemorial the meeting ground of trade-routes, races and civilisations. It has a composite and heterogeneous population, which comprises mainly the Malays proper, the Chinese and the Indians. According to the 1947 Census returns, they constituted 43.77 per cent, 33 per cent and 11 per cent, respectively, of the population in the Federation of Malaya. The same returns revealed that the Chinese numbered 77.6 per cent and the Malays 12.2 per cent in the Colony of Singapore in 1947.

Malaya has been throughout the historical period a close cultural relative of India. It was the bridge through which Indian culture passed into the Pacific.

The Indian influence on the life of Malaya—spiritual as well as material—has been so profound that “till the nineteenth century she owed nearly everything to India, alphabets, religion, a political system, law, astrology and medieval medicine, literature, sculpture in stone, metal work and the weaving of silk.”

Recent history has made Malaya specially dear to patriotic India. It was an important recruiting and training centre of the Indian National Army of Netaji Subhash Chandra Bose, who arrived at Singapore in 1943. About 20,000 I.N.A. men were trained in Malaya and the efforts put up by the great leader and his selfless followers “brought India's freedom miles nearer.”

Hindu and Buddhist influences were once supreme in Malaya. Islam went to Malaya in the 14th century. Islam, it should be noted, went from India. The whole peninsula became Muslim. A mingling of Muslim and non-Muslim cultures took place. Malaya was later on drawn into the vortex of European power-politics. Her natural wealth, strategic importance and weakness made her for many years a bone of contention among Portugal, Holland and England. Fortune favoured the last-named in the long run and the peninsula became an English colony which it still is, in fact, if not in name. The grant of Penang to Captain Francis Light in 1785 by the Raja of Kedah was the thin end of the wedge.

Japan occupied Malaya during World War II. War-time conditions quickened the growth of nationalism. Malaya is on the march today. She is eager to order her life in her way. But British imperialism clings tenaciously to its ill-gotten gain in South-East Asia.

Mr. Nedyam Raghavan spent 25 years in Malaya and the volume under review bears the stamp of his intimate knowledge of the country and its problems.

SUDHANU BIMAL MUKHERJI

On ART (Addresses and Writings): By A. D. Purani. Published in April, 1955, by Sri Aurobindo Karyalaya, Pondicherry. Pages 90. D.C. 1/16. Price. Re. 1-8.

This small book contains seven pieces providing ample food for thought. It is dedicated to the late Dr. A. Coomaraswamy. The author defines Art in the words of Sri Aurobindo as the discovery and revelation of beauty, as the self-expression of consciousness of aesthetic vision and a perfect execution. He has shown in his own simple way that there are not only aesthetic-values, but also life-values, mind-values and soul-values with which we are to enter into the true concepts of Art.

SATI KUMAR CHATTERJI

THE DIVINE NAME: By Sri Raghava Chaitanya Das. Published by the author from A/5 Anandasram, Proctor Road, Bombay-7. Pp. 456. Price Rs. 5.

The author of this attractive volume is a distinguished disciple of Sri Bhakti Siddhanta Saraswati, the founder of the Gaudiya Mission in Calcutta and pioneer of a renaissance of Bengal Vaishnavism. He is a learned preacher and deals in this book with the central message of Sri Gouranga Mahaprabhu, the medieval avatara of Bhagavan Sri Krishna. As its name signifies, the book mainly explains the wonderful efficacies of the Divine Name, the panacea of all ills of earthly life. It is divided into sixteen Chapters which are well written and profusely substantiated by Sanskrit couplets from various scriptures on Bhakti. About 550 Slokas from prominent Sanskrit

works as well as 60 Bengali verses from Sri Chaitanya Charitamrita have been quoted to make the book authentic and instructive. The evangelic life of Sri Haridas Thakur, known and respected as Namacharya has been described in some detail while discussing the nature of Bhakti and the practice of Nama-Sankirtan. In the opinion of the author the fourteenth chapter explains the importance of Sri Sankirtan vis-a-vis Smaran, Shrivana and Dhyana where the niceties of the four forms of devotion and the superiority of Sri Nama-Sankirtan over all these *sadhanas* are clearly brought out. The fifteenth chapter contains many suitable quotations from different Puranas in support of the subject discussed. In the last chapter the author tries to show that the devotional repetition of Sri Krishna Nama is the quintessence of all spiritual practices. Sri Chaitanyadeva's discourse on the saving grace of Nama is elaborately expounded in the tenth chapter.

Cordially we welcome this interesting book and recommend it to the devout of all sects and sections throughout India. It is written in a readable style, printed in large type on glazy paper, beautifully bound and decorated with a tricolour picture of Sri Chaitanyadeva. Few works in English on Sri Mahaprabhu have appeared till now. Of all Acharyas it is he alone who declared that Bhakti is greater than Mukti as well as that atonement of all sins and attainment of Mukti is within the reach of every body by means of Nama-Japa. Long ago Sir Jadunath Sarkar's *Sri Chaitanya and His Contemporaries* was published; but that seems to be antiquated in the course of several decades. Hence the publication of works like the one under review is the desideratum of the day. The religion of love practised and preached by Sri Chaitanya and recorded in *Sri Chaitanya Charitamrita*, *Sri Chaitanya Bhagavata* and other Bengali scriptures is unique and universal and should be broadcasted by such English work like the present one all over India and the world.

SWAMI JAGADISWARANANDA

INDUSTRIAL ORGANISATION IN INDIA: By Mahesh Chand M.A. and Shridhar Misra, M.A. Premier Publishing Co., Fountain, Delhi. Pp. 227. Price Rs. 5.

In eighteen chapters the authors discuss various aspects of organisation of industries in India. In the first seven chapters, Economic Evolution, Village Economy, Indian Agriculture, State and Agriculture, Treaties and Division of Industries, Manufacturing Industries and Organisation of Labour have been dealt with. In next eight chapters—Coal, Iron and Steel, Cement, Cotton, Sugar, Paper, Match and Glass Industries, have been discussed in lucid language suitable for young learners of the principal industries. Jute and tea should have been discussed. The authors devote a separate chapter for college students in U.P., now Uttar Pradesh. Trade Business and Trading Business in India are subject-matters for the last two chapters of the book.

Although the authors discuss the subjects as modern economists, they have never missed to give due weight to the considerations of Indian economy and the common man. The authors rightly devote a portion of their studies in each chapter on rural economy and small industries in the context of world trends. The book will be helpful in understanding the present-day industrial structures of the country.

A. B. DUTTA

RAJNI: By Pushpa Kapur. Distributed by Rama Krishna and Sons, New Delhi. Pp. 265. Price Rs. 3-12.

Set in pre-Partition Punjab this novel reads like one of those trifling purposeless films that one has generally learnt to associate with Bombay. The people in this novel belong to the so-called smart set who have discarded the Indian mode of living as something opprobrious or alien and have found their salvation in a glut of boisterous dinners, dances and parties. Lest all this should bore the unwary reader, there are pompous lectures on such varied topics as women's place in society and home, evils of alcoholism, oppression of domestics in rich men's houses, the virtues of wearing “pure khaddar” and doing social welfare work, etc. What little of narrative is there, is full of silly women's chatter and idle verbiage. The net gain, as one painfully reaches the journey's end, is one moderately successful marriage, one wrecked marriage, an unjustifiably delayed union of two loving hearts and the inevitable final impression that all the good paper wasted on this book might well have been used for some worthier purpose.

RAMESH K. GHOSHAL

THE PERENNIAL FOUNT: Lyrics of Adoration and Love: By Nana Lal. Translated from the original Gujarati by Balchandra Parikh. Hind Kitabs Ltd., 261-263, Hornby Road, Bombay. Price Rs. 3-8.

Sri Nana Lal is one of the foremost modern Gujarati poets. This small volume comprises twenty-three of his fine lyrics. Translation is always a difficult task. Much is lost in the process. Still, through these renderings we feel the fervour of the original poet.

D. N. MOOKERJEE

SANSKRIT

SIDDHA-SIDDHANTA-PADDHATI AND OTHER WORKS OF THE NATHA YOGIS: By Smt. Kalyani Mallik, M.A., B.T., Ph.D. Poona Oriental Book House, 330-A, Sadashiva Peth, Poona. Price Rs. 10.

Dr. Mallik, who has made a special study of the religion and philosophy of the Nathas, now publishes a number of works belonging to them, some of which are ascribed to renowned teachers and founders of the sect. The latter numbering four are in Sanskrit. They principally deal with matters relating to Yoga, the practice of which was essential in Nathism. Other works, all very small in size, published in the volume are six in number. Composed in modern Indian language five of them are eulogies of famous Natha Gurus. The sixth, the *Gorakh Upanishad*, gives an account of the characteristic features of the sect. The manuscript material on the basis of which the works are published is insufficient and defective. The printed text is therefore found to be full of corruptions many of which are corrected by Shri P. C. Divanji who has contributed a foreword to the volume. Dr. Mallik in her learned introduction gives a short account of Nathism and its propounders, along with a brief summary of the contents of the texts published in the present volume. A note on the position occupied by the works among the Nathas and their special contribution, if any, made by them to their literature and thought would have been welcome. Dr. Mallik's idea of collecting and publishing the literature of the Nathas, which is generally inaccessible, is commendable as it will be helpful in the proper appreciation of the sect and its tenets.

CHINTAHARAN CHAKRAVARTI

BENGALI

BANGLAR AGNI YUG: By Kshirode Kumar Dutta, M.A. Published by Hindi Prakashani Bhawan, 10, Dixon Lane, Calcutta-14. Pp. 124. Price Re. 1-8.

This is a short history of the freedom movement of India from 1857 to 1920 when Mahatma Gandhi became the leader of the Indian National Congress. Pre-Gandhian movement was neither non-violent nor non-co-operative. Since 1905, i.e., the Partition of Bengal the movement gathered force and there was national awakening in all spheres of Indian life. The author is a political sufferer and actively participated in the 1905 and subsequent movements and as such is in the know of many facts of the party organisations of those days when most of the Samities were secret organisations to escape Governmental repression. The author has touched all progressive movements—social, literary, educational, journalistic and cultural—of Bengal and India to bring out a comprehensive portrait of the struggle for India's freedom.

We commend this informative volume (Part I) to all interested in the subject. We anxiously wait for the next part.

A. B. DUTTA

HINDI

KALE NAGAR MEN: By Kamal Shukla. Oriental Book Depot, Nai Sarak, Delhi. Pp. 138. Price Rs. 2-8.

The modern city is for the lower middle class specially the Black city,—the dark valley of Death. Its struggle, day after day, for mere marginal existence is likely to wear out even a stone to pulverised dust. A member of this class has very often to fight his battle of life on two fronts, namely, in the office and at home, while his surroundings are sprawled over with temptations, usually too strong to be resisted. Such is the story of Umakant who, however, has some kind of a compensation towards the end in the form of penitent love, with a dash of deep understanding, of his wife, Kanak. *Kale Nagar Men* is a moving tale of the lower strata of our society, caught up to the point of strangulation, nay, death, in the tortuous ways of money as well as of the machine. The author has both skill and style and, above all, imaginative sympathy, without which all art is tinsel, in an abundant measure.

KAL AUR AJ: By Sneha, M.A. Amrit Book Co., New Delhi. Pp. 55. Price twelve annas.

A three-Act, stage-worthy short play, the theme of which is the Hindu Code Bill. It can be used effectively, if reformed widely and artistically, to make a breach in the stone-walls of orthodoxy.

GWALIOR RAJYA KE ABHILEKH: By Harihar Nivas Dwivedi. Madhya Bharat Puratattva Vibhag, Gwalior. Pp. 138. Price Rs. 5.

It is a very useful and informative catalogue of 750 inscriptions, covering in terms of time the Vikrama, Gupta, Shaka, Hijri and Christian eras, which have been deposited and deciphered in the Archaeological Department of Gwalior. It will be of great help to Indian historians.

G. M.

GUJARATI

KAVI PREMANANDNI SANDIGDH KRATIS: By Dr. P. M. Vakil. Published by N. M. Tripathi & Co., Bombay-2. 1950. Thick card-board cover. Pp. 330. Price Rs. 3-12.

His researches into the poetical works of the premier Poet of old Gujarat, Kavi Premanand, has led him to conclude that about 50 per cent of them were apocryphal, i.e., written by others and attributed to his pen. His work has brought him the Ph.D. Degree of the Bombay University. He has been a Professor of Gujarati. The subject has been handled in such a way as to rob Premanand of whatever repute he has had as the premier Poet of Gujarat. The work reminds one of the Bacon-Shakespeare controversy. Dr. Vakil dubs those eminent men, whom he suspects rather concludes the real writers, hiding beneath the glamour of the poet's reputation, as lovers of falsehood, dishonest money-glubbers, and not straightforward. He is welcome to his conclusions but to charge the eminent writers whom he suspects with trickery is rather going beyond the bounds of decency for a rising young inexperienced debutante. He gives his meed of praise to the distinguished Kavi, but rather hesitatingly. In Gujarat, there is a phrase, which says you can call your mother 'Mother' as well as 'your Father's wife'. The latter is not graceful. Dr. Vakil could have couched his observations in the spirit of that adage.

JYOTI REKHA: By Sundarji G. Betai. Published by R. R. Seth and Co., Bombay-2. 1950. Illustrated cover. Thick card-board. Pp. 22. Price Re. 1-8.

This is a second edition—the first was in 1934—of Shri Betai's poems. He has taken advantage of the publication of this second edition to add to his collection, one more poem, called *Bahidan* (Sacrifice), describing the crucifixion of Jesus Christ, who died so that humanity may live in peace. The addition is on a par with the previous poems in quality, imagination and expression, perhaps a little better.

JIVAN PANTH: By "Dhum Ketu." Published by Gurjar Granth Ratna Karyalaya, Ahmedabad. 1949. Illustrated jacket. Thick card cover. Pp. 351. Price Rs. 4-8.

Dhumketu (A Comet) is the *nom de plume* of Shri G. G. Joshi, who has written about 51 notable works in Gujarati and has become an established writer of readable fiction. The present book gives interesting glimpses on his life, in fact, is a book of reminiscences and shows how an unlettered poor village boy rose from obscurity to fame, from poverty to riches. A supplement is on the way, this is what the publishers say.

REPORT OF THE GUJARAT SAHITYA SABHA, FOR THE YEAR 1947-48: Published by the Sabha. 1950. Paper cover. Pp. 158. Price Rs. 3.

Gujarat Sahitya Sabha, Ahmedabad, is one of the best and foremost literary societies of Gujarat. This report setting out its activities in the year 1947-48 shows how in spite of great difficulties, in its way, it has carried on its useful work. The Gold Medal given by it every year to some well-known worker of the Province was given to Hari Narayan Acharya deservedly, he being the almost only the Naturalist of Gujarat, and a well-known researcher. Its other

function is to select well-known writers to prepare a review of the progress of Gujarati literature in the previous year. This work too has been capably done by Professor Raval and Danjibhai.

K. M. J.

BHOODAN YAJNA: By Vinoba Bhave. Published by Navajivan Prakashan Mandir, Ahmedabad-14. Pp. 12+143. Price Re. 1-4.

The book opens with an appeal to his countrymen by Vinoba. It gives the etiology of Bhoodan, clears some misconceptions, seeks support and winds up by saying that the movement which is true to India's genius will lead to economic and social revolution and bring world peace.

The book proper is made up of seventeen of his speeches selected so as to touch almost all the salient aspects of the movement, with another item—the eighteenth—given to questions put to and answered by him. The pages show that his is no tinker's job. He is there to demolish old values and create new values for a new social order.

BIRENDRANATH GUHA

PREMAPANTH, 6: Edited by Desai Valjee Govindjee. Navajivan Prakashan Mandir, Ahmedabad. March 1954. Price four annas.

This is the sixth of a series, culled from Gandhiji's writings about himself, edited in such a way as to be easily understood by the reader, and referring to Gandhiji's apprentice period, rather, its first half—as indicated by the name given to the selection by the editor, "Purvavardha of Udyogakanda." It relates among other things to the Congress in 1901, which

Mahatma attended; the Boer War; One Month's Stay with Gokhale; Gandhiji's First Experiences in Calcutta; His Early Struggles. This is a valuable addition to Gandhi literature made available at a cheap price and to be understood and appreciated by everybody.

The Expansion of Ancient Indian Culture

V. Raghavan writes in *The Vedanta Kesari*:

In ancient times India had not only cultivated every branch of science and humanistic study but, full of the spirit of adventure, carried on a very active overseas commerce, so that her material goods no less than her spiritual treasures, her spices as well as her doctrines, were in demand in the outside world. Some of her contributions to the world-culture were of fundamental nature: if the West came to know how to spend its leisure hours intelligently with a fable or a game of chess or if it knew counting, it was through India. In the East, she gave the entire South-East Asia its alphabet, literature, music and dance, architecture, code of life and religion, so that even to this day that part of the Orient retains a general unity with India. Thus, of the ancient and mediaeval worlds, in both hemispheres, India played the role of the prime guru.

Indians went out by land routes as well as by the sea and from the evidence of early literature and sculpture, they appear to have been a vigorous ship-building and sea-faring people. A Tamil proverb says: Cross the surging seas and gather your riches.

ANCIENT MIDDLE EAST

The Sumerians who were non-Semitic came from another country by the sea. The terraced pyramids or temple-towers of Assyria-Babylon called *Ziqqaratu* meaning pinnacle or mountain top strongly suggest *Sikhara*.

As early as 1400 B.C., Vedic Aryans had gone from India to *Asia Minor* and at Boghazkoi, clay tablets have been unearthed which record a treaty between the Mitanis and the Hittites in which the Vedic gods Mitra, Varuna, Indra and Nasatyau have been mentioned; and a treatise on horses and chariot-racing is also seen here which is in language closest to Sanskrit. Among Kassites circa 1746-1180 B.C., Sanskrit King-names have been found. In 10th century B.C. there was trade between Phoenicians and the Bombay coast and Indian ivory and peacocks went to decorate the temple of King Solomon. In the 7th century B.C., the library of Assurbanipal records the word *Sindhu* in the sense of Indian cotton. Indian teak has been found to have gone into the architecture of the Chaldeans.

GREECE

The Indo-Greek contacts is a favourite subject of research and scholars differ on the question and extent of the mutual indebtedness of the two countries. There are, however, some facts which are admitted, even by Occidental writers here, and these we may point out. They are not inconsiderable. In the sixth century B.C., Greece and India were brought together by Persia as the two wings of the

empire of Darius and Indian contacts led to a growth of new ideas in Greek thought. When the Persian King Xerxes invaded Greece in 480 B.C. there were Indian bowmen and cavalry in his army. Indian merchants went forth with their commercial products to Babylon and farther regions. In one of the Buddhist Jataka stories we read of Indian merchants who went to Baberu or Babylon with Indian performing peacocks. The Indian peacock was a curiosity and the Hebrew name of the peacock *Tuhi* is derived from the Tamil name *Tohai*. Similarly the Hebrew *Koph* for monkey is Sanskrit *Kapi*; Karpas, and cotton as well, are from Sanskrit *Karpasa*; Hebrew, Greek, Latin, Arabic, Spanish and other European words for Rice go to the Tamil word *Arisi*. Hebrew *Ahal* for aloe is Tamil *Ahil*. To return to Greece: Orphic theology, to which early Christianity was indebted, shows Indian influences in the cosmogony of the world egg (*Hiranyagarbha*), the essential divinity of man (*Upanishads*), rebirth, ascetic purificatory practices, etc. The philosophical and mathematical ideas of Pythagoras (6th century B.C.) were derived from India, his biographer Iamblichus recording his studying the esoteric teachings of the Brahmins. According to Aristotle's music-pupil Aristoxenus, Indian philosophers were seen in Athens interviewing Socrates. In Plato, we have clear echoes of Karma, Punarjanma, Varna-Brahman, Kshatriya and Vaishya,—as also of Maya and Vedanta. Alexander was very much attracted by Indian ascetics and he took one of them with him to Greece. The doctrines of the Eleatics—such as the unity of the individual soul and supreme soul and the unreality of plurality—are from Vedanta. The Samkhya doctrine of *Sat-karya-vada* is echoed by Empedocles, and Greek tradition says that Thales, Empedocles, Anaxagoras, Democritus and others went to the East for philosophical enlightenment. Neoplatonism, and Plotinus and his pupil Porphyry chiefly, were completely under the sway of Samkhya and Yoga; and to the same Samkhya system, Christian Gnosticism of the 2nd and 3rd centuries A.D. owed much. Dr. J. Filliozat of Paris, who is specially qualified to speak on matters medical, has reopened the question of the mutual contacts of India and Greece and shown clearly how Greece was indebted to India in medicine. In the post-Alexander period, there were Greek satrapies and settlements on the N.-E. of India and the Greeks there were thoroughly Indianised: some accepted the worship of Vasudeva and Krishna and some of the Buddha. Two outstanding examples of these two phases of Greeks becoming Vaishnavas or Bauddhas must be mentioned: In Gwalior State, at Besnagar near Bilva, you have an interesting stone monument (which I have myself visited)—a pillar with the Garuda—Garuda-stambha; he who set it up was a Greek ambassador named Heliodorus who subscribed himself in the inscription thereon as a most devout Bhagavata, and quoting

from the Mahabharata, said that three were the means of attaining immortality: Self-control, Sacrifice and Vigilance. Menander of Sialkot is an example of the Greek who became Buddhist and he figures in the Buddhist work Milindaprasna. According to this work, voyages to Alexandria were the most common thing in India and there were Indians living in Alexandria in the first century of the Christian era, and in the same century Taxila counted among its pupils Apollonius of Tyana. Clement of Alexandria refers to Buddhists and their doctrines. In fact, Buddhism which was actively spread by special missions sent by Emperor Asoka to the Greek kings Antiochus, Ptolemy-Philadelphus of Egypt, Antiochus Gonatus of Macedonia, Magas of Cyrene and Alexander of Epirus, influenced Christianity also, and along with a kind of Vedanta which went with it, sowed the seeds for the rise of Sufism too. There are striking parallels between Buddhist Jatakas and Christian parables; and Christian ritual, rosary and asceticism were derived from India. In the Periplus of the Erythraean sea, an interesting document left by an Alexandrian sea-captain who visited the Indian coast about A.D. 80, we are told that in return for condiments, spices, silks and unguents, India got, among other things, 'choice girls for royal harems'; the prevalence of Yavani or Greek female guards at Indian palaces are borne out by the Sanskrit dramas.

ROME

The same Periplus of the Erythraean sea referred to earlier speaks of brisk trade between Rome and India. Roman trade with ancient South India is amply attested by literary evidences in early Tamil literature, by Roman coins found on the Malabar coast and Madura and the archaeological finds at Arikamedu near Pondichery. At Muziris on the Malabar coast, and at Puhar, the mouth of the Cauvery on the east coast, there were Roman commercial settlements. On the accession of Augustus in 25 B.C., the Pandyan King sent him a congratulatory mission. Oriental luxuries had captivated the world of Roman fashion so much that Pliny complained about women clad in the too fine Indian muslin and the drain of Roman money by India to the tune of over a million sterling. The intellectual commerce between the two countries is particularly evident in the branch of astronomy, the Romaka-siddhanta in Sanskrit being a reminder of this contact. The astronomical writer Garga says, and Varahamihira quotes his observations, that the Yavanas were out of the Hindu fold, but among them this science of Jyotisha was well established, and to them therefore as much respect was due as to Hindu sages.

LATER MIDDLE EAST

From the 6th century onwards Iran and Arabia began to play the role of cultural liaison between India and the West. If the roots of branches of European science go to the Arabic, the roots of the Arabic themselves go to Sanskrit. The numerals are known as Arabic only because the Arabs conveyed them from India. The place value of numbers and the decimal system were the invention of India, and in the 8th and 9th centuries A.D., the Arabs spread Indian arithmetic and geometry over the world. Sanskrit works on astronomy and medicine were translated into Arabic when Indian scholars in both these branches were invited to Baghdad during the times of Caliphs Mansur and Harun. The Arabic Siddhanta is Siddhanta, i.e., the Brahmasphuta-Siddhanta of Brahmagupta; the same author's Khandakhadyaka was done into Arabic as Arkand. Aryabhata is

mentioned as Arjehir. Kanka and his work on lives and the mysteries of nativities and Sanjahal and his great book on nativities all represent translations of works on Jataka. In A.D. 899 an astronomer Sankaranarayana flourished under Ravivarman Kulasekhara of Quilon and wrote a commentary on the astronomical work Laghubhaskariya which has been discovered and published from Trivandrum; this author informs us of the visit of the Hindu astronomers to 'Mlecchadesa.' Indian doctors were much in demand in Arabia and were given places of honour in the hospitals and the Court. Scholars were sent to India to study medicine and Indian scholars were taken to translate Sanskrit medical works into Arabic. The Indian physician Manka attended upon Harun, rid him of an incurable complaint and later translated the Sanskrit treatise on Toxicology by Chanakya. It is recorded that when a Greek physician failed to cure the king's cousin, the Indian Bahla succeeded. Sanskrit works in every branch of medicine were translated: Arabic Sirak is Charaka; Sasrad is Susruta; Ledan is Nidan; Rai, 10th century, wrote on snakebite and he too was translated and it is from the Arabic source, from Masudi, historian of the 8th century, that we learn of a Hindu lady doctor Roosa who wrote in Sanskrit a treatise on woman's ailments. Down to the 17th century it is the knowledge derived from these Arabic versions that formed the basis of European medicine, surgery and surgical instruments.

The Arabs' interest in Indian medicine and astronomy was next only to that in Indian fables. In all these departments the Arabs derived their interest from that evinced earlier by the Persians in all these. The Sassanian king Khosru Anushirvan (531-

Diapepsin

CALCUTTA

579) had the animal fables of the Sanskrit *Panchatantra* translated into Pehlavi from which a Syriac translation was made in A.D. 570—Kahilag and Damanag, i.e., Sanskrit Karataka and Damanaka. From this an Arabic version rose in the 8th century and from that, these fables entered mediaeval European literature. Between the 11th and the 13th centuries other versions arose in Syriac once again, in Greek and Latin, in later Persian, old Spanish, and Hebrew, and then from the 15th century onwards German and other versions began to appear. There is no more remarkable book in this respect in the world of literature. The American scholar Edgerton says that no other work of Hindu literature has played so important a part in the literature of the world; and of its versions which exceed 200 and are in more than 50 languages, three-fourths are from countries outside India. The Christian storybook of Josaphat, which was very popular in the Middle Ages, draws on Indian fables, the name Josaphat itself being merely the Buddhist word Bodhisattva. One of the legends in Chaucer's Squire's Tale had an Indian origin. Some of the fables of Aesop too derive from Indian sources. Thus chess and fable were two precious gifts India gave to the leisure hours of the world.

CENTRAL ASIA

We shall take leave of the Middle East and the West and see how Hindu culture spread forth in the Asian continent itself in a more complete manner. It was with Buddhism that India claimed Central Asia, China and Japan, and nearer still, Ceylon, Burma and Tibet. From the second century B.C. and in some places from even the pre-Asoka period, Buddhism began to flourish in the territories neighbouring the North-West of India, in *Kotlan, Kuchar, Bactria*.

There were Buddhist monasteries here from the ruins of which fragments of manuscripts and writings on different materials have been unearthed, which have not only shed new light on Sanskrit and Buddhist literatures but have helped to reconstruct many local languages of these places, e.g., the Nam language which the doyen of Sanskrit studies here in England, Prof. F. W. Thomas has recently described. That Sanskrit medical lore, Ayurveda, was in vogue there is known from the medical MS. fragments called the Bower MS. unearthed in Kuchar. One of the discoveries made here, which is of utmost significance to the history of Sanskrit drama, is the find of fragments of a socio-religious play called *Saniputra-prakarana* and a farce of the Buddhist poet Asvaghosa, by the distinguished German Sanskritist Luders, plays which have been completely lost in India itself. The play uses abstract concepts like *Straddha* or Faith among its characters and forms the forerunner of the allegorical play in Sanskrit which was again to raise its head only in the 8th century A.D. Sanskrit Buddhist texts in the local scripts or translated into Kofasese, Tokharian, Sogdian and Uigurian have been discovered here. These places were very active with Buddhism and formed the media of the further spread of that faith into China. When the Chinese pilgrim Fa-Hien came here in A.D. 400 there were 4,000 Buddhists here and when his successor Hieun Tsang visited it, there were 150 monasteries and 10,000 Buddhists; and in the beginning of the 6th century A.D. Sanskrit was very much in evidence; Sanskrit works were even composed here. In the Kuchar region life was thoroughly Indianized, Indian names being taken, Indian music being sung and inter-marriages with Indians being practised.

MIRACLE MAN WITH UNRIVALLED POWER

Highly Appreciated By George VI King of England.

JYOTISH-SAMRAT SRI RAMESH CHANDRA BHATTACHARYA, JYOTISHARNAB, M.R.A.S. (London) of International fame, President of the world-renowned Baranashi Pandit Maha Sabha of Banaras and All India Astrological and Astronomical Society of Calcutta has won unique fame not only in India but throughout the world (e.g., in England, America, Africa, Australia, China, Japan, Malaya, Java, Singapore, etc.) and many notable persons from every nook and corner of the world have sent unsolicited testimonials acknowledging his mighty and supernatural powers. This powerfully gifted greatest Astrologer & Palmist, Tantric can tell at a glance all about one's past, present and future and with the help of Yogic and Tantric powers can heal diseases which are the despair of Doctors and Kavirajas, redressing the pernicious influence of evil stars and planets can help to win difficult law suits and ensure safety from impending dangers, poverty, prevent childlessness and free people from debts and family unhappiness.

Despaired persons are strongly advised to test the powers of Panditji

WONDERFUL TALISMANS

The New Materialism

Miss Clare Cameron writes in *The Aryan path*:

It has long been the custom to decry materialism as the root of all evil, and perhaps never more so than now, when the abuse of it is so painfully evident. Yet it was once said to me that our troubles lie, not in materialism as such, but in too much of the wrong sort and too little of the right. I have pondered on that chance remark.

Perhaps ever since man fell into duality, into the creation of "the ten thousand things," there has been the conflict between the "good" and the "bad" in him, the split in the psyche, which is now perilously wide. There must be prolonged self-emptying ere he becomes as No-thing, and in the abyss itself finds Everything. We cannot throw ladders across that abyss, for there are no short-cuts to heaven. Yet the figure of modern man, inflated with power and torn from his roots as he soars towards the stars (now almost literally), is familiar to us. The predominance of mental illness, neuroses of all kinds, crime waves and the violence bred from fear and greed, are also evident enough. The unbalanced state of the world is reflected in and shared by the sensitive person. For all this we blame materialism, which is not a cause but an effect.

True, there are signs of a religious revival throughout the world. Under an intense spiritual radiation from the heavens (which, incidentally, is the cause of much inner and outer disturbance, even such as a healing medicine first causes within the physical body) there is a quickening in the souls of men and women. They are "called", and according to their capacity and in their degree are responding, even though the initial stages of that response are sometimes painful.

We may think we know all the lore of the spiritual life, having read widely and thought deeply and, in a sketchy sort of way, made tentative attempts to put our lives in order. Conscience is appeased. We have many virtues to our credit, are active in good works, members of progressive societies, and pay sincere lip-service to our particular creed. We see the beautiful country of the Future from our threshold. But are we really prepared to help create it.

It is so easy to deceive oneself, to eat of the Tree of Knowledge and imagine we are fed. Usually we have to allow much of it to be removed from us before we are fit to take and even able to taste and appreciate, the simple Bread and the living Water. We have to be shown, in hard experience, the wrong use of materialism. It includes greed for ideas, as well as for possessions; rushing in to do good where angels would not tread, thus piling confusion upon confusion; emotional and intellectual self-indulgence as well as physical; and, in many other ways, denying our own soul.

Having felt the call, or thinking we have, we tend to swing from one opposite to the other. Riches are evil; so we choose to be poor. We bind ourselves to a rigid self-imposed discipline. Self-indulgence is a sin; so we renounce the harmless and legitimate pleasures of life. These reactions are not only the heritage of our Puritan ancestry, but also the result of too literal an interpretation of the great scriptures of the world, and far too little genuine insight. The split in the psyche grows wider as we exchange one tension for another. The conflict remains, since all these fine resolutions are dictated by the little separate self.

Long ago the Buddha discovered that neither in asceticism nor in indulgence, neither in escape from the world nor in submergence in it, was enlightenment to be found. Attachment is the cause of all sorrow. Freedom is won by treading the Middle Way between extremes, without attachment. Neither possessions nor lack of them are wrong in themselves, but their abuse, which derives from our being bound to them through Craving and Ignorance. Lao Tze taught very much the same thing, when he spoke of the Tao which is everywhere, and which we may experience for ourselves once we relinquish our grasp upon the passing, ephemeral forms. The old man of Tao, even though he has scarcely a rag to his back, is always gay and laughing, because he is wholly free. There is no split in the psyche for him! Man cracks himself, through the tension of misunderstood cravings.

What has this to do with the New Materialism? Even at the ascetic extreme we still have our being on the surface of life, on the circumference, unwilling to accept and explore through shame and suffering to the centre where truth abides in fulness. For at the heart of every problem is the point of release. We suffer, yes—because we resist the marvellous transforming process towards liberation. How well we know that travail precedes rebirth! But do we live as if it were true?

Instead, we make frantic attempts to jump this split in the psyche, to close it, by means of courses on psychology, the study of religion and anguished prayer to a God we create in our own image. We kick up such a lot of dust because we are frustrated and unhappy. In this dust we cannot see. We are familiar with the various forms of escape, some of them very subtle. Yet the Hound of Heaven is forever at our heels, and it is good that this should be so. The Beautiful Country of wholeness and peace and joy glimmers like a mirage before our longing eyes.

Yet the Buddha taught that even this longing for enlightenment was a form of craving. How deep this process of self-emptying goes! How patient we need to be while issues far down in consciousness rise up to be accepted, understood and adjusted! Even those from other lives arise at this time of spiritual urgency, when we are being prepared to take our part in New Materialism.

Allan Octavian Hume 1829-1912

K. K. Khullar writes in *Careers and Courses*:

Ganhiiji once remarked that if any Englishman dedicated his life to securing the freedom of India, resisting tyranny and serving the land, he would welcome that Englishman as an Indian. If that is the criterion of being an Indian, A.O. Hume will then, perhaps be considered as one of the greatest of the Indians, though of course born of alien parents. A.O. Hume, the founder of the Indian National Congress, had the making of an Indian.

FOUNDED INDIAN NATIONAL CONGRESS

Curiously enough the Indian National Congress which won for India complete independence and self-rule was founded by a man who was English by birth, and who was a member of the Indian Civil Service. At the time when battles were being fought on the sands of Sabraon and Mudki, when steel was clashing all around on the banks of the Sutlej, young Hume entered the Bengal Civil Service, full of energy and ambition. After a short training, he was made a magistrate and deputy collector in the historic district of Etawah. The biographers of Hume report his eternal interest in Sikh history. It is said that he was never tired of reading anything connected with Ranjeet Singh. Though essentially a student of science, Hume developed taste for Far Eastern and Indian histories.

His stay at Etawah was marked by a marvellous advancement in administration and education. Though a member of the Civil Service, known in those days as the 'White-Brahmin Caste,' he never harboured any official complexes and inhibitions with which his colleagues were accredited. Hume mixed freely with the people and talked openly as no other administrator would do. Thus breaking away from the official tradition he started free schools in the district of Etawah—a novel experiment in the history of Indo-Anglican education. And the medium of instruction was Urdu and Hindi. In this way about thirty schools were opened; roads made, hospitals constructed; with the result that Hume became a household word in Etawah. For people outside Etawah, Hume was a mysterious and legendary name.

A DIP IN JOURNALISM

At Etawah, Hume underwent another bold experiment in the field of journalism. Indian journalism in those days was just a newly born baby. Raja Ram Mohun Roy had started his nationalistic organ, *Sambad-Kaumudi*. Another mouthpiece of Indian Renaissance was, the *Banga-Doot* of Dwarkanath Tagore. The *Statesman*, the *Amrit Bazar Patrika*, and the *Civil and Military Gazette* came much later. A. O. Hume in collaboration with Kanwar Lachman Singh, initiated a journal named *People's Friend*. It was a brave attempt; and it was given a popular response. Hume's views on education and politics are there in the editorials of the *People's Friend* expressed unafraid. The journal was, therefore, certainly a positive contribution of Hume to Indian journalism. Later in his life, he started another paper entitled *Stray Feathers*, a magazine of birds.

Hume's tastes were intensely varied. Ornithology was his passion and botany his stimulation. In Simla he had a museum of his own with more than fifty thousand birdskins and with a large number of various types of eggs. Hume was very fond of extinct birds especially 'dodo' (a bird once found in Mauritius and Madagascar but which became extinct by the end of the 17th

The old order passes, giving place to the new. We want it to come quickly. Like children, we want it now—our sort of "now," not God's. Our "now" is born of ignorance, the temporal order and duality. Let it go!

At last, we are driven from the circumference to the centre, sometimes in despair, and we are as quiet as the earth in winter. Yet, as in the earth, much is happening in the soul during our winters of discontent, when they are accepted and used.

I believe it is from this soil to which all the leaves of the old order have fallen, both in us and the world, that the New Materialism will spring, in the heavenly time and the heavenly way.

Can we visualize a world in which there will be no competition, but men and women working together in love and unity of purpose because they are united in the love of God which reveals that purpose and, flowing through them, informs the heart, the brain and the hand? Can we see the Light breaking over the earth, as the shadows cast by man's abuse dissolve, when exploitation of the land, animals and peoples is no more? Can we imagine the recovery of health and freedom and joy, since it has been said that disease is the result of the inhibition of the soul's powers?

The choice is in our own hands. The Kingdom of Heaven is within, potential in time as it is ever-present in eternity. And the Kingdom will come when we take our greedy, grubby hands off it, cease trying to bring it in our own way, and let the Supreme Creator educate us in the laws of true being.

If there are only a few as yet who are crossing the threshold, yet they serve to map out the Beautiful Country, and to radiate the first beams of its sunshine. Not by words, not by deeds, but by what we are shall we quicken others to be aware of their lack, their need, and how they may be healed and fulfilled. Then the Tree of Knowledge is seen for what it is, and the Tree of Life begins to put forth its leaves for the healing of the nations.

Having passed through the cleansing fires of earthly experience, and realizing his destiny, Man begins to awaken into the new Adam.

century), and he spent a lot of time to know whether the bird had once again settled in New Zealand or not.

Hume also published a huge book on his research and studies, entitled *Game-Birds in India*. It is an exacting work, but truly it is love's labour. It reveals Hume's everlasting interest in birds. It is also said that he could understand the language and the laws of most of the Asian birds. The book is a store-house of information on birds and can be conveniently placed beside Kipling's Indian "Jungle-books." In brief, *Game-birds* is another solid contribution of Hume to Indian Ornithology.

Hume's attitude towards the 1857-rebellion is noteworthy. He always held that the main trouble of the Indian was poverty and it was the economics of poverty and frustration which led the Indian people to revolt against a foreign rule. In 1868, he was made the Commissioner of Excise and Customs in North-West Province and while negotiating with the Rajputs on the question of Sambar-lake silt, he showed boundless affection for the Indian people, with the result that he was transferred to the post of a Home Secretary. The financial policy of Lord Mayo also contained some of Hume's suggestions. Hume was also sensitive to the lot of Indian agriculturists and thus he wanted to ameliorate their conditions but he regretted later on that his hands were not free while in the service. In 1882, Hume retired and after that date a new Hume emerged—gay and happy—still industrious and ambitious. Even at that age his idealism was lofty and he was full of energy and enthusiasm. He set to work out his dreams with zeal and industry unknown to the officialdom in India; he founded the Indian National Congress. It was a step by which he earned the affection of millions of India and out of regard for him, he is called an Indian and the Father of the Indian National Congress. The idea of starting a national organisation had been developing in his mind for a long time, especially as a result of some extremely unpopular measures of Lord Lytton—press legislation, agricultural dabbings, racial discrimination policy and Afghan affairs. "All these measures of reaction combined with the Russian methods of police repression," to quote Wedderburn, "brought India under Lord Lytton within measurable distance of a revolutionary outbreak and it was only in time that Mr. Hume was inspired to intervene."

WAY CLEARED FOR NATIONAL MOVEMENT

Therefore in 1883, Hume gave a clarion call to the graduates of the Calcutta University in a soul-stirring letter asking for "fifty men good and true, selfless and fearless," "to act upon the eternal truth that self-sacrifice and unselfishness are the only unfailing guides to freedom and happiness." Lord Dufferin approved of this call. After that Hume went to England and met Ripon, Lord Dalhousie and John Bright. The Congress was to be held at Poona but due to the outbreak of cholera the venue had to be shifted to Bombay. On 28th December, 1885, in the famous hall of Tejjpaul Sanskrit College, all the leading men of the country well-acquainted with English language attended the conference. It was a four-day session and W. C. Bonerjee was elected as its first president but the moving spirit behind it was A.O. Hume. In all, the session was attended by seventy-two men who "elected themselves as delegates." Prominent among those who attended the conference were Dada Bhai Naroji, Pherozeshah Mehta, G. Subramania Aiyer and D.E. Wacha. And among the officials attending

the session Ranade and Wedderburn are two memorable names. The principal objects of the Congress were to eradicate racial distinction, to promote friendship among the earnest workers in the country's cause in the various parts of the empire and so on.

The Congress then passed a resolution demanding abolition of the India Council, holding of simultaneous I.C.S. Examination in England and India, admission of elected members in the Imperial and Legislative Councils, the separation of the executive from the judiciary. The leaders were quite profuse in their declaration of loyalty to the British throne and of the blessings of British Raj in India. Lord Dufferin gave a garden party to Hume and other prominent leaders but in the years to come his attitude was completely changed. The British press was shocked. *Pall Mall Gazette* wrote that Russian gold was pouring in India and the like.

It is generally presumed that after 1885 Hume disappeared from the scene but history has something else to tell. He remained in India till 1894, attending all the sessions of the Indian National Congress enthusiastically. Then he sailed for Britain. Hearty farewell was given to him at Bombay and it is a fact that people observed tears rolling down his eyes while leaving India, a country where he had spent half a century. There in England he joined the liberal party and led an active public life, supporting the cause of Indian independence whenever he found an opportunity.

Tripathi's Address at the International Labour Conference at Geneva

Following is the text of speech delivered by Shri K. P. Tripathi (General Secretary, I.N.T.U.C.), Workers' Delegate, India, to the 38th Session of the International Labour Conference, at Geneva on 6th June, 1955:

As I rise to speak my heart is drawn to India. Mr. N. M. Joshi died a few days ago of a heart attack. He was one of the founders of the Indian Labour Movement and was the Secretary of the All-India Trade Union Congress twice. He dominated the Indian scene for nearly a quarter of a century. He was a delegate to the I.L.O. for many years and was a member of the Governing Body. At his instance several labour laws were passed in India and his contribution to the I.L.O. was considerable. His loss has been a great blow to the Indian labour movement.

Coming to the Director-General's Report, I think I must congratulate the Director-General for the excellent Report he has presented. He has been rather apologetic about the subject and the manner of its presentation, as it differs from his previous reports, involving comprehensive surveys of world events. But I think he need not be: his treatment of labour-management relations in the context of the present-day situation and with reference to the changing future, evinces fundamental thinking. I think if there is any world institution which has a duty to survey world trends, with a view to guiding men's minds to the changing future, it is the I.L.O. Hence, the effort is worthwhile.

In a masterly analysis, the Director-General has pointed out how the world stands at a new age of atomic energy where man inherits world power, how the actual and the potential productive machine of the world has become so vast that it can produce world requirements many times over through the employment of only a fraction of the world's working population, and stands a little indecisive as to which way to go. The problem is yet a little obscured by the existence of national barriers which impede the free economic flow, the balance of payments question, the low productivity and purchasing power over vast regions of the world, and so on. Yet the problem is unmistakably clear to thinking minds. It is like a huge dam poised over a flat countryside which would be flooded if it burst. Wisdom lies in conducting the pent-up waters to irrigate the countryside, that both may assist each other to prosperity. In other words, the world cannot continue any longer, without the gravest danger to its politico-economic existence, to retain this artificial division into developed and under-developed regions. Either human wisdom will raise up the backward areas through planned development in a measurable space of time towards living standards obtaining in developed regions, or it will bring its own doom.

For this a vast flow of capital and technical know-how is necessary from developed to under-

developed countries. Some assistance at present is being given, but in comparison to the requirements and the urgency of the problem, it is extremely meagre. Those who can give seem yet to believe that the problem can be solved by military might, and therefore seem to be more interested in giving assistance for militarism and armaments, rather than for common development. If anybody believes that the problem can be solved through militarism, he is living in a fool's paradise. There is only one way to solve it, that is by the common development of the underdeveloped regions through the pooling of the resources of all those who have, so that the quickening desire for the well-being of vast masses of human beings now steeped in squalor, misery and hunger, may be met before it boils over into undesirable revolutions.

Consequently, the assistance has to be given without any strings attached. The world is politically cut up into national sovereignties which are extremely jealous of undue outside influence. There are other areas which have yet to become free and their only dominating passion is for national independence. Naturally these areas would forgo any foreign assistance if they felt that this had strings attached. Since it is clear that the development of backward areas is necessary not only for the sake of the countries themselves but also, and equally, for the developed areas, the assistance will have to be without strings, speedy and spontaneous. It must be recognised by governments and nations, as it is already recognised by thinkers, that the development of backward areas is necessary and urgent in the interests of the world as a whole.

In certain quarters, however, there is as yet no sufficient realisation of this. They admire their own prosperity and expect others to do the same. This attitude is born of a belief that their prosperity is entirely of their own making, but history tells us that it is through the sacrifice of the colonies and their industries that the Industrial Revolution of the 18th and 19th centuries, and consequently the prosperity of the West, were built up. The countries which owe their prosperity to the 20th century owe

it to the two great wars when they built up their production potential by remaining neutral while capital and "know how" of other established countries were engaged in destroying themselves.

Therefore prosperity anywhere is a product of adversity elsewhere as much as of the effort in its own place. Looking at this problem from this point of view we have to conclude that the prosperous people owe it as a duty and as a debt that they make adequate sacrifices to bring prosperity to regions which had once to be sacrificed for their good.

Today colonies and dependencies are disappearing. The new countries arising into independence will no longer get the benefit of exploiting others to build up their productive potential through colonialism. Neither will they get it through wars in which they might remain neutral. They do not desire prosperity at the cost of others. Then what shall they do if they want to become prosperous? In the present context, if they produce for export the advanced countries grumble that a low wage economy is competing unfairly with them. If they produce for the home market this can hardly absorb the products because of lack of purchasing power. This is the dilemma of unbalance. This planned expansion of production against planned expansion of wages and purchasing power for consumption on a global scale becomes the problem of this age. The question is, shall we have wisdom enough to tackle it?

Most unfortunately the world continues to be divided into mutually hostile and suspicious power blocs with most deadly weapons of mass destruction poised against each other. A fear complex rules. Even talks of aggression rearmament are indulged in. But anybody with a sense of history will realise that the two economic systems facing each other have come to stay, so that one cannot destroy the other without destroying both. In this context the only solution lies in accepting the necessity of the co-existence of both. Co-existence does not mean each scowling at the other from his own doorstep. It does not mean mere tolerance of each other. It means appreciation of the necessity of both systems with mutual respect. Once this fact is accepted by both camps the cause of tension will disappear and vast resources of mankind now tied up in war efforts could be freed for economic development and a consequent solution of the world's ills. I hope that the Four-Power Conference at the summit will succeed in accepting the fact of co-existence and in freeing the world from the fear complex so that economic issues may be tackled.

Europe developed through the sacrifices of colonies. America developed through the sacrifices of wars. How shall Asia and Africa develop? The answer is through the voluntary sacrifices of Europe and America, not through war or colonialism but through voluntary self-denial by the developed countries, so that part of the capital and "know how" may be diverted to develop the backward areas of the world.

Great powers which hold the destiny of the world in their palm are today on trial. Will they have gained wisdom enough to see the future and act accordingly?

The Director-General has discussed the question of worker-employer relations in the changing world of today. Time was when this relation was one of

master and slave. Later it became one of master and servant. After the Industrial Revolution it became one of employer and worker. Today, however, the worker has improved mentally, morally, culturally and organisationally. He has developed a personality. He has become the equal of the employer. Political power has fallen into his hands, in the democracies through the vote, in Communist countries through the dictatorship of the proletariat. So the employer-worker relationship has also undergone a change. The owner-employer has practically disappeared and has been replaced by the manager, who is himself an employee. The worker has been replaced by an employee who feels equal to the employer, if not like him in personality. The distinction between the worker and the management today is one of degree rather than kind, and the employer-employee relation has been replaced by that of co-partnership. In some countries, if not the boss, at least bossing has disappeared.

This is the most revolutionary change that one could conceive. It is showing itself effectually in workers' housing amenities, working and living conditions, conveniences, holidays, wages, securities, etc., so that in these standards also the difference between the management and the worker is becoming one of degree rather than kind.

The far-seeing employers understand this and try to adjust, but the bulk of the employers have still to realise this. To cloud the issue, in the undeveloped countries the employer has not yet been replaced by the management, so that a difference of kind rather than of degree obtains. Ideas in the modern world know no barriers. Modern ideas have reached the undeveloped areas of the world and vast forces are arising against the master-servant and employer-worker concept of the feudal and the industrial world. Whether the change will be easy or revolutionary only time will show. In India, the absurdity of this situation has been realised and there is at present a Bill pending in Parliament which will replace the hereditary employer concept by the modern manager concept. But co-partnership is still a long way off. The time has come when the industrial set-up of the world should be so recast that (a) the worker-management relationship might be replaced by co-partnership, (b) the lowest worker should be able to rise to the highest rung of the ladder of management through mere gradation, (c) the training of workers within industry or elsewhere should be automatically provided for such a rise, and (d) in working and living conditions, in welfare measures, comparable standards should be provided for the worker and the management.

It is a pity that the I.L.O. has so few chances to get into direct contact with the dictatorship countries and those with a colour bar. If it could come into more direct contact with them, perhaps the workers' lot in those countries might improve more quickly. I hope the I.L.O. will realise its duty to all labour all over the world and not try to confine

its activities to small regions out of political prejudice. The I.L.O. is a persuasive rather than a coercive institution, I say again, and I hope that those who are trying to utilise it for coercive purposes will desist.—I. L. O. News.

WHO's Sixth Year of Activity

Co-operation and mutual aid in health field increased in 1954:

In 1954 the World Health Organization (WHO) completed its sixth year of existence. Nearly 330 major health projects in 75 countries received assistance from WHO last year. At the same time, the Organization made further progress in the task of establishing standards for drugs and vaccines, in co-ordinating research and in developing training facilities for health personnel.

These facts emerge from the 200-page Annual Report for 1954 which Dr. M. G. Candau, Director-General of the World Health Organization, submitted to the Eighth World Health Assembly opening in Mexico City on May 10th.

The essential aim pursued by WHO in 1954 remained the strengthening of the permanent structure of public health services in its Member States, rather than short-term campaigns. Indeed, the fact that countries markedly increased their requests for WHO help in working out long-term plans for the development of their services is considered by Dr. Candau, in his introduction to the Annual Report, as "the most encouraging aspect" of the requests received by the Organization last year.

Another important development, in the Director-General's opinion, is "the growing attachment of Member States to the idea of international co-operation, and their increasing readiness to undertake joint action in solving problems which affect more than one country." The Annual Report lists a number of such joint undertakings, among them the Inter-American Centre of Biostatistics in Chile, the Regional College of Nursing in Egypt, the advanced course for waterworks engineers in Europe, etc.

HEALTH SERVICES IN THE FIELD

In order to strengthen national health services, WHO helps to introduce essential measures and techniques into the permanent organization of the country. These measures depend on the level of development of the country and its health organization. The Annual Report contains many striking examples of the work carried out with WHO assistance in widely different areas, including the S.E. Asia region.

South East Asia: The WHO Regional Office, located in New Delhi, is responsible for an area comprising Afghanistan, Burma, Ceylon, India, Indonesia, Nepal and Thailand. In these seven countries the Organization was able to assist 66 health programmes last year. As 85% of the population of South East Asia live in rural areas and have a low standard of living, the essential need is to provide basic health services for such areas.

Branch: Jamshedpur
Our showroom at old address 124, 124/1 Bowbazar Street, remains open on Sundays only.

As a step towards meeting this need, various kinds of rural health units are being organized by the governments. From a modest start, with emphasis on environmental sanitation and on maternal and child health, they are gradually being expanded as resources in money, material and manpower permit.

WHO-assisted programmes for maternal and child health, control of communicable diseases and for the training of health workers are being integrated progressively into the general public-health services. Basic environmental sanitation remains the most important single problem, and plans have been made to give more assistance in sanitation to all the countries in the region.

TRAINING AND EDUCATION

Approximately 40% of all health projects assisted by WHO last year were training programmes designed to meet the critical shortage of all categories of health personnel. So far, since its inception in 1947, WHO has awarded over 4,500 fellowships, of which 667 were in 1954. The tendency is to place a high proportion of fellows for study within their own region. In 1954 regional fellowships accounted for 68 per cent of the total awarded. Aside from obvious savings in travel costs, these regional fellowships have the advantage of enabling students to learn under conditions similar to those in their own countries, so that the process of adopting knowledge acquired by them to their home environment is easier.

FINANCIAL POSITION AND COLLABORATION WITH OTHER AGENCIES

The regular budget of WHO in 1954 amounted to \$8,500,000. In addition, 128 health projects directly involved in the economic development of various countries were made possible by an allocation of \$3,977,400 from U.N. Technical Assistance Funds. Joint work with UNICEF continued in all fields relating to the health of children. WHO also co-operated with FAO in nutrition, meat hygiene and zoonoses; with UNESCO on fundamental education; with ILO on occupational health activities and on the hygiene of seafarers and finally, with ICAO, on the sanitation of airports.—*WHO Press Release*.

Technical Assistance Mission Takes • Geologist from India to the Amazon Valley

Prof. Calamur Mahadevan, an Indian geologist, is arriving in Brazil this month on a technical assistance mission for the United Nations Educational, Scientific and Cultural Organization to work on a survey of mineral resources in the Amazon Valley.

Prof. Mahadevan's mission comes under Unesco's share in the United Nations world programme of technical assistance for economic development now operating in more than 90 countries. In Brazil, he will join a United Nations Food and Agriculture Organization team working with the Brazilian government on development of the Amazon region.

Prof. Mahadevan is on leave of absence from his post as head of the department of geology at Andhra University at Waltair in South India. He recently headed an Andhra University team prospecting for mineral resources in the Godavari Delta in South India.

Before joining the university in 1945, Prof. Mahadevan had been with the Hyderabad Geological Sur-

vey for fifteen years. He is the author of more than 100 research publications.

Prof. Mahadevan, who will be stationed at Manaus, is the first Indian national to be sent by Unesco to Latin America as a technical assistance expert.—*Unesco News*, June 30, 1955.

Independence Day Celebrations of Israel

The beginning of Israel's eighth year of statehood was officially inaugurated on Mount Herzl in the presence of several thousand persons by the Speaker of the Knesset (Parliament), Mr. Yosef Sprinzak.

In a short address Mr. Sprinzak said that now that the Jewish people had returned as free men to its own land, it was its duty to remember the day of the renewal of its freedom "in order to deepen our appreciation of our independence and to inspire us to preserve and build up our State."

Traditional ceremony of Independence Day eve was the visit of the Diplomatic Corps to the President to congratulate the President and the State on the occasion. The good wishes of the Corps were conveyed by its doyen, M. Pierre Eugene Gilbert, the French Ambassador. M. Gilbert was accompanied by the Ambassadors of Great Britain, the Soviet Union, and the United States, the Ministers of Belgium, Brazil, Bulgaria, the Netherlands, Switzerland and Yugoslavia, the Diplomatic Representative of Greece, and the Charges d'Affaires of Argentina, Australia, Canada, Chile, Czechoslovakia, Finland, Hungary, Italy, Poland, Rumania, Sweden and Turkey.

A special thanksgiving service was held at the Yeshurun Synagogue in Jerusalem at which Chief Rabbi I. H. Herzog delivered an Independence Day message.

Broadcasts to the nation were made by both President Ben Zvi and the Prime Minister, Mr. Moshe Sharett.—*News from Israel*, June 1, 1955.

Medical Discovery in France

TREATMENT OF BLOOD DISEASES

The Medical Faculty of the University of Paris has just awarded to one of its Professors, Dr. Jean Barnard, a prize of two million francs. The scientific and medical value of Dr. Barnard's discoveries is not of course, to be measured in terms of money. The prize has been awarded, more especially, for Dr. Barnard's contribution to the treatment of Leukaemia, a virulent disease of the blood, for which no cure had so far been known. Dr. Barnard is the sole scientist who has studied the disease with the best results, and the book which he published in 1948 with the title *Diseases of the Blood* (Flammarion) is well-known in medical circles throughout the world. His methods of treatment, which have been published in the medical journals and more especially in the *Hospital Weekly*, were communicated to the Third International Congress of Hematology which was held in Rome in 1952. The discovery for which he has received the prize, will orient the treatment of blood diseases in a new direction.—*News from France*.

SEPTEMBER

1955

VOL. LXXXVIII, No. 3

WHOLE No. 585

NOTES

The National Flag

In addressing a vast gathering of students and others at the Gandhi Maidan in Patna, on the 30th of August, Pandit Nehru is reported to have expressed his indignation at the defiling of the National Flag by Patna students thus:

"Mr. Nehru said: 'Let there be no mistake. I do not care if 100,000 or 1 million people have to die for maintaining the honour of the National Flag.'"

The report goes further to say:

"In an 80-minute speech, occasionally interrupted by disturbances created by a section of the gathering, Mr. Nehru said, it was a matter of shame that while Subhadra Bai was holding aloft the National Flag in Goa in the face of bullets, it was dishonoured in Bihar.

"Those who insult the National Flag are traitors and should be punished. I do not care if India is destroyed in upholding the honour of its National Flag."

And finally, in describing the mentality of a section of unruly students, he is reported to have remarked thus:

"Mr. Nehru said 15 students had gone to Delhi to represent their case. They forgot Delhi was not Patna and were arrested at the Delhi station for travelling without tickets. What shame!"

We fully endorse the comments and sentiments contained in the above speech, as it has been reported. There can be no excuse for indiscipline and undoubtedly an insult to our flag is an offence that should be regarded as mortal.

But has Pandit Nehru stopped to think as to why even after eight years of freedom, here in our own land, such an indignity could have been offered by our own young hopefuls. This offence should not have been possible even if they were unlettered rustics which they were certainly not. Matter of fact, it could not have been at all likely to happen in a

rustic area, where the sturdy peasant has a deep-rooted basic sense of pride in the National Flag as an emblem of our liberty and an emblem of the lifelong endeavour and sacrifice of those that fought for it. It is only possible where the callow youth—and grown-up Philistines—can be corrupted by unscrupulous disruptionists and crazy political fanatics, who would say anything or stoop to do anything without any thought about consequences, if only they thought their action or speech would embarrass the party in power. To them liberty or honour of the Nation as a whole does not count at all. All they are conscious of is power, power for their party, and personal power for themselves within the party.

It is easy for them to misguide the half-educated and unthinking. And their influence has led to widespread indiscipline and a distorted and totally diseased condition of the mental process amongst a vast number of the literate townspeople.

Pandit Nehru's Government has done nothing to combat this growing evil. Indeed, it may be said that the Government has helped the work of the disruptionists through its gross neglect of the masses in the matters of education and Mental and Moral Welfare. Moral values today, in Free India, is at a far lower level than it ever has been in our history. Let Pandit Nehru ask a few thoughtful persons, outside his coterie of office-seeking and profit-hunting yes-men, and he will find that to be the truth.

Take the case of education. Today the average man finds it even more difficult to educate his children than ever before. It is more difficult to get them admitted to proper schools, where real education is imparted, and it is almost impossible to put the children in the charge of teachers and tutors who are devoted to the cause of education. The old class of teachers and professors, who led a dedicated life, and imbued their students with a sense of proper moral values and ethical bases, are dying or due to outrageous neglect of the Government.

MIRA INSIDE THE TEMPLE
By Chittaranjan Roy

Prabasi Press, Calcutta.

Education itself has been taxed by the Finance department, in the imposing of a higher Excise duty on paper. The agile gentlemen in the Finance only thought of a crore or so of rupees, they did not consider the fact that the cost of paper in India, which we claim to be a civilized country, was already preposterously high, nearly 500 per cent of pre-war. No civilized country would have taxed paper under the circumstances, we would venture to say, for education means paper primarily, without taking into consideration these basic facts.

Pandit Nehru has held up—quite rightly—the magnificent example of Subhadra Bai. But can he say that his Government or he himself, has given a moment's thought, prior to the Patna incident, as to how to uphold the shining example of such sacrifice? We would say, on the contrary.

Goa and the British Press

The attitude evinced by the British Press on the Goa issue calls for outright condemnation not only in India, but also outside. We are not objecting to their freedom of expression, but we object to their freedom of telling lies, of varnishing the truth, of expressing calumny. Against whom? Against a senior member of the British Commonwealth in the region of Asia, against the most economically developed and politically stabilised partner of the Commonwealth in South-East Asia. We confess we can understand the attitude of the American Press and their public, but we cannot understand the attitude of the British Press. The British Press is not only conservative, it is being exceedingly unscrupulous, so far as Indian affairs are concerned—no matter whether it is Hyderabad, or Kashmir or Goa. The entire British Press—both the Conservative and the so-called liberal, with insignificant exceptions—dance to the same tune to condemn us whenever the slightest opportunity arises. Today of course liberalism or lukewarm politics has vanished from practice and it exists only in ideas and in that respect it is no wonder that the Liberal Press has to close ranks with the Conservatives. It seems, however, that the British Press is required to dance to the tune of American opinion, but they out-herod Herod even there. The fall of their empires, the crumbling of their imperialism, has undoubtedly maddened the British Press, and has deprived them of their senses of right and wrong. India undoubtedly misjudged the British mind when in 1949 Pandit Nehru waxed eloquent in his defence for the continued membership of India in the Commonwealth. It is Eire that seems to have really understood the former overlord and she has rightly cut off all connections from the Commonwealth because it is a Commonwealth of the British nations whose conservatism dies hard even in the face of changing conditions.

The chameleonic attitude of the British Press in its condemnation of the Indian attitude towards Goa

is, however, understandable in one context, and it is the fear complex. India's guilt before the British Press is that she has demanded the liquidation of foreign colonial pockets from the mainland of India, because India thinks that colonialism is an anachronism in a modern world that professes to stand for democratic rights of the nations of the world. But the British Press cannot but condemn India in her demand for the liquidation of colonies all over the world. To support India will be suicidal for the British interests, to help liquidation of their remaining colonies.

The *New Statesman* and the *Nation* has taken a different attitude in this matter. No wonder that paper is regarded as a black sheep in the context of the trends of British and American journalism. What will happen to Malaya, what will happen to Hong-kong seems the nightmare that seems to ride the Jezebels of British journalism.

Facts About Portuguese India

The so-called "Portuguese Overseas Empire" in India consists of only three tiny footholds on the Western seaboard of India comprising an area of 1532 square miles which is inhabited by 637,591 persons of whom only 1,079 are either European or of European origin. The population of Indian birth was 636,153. The Hindus numbered 388,488 and the Christians 234,275. There were only 14,162 Muslims there.

True to the imperialistic tradition, the Portuguese colonialists made every effort to keep the people in ignorance. As a result nearly 88 per cent of the people were generally illiterate. The percentage of people reading and writing only in Portuguese was only 1.43 per cent while that in Indian languages was more than 10 per cent.

The State revenue Rs. 24,778,358 in 1953 was almost double the figure in 1948 when it was Rs. 12,714,629, thus signifying intensified exploitation of the people. This interpretation of the growth of State revenue would be confirmed when one looked at the figures for expenditure on the import of arms and ammunitions in the colony. In 1948, such expenditure amounted to only Rs. 42,000 but in 1951 it was Rs. 2,934,000—almost seven times the 1948 figures.

The economy of Goa was greatly dependent on India. About 100,000 Goans were living in India. The remittances from the Goans in India kept the Goan economy alive. In 1951, only a little over 41 lakhs of rupees had been remitted from Portugal to Goa while the amount remitted from India was Rs. 68,035,241. Of the 247 ships entering Goa in 1951 only 2 were Portuguese.

Capital Formation in India

Now that India is on the threshold of a Second Five-Year Plan, it is just in the fitness of things that the country should have an idea of the rate and the volume of its capital formation. The annual rate of capital

formation gives the idea of the pace of industrialization of the country and ensures a stock-taking of our resources and their proper utilization. The rate of capital formation is admittedly low in India, in comparison with that of the Western countries. The rate of capital formation in the UK and the USA exceeds more than 20 per cent a year of their national income, whereas it is as low as 6 per cent in India. The result is low *per capita* annual income and the low standard of living. The first Five-Year Plan had the ambition to raise the annual rate of capital formation by about 20 per cent. of the additional income each year. The internal resources thus generated by the process of development would be supplemented to some extent by external resources. By 1955-56 national income, it is estimated, will have gone up to about Rs. 10,000 crores that is, by about 11 to 12 per cent. above the estimated level for 1950-51. Proceeding from the level of Rs. 10,000 crores reached at the end of this five-year period, the rate of progress in regard to national income and consumption standards could be attained if from 1956-57 onwards, investment is stepped up each year by an amount equal to 50 per cent. of the additional output. This means that the rate of saving as a proportion of total national income will have to go up from 5 per cent in the base year 1950-51 and 6½ per cent., in 1955-56 to about 11 per cent. by 1960-61, and 20 per cent by 1967-68. After 1968-69, though the resources devoted to investment will continue to go up in absolute terms, capital formation as a proportion of national income will not be raised beyond 20 per cent. of the national income. On these assumptions, *per capita* income can be doubled by 1977, i.e., in about twenty-seven years, and consumption standards raised by a little over 70 per cent. over the 1950-51 level.

During the first three years of the first Five-Year Plan, the net domestic capital formation improved by over 22 per cent. According to an estimate prepared by the Central Statistical Organisation in collaboration with the Economic Wing of the Union Finance Ministry, the volume of capital formation in 1953-54 is placed at Rs. 719 crores, as compared with Rs. 589 crores in 1950-51 (base year of the Plan). The improvement of Rs. 130 crores in capital formation has been accounted for largely by the public sector. During 1953-54, the total net capital formation in the public sector is estimated at Rs. 277 crores and this compares favourably with Rs. 199 crores in 1950-51 and this is an increase of as much as 39.2 per cent. The private sector also records a capital formation of Rs. 443 crores during 1953-54, as against Rs. 390 crores three years ago, and this represents an advance of 13.6 per cent. During 1953-54, the net domestic capital formation has been estimated at 6.8 per cent., of the estimated national income of that year.

The following table will give the estimates of domestic capital formation during 1953-54, as compared with those for the preceding years :

	(In crores of rupees)		
	1948-49	1950-51	1953-54
<i>Private :</i>			
Construction—			
Urban :	39	97	123
Rural	52	64	81
Improvement of lands and construction of irrigation works—	61	72	83
Agricultural and other implements and small enterprises	45	51	65
Mining and manufacturing enterprises	60	57	61
Transport	35	49	29
<i>Total Private :</i>			
Gross	583	703	786
Depreciation	291	313	344
Net	292	390	443
<i>Government :</i>			
Gross	200	262	349
Depreciation	46	63	72
Net	154	199	277
<i>Total Investment :</i>			
Gross	783	965	1,135
Depreciation	337	376	416
Net	446	589	719

The net domestic capital formation as percentage of national income was 5.2 per cent. in 1948-49; 5.8 per cent., in 1949-50; 6.2 per cent., in 1950-51; 6.7 per cent., in 1951-52; 6.7 per cent. in 1952-53 and 6.8 per cent. in 1953-54.

The above estimates have been derived on the basis of commodity flow approach. The gross fixed capital formation has been classified into buildings, roads and bridges, other construction and works, transport equipment, and machinery and other equipment. The public sector includes Central and State Governments, Port Trusts, Municipalities, District and Local Boards, Improvement Trusts and Village Panchayats. The capital formation in the public sector has been estimated from the budget documents and other connected publications giving details of expenditure incurred by them.

That the gross domestic fixed capital formation in India expressed as a percentage of the gross domestic product at market prices is low can be indicated from the following comparison with a few other countries :

	1948	1949	1950	1951	1952
Australia	20.7	24.3	24.8	30.6	25.9
Burma	15.1	8.7	10.3	12.0	15.1
Ceylon	6.0	8.8	10.5	11.6	13.3
UK	12.0	12.6	13.1	13.1	13.4
Indian Union	8.3	9.1	9.3	9.8	10.0

In computing the capital formation, Defence capital outlay has been treated as consumption expenditure of the Government. While constructions, such as dams, canals and wells are regarded as capital formation, expenditures on forest fire protection, eradication of pests and on research, etc., are included in consumption expenditure. All purchases of financial assets, such as shares of

private industrial concerns, etc., have been excluded. The estimation of private fixed capital formation is broadly placed under three heads, viz., (1) evaluation of construction, (2) evaluation of indigenous production of machinery and equipment, and (3) analysis of import of machinery and equipment. Among these, the data about imports are fairly comprehensive, but the data in respect of domestic output and construction are extremely scanty.

Rice Production

The Commonwealth Economic Committee in its review of world grain crops has revealed that the cooler regions of the world are now making higher yields of rice than those attained in tropical lands that mostly consume rice. Italy leads among the rice-producing countries of the world with an average yield of 26.6 cwt. per acre. Australia comes next with 25 cwt. per acre. This is followed by Japan with 22.6 cwt. per acre, the US with 14 cwt. per acre and Brazil with 8 cwt. per acre. In comparison with these, Burma obtains 7.6 cwt. per acre, Thailand 6.8 cwt. per acre and the yield in India is only 6.1 cwt. per acre. It is not milder temperature that contributes to better results, says the Committee, but intensive and better methods of cultivation and widespread use of selected seeds and fertilisers are chiefly responsible for the higher yields. The rate of rice yield per acre of land in India is extremely unsatisfactory. The First Five-Year Plan has made a considerable progress towards extensive cultivation of rice in this country, and the Second Five-Year Plan must endeavour to direct its resources towards developing intensive cultivation. The production of rice in India during 1954-55 was 2.42 crore tons, as against 2.76 crore tons in 1953-54. The fall in rice production in India during the year 1954-55, took place mainly in Bihar and West Bengal where heavy rainfall and floods in the northern districts and continuous drought in southern districts hampered the sowing and transplantation of both autumn and winter paddy. Out of the total shortfall of 3.4 million tons, these two States accounted for nearly 3.1 million tons.

According to the estimates of the Committee, the world output of rice in 1953-54, outside China, was 20 per cent above the pre-war level. In 1954-55, a slight decline in production is indicated. The world rice harvest for 1954-55 is estimated at 261 million tons of rough rice. The harvest is 2.7 per cent less than the previous year's record crop and about 17 per cent above the post-war average. In 1953-54, the total acreage outside China recorded a rise by 9 million acres to about 193 million acres. Over half the acreage outside China lies in the Commonwealth, the greater part being in the Indian Union. In 1953-54, for instance, both India and Pakistan had a record area under rice cultivation totalling 101 million acres and this was nearly one-third above the pre-war level for the sub-

continent. In recent years, however, there has been considerable increase in rice acreage in Malaya and Thailand, the latter increasing the area nearly twice as great as before the war. Indonesia, the Philippines, Korea and Formosa have also expanded their rice acreage, but the increase in Burma, Indo-China and Japan is insignificant.

The export of rice in post-war years has declined considerably in comparison with former years. In 1951, there was the highest post-war export of rice with 4.8 million tons, but this was less than two-thirds of the pre-war average and shipments since have been on the decline. Before the war, countries of the South-East Asia exported well over 5.5 million tons of rice, representing thereby three-fourths of the world trade; but the export dropped to only 2.5 million tons in 1953. Although Burma has emerged as the largest exporter of rice in post-war years, shipments from that country were only 1 million tons and this represented one-third of the pre-war level. Only Thailand maintained her rice exports, although her peak year was reached only in 1949. Exports from Indo-China continued to decline, while China raised her rice exports to a post-war peak of nearly 300,000 tons. In 1955, up to June, India has exported nearly 53,000 tons of rice. But in view of the devastating floods that are being hurled up against her north-eastern provinces by the furies of nature, she should take caution in the matter of exports of rice, so as to prevent shortage inside the country.

Sugar Production Increased

Although India is the second largest sugarcane producing country in the world, her production of crystal sugar is much below her normal requirements. The production of sugar was 10.01 lakh tons in 1953-54 as against 13.4 lakh tons in 1952-53 and 14.83 lakh tons in 1951-52. The decline is ordinarily attributed to the cane acreage having dropped from about 48 lakh acres in 1951-52 to about 36 lakh acres in 1953-54. This was further accentuated by the diversion of a large quantity of sugarcane from sugar to gur, which commanded higher prices. The consumption on the other hand was said to have swollen from 11.7 lakh tons in 1951-52 to 16.6 lakh tons in 1952-53 and 18.2 lakh tons in 1953-54. As a result of this falling production as against rising consumption, there was a deficit of sugar in the country.

The Development Council for Sugar Industry in its recent meeting at New Delhi has decided to set up a joint committee of the Indian Central Sugar Cane Committee and the Council to formulate a programme for inclusion in the second Five-Year Plan. The Council has been asked to estimate the requirements of the country for crystal sugar at the next Plan and suggest ways and means of achieving the target. The Council at its last meeting had recommended that the production

target be fixed at 22.5 lakh tons, to be attained by increasing the installed capacity of the industry from 20 to 25 lakh tons. This may be done by expanding the existing factories or installing new units or partly by establishing raw sugar refineries in the country and the matter is under the consideration of the Council for some time. The Council is also considering the suitability or desirability of stepping up sugar production by shifting or rehabilitation of factories unsuitably located or lying idle on account of inadequate supply of cane. The Council did not approve the proposal for setting up of refineries to cover up the additional capacity for the second Plan.

During 1954, 16 factories were lying idle and 20 were unsuitably located. In the case of some of these factories, production will be possible if proper measures are taken for developing cane cultivation in their areas of operation. The technical efficiency of sugar factories in this country is on the lower side when compared with that of factories in the more advanced sugar-producing countries of the world. This is due to the fact that most of the technical personnel do not possess the requisite qualifications and training and as a result are not able to effect improvements in the productive capacity of the factories. The sugar industry in India calls for early rationalisation. In India there are 170 sugar factories employing 92,000 workers. The minimum basic wage of the worker varies from Rs. 15 to 30 per month in Bombay to Rs. 8 to 24/6 in Andhra. In U. P. and Bihar the minimum wage inclusive of dearness allowance has been fixed at Rs. 55 per month. The dearness allowance paid to the workers in Orissa, Madhya Bharat, Madhya Pradesh, West Bengal, Bhopal and Bombay is according to income groups and ranges from Rs. 21 to 51/12 per month. In Andhra, Madras and Travancore-Cochin, the dearness allowance is linked with the cost of living index. The rate is 2 annas per point of rise.

U. P. and Bihar account for about 68 per cent of the factories and nearly 75 per cent of the labour force employed in the industry. The other important sugar-producing States are Bombay, Andhra and Madhya Bharat. The duration of the crushing season varies considerably in different States. It ranges from 121 to 183 days in Bihar; 101 to 176 days in U. P.; 116 to 176 days in Bombay and 56 to 93 days in Andhra. In other States the duration of the crushing season varies from 88 to 196 days. The services of all the employees, except a few technical hands, clerks and workers, are terminated at the end of the season.

Agricultural Labour in India

The Government of India conducted an enquiry into the socio-economic conditions of agricultural labour in India in 1950-51. The survey is said to be the largest of its kind in Asia and was conducted in three stages, namely, the "General Village Survey," the "General

Family Survey" and the "Intensive Family Survey." The reports of the first two stages have already been published. The report of the third and final stage of enquiry based on a survey of 11,000 agricultural labour families is recently published. It contains data on employment, unemployment, wages, income, cost and standard of living and indebtedness of agricultural labour families collected from each of the sample-families, interviewed every month during the period. The survey was conducted on scientific principles of stratified random sampling under expert guidance.

According to the survey report, the average annual income of an agricultural labour family in India is about Rs. 447. Of this 64.2 per cent is derived from agricultural wages, 11.9 per cent from non-agricultural labour, 13.4 per cent from cultivation of land and 10.5 per cent from other sources. The North-West India claims the highest average income of Rs. 651 per year per family, and South India has the lowest average annual income with Rs. 382. Region-wise, it is Rs. 551 in North India, Rs. 506 in East India, Rs. 391 in West India and Rs. 417 in Central India.

The total wage bill of agricultural families in this country is placed at Rs. 590 crores as against a total national income of Rs. 4,800 crores from agriculture other than plantation and this works to 10.5 per cent of the total national income from agriculture. The survey reveals that the per capita income of an agricultural labourer was as low as Rs. 104 per year as against the per capita annual income which was Rs. 264 in 1953. Thus, the share of the agricultural labour families representing 22.7 per cent of the total number of families in the Indian Union came out to be 8.3 per cent. In Madras, Travancore-Cochin, Bombay, Madhya Pradesh, Madhya Bharat and Orissa, majority of the families fell in the income range of Rs. 100 to 400. In U. P., West Bengal, Bihar, Assam, Saurashtra, Rajasthan and the Punjab, the income range of the families varies between Rs. 300 and 700. In Pepsu, forty per cent of the families belong to the income group of Rs. 901 and above.

The consumption expenditure is the highest in North-West India with Rs. 674 per year per family, and it is the lowest in West India with Rs. 392. Central India has an average expenditure of Rs. 423, while North India, East India and South India has Rs. 548, Rs. 528 and Rs. 397 respectively. In this respect, States in India have striking differences. Out of a total expenditure of Rs. 468, food alone accounts for 85 per cent. Most agricultural families have to face deficit budgets, the average per family being Rs. 14. The expenditure on clothing and footwear account for Rs. 29 or 6.3 per cent. of the total expenditure. There is practically no expenditure on house-rent and repairs, fuel and lighting, as the agricultural labourers mostly live in *kutcha* house.

According to the Enquiry, men formed 55 per cent.

of the agricultural labourers in rural India. On an average, an adult male worker keeps himself employed for 189 in the year in agriculture and 29 days in non-agricultural labour. The number of days of employment is the highest in North India, being 289. It is 245 days in Central India, 224 days in East India, 196 days in West India, and South India with 181 days has the lowest number of days of employment. As regards the employment of women, North India leads with the highest number of days (143 days) of employment for women, followed next by Central India with 141 days of employment. The number of days of employment for women is 139 days in South India, 116 days in West India, 115 in North-West and 123 days in East India.

On an average an adult remains without wage-paid employment for about 82 days a year. Even for the remaining part of the year, the labourer always faces the uncertainty of being gainfully employed. Nearly 16 per cent of the labourers throughout India did not secure wage-paid employment all through the year. In South India, unemployment is relatively high involving about 20 per cent. of the workers who remain unemployed for 115 days during the year. Unemployment among the agricultural labourers is also equally high in West India where they remain unemployed for nearly 113 days a year, and the number of days of employment is the highest in North India where they remain unemployed for only 44 days a year.

As regards the remuneration of workers, the average daily wage of an adult male casual worker is 17.5 annas for the country as a whole. The average daily wage for a woman worker is 11 annas. About 13.5 per cent. of the man-days worked by men is paid for at rates less than annas 10 and at the same rate women have to work for 56 per cent. of the man-days worked by them. An agricultural worker earns on an average only about one-third of the wage earned by an industrial worker. The average daily wage of a male industrial worker is 54 annas and it is 17.5 annas for a woman worker.

Indebtedness among the agricultural labourers is widespread in the country. Of the total agricultural labour families, nearly 45 per cent. are indebted, the average debt per family is Rs. 105. In South India, the family indebtedness is Rs. 102, in West India it is Rs. 108, in Central India Rs. 103 and it is the highest in North-West India with an average debt of Rs. 335. The total debt of the agricultural labourers in India has been placed at Rs. 80 crores.

The expenditure on clothing and footwear constitutes nearly 6.3 per cent of the total expenditure and it is higher on an average in North-West India. An agricultural family spends on an average Rs. 30 or Rs. 6.5 per cent. of the total expenditure on the services and miscellaneous group of expenditure including items like, tobacco, betelnuts, bidi, cigarette, washing soap and medicine. The expenditure on these items is the highest in South India.

U Nu on Goa

The daily press on August 21 carried the following item containing the clear and forceful remarks of the Burmese Premier on Goa:

"U. Nu characterised events in Goa as the 'kind of spark that can lead to a conflagration.'"

"The Portuguese had no right to be in India, he declared."

"I do not want the importance of the Goa affair to be underestimated. It is the kind of spark that can lead to a conflagration," U. Nu said.

"Such a serious problem cannot be solved by accusing Prime Minister Nehru of being a Hitler or a dictator. Nothing can be more absurd than to accuse such a man who told his Parliament that his Government would not be provoked by the killings (by Portuguese) into military action against Portugal and that he would try to seek the transfer of Portuguese India, the last foreign territory in the country, by peaceful means," U. Nu said.

"Declaring that Portugal had no right to be in India, U. Nu said, in his opinion Portugal's insistence to stay on even long after the British and the French had withdrawn was an amazing political phenomenon."

"The Burmese Premier said: 'Not only Mr. Nehru but also those who are Asians will not be able to tolerate colonialism, whether it is by Portugal or any other country.'"

"What is needed at present," U. Nu said, "is a concerted effort on the part of all peace-lovers to bring the Portuguese and Indian representative together to find a peaceful solution of the Goa problem."

Pandit Nehru on Goa

The following news appeared in the daily press on August 21:

"Sitapur, Aug. 20.—Prime Minister Nehru addressed the Council of the Uttar Pradesh Congress Committee for 70 minutes this evening."

"Shri Nehru is understood to have referred to the Goa Satyagraha and said that the movement was an intricate problem involving international complication."

"The Goa problem, he said, had to be solved by peaceful methods and there was necessity of self-restraint."

"He said the Government of India was taking steps for early liberation of Goa."

"Shri Nehru is stated to have observed that recent demonstrations at Bombay did more harm than good to the cause of the Goa liberation movement."

Radhakrishnan at Durgapur

The Vice-President delivered a short but exceedingly apt speech at the opening of the long-awaited Damodar Valley barrage at Durgapur, which was a very impressive and successful ceremony. We give an extract from the report from the *Statesman* of August 10:

"Durgapur (Burdwan), August 9.—Over 6,000 people, who had come from the surrounding areas, shouted with joy as Dr. Radhakrishnan, the Vice-President, opened the Durgapur Barrage, designed and constructed entirely by Indian engineers, and water from the controlled Damodar rushed into the irrigation-cum-navigation canal on the left bank of the river here this afternoon."

"Dr. Radhakrishnan, who dedicated the barrage to the people of India, said it would help to irrigate 100,000 acres immediately and 1.3 million acres ultimately and transform 'a valley of devastation and sorrow into a valley of progress and prosperity.'"

"The function took place in a pavilion erected on an embankment beside the barrage. Standing on the dais and invoking the blessings of God, the Vice-President pressed a switch which opened the head-regulator gates to allow the passage of water from the river into the almost dry bed of the canal."

"Dr. Radhakrishnan said that after Independence the country's first necessity was rehabilitation of refugees. Next in importance came the stepping up of agricultural production. The construction of this barrage was a step in that direction."

"Attempts were being made to control floods. At that very moment, the people of U.P., Bihar, North Bengal, and Assam were suffering from the ravages of floods. 'We appreciate the great courage and determination with which they are standing up to these natural calamities. It is, therefore, very essential that in the second Five-Year Plan we must do our utmost to bring about a greater measure of flood control.'"

"The second Five-Year Plan, he said, should not be regarded as a Government Plan. It was a national Plan in which every Indian should take pride. Unless economic freedom and social rehabilitation went into the content of political democracy, it could not be said that 'we have attained political freedom at all.' Measures were being adopted to bring about a social and economic revolution in the country."

"Pointing out the dangers of caste and provincial jealousies and communal rivalries, he said these impeded the march of a country. Those associated with the construction of the barrage had demonstrated that it was possible to subordinate these evils in the larger interests of the country. Men from different parts of India were here co-operating and endeavouring in a common purpose."

"There was a time in this country when people built sacred temples. Today, the alleviation of human sorrow, removal of poverty, and improvement of the lot of people must be regarded as a sacred task. This was a secular form of sanctity."

"Recently, many Indians had visited different countries and had been impressed by the passionate fervour, sincerity, and dedication with which the people there were working for their solidarity and uplift. Stupendous improvement had been made under a

different form of government. 'Here also, though our methods are different and though we believe in democracy, the same fervour, enthusiasm and national dedication will have to be generated among the people.'"

"A Welfare State should not be content merely with the advancement of the material well-being of the people. History showed how many Welfare States, which had economic prosperity, justice, and equality, had descended into the depths of degradation and the horror of concentration camps. A Welfare State must also be interested in raising the moral and spiritual standards of the people. The country expected from every citizen not feebleness but efficiency, not grudging work but dedicated service."

Corruption in Services

New Delhi seems to have woke up at last to the rampant evils of corruption in the Public Services. But unless a Central Ministry with a fearless and staunch person at the head is put in charge, nothing much will be achieved we fear.

"New Delhi, Aug. 6.—To fight the evil of corruption in public services each Ministry at the Centre will hereafter have an officer of at least the status of a Deputy Secretary to be the Vigilance Officer in that Ministry."

"Each Ministry will nominate its own officer under this procedure, the initiative for which was taken by the Home Minister, Mr. Pant."

"The Vigilance Officer, according to a Government Press release, will function under the direct control and guidance of the Secretary of the Ministry concerned and will concentrate on preventing and punishing corrupt practices in the Ministry and its attached and subordinate offices."

"It is fully realized, the release says, that the battle to root out the evil of corruption has to be waged on many sectors and in a variety of ways and that the main effort and initiative must come from within each Ministry and Department."

Conflagration in Morocco

The daily press of August 21, carried the news-item given below. It is a lurid example of the evils of colonialism:

"More than 60 people were killed or wounded in French Morocco to-day as violence flared up throughout the Protectorate according to reports reaching here."

"Biggest outbreak, which marked the second anniversary of the exile of the Nationalist Sultan Mohammed Ben Yusef, was in the Atlas mountain town in Kenifra where the commander of 3,000 French troops claimed to have caused 60 casualties among rebel tribesmen."

"Today was picked by the Nationalists for anti-French demonstrations but French officials had hoped tension would be eased in time by yesterday's Paris decision to

begin consultations on Monday with leaders of all the Moroccan parties.

"One person was killed and four were wounded in a clash at Rabat this afternoon. No further details were immediately available.

"In the villages of Boujad and Oued Zem, 180 miles south of here, six people were killed including a French official and a French policeman. Police opened fire on small groups of rioters in these villages.

"Reports here said that paratroopers dropped into the Atlas mountains during the night after riots in Kenifra which caused 14 deaths yesterday, sealed off the town and ordered the tribesmen to surrender.

"A paratroop lieutenant was shot and another soldier fatally injured as they tried to smash through barricades."

French North Africa

The weekly news magazine *Time* for August 29, carries a long report on the conflagration in North Africa. We give extracts below:

"Violence that came close to actual warfare blazed across French North Africa. In an 850-mile arc from Constantine in Algeria to Casablanca in Morocco, more than 800 were killed and thousands more wounded in a spreading, sporadic rebellion that brought the wrath of Islam close to the shores of Europe. The uprising threatened to cut off France's vast colonies in equatorial Africa. More than 300 million Moslems were already feeling their impact, from Senegal to the Celebes. In the eye of the storm were 20,000 Americans—airmen and their families stationed at the four Strategic Air Command bomber bases in western Morocco."

"In Paris there was shock and alarm. Premier Edgar Faure, who had appointed an able man to bring peace to Morocco and had then hung back from letting that man put through the reforms he demanded, condemned 'this terror and savageness,' and grimly warned of French retribution. In the Moroccan capital of Rabat, his appointee, French Resident General Gilbert Grandval, was shocked at the bloody collapse of his efforts to win a compromise.

"The man who arrived in Morocco a month and a half ago with the ardent desire to 'restore order and peace by friendship has a broken heart,' said Grandval. 'There is no motive that can excuse such a crime.'

"Day before the fighting broke out, Grandval had rushed back to Morocco from Paris with a special invitation to the nationalist leaders, asking them to meet with the French Cabinet to work out a compromise. Because Grandval had won their trust, most nationalist leaders accepted this last-minute offer. But though the moderates in Morocco urged calm on their impatient people, the extremists would not be stayed. As so often before, the French concessions came too late.

"The seeds of revolt had been sown over 43 years of French insensitivity to the political and spiritual

longings of North Africa's Arab peoples. France gave North Africa roads, hospitals and the works of Voltaire, but not the political liberty it demanded. The spark that ignited the violence was struck one day last week. It came on *La Date Fatidique* (literally, the fateful date).

"It was the second anniversary of the dethronement of Sultan Sidi Mohammed Ben Youssef as head of some 9,000,000 Moroccan Moslems. On August 20, 1953, the French bundled Ben Youssef aboard a DC-3 and exiled him, ostensibly to 'save' him from his own people, actually because he supported their demand for more political freedom. So flimsy a pretext was an insult to North Africa's faithful. Morocco's urgent nationalists flatly refused to accept the weak and wizened old man whom Paris foisted on them in Ben Youssef's place. Ben Youssef, never very popular as Sultan, became in exile a martyr.

"The French were dismayed and alarmed. Since last month's riots in Casablanca (*Time*, July 25), 60,000 of their troops have been standing guard in Morocco, but more, apparently, were needed. From its limited reserves in Europe, the French army flew a battalion of marines and a company of security police to beef up the Moroccan garrison. It even took space on commercial airliners to fetch hundreds of Senegalese NCO's from their units in Indo-China.

"There were other uprisings in Rabat, Marrakech and Fez, but the worst fighting broke out where it was least expected: among the Berber tribes. Lean, eagle-eyed horsemen who accept the authority of Islam, though not all of its practices, e.g., they eat wild boar, the Berbers are the descendant, of the proud indigenes of Africa's northwest corner. Many Berber tribes held out against the French until as late as 1934, but since then their *Caids* (chiefs) have accepted French gold.

"The French encouraged Berber hostility to the Moroccan Arabs as part of their general policy of divide and rule. Two years ago the Berbers were persuaded to back up El Glaoui, the cunning old Pasha of Marrakech, who acted as France's agent in the removal of Ben Youssef. El Glaoui has teamed up with the right-wing elements among the French *colons* in North Africa to delay and sabotage Gilbert Grandval's plans for reform and self-government.

"An important segment of Berbers had now switched sides. 'There is new hope in Morocco,' the Berber *Caids* wired Premier Faure recently. 'We respectfully ask you to put an end to the El Glaoui myth There is no question of accepting the Pasha of Marrakech as the chief of the Berbers. They form a part of the whole, the Moroccan people.' But when the French continued to temporize, the *Caids* told their Berbers to saddle up.

"While the French army had its hands full beating back the Moroccans, other fanatical Arabs saw their

chance in Algeria, North Africa's richest province and legally a part of France.

"With perfect timing, gangs of Algerian *fellaghas* (rebel bandits) raided French police stations and stormed the railroad station on the outskirts of Constantine (pop. 119,000). Fourteen Frenchmen standing at a bar were blown to bits by a bomb. The *fellaghas* called themselves 'The Army of Liberation'; they were joined by urban terrorists known as 'Death Battalions.' The rebels swept through dozens of French villages, burning, looting and killing. Scores of French civilians were knifed or torn to pieces before the troops swung into action.

"Pitched battles broke out in half a dozen Algerian towns. It was impossible to count all the casualties, but reliable estimates ranged as high as 560 dead (460 of them rebels) and possibly thousands injured.

"All told, *La Date Fatidique* claimed the lives of some 650 Arabs and 200 Frenchmen. French North Africa was in flames, and at week's end there was still no knowing how far the flames would spread, or how they would be put out."

Events in Sudan

The daily press carried reports about a mutiny amongst the Sudanese troops in Lower Sudan. The following extract from *Time* for August 29, gives the background:

"The Sudan moved closer to the pleasures and perplexities of freedom. In Khartoum the Sudanese Parliament voted unanimously last week to ask the British and Egyptians to withdraw their two remaining battalions of troops from the country within 90 days. Under the 1953 Anglo-Egyptian agreement, this clears the way for the Sudan, by referendum or election of a Constituent Assembly, to settle the one big question about its future: Shall the Sudan (pop. 8,800,000) become an independent nation or join with Egypt?"

Stigma of Illegitimacy

The Worldover Press supplies the following news:

"Rome.—The Italian Government is moving to eliminate the traditional stigma attached to children born out of wedlock. Until new legislation was brought forward, the estimated 2,000,000 illegitimates were marked on official records with the initials 'N.N.', meaning in Latin 'no name.' It is expected that soon the state will be permitted to assign fictitious names on birth certificates whenever one or both of the child's parents are not known."

Colour and Herrenvolk

The same source gives the following news:

"Johannesburg.—Figures on the relative success of white and coloured nurses in Pretoria taking identical examinations after training, show that the percentage of colored candidates passing the tests is higher than that of the 'Europeans'."

Pakistan Through U. S. Eyes

The international edition of the *New York Times* of August 14, gives the following editorial on Pakistan's changes in Government:

"Pakistan (area: 365,907 square miles; population: 76,000,000) has one of the best armies in Asia and is firmly committed to the free world camp in foreign policy. But in its eight years of independence it has experienced grave difficulties in establishing democratic self-government. A Constituent Assembly tried for six years, without success, to write a Constitution. It was dissolved in October, 1953 by Governor General Ghulam Mohammed, an appointee of the British Crown under the Indian Independence Act which, in the absence of a Constitution, is Pakistan's basic law. Since then, Ghulam Mohammed, though gravely ill, has ruled by decree.

"Pakistan's political difficulties are not surprising. Carved out of British India as the Moslem counterpart to Nehru's Hindu state, the country is split by a thousand miles of Indian territory into two halves. West Pakistan, including most of the territory and the capital, Karachi, is united in ardent devotion to the Moslem faith, but shot through with provincial rivalries. East Pakistan, a single province (East Bengal), includes most of the people and much of the industry, but has a strong Hindu minority and champs at direction from Karachi.

"At first, the gulf was bridged by the party that won Pakistan's independence—the Moslem League. But the league is based chiefly in West Pakistan. As the lustre of independence began to dim, there arose in East Bengal organized opposition to the League's policy of centralized control from Karachi and a special status for the Moslem religion. Despite the opposition, the League's leader, Prime Minister Mohammed Ali, tried to carry on a one-party Government. Dissolution of the Assembly in 1953 was one rebuff to his policy. A second came in Pakistan's first elections two months ago. The Moslem League won only 35 of the 80 seats in the new Constituent Assembly. Two Bengali parties—the United Front under Fazlul Huq, and the Awami party under Hussein Suhrawardy—won 16 and 13 seats, respectively.

"Last week in Pakistan the new Constituent Assembly convened and a fresh approach to the political and constitutional problems got under way. Sunday, Ghulam Mohammed resigned as Governor General because of bad health. He was replaced by a bluff soldier and personal protege, Maj. Gen. Iskander Mirza, 55. The same day Mohammed Ali resigned as Prime Minister. He was replaced by another Moslem League leader, former Finance Minister Chaudri Mohammed Ali. The New Prime Minister will head a coalition Government linking the Moslem League with the United Front of Fazlul Huq."

Democracy in Turkey

The following news, taken from the international

edition of the *New York Times* for August 14, shows the working of democracy in Turkey today:

"Istanbul, Turkey, August 13. (AP).—The leader of the chief political opposition to Premier Adnan Menderes' regime was arrested tonight for alleged insults against the Government in a talk at a news conference.

"Kasim Gulek, 45, secretary general of the People's Republican party, the party of the founder of the Turkish Republic, Kemal Ataturk, was taken into custody aboard the Turkish ship *Erzurum* while on a speaking tour along the Black Sea coast.

"The arrest was announced by Justice Minister Osman Sevdi Cecekdag in Ankara. The announcement said Mr. Gulek's arrest resulted from a news conference remark that last year's general elections were unlawful.

"Mr. Gulek was graduated from Columbia University in New York.

"Former President Ismet Inonu, now President of the People's Republican party, announced here the party might withdraw from Parliament because of Mr. Gulek's arrest."

Atomic Energy Conference

The international edition of the *New York Times* for August 14, gives a very clear report on the Geneva Conference on the Peaceful Uses of Atomic Energy. We append below a comprehensive extract:

"The day that marked man's first use of the most terrible weapon ever devised—August 6, 1945—also opened a prospect of vast potential benefit to civilization. President Harry Truman, announcing the destruction of Hiroshima by an atomic bomb, suggested the promise in these words:

"The fact that we can release atomic energy ushers in a new era in man's understanding of nature's forces. Atomic energy may, in the future, supplement the power that now comes from coal, oil and falling water * * *.

"In the decade since Mr. Truman uttered those words scientists have pushed far forward toward the goal of harnessing the atom. But they have done so largely behind the barriers of national secrecy, cut off from the free interchange of ideas and information which is the lifeblood of scientific progress.

"A major purpose of last week's meeting at Geneva was to give new impetus to mankind's hope in the atom as a boon and source of abundance. The atmosphere at the conference was a mixture of world's fair, industrial convention and scientific conclave. The meeting bore the official title of the International Conference on the Peaceful Uses of Atomic Energy. Its center was Geneva's imposing marble Palace of Nations, U.N. headquarters in Europe. There history's largest assemblage of the world's leading scientists—1,260 delegates from seventy-two nations—gathered in three sessions each day to hear more than 400 papers.

"Between sessions, the delegates and hundreds of curious visitors thronged the exhibits of the world's first 'atomic fair' in the halls of the Palace.

"The exchange of information at the formal sessions was broad and detailed. The papers—some of which bore such jawbreaking titles as 'Dosimetry of Reactor Radiations by Calorimetric Measurement'—covered virtually every non-military aspect of atomic research. But the subject that created the greatest interest was the potentiality of the atom as a source of power. The importance of the subject was underlined by a British paper delivered early in the conference on the life expectancy of present world sources of conventional fuels. The British report estimated that if the total demand for primary fuels increases at the rate of 3 per cent per year (the demand has been increasing at the rate of 2 per cent, but it is expected to rise), the fuels will be exhausted in about 150 to 200 years.

"The first steps in utilization of atomic power have already been taken. The United States, Britain and Russia all have current-producing reactors in operation. But cost has been one of the main barriers to faster commercial exploitation. Uranium, the primary source of fissionable material, is scarce and expensive, and the capital investment in uranium piles is high. At Geneva last week it was disclosed that new discoveries promise to reduce costs and greatly increase the available supplies of nuclear fuels, with an energy potential many millions of times greater than coal or oil. These were the main revelations at Geneva on the power question and other aspects of atomic research:

Breeder reactor. The breeder reactor has opened the possibility of a huge increase in the supply of fissionable material. In the breeder reactor, plutonium—the man-made fissionable element created by a uranium pile—'breeds' so that more plutonium is produced than was put into the reactor to begin with. The British disclosed that they have achieved a 2 to 1 result from a breeder reactor—that is, ended up with twice as much plutonium as as they started with.

Thorium. The scientists predicted that the element thorium might outstrip natural uranium as a basic source of fuel for atom power. While thorium, which is more plentiful than uranium, is not fissionable itself, it can be converted into U-233, a highly fissionable isotope of uranium.

Commercial exploitation. The businessmen were at Geneva in force. In the downtown section of the city, nine countries had on display industrial atomic equipment. The British, making a strong bid for the export market, had by far the largest exhibit.

Fusion. One of the most startling developments at the Geneva meeting came in connection with the possibility of producing nuclear energy through fusion. Fusion, in contrast to fission which is the splitting of atoms to form lighter elements is the transformation of atoms of a lighter element into those of a heavier. Fusion is the process that produces the sun's heat. It is also the process that gives the hydrogen bomb its awesome power. But because of the intense heat required for fusion—the hydrogen bomb, for example,

has to be triggered by an atomic bomb—the fusion process had been regarded as unadaptable to the production of useful energy. At Geneva last week Prof. Homi J. Bhabha of India, president of the conference, said:

"I venture to predict that a method will be found for liberating fusion energy in a controlled manner within the next two decades. When that happens, the energy problems of the world will have been solved forever, for the fuel will be as plentiful as the heavy hydrogen in the oceans."

"Professor Bhabha's statement caused speculation that some important 'breakthrough' in harnessing the fusion process had taken place recently. Lewis L. Strauss, chairman of the U.S. Atomic Energy Commission, and head of the U. S. delegation in Geneva, said that no such 'breakthrough' had occurred in the United States. But he disclosed that American scientists are working on the problem.

"With the Geneva conference still in progress—it is scheduled to end Saturday—it was still too early for a final assessment of its meaning and results. But some facts already stood out. One was that the conference had taken a long first step toward breaking down the barriers of international secrecy which heretofore had retarded atomic progress. Another was that the conference had further eased international tensions and renewed hope for eventual international control of the atom.

"Beyond these results was the broad panorama of benefits to mankind foreshadowed in the Geneva reports. A new industrial revolution, far greater in scope than the one that transformed society in the 19th century, was clearly in the making."

Thomas Mann

With the death of Thomas Mann, the last of the titans of the pre-World War days has passed away. That his philosophy of life was not always acceptable to the moderns, with their ideas of regimented nationalism will be clearly understood from the following note taken from the *New York Times*, international edition (August 14):

"Thomas Mann's death on Friday (Aug. 12) came more than half a century after the novel *Buddenbrooks* had brought him fame and torment. Torment his life indeed was, at least in part, for he suffered grievously from the collapse of the old Europe and the old values. The world of which he wrote so prodigiously was a sick world, and his genius felt this sickness. Dying at 80, he did not live long enough to experience the triumph of his ideas. He has been compared with Goethe, but in spite of his tremendous energy he lacked Goethe's robustness and confidence.

"Where shall we place him in the story of the world's literature? That he will be considered significant is certain. The impress of his thought on his contemporaries cannot, however, be measured. He would have liked this impress to be for freedom and man's dignity.

But though he rejected nazism with vehemence and repudiated Communism 'as long as the destination is totalitarianism,' he revealed in his later years a deep emotion, a passionate searching rather than a sharp decision."

South Korea

The *Time* for August 22, comments thus on the Korean riots that took place about the middle of August:

"More than 140,000 Americans were killed or wounded fighting Communists in Korea, and the U.S. is still spending \$250 million a year to clear up the wreckage of war. Yet last week, with bayonets and tear gas, U.S. troops were fighting again in Korea—this time against their allies, the South Koreans.

"At Pusan, where the U.S. put division after division ashore to save Korea in 1950, Korean mobs stormed U.S. barracks. Into Kunsan air base, where U.S. warplanes took off to bomb South Korea's invaders, Koreans were hurling bombs of their own. It was a strange and tragic conflict, for the Americans were fighting to protect their enemies: the Communist Poles and Czechs of the Neutral Nations Supervisory Commission.

"While the G.I.s were stoned in their defense, the Communists last week sat in safety behind U.S. machine guns, smoking American cigarettes, leafing through American magazines, drinking American beer. With their Swiss and Swedish colleagues, they came to Korea in 1953, ostensibly to ensure that neither side increased its military strength after the armistice signed at Panmunjom. That truce, which South Korea did not sign, was supposed to last 90 days, until a conference met to work out a treaty. It is now 23 months later, and President Syngman Rhee has run out of patience.

"His complaint: truce inspection is a farce, for only the U.N. observes it. Not a Sabre jet leaves Korea, not a howitzer is junked or a Patton tank replaced on the U.N. side, without its being reported to the NNSC and thence, via the Czechs and the Poles, to Pyongyang, Peking and Moscow. U.S. soldier replacements disembarking in Korea are greeted by Communist officers, who click them in with hand counters as they march off their Army transports. Yet on the North Korean side of the truce line, an immense and illegal buildup has gone on unchecked.

"Since the armistice, U.S. intelligence estimates that the Communists have increased artillery firepower by 30 per cent, laid out 40 military airfields and moved in more than 400 aircraft, including 150 MIG jets. Last year, the Swiss and Swedes reported that truce inspection in North Korea was 'completely illusory.' The U.S. called for its immediate abolition on the grounds that 'obstructionist tactics on the Communist side have made (its work) impossible.' Washington even promised Rhee that the U.S. would see to it that NNSC left Korea shortly. It is still there."

Israel Election Results

General elections were held on July 29 to elect Israel's third Knesset (Parliament) in which about 79 per cent of the 1,060,000 voters participated. The election was held on the basis of proportional representation, and 18 parties competed for the 120 seats in the Knesset of whom 7 parties failed to win sufficient votes—1 per cent of the total votes cast—to entitle them to any representation. The table following showed the relative position of the different parties:

Name of the party	Position in—		
	3rd Knesset	2nd Knesset	1st Knesset
			(Present Parliament)
Mapai (Labour)	40	47	46
Herut	15	8	14
General Zionists	13	20	7
Mapam	9	7	19
Achdut Avoda	10	4	—
Hapoel Hamizrachi	11	8	—
Mizrachi		2	—
Aguda	6	3	10
Poale Aguda		2	—
Progressives	5	4	5
Israel Arab Democrats	5	3	—
Communists	6	7	4
Others	—	5	9

* Religious Bloc

The *News From Israel* adds: "Final returns will not be published until the vote of men and women serving in the Defence Forces and who voted in army bases has been counted. When all votes have been finally counted the surplus votes will have to be distributed. (The surplus vote is the number of votes remaining over after dividing the number of votes received by a party by the 'key' required for a seat. For example, if 840,000 eligible votes were cast for the 120 seats the 'key' will be exactly 7,000—obtained by dividing 840,000 by 120. If party 'X' received 15,000 votes, it is entitled to two seats and has a surplus vote of 1,000. The Israel election law provides for party agreements in regard to the surplus vote, which agreements have to be registered before the elections with the Central Elections Committee. A party with a large surplus vote and an agreement with another party may thus still manage to obtain an additional seat in the final computation)."

Malayan Elections

As in the Singapore elections in April, the elections in Malaya resulted in the victory of the coalition of parties favouring immediate independence. So long Malaya had been administered through an executive council and a Legislative Council packed with nominated members. In the new Legislative Council, which would consist of 98 members besides

the Speaker, 52 members were elected from 52 constituencies. The new Council would have a cabinet consisting of nine members with Sir Donald MacGillivray, the British High Commissioner at the head. In the elections, held on July 27, a triple alliance of Malaya, Chinese and Indian organisations headed by Tengku (Prince) Abdul Rahaman swamped all rivals by winning 51 of the elected seats. The component parties of the alliance were United Malaya National Organisation (UMNO), Malaya Chinese Association (MCA) and Malayan Indian Congress. The chief opponent of the alliance was the Party Negara headed by the veteran Dato Sir On Bin Jaaffar but it failed to secure even a single seat.

Of the 29,00,000 adult inhabitants of Malaya about 17 lakhs were eligible to be voters; but actually only 12,50,000 registered themselves as voters of whom about 84 per cent were Malays. About half of the adult Chinese were excluded from the electoral rolls on the ground that they were outsiders.

The defeat of Dato Sir On Bin Jaaffar, who had been the founder of the United Malaya National Organisation but had left it later on, in his own constituency was most unexpected and caused the greatest surprise in political quarters.

The results of the election together with the success of 15 Chinese candidates put forward by the alliance in an election in which the voters were predominantly Malays were interpreted to mean that communalism had lost its hold in Malayan politics.

On August 2, the High Commissioner, Sir Donald MacGillivray invited ten members of the alliance—six Malays, three Chinese and one Indian—to join Malaya's first elected Cabinet. The Indian in the Cabinet, who would be in charge of Labour relations, was Mr. V. T. Sambandham, President of the Malayan Indian Congress.

U.S. Private Foreign Investment

More than 2,000 United States private business companies and corporations controlled and operated business enterprises outside the United States with a book value of 16,200 million dollars, reports the *New York Times*. They were dealing in the production and distribution, in the words of the newspaper, "of everything from breakfast food to Diesel trucks and from crude oil and dried coconuts to bobby pins and antibiotics."

USIS adds, "Encouragement of the flow of U.S. private capital abroad is an integral part of the basic foreign economic policy of the United States. Recent pronouncements and actions of the U.S. Government provide proof of a policy promoting and encouraging the flow of U.S. private capital abroad, and evince a willingness to do a big part of the job of bringing about a fruitful meeting between U.S. capital and foreign investment opportunities."

The U. S. Government created a new office in the Department of Commerce in April (1955) known as the Office of Foreign Investment with a view to encouraging private capital investment abroad. In May this year the U.S. Congress approved of U.S. participation in the International Finance Corporation which would be established as an affiliate of the International Bank for Reconstruction and Development and would work directly and intensively in the field of private enterprise. The U.S. Government would contribute \$35,168,000 as the U.S. share of the \$100,000,000 capital stock of the IFC.

Then there was the Investment Guarantee Programme, which provided, by means of inter-governmental agreements, insurance protection to U.S. foreign investors against the risks of inconvertibility of foreign currency receipts and loss through expropriation and confiscation. Through December 31, 1954, insurance totalling \$48.5 million had been issued to cover 69 investments of U.S. private capital engaged abroad. Of the total, \$45.9 million insured U.S. capital invested overseas against inconvertibility of foreign currency receipts, and \$2.6 million against loss through expropriation. Total fees collected amounted to over \$1 million; no payments under guarantee contracts were required. Up to May, 1955, twenty-four countries had signed such agreements with the U.S.A. The Government of India was reportedly considering the proposal for signing such an investment guarantee agreement with the United States. The latest reports indicate that a 25 years guarantee has been decided upon.

Mr. Eric Johnston, head of President Eisenhower's International Development Advisory Board and President of the Motion Picture Association of America, however, pointed out that while foreign governments were mostly willing to import American private capital, they found it impossible to accept the American terms for such investment.

U.S. Productivity

During the period since the end of the Second World War, factory output in the United States climbed six times as fast as factory employment. One of the high lights of the past decade was that the giant producers had grown bigger. For example, General Electric Company's plants had grown from 93 plants in 72 cities in 16 States to 135 plants in 105 cities in 28 States of America. Standard Oil of New Jersey, the largest oil concern, sold in 1954 nearly twice the petroleum products it had done in 1946. The largest chemical company Du Pont, had a sales volume in 1954 of almost triple its 1946 volume. There was, however, also a growth in the number of small producers. At the start of 1946 there were 264,000 manufacturing firms in the U.S.A. At the start of 1955 the total stood at 311,000.

The post-war decade also witnessed a gradual progressive upgrading of unskilled labour to skilled labour and an almost complete mechanisation of factory work. The percentage of work energy supplied by machine had risen from 17 per cent in 1880 and 84 per cent in 1930 to 95 per cent in 1954.

Another major trend of the period was the entrance of the Southern, South-western and Western States into the industrial age. Before the war those States were mostly agricultural.

This striking increase in the productivity was also reflected in the workers' income. There had been a 23-per cent rise in their real wages since 1946.

Ambassador and Colour Bar

Sri Gaganbehari Lal Mehta, India's Ambassador in the U.S.A., and his Secretary were the latest victims of the colour bar in the U.S.A. when on August 22 they were asked to leave the public dining room at the international airport at Houston in Texas, U.S.A.

Reuter reports: "Texas law forbids serving Negroes and white people in the same room but a Federal Government contract bars discrimination at the airport."

"Mr. John Stevens, the Houston Mayor's executive assistant, said the Government's anti-discrimination contract 'unquestionably applies to the dining hall'."

Nonetheless the Indian envoy and his secretary were asked by the manageress to leave the room. She is also reported to have said that had the Indians not complied with her request she "would have had to have them removed."

Mr. John Foster Dulles, U.S. Secretary of State, sent a formal apology to the Government of India through the U.S. Ambassador to India, Mr. Sherman Cooper, and also sent a personal apology to Mr. Mehta. *Reuter* adds that the mayor of Houston had apologised on behalf of every citizen of Houston to Mr. Mehta.

Referring to the incident, the *Vigil* writes editorially on August 27 under the caption "Negroes in America and Indians": "We think if we want to show real dignity we should inform the American Government that the apologies are unwanted. On the other hand, we should let the USA know what we think of the 'colour bar' by instructing all Indian representatives to prefer the company of Negroes wherever discrimination is practised as regards the use of any public place or other amenities. We should spurn the 'honour' of being, as 'privileged' foreigners, classed with whitemen who approve or tolerate such discrimination against their own fellow citizens on account of race or colour . . ."

The news paper expresses the view that the attitude, so long maintained by the Indians, in demanding separate treatment from the Negroes in

USA should be given up. Such an attitude had been of no help to the struggle for the end of racial segregation in USA. It had rather helped to strengthen the notion of the Negroes' inferiority in the minds of the white. The cause of the American Negro would be greatly helped and India's dignity would be considerably raised, the newspaper writes, "if instead of asking for equal treatment with the whites, Indians, while in America, show by their conduct that they make no distinction between white and coloured citizens of the U.S. and will, where discrimination is made, choose rather the Negro's side of the partition because the Negro, though as much a citizen of the U.S. as any white man, is weaker, wronged and under-privileged."

This incident has been closed by the extremely correct and dignified attitude of our Ambassador. The U.S. press, in general, has very severely condemned the action of the misguided female in charge, as she has brought her own country down to the level of the uncivilized barbarians of South Africa.

India-China-USSR Film Venture

The *Star*, weekly news-magazine, published from Lahore, reports that an Indo-Sino-Soviet co-production film depicting the life and travel to India in search of knowledge of the illustrious Chinese Buddhist scholar, Hiuen Tsang, was expected to be undertaken next year by Producer-Director Chetan Anand. According to the paper's cinema critic, "Permission to make the film—an unprecedented three-nation effort—was granted by the Government of India last month while the Soviet Government agreed to the proposal in October last when Chetan was in Moscow as a member of the Indian Film Delegation.

"The co-operation of the Chinese Government is being sought and its envoys in India have expressed enthusiasm for the project on the fabulous Chinese pilgrim, Yuan Chwang, as he is called by his people and whose name is lost in legends."

The film would be in Russian aquacolor and in four versions—Hindi, Chinese, Russian and another for international screening. The final agreement would shortly be signed in Moscow, the report adds.

U.N. Officials' Illegal Transmitter

That the charges often heard in this country against U.N. officials were not altogether unfounded would be clear from the subjoined news-item taken from the 4th August issue of the *Bombay Chronicle*:

"New Delhi, August 2.—Mr. Sadath Ali Khan, Parliamentary Secretary to the Prime Minister, said in reply to Dr. Gidwani that it was true that the United Nations representatives in Delhi had been operating a wireless transmitter without any permission or licence from the Central Government.

"The matter had been taken up with the U.N. Secretary-General in New York, he said."

It would be interesting to know the nationality of the particular officials since obviously the U.N., as an international organisation, cannot have any use for such clandestine news.

Press Commission Report

Sri B. V. Keskar, Union Minister for Information and Broadcasting, introduced a resolution in the Lok Sabha on August 19 for consideration of the report of the Press Commission. According to his statement, the Union Government had already reached tentative conclusions on most of the recommendations of the Commission. One or two recommendations only were still under discussion. Yet the views expressed by the House might induce a change on the views of the Government even on matters on which tentative decisions had already been reached, said the Minister.

The recommendations of the Commission that would require legislation by the Parliament were those relating to service conditions of working journalists, the revision of law regarding Press registration, the regulation of the economic aspects of the industry by the price-page schedule and the constitution of a Press Council.

According to the *Statesman's* special representative in New Delhi, the great majority of the members, taking part in the discussion that ensued, held that concentration of ownership was the most serious ailment of the Indian Press. "There was also marked unanimity on the best remedy: Imposition of a price-page schedule. Such a measure, it was argued, would protect small papers from unfair competition and thus prevent them from being taken over by large combines."

"The majority of speakers wanted early implementation of all the recommendations, which, in the opinion of Mr. H. N. Mukherji (Com.) were interdependent. . . ."

The two major Indian news agencies—*Press Trust of India* and the *United Press of India*—came in for sharp criticism for mismanagement and alleged blacking out of news.

PTI adds that Mr. Hirendranath Mukherji, Communist member from West Bengal, analysed the ownership and circulation of various newspapers and told the House that 18 persons, apart from their grip over the Press, not only controlled the operation and management of almost every sector of the industry, but also had a monopolistic position in regard to newsprint, advertising, financial resources, banking facilities and relations with the Government. Such power was dangerous, he said.

Mr. H. V. Kamath (PSP) referred to the "growing unholy alliance between political power and finance capital" and said that there was also an "unholy wedlock between the Government and what I call the Press barons. The manner in which the

Government has seduced the Press barons on some occasions has been very reprehensible . . ."

He said that Asian news agencies were unable to compete with well-established foreign agencies because of the Government's policy regarding cable rates, wireless and other charges which were now high. He urged the Government to help the *PTI*, *UPI* and other Asian news agencies through reduced cable and wireless charges.

Mr. Joachim Alva (Congress) wanted Indian business houses with annual earning of more than one crore to set apart at least 1½ per cent immediately for advertising and break the monopoly of the British and American advertisers.

Mr. S. Gurupadaswamy (PSP) drew attention to the fact that the concentration of the means of information in the hands of a few capitalists presented the greatest danger to Indian journalism. He then referred to the fact that only five agencies were controlling the majority of the advertising material.

Mr. C. C. Shah (Congress) stressed the need for encouraging Indian language papers for increasing the number of district papers.

Sri Sadhan Gupta (Communist) expressed the hope that the Government would not be cowed down by the threats of closing down their papers by the "Press Barons" if the price-page schedule was introduced and that it would "take stern measures to make them desist from closing down their papers."

Sri Gupta said that it was a "calamity" that the country had to depend for news on *Reuters* which was an imperialist agency. He referred to the despatches from India on Goa which had mentioned that "Goan villagers attacked Indian demonstrators with sticks," and on the basis of which Sir Anthony Eden's paper *The Yorkshire Post* had written an editorial article on Goa in a deplorable way. He asked the Government to ensure the prevention of circulation of news coloured by foreign agencies.

Mr. Fulsingji B. Babji (Cong.) asked the Government to ban crossword puzzles. The bill prepared by the Government showed that the Government did not propose to put a ban but only certain restrictions on the publication of crossword puzzle competition in newspapers, he said.

Mr. M. D. Joshi (Cong.) referred to the sad plight of weekly and fortnightly journals which had held aloft the banner of freedom during the struggle for independence and pleaded for help so as to enable them to fulfil their role in the country.

Mr. Jaipal Singh (Jharkhand) and Mr. T. N. Singh, both members of the Press Commission, suggested that the entire evidence laid before the Commission should be published so that the country could know that the "Press Barons" were not the patriots they claimed to be.

Mr. Singh said that from the beginning the

"Press Barons" had attempted to put obstacles in the way of the work of the Press Commission. There had been opposition and non-co-operation. It was only when the Commission had held out the threat of the authority vested in it that they had "climbed down."

Sri N. V. Gadgil urged for the implementation of the price-page schedule at least in the case of the papers published in the Indian languages. He referred to the fact that since the abolition of the price-page schedule 27 papers had closed down. In the case of English papers he suggested that no paper should be sold for less than two annas for eight pages and if the number of pages was increased to 12 then the paper should be priced at two and a half annas. He also urged for a ban on the publication of crossword puzzles.

Many speakers insisted on the immediate implementation of the Commission's recommendations relating to pay and conditions of work of the working journalists. Sri N. V. Gadgil suggested for inclusion in the proposed bill of the relevant provisions of the Payment of Wages Act, so that the journalist could get his emoluments on fixed dates and not instalments as was the case with some papers in Madras.

Replying to the debate, the Union Minister for Information and Broadcasting, Dr. B. V. Keskar, said that it would be wrong to suggest that the Government was trying to avoid implementing the recommendations of the Press Commission. The Government had the fullest confidence in the impartiality and competence of the members of the Commission. The time taken by the Government in reaching decisions over the recommendations was indicative of the importance attached by the Government to the recommendations, he added.

Dr. Keskar said that the Government could not agree to the publication of the evidence placed before the Commission, because in view of the undertakings given to a number of persons that their evidence would be confidential, it would be immoral to publish the evidence.

He agreed that just as in other businesses trends of monopoly were beginning to creep into the newspaper industry. While Government was aware of the dangerous potentialities of this trend, if it went unchecked, it must be realised that the Press was not already in the grip of monopoly. The recommendations of the Commission in this respect were preventive rather than combative of actual evil.

MacCarthyism in Indian Press

Referring to the recent criticism in a section of the Indian Press, more noticeable in New Delhi, of the reporting of political events by Indian newspapermen, the Calcutta *Statesman's* weekly political commentator under the pen-name of "Vedette" writes on August 7: "By an interesting coincidence, criticism of political reporting by Indian correspondents has arisen

only after the Prime Minister's tour of China on last October and of Russia in June. Charges of partiality to these two countries and of working under Communist influence have been freely brandished in certain quarters. Grave dissatisfaction has been expressed by critics in this category over the quality of reporting and the conclusion drawn that not all is well with the hearts and minds of the two Press teams that accompanied Mr. Nehru."

Part of the complaint could be explained by professional jealousy, says the commentator. But the real reason lay elsewhere even if it was agreed, for argument's sake, that the two Press teams that had accompanied the Prime Minister during his tour of China and Russia had left something to be desired in the matter of representation and ability.

He writes: "Over a period of some years now a group of indigenous MacCarthies have been operating in India, sometimes subtly, through rumour and scandal, but mostly by means of scurrilous writing. No means are repugnant to their conscience—'Letters to the Editor' are manufactured by the dozen, other people's views distorted, misquoted and torn out of context and vile personal attacks launched in the crusading spirit of the far away idol whom they seek to emulate."

"Here is yellow journalism in one of its worst forms. Most of these 'journals' have small circulations, and whenever one of them makes a personal MacCarthy attack, the victim is obligingly supplied with a free copy of the publication with a neat printed slip on the cover inviting attention to page so-and-so. Essentially, the object of the attack is the Prime Minister's foreign policy, but placing discretion above valour, they direct their fury at correspondents whose professional decency may prevent them from engaging in an unclean controversy or who may be frightened into silence and discouraged from doing their job with honest objectivity."

The columnist appeals to the public to beware of such little McCarthies and to the Government to take note of their *modus operandi*, which extended "from personal blackmail to pontifical lectures on objective journalism."

We are not unfamiliar with the tactics of yellow journalism pointed out by the *Statesman*. We have to remark that some more subtle poison is in action here, besides mere jealousy or personal feuds, though both of them are potent factors in the production of "yellow" journalism. The standards of journalism have gone down all over the world in the hunt for circulation and in the chase of political power for parties whose cause have been espoused by the journals concerned.

News Procurement Methods

While inaugurating the fourth annual conference of the Federation of Working Journalists, the Finance

Minister of Madras, Sri C. Subramaniam had strongly decried a tendency among the journalists to get news somehow and had compared it with a tendency in certain other sectors to make money somehow. "There is no difference between the two," he said. "I may be pardoned if I say that it is nothing but stealing the news from quarters from where you are not entitled to get it."

The Minister continued: "It is claimed as a privilege of the Press that it should not be asked to reveal the source of news even though it is an illegal source from which a particular item of news has been obtained, it is something astounding which we will have to think about."

The Federation of Working Journalists adopted a resolution reiterating the right of the Press to publish any news it thought necessary to the interest of the public and deplored "the tendency on the part of the authorities to deny journalists free access to sources of information and regiment publication of news."

The resolution added that the public advantage arising from freedom of information far outweighed any inconvenience or embarrassment to individuals, authorities or party interests.

The Executive Committee of the Southern India Journalists' Federation in a resolution adopted on July 29, expressed surprise and regret at the above remark of the Minister about journalists "stealing the news" and observed that "his subsequent effort at elucidation is not calculated to reassure the Press or the public."

While disclaiming any sympathy for those who distorted news, the committee expressed its inability to accept the Minister's view that it was the duty of the Press not to gather news bearing on the Government's plans, policies or actions except from authorised sources and not to publish it until such time as the appropriate authority considered suitable. The characterisation of journalistic enterprise as "stealing the news" was based upon the unsupported assumption that the Press resorts to wrong methods in getting the news.

The resolution concludes: "The committee deplores that the Minister should have thought it proper to warn the Press that the Government might be compelled to keep it at arm's length if it did not agree to the course he suggested. That would be a denial in practice of the freedom of information which is the life-blood of democracy. And it can only encourage wild speculation with consequent damage to public morale."

Law Commission

The Union Law Minister, Sri C. C. Biswas announced the appointment of a Law Commission in the Lok Sabha on August 5. The eleven-member Commission headed by the Attorney-General of India,

Sri M. C. Setalvad, would function in two sections and was expected to submit its recommendations by the end of 1956. The term of one or the other section might, however, be extended if required. The two sections of the Commission would deal with the two main tasks—reform of judicial administration and reform of statute laws.

PTI adds: "The terms of reference of the Commission are: First, to review the system of judicial administration in all its aspects and suggest ways for improving it and making it speedy and less expensive; and, secondly, to examine the Central Acts of general application and importance, and recommend the lines on which they should be amended, revised, consolidated or otherwise brought up-to-date."

"The Commission's inquiry into the system of judicial administration will be comprehensive and thorough, including in its scope, (a) the operation and effect of laws, substantive as well as procedural, with a view to eliminating unnecessary litigation, speeding up the disposal of cases and making justice less expensive; (b) the organization of courts, both civil and criminal; (c) recruitment of the judiciary; and (d) level of the bar and of legal education."

"The Commission's principal objectives in the revision of existing legislation will be (a) to simplify the laws in general, and the procedural laws in particular, (b) to ascertain if any provisions are inconsistent with the Constitution and suggest necessary alterations or omissions, (c) to remove anomalies and ambiguities brought to light by conflicting decisions of High Courts or otherwise, (d) to consider local variations introduced by State legislation in the concurrent list with a view to reintroducing and maintaining uniformity, (e) to consolidate Acts pertaining to the same subject with such technical revision as may be found necessary, and (f) to suggest modifications, wherever necessary, for implementing the directive principles of State policy laid down in the Constitution."

The chairman was empowered to co-opt as members one or two practising lawyers of a State to assist inquiries in that State.

The members of the Commission were: Sri M. C. Setalvad (Chairman); Sri M. C. Chagla (Chief Justice of Bombay High Court); Sri K. N. Wanchoo (Chief Justice of Rajasthan High Court); Sri G. N. Das, (retired Judge of Calcutta High Court); Sri P. Satyanarayana Rao (retired Judge of Madras High Court); Dr. N. C. Sen Gupta (Advocate, Calcutta); Sri V. K. T. Chari (Advocate-General, Madras); Sri Narasa Raju (Advocate-General, Andhra); Sri S. M. Sikri (Advocate-General, Punjab); Sri G. S. Pathak (Advocate, Allahabad); and Sri G. N. Joshi (Advocate, Bombay).

In an article on the tasks before the Law Commission in the *Vigil*, Sri S. N. Dwivedi writes that it

would be regretted that the Commission was not constituted more broadly. The Government was urged to consider the question of enlarging the Commission.

While congratulating the Government "for selecting an able and experienced personnel for the Commission" whose "learning ability and mellowed experience" commanded universal respect the writer points to the strange exclusion of political and economic thinkers as a result of which the judges and lawyers had a monopoly on the Commission.

The writer strikes a note of warning against the danger of the over-representation of the conventional thought in the Commission. The tasks before the Commission was legal planning, not mere tinkering at law reform. No patch-work but a liberal scientific approach was necessary. The Commission's task was to "survey the Indian statute book from two root-points, namely, social justice *versus* private property, and regulation *versus* anarchy."

We are in agreement with Sri Dwivedi's comments in general. The law today is so complicated and the process of justice so tortuous and expensive that the common man can hardly ever get justice on a equitable basis. Law is a lawyers' paradise and the happy hunting ground of the predatory sections of the rich. The few reforms that have been made since the attainment of freedom have increased the arbitrary powers of the government and added worse confusion in legal procedure everywhere. Justice, in short, is even less apparent today to the layman than it was before. It is a hard and bitter statement, but that is the considered opinion of the majority of thoughtful people. Lawyers, however eminent, cannot improve matters.

State Trading

The leader of the Communist group in Lok Sabha, Sri A. K. Gopalan, moved a resolution in the House on August 12 asking the Government to enforce immediately State monopoly of foreign trade in commodities like jute, hides and skins, coconut, pepper, tea, cotton, rubber, manganese, mica, coal and other metallic ores in order to implement successfully the Second Five-Year Plan, reports the *Statesman*.

When the resolution came up for discussion on August 26, according to the *Press Trust of India*, there was general support for the idea of State trading in selected commodities. The news agency report says:

"Mr. Gopalan said that if the Five-Year Plan had to be implemented successfully such a measure was necessary. State monopoly of foreign trade was also necessary in view of the State objective of achieving a Socialistic pattern of society. The present form of foreign trade was not at all helpful to the implementation of the Second Plan and unless it was taken over by the State, progress of State economy would be moonshine."

"As long as foreign trade remained entirely in the hands of private businessmen, there would be violent

fluctuations in the commodity markets. There would be booms and slumps resulting in closure of factories and causing much harm to the country's economy.

"If the State monopoly of foreign trade came into being the Government would be able to negotiate favourably for the disposal of the country's products. The Government would also be able to enter into long-term agreements with other countries which the private businessman could not do.

"Mr. Gopalan said that another advantage of State monopoly would be that the State would always look to the interest of the country, whereas in private hands the sole consideration was profit.

"Another distressing feature of the country's foreign trade was its dependence on Anglo-American market. 'We want to shed once for all our dependence on one type of markets.'

"Foreign trade, he said, yielded an income of about Rs. 125 crores and this could easily be utilised for augmenting the resources of the Second Five-Year Plan if the Government took over import and export trade. This would also lessen the burden on the common man, which he had to share by way of taxes on essential commodities.

"In China, the United States, USSR and many other countries, including capitalist countries, State-controlled agencies were functioning. If State monopoly of foreign trade was enforced, then by no stretch of imagination could it be conceived as a totalitarian method. Many of the foreign countries doing business with India had purchasing agencies here and tried to take advantage of the competition in the market. This proved harmful for the peasants.

"Mr. K. Raghuramaiah (Congress, Andhra) said he had a soft corner for State trading, but could not support the resolution. He said that it was true that the country wanted more money to implement the Second Five-Year Plan, but the question was how to get it. Trading was not a joke. It required contacts and planning. The Government had no such machinery. Moreover, who would take the risk, which was essential in such matters? In Britain, he said, Government tried State trading in raw cotton. But the experience was not happy. In India, too, we had some experience of State trading in foodgrains.

"Mr. Raghuramaiah said that the repercussions of such a measure on unemployment situation should also be taken into consideration. But in certain cases Government could step in and enforce State trading. Tobacco was one of them. India was at a disadvantage while dealing with Communist countries like China, where foreign trade was State-controlled.

"I suggest in dealing with such cases where trade is in the hands of monopoly organisations, whether it is State or some other organisation, and we are dealing with it, we must have an organisation in this

country whether Government or semi-Government,' he said." (*Hindu*, 28.8.55).

The Minister concerned had not replied at the time of this writing.

We, for ourselves, have a great deal of hesitation in advocating State monopoly in foreign trade. Until we have more experienced ministers and high officials and the standard of integrity was raised to a far higher level it would be asking for calamity to plunge into limitless State control. As regards efficiency and know-how, we have very far to go as yet.

Privilege Motion in Madras Assembly

The Deputy Speaker of the Madras Legislative Assembly rejected on August 20 a plea of breach of privilege raised by M. Kalyanasundaram, Deputy Leader of the Opposition, regarding the disciplinary proceedings started by the District Educational Officer of Salem, against a teacher of an elementary school in Rashpuram, on the alleged ground, among others, of his "close contact with top-ranking Communist leaders like Mr. M. Kalyanasundaram and Mr. P. Jivanandam," reports the *Hindu* on August 21.

Raising an issue of privilege M. Kalyanasundaram said that the charge against the teacher tended to imply that contact with members of the House constituted an offence meriting action under the Educational Rules, including cancellation of the teaching certificate. If members of the House were to discharge their duties effectively, it was necessary that they should be able to visit different places and institutions, and contact people in different walks of life, so that they could have first hand knowledge of matters and of people's problems, he said.

The Communist Party was a lawful organization and was recognised as an all-India Party. It was one of the main opposition parties in the Assembly. In the circumstances, Mr. Kalyanasundaram maintained, "the charge made by the District Education officer, Salem, was disparaging and calculated to bring down the prestige of the House and the members in the estimation of the people." He said, "How could members have contact with Government employees or people working in Government undertakings and know facts in order to be able to make proper suggestions in the House for improvement, if the very necessary contact was considered to be 'misconduct'?" The Government should not allow its officials to take such an attitude towards members of the particular party in the House." Referring to the particular case Mr. Kalyanasundaram said that he had been to Rashpuram only once in his life. The teacher had met him on that occasion and they both had gone to his house and had had discussions on educational, and not on party matters. The teacher, so far as he knew, was not a member of the Communist Party. "Even assuming that he is a member of the Communist Party, how is it an offence?" asked Mr. Kalyana-

sundaram. "Are not members of other political parties visiting the houses of Government officials and even staying with them? Some of them are their relatives. Why should this special discrimination be made against Communist Party. I say definitely it is a breach of privilege."

He further said that the analogy of Mr. Geoffrey Cooper's case could not be applicable because there the matter had rested on presumption, whereas in the case mentioned by him, the issue had been raised on the basis of an actual charge contained in a chargesheet.

Supporting Mr. Kalyanasundaram Mr. P. Ramamurthi, Leader of the Opposition, said that the whole matter had raised not only an issue of breach of privilege, but also of contempt of the House. It had a very important bearing on the rights and functioning of the members of the House. "Members of the House, including members of the Communist Party, in order to discharge their functions effectively were entitled to contact members of the public, including teachers. To say that this would constitute misconduct only meant that members of the Communist Party were bad characters and persons not to be contacted. That amounted not only to violation of the privilege of the House, but also to contempt of the House. Contempt had been defined as anything obstructing or impeding members in the discharge of their duties or anything which tended directly or indirectly to produce such a result. Irrespective of precedents they should judge the action of the District Education Officer from this point of view, if the action obstructed or impeded, or even had the tendency to obstruct or impede, members in the discharge of their duties. . . . Their concern was not with the action taken against the individual teacher, but its implications for members of the House and the House itself."

Mr. C. Subramaniam, Leader of the House, said in reply that there had been no breach of privilege and the motion had been brought forward with the intention to intimidate the official for the action he had taken. He said that there had been no intention to treat as offence a contact with any M.L.A. or any member of the public. What had been objected to was that teachers should at all take part in politics—Congress, Communist or otherwise. The question, therefore, was whether it had been correct for the teacher to have discussions on party politics. Mr. Kalyanasundaram had stated that he had not discussed party politics on the occasion. The minister was sure that due weight would be given to that statement.

Giving his ruling, the Deputy Speaker explained the privileges of members and said that in the present case clearly no obstruction had taken place nor anything which tended directly or indirectly to produce such results or which could be treated as contempt.

He then referred to the ruling of the Speaker of the British House of Commons on a case which was almost similar to the one mentioned by Mr. Kalyanasundaram. In 1951, Mr. Geoffrey Cooper, M.P., had alleged in the House of Commons that two Government servants had been dismissed from service on the ground that they had given information to the member. Mr. Cooper had maintained that such action would discourage persons coming to give information to members of the House of Commons and was, therefore, a breach of privilege of the House. The Speaker of the House of Commons had ruled that privilege could not be extended to such cases though "this, no doubt, may be a very desirable matter to discuss and debate on the vote on the Ministry (concerned)." Mr. Kalyanasundaram had not been obstructed and he could still perform the duties of a legislator in spite of the charge against the teacher. Therefore, there had been no *prima facie* breach of privilege, ruled the Deputy Speaker.

Second Pay Commission

Mr. D. C. Sharma, a Congress member from the Punjab, introduced a non-official resolution in the Lok Sabha on July 29 urging the appointment of a second Pay Commission "to go into the question of the pay structure of the country, so that the disparity between the highest salary and the lowest salary is reduced to the minimum."

Moving the resolution Mr. Sharma said that the resolution was conceived in the spirit of the directive principles of the Constitution which enjoined upon the Government to bring about an equitable distribution of wealth. Things had greatly changed since the last Pay Commission had submitted its report. The new socio-economic urges of the people demanded an integrated approach to the pay structure of the country both in the public and the private sectors. "Our pay structure has to be rationalised in terms of the new need of the country," Mr. Sharma added.

Mr. A. K. Gopalan, leader of the Communist group in Lok Sabha, said in support of the resolution that there were both political and economic reasons for revising the present pay structure. He referred to the strong desire on the part of the employees in Government and other industrial and commercial establishments for an increase in their standard of living not only on the economic but also the cultural side. The pay scales recommended by the Commission in 1946 had not been a living wage even according to that body. The recommendations made by the Pay Commission had been based on the assumption that the cost of living index would stabilise at a point somewhere between 160 and 175 but today the index stood at 354.7. The same pay structure could in the circumstances hardly be considered enough. There were, moreover, anomalies between the pay scales of the Central and State Governments. The

recommendation of the Pay Commission for fixing the ceiling at Rs. 2,000 per month had also gone unimplemented. He urged for the minimum to be fixed at Rs. 100 per month.

The *Hindu* reports: "Five amendments were moved to the resolution. One of them demanded that the highest and lowest salaries should be reduced to the ratio of ten to one, with Rs. 100 as the lowest and Rs. 1,000 as the highest."

Supporting the demand for a Second Pay Commission, the *People* writes in an editorial note on the 31st July: "That there is need for a yet another overhaul goes without saying. There is nothing wrong in revising, what has already been worked out, in ever-changing circumstances. Adjustments and readjustments have to be made. Therein lies what is termed as the dynamics of our society. The new pay commission, if and when it is set up, would do well to remove the incongruities which are still present in the pay-scales for various cadres."

The resolution for the appointment of a Second Pay Commission, though it secured approval of the Opposition and some Congress members, however, faced official Congress opposition in the Lok Sabha and was consequently defeated by an overwhelming majority.

Replying to the debate, Mr. M. C. Shah, Minister of Revenue and Civil Expenditure, dilated on the financial implications and said that raising the minimum wage of Government servants to Rs. 100 per month would require annually Rs. 28 crores. For raising the salaries of teachers a sum of Rs. 36 crores was needed. Roughly Rs. 100 crores would have to be raised annually to meet all the demands. The Government favoured that sum to be invested in the Second Five-Year Plan which aimed at raising the standard of living of the people as a whole.

Press Trust of India reports: "Mr. M. C. Shah said the minimum wage of a Government servant now was Rs. 70 per month and the disparity between the highest and the lowest paid had been reduced from 1 to 280 before 1946 to 1 to 30 or 31 after acceptance of the Pay Commission's recommendations. Before 1946, the lowest pay average was Rs. 12 and the highest Rs. 4,000 or Rs. 3,300 after deducting income-tax. The minimum today was Rs. 70 and the maximum Rs. 4,000 or Rs. 2,200 or so after deducting income-tax at the present rate."

"Mr. Shah said that if the suggestion that the highest salary should be reduced to Rs. 1,000 was accepted, the Government would save about Rs. 15 lakhs. If this amount was distributed among the other Government employees, each one would get an increase of Re. 1-4. He assured the House that the Government would endeavour to better the lot of the lower paid staff as much as possible. He requested Prof. Sharma to withdraw the resolution."

"Mr. Sharma commended the resolution to the

House but when the Deputy Speaker was about to put it to vote he begged leave of the House to withdraw the resolution. The Opposition refused permission to withdraw and when the resolution was put to vote it was declared lost by 69 votes to 27."

States Reorganisation Commission

The *Bombay Chronicle* published a dispatch from its special correspondent in New Delhi according to whom the States Reorganisation Commission was "sure to recommend the formation of two new States, Karnataka and Kerala." The correspondent writes that there was unanimity in the Commission about the formation of those two States though the possibilities of a Marathi-speaking State was not altogether ruled out. Another certain recommendation was the abolition of Part 'C' States. The cases of Delhi, Cutch, Manipur and Tripura would, however, require separate consideration. "Delhi is special case on account of its being the capital and the other three because of their strategic position. The question of hill areas also is receiving special attention."

The Commission, which would submit its report in September, would also recommend the appointment of a special Minister for Hill Affairs, the correspondent adds.

Text-Book Publication Delayed

The *Hitavada* in an editorial note on July 30 comments upon the inordinate delay in bringing out text-books by the Madhya Pradesh Government. It notes that though schools had opened a month ago, no work could be done in the absence of text-books.

A later report published in August 14 issue of the newspaper says: "While the primers and readers published by the State Government have yet to reach the students and teachers in the primary schools in the State, experienced primary school masters whom one contacted expressed the opinion that the books were undoubtedly attractive and well brought-out, but the planning of lessons in some of them left much to be desired."

1857 Martyrs

The Congress Working Committee recently decided (on July 23) that the centenary of India's first war of independence in 1857 should be celebrated throughout the country in 1957. A five-man committee was appointed to submit to the next meeting of the Working Committee a scheme for celebrating the occasion.

From an editorial note of the weekly *People* on August 28, it appears that there was also a move afoot in the Congress circles to collect information and statistics regarding persons who had lost their property through mass confiscations for participating in 1857 movements. The newspaper also refers to a move to grant adequate compensation for their living descendants and writes: "This is obviously a national task and deserves attention from all and sundry."

PANCH-SHILA

By SAILA KUMAR MUKHERJEE,
Speaker, West Bengal Legislative Assembly

THE Panch-Shila or the five principles of international relationship have been the logical culmination of independent India's foreign policy constantly and openly advocated by our beloved Prime Minister since attainment of independence and since he assumed charge of the Department of External Affairs. To fully appreciate Panch-Shila it would be necessary to state the background of Pandit Nehru's mind even prior to independence. It was Pandit Nehru chiefly who in his books and from Congress platforms, had from time to time given expression to his views on the kind of foreign relations that independent India should pursue. In successive Congress plenary sessions prior to Independence it was Pandit Jawaharlal Nehru, who under the inspiration of Mahatma Gandhi sponsored the resolutions on foreign policy, which independent India should adopt.

Since attainment of independence it has been the consistent policy of India's Prime Minister to allot a number of days for debate on the foreign policy of India as it was developing in the midst of explosive situations prevailing in the neighbouring countries in Asia as also in other parts of the world. We have before us exhaustive records of parliamentary debates from 1947 onwards from which it is easy to get a glimpse of the view which the leaders of the country held as also the other different views which the different political parties held. Today in the year 1955 it is much easier for us to have retrospective analysis of the various view-points on the foreign policy of independent India as reflected in the debates of the Parliament and expression of views outside. The doubts and fears, distrust and apathy that were reflected in the earlier years after independence are gradually being replaced by trust and confidence, respect and courage about the soundness of India's foreign policy. This is not my assumption or inference but I am speaking with reference to the records of parliamentary debates during the last seven years that confidence is gradually dawning on the leadership of India at least, so far as the foreign policy is concerned.

The architect of this foreign policy, Prime Minister Nehru, has in his various utterances during these seven years given unmistakable evidence of his deep debt of gratitude to Gandhiji's teachings and it is but natural that his foreign policy should bear the indelible stamp of Gandhian philosophy. In his last public utterance at Delhi at the public reception after

his historic tour of Soviet Union and East European countries with whom treaties based on Panch-Shila were for the first time executed, the Prime Minister declared in the language of Mahatma Gandhi that "an answer to Atom and Hydrogen bombs was not more of them, but truth and non-violence" and he pleaded with the huge audience to observe in their individual and social life the principle of peaceful co-existence by being tolerant towards all religions.

Let us now analyse these five principles. What are they?

- (1) Mutual respect for each other's territorial integrity and sovereignty;
- (2) Mutual non-aggression;
- (3) Mutual non-interference in each other's internal affairs;
- (4) Equality and mutual benefit;
- (5) Peaceful co-existence.

They are called Panch-Shila according to the Buddhist language prevalent in Burma and Indonesia representing five principles or codes of human conduct. They for the first time came into limelight of international politics when on 29th April, 1954 an Agreement was entered into between the Republic of India and the People's Republic of China on trade and cultural intercourse and facilities of pilgrimage and travel between India and Tibet. These principles form the preamble of the Agreement and are its most important part. The legal quibble over exercise of 'suzerainty' or 'sovereignty' by China over Tibet vanished as soon as China could effectively control Tibet and her sovereignty became a fact. China's sovereignty over Tibet had a historical background of centuries even recognised by some foreign powers. New India was not therefore interested in merely treating Tibet as a buffer State as was done by the British in her own colonial and Imperial interest. In consistency with another fundamental policy of India, viz., not to align herself with either of the two power blocs but to remain friendly with all countries, especially with her neighbours, she never took up a position which would have strained her relations with China and at the same time made the position of Tibet worse. Tibet never belonged to India and the charge commonly levelled that India sold Tibet to China is unwarranted. Judging from the above background the entire provisions of this trade and travel agreement have been based on these five principles and with a view to promote each one of them effec-

tively so that friendly relations between two great Asian neighbours may grow. The working of the Agreement for more than one year by implementation of its provisions justify the hope of its framers.

This Agreement of course has only a limited scope. Shortly thereafter, that is within two months, on 28th June, 1954, the two Prime Ministers issued a joint statement from Delhi with regard to mutual relationship between the two countries in which they reaffirmed their faith in the five principles mentioned above and they expressed the hope that these principles should be applied in their relations with other countries in Asia and other parts of the world. They further felt that if these principles are applied not only between various countries but also in international relations generally, they would form a solid foundation for peace and security and the fears and apprehensions that exist today would give place to a feeling of confidence.

Let us examine if these hopes have been fulfilled. Subsequent to the signing of the Agreement between India and China, similar agreements on international level have been entered into between India and Burma, India and Indonesia. In the Bandung Conference 29 nations of Asia and Africa have adopted these five principles with further extension to suit the need of other countries who due to special problems of their own wanted collective security pacts for self-defence. Further, the principles of their agreement have also, as hoped for by its sponsors, been extended to other parts of the world. An agreement based on five principles have been entered into between India and Yugoslavia, India and Poland and lastly between India and Union of Soviet Russia. The hopes expressed by the two Prime Ministers in the Panch-Shila Agreement about lessening the tensions in the world and creating a climate of peace as a result thereof are also on a fair way to fulfilment as will be apparent from records of world events in the East and in the West during the last 14 months which I need not repeat.

Let us now trace the background of these principles of peaceful co-existence. The question of peaceful co-existence can arise between two nations only when they do not exist on equal basis or differ in fundamentals and stand on opposite social or political structures. No question of co-existence can arise between nations who exist on equal terms and identity of interest and on uniform social and political systems. Therefore, peaceful co-existence can only arise between nations who have different political and social systems. India and China, two of the greatest nations of Asia, have entirely two different political and social systems now. But their historical and cultural associations date back to centuries—such contacts only having been snapped during the last two or three centuries. Both having shaken off the colonial

and Imperial dominations almost simultaneously both countries in their own democratic interest of rapid development and progress wanted peace above anything else. They wanted peace not only for themselves but for the whole of Asia and the world because in the context of the present-day world a conflict at any part is bound to have its repercussions on other parts. Therefore, they wanted to evolve a method of working out effectively the goal of peaceful co-existence and they devised the basis of peaceful co-existence as firstly mutual respect for each other's territorial integrity and sovereignty. I want to lay emphasis on the word *respect*. The first principle, therefore, enjoins creation of a mental make-up and attitude of mind of each State and its people to develop a sense of respect for other nations' not only integrity but sovereignty also—be it sovereignty of the people or the party or the dictator. The second and third principles involve some action to implement the first principle of development of mental attitude. Both are negative actions, i.e., not to do some acts, such as aggression and interference in each other's internal affairs. The third principle needs a little elucidation. It had been a consistent cry for years past in democratic countries that totalitarian States through extra-State organisations but backed by the resources of such State infiltrate into democratic countries totalitarian ideas through seemingly innocent organisations. This principle has been further amplified in the latest agreement between India and Soviet Russia, to define and extend the scope of non-interference in internal affairs to the extent of economic, political and cultural fields. This is the strongest safeguard against preserving the sovereignty of a nation. The fourth principle is a principle of positive action. Both countries are at liberty to take such political, economic and other measures as would mutually benefit them as equals and not with a superiority or inferiority complex. If these five principles therefore are fostered in each country on a national basis and gradually receives international recognition—human ingenuity fails to understand why nations should fight unless it be for the purpose of beastly instinct in men of self-interest and self-preservation alone at the cost of others. Panch-Shila therefore is an extension of the scope of human conduct in society between individuals, between different groups in the same state and further extended to the relationship between different nations in the world. As in society individuals want to live in peaceful co-existence with different views and outlook on life, as different groups within the same state having different social or political outlook want to live in peaceful co-existence for the benefit of the State, so too nations with different political and social ideologies can live in peace for the benefit of each nation and the world as a whole.

In the very first speech as foreign minister in the Parliamentary Debate on foreign policy, Prime Minister Nehru observed:

"A country's foreign policy ultimately emerges from its own traditions, from its own urges, from its own objectives and more particularly from its recent past."

The corner-stone of India's foreign policy is her desire to have peace and prevent war. Her policy of non-alignment in any power bloc arises out of this desire. She wants to be friend of all and it is with that view she has pinned her faith in the United Nations in spite of its weaknesses and failures.

This foreign policy of India which ended in that dynamic Panch-Shila is the logical outcome of the

struggle for freedom under the leadership of Gandhiji. Gandhiji held that "end cannot justify the means and that everything must be fair in politics." It may sound utopian still to many but I may conclude by quoting the memorable words of Gandhiji uttered in 1927:

"If India has patience enough to go through the fire of suffering and to resist any unlawful encroachment upon its own civilisation which, imperfect though it undoubtedly is, has hitherto stood the ravages of time, she can make a lasting contribution to the peace and solid progress of the world: If we are to be saved and are to make a substantial contribution to the world's progress, ours must emphatically and predominantly be the way of non-violence and peace."

BENGALLEES IN ASSAM—THE RECENT ROY-MEDHI TALKS

By BIMALCHANDRA SINHA, M.A.

THE problems of Bengalees in Assam have drawn sharp public attention all over India after the Goalpara incidents. There was an enquiry by Shri Madhavan Nair, the General Secretary of the Congress, and there was also a Resolution of the Working Committee suggesting a meeting of the two Chief Ministers and two P.C.C. Chiefs. The All-India Congress Committee, at its last Berhampore Session, also expressed its sorrow and concern at the Goalpara incidents. After that, S.J. Saratchandra Sinha, the President of the Goalpara District Congress Committee, has also issued a public statement expressing his regret for organising public meetings and processions, etc., on the eve of the visit of the States Reorganisation Commission in contravention of the directions of the Congress Working Committee. Lastly, Shri Bishnuram Medhi, the Chief Minister of Assam, came down to Calcutta along with S.J. Mahendra Mohan Chowdhury, the President of the Assam Provincial Congress Committee, and held discussions with Dr. B. C. Roy. After the talks were over, Dr. Roy told the Press the subjects they discussed and the views they held on different questions. It appears from those Press Reports that S.J. Medhi has tried to impress that Bengalees have no difficulty in Assam and the rules do not discriminate against them. Unfortunately, this is not a fact. Even from S.J. Medhi's statements it would appear that there are discriminatory rules which operate against the Bengalees. Moreover, S.J. Medhi has not given all the facts. From the days of the Line System up till even now there are rules in Assam which discriminate against the Bengalees of Assam. We do not propose here to cover the whole ground, but it is necessary, at least, to examine what S.J. Medhi has said now.

PRINCIPLES ENUNCIATED BY DR. ROY

In his talks, Dr. Roy has enunciated the following principles:

- (1) A child in the primary stage must have education in his or her mother tongue.

- (2) Students of higher classes should learn Assamese, though facilities must be given for imparting instruction through Bengali or English or Hindi, provided there is demand for the same.

S.J. Medhi does not appear to have disputed the soundness of these principles.

SJ. MEDHI'S ASSERTIONS

- (1) In reply, Shri Medhi has denied that discrimination is being made between one school and another, so far as aid to Bengali schools is concerned.

- (2) As regards secondary schools, S.J. Medhi has said, (a) there was no discrimination about aid, (b) there was no discrimination about admission, (c) there was no discrimination about the grant of Scholarship.

- (3) The question of domicile was then discussed. Let us now examine these points *seriatim*.

THE BACKGROUND

In Assam, restrictions on landholding on the basis of indigenous and non-indigenous population has substantially affected the language statistics. The fear that non-indigenous persons may not be permitted to hold land*—and those who do not have Assamese as their mother tongue are not regarded as indigenous persons—has compelled people to return their mother-tongue as Assamese, even when it is not so. (See *Assam Census Report 1961*). In all discussions it will be necessary to remember always this background. Otherwise the picture will not be clear.

PRIMARY SCHOOLS

1. Let us quote the Government Reply to the Question put by S.J. Santosh Kumar Barua, 4th session of the Assam Legislative Assembly, 11th September, 1953.

* See Letter No. Rs. 195/47/188 dated Shillong, the 4th May, 1948: "Government reiterate their policy that settlement of land should in no circumstances be made with persons who are not indigenous to the Province."

Statement showing the number of Primary Schools in Dhubri Subdivision, having as Medium of Instruction, Assamese, Bengali, etc., separately shown for different years.

	No. of Schools	1947-48 Expenditure (Rs.)	No.	Exp.	No.	Exp.	No.	Exp.
			1948-49		1949-50		1950-51	
1. Lower Primary Schools with Assamese as Medium of Instruction	348	96,135	582	211,470	773	384,063	833	358,990
2. Lower Primary Schools with Bengali as Medium of Instruction	250	66,000	130	48,360	45	22,236	3	4,674
3. Lower Primary Schools with Hindi as Medium of Instruction	Nil	Nil	Nil	Nil	2	983	2	1,367
4. Lower Primary Schools with Caro as Medium of Instruction	Nil	Nil	Nil	Nil	1	336	1	336
Total	598	162,135	712	259,830	821	4,07,648	839	3,65,397

Two facts emerge from this very remarkable statement. (1) It will be contended, in the first place, that Assamese-speakers have now increased very much. But in that case we shall have to remember the artificial and unreal nature of the increase. (2) But even granting for the sake of argument that there has been an increase in the number of Assamese-speakers, the Bengali-speakers yet constitute, even in 1951, by their own computation, 17.4% of the total population of the district of Goalpara. The percentage would be much higher in the Dhubri Subdivision which is more Bengali-speaking. The number of schools, using Bengali, is however much lower than 17.4%. In absolute number it is now only 3, while the number of schools using Assamese has gone up as high as 833.

Is this not discrimination?

2. There is also more direct evidence of discrimination. I give only a few instances collected at random from the different memoranda submitted before the States Reorganisation Commission:

(i) Order dated 4-12-48 by the Deputy Inspector of Schools, Dhubri,—Order No. 5965—4920 dated 4-12-48:—"Sishupathsala all the Local Board M.E. and L.P. and aided schools must take up Assamese in their Schools." Sd. H. Tamuli Phukan, D.I. of Schools, Dhubri.

(ii) Order by the Inspectress of Schools, Assam, as recorded in the Inspection Note on the Bidyapara Girls' Middle English School, Dhubri, as forwarded by her memo No. 696-700 dated 18-1-49:—"All the primary classes should have Assamese as the medium."

(iii) Letter No. PSO/15/48/534-48 from the Secretary, Provincial Primary Education Board, Assam, Shillong to the Secretary, Dhubri Subdivisional Primary Education Board, sanctioning a recurring grant of Rs. 210:—"The grants are sanctioned on

condition that the medium of instruction must be Assamese."

All these instances relate to primary schools. Can it still be contended that there is no discrimination about the primary schools, no discrimination about grants, no forced Assamese-isation? Can it be said that the principle enunciated by Dr. Roy that primary schools must give education in the mother-tongue of the pupils is being at all respected?

HIGHER EDUCATIONAL INSTITUTIONS

Here, the domicile rules act as a great discriminating factor. But of that later on. Here also, the facts are too many to permit detailed recapitulation. We give only a few illustrative examples:

The medium of instruction in the Government High School at Dhubri was Bengali in the lower classes from the very inception of the school some 60 years back, English being the medium in the higher classes as elsewhere. When in the thirties, Calcutta University prescribed vernacular to be the medium of instruction, the Dhubri Government High School remained the only Government High School in the Assam Valley Districts, with Bengali as the medium of instruction. Arrangements were made however, to impart children speaking Assamese through the medium of Assamese. But since March, 1954 the medium of instruction has become Assamese, and there is no arrangement for teaching Bengali-speakers in Bengali. Similar situations have arisen in the Hamidabad Aided High School and south Sālpara Aided High School.

Can it be said that there is no discrimination, even if we leave out the question of domicile at the present moment?

GRANT OF SCHOLARSHIPS

Sj. Medhi has said that there is no discrimination in granting Scholarships. We mention below two cases:

(1) Policy in this regard was laid down in Circular Letter No. 27868-933 dated 10-9-48 of D.P.I., Assam to the Heads of all Government and affiliated institutions. The Circular stated, "Government of Assam have decided that they would not henceforth be responsible for the payment of any Scholarship in any institution to those students who do not have their domicile in Assam, as constituted after the transfer of a portion of Sylhet to East Bengal."

(2) The most glaring case of discrimination in this regard is that of Shri Ranjan, Prasad Sen Gupta, who stood 10th in the University of Gauhati in the 1953 Matriculation Examination (Roll Dib. No. 398) from the Tinsukia Bengali High School. He has been refused Scholarship because he is not domiciled, though his father is a railway official at Tinsukia, has landed property in North Laming and is living in Assam for three generations.

(3) A girl-student, Sabita Dam, Roll Gau. No F-7, found eligible for a Scholarship on merits among girls, was refused the Scholarship, though her father owns a house at Gauhati and is an advocate of the High Court there. He is also a permanent resident of Assam Valley as certified by the Deputy Commissioner. The same was the fate of three other girls Miss Sabita Sinha, Chitra Ghosh and Bela Chowdhury, who are refugees from East Bengal and now citizens of India in Silchar, Assam. They were deprived of Scholarship earned by merit from Silchar Government Aided Girls' High School on the ground of domicile.

I believe the facts speak for themselves.

THE QUESTION OF DOMICILE

I do not know how domicile can be still enforced even after the passing of the Constitution. Bihar and Assam have long been insisting on domicile. After the commencement of the Constitution, the Bihar Government had to take recourse to a subterfuge. In reply to a Press statement issue on behalf of the West Bengal Provincial Congress Committee, the Bihar Government came out with a Press Note, which stated *inter alia* as follows:

"The rules were further liberalised after coming into force of the present Constitution. It was laid down in a circular of the State Government dated November, 26 1950, that no Indian national could be eligible for any employment under the State Government on the ground only of residence, or place of birth, though the State Government allow preference to candidates, who are natives of or domiciled in the State, for purposes of appointments in the offices under the State."

Assam Government, however, has not felt the need of even this subterfuge and having just written a letter to the Government of India, are continuing their policy of domicile in a remorseless and unabashed fashion.

Sj. Medhi has tried to give the impression that the domicile rules have now been liberalised. Let us understand its exact implication. The original policy was laid down in the Chief Secretary's Circular No. AAM/10/53/137. It is too long to be quoted in extenso, but we mention the salient points:

(1) *Employment under the State Government*: The first paragraph stated that "a person belonging to any of the following categories shall have to obtain a certificate to the effect that he is a native of, or domiciled in, or a displaced person migrated to Assam for the purpose of employment under the State Government." The second paragraph says, "A person who is not a native of Assam shall be deemed to be domiciled in it only when he has become the owner of a homestead in the State, has already lived in that homestead for 10 years and intends to live in that homestead until he dies." It now seems that a person living in a rented house has also been made eligible, but other conditions remain as they were. About the last condition (living till he dies) the official explanation, as laid down in letter No. AAM-14/48/233 dated the 21st October, 1947 from the Secretary to the Government of Assam, Appointment Department, is as follows:

"The last condition as to intention is not capable of such easy verification. At the same time this is the most important ingredient in determining domicile—it is necessary therefore that in deciding this point such circumstantial evidence as to whether the applicant has landed properties or other interests in his native place and whether he pays frequent visits there should be taken into consideration."

Now, what does this really mean? A Bengalee, residing in Assam for three generations, cannot obtain domicile if he has any property in Bengal or visit Bengal? Is this the way to respect the spirit of our Constitution?

(2) About displaced persons, the said Circular of 1948 lays down that

"The Government policy in the matter of appointment of displaced persons is that the cases of displaced persons shall be considered only if suitable local candidates (i.e. the candidates who are natives of, or domiciled in Assam) are not available."

It is very remarkable that while in other states, refugees are getting priority, even at the cost of the children of the soil, Assam follows an opposite policy.

(3) In the 3rd paragraph of the said Circular, it has been laid down that

"For the purpose of contracts, settlement of fisheries, ferries' toll bridges, forests, excise shops, etc., a person shall be deemed to have acquired a domicile in Assam if he has been in residence in the State for at least 10 years along with his family and can also speak Assamese or one of the tribal languages, if resident in districts other than Cachar, or can speak Bengali or Assamese or one of the tribal languages of Cachar, if resident in the Cachar District."

Now is this not discrimination again? If this formula is now put into operation in West Bengal, I wonder how many non-Bengalees who come here for the

season, stay almost invariably without their families, get jobs and contracts and send out money to other states will have to be driven away! But still it is not considered to be discrimination in Assam! If this is regarded to be a satisfactory formula for Bengalees in Assam, why then should it not be applied by the Government of West Bengal to non-Bengalees in West Bengal?

(4) The last paragraph of the Circular refers to admission into State-managed educational institutions. It lays down that

"For the purpose of admission to State-managed or State-aided educational institutions, a candidate who is not a native of or domiciled in Assam shall be deemed to have acquired a domicile in Assam if he/she or his/her parents fulfil all the requirements as stated in para 3 above" (i.e. qualifications for getting contract, etc.).

It is of course essential as Dr. Roy has said that a person working in Assam should speak Assamese if he is to be useful. But in case he does not speak Assamese and wants to stay in Assam say only for 5 or 7 years, will he be deprived of all advantages of education? Is that the policy followed in West Bengal? Had it been followed, how could the sons of thousands who come and stay in Calcutta for service or for business for a limited period, get education? The problem is really more acute in an under-developed state like Assam, where, unlike West Bengal, State-managed and State aided institutions are the only ones of their kind, there being no other private institutions of that type? And yet we would not call this discrimination?

CONCLUSION

Above facts speak for themselves. They conclusively prove that in spite of whatever picture S. J. Medhi may try to draw about Bengalees in Assam, there is undoubtedly victimisation and discrimination. Scholarships are not given even when earned by merit; even in primary classes Assamese is being forced upon pupils, Assamese is becoming the only medium of instruction even in predominantly Bengali-speaking areas; discrimination is being made in the matter of State-employment and admission to State-managed and State-aided, educational institutions and the slight concessions granted so far, even in the face of the Constitution, do not lessen the rigours of the system in the least. And if we remember in this context the highly discriminatory policy on the matter of ownership of land, the picture becomes an extremely dark one.

In fact if we study the atmosphere in Assam, we find that unless there is a radical and fundamental change of policy, the picture cannot improve in spite of all assertions. For what is actually Assam? We do not want to go back to history, but even now Assam is not at all a homogeneous province. It is not a province like Uttar Pradesh or West Bengal where the overwhelming

majority of the population has the same affinities, speak the same language and so on. As Assam Census itself observes, it is a veritable Babel of tongues. According to the Assam Census of 1931 (p. 177) the proportion of Assamese-speakers in the whole of the then Assam at successive Census enumerations was as follows:

Percentage of Assamese-speakers in Assam

1931	1921	1911	1901
21.6%	21.6%	21.7%	22.0%

In other words, only about 1/5th of the total population spoke Assamese. The Census of 1951 is absolutely unreliable in this respect and even the Census Superintendent of Assam has practically admitted that. But even according to that Census, where the proportion of Assamese-speakers has been much inflated, the Assamese-speakers constitute only 56% of the total population. Moreover, they are concentrated heavily in five districts. Thus it would be wrong to suppose that Assam is a State of the Assamese-speakers in the sense that West Bengal is a Bengali-speaking State. A minority language rules forcibly over the entire province. Now if for the purpose of State language Assamese has been adopted, though there is no reason why it should be so, it may be understood that all persons seeking State employment must understand and speak Assamese. But can there be any cogent reason why a contractor operating, say, in Mizoram or Garo Hills, must speak Assamese before he can be allowed to get contracts? Is this not an unnatural state of affairs? Perhaps this is bound to be so, so long as it is not clearly understood that Assam is not an Assamese-speaking province but a polyglot one and the Assamese language must resort to all unfair tactics if it has to be spread all over the province. The sooner the proper linguistic situation in Assam is understood the better for all concerned. Let us hope, the States Reorganisation Commission will not overlook this fact.

One word more. As the facts narrated above prove, Bengalees in Assam are being sharply discriminated against and the rules are not fair to them. Bengali as a language is also being unmistakably repressed. It is also clear from S. J. Medhi's statements that he considers the rules to be fair and the situation all right and he has no intention to introduce any change. But while having no intention of really doing justice, S. J. Medhi is trying to impress upon people that Assam is now anxious for the welfare of Bengalees and even seeks the help of West Bengal for her own development. We wonder what is the real implication of this policy. Is it the idea to lull the States Reorganisation Commission into the sense that everything is now all right for Bengalees in Assam and it would not therefore be necessary to transfer the Bengalee-speaking areas of Assam to West Bengal though in reality Assam wants to do nothing for them?

GEOGRAPHIC ENVIRONMENT IN INDIA

By PROF. C. B. MAMORIA, M.A. (Geog.), M.Com.

INTRODUCTION

THE natural resources of a country are of primary importance for the development of the economic life of its inhabitants. As a matter of fact, natural resources determine the economic life of a nation. England, for example, is an industrial country but she owes her present position to her coastlines, rivers, the proximity of rich coal mines and iron fields and the temperate climate which induces hard-working habit. The U.S.A. is an agricultural as well as an industrial country. She possesses the requisites of industrialisation, coal, petroleum, timber, cotton and other agricultural raw materials, and at the same time its soil at places is very fertile and climate suitable for human development. Japan, too, is an industrial country only because there is no scope for agriculture, as the very nature of the soil is not favourable for agriculture. France is an agricultural country and Germany an industrial country only because of the natural resources available in those countries. Man may grow rich in knowledge and intelligence, he may conquer nature, span seas and cut mountains, travel under water and annihilate distances by fast means of locomotion, and by electricity turn night into day and tone down the rigours of climate to suit his living and working conditions and through irrigation schemes may secure his independence from Nature in the matter of rain and he may, above all, harness mighty forces of nature in his services, but his mastery of nature is not complete and unquestioned. Nature has a knack of escaping from chains and asserting her way. All operations, even living, are hampered by weather conditions. Some physical disturbance might upset human plans. Thus he has been able to conquer nature only partially, and therefore, the effect of geographical environment on the life and working of any people cannot altogether be ignored and completely eliminated. "Undoubtedly men's choices are limited and conditioned and their projects limited by physical framework they live in."

The term 'geographical environment' in relation to man covers all those features of land in which he lives, in respect of their effects upon his habit of life in whatever connection. "Such features include the surface of the land, with all its physical features and natural resources, the nature of the soil, whether fertile or unfertile, well-watered or dry, its position, whether insular, continental or peninsular; its relation to other lands surrounding it, its climate, vegetation and mineral wealth, the distribution of land, and water, mountains and plains, plants and animals and

all the cosmic forces—gravitational, electric, radiational, that play upon the earth and affect the life of man."

In the case of India, a study of her population problem and her economic activities should start with an investigation of the physical environment. This subject may, therefore, be considered under the heads of situation and coastline, physical features, geological structure, climate, water resources, flora and fauna and the facilities of transportation.

LOCATION, SIZE, ETC.

India is a vast country lying entirely to the north of the Equator between latitudes 8 deg. and 37 deg. north and longitudes 66 deg. 20 min. to 97 deg. It is one of the central and largest of the three irregular peninsulas of Southern Asia. It bridges the space between the semi-arid Southern Asia and the rice-producing and rice-exporting countries of the South-Eastern Asia. It, therefore, occupies a central position between two distinctly different regions. It possesses a highly favourable position as regards the rest of the world for purposes of international trade. She stands at the head of the Indian Ocean at the very centre of the Eastern Hemisphere commanding trade routes running in all directions and connecting India with U.S.A., Great Britain, Germany, France, etc., in the west; S. Africa in the south-west; Ceylon in the south and China, Japan and Indonesia, etc., in the east and Australia in the south-east.

It measures 2,000 miles from north to south and 1,700 miles from east to west. It has a land frontier of 8,200 miles and a coastline of about 3,500 miles. Extending over an area of 12,69,640 sq. miles, she comprises 29 States (including Jammu and Kashmir and Andhra). Measured by the extent of its territory, she is the seventh largest country in the world. It is about 13 times as large as U.K.; 8 times the size of Japan; two and a half times the size of U.S.A. and more than a third of Canada and of Europe and a seventh of U.S.S.R.¹ Its shape has been defined by the great Greek geographer, Strabo as "rhomboidal rather than triangular with an acute apex pointing southwards into the southern Indian Ocean."²

The situation of an area relative to the larger mass of a region often exercises a significant influence. On a land frontier, the people, by force of circumstances, have to develop a turbulent and martial spirit and may develop a defensive or aggressive spirit, according as their region is better or worse than that across the border. They are brave and courageous through elimination of the weaklings and are in the front rank in attack or defence.

There is no part of the world better marked off by Nature as a region by itself than the Indian subcontinent.⁵ The northern borders are well-defined by lofty mountains with their snow-capped peaks penetrating far into the sky. There are no easy ways in and out through the mountain-wall which shuts off India from the rest of Asia but there are a few difficult passes like Zozila and Shipki passes in the north. Towards the east the eastern offshoots of the Himalayas are not much high but due to deep gorges and ravines and impenetrable forests ingress and outgress of people to and from Burma is quite impossible except through the recently made Ludo Road. On the southern extremity the Indian Ocean with its two arms—the Bay of Bengal and the Arabian Sea—washes her eastern, southern and western shores. In the south, Ceylon represents itself as a lotus flower paying homage to mother India. Thus India is a geographical entity due to the separation from the rest of the continent of Asia by the Himalayas. This geographical isolation explains the uniqueness of Indian culture. Indian ideas and institutions, taken as a whole, resemble those of no other people. They have tended to transform and absorb any foreign elements that trickled into the region, for Indians though sometimes politically conquered by outsiders, were never—except possibly by the original Aryans—culturally conquered.

India has a coastline of 3,500 miles, which gives one mile of coast to every 400 sq. miles of area. India for its extent has one of the shortest coastlines of any important country bordering the ocean. Its outline is scarcely broken by a single inlet.⁶ Even this short stretch of coastline is remarkably uniform and straight and characterised by a general absence of deep indentations. The sea around the coasts is nowhere deep, the 100-fathom line running parallel to both the Arabian and the Coromandal Coasts; this combined with the flat and sandy nature of the seabottom makes navigation extremely difficult. The coast of India belongs mainly to the Atlantic type and are non-embayed, reefless and continental in nature.⁷ These coasts are practically devoid of natural harbours

and hence the great paucity of good ports. The whole is storm-swept and scourged by fierce currents; there are hundreds of miles of bare rock-walls in the western half and of mangrove-swamp in the eastern half; the river harbours are the most expensive and dangerous in the world, and the only sea-port that is natural and always firstclass is Bombay,⁸ while Madras, Vizagapatam, Calcutta, Okha, Kandla, etc., are artificial harbours made by the enterprise of man. The Gulf of Kutch, Cambay, the backwaters of Cochin and Malabar, the Palk Strait and the Gulf of Mannar, the Palicut, Kolar and Chilka lakes and the indentations on the mouths of the Ganga are the few inlets and straits found along the Indian coast. These are all shallow and permit navigation when they are made deep by dredging operations.

The coastline of a country plays an important part in promoting or retarding the economic development of an area. If the coastline is broken and easily accessible from the interior, as in the case of the Gujarat and Malabar Coasts, intercourse and trade with foreign countries by sea are facilitated, and the people not only become progressive and civilized, though ease- and peace-loving, but they also develop a broad cosmopolitan outlook instead of becoming sectarian or communal, while the nearness to the sea makes them adventurous and enterprising with a well-developed commercial instinct. If, however, the coastline is not easily accessible from the interior, as in the case of Konkan, the people tend to be intelligent, progressive and ease-loving, but, being isolated are simple and backward, though adventurous, and make good fisher-folk and seamen.

PHYSICAL FEATURES

There are very great differences in the physical conditions of India. In the north, there are magnificent snow-capped mountains. At their feet lie smooth wide spaces of depressed river basins—either dry or sun-scorched or cultivated and water-logged under a steamy, moisture-laden atmosphere. To the south spreads the Deccan Plateau. There the indigenous forests still hide the scattered classes of aboriginal tribes, flanked on the west by the broken crags and castellated outlines of ridges overlooking the Indian Ocean, and on the south by gentle, smooth, rounded slopes of green uplands. On the one hand, there is in Bengal a land of constant heat and damp, luxuriant vegetation, river banks, rice fields and cocoanut groves with a few cities and densely inhabited by a mild and unaggressive population. On the other, there lie East Punjab and Western U.P., scorched with winds like the blast of a furnace, with a cold and bracing winter climate, covered with wheat and barley and products of temperate zone, and the famous cities and splendid monuments containing a strong and virile population.

8. L. W. Lyde: *The Continent of Asia* (1938), p. 356.

On the basis of topography, India may be divided into four well-marked parts:⁹

1. The Himalayas,
2. The Indo-Gangetic Plain,
3. The Deccan Tableland,
4. The Coastal Plains.

1. The Himalayas extend over a distance of 1500 miles in a sword-like direction and are 150 to 250 miles in width. They are more steep towards the plains and are gentle towards the Tibetan Plateau. They consist of a series of parallel but converging ranges intersected by valleys and big plateaus. They are built of three parallel ranges¹⁰ and have the world's highest peaks, viz., Mt. Everest (29,141 ft.), Mt. Godwin Austin (28,500 ft.) and Kinchinjanga (28,146 ft.). In addition to being the highest, they are also the newest mountain-fold range in the world, having been formed by a Gangetic upthrust from a former ocean-bed known as Tethys. As a result they are eroding rapidly and sending out rich loam to the plains below. The region contains the fertile Kashmir and Kulu Valleys (so famous for fruit cultivation), and in the east, the mountain ranges are much lower and are known as Patkoi; the Naga Hills are in the north-east and the Khasi and Garo Hills in the south-west of Assam.

The Himalayas have acted as a barrier to piercing cold winds of the north and have protected India from the foreign attacks from the north. Historically its importance lies in isolating India from the rest of northern and central Asiatic and other European countries. For ages natural barriers of high mountain walls and stormy tropical seas have largely protected India from the influence of the rest of Asia,¹¹ so that

9. The 1951 Census Report divides the country into four topographical categories: (i) Mountainous area which rises over 7000 ft., contains 10.7 per cent of total area of the land; (ii) Hilly tracts, which are about 7000 ft. above sea level, comprise 18.6 per cent of all land in India; (iii) Plateau region, which lies between one and three thousand feet above sea level, measures 27.7 per cent of the total land area; and (iv) Plains region, which is below 1000 ft. above sea level, contains 43 per cent of the area. The following table gives the relevant figures for the country:

Zone	Total land area	Mts.	Hills	Plateaus	Plains
N. India	726	79	41	34	572
E. India	1,675	145	521	204	804
S. India	1,075	4	278	286	506
W. India	957	..	198	284	476
C. India	1,852	..	333	1,125	395
N.-W. India	1,226	97	88	300	742

India (including J and K) 8,126 873 1,506 2,248 3,498
(Census of India, 1951, Vol. I.A., p. 8)

10. The three ranges of Himalayas are: (i) Great Himalayas—1500 miles long with an average height of 20,000 ft.; (ii) Lesser Himalayas—South of Great Himalayas, average elevation of 15,000 ft.; and (iii) Outer Himalayas lying between Lesser Himalayas and the plains, average elevation 3000 to 4000 ft. above sea-level.

11. G. C. Clewell & H. T. Thompson: *Land and People*, Vol. IV, p. 82.

they have checked the flow of barbarians into the country developing its own art, industry and culture peacefully uninterrupted by the turmoil of the rest of the world. But at the same time they have made trade through the northern border difficult and tedious. The main Indo-Tibet trade routes pass through the Gelepla and Natulal Passes. There are also other Passes like Rohtag, Bara Lapcha and Jojila in the west and Shipki in the centre but they are not so important.

The Himalayas act as a barrier to the monsoon winds and prevent them from going across. This gives plenty of rains to the Himalayan region and a number of the big rivers—particularly the Jamuna, the Ganges, the Brahmaputra, the Sutlej, etc.—which receive their waters from the mountain snows and are fed by rain water in the rainy season, originate in this area. Like two great arms the Ganges and the Brahmaputra completely clasp themselves round the Himalayan ranges so that all the rain that falls and all the snow that melts (whether in their northern or southern flanks) is bound to come into India. Geographically, the Himalayas belong as much to Tibet as to India, but the river systems have lent all the benefits of these mountains to India alone.¹²

The main rivers of India together with their numerous tributaries have their sources in the Himalayas and all bring down water and silt that has made the Gangetic plain, covering the whole of north India, the most fertile area of its size in the world. In a way, this plain may be called the "Gift of the Himalayas and its rivers."

Varieties of climate on these mountains have facilitated the growth of natural fauna of various types. Owing to the heavy rainfall these mountains are clothed with dense forests containing from the silver spruce, *deodar*, fir on the very high altitude to *neem* and *shesham* of the lower slopes. The lesser and outer Himalayas are rich in animal and forest resources. There are extensive tea-plantations in the outer Himalayas from Assam to East Punjab. Physical difficulties do not permit cultivation excepting in the Lower Himalayas where rice, chilly, ginger, tea, wheat, potato and fruits are cultivated.

The scenery and mighty peaks of the Great Himalayas attract tourists and climbers from different parts of the world and this provides a source of income to many hill stations like Darjeeling, Simla, Nainital, Mussourie, etc. Because of such influx of people, many hill stations have developed hotel industry in India, although it is not comparable to what exists in such countries as Switzerland and Italy.

The mountains have also influenced the life and character of the people living in this region. A hard life, isolation in valleys, and difficulties of intercourse

12. C. Morrison: *A New Geography of India and Burma* (1926), p. 67.

are characteristic features of these regions, so that people in these regions are sturdy, brave and liberty loving, but often simple, backward and unprogressive, slow and stolid. They are essentially conservative and outside influences do not reach them. Being conservative, they are sensitive to criticism, suspicious of strangers, superstitious, religious and strangely attached to home and family. The struggle for existence is hard and this develops in them the qualities of frugality, providence, industry, honesty and indifference to luxury. These regions by isolation and retardation often preserve old customs and practices. Mountain people have to raise their food supplies from an unproductive soil and under the stimulus of hunger they often raid the fields and stores of their rich neighbours on the plains below and also indulge in the habit of cattle-lifting in the time of drought.

The Indo-Gangetic Plain lies between the fold mountains of the north and the stable tableland of the peninsula. It is a part of the great depression which is traceable across Northern Africa, Southern Europe and Southern Asia. It occupies an area of about 250,000 sq. miles and extends for nearly 1,500 miles from east to west with a width of 150 to 250 miles. This region is served by a number of rivers, viz., the Ganga and its tributaries—the Jamuna, the Gomti, the Gogra, the Gandak—and in the east the Brahmaputra and its tributaries. The Delhi Ridge divides it into two parts. This plain is wholly composed of the sediments deposited by three great rivers of northern India. It is literally the dust of the mountains.¹³ The great depth of the alluvium has made this plain very fertile. No rock-bed is disclosed by boring done from 500 to 1,000 ft. It is the region of the deepest soil. Geologist R. D. Oldham has concluded that the maximum depth of the soil is about 15,000 ft. near its southern edge. The deposits include a great thickness of clay, loam and silt. Every year new silt is laid by the rivers which make the soil very fertile for the growth of crops.

This plain contains nearly one-third of the land and two-third of her population and also has the highest density of population. Due to extensive irrigation facilities dry and desolate tracts have been turned into populous spots of smiling plenty. This region has always been known for its inexhaustible supply of people who wanted to enjoy its bounty either through the sword or through the scale.

Because of fertile alluvial soil, favourable climate, flat surface rendering possible the construction of roads and railways, navigable rivers and canals, agriculture is the chief occupation of the people in this plain. The chief crops raised are rice, wheat, sugarcane, tobacco, gram, barley, oilseeds, etc.

Although of great importance as the principal theatre of Indian history, geologically speaking this plain is the least interesting part of India. Geologically the history of this plain is only the annals of yester-years of being the alluvial deposits of the rivers brought down from the Himalayas and deposited at their foot.¹⁴

In plains, the characteristic feature is the facility of communication and intercourse, leading to the development of intelligence and the evolution of civilization and progress. It is the small and protected plains that have seen the rapid achievements of human progress. Easy life brings about a desire for ease and pleasure and peace; but the development of intellect breeds cunning or shrewdness and ambition. The people of the plains, therefore, tend to become politically minded and intriguing. They have a great diversity of occupations, commercial and industrial; they are amenable to discipline but are not martial.

The Deccan tableland is an elevated plateau separated from the Indo-Gangetic plain by a mass of hill ranges varying from 1,500 to 4,000 ft. in height. The more important of these being the Aravalli, Vindhya, Satpura, Maikal and Ajanta. On the west it is hemmed off from the Ocean by the Western Ghats and on the east by the Eastern Ghats. It is a part of the earth's outer shell that is composed in great part of generally horizontal rock-beds that stand upon a firm and immovable foundation and that have for an immense number of years remained so in a passive state amidst all cataclysm and revolutions that have again and again changed the face of the earth. The rocks composing this plateau are the various gneisses and other crystalline rocks and there is a great richness of wealth associated with them. Overlying these rocks is a great thickness of unfossiliferous rocks. The rift valley of the Nerbada divides this plateau into two irregular parts—the Northern being known as the Central Indian (Malwa) Plateau and the Southern the Deccan Tableland. On the former are to be found large areas of ravines which are quite unfit for cultivation besides some fertile regions too which produce much wheat; while on the latter are found dark-coloured basalt rocks and the black cotton soil which represents one of the most fertile soils of India. This tableland is at places very rocky and uneven and extends to a number of hilly ranges in far south which are over 4000 ft. high. Of these, the Nilgiris, and the Cardamom hills are the more important. This plateau is traversed by the rivers Nerbada and Tapti which fall into the Arabian Sea, and the rivers Mahanadi, Godavari, Krishna and Cauvery which drain into the Bay of Bengal. The plateau is poor in forest resources but it is rich in mineral resources and regarded as the 'store-house of minerals.' The principal

crops of the Deccan are cotton, coffee, tea and spices. Cinchona and cocoanut are also available.

The peninsula is flanked by coast ranges known as the Western Ghats and the Eastern Ghats. The former are much more considerable and form a gigantic and continuous sea-wall rising over 3,000 ft. above sea-level. They are pierced by no valley of any size and are unbroken except for a very curious gap (Pal Ghat) two hundred miles from its southern extremity on the Nilgiris. In the north also at two places the Nerbada and the Tapti traverse these Ghats, viz., at Thal Ghat and Bhor Ghat through which Central and Southern Railways pass. As these Ghats have steep slopes towards the sea, the rivers are swift-flowing and short and therefore give rise to waterfalls in their lower courses.

The Eastern Ghats (1,500 ft. high) are much less formidable and are broken, discontinuous and interrupted by many broad valleys of the rivers like the Mahanadi, the Godavari, the Krishna and the Cauvery—all flowing into the Bay of Bengal. These rivers are rain-fed and hence dry up during the summer. Their course is rapid and they abruptly descend from a higher level and are, therefore, little useful for irrigation but are favourable for the producing of hydro-electricity. The important products grown are rice, pulse, sugarcane, cotton, millets and oilseeds.

The coastal plains are the narrow strips of land on both sides of the plateau. These have been formed by the wearing down of the oldest tableland into coastal plains. The western plain is very narrow and is 40 miles wide in some places. It extends from Cambay Gulf to Cape Comorin. On this coast the monsoon floods bring enormous silts and help the growth of forests and plantations. Cocoanut, palm, cardamom, rubber and spices are largely grown. The shores of these plains have very few creeks and outlets. On the Malabar coast there are some lakes, lagoons and breakwaters, which are joined by canals. They serve for good coastal traffic by boats, rafts and canoes. These plains are thickly populated.

The Eastern Coast stretches from the delta of Ganga to Cape Comorin. It is wider and the beach is surf-beaten. This coast is intersected by numerous swift-flowing rivers. The lower section of the plain consists of the deltas of the rivers and is entirely alluvial while the upper section consists of plains in the upper courses of rivers and hence is partly alluvial and partly paneplain. These plains produce good crops of rice, sugarcane, jute, etc.

Geological Structure

According to Edward Suess, there was a hypothetical southern Palaeozoic continent known as the Gondwanaland, which included practically the whole of Africa, Madagascar, Peninsular India, Australia, Tasmania, Antarctica, the Falklands and all South America (except the extreme west and north-west)¹⁵

—these were all rigid masses of the south,¹⁶ while over the areas where now exist the regions of the Punjab, Rajasthan, U.P., Bihar and Bengal, the tides of a wide and shallow sea ebbed and flowed. This continent finally broke up during the late cretaceous period due to a series of volcanic cataclysms and violent earthquakes which entirely changed the natural features of this vast continent separating America, Africa, India and Australia—one from the other. Finally, as the result of a slow process of geological evolution extending over thousands of years, India acquired her present shape and physical characteristics.

Geologically, India comprises all the rock formations of all ages from the Archaen to the present day, covering a period of nearly 2,000 millions of years. The peninsula is a 'Shield' area geologically composed of very ancient rocks of diverse origin most of which have undergone crushing, recrystallisation and metamorphism. Over these ancient rocks lie a few basins of Pre-Cambrian and later sediments and extensive sheets of horizontally bedded lavas of the Deccan trap formation. The Mesozoic and Tertiary sediments are found mainly along the coastal regions. The extra-peninsula, though containing some very old rocks, is predominantly a region in which the sediments, laid down in vast geosyncline (Himalayan Geosyncline) continuously from the Cambrian to the early Tertiary periods, have been ridged up and folded into the Great Himalayan mountain chain. They thus show enormous thickness of sedimentary rocks, representing practically the whole of the geological column, which have been compressed and raised into dry lands only in geologically very recent times. The core of the mountains is composed of granitic intrusions of presumably Tertiary age. The southern fringe of the Himalayas bordering on the plains consists of fresh-water and estuarine deposits of Mio-Pliocene age derived largely from the rising Himalayas. The Gangetic plains are built of layers of sand, clay, etc., of geologically very recent date, filling up a deep depression between the Peninsula and the Extra-Peninsula.¹⁷ The depth of the alluvium in the Indo-Ganges depression is tremendous, estimated to be from 6,500 ft. to 15,000 ft. The trough is not of uniform depth along its whole length; it is probably at its maximum between Delhi and the Rajmahal Hills and shallowest in Rajasthan and Assam.¹⁸

The successive geological formations have left their marks on the physiography of India, and they may be had under six heads, viz., (1) Archaen,

(2) Vindhyan, (3) Gondwana, (4) Basaltic, (5) Tertiary and Cretaceous and (6) Alluvial.¹⁹ As, however, a detailed examination of these formations is not necessary for our purpose, we shall content ourselves with a brief discussion of the various kinds of soils and minerals that owe their existence to them and which in turn determines to a great extent the distribution and activities of its population.

The Indian Council of Agricultural Research set up an All-India Soil Survey Committee, which submitted its report in 1953. According to this Committee, in India the following soil groups are found:²⁰

(1) Red soils, (2) Laterite soils, (3) Black soils including black cotton soil, (4) Alluvial soils, (5) Forests and Hill soils, (6) Saline and Alkaline soils, and (7) Peaty and Marshy soils.

Agriculturally the most important soils are the alluvial ones which occupy extensive tracts of land in the Northern, North-western and North-eastern parts and include greater parts of Gujarat, Rajasthan, East Punjab, Uttar Pradesh, Delhi, Bihar and Assam (centre areas of Lohimpore, Darang, Sivsagar, Kamrup, Goalpara and parts of Garo Hills), West Bengal, the Godavari, the Kistna and the Tanjore districts of Madras and the strips extending along the eastern and western coasts of the Peninsula. The depth of this soil exceeds 1600 ft. below the ground surface. These soils are derived mainly from the debris brought down from the Himalayas or from the silt left by the old sea which has not retreated. These soils differ in different parts of the country in physical texture and chemical composition. In North and North-west India, it is dry, porous and in some places sandy giving rise to crops not requiring the retention of a great deal of moisture about their roots. In Bengal, it becomes more compact, less coarse and moist where rice, sugarcane and jute are largely cultivated; while in the deltas of the Peninsular India, it is actually clayey, non-porous and of dark colour. The chief advantages of porous and light soils are that they are easily worked by the plough and easily permeated by water, leading to greater fertility of land where water supply is abundant; but their great defect is that they allow water to sink into the lower strata, and are unsuitable for the growth of those crops which require the retention of a great deal of moisture about their roots and thus they cause nonfertility in regions where showers are not frequent.

Alluvial soils are rich in chemical properties. Phosphoric acid, potash, lime and magnesium are found in sufficient quantities but are deficient in nitrates

and humus contents. These soils are of marvellous fertility producing under irrigation splendid crops of rice, sugarcane, tobacco, and jute. The regions of these soils are heavily populated.

The desert soils occur under arid and semi-arid conditions and occupy a large tract in Rajasthan and South Punjab. The Thar desert alone occupies an area of 40,000 sq. miles. These soils consist mostly of sands which have been derived from old sea-coasts. These soils contain a high percentage of soluble salts, varying degrees of calcium carbonates and are poor in organic matter. The limiting factor being mainly water, the soils may be reclaimed if proper facilities of irrigation are available. Very few crops specially millet, jowar and bajra are grown for want of water supply and hence the population supported by the regions is very small.

SALINE AND ALKALINE SOILS

Many parts of the arid and semi-arid regions of the north specially of Bihar, U.P., Punjab and Rajasthan give rise to saline and alkaline efflorescences. It is known under various names like *Reh*, *Kallar* or *Usar*. These efflorescences are mainly salts of sodium, calcium and magnesium. Soils impregnated with these salts are rendered unfertile and hence uncultivable. These salts are transported in solution by the Himalayan rivers, which later percolate in the sub-soils of the plains. This salt goes on accumulating in the areas of arid climate and insufficient surface drainage during the dry seasons; the soluble salts are sucked up in solution by capillary action to the surface and are deposited there in the form of white efflorescence. Similarly in places under irrigation by canal waters and in those in which the sub-soil water level is high as in the coastal tracts, this transference is facilitated. It is in this manner that saline and alkaline soils of the irrigated tracts of Bombay, Deccan, Madras and of those near the sea-coasts and in the Punjab and U.P. have originated. Such soils occupy over five million acres of land in Saharanpur, Mathura and Aligarh districts of U.P.;²¹ in Nira Valley of Bombay, Alkali land has arisen from canal irrigation and it has been recorded that 51,000 acres have been damaged in this way. The damage is enormous, the area representing more than 25 per cent of the actual area of irrigation.²² In the Punjab such area extends over 300 sq. miles.²³

Saline soils (Solon chak) containing free sodium and other salts are prevalent in the drier tracts as in Western Rajasthan; whereas alkaline soils (Solonetz) which do not contain any free salts are found in the irrigated tracts as in Bombay-Deccan. The degraded alkaline (Solodi) soil is rarely found in India due

perhaps to the presence of calcium salts in the saline soils.²⁴ The alkaline soils are deficient in calcium and nitrogen and are highly impervious.

PEATY AND MARSHY SOILS

Peaty soils originated in humid regions as a result of an accumulation of large amounts of organic matter in the soils. They may contain considerable soluble salts. Such typical peaty saline soils (Kari) have been observed in Travancore-Cochin. The depressions formed by dried river basins and lakes in alluvial and coastal areas sometimes give rise to peculiar water-logged and anaerobic conditions of the soil. The soils of these places are generally blue-coloured due to the presence of iron and also contain varying amounts of organic matter. Marshy soils of this type are found in coastal tracts of Orissa, in the Sundarbans and other places in Bengal, in the central portions of North Bihar, in Almora districts of U.P. and in the South-east coast of Madras.²⁵

BLACK SOILS OR REGAR SOILS

Such soils are the products of the decomposition of lavas. These soils occupy greater parts of Bombay and Saurashtra, the western parts of Madhya Pradesh, Madhya Bharat, Hyderabad and the districts of Bellary, Kurnool, Kuddapah, Coimbatore, Salem and Tennevelly in Madras. These soils are highly retentive of moisture and extremely compact and tenacious and rich in chemical properties. These soils are loamy to clayey in texture; vary in depth from 1 to 2 to several feet; and contain lime *kanhar* and free calcium carbonates, and contain heavy cracks in summer season. These soils are endowed with inexhaustible fertility and are useful for commercial crops. They are generally deficient in nitrogen, phosphoric acid and organic matter but potash, lime and iron are usually high. The kind of crops most suited to these areas is the *rabi*, but the *kharif* crops are also grown in many cases. Cotton, wheat, linseed and millet are the chief crops.

RED SOILS (TRAP SOILS)

The commonest form of red soils is sandy clay coloured by iron peroxide. It is either derived from the rock *in situ* or from its products of decomposition worked to a lower level by rain. The red soils comprise practically the whole of Madras, Mysore, South-east Bombay, East Hyderabad, and a strip of tract running along the eastern part of Madhya Pradesh to Chota Nagpur and Orissa. In the north, its area extends into and includes the greater part of the Santal Parganas in Bihar, the Birbhum district of Bengal, the Mirzapur, Jhansi and Hamirpur districts of U.P., the northern portion of Madhya Bharat, the Aravalli's and the eastern half of Rajasthan. The red

soils differ greatly in consistency, depth and fertility. On the uplands they are thin, poor, gravelly, sandy or stony and porous light-coloured soils on which food crops like bajra can be grown. But on the lower plains they are rich, deep, dark-coloured fertile loam on which under irrigation can be produced excellent crops like cotton, wheat, millets and pulses. These soils are rich in potash and lime but are poor in nitrogen and phosphoric acid.

LATERITE OR LATERITIC SOILS

These soils are characterised by compact vascular rocks composed essentially of a mixture of oxides of iron and aluminium. They are derived by the atmospheric weathering of several types of rocks under monsoon conditions of alternating dry and wet seasons. Such soils are specially well-developed on the summits of basaltic hills and plateaus of Madhya Bharat, Madhya Pradesh, Deccan, Raj Mahal, the Eastern Ghat regions of Orissa, South Bombay, Malabar and parts of Assam. These soils vary in quality. On the higher levels, they are exceedingly thin, usually of a pale colour, shallow and gravelly with little power to retain moisture and poor in nutritive substances, producing millets and pulses. But on the lower plains and in the valleys they are dark, heavy loams and clay of finer texture, which readily retain moisture and produce good crops like cotton, wheat, millets and pulses. These soils are deficient in potash, phosphoric acid and lime but humus is present in quantities decidedly better than in most other Indian soils.

In the midst of these varying features one characteristic is found to be common to almost all soils, *viz.*, their comparative dryness. This absence of moisture in the land makes the supply of water an absolute necessity in Indian agriculture.

RIVERAL RESOURCES

Such is the surface of the earth as we find it in India. It is needless to say that it is of the greatest importance in the economic life of her people, whose material and moral welfare is indissolubly bound up with the soil. But of equal importance is what lies beneath the surface. The wealth of a country and ultimately the prosperity of its people in modern times corresponds, in a large measure, to its output of economic minerals.

It was a common notion sometime ago that the Indian mineral deposits were too poor to be worked profitably by modern methods but more recent investigations have made it clear that if not unlimited they are at least enough to maintain the existing industries of India. V. Ball quotes the statement of Megasthenes that "India has numerous underground veins of all sorts of minerals," and regards it as absolutely true. He goes on to say:

"Were India wholly isolated from the rest of the world, or were her mineral productions pro-

25. *Ibid.*, p. 16.

ected from competition, there cannot be the least doubt that they would be able from within her own boundaries to supply very nearly all the requirements, in so far as the mineral world is concerned, of a highly civilized community.²⁶

It is true although India is not so much rich in mineral resources as U.S.A., U.S.S.R. or Germany, yet she is by no means deficient in them.

NATIONAL SELF-SUFFICIENCY IN MINERALS

The fact is that (i) India has an exportable surplus in respect of 5 minerals compared with 6 in U.S.A. and 5 in U.S.S.R. (ii) India is self-sufficient in four, whereas U.S.A. is so in 5 and Russia in 7 and Germany and Pakistan in 1 each. (iii) With respect to major minerals like iron ore, coal, manganese, magnesite, mica, chromite, bauxite, India is well provided. She is deficient in copper, zinc, tin, lead, sulphur and petroleum. U.S.A. and U.S.S.R. are well provided with petroleum, but are deficient in mica, and U.S.A. is also deficient in manganese; Germany and Pakistan are comparatively very deficient in mineral resources.

India has large supplies of mica and produces between 60 and 80 per cent of the world's output. Its supplies of manganese, ilmenite, monazite and high grade iron ore (contain over 60 per cent iron) are amongst the largest in the world.²⁷ The reserves of the high grade manganese ore (49 per cent content) are of the order of 18 to 20 m. tons and those of lower grades will amount to about 3 times the above quantity. The reserves of iron ore are estimated to be over 10,000 m. tons.

REGIONAL DISTRIBUTION OF MINERAL RESOURCES

The mineral resources are widely distributed over the whole area. According to Dr. Dunn, on the west of a line drawn from Mangalore to Kanpur and to the Himalayas, mineral resources are not only sparsely distributed but are also perhaps unimportant with the exceptions of mica, lead, salt and some coal and perhaps copper in Rajasthan. Among individual States there is an unequal distribution of minerals.²⁸ Dr. D. N. Wadia says, "Nature has made a very unequal territorial distribution of minerals in the Indian region."

The vast alluvial plains tract of North India is devoid of mines of economic minerals. The Archaen terrain of Bihar and Orissa possesses the largest concentration of ore-deposits, such as iron, manganese, copper, aluminium, chromium, valuable industrial minerals like mica, ilmenite, phosphates and over three-fourths of India's reserves of coal, including cooking coal. The iron-ore reserves lying in one or two

districts of Bihar and the adjoining territories of Orissa are calculated to be over 8,000 million tons, surpassing in richness and extent those of any other known region. There are large reserves of manganese areas; over 50 per cent of world's best mica (Ruby mica) block, splittings and sheet are supplied by the mica mines of Kodarma and Gaya in Bihar. The second minerally rich State is Madhya Pradesh, carrying good reserves of manganese, iron, limestone, coal and bauxite. Madras has workable deposits of iron, manganese, magnesite, mica, limestone and lignite coal. Mysore has yielded all the gold of India, besides producing appreciable quantities of iron, porcelain clay and chrome ores. Hyderabad has good reserves of second grade coal, besides being a potential source of several industrial minerals. Travancore possesses enormous concentrations of heavy-mineral sands of high strategic importance, calculated to contain some 250 million tons of ilmenite, besides containing monazite, zircon, rutile, and garnet in workable quantities. Bombay (N.-W. districts) and East Punjab have been far less productive and have scarcely as yet figured in India's mineral statistics. Rajasthan for a long time absent from India's mineral returns is gradually becoming a productive centre, holding promise for a bright future in non-ferrous metals—copper, lead and zinc, mica, steable, beryllium and precious stones like emerald and aquamarine, asbestos, lignite and gypsum, building stones, manganese. Assam supplies about 60 million gallons of much needed petroleum, besides carrying important reserves of tertiary coal. Of the vast extent of the Himalayan region, the only proved mineralised regions of importance is the territory of Kashmir, south of the Great Himalayan Axis, with its coal (some of it is anthracite), aluminium ore, sapphire and some minor industrial minerals. But for the partly-known copper deposits of Sikkim and Kumaon and some fairly widely-spread iron-ore bodies in these areas, the rest of the Himalayan region is a veritable *terra incognita* as regards economic minerals. West Bengal's mineral resources are confined to coal and iron ores. The Damodar Valley area is very rich in mineral resources, containing as it does the concentration of 100 per cent of India's total production of copper ore; 100 per cent of kyanite, 93 per cent of iron ore; 80 per cent of coal, 70 per cent of chromite, 70 per cent of mica, 50 per cent of fireclay, 45 per cent of asbestos, 45 per cent of china clay, 20 per cent of limestone, 10 per cent of manganese and 10 per cent of building materials.

It is generally known that no country in the world, not even the U.S.A. or U.S.S.R., is entirely self-sufficient in all the mineral resources necessary for its economic development. It is, therefore, an extremely hazardous task to venture on a final opinion about the mineral resources of India, as only a few

portions of the vast territories have been intensively surveyed. The mineral wealth of India as at present known, though by no means inexhaustible, comprises an adequate range of useful products that are necessary for industrial development; but at the same time India has certain important deficiencies. The following gives a good idea of the position of India's mineral resources, their adequacy and deficiency, etc.:²⁹

I. Minerals in which India has large exportable surplus to dominate world markets:

(i) Iron ore, (ii) Titanium, (iii) Thorium ores and (iv) Mica.

II. Minerals of which the exportable surplus forms an important part:

(i) Manganese ore, (ii) Magnesite, (iii) Refractory Minerals, (iv) Bauxite, (v) Granite, (vi) Silica, (vii) Beryllium, (viii) Steatite, (ix) Corundum, (x) Monazite, (xi) Natural abrasives.

III. Minerals in which India may be considered self-sufficient:

(i) Coal, (ii) Cement materials, (iii) Aluminium ore, (iv) Copper ore, (v) Chrome ore, (vi) Building stores, (vii) Marble, (viii) Slate, (ix) Limestone, (x) Dolomite, (xi) Mineral pigments, (xii) Industrial clays, (xiii) Sodium salts and alkalies, (xiv) Gypsum, (xv) Glass sand, (xvi) Pyrites, (xvii) Borax, (xviii) Nitrates, (xix) Felspar, (xx) Phosphates, (xxi) Zircon, (xxii) Barytes, (xxiii) Arsenic, (xxiv) Vanadium, (xxv) Antimony, (xxvi) Alum, and (xxvii) Precious and semi-precious stones.

IV. Minerals in which India has to depend largely or entirely on foreign imports:

(i) Silver, (ii) Nickel, (iii) Petroleum, (iv) Zinc, (v) Lead, (vi) Tin, (vii) Mercury, (viii) Tungsten, (ix) Molybdenum, (x) Platinum, (xi) Graphite, (xii) Asphalt, (xiii) Potash, (xiv) Fluorides, (xv) Sulphur.

The main features of our mineral industry might be enumerated as below:

(1) The mineral resources of India are vast and varied.

(2) The distribution is capricious in territorial sense, some parts of the country being poor, others being comparatively rich.

As inland waterways have not been well-developed in this country, the railways are the chief agencies of transport. Minerals are unequally distributed, they have often to be moved long distances to reach the consumer. The cost of transport, therefore, becomes high. The effect of the disproportionately high freight is to shut out some of our minerals from certain internal markets.

(3) Only a few small areas may be said to have been examined by geologists in a fairly detailed manner. There are large regions, the geology of which is not known, while in the case of some areas in Orissa and Assam even general information is lacking.

(4) In most cases the reserves, though known to be large enough, are not known in sufficient

detail, especially in regard to quality for purposes of development.

(5) Until recently, mineral exploration and their exploitation received little attention. Except coal, iron ore and petroleum required for internal use, the majority of the minerals especially mica, manganese, magnesite, kyanite, ilmenite were raised for purposes of exports without any dressing, processing and fabrication. These exports brought but a small return to the country.

(6) The mineral industry also suffers from these defects:

Lack of policy and organised plans for prospecting, mining and utilisation of minerals and economical marketing of the minerals; lack of effective State control, assistance and encouragement; absence of basic industries; lack of trained men and technical skill; want of real estimates and reliable information regarding the reserves, the possibility of new sources and the industrial application of minerals; the haphazard mining of the ore bodies with an eye for immediate gains, leading to the rapid depletion and waste of the useful portions of the deposits, and inroads by foreign firms who have taken up concessions for most of the important Indian minerals; and mechanical methods are not common in the mining fields.³⁰

The mines and quarries coming under the Mines Act, employed over 471,761 persons in 1950 and if we include smaller quarries, the number of persons dependent on this type of employment may be well over 600,000. The many industries based primarily upon minerals probably employ over 2 million persons. The mineral industries not only support this large population but pay income-tax on their profits, customs duties on their imports of machinery, tools and appliances, and contribute to the State coffers in other indirect ways. Mining contributed to 0.7 abjas of rupees to the national income in 1950-51.

Minerals are wasting assets and unlike forests, once they are used up, they cannot be replenished. Hence, conservation of these resources is greatly emphasized. Besides the conservation and control of minerals, attempts must also be made to develop basic industries in India in such a way that our mineral resources can be utilised inside the country, and mining industry need not be dependent upon the economic uncertainties of other countries for its prosperity. Further research must also be conducted with respect to the best possible uses of the available minerals in India. Substitutes for some of the minerals for which we are entirely dependent on other countries must also be discovered. Attempts must also be made to diversify the mineral industry in India by trying to utilise resources available in different parts of the country.

VICTORY AT GENEVA

By Prof. SHRIMAN NARAYAN

It is, indeed, gratifying to know that the Big-Four "Summit" Conference at Geneva was "a complete success." The heads of the U.S.S.R., the United States of America, Britain and France agreed on all points. It was agreed that the Foreign Ministers will now meet during autumn to study and discuss the subjects of German re-armament and European security. The recommendations of the Foreign Ministers on disarmament will be addressed to the U.N. Disarmament Sub-Committee. This is the first time that the Big-Four Powers have been able to discuss together in a cordial manner various difficult problems in international affairs. Although it was not possible for them to agree at this stage on certain specific proposals, the secret of their success lay in their manner of approach and in the spread of mutual goodwill and co-operation. As Shri Nehru observed at a recent meeting of the Congress Parliamentary Party, it was the "cordial spirit" in which the issues before the Conference were discussed, which was largely responsible for the success of Geneva. "For once views were expressed moderately and without rancour or bitterness." One of the important factors which was helpful in creating this atmosphere of goodwill was the recent visit of our Prime Minister to Soviet Union, Britain and some of the Eastern European countries. "Panch-Shila" or the Five Principles which formed the very basis of India's foreign policy have been amply vindicated. The Big Powers have now sincerely realised that lasting peace in the world ultimately depends on the principle of "live and let live." It is the fear-complex which creates a sense of insecurity and nervousness in the minds of the people. If all the nations, big and small, decide to live at peace within themselves and not interfere with the affairs of other nations, all will be well with the world. This does not mean isolationism. In this modern age no nation can afford to live in isolation, unaffected by the events that take place in other parts of the globe. But non-aggression and non-interference essentially mean that each nation tries to develop itself in accordance with its own genius without trying to impose its pattern on others. It is good to learn from one another. But imposition of one economic or political system on other nations or the imitation of the ideology of another nation is never a sound principle.

It must also be realised that peace is not an end in itself. It is only a means to an end. The ultimate objective of world peace is the social, economic, cultural and gradual development of humanity. It is impossible to give the highest priority to the develop-

ment of human beings in a world which is torn with fears and suspicion. The Prime Minister of India has stated repeatedly that India has no time to think about wars and international conflict because she is primarily concerned with the social and economic development of the millions of her people. The same is the case with other nations as well. It is now being realised on all hands that wars do not solve any problems, economic or political. In fact, they only result in additional worries and difficulties.

In the course of his address to the A.I.C.C. Session at Berhampur Acharya Vinoba Bhave remarked that the international situation was like the case of a sick person about whom the doctors issue bulletins from time to time. Sometimes the condition improves and then again deteriorates. The ultimate solution of international conflict is, therefore, not to be found in mere "patchwork" or joint agreements on superficial issues. The fundamental problem to be tackled by different nations is the reorientation of the basic values of life. So long as money continues to play a vital role in our lives and material considerations remain predominant in social relations, there is not much hope for lasting peace and goodwill. As Gandhiji always told us, the ultimate solution of international conflict lay in the philosophy of decentralisation and the ideal of simple living and high thinking. So long as the motto of different nations continues to be a rise in the material standards of living, there was not much scope for the development of the moral and cultural values of life. It will, therefore, be necessary for all of us to effect radical changes in our lives by substituting mutual love and co-operation for mutual hatred and exploitation. The pattern of social and economic development of various nations will also have to undergo certain basic changes. A society or a State based on a highly centralised and regimented economy would necessarily engender violence and conflict. A society based on the philosophy of "bread-labour" and non-exploitation cannot defuse the climate of peace and brotherhood.

The problem of peace, therefore, is the problem of life itself. If individuals change the pattern of their lives, the social pattern changes. With the change in the social pattern, the pattern of international relations also undergoes a radical change. India has learnt these basic values of life from her great sons and leaders through the centuries. We are confident that the message of India would be helpful in recreating an atmosphere of peace and co-operation in this war-weary world.

DEVALUATION OF PAKISTAN RUPEE

By PROF. V. N. HUKKU, M.COM.

THE Government of Pakistan devalued their currency on the 31st July, 1955 to the same extent as India did about two thousand one hundred and forty two days ago. This brings down the value of Pakistan rupee from 0.268,601 to 0.186,621 grams of fine gold and in terms of dollar from 30,225 cents to 21 cents. In certain circles this decision has been considered to be a belated action and also termed as the return of the 'Prodigal Son.' According to some, the main reason attributing to this action has been the deteriorating state of her balance of payments' position due to the cessation of the export trade boom consequent upon the silencing of guns on the Korean front in 1952. She has been suffering a setback in her export of almost monopoly goods due to slackness in demand and close competition. On the other hand, an announcement of the Pakistan Government has justified this action because "Pakistan's economy has been developing at a fast pace. The exchange rate that has been appropriate so far is no longer suited to the needs of the growing economy of the country." In a subsequent statement following the devaluation, the Pakistan Finance Minister, Chaudhari Mohammed Ali is reported to have said in a press conference that the government's decision to devalue her Rupee had not been taken under pressure from any quarter but the present needs of the country due to its transformation from complete agricultural economy to semi-industrialised phase required this adjustment.

DEVALUATION OF 1949

The seed of devaluation was sown on 18th September, 1949 by U. K. after the 1931 worldwide depression by devaluing her currency in terms of gold and dollar to an extent of 30.5 per cent. The decision was based on peculiar British position as regards the Convertibility of Sterling and dearth of production. The Sterling-Dollar difficulties had become insurmountable and Britain's gold reserves had begun to "run at much too fast a rate despite the Aid she was receiving from Marshall Plan." The desire of the people for the conversion of £ in gold and dollar was so much pressing that the U.K. Government decided to ease the situation, *inter alia* by lowering the exchange value of £ sterling from \$4.03 to \$2.80. The Moscow radio comment as reported by *P.T.I. Reuter* on 20th September, 1949 said that "devaluation had led to financial panic throughout Marshallised Europe" and that the British Government had "surrendered to the U.S.A." in spite of assurances by Labour leaders. Yet such an

action was approved by the International Monetary Fund and in the words of the then Managing Director Mr. C. Gutt, it was a step in the right direction. The decision was quickly followed by announcements in several Sterling Area and Non-Sterling Area countries devaluing their currencies in diverse magnitude. 17 countries including India devalued their currencies against dollar by 30.5 per cent but maintained parity with Sterling. 4 countries devalued their currencies against the dollar by 5.6 per cent to 22.2%. 12 countries including Pakistan declared that they will not devalue their currencies against dollar. From the International Monetary Fund membership standpoint, nineteen countries out of the then total membership of 48 with an aggregate quota in the Fund of more than 71% of the total subscription excluding that of U.S.S.R. had readjusted their par values in the middle of October 1949.

Along with U.S.S.R., Japan, Turkey, Persian, Italy, Switzerland and Poland the only sterling area country, which did not devalue her currency was India's next door neighbour—Pakistan. This decision of Pakistan at that moment was highly criticized by India as it brought about serious repercussions on the Indo-Pakistan trade in the very early stages of post-partition period. Before reviewing the Pak policy, it is necessary to throw some light on the Indian decision to devalue her currency in tune with sterling. While India was sure to suffer from an increase in her liabilities in respect of increased value of dollar loans from the world bank and depreciated value in terms of dollar of her sterling balances. She gave due importance to her alignment with the sterling area in the absence of which she would have been deprived of her share in the dollar pool from which she had drawn next to Britain. Moreover, India in 1948-49 had more than 70 per cent of her trade with sterling and soft currency areas. Moreover, the Finance Minister of Government of India expected higher earnings from exports and improvement in the investment of foreign capital particularly from dollar area into India.

There was least apprehension in Indian official quarters that after 48 hours of their decision the Secretary General of Pakistan will throw the "No devaluation Bomb" on 20th September, 1949. The Finance ministry communique from Karachi on the 21st September, 1949, clarified their government's standpoint by stating that the decision was in the interest of Pakistan because *firstly*, the balance of payment position did not necessitate devaluation, *secondly*,

LABOUR TRAINING—AN INTEGRAL PART OF MAN-POWER PLANNING

By PROF. SANTI KUMAR GHOSH, M.A.

A steady flow of skilled and technically qualified personnel is a *sine qua non* of industrial progress. The importance and urgency of training and equipping rank-and-file workers to fill various positions in industry can hardly be overemphasized. Adequate job-training promotes job-efficiency and reduces labour turnover. To the individual worker, it means a possibility of increased earnings and the personal satisfaction and self-confidence derived from the ability to do a job well; a knowledge of several jobs is a protection against unemployment.

The facilities now available in this country for training in industry are woefully inadequate in relation to the number of trades and occupations and the number of persons employed therein. This lack of provision for comprehensive and systematic training has an important bearing on labour-efficiency. The level of an average Indian worker is far below that of his counterpart in other industrialized countries of the world. Possessing an agricultural background, the raw and illiterate recruit enters the factory and tries to pick up whatever knowledge he can from no qualified instructor but his senior operator and thus learns and perpetuates bad habits and slipshod methods.

In the initial stages, industrial training was considered as lying outside the sphere of the Government of India. But as early as 1888 the Government was forced to call the attention of the provincial governments to the need for extending industrial and vocational training. Already in 1877 the Victoria Jubilee Technical Institute was established in Bombay under private initiative. In 1901 an educational conference called by Lord Curzon resulted in making some improvements in the teaching of science at the universities and providing a number of scholarships in the provincial budgets for the higher technical training of students in foreign countries. But the trainees were not placed in suitable concerns.

During the First World War the question of industrial training received some consideration at the hands of the Industrial Commission of 1916 which recommended the establishment of a school of mines, a school of sugar technology and a few engineering colleges. Later, in 1936, the Government of India appointed a Committee of two experts (the Abbot-Wood Committee) to recommend measures for the provision of facilities for vocational education.

The shortage of skilled personnel within the country was brought into bold relief during the Second World War. In accordance with the recommendations of the Technical Training Enquiry Committee under the

Chairmanship of Sir Sargent, the Government of India launched the Technical Training Scheme for imparting technical training to suitable persons who were later to be employed for work as technicians in the Armed Forces or in factories engaged in war work. Training was imparted in over fifty engineering and building trades and its duration was about a year. During the five years of its existence the training scheme turned out more than a lakh of trained men. Provision was also made under the Bevin Training Scheme for higher technical training of some of the munition workers under modern factory conditions of England.

The wartime training schemes were not based on any firm foundation of theoretical knowledge and were confined only to mechanical engineering. But these schemes laid the foundation for building up a skilled labour force for India. The post-war training schemes of the Government of India had the object of providing facilities for training to demobilised servicemen and displaced persons in certain trades and particularly engineering and building trades, and vocations particularly non-engineering trades and occupations, i.e., mainly cottage and small-scale industries.

An increasing amount of attention has been given to technological education during the last five years. Facilities for undergraduate study have increased considerably, but similar facilities for post-graduate education and research are still inadequate. Also the provision of training for industrial workers, technical teachers and instructors has not kept pace with the needs of the country. The existing technical and vocational institutions have therefore to make up considerable leeway in point of efficiency, both with regard to equipment and the quality of teaching. Moreover, vocational schools are run on lines similar to those imparting purely liberal education, with short working hours and long vacation, rather than under ideal factory conditions. Again, most of the training institutions cater at present for the urban population. The establishment of rural training centres, each at the centre of a group of villages, will, therefore, go a long way towards improving techniques and skills of the villagers.

There is one important lacuna in our schemes of technical training. The facilities that now exist in this country for the training of technicians of the foreman class are extremely limited, with the result that in many lines of manufacture, India has still to depend for this type of technical ability on foreign sources of supply. In any scheme of technical training intended to promote the supply of this type of skilled labour it is essential that the training imparted should be of such a high

calibre as to enable them in due course to take independent charge of particular technical processes in the industries from which they were recruited.

Apart from technicians, there is acute shortage of persons trained in the principles and techniques of industrial engineering and organisation. The circumstances of industrial development in India during the last fifty years did not favour the rise of this technological class; the industries relied on foreign specialists or consultants for high-level technical advice. The measures recently taken to strengthen technological education through the activities of the All-India Council of Technical Education and its Boards of Studies have expanded the facilities for technological education in this country. The establishment of an Institute of Higher Technology at Hijli (West Bengal) is a notable step in the same direction, but clearly there is need for more institutes of this type.

In planning training of skilled personnel for industry we have to take into account three classes of personnel: managerial, supervisory, and skilled workmen. Efficient organisation demands that training should be imparted at all the three levels. The first stage in the training of the younger generation of factory workers should start with general compulsory basic education with an industrial bias, and should precede vocational training in any one of the specific trades. Schools imparting such liberal education should be equipped with workshops for different crafts, where boys and girls could receive manual training. Their object should be to prepare boys and girls for further specialised training in specific trades.

Vocational schools enable young persons to discover and try out their aptitudes, to learn to use some of the basic tools of their chosen trade and to acquire the fundamental disciplines of work—carefulness, precision and thoroughness. Individuals with such general preparation must learn the details of their particular jobs in the plant itself. Vocational education at its best can never take the place of training in the job. Job-training is essentially learning by doing. At their jobs they learn by observing others and from instructions given by their foremen. However, an increasing number of employers consider that this "pick up" method of job-learning has deficiencies. The alternative to "breaking in" on the job is short, intensive instruction by trained instructors away from the production line.

In the present stage of her industrial development, and considering the limited resources at the disposal of the Government, it may be advisable for India to adopt

a system of training more or less similar to the one obtaining in the U.S. with, of course, suitable modifications to suit local conditions. This system has two types. In the case of training in the job, a textile worker, for instance, may be started as a cleaner and by a process of upgrading finally becomes a spinner, having been trained by close contact with the job. Under the 'vestibule system,' a part of the machinery is set aside on which learners may practise under the guidance of special instructors without interfering with the normal course of production.

The problem thus is first, to train the necessary number of persons in appropriate trades, and second, to train them up to a high degree of skill. The existence of a considerable number of semi- and under-skilled persons who are unacceptable to employers is creating problems for government to solve. The way to check this growing evil is by providing adequate facilities for higher training of craftsmen. Training should be intimately wedded to the needs of industry so that there may be a correspondence between the demand and supply of available skills in specific trades. Since employment policy demands that labour should be steered towards the under-staffed occupations, there is need for a system of advisory service to provide guidance as to the most suitable trades in which they may be trained with advantage.

In respect of large-scale industries, technical institutes should be started and maintained by the large industrial concerns themselves for the benefit of their employees. The Central Government will have to take the initiative by offering liberal grants-in-aid. It should also maintain an inspectional staff for planning, supervising and co-ordinating the training activities all over the country.

Talent for future needs could be encouraged by legislation calling for foreign enterprises to train Indian staff for responsible positions. Practical training should be combined with the theoretical as well as industrial with commercial training. Competent administrators should also be trained in the fundamentals of business administration and in scientific methods of industrial management. Technical and managerial skills are, however, developed not merely by formal training but also by environment. This can best be done by promoting widely diversified small industries which will train a maximum number of people in new skills and will provide a wide technological climate favourable to the emergence of capable leaders. In this way an effective system of 'training within industry' may be evolved for turning out a highly skilled and efficient labour force.

non-devaluation would cheapen imports and curb inflation, *thirdly*, Pakistan would be in a better position to get capital goods and raw materials from dollar and sterling areas both, *fourthly*, it would stimulate the earnings from the export of her almost monopoly products, raw jute, cotton, tea and hides and skin. Though the decision was received with surprise in economic circles in India and Washington the International Monetary Fund set its seal of approval of Pakistan Rupee exchange rate at the time of Pakistan's admission to the International Monetary Fund and World Bank in 1950.

JUSTIFICATION OF PAK-RUPEE DEVALUATION

Recently in the statement cited above the present Finance Minister of Pakistan, in support of the past and present decision of Pakistan Government in this connection, said that had Britain not devalued her currency in 1949 no one would have ever thought of devaluation. "At the present stage we are in a position to augment our foreign exchange by exports of manufactured goods."

According to the Pak Finance Minister, the decision has been taken by the government after a very careful consideration as a deliberate step designed to strengthen Pakistan's economy. "Government have no doubt that the decision will lend new strength to the economy of the country and lead to greater happiness and prosperity of the people."

One of the main reasons of non-devaluation of Pak Rupee in 1949 was to keep up the price of jute sales and thus increase the purchasing power in the hands of the East Pakistan cultivators which they got mostly by selling jute. Once again the jute prices have become one of the main consideration of the devaluation. The price fell down from the pre-devaluation Rs. 31 to Rs. 14 and once again the consideration of the purchasing power with the jute-growers has become so significant. Moreover, during these six years there has been a lot of smuggling so much so that the non-official Pak-Indian currency Exchange ratio had almost been the reverse of the official one. "The two main considerations leading to the present decision are to ensure a reasonable return to the grower of jute and cotton and to facilitate exports so as to increase our foreign exchange earnings." The agriculturists in Pakistan are suffering on account of the fall in prices of jute and cotton in international markets. It is expected that now the disposal of the jute crop would be easier. Moreover, Pakistan by now has got 10 jute mills as against two at the time of partition. These mills naturally would require more raw jute to be utilised with a view to increasing the export of jute manufactures. This would help in bringing better returns on sales to the jute-growers in East Pakistan. As the cotton textile mills in Pakistan are consuming more cotton than before, the quantum of cotton export has

been lowered. The Government of Pakistan has, therefore, decided to step up the production of cotton. This can be encouraged by a rise in cotton prices consequent upon the increased consumption by cotton textile mills. The mills would also now be able to manufacture more for export after satisfying the local needs. Thus the increased exports of jute and cotton—raw and manufactured goods—and tea would bring in more of foreign exchange earnings and would facilitate the acceleration of the pace of development in the country. It will at the same time check smuggling and anti-social practices. In principle devaluation brings inflation due to rise in prices of imported goods but since the Government of Pakistan is keen on developing the productive capacity of the country the implied danger of inflation has been lessened. Much depends upon how the Government manages and controls the situation particularly in respect of price structure.

EFFECT OF DEVALUATION ON INDO-PAK TRADE

The devaluation of Indian rupee and non-devaluation of Pakistan Rupee in 1949 brought about immediate deadlock in the Indo-Pakistan trade. This deadlock should be viewed in the light of the peculiar economy of the two countries. While East Bengal had the monopoly of the production of raw jute, West Bengal had almost all the jute mills to manufacture jute goods. Both Bengals were then solely interdependent. After devaluation India refused to buy jute from East Pakistan. This brought about closing down of some jute mills in Calcutta, causing widespread unemployment and in East Bengal jute prices fell tremendously due to accumulation of unsold stocks of jute. Almost similar was the case of cotton. While Pakistan was a chief producer of cotton India was deficit in raw cotton, for her cotton textile industry happens to be one of the most organised and expanded industries in India. India's refusal to buy raw cotton from Pakistan led to closure or reduced working hours in Indian cotton mills and thus to an increase in unemployment. India also refused to supply coal to Pakistan which was in great demand there due to her plans for industrial development. Thus both the countries adopted retaliative policies in respect of control, duties and restrictions. The situation was gradually made more comfortable due to the growing sense of mutual goodwill and co-operation. But both the countries since then have been trying to become less dependent upon each other. Pakistan has increased the number of jute and cotton mills so as to increase the consumption of raw jute and cotton inside the country, thereby maintaining their prices. On the other hand, India has increased her production of raw cotton and raw jute.

There is a difference of opinion regarding the effect of the devaluation of Pakistan Rupee on Indo-

Pakistan trade. While the Pakistan Finance Minister believes that the trade between the two countries would be facilitated, certain circles in India believe that the devaluation would not have any great effect on Indo-Pakistan trade. It has to be confessed that devaluation has brought about immediate effect on Indian policy as regards jute. For the first time after World War I, Indian jute goods have been exempt from export duty. In 1949 immediately after devaluation India raised the export duty on hessian from Rs. 80 to Rs. 350 per ton and it reached Rs. 1500 per ton during Korean war. The present rate of export duties was Rs. 80 per ton on sacking and Rs. 120 per ton on hessian. Immediately within 24 hours of devaluation of Pakistan rupee an announcement was made by the Indian Ministry of Finance (Revenue Division) in a press communique on Monday, the 1st August, 1955 that "in accordance with their policy of keeping export duties under constant review, the Government of India have decided to exempt with effect from August 2, 1955 all types of jute manufactures from the export duty leviable thereon." It is correct that the Government of India might have granted this exemption even in the absence of devaluation of Pak-Rupee but the promptness with which it has been done clearly depicts the influence of Pakistan's decision to devalue her currency.

It should not be lost sight of that the devaluation of Pak-Rupee may confront India with competition from Pakistan as the latter has developed industries from a completely agricultural economy and can export goods at competitive prices. Pakistan can now export jute goods worth Rs. 7 crores as against an import of the same worth Rs. 4 crores a few years back. Pakistan has planned a target of 1.5 million bales for export. Devaluation would bring Pakistan jute prices nearer to Indian jute prices and India would benefit in respect of whatever quantity of jute she imports from East Pakistan. Since Pakistan and other European countries are also developing their jute mill industry with a view to competing with Indian jute goods in the American market, India's situation has become somewhat delicate. As Indian jute goods have just been able to stabilise, their exemption from export duty is most welcome at this hour to nullify the special advantage to other jute manufacturing and competing countries from the effect of Pak rupee devaluation on Pakistan jute prices.

As regards cotton the situation would not be much affected as Indian cotton prices are lower than those of Pakistan. The landed cost of Pakistan cotton in India is twice that of Indian cotton. Only to a limited extent Indian cotton mills may benefit

from purchasing some staples of cotton from Pakistan. Moreover, Pakistan also has at present 67 textile mills as against 6 at the time of partition and her internal demand of cotton is so high that it would not enable her to compete with India in this field for some years. As regards tea, Pakistan is not a large contributor to the world tea trade and would not affect India's position. Hides and skin and betelnuts would be available at cheaper rates to India.

CONCLUSION

The immediate effect of Pak-Rupee devaluation has been reflected in the immediate rise in the prices in Pakistan. Prices of consumer goods, textiles, medicines and chemical goods have risen by about 25 to 50%. Prices of jute has, however, slightly risen by about Rs. 3 per bale, the present price being Rs. 132 per bale. Cotton has also registered an increase. The unofficial rate of exchange has deteriorated and 65 Indian rupees have been quoted for 100 Pakistan rupees as against 85 Indian Rupees for 100 Pakistan rupees quoted prior to devaluation.

While on the one hand reaction in the business circle has been evidenced by the appreciation of this opportune decision by the Dacca-Narayanganj Chamber of Commerce and the Pakistan Jute Board, it is observed that certain circles in Pakistan are highly critical of the devaluation not only on economic grounds but political as well. Mr. Fazlul Huq, Leader of the United Front, is reported to have said:

"I cannot on any account agree to a decision being taken by the Central Government without any previous notice to the province concerned because, it gives me the impression that wise men at the centre think nothing of the provinces lying far away. The action taken by the Central Government resembles very much what a Bengali proverb says about rubbing oil on an oiled head. Devaluation of Rupee will fill the pockets of the millionaires with crores of rupees by profits they shall make on their foreign exports but a poor Bengali trader with a small capital whose transactions are limited within the province will incur heavy losses leading in some cases to utter ruin."

Whether there is any substance in this statement or not the main purpose of quoting it is to bring to light the grave discontentment and political rivalry that is in vogue in Pakistan and this state of affairs is bound to jeopardise the economic policy of the Government of Pakistan. Under such circumstances a clear and accurate assessment of the repercussion of devaluation of Pakistan Rupee on her economy will not be easy.

THE ROLE OF DRAMA IN EDUCATION

By USHA BISWAS, M.A., B.T.

THE role of drama in the education of children as well as adults should not be underrated, inasmuch as it constitutes an important means of self-expression. Education in the true sense of the term does not consist in mere theoretical instruction to be imparted in the class-room. Nor is it something imposed on the minds of children from outside. The object of true education should be the cultivation of their instincts as well as the proper development of their innate powers and potentialities. So their attempts at self-expression, however crude these may be, should be encouraged by all means, if the true aim of education is to be achieved. Drama provides one of the excellent media through which the imagination, emotions and sentiments of children can find an outlet. When acting a part, they have to attribute their own feelings and sentiments to the characters they are personating. They have thus to identify their own thoughts and ideas, joys and sorrows, passions and interests, with those of the characters whose part they are acting. The scenes to be enacted as well as the situations to be realised have to be visualised as vividly as possible for the purpose of reproducing those on the stage. All this calls for a good deal of powers of imagination and imitation on the part of the children. To ensure accurate reproduction and natural acting, the actors and actresses have to project their own mind, so to say, into that of the characters of the drama. None can prove good actors or actresses unless they can forget their own entity for the time being, and can merge their identity into that of the characters whose part they happen to be playing. Thus both children and adults derive immense pleasure from the pretence or make-believe called forth in dramas and stories. Hence the educational importance of the cinema and the theatre. Drama leads to the gratification of children's play-impulse and their innate love of play. The love of play is an instinctive urge of childhood as well as a vital need of it, as is indicated in the play activities of the young of the species—human and other than human. Apart from the biological utility of these activities, the educational value of play cannot be overestimated. The thrill of intense pleasure and the rapture of spontaneous joy, springing from the pretence or make-believe that is called into being in drama make for the happy and healthy development of the budding minds of children. Every opportunity should be provided in all the educational

institutions for promoting the development of their mind on the right lines during the formative period of childhood. We all know how fond children are of imitating their elders. Very often they are found to be playing at being adults. This is indicative of their innate urge to imitate the grown-ups by way of play. So the instinct of imitation as well as imagination can be appealed to in and through drama. In all the educational institutions ample scope should be afforded for the development of children's personality by encouraging their attempts at self-expression in both team and individual work. The present-day educational system of our country seems to be incomplete and defective, as it hardly meets the social and emotional needs of pupils. If the education of the 'whole man' is to be aimed at, these needs of children should not be overlooked.

If the emotional needs of children are to be satisfied, creative activities should form an important part of the school curriculum. These activities, in which the creative powers and energies of children are called into play are conducive to the development of their personality and individuality. Drama constitutes an important creative activity, the educational value of which should not be underestimated. Tagore with the unerring insight of a true educationist fully realised the importance of drama as a means of developing children's personality. With this end in view he assigned an important place to dramatics on the programme of education chalked out by him. He composed several dramas and playlets, suited to the needs of the occasions on which those were staged by the students of his educational institution. He as well as the pupils and teachers of his school took part in many of the dramatic performances, organised from time to time on various occasions. For this he was ridiculed and looked upon as a person, bent upon bringing about the ruin of the entire educational structure of his province. His educational theories were decried as being positively harmful and detrimental to the interests of the education of his country, as his ideas happened to have run counter to those obtaining in Bengal at the time. At the present moment the educationists of the day are gradually awakening to the necessity and importance of the activities that found a place in the curriculum evolved by the poet. There is no gainsaying the truth of his observation that "during the early period of education, children should come to their lessons of truth through

natural process—directly through persons and things." Rousseau and other pioneers of modern education also advocated the same theory. It is a commonplace of modern pedagogy that at the early stage of education, instruction should be made as concrete as possible, inasmuch as mere abstract teaching hardly appeals to small children. Tagore rightly hit upon the gravest defect of the average educational institution of his time, which was designated by him as 'a manufactory specially designed for grinding out uniform results.' According to him, the prevalent system of education was "a mere method of discipline which refuses to take into account the individual." Even at the present moment very little scope is provided for the development of children's personality or individuality at the average educational institution of our country. This constitutes one of the most serious defects of the present-day educational system of our country.

The cultural value of drama as a creative art, too, should not be ignored. It is an art by means of which the personality or individuality of children can be given its fullest expression. A person has to recreate himself in the character whose part he is playing and has to be fully oblivious of his own identity for the moment. Acting is an unrivalled art of reproducing the emotions and sentiments of the actor in an outward form, the beauty and perfection of which cannot but captivate and enthral the mind of his audience. Drama is, therefore, an important art in which the creative talents and energies of the actors can be in full play. If the education of the 'whole man' is the real objective to be achieved in the educational system of the day, the cultural side of education should not be overlooked. The aesthetic and cultural training given to children at an early and impressionable age is of an immense value. Those who are specially gifted are thus afforded ample opportunities of assessing their talent and laying the foundation of a future career.

Dramatisation serves the purpose of an important audio-visual aid in teaching also, and as such it can be turned into a valuable educational method. The necessity and importance of audio-visual aids in teaching are being borne in upon all the educationists of the day. What is taught by means of drama is likely to leave an indelible mark on the mind and character of children, inasmuch as they can thus be appealed to through more than one sense. They are afforded the opportunity of acquiring knowledge and information direct from persons and things and not through the medium of books. The boredom of dry, uninteresting theoretical instruction can be reduced to a minimum, if dramatisation is restored to in the class room. It helps to enliven the lessons and to make them both agreeable and

impressive. In this manner it serves to get the lessons fixed in children's memory. Drama as a method of school instruction, involves the psychological principle of "learning by doing." The acquisition of knowledge is thus motivated by children's innate urge to learn and solve the real problems they are faced with. Dramatisation may be taken recourse to for the purpose of playway methods too. All this is sure to mark an agreeable departure from the hackneyed and stereotyped methods of teaching and to make the process of learning a joyous pursuit. The atmosphere of make-believe or pretence created in drama does away with the boredom of drill and affords relief and diversion from the dullness and monotony of class routine.

Drama constitutes an important method of teaching literature, reading, and history. Good pieces of literature, if learnt by heart, help to enrich children's vocabulary and develop their powers of expression, both in speech and writing. The beauty of language, thus mastered, unconsciously affects their mode of expression and style of writing. But the mere memorising of 'set pieces' is likely to bore children, who fail to appreciate the need of it. So Bertrand Russell suggests that "learning by heart should be associated with acting, because then it is a necessary means to something which every child loves." From the age of three onwards children take immense pleasure in acting a part. When learning their own parts they get to learn those of others too. The beautiful forms of expression, thus learnt by heart, naturally find their way into their vocabulary and influence their style of speech and writing. In this manner, dramatisation may be of great help in teaching a foreign language also. Children may be taught how to read naturally and with proper information by means of acting. Drama admirably lends itself to the teaching of history too. Many of the deeds of valour, chivalry and bravery of the ancient heroes of different countries, enshrined in legends, myths and songs as well as in the annals of history provide excellent material for dramatisation. The glorious heritage of the past—its joys and sorrows, its manners, customs and conventions—its religious, moral and social ideals—its cultural traditions, crystallised in the literary and artistic achievements and aspirations of the country—can be recaptured by dramatists and play-wrights and can be represented on the stage and the screen. The historical events of bygone days, the history of religious, social, political and economic upheavals may serve as themes for dramas and plays. If historical stories are thus dramatised, the true significance as well as the emotional appeal of the past events of great moment can be vividly brought home to children, so as to enable them to reconstruct and to revive the past in a lifelike form. In that case,

history will cease to be a mere catalogue of dull events of the dead past and of dry facts to be memorised. In this manner the historical judgment of children can also be formed. The historical personages represented on the stage will appear to be real human beings of flesh and blood—men and women with hearts throbbing with life and emotions, whose deeds and actions can be assessed and appraised both by children and adults. The evil deeds of the historical figures enacted on the stage and screen serve to alienate the sympathies of the juvenile audience, who feel inclined to condemn those strongly, while their laudable acts are applauded by them. Dramatisation thus serves as an important method of teaching history to small children, to whom the lessons are thereby made both concrete and interesting. National and patriotic feelings may well be fostered by staging suitable historical dramas, by means of which children may be induced to imbibe the noble ideas and ideals of the past and the present. Whatever is noble, good and praiseworthy in our national ideals and traditions may well be upheld on the stage and the screen for the edification of both the young and the old. Drama may thus play an important part in the training of children's characters.

Drama may come to the aid of social reform as well as social education. In and through social dramas, the magnitude of many of the social problems may be brought to the fore, and the evil customs of society may be made a target for scorn and ridicule. The audience may be so carried away by the feelings roused by a play that they may forget for the time being that what is being enacted on the screen and the stage is not real but mere acting. The evil deeds of a villain on the stage are denounced and cried down by them, while the noble acts of the good characters meet with their applause and approbation. So a good deal of moral and ethical lessons can be inculcated on children and adults by means of drama. The audience may be impressed and enraptured by the scenes of a play staged in such a manner that they remain spell-bound for hours on end. Drama thus helps to ennoble their mind and sublimate their spirit for the time being at least, by purging it of all sordidness and grossness. The nobility and greatness of the lofty social, moral and religious ideals can be impressed on the audience through the medium of a drama. The impressions thus formed cannot but be deep and lasting. Drama can be an important instrument for social education too. Formerly, *jatras* and *kathakathas*, some crude forms of dramas, were in

great vogue in our country, and were of great help in propagating moral and religious truths among the masses. The ideas and ideals of abiding interest, embodied in the mythologies and religious scriptures of the country, which were once a perennial source of joy and inspiration to the people of our country furnished the material of these dramas. Unfortunately at the present moment these indigenous forms of art are dying out for want of sufficient encouragement. The Indian stage and the screen are being remodelled on Western lines. As a result of this, these crude and ancient forms of dramas, which once proved so helpful in educating the illiterate masses, have ceased to find favour in the eyes of the public at large. Now-a-days these are considered to be rather crude and vulgar, as in these, sometimes, attempts are really made to appeal to the vulgar taste of the audience. An all-out effort should be made to popularise these social institutions again in the rural areas of the State, inasmuch as these form an excellent medium through which moral and religious ideals can be brought home to the people of the country. Drama may thus prove of immense help in the task of national uplift and nation-building as well as in social reform. The masses may be taught the elementary principles of hygiene, sanitation and citizenship with the aid of suitable film-shows and dramas. They may be taught how to be useful citizens of the State too, by rousing their civic sense.

If possible, a dramatic club may be organised by the students in each school by way of extra-curricular activity. They may be called upon to compose dramas and plays suitable for different functions, to dramatise suitable stories, to improvise a stage and to take part in the dramatic performances organised by themselves. Such extra-curricular activities are sure to develop their initiative and organisational ability as well as a sense of responsibility. The need of such students' organisations cannot be stressed too strongly, the entrusting of self-government to pupils being essential for the maintenance of discipline in a school. Besides, such activities help to boost self-confidence and self-reliance on the part of children, who are thus able to get over shyness and nervousness. Drama can also serve as an important means of speech training and teaching elocution. The rehearsals will thus constitute the lessons in elocution. In dramatisation children will be required to enunciate distinctly each word spoken and to speak loudly enough to be heard by the whole audience. They can be trained in public speaking, too, by means of drama.

THE BODH-GAYA RAILING

By R. N. SIRCAR, BAR-AT-LAW

ONE of the most characteristic features of Buddhist architecture is the railing surrounding a *stupa* (a mound funerary or commemorative) or a *chaitya* (sacred memorial structure generally used as an assembly-hall). The railings such as survive today bear elaborate sculpture on them, and such sculpture has preserved for posterity a picture of the India of two thousand years ago in a manner which no other single medium of recording has done. The railing at Bodh-Gaya, quite apart from its artistic merits, and its importance for the history of Indian art, furnishes an invaluable "document" containing a record of the contemporary manners and customs of the people.

HISTORY

Buddhist ritual demanded circumambulation, that is, going round and round a monument or an object of worship which represented the creed symbolically, such as the Bodhi-tree (popularly, Bo-tree, which is the pipal or the *aswattha* tree) which stood for the Great Enlightenment, the Chakra (the Wheel of the Law) representing the Buddhist creed of the *Stupa* which was usually an emblem of the Mahaparinirvana (i.e., the death of the Buddha). Actually, all such symbols represented the Buddha in a non-anthropomorphic form, for early Buddhism did not allow a graven image of its Founder. Circumambulation required that a path or a corridor for going round should be provided, which was done by erecting a fence (*vedika*) round the object of worship. The earliest fenceings were all wooden palisades. The space between the monument and the fence was used as the circumambulatory (*pradakshina patha*). In Bodh-Gaya the object of

worship is the temple, known as the Mahabodhi Temple, and which is in fact a huge *chaitya* marking the spot where Siddhartha of the Sakya clan attained Enlightenment and became the Buddha. It is not a temple in the sense in which the word is usually understood by Hindus. The railing was disposed round this monument with the processional path in-between. The original monument, however, was quite unpretentious. It was a simple *chaitya* with the enclosed space on which the sacred tree stood, open to the sky. The spot was visited by the Emperor Asoka (3rd. Cent. B.C.), and this visit is pictorially recorded on a stone panel of the Bharut railing. This *chaitya* was later replaced by the brick temple which we see today, and which has approximately the same shape as it originally had, sometime during

the Kushan period (1st.—3rd cent. A.D.). Hiuen Tsang, the great Chinese scholar and traveller, visited it in the 7th cent. A.D., and has left us a valuable record of his visit.

Besides the Bodh-Gaya railing, there are three other railings which we know, viz., those at Sanchi, Bharut and Amaravati. Sanchi is situated in what was lately the Bhopal State in Central India, and Bharut also was in Central India (in the little State of Nagodh). Amaravati was situated near the mouth of the River Krishna in the Andhra country (near modern Vijayawada). Bodh-Gaya is about 7 miles to the south of the modern Hindu pilgrimage town of

Railing on South Eastern end, outer face. Shows Jataka scenes, winged elephant, and medallions. On extreme right: A yakshi climbing a tree (Sunga period)

Gaya in Bihar. The existing rails of Bodh-Gaya and Sanchi are to be found mostly *in situ*. Those of the other two exist in museums only, and their sites are of interest solely to antiquarians. Of Amaravati, however, only a few sculptural fragments now remain. The exact dates of the commencements of the construction of these railings are not beyond controversy. However, it may be stated, without being too precise, that the railings of Bodh-Gaya, Bharut and Sanchi commence from the 2nd cent. B.C., while that of Amaravati from the 2nd. cent. A.D. The Bharut railing is supposed to be slightly older than the Bodh-Gaya railing.

STRUCTURE

The original railing at Bodh-Gaya, as elsewhere, was undoubtedly of wood. The wooden railing was re-

placed later on by the stone railing which we see today. The existing railing belongs to two distinct periods. The earlier part belongs to the Sunga period (2nd—1st cent. B.C.), and the later part to the latter half of the Gupta period (4th—7th cent. A.D.). The rails of the Sunga period are in grey sand-stone, while those of the Gupta period are in coarse-grain granite. The former are in a much better state of preservation than the latter which have suffered greatly from the ravages of the elements, and have a worn-out appearance. The railing of Bodh-Gaya is not tall; the pillars are about 6 ft. 8 in. high from the plinth.

The railing (*vedika*) consists of: the plinth (*alambana*), the upright posts (*stambha*), the horizontal cross-pieces (*suchi*), and the coping (*ushnisha*). The plinth is of brick; the others are of stone. The posts again are of two kinds: pillars and intermediate posts. The pillars are found at the corners (the railing being square to conform to the square design of the temple); they are also found flanking the open-

wooden structure which it replaced. As a matter of fact, it does look "wooden." The technique of construction is that of the carpenter, not that of the stone mason. The carving also has the appearance of the wood-carver's art not that of the sculptor's. Vincent Smith rightly says that these carvings "may be regarded as pictures executed in stone." Further, there is reason to believe that these "pictures" were painted over in vivid colours, exactly as their wooden originals were. The sculpture on the gateways at Amaravati was certainly painted. The reason usually suggested as to why the "wooden" technique was followed with stone (although stone was being regularly and increasingly used from Asoka's time) is that Indian stone-workers had not yet acquired sufficient skill in the working of the new medium. E. B. Havell, however, repudiates this suggestion and says:

"It was not because they were unpractised in the use of stone, but because they wished to avoid a break in the railing and to maintain the sacred associations of the old wooden work."

SCULPTURE

The carvings on the rails cover a varied and extensive range of subjects and motifs, and give a very vivid picture of the details of the life of the age. There are scenes from the Jatakas (stories of the Buddha's former births), the purpose of which was presumably to instruct the laity in matters of the Buddhist faith. There are scenes of religious life showing stupas, sacred trees, chakras and other symbols of the Buddhist faith, and also of devotees worshipping such symbols. There are representations of altars, vedikas, and chaityas. On some posts secular dwelling houses are represented, and the costume of the people is clearly shown in many of the carvings. Even non-Buddhist mythological personages are figured in the carvings, such as Lakshmi (the Hindu goddess of

plenty) standing on a lotus springing from a vase. This has been brilliantly interpreted by Mons. Fouché as symbolizing the Nativity of the Blessed One, Lakshmi being identified with Maya, the mother of the Buddha. A figure holding a trident is undoubtedly the Hindu god Siva. It occurs on a pillar of the late Gupta period. It has been conjectured that this figure was introduced by Sasanka, the Hindu King of Gaur (7th cent. A.D.), with the object of investing the temple with a Saivite character.

Tree and serpent worship in India is of high antiquity, being long anterior to Buddhism. Such worship has been a considerable ingredient of the popular Buddhist cult from the very inception of the latter. It is still extant in an active form in various

Railing on South inner face

ings in the railing. Actually, there were three such openings in the Bodh-Gaya railing—one each, on the south, the east, and the west sides. The pillars are carved on two, or even on three, consecutive faces. The intermediate posts occur in between the pillars, and are carved on two opposite faces, the outer and the inner. The horizontal crossbars are simply but tastefully decorated with carvings of lotus-shaped medallions in the middle, on both sides. The coping stones, however, are profusely carved on both sides. The outer faces have floral designs carved on them, while the inner faces are ornamented with long friezes of animals.

The railing which one now sees at Bodh-Gaya is supposed to be a replica, in shape and design, of the

Pillar on S.-W. corner, south face

parts of India. Trees were worshipped not for their own sake, but for the sake of the deities (*vriksha-devatas* or arboreal deities) whose abode they were supposed to be. In olden times they were known as *yakshas* (male) and *yakshis* (female). Their importance

(Sunga period)

and their characteristics varied a great deal, but all were supposed to have the power to control and direct the forces of Nature on which depended fertility, and

therefore prosperity and riches. Hence, it is that in epic and classical Sanskrit *yakshas* are the guarantors of treasure. The dwarf *yakshas* are usually represented as supporting heavy loads. The bottom panel of the pillar on S. W. corner shows two gnomes or dwarf *yakshas* each supporting a stupa on his head. The *yakshis* are dryads or wood-nymphs. The almost headless and armless figure of a female climbing a tree (railing on S. eastern end) is that of a *yakshi*. On her person she bears the classical *mekhala* (hip-girdle) as also the classical *nishka* (breast-ornament), and is supported by a dwarf *yaksha*. This type of *yakshi* is known in Indian art as the *salabhanjika* (literally, a statue made of sal wood)—a tutelary deity of human fecundity. Many are the old Hindu temples which she adorns with her supple grace. The idea is derived from the ancient Indian festival of gathering flowers of the sal tree, which is essentially a fertility-rite. The connected literary motif that the Asoka tree does not bloom until kicked by a fair young damsel is familiar to readers of classical Sanskrit drama. Hence, Sir Edwin Arnold's:

"As pale Asoka buds
Wait for a woman's foot!"

A not inconsiderable portion of the sculpture has no religious significance, being entirely secular in character, and even includes scenes of such unspiritual activities as drinking, gambling and love-making.

Speaking of the sculpture of Bodh-Gaya and Bharut James Fergusson says:

"It is thoroughly original, almost without a trace of foreign influence, but quite capable of expressing its ideas, and of telling its story with a distinctness that never was surpassed—at least in India. Some animals, such as elephants, deer and monkeys, are better represented there than in any sculpture known in any part of the world; so, too, are some trees, and the architectural details are cut with an elegance and precision which are very admirable. The human figures, too, though very different from our standard of beauty and grace, are truthful to nature, and, where grouped together, combine to express the action intended with singular felicity. For an honest, purpose-like per-Reaphaelite kind of art, there is probably nothing much better to be found anywhere."

KANGRA : THE VALLEY OF THE GODS

By PROF. SUDHANSU BIMAL MOOKHERJI, M.A.

I

KANGRA with a population of about 10 lakhs is the largest district of the Punjab. Its 9,978 square miles are rather sparsely populated. Culturally and geographically, it has not much in common with the Punjab plains. It has been rightly pointed out that "it is not only the natural features of the country, but also the character of the people, their manners and their customs, which take one back to primitive conditions, and which make Kangra partake more of the characteristics of Hindustan than of the rest of the Punjab in which the District is for the purposes of administration included. As soon as one enters the valley, one is in an old world with its own problems with a beautiful scenery, with its old stone temples, slate-covered houses, running hill-torrents, snow-peaked hills one one side, and a valley full of fertile lands below."—*Punjab District Gazetteers*, Vol. VII, Part—Kangra District, Introductory, pp. 7-8.

Kangra Valley

Kangra Valley is only a part of the district of the same name. It is 30 miles long and 10 miles broad. The Valley lies at the foot of the Dhavaladhar Range of the Himalayas and is the only fertile region in the whole Kangra district. It is divided into five *tehsils* or revenue Sub-divisions. They are: Kangra, Nurpur, Palampur, Hamirpur and Dera.

Hindu cultural influence and tradition are dominant everywhere in Kangra. As pointed out above, Kangra has little or no affinity with the Punjab plains. The geographical position, natural scenery and manners and customs of the people of the two are quite different. Consideration of administrative convenience and that alone is the only *raison d'être* of their amalgamation. If ethnic, linguistic and cultural affinities and common hopes, aspirations are any consideration for the amalgamation of adjoining regions, Kangra should have been included in the newly created State of Himachal.

Kangra, in fact, seems to be a world by itself. It has nothing in common with the rest of the Punjab. Kangra's problems are peculiarly her own. Nature has showered her bounties upon Kangra.

Dhavaladhar

"No scenery," observes G. C. Barnes, the second English District Officer of Kangra (1847-51), "presents such sublime and delightful contents. Below lies the plain, a picture of rural loveliness and repose, the surface covered with the richest cultivation, irrigated by streams which descend from perennial snows and interspersed with homesteads buried in the midst of groves and fruit trees. Turning from these scenes of peaceful beauty, the stern and majestic hills confront us; their sides are furrowed with precipitous water courses, forests of oak (?) clothe them and higher up give place to gloomy and funeral pines, above all, the works of snow or pyramidal masses of granite too perpendicular for the snow to rest on."

General view of the ruins, Kangra Fort

Kangra's percentage of literacy is among the lowest in India. Economically Kangra is among the most undeveloped areas of the country. But if the honesty of the people, the meanness of their temper

and their willingness to help others are any criteria of culture, Kangra does not culturally lag behind the rest of India. It is, on the contrary, well ahead of not a few regions.

Main Gate, Kangra Fort

Pre-historic Kangra Valley formed a part of the kingdom of Trigarta or Jalandhar, which once included the hill tract between the Sutlej and the Chenab, and the Jalandhar Doab (between the Sutlej and the Beas) and Sirhind in the plains. Trigarta literally means the "Land of three rivers." These rivers may be the Sutlej, the Beas and the Ravi or the three tributaries of the Beas—the Vana Ganga (Baner or Bander), the Nogle and the Kurli—that flow through Kangra Valley. Trigarta in the post-6th century era was however much smaller than before and was synonymous for Kangra Valley. It was split into eleven petty principalities. These were: Nurpur, Guler, Datarpur, S'ba, Jaswan, Kangra, Kulehr, Mandi, Suket, Kulu and Chamba. They were subdued and forced to pay homage to the Mauryas, the Kushans, the Guptas and the kings of Kashmir one after another. But their internal affairs were never interfered with.

A narrow gauge railway line from Pathankot on the Northern Railway connects Kangra and part of Himachal with the plains. There are motor services besides.

Nurpur, about 15 miles from Pathankot, is the gateway to Kangra Valley. The ruins of the once famous fort of Nurpur seem to stand guard over the Valley beyond. The Pathania kings of Nurpur once became a power to reckon with in the Punjab hills. They annexed a portion of the Punjab plains as well. The kingdom of Nurpur was founded about 1,000 A.D. by one Jhetpal, who claimed to be a Tomar Rajput. The Tomars, who once ruled over Delhi, are said to have descended from the Pandavas of the Mahabharata fame. Jhetpal had his capital at Pathankot. Nurpur submitted to Emperor Akbar in the latter half of the 16th century. The capital was later on transferred to Dhameri by Raja Vasu or Vasdev. Jehangir,

who paid a visit to Kangra Valley in 1622, returned to Agra by way of Nurpur. Dhameri was renamed Nurpur in honour of the Emperor, whose real name was Nooruddin.

Jagat Singh, the greatest of the Pathanias, was on the throne from 1619 to 1646. He fought on many a field for the Mughals. He helped Prince Khurram when the latter revolted against his father. Nur Jahan however saved him from the Emperor's revenge. Jagat Singh revolted against Emperor Shah Jahan in 1641. He was, however, reduced to submission within a short time. He died in 1646. Jagat Singh was a favourite of Nur Jahan and addressed the Empress as *beti* (daughter). His name has been immortalised by poets and wandering minstrels. One of the well-known doggerels about him says: Raja Jagat, son of Vasdeva (*i.e.*, Vasudeva), was a great devotee (of God). His conquest extended beyond the Indus. He pitched his tents on the snow-capped peak and aimed firearms at the sky. He is therefore called Jagat (*i.e.*, the world).*

The Pathanias submitted to the Sikhs after the disintegration of the Mughal Empire. Ranjit Singh dethroned Bir Singh, the last of the Pathanias, and annexed his kingdom. Bir Singh, however, refused to

Darshani Darwaza, Kangra Fort

be reconciled to his lot and made a bold bid to recover his lost kingdom once in 1826 and again in 1845. He died in the attempt and breathed his last at the foot of the walls of Nurpur. Bir Singh's sacrifice is no less noble than that of the great Tipu Sultan of Mysore. It is a tragedy however that history does not remember all its martyrs.

Nurpur passed into the hands of the East India Company in 1846 after the first Sikh War. Bir Singh's son was granted a pension by the Company. The

* "Jagta Raja, Bhagta Raja,
"Vasdev ka jay.
"Sindu mare, Sagar mare,
"Himachal dera pay.
"Akash ko arb kita,
"Tan Jagta kahay."

main branch of Pathanias still lives at Nurpur. The fort is a protected Monument under the supervision of the Archaeological Department to the Government of India.

A little above 30 miles from Nurpur lies the modern Kangra town, known locally as Tehshil Kangra. The old town called Town Kangra or Kot Kangra, lies about 2½ miles away. Tehshil Kangra is a small rural town with a population of about 5,000. The district headquarters, Dharamshala, is 11 miles away from Tehshil Kangra. Dharamshala is famous for its scenic beauty, rainfall and slate industry. Barring Cherapunji in Assam, it has the highest rainfall in India. The only college of Kangra district is situated at Dharamshala. It is a Government institution imparting instruction up to the degree standards of the Punjab University.

The ruins of the fort of Kangra occupy 3½ square miles. The colossal ruins, the tragic grave of departed greatness, stand at one end of Kot Kangra, *i.e.*, old Kangra. Narrow, stone-built paths full of ups and downs, shallow, open drains on the roadside and a

Mahaton ki Darwaza, Kangra Fort

few ancient temples are the only reminders of Kangra's antiquity. Everything else has been wiped out of existence by a terrible earthquake in 1905. About 200 refugee families from the West Punjab have been recently resettled here. It was the headquarters of Kangra district till 1905.

Kangra has been known as Susharnapur, Bhim Nagar, Bhimkot and Nagarkot in different ages. The present name gained currency from the Mughal period. The beginnings of and the earliest chapters of its history are lost in obscurity. A Kshatriya class with the surname of Katoch is found ruling in Kangra in the historical period. Bhum Chand (Bhumi Chand?), a Kshatriya of the lunar dynasty, is said to be the founder of Katoch royal line. Sultan Mahmud of Ghazni invaded Kangra in 1009 A.D. The garrison in the fort surrendered after a nominal resistance. The invader collected a huge booty from here. The Muslims were driven out of Kangra in 1043 A.D.

Muhammad Tughlak of Delhi conquered Kangra in the second quarter of the 14th century. He could not, however, keep it in his possession for a long time. Muhammad Tughlak's successor Firoz Tughlak reconquered Kangra. Again the Muslim rule was short-lived. Khawas Khan conquered Kangra during the

The mouth of the tunnel from the Palace to the Patal Ganga, Kangra Fort

reign of Sher Shah in 1540-41. The conqueror plundered the temple of Vajreshwari or Mata Devi, the family deity of the Katoch Kings. The stone image of the goddess was sent to Delhi where it was broken into pieces to be used as measures of weight by the butchers of the capital. The copper umbrella of the goddess was utilized to make water vessels for the use of Khawas Khan and his household.

Kangra was the first among the hill States of the Punjab to submit to the Mughals. Jehangir deposed the ruling chief and annexed Kangra to his empire in 1620. Raja Ghamand Chand Katoch made futile attempts to recover the fort of Kangra in the late

Lakshmi Narayan Temple, Kangra Fort

18th century. He, however, succeeded in retrieving much of the departed glories and fallen fortunes of his family. He founded a new capital at Sujanpur known today as Tira Sujanpur. Ghamand Chand's grandson Sansar Chand II, the greatest king of his line, ascended the throne in 1775. India had been passing through some of the darkest days in her

annals at the time of Sansar Chand's accession at the age of ten. The once mighty Mughal Empire had fallen in all but name. Alien and indigenous soldiers of fortune had been fighting all over the country. Sansar Chand drove out the Mughals from Kangra fort 1783 and his Sikh ally Jay Singh Kahneya took possession of the fort. It came to Sansar Chand's hands only three years later when he surrendered all his conquests in the Punjab plains to Jay Singh in return for the fort and town of Kangra.

Gaddi man and wife

Sansar Chand reduced to submission the whole of the Kangra Valley. All the local chiefs promised to pay him tributes and to fight under his colours. A patron of fine arts, Sansar Chand appreciated talents and was tender-hearted. He dreamt of extending his sway over the Punjab plains. Desire makes man adventurous. Adventure invites dangers and disasters. Inordinate ambition brought Sansar Chand to grief. He invaded Hoshiarpur and Bazwara in the Punjab plains in 1803 and 1804. But the Sikhs of the Punjab had awakened to new life under Maharaja Ranjit Singh. The "Lion of the Punjab" had breathed new life into them and they were poised for action. The invader from the hills was pushed back on both occasions.

Ambition dies hard. Rebuff at the hands of Ranjit Singh only served to whet Sansar Chand's. He cast his eyes on the hills beyond Kangra Valley and grabbed a part of Kahlur (Bilaspur in Himachal) in 1805. This act of wanton aggression was the immediate cause of Sansar Chand's final discomfiture. The infuriated hill chiefs invited the Gurkha leader Amar Singh Thapa to invade Kangra. The sturdy Gurkhas of Nepal had long been dreaming of an empire from

Kashmir to Kathmandu. They had even invaded Kangra. Defeated, they had accepted the Katoch authority up to the Sutlej.

The hill chiefs promised to desert Sansar Chand as soon as the Gurkha army crossed the Sutlej. The Gurkhas invaded Kangra in 1806. The hill chiefs made a common cause with them. The Katoch army was defeated in the battle of Mohal Morian. Sansar Chand abandoned Tira Sujanpur and took shelter in the fort of Kangra. It was invested by the enemy. Four years passed away Kangra was still besieged. Sansar Chand appealed for help to Maharaja Ranjit Singh. The old rivals met in the tangle of Jwalamukhi, about 25 miles away from Kangra. The Katoch prince promised to hand over the fort of Kangra to the Sikh chief. The latter assured the former in return that no harm would be done to him. Sansar Chand is found plotting with the Gurkhas against Ranjit Singh even after this agreement. "All is fair in love and war!"

The Gurkhas beat a retreat on the approach of the Sikh army. The fort with the town of Kangra and 66 villages around was annexed to the growing kingdom of the Punjab. The newly annexed territory is known as Sandheta in Sikh records. Sansar Chand became a Vassal Prince under Ranjit Singh and lived at Tira Sujanpur as before. He ruled over almost the whole Kangra outside Sandheta. Kangra, annexed to the Sikh kingdom on the death of Sansar Chand in 1823 or 1824, passed into the hands of the East India Company in 1846 after the first Sikh War.

Gaddi women

Every visitor to Kangra Valley must pay a visit to the fort of Kangra, rather the ruins thereof. The earthquake of 1905 which destroyed Kot Kangra did not spare the fort. The ruins are under the supervision of the Archaeological Department to the Government of India. A small establishment of the Department near the ruins look after the protected Monuments of Kangra Valley.

The main gate lies at the northern end of the ruins. The gate, protected with thick wooden doors, was built by Maharaja Ranjit Singh. A second gate stands at the end of the yard immediately behind the first. The first is called *phatak* and the second *darwaza*.

is to be found in one of them. The inscription on the pedestal shows that the image belongs to the 15th century. The ruins of a gateway known as the Darshani Darwaza stand at the entrance of a yard by the side of the above group of temples. The visitor comes across another ruined gateway on the way from the Darshani Darwaza to the site of the palace. It is called Mahalon ki Darwaza. Not far off lies a paved yard. A few stone pillars without capitals stand on a side. The Katoch princes used to hold their court here. An elevation at one end of the yard was perhaps meant for the throne. There was a tunnel from the palace to the Patal Ganga which flows

A Gaddi child

A number of ruined gateways one after another lead into the heart of what was once regarded as an impregnable stronghold. They are called the Ahani Darwaza, the Amiri Darwaza, the Jehangiri Darwaza and the Andheri or Handeli Darwaza. Three huge mounds in the highest part of the ruins are all that remain of the Katoch palace.

Lower down stood the Laxminarayan temple. It was said to have been covered with gold plate. A few well-chiselled stone images and small fragments of stone pillars of fine workmanship are neatly arranged on one side of what was once the floor of the temple. Two small temples stand side by side not far from here. One of them was dedicated to goddess Ambika and the other, to Sitala. Two Jaina temples stand a little to the south of Ambika temple. They face west. A seated image of Adinath, the first Jaina Tirthankara,

A Gaddi bride's first journey to her husband's place

by the fort. Ladies of the harem used to come by this underground passage to the river for bath. A partially ruined mosque in the fort is said to have been built under orders of Emperor Jehangir.

Two tanks and five wells supplied drinking water to the fort. One of the tanks has dried up and is therefore called *Sukha Talao*. The other is known as *Karpur Sagar*.

The first builder of the fort of Kangra must have been a strategist of no mean order. Built on a ridge, at a height of 2494 ft. from the sea-level, fortified by a thick stone wall running around and surrounded by two swift-flowing hill streams, the fort of Kangra was admirably suitable for purposes of both offence and defence and struck terror in the stoutest heart.

II

Kangra is a land of temples par excellence and is rightly called the "Valley of the gods." Temples—big and small, well-known and otherwise—confront the visitor almost at every step.

Dhogris. They are among the untouchables of the Gaddi society

Jwalajee or the temple of Jwalamukhi is the most famous temple of Kangra Valley. To the local inhabitants it is, however, only second in importance to the Temple of Vajreshwari or Mata Devi at Bhawan midway between old and new Kangra.

The temple of Jwalamukhi is built in a natural niche of the Kalidhar ridge of the Shivalik hills. Standing at a height of 1,958 ft. from the sea-level, it faces the south. The roof and the domes of the temple were gold-plated by Maharaja Ranjit Singh and his son Kharak Singh, respectively. The silver doors of the temple are a present from the latter. Two gold-plated lions in the temple yard are the present of an unknown benefactor. The temple of Jwalamukhi does not seem to be very old. There is no image inside the temple. It is popularly believed that Bhagabati, i.e., the Supreme Mother of the universe, has manifested Herself at Jwalamukhi in a fiery form. Three flames in the crevices inside the temple are the objects of worship. None of the flames is very bright. None seems to be as hot as ordinary fire. The flames never go out. The one in a pit in the centre is the principal object of adoration. Scientists attribute these flames to some unknown natural gas. The temple of Jwalamukhi is believed to have been built upon some stratum of this gas. In all thirty-three

flames have been seen so far in the temple and its neighbourhood.

Tradition has it that Emperor Akbar sought to put out the flame in the centre of the temple by filling the pit with water. The attempt having failed, he covered the flame with an iron pan. The pan was burnt to ashes and the flame shot up higher and brighter than ever. The Emperor was convinced that it (the flame) was really a manifestation of the Divine Mother. He presented a golden umbrella to the Mother.

The priests of the temple of Jwalamukhi, who are also the proprietors, are known as Bhojaki Brahmins. The orthodox Brahmins say that the Bhojakis do not belong to the pure Brahminical stock. Inter-dining and inter-marriage with them are tabooed. Jwalajee attracts pilgrims from all parts of the country and is quite a lucrative property. The annual income is estimated to be well over a lakh of rupees. In the days of Kangra's independence, the income of the temple used to be pocketed by the Katoch chiefs. For many years during the Muslim rule in India, pilgrims to Jwalamukhi had to pay a tax of one anna each.

Jehangiri Darwaza, Kangra Fort

The temple of Mata Devi or Vajreshwari at Bhaban near Kangra, though little known outside, has a much greater local popularity than Jwalamukhi. Mata Devi or Vajreshwari was, as pointed out above, the family deity of the Katoch kings of Kangra. The old temple, built in the middle of the 15th century and repaired about 400 years later by the first Sikh Governor of Kangra, was razed to the ground by the great earthquake of 1905. Vajreshwari Devi is housed in a temple built after the earthquake. There is no image in the temple. A piece of black stone is worshipped as the goddess. The goddess and the temple are both the property of the Bhojaki priests.

The Vajreshwari temple may have been of Buddhist origin. Vajreshwari may be the Hinduised form of the well-known Tantric goddess Vajra Tara.

Tantricism, by the way, is a later development of Buddhism. The Five Offerings (Pancha Vali)—the buffalo, the cock, the goat, the coconut and the pumpkin—are made to Vajreshwari on special occasions. Orthodox Hinduism regards the cock as unclean. Its sacrifice to Vajreshwari certainly points out to the non-Hindu, non-Aryan origin of the goddess herself. It is just possible that Vajreshwari had been first admitted to the Aryan fold by the Buddhists before her admission to the Hindu pantheon.

Shiva Temple, Vajjnath

Vajjnath on the Punjab-Himachal border is a much frequented place of pilgrimage in Kangra Valley. The famous Shiva temple here attracts pilgrims from far and near. Ornamental works and images of excellent workmanship decorate the walls of the temple. Two stone inscriptions in the temple say that it was built in the Saka era 1126 (1204 A.D.) in the days of Lakshman Chandra of Kiragrama, a vassal of King Jay Chandra of Trigarta. Kiragrama is the old name of Vajjnath. The temple was built by two merchant brothers, Ahuka and Manyuka by name. Cunningham and Fergusson believed that the temple of Vajjnath was repaired during the reign of King Sansar Chand II (1776—1823-24) of Kangra. Sir Aurel Stein, who visited the temple in 1892, does not, however, accept the view.

A Shiva Linga of black stone is the object of worship at Vajjnath. A fair on every Monday in the month of Shravana attracts crowds of pilgrims from the neighbourhood as also from places farther off. A dip in the Kshir Ganga or Binode Ganga (local name

Chamunda Devi Temple

The temple of Vajjnath has rent-free properties worth Rs. 5,000 a year. The income from the offerings of the pilgrims runs to about Rs. 3,000 a year. Almost the whole of it is spent by the *sewayat* for his private purposes. Very little is left for the deity, whose servant the former claims to be. The temple of Vajjnath like that of Jwalamukhi and the fort of Kangra are protected under the Act for the preservation of Ancient Monuments.

Vajreshwari Temple, Kangra

Chamunda Devi about 3 miles from Malaun on Pathankot-Kulu road is another important place of pilgrimage of Kangra. The temple of goddess Chamunda at this place is not very old. Tradition has it

that in the day of one king Chandrabhan the temple of Chamunda was nearly 8 miles away from its present site. Human sacrifices used to be made to the goddess in those days.

District Board Bridge under construction on the Vana Ganga, Chamunda Devi

A stone image of the ten-handed goddess Chamunda in the temple inspires awe and terror rather than love and devotion. In one corner of the temple premises stands the temple of Nandikeshwara Shiva. As at Vajjnath, a fair is held at Chamunda Devi on every Monday in the month of Shravana. The quiet of the temple and its surroundings are suitable for those with a spiritual and philosophical bent of mind. The Vana Ganga (Vaner or Vander) flows on two sides of the temple with a murmuring sound. The ceaseless murmur fills the temple and the temple precincts. On the other two sides lie meadows of wide expanse bordered by an undulating mountain range. All is green from the temple to the hill. The bewitching landscape with its all-pervading quiet barring the non-stop music of the Vana Ganga reminds one of the dreamland. Tagore must have some such place in view when he wrote: *E desh legechhe bhalo nayane* (This place has appealed to my eyes).

III

Tea and rice are the principal products of Kangra Valley. Tea is grown exclusively in Kangra and Palampur tehsils. Most of the tea-estates are, however, in Palampur. Tea and cinchona were introduced into Kangra by the English planters in the middle of the 19th century. Cinchona did not flourish in Kangra. Its cultivation was therefore discontinued before long. The tea industry, however, prospered. Kangra's soil and climate are both suitable to tea-cultivation.

Kangra's 2,580 tea-estates own 8,000 acres of land. The whole of it is not however under tea. Many of the estates are tiny and range from 1 to 4 acres in area. Kangra tea was once quite popular in the markets of Europe. But today, neither in popularity

nor in quality, does it come within miles of the Darjeeling, Nilgiri or even Assam tea. Kangra's tea industry was the monopoly of foreign capitalists till the Great War (1914-18). The position has since changed and the industry is today owned, managed and controlled exclusively by Indian capital. The average yield of the Kangra gardens is 250 lbs. of tea leaves per acre per year. The average yield of the gardens in Bengal and Assam, on the other hand, is 1,000 lbs. per acre per annum. Unscientific, outmoded methods of cultivation, inferiority of the soil and excessive rainfall are among the causes of this difference.

A Government Experimental Tea Estate at Palampur has succeeded in raising its output to 4,000 lbs. per annum per acre. Some of the local plantations have obtained encouraging results by following its methods. The quality is still very poor however.

An account of Kangra Valley is incomplete without at least a passing reference to the Gaddis, the most remarkable among the peoples of the Lower Himalayas from the historical and cultural points of view. The Gaddis build their homes as high as 7,000 ft. above the sea-level. Agriculture is almost impossible on higher altitudes.

Bath in the Vana Ganga at Chamunda Devi

Gaddi means a Shepherd, and Gadheran, the Gaddi homeland in Himachal, means the Land of the Sheep. The ancestors of the Gaddis once lived in the plains of the Punjab, mostly in and around Lahore. Persecution and the fear of forced conversion to Islam uprooted them from their homes in the days of Aurungzeb Alamgir in the 17th century. Not a few of us have a bitter, firsthand experience of the circumstances which drive people out of their homes. Historians wax eloquent over the Great Trek of the South African Boers (1836) and over the Long March of the Chinese Reds (1934). But who cares for the band of obscure Indians of the Punjab plains, who, in the 17th century left their earthly all for their honour, religion and culture? These migrants were a

heterogeneous group composed of Brahmins, Kshatriyas, Sudras and others. The Kshatriyas outnumbered the rest. Many swelled the ranks of the original migrants later on. The descendants of the former are the untouchables of the Gaddi society today. Inter-dining and inter-marriage with them are strictly forbidden.

On the way to Chamunda Devi

The Gaddis are an agricultural and pastoral people. The sheep and the goat constitute their principal wealth. Worship of the sheep on the full-moon day in the month of Ashadh is one of their most important religious festivals. With the approach of winter they temporarily migrate in large numbers from their homes in Chamba and Gadheran Valleys to warmer regions, such as, Mandi, Suket, Kangra and the like. They go back home in spring. A large number of Gaddis have, however, settled down permanently in Kangra Valley.

Temple yard, Jwalamukhi

The Gaddis are a sturdy and charmingly handsome folk. They are fairly well-to-do. Home-spun, home-woven woollen garments are their normal apparel. Cotton clothes are rarely used. The Gaddis have their own tailors. Men wear long trousers. A low skirt reaching the ankles, a blouse and a piece of cloth for the upper part of the body make up the woman's wear. Women's garments are tight-fitting

and in good taste. Men as well as women wear thick, black, woollen girdles. Women like their sisters all over the world have a weakness for ornaments. Shoes are not generally worn.

Caste system and untouchability prevail among the Gaddis, who are Hindus by religion. Re-marriage of widows, though permitted, is frowned upon by society. Nor is it widely practised. Marriages are almost always negotiated. Love-marriages are seldom heard of. Men generally marry at about 25, women at about 20. Extra-marital sexual relations are extremely rare. Adultery is punished by ex-communication. Those so punished are re-admitted into normal social life after pilgrimage and purificatory ceremonies. Village elders settle all minor disputes by arbitration. Priests are held in high esteem.

Jwalamukhi Temple

The Gaddis are a gay, truthful, open-hearted and religious-minded people. Seclusion of women is not practised. Nor is free mixing between men and women permitted. The Gaddi women are far-famed for their loyalty to wedded love. Drinking is one of the besetting vices of the Gaddis. They are an absolutely unlettered people and their percentage of literacy is hardly one.

Unlettered as they are, the Gaddis are a self-respecting people and look down upon service as a means of livelihood. They are quite intelligent too as would be evident from one of the Gaddi ditties. It says that if one husband dies, another may be sought for. But the lover's death makes life unbearable. Planket, if torn, may be patched. But the rent sky cannot be sewn.

The Gaddis sing to the accompaniment of the *dholak* (a small drum). The present writer has had an opportunity of hearing the Gaddi music. Two lines of one of the songs he heard still linger in his memory:

*"Bhadru mahine nehri rati han,
"Krishne han janam liya han."*

i.e., Krishna was born in the dark night of the month of Bhadra.

How significant! When "pain and anguish wring the brow," when storm-clouds lower on all sides, when no silver lining is visible anywhere, when man loses all faith in himself, the Deliverer appears. He tells man that the good will prevail over the evil in the long run, that man is unconquerable and that obstacles, frustrations, and set-backs notwithstanding, he is sure to reach the sanctuary of Immortality in the end.

HEADMASTERS' SEMINAR IN THE LAND OF CLOUDS

By NARAYAN C. CHANDA, M.A. B.T., W.B.E.S.

On the morning of 13th May, 1955 I received an urgent telegram from the Director of Public Instruction, West Bengal, intimating that I was selected to attend Headmasters' Seminar at Darjeeling which was to continue for a month from 15th May, 1955 and that a first class reservation was available for me on 13th May, 1955. It was a pleasant surprise. The sun was pouring down molten rays relentlessly from the cloudless brazen sky; mercury in the barometer began to be whipped up in a steady progress day by day. The prospect of cool climate in the land of clouds appeared all the more covetable as an escape from the realm of fire to the dreamland of fog and moonlit mystery.

THE JOURNEY

I hastily arranged things at office and at home and started on the morning of 14th May, 1955. The pitch on the Calcutta road was bubbling in sweltering heat; the barometer recorded 108. I contacted the Air India office for a passage to Bagdogra but was told that all seats up to 20th May had already been booked. I rang up Eastern Railway office and was at once informed that no reservation could be available up to 22nd May. I was in a fix. The Railway office, however, at last assured that one berth could possibly be allotted on the Assam Link on 17th May, 1955. The West Bengal Cabinet had already moved to Darjeeling; the rush for the cooler region was tremendous. Luckily, I

got one reservation on 17th. The train steamed off from the Sealdah Station. The fans in the compartment whizzed to the utmost capacity but the air had become warm and uncomfortable, the more so as the train approached the border of Bihar.

The pleasure of the journey from Siliguri to Darjeeling compensated for all the trouble and discomfort in the plains. The upward journey along the sides of the hills, through loops and zigzags, was thrilling and romantic. Relieved of intolerable heat, the body rejoiced and the eyes feasted on the lush green woods and charming foliage. The sombre majesty of the hills seated in deep meditation, as it were, brings the message

On the lap of the hills: a view of
Darjeeling from L. J. Sanatorium
Photo by the writer

of quiet and peace in the worry-stricken mind. The language of the mountains is speechless but direct and effective. The hills are the symbol of patience, truth, beauty and unfathomable mystery.

THE SEMINAR: COMPOSITION

Under the auspices of the Ministry of Education, Government of India, the Headmasters' Seminar for the Eastern Zone comprising Assam, Manipur, Tripura and West Bengal was arranged at the Lewis Jubilee Sanatorium, Darjeeling. Sri A. K. Chanda, M.A. (Oxon), I.E.S. (Retired), was appointed Director of

HEADMASTERS' SEMINAR IN THE LAND OF CLOUDS

the Seminar. The different regions were represented by education officers as stated below:

Assam: Headmasters	6
Inspectress of Schools	1
Manipur: Headmasters	2
Deputy Inspector of Schools	1
Tripura: Headmasters	3
West Bengal: Headmasters of Govern- ment High Schools	5
Headmasters of non- Government Schools	26
(including 5 Headmistresses)	
Inspecting Officers	3
Lecturer, Training College	1

Total 48

INAUGURAL ADDRESS

Prof. Humayun Kabir, Education Secretary to the Government of India, opened the Seminar on 15th May.

Clouds playfully approach from below
Photo by Shri Nirmal Roy

1955 in charming surroundings. In an inspiring speech he dwelt on the needs of reorganisation of Secondary Education in the country and the socio-economic conditions under which the teachers have to work at present. Prof. Kabir suggested in bold outlines the measures to be adopted for remedy to the long-standing ills in the system of education in the land. A man of wide erudition and high ideals he has the gifts of head, heart and tongue combined in an abundant measure. He rightly diagnosed the malady when he said, "The efficacy of a system of education ultimately rests on the quality of teachers. It is, therefore, essential to attract the right type of men into the profession, give them the necessary training and create conditions in which their enthusiasm for the work is maintained throughout their professional life." The teacher is the pivot on which the edifice of education hinges. Contented, able and earnest teachers can change the face of the society in course of a generation. They are the real makers of a nation, but they must know the art and devote themselves to the high task.

Dr. B. C. Roy, Chief Minister of West Bengal, was pleased to visit the Seminar and meet the members in an open-air assembly. He spoke about reorganisation of Secondary Education in the State in the context of

the present conditions, status of teachers, financial assistance to schools and other matters relating to education in general.

AIMS AND OBJECTIVES OF THE SEMINAR AND THE BACKGROUND

"Upon the education of the people the future of the people depends" is a trite saying of Lord Disraeli which has become a favourite motto with the enlightened people in the world. A Chinese proverb which beautifully portrays the place of education in human society says:

If you are planning for one year
plant seeds;
If you are planning for ten years
plant trees;
If you are planning for hundred years
plant men.

Shining pearl at dusk: Raj Bhawan,
Darjeeling
Photo by the writer

"It is the human being that counts and it counts much more as a child than as an adult," says, Shri Nehru, the Master Architect of our Nation. Upon the teachers devolves the main responsibility of shaping and guiding the future generation through their present activities and efforts. The teacher has therefore an important and dignified role in the make-up of the society; as a maker of men his place is the most prominent, no matter how mighty and lustrous other men might be in other spheres of life.

The Secondary Education Commission under the chairmanship of Dr. A. Lakshmanswami Mudaliar submitted a detailed Report on the reorganisation of Secondary Education in India keeping in view the advance of science and the socio-economic background of the country.

With the financial assistance of the Ford Foundation an International Team of educationists was appointed by the Government of India to recommend measures for improving the quality of teachers and of the curricula in Secondary Schools. The Team travelled extensively in India and visited Denmark, a primarily agricultural

country, the U.S.A., a highly industrialised land and the U.K. which stands somewhere between the above two in spite of its industrialisation.

"It was felt," as says Prof. Kabir, "that a comparison of the methods and practices in these three countries would enable the Team to frame proposals relevant to the fast changing economy in India."

The Government of India very wisely decided to enlist the co-operation of the teachers by holding Seminars in different regions in the country and giving Headmasters opportunities of discussing the Report of the Secondary Education Commission and also the findings of the International Team in the light of their own experiences and local conditions and of drawing specific programmes of reform for their own schools.

Kurseong Forest School—a side view
Photo by the writer

THE SEMINAR AT WORK

The members of the Seminar met in earnest and set to work under the inspiring guidance of the Director. The day-long programme was strenuous but not boring. The morning sitting continued from 9 A.M. to 11 A.M. and the afternoon sitting from 2 P.M. to 4 P.M. on week days. After general discussions for the first 4 days the members divided themselves into 3 groups for detailed consideration of the recommendations and findings of the previous Committees in the light of their practical experience. The groups occasionally met in plenary session for discussion of important items of School curricula and School management. The discussions sometimes took the shape of intellectual fight in which the "fighters" brought to play their knowledge, experience, wisdom and foresight.

It was accepted that there should be an integrated elementary education (to be known as Basic Education) for 8 years from 6 to 14 years on free and compulsory basis; the Secondary School should consist of 6 classes from Class VI to Class XI with multi-lateral subjects in the last 3 years of the School period. Up to Class V there would be one single stream of pupils who will be examined and diverted to two different streams (e.g.,

Basic and Secondary) from Class VI, according to their merit and aptitude.

The question of language engaged the serious attention of the members. India is a multilingual country, and language is one of her vital problems. The Seminar accepted the view of the Secondary Education Commission that

"With two other languages (Hindi and English) besides the mother-tongue, the course in languages will be rather heavy. It is unavoidable in a country like ours which has a multiplicity of languages and we should be prepared to pay this price for the wealth of linguistic heritage."

The groups drew up and the Seminar approved after modifications, where necessary, the reports regarding status of teachers, organisation, method and contents and administration and control of Secondary Education. Besides, some individual members submitted projects on different aspects of school instruction and development of students' behaviour pattern which may be adopted without much initial expenditure. The Seminar probed the Educational Plan in a thorough and realistic way without detracting however from the high ideals of man-making education.

EDUCATIONAL FILM SHOW

As an exhibition of Audio-visual aid, arrangements were made for display of films on historical, geographical and scientific subjects on every evening during the continuance of the Seminar. The Film Librarian attached to the Education Directorate, West Bengal went to Darjeeling with a projector and a number of films which were highly interesting and entertaining. The show became so popular, particularly with the school-going children, that the Seminar Hall would always be 'full' to capacity with the members of the seminar and others drawn to it by curiosity and pleasure. The Headmasters were convinced that teaching would be much effective and attractive if the school were provided with a 16 m.m. projector and educational films as in the U.S.A. and other advanced countries.

GRAMOPHONE RECORDS

Side by side with intellectual wrestling and technical jostling provisions were made for cultural entertainment. The Director took with him an excellent gramophone (Hifi) machine and a large number of choice records on Rabindra Sangit, Indian Classical music, English songs and orchestra, Shakespeare's plays, recitations from the works of Shakespeare and other English poets by noted English players. Music added to the zest of work during our sojourn.

TAPE RECORDER

A Tape Recorder is a quite handy and wonderful machine. It was used to record speeches, discourses, songs and recitations and to reproduce them whenever required. The recording was most faithful and natural. It caused a pleasant sensation to many. Songs by Shri Nirmal Kumar Roy and Srimati Radharani Chatterji and recitation by Miss Jogmaya Das when reproduced by the wonder-machine became objects of delight. With

the progress of science learning is going to be a joyous art. A Tape Recorder may be used in a school to teach correct reading and pronunciation. The same tape may be used over and over again for reproduction; it may also be used for fresh recording by wiping off the old impressions.

VISIT TO ST. PAUL'S SCHOOL AND ST. JOSEPH'S COLLEGE

In between work and amusement we visited St. Paul's Public School on Jalapahar and St. Joseph's College at North Point and had discussion with the chief member of the staff regarding management and instructional functions.

EXCURSIONS: BOGORA FOREST

Excursion formed an exciting and educative feature of this Seminar-cum-camp life in a Hill station. The first excursion was organised under the auspices of the Forest and Fisheries Departments, Government of West Bengal, with the kind assistance of Shri K. Sen, I.C.S., Secretary to the above Departments. A fleet of nine jeeps and a station wagon carrying the whole party proceeded along the narrow hill road at an altitude of over 7,500 ft. through the Reserved Forest. The road has numerous sharp bends, so much so that we had to cross one in every minute and it is the keen eye, agile hands and feet and strong nerve of the driver that could avert a headlong crash into a chasm. This clock-wise and anti-clock-wise whirling of the car in the upward move was too much for a lady who could not withstand giddiness and began to vomit.

Luckily for us, the weather was ideal. At places waterfalls were rushing down the hills with a continuous music on one side and on the other stood innumerable Cliptomaria trees vying with one another there to reach the blue dome overhead for a greater share of the golden sunshine. The deep green forests looked like silent and motionless waves of the ocean. Clusters of thin clouds were floating over the forest and playing hide and seek, sometimes entering the woods from one side and getting out from the other. Standing on the edge of the road at a sharp bend one could see that the sky had descended down the hills, as it were. It appeared that the spot where we stood was the only island in the limitless ocean of the blue firmament. The sight was bewitching. We were mad with joy.

We wanted to enter into the Reserved Forest and have a look inside. Mr. Rao, Divisional Forest Officer, who was accompanying us readily agreed and took us into the woods. Tall and handsome Cliptomaria trees planted in rows 6 ft. apart rose straight into the sky. The hill slope on which the trees stood was covered

with soft leaves which formed something like a cosy Dunlopillo cushion beneath our feet. We found ourselves in a wonder-land. There were no bushes or shrubs; there were only the straight pillar-like stems of the Cliptomarias as far as eye could go. Here also clouds were found meandering their courses and embracing the trees in a playful spirit.

We gathered from the Forest Officer that Cliptomaria (a kind of coniferous pine) was native to Japan and grew at an altitude of 4,000 to 8,000 ft. The tree matures in 90 years and yields very good wood. But in our soil the tree has begun to grow so quickly that its fibre has become soft unlike that of its

Left to Right: Dr. J. G. Fowlkes, Shri R. Chatterji, Shri E. J. Bellgard, and the writer
Photo by Shri Nirmal Roy

ancestors in Japan. According to Mr. Rao, the problem of the Conservator of Forests is to stop the quick growth of these trees, otherwise they could be used for no other purpose than pulp for paper. Wild bear and barking deer are occasionally found in these forests.

KURSEONG FOREST SCHOOL

The School is situated in beautiful environment surrounded by gardens with lovely flowers. The collection of specimen planks of various kinds of woods and the Natural History Museum there are a source of interest to the inquisitive mind. The Forest Officers were all attention to the guests and showed us round. The party was then treated to tea and the neat function in the School Hall ended with a fine speech by Shri K. Sen, I.C.S., Secretary, Forest and Fisheries Departments. On our way back via Kurseong we visited the Dow Hill Girls' School where the Principal took the party round the school rooms and dormitories. When we reached Darjeeling in the evening, moonlight and floating fogs had spread a spell of mystic charm over the town; sometimes the rows of electric lights gleamed as in a Diwali night and presently they would be obliterated by the rolling clouds. The town appeared like a fairyland.

MANIBHANJANG AND NEPAL BORDER

On 28-5-55 we started for Manibhanjang situated on the border of Nepal and the Rangit Valley. Eight jeeps were hired for the trip. The journey down from Ghoom to Sukhiapokri was difficult and thrilling. Fog was so dense that nothing could be visible beyond the length of a man's arm. Moreover, there are sharp bends and bridges over the road which passes along the side of the mountains with steep stone-wall on one side and deep gorges on the other. The Hill men driving the cars used their sixth sense, as it were; we passengers seemed to float blindfold through the clouds.

The Teesta rushes on under the bridge
Photo by Shri Subash Roy

From Sukhiapokri one road leads to Simana Busti on the Nepal border and the other goes up to Manibhanjang through a Government Forest. The panoramic beauty is enthralling. On the left, on the mountain sides tall stately trees 100 to 200 ft. in height, mostly oaks and other varieties, stretched themselves in majestic grandeur. Thick fern covered the base; innumerable creepers wove round the trees and added to the thickness of the foliage. On the right along the slopes clouds floated over the tops of the trees sometimes vanishing in the green ocean and again coming out like masses of incense-smokes. There is a Youth Hostel (altitude 6,680 ft.) at Manibhanjang which stands just facing the Rangit Valley and the Mim Tea Estate.

We returned to Sukhiapokri and thence proceeded to Simana Busti which stands on the Nepal border. There are no definite demarcating lines except a few poles with white flaglike pieces of cloth fastened to them. Thick fog enveloped the place, nothing was visible beyond a distance of 5 ft. On the return journey we paid a visit to Ghoom Monastery where incense is being burnt day and night in front of a big bronze statue of Goutama Buddha about 10 ft. in height. Ghoom, as the name implies, is the land of slumber, almost always covered with fogs or saturated with drizzles.

TEESTA BRIDGE

With a fleet of eight Landrovers the party went up to Teesta Bridge some 22 miles from Darjeeling along

the famous Peshok Road which commands a grand long-range view of the hills and the forests. The Road slopes down rather sharply as it approaches the Teesta and reaches the Bridge by several steep loops. The Bridge known as Anderson Bridge, built in 1933, covers the river by a single span below which rushes the gushing stream frothing and whirling and splashing against the boulders strewn over the bed. Teesta appeared to be a flourishing business centre situated in a valley at an altitude of about 500 ft. It is moist and damp.

It was a market day and as we passed through the bazaar we came across womenfolk dressed in colourful Tibetan garments and quacks advertising the efficacy of their medicinal *tuk-taks* through battery-operated microphones! They have improved upon their counterparts in the plains.

DISCUSSIONS WITH LEADERS OF THOUGHT

One of the chief gains of Seminar of this type is the ignition of intellect due to contact with leaders of thought in different spheres of activity. Dr. D. M. Sen, Education Secretary, Government of West Bengal addressed the Seminar and spoke in detail about the Secondary Education curriculum. He emphasised the fact that the aim of education was the development of the total human being and not a lop-sided growth of any individual qualities of the educand. Dr. P. Roy, Director of Public Instruction West Bengal met the members on 20th May, 1955 and gave an idea of the educational pattern envisaged in the Second Five-Year Plan. Shri S. K. Day, I.C.S., Development Commissioner, West Bengal, in an address before the Seminar dwelt in detail on the objectives of the Community Projects which according to him are an all-round progress and development of the people. Community Projects, said Shri Day, should start from the village and grow from within and not be thrust upon the people by Government. Shri Bimal Chandra Sinha addressed the Seminar on 23rd May, 1955 and discussed the history of the present system of education in our country. He expressed the optimistic view that the future of the country lay in the hands of the educators of the future generation.

DR. JOHN GUY FOWLKES

Dr. Fowlkes, an eminent American educationist and Adviser to the Ministry of Education, Government of India, stayed at Darjeeling for about a week and took an active part in the discussion in the Seminar. His talks, his thorough and comprehensive replies to the volleys of questions on various aspects of education in India and the U.S.A. were illuminating. On the 9th evening Dr. Fowlkes delivered a lecture in the Sanatorium Hall on *Some Characteristics of Learning and Teaching*. The meeting was well attended by teachers of the local schools and colleges and others interested in education. The speech was as brilliant as could be expected of an educationist of Dr. Fowlkes' stature. Learning, as beautifully defined by Dr.

Fowlkes, is self-discovery through persistent efforts; a teacher's duty is to stimulate and direct pupils efforts for learning. The teacher should be an energetic student throughout life; he must have a sense of humour and realise how ridiculous he himself sometimes may be; he must be earnest and sympathetic; he must love children and must be soft and tender and at the same time firm and bold. A labourer works with his hand, an artisan with his hand and brain, an artist with his hand, brain and heart. A teacher is an artist par excellence. A gardener is delighted when his plants grow and bloom, a scientist is happy when his inventions work up to expectation but the teacher who is the greatest artist has the unique joy of dealing with the plastic, living and the most wonderful creation of God—the children, the hope and stay of the future. Dr. Fowlkes declared, amidst spontaneous applause, that "to act as a teacher is a blessing and a glorious privilege."

We felt ourselves stimulated and our job ennobled. Shri B. K. Neogi, Chief Inspector, Secondary Education, West Bengal, addressed the Seminar on the closing day and dwelt on the duties and responsibilities of the teachers who are the real makers of the nation and exhorted them to further the cause of education by devotion to duty, humility of mind and noble conduct in their walk of life.

We met from different parts of the country—Assam, Manipur, Tripura and West Bengal districts. We felt oneness of purpose pervading our minds. It was a sort of educational pilgrimage where we took our dip in the confluence of heart and intellect and acquired new ideas, wider outlook, new energy for carrying on our work and new friends with intellectual affinity. After about a month's stay we bade adieu to Darjeeling, the charming land of clouds and flowers.

COMMENT AND CRITICISM
"First National Exhibition of Art"

Dear Sri "Kaundinya,"

I have gone through your article published in *The Modern Review* of July, 1955. The contents not only bear the thoughts of one who has spent considerable time in the pursuit of art but also are charged with that element of sincerity which provokes thoughts and demands respect.

There are some points about which I may not fully agree with you but there are some which cannot be lightly dismissed. Rather I should say that what has found place in your article vitally concerns the invasion manoeuvred by the unassimilated ultra-modern fashions into the cultural field generally, I mean, Graphic and Plastic Art. The followers carrying on this crusade have no other objective than to leave an impression of assertion without giving the least attention to the consequences. To me it appears that they feel quite happy in destroying the conventions which had contributed to the cause of culture of our concern.

I am not known to you. However I have discovered from your article that my works are not unfamiliar to you. Taking this advantage I am feeling inclined to know your views better by direct contact. As such it is but natural that there should be a desire from my side to meet you and discuss on such points as would help our mutual interest, particularly that of the Lalit Kala Akademi. I do not know how and when this would be possible. Perhaps you might be helpful in this respect.

With kindest regards,

Yours sincerely,

DEVI PROSAD ROY CHOWDHURY

To the Editor, *Modern Review*
Sir,

I have read with great pleasure the very frank and outspoken letter of Sri Devi Prosad Roy Chowdhury, President of Lalit Kala Akademi. My review of the National Art Exhibition has roused his conscience and he has felt that all is not well with the Delhi Akademi which he is destined (by reason of his great talent and long experience and practice of the Arts) to develop on proper lines so that our art of today may be worthy of our art of yesterday. As the worthy disciple of Acharya Abanindranath Tagore Sri Roy Chowdhury is charged with the sacred duty of guiding the destiny of Modern Art on the lines shown by Tagore, the Father of Modern Art, not by "reviving" ancient and outworn traditions or repeating mechanically the conventions of the Buddhist schools, the Moghul or the Rajput schools, but by pushing the basic tradition of Indian Art on new lines of development.

This has been very well demonstrated not only by Acharya Tagore, but by Sri D. P. Ray Chowdhury himself in his wonderful paintings which have magnificently upheld the claims of the old and of the new in the way the old has taken new forms without abandoning the essence and the spirit of the old. The poetry of Rabindranath Tagore has not abandoned the age-old Bengali language, but given it a brilliantly new form. The language of Indian Art should not be abandoned but given new forms as demonstrated in the paintings of Abanindranath, Dr. Nandalal Bose, and Sri Devi Prosad Roy Chowdhury.

To give the correct lead to our Modern, Sri Roy

Chowdhury, as President of the Delhi Akademi, must assert himself and be not misled by the dictations of incompetent persons from behind. It is an open secret that the Akademi is not functioning according to the guidance of Sri Roy Chowdhury, but according to the dictation of official wire-pullers and an incompetent Secretariat. We have before us a happy example of the Sangit Natak Akademi brilliantly guided by its distinguished President and sincerely served by a thoroughly competent and highly educated Secretary, Miss Nirmala Joshi. There is no hope for the Lalit Kala Akademi before its Secretariat and executive committee are thoroughly overhauled and replaced by competent experts. It may be useful to remember that Sri N. C. Mehta, Sri Mukandi Lal, Sri Arun Sen, and Prof. O. C. Gangoly, men of international reputation are still in the land of living and are highly qualified

by their brilliant services to Indian Art and their vast experience to help Sri Roy Chowdhury to run the Lalit Kala Akademi on proper and healthy lines. I have no personal knowledge of the inner working of this Akademi, but people who have personal knowledge have unanimously condemned it in unqualified terms. The Government has provided generous grants, but the money provided is not being used properly and conscientiously. One is entitled to expect Sri Roy Chowdhury to utilize the grant with meticulous care and responsibility, so that both the formulation of the policy and programmes and proper utilization of the funds now rest on Sri Roy Chowdhury if he asserts his rights to guide the Akademi independently. I wish him good luck in this great undertaking.

Yours faithfully,
KAUNDINTYA

II

"Keshub Chandra Sen—An Artist"

THE article entitled "Keshub Chandra Sen—An Artist" by Sri Kajal Basu M.A., appearing in your February issue is not always very clear in its import and meaning. The main thesis has been very weakly worked out and there are confusions of thoughts at many places. We failed to understand all about Keshub Chandra's inspiration and Benedetto Croce's intuition being somehow identical. Even on an analogy of rare far-fetchedness, the author of the article could not convince his readers that there is any parallelism whatsoever between Keshub Chandra's religious inspiration and Croce's aesthetic intuition. Of course, both start with the letter 'I' and that is the only point of agreement that we could find. Again the author has unwillingly referred to Plato's notion of 'inspiration.' Plato condemned inspiration as something irrational and as such he started a crusade against all forms of fine arts (which are more or less inspired) and wanted them to be banished from his ideal Republic. Of course, a modern defence of Plato has been eked out by Collingwood and others and it has been contended that Plato only condemned the amusement arts to save a decaying nation from imminent ruin. So a comparison between the concepts of inspiration of Brahmananda Keshub Chandra Sen and Plato is not only misleading but betrays a staggering lack of understanding on the part of the author, of the fundamental concepts of these two great minds.

The author, as I have already pointed out, drew a futile analogy between Croce's 'intuition' and Keshub Chandra's 'inspiration.' Any student of Croce's aesthetics would be reluctant to accept the comparison to be

of any worth because Croce's intuition is below the logical level. Aesthetic activity is prior to logical activity and as such the notion of reality or unreality is not applicable to the level of art. These value-judgements, according to Croce, are devoid of all reference to reality. As for Sidgwick 'intuition' has a special meaning, so also for Croce and it can not be abstracted from 'expression' even in the thought-level. The two are identical. Such a concept of identity of intuition and expression is peculiar to Croce and it works only in his system as the Rasa-lila of Lord Krishna holds good only within the four walls of Brindavana. Croce's intuition has been placed below the logical level whereas inspiration of all saints and seers is taken to be supra-logical. Such supra-logical inspirations are out and out rational because the products of such inspiration are subsequently vindicated by reason. Anybody reading the passages quoted in the article from Croce and Keshub Chandra will fail to understand the points of agreement between the two worlds of ideas as represented by the passages. Certainly Croce's 'intuition' cannot be compared to a devotee's inspiration even on a very lenient estimate of the two. A rigorous survey would have given a rigid determination of the two ideas and that would have shown clearly that they could not be compared. We would like very much a clarification in your esteemed columns from the author on the issues raised and that will undoubtedly enable us to understand the significance and meaning of the comparison suggested.

DR. SUDHIR KUMAR NANDI, M.A., D.Phil.

THE HINDU COLLEGE The First Phase

By JOGESH C. BAGAL

IN the previous article* I gave the story of the foundation of the Hindu College. The school department was only opened at the time. During the first eight years or so, the College remained practically a school. Attempts were, however, made for starting the 'Academy' (the College section) from time to time. But this could not be realised till the Government allotted sufficient funds for the purpose in the late twenties.

The establishment of the Hindu College gave an impetus to fresh educational efforts in this part of the country. The School-Book Society was started in July 1817 to provide for suitable text-books, both English and Bengali. With a view to improve the indigenous system of instruction, the Calcutta School Society was formed in September 1818. They not only took steps to reform the existing *pathsalas*, but also started model schools, where English constituted a part of the curriculum. These latter served as a feeder to the Hindu College. Raja Rammohun Roy founded an English school almost simultaneously with the Hindu College where an improved system of instruction was followed. The movement set afoot by the Hindu College grew in volume as the years rolled on.

II

Work of the Hindu College in its school department commenced on 20th January 1817, with twenty scholars on its roll. The number increased to sixty-nine at the end of the session. The scholars belonged to two categories: (1) Free scholars were the nominees of the Governors and Managers according to rules. They numbered sixteen at the end of the year. (2) Others were paying scholars, the monthly fee being rupees five for each. Teaching in English and Persian started from the very beginning, teaching in Bengali and Byakaran on the 1st of March 1817. It appears that Pandit Gourmohan Vidyalkar and Pandit Ramjiban Nyayabhusan were appointed on this date to instruct the boys in Bengali and Sanskrit. Pandit Gourmohan subsequently joined the Calcutta School-Book Society as their *Pandit*, or literary assistant. He also served the School Society in another capacity.

The first annual general meeting of the subscribers to the Hindu College was held on 6th January 1818. The European Secretary, Frederick Irvine, read the annual report and the Native Secretary, Baidyanath Mukherjee, presented the accounts before the mem-

bers. Both of them referred to the progress of the College. Lines of improvement were also suggested in the European Secretary's report. We find in this report that all the sixty-nine scholars learnt English, twenty-six Persian and seventeen Byakaran. During the year many Indian gentlemen visited the institution and were pleased with the progress made by the scholars. Progress would have been greater, had the students been regular in their attendance. The Secretary, *inter alia*, asked the guardians of the scholars to see to it that their wards must not absent themselves without any pressing ground. The Managers sent a circular to the guardians and subscribers to this effect afterwards on January 13, 1818.

Much inconvenience was felt for want of proper text-books, and it was found necessary to write lessons for the boys. But this desideratum, says the report, would soon be met by the recently formed Calcutta School-Book Society. "By this means the Hindu College will be supplied with school books free of expense. Some have already been received from that Society." The Secretary further writes that 'the most respectable English gentlemen both here and at home are friends to the Hindu College and there are now great hopes that Government will assist it, its importance and progress will, it is hoped, be greater and greater every year.' The accounts showed that the funds of the College stood at a little over seventy-two thousand.

In obedience to the rules, election of Managers or Directors was held early in January 1818. Names of those elected were reported to the meeting of the Managing Committee on 28th January 1818. Besides those of the previous year, two new Directors were elected, namely, Radhakant Deb and Guruprasad Bose. Kasinath Mallik was added to the Committee in May. We find Gopeemohan Tagore deputed for the first time by his eldest son Suryakumar Tagore at the above meeting. It was then resolved to 'petition the Governor-General in Council to grant the aid of Government to the Institution.' During the session the College received a donation of Rs. 2,000 from Pandit Raghunani Vidyabhusan. Of this sum only one hundred was to be given to the Calcutta School-Book Society. The College was removed to the house of Rupchand Ray in the Chitpore area in July 1818 on a monthly rental of Rs. 60 for one year. The owner was entitled to send two free scholars to the College. A portion of the College fund was advanced

* The Modern Review for July, 1955.

to a commercial firm as loan on handsome interest for two years from July 1818.

But it was soon found that the monthly expenditure of the College exceeded the income which accrued from pay of the scholars and interest of the fund. In September 1818, monthly expenditure was Rs. 950 and monthly income only Rs. 700. To meet the deficit the Committee proposed to dispense with the services of the Native Secretary on 10th September 1818. It was also resolved at the meeting to turn the institution into a free one from January 1819. Paying scholars could, however, be admitted on the approbation of one of the Managers. Two reasons can be adduced for this decision. One was the unpopularity of the 'pay' system. But the main reason was evidently to induce the opulent to subscribe to the Education Fund more liberally. At the next meeting, held on 24th November, the Managing Committee resolved that the services of the Secretaries would be gratuitous. Other retrenchments in the instructive establishment were also to be effected from that date. The Calcutta School Society intended to send some selected boys of their indigenous schools to the Hindu College for higher education. They would pay Rs. 5 per head per month. The Committee resolved that the number so sent should be 'equal or exceed twenty.'

III

The year 1819 saw the Hindu College as a full-fledged free institution. Its income was Rs. 100, being the pay of the twenty scholars sent by the Calcutta School Society as well as the interest from the College Fund. The establishment charges were considerably reduced, and in June 1819 these came down to Rs. 535. They varied between this amount and Rs. 550 for several years to come. It was perhaps from this month that the College was removed to the historic house of Feringhee Comul Bose in Chitpur. In May 1819, the Managers of the Hindoo College advanced the Company's papers amounting to sixty thousand *sicca* rupees to the house of Messrs. Joseph Barretto and Sons, the Treasurer of the Institution, at an increased interest thereon from 6 to 8 per cent for the term of six years . . .

On 16th April 1819, the Managing Committee entrusted the Head Teacher Mr. D'Aselme with preparing a plan for better administration of the College. He accordingly prepared a plan and got it circulated amongst the members. This was accepted with some amendments. The plan related to admission of scholars, hours of study, dispersal, holidays, etc. According to rule No. 1, 'no boy was to be admitted as a new scholar in the school after 14 years of age.' To keep constant vigilance specially on the study and progress of the scholars, the Committee asked H. D. Loring and David Hare, friends of Indian education, to act as 'Visitor' to the College, between May and June, 1819. David Hare had already been appointed

by the Calcutta School Society, Superintendent of the latter's scholars in the College. The Committee's letter (12th June 1819) to Hare deserves to be quoted:

"Your sound judgement in matters of education and friendly regard towards literary institutions induce us to request the favour of you to become a 'Visitor' to the College. We shall feel infinitely obliged by your inspecting it at your convenience and communicating such hints and observations as may occur to you for its improvement."

The Hindu College had soon to lose the services of its European Secretary Lt.-Col. Frederick Irvine. Irvine intimated the Managers on 18th June 1819 that he had received an order to join his battalion forthwith. Therefore he had no other alternative but to resign his situation in the College. The Managers accepted the resignation with regret. They, however, wrote to him acknowledging his useful services to the Institution.

We should now refer to some efforts in England by J. H. Harington who had already been there in early 1819. He acted as Agent to the Hindu College, the Calcutta School-Book Society and the Calcutta School Society. Harington prepared a paper on these institutions, got it printed, and circulated it amongst the intellectual and benevolent Britons. Harington had served the country in various capacities for previous thirty-eight years, and as a real friend of the people, assisted all the benevolent endeavours, particularly the educational institutions of his day. His views in support of the Hindu College carried considerable weight in England. The establishment of this institution had already been a known fact there. He now laid special emphasis on the usefulness of the institution and contacted the Rt. Hon'ble S. C. Villiers, brother of Lord Clarendon, who took special interest in Indian education. Harington suggested to him that 'a philosophical apparatus be presented to him; such as will enable a qualified professor to give, at an early period, a course of lectures upon Astronomy; and upon the several branches of Natural Philosophy. Harington further added that this was the most likely means of advancing the measure, without any great expense. Harington's efforts were reinforced with the arrival, in early 1820, of W. H. Grant, who had taken particular interest in the Hindu College while in Calcutta, and who had made some personal gifts to the institution at the time of his departure. We shall have to say more of their combined efforts in the subsequent section.

Since the departure of Irvine, the post of the European Secretary had remained vacant. It was filled by G. G. Money in May 1820. One month previously George Mollis was appointed assistant teacher on one hundred rupees per mensem. The Calcutta School Society sent to the College an additional number of ten boys selected from the indigenous schools from

July 1820 and to be paid for by it at the former rate. The number of Society's scholars in the Hindu College now stood at thirty.

IV

Harington's paper and his constant meetings with responsible and benevolent Britons excited particular interest in their minds with regard to the Hindu College and sister institutions. W. H. Grant joined Harington soon in these efforts. In a communication to the Governors and Managers of the Hindu College, dated 23rd July 1821, Harington, jointly with W. H. Grant and John Toyader, intimated that the British India Society was formed on 26th May 1821 in London "for the intellectual and moral improvement of the native inhabitants of British India and parts adjacent." A provisional committee was appointed. An address to the British public was circulated on its behalf, explaining the objects for which the Society was started. W. H. Grant was the Secretary of the Society. The object of the communication, they wrote, was

"To make you Governors and Managers of the H. C. acquainted with the formation of the British India Society; and to request you will transmit to it from time to time, besides your periodical reports, any information relative to your Institution, which may enable the Committee, now or hereafter, to aid your exertions in promoting the design above-mentioned, especially by the supply of books, or other articles, required from Europe."

"Any circumstantial details of facts, connected with local improvements in education, and with the desire of the Natives of India to obtain the means of advancement in useful knowledge and literature, will likewise be received with satisfaction in this country; and may eventually promote the success of every institution which has in view the same interesting and important object, as that of the British India Society."

During 1821 some changes were effected in the management of the College. Joykissen Singh, one of the foundation-members, died on 27th October 1820. His gap in the Committee was filled up by his younger brother Rajkissen Singh in July 1821. In the same month Ramcomul Sen was added to the management as Superintending Director. The object of appointing this additional Manager to the Committee is stated to be that he would 'frequently visit and superintend the duty of the school.' Ramcomul Sen, already a subscriber, was considered very competent for the purpose. New regulations were prepared and circulated amongst the members for the better management of the College.

Progress of the College was maintained as far as possible with its limited means during the year 1822. But it suffered some serious loss in the departure of one and death of another of its ardent friends. Sir Edward Hyde East left the country in

January 1822. Leaders of the Hindu and the Mahomedan community joined hands in giving him a farewell address. The students of the Hindu College, for which he did so much, presented him with an address on 18th January 1822. The address was read by Shih-chandra Thakur, a prominent student of the College.

The College also suffered severely by the death of its Native Secretary, Baidyanath Mukherjee, on 10th November 1822. The efforts of Baidyanath at the foundation of the College will always be written in letters of gold. His place was taken up by his worthy son Lakshminarayan Mukherjee till death in 1839. Lakshminarayan was the father of Justice Anukul Chandra Mukherjee of the Calcutta High Court. In this session a sub-committee was formed to look into the administration of the College, of whom Radhakant Deb was appointed a member. It should be said in passing that Radhakant was taking keen interest in all matters relating to the institution since his election as Director in 1818.

V

Prospects of the Hindu College being a full-fledged Academy or College became bright in 1823. J. H. Harington returned to Calcutta early this year. He had persuaded the British India Society of London to make a gift of the philosophical apparatus, so necessary for science-institution, on certain conditions. The apparatus related to Mechanics, Chemistry, Astronomy, Optics, etc. It was already on the way. Managers of the Hindu College lost no time in requesting such a benefactor of the College to be its 'patron.' This they did in a letter dated 22nd February 1823. They also approached the Rev. W. Yates with the request of his being a 'visitor' to the College. Duties of the 'visitor' were stated to be: (1) to visit the College as often as possible; (2) to examine students occasionally; and (3) to recommend alterations and amendments on the regulations and management of the Institution. Yates gladly accepted the post of an honorary 'Visitor' to the College on 10th April 1823.

We find for the first time in the MSS. *Proceedings* a certificate given to its alumnus Harimohan Dey. This was under the signatures of G. G. Money, European Secretary, J. J. D'Aselme and four Directors of the College, namely, Radhakant Deb, Radhamadhab Banerjee, Ramcomul Sen and Russomoy Dutt. Harimohan was a student of the College for a period of three years and a half, 'during which he conducted himself to the satisfaction of his teachers. He was assiduous and regular; and his improvement in the different branches of learning, viz., Geography, Astronomy, Natural History, Grammar and Arithmetic, has been comparatively great.'

Further development of the College required additional help and guidance. By the middle of 1823, the Government were inclined to help non-official agencies

instituted for the propagation of knowledge amongst the people. The managers and supporters of the Hindu College sent a petition to the Governor-General in Council on 19th June 1823 for pecuniary assistance. This petition is important for many reasons. While giving a short history of the College, it lays down that 'there never has been any system of instruction established in Calcutta that in the same length of time has been crowned with equal success in giving the Hindoo Natives a correct knowledge of the English language and accurate conception of some of the most useful branches of European sciences.' The number of students fluctuated between eighty and one hundred. "Some of those who have left it, have obtained high responsible situations, and brought great honour on the place of their education." As regards finance, the petition says that the Hindu College authorities invested sixty thousand rupees with Messrs. Barnetto & Sons at the interest of 8 per cent per annum. The period would expire in 1825. They had an income of Rs. 150 per month as fee from the Calcutta School Society's thirty boys. The College instructed the boys in English, Persian and Sanskrit. But for want of adequate funds, the wider objects of the College could not be fulfilled. They were obliged to reject the applications of innumerable boys 'who, if educated, would hereafter prove most useful members of the Native population.' They, therefore, solicited aid from the Government funds. They further added:

"But we beg leave to say that independent of pecuniary assistance we are greatly in want of a suitable building for the Institution, and we cannot but think that if the College, for which we have now the honor to solicit the favourable consideration and assistance of the Governor-General in Council were removed to the vicinity of the Sanskrit College about to be formed under the immediate patronage of the Government that the two establishments by having the two extensive media of instruction, such as, philosophical apparatus, lectures, etc., etc., common to both, might greatly assist and benefit each other."

The petitioners requested the Governor-General in Council to be 'Patron' of the Institution. Meanwhile the letter of W. H. Grant, dated 8th January 1824, reached J. H. Harington. He wrote, amongst other things, that the philosophical apparatus 'should be placed at the disposal of the Hindu College, should the Committee of that Institution have the means of employing a competent lecturer.' A considerable number of books had been forwarded by the Secretary to the Calcutta School-Book Society. He also intimated that amongst them such books should be selected as might be 'useful as an accompaniment to the philosophical apparatus.' Grant's letter gave an additional importance to the above-mentioned petition.

The Governor-General in Council took a favourable view of the matter. Their decisions were communicated to the Managers in a letter dated 17th July 1823. The Governor-General in Council accepted the patronage of the Hindu College, and ordered to provide for a lecturer, and to build a suitable house for the Hindu College close to the Government Sanskrit College. The Sanskrit College was to be opened on 1st January 1824 in a rented house. Land had already been secured to the north of the College Square, Calcutta, where suitable permanent buildings were to be built. The Managers were further asked to communicate with Lt. Buxton, Assistant Superintendent of Public Buildings, with regard to the plan of a school-room near the intended Sanskrit College.

The philosophical apparatus reached Calcutta by July 1823. W. B. Bayley, Chief Secretary to the Government, informed the Managers of the College that the Governor-General in Council had authorized James Thomason of the Civil Service to have proper cases made for keeping the apparatus received from the British India Society for the use of the Hindu College, and also to incur any other trifling expenses that might be requisite for the care, etc., while it would remain under his custody.

VI

Meanwhile, the Governor-General in Council appointed the General Committee of Public Instruction on 31st July 1823, subject to the approval of the Court of Directors, to supervise and control the educational institutions and to disburse funds on their behalf. J. H. Harington was its first President and H. H. Wilson its junior member and Secretary. Both these gentlemen were well conversant with the needs and prospects of the Hindu College. Wilson had previously written to Harington (11th April 1823) in the following vein:

"The school decidedly merits support as it has done much in the dissemination of the English language in Calcutta."

The foundation-stone of the proposed building in the College Square was laid with great ceremony on 25th February 1824. It was decided to house both the Government Sanskrit College and the Hindu College in this building. But the building would require considerable time to finish. The Managing Committee of the Hindu College wrote to J. H. Harington, President of the General Committee on 30th January 1824, to appoint a teacher temporarily for science-instruction. They further prayed for a monthly sum to pay the rent of the hired house till their transfer to the new building. They also asked the General Committee to allow their Secretary and the Secretary to the Sanskrit College to lend their assistance, when both the institutions would be accommodated in the same building.

This solicitation on the part of the Managers led to considerable correspondence. The General Committee of Public Instruction, with concurrence of the Governor-General in Council, agreed to most of the proposals of the Managing Committee. H. H. Wilson intimated to them on behalf of the General Committee on 28th May 1824 that Mr. D. Ross was appointed Lecturer, Natural and Experimental Philosophy, by the Government, and he would begin lecture from 6th July 1824. The sum of Rs. 280 per month was granted 'to cover the rent of a house and lecture-room and expense of small establishments.' It is interesting to note that Rev. John Mack of the Serampore Baptist Mission was an applicant for the post. But the authorities preferred Ross to Mack. Pecuniary assistance by Government necessitates supervision by them or their deputy. On this point wrote Wilson (28th May 1824):

"With reference to the extent of the aid already given to the Funds of the Vidyalaya and other arrangements in contemplation for its improvement, such as the grant of a Library, Endowments of scholarships, and liberal provision for the most effective superintendence that can be obtained, the expense of which will probably be fully three times the amount now derived from the Funds of the College, Government conceive the proportional share of authority over that establishment should be vested in the General Committee of Public Instruction."

The managers took the hint. They prepared a detailed plan in which united management of the College was proposed, and communicated it to the General Committee on 1st July 1824. The General Committee were convinced of the Managers' sincere intentions and on their behalf Wilson wrote (6th August 1824) in part:

"In order to render this general supervision as practical as possible they propose to exercise it through the medium of such their members as they may from time to time appoint and on the present occasion they avail themselves of the services of the Junior Member and Secretary, Mr. Wilson, whom they request the Managers of the Native College, to regard as the organ and representative of the General Committee."

"It is expected that any recommendation proceeding from the General Committee relative to the conduct of the Institution as expressed through the Acting Visitor will meet with the concurrence of the Managers of the Vidyalaya, unless sufficient reasons can be submitted in writing for declining such concurrence."

The venue of the Hindu College was changed to 123, Chitpore Road in September 1824 at the monthly rental of Rs. 300. According to the previous arrangement, Dr. Horace Hayman Wilson became a member of the Hindu College Managing Committee. We find him designated as Vice-President and taking active part in the deliberations of the Committee for the

first time on 11th October 1824. The Hindu College had been a full-fledged free institution since January 1819. In 1824, paying scholars were being admitted. It was at the fag-end of this year that a controversy was started between the Hindu College Managing Committee and the Calcutta School Society over the dismissal of a Society's student for irregular attendance. This, however, was quickly set at rest, and David Hare, Superintendent of the Society's scholars, was taken on the Managing Committee.

VII

With Dr. H. H. Wilson in late 1824 and David Hare in the middle of 1825 on the Managing Committee, the Hindu College marched towards progress in spite of certain reverses and set-backs in the financial sphere. The first public examination of the Hindu College students, as far as it is on record, was held on 22nd January 1825. Besides J. H. Harington and H. H. Wilson, many European and Indian friends of education attended the function. Meritorious students were given prizes. It was at this meeting that Kashikanta Ghosal, son of Kalikanta Ghosal of Bhukailash, donated twenty thousand rupees for the development of the College. The sum was placed in the hands of the General Committee.

Mr. D. Ross commenced his lectures on 6th July 1824. Senior students of the College attended them and gave proofs of their acquaintance with scientific subjects. In the two certificates awarded respectively on 8th March and 7th July 1825, this point was particularly noted. In the third it was specifically stated that 'he (Heramba Nath Thakoor) has acquired some knowledge of the rudiments of science; and that he attended the lectures on Experimental Philosophy delivered by Mr. Ross during the whole of the first period.'

By 1825, the Hindu College School, as it was sometimes called, was divided into ten classes, four upper and six lower. On the establishment were only four teachers who taught the upper classes. The lower six were placed in charge of monitors, students of the upper classes, who taught their younger brethren at certain intervals. Their studies were thereby not a little hampered. The Science-teacher was outside this establishment. The meeting of the Managing Committee, held on 6th June 1825, on which we find David Hare for the first time, discussed how the system of instruction could be improved, and thrashed out a detailed scheme. This would require some additional expenditure for which the Committee proposed to approach the General Committee. Improvement in instruction was specially mooted by Wilson in his report to the General Committee in January 1825. Wilson also took upon himself the task of carrying out reforms in the internal management of the College in his capacity as a 'Visitor.' Hours of study were increased from four to seven, regularity in attendance was enforced, and strict discipline introduced. The course of studies

was also widened within certain limits. He recommended for the appointment of a teacher of Mathematics, which subject was very much neglected in the College.

The Managing Committee resolved at the above meeting to appoint permanent monitors from amongst the proficient students of the College, because they thought it to be attended with many obvious advantages if it should be found possible to rear useful assistant teachers from amongst the natives themselves. By this new arrangement the College would be able to teach three hundred scholars, who belonged to three categories: Foundation (free) scholars, School Society's boys and paying students. These reforms effected a marked improvement in the education of the scholars, and Dr. Wilson, we find, report favourably on the subject in 1927.

There was also effected some radical change in the curriculum of studies in early 1826. At its meeting on 24th February 1826, the Managing Committee resolved:

"That the free boys and S. C. boys of the three first classes may learn Sanskrit instead of Persian if they wish.

"That the free boys and S. C. boys of all the classes below the 3rd as far as the 8th be obliged to study Bengali.

"That the attendance of the pay scholars on

either of the classes, Bengali, Persian or Sanskrit, be regulated by the wishes of their parents.

"That a Sanskrit class be formed of the following lads if they wish: Krishnamohun, Gangakant Pattak, Badan Chandra Ghose, Nasiram Mitra.

"That the Bengali Grammar be substituted for the Mugdhabodha in the Bengali class."

Finances of the College stood at a very low ebb owing to the fall of Messrs. Joseph Barretto & Sons in early 1825, with whom the sum of sixty thousand rupees had been deposited. Some handsome donations had been made in favour of the College, to the amount of a lakh of rupees during this session, by Raja Baidyanath Ray, Kashikanta Ghosal and Raja Harinath Ray. But as these were endowment funds, placed in the hands of the Government, and earmarked for definite purposes, the Managing Committee of the College could not derive any benefit from this source to meet its day-to-day needs. The General Committee of Public Instruction came to its rescue, but with increasing supervision and control over its affairs. The Hindu College entered into a new career as it were when it occupied the new buildings along with the Government Sanskrit College on 1st May 1826.*

* Mainly based on the MSS. Proceedings of the H. C. Managing Committee.—J. C. B.

REFLECTIONS ON MODERN INDIAN PAINTING

By O. C. GANGOLY

To make even a short survey and summary appraisal of Modern Indian Painting it is necessary to indicate the chronological limits and the implications of the phrase Modern Art. It is when mediaeval art terminates and expires that modern art comes into existence by discarding all marks of mediaevalism, that is to say, by rejecting timeworn and traditional conventions of forms, by discarding old-world types and techniques which for centuries had dominated the ideals and methods of mediaeval art. The period of extension and continuity of the mediaeval manners has varied in different countries according to the peculiar circumstances and historical reasons governing each country. Thus in England, the mediaeval era was followed by the productions of the Victorian era more or less marked by modern tendencies and ideals. In India the mediaeval era and its older outlook and methods of art have continued to a much later time, almost touching the beginning of the 19th century. In Indian Painting the older era ended about the year 1830 with the death of Molaram, the last representative of the Kangra School (Gharwal Branch), which itself was the last phase of mediaeval era in pictorial art. By the

middle of the 19th century European ideas had begun to penetrate and influence Indian culture in its many phases. This contact with European ideas brought about a modern outlook in literature as well as in the visual arts. And the importation of large-size canvases painted in oil brought in a temptation to the Indian painters to try and imitate the realistic and naturalistic methods of European Painting and to discard the flat, shadowless, and disproportionate conventions of Indian methods of the mediaeval times which still lingered here and there in remote corners of India. The most successful imitator of the naturalistic manners of European technique was Raja Ravi Varma, who brought about a new era by illustrating the themes from the Indian epics by a vivid naturalism, correct and proportionate anatomy, and a new manner of treating lights and shadows borrowed from the paintings of the European studios. He never attempted to enrich Indian methods of painting by adapting or assimilating his elements from European manners of painting. He totally ignored the language of Indian pictorial art and totally adopted a foreign language with all its stylistic tricks and techniques. Bengal had also her European imitators

who came after the establishment of the Government School of Art in Calcutta, who took their lessons from the new School of Art in which the art of painting from living models, studies of actual costumes, and drawing live human types and natural contrasts of lights and shadows were taught. These Anglo-Bengali painters began to interpret the stories of Indian mythologies in the new realistic technique they learnt from their European teachers in the Government School of Art. Their productions, reproduced in crude colour lithographs, became famous as the pictures of the "Bow Bazar Art Studio" and decorated the rooms of prosperous Bengali Zemindars and merchants. The quality of these productions was somewhat equal to, but poor in colour values in comparison with, the work of Raja Ravi Varma. The superficially attractive pictures of Raja Ravi Varma with their theatrical heroes and heroines in their artificial poses and gestures continued for a long time to govern the tastes of the Indian people in their popular and sentimental appeal. And his methods of realistic and incongruous representation of super-human types and supernatural episodes of our national epics were continued in Western India by the students of the Sir J. J. School of Art opened about the year 1865. The "School of Art" methods, following the paths of European naturalistic techniques, was typically illustrated in the later works of Visvanath Mahadev Dhurandhar, a talented Marathi artist who introduced many improvements in the illustrations of Indian mythological themes, particularly in the background sceneries and architectural framework, many details of which and of costumes and jewellery were borrowed from the wall-paintings of Ajanta. But in the meantime, people were getting tired of these realistic presentations of the ideal and romantic themes of Indian mythology and a new movement was ushered in by Dr. Abanindranath Tagore, a nephew of the Poet Rabindranath. Led by E. B. Havell, Abanindranath discovered the language of Indian art, the old pictorial native dialect of India. Having collected some masterpieces of Rajput and Moghul paintings, Abanindranath discovered the threads of the old idiom of Indian painting and he found that the old language was not dead, but was capable of being used as a living language of Indian painting to interpret the thoughts and ideas of modern times. His paintings were designed as an organised protest against foreign influences and as a passionate plea for artistic expression through indigenous forms, a plea for the use of the old vernacular Art of India as the medium of a truly National Art. He came as a rebel against the domination of the Western standards of art and as an able demonstrator and interpreter of the finest elements of indigenous Indian painting. As an artist, his reputation was built in a day when in 1914 his works were exhibited in Paris, where the famous critics and connoisseurs of Europe gathered to heap on the works of Tagore a unanimous verdict of warm and reverent tributes. It was not only a triumph of

Abanindranath but a triumph of the ideals and standards of Indian painting. Tagore soon brought up and trained a brilliant group of disciples and followers to help him develop the growth of this new movement of Indian painting with a new national and spiritual outlook absent in the works of Raja Ravi Varma or Dhurandhar, and soon this new movement spread all over India and broke the back of European imitation in modern Indian painting. For the last few years some critics have attempted to discount the merits of the works of Tagore on the wrong charge that Tagore has been a 'revivalist' of old traditions ignoring the demands of the new age demanding new and fresh methods of expression and asking for representations of sights and happenings of daily life in which old mythology has no place. But it is a mistake to suppose that Tagore has been a revivalist or champion for a return to the past. He has gathered lessons not only from Indian, Japanese and Chinese masterpieces but in a free and eclectic spirit derived valuable lessons from the methods of European painting, and he introduced in his productions methods of European compositions of pictorial art and Western ways of space-compositions, perspective, and new uses of lights and shadows absent in Indian pictorial conventions. The modern protest against the illustrations of Old Indian mythologies is a fallacious and arbitrary protest. For if we realize that beyond the narrow circumference of about ten per cent of English-educated Indians the majority of the Indian populace has still passionately clung and adhered to their religious beliefs and are steadfast in their devotion to the legends of Radha and Krishna, Shiva and Parvati, which still continue to embody and stimulate the spiritual culture and religious beliefs of the ninety per cent of the Indian population. The spiritual needs of this major portion of the Indian people can only be met through the pictorial visualization of old mythological legends and the great systems of religious beliefs and doctrines. The second phase of modern Indian painting is represented by the works of another Bengali painter still living, Jamini Roy, who specialized in the exploitation and development of the language of the old Folk Art of Bengal. He studied carefully the surviving relics of Bengal *patua* paintings, the products of the Bengal *patuas*, the successors of the village painters of mediaeval times, deriving his inspiration from the collection of old Bengali picture-rolls made by the late Guru Saday Dutt. This new exponent of old Bengali folk art has succeeded in putting life and spirit into an obsolete language and to revive it in a newly rejuvenated form and a new power of expression which could appeal to the modern mind. But his stock-in-trade is very limited, being confined to a few types of Gopinis, Yashodas and cow-herd boys copied and derived from the decorations of the old ritual and processional cars of Bengal folk religion.

An inherent defect and incapacity in this modern

endeavour to resuscitate the forms and formulas of old folk painting is the sophisticated and artificial city-life of most of our modern practising artists who pretend to rejuvenate folk art by trying to recapture the elusive folk mind which most of our artists have left in their native villages many years back many miles behind. Indeed, it is one of the standing jokes of some of the artists in Calcutta that these new exponents of old Bengali folk art have been incessantly manufacturing "Folk Art" from their fertile factories in the heart and hubbub of the city of Calcutta.

The third phase of Modern Art in Bengal is the activities of a group of young artists in Calcutta, who grouped themselves under the label of the "Calcutta Group" and began to paint pictures in frankly European techniques, borrowing their methods and mannetisms from the Modernists of Paris and London repudiating not only the claims of native Indian pictorial traditions championed by Abanindranath, but also repudiating the cheap and literal naturalism of the academic painters of the Victorian Era. Their association did not survive long and they have now disbanded, each going on his own way without subscribing to any agreed doctrine of art. The late adherents of the Tagore movement are very few and are not worthy exponents of the principles of Indian Art discovered and demonstrated by Tagore.

We now come to the most active dynamic section of modern painting, the contemporary painters of Bombay and Delhi. The Bombay Group, though not knit together by the ties of an agreed creed of Art, consist of independent individuals all having their gaze fixed on the lessons to be derived from the post-Impressionists, Cubists and the Abstract Painters of Europe. They are united by a common and unqualified rejection of the native, indigenous language of Indian painting, which they believe are useless for interpreting modern ideas and modern thoughts cropping up from the dynamic life the modern Indians are living to-day. But, with a few exceptions, most of these contemporary Indian painters are not in direct touch with life, and rarely fraternize with the common people or even the cultured and educated groups of modern Indian society, so that they receive no social, intellectual or spiritual stimulation from the people around them and live a life in a "vacuum," shut up in their own studios, painfully copying the manners and mannerisms of the Modernists of Europe from reproductions in albums rather than from actual originals. Many of these contemporary painters pretend that they are utilizing and developing the best elements of Indian folk art. But the amusing joke is that except in a private collection in Calcutta, now locked up and

inaccessible to students, there is no collection of Indian folk painting in any museums in India, private or public. The early Guzerati paintings and the primitive Ragini masterpieces of Rajasthan could indeed provide valuable lessons to our contemporary experimentalists, but no example of Ragini "primitives" can be seen in any public museum in India, and of early Guzerati folk painting only a few stray copies are to be seen in one or two museums and are never studied by our living painters. Ever since Gauguin and Picasso began to call attention to the dynamic qualities of Primitive Art and of Negro Sculpture and Polynesian Art of the East, it has been the fashion with many of our imitators of European modernistic painters to talk glibly about the qualities of folk art and of the masterpieces of primitive art. But it is nothing but a hollow pretension, as our Modernists, excepting Jamini Roy, have never studied in originals the folk art of any culture-areas of India. There are greater opportunities to European artists to study the actual masterpieces of Negro and Polynesian Art in some of the European museums. But no such opportunity exists in any Indian museum to study at first-hand typical examples of the folk paintings of India. So that the claims of our contemporary artists that they are assimilating and developing the traditions of Indian folk art are, at best, naive and childish illusions. Any contemporary artist who attempts to free himself from the fetters of academic tradition in search for a spontaneous and sincere approach to the subject-matter of his studies must study at first-hand actual examples of folk painting, at one time current in various culture-areas of India. Their aim should be not to introduce another kind of "ism," but to get rid of certain modern brands of "isms," by recovering the spontaneity and the artlessness of folk art which academic artists of Europe have largely lost. But wise critics have pointed out that the artist of to-day can never capture or recover the original *nativete* of folk art and can never produce really "primitive" works of dynamic quality. Art is the expression of the artist's mentality, and is inseparably bound up with his whole life, surroundings and history. Civilized man cannot unlearn all that he has learnt, or rid himself of the centuries of science and technical knowledge which have become an inherent part of his nature. Imitating the mere "primitiveness" of primitive art or aping the forms of folk painting is like rejecting all modern comforts and modern spiritual and intellectual possessions, and going back to "caves" and to "skins." It is not only against all rules of logic, but utterly opposed to the brilliant lessons of human history.

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.

EDITOR, *The Modern Review*.

ENGLISH

CATALOGUE OF THE GUPTA GOLD COINS IN THE BAYANA HOARD: By Dr. A. S. Altekar, M.A., LL.B., D.Litt., Professor of Ancient Indian History and Culture, Patna University. Published by the Numismatic Society of India, Bombay, 1954. Foreword by Savai Brajendra Singh, Maharaja of Bharatpur. Pp. clvii + 363. 43 plates. Price Rs. 60.

The accidental find of a hoard of Gupta gold coins by some villagers in the village of Nagla Chhela (seven miles south-east of Bayana in the former Bharatpur State of Rajasthan) in January, 1946, is, as the author of this scholarly work rightly observes, "the most sensational numismatic discovery so far made in the history of Indian archaeology." The hoard consists of 1821 coins (out of a total of nearly 2100 pieces) which were recovered from the vandalism of the villagers by the zealous efforts of H. H. the Maharaja of Bharatpur to whose enlightened generosity the publication of this work likewise is due. In this sumptuous volume the whole collection has been described by the author with such thoroughness and learning as to make it an indispensable book of reference for all students of the Gupta period of our history. The work consists of an Introduction (158 pages), the catalogue proper (314 pages), a short sketch of figures on the coins in illustration of the costumes, furniture and weapons (7 pages) and 8 Appendices (41 pages) including a Bibliography, a genealogical and chronological table of the Gupta Emperors, an Index of types and motifs, an Index of symbols and a general Index. Of the 48 plates enriching this work no less than 32 (illustrating 449 coins of the hoard) were prepared in England by the collotype process and the remaining 16 (illustrating the coin-legends, the costumes, furniture and weapons, and the symbols) were prepared from special drawings. The Introduction contains *inter alia* a general account of the history of the dynasty and a comprehensive as well as up-to-date study of Gupta numismatics (with a complete account of the different coin-types and their varieties as well as the metrology, palaeography and symbols of the coins). The catalogue is a well documented record of all the coins of this collection after their weight and size and the descriptions of their obverse and reverse. The selection of coins for the plates has been made carefully so as to illustrate fully the rare types as well as the coin-legends, the individual royal portraits, the peculiarities of dress, coiffure and so forth. The author's painstaking research has led to the discovery of some new Imperial Gupta coin-types and their varieties (including one type of Chandragupta II and five of Kumara-

gupta I) and some new poetical hemistiches on the coin-legends.

We propose to make a few remarks. In discussing the problem of Ramagupta (the alleged brother and predecessor of Chandragupta II according to the evidence of some surviving fragments of a lost Sanskrit drama) the author convincingly states the case against his historicity. Nevertheless the author ends by adjudging him to be such a historical figure as to deserve a place with an approximate reign-period (c. 370-75 A.D.) in his dynastic history of the Imperial Guptas. Among his arguments in support of the story of Chandragupta II's seizure of the throne after his brother's murder (to which reference is made in the fragments of the lost Sanskrit drama above-mentioned) there is one which is open to serious criticism. Marriage with an elder brother's widow, we are told (Introduction, pp. xxiv and xxvi), was permitted by Dharmasastra writers and was the current custom. Both these statements are unsupported by any reference and are in truth contrary to fact. Among minor slips we have noticed that the proper name Purugupta has been invariably transliterated with a short u attached to the letter p.

We cannot conclude without observing that this valuable work does as much credit to the author's scholarship as honour to his generous and enlightened princely patron.

U. N. GHOSHAL

BUDDHIST MEDITATION: By Miss G. Constant Lovinsbery. With a foreword by Dr. W. Y. Evans-Wentz. Published by Luzac & Company Ltd., 46, Great Russell Street, London, W.C.1. Pp. 197. Price cloth-bound Rs. 6.

It is an excellent handbook on the Buddhist method of meditation current in the Southern School or Hinayana Buddhism. It contains in a nutshell the theory and practice of Buddhist meditation and is specially meant for Westerners. The authoress, who is the President of Les Amis Du Bouddhisme, Paris, is both a scholar and a follower of Buddhism. The first American edition of this interesting book appeared in 1936. Dr. Evans-Wentz, who is a celebrated authority on Buddhist mysticism, deals with the science of Buddhist meditation in a very valuable foreword and rightly remarks therein that meditation is the royal highway to man's understanding of himself—of the innumerable Karmic predilections resulting in mental impulses and actions both good and evil and of the whole of Sensuous being in the many worlds of the *Samsara* or Universe of Life's dominion.

The book under review is divided into two parts, the first part containing the theory of meditation and

the second part the practice of it. In the first part, general outline, essential ideas, concentration, character, classical subjects of meditation and other subjects of meditation suitable for occidental students and Janas are clearly dealt with. In the second part, practical instructions for posture, respiration, four divine states, four fundamentals of attentiveness and other pertinent matters are discussed. A bibliography of about twenty books on the subject and a glossary of Pali terms are appended. Buddhist postures and breathing exercises are very similar to those of Hindu Yoga found in the classical works of Patanjali and others. Southern Buddhism prescribes attentive observation of respiration called technically in Pali Anapana Sati. It is akin to preliminary practices of Hindu Pranayama and is considered of greatest importance in the practice of meditation. Most probably Buddhist and Hindu Yoga were parallelly developed.

A resume of the eight stages of Buddhist Yoga is also given. Any one can practise this method and experience its wonderful effect on mind and body. In the first stage of Anapana Sati, the inhaled and exhaled breaths are to be counted and in the second one has to be aware that breathing is taking place; but without paying particular attention to it. Thus one stage after another has to be gradually mastered till the mind becomes extremely one-pointed and trance is attained.

The chapter on meditation upon Self will appear strange to the Hindu readers. The Theravadi Buddhists do not believe in a Self or a God. Hence, their meditation is aimed at realizing that Self has no substance but is a constant flux like the stream of a river. Whatever their philosophical standpoint may be, profound meditation is sure to reveal the true nature of man and grant him lasting peace, that is not available anywhere in the phenomenal world.

The more such books are circulated in the Western hemisphere, the more peaceful will be their individual and collective life. Such a book is sure to serve as an antidote to the increasing war-craze of the Westerners and make room for peace in homes and society.

SWAMI JAGADISWARANANDA

THE YOGA OF SRI AUROBINDO (Part Seven): By Nolini Kanta Gupta. First Edition. March, 1955. Published by the Sri Aurobindo Ashram, Pondicherry. Pages 192. D.C. 1/16. Rs. 2-8.

The writings included in this volume are based on talks given by the Mother to the young children of Sri Aurobindo Ashram, Pondicherry. Yoga, according to Sri Aurobindo, enables the human being to attain to a consciousness higher than mind. From that standpoint these talks are simple and at the same time very elevating, awakening the spiritual consciousness in children. We recommend the book to the guardians and the teachers and also recommend that these talks may be repeated by them to the children under their care. The publishers should have named the book "The Yoga of Sri Aurobindo (for the spiritual education of children)."

SATI KUMAR CHATTERJI

THE TROJAN HORSE: Published by the Society of Defence of Freedom in Asia, 12, Chowringhee Square, Calcutta-1. Pp. 120. Price eight annas.

This is a study of the organisation, methods and objectives of the Communist parties. The book is divided into three parts and thirteen chapters giving

a description of the personnel and underground activities of the party and its new work throughout different countries of the world. At the present moment the party seems to have changed its tactics in India following the changed policy of Soviet Russia. It is still to be seen to what extent the "co-existence" principle is successful in modern diplomacy although it has allegiance of almost all Asian and African countries including Russia and Yugoslavia.

THE SOVIET PRISON HOUSE OF NATIONALITIES: Published from 12, Chowringhee Square, Calcutta-1. Pp. 226. Price Re. 1.

This is an exhaustive description of the Soviet experiments in solving the multinational, racial and language questions of U.S.S.R. The subjects discussed in the book are: Russian Revolution, Colonisation, Russification, Great Russian Chauvinism, Backgrounds—theoretical, historical and constitutional, and Oppressed Nations. Soviet treatment of minorities is described in detail in Central Asia, Trans-Caucasia, North Caucasias; Jews and Mongols and Muslim minorities are dealt with in an interesting manner. Eastern European States under the domination of Soviet Russia represent Russian Imperial expansion in the West. The expansion of the Soviet is a menace to the freedom of the world. It is the same as the expansion of European Imperialistic Colonisation in Asia, Africa and other parts of the world. In the hands of the Soviet, Imperialism has taken a new shape which all freedom-loving people should resist. The readers wishing to know about the minor working of the Russian administration will find this book informative.

A. B. DUTTA

CHANGE OF HEART: By Harold A. Ehrensperger. Y. M. C. A. Publishing House, Calcutta. 1954. Pp. 153. Price Rs. 2.

This short, inconsequential novel is built around a callow youth from Bihar who comes down to Calcutta in search of a living. This he finds, but he is soon enmeshed in the tentacles of Communist conspirators and is almost on the point of being bowled over into the vortex of a vicious and putrid political system. At this juncture appears a friend, a Muslim who is a follower of Vinoba Bhave (whom the author enthusiastically, but rather tactlessly calls "this new Gandhi"). This friend talks the bewildered youth from Bihar out of his halfbaked and fatuous dreams of a Communist paradise and the boy ultimately accepts the ideology of Bhudan as the only panacea for India's various ills. There is also a slender romantic vein, but that has no bearing on the main story.

Even a casual glance through the book would show that Mr. Ehrensperger's three years in India have stood him in good stead. His picture of life in Calcutta immediately before and after the first general election has an authentic ring, as also the well-known infiltration techniques of the Communist saboteurs, the anatomy of an Indian mob (pp. 10-11) or the scene at a busy railway station (p. 81).

But there is another, only more purposeful side to all that Mr. Ehrensperger has to tell us. He is anxious to praise Christianity as the only religion that is capable of delivering the goods. It was this anxiety and this mission that prompted Mr. Ehrensperger to collect a Hindu, a Muslim, a Buddhist and a Christian for his principal characters. The inevi-

table moral is sought to be rubbed in rather crudely whatever corner of the earth it came, he was nevertheless keenly conscious of his country's culture and tradition and considered it his duty to uphold them in their full dignity and majesty.

The volume under review comprises all the works of Bankim Chandra except his novels. It is divided into five sections: the first includes his humorous and satirical works; the second, miscellaneous short essays; the third, rather comprehensive treatises on religion and philosophy; the fourth, introductions to others' works that he edited, along with his scattered writings hitherto unpublished in book-form and letters and school-text-books; and fifth, some sketches and verses, juvenile compositions and unfinished work. Handy, decent, nicely printed and bound it is sure to win the favour of the general reader, the more so on account of its comparatively moderate price. Of the two other editions available in the market, one is rather too costly for the average buyer and the other, though cheap, does not appear in such an attractive, durable form. It is time that we had various editions of our classics to suit the taste and the purse of every section of our reading public.

One particular attraction of this volume is certainly the carefully written introduction by its editor Sri Jogesh Chandra Bagal. As an honest, fastidious, hard-working historian, he is held in esteem by our scholars. By collecting all important informations even from hardly accessible sources and presenting them in a precise, compact form, he has fulfilled his task in a manner expected of him. Bankim Chandra's own references to his various works and contemporary opinions on them provide interesting study.

D. N. MOOKERJEE

RAMESH K. GHOSHAL

BENGALI

BANKIM RACHANABALI, Part II (Essays and other writings except novels): Sahitya Samsad, 92-A, Upper Circular Road, Calcutta-9. Price Rs. 12-8.

In the field of literary essays, no less than of novels, Bankim Chandra is at once a pioneer and a supreme artist. In his appreciation of poetry he evinces a rich sensitive soul; and in his dissertations on science, history, theology, philosophy and politics we get sure evidence of a highly intellectual mind. A wonderfully versatile genius he has not yet been surpassed by any other Bengali writer. In him, we find creative vision side by side with analytical faculty. His erudition too has hardly any parallel. Bepin Chandra Pal rightly said, "When we read the works of Bankim Chandra, we cannot conceive of a subject he did not know or of a writer—Indian or European—whose works he was not acquainted with." A combination of scholarship, intellect and imagination is, perhaps, best to be seen in his *Krishna Charitra* and to some extent *Dharma Tattwa* and *Samya*. They illustrate a profound faith in dharma, tempered by scientific judgment and a sober attempt to synthesise the mundane and spiritual aspects of man. Easily responsive to all noble ideals and liberal enough to accept truth from

NEPALI

BHANUBHAKTAKO RAMAYANA: Annotated and Revised Second Edition : Edited by Surya Bikram Gewali. Published by Nepali Sahitya Sammelan, Darjeeling. Card-board bound. Pp. 360. Price Rs. 2.

It is a Nepali version of the great Sanskrit epic, the Ramayana, written in Nepali verse by Acharya Bhanubhakta. In the preface, Dr. H. C. Mookerjee, Governor of West Bengal, writes, "Kavi Bhanubhakta Acharya's Ramayana in Nepali written about 1840 is regarded not only as the earliest, but, according to many, up to the present, the only high-class specimen of Nepali poetry. In addition, it is also valued as a scripture." At his request Sri S. B. Gewal, Headmaster of Government High School, Darjeeling, an old pupil of the Governor, carefully and diligently edited the present text from an old manuscript, noting down variations in different texts. In the Introduction, Sri K. M. Munshi, Governor of Uttar Pradesh, writes a brief sketch of the life and works of the author and shows skilfully the beauties and merits of the Nepali version of the Ramayana, written by the greatest poet of Nepal. The book is illustrated with fine pictures. The text is printed in clear large type. The book is sure to find a wide market among the Nepalis.

B. K. SEAL

HINDI

NEPAL KA PUNARJAGARAN: By Paripurna-nanda Panyuli. Garhwali Jan-Sahitya Parishad, Tehri. Pp. 154. Price Rs. 2.

It is a short history of Nepal up to the time of its recent reawakening after a sleep of centuries. The

geographical, cultural and political aspects of the country, all have been brought into the picture.

HAMARA RASHTRA-JEEVANA KI PARAM-PARA: By Umakant Keshav Apte. Bharat Prakashan, Nagpur. Pp. 149. Price Rs. 2.

This is a Hindi translation by Shri N. G. Waze of the author's original, in Marathi. It attempts to present a picture of Indian culture and polity from a point of view which savours, it would seem, more of the spirit of resurgence than of the spirit of re-orientation to the ever-expanding vision of Truth. For, does not culture imply an ever-enlarging, historical horizon?

G. M.

GUJARATI

NANDINI: Published by the Trustees of Govind Krishna Nidhi, Ahmedabad. 1950. Illustrated cover. Pp. 144. Unpriced.

Nandini, in whose memory, *Nandini Samsmarikika*, is published was the youngest daughter of Shriyut P. G. Shah, M.A., B.Sc., C.I.E., ex-Accountant-General, Bombay, and President of the Public Service Commission, Bombay, and died young (Samvat 1979-2006). Brought up in a cultured but orthodox family and married happily, she won the regard, by her services and co-operation, not only of her husband's family but of numerous other friends, who have all paid their meed of tribute and admiration to her dear departed soul. Prayers were offered after her death where well-known Swamis like Kedarnathji and other close friends prayed for rest to her soul in heaven. It is a touching record and contributes to a chastened mood.

Educational Reform

A. S. writes in *Science and Culture* :

The Central Ministry of Education has sponsored a scheme of reform at the Secondary-cum-University stage of education throughout the country. Far-reaching in implications as it is, educationists and the general public, particularly in West Bengal where its impact is likely to be the heaviest, have naturally come to feel deep concern over the plan and the way it is being sought to be implemented. The changes visualised in it are almost sure to bring about a state of confusion in the entire field of higher education and, instead of effecting any appreciable improvement, are likely to create a series of difficult and complicated problems. It would appear rather strange that, despite well-grounded criticism of the proposal from different competent quarters, the authorities are apparently determined to push it through with what may legitimately be called unseemly haste.

The scheme proposes a three-year course of studies, after the completion of the Higher Secondary course, for the first Degree examination. Its main features are the abolition of the present Intermediate course, wherever it exists, and tagging its first-year class with Secondary schools and the second-year class with the Degree colleges. The new type of schools, thus to be formed, are to be known as higher secondary schools and students passing out of them will have to go in for a three-year course of studies in colleges before taking their first Degree examination. These structural changes are proposed to be introduced all over India in two or three years' time. During the transitional period, extending over five years or so arrangements will be made in certain selected upgraded secondary schools for opening higher secondary classes. These, together with the pre-university classes to be retained in colleges, will replace the existing first-year classes in the Intermediate course. Gradually, the pre-university classes in the colleges are to be taken over by the higher secondary schools. The Intermediate colleges and the Intermediate classes in the Degree colleges will thus altogether go out of existence and only the higher secondary schools and the Degree colleges will be left in the field to impart secondary and collegiate education respectively.

This plan of so-called reform is based on the recommendations of the Secondary Education Commission which submitted its report to the Government of India in August, 1953.

The memorandum prepared by the Central Education Ministry in this regard and circulated several months ago to different universities made some modifications of the original recommendations. The Inter-University Board as well as the Central Advisory Board of Education are reported to have endorsed the scheme. The conference of Vice-Chancellors, convened by the Central Ministry of Education at New Delhi in

January last, is also said to have approved of it with suggestions for some more changes in addition to those already made in the Central Education Ministry's memorandum. What is, however, curious in the whole affair is the hush-sush policy, the authorities have evidently been following in so vital a matter. The public have had no opportunity of knowing fully the scheme as originally set out in the Central Education Ministry's memorandum. What transpired at the Vice-Chancellor's conference was not also published in detail. The Senate, the Syndicate and the Academic Council of the University of Calcutta, too, were not taken into full confidence at least at the early stage of discussion of the proposal. Later on, of course the Vice-Chancellor called an informal meeting of the educationists of West Bengal to acquaint them with the official version of what had taken place at New Delhi. But that meeting was not open to the public or to the press. Representative organisations of teachers like the All-India Federation of Educational Associations and the West Bengal College and University Teachers' Association have never been consulted for opinion. Apart from the intrinsic merits of the scheme, the procedure followed so far cannot certainly be called democratic.

The main argument advanced by the sponsors of the plan in its favour is that it will give the much-needed practical bias to secondary education through diversification and bring about qualitative improvement both in the sphere of secondary and higher education. It has, moreover, been pointed out that in Great Britain there is no Intermediate course and its absence has prevented wastage of time without hampering the progress of higher education. There may be some substance in this contention but there are other weightier considerations which, on all showing, have been deliberately ignored by those who have fathered the scheme and are eager to foist it on the country. No sensible person denies the need for a thorough overhaul in the content and structure of education in independent India. It must, however, be done in a way that gives the least possible shock to and creates the minimum dislocation in the prevailing set-up and, at the same time, improves the standard of education at all stages. Nothing should be done in the name of reform that actually deforms the existing shape of things. And the primary condition for really progressive measures of reform is to make the beginning at the right point, for things well begun are things half done. The proper plan for educational reform in India should make the base rather than the apex of the structure of education the starting point. The Constitution, in one of its Directive Principles, envisages free and compulsory education for all children up to 14 years of age in course of ten years from its commencement. How that direction is being followed will be apparent from the fact that during half the prescribed period only about 5% of the total population of 36 crores were in primary schools at the beginning of the current year. The Government's intention in this regard is clear from the decision of a

TO THE YOUTH OF INDIA

By

SWAMI VIVEKANANDA

The object of this publication is to bring within the easy reach of our student population a small, cheaply-priced yet representative selection of the Swami Vivekananda's message to the sons and daughters of India.

recent conference of the State Directors of Public Instruction, convened by the Central Education Ministry, that primary education need not be made compulsory as the people have become sufficiently education-conscious to utilise all available opportunities for becoming literate. This is the picture of primary education. The state of higher education, quantitatively speaking, is even more disappointing. Only 0.3 per cent of the total population of India were holders of Degrees or Diplomas and 0.1 per cent had education up to the Intermediate standard, according to the 1951 census. The total number of students throughout the country under instruction in all types of recognised institutions were a little over 2.52 crores at the beginning of 1955. This being the condition of education in the country, after more than seven and a half years of independence, the Government should have concentrated its attention on speedy expansion of primary education instead of dabbling with higher education in a manner that is bound to cripple rather than strengthen and upgrade it.

The practical bias which the sponsors of the scheme propose to give to Secondary education through diversification is also a utopian idea in the existing situation in the country.

In the first place, the age at which students in secondary schools are proposed to make selections of diversified courses of studies is too immature for that purpose. The guardians, who are generally unfamiliar with the nature and prospect of the different courses of studies to be introduced, will practically be of no help in this matter. The present dearth of trained and experienced psychologists—the lacuna is not likely to be removed in course of many years to come—will make it impossible for the schools to test the bias and potential capabilities of the students for the diversified courses. Besides, the paucity of equipment and accessories, which cannot be made up within a short period, will continue to be a standing barrier in the way of proper instruction in the different courses of studies in schools as proposed in the scheme.

The proposed abolition of the Intermediate course (after tagging its first year class to Secondary schools and the introduction of a three-year course of studies for taking the first Degree examination) runs counter to the recommendations of different expert commissions, appointed in the past (to report on the Indian University Education and to enquire into and suggest extension and improvements of University Education in India). The Calcutta University Commission (1919) recommended the institution of Intermediate Colleges as "the very pivot" of their whole scheme of reform. Such Intermediate Colleges were expected to impart a sound and liberal training to the students. Opportunities would be provided there for adapting them to the needs of industry, commerce and agriculture as well as medicine and engineering in all its branches. The aim of the Intermediate Colleges would be to meet a variety of needs and requirements of our boys by giving a vocational bias to their courses while retaining at the same time their value in a system of sound general education as a preparation for University courses.

The following paragraph from the report of the Calcutta University Commission describes very admirably the essential qualities of a good education to be imparted at the Intermediate Colleges:

"Education should be given under conditions favourable to the health of the pupils. Their bodies should be developed and trained by systematic and vigorous exercise. Their eyes should be trained to see,

their ears to hear, with quick and sure discrimination. Their sense of beauty should be awakened, and they should be taught to express it by music and by movement, and through line and colour. Their hands should be trained to skilful use. Their will should be kindled by an ideal and hardened by a discipline enjoining self-control. They should learn to express themselves accurately and simply in their mother tongue, and, in India, in English also. Through mathematics, they should learn the relation of forms and of numbers. Through history and literature they should learn something of the records of the past; what the human race (and not least their fellow-countrymen) has achieved; and how the great poets and sages have interpreted the experience of life. Their education should further demand from them some study of Nature and should set them in the way of relating both the amount and the quality of evidence which a varied education requires. Besides this, it should open windows in their mind, so that they may see wide perspectives of history and of human thought. But it should also by the enforcement of accuracy and steady work, teach them by what toil and patience men have to make their way along the road to truth. Above all, the education should endeavour to give them, by such methods and influence as it is free to use, a sure hold upon the principles of right and wrong and should teach them to apply those principles in their conduct. Thus its chief work is to enlighten and practise the conscience, both the moral conscience and the intellectual. And, through the activities of corporate life in school, it should give the pupils experience in bearing responsibility, in organisation and in working with others for public ends, whether in leadership or in submission to the common will."

It is admitted on all hands that teaching in our Intermediate Colleges has fallen considerably short of these ideals. But the remedy does not lie in the abolition of the Intermediate Colleges and classes, and in transferring the First Year class to the Secondary schools and introducing a three-year course of study for taking the first degree examination.

In the Secondary schools, lack of accommodation, equipment and competent teachers will present insurmountable obstacles and difficulties in the way of the realisation on the above-mentioned aims and objectives.

Even if sufficient funds are made available to these schools for the employment of competent teachers and removal of other difficulties, it is bound to prove uneconomic, considering the possible number of pupils in the top-classes of a higher secondary school. What is needed at present is the raising of the standard of teaching in our Intermediate Colleges and classes so that the aims and objectives, so admirably set forth in the report of the Calcutta University Commission, may be attained. In this connection, we cannot do better than quote the following from the report of the University Education Commission (1950):

"While we are definitely of opinion that no student should be admitted to a University until he has passed the Intermediate Examination, we are equally convinced that the mere raising of the standard of admission would not by itself improve the work of the Universities. We must at the same time make better provision for the training of students at the High School and Intermediate College level."

And again:

"While we do not insist on a uniform pattern of institution for the higher schools and the Intermediate Colleges and will even allow Intermediate classes to continue in the degree colleges as in South India, we think that there should be only one public examination and that at the Intermediate stage. This examination will mark the end of Secondary education and the beginning of University education which will extend over a period of three years for the first degree course."

It is interesting to note that what the Radhakrishnan Commission envisaged was a three-year degree course after passing the present Intermediate Examination after completion of a two year course of study in separate institution, if possible; in Degree colleges if separate arrangements cannot be made.

The benefit which the Intermediate students now get from highly qualified college teachers will also be unavailable in the higher secondary classes where teachers of like qualification are not expected to be employed. The result will be only a deterioration in the standard of education maintained at present in the Intermediate classes attached to colleges.

So far as the proposed three-year Degree course is concerned, similar decline in standard will also certainly come about. In all the modern progressive countries the trend is not to reduce but to increase the period of University education. In the U.S.A., collegiate education extends over a period of four years. In France education in the higher grades is divided into three cycles covering a total period of six years. In the U.S.S.R. there is a five-year course ending in final examination and thesis for the Degree of candidates in Sciences. In Japan the School Education Law, passed by the Diet in March, 1947, provided for a four-year University course similar to that in the United States. In China the first Degree course extends over a period of four years. Even in the United Kingdom, the Association of University Teachers and other organisations have proposed that specialised study, particularly in sciences, should be postponed until the third or fourth year of the Degree course. In Canada also the University course, in most of the English-language universities, leading to a Pass Bachelor's Degree is normally four years. In the background of this trend in educationally advanced countries, the scheme of curtailing the present four-year period of collegiate studies is highly irrational and is sure to result in the deterioration of the standard.

These are some of the major objections to the plan which has originated in the Central Secretariat and is being sought to be imposed upon the States. There are other equally strong grounds for opposing it. The Mudaliar Commission, which was appointed for investigating the condition of Secondary education in the country and for suggesting methods for its improvement, went beyond its jurisdiction by recommending reforms in higher education from which no competent spokesman was invited by it to give opinion. The recommendations of the Radhakrishnan Commission, which was asked to recommend ways of improving university education in the country, have for all practical purposes been shelved.

It is surprising that the Government, to whom the Radhakrishnan Commission submitted its report about three years earlier than the Mudaliar Commission, has sat tight over the former and is now eager to implement the suggestions of the latter in respect of University education.

Constitutionally also, Education is a State subject and the Central Education Ministry has nothing to do with it except general supervision, co-ordination and grant of financial assistance. In trying to introduce the present scheme on its own initiative the Central Ministry of Education has obviously over-stepped its constitutional limit. There is, again, the important consideration that the uniformity which the Centre is seeking to bring about in the field of education throughout the country by means of this scheme will be extremely harmful to the cause of education. It is not for nothing that the framers of the Constitution thought it wise to exclude Education from the Central List and put it in the State List. Different regions in the country have got different traditions, psychological background and objective conditions. Education in these different areas should, therefore, be planned keeping in view all these divergent factors. Otherwise, the steam-roller of uniformity will certainly stunt the free and normal growth of the mind of the students in the different areas of the country. Those who seem to be over-anxious to give effect to this new-fangled plan of educational reform should yet pause and ponder before it is too late. Instead, they should direct their attention to the improvement of "the curricula, methods, techniques and materials of education that have been for long, and still continue to be the butt of adverse criticism," as pointed out in the Five-Year Plan. Education is a continuous process and cannot be divided into watertight compartments like Primary, Secondary and University education. The essential requisite for any educational reform is, therefore, to devise a scientific syllabus of studies from the base to the top and then divide it into different stages according to the capacity for absorption of students of different age-groups to take up these studies at different strata. The next important point is improvement of the financial condition of the institution and the teachers who form the bed-rock of the educational structure. All these require money which has always been denied to education in this country. The First-Five-Year provided only Rs. 161 crores for education. Even this amount could not be spent during the period the Plan has been in operation. This is a deplorable state of affairs in all conscience. What the Second Five-Year Plan proposes to do for education still remains to be seen. If the Government has sufficient funds for expenditure on education—which

it should have if real national development is to be secured—it should give up such unrealistic schemes and provide money to starving educational institutions so that the standard of education can be upgraded to the desired level.

Early Contact Between Indo-China and South India

K. V. Raman writes in *The Indian Review*:

The cultural expansion of India into the Far East in the early years of the Christian era forms a most fascinating chapter in history. In the momentous task of broadcasting Indian culture abroad both North India and South India played a notable part. If Bengal, Manipur and Assam spearheaded the waves of invasion that went through land to the Far East, South India, thanks to her close proximity to the sea and her long experience in navigation, exploited to the hilt the sea-routes to reach those far-off islands.

Scholars like Gerini once held that only the Indians of Malabar and the Coromandel Coast colonised Indo-China by the sea-routes. Though this view is no longer true (for Prof. R. C. Mazumdar has shown that Bengal also played a great part in the colonisation through the sea) it goes to show at least the importance of South India's stupendous role in the field. People from South India must have started from that coast of Coromandel which faced the East, the coast of ancient Kalinga, of ancient Telingana, particularly the country of the lower courses of the Krishna and the Godavari.

That South India from time immemorial had contact with Indo-China is easily gauged from the following facts: Pan-Kou, a Chinese writer, who lived not later than the second century A.D. gives the route and the duration of travel from Upper Annam (Je-nan) to the Coromandel coast and even to Kanchi. That Chinese writer also states that there was contact between China and Kanchi even at the time of the Chinese Emperor Wou (140 to 86 B.C.).

The Periplus also mentions the trade route from three harbours on the eastern coast near Masulipatam across the Bay of Bengal to the Eastern Peninsula.

Legends and traditions also reveal the ancient ties between Indo-China and South India. For example, Ligor, a province of Indo-China, is believed to have been founded by a certain Dandakumara who fled from Godavari District and got shipwrecked off the coast of Malaya Peninsula. (Gerini: *Researches on Ptolemy's Geography*).

Again, the story of the origin of the royal dynasty of the Kambuja bears a close resemblance to the story of the origin of the Pallava dynasty, the common factors being the marriage between the Indian Prince and a Naga woman, and the association of Asvathama.

According to the Chinese chronicles the first Hindu who went to Kambuja was a Brahmin, Kaundinya by name. A supernatural voice said to him, "You must go and reign in Funan" and he went to Funan where he was warmly welcomed by the people and crowned as their king. This Kaundinya, was a Brahmin from South India, perhaps from Mysore. (*Journal of Greater India Society*, Volume VI).

Leaving traditions and legends and coming down to historical facts, we find that the man who founded the first Hindu dynasty in Champa in the 2nd century

A.D. was Sri Mara, and it has been suggested that Mara was a title or name assumed by the Pandya Kings of South India, and so the title might well have been borrowed, from the Pandyas. Another significant fact is that the later Cambodian kings assumed the title of Varman. This reminds us of the Pallava kings who also invariably clubbed 'Varman' to their names. Not only that, the very names of the Pallava kings like Mahendravarman were adopted wholesale by the kings of Cambodia.

There is an inscriptional evidence to show that Sivasoma, the grandson of King Sri Jayendrhipativarman came all the way from Indo-China to India to learn the Sastras from Bhagavat-Sankara the great expounder of the Advaita Philosophy, who hailed from South India. (R. C. Mazumdar: *Kambuja Desa*, Sir William Meyer Lectures.)

The very script of the inscriptions that are to be found in Indo-China bears unmistakable proof for the South Indian influence on Indo-China. Along with North Indian script Pallava script was also in vogue. Prof. K. A. Nilkanta Sastri says that the script of the oldest inscription in Indo-China (which dates from the 3rd century A.D.) is very much akin to the type of writing that was used in the East coast of South India by the Telugu dynasties like the Salankayanas. Prof. R. C. Mazumdar however thinks that it was derived from the script employed by the Kushanas in the Central regions of North India.

It is architecture that furnishes the most eloquent testimony to the influence of South India on Indo-China. The existence of the *gopuras* of the Dravidian style in Cambodia makes us think that the South Indian artists must have gone over to Cambodia to give a helping hand to the local artists. Again, the style of architecture found in Champa bears a striking resemblance to that found in Mamallapuram, Kanchi and Badami. But one should not however overlook the fact that the artists of Indo-China were not slavish imitators. They, on the other hand, effected vast improvement and showed their originality.

Not the least of all, the social customs and religious beliefs tell us much about the impact of South India on Indo-China. For example, the law of inheritance through the female line that was known in Malabar as Marumakkattayam was practised in Indo-China. The custom of Sati was also there. If we take religion, it is to Tamilnad that goes the credit of having introduced the Nataraja form of Siva in Indo-China. Even though Vaishnavism and Buddhism were also practised, it was Saivism that was most popular in Indo-China. Moreover, a number of Bhagavati images have been found in Indo-China which bear ample evidence to the fact that the Bhagavati cult, peculiar to Malabar, was prevalent there. Tradition has it that the cult was introduced by Bhargava Parashurama, with whose name Malabar is also connected. Malabar was, in fact, known as Parashurama-kshetra. The name Sasta is also the name of one of the gods of Kambuja and according to Prof. S. V. Viswanatha, Sasta or Dharma Sasta is the name under which Harihara or Ayyappan appears in Malabar. (S. V. Viswanatha: *Racial Synthesis in Hindu Culture*).

Thus, it will be seen that the early contact between South India and Indo-China made its way into the cultural plane and led to a brilliant flowering of South Indian culture abroad.

FOREIGN PERIODICALS

An Imaginary Conversation with Karl Marx

Sidney Hook has been preparing for this dialogue with Marx for a quarter of a century. Chairman of the Graduate Department of Philosophy at New York University, Dr. Hook published his first book on Marx, *Towards the Understanding of Karl Marx*, in 1933, and followed it three years later with a collection of studies in the history of ideas entitled *From Hegel to Marx*. Another group of essays, *Reason, Social Myths and Democracy* (1940), included new studies to Marxism and Bolshevism. The reader will find the 'conversation' interesting reading:

It was not difficult to find the shade of Karl Marx in limbo. His spectral beard was trimmed, his monocle was gone and he seemed much more benign than his pictures show him—indeed, almost grandfatherly. Flanked by Engels and Kautsky, he was arguing a technical point with Keynes, Veblen and Schumpeter. Lenin was not in the circle. Later my guide told me he was waiting with brooding impatience for Stalin, who, although due, was still missing; there were rumors that limbo would not receive him.

Marx detached himself from his fellow shades when he learned that a visitor from earth had arrived. Instead of introducing myself as an author of several studies of his thought (I had heard that biographers and critics sometimes got an unspiritual reception when they met their subjects face to face), I announced at once that I had news for him.

"News?" he said. "I hope it's agreeable for a change. For the last twenty years or so, it has been uniformly unpleasant. Almost every new arrival prominently connected with public affairs has picked an argument with me, as if I were responsible for what's happening on Earth."

"My news is more personal," I replied. "The Marx-Engels-Lenin Institute at Moscow is issuing a new corrected edition of your works at the command of the Central Executive Committee of the Russian Communist party."

"Corrected edition, indeed!" he remarked bitterly. "They have been correcting me by word and deed ever since 1917. Every last outrage they commit is laid at my door—even by people who should know better."

"Well," I pointed out. "Isn't it natural? You called yourself a Communist at one time and they call themselves Communists."

"That, my dear Professor," Marx interrupted, "is known as the fallacy of the undistributed middle term, according to the logic you teach, whose laws, I gather from our cosmic news ticker, the Kremlin has just rediscovered. As well say that, because both sides in the Thirty Years War called themselves Christian,

they really were in agreement with each other. Soviet Communism and mine are quite different."

"In what respect?" I inquired.

Marx's retort surprised and alarmed me a little because it indicated either that his reading habits were still omnivorous or that the cosmic ticker paid attention to him. "You ought to know, since you've read the material. We called ourselves Communists in order to differentiate ourselves from sentimental socialists who had their eyes so fixed on a Utopia that they couldn't see what the necessary steps were in the process of realizing it. As you recall, when my friends and I were members of the Communist League we wrote that 'we were not among those Communists who were out to destroy liberty and who wished to turn the whole world into one huge barracks or into a gigantic warehouse. There certainly were some Communists who with easy conscience refused to countenance personal liberty.' But for me personal liberty was the very oxygen of any decent society. My criticism of capitalism was based on my desire to diffuse freedom among those who were suffering from lack of it."

"But if that's true," I objected, "why have the leaders of Communist Russia canonized you and

built a cult around you? Surely, to use a favorite phrase of theirs, it is no accident that—

"It's a long story," Marx interjected, "and there are accidents in history even if this isn't one. The Russians were always difficult and different. More than once I had to say, 'I am no Marxist.' Bakunin, who also once called himself a Marxist, I disowned on Earth. The Communists are people of his kidney, and even Bakunin rages against them up here. I don't recognize the present-day Communist brood as my legitimate offspring no matter what they call themselves."

"I've heard other fathers say that," I replied, "but saying it is not enough to disprove parentage. Legitimate or not, they claim to be inspired by your ideas and to have built a socialist society. You may not like how they got there, but they are there, are they not?"

"By no means," Marx replied with a vehemence that seemed to make his beard-tip glow. "A Socialist society as I always conceived it is one in which the free development of each is the condition of the free development of all. That excludes the dictatorship of a party, and especially the rule of despots. A socialist society is based on equality, even if it cannot be absolute, and, in the beginning, on equality of wage payments for equal working time. The Communists have substituted a new and worse system of exploitation of the workers—through piecework, speed-up devices, and differences in earned income and living conditions greater than existed in the early days of capitalism. Why, they claim to be Marxists and socialists and yet they frankly admit that labor power is still a commodity subject to the law of value. The surplus value sweated out of them goes to their masters."

Fearing that Marx was going to ride his ancient economic hobby horse, I interrupted. "Surely not all of it. Some of it goes into new plants, and they do have trade unions."

By this time, Marx's whole beard was incandescent. "Trade unions!" he burst out. "Their trade unions are worse than company unions. They are auxiliaries of the secret police whose function is to intimidate the workers into producing more. I have always taught that the working class regards its courage, self-confidence, independence and sense of personal dignity as more necessary than its daily bread. How is this possible under a regime of a ruthlessly censored press, regimented schools from kindergarten to universities, forced labor, juridical frame-ups, mass deportations and executions? No, the Soviet Union is not a socialist society."

"Nor is it a capitalist society," I added while he paused to draw a fresh breath, "since all the major instruments of production, distribution and exchange are collectivized. What kind of social system is it,

then? Your theory of social development seems unable to account for it."

"This is a terminological matter," Marx declared with a touch of asperity. "The main point is that Soviet society, wherever it exists, outrages all the democratic traditions for which the socialist movement fought as well as those of the great revolutionary movements of liberation whose heirs we always considered ourselves to be."

"Very well," I said hurriedly. "I grant your social philosophy is not theirs. But there is nothing in the notion of a completely collectivized economy which insures that your social philosophy will prevail rather than theirs. What I am asking you to explain, however, is the origin and development of the Soviet social system on the basis of your own theory of history. Didn't you say over and over that 'no social order ever perishes before all the productive forces for which there is room in it have developed?' There was certainly plenty of room for the development of productive forces in Russia in 1917, even more than in the United States of 1917, which was decades ahead of Russia and which has enormously increased its productive capacities since then."

"Quite right," retorted Marx with a triumphant air. "I predicted that socialism would come first to England and the United States because those countries are ripe for it. And certainly not in a backward, undeveloped, semi-barbarous country like Russia. You see how presumptuous the Communists are in calling themselves Marxists."

I wondered why he sounded so triumphant. "I see," I exclaimed, "that the Communists are not Marxists as they claim to be and that, if you came to life again in Moscow, the Grand Inquisitors of the Kremlin would probably throw you into the cellars of the Lubianka as an agent of American imperialism. But it seems even clearer to me that the Communists have refuted the central doctrine of Marxism in the name of Marxism. According to that doctrine, the mode of economic production determines political events; not conversely. But the Communists seized political power, nationalized the economy, industrialized the country, collectivized agriculture. Their culture may not be democratic, but their economy is collectivist. It is quite apparent that it was not, as you proclaimed, 'historical laws working with iron necessity toward inevitable results' which were the driving force of events in Russia but the driving will of the Communists. Doesn't this show that men control economic forces, for good or evil, wisely or unwisely, and are not controlled by them to the extent that you taught? In other words, haven't the Communists refuted the central proposition of the theory of historical materialism?"

"Not so fast, Professor," Marx quietly replied. "If you take my words literally, you may be right."

But let's look for the meaning behind the mere words. When I wrote about what was historically necessary or impossible, I assumed that there was a certain level of civilization which we could take for granted, certain basic human needs and values which would guide human action, or at least limit what human beings would do to other human beings. I was a humanist before I became a socialist, and therefore I believed it was impossible to build a socialist economy in a backward country like Russia except at a morally prohibitive cost. But if we are completely indifferent to questions of human cost and suffering, only physical and biological necessities limit our action and we are all reduced to the level of clever beasts of prey."

"Nothing can grow in a desert," he continued after a pause, "but we make even a desert bloom like a flower garden if we are prepared to fertilize it with human corpses and water it with rivers of blood. A country which doesn't grow into socialism on the basis of an already prepared economic foundation, a tradition of skill, management, democracy and culture, will defeat the very ends in behalf of which the socialist movement came into existence."

"It is a pity," I observed, "that you didn't spend more time in elaborating on these ends. By concentrating mainly on the economic conditions of achieving them, you gave the impression that collectivism was the be-all and end-all of socialism; that, once it was achieved, all the other virtues would be added to society. The fault is not completely attributable to those of your disciples who converted a necessary condition into a sufficient one. The sentimental socialists may have ignored the means, but you lost sight of the ends. It seems to me that your fault is graver."

"No," said Marx, "my Hegelian teachers had convinced me that means and ends are so intertwined that they couldn't be separated. It may be I took too much for granted. But, remember, I wasn't writing textbooks or manuals or recipe books for revolutions everywhere at any time."

"Then tradition becomes an important constraining force in what men can make of man," I pointed out, "and under some conditions as decisive in influencing the direction of social change as the mode of economic production."

"I have never denied it. On the contrary. Men make their own history, but not just as they please. They do not choose the circumstances as they find them. The legacy of the dead generations weighs like

a nightmare upon the brains of the living. At the very time when they seem to be creating something perfectly new, the past often creeps back. The Russian past could not be wiped out by any Commissar's decree; it still lives in the present. As of old, for the Russian rulers progress consists in extending the domain of their despotism. What I said at the time of the suppression of Poland by Tsarist Russia is even truer today: 'The policy of Russia is changeless. Its methods, its tactics, its maneuvers may change, but the popular star of its policy—world domination—is still a fixed star.'"

Not wishing to discuss foreign policy in limbo, I shifted to another question.

"Well, now," I asked, "what about China. Surely

Branch: Jamshedpur
Our showroom at old address 124, 124/1 Bowbazar Street, remains open on Sundays only.

here is something you didn't foresee. Do you think China can build socialism, even with the help of the Soviet Union?"

"My analysis of the Soviet Union," Marx spoke scornfully, "is even more valid for China. I predict that the attempt to introduce socialism in China will fail even more badly than it has in the Soviet Union."

"Agreed," I replied, "but what you didn't predict is that the attempt would be made! Since the consequence of the attempt, whether it fails or succeeds, is bound to give rise to momentous historical changes—indeed! it already has—something important about history is left unexplained."

"My main interest, as you should know," Marx patiently explained, "has always been in the Western world, and the truth or falsity of my theories rests primarily upon developments there. I predicted the growth and centralization of large-scale industry, increasing mechanization, the concentration of capital and monopoly, the entanglement of all peoples in the net of the world market, and periodic crises of production. By and large, all these things have come to pass."

"Quite true," I rejoined, "but there are a number of other things you predicted which didn't come to pass. You predicted the pauperization of the working classes, the disappearance of the middle class, the atrophy of nationalism and patriotism. Large groups of workers in Western Europe, and especially in the United States, enjoy a standard of living higher than the privileged classes of some previous societies. Nationalism is as strong as ever. The middle class has not disappeared. And the plain fact is that the workers in non-collectivist economies have incomparably more freedom, political power, and a greater share of what they produce than the workers in presumably collectivist economies."

"I cheerfully admit it," Marx smilingly responded, "but I believe I can take some credit for it since I taught the necessity of political action and called attention to the influence of factory legislation."

"But, in addition to the predicted things which didn't happen," I objected, "there are other things which happened that you did not predict—the birth of new industries, the expansion of productive forces, the rise of fascism, the emergence of the welfare state."

"I underestimated the vitality of capitalism," said Marx, "and the extent to which the democratic process could be used to strengthen social control and responsibility. But this is a matter of detail and degree. I always argued that in countries like Great Britain, Holland and the United States the transition

from capitalism to socialism could be effected peacefully. Similarly with the development of the technological revolution. I believe I was the first to recognize the impact upon society of 'conscious technical application of science to industry and agriculture'."

"But you claimed that technology was always a subordinate instrument to war and industry," I protested. "Yet neither you nor anyone else guessed that some day the choices we would have to make concerning its dread uses might affect the very existence of civilization as such."

"The effects of certain discoveries," he agreed, "as well as their significance, cannot always be measured by their origins. Whatever the causes of technological change in the past, unless men today think and plan better than they have in the past, they may not even survive. Limbo will become rapidly overpopulated."

I turned to ask a last question. "Do you believe the basic issue of our time is still between capitalism and socialism?"

Marx spoke deliberately. "Capitalism and socialism as they were traditionally conceived are today irrelevant abstractions in understanding social reality. Wherever free institutions exist, they have been used to make capital more socially responsible and labor more powerful and prosperous. Aside from the defense of freedom itself, the great problems arise in the West not from a quest for new forms of property but for new modes of democratic human experience which will enrich human life and multiply the possibilities of creative fulfilment. The choice is not between *either* capitalism or socialism but of *more or less* insofar as they bear upon the possibility of maximizing in each specific situation the opportunities of freedom. Socialism must today be conceived as a principle of welfare and fraternity integral to the democratization of culture on every level—economic, educational and social. It is democracy as a way of life. It relies on creative intelligence to conceive, modify or transform any or all institutions with one goal in view: the development of a community of free persons—each one different from the other and yet enjoying or respecting one another's differences."

By this time, the space ship which was to take me back to Earth had arrived, and Marx escorted me to the ectoplasmic gangplank. I told him that it was not likely that credence would be given to my report of our conversation. His last words to me were the sentence from Dante with which he completed the preface to his chief work: "*Segui il tuo corso, e lascia dir le genti*—follow your own course and let people talk."—*The New Leader*, May, 2, 1955.

CARRYING PLANTAINS
By Satindranath Laha

Prabasi Press, Calcutta.

NOTES

The A.-I.C.C. Meeting

The last meeting of the A.-I.C.C. at New Delhi was even more disappointing than the previous one. Indeed, to invert a *cliche*, one could say that the A.-I.C.C. is descending from weakness to weakness. We cannot claim that we possess any knowledge, beyond what is public, of what transpired behind closed doors. But judging by the fruits of those deliberations, so far as they have been made public, little was attempted and still less achieved that did not show marked signs of futility. As we can judge from press reports, the A.-I.C.C. seems to be functioning merely as an extension service of the Publicity Departments of the Government of India.

Take the Goa resolution. We are not concerned with the merits of the Government of India decision to prohibit the entry of Indian nationals into Goa, across the Indian frontiers. That is a question for the Lok Sabha and the Lok Sabha, in its wisdom or lack thereof, has tacitly decided in favour of that move, and that is the end of the question, until the next election.

But was the pronouncement of the A.-I. C. C., on that vital question discussed along the lines of the justifiability of *Satyagraha* at this juncture? The reasons put forward in support of the Goa Resolution were the most puerile ever in the records of that once august and autonomous body. Why was the question of the Government of India being embarrassed brought into the resolution at all? The Government of India is not under the control of the A.-I.C.C. Indeed on the contrary. The Lok Sabha is supposed to exercise that power. "Goa is not Indian territory" we are told. Granted, but is South Africa India? If not, then was Mohandas Karamchand Gandhi in the wrong when he first evoked the force of *Satyagraha*?

Is his worthy son, Manilal, also committing a sin in following in his father's footsteps?

The question of *Satyagraha* in Goa should have been examined purely on its moral and ethical merits and not from the legalistic point of view. As the Resolution stands, it means that however wrong the Government of India might be in any of its future decisions, on whatever question, the A.-I.C.C. shall not pass any resolution or come to any conclusion, that might embarrass it, that paramount principle having been established by this resolution. It means an absolute moral surrender of the last court of justice that the people of India had.

The fitness of the leaders of the Goa movement to initiate *Satyagraha*, the desire of the people of Goa, the intrinsic suitability of *Satyagraha* to the exigency, these are the questions that should have been discussed and weighed.

In the elections to the Working Committee, the same eager servility to the Powers-that-be has been observed.

The Working Committee had been a council of Elder-statesmen in the old days, composed of people ripe in years and experience and with an intimate knowledge of public affairs and current public opinion. And yet the maximum votes were given to a young lady who, though deserving of love and affection from all, is lacking in just these assets. The Government of India is rapidly becoming bureaucratic and has lost touch with its people. Does the A.-I.C.C. need to go the same way?

In the examination of the Second Five-Year Plan Frame, we had expected a better and closer analysis of ways and means, and a more expert assessment of the possibilities, in the terms of effective and efficient production. It seems we were mistaken in taking the A.-I.C.C. members to be more knowledgeable

than the framer of the much-publicized Frame. Cottage industry means skilled artisans. Any labourer, who is willing to undergo normal physical effort and has a minimum capacity to execute a few set movements, can be trained to work an automatic, power-driven machine or tool. The makers of mechanically perfect, fool-proof, automatic high-production machinery, lay their plans and devise their machines just that way. The prime-movers supply the power and the machine works efficiently with the minimum of skilled attention, at a high speed.

In cottage industries, on the other hand, the artisan has to execute all the moves and devote a skilled attention at every stage of production. He has to acquire a know-how over a prolonged period of apprenticeship and the personal factor of suitability of the man to the job, physically and psychologically, is of the highest import. Craftsmanship is not an easily acquired quality where hand-tools and cottage-industry methods of production are concerned. A cobbler cannot become a copper-smith overnight nor can a brawny smith become a fine weaver.

Then again, after skill and craftsmanship has been acquired through a long apprenticeship, there must be a capacity to undergo prolonged toil, else the production will be either highly costly and unmarketable or the artisan will have to starve. And under the best of circumstances a cottage-produced consumer article is likely to be at least 25 per cent more costly than the mechanically produced article. Khaddar cloth for example—yard for yard and without taking quality or durability into consideration—is even today 100 per cent more costly than mill-cloth, as Khaddar-wearing people like us know.

This means that even if everything goes along as planned, the cost of living will increase according as cottage-produced goods replace factory produced goods. And if the necessary skill, toil and efficiency is not attained by the 12 millions who will replace mechanisms, then production will drop far below expectations, in quantity, in quality and in usefulness.

The standard-of-living means nothing to the olympians of New Delhi, neither does it matter to tame statisticians. Nor yet does it matter, so it seems, to the utopians of the A.I.C.C. But to the common man it will seem a swindle if his income goes up by 5 per cent and his living expenses go up by 25 per cent, which will either mean lowering

his standards of life below even the penury and want of today, or else extinction.

We are all for cottage-industry, let there be no mistake on that point. We have advocated it, spent time, money and effort, in the study and encouragement of it. But we have no patience either with the fanaticism of the 'damn-the-consequences' type of super-Brahmins, who would make it a cult, or with the colossal ignorance of those who believe that 12 million efficient artisans could be mass-produced in five years time, without mass instruction and without consideration of their adaptability, capacity for physical toil and endurance and psychological compatibility.

Restriction in production invariably has resulted in rising of costs and lowering of quality in recent years, as all consumers know to their cost. What provision has there been made to counteract that reaction?

Rashtrabhasa

Some groups of over-zealous Hindi protagonists have aroused the suspicion and indignation of non-Hindi speaking peoples by their impatience and arrogance. The appended report indicates how deep that suspicion lies:

"The Home Minister Pandit Govind Ballabh Pant, assured the south that when Hindi became the official language of the Union, non-Hindi-speaking area would not be discriminated against in the matter of recruitment to the services.

"He was replying in the Lok Sabha to strong speeches made on an Opposition cut motion.

"Ignoring angry comment by members from the Hindi-speaking areas, Mr. Gurupadaswamy characterised Government's attitude as 'madness' and said that the Commission was packed with representatives from the Hindi-speaking areas and one could not expect from it any equity, justice or fairplay.

"Pandit Pant said: 'If we want to accelerate the pace of Hindi in the country, we have to win over those who are not familiar with this language. We cannot march faster except with the fellowship, friendship and co-operation of these people.'

"The Home Minister said that there had been a certain amount of apprehension lingering in South about the examinations conducted by the U.P.S.C. for recruitment to Government services. 'I want to reiterate my assurance to the members in this House that we do not want anyone to be placed at a disadvantage on account of his being born in non-Hindi-speaking area. We want best of men to join Government services and it has been laid down that nobody who is otherwise competent to get the job should be left out because of his non-familiarity with Hindi.'

Government Machine Tool Works

In the present session of the Indian Parliament much criticism was made against the affairs of the Government Machine Tool factories at Jalahalli and Ambarnath. Much more unfortunate was the Government's defence in so far as they tried to impute motive to the British expert who described the factories as a "colossal financial failure." The machine tool factory at Jalahalli is a cent per cent Government concern. It is owned by the Hindusthan Machine Tools Ltd., with an issued and called-up capital of Rs. 3 crores. For starting the factory the Government of India entered into an agreement in 1949 with a Swiss firm, Oerlikon Machine Tool Works, Zurich. The production was started in 1954, and the manufacture of component parts of high speed lathes was undertaken. The Machine Tool Prototype Factory at Ambarnath was set up in 1953. It provides facilities for the development of prototypes to be utilised by technicians engaged in the production of defence industries in India. The services of Mr. Scaife, the British expert, were obtained by the Government of India under the Colombo Plan. Mr. Scaife was requested to assist the Engineering Capacity Survey Committee of the Ministry for Commerce and Industry and he submitted his report in 1954. In his report Mr. Scaife severely criticised the Swiss firm.

Mr. Scaife has several hard words to say about the Jalahalli factory. He says: "After some three and a half years of indecision, the final plan is to build twelve 8½-inch geared head lathes from parts made in Switzerland, on equipment designed and made in Switzerland and the only Indian experience will be the assembly and painting." He further says that it is true that some Indian experience will be obtained overseas but this is totally inadequate for the necessary technological training in machine tool making and the project will ultimately be left, as at Ambarnath, without the trained body of machine tool production engineers which is essential for the building up of a progressive industry. The heart and brains of the organisation are outside India and outside the control of the Indian management and, therefore, whilst the development of this project is outside, the responsibility for success is left with the Indian management. The line of least resistance is now being taken by concentrating on 8½-inch geared head lathes, the demand for which is covered by the enterprise, skill and courage of Mysore Kirloskar, Harihar, who are now, after ten years of persistent effort, making a first class lathe equal to meeting any possible

Indian requirements within its capacity. He then observes: "Whether the Jalahalli project proves a success or failure (and my opinion is that it will prove a colossal financial failure), it will be successful in putting Mysore Kirloskars out of business as this and other private machine tool firms will recognise the futility of trying to compete with a competitor who is subsidised with public funds." Mr. Scaife adds: "To my mind it is the most glaring case of commercial immorality I have met with in the whole of my experience and this should be the deliberate policy of a Government which claims to be building up a self-sufficient economy is beyond my comprehension."

About the Swiss consultants, Mr. Scaife remarks that what they have sold to India was in fact Swiss skill and which was not theirs to sell, since they had not the psychological ability to transport their skill to Indian minds. His main criticism against Government machine tool factories is that there were not enough Indian experts at the time when the machinery for the factories arrived and that even at present Indian staff is not sufficiently available.

Mr. Scaife has not only criticised the Government in the above matter, he has also offered constructive suggestions. In his view the machine tool industry must be allowed to grow naturally side by side with the general industrial development of the country. He claims that this is an indisputable historical fact and for rendering assistance, some initial technical and financial help should come from the Government. A machine tool factory calls for the production of goods of a specified quality at a minimum of cost in time and effort and this must be linked up with the demand in the market. To undertake the production of machine tool before ascertaining the specification covering productivity and quality performance is to risk the expenditure of capital on machine tool which will go abegging in the market, involving waste of skilled labour.

Mr. Scaife thinks that the Government departments have been wrongly advised in setting up the machine tool factories on the projected scale and this results in financial loss to the Government. The authorities have further erred by concentrating development through a single channel which has not had extensive background in machine tool practice, although well known in the restricted field of armament manufacture. He suggests that various standard types and sizes, with different grades of quality for different purposes, call for individual and separate technical and administrative approach and each unit should be directed towards producing one

or two related types and grades of machines. This will facilitate the employment of workers most suited for the purpose and their numbers will be gainfully determined. Mr. Scaife's main suggestion is that the production of machine tool in the country should be entrusted to the private sector which would, of course, collaborate with the authorities. The Government should take initiative in forming an association of national machine tool makers with branches in a number of industrial centres and through this association the national demand for tools should be channelled. Established firms which are already engaged in the production of machine tools of grade and quality should be assisted by the Government with loans at preferential rates and also with a loan of sufficient plant from Government stores in order to meet national demand in their respective class of machine tools. Firms engaged in the production of ungraded machine tools should also be helped by the Government with financial and technical assistance and adequate initial orders are to be placed with them through their trade association to meet Government requirements. Mr. Scaife suggests for the establishment of selling and servicing organisations by the association branches in their respective areas for servicing and demonstration purposes.

He also stresses for raising the technological level of management and supervision and this calls for the training of a sufficient number of production engineers who should have training specifically in the art of using modern production equipment in preference to general mechanical engineering science. In his opinion a trainee of matriculation standard may well become a good production engineer. For imparting training, he recommends the educational procedure of Dr. Schlesinger at Charlottenburg University, Germany, where engineers are trained at a central establishment on lines which would provide key personnel to prospective enterprises financed by private firms. Around this central educational organisation the nucleus of new projects would be set up.

The Government of India is evidently not impressed by the criticisms of Mr. Scaife. The Union Minister of Defence Organisation, Mr. Mahavir Tyagi, has brushed aside Mr. Scaife's criticisms by remarking that they "cannot bear close examination." In defence, he points out that the Engineering Survey Committee has not endorsed the views expressed by Mr. Scaife. It is further alleged by the Government that the British machine tool industry, with which Mr. Scaife is connected, is not favourably disposed

towards Government of India's venture in the field of machine tool production. In the opinion of the Government, Mr. Scaife's association with the British industry appears to have led him to taken an "unjustifiably unfavourable" view of the assistance obtained from the Swiss consultants. Mr. Tyagi deprecates Mr. Scaife's bias against State-owned undertakings.

Notwithstanding Mr. Tyagi's imputation of motives to Mr. Scaife's observations, the public in India are not very much impressed with the Government views in the matter nor is the progress in the Government machine tool factories is very convincing so as to support Mr. Tyagi's contentions. As regards the firm of Swiss consultants it is not perhaps unknown that it is they who supplied arms to the Egyptian army during the war of Palestine and the Egyptian army had to suffer disasters and debacles for old and faulty weapons.

International Monetary Fund

The latest annual report of the International Monetary Fund records satisfactory progress towards freer trade and multilateral payments arrangements. The report is for the year ended 30th April, 1955. The year under review witnessed a strong underlying trend towards world economic and payments equilibrium. In the field of international payments, three favourable trends are discernible. In the first place, the aggregate value of world trade during 1954 was higher by more than 4.5 per cent at about \$74,200 million as compared with \$71,000 million in the preceding year. Secondly, there were larger capital movements in 1954 than in 1953. And thirdly, with the increase in the volume of international transactions, the foreign exchange reserves of non-dollar countries rose considerably, with some significant exceptions. The reserves of the non-dollar areas as a whole were higher by no less than \$2,200 million. The following Table will reflect world gold and foreign exchange reserves:

(See Table on next page)

The world excludes the USSR and Mainland China and the countries associated with them. Japan, Indonesia and Egypt are among the countries in the group—"Rest of world." The remarkable improvement in the international payments position is attributed to the stability in the average price levels of primary products and this helped to maintain the supply of dollars to the rest of the world. The terms of trade in favour of the primary producing countries were sustained by stable price

World Gold and Foreign Exchange Reserves including net EPU and IMF positions (In million U.S. dollars)

Area	End of 1952	Change in		End of 1954	Reserves as per cent of 1953-54	
		1953	1954		average imports	End of 1953
World	47070	1330	1750	50150	60	64
U. S.	24715	-1256	-479	22980	216	200
Canada	1939	-38	128	2029	41	43
Dollar Latin America	1635	66	-71	1630	46	46
Non-dollar Latin America	1510	295	-95	1710	46	52
Continental OEEC countries	8285	1370	1435	11090	37	49
U. K.	1312	803	586	2701	14	29
Independent sterling area overseas countries	4250	420	40	4710	58	64
Rest of world	3424	-330	206	3300	22	21

levels. The favourable trade balance was due largely to the higher output and real income in industrial countries outside North America. The rise in real income resulted in the higher demand for primary products.

The annual report points out regretfully that the use of the Fund's resources by member-countries is gradually declining. In its fiscal year ended April, 1955, member-countries drew only \$49 million and repaid \$276 million of previous drawings. On April 30, it apparently had only \$55 million of its own money in the hand of members. Of the total of \$1,197 million drawn from the Fund since it started operations in March 1947, a sum of \$807 has been repaid to it. Of the remaining \$390 million, \$335 million represents drawings by various countries of the equivalent of gold that the same countries had subscribed to the Fund. On April 30, the Fund held \$3,719 million of gold and convertible currencies, and the equivalent of \$4,325 million of other currencies.

The report discloses that the Fund has reached practical compromises on certain technical disputes with Canada, Peru and France regarding their currency parities. In the same sense, the Fund allowed a drawing by Indonesia which has not declared a currency parity. The report gives a heterogeneous list of countries which have no dollar discriminations, namely, Belgium, Ethiopia, Greece, Indonesia, Luxemburg, the Netherlands, Pakistan, Peru, Thailand and the Union of South Africa.

The diversity of the experience of the

underdeveloped countries in 1954 again showed that the degree of success attained in maintaining monetary stability, while they are pressing forward with development, depends upon their economic policy as a whole rather than upon any single factor in it. The Fund remarks that some countries that faced balance of payments deficits, because their domestic income and price levels had not been adjusted to lower export earnings, attempted to maintain incomes in export industries by various kinds of subsidy, while imposing more stringent exchange restrictions to correct the balance of payments. Such efforts, however, cannot produce results that are satisfactory for the economy as a whole; they usually create inflationary pressure or intensify pressures already operating in the economy, while they also tend to become progressively more difficult to enforce.

Sales Tax Controversy

For some time past the issue of sales tax in India has become highly controversial in respect of the rights of the States to levy and collect it. The provisions of the Indian Constitution in this connection have been observed more in breach rather than in compliance. The Article 286 of the Indian Constitution, the villain of the piece, is most clumsily worded and leaves scope for controversy and divergence of interpretation. It reads:

"286. (1) No law of a State shall impose, or authorise the imposition of, a tax on the sale or purchase of goods where such sale or purchase takes place—(a) outside the State; or (b) in the course of the import of the goods into, or export of the goods out of, the territory of India.

Explanation.—For the purposes of sub-clause (a), a sale or purchase shall be deemed to have taken place in the State in which the goods have actually been delivered as a direct result of such sale or purchase for the purpose of consumption in that State, notwithstanding the fact that under the general law relating to sale of goods the property in the goods has by reason of such sale or purchase passed in another State.

(2) Except in so far as Parliament may by law otherwise provide, no law of a State shall impose, or authorise the imposition of, a tax on the sale or purchase of any goods where such sale or purchase takes place in the course of inter-State trade or commerce: Provided that the President may by order direct that any tax on the sale or purchase of goods which

was being lawfully levied by the Government of any State immediately before the commencement of this Constitution shall, notwithstanding that the imposition of such tax is contrary to the provisions of this clause, continue to be levied until the thirty-first day of March, 1951."

The sub-clause (2) specifically restricts the power of a State in imposing sales tax on goods where sale or purchase of such goods takes place in the course of inter-State trade or commerce. The Explanation to sub-clause (1) does not empower a State to levy sales tax on inter-State trade or commerce, it simply explains where the sale or purchase takes place; that is, the sale or purchase will take place in that State where delivery has been given for consumption and not where title to ownership legally changes hands. Now the question is, whether Article 286 is governed by Article 304. If it is so governed, then the States in India can impose taxes on sales or purchases of commodities entering into inter-State trade or commerce. If, on the other hand, Article 286 governs Article 304, then the States have no right to impose taxes on commodities entering into inter-State commerce.

In the "State of Bombay v. The United Motors (India) Ltd.," (1953 S.C.R. 1069), the Supreme Court held that Article 286(1) (a) of the Constitution read with the Explanation thereto and construed in the light of Article 301 and Article 304 prohibits taxation of sales or purchases involving inter-State elements by all States except the State in which the goods are delivered for the purpose of consumption therein. The latter State is left free to tax such sales or purchases and it derives this power not by virtue of the Explanation to Article 286(1) but under Article 246(3) read with entry 54 of List II. The view that the Explanation does not deprive the State in which the property in the goods passed, of its taxing power and that consequently both the State in which the property in the goods passes and the State in which the goods are delivered for consumption have the power to tax, is not correct.

The Supreme Court further held that the expression "for the purpose of consumption in the State" in the Explanation to clause (1) of Article 286 must be understood as having reference not merely to the individual importer or purchaser but as contemplating distribution eventually to consumers in general within the State, and all buyers within the State of delivery from out-of-State sellers, except those buying for re-export out of the State, would be

liable to be taxed by the State. Clause (2) of Article 286 does not affect the power of the State in which delivery of goods is made to tax inter-State sales or purchases of the kind mentioned in the Explanation to clause (1). The effect of the Explanation is that such transactions are saved from the ban imposed by Article 286(2).

The above view of the Supreme Court has recently been over-ruled by a Bench of the same Court presided over by the Acting Chief Justice Mr. S. R. Das. The Courts in India generally follow the British principle of *stare decisis*, and this is perhaps the first time that a previous decision of its own has been over-ruled by the Supreme Court. This is rather a new precedence in legal history in this country. In a recent case, "The State of Bihar v. Bengal Immunity Co., Ltd.," the Supreme Court held that until Parliament by law provides otherwise, no State can impose or authorise the imposition of any tax on sales or purchases of goods when sales or purchases take place in course of inter-State trade or commerce. This means that the tax shall not go with consumption in respect of goods sold or purchased in course of inter-State trade or commerce. The Acting Chief Justice Mr. S. R. Das observed: "We are definitely of opinion that until Parliament by law made in exercise of the powers vested in it by clause (2) of Article 286, provides otherwise no State can impose or authorise the imposition of any tax on sales or purchases of goods when such sales or purchases take place in the course of inter-State trade or commerce, and the majority decision in the *State of Bombay v. the United Motors (India) Ltd.* in so far as it decides to the contrary cannot be accepted as well founded on principle or authority."

The appeal in the case of the Bengal Immunity Co. Ltd., raised a question of construction of Article 286 of the Constitution. In the judgment under appeal the High Court of Bihar took the view that sales or purchase in the course of inter-State trade or commerce referred to in Article 286(2) must be construed so as to exclude the particular class of sales or purchases described in the Explanation to Clause (a) of Article 286(1) and that therefore, the provisions of the Bihar Sales Tax Act, 1947, in so far as they purported to impose tax on such sales, were not in conflict with Article 282(2) as so construed.

After this decision of the Patna High Court the question came up for consideration before a Constitution Bench of the Supreme

Court in the "State of Bombay vs. the United Motors (India) Ltd." The majority of that Bench held that Article 286(1) (a), read with the Explanation thereto and construed in the light of Articles 301 and 304, prohibited the taxation of sales or purchases involving inter-State elements by all States except the State in which delivery of the goods was so made to tax the sales or purchases involving inter-State elements by all States except the State in which delivery of the goods was so made to tax the sales or purchases of the kind mentioned in the Explanation, the effect of which was to convert such inter-State transactions into intra-State transactions and to take them out of the operation of Clause (2) of that Article.

In the appeal preferred by the Bengal Immunity Co., the Supreme Court held that it is not bound by the majority decision in the appeal of the United Motors Ltd., and that it was still open to it to examine and ascertain the true meaning, import and scope of the article in question. This majority decision of the Supreme Court in the Bengal Immunity Co.'s appeal shall create a vacuum in the prevailing structure of sales tax in the various States of India in so far as it has overruled the majority decision in the appeal from Bombay of the United Motors Ltd.

The decision in the Bengal Immunity appeal shall render nugatory, *ipso facto*, Article 304 of the Constitution which empowers the Legislature of a State to "impose on goods imported from other States any tax to which similar goods manufactured or produced in that State are subject, so, however, as not to discriminate between goods so imported and goods so manufactured or produced." The earlier decision tried to reconcile between Article 286 and Article 304. The latter decision affirms that Article 286 is independent of Article 304.

World Bank in 1954-55

The year 1954-55 records an expansion in the activities of the International Bank for Reconstruction and Development. There were higher earnings, substantial accretions to reserves, record amount of lendings, prompt payment of interest and principal due. Another outstanding feature is the participation of private capital in the Bank's financing operations. In 1954-55, the Bank advanced loans totalling the equivalent of \$410 million as against \$323.7 million in 1953-54—this is the largest sum lent by the Bank in any

fiscal year. The twenty loans were made in fourteen countries and territories. Lending since the Bank began operations now totals the equivalent of \$2,324 million (\$2,274 million net of cancellations and refundings) in 37 countries, as compared with \$1,914 million in the preceding year. The Bank's total disbursements now stand at \$1,680 million as against \$1,405.6 million in 1953-54. Net earnings of the Bank reached a new record figure of \$24.7 million and reserves rose to \$184 million. Borrowers met all payments of interest and principal due during 1954-55. During this period, India received two loans from the Bank. The Bank lent in India in November 1954, a sum of \$16.2 million to the Tata group for its thermal power station in Bombay. The thermal power plant will help to relieve the acute power shortage in Bombay and the surrounding area. In March, 1955, the Bank lent \$10 million to the new industrial Credit and Investment Corporation of India which has been established to assist the growth of private industry.

The Bank's source of funds available for lending operations to its member-countries is given below:

(In million US dollars)	
Two per cent portion of subscription of all members	177.8
Eighteen per cent portion of subscription made available by members	764.5
Total available capital subscriptions	942.3
From operations	128.6
Sale of Bonds	851.6
Principal of repayments and prepayments	139.3
From loans or funds agreed to be sold	200.1

Total \$2,261.9

Of the total lendable funds of \$2,262 million, \$368 million represented additions made during 1954-55. Besides India, other countries that borrowed from the World Bank include Austria, Australia, Belgium, Ceylon, Colombia, East Africa, El Salvador, Finland, Italy, Mexico, Norway, Pakistan and Peru. In all 20 loans were made to 14 countries.

The A.-I.C.C. Meeting

We append below a summary of the A.-I.C.C. meeting from the *Statesman*. First of all is given Pandit Nehru's comments on the Goa Resolution:

"The A.-I.C.C. met behind closed doors, but later a spokesman gave Pressmen a gist of the speeches made."

"Mr. Nehru said it was always good to say correct thing with courage and try to explain the position clearly to the people and take them into confidence.

"The Congress was so far very clear that there was no question of taking police or military action and that mass satyagraha was not proper. The door had, however, been left open for individual satyagrahis. The position had now been made clear beyond any doubt.

"It was not proper for them to condemn other parties in this matter, although they (other parties) had been criticizing the Congress in an unfair manner. There was no doubt that these people who had suffered with courage and had shown a sense of sacrifice should be shown respect and admiration.

"It was true that in international affairs they should have a national policy. But a national policy in international matters should not mean that it should be a mixed or confused one.

THE GOA RESOLUTION

"During the last nine years, the Congress has repeatedly expressed its views on the Portuguese possessions in India and pointed out the incongruity of a very small corner of India being under foreign colonial domination when India herself had achieved freedom. As recently as July 1955, the Working Committee passed a resolution on this subject affirming the right of the people of Goa to freedom. The committee reiterated that the struggle for the freedom of Goa must be carried on through peaceful methods. Further, the committee declared that it was not in favour of any attempts at mass entry into Goa from outside with a view to offering satyagraha.

"Since this resolution was passed, various developments have taken place in these areas, which have naturally moved the Indian people deeply, and the A.I.C.C. has given careful and anxious consideration to the situation in Goa and other Portuguese possessions in India.

"In the struggle for the liberation of Goa, many have suffered banishment and long imprisonment, faced bullets and died in resistance to colonialism. The committee deplores and condemns the violence and brutality adopted by the Portuguese Government in its attempts to suppress the Goan people and to retain its colonial rule on this part of the Indian mainland.

"More recently, on August 15, of this year, the Portuguese authorities fired upon unarmed people and killed numbers of them and inflicted serious injuries on many more. To those who have thus suffered, the committee pays its tribute, and to the families of the dead, it extends its

sympathy in their sad, though noble, bereavement.

"The A.I.C.C. places on record and proclaims its considered view that the shooting and killing of unarmed men and women by the Portuguese authorities is a violation of international law and a crime and is contrary to the well-established practice of civilized Governments.

"The committee has noted with appreciation and sympathy the continued endeavours of the Goan people, in spite of the fierce repression by the Portuguese authorities, to secure their freedom and the liberation of their territories from foreign rule, and conveys to them the goodwill and sympathy of their fellow countrymen in free India.

"The A.I.C.C. recalls the unanimous decision of the nations assembled in the first Asian-African conference at Bandung last April, against colonialism, and expresses the confident hope that all the participants in that conference will support the cause of the liberation of Goa and the other Portuguese possessions and the people therein and condemn the suppression of their freedom movement and the violence and brutality adopted by the Portuguese Government.

"The A.I.C.C. warmly supports the decision of the Government of India to withdraw and withhold co-operation in respect of the Portuguese Government and the other peaceful steps taken by the Government of India in this connexion. In particular, the A.I.C. appreciates the policy of the Government of India in adhering to and stating without reservation that it will seek a solution of this problem in accordance with their well-known and established principles and approach in regard to all international disputes, namely, those of peace and non-violence. This policy is not only in keeping with the national and international approach of India but, the A.I.C.C. is convinced, is in the best interests of the Goan people themselves and their liberation.

"The A.I.C.C. fully appreciates and is in sympathy with the strong feelings that have been aroused all over India in favour of the liberation of these Portuguese possessions in India and against the brutal suppression by the Portuguese authorities of the freedom movement there.

"The committee would, however, appeal to the people of India to view this problem in its national and international context and not on any party basis and to support the Government of India's policy in this matter. Any differing and conflicting policies will weaken the national resolve and also the efforts to secure the liberation of Goa.

"In their last resolution on Goa, the Work-

ing Committee issued warning against any attempts at mass entry into Goa from outside. This warning was unfortunately not fully heeded. The A.I.C.C. is strongly of opinion that any mass entry into Goa, in the name of satyagraha or otherwise, is undesirable. The Government of India, after the withdrawal of co-operation from the Portuguese Government, has closed and sealed the borders of Portuguese possessions in India and, in these circumstances, any entry into Goan territory by Indian nationals will be inappropriate.

"The A.I.C.C. is, therefore, of opinion that, in the present context, even individual satyagraha by Indian nationals should be avoided.

"The A.I.C.C. is confident that the people of Goa and Daman and Diu will regain their freedom and Portugal will be compelled to relinquish her authoritarian rule in her possessions in India. The committee sends its greetings to the Goan people and expresses its full sympathy with them in their legitimate and laudable aspirations and efforts for freedom."

The Second Five-Year Plan

The question of the Second Five-Year Plan was discussed as is given in the summary below of which the Recommendation portion is taken from the *Statesman*:

"New Delhi, Sept. 4:—Recommendations made by the A.I.C.C. today on the second Five-Year Plan involve a substantial increase in its size, if accepted.

"One of the main factors is the adherence to the employment target of 11 to 12 million jobs in the face of Mr. G. L. Nanda's note that a plan of the size recommended in the plan-frame was not likely to achieve full employment.

"The stress laid by the A.I.C.C. on transport, power and heavy industries indicates that it does not accept any reduction in expenditure on these items. In addition, it laid stress on social services as necessary for their own sake and to ensure better understanding and acceptance of the plan.

"Particular emphasis is also laid on flood control, programmes for educated unemployed, co-operative training programmes and development of village and small industries.

"Although it is felt that financial resources have been underestimated in the draft-frame, the expected increase is not likely to cover the increase in the plan's size.

"Among the expected sources of additional resources are loans and small savings, taxation and State operations in banking, insurance, finance and trade.

"It was stressed that it was necessary to

curb unsocial ways of spending. During the discussion, Mr. Deshmukh, Finance Minister, said he agreed with the suggestion that an 'expenditure tax' was necessary.

"Mr. Gulzarilal Nanda, Union Minister for Planning, suggested on Saturday that a block provision of about Rs. 150 to 200 crores should be made in the Second Five-Year Plan for being used solely for the relief of the educated unemployed.

"In a note on the problem of the educated unemployed, circulated among members of the A.I.C.C. now in session here, he said that the relief was not to be in the form of a dole, but would be used for increasing the production and the productive assets in the country.

"The educated unemployed presented a special problem to the planners. On the one hand, there was an irresistible demand to increase the number of schools and colleges thereby increasing the flow of such persons into the employment market. On the other, nothing much was done to remove from the minds of the educated the unrealistic conception 'that they had with regard to jobs for themselves.' The result, he said, had been that the pressure on employment exchanges for 'white collar' jobs had been increasing. As against the over-all increase of 75 per cent. on the live registers of the employment exchange in the last four years the increase in the numbers seeking clerical and other jobs had been more than 120 per cent.

"A very rough estimate of the employment opportunities likely to be created by the Second Plan shows that the situation in this regard will not alter materially. The existing frustration among the educated classes, which manifests itself in the form of indiscipline among students, will therefore, continue and constitute a major element of instability in our national life."

"The A.I.C.C., in a report referred to the Working Committee today, recommended that production of mill-made cloth should be limited to 5,000 million yards a year, leaving it to the handloom industry to meet the balance of the demand for cotton textiles."

Porkkala Agreement

The Soviet Union is evidently trying to create an atmosphere of peace all round. The following report of the agreement with Finland is taken from the *New York Times*:

"In the midst of a busy diplomatic week on large matters, the Russians last week managed to conclude an agreement with Finland for return of the Porkkala military base near Helsinki. The 152-square-mile enclave

on the Gulf of Finland was ceded to Russia on a fifty-year lease in the Soviet-Finnish armistice of 1944. Return of the base was one of the principal objectives of a mission to Moscow last week headed by Finnish President Juho K. Paasikivi and Premier Urho K. Kekkonen. The Soviet concession, it was believed, was motivated by a desire to clear the way for renewal of the Soviet-Finnish treaty of friendship, which was signed in 1945 and is about to expire, and to promote better trade relations. Return of Porkkala apparently insures that Premier Kekkonen will have no difficulty in obtaining approval of a treaty renewal."

French North Africa

France is still dallying with fate in persisting with a strange obsession regarding her colonial possessions in Morocco, Algeria and Tunis. Disregarding all the portents of the times, she is trying to stave off justice by force. The latest attempt at settlement in Morocco is described in the news-magazine *Time* as follows:

"Across the Mediterranean to troubled North Africa poured the greatest flow of reinforcements since the days when Rommel's *Afrika Korps* held sway. The French cruiser *Montcalm* landed a battalion of French infantrymen at Casablanca, and a steamer brought 400 more; nine battalions started moving to Algeria, following the six from Germany that had already arrived; transport aircraft brought naval commandos. Back in France, 100,000 conscripts had their period of service lengthened indefinitely; 50,000 reservists were recalled to the colors. All told, the rapid build-up brought French strength in colonial North Africa to some 200,000 men—more than there are on the Rhine.

"The politicians hoped that the French punitive expeditions had already broken the back of the Arab revolt; yet last week the killings went on. In Morocco, nationalist saboteurs burned French gasoline dumps; in Algeria, rebel bands fought a four-hour battle with the Foreign Legion, and 54 died. Even in relatively tranquil Tunisia, 23 rebels and eleven Frenchmen were killed in a sudden outbreak. Total casualties in North Africa since August 20: close to 3,000 dead, thousands more wounded."

"*Dynastic Desperation.* The 'solution' involved France in a desperate game of dynastic musical chairs. Premier Faure proposed to:

"Replace Sidi Mohammed ben Moulay Arafa, the puppet Sultan whom the French installed in Morocco two years ago, with a three-man regency council. Its senior member: El

Mokri, 108, Morocco's feeble old Grand Vizier.

"Replace Grandval, whom the French *colons* detest, with General Pierre Boyer de Latour du Moulin, the successful Resident General of Tunisia.

"Return the exiled Sultan ben Youssef from Madagascar to France.

"Set up a representative Moroccan government under Fatmi ben Slimane, onetime Pasha of Fez.

"A French general with eight police inspectors, 30 gendarmes and a section of paratroopers drew up in a hurry outside the Hotel des Thermes in Madagascar one day last week. They came not to try the golf course, to splash in the pool or to take the waters (which are said to be good for that old weakspot of Frenchmen, the liver). They came instead to see a splendidly installed prisoner, the exiled Sultan of Morocco, Sidi Mohammed ben Youssef. French General Georges Catroux, 78, found His Majesty waiting for him."

"Convincing the other Sultan, Moulay Arafa, was a task for another French general, Pierre Georges Boyer de Latour, the new French Resident-General in Morocco. Last week De Latour called on the old man in his dazzling white palace at Rabat and delicately indicated that the time had come to leave. From the French *colons* and their ally in intransigence, aged El Glaoui, the Pasha of Marrakech, came exactly the opposite advice: Stay where you are. Moulay Arafa uncomfortably announced that only Allah could recall him, but at the same time looked longingly at the sumptuous palace waiting for him across the border in Tangier.

"The next move was up to Premier Faure, who had promised a 'solution' by September 12. At week's end, he announced what he had in mind: once the old and new Sultans had been replaced by a three-man regency council, a Moroccan government with control over most of Morocco's internal affairs would be set up in Rabat. This new regime would negotiate a new political link with France, revising the obsolete protectorate treaty of 1912.

"The new arrangement would set Morocco on the way to what Paris called 'independence within interdependence.' It was not freedom, and it might not last, but it was an improvement."

Cambodian Elections

Democracy is slowly asserting itself in Indo-China, as the following comments taken from *Time* of September 26 would go to show:

"*Clean Sweep.* More than half a million, 60 per cent. of the electorate, also voted. Their ballots gave a clean sweep to the firmly anti-Communist Sangkum (Socialist People's Community) Party, organized only six months ago by popular, chubby 32-year-old ex-King Norodom Sihanouk. The neutralist Democratic Party, which controlled the last National Assembly before its dissolution in 1952, polled a mere 18 per cent. of the votes. The Communists got almost none except in their stronghold of Kampot, shared with other minor parties only some 12 per cent. Sangkum candidates won all 91 seats in the new Assembly, a victory of almost embarrassing proportions for Prince Sihanouk. Apologizing for success, he declared: 'If I wanted to fake the elections, I would never have the effrontery to scrounge all the seats.'"

Exit Peron

Another dictator met with nemesis with the fall of the autocrat of Argentina, Juan Peron. The first report appeared in the *New York Times* as given below. This was followed by the victory of the rebel fighting forces units and the flight of Peron to a Paraguayan gun-boat in the estuary:

"Smoldering grievances burst into flame again in Argentina last week as military units rebelled in the nation's hottest blaze of violence since President Juan Peron seized power in 1945. As a tough dictator, a maker and user of violence, Juan Peron gave many Argentines cause for hatred and anger. Among the revolt's leaders were Roman Catholics outraged by Peron's attacks on the church, ardent nationalists opposed to his oil-exploitation contract with a Yanqui company, sincere patriots sick of the corrosion of liberty, dissident officers who lost their commands in his purges.

"As they did in the brief, bloody rebellion of June 16, the top army generals again rushed to Peron's rescue (or rather to the rescue of the offices, privileges and rackets they stood to lose if the rebels won). Peron's old crony and army minister, balding General Franklin Lucero, again took command of all loyalist military and police units—the 'forces of repression' as the government badly labeled them.

"After Lucero and other inner-circle generals propped Peron on his feet last June, they let him take control again, hoping that they could go back to privileged prosperity as usual. But during the post-revolt interlude of 'pacification,' Peron utterly failed to pacify his opponents: he offered too little freedom, too late. Three weeks ago, dropping the mask of pacification, he

summoned his hardcore of labor followers of the Plaza de Mayo, ferociously called for his enemies' annihilation; that may have triggered a revolt that showed signs of long planning."

At the time of writing these notes the whereabouts of the ex-President was not definitely known. The new regime's intentions are no clearer than they were when the following report came:

"Buenos Aires, Sept. 23.—New riots broke out in the southern working class suburb of Buenos Aires this afternoon. They coincided with the installation of General Eduardo Lonardi today as Provisional President of Argentina. He took the oath of office at two o'clock this afternoon.

"Earlier, the Uruguayan Government announced its official recognition of the new Argentine Revolutionary Government.

"There is a growing doubt in the minds of observers here whether the new Government will allow ex-President Peron to leave the country. Though the new regime is insisting that it will not act with rancor there is heavy pressure from one section of the Army which is afraid to allow Peron to become a rallying point abroad for disciples."

The Arab-Israeli Problem

The Gaza strip on the Egypt-Israel border was again the scene of a flare-up, about a month back. This perennial source of trouble has become such a headache to the United Nations, that the latest incumbent at the head of the peace-preservation and truce committee Major-General E. L. M. Burns, has finally asked for the establishment of a physical barrier between the two opposing forces. The international edition of the *New York Times* for September 11, gives the news in the following graphic form:

"I am now of the opinion that a repetition of the incidents of firing between Egyptian outposts and Israeli motor patrols * * * will only be avoided if the forces of the opposing sides are separated by an effective physical barrier * * *"

"This extraordinary proposal for keeping Arabs and Israelis from each other's throats was made last week by Maj. Gen. E. L. M. Burns, United Nations truce chief in Palestine. Behind it lay a long history of frustration in the effort to maintain the armistice signed between Israel and the Arab States in 1949. Repeatedly the two sides have renewed pledges to observe a cease-fire. Repeatedly raids across the border

and retaliatory assaults have reduced the agreements to scraps of paper.

"The latest such agreement was reached last Sunday. It came after a two-week period of clashes in which forty-seven Egyptians and sixteen Israelis were killed. Both sides pledged 'unconditional' acceptance of an urgent cease-fire appeal issued by the U. N. But this time General Burns was not relying on pledges alone. In a report made public by the U. N. last Wednesday, he made his proposal for a 'physical barrier' along the demarcation line of the Gaza strip, an Egyptian-held slice of territory which lies between Israel and the Mediterranean. Gaza has been the scene of most of the Arab-Israeli clashes. General Burns also proposed a one-kilometer demilitarized zone along the Gaza frontier. On Thursday, the U. N. Security Council unanimously urged Israel and Egypt to accept the Burns proposal."

Discussing the Security Council's resolution on the situation in the Gaza strip, *The Times* (London, Sept. 9) says: 'If the United Nations could impose sanctions upon those who ignore its resolution, or if members of the United Nations wished to use their troops to enforce United Nations' wishes, matters might be easier. But no country wishes to send troops when collective security is not endangered.'

The Times adds: 'The resolution the Security Council will consider now for establishing a no-man's-land a thousand yards wide between Egyptian and Israeli forces is not new but can usefully be brought forward again. General Burns himself feels that he can make no progress towards agreement between the two local commanders until he has made a frontal assault upon the problem of separating the two armies.'

'In the past both sides have accepted the principle of a barbed-wire obstacle between them and in varying ways approved the no-man's-land.'

The psychological background to this long-standing tension between Israel and Egypt is discussed in the September 18 issue of the international edition of the *New York Times*. We append a few excerpts below:

"Geographical circumstances—control of the Suez Canal, the Gulf of Aqaba and responsibility for the Gaza Strip protectorate—oblige Egypt's rulers to bear the main burden of the boycott and 'technical state of war' against Israel. Furthermore, members of the Cairo military junta experienced Egypt's severe

defeat at the hands of the Israeli Army in 1948. That still rankles.

"The average Egyptian, however, rarely occupies himself with Israel or the Palestine problem. It is difficult to keep a conversation on Palestine going with most Egyptian businessmen, shopkeepers, professional men, landowners, laborers or peasants. Before leaving Egypt this correspondent asked many such persons how they would feel about peace with Israel. A typical response was, 'Why not? Nobody wants a war.'

"In the Arab countries of Asia Minor, however, from the Gaza Strip to Jordan, Syria and even Iraq it is difficult to stop a conversation on Israel and the Palestine problem. It is in this region that Israel is most thoroughly thought about and most frequently misrepresented. Most of the misrepresentations are a result of a tendency to accept critical reports about Israel and to reject favorable ones, to absorb news of Israel's difficulties and to forget news of its successes.

"Israelis tend to do just the reverse with regard to their own country, often making equally great misrepresentations on the credit side, but their mental image of the Arabs is more balanced than the one the Arabs have of them.

"The Palestine Arabs of Jordan, for example, regard Israelis as clever and industrious barbarians, clad for the most part in khaki shorts, living in a semi-anarchic community compounded largely of former terrorists, engineers and Rumanian pawnbrokers who have been unable to make the grade as farmers. They regard Menahem Beigin, former leader of the terrorist Irgun Zvai Leumi as more representative than Premier Moshe Sharett. They picture the Premier designate, David Ben-Gurion, as a wolf in sheep's clothing who talks peace in New York but prefers to express himself with a sub-machine-gun in the Middle East. They believe Israel is determined some day to seize Old Jerusalem and the rest of former Palestine and regard Israeli professions of a desire for peace as a deliberate snare."

Meanwhile the Arab States, with Egypt at its head have decided to be prepared for all eventualities. Egypt has decided to purchase arms from Czechoslovakia and the Soviet Union, which will nullify the attempt to control arms supply to the Arab States by the Western Powers. Naturally this has upset British opinion.

Cyprus

Tension has become acute over the question of *Enosis* in Cyprus. The two parties at loggerheads, Greece and Turkey, are both members of the Western Powers' organisation called N.A.T.O. Britain is in possession and is bearing the brunt of the disorders let loose by the Greeks in that island led by the head of the local Greek churches, and is therefore vitally interested. A conference was called in London. The weekly news magazine *Time* on September 19, reported:

"For ten days the Foreign Ministers of Britain, Greece and Turkey met in London to discuss the burning topic that was disrupting their NATO friendship. The problem was Cyprus, a British colony and British bastion in the Mediterranean. Four-fifths of its 500,000 people speak Greek; most of the rest are Turks. The Greeks claim it (though they last possessed it in 323 B.C.); the Turks don't want the Greeks to have it; and the British are only willing to talk about gradual self-rule."

Serious disturbances broke out at Salonika in Greece and all over Turkey. Military forces had to be used to quell the riots. The position at present may be summarised by the following news extracts:

"London, Sept. 10—The failure of Britain, Greece and Turkey to agree here this week on the future of Cyprus now threatens to split the North Atlantic Treaty Organization and the Balkan Pact. Greek-Turkish hostility is rising and if unchecked may imperil the West's defense structure throughout the Middle East.

"Britain has offered a measure of home rule to the 400,000 Greeks and 100,000 Turks on the island. She has refused, however, to offer 'self-determination' to the islanders at some fixed date, such as Greece wants. Britain will retain indefinite control for strategic reasons.

"Greece, which has become emotionally aroused over the Cypriotes' desire for union with Greece, is now bitterly disappointed.

"Turkey, on the other hand, is pleased at the suspension of the talks here. She has achieved her main aim: to block any shift in the status quo that would weaken the British hold on Cyprus and thereby increase Greek influence.

"There are three main positions to be understood in the Cyprus question: the British views, the Turkish views and the views of the 400,000 Greek Cypriotes supported, with slight differences, by the Greek Government.

"Cyprus is the third biggest island in the Mediterranean. It lies forty miles off the Turkish

mainland athwart the sea approaches to the vital military port of Iskenderun.

"In the Christian Era, Cyprus has been ruled successively by Caliphate, Byzantine, Crusader, Venetian, Turkish and British proconsuls. Turkey granted Britain the right to administer Cyprus in 1878 and in 1923 ceded the island outright in the Treaty of Lausanne—to which Greece was a signatory.

"The shock of this conference, to both the Greeks and British, was the tough, intransigent line of the Turkish delegation. It was soon evident that the Greek Government had made no serious effort to compose its policies with Turkey before coming to London. Therefore, the Greeks and Turks appeared to be diametrically opposed, with the British in the position of mediator.

"The Turkish delegation, headed by Fatin Rustu Zorlu, refused to accept 'self-determination' in Cyprus.

"Moreover, the Turks declared that Turkey would demand 'equal' political rights for the 400,000 Greeks and the 100,000 Turks. Since Cyprus is a 'geographical extension' of the Anatolian Peninsula, Turkey would claim Cyprus herself before allowing Greece to acquire it, the Turkish delegates added."

Istanbul, Sept. 8.—Military commanders today imposed an 11 p.m. to 5 a.m. curfew on Istanbul, Ankara and Izmir, where martial law was declared last night. Tanks and troops are patrolling the streets following anti-Greek riots two days ago when crowds set fire to 54 buildings, including 19 Greek Orthodox churches, and 57 people were injured.

All meetings except religious gatherings and school examinations have been banned. Theatres and restaurants were ordered to close early.

Demonstrators arrested for their part in the "Cyprus is Turkish" riots will be tried by military courts. More than 200 people were arrested in Izmir and 2,000 questioned in Istanbul.

United Germany

The visit of the Western German Chancellor Adenauer to Russia has clarified issues somewhat, particularly to the question of the release of German prisoners of war still held in Russia. But one of the main problems remains untouched, indeed it is obviously being shelved.

The *Worldover Press* gave the following comment on this issue in its August 12 issue:

"Around one issue there has been, ever since Geneva, increasing propaganda and obscurantism. That issue is the unification of

Germany. The Germans themselves reveal an awareness of this by the dichotomy in their expressed views. Almost the entire German press, not excluding that section of it which takes its tips from Chancellor Adenauer's government, has been branding the Summit talks as a failure because the question of unification was postponed and tied to continental security. Yet Adenauer, as if to echo determinedly the Geneva theme song—"In the Good Old Summit Time"—hailed the stand of the West, described himself as "serene," and called the meeting a big success.

"The truth is, nobody but the Germans is in any hurry to see the country unified. The Russians are not completely opposed, as the U.S. press persistently portrays them, but they want a high price—either a guarantee against the use of German might in the east, or severe limits on German military strength. The French, off the record, are no more enthusiastic than ever. The British are lukewarm, to say the least. and Washington, knowing that a united Germany voting freely would mean the end of Adenauer and an almost certain triumph for the Social Democrats, is in no haste at all. Besides, it wants to get the German army under way before it has to bargain."

A slightly different viewpoint is exposed in the following comment:

"The German people have now been forcibly divided for over 10 years. The perpetuation of this division is a crime against nature."

"Three-quarters of the Germans are in the Federal Republic, and they are fortunate in having a great leader, Chancellor Adenauer. He stands for a united Germany that will be peaceful and that will find its mission in friendly co-operation with its neighbours. He is determined that Germany's legitimate needs for security and sovereign equality shall be met without a revival of German militarism."

"It would, however, be a tragic mistake to assure that because most of the Germans now have chosen that enlightened viewpoint, the injustice of dividing Germany can therefore be perpetuated without grave risk."

"There are many nations who feel that their own future security and world peace urgently require that Germany should be reunited, and enabled, if it so desires, to become a party to the Western European arrangements for limitation, control and integration of armed forces, so that they can never serve an aggressive purpose."

"There are others who profess to feel that a united Germany within NATO would endanger them even under these conditions."

A New European State?

The Austrian Treaty signed and ratified recently has caused a reaction in an unforeseen manner. The *Worldover Press* for August 12 gave the background in the following commentary:

"A crisis started in South Tyrol shortly before the signing of the Austrian Treaty. The Volkspartei saw the signing as the end of one of its last hopes. A delegation rushed to Vienna to persuade the Austrian Chancellor, Julius Raab, to include a clause to the effect that the question of South Tyrol should not be considered closed. But Raab, not wanting to give anybody an excuse to postpone the Treaty, was unmoved. Then the Volkspartei, like an Indian tribe being forced back into its reservation, decided to fight and put its faith in the gods."

"Perhaps one of these gods was Mr. James Conant, American Ambassador in Bonn, who came to Bolzano at the end of May. When the Volkspartei learned he was there, they thought he might be 'interested in their problem.' It was whispered he was looking around 'to see where the American troops would go.' Simultaneously, an Adenauer-inspired German paper demanded that 'Atlantic troops should be stationed in Italy.'"

"The idea of a separate state is nothing new. At the end of the First World War, the victors had the idea of creating a neutral state by joining North Tyrol (Austrian) with South Tyrol (now Italian) as a buffer to Austria. The idea is now being resurrected in an inverse way. This time a part of neutralized Austria (North Tyrol) would be subtracted and joined to the province of Bolzano. Far from being neutral, this tiny Tyrolean state would provide the solution to the most important American strategical problem in Europe—the linking of the Mediterranean theatre (and the American base at Leghorn) with Western Germany. This link becomes 'necessary' because of the Austrian Treaty—so runs the scheme—and the consequent neutralization of Austria."

Problems of Free Austria

Some interesting side-lights on the Austrian Treaty are provided by the *Atlantic Monthly* in its August issue. These mainly relate to the status of Austria in between the two opposed power blocs. The following is a typical comment:

"The situation can be illustrated by a little episode that occurred in Moscow as the Soviet and Austrian delegations were complet-

ing the drafting of the new State Treaty. Nikita Khrushchev turned to the Austrian Chancellor, Julius Raab, and said: 'During the past few days, we have come to know you, Mr. Raab, as an honest, forthright man. I shall give you a good advice: follow my example and become a Communist . . . But if I am absolutely unable to persuade you, for God's sake, stay what you are. We shall not interfere. We know conditions in Austria. We shall let the Austrian people live the way they want.'"

Free Austria has a great many problems, most of them generated by the long occupation. The *Atlantic* puts forward one of them in the following words:

"The end of the occupation brings up the politically as well as economically difficult question of what to do about the plants and stores which the Russians took over in 1945 as war booty. There are 296 such plants, with a total of 63,000 employees. These factories comprise one-third of all Austrian steel mills and practically all the oil industry. For the last ten years they have been operated not as part of the Austrian but as part of the Soviet economy. They have paid no duties for exports or imports, nor taxes on profits. Their output has gone either to Russia or to the Russian satellites, being exchanged on a barter principle."

"The condition of the plants is poor, and they lack raw material stocks, fuel, and capital. It has been estimated that about half a billion dollars will be needed in new capital to replace worn-out machinery, a colossal amount of money in Austria."

President Eisenhower

Last week came the following news about President Eisenhower's illness and its possible ill-effect on the *pour-parlers* on the Far Eastern question. We hope the U.S. President will make an early recovery as his genial and strong personality is of illimitable value at the present juncture:

"Denver (Colorado), Sept. 25.—Doctors attending President Eisenhower, in hospital here after a heart attack, today reported that the President spent a 'very satisfactory night' on Saturday and that there were 'no complications.'"

"The President was taken to the Fitzsimmons Army Hospital here after he had a slight heart attack on Saturday. Throughout Saturday night he rested quietly in an oxygen tent while Mrs. Mamie Eisenhower, his wife,

stayed overnight in the President's suite at the hospital."

"Washington, Sept. 28.—President Eisenhower's heart attack and his long convalescence will have a profound effect on prospects for a general Far East settlement between the U.S.A. and Communist China, in the opinion of competent observers here."

"The first direct result of the President's illness on the Far East situation is expected to be a definite slackening in the already slow progress by American and Chinese representatives in negotiations at Geneva."

"The Big Two talks have reached a stage of uncertainty because of U.S. refusal to take up broad political, diplomatic and trade disputes until all American civilians have been released from China."

Far-East U.S. Viewpoint

We give below a summary of the U. S. Secretary's speech on the Far-Eastern situation. This clearly illustrates the U. S. viewpoint:

"In the China area the situation is somewhat less ominous than it was. We hope that the Chinese People's Republic will respond to the manifest will of the world community that armed force should not be used to achieve national objectives."

"The record of this Communist regime has been an evil one. It fought the United Nations in Korea, for which it stands here branded as an aggressor. It took over Tibet by armed force. It became allied with the Communist Viet Minh in their effort to take over Indo-China by armed force. Then, following the Indo-China armistice, it turned its military attention to the Taiwan (Formosa) area. It threatened to take this area by force, and began active military assaults on its approaches, which assaults, it claimed, were a first step in its new programme of military conquest."

"This constituted a major challenge to principles to which the United States is committed by our Charter. It was also a direct and special challenge to the United States itself. We have a distinctive relationship to these islands, a relationship which is reinforced by a mutual defence treaty with the Republic of China covering Taiwan and Pescadores."

"At this point, on January 24, 1955, President Eisenhower asked the Congress of the United States for authority to use the armed forces of the United States in the defence of

Taiwan and Pescadores and related areas which the President might judge as appropriate to that defence. After full hearings in the House and the Senate of the United States, the requested authority was granted. In the House the vote was 409 to 3, and in the Senate the vote was 83 to 3. The authority terminates whenever peace and security of the area are reasonably assured by international conditions created by action of the United Nations or otherwise.

"Shortly thereafter the Bandung Conference was held. There again the peace-loving nations—many of them members of the United Nations—made clear to the Chinese Communists their adherence to our Charter principle that States should refrain in their international relations from the threat of force.

"From the site of the Bandung Conference, Mr. Chou En-lai proposed direct discussions with the United States, a proposal which I promptly indicated was acceptable to the United States so long as we dealt only with matters of concern to the two of us, not involving the rights of third parties. That reservation applied particularly, so far as the United States is concerned, to the Republic of China to which we are loyal as to a long-time friend and ally.

"Shortly thereafter the Chinese Communists released four and, later, the other eleven, of the United States fliers of the United Nations Command whom it had been holding in violation of the Korean Armistice Agreement. This release had been sought by resolution of this General Assembly adopted last December. The outcome justified the confidence which the United States placed in the United Nations and our restraint in the use or threat of our own national power.

"Some 15 months ago, the United States had started talks with the 'Chinese People's Republic' at Geneva with regard to getting our civilians home. As a result of the Bandung statement made by Mr. Chou En-lai and my reply, the talks were resumed last August, to deal first with the topic of freeing civilians for return, and then with other practical matters of direct concern to the two of us.

"All Chinese in the United States who desire to return to their homeland are free to do so. They have always been free to do so except for a few who were temporarily prevented by restrictions arising out of the Korean war. The 'Chinese People's Republic' has now declared that all Americans on the China mainland have the right to return and

will be enabled expeditiously to exercise that right."

Pakistan and Baghdad Pact

Pakistan has now formally joined the Western Bloc, in the M.E.D.O.

"Karachi, Sept. 23.—Pakistan today formally acceded to the Baghdad Pact when the Instrument of Accession was deposited at Baghdad by the Pakistan Ambassador there, Mr. Lal Shah Bokhari.

"This brings the total number of adherents to the Pact to four: the U.K., Turkey, Iraq and Pakistan—virtually the M.E.D.O. without the U.S.A.

"According to indications available here, the permanent Ministerial Council envisaged under Article 6 of the Pact will come into existence 'very soon.' The initiative in this connexion is expected to be taken by the original signatories, Turkey and Iraq."

Pak-Afghan Dispute Ends

Karachi, Sept. 13.—The Pakistani flag was ceremonially rehoisted over the Embassy in Kabul today, thus marking the end of the five-month-old dispute with Afghanistan.

The Afghan Foreign Minister, Sardar Mohammed Naim Khan, rehoisted the flag promising safety for Pakistani lives and property in his country. He expressed pleasure that the two countries had agreed to discontinue propaganda hostile to each other.

An Afghan military unit of 100 riflemen fired a salute to the flag and a band played the National Anthems of the two countries.

The Pakistani flag over the Embassy was hauled down by demonstrators last March when they demanded Pushtoonistan.

Tomorrow the Pakistani flag will be similarly rehoisted at Jalalabad where the Consulate was also attacked in March. On Thursday, the Afghan flag will be rehoisted at the Peshawar Consulate by Pakistan's Communications Minister.

Bengali in Pakistan

East Pakistan's claim for the State recognition of the Bengali language has gained a point as indicated by the news below:

"Karachi, Sept. 21.—The Deputy Speaker today disallowed a Bengali member from speaking in his mother-tongue on the ground that the 'chair' did not understand the language.

"Heated arguments followed the ruling in which both Bengali and non-Bengali members supported the member's demand for permission to speak in Bengali.

"Mr. Fazlul Huq, Minister for interior, said if the chair did not revise its ruling, most of the members might like to walk out.

"The chair ultimately revised the ruling and the member concerned spoke in Bengali."

Japan and Goa

The following news is of interest in connection with the Goa dispute:

"Bombay, Sept. 24.—Japanese shipping lines have ordered their ships on high seas in the Indian Ocean not to touch the port of Marmagao in the Portuguese settlements in India. The order followed advice to the shipping lines by the Japanese Government, it was learnt here today.

"It was interpreted here as evidence of Japan's anxiety to retain her goodwill and trade with India even at the cost of her trade with Goa.

"Japan has important interests in Goa because she not only has millions of yen invested in the iron and manganese ore mines in this Portuguese pocket but has also contracted to buy at lower than world price 600,000 to 900,000 tons of ores annually.

"Japanese sources pointed out that it was becoming clear that the Goan production was very much lower."

"Murder Most Foul"

A news-item appeared in the *New York Times* under the above caption, we give it in substantial extract, as well as the sequel as given in the daily press here. It seems that there are yet some spots in the U.S. where the light of civilization has not penetrated:

"Late last month a 14-year-old Chicago Negro schoolboy named Emmitt Louis Till went South to spend a two-week vacation with his uncle, a poor tenant farmer in Laflore County in northern Mississippi. On August 27, Till with his cousin, entered a local store owned by a white man, Roy Bryant, and allegedly 'wolf-whistled' at the proprietor's wife. The next night Bryant and his half brother came and took young Till from his uncle's house. The men said no harm would come to the boy 'if he's not the right one.' Next day, with Emmitt still missing, his uncle complained to the police and the two men were arrested on a kidnapping charge. They admitted to having abducted Till but said they released him unharmed.

"Then, on August 31, the nude body of a teen-age boy, bound with barbed wire and weighted with a 100-pound cotton gin pulley, was

taken from the near-by Tallahatchie River. It was identified by Till's uncle and others as that of young Emmitt. There was a bullet hole in his head. The body, after a brief interment in Mississippi, was brought back to Chicago a week ago Friday. There, thousands of Negroes passed before the bier to view the victim's mangled face. The boy was buried in a Chicago suburb last Tuesday. A spokesman for the National Association for the Advancement of Colored People said the case seemed to 'qualify as a lynching.'

"Last week there was disagreement among Mississippi authorities as to whether the body had actually been Till's. The Tallahatchie County sheriff charged that the case was 'all a plot' perpetrated by the N. A. A. C. P. But an eighteen-men, all-white Tallahatchie County grand jury last Tuesday indicted Bryant and his half brother on charges of kidnapping and murder."

"Summer (Mississippi), Sept. 24.—The National Association for the Advancement of Colored People today assailed what it called the 'shameful' acquittal here of two White men accused of murdering a Negro boy.

"The verdict is as shameful as it is shocking," the Association said in a statement from its New York headquarters. "The jurors, who returned it deserve a medal from the Kremlin for meritorious service in communism's war against democracy."

"Half-brothers Roy Bryant (24) and John Mila (36) were found not guilty by an all-White jury here yesterday of killing fourteen-year-old Emmitt Till, who was alleged to have 'wolf-whistled' at Bryant's pretty wife.

"After embracing their wives happily, they were taken back in custody and put in Greenwood Prison, in neighbouring Leflore County to face kidnapping charges.

"The Summer Jury found them not guilty of murder after 68 minutes of deliberation and three ballots. Afterwards the Jury foreman said the deciding factor was the State's failure to prove the identity of a body pulled from the Tallahatchie River.

"The State maintained that this body, weighed and shot through the head, was Till's.

"Before the trial, police said the 21-year old Mrs. Bryant was the object of Till's whistle. But on the stand as a defence witness, she mentioned no names in relating an alleged incident at her husband's shop. Bryant's lawyers used this lack of identification to demand of the prosecution: 'Where is the motive?'

"Part of her testimony was withheld from the Jury and she was not cross-examined."

War or Genocide ?

The unfortunate and dispossessed sons of Africa who were indiscriminately classified and massacred as Mau Mau, seem to have come to an end of their agonies, as the news below would indicate. The item is taken from *Time*:

"After three years' bitter fighting and 11,400 killings (including 9,400 Mau Mau, 35 white settlers, 550 soldiers), the British army in Kenya thought it had the Mau Mau war well enough under control to announce the withdrawal, within the next four months, of 2,500 British and 1,000 African troops—almost one quarter of the total force engaged."

Indo-Pak Trade Agreement

The 1955-56 Trade Agreement between Pakistan and India signed in Karachi on July 19, has been ratified by both the Governments. It came into force on September 1, 1955, and will remain valid until the end of August next year.

Under the agreement, Pakistan will import from India, among other things, coal, stone boulders, hard and soft wood, mica, antimony, books and periodicals, lime and lime stone, cinema films, chemicals and pharmaceuticals.

The agreed items of export from Pakistan to India include raw jute, raw cotton, hides and skins, fish, poultry and eggs, betel nuts, saltpetre, books and periodicals, rock salt and cinema films.

A special feature of the agreement is the provision allowing the people living within the border areas of East Pakistan and West Bengal, Bihar, Assam and Tripura to trade in certain commodities of daily use. These facilities will be available only to persons holding 'A' category visas and will be subject to review after a period of six months.

World Coffee Production

On the basis of data collected by the Foreign Agricultural Service of the U.S. Department of Agriculture, total world production of green coffee for the marketing year of 1955-1956 is forecast at more than 45,000,000 bags of 132.276 pounds each. This figure would be 11 percent more than the 40,600,000 bags produced in 1954-1955, six per cent higher than the 42,400,000 bags of 1953-1954, and eight percent higher than the pre-war average of 41,600,000 bags. The principal increases in production have taken place in Brazil, Colombia, Mexico and the French African territories. Exportable production is forecast at 36,700,000 bags, compared with 32,300,000 bags for 1954-1955 and 33,500,000 bags for 1953-1954.

Felicitations

We offer our heartiest congratulations to Sri Hemendra Prasad Ghosh, the doyen of Indian journalism, on the attainment of his eightieth year. He began his journalistic career during the *Sundhya* and the *Bande Mataram* days in the early part of this century, and for fifty years he has been a very prominent figure in this field. He wields a facile pen both in English and in Bengali. He is a mine of information, and his encyclopaedic knowledge has been of great help to younger journalists who always receive from him valuable guidance. His contribution to Bengali literature is of no mean order. During his long career as a journalist he has helped considerably to raise the standard of journalism. He is also a familiar figure on the platform, and his informative speeches interspersed with witty remarks are always enjoyable. As a representative of Indian journalists he went abroad after the First World War. As an educationist, litterateur and journalist he has become an institution by himself. We wish him a long and happy life.

Fine Paper from Bagasse

W. R. Grace & Company, a United States organisation whose interests have been largely in the development of South and Central American agriculture and in American air and water transportation, has announced the development of a new process for the making of high grade commercial paper from bagasse. The new process is a continuous quick-pulping method in which bagasse (the fibrous residue of sugarcane after the sugar is extracted) is transformed directly into pulp as it leaves the sugar mill. The ordinary process for pulping bagasse required several hours, but the new method takes only 5 or 10 minutes.

In India, we produce and burn at least three million tons of bagasse. Should we not investigate the possibilities of this process?

U.S. Technical Co-operation

"New Delhi, Sept. 24: An agreement signed here this week between the Governments of India and the United States allocated \$7,844,115 (Rs. 372.5 lakhs) toward the multi-purpose Rihand Valley Development Project under the Indo-U.S. Technical Co-operation Programme.

"The Government of India will spend Rs. 7 crores for the first phase of this development project, which will be obtained from the sale of \$30 million worth of wheat and cotton being given to India by the U.S. as a loan.

"Finance Minister C. D. Deshmukh and

American Ambassador John Sherman Cooper were present at the signing ceremony.

"The Rihand Project is a major river valley development scheme designed to speed the agricultural and industrial advancement of Uttar Pradesh, Bihar and Vindhya Pradesh States. The U.S. will finance the first phase (to be completed by June 30, 1957) of the project under the Technical Co-operation Programme. When completed in 1959, this Rs. 45.26-crore project will generate 240,000 kilowatts of electric power, mitigate flood damages in Bihar, and bring over 2,050,000 new acres of land under irrigation, yielding 600,000 tons of additional foodgrain every year as well as other valuable agricultural products."

Sports Ambassador Owens

Considerable interest has been created in our sporting circles by the coming visit of Jesse Owens to India.

Jesse Owens' timing of 10.2 seconds in the 100-metre dash at the 1936 Olympics is still a world record. Nor has any athlete succeeded in clearing 26 feet 8½ inches in the running broad jump as Owens did at the Western Conference Championships at Ann Arbor, Michigan, in 1935.

The is why Owens is still considered the "world's fastest human," as America's greatest track star of all time.

Prize Competitions Bill

The Lok Sabha has at last put restrictions on this gambling that was becoming a social curse. The following news-item gives the short details:

"New Delhi, Sept. 26.—The Lok Sabha passed the Prize Competitions Bill today after a debate varying in tone between humour and reformist zeal.

"While the Bill places a maximum of Rs. 1,000 on the total value of the prize (whether cash or otherwise) to be offered by any competition in any month, an amendment limits the entries to a maximum of Rs. 2,000.

"In marked contrast to the speeches of many members who pleaded for a complete ban Pandit Pant took the view that a small prize added zest to games of skill. The element of 'swindle' was removed by limiting the prize money. He assured the House that, if exploitation of the guileless continued in spite of the limitation on the prize money, stricter steps would be taken.

"The Bill was extended to six States in addition to Bombay, Andhra, Pepsu and all Part C States mentioned in the Bill since their State legislatures had passed similar resolutions

empowering Parliament to make a law on the subject. The Home Minister said every State in the Union had undertaken to pass similar resolutions. He also assured the House that rules for issue of licenses to conduct prize competitions would be so framed as to license only those requiring skill and exercise of intelligence. He used harsh language in describing the manner in which crossword and similar competitions were being run at present. They 'seduced and tempted' guileless people, had become 'almost an organized fraud,' were a 'plunder of the unwary' and had driven many to madness."

Hindi and the I.A.S.

We reproduce below part of an editorial from the *Harijan*, as it is of crucial interest to the majority of Indians:

"A friend from Madras draws my attention to a notification of the Government of India which says that for probationers in Indian Administrative Service, the qualifying tests will be in the following subjects—1. Riding, 2. a Regional Language, and 3. Hindi, except for candidates who are examined in Hindi as a regional language under item 2 above.

"It says further that 'every probationer shall be examined in the regional language or one of the regional languages shown in column (2) of the Schedule against the State to which he is allotted'"

"The Schedule is as follows :

State (1)	Regional Languages (2)
Andhra	Telugu or Hindi
Assam	Assamese or Bengali
Bihar	Hindi, Bengali, San'hali or Oraon
Bombay	Marathi, Gujarati or Kannada
Madhya Pradesh	Hindi or Marathi
Madras	Tamil, Telugu, Kannada or Malayalam
Orissa	Oriya, Telugu or Bengali
Punjab	Hindi or Punjabi (in Gurmukhi script)
Uttar Pradesh	Hindi
West Bengal	Bengali or Hindi
Hyderabad	Marathi, Telugu, Kannada or Urdu
Madhya Bharat	Hindi
Mysore	Kannada
Patiala and East Punjab States Union	Punjabi (in Gurmukhi script) or Hindi
Rajasthan	Hindi
Saurashtra	Gujarati or Hindi
Travancore-Cochin	Malayalam or Tamil
Vindhya Pradesh	Hindi

"The notification raises many questions. One of them is noted by the Madras correspondent as follows :

"The following States are announced as Hindi regions—Bihar, Madhya Pradesh, Punjab, Uttar Pradesh, Madhya Bharat, Rajasthan, and Vindhya Pradesh. The candidates from these regions will take only Hindi as their language, whereas the candidates from Andhra, Assam, Bombay, Madras, Orissa, West Bengal, Hyderabad, Mysore and Travancore-Cochin will have to take two languages, i.e., the regional language and Hindi. Thus, candidates of the Hindi-speaking regions are in an advantageous position of taking only one language. Others will be in a disadvantageous position, having to take two languages. Thus it is clear that the scales cannot, by this method, be held even between the candidates from Hindi and non-Hindi regions.

"Why not one of the Dravidian languages—Tamil, Telugu, Kannada or Malayalam be made an additional compulsory language for the candidates from the Hindi-speaking areas, so that there may be equal advantage for all and there may be interchange of ideas between the North and the South and strengthening of national solidarity?"

"There is another point worthy of notice in the above Schedule. We see that Andhra, Pepsu, and Saurashtra are scheduled to have Hindi as a regional language. Urdu is mentioned against Hyderabad only, even though it obtains as a regional language, more or less, all over the areas where Hindi is mentioned as a regional language; for example, U.P., Punjab, Bihar, Rajasthan, etc. It is worth while to know the basis on which the regional languages are prescribed in the Schedule, for it raises important questions in regard to future administrative set-up."

Examinations in 'Mother-Tongue'

It is interesting to note the opinion of experienced teachers in the matter of examination in Regional Languages. The following news is noteworthy:

Guntur, Sept. 14.—The Andhra Tutorial Teachers' Conference was held here recently in the Kalodaya Tutorial College buildings. Mr. G. V. Subba Rao of Vijayawada presided.

Mr. G. V. Subba Rao, in his presidential address, said that English must be replaced by the regional language at all stages. He added that any attempt to perpetuate a foreign language medium would be resisted. He advocated the reviving of primary and middle school public examinations and making physical education compulsory. He appealed to the University authorities to accord recognition to tutorial

institutions. The State Governments, he said, must come to the aid of the tutorial institutions as they were rendering great service to the students of the country.

The Conference passed a number of resolutions. One of them urged that in order to spread literacy and to promote general awakening in the country, public examinations should be thrown open freely to all private candidates without any restriction. The Conference requested the authorities to give adequate representation to teachers of tutorial institutions in the Senates of Andhra and Venkateswara Universities. It was resolved that English should be replaced by the mother-tongue in the university classes and that the mother-tongue should be recognised not only as the first language but also as the medium of instruction and examination in both secondary and collegiate courses.

Dr. Kartick Chandra Bose

Dr. Kartick Chandra Bose, an eminent physician of Calcutta and one of the pioneers in chemical and pharmaceutical industry in India, passed away on 25th August at the age of eighty-three. As a pioneer in this field his name should be remembered along with that of Prof. Gajjar of Bombay. Born in 1873 at Changripota, 24-Parganas, Dr. Bose graduated from the Calcutta Medical College in 1897 securing first class marks in all the subjects and topped the list of successful candidates. He joined the Bengal Chemical and Pharmaceutical Works in 1899, and was its Managing Director for eight years. He was also the founder of Bose's Laboratory in Calcutta which he started in 1903. He was the founder-editor of the *Suasthya-Samachar* in Bengali which ran for forty years. He also edited its Hindi, Urdu and English editions. He is the author of sixteen books on medicine and health, and published in 1902 his famous *Official Indigenous Drugs of India*. He was also a pioneer social worker. In his native village he opened at his own cost branches of the Social Service League and the Anti-Malarial Society. His Multi-purpose Co-operative Society may be taken as the precursor of Deshabandhu Palli-Sanskar Samity.

NOTICE

On account of the Durga Puja Holidays, "The Modern Review" Office and the "Prabasi" Press will remain closed from 23rd October to 6th November, 1955, both days included. All business accumulating during the period will be transacted after the holidays.

KEDAR NATH CHATTERJI,
Editor

INDIA'S "SUBMERGED HUMANITY"

By RAJANI KANTA DAS, Ph.D. and SONYA RUTH DAS, D.Litt. (Paris)

AN outstanding problem of India is that of her "submerged humanity" or of those peoples whose mode of life, as determined by living standard and cultural achievement, falls far short of the level achieved by caste Hindus or, in other words, those peoples who are "socially, educationally, and economically backward." Although this definition is too simple to be applicable to a dynamic nation in the process of rapid industrial development, when all these three characteristics are taken into consideration together, this is still true in the case of India where the caste system plays even today a dominant part in determining one's social position.

Most of the "submerged peoples," of whom fairly detailed information is available, fall into three categories, namely, Scheduled Tribes, Scheduled Castes, and Backward Classes, numbering respectively 20, 55, and 35.6 million, or 5.6, 15.3, and 9.3 per cent of the total population. In other words, 110.6 million or 30.2 per cent of the total population of India are backward in social, educational, and economic achievements, as indicated below :

India's "Submerged Population" in 1951		
Submerged population	Number in million	Percent of total
Scheduled Tribes	20.0 ¹	5.6
Scheduled Castes	55.0 ²	15.3
Backward Classes	35.6	9.3

Total backward peoples 110.6 30.2

SOURCE : India—A Reference Annual—1954, Government of India, p. 348. According to the Census of 1951, the total population of India is 356.8 million, exclusive of Kashmir and Jammu, which had, however, a population of 4.4 million, the detailed information of which was not available at the time the Indian census was taken.

In addition to the above three groups of peoples, Scheduled Castes, Scheduled Tribes, and Backward Classes, there are also 198 ex-Criminal Tribes, although the exact number of their population is not known.

These social, political, and economical conditions of about one-third of India's population have not only retarded the intellectual, moral, and spiritual development of these peoples themselves, but have very detrimental effect upon the progress and prosperity of the whole nation.

1. Including 995,000 persons of the "Leftout Tribes and Areas" as indicated by the Report of the Commissioner for Scheduled Castes and Scheduled Tribes, 1954, Government of India, p. 139.

2. See the Indigram, The Embassy of India, Washington, D.C., July 18, 1955, p. 742.

1. THE "SUBMERGED HUMANITY"

Although grouped together under the "common designation" of "submerged humanity" or backward peoples, each group is different from the other, both in origin and nature of its problem, and would therefore require a different kind of treatment in each case. The common factor among them is that all of them are "backward." But even this "backwardness" varies in degree from group to group, as shown more clearly in the discussion of the origins and problems of each group.

Scheduled Tribes : The origins of India's Scheduled Tribes have been traced to such races as the Proto-Australoids, who one time practically covered the whole of India ; secondly, the Mongoloids who are still located mostly in Assam, e.g., Naga Tribes ; and finally, to a limited extent, also the Negritos strain as indicated by frizzly hair, among the Andamanese and the Kadars of the South-west. These original tribes in India have been divided and subdivided into a large number of sub-tribes, all mutually exclusive, each having the endogamous and exogamous clans with their own totem names and their own customs. The common features of all these tribes are : (1) primitive way of living ; (2) habitation in remote and less easily accessible areas ; and (3) nomadic habits and love for drink and dance.
