The Tribal Welfare Committee which met under the auspices of the Indian Conference of Social Welfare Work at Calcutta and consisted of anthropologists and other social workers, recommended the following classifications of the existing tribes : (1) *Tribal Communities* or those who are still confined to the original forest habitats and follow the old pattern of life ; (2) *Semi-Tribal Communities* or those who have more or less settled down in rural areas and have taken to agriculture and allied occupations ; (3) *Acculturated Tribal Communities* or those who have migrated to urban or semi-urban areas and are engaged in modern industries and vocations and adopted modern cultural traits ; and (4) *Totally Assimilated Tribals* in the Indian population.

The impact of Christianity on the life of some of the Scheduled Tribes must be recognized both as far as the development of their literacy and culture is concerned. Since every

3. Report of the Commissioner for Scheduled Castes and Scheduled Tribes, 1954, pp. 326-333.

citizen has been granted by the Constitution his right to preserve his personal faith and religion, the tribal man is entitled to preserve both his faith and religion. It must be remembered that in the Indian renaissance movement as indicated by the Brahmo Samaj and the Arya Samaj movements, the Christian missionaries have made great contributions to the development of vernacular language and literature. What is required of every citizen is that he should learn both the State language and the national language so that he can easily understand his duties and responsibilities to the State and exercise his rights and privileges as a citizen.

The Scheduled Tribes of India are the earliest inhabitants (Adivasis) or indigenous peoples of the country, who were unable to defend themselves and were gradually forced to recede before the invading hordes of such peoples as the Dravidians, Indo-Aryans and Mongolians coming from the West, North-west, and North-east respectively, who were not only superior in numerical strength but also in mechanical equipment. The indigenous peoples thus took shelter in the mountain fastnesses and thick jungles, where a considerable number of them still are and have been estimated to be about 5 millions. Those who were left behind on the plains gradually disappeared either by absorption or by acculturation.

According to the Census of 1951, there are about 245 Scheduled tribes (1950) with a total population of 20 million in 1951. They are concentrated in the central belt beginning from the Aravalli Hills in the west and extending into parts of Bombay State, Madhya Pradesh, Bihar, Orissa, West Bengal and Assam. In the north, they are found in the southern ranges of the Himalayas, and in the south in the Eastern and Western Ghats and in the Vindhya and Satpura mountains.

The various groups making up the indigenous population in India are in different stages of primitive existence, as determined by their habitat as well as by the facilities of their internal and external communications. These groups differ from one another in ethnology, language, and social and religious customs. Education is difficult for the aboriginal races because of inaccessibility of their places of residence, difficulty of finding a common language, and the scarcity of appropriate teachers. But there is no doubt that the people of these

regions will gradually appreciate the value of education and take full advantage of free compulsory education. This is best indicated in the case of Assam where the young people of both sexes attend school together.

Scheduled Castes: The largest number of backward peoples belong to Scheduled Castes, which amounts to over 55 millions, about one-seventh of the total population of India in 1951, as noted before, and which are variously called exterior castes, depressed classes, untouchables, and Harijans (as Mahatma Gandhi used to call them). Of these various designations the two most important are Scheduled Castes, which have been official designations and have appeared in all their constitutional and legal relationships. The second is Harijans, a term which is also legal, as indicated by the Bombay Harijan Temple Act of 1947 and also by the fact that some of the leaders of the group have accepted it.

The origin of untouchability is "partly racial, partly religious, and partly a matter of social custom." There is, however, a strong opinion in certain quarters that "the idea of untouchability originates in taboo." Besides its origin, the concept of untouchability has undoubtedly been "accentuated by differences of race and racial antipathies, which seem common to every branch of the human family and have reinforced the magical taboo." Once such a group was formed, all the peoples, mostly of the aboriginal origins, who were employed in certain unclean occupations, were added to these untouchable classes, thus augmenting their number. (The greatest factor in the increase of the number of the untouchables was, however, penalization and condemnation by the Brahmins of all those Indian Buddhists who refused to give up their religion). There are several disabilities from which the Scheduled Castes suffer: (1) They are barred from the use of public utilities, e.g., schools, wells, bathing places, and often from burning ghats (cremation grounds); (2) they are barred from entering into Hindu temples; (3) they are deprived of the services of such peoples as barbers, tailors, and washermen; and (4) in certain provinces, their contact or proximity is regarded as pollution.* Lately, some of these conditions have been modified but the essential features of their disabilities still exist.

5. *Census of India, 1931, Vol. I, India: Part I: Report*, p. 486.

6. *Census of India, 1931, Abstract*, Government of India, 1932, p. 6.

4. *First Five-Year Plan, People's Edition, Planning Commission, Government of India*, p. 243.

Backward Classes: Backward Classes imply the groups of people who are "socially, educationally, or economically backward," although the terms have not yet been officially so defined by the Constitution. Under Article 15 of the Constitution, the State is empowered to make special provision for the advancement of any socially and educationally backward classes besides Scheduled Castes and Scheduled Tribes. In some States, no distinction is made between Scheduled Castes and Backward Classes. Some of the States, such as Madras, proposed to spend about 14.4 million rupees on welfare schemes for Scheduled Castes and other backward classes in 1952-53.

The Government of India has appointed a Backward Classes Commission with Shri Kaka Sahib Kalelkar as Chairman. The Commission was inaugurated by the President on March 18, 1953. It has a three-fold function: (1) To determine the test which a particular class or group of peoples can be described as backward; (2) to prepare a list of such backward communities for the whole of India; (3) to examine the difficulties of the backward classes and to recommend the steps to be taken for their amelioration. The Commission has power to co-opt at least two members, including a woman, from every State as it proceeds with the examinations of the witnesses. The terms of references include the Scheduled Castes, Scheduled Tribes and a number of other groups, which are backward socially, educationally, and economically.

The Government has also prepared a list of measures which have been undertaken by 22 States up to December 31, 1951, to remove social disabilities among the Hindus.⁷

Ex-Criminal Tribes: In addition to Scheduled Tribes, Scheduled Castes, and Backward Classes, as mentioned above, there are other classes of backward peoples in India, of which the most important are the Ex-Criminal Tribes, the exact number of which have not, however, become available. They are made of some 198 nomadic tribes who have not been able to adjust themselves to the proprietary conventions of a settled economy. Although many of these tribes have been associated with anti-social activities, others have shown a disposition to settle down as small traders and shop-keepers and have shown signs of skillfulness, which could be developed and utilized for the development of various crafts.⁸

In order to regulate the activities of these nomadic tribes, an Act was passed in 1924, under which certain tribes were classified as "criminal" as a result of their habit of banditry. Once they were so declared, they could not leave the places of residence at night, nor could they move out of the areas of their residence without permission. As under the Constitution of the Republic, no man can be deemed guilty unless he is proved to be so in a court of law. The Criminal Tribes Acts were repealed from August 20, 1952. Individual acts of criminality will be dealt with under the ordinary law. They will in the future be treated as backward peoples and remedial measures for the improvement of backward peoples would be applicable to the so-called Ex-Criminal Tribes also.

2. POLITICAL AND EDUCATIONAL MEASURES

After centuries of neglect and apathy, India has been awakened, as soon as she has become independent, to do everything in her power to integrate her "submerged humanity" into her social, political, intellectual, moral and spiritual life by all means at her disposal. These measures might be classified under the following headings, such as Constitutional safeguards, reservations in services, and representations in legislative bodies, and development of Scheduled Tribal Areas.

CONSTITUTIONAL SAFEGUARDS

Articles of the Constitution: Article 15 of the Constitution prohibits discrimination against any citizen on grounds of religion, race, caste, sex or place of birth. Article 17 abolishes untouchability and forbids its practice in any form; and Article 29(2) provides that no citizen can be denied admission into any educational institution maintained by the State or receiving aid from it, on grounds only of religion, race, caste and language.

Directive Principles of State Policy require the State first of all to promote the welfare of the people by securing and protecting a social order in which justice—social, economic, political—shall inform all institutions of national life; and provide in the second place that the State shall promote the educational and economic interests of the weaker sections of the people and, in particular, of the Scheduled Castes and Scheduled Tribes, and shall protect them from social injustice or all forms of exploitation.

Removal of Social Disabilities: Under Article 338 of the Constitution, the President appointed a Commissioner for Scheduled Castes

7. *India—Reference Annual, 1954*, pp. 354-55.

8. *First Five-Year Plan, Government of India, 1953*, p. 245.

and Scheduled Tribes on November 18, 1950. The Commissioner was required to investigate all matters relating to safeguards provided under the Constitution and to report upon their working at such intervals as the President may direct. Moreover, between 1938 and 1951, especially during 1947-51, some 22 Acts and their amendments were passed by various States as for the removal of social or civil disabilities of the Harijans or Scheduled Castes.

Reservation in Services: Article 335 read with Article 16(4) makes it possible for the State to reserve appointments for Scheduled Castes and Scheduled Tribes and give them some other facilities as it may consider necessary. In fact, as early as 1934, instructions were issued by the Government of India to ensure that qualified candidates from these classes were not deprived of fair opportunities for employment merely because they could not succeed in open competition. In 1943, it was decided to reserve 8½ per cent of vacancies for them, and in 1946, the percentage of reservation was raised to 12½ so as to correspond to the percentage of the Scheduled Castes in the total population of the country. After the attainment of independence, it was decided that 12½ per cent of the vacancies filled on the basis of competition should continue to go to the Scheduled Castes. For all other posts, the figure of reservation was raised to 16½ per cent. At the same time, the appointing officers all over the country, especially in Assam, Bihar, Madhya Pradesh and Orissa, were required to keep in view the desirability of recruiting suitable candidates belonging to the Scheduled Tribes. In July, 1949, concessions in regard to age and fees, which have been given to the Scheduled Castes, were extended to the Scheduled Tribes.

REPRESENTATION IN PARLIAMENT AND LEGISLATURES

The Scheduled Tribes and Scheduled Castes have been given special representation in Parliament and State Legislatures for a period of ten years from the date of the inauguration of the Constitution. The total number of seats reserved for the Scheduled Tribes and Scheduled Castes are respectively 28 and 71 out of a total of 502 seats in the House of the People in the Central Government and 188 and 473 seats out of a total of 3,315 seats in the Legislatures of the States. Moreover, there were 11 members of Scheduled Tribes and Scheduled Castes in the Upper House, the Council of the States.⁹

9. Under Articles 330, 332, and 334 of the Constitution.

Appointment of Ministers: Under Article 164 and 238 the States Madhya Bharat, Madhya Pradesh, Bihar and Orissa are required to appoint Ministers to look after the welfare of the Scheduled Tribes, Scheduled Castes, and other backward classes. Some of the States have created departments of welfare services. Of the Ministers, Deputy Directors, and Parliamentary Secretaries, 31 belong to the Scheduled Castes and other backward classes.

THE DEVELOPMENT OF SCHEDULED AND TRIBAL AREAS

The welfare of backward areas has been assured by special provisions in the Constitution. The Constitution provides for the establishment in each State having Scheduled areas of a Tribal Advisory Council to advise the Head of the State on such matters relating to the welfare of the Scheduled Tribes. Most of the States have already set up such councils. Such States are required to submit a report to the President regarding their administration.

Educational and Welfare Schemes: Article 46 of the Constitution has also laid down that the State shall promote educational and economic interests of the Scheduled Tribes and Scheduled Castes. In order to give effect to this plan, a variety of measures has been undertaken by both Central and State Governments: (1) The total expenditure on welfare schemes for the Scheduled Castes and other backward classes in the States was Rs. 27.5 million in 1951-52, Rs. 35.0 million in 1952-53, and the budget for 1953-54 had a provision of Rs. 52.0 million. (2) The Government of India has been implementing the scheme for award of scholarship for post-Matric students and spent for Scheduled Tribes, Scheduled Castes and other backward classes Rs. 15.40 million in 1951-52 and sanctioned Rs. 30 million for 1952-53. (3) By the end of December 1952, 3,065 scholarships were awarded to Scheduled Castes, 1,094 to Scheduled Tribes, and 1,734 to other backward classes, or a total of 5,893 scholarships.

Other Welfare Work Grants: Of these welfare services, the most important are:

(1) *Developmental Plan,* for which Article 275 of the Constitution requires the Central Government to make grants to the State Governments from the Consolidated Funds of India to enable the latter to carry out development schemes for the benefit of the backward classes. The Central Government has thus granted Rs. 37.87 million to different States during 1951-53.

(2) *The Benefit under the Five-Year Plan:* A provision of Rs. 40 million has been made in the First Five-Year Plan for the amelioration of the Scheduled Castes and other backward classes. For implementing development of schemes in tribal areas, the Government of India has taken into consideration the need for the preservation and development of tribal culture. In accordance with provision now made in the Five-Year Plan, the States will spend a total of Rs. 188.72 million during the planned period.

3. POLICIES AND PROBLEMS

Although all the groups discussed above fall under the same category of "submerged humanity," they are different in origin and also require different methods of approach in solving their specific problems. They should, therefore, be discussed separately.

ASSIMILATION OF SCHEDULED TRIBES

Since the beginning of the Indian history, the policies both of the Dravidian and Indo-Aryan peoples have been to leave Scheduled Tribes alone and let them live their lives as they pleased without any interference from outside. Two outstanding events have drawn the attention of Indian peoples to the problems of the Scheduled Tribes: First, the uprisings of Paharia and Santal tribes in 1782 and since then and up to 1947, various acts and regulations were promulgated and some important reforms introduced. Second, the gradual penetration into tribal areas by foreign missionaries bringing in some extraneous influences in various parts of the country. Both these events indicated that India must develop some definite policies and take some positive steps toward her neighbouring tribal populations.

The first attempts of the Government of India were the provisions of welfare services for the tribal peoples in the Constitution. Under Article 275 of the Constitution both the Central Government and State Governments made contributions of Rs. 120 million and 110 million respectively, for promoting the welfare of the Scheduled Tribes. Moreover, a grant of Rs. 30 million was also made for the development of the North-East Frontier Agency in which a large proportion of the tribal population lived. This is a positive policy of assisting the tribal peoples to develop the natural resources of the areas in which they live and to evolve a more productive economic life depending upon themselves rather than upon over 17 States.

Article 338 of the Constitution makes further provision for the appointment of a

special body to investigate the safeguards provided for tribal populations and to report to the President on their working. This body started functioning with effect from November 1, 1950 under a Commissioner assisted by five Regional Commissioners with jurisdiction over 17 States.

Part X of the Constitution made special provisions for the autonomous administration of the tribal areas of Assam in special relations to the allotment and use of land, taxation, education, and the control of money-lending and trading; other States having Scheduled Tribes and Scheduled Castes will have Tribal Advisory Councils to advise the authorities on the advancement and welfare of aborigines. Such councils exist in Assam, Madras and Orissa. In Assam, Hyderabad, Madhya Bharat, Orissa and West Bengal, there are special departments or ministers responsible for tribal affairs.

It was not until 1952 that a fundamental policy of the Government towards the tribal people was definitely declared. In June 1952, a meeting was held in Delhi of the State Government representatives, the Bharatiya Adimjati Sevak Sangha, Members of Parliament, anthropologists, missionaries and social workers, to study the program of action on behalf of the aboriginal population. During the meeting the Government's intention to assimilate the tribal population without prejudicing its peculiar character was reiterated.¹⁰

This means that, subject to due respect to the minority rights granted by the Constitution, as well as some specific rights granted temporarily as mentioned above, Scheduled Tribes will have the same rights and privileges as any other group of peoples, irrespective of race, caste, or creed, e.g., free and compulsory education of the children up to age 14, and social education of adults in the language which they can understand, and also vocational education of adults in the language which they can understand, and also vocational education in occupations which are appropriate to them. Like any other group or community, they are entitled to all the civic rights, including participation in municipal, district, State and Union elections to choose their representatives. Moreover, as in the case of Scheduled Castes, reservations have also been made for Scheduled Tribes, both in higher services as well as for ten years in Parliament and State Legislatures, on the basis of their population.

10. *India News, The Indian High Commission, London*, 14 and 21 June, 1952, pp. 8 and 4 respectively.

INTEGRATION OF SCHEDULED CASTES

Another outstanding problem of India's "submerged humanity" is the integration of her 55 million or one-seventh of the population of India's Scheduled Castes or the so-called "untouchables," into her social, political, economic organization. It has also been mentioned that untouchability originated most probably from some unclean occupation, which under the magic of taboo, created such a wide gulf between the caste Hindus and the so-called untouchables that it remained unbridged for thousands of years.

In spite of the wide gulf between two races, blood fusion has taken place among them, as in fact, among all the races of India, and has resulted in the rise of existing racial variations among the Indian population. What is more to the point is the fact that there is some aboriginal blood among the high class Hindu population and a still larger number of the so-called untouchables resemble in features the high caste Hindu populations. While the first point may be explained on the ground that the higher class Aryans were permitted to take wives from lower castes, both the youth and beauty of some of the aboriginal classes might have attracted them even to matrimony. Even today the Santal women have become the artist's models all over India. As to the second point, it might be pointed out that considerable numbers of untouchables were once the descendants of high caste Hindus who embraced Buddhism, and became untouchables through the curse of the Brahmins. Moreover, it must be remembered that race diffusion often travels through bypaths and short-cuts rather than through the royal road of matrimony. In short, many Scheduled Castes have Aryan blood in them, and by treating them wholesale as "untouchables" great injustice is done to their own blood relatives.

Both the concept and practice of untouchability are the blackest spots of Hindu religion and Hindu culture. They have broken the moral and spiritual backbone of a large section of the Indian population and their misery and degradation know no bounds. There is no parallel class of people in the whole history of the human race. Poverty and starvation, illiteracy and ignorance, disease and ill health have been constant companions of these unfortunate peoples. They have been condemned by society as "untouchables," avoided by community for fear of imbibing impurity, segregated in the worst part both in the village and in the city, deprived of all the public utilities,

such as bathing ghat, drinking water, as mentioned before. That most of these conditions still exist today is best indicated by the report of the First Five-Year Plan, according to which "a large portion of agricultural workers belong to the Scheduled Castes (untouchables)." They are "the first victims of famines, epidemics, and any other natural and national catastrophe, and form the lowest social, political, economic strata of Indian national life."

The problem of untouchability has occupied the mind of all moral and spiritual leaders of India from Buddha to Gandhi, and some of their miseries have also been mitigated. Mahatma Gandhi started several kinds of welfare services for the Harijans, which are not only carried on by his followers even today, but have been incorporated into India's national Constitution. The Constitution provides safeguards for protection of interests of the Scheduled Castes, such as the abolition of untouchability; reservation of appointments in Government services; granting of special representations in Parliament and in State Legislatures, and similar other concessions. The most important and significant provision of the Constitution is the abolition of untouchability and "its practice in any form is forbidden." This provision of the Constitution was given effect to by an Act which was passed by the lower House of Parliament early in June 1955, making "discrimination against untouchables an offence punishable with a six-month jail term or a fine of Rs. 500." The Act grants right to the untouchables to demand full access to shops, restaurants, public wells, tanks and bathing ghats. It is a great achievement by the untouchables in their march toward obtaining human dignity.

The Welfare of the Scheduled Caste is mainly the responsibility of the State Governments. In 1953, the Government of India decided to make grants-in-aid to the State Governments for their schemes of removing untouchability. These grants are mainly intended for carrying on intensive propaganda for abolishing untouchability, especially in rural areas. Moreover, the Government of India has also been giving grants to the following non-official organizations for their welfare activities for the removal of untouchability, such as (1) Bharatiya Depressed Classes League; (2) Harijan Ashram; (3) All-India Harijan Sangh; and (4) Scheduled Castes Federation. While the grant to the last-named Organization was still under consideration, the first three organizations were granted a total

of Rs. 469,000. The activities of these organizations is best indicated by that of the Bharatiya Depressed Classes League which employed 60 social workers for carrying on against untouchability, organizing public meetings and social gatherings, with special emphasis on the opening of wells, temples, *dharamshalas*, hotels, etc., to Harijans, where they were still closed.¹¹

AMELIORATION OF BACKWARD CLASSES

Backward Classes form the third important group of India's "submerged humanity," the problem of whom has come under consideration by the Government of India. As noted before, a Commission has been appointed to report on their conditions and to recommend the methods of the amelioration. Until the publication of the Report of the Commission, no definite policy could be adopted and no scheme of work could be organized. Some work which has been adopted related mostly to helping them to obtain a higher education.

WELFARE OF EX-CRIMINAL TRIBES

After the repeal of the Criminal Tribes Act in 1952, it was realized that all State Governments should undertake welfare services for making the Ex-Criminal Tribes economically self-supporting and for gradually adjusting them into India's social organization. The Government of India made grants-in-aid to State Governments for undertaking welfare services and indicated the following schemes, such as: (1) Education, (2) Agriculture, (3) Housing, (4) Cottage Industries, (5) Medical, (6) Public Health, (7) Aid to voluntary agencies, and (8) Miscellaneous. During the two-year period of 1953-55, the grants-in-aid of the Government of India to the State Governments amounted to Rs. 4.13 million and the total expenditures of the State Governments amounted to Rs. 4.67 million for the welfare services for the Ex-Criminal Tribes; in other words, both the Government of India and State Governments spent a total of Rs. 8.80 million for such welfare services.¹²

In addition to the grants-in-aid to the State Government, the Government of India also made grants to private organisations devoted to the welfare services of the Ex-Criminal Tribes. The Vimukta Jati Seva Sangha, Delhi, for instance, received Rs. 22,000 from the Government of India in 1954-55. During this period the Organization established

3 colonies and 36 quarters for the Ex-Criminal Tribes in different places, organized the Boys Scouting and Girls Guide Movements; established 3 Adult Educational Centres, where women were taught tailoring, knitting and embroidery; granted 23 scholarships to students for higher education; and provided free medical aids to 600 patients, thus laying a solid foundation of welfare services for the Ex-Criminal Tribes.¹³

CONCLUSION

An outstanding problem of India is the integration of her "submerged humanity" or backward peoples, amounting to 110 million or over 30 per cent of the total population, into her national organization. A large population, when developed physically, intellectually, morally and spiritually, becomes a valuable national asset. But when left alone, in poverty, disease, ignorance and inactivity, it becomes a social liability and a source of national calamity. The general policy adopted by the Government and approved by the people, towards Scheduled Tribes, Scheduled Castes and other Backward Peoples is that, with due respect to their special cultures, they should be gradually adjusted to the social, political, and economic organization of India so as to form an integral part of the Indian Commonwealth.

India's "submerged humanity" or backward peoples, who have lived in India from time immemorial, fall under the following principal categories: First, Scheduled Tribes, the population of which has been recently estimated to be 20 million and which are the earliest inhabitants of the country and have preferred to live in savagery rather than to join the invaders and to lose their identity. Second, Scheduled Castes, the present population of which has been estimated at 55 million, which are the most neglected and ill-treated peoples in the history of the world, and have come to be known as "untouchables" and "pariahs." Third, Backward Classes, the present population of which has been estimated to be over 35 million, but very little is as yet known about them and the report of the Commission appointed on them has not yet become available. Finally, the Ex-Criminal Tribes, which have been estimated at 198, but the exact number of their population is not yet known. The very antiquity of these tribes, castes, and classes, and their intricate problems arising from social, economic and educational conditions have been left alone by the foreign

11. Report of the Commissioner for Scheduled Castes and Scheduled Tribes, 1954, Government of India, pp. 209 and 229.

12. Compiled Report of the Commissioner for Scheduled Castes and Scheduled Tribes, 1954, Government of India, pp. 382-83.

13. Ibid, pp. 236-37.

rulers who have dominated the destiny of India for several centuries.

The achievement by India of her national independence and the establishment of the Democratic Republic have brought a new life among the people, who have decided to uproot the century-old social evils. The Government of India, together with the State Governments, have mobilized all Constitutional, legislative, and administrative powers at their disposal to remove age-long evils from which Scheduled Tribes, Scheduled Castes, and other Backward Peoples have suffered so long, and have adopted the following measures:

(1) Constitutional safeguards; (2) Reservation of Services; (3) Special representation in Parliament and Legislatures for ten years; (4) Development of Scheduled and Tribal Areas; and (5) Educational and other welfare schemes. An outstanding measure of the Government of India to the untouchable classes is the enactment of the Act making the observance of untouchability in any form a criminal act punishable by payment of a fine of Rs. 500 or imprisonment of six months.

These measures of the Government are

being supplemented by those of the people, both individually and collectively. From very ancient times welfare activities have been undertaken by intellectual, moral and spiritual leaders from Buddha to Gandhi. Even today Acharya Vinoba Bhave, India's walking saint, has been travelling on foot thousands of miles and appealing to the nobler instinct of land-owners to donate land for the landless with wonderful success; and it is the followers of Gandhi and Ramakrishna who are in the lead in the welfare services among the tribal and caste groups. What is more significant is the fact that, aside from religion which is more or less a question of individual conscience and group conviction, there has been developing in India, since the beginning of the nineteenth century, a new culture or an Indian civilization, which is the expression of the life and labour of the people of modern India. Like the State, this new culture or civilization is the commonwealth of all the people of India, irrespective of their race, caste, or creed.¹⁴

—:O:—

GEOGRAPHIC ENVIRONMENT IN INDIA

By PROF. C. B. MAMORIA, M.A. (Geog.), M.Com.

II

CLIMATE

OWING to the great size and position and the diversities of relief, there are greater striking contrasts of meteorological conditions in different parts of the country than are probably found in any other part of the world. One part of the country lies north of the Tropic and the other within it. In the north-west lies the great Thar Desert with an average annual rainfall of less than 5 ins.; in the north-east are the Khasi hills with an average of 425 ins. at Cherapunji. Dras in Kashmir has recorded a minimum temperature of -49 deg. F, while Ganganagar in Rajasthan has several times recorded a temperature of over 120 deg. F. Hill-stations in the Himalayas (such as Simla) may be shrouded in cloud for days together in August with humidity of 100 per cent; while in December they may be overrun by air of nearly 0 per cent humidity. The mean maximum temperature at Cochin does not go above

89 deg. F in any month nor the mean minimum below 73 deg. F; while at Ganganagar the mean maximum temperature goes up to 108 deg. F in May and the mean minimum to 38 deg. F in January.

The climate of India is influenced from outside by two adjoining areas. On the north the Himalayan Range shuts it off from the cold climate of Central Asia and gives it continental climate, the characteristics of which are the prevalence of land winds, great dryness of air, large diurnal range of temperature and little or no precipitation. On the south, the ocean gives it a hot monsoon climate more typical of the tropical than of the temperate zone.

"We always think of India as essentially a tropical country. And rightly so, for the whole area within the mountain wall must be considered as a unit, with a common type of climate throughout, that of tropical monsoon."¹

1. L. D. Stamp: *Asia*, p. 170.

The chief features of such a climate are the great uniformity and the small diurnal range of temperature, the great dampness of the air and more or less frequent rains. For the purposes of climatological studies India may be divided into two parts: Peninsular India and Northern India.

The whole of the Peninsular India lies within the tropics and has a tropical climate, the variations of temperature between summer and winter being small. In winter the temperature is controlled by the proximity of equator and the oceanic influences and it is between 65 deg. to 80 deg. F. But in summer the temperature rises over 90 deg. F near the tropics but in the neighbourhood of the oceans the climate is equable and the atmosphere is generally cloudy. In Malabar, the range of temperature is about 60 deg. F and in S.-East Madras about 120 deg. F. These features are specially observable on the windward coasts, and they diminish with the increase in distance from the sea.

Although the whole of Northern India lies beyond the Tropic of Cancer, the climatic conditions here are more complex. The severity of heat or cold and the amount of moisture in the air, however, differ greatly in the different states and during different seasons. East Punjab and W. Rajasthan are very cold in winter and extremely hot in summer and the air is generally devoid of moisture. But in West Bengal, Assam, Bihar and U.P. winter is cold and summer is moderately hot with plenty of moisture in the air. In winter the temperature in Northern India is controlled, apart from the slanting rays of the sun in winter, by the anticyclone that covers this area then. The temperature varies between 55 deg. and 65 deg. F. The summer temperature is largely the effect of (i) direct rays of the sun; (ii) continentality emphasizing land influences far from the sea; (iii) anticyclone, which maintains a steadily rising temperature; and (iv) modification by the breaking of the S.-W. monsoon. The highest temperature is to be found in the neighbourhood of Madhya Bharat, Rajasthan, S.-W. Punjab and West U.P.

Altitude tempers the heat of low latitudes. Up on the hills it is delightfully cool and refreshing even in mid-summer, but beyond a certain point the excess of cold forbids human habitation.

SEASONS

India enjoys three well-marked seasons, (i) a cool dry season, i.e., winter, when

light northerly dry trade winds prevail over the greater part of India, the skies are clear, the weather fine and the humidity low so that there is little or no rainfall except in the northern parts where moderate cyclone storms occasionally occur; (ii) a hot dry season, i.e., summer before the onset of rains, usually comes suddenly with heavy thunderstorms, dry scorching westerly winds (known as *loo*); and (iii) a hot wet season, i.e., rainy season, with winds of oceanic origin, high humidity, much cloud and frequent rain.

MONSOONS AND RAINFALL

The most important feature in the meteorology of India is the alternation of seasons known as monsoons. Strictly speaking, monsoons are seasonal winds whose direction is more or less reversed twice during the year. Lying largely within the tropics, and with the great Asiatic continent to the north and the wide expanse of the Indian Ocean to the south, India furnishes the best example of a monsoon country. During winter the general flow of surface air over the country is from north to south, north-westerly in the plains of Hindusthan, northerly in the central parts and north-easterly in the south of the Peninsula and the neighbouring seas. In this season the air over the country is mainly of continental origin and hence of low humidity and the season is known as the north-east or winter monsoon. In the summer months (June to September) the general flow of winds is from the opposite direction from sea to land and the season is one of much humidity, cloud and rain. The direction of winds in the major parts of the Arabian sea and the Bay of Bengal being south-westerly, the season is named the South-west monsoon season. The causes determining the monsoon currents are many and varied but the fundamental cause is undoubtedly the periodical excesses of the heating of the land masses of Asia in summer and of cooling in winter as compared to that of the water of the Indian Ocean and the Chinese Seas.

Though agriculture is the main occupation in India, yet only about 20 per cent of the area under cultivation receives artificial irrigation, the remaining 80 per cent depending entirely upon the mercy of rain every year for the successful cultivation of various agricultural crops. In India, the rain-giving monsoon is known as the South-west monsoon. The South-west monsoon season during which 75 per cent of the total rainfall is recorded is the most important rainfall season. The monsoon

sets in June, spreads almost all over the country by July and August and gradually gets weakened in September. During this period rains are very important because they provide necessary moisture for agricultural operations for the sowing of *kharif* crops like cereals, pulses, sugarcane, cotton, oilseeds and jute, which account for more than 80 per cent of the total area sown to crops. Thus the setting in of the South-west monsoon marks the beginning of the agricultural operations over a wide area. The South-west monsoon generally spreads through two branches because of the peculiar shape of the Peninsula, viz., the Arabian Sea branch and the Bay of Bengal branch. The former brings rainfall to the southern and western parts of the country, but, as the monsoon advances, it penetrates further into the Central and North-West India. This branch of the monsoon comes first into the country in the southernmost tip, viz., Travancore-Cochin, generally at the end of May. The second branch comes slightly later and confines itself to Assam, West Bengal and North-eastern India.*

The post-monsoon season begins with October, and extends up to December. It provides only 13 per cent of the annual rainfall. Normally good post-monsoon showers are received in these three months in the eastern region comprising Assam, West Bengal, Orissa, Madras, Andhra, Konkan and Malabar. In other parts of the country, only light occasional showers are received and the intensity of these showers decreases from east to west. But these light showers are very important for the growth of the late sown *kharif* crops, especially in Southern India, as well as for the sowing of *rabi* crops. In Madras and Andhra, the rainfall during the period is known as the North-east monsoon. The rains during this period are of considerable local importance.

Winter monsoon commences in January and lasts up to the end of February. This provides only 2 per cent of the annual rainfall. Yet this is important for the proper growth of *rabi* crops of wheat, barley, gram and *rabi* pulses in Northern India, especially in the Punjab, Pepsu, U.P., Bihar, Madhya Pradesh,

Rajasthan, Madhya Bharat and some parts of Assam.

Pre-monsoon showers during March to May amount to roughly 1 per cent of the annual rainfall. This period of the year is generally dry over the land mass of northern and peninsular India where *rabi* crops are harvested and the irrigated crops like sugarcane, cotton, summer rice and vegetables are grown. But the stronger winds near the sea-coast, which increase in strength as the monsoon advances, bring rains to the north-eastern parts of the country consisting of Assam, West Bengal, Orissa and Bihar and the north-west coast of Madras and Travancore-Cochin, Malabar and south-east Madras. In the north-east region they help the sowing of autumn paddy and maize, while in the southern area, these rains are beneficial for the sowing of *kharif* crops like paddy, coffee, sugarcane and some vegetables on lands where irrigation facilities are available.

Part of the rainfall from the monsoon in India is orographical, and part cyclonic or convectional. All along the Himalayas, Assam and Western Ghats, the rising air currents result in the condensation of moisture and rainfall. The cyclonic rainfall is due to the passage of a number of depressions or cyclones, some of which are of local origin, while others have their birth in the neighbouring seas and are more landward. Rains in winter in North-west parts of India are of this nature. Convectional rainfall takes place sometimes due to local heating which produces cumulous clouds. This type of rain is strictly local and occurs mostly in autumn or spring.

The annual rainfall of India is 42 ins., that is to say, we get all over one lakh maunds of water on every acre of land,* and variations from this normal as great as +12 inches and -8 inches occurred in 1917 and 1899 respectively. Generally the variability decreases with increasing rainfall, the variability being largest in the driest parts of the country and least in the wettest regions.† The high variability in areas of low rainfall is, however, not such a serious menace to agriculture as the comparatively low variability in areas which have just enough rainfall for agricultural purposes. Any decrease in rainfall in such areas

2. The normal dates of the onset of South-west Monsoons in the different States are as follows: Bombay, 1st June; Assam, 5th June; Madras and Andhra, 7th June; West Bengal, 10th June; Bihar, 15th June; U. P. West, 20th June; U. P. East, 25th June; and Punjab and Pepsu, 1st July.

V. S. Menon: *Weather and Crop Conditions in India in Agricultural Situation in India*, Vol. IX, No. 7 (Oct., 1954), p. 432.

3. *Census of India*, 1951, Vol. I, Pt. IA, p. 10.

4. e.g., Kanpur, whose annual rainfall is 34 ins. has a variability of 20 per cent but Calcutta, with 65 ins., has only 11 per cent variability.

Vide R. N. Dubey: *Economic Geography of Indian Republic* (1951), p. 29.

makes it impossible for agricultural operations to be carried on and a famine is the result. As the average rainfall diminishes from place to place and as it becomes more concentrated in one season, variations from year to year increase. When the normal total is under 20 ins., no agriculture is attempted without irrigation, rainfall fluctuations are expected and planned for. Where the total exceeds 80 ins. there is almost always a surplus of moisture available for the growing of crops. Forty inches of rain is normally adequate but when it fails, a famine is threatened. Thus, the most seriously affected areas are those where the rainfall is 30 ins. and 50 ins. and this is the famine zone of India. In Rajasthan, Saurashtra, Central India and the Deccan, where some rain usually comes but the variation is great, famine occurs frequently. In this area there is enough rain for crops during normal years, so that adequate provision of irrigation facilities does not exist. This fact is the source of considerable suffering in times of drought. Long experience with rainfall fluctuations has brought population distribution into close agreement with climate possibilities, but so great is the pressure of population that many have occupied the marginal lands where drought is certain to occur. In certain areas, notably the East Punjab and Madras, irrigation has made the settlers somewhat independent of rainfall changes; but a prolonged failure of monsoon causes rivers and wells, the source of irrigation, to have less water than usual and thus to be less adequate for irrigation.

CHIEF FEATURES OF INDIAN RAINFALL

The monsoon rains in India are often marked by some important variations from the normal. viz., (i) The beginning of the rains may be delayed considerably over the whole or a large part of the country. (ii) It may end much earlier than usual causing damage to *kharif* crops and also make the sowing of *rabi* crops difficult or uncertain. (iii) There may be prolonged breaks of rain lasting over the greater part of July or August, when the summer crops needing plenty of moisture are just growing. (iv) The rains may persist more than usual in one part of the country and desist from another part. (v) It is concentrated for a few months. It is seasonal. Fluctuations in the rains as regards climate, distribution and timeliness bring misery or prosperity to millions of people. For several months in a year, India is on trial for her life and seldom

escapes without a penalty.* (vi) It is also unevenly distributed over the country. Certain regions like the Western Ghats, Himalayan Tarai and East Assam suffer from excessive rainfall, while others like Rajasthan, West U.P., the Deccan, etc., are devoid of adequate rainfall. The sharp transition from heavy rains to dire scarcity is testified by the old proverb, "One horn of the cow lies within the rainy zone and one without."† (vii) It is erratic, sometimes falling in torrents and heavy downpours leading to a considerable run-off. This results in excessive soil-leaching and soil-erosion.

RAINFALL ZONES

India may be divided into following rainfall belts: (i) Below 15 ins. belt; (ii) from 15 ins. to 30 ins. belt; (iii) 30 ins. to 50 ins. belt; (iv) 50 ins. to 70 ins. belt and over 75 ins. belt. The first two belts taken together cover about one-third of the country. Here the seasonal fluctuations are so frequent that they are more or less regularly expected; and when they occur, they cause a great deal of hardship to the people and expense to the Government. The first belt has so little rain that a great many people do not live there; but in the second belt about one-fourth of the people live. The third region covers almost exactly another one-third of the country. Here rainfall, if timely, is adequate; but the vagaries of the monsoon are apt to cause an occasional failure of crops and the consequent distress. The fourth and the fifth regions also cover about a third of the country. These are well-provided with rain, which is generally, though not invariably, dependable.

INFLUENCE OF CLIMATE ON ECONOMIC ACTIVITIES

(1) Perhaps in no other regions of the world the rainfall enters so much into every aspect of life as in India. Life here is primarily based on agriculture, which is dependent for its very existence on the South-west monsoon. *This monsoon may be said to be the pivot upon which the whole of Indian life revolves.* The deficiency of rainfall spells disaster for the cultivator and the prolongation of the dry season renders all hopes of a rich harvest that year futile. Hence, in one period India is deluged with rain and is the scene of the most wonderful and rapid growth of vegetation; in another period the same tract becomes a

5. C. L. Knowles: *Economic Development Overseas*, Vol. I, p. 278.

6. Ronaldshay: *India, A Bird's Eye View*, p. 15.

sun-burnt, dreary waste. In fact, "if monsoon fails, there is a lock-out in agriculture industry," a disaster which calls forth the virtues of patience and fortitude.

(2) As winter temperature is never too low in any part of the country, the growing period for the crops is prolonged and this fact enables us to grow both the temperate land crops in winter and tropical as well as sub-tropical land crops in summer months. In parts of West Bengal, Assam and the Peninsular region, owing to the availability of sufficient water supply, the growing of crops is easy. As many as three crops of rice can be grown in one year in these parts. The summer temperature is high and rises suddenly, hence crops mature earlier. This rapid maturity of crops tends to deteriorate their quality. India is, therefore, not a 'quality' producer, but only a 'quantity' producer. This applies to winter crops as well as summer crops.

The uniformly high temperature during the period of the greatest rainfall (June, July and August) is of great benefit for the quick growth and maturity of crops like millets and maize. The hot and moist climate of this period produces an abundant vegetative growth in plants which serve as fodder for cattle. As the rainfall is concentrated to only a few months, the greater part of the year is dry. The fact discourages the growth of grasslands in India. Whatever grass grows during the rains is scorched during the dry season. Hence pasturage is poor in India and cattle and other livestock have, therefore, to be stock-fed. The extreme uncertainty of rainfall in various parts of the country and its compression into one or two months, have necessitated the practice of irrigation more universally and on a larger scale in India than in any other part of the world. A special peculiarity of Indian agriculture is the ingenious and assiduous manner in which water is applied to increase the produce of the soil, by means of tanks, embankments, sluices, river-dams and channels, wells and irrigation canals.

Climate also affects man's life. The degree of effort required for man's struggle for existence determines his character to a great extent. The Indian is typically a man of Tropics, he matures early and withers early, and is not generally long-lived. Girls reach the age of puberty at an early age and hence early marriage is generally the practice rather than an exception. The ample leisure is turned to

good use and imagination runs riot, producing a bewildering complexity and succession of ideas and projects which energize him and give him enthusiasm, but though not fitful, his energy and enthusiasm are not long-sustained. He tends to be fickle. Quick and alert, he easily tires. Passionate and excitable, his animosities are but a passing phase; quickly aroused, he is quick to forgive and forget; though ambitious he is contented; on account of the lack of sustained effort needed for the pursuit of the ambitions suggested by his acute intelligence, he falls back on contentment. Metaphysical speculations blend strangely with materialistic desire, for the non-attainment of which he seeks solace in spiritual philosophy.

As said above, under the easy conditions of living in the low-lying plains of the Ganges and the eastern and western coastal plains, individuals mature early, and the fertile regions become densely populated. The people are of comparatively modest physique sustained mostly on a rice and fish diet. The intensive cultivation and multiple cropping support a very dense population. Whereas in the hot and dry summers and cold and moist winters in the north, the areas are populated by stalwart races, very energetic and brave who subsist mostly on a wheat, milk and meat diet.

Clothing, no less than physical and mental characteristics, is also controlled by climate. In India, the great heat of the summer and the closeness of the monsoon period render it necessary to have merely light and loose garments. A *dhoti* and *uparna* (a nether and an upper covering), loose and light, preferably white in colour so as to reflect and radiate as fully as possible the solar rays, is the natural dress of the Indian, particularly in the tropical south and the hot east; fashion may add a border to the *dhoti* and create different styles of wearing it; the *uparna* may change similarly into a loose *kurta*; the head-wear may be transformed into the stylish *phenta* (turban) of the Rajputs, Gujars and Jats, into the flaming *pagri* of the common people or into the small white cotton cap of the Banarasis. The garments are generally made of cotton; not because it is cheaper or because it grows locally but because it is the characteristic clothing material for the tropical and sub-tropical countries, where men desire not too much to retain warmth, but require things to permit partial radiation and promote cooling. In parts of India, as in the north, where winters are fairly cold, padded cotton garments are in use. Silk is light enough for a tropical

country and therefore it forms the material for the ceremonial dress of the Hindus, the *pitambars* and *saris*. In India, luxuriant vegetation and the flora with varied hues lead to a preference for printed fabrics and variegated patterns in bright colours, particularly in the dress of the womenfolk. The sombre black or dull grey are more in consonance with foggy and cloudy skies of the cool temperate West than with the brilliance of the sunny tropical and sub-tropical East. The baggy trousers of the Sindhis, the voluminous shirts of the Marwari women are all in harmony with the extremes of heat experienced in their lands. Similarly, the Mohammedan lady's *pyjamas* satisfies the need for rapid and quick movements necessary in the desert and semi-desert areas where Islam has chiefly spread.

Tropical countries do not want so much light as the free movement of air, hence, in India, we have verandahs, courtyards, balconies and terraces, *jallies* and *chajjas* and perforated screens to keep out the strong glaze of the sun and to permit the outside breezes to cool the interior. The great heat makes it further necessary to have high ceilings in rooms to interpose a long column of air and thus prevent excessive heating of the lower air in the buildings. The construction of domes and cupolas and the tapering *gopurams* in temples is thus a response to the climatic conditions, and not merely a device for ornamentation. In Western India, a house frontage on the east is much prized, for while permitting east to west ventilation, it enables the health-giving rays of the morning sun to reach the interior; a western front is only second to this. A southern front is fairly good since it permits the south-west monsoon winter to enter, while a northern frontage is considered least desirable. Sloping roofs are the characteristic of Western and Southern India because of heavy rainfall which requires efficient drainage. In areas of scanty rainfall and in arid regions like West Rajasthan, flat roofs and terraces better suit the conditions, not only by permitting the residents to escape from the heat inside to the cooler house-tops, but also by enabling the rain water to be led off by pipes and stored in tanks so as to provide good water for drinking purposes.

The great civilizations of the ancient world are found to have arisen in the sub-tropical regions between 30 deg. and 40 deg. and this is best-fitted for the birth of great

religions of the world. Of these, Hinduism was envolved in the steppe lands of Central Asia, the original home of the Indo-Afghan people; Jainism and Buddhism in the plains of the Ganges; Christianity and Judaism in the arid lands of Palestine; and Islam in the desert lands of Arabia.

A tropical and monsoon region like India is subject to two periods of danger when disease stalks boldly through the land. Diarrhoea, dysentery, cholera and small-pox rage violently in summer, and the beginning of a rise in mortality is perceived in April. There is another period, October, when malaria rages in India in all its fury.

These diseases not only sap the vitality of the people but also make them inefficient and easy-going. The number of deaths in India from preventible disease every year has been above 5 to 6 millions and the number of working days lost by each worker for the same reason has been estimated at 15 to 21 days in a year. The loss in efficiency due to diseases has been not less than 20 per cent. The fatigue and the ill-defined general conditions of debility produces a disinclination to hard work. Various kinds of diseases also render the body weak and reduce the span of life. The cumulative effect of all this on the people is to produce a lack of energy and strength needed to develop the best in themselves and in the resources of the country.

Climate also exerts a great influence on agriculture, the basic industry of India. Water is more valuable than gold in India and hence with the failure of rains, crops fail and famine conditions quickly overtake the region. The agriculturists are not the only persons who are affected by the failure of monsoons. As the incomes of the agriculturists fall, their capacity to buy industrial goods and services is diminished. Lawyers, doctors, and professional men find their incomes reduced. Sales of industrial products diminish, and there arises a shortage not only of agricultural materials but also of food crops. Failure of crops reduces railway earnings and affects the volume of exports. Rent cannot be collected and land revenue falls into arrears. Thus the Finance Departments find their Budget calculations upset. It has, therefore, been rightly remarked that "Budget-making in India is a gambling in rains."

(To be continued)

WEST BENGAL'S INTER-STATE TRADE IN AGRICULTURAL PRODUCTS

By A. N. BHADURI, M.A.,
Directorate of Agriculture, Marketing Branch, West Bengal

If the current earnings of a society are used up wholly by current consumption bearing no surplus, there sets about a process of deterioration of the economy, at first slowly but very soon at a progressively high rate. It happens so because, at first replacement and payment for depreciation are put off. This reduces earnings and leads to fall in the living standards. This process continues for some period, and very soon a stage is reached when expenses for current consumption (consumption standard or habits die hard) begin to be met from depletion of capital stock. This process of deterioration of the economy proceeds with accelerated motion, with the inevitable consequences of low production and fall in employment and income until the economy seeks a new equilibrium level far down in the scale of economic activity.

To make possible creation of new sources of products and incomes through investments or in other words to raise the economic level of any particular society, it is necessary that the society as a whole must have at its command a fund of purchasing power over and above what is required for maintenance of the economy at its existing level of efficiency. The greater the volume of this surplus purchasing power (along with potential resources), the higher are the chances for its developing quickly.

This surplus purchasing power may well be netted within the country itself, but this source is to be tapped very cautiously so that there may not be any deterrent effect on the current consumption standard. Loans from foreign lands may also serve as another source but besides being a burden to the borrowing country such loans are attended with various delicate considerations both political and economic especially in periods of high-tension international relations. It places a country in a particularly convenient position if the required amount of additional purchasing power is met as much as possible from earnings from external trade without any forced sacrifices at home. The spectacular economic development of Great Britain during the 19th century would have hardly been possible at the scale it was achieved without the vast external resources she had at her command.

Though it is true that the additional

purchasing power required for capital investment in developing countries is best acquired through external trade balances, it should be remembered well that any policy of artificial trade barriers or of repriminations used as an instrument of trade earnings, will lead to ultimate harm rather than benefit in so far as such policies prevent the world economy from freely following the path of comparative advantage.

The principle stated above is as much applicable to international as in intra-national trade as it holds between different States of the Indian Union. In what follows West Bengal's earnings from the external trade in so far as it relates to the other member-States of the Indian Union is briefly studied.

In this study West Bengal has been taken to mean West Bengal excluding Calcutta. Because Calcutta, so far as agricultural products are concerned, is not a producing but only a consuming market, for the supply of whose agricultural needs West Bengal has to enter into competition with other States. A correct assessment of West Bengal's performance in exporting her agricultural produces should also take into account her volume of trade with Calcutta, which is rather cosmopolitan in character. Out of these considerations Calcutta has been treated as a separate unit in this study, this being made possible due to separate statistical records maintained by the Directorate of Commercial Intelligence and Statistics, Government of India.

CEREALS

The export of paddy and rice, wheat and wheat products from Bengal before partition and from West Bengal since partition is shown in the following table:

(See Table I)

It will appear from the Table that the partition of the province in 1947 has not effected any material change in the trend of export of paddy and rice and that West Bengal has since then maintained well the same trend of having surpluses of rice and paddy, though as it is quite natural in far reduced volume. It may, however, be noticed that her export is ruling at a level much above her proportionate share of total cultivated area of the undivided Bengal, which is barely 30 per cent. The paddy and rice situation is expected to improve further during the next few years and, in fact,

WEST BENGAL'S INTER-STATE TRADE . . .

283

if the bumper crop of the last season is followed by even a moderate crop during the next she will be in a position to further consolidate her position as regarding cereals and may even look up for a position of freedom from heavy dependence on wheat and wheat products as will be evident from Table II.

TABLE I
West Bengal's Import and Export of Paddy and Rice* (Inland)
(In lakh maunds)

Period	Import	Export	Net (a)	Net export to Calcutta
<i>Paddy: (Average)—</i>				
Undivided Bengal:				
1936-37 to 38-39	12.47	24.11	+11.64	
1944-45 to 46-47	4.49	18.59	+14.10	
West Bengal:				
1947-48 to 49-50	0.62	18.39	+17.77	17.44
1950-51 to 52-53	1.03	22.88	+21.85	21.75
<i>Rice (Average)—</i>				
Undivided Bengal:				
1936-37 to 38-39	30.63	80.31	+49.68	
1944-45 to 46-47	25.86	69.56	+43.70	
West Bengal:				
1947-48 to 49-50	5.57	35.86	+30.29	30.83
1950-51 to 52-53	15.48	40.05	+24.57	26.16

N.B. (*) Source: Accounts relating to inland (Rail- and River-borne trade) in India. The same source has been utilised for subsequent Tables except where it is otherwise stated.

(a) Notation (+) indicates export and (—) indicates import balance in this and subsequent Tables.

TABLE II
West Bengal's Export and Import of Wheat and Wheat Products (Inland)
(In lakh maunds)

Period	Import	Export	Net
<i>Wheat (Average)—</i>			
Undivided Bengal:			
1936-37 to 38-39	1.81	0.72	—1.09
1944-45 to 46-47	1.43	0.64	—0.79
West Bengal:			
1947-48 to 49-50	0.11	1.83	+1.72
1950-51 to 52-53	15.04	0.61	—14.43
<i>Wheat Products (Average)—</i>			
Undivided Bengal:			
1936-37 to 38-39	12.97	0.22	—12.75
1944-45 to 46-47	15.16	0.23	—14.93
West Bengal:			
1947-48 to 49-50	5.08	0.47	—4.61
1950-51 to 52-53	16.48	0.12	—16.36

It will be found from the above Tables I and II that during pre-partition days, against an average net export balance of about 60 lakh maunds of paddy and rice, Bengal would have an import of about 13 to 14 lakh maunds of wheat and wheat products. During the

post-partition period of 3 years, it is found that West Bengal even acquired small export balance in wheat against an import balance of about 5 lakh maunds of wheat flour. The position underwent very rapid change in recent times towards heavy dependence of imported wheat and wheat products as a cover against short fall of paddy and rice.

One very significant feature of the cereal position during the last 3 years is that West Bengal during this period earned an export balance of 46.42 lakh maunds in paddy and rice while receiving a net import of 30.79 lakh maunds of wheat and wheat products. When it is remembered that a good portion of this import is normally required for wheat-eating people of this State, West Bengal would have fairly enough met her own requirement of cereals had she not to make provision for Calcutta, to which her export of cereals was mainly directed. (It may also be noted that some imports to Calcutta from adjoining areas of the West Bengal districts are moved by roads and have no statistical accounts available). In view of the above accounts of statistical movement it will be realised that the Food and Agriculture Minister, the late Rafi Ahmed Kidwai, did take no unusual decision, while relieving West Bengal from the burden of feeding Calcutta.

GRAM AND PULSES

The position in respect to gram and pulses may be seen from Table III. Records of inland trade in pulses other than gram are not available beyond 1947-48.

TABLE III
West Bengal's Import and Export of Pulses (Inland)
(In lakh maunds)

Period	Import	Export	Net
<i>Gram (Average)—</i>			
Undivided Bengal:			
1937-38 to 39-40	2.92	5.74	+2.82
1944-45 to 46-47	1.65	2.76	+1.10
West Bengal:			
1947-48 to 49-50	1.98	1.49	—0.49
1949-50 to 52-53	2.27	2.25	—0.02
<i>Pulses other than Gram (Average)—</i>			
Undivided Bengal:			
1937-38 to 39-40	N.A.	N.A.	
1944-45 to 46-47	N.A.	N.A.	
West Bengal:			
1947-48 to 49-50	3.65	1.95	—1.71
1949-50 to 52-53	11.33	3.32	—8.01

N.A.—Not available.

As indicated by the above Table, the position re: gram remained after as before partition a both way traffic, with a tendency

for the trade to reach higher levels. But the position re: other pulses is found to have undergone radical changes both in level of trade, which has been much above that of the first 3-year-period after partition and in abnormal increase in import compared to export.

OIL AND OIL SEEDS

Rape and mustard are by far the most important of the oilseeds imported by West Bengal. The position of the three major oilseeds is indicated by the Table below:

TABLE IV

West Bengal's Export and Import of Oilseeds (Inland)

Period	Import	Export	Net
<i>Rape and Mustard</i> (Average)—			
Undivided Bengal:			
1936-37 to 38-39	12.12	0.51	-11.61
1944-45 to 46-47	17.26	0.18	-17.08
West Bengal:			
1947-48 to 49-50	18.13	0.34	-17.79
1950-51 to 52-53	14.33	0.56	-13.77
<i>Groundnut</i> (Average)—			
Undivided Bengal:			
1936-37 to 38-39	0.36	0.08	-0.28
1944-45 to 46-47	2.38	0.15	-2.23
West Bengal:			
1947-48 to 49-50	0.69	0.10	-0.59
1950-51 to 52-53	0.51	0.05	-0.46
<i>Linseed</i> (Average)—			
Undivided Bengal:			
1936-37 to 38-39	2.13	1.94	-0.19
1944-45 to 46-47	1.48	0.40	-1.08
West Bengal:			
1947-48 to 49-50	2.36	0.25	-2.11
1950-51 to 52-53	1.15	0.31	-0.84

It will be evident from the above Table that the trade pattern in rape and mustard has not in the least been affected in any way by partition. Far from any reduction in the volume of import, as was expected of the consequences of partition, the same is found to have ruled at a higher level than in the pre-partition period. The average import during the last three years is ruling still above the average for the period 1936-37 to 38-39, for the whole of Bengal. While the position re: linseed has followed almost the same pattern as rape and mustard the import of groundnuts recorded steep fall after partition and is found to have been still following the falling tendency.

The trade position in respect to oil may be found in the Table below. For want of statistical records the relative position of the different categories of oil except of cocoanut and groundnut could be shown.

TABLE V
West Bengal's Inland Trade in Oils
(In lakh maunds)

Period	Import	Export	Net
<i>Groundnut Oil</i> (Average)—			
Undivided Bengal:			
1944-45 to 46-47	2.69	0.10	-2.59
West Bengal:			
1947-48 to 49-50	1.65	0.14	-1.52
1950-51 to 52-53	2.83	0.86	-1.97
<i>Cocoanut Oil</i> (Average)—			
Undivided Bengal:			
1944-45 to 46-47	1.15	0.06	-1.09
West Bengal:			
1947-48 to 49-50	0.40	0.05	-0.35
1950-51 to 52-53	0.40	0.03	-0.37
<i>Other Oils</i> (Average)—			
Undivided Bengal:			
1944-45 to 46-47	6.58	0.36	-6.22
West Bengal:			
1947-48 to 49-50	2.60	0.17	-2.43
1950-51 to 52-53	2.15	0.36	-1.79

The above Table read together with Table No. IV makes clear the trend of imports of oil and oilseeds. It appears that fall in import of groundnut seeds and rise in the level of imports of rape and mustard are concurrent with the rise and fall in import of groundnut and other oils (mustard oil constitutes the bulk of "other oils"), respectively. During the last three-year period import of groundnut oil has exceeded the import level for the whole of Bengal before partition. This expansion of the markets mostly may be due to its increasing use with mustard oil and higher utilisation in Vanaspati factories. The falling tendency in import of mustard oil is more than made up by imports of mustard and rape seeds in large quantities.

SUGAR, GUR AND TOBACCO

Bengal was deficit in sugar and gur even before partition but not so in tobacco. The trade position is shown in Table VI.

(See Table VI, next page)

It is evident from the above Table that while import of sugar had considerably been reduced from pre-partition level almost proportionately to her population share, that of gur, though fallen to about half immediately after partition, has during the last 3 years almost attained the same as the pre-partition level. In respect to tobacco, on the other hand, West Bengal found herself after partition in the position of a net importer as against that of a net exporter, as enjoyed by the undivided Bengal.

OTHER COMMODITIES

The position before and after partition of some other important items is indicated in the Table VII below.

TABLE VI
West Bengal's Inland Trade
(In lakh maunds)

Period	Import	Export	Net
Sugar (Average)—			
Undivided Bengal:			
1936-37 to 38-39	19.16	1.33	-17.83
1944-45 to 46-47	12.73	0.17	-12.56
West Bengal:			
1947-48 to 49-50	4.83	0.79	-4.04
1950-51 to 52-53	6.26	0.86	-5.40
Gur* (Average)—			
Undivided Bengal:			
1936-37 to 38-39	13.29	1.73	-11.56
1944-45 to 46-47	12.43	0.66	-11.77
West Bengal:			
1947-48 to 49-50	6.54	1.12	-5.42
1950-51 to 52-53	12.00	0.83	-11.17
Tobacco (Average)—			
Undivided Bengal:			
1936-37 to 38-39	3.27	4.17	+0.90
1944-45 to 46-47	1.60	2.44	+0.84
West Bengal:			
1947-48 to 49-50	1.12	0.86	-0.26
1950-51 to 52-53	1.24	0.71	-0.53

* Includes molasses, rab and jaggery.

Table VII reveals that in both hide and skin, the export dropped to about one-third of the pre-partition level, as the consequence of partition. Similar trend is found to prevail as regards the export of sheep and goats in a drastic form, the present level of export having fallen to even less than 8 per cent of the pre-partition level. As regards cattle, while import has gone very much down, export has improved more than double the pre-war level. The import of oilcakes has not fallen down much below the pre-partition level and even during the last three-year period the import has gone up nearer the pre-partition level. It is significant to note that the import of rape and mustard has also followed similar trend of imports ruling at a high level in spite of the partition.

JUTE AND TEA

The position with respect to tea has very little been affected by partition. On the other hand, jute has been worst affected by partition and West Bengal has to import about one-third of her raw jute requirement of her jute industry from her truncated portion. As the entire bulk of jute produced in the State find their way to the jute mills around Calcutta, the trend of trade in jute is best indicated by the trend of production, in absence of detailed trade statistics, the export of raw jute being now restricted.

† Valuation of some of the minor items both of import and export could not be made with reasonable accuracy due to lack of movement statistics or quality-wise classification of stocks, even when such statistics are available, there being wide variation of prices according to qualities. This, it is hoped, will not affect seriously the result of this Table as such omissions occur on both sides of the balance: import as well as export.

BALANCE OF TRADE

Table VIII indicates West Bengal's balance of trade accounts in respect to the important items of agricultural trade for the years 1951-52 and 1952-53. While computing the balance of accounts and their corresponding money value as shown below for these two years, the position has been considered from the angle of the earnings of the agricultural community only. The earnings from tea has naturally been excluded from these accounts for the reasons that tea belongs to a large-scale plantation economy and the average cultivator does not directly participate in the earnings from tea. On the contrary, the tea habit has been so popular that it constitutes often a regular item of expenditure in his cost of living.

The method adopted for preparation of these accounts has been to arrive at the positive or negative balance of trade for each item under consideration and then to evaluate the same balance by means of the wholesale prices as prevailed in Calcutta. The evaluation of the trade balances has been done at the Calcutta wholesale prices due to the limiting factor that adequate price statistics covering the numerous places of origin and destination of the various items are not easily available at present. In absence of such elaborate price data, however, it is hoped that the Calcutta wholesale prices may well serve to indicate the position broadly.

The result is shown above in Table VIII.

It is evident from the above Table that in almost all her essential requirements for agricultural commodities, West Bengal has an unfavourable balance and in 1951-52 and 1952-53, her net deficit balance was to the extent of about Rs. 1858.54 and Rs. 1165.20 lakhs. The computation of similar balance of trade accounts of any other year is likely to reveal net deficit more or less of a similar order. Surely this must have been a great weakness in her agricultural economy and such an annual drain would have decapacitated her from any kind of economic development but for the wealth derived from jute in which she enjoys comparative advantage. On computation from available data it is found that West Bengal's

earnings from raw jute was to the extent of Rs. 6292.27 and Rs. 2689.50 lakhs from the production of the year 1951-52 and 1952-53 respectively.* On the agricultural balance sheet the contribution of this fibre not only makes it possible for her to meet the deficit incurred for obtaining the essential requirement of agricultural supplies but also to leave her sufficient balance for meeting her expenditure on items other than agricultural. In short, it is a vital point to realise that West Bengal's agricultural economy is most precariously dependent upon this fibre, and the present study is an attempt to make an approximate measure of such dependence.

One other fact of supreme importance is that jute is essentially the feeder of an export market, in which price factor occupies a very important position, particularly in the present times when competition from rival sources and also from substitutes is being potently felt. Any measure directed towards reduction in price is not only desirable but extremely urgent and both production and distribution costs need simultaneously be vigorously dealt with for effective economy. This aspect of the problem has strongly been emphasised in their recommendations by the Jute Commission. "In the new situation," the Commission say, "the Indian mill production can maintain its markets only by an all-out effort to keep down production costs by modernisation and rationalisation and by obtaining its raw materials at the most economic price."†

While action in some important respects have been directed towards raw jute for reduction of its cultivation costs, the equally important problem of its distribution has remained practically still untouched.

* For computing the market value of jute, production less 1 per cent held as retention has been evaluated at the average Calcutta wholesale prices, the proportionate share of each quality having been taken at Top 5 per cent, Middle 20 per cent, Bottom 45 per cent, Cross Bottom 20 per cent, and Mesta 10 per cent. In arriving at the annual average, monthly prices have been given the following weights: February to September—1 for each month, and October to January—3 for each month. Thus the marketable surplus of 110.76 and 112.16 lakh maunds are evaluated at the average prices of Rs. 51.81 and Rs. 18.98 per maund for the years 1951-52 and 1952-53 respectively.

† Report of the Jute Commission, p. 6.

SOME ASPECTS OF THE POLITICAL PHILOSOPHY OF SRI AUROBINDO

By Dr. JAGADISH NARAYAN SARKAR, M.A., PH.D.,

Professor of History, Ranchi College

SRI Aurobindo was one of the shining lights of the Indian Renaissance of the 19th century, who tried to liberate the soul of India from bondage. The Marathas and the Rajputs disintegrated as national entities by 1818 and the Sikh nationalism failed to sprout after 1839. The dreams of reviving the rule of Peshwa and the Padshah were dissipated in 1858. With the passing of Maharashtra out of the political stage Bengal stepped in to give a new lead to Indian political life. Renascent Bengal became the first workshop of the spirit of the 'Eternal and Timeless India' and Sri Aurobindo was one of its chief organisers. If Raja Rammohun Roy was the herald of the new age, Vivekananda stirred the sleeping giant. If Bankim saw the vision of the Mother and was the *Rishi* of the *mantra* of awakened nationalism, Sri Aurobindo was the prophet of national freedom.

Steeped in English education and isolated from Indian culture though he was in his early life, Sri Aurobindo became an ardent champion of Indian freedom. Master alike in Western lore and in India's wisdom, Sri Aurobindo gave expression to some revolutionary ideals for independence during the nineties of the 19th century. These years were, indeed, a turning point in the history of the Indian National Movement, witnessing the rise of Religious Nationalism or Extremism and Revolutionary Nationalism or Terrorism. In 1900 Aurobindo made the first move by sending Jatin Banerjee from Baroda to infuse the spirit of a secret society among the youth of Bengal.

Parting company with the Moderates, Sri Aurobindo loudly proclaimed the priority of freedom over any other thing. "First freedom, then (moral) regeneration." "It is the first condition of life, which must be satisfied, if the nation is to survive." "Political freedom is the life breath of a nation. Without it a nation cannot go, cannot expand . . ." Political freedom, in his opinion, was then the greatest and the only work before the country, as foreign subjection was eating into the vitality of the nation's being, emasculating its body, corrupting its morals and corroding its soul.

Stressing this social emasculation and stagnation, economic ruin and many other adverse results of foreign government more powerfully and persistently than had been done even before, Sri Aurobindo sounded the clarion call that good government is no substitute for independence and self-government.

He emphasized in his Kishoregunj resolution (April, 1908) that the village being the cell of the national body,

Swaraj should begin from the village; the political sense of the masses could be awakened only through the *Palli Samiti* (*Speeches*, 40 ff).

The Partition of Bengal (1905) was the spring-board of Extremism. At the Benares Congress (1905) the extremists (Bal Gangadhar Tilak, Lala Lajpat Rai, Bipin Chandra Pal) parted company with the moderates under Gokhale, while at the Calcutta Congress (1906) an open rupture was avoided by the adoption—under the influence of its 82-year-old President, the Grand Old Man, Dadabhai Naoroji—of the ideal of Swaraj or self-government. As Editor of the *Bandemataram*, Sri Aurobindo declared the policy to be "complete autonomy free from British control," but it was soon given up and the newspaper became the fiery organ of dynamic nationalism declaring in 1906 complete independence to be the goal of India (an ideal accepted by the Congress only in 1931) and gave a dynamic lead towards it.

Disclaiming the Congress policy of attaining Swaraj by mendicancy or petitioning as the "dream of timid inexperience, teaching of false friends, foolish to reason false to experience," Sri Aurobindo preached the "only two modes to effect the fulfilment of national desires: self-development and self-help (distinguishing between that of an independent nation and that of a servile people) and passive resistance," thus furthering the idea of Bipin Pal who was working through his paper *New India*. Sri Aurobindo was convinced that no material self-government was possible without *rajashakti* (and central organisation, such as Japan had). Considering the Plan of Campaign and obstructive methods of Parnell in Ireland and the organised untiring campaign of murders, riots, strikes and agrarian unrest (as in Russia), Aurobindo was convinced that the only effective means of national emancipation in India, short of actual armed revolt (the readiest and swiftest) was passive resistance (1907); it was the sole alternative to the ordeal of sanguinary violence. He organised the Nationalist Party (Cf. Sinn Fein of Ireland) to capture the Congress and use it for revolutionary action, if not to form a central revolutionary body.

Without recommending the method of refusal to pay taxes, a method usually followed in Europe, by the Dissenters in England, the Irish peasants and the Americans—involving direct defiance and breach of legal obligation and demanding perfect organisation and ultimate preparedness that were lacking in India then—Sri Aurobindo suggested (April 1907) (1) the negative method of boycott,—the organised refusal to do anything

to help the British, whether in administration, commerce, education, justice, and organised refusal to help the process of exploitation and impoverishment, and (2) the positive method of Swadeshi, constructive left-help in all these spheres, whether economic, industrial, educational (national schools), judicial (creation of arbitration courts) and military (creation of a volunteer force).

A passive resister had to undertake three obligations: to be prepared to break an unjust coercive law, to resist an unjust coercive order and to boycott those who use foreign goods and are guilty of treason to nation. The enforcement of these three canons would produce the actual shock of battle. Passive resistance, would, however, cease and active resistance would be a duty as soon as executive action became illegal and violent coercion. No longer passive, it would still be defensive resistance.

The most significant effect of all this was the creation of a new spirit of courage, indomitable and undaunted, rising again and again, wave after wave. The whole fate of Indian politics was changed. The subsequent Non-Co-operation movement and the Civil Disobedience movement of Mahatma Gandhi can be well understood in this background.

Sri Aurobindo insisted that freedom demanded sacrifice.

"The work of national emancipation is a great and holy *Yajna* of which boycott, Swadeshi, national education and every other activity, great and small, are only major and minor parts. Liberty is the fruit we seek from the sacrifice and Motherland, the Goddess to whom we offer it: into the seven leaping tongues of the fire of *Yajna* we must offer all that we are and all that we have, feeding the fire even with our blood and the lives and happiness of our nearest and dearest ones; for the Motherland is the goddess who loves not a maimed and imperfect sacrifice, and freedom was never won from the gods by a grudging giver."

This emotional and devotional appeal electrified the youth of the country and stirred them to the depth of their beings.

Indeed, inspired by the spirit of the song *Bande Mataram*, Sri Aurobindo loved and worshipped India as the Mother, the eternal and infinite Mother.

But to Sri Aurobindo, patriotism was more than a religion. It was a spiritual experience. He believed that the movement of India's freedom was guided by an unseen power, and that through it some higher will was fulfilling itself. In his Uttarpara speech (*Speeches*, pp. 57-59) he disclosed how his jail life was an intense spiritual *sadhana* and how he saw the *Viswarup* of Lord Krishna. Speaking against Government repression in Bengal to a Bombay audience Sri Aurobindo made a remarkable utterance recalling the German idealist philosopher Hegel's view of history. History, to Hegel, represented the march of God on earth.

"Nationalism," said Sri Aurobindo, "is not a mere political programme: Nationalism is a religion that

has come from God . . . Nationalism is immortal. Nationalism cannot die, because it is the human thing, it is God who is working in Bengal" (*Speeches*, p. 7).

Sri Aurobindo's public political life was brief. Predicting in January, 1910, that India would be free after a period of wars and worldwide upheavals which were to begin in 1914, he retired to Pondicherry in response to his inner spiritual urge. The active patriot and the active nationalist in him now receded to the background, the spiritualist came to the fore. Spiritualism engulfed his politics; but did not crush it, rather improved it. Immersed in his mystical and mysterious Yoga Ashram in Pondicherry, and convinced of the inevitability of the grant of independence to India by Britain due to insistence of demand and pressure of international events, Sri Aurobindo refused to return to practical politics. Nevertheless, in his *ashram* seclusion away from the political arena he always remained keenly interested in world affairs and India's fate, and devoted himself to the solution of these problems. He relaxed his earlier uncompromising formula of passive resistance when the Montagu-Chemsford reforms were coming in 1919. Considering Nazism to be a challenge to spiritual evolution of humanity and an instrument for enslaving not only Europe but also Asia, Sri Aurobindo supported the Cripps offer as a step towards independence.

With unflinching faith in India's great mission to the world Sri Aurobindo like Vivekananda, was convinced that India was arising not to serve her material interests only but as a helper and leader of whole humanity. In 1907 he wrote:

"A divine power is behind the movement, the *Zeit Geist*, the Time Spirit is at work to bring about a mighty movement of which the present juncture has need. That movement is the resurgence of Asia and the resurgence of India is only a necessary part of the larger movement but its central need. India is the keystone of the arch, the chief inheritor of the common Asiatic destiny . . ." (Mitra, pp. 46-47, also p. 57).

Again, "India is the giver of the nations, the physician of human soul in its profound maladies . . ." In his Uttarpara speech (p. 63) he conveyed to his audience the divine message, "I am giving them (the people of India) freedom for the service of the world . . ." In his Beadon Square speech (p. 73) he said, "The sun of India's destiny would rise and fill all India with its light and overflow India and overflow Asia and overflow the world . . ." Thus Aurobindo, in his Independence Day message on 15th. August, 1947 said that the day "has a significance not only for us, but for Asia and the whole world . . ."

But neither the Mother (June, 3, 1947), nor Sri Aurobindo considered the partition of India to be in the interest of her unity and greatness. "Freedom, not yet to unity." In the infinite plenitude of supramental light revealed to Sri Aurobindo, he advised us that the

"new India of the future" could not be built upon political freedom only and so commissioned us to rediscover and repossess our priceless heritage and on that to build the greater India of tomorrow. He saw the vision of a free and united India as means of fulfilling India's destiny.

"I believe firmly that a great and united future is the destiny of this nation and its people." (February 5, 1948).

In his *The Ideal of Human Unity* (postscript chapter, 1950) he envisaged the "necessity and inevitability of some kind of world union," and world consciousness and concluded that

"The ideal of human unity would be no longer

an unfulfilled ideal but an accomplished fact and its preservation given into the charge of the united human people." (p. 400).

At this crisis in human history, standing at the cross roads of *Amritam* and *Vinasham*, Sri Aurobindo repeated the message of the old seers to "Aryanize the whole world."

I cannot better conclude than by quoting the prophetic words of Deshabandhu C. R. Das (in the Alipore Conspiracy case) in 1909:

"Aurobindo will be looked upon as the poet of patriotism, the prophet of Nationalism and as the lover of humanity . . . his words will be echoed and re-echoed not only in India, but across distant seas and lands."

—:O:—

THE DEADLOCK ON GOA

An Editorial of *The New York Times* and a Reply by Dr. Tarak Nath Das

A complete rupture of the diplomatic relations between India and Portugal was almost inevitable when the dispute had been allowed to reach the violent stage. If the break makes it clear that some new approach must be made and some new formula for settlement devised it will have served a good purpose.

The basic tragedy in this situation is that the clash over Goa is a clash of emotions rather than of interests. The tiny Portuguese enclaves on the Indian subcontinent have virtually no economic importance and no military significance.

Their emotional significance to the Portuguese is twofold. They are a symbol of the once greater Portuguese Empire. As such they may be a political anachronism, but to the Portuguese they are sovereign territory that must not be alienated. In addition, because of the connection with Saint Francis Xavier, Goa is one of the most sacred shrines in Roman Catholic Christendom. It is easy, therefore, to appeal to religious feeling with the argument that it should not be allowed to pass into the hands of a non-Christian nation.

On the other hand, the emotional significance of the case to the Indians lies in the fact that these tiny holdings are a symbol of the colonial status from which India has now emerged. Their very presence on the map of the subcontinent is an affront to the nationalistic sensibilities of a newly independent nation.

In our judgment the Portuguese have been at fault in obdurately refusing even to discuss the question. The Indians have been at fault in tolerating

and quietly encouraging "non-violent" demonstrations that were certain to end in violence.

Prime Minister Nehru has repeatedly assured that the religious significance of Goa would be fully respected under Indian sovereignty. This is undoubtedly true in so far as a person of Mr. Nehru's mental and moral stature is concerned. It may not be true of some others, and *the Portuguese should have assurance on this point.* The Indians, on the other hand, should have the assurance that the problem can be discussed fairly and amicably.

What good offices can be used is not yet clear at this stage. But there is need for them and for a fresh approach.—The New York Times, August 21, 1955.

A REPLY

To the Editor of *The New York Times*,

These are days of numerous tensions among nations. But on the issue of Goa, Indo-Portuguese tension has reached the point of a serious international crisis. It is a pity that while discussing Goa issue, many American editorials have been violently anti-Indian which has meant adding fuel to existing Indo-American suspicion, leading to ill-will. Because of this situation existing in America, I am very happy to read the sober editorial "The Deadlock on Goa," published in the issue of *The New York Times*, Sunday, August 21, 1955.

We all know that Mr. Nehru, on the Goan question, has been more temperate than Indian politicians and average Indian nationalists and men and women on the street; and he wanted to settle the issue peacefully as he has settled the question of

THE DEADLOCK ON GOA

French possessions in India through negotiations. But the attitude of the Portuguese government has made it impossible to settle the Goa issue by Indo-Portuguese negotiation. *The New York Times* editorial rightly points out:

"In our judgment the Portuguese have been at fault in obdurately refusing even to discuss the question . . ."

Furthermore, the massacre of unarmed *satyagrahis* (Indians) on the 16th of August by the Portuguese police and armed forces which has only parallels in the "Amritsar massacre" or the "bloody Sunday" of Czarist days, has created such a grave situation that the Government of India has ended its diplomatic relations with Portugal. This is a serious situation, ordinarily presaging a bloody conflict.

It is safe to say that Mr. Nehru will do his best to prevent an armed conflict. But we must not forget that on the issue of Hyderabad, India was forced to take a justifiable police action; and the same thing may happen unless Portugal decides to open negotiations with India.

The most significant passage in this editorial of the *Times* reads as follows:

"What good offices can be used is not yet clear at this stage. But there is need for them and for a fresh approach."

In any effort for solution of Goa question one must not forget that the Portuguese claim is neither sacred nor eternally binding to India. The Portuguese do not have any superior claim to Goa that the British had to Bombay and other parts of the former British Empire in India or the French claim on Pondicherry which have become parts of Indian national domain.

If I understand correctly the present trend of Indian politics regarding the issue of ending any and all political foothold on Indian soil by any alien power, India will carry on the struggle on Goa indefinitely.

There should be no mistake in recognising the fact that no Government of India will ever agree to recognise Portuguese claim on Goa. All political parties of India are determined to end Portuguese control over Goa. On this point, Goa situation can be compared with the issue of ending partition of Germany which is wanted by all German political parties. All India recognises *Goa is India and must be a part of India.*

Great Britain has a treaty of perpetual alliance with Portugal. Spain is also in alliance with Portugal. The United States, France and other countries have close relations with Portugal. These nations should induce Portugal to follow the foot-steps of Britain and France and give up her untenable claims on Goa.

If I understand the existing diplomatic line upon the issue of Goa correctly, I find that all Asian States except Pakistan are with India. It may be added Egypt which recently has regained possession of Suez base from Britain would support India. There is some reason to believe that Britain and France regard friendship of India is of greater value than that of Portugal. It is needless to say that Soviet Russia and her allies will support India diplomatically. If one takes a poll of South American Republics (Catholic States), even there, he will find that some of them would not support Portuguese claim on Goa.

In my discussions on Goa question with American scholars and statesmen, I find that some of them suggest that it might be decided by a plebiscite or by commission of the United Nations. I venture to suggest that neither India nor Portugal would submit the issue of territorial sovereignty over Goa to plebiscite or the U.N.

Thus those who wish to offer good offices to bring Portugal and India together to re-open the discussion on Goa, should find a "face-saving formula" for Portugal which must acknowledge Indian sovereignty over Goa, while India should make some concessions in the form of a treaty of friendship or may even purchase Goa from Portugal, as the United States purchased Louisiana and Alaska at a nominal price. It is to be hoped that Portuguese statesmanship would recognise that friendship of India is worth more than hundred Goas.

APPENDIX I

Violent Outbreaks Follow the Attempts to Force the Portuguese Out

By A. M. ROSENTHAL
(Special to *The New York Times*)

New Delhi, India, August 20: To tens of millions of Asians the most important place in world this week was Portuguese Goa, a lush sliver of land bounded by the Arabian Sea and Asian nationalism.

On August 15, about 3,000 Indians walked through jungles and crossed into the Portuguese territory at about a dozen places. They were invaders, but they went unarmed and offered themselves for arrest to nervous Portuguese border guards. All India watched.

Before the day was over, at least twenty-two

persons had been shot to death by Portuguese policemen and soldiers. More than 200 persons were wounded, some were beaten and the rest were rounded up and pushed back across the border.

That was the climax of a campaign of political harassment that has been growing in passionate intensity for a year.

But what happened the next day was perhaps more important for India, certainly more important to an understanding of life in India.

The official philosophy of India is non-violence and most Indians talk of it as an accepted way of life. But the fact is that India, non-violent in philosophy, always teeters on the edge of a frightening, catastrophic sort of violence.

ORIGINS OF VIOLENCE

Last Tuesday non-violence crossed the thin edge. In the great port city of Bombay, political demonstrations turned into mob looting and destruction. In Calcutta and Madras, there were strikes and turmoil.

The reasons for the political invasion, the willingness to die on the borders of Goa, and for the mobs that rose in India are not particularly complicated. Economically and militarily, Goa means little to Portugal and less to India.

The basic motivation for Indians is simply that Goa in Portuguese hands represents a hangover of colonialism and an affront to a national dignity of which Indians are extremely conscious.

That is the motivation. But the impetus for doing something about it comes in great part from domestic political factors. Prime Minister Nehru and his Congress Party have not officially encouraged the movement. Opposition parties see in Goa just about the only popular issue on which they can take the lead from Mr. Nehru and his party.

The Portuguese see Goa as an inalienable part of their national territory; and they fear that to give it up might give ideas to their African colonies of Angola and Mozambique. All over Goa are signs that read, "This is Portugal."

Physically, Portuguese Goa is a lovely country of glistening seacoast and deep green jungles. Intellectually, it is on the depressing side.

The ladies of the Portuguese colonial officers in the capital city of Pangim go in the evening to the country's only decent hotel and listlessly put another day behind them with canasta and mah jong. The Portuguese gentlemen go to the same hotel and sit

at different tables. They play a little bridge, drink a little wine and wait for the time to go home. Everybody seems to be awaiting the arrival of Somerset Maugham.

FEAR AS A FACTOR

Politically, it is even more depressing. India's way of life still is heavy with a powerful bureaucracy and her social forms still are largely innocent of democracy. But politically, India's leaders are modern. Portuguese Goa still is inching toward the nineteenth century. It is a police State.

There are about 10,000 soldiers and 2,000 police men in Goa, well-armed with light weapons. That means about one armed man for every fifty Goans.

Although hundreds of Goans have gone to jail, there are few outward signs of political unrest. It may be that the people are content. It may also be they are afraid.

Portugal is trying to work up enthusiasm for the election of a Goan Council, but the elections held so far in the colony have been farcical—no choice, no campaigning.

There is always another side. It is probably true that Goans live a little better than Indians. The cleanliness of Goan towns is a rebuke to Indian towns and villages across the border. The color line does not exist and there are Goans to whom Portuguese citizenship is as meaningful as to anybody in Lisbon.

RELATIONS BROKEN

A negotiated settlement seems remote. The Portuguese are willing to talk but not on any issue that involves the question of sovereignty. The Indians do not see anything else to talk about.

If there are to be any talks in the future, they will have to be through a third party. Indians this week broke their last diplomatic relations with Lisbon.

Some Indians feel the peaceful resistance movement has three strikes against it: it is largely from India and not Goa, the Portuguese are not at all reluctant to crack down hard, and there is no real political Opposition in Portugal to raise a protest.

But this is probably a minority viewpoint. Most Indians are convinced that Portugal cannot hold out for ever against constant political pressure and a tightening economic blockade. They are convinced that anti-colonialism is part of the tide of history and that Portuguese rule in Goa will be drowned in it.

MAHABALIPURAM

By N. R. BANERJEE, M.A.,

Asst. Superintendent, Dept. of Archaeology, Southern Circle, Madras

For the first time in the history of our sub-continent the whole country was united under one royal banner during the benign rule of Asoka. Even in his days the kingdoms of the Cholas, the Cheras and the Pandyas in the extreme south did not form part of the big empire, but were attached to the great kingdom by ties of friendship, religion and culture. The political unity achieved by Asoka was of course short-lived. Many centuries after Asoka the Pallavas are known to have ruled over the Coromandel coast. But the information about the early Pallavas is so scrappy and straggling that endeavours hitherto made to make up a connected and chronological account of these people have not been entirely successful.

It is to the Imperial Branch of these Pallavas that we owe the works of art which have made Mahabalipuram memorable. The period of their ascendancy can be counted roughly from 600 A.D. to 850 A.D. for a span of about 250 years. Kanchipuram was their capital town and Mahabalipuram, forty miles away, their harbour on the sea. The enlightened kings of the dynasty, mainly responsible for the works of art which have borne their name and fame to this day, were the illustrious Mahendravarman I (600-630 A.D.) and his son Narasimhavarman I (630-668 A.D.). The latter, because of his great valour, was surnamed Mahamalla or Mamalla, i.e., 'of great prowess'. Hence the name of the little village, which bears his name, was Mamallapuram. The centuries that have rolled away since these great figures trod the soil here have transformed this name into the corrupt form of Mahabalipuram, and consequently, interesting legends have grown round the origin of the village and its glories. Untenable credit for these is given to the mythical king Bali or Mahabali, whose pride was humbled by Vishnu in his incarnation as Vamana, the dwarf. But tradition dies hard, and it is difficult now, if not impossible, to revive the original name. The next illustrious ruler, who contributed immensely to Pallava art, was Narasimhavarman II, surnamed Rajasimha, in whose time the first structural temples in South India, including the Shore Temple at Mahabalipuram, came into being. Narasimhavarman II ruled from circa 696-722 A.D.

The Pallavas were devout worshippers of both Vishnu and Siva and their catholicity and breadth of outlook revealed themselves in the exquisite creation of temples dedicated to the two gods.

Mahabalipuram is a veritable treasure-house of art, rich alike in variety and extent. Years of patient labour under the guidance of a master-mind would have produced them. These mute artists are long since dead, their names no one can discover, but their work bears eternal testimony to their devotion and skill. The level

of perfection which these works attained, at almost the dawn of stone art in South India, speaks of years of apprenticeship, here or elsewhere, in some more pliable and, of course, perishable medium like wood. There is enough justification for this theory of the evolution of art. Unnecessary members or parts of the stone-cut structures remind too strongly of the rightful place they occupied in wooden architecture. When they translated their experience of building with or carving in wood into the stone medium, they created those members or parts essential to a wooden structure, like the frame-work under a sloping roof, under the force of habit, and the simplest form of rock-cut architecture, which emerged first, was the rock-cut cave.

Gajalakshmi in the Varaha Cave

The works of art in Mahabalipuram can roughly be classified into four groups, namely, (1) Rock-cut Caves, (2) Rock-cut or monolithic structures described as Pagodas or Rathas, (3) Structural temples and (4) Sculptured scenes on the vertical faces of exposed rocks. The first three also correspond to a chronological classification in the same order of evolution.

These monuments of various types are not clustered together but scattered over a rather wide area. A longitudinal ridge of low hillocks flanks the village,

forming its western boundary running north to south. Most of the monuments nestle at the foot of this ridge.

A few of the more prominent monuments are being described here :

Simhavishnu and his two queens in the Adi Varaha Cave

The Rock-cut Caves : Such caves have been in use as places of worship as well as dwelling ever since the times of Asoka. Some of them like the Lomas Rishi and Sudama caves in the Barabar hills near Gaya, the caves at Khandagiri and Udayagiri near Bhubaneswar in Orissa, the world-famous Cave Temples and monasteries of Ajanta and Ellora, the renowned caves at Elephanta Islands off Bombay, and the Caves of the monastic order at Bhaja, Pital Khora, Karle and Kanheri, all displaying a high skill of craftsmanship, belong to the common order of rock-cut caves as at Mahabalipuram. The spurt of artistic activity in Mahabalipuram cannot be looked upon in isolation, and we have to look for their inspiration to the art of carving caves which began in Asokan times and spread through a vast expanse of space and over a good many centuries until a high order of craftsmanship was reached as at Mahabalipuram. But Mahabalipuram is not the only place where caves in South India abound. This peculiar form of rock-cut architecture in South India owes its inspiration indeed to the Pallavas, and are widely distributed all over South India. At Mahabalipuram itself, the rock-cut caves were the first to come up in point of time and are very

simple in form. Each cave consists of a central niche carved in the rock, with a scooped out rectangular verandah in front. The verandah is divided up in space by pillars. The central niche takes the place of the *Sanctum sanctorum* of a temple and contains, if at all, a Lingam symbolising the deity, Siva. The rear wall of this niche is often carved with the figures of Siva and Parvati, sitting side by side, with the playful figure of young Kartikeya called Skanda or Kumara. This group is collectively called Somaskanda, that is, Siva accompanied by Uma and Skanda, and is a characteristic feature of evolved Pallava art as the Pallavas were great devotees of Siva. Sometimes the central niche would also have a small Mandapa or pavilion in front of it consisting of a roof or canopy supported by pillars. The two sides of the central wall alongside the central niche would alternately remain blank or would be pierced by two or four more niches—each meant for a deity or would be covered with a group of sculptured figures. Likewise the two side walls of the verandah too would bear a bas-relief.

The method of scooping, as shown by unfinished examples on living rock lying here and there, is very interesting. The surface was divided up into square grids and deep grooves were chiselled along the outlines of the squares separating one from the other. These were then removed by gentle pressure and a hollow was thus scooped out. It is difficult indeed to calculate how much time and labour were involved in the 35 and odd individual monuments, big and small, scattered around the little village of Mahabalipuram.

The Mahishamardini Cave : One of the most remarkable of the rock-cut caves is so called because of the occurrence in it of a panel of Durga in her role of slaying the Buffalo demon. The central niche of the cave contains the empty socket where the Lingam should have stood. The rear wall of this niche contains the characteristic group of Somaskanda with the Nandi or bull reclining at its feet. Brahma and Vishnu are seen flanking the couple. Two other niches flanking the central cell are bare. The two side walls of the verandah contain respectively the recumbent figure of Vishnu lying on his usual bed of the coils of the divine reptile, Ananta or Sesha, and the portrayal of the fierce battle scene between Durga and the Buffalo demon. On one side is the picture of peace unsullied even by the effrontery of the demons Madhu and Kaitabha, put out of countenance by the weapons of Vishnu, namely, Sankha, Chakra, Gada and Kharga. In this scene these have taken anthropomorphic forms and brought about the discomfiture of the disturbing demons at the bidding, as it were, of Vishnu who in his *yoga nidra* is the very picture of bliss, and juxtaposed in contrast is a scene of battle raging furiously on the other. The other panel shows Durga astride a lion, each of her eight arms bearing a missile. The divine figure is turned sideways in the vigorous effort

The Shore Temple

of drawing the string of a bow and discharging a dart. The Buffalo demon, accompanied by his followers, made a vigorous effort to resist the onslaught. He is clearly at a disadvantage appearing to retreat with a back-to-the-wall attitude. His companions and attendants are in utter distress in the hands of the tiny *Ganas* or dwarf servants and attendants of Durga. In Bengal, Durga is worshipped in this form indeed, but in the traditional image the Goddess is completely calm and shows none of her vigour which is too manifest here. The Mahabalipuram panel forms one of the most vivid and life-like expositions of the subject. The skill of the artist in having achieved this effect is a thing to wonder at. No visitor to Mahabalipuram can afford to miss this epic scene.

Adivaraha Temple : Perhaps more interesting but less known than the preceding one is the Cave temple devoted to Adivaraha or the Boar incarnation of Vishnu. The temple occurs on the western side of the ridge, near its southern tip. During the Vijayanagar period this cave temple was hemmed in by a stone enclosure with its roof supported by pillars. Though this has, in effect, hidden the Cave temple from view and made the interior very dark, it has been a blessing in disguise. Inasmuch as the monument is completely covered by this Vijayanagara enclosure

numerous sculptures decorating the walls of the cave have been preserved remarkably from the deleterious effects of the salt and sand laden winds coming from the sea, and the pristine sharpness of the sculptures have been well preserved. Apart from the preservation, the sculptures themselves have their own tale to tell. Besides the exquisitely carved figures of Siva supporting Ganga in her anthropomorphic form, Brahma, Gajalakshmi, Durga standing on the prostrate head of the slain Buffalo demon—all of them carved exquisitely—are two figures of the Pallava Kings Simhavishnu and Mahendravarman I, each accompanied by their two queens. The scene of Gajalakshmi in this group, seated in right royal style on her lotus throne while she is being bathed by elephants turning full pots of water over her head supplied in an unceasing stream by a string of gracefully poised maidens, arrayed on the two flanks, would indeed be a scene for the gods to see. A visit to this cave temple can only be arranged with the trustee of the temple, who lives in the village.

The other rock-cut caves, which are also excellent in execution as well as in their state of preservation, can only be mentioned in passing. They are the Varaha Cave, the Trimurti Cave, Kotikal Mandapa, the five-celled Mandapa and so on.

The Varaha Cave carries four panels of sculptured

figures depicting respectively the scenes of Varaha lifting Bhu Devi, Gaja Lakshmi—a repetition of the panel described under the Adivaraha Cave—Durga, and the scene of the discomfiture of the King Mahabali by Vishnu as Trivikrama. The occurrence of the last-named panel distantly but mistakenly suggests the association of the township of old with the mythical King Bali or Maha Bali.

The Trimurti Cave, as the name implies, combines the trinity of the Hindu pantheon and declares eloquently the catholicity of the Pallavas who created this. Stylistically, the rock-cut caves evolved from Mahendravarman style.

Mahendravarman and his two queens in the Adi Varaha Cave

The Rock-cut Temples: These represent the second phase in the evolution of carving in Mahabalipuram and consist of the isolated group of five Rathas and the lonesome Ganesa Ratha in the heart of the village. The Five Rathas, otherwise known as the Pandava Rathas, occur in a secluded cluster about a couple of furlongs to the south of the village. It is said that all five of them were carved out of one low hillock which once stood here. They are respectively called Draupadi Ratha, Arjuna Ratha, Bhima Ratha, Dharmaraja Ratha and Nakula-Sahadeva Ratha, named after the five brothers and their common wife. The term *ratha*, which has come to stay, is apparently a misnomer, as the monuments do not look like Rathas or chariots at all. They delineate, however, altogether four

different styles of architecture and are in the nature of temples. Their juxtaposition and the occurrence of so many of them together, the lack of deities to be worshipped and the fact that they were not completed prove all too clearly that they were not meant to be functional. It is no wonder, therefore, that many scholars have suggested that there was an open-air school of arts here.

Stylistically, the architectural structures here can be grouped into four types. The Draupadi Ratha reminds one too strongly of the conical-roofed common man's hut, still prevalent in the temples of Mari Amman and other minor village deities in Tamil land which are comparable to the four-faceted conical-roofed mud houses of Bengal, known as *chauchala ghar*. The Arjuna Ratha and Dharmaraja Ratha represent, in their different sizes, the characteristic style of storeyed Dravidian architecture. The Bhima Ratha is an example of the less popular wagon-topped type of architecture. The Nakula-Sahadeva Ratha is an example of the *gajaprastha-kriti* or elephant-backed apsidal style. The juxtaposition of the stone-carved elephant just by its side drives home the point by their obvious similarity. In this group there is also a majestic figure of a humped bull reclining with an air of utter nonchalance, looking upon the rest of creation with the greatest unconcern as it were. An imaginary and poorly sculptured lion also finds place in this motley group. This is indeed a blemish on the otherwise unsullied examples of art arrayed here.

Needless to say, the walls of the various Rathas are covered with sculptured figures testifying to the high conception and execution of the nameless and forgotten artists. The outer walls of the Dharmaraja Ratha shows in one corner the figure of Narasimhavarman Mamalla, the patron of this art, and records in florid Pallava *grantha* script his various achievements. The same Ratha bears also a sculptured figure of Ardhanarisvara, half Siva and half Parvati—a very popular form of the conception of the unison of Prakriti and Purusha symbolising Sakti or the cosmic force. It has a grace of its own but, in its comparative stiffness of pose, it is indeed inferior to specimens of the same form in the more evolved and developed Chola art as in the Brihadisvara temple at Gangaikondacholapuram (Tiruchi District) or at the Tirunagesvaram temple at Kumbhakonam (Tanjore District).

Besides the above group of five Rathas there is an isolated and rather singular rock-cut temple, also likewise miscalled a Ratha, near the village and is known Ganesa Ratha. It is situated to the east of the longitudinal rocky ridge almost in the heart of the village. It is more complete than any of the above group. This Ratha bears a mutilated trident at one end of its top and proclaims the cult of Siva which received accentuated devotion in this period. The original deity, which must have been that of Siva, is missing; but

the local people have set up a crude modern image of Ganesa in this temple and, hence the name. Though it is not under regular worship, it does not miss the reverential act of an occasional besmearing by oil and offering of flowers.

The inscriptions on the walls of this cave proclaim aloud the greatness of Siva, the great Lord who restores all, who have strayed to the right path. These monolithic temples are attributed to Narasimha-varman Mamalla and the style involved is, therefore, designated the Mamalla style.

From the rock-cut temples to the structural temple is not a far cry, and the latter is the practical successor, in the line of evolution of the former. There are three such temples in Mahabalipuram, but, with the exception of the well-known Shore Temple, the two others are in a state of ruin. Even the Shore Temple is fast deteriorating owing essentially to its location on the seashore and under the continuous attack of salt and sand-bearing winds and spray of sea water. Even about 10 years ago, the sea was beating directly on the temple and the temple has all but crumbled away under the incessant attack. It is now protected by a semi-circular groyne wall which has kept the naughty sea at a respectable distance in a weak endeavour, as it were, to withstand the mighty and destructive forces of nature. Man, however, can perhaps do no more to save this the very first example of Dravidian architecture in India. The Shore Temple complex consists of two temples, juxtaposed back to back, the one with larger steeple facing

the sea in the east and the other facing west. The rear walls of both have the traditional panel of Somaskanda. The bigger one has still the battered reminiscences of a 16-faceted Linga installed on the Yonipatta. In between the two temples is a vestibule which houses a recumbent image of Vishnu who, in this form, is known as *Jalasayana perumal*. The co-existence of Siva and Vishnu is at once a proof and tribute to the catholicity of the Pallavas. This temple was built early in the 8th century during the reign of Narasimhavarman II, Rajasimha, who was responsible for the style called after him as the Rajasimha style.

There is a very strong belief among the local people

that there were originally six more temples at Mahabalipuram like the Shore Temple but that the sea has swallowed them all and is about to swallow even the seventh and last remaining vestige. The local guides still point to a couple of glistening crests in the distant

The central scene from Arjuna's Penance

sea as the vestiges of those temples under the sea by way of proving their statement. There is indeed in this explanation a justification for the other name of Seven Pagodas by which this place is known to the Europeans. There is, however, no geological proof of so much advance of the sea during the last two thousand years as to justify the above guess. It may be more credibly surmised that the early seamen who traversed this region may have been able to see about seven temple structures from the sea and, therefore, gave it the above name. The earliest European to notice the place was Manucci, the Italian traveller, who visited India about the beginning of the 18th century. Much of this temple was buried

under sand and it was at considerable expense of time and money that the sand was cleared and the monument reclaimed for the delight of posterity. The construction of this temple marks the beginning of temple architecture in South India, which continued through the centuries under the succeeding dynasties of the Cholas and Pandyas and the rulers of Vijayanagar. This architecture reached its high watermark in the Big Temple of Tanjore, called the Great (Brihadisvara) temple, built by Raja Raja Chola in 1001 A.D. It shone brightly for some centuries, and later decay set in.

A scene from Krishna Mandapa

Now, to turn to the sculptured scenes or the fourth group of monuments at Mahabalipuram. The scenes are in effect 'frescoes in stone' and is a combination of the synoptic and the narrative methods of exposition. The tale has been told powerfully and impressively indeed. With the exception of an inferior experimental specimen, there are two scenes, called respectively Krishna Mandapa and Arjuna's Penance, on the eastern vertical face of the ridge in the heart of the village. The degree of perfection achieved in such a broad endeavour would clearly point to considerable experience in this kind of work. These bas-reliefs can be attributed to Narasimharman I Mamalla.

The Krishna Mandapa: The scene represented here is of the cowherds and their women in Vrajabhumi plying their daily avocations in peace under the benign rule of their king Krishna, completely forgetful of the wrath of Indra, the lord of thunder and rain. Enraged, Indra plans to punish them but their royal friend comes to their help and lifts up the Govardhana rock as a protective shield over the heads of the bewildered Gopas and Gopis, until the storm passes over. This establishes his claim to the title of Govardhanagiridhari. Here is shown a lovely everyday scene of a milkman milking a

cow and the cow in turn, in profound affection, licking its little calf. Scenes of men and women carrying their ware of milk, curd, butter and cream and going their way, accompanied by their little children, and the cattle moving about to graze are scenes with which we are already familiar, and which have been captured here in stone for posterity in all their vividness. The king is also shown in his role of a friend of his people by putting his arm round a common wood-cutter armed with an axe. This scene is known to belong to Vrindavana. Does not its existence down in the south point to the oneness of Indian culture?

Arjuna's Penance: Perhaps more exquisite than the above is the sculptural delineation of Arjuna's Penance. The great poet Bharavi adopted a theme from the Mahabharata and wrote the famous epic entitled *Kiratarjuniya* which has made him famous among the galaxy of Sanskrit poets. He lived in the 7th century in the Pallava Court and composed this single work which carved for him a perpetual place in the niche of literary fame. The sculptor artist of Mahabalipuram was, therefore, inspired by this work, and we find here a sculptural depiction of the great poem verse by verse. The central figure is that of Arjuna, who, standing on one leg, and performing severe penance, is emaciated and

his hair and beard have grown long. Siva is pleased with his penance and comes and stands on his right and offers him the *pasupatastra*, for which he has been striving. The Sun and Moon in anthropomorphic forms, with a nimbus to indicate them, and other gods and goddesses in pairs in the posture of flying through the ethereal heavens, six pairs of Kinnaras (half man and half animal singers) and the animal world watch with delight and wonder at the travails of Arjuna. As a lithic exposition of a theme, culled out of the *Mahabharata* and enriched by a poet's imagination, the panel of Arjuna's penance has an all-India appeal and compels the attention and reverence of all people, from far and near, lettered and unlettered, and they recognise in it familiar figures—our common heritage. There is a temple of Krishna in the scene below. In front of it a few men are seen performing their ablutions and *Suryanamshaka* or *tarpana* by the side of a river, indicated by a natural cleft in the rock. Some of them after the bath have sat down with wet clothes on for meditation before the temple. A group of elephants and their young ones emerge from one side and romp playfully in the shallow waters of the bank—their favourite sport. The humorous mood of the artist has found expression in

the delineation of a cat in this scene standing upon his hind legs in the pose of performing penance in the manner of Arjuna and the over-joyous mice, delighted at the pre-occupation of the hermit cat, have thrown off their guard and are running pell-mell round him only to fall into his mischievous and deliberate trap. This reminds one of the story of the mischievous cat 'Dadhikarna.' The vast extent of the scene, the clearness of conception, and the distinction of execution point to the high artistic merit of the sculptors of the past. The occurrence of a Naga couple on two sides of the cleft imparts completeness to the scene which is being witnessed by the gods and demigods in the ethereal region, by men and animals in the mundane regions, and by the *Nagas* of the nether region as it were.

—:O:—

YAMUNOTRI AND GANGOTRI

By D. V. Rege, i.c.s. (Retd.)

THERE are four principal *dharmas* or holy places in Uttarakhand, i.e., modern Garhwal: Yamunotri, Gangotri, Kedarnath and Badrinarayan. Lord Shri Krishna says in the *Bhagwadgita* that of the mountains He is the Himalayas and that of the rivers He is the Jahnavi, i.e., Ganga. Gangotri, i.e., the source of the river Ganga is in the Himalayas and is, therefore doubly holy. As I had been to Kedarnath and Badrinarayan about four years ago, I visited the remaining two *dharmas* this year.

I left Indore with a servant in the small hours of 23rd May and reached Rishikesh on the 24th morning. After staying for a day at Gita Bhavan, I left for Dharasu (78 miles) by bus on the 25th morning and reached there in the evening. The motor road is sufficiently wide and quite safe. The Kali Kamliwala *chatti* is on the bank of the Ganga while the forest rest-house is on the top of a hill close by. There is a coolie registration agency at Dharasu also and coolies are available cheaper here than at Rishikesh.

DHARASU TO YAMUNOTRI: 48 MILES

I left Dharasu (2,750 feet high) early next morning and reached Silkyari *chatti* by evening, after halting at Kumradi *chatti* on the way for mid-day meal and rest. Though it was the first day of walking and though the distance was 14 miles I did not feel very tired, as the road was level and flanked with pine trees. There is

Mahabalipuram to-day is a tiny village with a small population of a few hundreds. Gone are the days when it hummed with manifold activities of the daily avocations of life and the noise of sailors from far and near, who came to load and unload their cargoes here. Gone are their footsteps, their smiles and revelry, yet Mahabalipuram is very much alive to-day with the haunting shadows of these figures of the past, and the bright chapter of history they illuminate. Their undying message—the message of the cultural unity of India—hold its charm of freshness. Let us not, therefore, run astray and forget our cultural unity but bow our heads in reverence to the master-minds, who must have anticipated the trends of to-day to have left their messages in undying stone.

Ganga Mandir

season. Close by is Ganga *kund* with its small temple containing two idols—one white of Ganga and the other black of Yamuna. Jamna *chatti* is seven miles from here and on this road one is likely to be bitten by small flies on calves if they are uncovered. The road beyond Jamna *chatti* is rather bad. Hanuman *chatti* (eight miles) is on the bank of Hanuman Ganga which

A view of the Ganga near Harshil

meets the Yamuna close by. On the 29th, I stayed at Phool *chatti* (three miles) which was built only this year by a Panda with money given by one Phool Das of Ahmedabad. One mile beyond is Janki *chatti* which is also known as Markandeya *chatti* as the sage Markandeya is said to have done penance at a *kund* which is close by. Just opposite the *chatti* is a forest rest-house in a dilapidated condition. Kharsali village of Yamuna Pandas is less than a mile from here. The image of Yamuna is brought down here from the temple at Yamunotri in the cold season for worship. As there is a very steep ascent of over two miles beyond Janki *chatti* and as I was feeling somewhat weak on account of cough for the last two or three nights, I took a *kandi* to go to Yamunotri. Three miles beyond is a small temple of Bhairav who appears to be the guardian deity of this region. My servant told me that when he was feeling afraid while he was sleeping on the verandah of the forest rest-house at Gangani, he saw Bhairav standing near his bed and did not feel any fear afterwards.

YAMUNOTRI (9,900 ft.)

I reached Yamunotri at about 11 a.m. on the 30th May. The real source of the river is at Bandarpunch which is a snow-clad mountain peak, 20,730 feet high. But as it is not possible to go there, Yamunotri is commonly taken as the source of the river. It is a narrow valley between two mountains and it is not possible to build big structures here as in Gangotri. There are one or two dilapidated *dharamshalas* and the forest rest

house also is in a shabby condition. There is no Kali Kamliwala *chatti* here. As Yamunotri is very cold and as there is no suitable accommodation, most of the pilgrims prefer to go back the same day after doing the necessary religious rites.

The Yamuna temple is a small building with two idols—the bigger black one of Yamuna and the smaller white one of Ganga. Below the temple there is a hot water *kund* where pilgrims immerse rice, potatoes, etc., tied in a cloth and take the cooked articles home as *prasad*. Below this *kund* there are three other hot water *kunds*—two for bathing for the higher castes and the third for Harijans. The water is not very hot and one can remain in the *kund* comfortably for about 15 minutes. The *kunds* are about 10' x 10' and about 4' deep. The Yamuna flows by the side of these lower *kunds* and the water is icy cold. Though I had kept away the Pandas at Dharasu, one Panda somehow attached himself to me. He had made inquiries from my servant about my pay and naively suggested that I should give him 10 days' salary as his *dakshina*. I gave him only Rs. 10 and that also was rather too much for him in view of his poor knowledge of Sanskrit and the Puja ritual.

YAMUNOTRI TO UTTAR KASHI 41 MILES

I left Yamunotri at about 3 p.m. and reached Phool *chatti* in the evening. One has to return by the same route up to Simli which is 25 miles from Yamunotri and then take the road to Uttar Kashi. Singot is seven miles from Simli of which the first four miles are fairly

steep. One gets the first glimpse of the Ganga as soon as the ascent is over. Nakori is three miles from Singot and is on the bank of the Ganga which is fairly wide here. Uttar Kashi is six miles from Nakori and the road is good. I stayed in the palatial double-storied Birla Dharamshala built in 1941. It has five rooms on the ground floor and five well-furnished rooms on the first floor. It has a bath room which luxury is not found in the *chattis*.

UTTAR KASHI (3,740 ft.)

Uttar Kashi is a charming spot and a large number of *sadhus* stay here. It has many characteristics of Kashi or Banaras as the Ganga is *uttar-vahini* (flowing northwards here for a short distance, as the Varuna and Asi rivers join the Ganga close to it and as a Vishwanath temple is also here. The ghat in front of the Kali Kamliwala *chatti* is known as Manikarnika Ghat. Besides Vishwanath temple, there are Ekadashi Rudra temple built by the Maharaja of Jaipur, Koteswar temple, Jyotirmath, etc. In the Jyotirmath there are white marble idols of Shri Shankaracharya and his disciple, Trotakacharya. There is also Sri Kali Satya Narayan Mandir where Ma Anand Mayi stays when she comes to Uttar Kashi. The image is of Kali in black marble trampling on Shiva in white marble. There is also a small Dattatreya temple with a brass image but not the usual three heads. It appears to be the image of a disciple of Buddha.

Uttar Kashi is a sub-divisional headquarters in the Tehri Garhwal district. It is also the headquarters of the Divisional Forest Officer, Uttar Kashi division. There is a hospital, but there was no Assistant Medical Officer for the last two months. It has a post office and the only telegraph office in this region. It, however, only works for six months in the pilgrim season. Uttar Kashi is also the headquarters of the Special Border Police Force who have their military wireless all the year round.

Ujeli, a suburb, is about $\frac{1}{2}$ mile from Uttar Kashi and most of the *Sadhus* stay here. I met R.T. Anand Swami, about 75 years old, who is a disciple of Swami Ramatirth and who renounced the world when he was 20. He told me that *Sadhus* were like mountains, good to look at from a distance. His own philosophy of life is to have faith in God, to work and act without attachment and to make efforts to approach the ideal of *chaitaprajna* described in the *Gita*. I also met the monastic sage Tapovanji. When asked why God created the universe which is full of pain and misery, he said *Sama*. God and creation were both *anadi*, i.e., without

Gangotri

beginning in the Hindu religion unlike in other religions, and so the question why God created the universe did not arise. When asked about the best method of God-realisation in *Kaliyuga*, he said that though *jnana* could be obtained by various methods like Karma Marga, and Bhakti Marga, Sanyasa or renunciation was necessary for *moksha*. He added that people like King Janak who did not renounce the world must have done so in their previous birth, as stated by Shri Shankaracharya. His

view is that the *Gita* cannot be interpreted in opposition to Shruti (Vedas) and Upanishads, as otherwise our ancient sages would be liars and Sanatan Dharma would be meaningless. He, therefore, thinks that though from the context the *Gita* seems to support Karma Marga, it really preaches Sanyasa for obtaining *moksha*. He thinks that a Guru is necessary to show the path and that hermits in the Himalayas do not secure their own salvation but also do good to the public by their spiritual practices.

I, however, noticed two things in Uttar Kashi which were not in keeping with the prevailing atmosphere there. I saw two girls dancing to the accompaniment of a *mridang* in front of a house probably to ask for alms and one fellow dancing and singing a cinema tune to advertise tiger brand *biris* in the bazar chowk.

UTTAR KASHI TO GANGOTRI: 56 MILES

On the 4th morning I left Uttar Kashi and reached Maneri (10 miles) on the bank of the Ganga. In fact, the whole road from Nakori to Gangotri runs by the side of the river and even beyond Nakori the road goes by the side of the river up to Tehri. I stayed at Saina *chatti* (three miles off) in the evening. It is a new *chatti* and not yet completely built and has two rooms. It is much better to stay in such a place than in crowded old *chattis*. Bhatwadi (4,800 feet) is five miles from here and has a forest rest-house. Gangnani is none miles

away. On the way, there was a diversion to avoid a land-slide but there was no board or any other sign to show it, with the result that after walking two furlongs beyond the diversion I came to a very dangerous cliff which I thought of negotiating, thinking that it was the correct road. Fortunately I saw some people on the other bank of the river going towards the diversion and was saved an unpleasant and hazardous experience. Sukki *chatti* is nine miles from Gangnani. After the first five miles the road is bad and there is ascent also,

A waterfall near Gangnani

the last mile being very steep. Harshil (Haraprayag) is five miles from here. The river becomes wide from Zala, three miles from Sukki, and big patches of sand are seen in the bed. There is no *chatti* at Harshil and pilgrims go to Dharali, two miles ahead, but I stayed at the forest rest-house (8,400 feet) which is a ramshackle double-storied building formerly owned by a European. It is none better than a *dharamshala* or *chatti* but repairs are being undertaken. The rest-house is at the end of the village and one has to cross five wooden bridges, some merely logs of wood, on streams to reach it. The ground floor is occupied by the Border Police Force. There is a small Tibetan population here and Tibetan influence is clearly visible. There are mounds of stones at the entrance of the village, some of which bear the inscription of Om Mani Padme Hum as is common in Tibet. Also there are small banners and buntings of cloth on some houses. Tibetans, or rather the Chinese, are said to be claiming 55 miles of our territory including Gangotri, Bhairavghati, etc., on the ground that this area has been included in their map. Bhairavghati is nine miles from here and the last mile is very steep. River Jahnavi which rises near Nelang

about 40 miles away meets the Ganga about a mile before Bhairavghati. The *chatti* is recently built by Kali Kamliwala Trust as the old one was burnt through the negligence of a Sadhu two years ago. There is water scarcity here and water from a distant *jharna* is stored in a small tank for drinking purposes. Gangotri is six miles from here and I reached there at about 6 p.m. on the 7th June.

GANGOTRI (10,300 FT.)

After seeing the Gangamandir, I went to Yoga Niketan on the other side of the Ganga and Kedarganga by crossing three small wooden bridges. This Niketan has been started by Swami Dayalji who has built about 15 wooden huts for Sadhus and others. The whole place is very neat and clean and contains a bath room and latrines. A wooden cot is provided in each room and a small foldable table and a chair are also given, if wanted. Swami Dayalji originally came from the Punjab about 20 years ago and was living under a big boulder for some years. One day while taking water from the river he slipped but was miraculously saved. Then he built a small hut on the present spot. No permission was necessary as Tehri Garhwal Darbar allowed Sadhus to squat wherever they like in forest areas. Gradually more huts were built with the help of his devotees and admirers. He does not accept

money, as he believes that many Mahatmas have fallen through love of money and as he has a firm belief that God supplies his needs. Explaining the descent of Ganga from Heaven, he said that the abode of Shiva in the snow-clad mountain was called Swarga (heaven) and that as Ganga had descended from this mountain she was said to have descended from Heaven. He also told me that the sons of King Sagar were burnt near Gangasagar, not far from Calcutta. I stayed at the Yoga Niketan for two days and three nights.

Ganga water was icy cold; so I did not venture to bathe in the river, but got the water boiled for my bath, the essential point, in my opinion, being taking a bath in Ganga water. The Panda at this place was more reasonable and learned than the one at Yamunotri. The stone slab on which King Bhagirath is said to have done penance to induce Ganga to come down on the earth is in front of the Ganga temple. The temple which was built a few years ago by the Maharaja of Jaipur is bigger structure than the one at Yamunotri. In its centre there is a brass idol of Ganga. Below in and are images of Shankaracharya, Jahnavi, Saraswati, Bhagirathi and Yamuna.

There were about 20 Sadhus in Gangotri out of whom about half a dozen live there throughout the year. One of them is Gangadas who lives in Rama Mandir at Amritghat which is 1½ miles from Gangotri. He is a comparatively youngman and lives on fruits and milk only. In the temple there is a big wooden pedestal with the idols of Shri Rama, Janaki and Lakshmana at the top and of Shri Krishna a little below. He discoursed for a while on a Sanskrit verse which says that a mean person, according to Vyas, who knows all the Vedas is he who does not remember God and not he who is poor or meritless and said that God gave unseen blessings like peace of mind and contentment to his devotees. He added that it was not necessary to go to a forest and be a recluse for God-realisation and that all that was necessary was to do one's duty without attachment.

Krishnashramaji who is over 80 years old lives in a small hut on the other side of the river opposite the Ganga temple. He is nude and observes silence. He has a local woman as his disciple who looks after his wants. He taught her Sanskrit and she is said to be well-versed in the Gita, Upanishads, etc. He now always lives at Gangotri but had once gone to Banaras when he was invited by the late Shri Madan Mohan Malaviya to lay the foundation stone of the temple in the Hindu University. Later when the Harijans were admitted into the temple, he is said to have written to Malaviyaji that he should not be associated with the temple any more. This if true, shows a lack of *samadharshita* (looking equally on all) which is a mark of a Pandit or a highly developed soul according to the Gita. He does not accept money from visitors but many of his devotees send him some annually. Sadhu Pradnya Das who has started the Yogashram which is opposite the Yoga Niketan and on the confluence of the Ganga and the Kedarganga has built two or three huts for spiritual aspirants and has published several religious pamphlets. He said that after doing pilgrimage a man should be truthful and pure. He was of the opinion that a Guru was necessary as, even if he was bad, he would not give bad advice, and told the story of a man who closed his eyes and concentrated on God at the behest of a thief (who meanwhile robbed him) and realised God.

At the Yoga Niketan, I met Vyas Deoji of Swargashram, Rishikesh. He conducts a class every year from 15th November at Swargashram for four months for teaching various Yogic practices, such as *Samadhi*, *Kundalini-awakening*, etc. He is 68 and

has been doing Yoga practices for the last 54 years. He said that Yoga was necessary for God-realisation as it teaches how to control body, mind, intellect, etc. He is of the opinion that our life-span and suffering can be changed by *pranayam* (breath control) and by *purushartha* (personal efforts) respectively. He is a close associate of Swami Dayalji and they have built a small Yoga Niketan at Uttar Kashi also.

Ganga Kund is about a furlong below the Yoga Niketan where the Ganga is supposed to have actually fallen on Shri Shankara's head. Here the stream falls through a rock about 20 feet below on a Shivalinga which was not then visible but which becomes visible when the water goes down. Gomukh (14,400 feet) which is the real source of Ganga is about 14 miles from Gangotri, but as there is no regu-

A Kuti the writer occupied in Yoga-Niketan with Swami Dayalji in front

lar path and the journey is very difficult very few people go there. There is a *chatti* at Chadivasa about six miles from Gangotri on the way.

Kali Kamliwala *chatti* which is just on the bank of the river and close to the temple is a double-storied building in a good condition. There are some special rooms for the better class of pilgrims. Free food is given here to Sadhus who are in receipt of *chits* issued by the head office at Rishikesh. Each person is given 10 chhataks of flour, *adhapow* dal or potatoes, a little salt, etc., but only those who have got some cash with them are given the *chits* as free food is given only at selected *chattis* and as they are expected to shift for themselves at other places. The *anna-chhotra* (place where free food is given) is maintained only for three months at Gangotri by the Trust, but is continued by Swami Dayalji for two months more. There is a Committee to manage the affairs at Gangotri as well as Yamunotri with the local Range

Forest Officer as Chairman and three Pandas as members. The Pandas get food from the offerings to the deity but no pay. The Committee has power to fine persons guilty of adulteration of foodstuffs up to Rs. 50/- and those who eat flesh or drink up to Rs. 500/-. The Pandas are not allowed to bring their wives for more than three days at Gangotri.

The image of Ganga is taken to Mukhi Math, the Panda village, about 12 miles from Gangotri, for worship during the cold season. Kedarnath is only about 12 miles and Badrinayan about 25 miles from Gangotri as the crow flies. Of all the places I have visited so far, I found Gangotri most charming and conducive to mental peace. Thousands of people have done penance there since the days of King Bhagirath and one almost feels spiritual waves in the atmosphere. The river valley is fairly broad and is flanked by mountains covered with pine trees. The snow-covered mountain in the background adds to the majesty of the scene.

Gita Bhavan, Rishikesh

GANGOTRI TO DHARASU: 74 MILES

I left Gangotri on the 10th morning for Dharasu. On the way near Shyam Prayag, I met the District Information Officer of Tehri Garhwal. He told me that a military training camp was being started at Uttar Kashi for border people and that some had already enrolled, that a weaving centre costing about 1½ lacs was to be started at Harshil and that Bhatwadi was to have a National Extension Service block costing about 3 lacs. I stayed at the Gangnani rest-house (6,420 feet) which is on the top of a hill overlooking the river. Close by there are three *kundas* of hot water—two for bathing and one for washing. I got water from there and had a bath in the rest-house. The Chowkidar who is a Panda insisted on my bathing with *mantras* and asked for gift of food or cloth for his services. On the 12th afternoon when I was on my way from Bhatwadi to Maneri, I was

caught by heavy rain and had to make a forced halt at Saina *chatti*. I arrived at Uttar Kashi the next day and was glad to meet Anand Swami again. He told me that he had stayed for a month at Amarnath in Kashmir and actually seen the Pandas making the image of Parvati out of snow and placing it near Shivalinga formation before the day of pilgrimage. He added that the Linga changed in size according to the weather and that the two white pigeons always lived there. The next day I left for Dharasu. As there was no suitable resting place at Dunda, I spread my camp-cot under a big banyan tree and rested there. Six officers of the Indian Air Force who were on a hiking trip to Dodital (a charming lake about 20 miles from Uttar Kashi), Yamunotri and Chakrata met me there. The Air Force has a Hiking Society which makes arrangements for the officers who express a desire for hiking. I reached Dharasu, a distance of 18 miles in the evening as the road was good.

GITA BHAVAN, RISHIKESH

I reached Gita Bhavan in Rishikesh on the 15th afternoon. It is a palatial building on the bank of the Ganga and was completed by the Gita Press Trust of Gorakhpur at a cost of about 10 lacs of rupees in 1949. Extension work is still going on and already there is accommodation for about a thousand people. There is no temple in the Bhavan but there is a big Satsang hall measuring 80'x30' on the first floor which accommodates about a thousand people. The whole of Gita is inscribed in marble tablets in the hall and *dohas* (couplets) from Tulsidas, Kabir and others are inscribed in white on a background of red cement all over

the building. There are 35 beautiful paintings hung on the walls of the Bhavan illustrating the teachings of the Gita, etc. The guiding spirit of the Bhavan is Shri Jaydayal Goyandka who is the head of the Gita Press Trust as well as now of the Kali Kamliwala Trust. He stays there for about four months every year from March to June. He has done excellent service in turning the minds of the money-minded Marwaris to the spiritual side. The easiest way of God-realisation according to him is combination of Bhaktiyoga and Karmayoga. He thinks that it is not necessary to go in search of a Guru especially as there are many hypocrites now-a-days and that one should look upon the Gita as a Guru just as the Sikhs look upon their *Granth Saheb*. He also said that there was some danger in doing Yogic practices, such as Samadhi, Kundalini-awakening. He kindly presented me with a copy of his commentary

in Hindi called *Tatva-Vivechani on the Gita*. He gives a religious discourse every morning at 4-30 and discourses are given by different scholars throughout the day till 10 p.m. They are generally held under a big banyan tree half a mile from the Bhavan but they take place in the Satsang hall in bad weather. There are about 25 tents for Sadhus to stay near the banyan tree.

The publications of the Gita Press, Gorakhpur, are available here for sale at the original price. Books worth about Rs. 60,000 are sold every year, about half being sold during the Satsang four months. The Gita Press publications including the famous monthly *Kalyan* which was started 29 years ago and has now a circulation of a lac and a quarter deal with spiritual topics, our ancient culture and civilization, our epics, our heroes and heroines, etc., and are extremely useful for making our people understand their ancient noble heritage. It has also published very useful books for children. All the publications are neatly printed on good paper, are well bound and are sold at an amazingly low price. This has become possible only because the people working in the press do so with the idea of service and the profits derived from some paper agencies and interest on trust funds are used to cover the loss in the working of the press.

Adjoining Gita Bhavan is Swarga-ashram and Samadhi of Shri Swami Vishuddhananda, who is also known as Baba Kali Kamliwala from the black blanket always worn by him. He laboured all his life to provide resting places and other amenities to pilgrims in Uttarakhand.

Another big spiritual centre in Rishikesh though of a different kind is Shri Sivanand Ashram which is just opposite the Gita Bhavan. I spent a day there with Shri R. R. Tiwari of Gwalior. The hill on which the Ashram stands was presented to the Swamiji by the Tehri Garhwal State. Several *kutis* (buts) have been built by his devotees on this hill and a new temple of Vishwanath has been recently built on the top. The Ashram has a good Yoga museum. The four *margas* or paths of God-realisation and their chief exponents are shown there pictorially. The Swami has written a large number of useful books on spiritual subjects and maintains his own printing press and dispensary. I saw a book called *Sivanand Upanishad* published here. Bhajan is done here every evening.

I left Rishikesh on the 16th and after visiting Musoori and Delhi on the way returned to Indore on the 20th morning.

UNPRECEDENTED HAPPENINGS

Two unprecedented incidents happened this year in Uttarakhand. One was a dacoity which took place at Pangarana *chatti* on the night of the 4th June. This *chatti* is in a thick forest and is about 18 miles

on the Kedarnath road from Malla *chatti*. Four Punjabis dressed as Sadhus and armed with revolvers attacked the *chatti* and killed one coolie and wounded two or three other persons. They were fortunately arrested the next day. Another incident was the disappearance on the first of June of a wealthy person called Anant Mal of Ajmer near Janki *chatti* on the Yamunotri side. He had his own cook from Ajmer and a local coolie. On the fateful day, he told them to go ahead and that he would follow after settling the shop-keeper's bill. They waited for some hours at the Hanuman *chatti* but as he did not come, they went back to Janki *chatti* but could not find him. The cook went to Ajmer and informed his family. I met his son at Dharasu on the 14th June and he told me that in spite of all his efforts no trace of his father was found. Anant Mal was rather lavishly spending his money in feeding and helping the poor and some fellow thinking that he was carrying a lot of money must have robbed him and given him a push down the ravine when he was walking alone.

HIMALAYAN HOLY PLACES

A trip to Himalayan holy places is very interesting and health-giving apart from any spiritual merit that may or may not accrue. The Himalayas are a great blessing to our country and hiking in these mountains, inhaling the pure and fresh air of pine trees and seeing enchanting scenes of rivers and snow-clad mountain ranges is very exhilarating. There is no danger at all in these trips if one observes a few precautions, such as taking cholera injection, eating light meals and drinking stream (*jharna*) water after boiling. River water should be avoided. A few necessary medicines should also be kept. A foldable camp-cot, Bata hunting shoes, a water bottle and an iron-tipped bamboo stick about six feet high are a great help. One should travel as light as possible as the coolies do not take more than about a maund of luggage and every additional seer costs money. Kali Kamliwala *chattis* are available at most places at convenient distances but are generally overcrowded. There are, however, forest rest-houses at Dharasu, Silkyari, Gangnani, Beef (opposite Janki *chatti*) and Yamunotri on the Yamunotri route and at Nakori, Maneri, Bhatwadi, Gangnani, and Harshil on the Gangotri route, but those at Beef and Yamunotri are in a dilapidated condition at present. There are no post offices on the way to Yamunotri, but, on the Gangotri side, they are at Dunda, Uttar Kashi, Bhatwadi, Harshil and Gangotri during the pilgrim season. In all, I walked about 220 miles, averaging about 12 miles a day, but at no time I felt very tired or depressed. If one is hard pressed for time, one can safely omit Yamunotri, but one should not fail to see Gangotri which is the best of all the four holy places in Uttarakhand.

BASTAR—LAND AND ITS PEOPLE

By S. L. SAHU

BASTAR which is situated in the South of Madhya Pradesh State of India may be described as nature's paradise. It is bounded on the North by Kanker Tahsil and Raipur district, on the East by the Jeypore of the Madras Presidency; on the South by the Bhadrachalam taluk of Madras Presidency and on the West by the Chanda district.

Maria boy in his dancing dress

Bastar is considered one of the most backward areas of the country. There are still many places where man has not yet reached. From the anthropological points of view it is one of the most important and interesting areas.

To the South-West of Bastar there lies the extensive mass of hills known as the Abujmar, to the South the Bailadila range and to the East the Tulsidongri range. The Albaka range of the Madras Presidency forms the Western boundary of the State. The highest peak of the State is 3915 feet above sea-level.

The largest and most important river of the State

is the Indravati which has numerous tributaries, the largest being the Pamer Chinta. Flowing through the State for about 240 miles, it falls into the Godavari at Bhadrakali. It also makes a big fall at about 23 miles from Jagdalpur which is called Chitrakoot Falls. The 100-foot Chitrakoot falls is very lovely and attractive. Fishing is the main hobby of the aboriginals of this area. The Kanger, another tributary which particularly passes through several deep gorges makes a fall at the Tirathgarh.

HISTORICAL BACKGROUND

The history of Bastar dates back to the 11th century according to a few inscriptions and copper plates found by Rai Bahadur Panda in the early years of this century. According to these inscriptions and copper plates, there was a kingdom in the central part of Bastar formed in the 11th century by a Nagvanshi family who had their capital at Barsur, a village in the Jagdalpur district. Barsur is said to be as the same village which is called Kuruspall today. Their kingdom was known as Chakrakot. The Chakrakot kingdom was often raided by many kings from the South. A few descriptions could be found in the *Epigraphia Indica*. The Chakrakot kingdom subsequently formed part of the Warangal kingdom of Kaktiya dynasty who were feudatories of the Chalukya kings.

Bastar Raj family claims its descent from Pandu king, Birbhadra of Delhi. The story of this king is this that he was granted by the family goddess Dilleshwari an arrow as his weapon of the war. This Birbhadra subsequently moved to Mathura, where he received a trident from Goddess Bhuvaneshwari. Thence the family with the family goddess moved on to Jeypore in the Madras Presidency in the time of Vireshwari. Later on, they settled at Warangal with Manikya Devi (or Danteshwari as she is called in Bastar), their family goddess, who granted them a sword when they moved into Bastar. Since then several rulers ruled over the State to the time when Bastar was virtually ruled by a British administrator who collected the taxes and maintained law and order on behalf of the Maharaja but all this time a very little had been done to raise the life of the people to a higher level by means of better agriculture, education and other amenities. Then came the great dawn of independence followed by the merger of this State into the administration of Madhya Pradesh.

The population of Bastar is 6,11,601 according to the latest figures. In comparison to the other States

the aboriginals constitute the largest proportion of the population of Madhya Pradesh numbering about 12 per cent of the total population. Maria, Muria, Parja, Bhatra and Godbha tribes are in majority in this area.

PEOPLE AND THEIR CUSTOMS

Marriage customs are quite different from the customs of the Hindus. According to their rites, a man must marry in the maternal cousin's family. The bridegrooms have to work in their father-in-law's house for five years to get the bride. This custom is called 'Lamsena.' 'Pendul' is the name of the ordinary marriage. 'Er-Utto' is called the marriage of a widow while the 'Poyosotur' is called for the marriage by capture. When there is no offer for a grown-up girl, her parents induce her father's sister's son or mother's brother's son who has a claim to the girl, to capture her or to take her away. 'Paia Mundi Paithu' is a form by which a woman, whether a virgin, married or widow, of her own choice and without the consent of her guardians goes into the house of another man. 'Armirtur' is that form in which a virgin or a married woman runs away with another man. The pair is traced and brought back and caste dinner is given.

The aboriginals of this area prefer shift cultivation. Men usually perform hard and arduous works while women are put in charge of lighter tasks. In many places women help their husbands in ploughing the fields.

Hunting is their main hobby. The women also go for hunting and kill even tigers and panthers. They use bows and arrows, guns of sorts and spears. In several places nets are also used to trap the wild animals. Tigers and panthers are very common here which could be found even on the road-side forests of Bastar. When the Prime Minister, Pandit Jawaharlal Nehru, came here to inaugurate the All-India Tribal Welfare Conference in March last, he was presented by a young aboriginal lad of 16 and a young girl of 13 with three cubs of tigers which he took to Delhi. He was also presented with the bows and arrows and several other articles of the aboriginals.

Wild dogs are found in large numbers, but they are not destroyed by the aboriginals owing to the superstitious idea of the villagers that the killing of these animals will entail the destruction of their cattle.

It is also said that the elephant and the rhinoceros were used to be found in this area but now it has become a folk tale only. Mr. Blockman in his *Ain-i-Akbari*, Vol. I, states that in the Bastar forests elephants used to be found. As to the rhinoceros, Mr. Gayer writes:

"Some Murias in the hills of the Indravati described very fairly accurately to meet the rhinoceros in the densely grassed valleys to the north of the river

about the Bailadila range. I can hardly believe they had ever heard of the rhinoceros from other parts of India, still less their fathers might have evolved a wonderful creature from their imaginations."

Mr. Jerdon in his *Mammals of India*, 1874 says:

"The lesser Indian rhinoceros (*Rhinoceros sondaicus*) is found at present in the Bengal Sundarbans and very few individuals are stated to occur in the forest tract along the Mahanad river."

The aboriginals of Bastar are honest, extremely generous, hard-working and cheerful. They attach no

Prime Minister Nehru with the tiger-cubs presented to him at Jagdalpur, Bastar

importance to money. They have got very little wants in their life and do not pay any heed to their dress. Both men and women wear only a piece of cloth round their waist. They wear iron and brass rings. Tatooing on the face, legs, hands and breast is very common in these tribes.

The names of their five main dances are (i) Dandami Madia, (ii) Zhorla Mudia, (iii) Parza Dhurwa, (iv) Parwa and (v) Abuz Mad. For dances the Maria men place a strip of cloth backwards and forwards round the upper part of the body and wear head-dresses made of bison-horns. The drum is the main musical instrument which is used during the dances.

The tribes of Bastar pay much importance to the Dashara festival. Among the other important festivals are Chitrai and Nawakhai. On the Chitrai day

a pig or a fowl is offered to the village god with some liquor. The Nawakhai is observed in Bhadon, i.e., September. On this day they offer new grain and liquor to their ancestors.

YOUTH INSTITUTIONS

In every Muria and Maria village a social institution for young bachelors which is called the Gotul is

One of the most important things to note in these Gotuls is that all the bachelor boys and girls of the village meet together in the hall. They do not use any sort of partition or observe any privacy. Another surprising thing is this that after getting so much liberty and opportunity they do not go into sexual acts. The boys who visit such Gotuls are called *Chelik* and the girls *Mutiari*.

President Dr. Rajendra Prasad witnessing feats of an aboriginal at Jagdalpur, Bastar

run by the aboriginals. Here the young boys and girls meet in the night after their dinners, they chit-chat, do some gossip, tell some stories and perform dances but in no case they go into any kind of sexual acts till they are married. The main purpose to run such Gotuls is to provide opportunities for young boys and girls to stabilize and strengthen intimacies.

Such Gotuls are found in Narainpur and Kondagaon Tehsils of Jagdalpur. The Gotuls are made of long rectangular shape houses with only one big hall. The walls are made of mud. The Gotuls also consist of a big courtyard between the house and the outer fence which is used as playground.

In short, Gotul is an ideal institution that has manifold uses. Apart from the training in post-marital behaviour it teaches social habits to both the sexes. It also inculcates a feeling of social and religious duties and discipline.

Before concluding the article it will not be out of place to mention here that Bastar is very charming and extremely beautiful, full of teak and timber which grow to enormous heights as much as 200 feet or more. Bastar can reasonably be proud of her own land and people. Almost every part of the land is a hidden paradise of natural charm and grandeur where a picturesque assortment of hill tribes display their own colourful dances and shows.

IRRIGATION PROJECTS IN ANCIENT INDIA

By BHAWANI SHANKAR SHUKLA, M.A.,

Lucknow University

IRRIGATION in India has always been a potent factor affecting millions of the farmers of this country whose economic character is predominantly agricultural. Even the ancients, despite their ritualistic reliance on the caprice of rains, were not unconscious of the importance of artificial irrigational devices. A peep into the ancient history of our country reveals their various attempts of the construction of dams, tanks and other major irrigation works which were made from time to time with the express purpose of minimising the recurrence of famines, droughts and other allied natural calamities. We come across many references to *kulyas* (ducts) in Rigveda. These were the devices to carry water to the fields (*kshetras*). But these devices were not so adequate as to free the farmers from the dependency of rains in case of droughts or meagre rainfall. The significance of rains is well proved in the Vedic literature for it was the chief source of irrigation. Numerous prayers have been offered to the rain-god (*Parjanya*) for it was he who was responsible for a good harvest.

And every creature then receives the quickening draughts.

When over the land Parjanya's grateful stream descends.

The thirsty fields he covered with waters of plenteous falling rains; but it is enough now.

He caused the herbs to spring for our refreshment, And what his people sought of him has granted.

—Kaegi: *Rigveda*, 5.83. 4-10.

It was always expected of god Parjanya that the rains would be neither heavy nor little. But in spite of these prayers floods or droughts would follow, hence famine. Sometimes we notice excessive rains and farmers pray to Parjanya to stop them.

"Thou hast rained; now check well the rain; thou hast made the deserts capable of being crossed."

—*Vedice Selections*, p. 216

This condition of helplessness continued for a long period until our view regarding the material world, our feeling of fear, relation with nature and our value of life changed to a certain extent. Fatalism was no more our defence. We had to find new means and ways to make human life happy. Vedic Aryans did

not rely only on supply of natural water, but irrigated their fields by artificial wells and channels."

We know from the Mahabharata that Narada at one place enquires of Yudhishtira:

"Are large tanks and lakes established all over the kingdom at proper distance, in order that agriculture may not be entirely dependent on the showers of heaven?"

The Buddhist literature is also full of evidence to prove that irrigation by artificial means, other than wells or tanks, was well-known in ancient India. The course of water was skilfully changed and was converted into channels. (*Dhammapada*).

During the later period Parasara has given a detailed account of agriculture in his *Krishi Sangraha*. This volume deals with various aspects of agriculture, e.g., soil and its classifications, meteorological observations leading to forecasting of rainfall, preparation and application of manure, ploughing and sowing, etc.

2. "Let us pour out the water of the well, which is full of water, fit to be poured and not easily exhausted." RV. X. 101.3.5 (Wilson); and also "After cattle-keeping, the most important interest of Vedic Aryans was agricultural." "The ground is worked with plough and harrow, mattock and hoe, and when necessary watered by means of artificial canals."

—Adolf Kaegi: *The Rigveda*, p. 13; and also Zimmer, AIL. 235-245.

Khana has also given numerous maxims which tell us about the probable rainfall.⁴ The former writer devotes much of his time to determining the rainfall which helped the farmers of old age in their agricultural pursuits. His verses determine the date and time of rains, droughts and the like according to movements of planets, etc. (Parasara's *Krishi Sangraha*), rituals and hymnology (*ibid*) and directions of wind (*ibid*).

The ancient literature is full of evidence to show that it rained heavily during the rainy season in India with the result that rivers were usually in spate and caused great destruction. Sometimes it also happened that due to lack of rains the rich harvest was destroyed. Naturally, unless some permanent arrangements were made to remove such calamities caused by nature, agriculture would not be possible. And obviously these arrangements were for constructing river projects of various sizes, firstly, in order to check the floods and secondly to store the water for irrigation purposes. Keeping this fact in view, we find that a number of irrigational projects were built by various kings of India with the co-operation of the public. Besides these projects, minor irrigation works, such as wells, etc., were also constructed in large numbers. We shall, however, confine ourselves to the treatment of the major projects only, specially the dams, artificial lakes, big tanks, embankments, canals, etc.,

The Hathigumpha Cave Inscription of Kharavela testifies that King Kharavela in the first year of his reign excavated and dammed a tank.⁵ We further notice in the same inscription that in the fifty years of his reign he extended a big canal which was excavated by Nandaraja (Mahapadma Nanda?) and was brought to the capital of Kalinga at least 103 years (300?) ago. This was, indeed, the most important event of his reign as regards the welfare of his subjects.⁶ It can also, by the way, be said that Nandaraja, though not a reputed king, was aware of the importance of irrigation.

But the greatest wonder of hydro-engineering is found during the reign of Chandragupta Maurya. The system of irrigation in his kingdom was perfect and well-organized. He established a special Irrigation Department. We are informed by the accounts of Megasthenes that numerous officers were appointed to measure the land and protect those canals whose water was distributed for irrigation. And in this way everybody

got the share of his profit. It appears that an irrigation tax was also levied. *Arthashastra* refers to heavy water-rates which were levied. It also informs us that canals were strictly maintained.⁷ For providing irrigation facilities in the distant regions of his kingdom, Chandragupta Maurya excavated a big lake, named Sudarsana by the help of his provincial governor Pushyagupta, the Vaisya in Surashtra. The lake was constructed after damming the sources of a few hilly rivers, particularly, Suvarna Sikata and Palasini.

"The fact that so much pains and expense were lavished upon this irrigation work in a remote dependency (Surashtra) of the empire," says Vincent Smith, "is conclusive evidence that the provision of water for the fields was recognized as an imperative duty by the great Maurya emperors and it is a striking illustration of the accuracy of Megasthenes' remark that imperial officers were wont to measure the land as in Egypt and inspect the sluices by which water is distributed into the branch canals so that every one may enjoy his fair share of the benefit."⁸

We are further informed by Junagarh Rock Inscription of Rudradamana I (1950 A.D.) that Tushaspa, the Greek Viceroy of Asoka, excavated canals from Sudarsana lake. In spite of utmost care taken in the maintenance of this lake its bunds once got burst on account of heavy rains during the reign of Rudradamana I and the water, thus uncontrolled, began to create trouble.⁹ The water moved with tremendous speed. Like a benevolent ruler, who could not see such scenes or sit idle, Rudradamana got the bunds of the lake reconstructed under the supervision of Suvisakha, the son of Kulaipa and the Pahlava governor of Anarta and Surashtra. This time the bund was

7. The following shares of produce payable as water-rate or irrigation tax (*Udakabhaga*) are laid down:

Hastaprasavartima—when the water has to be raised by manual labour—one-fifth;

Skandhaprasavartima—when the water is raised by water-lifts worked by bullocks—one-fourth;

Srotayanaspravaritima—when the water is supplied by irrigation channels—one-third;

Nadisarastakakupodghata—when the water is supplied by rivers, lakes, ponds or wells—one-fourth.

—F. J. Monahan: *The Early History of Bengal*, p. 65.
Punishment was imposed over those who did not properly maintain the waterworks under their charge.

—*Epigraphia Indica*, Vol. VIII.

made three times stronger than the previous one. And to the surprise of all, Rudradamana did not tax his subjects at all for reconstruction of this lake. He was rather proud that he built this huge bund from his own treasury.¹⁰

The strong bunds constructed by Rudradamana I probably worked smoothly for three hundred years. But, in A.D. 455, the bunds were again broken by heavy rains during the reign of Skandagupta. Chakrapalita, the son of Parnadatta, was then governor of Surashtra. The people were bewildered as usual and could not know what to do.¹¹ The then government of Surashtra was again very prompt and after spending an enormous amount of money got it permanently repaired. According to Fleet, the embankment, thus constructed, was 100 cubits in length, 68 cubits in breadth and seven men's height in elevation.¹²

That the Sudarsana lake was the biggest irrigation project of its times, is an established fact. But the ancient history of Kashmir witnesses an equally important work although the *Rajatarangini* of Kalhana contains references to many such projects. We are told that formerly the productivity of Kashmir was very low because she was not unfrequently affected by great inundations of Mahapadma lake and river Vitasta. King Lalitaditya-Muktapida (A.D. 733-69) adopted the requisite measures and the waters were drained off. Thus the fertility of the land was considerably increased. It was at Chakradhara where the king excavated the canals for conducting the water of Vitasta and made arrangement for its distribution to various villages with the help of a series of water-wheels.¹³

13. चक्रे चक्रधरस्तेन चितस्ताम्रः प्रतारणम् ।
विनिर्माया रघटालीक्षांस्तान्प्रामाण्यचक्रता ॥

—*Rajat*, IV, verse 191.

Chakradhara is believed to be the modern Tsak-dar. It is situated on the alluvial plateau lying on the left bank of the river Jhelam (Vitasta). 'The system of irrigation here referred to,' writes

After Lalitaditya-Muktapida, the successors of Jayapida, who were very weak, could not improve the fertility of the soil. On the other hand, the productivity further went down and disastrous floods again began to creep in. During the reign of King Avantivarman (A.D. 855-83) there occurred a great famine. The condition was overwhelmingly acute, so much so that one Khan¹⁴ of rice was sold for ten hundred and fifty Dinars. At this movement, Suyya, the King's minister for public works, rushed to the rescue of the people's lives. He initiated several improvements in the existing system of irrigation. He changed the course of Vitasta which was the cause of these floods. He also had the bed of the river cleared. After creating adequate channels for the drainage of the surplus water of the river he erected a huge store dam at one place for securing the river-bed from any future inundation. This store dam was a wonderful specimen of engineering during ancient days.

"The whole river, which Nila produced, was blocked up by Suyya for seven days by the construction of a stone dam."¹⁵

Wherever floods used to cause trouble he constructed new beds for Vitasta. The river, consequently flew in numerous channels. Besides all this, Suyya made different streams according to his own will.

"After constructing stone-embankments for seven Yojanas, along the Vitasta, he dammed in the waters of Mahapadma lake. Trained by him the Vitasta starts rapidly on her way from the basin of the Mahapadma lake like an arrow from the bow."¹⁶

Freed from the water, the land of Kashmir became much productive. Suyya then founded several villages, "which were filled with a multitude of people."

This great engineer and irrigation specialist effected many other improvements in irrigation. He scientifically examined different classes of land and accordingly procured the required amount of water for them. After experimentations and observations he could deter-

Stein, 'is explained by the configuration of the ground near that locality on account of the high alluvial plateaus or Udars, which stretch in the semi-circle from Virobhor to below Tsak-dar, the land enclosed between them and the left bank of the river cannot be irrigated by the ordinary means of canals.'

14. We do not know with certainty about the measure called Khan. A mention of it is made in *Rigveda* IV.32.17, in the work of Panini and in the *Loka-Prakasa* where it is named as Kharika. From the writings of various authors, e.g., Abul-Fazal and Moorcroft it appears that a Khan is equal to 1920 Palas or 177-129/175 lbs., if a Pala is taken to be equal to 3-3/5 tolas (see also Stein, *Rajat*, V, pp. 195-96).

mine the period within which different soils required watering.

Sung Yun, speaking of irrigation in Kashmir, says:

"At the proper time they let the stream overflow the land by which the soil is rendered soft and fertile."¹⁷

The rulers of South India also took keen interest in constructing various irrigation projects. Among such rulers, the name of Chola king Karikala I is very prominent. Karikala (A.D. 6th century) built high banks on the Kaveri river. This is proved by the Copper-plate charters of the Telugu-Chola chiefs. This river also used to overflow like Vitasta in Kashmir and off and on caused floods. Due to the efforts of Karikala, mentioned above, people, thus, got rid of this recurrent trouble. Kaveri delta was so important that almost every Chola king had to pay some attention to its irrigation. It was long ago that Kaveri had changed her course giving rise to a new stream. It is doubtful whether the change of her course was natural or was caused by some particular individual. The name of this river is mentioned in several South Indian Inscriptions. Floods by this river were frequent and so were the damages to men and wealth. Karikala, besides building banks on the river in order that the water could be controlled and utilized for productive purposes, opened new canals. 'The banks are said to measure 1080 feet in length, 40 to 60 feet in width and 15 to 18 feet in height.' The project was very successful and lasted for many centuries.

These bunds were maintained both by the Government and the public. It is possible as Mr. Aiyer believes¹⁸ that persons according to some ancient custom took out a fixed quantity of mud or sand from the bed and threw them on the bund every year. No doubt, the government maintained these bunds by levying taxes but it was the private individuals that kept them in working order out of sheer religious zeal; for great value used to be attached to such works.¹⁹

The successors of Karikala also continued a good irrigational policy.

Bhaskara Bhavadura (of First Vijayanagara dynasty), too, built a big tank in a district which was frequently affected by famines. In the same dynasty Bukkaraya also excavated big canals from river Henne with the help of Sinyayya Bhatta called Pratapa-Bukkaraya-Mandala channel.²⁰ Krishna-devaraya was no less enthusiastic in building irrigation projects and it is said that due to his efforts cultivation was improved.

We have not yet considered the digging of a large number of tanks for the purpose of irrigation. Among such numerous tanks throughout India, mention may be made of those referred to by Venkayya,²¹ prominent among them being Mahendra Tataka, Vaijir mega tataka, Cholavaridhi, etc. These tanks of South India were dug between A.D. 8th century and 10th century and were connected with rivers. That these tanks were maintained and repaired by private individuals in times of necessity is clear from the following statement of Venkayya who made his studies on the basis of certain inscriptions:

"From the inscriptions and the transactions recorded in them it appears that repairs to tanks were undertaken as works of merit. But as in most cases tanks had endowments of land or money, the repairs were executed at the expense of these endowments. In the Kanarese country the term Kodage, which, according to Mr. Rice, has continued in use to the present time from great antiquity, denotes a grant of land rent-free for the construction or upkeep of a tank. In cases where no endowment existed or where they were not properly managed, and where no private individuals were charitable enough to undertake repairs at their expense, the village assemblies could grant some land either near the tank to be repaired or from the waste land of the village, over which they seemed to have enjoyed undisputed ownership, an inducement to undertake the work. In course of time the cultivable waste of villages must have dwindled down and in cases no private enterprise or charity was forthcoming to repair the tanks, it must have been undertaken at the joint expense of the villagers, as they were all to benefit by it. Thus apparently there arose the custom of Kudimaramat in Southern India."

Like Southern India, Bengal also possessed a large number of very old tanks by which irrigation was done. A Bill of 1937, passed as an Act in 1939 in Bengal Legislature, as described by Dr. Sundar Lal Hora, Director, Geological Survey of India,²² draws our attention towards "numerous old irrigational tanks and bunds in Bengal which have become useless as they have not been kept in proper repair. And, therefore that Bill aimed to provide for the repair and re-excavation of these."

The above account may give an idea of irrigation in ancient India. Although in a fragmented way, it may yet help the reader in understanding the consistent history of irrigation up to the beginning of the mediaeval period.

—:O:—

THE PLACE OF TRUTH IN ANCIENT INDIAN CULTURE

BY PROF. PARESH NATH MUKHERJEE, M.A.

TRUTH is one of the main pillars of any culture. It is one of those elements that makes a culture great and permanent. Any culture worth its name cannot afford to neglect Truth. But the culture of Ancient India puts the greatest emphasis on Truth.

Truth was first stressed by the main religions of the world. In very early days, as a matter of metaphysical speculation, Truth acquired importance as the ultimate reality. It was accepted as real where every other thing of the material world was accepted as unreal. It was the one unchanging reality in the world, where everything else changes.

The concept of Truth in Ancient India was to a very great extent, a religious concept. But, the greatness consists in that Truth guided day-to-day life and behaviour of the masses, and was not confined to religion alone. This practical application of Truth, in the every-day life of the masses to the greatest possible extent, was a unique feature in Ancient India.

Thus, we find that whereas the religion of the West declared with the same idealism and eagerness the importance of Truth as the religions of India, far greater emphasis was put on its application in every-day life here than elsewhere. "And ye shall know the truth, and the truth shall make you free," was indeed a very noble expression of a religious sentiment in the West which, however, did not influence every-day life in the same way as it did in India.

Truth had a far wider application in India. Thus Sukesa of the Bharadvaj clan declares in the *Prasnopanishad*:

"Samulo wa esha parishushyati jo Anritam avibadati."¹ "Who tells a lie is destroyed from the roots."

1. *New Testament*, John VIII. 32.

2. *Prasnopanishad*, Question VIth, Sloka 1.

It was not only a matter of academic speculation but a life and death question here.

Even for the attainment of success Truth was absolutely necessary. The Upanishad declared:

"Satyam eba jayate na Anritam. Satyena Pantha vitato Devajano."²

"Truth alone conquers, never Untruth. By Truth is laid the Divine Path."

Spiritual progress was unthinkable without Truth.

"Satyena labhya Tapasa jhyesha Atma Samyag-nanena Bramhacharjena nityam"³.

"The Self is attained through Truth, Tapasya, Wisdom, and Continence—all constantly cultivated."

That was the secret in Ancient India. The morality was not, as it is unfortunately in our days, that success is to be attained through the black market. For success of any sort Truth was the indispensable means. They knew that momentary success (wrongly so-called) attained through organised lying or cheating, could never be a real or permanent success.

Truth was everything. The Upanishads were founded on Truth.

"Tashyoi Tapo Damah Karmeti pratishtha Veda Sarvangani Sattyamayatanam."⁴

"Its (Upanishad's) foundations are—Austerity, Restraint, Dedicated Work. The Vedas are its limbs. Truth is its abode."

The Upanishads also declared in very clear terms: "Ritang badishyami. Satyam badishyami"⁵ "I will proclaim the Real. I will proclaim the Truth."

3. *Mundakopanishad*, Ch. III, Sec. I, Sloka 6.

4. *Ibid*, Ch. III, Sec. I, Sloka 5.

5. *Kenopanishad*, Part IV, Sloka 8.

6. *Aitareyopanishad*, Shantipatha.

17. Banerjee, P. N.: *Public Administration in Ancient India*, p. 253.

18. Aiyer, K. V. Subrahmanya: *Historical Sketch of Ancient Dekhan*, p. 196.

19. 'A ruined family, a breached tank or pond, a fallen kingdom whose restorer or repairs a damaged temple, acquires merit four-fold of that which occurred from them at first.'

20. Proceedings of the Indian History Congress, 6th Session (1943); Dikshitar, V.R.R., Prof.: *A History of Irrigation in South India* (Summary), pp. 127-29.

Ever since that early dawn of civilization the one sincere and persistent desire of mankind has been to proclaim the Truth. Every bit of scientific research or metaphysical discussion has been nothing but the sincerest desire to proclaim the truth. The Mahabharata declared with great force :

"Nasti Satya samo Dharma. Na Satyat bidyate param. Nahi tibratarang kinchid Anritad iha bidyate."

"There is no Dharma like Truth. Nothing is superior to Truth. In this world nothing is more bitter than Falsehood."

The famous instruction of the Upanishad was :

"Satyang vada. Dharmang chara."

"Speak the Truth."

"Follow the Dharma."

In another place the advice is given "Do not be careless to Truth"—"*Satyat na pramaditabyam*."

In the history of India for the sake of Truth great and noble self-sacrifices were also performed many times. Thus the Prince of Kapilavastu gave up everything that the world and kingship could offer him and voluntarily accepted the robe of the Sannyasi to find and preach the Truth that would deliver mankind. For the sake of Truth, Ramachandra, the Prince of Ayodhya, gave up kingship for fourteen long years (undoubtedly the best part of a young prince's life) and lived in forests. Asoka lived up to the ideals of a Rajarshi avoiding all pleasures and doing everything for the upliftment of suffering humanity. Emperor Harsha as a regular feature gave up his accumulated treasures at the end of every five years, and borrowed second-hand garments from his sister Rajyasri. It has been rightly called by a very reputed historian as "a record in charity."⁷ In more recent times, in accordance with this glorious tradition C. R. Das, Gandhiji, Motilal Nehru and Pandit Jawaharlal Nehru have made very great sacrifices for the cause of Truth they upheld. Gandhiji, that great Buddha of modern times, was an incarnation of Truth and Self-sacrifice.

The ideal of Truth was so important in Ancient India that innumerable references can be added without any difficulty. In almost every Purana in the inscrip-

tions of Asoka (cf. M. R. E. II, P. E. II, and VII) and scattered throughout the Sanskrit literature are hundreds of such references. But to conclude, here we shall better discuss a critical point.

The question is, did the Ancient Indians accept Truth as relative, or did they adopt a very unscientific and orthodox attitude in the matter? Ordinarily it is held that their attitude was very orthodox and unscientific. It is pointed out that the Vedas were held to be the unquestionable repository of Truth. The Code of Manu changeth not. How then, could their attitude towards Truth be regarded as scientific in the modern sense? The present scientific outlook is that Truth is tentative, and not final. It is a working hypothesis. In Ancient India, it is said, Truth was regarded as final, and eternal. And so, the attitude was, it is held, unscientific. Let us examine it more closely.

Only in matters of religion and spirituality, was Truth accepted as final. And that was necessary and desirable. The *Brahman* was the ultimate Truth, without any equal, infinite and boundless. But, otherwise, in every-day life Truth was more relative. Thus, the Buddha in the fifth century B.C. challenged the infallibility of the Vedas. He also challenged the caste system, one of the most important institutions of the Hindu society. So, the idea of finality was never blindly accepted in society. Every reformer and every new system introduced necessary modifications, so that old Truths gave place before new Truths. There are ample cases to suggest that in a worldly sense Truth was more relative. The Truth of the Vedas was challenged by Buddha, whose Truth was again challenged by Shankar, and who was again challenged by Ramanuj, and so on. So Truth was relative to a remarkable extent.

We can best sum up the situation in the words of Gandhiji :

"Truth is not Truth merely because it is ancient. Nor is it necessarily to be regarded with suspicion because it is ancient. There are some fundamentals of life which may not be lightly given up because they are difficult of enforcement in one's life."⁸

And this was in reality the attitude towards Truth in Ancient India. The Buddha's last advice was : "Hold fast to the Truth as lamp. Hold fast as a refuge to the Truth."

Thought in Ancient India.

COMMENT AND CRITICISM

"First National Exhibition of Art"

Dear Mr. Kaundinya,

Your article entitled 'Comment and Criticism' published in *The Modern Review*, September issue.

I appreciate the kind sentiments expressed about me for which thanks are due to you and I offer the same without reservation. But I cannot pass by the comments you have made after publishing a personal letter addressed to you without my consent.

If you had read carefully the contents of my letter, you would have found that I wanted to enlighten myself by discussion with you and as a result of which I was prepared to use such views as would have been beneficial to the objective of the Lalit Kala Akademi. This spontaneous approach from my side was made with an intention to know better as I feel there is nothing in this world made by man that can be considered flawless and if there was anything wrong a check could be enforced. But unfortunately lack of patience had driven you to act in a manner which I am constrained to say is a gross violation of courtesy. However I have a lot of things to say in support of the Working Committee of the Lalit Kala Akademi. But I must refrain myself from being involved into details as I might encroach into the limited space of the esteemed journal.

At the outset I should like to point out that in support of your sweeping, if not, damaging remark on the working of the Akademi you have made no attempt to substantiate what you published by authentic evidence. This is obvious from your own admission which is as follows: "I have no personal knowledge of the inner working of this Akademi but people who have personal knowledge have unanimously condemned it in unqualified terms." One may infer from this that your information is not only second-hand but it is also charged with other's interest in which I am inclined to feel your share is not that of the lion's.

I may further add in this connection that for whatever reason the financial resource had been utilised it was so done after giving due consideration to the purpose it was going to serve. The members of the Executive Committee had always been most helpful to me in all matters often at the sacrifice of their own time which on occasion meant money. In short, I should bring to your notice that the members of the Executive Committee are much more competent than what you take them to be. Otherwise you would have yourself mentioned their defects specifically which in your opinion stood as a hindrance to the proper function of the Akademi.

Now coming to the opinion on the alleged over-emphasis given to a certain school of painting I should say you would have done well if you had exercised

some restraint in the absence of a judicious enquiry. It is obvious from your remark, which I must say is vague that you were not aware of how the decision of the judges was arrived at. Let me for the sake of information tell you that the judges used the severest discretion in the question of selection and as a result of which the judges chose the best exhibits out of the total number received and this was done on grounds of sheer merit irrespective of the school or individual.

We are pledged to encourage every form of individual expression so long it bore artistic values. Therefore, the question of trend of this school or that does not arise. Further, if exhibits with ultra-modern trend were overwhelming in number and revealed better quality than other schools of painting, the selection or judging committee could not possibly underestimate their legitimate assertion nor the judges blamed for better works not being available.

With regard to the influence of the Secretariat referred to in your article I should say it is a revelation not only to me but also will be to those who know my temperament.

Lastly, I may add that the report of the judges published in the catalogue of the exhibition held in March 1955 amply supports the fact that there was much to be desired about the standard of work sent for the exhibition. A true copy of the judges' verdict is given here for the information of the public :

"The Selection and Judging Committee for the first National Art Exhibition met and considered the entries."

They regret to state that the general average of entries has been comparatively low, which is demonstrated by the fact that out of 1000 entries only about 260 could be accepted for Exhibition although the Committee made every effort to give every single entry its fullest critical consideration. The Committee wished this first Exhibition to be as large and representative as possible, but they felt that the standards demanded were not achieved.

The Committee feel that the foremost Exhibition in the country deserves better response from artists, and they request that the artists of India should, in future years, make special efforts to enable this exhibition to become more truly representative of the genius of India. The honour of being displayed in the Akademi's National Exhibition should supply the greatest incentive to more intensive creative efforts.

They also request the Council of the Lalit Kala Akademi to make in future years arrangements for the Exhibition in such a way that artists are given sufficient time to make the utmost efforts to send in their best works.

The Committee therefore recommend: that the Akademi's gold plaque and cash award of Rs. 2,000 be not awarded."

SHELLEY'S PLATONISM

By R. DE LOYOLA FURTADO, M.A. (DeP., Chicago)

MODERN research has thrown new light on Percy B. Shelley's attitude towards a rational belief in the supernatural. The transition from his avowed materialism to Platonic doctrine has been the subject which modern research scholars have studied with the greatest care.

The last five years of Shelley's life point to his full conversion and belief in the Greek idealistic philosophy. His biographers have clearly stated that he had drunk deep of Plato. He had read, discussed, re-read, and translated Plato. Thus his early poem, *Queen Mab*, marks the materialistic period; the *Revolt of Islam*, the period of transition; *Prometheus Unbound*, the loftiest expression of Platonism.

The idealism of Plato was to lead Shelley to believe in God, the one of the "graceful religion of the Greeks," and, consequently, Nature or Power or Spirit, as mere terms, was relegated to a secondary place. So much was he under the spell of Plato that in June, 1822, only a month before he was drowned, he wrote that the doctrines of the "French and Material Philosophy are as false as they are pernicious." Professor Beach points out the two main concepts in which Shelley is influenced by the Platonic doctrine:

"The first is the concept of the soul as having descended from the realm of the Eternal and as destined to return to the burning fountain whence it came." The second, the more important and inclusive concept, is that of the general or 'eternal' forms (ideas, essences, abstractions, intelligibles) as in some sense the most real things in the universe, and of the natural world as having a sort of a secondary reality, which it has in so far as it partakes of the essence of the eternal forms. This is a view as remote as possible from the ordinary assumptions of nature-philosophy."

Both Shelley and Plato contemplate the so-called Spirit, the One, in different forms, like Love and Beauty. Also, they "lay hold of the Deity largely from the aesthetic side."

Shelley's Platonism is vaguely felt in *Alastor* (1815); it is more obvious in the *Hymn to Intellectual Beauty* and *Mont Blanc* (both 1816); and it is

still more strong in *Prometheus Unbound* (1818), the *Witch of Atlas* (1820), *Epipsychidion* and *Adonais* (1812).

Alastor and *Hymn* are the turning points at which Shelley subscribes to the belief that reason is a lesser power, and imagination and intuition are the major powers of the mind. In the preface to *Alastor*, Shelley states that the poem is "allegorical of one of the most interesting situations of the human mind." It represents a youth with a pure mind, in search of knowledge and engrossed in the contemplation of the universe. In his wanderings, the youth has the vision of the "veiled maid" who personifies the "unrealised completeness" of the self.

Shelley here uses Platonic symbolism for, according to the Platonic fable, the soul in its heavenly and complete state is both masculine and feminine, and, in its earthly state, seeks for ever a return to its previous unity. Also, according to neo-Platonic symbolism, a stream of water is symbolic of man's life. Thus in *Alastor* we have:

O stream!
Whose source is inaccessiblely profound,
Whither do thy mysterious waters tend?
Thou imagest my life. Thy darksome stillness,
Thy dazzling waves, thy loud and hollow gulls,
Thy searchless fountain and invisible course,
Have each their type in me; and the wide sky
And measureless ocean may declare as soon
What rosy cavern or what wandering cloud
Contains thy waters, as the universe.
Tell where these living thoughts reside,

when stretch
Upon thy flowers my bloodless limbs shall waste
I the passing wind!

In the very next year after the publication of *Alastor*, Shelley wrote the classic *Hymn to Intellectual Beauty*. The term "intellectual beauty" occurs in Plato's *Symposium*. Shelley, himself, had translated this work, and he must have come across the term in the passage where the prophetess Diotima speaks on the subject of Love and Beauty. The central idea of the *Hymn* is none other than is contained in Plato's words. For, according to Shelley's translation, Beauty is

"... eternal, unproduced, indestructible; neither subject to increase or decay; not, like other things, partly beautiful and partly deformed; not at one time beautiful and at another time not; not beautiful in relation to one thing and deformed in relation to another . . . All other things are

beautiful through a participation of it, with this condition, that although they are subject to production and decay, it never becomes more or less, or endures any change."

Intellectual Beauty, then, was the only value which lacked transience and which would endure for ever. It was to Shelley like a straw which he must clasp lest he flounder. It was this same Beauty which would eventually lead him through what he called wilderness, another Platonic echo.

The wilderness has a mysterious tongue
Which teaches awful doubt, or faith so mild,
So solemn, so serene, that man may be
But for such faith with Nature reconciled.

This wilderness is not in the least related to the 'wasteland' of T. S. Eliot. Rather, it is a symbol of the maze of the external reality or of the complexity of the individual mind.¹ It occurs again and again in Shelley, especially in *Prometheus Unbound*.

Prometheus has for its source the lost *Prometheus Bound* of Aeschylus, but, as Shelley states in the preface to his poem, "it has no resemblance to the Greek drama. It is original." And it is justly so. Being essentially based on the Greek myth, it abounds in Platonic symbolism and references. The influence of Plato and Dante upon Shelley's thought is evident throughout, even though its philosophy is derived from various sources. "The ethics of Christ," says Professor Grabo, "is fused with the metaphysics of Plato."²

Beside the very obvious borrowings from Greek mythology, *Prometheus* also contains indirect references to Plato. Thus one of the characters is found exclaiming:

Ah, sister! Desolation is a delicate thing:
It walks not on the earth, it floats not on the air,
But treads with killing footstep . . .

In the *Symposium* we have: "For Homer says that the Goddess Calamity is delicate, and that her feet are tender. Her feet are soft, for she treads not upon the ground but makes her path upon the heads of men."

The greatest Platonic influence in *Prometheus*, however, is the very elaborate symbolism which pervades the poem. Asia, the same as Aphrodite, is the personification of Nature. She sings:

My soul is an enchanted boat
Which, like a sleeping swan, doth float
Upon the silver waves of thy sweet singing.

The boat of the song is "harmonious with his neo-Platonic imagery of sea, cloud, cave and stream."³ The cloud in Shelley, as also in the great epic poems of India, symbolises change and fertility. The cave is only an allusion to the well-known passage from Plato in which human life is likened to a cave in which the images are but the shadows cast

upon its walls from reality without. Shelley's cave is only another name for the phenomenal world.

The Platonic thought in *Prometheus* is carried further to all Shelley's later poems, life to him being a compound of shadows, death a mockery, and Love, Beauty and Delight being the enduring things. This attitude is overtly pronounced in the *Sensitive Plant* and *Adonais*. Throughout these poems a Spirit pervades, a Spirit which, Shelley tells us in the essay *On A Future State*, is "the mysterious principle which regulates the proceedings of the universe." Through it, Keats in *Adonais*

. . . is made one with Nature: then is heard
His voice in all her music, from the moan
Of thunder to the song of night's sweet bird;
He is a presence to be felt and known . . .

In 1821, this Spirit was for the first time called God by Shelley. This God had all the attributes of the One of Platonic tradition. Thus:

The spirit of the worm beneath the sod,
In love and worship, blends itself with God.

Again,

From the great morning of the world when first
God dawned on chaos.

In the preface to *Adonais*, Shelley refers to Keats as "one of the noblest specimens of the workmanship of God."

A very important and distinct Platonic concept is the pre-existence of the soul, and Shelley fully believes in it. The belief that our present existence is but a dream is another Platonic concept which often repeats in Shelley. Thus in *Hellas*:

What thou seest
Is but the ghost of thy forgotten dream.

Shelley also believes in the immortality of the soul, which is also a Platonic concept. To Shelley, Keats became "a portion of the Eternal," "a portion of the loveliness which once he made more lovely," and "he hath awakened from the dream of life."

Love is only another attribute of the One, who is, in turn, equivalent to the Ultimate Beauty. Needless to say, these are synonyms which are very characteristic of Platonism, their effect on Shelley being all too evident. He returns again and again to the old theme of Ultimate Beauty, which is "more intrinsically real than the actual objects—waves, flowers, clouds, woods, rocks—which it warms and illumines."⁴ This Beauty is also Love. These various Platonic concepts were to relegate Nature to a secondary place, and Love was the gospel which would eventually save Man from the bondage of custom, tradition and intolerance. The gospel of Love, which was in its essence the same as Plato's Intellectual Beauty, would conduce Man back to Nature, which he had presently forsaken.

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.

Editor, *The Modern Review*.

ENGLISH

THE FUNDAMENTAL UNITY OF INDIA : By Dr. Radha Kumud Mookerji. Published by Bharatiya Vidya Bhavan, Bombay. Pp. 122. Price Rs. 1.12.

The author who is a well-known historical writer and politician, has deserved well of all students of Indian history by bringing out this work (published as early as in 1914) in the cheap and easily available Book University series of the Bharatiya Vidya Bhavan. Quite appropriately he has prefixed to this reprint an Introduction in the course of which he has put forward a passionate plea (with which all of us can sympathise) for the continuance of the old economic, religious and cultural ties between India and Pakistan in spite of their political division. Equally unexceptionable is the thesis of the author's work to the effect that the unity of India instead of being a creation of British rule may be traced back in the historical consciousness of the Hindus from a remote age. This is sought to be proved by a mass of details culled with great industry from our ancient literary and epigraphic records. The author's data comprise a common name for the whole country, the occurrence of geographical names in our ancient hymns from the celebrated river-hymn (X.75.5) of the Rigveda downwards, the lists of Hindu shrines and sacred places in the Puranas and other works, the Hindu (to which ought to have been added the Buddhist and the Jaina) institution of pilgrimage, the geographical knowledge of the whole country developing from its dim beginnings in the Vedic Age, the idea and the institution of universal sovereignty and the distinctive physical phenomena of the country.

While we can accept the author's contention to be fundamentally sound, we propose to make a few remarks. The author seems somehow to have missed the basic factor of India's unity, namely, the dominance of one type of culture of which the distinctive characteristics are the institution of caste, respect for the Vedas, Epics and Puranas, a universal system of social and religious law, a more or less common outlook on life and common ethical standards. Equally unfortunate is the author's omission to consider in the context of his thesis the mutual reactions of Hinduism and Islam in the Middle Ages about which period indeed he is completely silent. Some of the author's statements again are not above criticism. Is Bharatavarsha (known for the first time to the Epic and Puranic tradition) the oldest Indian designation for the whole country? (p. 31). Considering the high antiquity of Buddhism and its links with the Brahmanical religion, can we properly state with the author (pp. 63-64) that "Buddhism, in fact, is the

name given to Hinduism of the first few centuries of the Christian era, where precipitated in a foreign consciousness?" In view of the foundation of the Maurya Empire by Chandragupta Maurya on the ruins of the heritage of the Nandas, is it correct to say (p. 64) that "the most noteworthy contribution of Buddhism was a vast imperial organisation, highly centralised, coherent in all its parts, full of the geographical consciousness, uttering itself in similar architectural forms in the east and west of India" and so forth? To magnify (p. 80) Harshavardhana's Empire as embracing "the whole of the basin of the Ganges (including Nepal) from the Himalayas to the Narmada, besides Malwa, Gujarat and Saurashtra" is to ignore the results of recent research. How is it again that the author (pp. 84-91) while discussing the significance of the Vedic ceremonies of imperial consecration confines himself to the Vajapeya (which by the way does not derive its name from its ritual of the chariot-race) and the Rajasuya and dismisses the Asvamedha with a single reference in a footnote? Finally, is it possible to sum up the genius of India's complex civilisation with a single formula, namely, that "India's gift to the world has been the fair fabric of an Empire, a nationality, founded on the basis of Universal Peace (*Ahimsa*), peace between man and man, and between man and every sentient creature?" (p. 121).

U. N. GHOSHAL

CONSCIENCE AND REASON : By Grace Stuart. George Allen and Unwin Ltd., London. Price \$15 net.

"Whoever you speak to, they're in trouble"—that was a chance remark of a weeping woman in a railway carriage overheard by Mrs. Stuart which ultimately led to the production of this reassuring book. About the troubles of the people no one need be reminded; they are too glaring to remain unnoticed. But the question is: Should we go on suffering from them and blaming Fate and others for them? Pessimism suggests that there is no way out; future of mankind is dark and will grow increasingly darker as century advances on century. The atom bomb and the hydrogen bomb lend additional support to the development of this attitude.

The spirit of man, however, refuses to be daunted. History produces ample evidence that the spirit has repeatedly triumphed even over the gloomiest of circumstances and has emerged in greater glory even from the most unhallowed situations. The atom bomb is challenging it once more. And it must be admitted that if there ever was an occasion to make the most determined and heroic effort to rise above the circumstances, and to dispel the most thickly accumulated smoke of doubt and despair that per-

BOOK REVIEWS

319

vades the entire atmosphere, that occasion is undoubtedly now.

Fortunately, as Mrs. Stuart mentions, "in spite of difficulties and despair, there has never yet been such wise or such potentially helpful thinking done about human problems as is being done today." The book under review is one of the products of such thinking.

Destructive behaviour is one form of behaviour that is shared by men with the animals. Modern psychology has belied the all too common belief that men are governed by reason and animals by instinct. There is much that is instinctive in human activities. Many illustrations of this have been given in the book. Brute-like destructive tendencies are present in all men, but it is the growth of conscience within us that educates us to refrain from aggressive activities. The growth of conscience depends much on factors and conditions the nature of which we have learnt to appreciate only recently. We have at much cost to ourselves and to civilization, at last come to realise that in this matter of the growth of conscience, forces within us about which we are not conscious play the dominant part. Now that we have gained this insight it is incumbent on us to shape environmental conditions in such a way that the development of the Super Ego of our children may take place on desirable lines. Every chapter in the book helps us in achieving this objective. By removing false ideas about the development of the child mind and by compelling all to think anew about our sense and scale of values the authoress has made a definite contribution towards the attainment of that Peace so devoutly wished for by all. The book is a feast to the intellectuals and an inspiration to the troubled ones. The conscience will be inclined to behave more rationally and the reason tend to function more conscientiously of those who read and digest Mrs. Grace Stuart's *Conscience and Reason*.

S. C. MITRA

THE FOUNDATIONS OF INDIAN CULTURE : By Sri Aurobindo. Published in 1953 by the Sri Aurobindo Library, Inc., New York City. (Demy 8vo.). Pp. 442.

The book consists of a series of articles that appeared in the *Arya* from 15th December, 1918 to 15th January, 1921, and later on were revised by the author. Sri Aurobindo is always brilliant in his essays. His interpretations of the Vedas and Upanishads, his essays on the Gita, his poetic criticism on the future poetry have no equal. In these essays he is in the role of a nation-builder. In them he has thrown his searchlight on the principles and foundations of Indian culture, Indian polity, Indian society, Indian religions, and Indian art. He has based his discourses on William Archer's *Is India Civilised?* and Sir John Woodroffe's reply to same. In course of writing he has touched on many eminent thinkers and writers in that line.

There was a time when Europeans entered the domain of Indian culture and such other matters with an attempt to prove that everything Indian was barbarous. They held, by civilization was meant superiority in science and earthly conditions. It was between 1830-1883 that great men like Raja Rammohun Roy, Brahmananda Keshub Chunder Sen, Bhai Protap Chandra Majumdar bearded the lion in his own den, and tried to open the eyes of both the Europeans and the Americans to the special character of religion and spirituality of Indian culture and society. This

they did by lectures, by new interpretations of Indian literature specially religious and by their own lives. As early as that they had prescribed synthesis of the East and the West, of Spirit and Science for the salvation of the world.

This vindication of Indian history and culture soon took a militant character, of which Swami Vivekananda and Sri Aurobindo were the champions. Sri Aurobindo played his part in a superb style. The nation will ever treasure his studies of the past and thoughts on the future. Maybe, we may not agree with some of his theories but the way shown by him to awaken the spirit and the thinking power amongst us will remain a beacon-light to the coming generations, who by Providence are charged to build the future India. Bankruptcy of thought and spirituality means the doom of civilization against which Sri Aurobindo raised his clarion voice just when New India was astir with the spirit of Nationalism. The printing, get-up and presentation of the book are excellent.

SATI KUMAR CHATTERJI

OUR PATRIOTS OF WAX, IRON AND CLAY : By T. N. Lahiri. U. N. Dhar and Sons, Ltd., 15, Bankim Chatterjee Street, Calcutta-13. Price Rs. 3.

The author writes in the Preface: "This is a thumb-nail sketch of the main political forces which participated at various stages in the movement for Indian freedom from the point of view of a citizen of Bengal who came in contact with the revolutionary movement for a number of years."

The book is divided into five main chapters, viz., 1. The Background, 2. The Moderates, 3. The Revolutionaries, 4. The Middle Coursers—The Gandhian Phase of the Congress, 5. The Conclusion! In the course of these chapters the author has dealt with the various phases of our political struggle. In the Background he has dwelt on the causes that led to the rise of political consciousness and active political movements. The pioneers of the struggle for freedom have been dubbed by the author as 'Moderates', which appellation they hardly deserve from their sensible countrymen. The author himself took part in the revolutionary phase of the struggle, and the chapter on this phase has necessarily been dealt in considerable detail. The Middle-courers, as he calls the leaders of the Gandhian phase, have received scant justice at the hands of the author. And let us quote what he says about Mahatma Gandhi:

"On the touchstone of reality, the idealism and moral teachings of the high priest of the Congress proved no more than an evanescent hare. The forces he led, walked into power over the hecatomb of whole nationalities and the ruin and degradation of millions."

Reality par excellence!

JOGESH C. BAGAL

1. SWAMI SIVANANDA : MYSTIC, SAGE AND YOGI : By Swami Venkatesananda, Dr. Frederick Spiegelberg and others. Pp. 405, Price Rs. 4-8.

2. EVERYMAN'S PHILOSOPHY OF SWAMI SIVANANDA. Pp. 61. Price Re. 1.

3. SWAMI SIVANANDA AND THE MODERN MAN : Pp. 82. Price Re. 1.

The second and the third books are by Swami Omkar-ananda. All the three are published from the Yoga Vedanta Forest University, P.O. Sivananda Nagar, Rishikesh, Himalayas.

The first book contains among other things a psychological study of Swami Sivananda by Dr. Frederick Spiegelberg, Ph.D., a lecturer of Stanford University, California. This American savant came to India on a special mission from his University to investigate if spirituality was still alive in this country. He stayed for a week in the hermitage of Swami Sivananda at Rishikesh in the Himalayas and was highly impressed with his life and thought. He returned home and reported to the American people that spirituality was alive in India even today but emphasized at the same time that India was threatened all around by modern doctrines imported from the West.

Requested to write an essay about his impressions of Sivanandaji he sent the Standard test of ten ink-block cards pertaining to the Rosschah Test as a means to gather facts in order to have a character evaluation of the dynamic monk. Dr. Rosschah, the Swiss Psychiatrist, developed this wonderful psychodiagnostic test in the last century. After studying the reactions of Swami Sivananda to these psychological tests Dr. Spiegelberg came to the conclusion that Swami Sivananda is a personality of extraordinary vigour and creative drive as well as highly artistic. At the end of this book are given in detail several astrological readings by eminent astrologers of Swami Sivananda's horoscope.

Swami Venkatesananda, Samananda, Omkarananda, Saswatananda and others whose warm appreciations are collected in these three books are beloved disciples and enthusiastic workers of Swami Sivananda. Hence, their appreciations must be devotional outpourings and therefore, be considered as exaggerated accounts. As long as a monk is alive he should not be so much advertised and emblazoned as it definitely belittles the greatness of the man concerned. People are spontaneously drawn to one who possesses genuine worth and achievement.

SWAMI JAGADISWARANANDA

FRENCH

TEFEDEST : MEHAREE AU SAHARA CENTRAL : By Louis Carl Et Joseph Petit. Collection "Les Clefs de l'Aventure," Arthaud, Paris. 1953. Pp. 262.

Tefedest is the chain of mountains which stretches northwards from the enormous basalt masses of the Hoggar country in the far south of Algeria. The Sahara, contrary to what many people imagine it to be a flat stretch of sand studded with a few oases—actually embraces many lofty plateaux strewn with rough blocks of granite and deep river valleys.

In October, 1949, four young Frenchmen left Paris to explore the dead and desolate region of the Tefedest massive to make a scientific study of the area which is known to be particularly rich in prehistoric rock paintings. In Europe, the prehistoric art is hidden mostly in subterranean caves. In the Sahara it is found mostly in the form of polychrome wall paintings on rock shelters situated in high places of difficult access. The style of these paintings is delicate and animated with great artistic sensibility. Preliminary work on the rock paintings had been done by the 1935 Coche Expedition and also by the 1945-47 Cousin and Lelubre Expedition. But it is to the 1950 Hoggar Expedition that the chief credit is due for systematizing the records of the paintings and engravings already discovered and for an exhaustive

survey of the area. The expedition had, of course, other objectives—zoological, botanical and topographical research on this yet unexplored region.

This book has been written by two members of the expedition to give an authoritative account of the expedition which lasted for six months. The narrative, vivid and vivacious, makes highly entertaining reading. The journey was undertaken with the minimum of resources, which put the will-power and the zest of the members to a severe test. Transporting the technical equipment to the high places where the rock paintings were located proved almost impossible. Most formidable of all was the task of providing food and water for the men and the camels in this difficult terrain. Many a time they escaped catastrophe by the narrowest margin.

But the hardships suffered were immensely rewarded. The expedition was able to make a very large collection of palaeontological material of great interest as well as rock paintings of high anthropological interest. At the time this book was written the various scientific recordings had not been fully analysed. It looks as though when this new corpus of knowledge has been properly assimilated and its significance mastered, solutions of many old questions will be found and perhaps new theories will suggest themselves not only about the ancient inhabitants of this area but also about the migration of prehistoric peoples in general.

Not the least interesting part of the book is the first-hand account of the mysterious nomadic Tuaregs—the veiled men—their food and music, their superstitions, present-day customs and their strict code of honour.

The book would have been of greater value to lay readers if the authors had annexed to it a detailed map of the region just as reproductions of some of the paintings which were discovered would have added to its interest. Also, the authors might have given a fuller account of some of the paintings that were discovered. Non-French readers who are less familiar with the history of North Africa would have been grateful, too, for an outline of the history of the early inhabitants.

MARGARET R. BASU

BENGALI

PREM-O-MRITYU ("Love and Death") : By Sri Aurobindo. Translated into Bengali by Prithvi Sinha Nahar. Published by Sri Aurobindo Ashram, Pondicherry. Price Rs. 2-8.

This is one of the famous poems of Sri Aurobindo rendered into Bengali by Prithvisinha Nahar. Sri Aurobindo read the story of Ruru and Priyambada in the Mahabharata and wrote this poem "in a white heat of inspiration," where how love won death is described. The fact is, poetry can never be adequately rendered into another language, for it often fails to reproduce the power of language in giving the proper shade to its meaning. The rhythm, the harmonious movement and other things are also to be considered. Of course, a translation mostly depends on the ability of the translator.

The faults in the book under review are obvious. There are far too many compound adjectives, far too many compound nouns and a good deal of rhythmically unsound groups of words that hamper the movement of language. Quotation of a few lines from anywhere of the book will indicate how far this fault can go. The story itself is hardly discernible

from this maze woven out of worn-out words very badly used. However, undoubtedly this is an honest attempt.

KRISHNAMAY BHATTACHARYA

HINDI

PATH KI KHOJ : By Dr. Devamaj. *Buddhivadi Prakashgriha, Lucknow. Parts I and II: "Vishvas aur Nirasha," pp. 412; "Swapna aur Jagaran," pp. 420. Price Rs. 4-8 each part.*

This is a brave novel, rather a series of novelettes. For, like a magician, the author raises a number of multi-coloured balls in the air, one after another, with unusual dexterity and dynamism. In his handling of various situations and the characters participating in them his intellect has worked its way through with the skill of a deft surgeon, neatly and never-failingly. The story is of a young man who, while passing through a forest of traditions, teachings and truths, has to face many problems and perils in the course of his quest for an all-embracing Reality in time, as contrasted from the Reality in Eternity. For, one can live fully and freely only in this manner. Every reader will await the third part of this great work eagerly; nay, impatiently. Doctor Devaraj has, indeed, a world-wide vision of the cross-currents of life.

G. M.

GUJARATI

CHAMPO ANE KEL : By Chunilal Modia. Published by N. M. Tripathi and Co., Bombay-2. 1950. Illustrated jacket. Thick card-board. Pp. 212. Price Rs. 3.

The *champa* flower and the plantain tree—what a more romantic title could be selected for the batch of the seventeen stories contained in this volume, written by a rising young writer of original tales, than this one! His description of village life, rustic manners, given in the original village dialect of Kathiawar is realistic and that is its best and outstanding merit. He is found to be popular and so he is.

APANI SHRESHTHA NAVALIKAO : By Gulabdas Broker. Published by the National Information and Publications, Ltd., Bombay-1. 1948. Illustrated jacket. Card-board cover. Pp. 208. Price Rs. 3-8.

"Our Best Short Stories," under this heading Shri Broker has reviewed the works of 14 best short story writers of modern Gujarat, prefacing it with a short Introduction on the subject of 'Short Stories.' Mr. Broker's task was none too enviable, but he has achieved his object in an impartial, efficient and able way, and shown how wide and deep his study has been.

RAINO PARVATNI SAMIKSHA : By Dr. B. J. Jhaveri. Published by Ramesh Book Depot, Bombay-2. 1950. Illustrated cover. Pp. 104. Price Rs. 1-12.

Having obtained his Ph.D. degree by a thesis on the late Sir Ramanbhai Nilkanth's literary work, Dr. Jhaveri had naturally to study his outstanding work, the drama called *Raino Parvat*, wherein due to circumstances a gardener becomes a king. As a result of that study this comprehensive review including the genesis of the *natak* is published. The review has been made ably and informatively and from all points of view. It is a model review.

the heart of Asia . . ." And the *London Economist* writes: "Mr. Bhabe single-handed, has done more than all the State Governments to get land for the landless, and he has done it without red tape . . ."

WIDER APPEAL OF BHOODAN

Indians are not the only nation which has been impressed by Acharya Vinoba. This is shown in a beautiful manner by Taya Zinkin, who writing in the *Manchester Guardian Weekly* concludes: "Could Bhabe be effective outside India? The answer is yes. His being a scholar, dark-skinned, Gandhian, is all irrelevant. If one day he comes to London or Manchester half-naked, bare-foot, quiet, asking for a room in your house for the poor, you will give it—gladly or grudgingly—but you will give it, just as the landlords of Bihar do, for Bhabe is irresistible." Mr. Alvin R. Field also believes the same when he says: "Vinoba is 5 feet 8 inches tall but his spiritual stature is so large that his shadow falls across the sub-continent. His message may yet travel across the ocean and around the world." In yet different worlds, Hallam Tennyson says: ". . . something in the enormous tranquillity of his patience and his faith . . . told me that Vinoba's message was not limited to the country in which it was uttered. The twentieth century may be rich in jet aeroplanes. But it is pretty poor in saints. We need to remember that what we call 'progress' is nothing if it leads to no corresponding inner change and Vinoba gives us this reminder in the one way which has power to move and impress."

The Expansion of Ancient Indian Culture

The first part of the article by V. Raghavan in *The Vedanta Kesari* was reproduced in our August issue. The concluding portion is given below:

CHINA AND JAPAN

The silken bonds between India and China started with the exchange of Chinese silk and Indian philosophy from about the first century A.D. Buddhist priests started coming to China and establishing a monastery there. From this time onwards, for ten centuries India was the holy land to which the Chinese made pilgrimages, and the devotion with which the barriers of the mountains and seas were crossed for this spiritual quest forms a unique event in the whole history of learning. During this period when China was in active pupillage under India, 103 Sanskrit scholars from India went over to China and 2,184 Sanskrit works were translated into Chinese and these translations which included some non-Buddhist works also, preserve today Sanskrit classics lost in their originals in India or available only in fragments. The full text of the most celebrated Sanskrit epic poem of Buddhism, Asvaghosha's *Buddhacharita* is available only here; in Samkhya philosophy, the Chinese translation has preserved the *Suvarnasaptati* and in Vaisesika School of atomic pluralism, the *Dasapadartha-sastra* of Matichandra.

In the beginning of the 6th century, the Indians in China had swelled in number so much that they began to enter Japan. All these were not solely engaged in religious pursuit, but all of them were spreading some aspect of Indian culture, Buddhism, Sanskrit, Indian music, etc. It became necessary for the Chinese to learn Sanskrit; in the beginning of the 6th century, there were 700 monks all of whom knew Sanskrit. Sanskrit names of high spiritual significance were assumed by the Chinese; e.g., Fa Hien was called Mokshacharya; Hieun Tsang, Mahayana-deva; Itsing, Paramarthadeva. Between the Chinese pupils and their Indian teachers, teaching as well as other communications by letters was carried on in Sanskrit. Sanskrit was taught in China till the beginning of the 15th century. Four Sanskrit Chinese dictionaries had been compiled between 7th and 9th centuries. It was with the help of Sanskrit that the arrangement by initials of the 36 letters of the Chinese alphabet was made. Besides the three famous pilgrims whom we have already named, several Chinese pilgrims regularly visited India; and at Buddha Gaya, there was built a special place for them called the Chinasangharama. They continued to come till the end of the 10th century.

It should not be supposed that this movement was solely Buddhist. Several Brahmins were also in it, particularly in artistic activities like music and in the work of Sanskrit teaching or translation. In A.D. 657, the Chinese King desired some ritual to be performed for the strengthening of his life and sent one Wang-Hiun-tso to India to fetch a Brahman Tantrika who could perform it. In the middle of the 8th century, it has been recorded, there were three Brahman temples in Canton, and Brahman families resident there. China borrowed puppet and shadow plays from India. An Indian musician named Miao-ta was a celebrated figure in China between A.D. 550-577. In fact, Indian music had gained so much ground there that a futile attempt was even

made in the end of the 6th century by Emperor Kao-tsu to ban it by a decree; instead of dying, Indian music spread out to Japan. Three notes of the Chinese gamut bear Indian Svaram-names: Panjam which is Panchama; She-li-she (the sound of the bull) is Rishava; Sha-da-lik or Sha-che, Shadja. Indian sculptors, architects and painters went over to excavate cave temples and carve out and paint images of the Buddhist deities; there is a painting of Ganesa at Tung-Huang, executed in the 6th century. China became indebted to India in astrology and mathematics too. There were frequent requests for Indian astrologers, and the Indian astrological schools Kasyapa, Gautama and Kaumara were current there for three centuries. The Chinese calendar was from time to time revised by Indian astrological works and even calendars were rendered into Chinese. In medicine Ravana's *Kumaratantra* on children and portions of Kasyapasamhita were translated, and a mission was sent to India for collecting Indian herbs. As South India had wide commercial and maritime activity, this Indo-Chinese relation comprised some special contacts in South India. Some of the leading Buddhists that went to China were from Kanchipura. Chinese coins are found in South Indian sites. Goodwill missions and exchange of presents between China and South India are known from the first century onwards. In the 7th century, the Pallava King Rajasimha of Kanchi and the Chinese King kept such personal touch that at the request of the Pallava King, the Chinese Emperor christened the Pallava army and a temple built in Kanchi in honour of himself. During the Chola times three such missions were sent, and a similar contact existed also between the Pandyan King and Kublai Khan.

The school of Buddhism that spread to Japan is known as Zen: Zen is just *Dhyana*; and Bodhidharma who spread this was from Kanchipura.

SOUTH-EAST ASIA

Much more complete and enduring was the influence of India over Cambodia, Siam and the islands of the archipelago. Indeed, in these regions we had for several centuries Hindu kingdoms. No campaigns were undertaken but wave after wave of Hindus, merchants, scholars and others went, married locally, established dynasties, gave the peoples of these countries a script and literature, codes of conduct and government, religion and arts, and brought them up into the light of history. Today, as witness of this great Far East cultural colonial empire of India stand numberless Sanskrit inscriptions, Indian names of places and countries, Indian ceremonial, huge temples and carvings in Indian style and the art of dance and drama. This cultural movement, which went forward, not with flame and sword but with the Ramayana in one hand and Manu in the other, was under the direction of foremost scholars, for firstly the inscriptions found in all these places is not only in correct Sanskrit, but in beautiful poetic style which often-times excels models on the mainland of India; Sanskrit was so well established that some of the Chinese pilgrims who went to India, like Itsing, learned their Sanskrit in these countries before reaching India; secondly, very learned methods of worship and highly original scholarly imagination had been brought into play, with the result that a freedom of expression giving birth to new or fuller realization of forms is seen here. Tantrik worship, the cult of Devaraja, of Siva as the Lord of the mountains, of Vishnu were developed side by side with Buddhism which was

the only tooth paste

CHEMICAL

more prevalent in the islands, and the Trimurtis of these countries comprised Siva, Vishnu and, not Brahma, but Buddha; it is always true that when the people of a country assemble in a distant foreign clime, a new spirit of unity and synthesis develops among them, consciously as well as unconsciously; in these regions of Greater India, there was a blending of Hinduism and Buddhism and a composite form of Siva-Buddha evolved. In India, we are familiar with the Buddha being counted as one of the avatars of Vishnu but in the Far East, the ascetic or yogic conceptions of Siva and the Buddha were much nearer and more helpful for mutual assimilation. Saivism was of course most widely prevalent in Cambodia. In its inscriptions figure a number of Saiva teachers of great learning and austerity, Vidya-pushpa, a Pasupata and poet Somasiva and his pupil Vamasiva, Rudracharya, and a Sivasoma who is said to have been a pupil of Bhagavan Sankara. Agastya was the patron sage of these parts. In temple-architecture too huge proportions which were not quite common in India were resorted to, and the ideal of a temple as the Meru, rising tier upon tier, was realized here, and the supreme examples of which standing to this day are the Hindu Ankor Vat in Cambodia and the Buddhistic Borobudur in Java. In literature, on the analogy of the Ramayana they wrote the Krishnayana, and on the beautiful theme in Kalidasa's *Raghuvamsha* in which King Aja's queen Indumati passes away on the fall of a flowery garland from above, they reared the poem called 'the flowery death'—*Sumanasantaka*. It may be said that the whole civilization here was raised with the Ramayana. India may have produced the epic of Rama but it was in Greater India, in Ankor Vat and Prambanan that you have the richest sculptural representations of the Ramayana; the whole world of Javanese dance and drama is permeated with the Mahabharata and the Ramayana, which they do even now, though formally the peoples had been converted to Islam. In fact, according to some research scholars Lanka where Sita remained in captivity was near the Sunda islands. The mountains in the east described by Sugriva in the Ramayana as the habitat of sage Agastya are in the Indonesian islands. In Funan, a temple was built for Valmiki, the immortal sage who gave us the Ramayana, and copies of the Ramayana and the Mahabharata were presented to it for being recited and expounded to the public. The Brahmanda Purana was known in Java and Bali.

Besides the Sanskrit inscriptions, a number of sacred Sanskrit texts have been used and preserved in these parts; from Bali, Sanskrit hymns and religious texts were secured and edited by the French savant Sylvain Levi. Recently when I was in Paris, I read in the *Bibliothèque Nationale*, photo-copies of a number of Sanskrit texts including Vedic mantras used in daily worship and the purificatory ceremony and coronation of the King in Siam; these were originally written and preserved in the South Indian Grantha script showing South Indian influence and are used by the priests who were Brahmans and still call themselves so, though they have since adopted Buddhism. In Borneo, in its eastern part, have been discovered seven stone Yupas or sacrificial posts; on these are found Sanskrit inscriptions which say that King Mulavarman of that country performed many gifts which were attended and honoured by many Brahmans from different countries.

In music, dance and drama, the Indian arts

travelled to Java and Bali so completely that not only do we derive help from the sculpture of these islands for the understanding of ancient Indian music and dance, but many departments of the music accompaniment of ancient Indian drama and of ancient Indian dance can be better understood and reconstructed by what survives in Javanese *wayangs* and Balinese dances.

Looking at the history of this expansion, we find that in the case of Java, both Gujarat and South India took part in this activity. Even now a newcomer is called in Java Kling, i.e., Kalinga, which is Orissa. One Kaundinya, a Brahman from the South, went forth to Cambodia and was responsible for laying the foundation of Hindu culture there. The heyday of the Hindu Brahmanical rulers of Cambodia extended from the 6th cent. to the 12th cent. From the 7th to the 14th cent. there was a powerful dynasty called the Sailendra which held sway over Sumatra and part of Malay; it came into friendly as well as hostile contact with the South Indian Chola kingdom and Rajendra Chola sent a maritime expedition against the Sailendra King Sangrama-vijayotungavarman and brought as trophy his arch of triumph. In Nagapattinam, on the coast in Tamil country, the Sailendra King built a Buddhistic monastery called Chudamani-varma-vihara. One of the Sailendras built also a monastery in the Buddhistic University of Nalanda in Bihar. Great builders, it is they that gave us the magnificent temple of many Buddhas,—Borobudur.

Ceylon, Burma and Tibet, three countries very much closer to India, simply grew like children nestling in the lap of the Mother. Buddhism was introduced into Ceylon in the time of Asoka; along with Burma it forms the greatest home of Pali Buddhism or the Hinayana school as against the Sanskrit Buddhism of the Mahayana which spread across to Central Asia and went to China. Ceylon, also connected legendarily with the Ramayana, was in close cultural contact with South India and the Tamil Chola Kings invaded it and annexed it. So that, from South India, Ceylon received Sanskrit and Tamil influence in literature, religion, dance and drama. Burma was referred to as Svarnabhumi and colonists went forth there from Bengal, Banaras and Ceylon. One of the derivations suggested for Burma is Brahma. Besides, Buddhism, Hinduism also had some vogue there and a Tamil inscription too has been

found here. Tibet, like China, took to Buddhism; and in the large corpus of Tibetan translation, there are many Sanskrit works which are no longer available in their originals in India. Tibet became the home par excellence of Tantrik Buddhism.

SOUTH AMERICA

We cannot say anything definitely about Indian contacts of the far-flung *Polynesian islands*, except that the original inhabitants here turn towards India when they bow to their ancestral home. More has been written upon *South American civilization* and the possible Indian sources. I have gone through about 30 Archaeological Reports and books pertaining to this civilization and presented together in a Tamil contribution of mine all the available indications of Indianism in the remnants of the culture of the Mayas, Incas and Aztecs which have escaped destruction at the hands of Spanish missionary settlers who came there after the discovery by Columbus. The possibility of Indo-American contact in the geological period of the submerged Limuria, the Maya, Inca and Aztec memories of their having come by ships from the direction of India, resemblance of facial features, of streets and houses and of the magnificent temples and worship,—all dispose one to accept Indian connection rather than reject it.

Authorities on this subject like J. Eric Thompson, author of the *Archaeology of South America*, have also drawn attention to the find of Indian cotton, elephant drawings featuring the animal according to specimens known in India and Sumatra, the use of the Indian-discovered zero and decimal system, occurrence of Indian edible herbs and plants, and the art of dyeing—all of which point to a migration of culture from India through Indonesia. According to Hewitt, Mayas might have been the Maghas of Iran and India and Nahuas might be related to Nahusha. Pedra de Cieja says in his *Chronicle of Peru* that the 'Amanta' was a companion and guide and adviser of the King here; this corresponds to Amatya, the Sanskrit word meaning 'one who stands by the King' or the Minister. Harold T. Wilkins has worked out in his book on the *Mysteries of Ancient South America* the similarities of the South American letters and those found in Tibet and Indian inscriptions. George Torres Quintero points out in his study of Education among the Ancient Mexicans that the society was organized into four groups, Kings, Teachers, Cultivators and Workers, that vocation was hereditary, and that the first two groups were held to be higher in status and between them the King and the Teacher controlled everything—all of which strongly reminds one of India. They worshipped the Sun whom they called Vira which may be Viraj; in worship coaches were blown, incense burnt and flowers profusely used. Omens in the sounds of birds and beast were believed

in; ear-boring was prevalent; a sacramental second name (Samskarnama or namakarana) was in vogue; but what is more surprising is that, as Mr. Thompson says in his *Civilization of the Mayas*, this second naming was considered a second birth—a surprising parallel to our 'Dvi-ja'—the twice-born. Birth and death alike were considered as causing pollution, *asaucha*; in separation by death, shaving of the head was known as a mark of grief; mensus-pollution was observed by women. Something like our Sraddha was also done for the dead ancestors. In higher thought, they believed in a Soul and in rebirth and a kind of penance and yogic discipline were also practised. In their temple architecture, we have striking resemblances to our Gopuras, Prakaras and thousand pillared halls. Like India, ancient South America worshipped the Sun; Incas called themselves descendants of the Sun; Ina in Sanskrit means Sun; apart from their adoration of the Sun, the snakes or Nagas or other deified beings like the Makara-fish, they believed in a higher impersonal Divine Being too which may not be much different from our Brahman. I may here narrate an illuminating conversation recorded by Ralph L. Roys in his book *Indian Background of Colonial Yucatan*. When the Spanish missionary first asked the native South Americans about their God, they replied: 'The real God is only one; He has neither form nor name; how could we have an image of Him when he has no body?' The reply might well hail from an Upanishad.

The above account would show how we had not been pure home-birds in the past. Today again we are, in the pursuit of different modern avocations, in all parts of the world. The scientific and technological advancement of the West has left us, the ancient *gurus*, very much behind. But the West still looks to us as the apostles of wisdom. Ever since the Gita and the Upanishads were made available in an European language, in 1785 and 1801, Indian philosophy has exerted visible as well as invisible influence on European thought and literature. The Vedanta and the Yoga of India are today studied all over the world. The yogic discipline, transcending the purely medical sphere, offers a unique method of regenerating and reconditioning the human system and the Vedanta teaches a universal oneness in which the world may end all its competition and enmity and realise in truth the peace of the 'one world' which is uttered as an airy slogan today. Several Hindu cultural missions are no doubt working in the different parts of the world spreading through art, literature and philosophy the message of India, but the fulfilment of this message is nearer when everyone of us abroad is imbued with the true spirit of Hindu culture and functions as a true embodiment and effective conductor of that energy.

Glimpses of the History of India

On the Russian Edition of Nehru's *Discovery of India*, N. Pastukhov writes as follows:

Wide circles of the Soviet public display a great and natural interest in the history of the great Indian people, their heroic struggle for freedom and independence and in their rich ancient culture and art. This interest has not been born overnight, it has age-old traditions. A considerable number of Indian historic, journalistic and fiction writings has been translated into Russian.

The Soviet reader welcomes the appearance of *The Discovery of India* by Mr. Jawaharlal Nehru, Prime Minister of India.

The history of India can provide a great number of splendid examples of heroism displayed by the Indian people in the course of their struggle against foreign oppressors, it speaks of their love for creative labour, freedom and peace. Nehru's book which has been published in the Russian translation by the Foreign Literature Publishing House treats of these characteristic features of the Indian people. In his foreword to the Russian edition Mr. Jawaharlal Nehru wrote on May 28, 1955:

"I am happy that my book *The Discovery of India* is being translated into the Russian language. This book was written twelve years ago when I was in prison and war was waging in a great part of the world. It reflects the mood and my thoughts of that period.

"These past ten years have brought great changes in the world and already we seem to be far removed from the early forties of this century. But the book deals chiefly with the long past of India, and it might help a little perhaps in understanding the background of this ancient country. Perhaps also it will help in giving some understanding of the events which conditioned the present generation in India.

"Within a few days I hope to travel myself to the great country, the Soviet Union, to see for myself what I have read about so much and to gain some understanding of the forces that have contributed to the building up, in the modern age, of this great and vast country which is exercising such a powerful influence over the destinies of the world. It is a special pleasure to me that this book, the product of the solitudes of my prison life, should now find a clothing in the Russian language."

Chapter One of the book recalls the grim years of the Second World War. Mr. Jawaharlal Nehru condemns the Japanese aggression in China and the Italy's aggression in Ethiopia. He speaks wrathfully of fascism against which peoples of the anti-Hitler coalition were waging a courageous struggle at the time. The book exposes the policy of so-called "appeasement" carried out by Britain and France with respect to fascist Germany, and emphasises that "there was behind it not only a fear of Hitler, but a sneaking admiration for him."

Mr. Nehru was an uncompromising opponent of fascism. Despite "a pressing invitation" from Mussolini to see him Nehru bluntly rejected the proposal.

Chapter One, among other things, appraises the importance of the Great October Socialist Revolution and its influence on the destinies of the world. The October Revolution, in Nehru's opinion, "had advanced human society by a great leap."

The subsequent chapters are dedicated to the history of India from ancient times. The approach to the subject differs fundamentally in spirit from hundreds of books written by British authors, Elphinstone, Lyall, Vincent Smith, Moreland, the authors of the six volumes of *Cambridge History of India* and others. Nehru aptly remarks that "the histories of India that most of us have had to read, chiefly written by Englishmen, are usually long apologies for and panegyrics of British rule and a barely veiled contemptuous account of what happened here in the millennia preceding it. Indeed real history, for them, begins with the advent of the Englishman into India."

The chapters of the book dealing with the history of India abound in material of great cognitive value. They contain a description of those majestic architectural memorials of ancient India—Mohenjo-Daro,

and Harappa—built over 3,000 years before our era. Mohenjo-Daro and Harappa maintained close ties with Persia, Mesopotamia and Egypt. Even at that remote period Indian cities used cotton for textiles; drainage system and public baths already existed; there were two-storeyed private houses made of baked bricks, with bathrooms and other subsidiary premises. "It is interesting to note," Nehru observes, "that at this dawn of India's story, she does not appear as a pulling infant, but already grown up in many ways."

The historic chapters tell of the birth of various religious dogmas in India, Hinduism in particular; the Vedic period in the history of India is dwelt upon, as is the Upanishadas period; the emergence of castes and the spreading of the caste system is described. The book provides interesting information about the development of science and arts in ancient India. As early as the sixth or seventh century before our era Panini, a scholar of the ancient times, wrote his great grammar of the Sanskrit language. The book lays an emphasis on the fact that Professor Th. Scherbatsky referred to the book as "one of the greatest productions of the human mind."

The appearance of such epic works as the Ramayana and the Mahabharata was a glorious landmark in the history of India. The Ramayana is an epic poem, the Mahabharata is a collection of ancient lore. Both epics took their final form by the beginning of our era. "It is really the Mahabharata that is one of the outstanding books of the world," Nehru points out. "It is a colossal work, an encyclopedia of tradition and legend, and political and social institutions of ancient India."

India's ancient culture is, first and foremost, a monument to Indian people's love of labour, to their wisdom and talent. Afanasi Nikitin, the first Russian traveller to visit India, remarked several centuries ago on these traits of character of the Indian people. Soviet people who had a chance to visit India speak and write of this, too.

Those who admired the wonderful frescoes of Ajanta and Ellora, the intricate marble lacework of the Taj Mahal, a pride of Indian architecture. Jaipur palaces and the temple of goddess Minakshi in Madura, are unanimous in their conclusion: the people who built all this with their own hands have not only a great past but a wonderful future ahead of them, too.

The book further narrates the historic developments in India of the middle ages, up to the invasion of the country by European colonisers.

The book furnishes material valuable from the cognitive point of view, and many of its chapters are dedicated to the problems of the development of society. It should be mentioned here that the Soviet reader will not agree with the treatment of some cardinal problems of the development of society. This refers in particular to the negation of the role the class-struggle plays in the development of society, to the appraisal of the role of the working class,

peasantry and the Communist Party in the national-liberation movement, and to some other questions.

The book, however, contains valuable material making it easier for the Soviet reader to understand the historic destinies of the great Indian people. *The Discovery of India* tells the reader of the grim colonial heritage left over to the Indian people by foreign oppressors. Chapters on the two-centuries long rule of the British imperialists in India provide the Soviet reader with a better outlook of the greatness of the struggle waged by the Indian people in our days for the elimination of the consequences of colonial rule and for all-round development of their country.

The British colonisers, writes Nehru, ruined the Indian textile industry. Throughout the 19th century other Indian industries were also broken—ship-building, metalwork, glass, paper and many crafts. Analysing the level and consequences of colonial domination the author draws the following conclusion: "The classic type of modern colonial economy was built up, India becoming an agricultural colony of industrial England, supplying raw materials and providing markets for England's industrial goods."

The consequences of the British colonial rule in India are described in the following words: "Nearly all our major problems today have grown up during British rule and as a direct result of British policy: the princes; the minority problem; various vested interests, foreign and Indian; the lack of industry and the neglect of agriculture; the extreme backwardness in the social services; and above all, the tragic poverty of the people . . . Imperialism must function in this way or else it ceases to be imperialism."

For ages the peoples of India had been discriminated against by the colonial powers. [Until now] the Indians, just as Negroes and other "coloured" people, are persecuted on account of their race in countries where colonial regimes have yet been preserved. Mr. Jawaharlal Nehru wrathfully condemns racial discrimination, this condemnation being expressed in *The Discovery of India* and in his subsequent political statement. ". . . We in India," writes Mr. Nehru, "have known racialism in all its forms ever since the commencement of British rule. The whole ideology of this rule was that of the *Herrenvolk* and the master race, and the structure of government was based upon it; indeed the idea of a master race is inherent in imperialism."

As vividly shown in the book the freedom-loving Indian people have never reconciled themselves to the colonial subjugation. The history of India knows of many bright instances of a heroic struggle waged by her finest representatives against the foreign oppressors. This struggle invariably roused the admiration of the Soviet people. The book emphasises the fact that the Soviet Union exerted a tremendous influence on Indian fighters for peace and independence.

"But most of all we had the example of the Soviet Union, which in two brief decades full of war

and civil strife, and in the face of what appeared to be insurmountable difficulties, had made tremendous progress. Some were attracted to Communism, others were not, but all were fascinated by the advance of the Soviet Union in education and culture and medical care and physical fitness and in the solution of the problems of nationalities—by the amazing and prodigious effort to create a new world out of the dregs of the old."

The defeat of Hitler Germany, fascist Italy and militarist Japan in the Second World War weakened the camp of imperialism. A mighty national-liberation movement developed in the countries of Asia and Africa, whose peoples advanced the demand for freedom and independence of their countries.

The British imperialists were not willing, however, to surrender their colonial positions in India. Churchill, who was at the time the inspirer of British imperialist policy in India, admitted cynically that Britain had no intention whatsoever of parting with India. Churchill's words to this effect are cited in the book: "We have no intention of casting away that most truly bright and precious jewel in the crown of the king, which more than all our Dominions and dependencies, constitutes the glory and strength of the British Empire."

Commenting on this statement Mr. Nehru writes: "India was the empire, it was her possession and exploitation that gave glory and strength to England and made her a great power. Mr. Churchill could not conceive of England except as the head and possessor of a vast empire, and so he could not conceive of India free."

The tempestuous growth of the anti-imperialist movement in India threatened to develop into a general uprising of the Indian people against the colonisers. To avoid this Britain granted India in 1947 the rights of a Dominion following the division of her into two parts—India and Pakistan. National governments were set up in both Dominions. The Indian National Congress Party came to power in India, and the Muslim League in Pakistan. Since 1950, India is a Republic in the British Commonwealth.

The appearance of *The Discovery of India* in the Russian translation is an important event. The acquaintance of the broad Soviet public with the book written by the outstanding Indian statesman will help to promote friendship, co-operation and mutual understanding between the two great nations for the benefit of universal peace and security.—*Pravda*, June 5, 1955.

Indians in Mauritius

B. Bissoondoyal writes in *Contemporary Review*, June, 1955 :

There are today some four million Indians outside India who have settled for the most part in British colonies. One of every twelve overseas Indians lives in the little South Indian Ocean island known by the name of Mauritius. This Crown colony was the first to receive Indian immigrants in the early thirties of the last century. Slavery had been abolished and manumitted slaves had developed so great a disgust for all agricultural work that they decided not to till

the soil any more. History records that half of them died as a direct result of this misplaced aversion. Mauritian planters were faced with ruin. It is then that they had the idea of getting cheap labour from India, an agricultural country where labourers had low wages. Even before the advent of the British this island had a sprinkling of Indians. The French occupied the island in the first decades of the eighteenth century. They were fortunate in having Labourdonnais as one of their early governors. Labourdonnais, "the greatest of all governors of Mauritius," turned the island from a wild forest into an inhabitable spot. And in this stupendous task he had the willing co-operation of Indian artisans he had brought from Pondicherry and other parts of French India that is now fast disappearing. The latter gave so good an account of themselves that Godeheu wrote in his diary—a historical document of no mean importance—that they richly deserved a long leave that could enable them to go back home where their countrymen would be prevailed upon to go out to Mauritius in greater numbers.

It is in 1810 that the British captured Mauritius or, to be more exact, *Ile-de-France*. They came all the way, from India and had thousands of sepoys with them. The General that led the expedition congratulated "both the officers and the soldiers, whether they were Indian or European" on their feat. So before the advent of labourers, Indian artisans and soldiers had reached Mauritian shores. The first British Governor came from India. While he was in the Indian Civil Service he had ample opportunity to see that Indians could only be a valuable asset as they were spend-thrift and industrious. It occurred to him that even convicts from India could help to develop the land. Indian convicts came as early as 1815 and they justified his hope. Stalwart Indians were seen constructing the main roads. Darwin felt drawn to them during his historic stay. The convicts were for the most part "Sepoys who had been guilty of military insubordination or political offences . . . They bore their exile with all the indifference of their race. The only crime of which they were known to be guilty was the murder of one or two of their inspectors, by whom they had been treated with cruelty." There were too some Indians who were plying their trade in Port Louis the capital. They had come mostly from the Punjab and Gujarat. "Skilled craftsmen and engineers from Madras and Pondicherry" also were contributing their mite.

As we have seen, the trying need for Indian labour was responsible for the arrival of another

class of Indians. Nor were they less useful. Their piety, patience, temperance, gentleness and courtesy at once earned them the praise of those under whom they worked. The efforts they put forth led the planters to apply for more labourers. Tens of thousands of Indian immigrants arrived in quick succession so that one fine morning in the second half of the nineteenth century the Indian minority became a majority. The immigrants came to stay. Their children began to go to school. In 1865, the then Superintendent of Government Schools wrote that "their mental capacities are of no inferior order." The son of an immigrant topped the list of the successful candidates that sat for the "Pupil Teachers' Comparative Examination" held in 1864. Despite the progress achieved by a handful of

Indians the masses remained inarticulate for more than half a century. If the world came to know at times that the masters were not always kind to them it was thanks to the humanitarianism of the members of the Anti-Slavery Society that would not brook the inhumanity of men who ought to have known better than to bully genuine co-operators who could turn every idle hour to account. The indignities suffered by the immigrants were materials that were made common coin by numerous contributors to *The British Friend of India*, a London periodical. Once numerous Indians resolved to suffer imprisonment in pursuit of justice.

The period that preceded the arrival of Gandhi was markedly dull. His visit is a landmark in the history of Mauritian Indians. He landed here towards the close of 1901. Hindus and Muslims vied with each other to welcome him. His fame had spread far and wide as a consequence of the victories he had scored in South Africa. The newspapers of the day shed their chauvinism for once. The honour of his visit overwhelmed all Mauritians. Mauritius Indians stepped into a new era. Their illustrious countryman was given a warm welcome wherever he went. The press agreed that his stay was a historic one although he was our honoured guest for only a fortnight. Gandhi chalked out, as it were, a programme for the future. He admonished the Indian traders and labourers to send their children to school. The traders were absorbed in their business and never so much as dreamt that education was desirable. Anybody else's admonition would have left them cold. Mr. Gandhi was a genuine guide, so the lesson was not lost upon them. He did not come on a fruitless errand. Our guest had said in a memorable speech that was as lengthy as it was interesting that Indians had come of age and should accordingly be interested in Mauritian politics. He spoke with unrestricted frankness. His words came as a very invigorating tonic.

This well-meant and timely advice helped Mauritian Indians out of their difficulty. But for three decades or so all about the visit paid to Mauritius was clean forgotten. Years passed uneventfully. Many Indian planters had grown rich after World War I when there was a phenomenal rise in the price of sugar. Except for the generous act of the Indo-Mauritian planter who spent tens of thousands of rupees to erect a munificent building that housed a school in his native village, the Indians were practically inactive.

An interval elapsed between Mahatma Gandhi's visit and the new awakening witnessed among the Indo-Mauritians of late. The relentless efforts made in almost all fields of activity by an element that was politically non-existent at last bore fruit. The country was awarded a new constitution in 1947. The important Indian languages that are spoken in the island obtained official recognition. Adults of both the sexes who can read and write simple sentences not only in English or in French but also in Hindi, Tamil or Gujarati can now become electors. The number of electors increased six-fold, rising from 12,000 to 72,000. The Indo-Mauritians captured 11 seats, the Coloured 7, and the Whites obtained 1 seat at the General Elections held in 1948. The 1953 Elections had the same results with this difference that instead of 11 Hindus this time 10 Hindus and 1 Muslim were returned. The elders had had their innings. The con-

temporaries followed in their footsteps. At one bound they became a force in the country. A new epoch set in. Nor do the latter as a whole prove unworthy of the trust placed in them. Their heart bleeds when the common fatherland does not receive its due. Last year, some members of the Legislative Council expressed the wish to send a delegation to London. An Indo-Mauritian member who has a good grasp of questions relating to Mauritian affairs hinted that even if the delegation were to reach London, the apathy of the British press would nullify the effect it could produce; if that press remained what it is it would only place a tiny and neglected colony like Mauritius at a great disadvantage. That idea had been expressed sincerely. And it did not go unnoticed: a British weekly wrote: "He (the Indo-Mauritian member) shows an unfailing knowledge of our press and its attitude to colonial problems." He who is today anxious to serve his fatherland shows the same solicitude that his immigrant forefathers showed in days gone by.

Gandhi was of the definite opinion that Indians should throw in their lot with their non-Indian neighbours. He said once: "When I was in South Africa, I tried to use as many things as I could made by African hands." Except for a spell, his message, has, across the decades, kindled in the Indo-Mauritian's heart the desire to be of some service to the land of his adoption. This is why he has ceased to be a mere looker-on. It is the Mahatma's liberal-mindedness that endeared him to one and all. His words are echoed and re-echoed today; but unfortunately for us few are the Indo-Mauritian leaders whose gestures are approved of by the non-Indian press. The others are too often thrown off their balance. They fall foul of a certain section of the Mauritian community only because that section happens to belong exclusively to one race, and are full of praise for another only because it differs racially from the one that is looked down upon. The redeeming feature is that the masses are not prepared to do the bidding of those who think in terms of race or the like. At this critical juncture communal harmony is a desideratum that cannot be valued too highly. It must not be merely a pious wish. Indo-Mauritians are 335,000 strong as against non-Indians numbering 165,000, i.e., they number 67 per cent of the total population. Any rash act that can lead non-Indians to believe that they are being overpowered by sheer numerical strength will have disastrous results. Indo-Mauritians have no wish to migrate to India, the country of their forbears. They have made their own the island that required their labour. So far they have not been guilty of any offence that can mark them out as enemies of the land. If they do not allow themselves to be misguided by the counsel of despair, their presence will no doubt be hailed as a blessing. It is a happy sign of the times that the good example set by Mahatma Gandhi is influencing in the right direction all those who are here not to disturb the peace of the island. Nor is the interference of the disturbing element, undesirable as that is, felt as a serious difficulty. Spade-work has been done with astonishing rapidity. It now remains for all elements to be tolerant enough to let a country that is only a speck on the globe continue to enjoy the reputation of being a tiny and quiet spot.

NOTES

Moral Values

A few years ago we saw a book that gave a survey of *Morals* in Britain, in the fifty years from 1900—1950. Sex-morals were included but in a minor way. The measurements taken were principally of Moral values, as obtaining at the turn of the century and as prevailing today, where Britain was concerned. Needless to say, the survey, which was made by a group of eminent research workers in social and economic affairs, indicated a change for the worse in every way, although the findings were as cold, dispassionate and unbiassed, as should be, from the point of view of a detached sociological study.

It is about time such a survey was made in India, of Moral values, by a group of completely impartial research workers. We believe the results would be startling.

We are not writing a denunciatory sermon, nor are we launching upon a tirade against the powers-that-be. We are constrained to write in this tone because we find that the foul murders recently committed in Barabanki, do not seem to have left any impression on the minds of the thinking public, nor did it attract the attention of Authority, excepting an almost casual reference, in the best official pattern, in the Uttar Pradesh Assembly. We quote the report in the daily press:

"Lucknow, Oct. 17.—Yet another member of the U.P. Assembly has been killed, and again in Barabanki district.

"The victim of yesterday's mob violence in the village of Baddupur on the Barabanki-Sitapur border, was Mr. Avadh Saran Verma who belonged to the P.S. Party. It was a case of double murder, the other victim being Mr. Siaram, a local P.S.P. worker.

"According to first reports the incident took place at a public meeting which was raided by an armed mob of 500. The murderers took away the bodies of their victims.

"Mr. Avadh Saran Verma died while trying to save the life of Mr. Siaram. While the meeting had been in progress for some time it was suddenly overwhelmed by the mob armed with lathis and shouting that they wanted to kill Mr. Siaram who was at the meeting. The mob yelled the warning that nobody should come in its way and demanded Mr. Siaram. Mr. Verma rose to the defence of Mr. Siaram, who was being attacked. He covered Mr. Siaram with his body. Both were cruelly done to death.

"On September 7 Mr. Bhagwati Prasad Shukla, a Congress M.L.A., was shot dead in broad daylight in Barabanki town.

"News of the latest outrage was given to the House by Mr. Sampurnanand, the Chief Minister, and on his request the Speaker adjourned the sitting for the rest of the morning.

"Mr. Sampurnanand said that Mr. Avadh Saran Verma was 40. He was a prominent nationalist worker of the district and had been to prison twice. He had a pleasant disposition and a

remarkable gift for making friends which he said other members of the House would testify. The manner in which he met his death was in keeping with his character. He died while trying to save another person."

The scanty reports that have appeared in the Press indicate, beyond all doubt, that the murders were premeditated and that the plans were known to the local authorities in charge of law and order prior to the mass-attack.

It has been made out that the murders were the outcome of a private feud. But it seems most curious that a private feud should result in a mass-attack on a political assemblage in a public place and in broad daylight. As investigations are presumably proceeding we shall not expand on the matter.

What we would like to impress on Pandit Nehru, who after all is a Uttar Pradesh whatever his Brahmin sub-caste might signify, that it is about time to enquire as to why moral values are degenerating in his home province. We do not mean to say that any other province is better placed in that respect, but the Uttar Pradesh, being the biggest, should naturally be the best example of progress, of social and moral uplift and of culture. It is up to Pandit Nehru and other prominent representatives of the Uttar Pradesh, to find out which way their province is proceeding.

The Man Singh chapter has not yet been closed. An unbiased historian, if allowed to investigate the causative and subsidiary factors that led to the immense growth of power and influence of that band of freebooters, would unearth factual material that would astonish and shock all right-thinking men. The complicity of men in authority, the direct contact with Congress leaders and the wholesale corruption of the lower ranks of services, that enabled Man Singh's myrmidons to levy tribute over three States, is common knowledge in all that area.

But why pick up the Uttar Pradesh? There is a general down-the-grade movement all-round and all over India. Corruption, theft and bribery is rife in the railways, as never before. The Police record, bad as it was in the past, has reached a "new low" in majority of States, although individuals are trying their best to reform and reorganise that body where corruption has been endemic since the days of John Company. In this work they are actively

hampered by Congress bosses, most of whom are no better than the worst gaol-birds, where integrity and moral purity is concerned.

The Post Office, which had a fine record of service in the not-so-distant past, has degenerated beyond count. It is now "self before service" in every case, and time has become a secondary consideration in all cases excepting that of pay. The telephone service also has degenerated beyond measure.

What is the root cause of this flood of corruption that is tending to plunge the entire country into a morass of evil urges and indiscipline? We believe it lies in party-politics and the consequent degeneration of the Congress. For the Congress today is like a festering marsh of corruption in all States and at the centre. And the evil is spreading even into the realms of *Sarvodaya* and the allied programmes.

Khaddar used to be a symbol of Truth, Pure Ideals and Self-Abnegation. Today it stands for corruption and rapacious self-interest in the vast majority of cases. Those at the top are satisfied with self-aggrandisement, being drugged with flattery to a state of ecstatic Narcissism. But their myrmidons are wide-awake to the main chance, and no ethical consideration is allowed to stand in the way of those vile blood-suckers.

Millions are being spent for the spread of the *khaddar*, spinning as well as weaving. It pains people like ourselves, who have tried to abjure all evil passions, to the best of our conscious powers, with the wearing of *khaddar*, to see that 90 per cent of the money is on the way of being wasted, through misappropriation and through waste. A check survey by any group of non-political auditors would confirm our statement. And the same is the case of every Congress or Congress-Government-sponsored betterment effort, be it Cottage Industry or Community Projects. The men in charge, almost without exception, do not believe in anything else but self-interest and self-advancement.

India is progressing, in the terms of concrete and steel and material output. But the very soul of India is being corrupted, through the total rejection of moral values, as being of no account in this world of Statistics and Plans.

We have adopted the old Tammany Hall methods as our ideals, so what else could be expected? Unless the Congress is purged free

of all the intrusive elements of evil, the future is black indeed.

The Barabanki incidents are merely indicators, as were the acts of violence perpetrated by Hitler's supporters like Roehm, in the early days of the Nazi Party. We are not inclined to believe the story of private feuds, unless substantial proof is forthcoming. Indeed, we shall be very pleasantly surprised—and astounded—if the real culprits are ever brought to book in this case.

It is no use prating about *Sarvodaya*, about soul-force and about India's mission of world uplift, unless the speakers are willing to forswear the vices of self-aggrandisement, addiction to flattery and fetishism. Where the Nation is concerned, these vices are even worse than alcoholism or plain theft. Super-Brahmins of the old days brought seven centuries of slavery and abject degradation on an India that was materially the most prosperous and advanced in the world of the early mediaeval days. Our Super-Brahmins, through their craze for fetishes and a totally un-Gandhian lack of humility and self-introspection, are leading the country the same way.

The writing is on the wall. Would our Nebuchadnezzars take a lesson in history from the ancients?

The Sugar and Wheat Racket

Calcutta is a city where the markets are in charge of groups of racketeers, the equal of whom is hard to find anywhere else. Last year the citizens of Calcutta were mulcted to the tune of over a crore of rupees through the black-marketing of wheat, sugar and cloth. This year there is a repeat performance. The State authorities, be it said to their credit, took firm action in the matter of cloth. But in sugar and wheat they were powerless as the following news report indicates:

"Calcutta's sugar market has been showing signs of instability during the last few days. This is suspected to be the result of speculation by traders taking advantage of the increased Puja demand.

"During the last four or five days, the price in the wholesale market has increased by over 8 annas a maund. As is always the case, the increase in the retail price has been disproportionately high—about one anna a seer. of Rs. 2-8 a maund.

"To check the rise and help stabilize the market, the Government of India has decided to release imported sugar from its stocks in the city at a reduced price, the reduction being 8 annas a maund.

"For similar reasons the Government of India has agreed to resume direct sale of imported wheat from storage depots in Calcutta."

Last year representations were made to the then Minister-in-Charge at Centre, the late lamented Rafi Ahmed Kidwai, and he was finally convinced of the necessity to investigate whether those in charge of distribution were involved in the racket. Unfortunately his sudden demise upset all the programme.

We would like to enquire whether the Centre still has the same officers in charge and control in Calcutta as it had last year. It is most curious that the racket developed and went along the identical lines as in last year. This year too the public has been defrauded out of their hard-earned moneys to the same tune and on the same items.

In any case, we consider that there is a case for enquiry at the top. This racket could not have been repeated without those in control being either totally inefficient and careless about public interest, or being corrupt.

States Reorganisation X

If inconsistency is a virtue of the great then the members of the States Reorganisation Commission have certainly attained greatness through their report. For that document may be regarded as being remarkable in its inconsistencies and illogical deductions. The only consistency lies in the adherence to the principle, "What is sauce for the gander is not sauce for the goose."

Let us not cavil at the start on account of those incongruities and inconsistencies. It should be taken into account that the Commission had been set a very hard task, and it should also be put to the credit side that they have worked hard in striving for a solution, in the face of claims and counter-claims.

That they have not succeeded in formulating an impartial solution, in which strict justice had been meted out, is due mostly to the political and parochial hulabaloo that had been set up by those who wanted to stick to their possessions, justice or humane considerations notwithstanding.

What is more difficult to excuse, is the constant shifting of ground in order to suit the requirements of political exigency. The shift starts right from the formulation of the main premises, in which linguistic considerations were pushed aside, as being of no consequence. In this matter let us quote Gandhiji and Pandit Nehru, as given in the columns of the *Harijan*, in the matter of languages and linguistic redistribution:

"The redistribution of provinces on a linguistic basis was necessary if provincial languages were to grow to their full height. Hindustani was to be the *lingua franca*—*Rashtra Bhasha*—of India, but it could not take the place of the provincial tongues. It could not be the medium of instruction in the provinces—much less English. Its function was to make them realize their organic relationship with India."

"I may note here an observation of Pandit Jawaharlal Nehru which is very apt and pertinent in this connection. He said that all our Indian languages are our national languages; Hindi as defined in Article 351 of the Constitution of India will have the distinction of being used for inter-State and all-India intercourse, as it is known to the largest bulk of our people."

Now Pandit Nehru is attempting to further the argument advanced by the Commission. On October 30, he made the following statement in a public address at Surat:

"Shri Nehru asked the people to eschew petty things, parochialism, casteism and narrow outlooks."

"Shri Nehru deprecated bickerings in the name of religion, region or language which, he said, would hamper the nation's progress."

"Shri Nehru said: 'We have made some progress during the past few years. Given some time, we shall achieve more. But it is not the progress of a few. It is the progress of everyone. In a democracy in a people's Raj, the people have a greater responsibility. Unless they understand and fulfil their responsibilities, we cannot progress.'"

"We should not, therefore, be lost in futile controversies and rivalries and lose sight of the goal."

"Shri Nehru characterised 'talk of socialism and revolution as childish' and said, 'Many talk freely of a militant policy, a struggle and a revolt

against the existing order of things. A socialistic pattern of society means equal opportunities for everyone and a welfare State. For this we have to work. Mere struggles and movements are counter-revolutionary. How can you bring socialism in a poor country? We have to first work and produce the goods we need. Then we can talk of distribution. Can we divide and distribute poverty amongst our people?"

"Shri Nehru said that those who talked in the name of a region or language forget for the time that we had to rise or fall as a nation. 'Every-one of our languages has to be cultivated. We shall have to, of course, adopt one language for the whole country. We shall have to learn even foreign languages, especially English, if we have to know the world.'"

"The reorganisation of the States is just for administrative convenience. We do not become a separate State and independent of India, if we are organised on the basis of a language. 'We should not get lost in small quarrels. We should put down in a determined way such parochial tendencies.'"

Prior to that address, he had made a statement in which he expressed himself as being strongly in favour of the Centre acquiring powers to safeguard the rights of minorities in every State, which is one of the recommendations of the Commission.

Both the recommendation and its support by Pandit Nehru can have only one meaning, which is that in certain States linguistic minorities are being denied their constitutional and fundamental rights by the State Governments concerned. It also means that the Commission was convinced of the correctness of that accusation against those State authorities and that Pandit Nehru is also aware of that fact.

It is about time Pandit Nehru understood that the Union cannot be established on firm foundations unless Party-Caucus rule is replaced by a truly democratic form of Government. In most States, as at the Centre, everything is run on party lines.

If that be so, then what is the point in talking of People's Raj, of the nation's progress and so on and so forth? In a country where any substantial minority has outrages perpetrated on them by those in power, all talk of progress and of People's Raj is just moonshine.

Problems of Indian Shipping

India is a maritime country with a coastline of about 3,500 miles; but India hardly owns 2 per cent of the world shipping tonnage. The second world war gave a crushing blow to the Indian shipping strength as it came down from 125,000 GRT in 1939 to a mere 75,000 GRT at the end of the war. In coastal trade the share of the Indian shipping was only 12 per cent and in foreign trade it was barely 2 per cent. Since the attainment of independence, the Government of India took up the cause of Indian shipping and announced a national shipping policy. The tonnage was raised to 280,000 and the share of Indian shipping in the coastal trade increased to nearly 25 per cent. The Shipping Policy Committee in 1947 recommended a target of 2 million tons. Under the First Five-Year Plan, the shipping target was placed at 600,000 GRT to be attained by 1955-56. The total tonnage at the end of the fourth year of the Plan is expected to reach 4,81,739 GRT. There will be further additional tonnage following the acquisition of several vessels by some shipping companies. For the expansion of shipping a sum of Rs. 19.45 crores was originally provided in the First Five-Year Plan and this was subsequently raised to Rs. 23.16 crores.

The following table will give an idea of the comparative tonnage of merchant fleets of the countries of the world: (In thousand tons)

	No.	Gross Tons	DWT Tons.
U.S.A.	3,346	25,483	35,930
U.K.	2,538	17,522	22,876
Norway	1,056	6,559	9,379
Japan	598	3,242	4,760
France	589	3,540	4,330
Italy	581	3,634	4,688
USSR	581	1,729	2,284
Sweden	576	2,492	3,684
Germany	558	1,992	3,098
Panama	519	3,935	3,925
Netherlands	507	3,083	4,042
Liberia	363	3,487	5,452
Spain	285	1,070	1,420
Denmark	315	1,451	2,099
Finland	215	643	967
Brazil	192	753	1,058
Greece	198	1,148	1,707
Argentina	146	908	1,171
China	143	424	601
Australia	131	480	644
Turkey	129	459	631

India	97	458	674
Portugal	92	441	540
Canada	86	358	403
Belgium	76	439	602
Others	876	3,528	7,789
Total	14,793	89,258	124,754

During the first three years of the Plan, only a sum of Rs. 6.54 crores was employed in the ship-building industry. With the subsequent relaxation in the terms of the loans given by the Government of India to the shipping companies, the latter have availed themselves of Rs. 23 crores as loans. From the year 1946 to March 1955, 15 ships have been constructed by the Hindusthan Shipyard which is now owned jointly by the Government of India and the Scindias. The progress of the Hindusthan Shipyard is not very satisfactory and its plan is said to be faulty by experts. The team of French experts that was appointed by the Government of India did not much improve the productive capacity of the shipyard. Recently there has been a change in the design and type of vessels that are constructed in the shipyard. The estimated cost of construction of the new type of ship is nearly Rs. 113 lakhs as compared with Rs. 74 lakhs for the older type.

The Plan frame for the second five-year Plan has placed a target of 1.5 million GRT. The Ministry of Transport has drawn up a plan for the building of 72 ships at a cost of Rs. 80 crores. But how would be the capital raised to the extent of Rs. 80 crores? According to the Study Group (composed of representatives of shipowners) the private sector can provide at most Rs. 10 crores only during the second five-year Plan period. The balance shall have to be provided by the Government. As already noticed, the Government have advanced a sum of Rs. 23 crores to shipowners. The interest charged is 4.5 per cent on loans for developing coastal trade and 2.5 per cent on those for expanding overseas trade. The period of repayment varies between 10 to 12 years. At present nearly 75 per cent of the cost of the ships are advanced as loans by the Government, while the shipowners demand a loan of 90 per cent of the cost of the vessel.

Under the second five-year Plan about Rs. 70 crores shall have to be provided by the Government to the private sector for the purpose,

of constructing vessels. Now the question is, will it not be desirable for the authorities to start new shipbuilding yards for constructing more vessels, rather than lend such a huge sum to the private sector and allow it to earn profit at the cost of the State? In the early days of the Company rule Calcutta was famous for its shipbuilding yards and ships. Now that the Government are contemplating the establishment of a second shipyard, it should be set up on the river Hooghly near Calcutta. It should be provided with modern equipments and it should be a cent per cent Government concern. The resources of the private sector are much too inadequate to undertake shipbuilding on a large scale and we do not think it desirable that the State should lend a sum of about Rs. 70 crores to the private sector for this purpose.

The Industrial Finance Corporation

The latest annual report of the Industrial Finance Corporation shows considerable progress in its activities for the year ended June 30, 1955. Since its inception to June 30, 1955, the Corporation has sanctioned loans aggregating Rs. 28.08 crores. The amount actually disbursed to the borrowing concerns was Rs. 14.53 crores or nearly 50 per cent of the total granted. Of the undisbursed amount, Rs. 3.78 crores have been declined by the applicants. This is a normal practice every year that some of the applicants decline the loan sanctioned to them. They do this on account of some favourable changes in their financial position or changes in their plan. Financial assistance has been rendered to various industries including cotton textiles, chemicals, cement, sugar, automobiles and paper. The Corporation gave loans for the purpose of setting up new industrial concerns and also for raising the installed capacity of the existing ones. Loans were given also for renovation and modernisation of industrial undertakings and for conversion of uneconomic units into economic ones.

Of the total amount of Rs. 28.08 crores sanctioned during the last seven years, the sugar industry heads the list with a loan amount of Rs. 4.43 crores, followed next by the textile industry with Rs. 4.11 crores. The cement industry occupies the third place among the recipients of loans with a loan amount of Rs. 3.15 crores, followed by the paper industry with Rs. 3.11 crores, chemicals Rs. 2.81 crores, ceramic and glass Rs. 1.45 crores, electrical

engineering Rs. 1.36 crores, iron and steel Rs. 1.23 crores, automobile tractor Rs. 1.12 crores, and rayon industry Rs. 1.10 crores. Two co-operative sugar-manufacturing concerns, each with a crushing capacity of 800/1,000 tons of sugarcane a day, received loans for Rs. 83,00,000.

The Corporation's gross profit during the year ended June 30, 1955 rose from Rs. 2.51 lakhs to Rs. 24.70 lakhs. This is the highest gross profit earned by the Corporation in any single year since it started operations. But in spite of this rise in the gross profit, the Corporation had approached the Government of India for a subvention of Rs. 11.25 lakhs to meet the entire guaranteed dividend, as compared with Rs. 4.06 lakhs in 1953-54. The total subvention received from the Government of India will thus stand at Rs. 42.20 lakhs. This subvention was required as the Board of Directors decided to transfer a sum of Rs. 15 lakhs to the reserve for doubtful and bad debts as against only Rs. 5 lakhs transferred in 1953-54.

A notable feature of the working of the Corporation during 1954-55 is its disposal of the Sodepur Glass Works over which it lost much in terms of money and prestige. On this transaction the Corporation had to incur a net loss of Rs. 50 lakhs for which provision shall have to be made from the future profits. The Glass Works has been sold to Messrs. Asahi Glass Company of Tokyo at Rs. 62 lakhs. The price will be paid in instalments spread over a period of 17 years, together with interest on the unpaid balances at 3½ per cent a year. The Vendee Company will form an Indian company immediately to take over the assets and work the plant so as to be able to bring the factory into production early next year. The Asahi Glass Company has the reputation of being one of the largest and most efficient glass-manufacturing concerns of the world today.

International Finance Corporation

The P.T.I. reports that Mr. G. L. Mehta, India's Ambassador in the U.S.A., signed on 19th October, 1955, the Charter of the International Finance Corporation on behalf of the Indian Government at the International Bank. The Corporation has been established to promote the international movement of private capital in productive enterprises in underdeveloped areas of the world. Early this year the Charter of the Corporation was sent to member-Governments

for their consideration and acceptance. The Corporation will come into being when at least 30 Governments have subscribed the minimum capital requirements of \$75 million. The USA is the largest shareholder in the Corporation followed next by the United Kingdom. The following list will show the share capital of some of the important members: (The figures are in thousands of U.S. dollars):

United States 35,168; United Kingdom 14,400; China 6,646; France 5,815; India 4,431; Germany 3,655; Canada 3,600; Netherlands 3,046; Belgium 2,492; Japan 2,769; Australia 2,215; Italy 1,994; Indonesia 1,218; Brazil 1,163; Pakistan 1,108; Sweden 1,108; South Africa 1,108; Denmark 753.

The basic objective of the Corporation is to supplement the activities of the World Bank by encouraging the growth of productive private enterprise in member-countries, particularly in less developed areas. It will work in association with private investors, assist in financing the establishment, improvement and expansion of productive private enterprises which would contribute to the development of its member-countries by making investments, without guarantee of repayment by the member-Government concerned, in cases where sufficient private capital is not available on reasonable terms. The Corporation will seek to bring together investment opportunities, domestic and foreign private capital, and experienced management. It will also seek to stimulate, and to help create conditions conducive to, the flow of private capital, domestic and foreign, into productive investment in IFC member-countries.

The membership to the Corporation is open to Governments which are members of the World Bank. The Corporation has an authorised capital of \$100 million, available for subscription by members in amounts proportionate to their subscription to the capital of the World Bank. Subscriptions are to be paid either in gold or the US dollars. The authorised capital is divided into 100,000 shares of \$1,000 each. The IFC is affiliated to the World Bank in the following ways: (i) Membership in the World Bank is a prerequisite to membership in the Corporation; (ii) Each Governor of the Bank representing a Government which joins the Corporation becomes a member of the Board of Governors of the Corporation; (iii) The IFC's Board of Directors shall consist of those executive directors of the Bank who represent at

least one Government which has joined the new institution; and (iv) The President of the World Bank, who is Chairman of the Bank's executive directors, will also be Chairman of the Corporation's Board of Directors.

The Corporation is, however, a separate body quite distinct from the Bank. The assets of the two institutions will be kept entirely separate, and the Corporation is prohibited from borrowing from the Bank. The Corporation has its own President appointed by its Board of Directors on the nomination of the Chairman of the World Bank. Subject to the policy direction of the Board and the Chairman, the President is responsible for the conduct of the Corporation's business.

The Corporation is authorised to make its investments without governmental guarantee. It can make loans on fixed interest and also investments of other kinds. The Corporation may purchase securities which will give it a right to participate in the profits of an enterprise and such securities, when sold by the IFC, can be converted by the purchasers into capital stock. The Corporation, however, is not empowered to invest in capital stock, nor can it assume responsibility for managing the enterprises in which it invests. The Corporation has been given greater freedom than the World Bank in financing private enterprises. The World Bank can lend to private borrowers only on governmental guarantee and has a discouraging effect both on private entrepreneurs and governments in approaching the Bank for loans. Further, the Bank can make only fixed-interest bearing loans; but the private enterprise often requires venture capital as well as fixed-interest bearing loans; but private enterprise often requires venture capital as well as fixed obligations for the purpose of establishment or expansion of industrial undertakings. The Corporation can render financial assistance to any kind of productive private enterprise, including agricultural, financial and commercial undertakings. Besides, the Corporation will serve as a clearing institution to bring together investment opportunities, private capital and experienced management.

Where an entrepreneur is in need of capital and technical skill from abroad, the Corporation will endeavour to interest investors outside the country who are in a position to provide capital and management experience. Again, where an entrepreneur seeks to establish or expand industrial undertakings abroad, the Corporation will

make efforts to recruit domestic capital and local partners in the country of investment. In such enterprises, the Corporation itself may invest. It should however be remembered that the Corporation will not supplant private investment, but it will supplement it. It is the supplier of finance in the last resort; where other sources of capital are available, it will not step in.

The IFC can revolve its funds by selling its investments to private investors on satisfactory terms. It has the power to raise additional funds by selling its own obligations in the market. By reason of investments by the IFC, private enterprise will not have any special status under domestic laws and regulations. In matters of transfer of earnings and repayments of principal on its investments, the IFC will be in the position of a private investor and will be subject to the domestic regulations on foreign exchange.

Government of India's Coal Policy

For some time past the coal industry in the private sector is not feeling happy over its future prospects. The rumour is in the air that the Government of India is contemplating to nationalise the coal industry. In the last week of August this year, Mr. K. C. Reddy, Minister for Production, disclosed during question hour in Parliament that the Union Government was considering the question of nationalisation of coal mines. The Government proposes to carry out all prospecting and establishment of new coal mines as a public enterprise. The private collieries also apprehend that the development of new coal mines will be so defined as to cover even sinking of new shafts and the result will be that the private sector will have very little scope for expansion.

The Government is considering the procedure for cancelling unexploited leases held by existing coal-mine owners and this will facilitate new prospecting and mining by the Government. At present the State Governments are owners of mines in their respective regions and if the coal-mining industry is nationalised, the State Governments will have also shares in the nationalised industry. The Union Government shall have to take leases from the State Governments for exploiting new coal mines. For the present, therefore, there will be partial nationalisation of the coal industry; and the private sector in this field shall have to die a natural death not being allowed to exploit new mines. The Union Government is also

considering to revise the target of production in private as well as in the public sector of coal mining industry.

In June last a conference was held between the Planning Commission and the coal interests and it was decided there to permit the private sector to expand its production by 11 million tons and the public sector would raise its production by 12 million tons—the total increase envisaged was 23 million tons. The overall target for the industry was placed at 60 million tons to be reached by March 1961. Now the Government is considering reduction of the target in the private sector to 8 million tons and increasing that of the public sector to 15 million tons.

Under the Industrial Policy Resolution of 1948, the coal industry was granted an immunity for ten years. There are still three years to go to complete the said period of ten years, but meanwhile the industry has been thrown into uncertainty as to its future. The private owners of coal mines are further concerned, now that the compensation has been rendered a non-justiciable issue. With the future doubtful the private sector will hesitate to provide the large capital needed for mechanisation of mining operations, stowing and installation of washeries.

The output of coal in 1954 was 37 million tons, of which metallurgical coal accounted for 13.67 million tons. Of the new target of 60 million tons to be attained by 1960, the share of metallurgical coal is placed at 16.5 million tons. The uncertainty about the future of the coal industry has been further aggravated by the fifteenth report of the Estimates Committee of the Parliament on the working of the Ministry of Production. The report was placed before the House of the People on 27th September, 1955. In the opinion of the Estimates Committee, the nationalisation of the coal industry is essential in the long run in the interest of industrial development of the country. The Estimates Committee, however, feels that the Government may not have sufficiency of technical manpower at its disposal just at the moment to take over all the collieries at a time and nationalisation will have to be spread over a number of years. In the meantime, the private sector may be allowed a fresh lease of life for a fixed period to run the private collieries on the following terms:

(a) That adequate capital is invested by them with a view to stepping up production to

the limits laid down by Government for each colliery; (b) that scientific methods are employed in raising coal; (c) that as far as possible, mechanisation and safety measures are to be introduced for quicker and better output; and (d) that labour conditions are improved according to the standards laid down by the Government in this respect.

The Estimates Committee observes that in exploiting natural resources the private owners are guided sometimes by short-sighted policies of quick returns rather than by considerations of maximum economic exploitation and preservation of national assets. It is well known that for more than a century the Indian coal mines have been subjected to destructive exploitation by the over-greedy private owners with colossal wastage of lower grade coal and bye products. The Estimates Committee has rightly suggested that to prevent destructive exploitation, the following measures should be adopted by the Government:

(i) All new collieries should be State-owned and managed under the ultimate control of the Coal Commission, which should be set up immediately; (ii) the State, should, as far as practicable, take over all private collieries which wholly or to a large extent are engaged in raising metallurgical or high grade coal; and (iii) steps should be taken to vest the Coal Commission with powers to take over all those collieries, at present under private management which do not follow its directions and do not function according to the standards laid down by it, or which cannot function economically and satisfactorily due to any reason whatsoever.

The Coal Commission should have power to determine whether the management of the private-owned collieries should be acquired by the State for a limited period or indefinitely with a view to imparting efficiency and economy in the working of the colliery. The Commission may also decide whether in the circumstances of individual cases, the State should nationalise particular collieries and in that case compensation according to the general procedure and principle shall have to be paid to the private owners. The Estimates Committee thinks that the constitution of the Coal Commission is only a preliminary step towards nationalisation and towards organising the coal industry on sound and efficient basis. The Commission will take steps for raising production and ensuring quicker distri-

bution of coal at cheaper rates through introduction of new and up-to-date methods of coal raising, and of better labour welfare measures. The Committee suggests that the Commission should be constituted on the lines of the Tennessee Valley Authority so as to make it clothed with power of Government but possessed of flexibility and initiative of a private enterprise. In this connection, the Committee has recommended the observation of the Indian Coalfields Committee, 1946, which runs as follows: "The managerial autonomy essential for business demands freedom from political considerations and control. This does not imply that the Government or the Legislature should exercise no control over fundamental policies. A determination as to whether a particular coalfield shall be developed and necessary railway facilities arranged involves question of broad policy and hence of economic planning for the Government and the Legislature to decide. But once such a decision has been taken, the opening up of the field, etc., is a task to which political consideration ought to be completely unrelated."

The S.R.C. Report

Under the scheme of reorganisation proposed by the Commission, the Indian Union will consist of 16 States as against the existing 27 and there will be 3 Centrally Administered Areas, that is Delhi, Manipur and the Andamans.

The prospective units, their area and population will be as follows:

	STATES	
	Area (In sq. miles)	Population (In millions)
Madras	50,170	30.0
Kerala	14,980	13.6
Karnataka	72,730	19.0
Hyderabad	45,300	11.3
Andhra	64,950	20.9
Bombay	151,360	40.2
Vidarbha	36,880	7.6
Madhya Pradesh	171,200	26.1
Rajasthan	132,300	16.0
Punjab	58,140	17.2
Uttar Pradesh	113,410	63.2
Bihar	66,520	38.5
West Bengal	34,509	26.5
Assam	89,040	9.7
Orissa	60,140	14.6
Jammu & Kashmir	92,780	4.4

TERRITORIES		
		(Actual numbers)
Delhi	578	1,744,072
Manipur	8,628	577,635
Andamans and Nicobars	3,215	30,971

The States Reorganisation Commission was appointed on December 29, 1953 by a Government of India Resolution to examine "the whole question of the reorganisation of the States of the Indian Union objectively and dispassionately so that the welfare of the people of each constituent unit, as well as of the nation as a whole, is promoted."

The Commission consisted of Shri Saiyid Fazl Ali, Chairman, and Shri Hriday Nath Kunzru, Member of the Council of States, and Shri K. M. Panikkar as Members.

The existing structure of the States of the Indian Union, states the Report, "is partly the result of accident and the circumstances attending the growth of the British power in India and partly a by-product of the historic process of the integration of former Indian States. The division of India during the British period into British provinces and Indian States was itself fortuitous and had no basis in Indian history. The formation of provinces had been mainly governed by considerations of administrative convenience and economy and by reasons of military strategy and security."

FACTORS BEARING ON REORGANISATION

The Commission observe that an essential consideration is that no change should be made unless it is a distinct improvement in the existing position, and unless the advantages which result from it, in terms of the promotion of the "welfare of the people of each constituent unit, as well as the nation as a whole," the objectives set before the Commission by the Government of India, are such as to compensate for the heavy burden on the administrative and financial resources of the country, which reorganisation of the existing units must entail.

The Commission consider that in the interests of national unity the administrative and political structure of the country should be based on the primacy of the nation. The administrative set-up in strategic areas should be determined primarily by considerations of national security. When border areas are not under the direct control of the Centre it would

be safer to have large and resourceful units.

The Commission state it is neither possible nor desirable to reorganise States on the basis of a single test of either language or culture. A balanced approach to the problem is clearly necessary, and such a balanced approach would appear to be—

- (i) to recognise linguistic homogeneity as an important factor conducive to administrative convenience and efficiency, but not to consider it as an exclusive and binding principle, over-riding all other considerations, administrative, financial or political;
- (ii) to ensure that communicational, educational and cultural needs of the different language groups, whether resident in predominantly unilingual or composite administrative units, are adequately met;
- (iii) where satisfactory conditions exist, and the balance of economic, political and administrative considerations favour composite States, to continue them with the necessary safeguards to ensure that all sections enjoy equal rights and opportunities;
- (iv) to repudiate the "home land" concept, which negates one of the fundamental principles of the Indian Constitution namely, equal opportunities and equal rights for all citizens throughout the length and breadth of the Union;
- (v) to reject the theory of "one language one State," which is neither justified on grounds of linguistic homogeneity, because there can be more than one State speaking the same language without offending the linguistic principle, nor practicable, since different language groups, including the vast Hindi-speaking population of the Indian Union, cannot always be consolidated to form distinct linguistic units; and
- (vi) finally, to the extent that the realisation of unilingualism at State level would tend to breed a particularist feeling, to counter-balance that feeling by positive measures calculated to give a deeper content to Indian nationalism.

Financial viability has an important bearing on reorganisation proposals, but it has to be considered along with other relevant factors. The units should, as far as possible, be self-supporting. They should be so constituted that they have an incentive to raise and are able to raise, on their own initiative, at least a part of the resources needed for their development.

The States cannot be so reorganised as to conform to economic regions. Nor can the principle of economic self-sufficiency within an administrative unit be regarded as a clear criterion. Consistently with these principles, however, it would be desirable to avoid as far as possible wide disparities in resources between the various States.

The units should be large enough to ensure administrative efficiency and the co-ordination of economic development and welfare activities.

The wishes of the people should be regarded as an important factor bearing on reorganisation, but they have to be considered along with other relevant factors.

The facts of the existing situation are more important than the previous historical associations of different areas. Undue importance cannot be attached, therefore, to historical arguments.

Geographical contiguity of the units is important from the point of view of administrative convenience. Other geographical factors have to be regarded as secondary.

PATTERN OF COMPONENT UNITS

The present classification of States into three categories known as Part A, Part B and Part C States was adopted essentially as a transitional expedient, and was not intended to be a permanent feature of the constitutional structure of this country. The Commission, therefore, recommends that the existing constitutional disparity between the different constituent units of the Indian Union should disappear as a necessary consequence of reorganisation.

Part B States can be equated to Part A States by omitting Article 371 of the Constitution. The institution of the Rajpramukh should also be abolished, as large sections of public opinion view with disfavour its continuance, on the ground that it ill accords with the essentially democratic framework of the country.

As regards Part C States, there is a general

consensus of opinion that the existing set-up of these States is unsatisfactory. These small units will continue to be economically unbalanced, financially weak and administratively and politically unstable. Taking all the factors into consideration, the conclusion reached by the Commission is that there is no adequate recompense for all the financial, administrative and constitutional difficulties which the present structure of these States presents, and that, with the exception of two, to be centrally administered, the merger of the existing Part C States with the adjoining States is the only solution of their problems.

In respect of Himachal Pradesh, Kutch and Tripura, the Commission recommend that the Central Government should retain supervisory power for a specified period to maintain their present pace of development. Such of the existing Part C States as cannot be merged in the adjoining areas for security and other imperative considerations should be administered by the Centre as territories.

The component units of Indian Union will thus consist of—

- (a) "States" forming primary federating units of the Indian Union; and
- (b) "Territories" which are centrally-administered.

TERRITORIES

The units or areas which have not been dealt with so far will be directly administered by the Centre and will be known as territories.

1. *Delhi*: If Delhi is to continue to be the seat of the Central Government, it must adopt a model which is sound in principle and administratively workable in practice. The people belonging to centrally-administered territories in India are more advantageously placed than those of centrally-administered areas in other important federal countries, in that full representation in the Union Parliament has been provided for under the Indian Constitution.

2. *Manipur*: Manipur should be a centrally-administered territory for the time being. The ultimate merger of this State in Assam should be kept in view.

3. *Andaman and Nicobar Islands*: The *status quo* in the Andaman and Nicobar Islands should continue.

The arrangements in regard to areas which have been or may be brought under Central administration in future, either before or after

becoming *de jure* part of the territory of India, must be flexible, until the position is finally clarified.

SAFEGUARDS

Constitutional recognition should be given to the right of linguistic minorities to have instruction in their mother-tongues at the primary school stage subject to a sufficient number of students being available. The Central Government should acquire power to enforce this right on the lines of the provisions contained in Article 347 of the Constitution.

The Government of India should adopt, in consultation with the State Governments, a clear code to govern the use of different languages at different levels of State administrations and take steps, under Article 347, to ensure that this code is followed.

The domicile tests in force in certain States operate to the disadvantage of minority groups. The Government of India should, therefore, undertake legislation under Article 16(3) of the Constitution in order to simplify and liberalise the requirements as to residence.

In examinations regulating entry into the public services of the States, a candidate should have the option to elect as the medium, apart from the main language of the State, the Union language, namely, English or Hindi, or the language of a minority constituting about fifteen to twenty per cent or more of the population to the State.

S. R. C. Report and Maharashtra

The S.R.C. recommendations have caused wide repercussions, of which the most forceful were those in Bombay. We append below a report of a meeting addressed by Shri Shanker Rao Deo :

"Addressing a public meeting at Shivaji Park on the evening of 23rd October, Mr. Deo warned Maharashtrians against any acts of violence or slogan-shouting to achieve their goal.

"Their demand, he stated, was just and right and Maharashtrians would not try to snatch anything from others. They would take it only after convincing their opponents of the rightness of their demand.

"Mr. Deo assured Maharashtrians that he would leave no stone unturned to achieve a separate linguistic State.

"The Congress High Command had accepted the justness of the Maharashtrian demand for the City of Bombay, but, because of certain difficulties, it could not be joined to Maharashtra.

"On the question of Bombay City there could not be any compromise.

"When the Maharashtrian deputation met Mr. Nehru and other Congress leaders in New Delhi, it tried to convince them that there was no need for minorities to fear as their rights were safeguarded in the Constitution and by a special chapter of the SRC report itself.

"He referred to a remark in the report about Maharashtra that there was 'fear and misgiving' among the city's minorities if Bombay was made the capital of a united Maharashtra State.

"He said, it was a grave injustice and a dishonour to Maharashtrians."

The "Slow-down" Policy

The Industrial Tribunal that sat over the adjudication on the slow-down and strike in the Indian Iron and Steel gave its award in the first week of October. We reproduce part of the report below as it is a clear indictment of "slow-down" methods in industry :

"The fifth Industrial Tribunal adjudicating on the slow-down in the hot mills (sheet mills section) of the Indian Iron and Steel Co., Ltd., Burnpur, in 1953 has given its award in favour of the management in all the four issues referred to the tribunal.

"As a result of the go-slow, there had been a loss of approximately 100,000 tons of finished and semifinished steel to the country from this mill, which had been declared a public utility concern since 1951.

"The tribunal said : 'A slow-down can never be justified under any conceivable circumstances. It is a misconduct, as it interferes with and pushes down production. It is an insidious process which not only does hamper production but also acts unfairly to the employer. The workers get pay, and so they are duty bound to give production. But if they do not give that amount of production which they are normally expected to give but move slowly and sit idle, then they should not earn wages. To earn wages and not to give production can never be justified.'

Nehru's Speech at Perambur

We append below part of Pandit Nehru's speech at the opening of the Coach Factory at Perambur, as it clearly shows his attitude towards basic industries :

"In the speech, explaining Gandhiji's ideals further, Mr. Nehru said the Mahatma would have been glad about the opening of this factory.

"Like all other factories it did not come in the way of development of village industries and generally raising the standard of the rural and urban population. Some people took a rather narrow, lopsided view of Gandhiji's ideals, without understanding all the aspects of their many-sided character.

"Many, he thought, laid emphasis on the philosophy for which the Mahatmaji stood, without understanding the spirit underlying it. For the functioning of a great movement in India, and as the leader of the great struggle against a mighty Empire, he laid stress on village industries. Curiously enough, those who were sceptical of him then, now stood for development of village industries.

"But today,' said Mr. Nehru, 'we stand on the threshold of an atomic era. Atomic energy is an enormous new source of power at our disposal and you cannot ignore it. Even if you ignore it, others will not ignore it but will use it to their advantage. Therefore, we have to use this source of power when the time comes. At the same time, everything has ultimately to be judged in terms of human welfare—in terms of the welfare of the millions of our country.'

"Therefore, he said, it was fitting that this day should be chosen for the factory's opening.

"This Integral Coach Factory, he said, was a symbol of something bigger—some bigger integration—that was taking place. In the factory they were making integral coaches by a process of welding. 'Some of us are also engineers—human engineers—trying our utmost to weld and integrate the nation.

"We, as a nation, suffer from some kind of split personality. We talk in terms of high ideals and act in a completely opposite way. No one in the world talks of higher ideals than we do, but our deeds do not wholly conform to our talk.'

"He said there were powerful forces—forces working for integration and consolidation—while others were working for disintegration and disruption. There was bound to be a conflict between such forces more especially at the time of transition.

"The new integral-type of coach is a lightweight all-welded steel coach. The factory, initiated by the late Mr. N. Gopalaswamy Iyengar, three years ago, is designed to meet the country's increasing needs in respect of passenger coaches, while the Chittaranjan Factory takes care of the locomotives.

"The Rs. 7.35-crore factory will assemble 20 coaches in the first year, this figure rising to 350 coaches under a phased programme. The factory will provide employment to over 4,000 workers ultimately."

Nehru at Indian Industries Fair

Pandit Nehru spoke much in the same vein as at Perambur, at the Indian Industries Fair as the following report indicates:

"New Delhi, October 29: Mr. Nehru, who visited the Indian Industries Fair for over two hours in the morning, later formally opened it and said: 'It is truly an international exhibition.'

"Credit for giving it this character deservedly went to the foreign countries which had so eagerly participated in it. It was due to them, said the Prime Minister, that the exhibition had become so unusual, not only for India but for the whole of Asia.

"It contained pavilions from diverse countries including 'those which were not considered friendly by some others.' The exhibition, therefore, had become an experiment in co-existence, added Mr. Nehru.

"India, he said, was also changing in the rapidly changing world. Anybody returning to India after two or three years could easily notice the difference.

"The new technical changes, he said, were promising the world an age of abundance for every individual. Yet, at the present moment, some countries not only lived in scarcity but in extreme poverty. The fact remained that in theory, the truth of which could be demonstrated, there was no justification for continuing poverty.

"So far as India was concerned, it stood on the threshold of industrial revolution or a big-scale change, and it was time, he added, it did so. It could not be forgotten, however, that when India did cross the threshold of industrialization, other countries would think in terms of atomic power. Thus, if India took ten steps towards her goal, other countries would be able to move much faster. It was, therefore, necessary that the tempo of progress should be increased if India was to overtake the more advanced countries.

"Mr. Nehru said he was a firm believer in the utility of machines. He wanted them to be bigger and better. The only question was how far the machine could be controlled or was it

likely to be allowed to dominate man or his mind.

"It was clear that India could not run away from the machine. It solved many problems of the day. Therefore, India must have machines, the purpose being advancement of the lot of man. If India had to have machines it must have the latest and best machines.

"Though the machine was inevitable, 'it cannot be allowed to run away with you.' It was necessary to utilize it with understanding, tolerance and compassion.

"While in other countries there was conflict between ideals and objectives, India had yet to satisfy the primary needs of her people and the secondary needs of some of them."

Prohibition

We append below the news-item giving a summary of recommendations of the Prohibition Enquiry Committee.

We have italicized the second paragraph of this news-item in order to lay emphasis on the extremely doubtful procedure of enquiry adopted by the Committee.

Let us state to start with that the policy of this journal is, and always has been prohibition. We have no use for alcohol as a beverage ourselves nor do we like the use of it by others.

But that does not alter the fact that the Committee's assertion that there is strong support for nationwide prohibition in every State, is just a figment of fancy. How do they know it without making a nationwide enquiry at all? It is a total untruth to say that anything like that has been made. We do not like the gilding of truth, or its assumption by fanciful fanatics, and that is the long and short of it.

"New Delhi, October 25: 'We recommend that the target date for completing nationwide prohibition should be April 1, 1958,' says the Prohibition Inquiry Committee appointed by the Planning Commission in its report, issued today.

"The committee points out that there is strong support for such a nationwide prohibition policy in every State it visited and also a demand to put that policy into effect as early as possible.

"We are of the opinion that to focus the attention of all States to this end and to mobilize popular sympathy in favour of prohi-

bition, it is necessary to fix a definite target date to bring into effect complete prohibition throughout the country,' the committee adds.

"On the experience of prohibition in States like Bombay and Madras, the committee says that 'prohibition is not only a sound policy but also a practical proposition. The aim should be to promote nationwide prohibition and to achieve better and more lasting results through effective implementation.'

"In recommending the target date—April 1, 1958—for nationwide prohibition, the committee explains that it has taken into consideration both the urgency of the situation and the practical difficulties which have to be overcome by the State Governments concerned."

"New Delhi, October 24: In a dissenting minute to the Prohibition Inquiry Committee Report, Mr. Kodanda Rao says that there is something wrong with orthodox prohibition when several Governments stimulate consumption for the sake of public revenue and profit, the Congress High Command and the Government of India advise the State Governments to 'go slow' with prohibition and the police are not keen in enforcing prohibition and the magistrates unenthusiastic about deterrent sentences.

"He regrets that the Prohibition Inquiry Committee should have been asked to review only the administration and not the policy concerning prohibition. He suggests that the policy of prohibition should be reviewed by a high-powered commission representing all shades of opinion, similar to the American Wickersham Commission.

"He disagrees with the majority report which stigmatizes consumption of liquor as 'moral turpitude, a vice, a sin.'

"Excessive consumption offends the moral conscience of the world but not moderate consumption,' he adds.

"He refers to the example of progressive nations which treat moderate consumption of liquor as harmless, normal and even an honourable social custom.

"Mr. Rao adds: 'If their great and enviable progress in a variety of directions was compatible with such consumption; if foreigners and Indians may consume liquor in foreign countries and foreigners may do so in India and only Indians in India may not; if some communities do not feel any moral compunc-

tion in consuming liquor; if some of the most respected Indians, official and non-official, take liquor without moral qualms; if liquor is used for sacramental purposes among certain religions, the moral elevation claimed for prohibition is somewhat weakened.'

"In its very nature, he says, the appraisal of prohibition policy lends itself more to subjective pre-conception than to objective conclusions. In the circumstances, he adds, it would be presumptuous to dogmatize.

"He also reveals that instead of asking other States to follow their example, both Bombay and Madras had, in fact, somewhat 'warned them off' although the advice was urged 'with a view to furthering prohibition.'

"Mr. Rao also regrets that the Committee had ignored the advice of Bombay and Madras—the two States whose experience was most valuable in considering extension of prohibition to other States."

Goa

The question of Goa is still in a liquid state. Ferocious sentences are being imposed on *satyagrahis*, Indian and Goanese, by the degenerate Portuguese colonial government.

Indeed, nothing better could be expected from a nation whose entire colonial record is of undiluted brute passions, black treachery and arrant cowardice in the face of a superior force.

The Hindu in an editorial on the 30th of October gives the present position as is given *infra*:

"As early as May of last year our Prime Minister made it clear in Parliament that the Portuguese claim for military aid, from the signatories to the North Atlantic Treaty Organisation, for retaining her colonial possessions in Asia cannot affect our claim for the re-union of Goa with free India. Mr. Nehru proclaimed categorically that 'to us it is quite clear that those alliances do not concern any foreign establishment in India.' Since then France has voluntarily surrendered her sovereignty over her settlements in this country without calling on any NATO Power to come to her aid for resisting the just claims of the people of the settlements. But Portugal continues to be adamant and there is reason to believe that she may be banking on outside help. For, in April of this year, Mr. Nehru reverted to the subject at the Afro-Asian Conference during the debate on

colonialism in Asia. He commented on the extraordinary stand taken by some members of NATO. Following Portugal's request to them to tell us, 'You should do this and that', India was getting letters from some of the so-called Big Powers along those lines. He did not mention which Powers wrote but it must be mentioned that the United States has never given countenance to the Portuguese stand on Goa. If anything, her leaders have openly and more than once come out against colonialism under any guise. We have already noted the Canadian Prime Minister's declaration that NATO could not be invoked by Portugal for this purpose. Mr. Nehru has observed that it does not matter who these Powers are, but it is gross impertinence and the new Republic of India has told them that it is gross impertinence."

Macao and Goa

The Portuguese colony of Macao, on the mainland of China, has been the worst plague-spot in Asia for centuries. It is a huge conglomeration of brothels, gambling dens and resorts of international drug and opium smugglers. The Chinese have declared their policy regarding Macao, as the following news-item indicates.

It is to be noted that subsequent reports indicate that this note of displeasure was enough to force the panic-stricken Portuguese to abandon the "celebrations":

"Hongkong, October 25: Peking Radio said today that China had the right to demand the return of the Portuguese colony of Macao which adjoins the Chinese mainland.

"The broadcast in English was described as 'a late message.' It said: 'Macao is Chinese territory and the Chinese people have a right to demand the return of their territory from the hands of the Portuguese colonialists.'

"The radio broadcast a report which, it said, had been received from Canton saying that the Portuguese authorities were compelled last week to announce cancellation of their plans for the celebration of the 400th anniversary of the opening of Macao as a port.

"Mr. Chou En-lai, the Chinese Prime Minister, declared his support for India's stand over Goa and asked for the prevention of extensive celebrations planned in Macao of the 400th anniversary of the founding of this tiny colony on the Chinese mainland, according to authoritative sources here today.

"Mr. Chou, according to the sources, told Mr. O'Neill, British Charge d'Affaires in Peking and Sir Alexander Grantham, Governor of Hongkong, at a luncheon in the Chinese capital early this month that the people of China and the Chinese in both Macao and Hongkong would be 'very displeased' with the celebrations.

"The sources said that Mr. O'Neill had reported this to the British Foreign Office which in turn had sent a report to the Portuguese Government through the British Ambassador in Lisbon."

Buraimi Oasis

The Persian Gulf is the key to the vast British (and allied) petroleum concessions in Iran, Bahrein and the neighbouring territories. There has been a long-standing dispute, between Saudi Arabia and the potentates of the oil areas of the Gulf, regarding the demarcation of frontiers. Recently there has been a resort to arms as the following news-item indicates. Fighting has broken out after the occupation:

"London, Oct. 26.—Troops of the Sultan of Muscat and of the Sheikh of Abu Dhabi, Arab rulers of Persian Gulf States in treaty relations with Britain, today occupied the disputed Buraimi Oasis which has been claimed by Saudi Arabia, Sir Anthony Eden, the British Prime Minister told the House of Commons today.

"Sir Anthony said that the troops had occupied the oasis up to a line proposed by Britain in 1935 but further modified in favour of Saudi Arabia in 1937.

"The Prime Minister told Parliament that the decision to move in troops had been taken because of the breakdown of the recent arbitration proceedings in Geneva on the status of the oasis.

"Announcing the breakdown of proceedings before the tribunal Sir Anthony said the actions of the Saudi Arabian authorities in the disputed area and during the arbitration 'amount to a repudiation of the arbitration agreement and have made a continuation of the arbitration impossible.'

"He said the Saudi Arabian Government was being informed of the decision to reoccupy the oasis up the modified 1935 frontier line.

"I hope in time the Saudi Arabian Government will accept the solution we have had to declare, he concluded."

South Viet Nam

In Indo-China the last traces of French colonialism has been eliminated apparently as the news-item below would indicate. The French puppet Bao-Dai has lost his last throw:

"Saigon, Oct. 26.—Mr. Ngo Dinh Diem, the Prime Minister, today proclaimed South Viet Nam to be a republic. The proclamation follows last Sunday's nationwide referendum in which a large majority of the voters chose Mr. Diem to replace Bao Dai as Head of State.

"The Premier read the proclamation to more than 30,000 people from the balcony of his official residence.

"It followed a Cabinet meeting which discussed the referendum results.

"The day has been declared a public holiday in celebration of the event.

"Mr. Diem told the crowd outside his residence: 'In the darkest hours of our history our people have always joined together, and now in a moment of supreme unity we have broken the bands of iron and fibre which encircled us, taking the path of independence and liberty.

"We shall see a unified, free and prosperous Viet Nam emerge triumphantly.

"Thailand and Japan today recognized Mr. Diem as Head of State."

French North Africa

French colonialism is still trying to retain its hold on North Africa, now by an attempt at compromise. The French *colours* still want forcible suppression of the demand for liberty, and on the other side are the implacable foes of colonialism in the shape of the children of the soil. Prime Minister Faure is now taking desperate chances in mediation. The reaction, as indicated in the news below, is still unfavourable:

"Casablanca, Oct. 18.—A fresh upsurge of terrorism in French North Africa has taken a toll of 21 lives during the past 24 hours.

"In a new series of attacks and rioting in the principal cities of Morocco, eight Moroccans had been killed by tonight and a number of Moroccans and Europeans injured.

"Algerian rebels claimed 13 victims, seven of them Europeans, when a band of 100 attacked a packed bus on the Bone-Berbillon road yesterday.

"Marakesh, Morocco's third largest city, has been the scene of the worst disorders in the protectorate.

"For the fifth day running bands of youths roamed the streets of the Arab quarter, setting the torch to shops and knocking down telephone poles. Saboteurs cut the telephone cable between Morocco and Algeria tonight.

"The demonstrations are in protest against the composition of the Moroccan Throne Council to replace Sultan Ben Arafa."

Apartheid

The U.N. Commission has given a mild report on the apartheid policy of the degenerate anti-diluvians of "Africans" South Africa. We append the news-item below, for all its worth:

"New York, Oct. 12.—The general lines of South Africa's policy of apartheid had not changed during the past year, the U.N. commission of inquiry into the racial situation in South Africa said in a 15,000-word report presented today to the current session of the General Assembly.

"During the year, a series of legislative measures were enacted which were consistent neither with the obligations assumed by the Union of South Africa under the Charter nor with certain provisions of the universal declaration of human rights, the commission said.

"At the same time, the commission said that the programme of apartheid had during the past year been proceeding extremely slowly, cautiously and carefully. 'At the rate at which the Government is promoting each day a fuller measure of apartheid, it may well take many years before the theories of the new apartheid bear even a modest resemblance to actual fact. By then, the succession of generations, white and black, will have changed the course of events.

"The South African Government is the only Government in the world which believes that it can carry out such a fabulous experiment successfully,' the report said in another reference to apartheid.

"The members of the commission are Dr. Herman Santa Cruz, of Chile (chairman); Mr. Dantes Bellegarde, of Haiti; and Mr. Lagier, of France."

Pakistan and Afghanistan

The uneasy truce in the Pak-Afghan disputes has again been broken up, over the issue of Pakhtoonistan. The news report given below summarises the situation:

"Karachi, Oct. 18.—The Pakistani Government this evening announced its decision to withdraw its Ambassador in Kabul, Col. A. S. B. Shah,

following Afghanistan's decision to recall her Minister from Karachi.

"Government sources said that Col. A. S. B. Shah would soon return to Karachi. The immediate cause for the recall of the Afghan Minister was the refusal by Pakistan to discuss the formation of a One-Unit West Pakistan Province.

"Afghanistan is opposed to the integration of Pakistan's tribal areas and parts of the former North-West Frontier Province inhabited by Pakhtoons in West Pakistan Province without ascertaining the wishes of Pakhtoons.

"A Pakistani Government spokesman said that although the country had decided to recall its Ambassador at Kabul, Pakistan would, 'as in the past, always be ready to discuss and amicably settle with the Afghan Government all matters of common interest.'

"But he wished to make it clear that Pakistan could in no circumstances discuss with Afghanistan internal matters like the merging of West Pakistan Provinces and States into a single unit.

"The Afghan National Assembly, meeting at Kabul yesterday, approved the Government's policy on the issue of 'Pakhtoonistan.'

"Reporting this, a Kabul Radio broadcast last evening said that the Afghan Prime Minister, Sardar Daud Khan, explained in detail to the Assembly the Government's stand concerning a homeland for Pathans residing in what now constitutes Pakistan's tribal areas and parts of the former North-West Frontier Province.

"The Assembly, the broadcast said, offered its full co-operation in whatever steps the Government takes to vindicate its stand."

Result of Saar Referendum

There was a referendum in the highly industrialised area of the Saar, on the Franco-German border. The choice before the people of the Saar was between international control in the guise of a Europeanised Saar, and merge with Western Germany. They decided overwhelmingly in favour of merger. The reactions of that decision are given in the news below:

"The German Federal Chancellor, Dr. Adenauer, declared his 'firm conviction that the outcome of the referendum should not, and will not, prejudice the good relations between our two countries,' and added: 'Knowing that both governments sought a settlement in the spirit of European solidarity and have loyally observed their obligations, I am certain that

in the future, too, they will go the way of harmony and friendship.'

"The French Prime Minister, M. Faure, replied: 'Like you, I am convinced that the results of the Saar referendum cannot divert our two governments from the path they have taken. The new difficulties in our way . . . will not weaken our common will to serve the cause of Europe and of understanding between our two peoples.'

"The steps now to be taken about the Saar, London observers point out, are a subject for joint discussion between the French and German Governments. The Saar agreement of last October was at once a consolidation and a symbol of Franco-German *rapprochement*. The manner in which the two governments are approaching the new problem raised by the referendum result is regarded as of good augury."

Egypt and Israel

The mounting tension between Egypt and Israel—indeed between Israel and all the Arab world—has reached the breaking point consequent on Egypt's decision to purchase arms, which they could not get from the U.S. group, from Czechoslovakia. The position is well-presented in an editorial in the *New York Times*, international edition, for the 16th of October. We append a long extract:

"Israel and Egypt both maintain they want no war. Yet the pressures for war are strong.

"At present there is believed to be at least a rough military balance between Israel and the Arabs. Israel is reported to be superior in manpower; she has a well-trained army of 50,000 and a reserve force of 200,000. Together the Arab armies are numerically superior—Egypt alone has 50,000 to 60,000 men—but their training is considered poor and they have no reserves.

"In weapons, however, the Arabs may have an edge over Israel. Egypt has 100 combat planes including a squadron of jets and well over 100 tanks; Israel has a small number of planes, including some jets; there are no reliable reports on the strength of her tank force.

"Egypt's Premier Abdel Nasser contends he is buying Communist jets, tanks, heavy artillery and naval craft solely for 'defense' purposes because, he says, Israel is militarily superior to Egypt and might attack Egypt. Repeatedly Colonel Nasser has assured the West he does not want to fight Israel.

ISRAEL'S VIEW

In Israel, the Arab-Communist arms deal is regarded as the gravest threat to the Jewish state since its birth seven years ago. At that time the Arab states were weak; Israel's forces were vastly superior. The war between them was bloody and difficult but the outcome was never seriously in doubt.

But today, Israel contends, the Arabs are superior to her in weapons; she points out that, notwithstanding his assertions now, Premier Nasser last July said his army was stronger than Israel's. Once Egypt starts getting Soviet Migs and other Communist heavy weapons, Israel will be hard put to defend herself.

"Accordingly, there is some pressure for launching a preventive war against the Arabs now, while Israel has the stuff to ensure victory. It is hard to assess the importance of this sentiment. In Israel's parliamentary elections last summer the biggest gains were scored by the two parties which stood for tough action against the Arabs—Herut and the Workers party. They won about 22 per cent of the vote, and that was long before anyone in Israel suspected that the Arabs would receive new supplies of arms.

"Tomorrow Israel is to get a new government. Its political composition will be about the same as at present, but changes of individual members are certain to affect its collective attitude. The most important change will be the return of former Prime Minister David Ben-Gurion to the Premiership next week; he is now resting under doctors' orders. Mr. Ben-Gurion, a firm believer in the Old Testament principle of an-eye-for-an-eye where the Arabs are concerned, is not a man to sit back idly and wait for an Arab attack on his country.

"What then can he do? He seems to have three possible courses of action: (1) purchase of arms from the Communists; (2) enlistment of Western help in the form of arms to even the balance and or a Western guarantee of Israel's borders; (3) preventive war.

CONFERENCE IN WASHINGTON

"Israel has apparently rejected the first course. Reports last week that Moscow was offering to sell arms to the Jewish state met with a hostile 'No thanks' from Tel Aviv officials. Israel would have a hard time paying for Communist arms; if she tried, she would alienate important friends in the United States.

"The second course is obviously Israel's best

bet. Last week in Washington her Ambassador, Abba Eban, called on the Assistant Secretary of State for Near Eastern Affairs, George V. Allen, Mr. Eban did not ask for any specific amount or type of arms. But he urged the U. S. to pledge to help Israel match whatever arms Egypt receives from the Communists. Mr. Eban also asked the U. S. to put into effect the guarantees of the borders between Israel and Arabs that Secretary of State Dulles had proposed last summer.

"As for Course No. 3—preventive war—the majority of Israelis obviously oppose it. But there is the possibility that if the West refuses to help Israel, she might feel herself forced to go to war. As Mr. Eban put it, Israel will not sit like a rabbit waiting for the snake to get big enough to swallow her."

Relief of Arab Refugees

Vast numbers of Arabs were displaced by the formation of Israel. Their homeland occupied by the Israeli immigrants, without any question of compensation or rehabilitation, the plight of these poor displaced people is miserable in the extreme, as the following extract indicates:

The *Manchester Guardian* (October 24) writes: "The report of Mr. Labouisse, Director of the United Nations Relief Agency for Arab Refugees, will receive the more attention because of the new dangers in the Middle East. Over 800,000 refugees are still being fed, and of these nearly 100,000 are still living in tents.

"Mr. Labouisse thinks that new irrigation projects might give livelihood for 200,000. Unhappily, the rejection of the Johnston scheme for Jordan irrigation now puts this in doubt.

"Mr. Labouisse says that the desire for repatriation continues as strong as ever, and he adds an important comment: 'For the majority, repatriation means a return to the conditions they knew in Palestine prior to 1948. It is not possible to know how many of them would, in fact, accept the opportunity to be repatriated if that repatriation would mean something different from their old homes and their former way of life.'

"No prediction can be made until the refugees have been given the opportunity of choosing between distinguishable alternatives—namely, on the one hand, repatriation whose true nature is clearly understood at the time of choice; and on the other, the amount and

form of the compensation that would be offered instead."

"He says that if a major part of the refugees do not become self-supporting soon, the cost of relief will grow. There does not look to be much hope of any improvement soon, though 110,000 have been allowed to return to Israel under the scheme for reuniting families, and Israel is unfreezing the refugees' blocked assets.

"But this only touches the fringe of the problem. Mr. Dulles's recent proposal of a loan to Israel for paying compensation has been accepted by Israel in principle, but on condition that the Arab blockade is lifted.

"The United Nations may see that the refugees do not actually starve, and some of the Arabs may now have grown used to their way of life (and may be apathetically content, though the ration gives only 1,500 calories a day). But to be a refugee is still one of the hardest misfortunes of the modern world."

Turkey To-day

Adversity, it is said, makes strange bed-fellows. So does, it seems, unreasoned bellicosity.

Turkey is the strongest bastion in the "Northern Tier" of the Middle East. It is well known, likewise, that the present-day rulers of Turkey are not of the same ilk as Kamal Ata-Turk, or his followers. They are more a throwback to the old Turkey. The following extract from *Time* of October 24, is illuminating, coming as it does from the most reactionary and bellicose of all U.S. journals:

"Oil for the machines of Turkey lay bottled in the bowels of tankers last June while representatives of four big oil companies served notice on the Turkish government: unless some \$50 million in past oil bills was settled, the new shipments would not be unloaded. With only a week's oil in reserve, the government did some frantic juggling and scraped together a payment.

"The U.S.'s strongest ally in the Middle East is so strapped that it can barely pay its day-to-day bills.

"A newspaper editor reported one day last summer that while Premier Adnan Menderes was off on a trip, some political scalawagging was going on inside the ruling Democratic Party. 'While the cat's away,' wrote the editor, 'the mice will play.' The editor was arrested,

and only by appeal to a higher court escaped a jail sentence of six months. His crime: imputing animal characteristics to the Premier.

"In Turkey," said a troubled Istanbul man, "it is still possible to be a free man, a free journalist, or a free judge—if you are willing to take the risk."

"Only yesterday Turkey had seemed a solid rock in the free world's sea of uncertainties. Now it is a bothered bastion. Its economy is sick and its government is flirting with bankruptcy. Its brief but intense experience with democracy is afflicted with a return of the familiar weapons of autocracy."

"What has gone wrong, and what can be done about it? These questions, raised for months past, concern more than tough debonair Adnan Menderes, his government and his 23 million countrymen. All the other allies of NATO have cause to worry about the health of the member that anchors NATO's Eastern wing, provides the allies' largest single bloc of soldiers (the entire Turkish army of 500,000 men), and stands stoutly across the Black Sea from Russia. The U.S., in particular, has cause for concern. It cannot let Turkey sink, and Turkey insists that the U.S. owes it the means to stay afloat. The proposed means: a \$300 million loan, no strings attached. The U.S. reply: no more loans until Turkey puts its economic house in order. The question: Who will back down first?"

Syngman Rhee Portrayed

Another queer *protege* of the U.S. is that obnoxious little autocrat who now rules South-Korea through the grace of the U.N. We append a sketch of this character from the back columns of the *Worldover Press* of August 26:

"The big issues in Korea are in danger of being lost to sight. When thousands of our allies, the South Koreans, stage repeated and frenzied attacks on American troops defending the safety of the truce commissioners, it is dramatic and distressing. But even if the terms of the commission's mandate now need revision, some sort of supervisory body must do the same job, and it must be representative of both sides. And Syngman Rhee has made it clear that he really opposes any truce commission. For reasons of strategy, he has concentrated his attacks on the Communist members from Poland and Czechoslovakia, but a while ago

he was bitterly assailing the Swedes and the Swiss.

"If Rhee's record is reviewed, the urgent necessity of squelching him becomes apparent. Nine months ago, Rhee gave the Polish and Czechoslovak members of the truce commission a week to get out of Korea, thus acting to break the international truce unilaterally. What was the result? He was 'warned' by the United Nations Command that the truce team would be protected. If sterner action had then been taken against Rhee, this August would not have witnessed the wounding of many U.N. troops and the loss of South Korean lives in demonstrations. Rhee had the nerve to call 'spontaneous' (in good old Nazi style), when they were actually whipped up on his personal orders. Rhee backed down temporarily; but he never departs from his fundamental aim of a new Asian war with the United States committed as the major belligerent."

"Even before the war in Korea, Rhee was a hopelessly undemocratic ruler. In the 1948 elections, there was scant freedom; he systematically disposed of his popular opponents. During the first two years of his presidency, there were 89,710 arrests, including 10 members of the National Assembly and the nation's Vice-President. The Chief Justice of the country asserted: 'Any individual Korean is at the mercy of the police.' Seven newspapers were closed down and their staffs jailed. Political prisoners were treated brutally and often tortured. Some of the victims were not free from the taint of Communism; many were."

"Defying the U.N. Command in early 1954, Rhee was only stopped at the last moment from using ROK troops and U.N. funds and equipment to seize by force, from the U.N. Command itself, a large area north of the 38th parallel. Rhee's intention was nothing less than to annex this area, extending 58 miles north of the parallel."

"The Communists are hard enough to handle without the benefit they derive from the impression, throughout the neutral and uncertain world populations, that Communist sins have their equivalents on the anti-Communist side. Syngman Rhee is no friend of democracy, peace and freedom, and it is high time the U.S. and the U.N. made unmistakable to world opinion their recognition of this truth."

MUST INDIA DISINTEGRATE?

By PROF. JADUNATH SARKAR, Hony. D.Litt., Hony. M.R.A.S. (London)

1. HISTORIC ORIGIN OF OUR PROVINCES

NATURE has formed India into a self-contained block of land, living in isolation from the rest of the world. Two vast oceans guard her flanks, while her head and shoulders are fenced round by the tallest mountain in the world. But the unity born of this sheltered self-sufficient life has been spiritual, not political. Sanskrit learning and Hindu religion have imposed a cultural uniformity over all the provinces of India, but they have not been welded into one State; a sub-continent cannot quickly be. Indeed, most of India's provinces, though each as large and populous as many a sovereign State of Europe, have failed to acquire a compact frame with oneness of language, tradition and manner of life clearly marking each off from its neighbouring provinces, such as history imposed on Burgundy, Provence, or Lorraine. Our provincial boundaries have constantly changed, since the remotest antiquity, owing to conquest or loss and not to linguistic disharmony. We have a proverb that in this country the local dialect or *patois* changes every ten *kos*!

How the different provinces of India have grown to their present shape on our maps, is a matter of known history. The kernel of each province has remained fairly constant, but its borders have been very elastic, sometimes evanescent. Each has expanded (or shrunk) under the pressure of historical or economic forces, and formed a larger (or smaller) political unit by coalescence (or attrition). Sir Richard Temple in his *Journal* has traced every step of the formation of Kashmir and Jammu (only a hundred years old). The piecing together of the mosaic conveniently called Assam, began even later and has not yet been finalised. Even the changing boundaries of the State of Delhi (I mean the *subah* and not the capital city) is a headache to the compiler of a Historical Atlas of India. The Bombay Presidency, a little older in time, is no better off in this respect.

In the earliest Hindu age traceable in history, each political unit (however small, like the city republics of the Panjab described by Alexander's companions), originated from the settlement of one clan or profession (*i.e.*, caste) and took its name from that body of ruling people. Such was the origin of Malwa (the new home of the *Malloi* tribe encountered by the Macedonians in the Panjab), Gujrat (the Indian colony of the Gurjar or Gujar nomads), and so on. Their bond of union was ethnic, not political, nor linguistic oneness, because two or three clans spoke the same language and yet lived apart in spite of this affinity of speech. Later, in the course of ages, our Hindu empires began to grow and unite several provinces under one political rule, though few of them could retain this union after three generations. Within the empire the diverse subject population held together because the suzerain allowed each locality to follow its own customs, the State's sole concern being to put down rivals and rebels and take one-sixth of the crops for its service,—hence the Hindu king's Sanskrit title of *Sadangsha-Bhak* or the owner of one-sixth.

2. UNIFYING WORK OF EMPIRES

After the Muslim conquest of Delhi (*circa* 1200 A.D.) the States became larger; in many cases each of them embraced two or even more provinces as we now understand that term; but there was as yet no *political* homogeneity in Muslim India. Under the Mughal empire (a live force from 1575 to 1750), the true political integration of India took place and the provinces became really limbs of one empire. By an imperial edict, issued on 24th November, 1586, Akbar imposed the same type of administrative organisation on each of the provinces (called *subahs*) under his rule.

"Two hundred years of Mughal rule gave to the whole of Northern India and to much of the Deccan also, oneness of official language, administrative system, and coinage, and also a popular *lingua franca*

for all classes except the Hindu priests and the stationary village folk. . . . All the twenty Indian *subahs* of the Mughal empire were governed by means of exactly the same administrative machinery, with exactly the same procedure and official titles. Persian was the one language used in all official records and letters. Officials and soldiers were frequently transferred from one *subah* to another; travellers and traders passed freely from one city to another, one *subah* to another."

The British paramountcy only extended and perfected this process of political unification. The official languages (Persian in the middle ages and English in the 19th century) were extremely simple and easy to learn, except for those who want to make a rhetorical parade; they gave the key to the cultural heritage of Asia and Europe respectively. Thus, all our administrative work at the highest level was performed very smoothly and universally, during the Muslim and British regimes, and linguistic difference did not then raise its head as a disintegrating force.

3. GEOGRAPHICAL CHANGES INEVITABLE, WHY

Not only have our provinces changed their frontiers within historic times, but the centre of gravity of many of them has also shifted in an incredible degree. Pataliputra (Patna), the colossal capital of the Maurya emperors as seen by the Greek ambassador Megasthenes in 290 B.C., had become a desolate hamlet in 630 A.D. Kanauj, the famous capital of Harsha, which the Chinese Buddhist pilgrim Yuan Chwang glorified in 640, was later "so completely destroyed that nothing beyond rubbish heaps remain." (V. A. Smith). As for the imperial city where Shah Jahan gloried and drank deep, the very title of Dr. Spears' charming book, *Twilight of the Mughals*, indicates its condition in the British period.

The civilisers and kingdom-builders came to Bengal by the land-route from the west, via Anga (Bhagalpur) and Gaur (Malda). In the early Muslim period they moved east, again by land, through Ghoraghat (Bogra-Rangpur) to Mymensingh and then southwards by land through Egara-sundar, Rampal and Bhawal to

Vikrampur (Dacca). The river highway to East Bengal was opened in the 15th century after the coming of foreign traders (Chinese, Persian and Portuguese), when Hugli (Satgaon) grew into our greatest seaport, second only to Chatgaon, the "Great Port" of the Portuguese writers. The real conquest of Bengal by Islam Khan (Jahangir's governor, 1609-13) moved the capital of subah Bengal from Rajmahal to Dacca; and in the early 18th century, Murshidabad replaced Dacca, only to give way to Calcutta in 1774.

Under British rule, administrative convenience had led to Bengal, Bihar and Orissa being lumped together as one political unit, as had been the case for a few years in Shah Jahan's reign also. But there was no fusion of these component elements.

Thus the chequered board of India's political map has never attained to finality. Administrative (particularly strategic) convenience has always been the deciding factor in changing our boundaries.

Today the exclusive use of the local vernacular in the official work of each province is being proclaimed, as the highest form of patriotism. It will lead to a great loss of time and money to the Government and the public alike. Even the administration will jog on, like the creaking discarded old motor buses in which I have travelled on the wretched roads (rather ruts) in the interior of the Hyderabad State. But how will this new patriotic policy work if the same narrow parochial outlook dominates the field of our education? Can our grandsons under a purely vernacular education attain to sufficient efficiency for standing up against their rivals in the modern world of competition? How will a free India, with her citizens trained on this pure *sanatani* model, hold herself erect in World War No. III? War is the supreme test of a nation's efficiency.

4. FUTILITY OF THE ONE-LANGUAGE PROVINCE THEORY

Let us consider two illustrations. The State of Bombay as drawn on our maps is a purely British creation, without any historical, ethnic or linguistic unity of its own. It has

six cultural languages, none of which can be ignored.—Marathi (spoken by less than 50 per cent of the people even in the capital, Bombay City), Gujrati (the speech of the richest and brainiest portion of the population, besides being the home language of the Parsis), Kanarese (the heritage of an intransigent minority with millions of brothers across the border), Portuguese and (or) English (for the large Goan population, because more of the educated and enterprising subjects of Portuguese India live outside Goa territory than within it), and Persian (for the ancient cultural heritage of the Parsis and the daily life of the new immigrants, called Iranis, who are prominent in every commercial quarter and even railway station-store). Which of these six languages can you safely exclude from free choice by some section or other of the Presidency's population, as the medium of their education? Remember, these classes form the upper layer of society; they are not Chinese coolies of Hongkong and Canton who speak a broken tongue called *pidgin English*, like the *pidgin Hindi* which we use in railway travel. Their cultural ambition will be frustrated and these very important sections of the State population will be rightly antagonised towards the present rulers of Bombay if the monolanguage tyranny continues. I have seen B. G. Kher and G. V. Mavalankar speak Marathi and Gujrati (besides English) with equal fluency and correctness. But they are exceptional men and even they have not gone beyond three languages.

5. LINGUISTIC INTRICACY OF N.-E. INDIA INSOLUBLE

Let us pass on to the diametrically opposite side of India. Geography has made our north-eastern corner the most vulnerable point in the country's defence front. Here our boundary with Eastern Pakistan runs in a criss-cross line several hundred miles in length, which cuts Assam and other districts off from the sea to its south by way of the oceanic river Brahmaputra. Its races and languages are as diversified as its geography. The population is made up of pure Bengalis (in Kuch Bihar

and Tippera), cultural converts to Bengali for over four centuries (in Manipur, Kamrup—Goalpara and Dhubri), Indian natives of the old Ahom kingdom (called *Kolitas* and admitted as Bengalis by the Persian historians), Ahom immigrants of Shan stock now completely Indianized, besides a dozen wild tribes of remote antiquity and historical importance. The language called *Assami* is written in Bengali characters, and its grammar is Bengali, though the vocabulary contains a small number of non-Bengali (Mongoloid?) words also. If grammar and vocabulary be the essence of a language, then Assami is only a dialect of Bengali, as Konkani (the Goa vernacular) is of the Marathi language.

Less than 30 per cent of the people of this north-eastern block speak and write Assami. The various other tongues when each of them is taken separately, are spoken by even smaller percentages. Among the English-educated people living in this composite province probably as many know Bengali as do Assami or both for literary purposes. How can linguistic monopoly be imposed on such a mosaic of tongues and races? And the monopoly of which of the local languages?

In war-time our entire north-eastern corner's transport and public services must be run by one united command. Such unity of administration cannot be improvised after the war-clouds have burst; it must be a previously perfected and tested machine.

6. STATESMANSHIP AND COURAGE CAN SAVE UNITY OF INDIA

The conclusion is inescapable that in N.-E. India, as in Bombay, there should be a super-State authority, functioning at the expense of "State rights" which is merely a mask for parochialism and the fissiparous spirit. The whole trend of the history of the U.S.A. has been to curtail the State (i.e., provincial) rights and give the Federal Government more and more power of control in the 33 once-independent colonies. The U.S.A. was saved from the fate of Latin America and prevented from breaking up into the Disunited States of (North) America, only at the expense of a

five years' war, which cost the victor 359,528 lives and the losing side 258,000,—the victims being mostly "the young, the proud, the brave" of the nation.

True leaders must *lead* and not follow the mob like slaves under the lash. Let our ruling V.I.P's take warning before the situation, bad already, becomes uncontrollable. It will not "outlast my time."

I am sure that half the present bitterness between nationals and undomiciled (foreign locusts! as I have heard the term used), and all the clamour for the transfer of fringe areas to form mono-lingual States, will die out, if we can provide equal opportunities for all citizens of India in all provinces and thus make them realise in their daily lives that "the Republic is one and indivisible" and that the quarrel between the native and the undomiciled (*mulki* and *ghair mulki* in Hyderabad) is only the quarrel of private greed and not one due to political disability imposed by a dominant majority (in the case of N. E. India, by a minority of 30 per cent only) over all others within the State.

7. COMPROMISE PROPOSALS

True statesmanship can prescribe only one remedy. And I shall here repeat an appeal I made elsewhere before:—

1. The youth of the province (both domiciled and new-comers) not speaking the local vernacular, should be left free to study in high

schools and colleges with the English medium (and primary schools teaching their own mother tongue), if they can conduct such institutions for themselves.

2. This academic freedom should be guaranteed by the Constitution (*pace* State rights in respect of education as a transferred subject), and such 'foreign' colleges should be recognised as competent to grant degrees recognisable elsewhere in India. The Union must create a special University Board of its own to supervise, correct and finance them.

3. An equitable subsidy, at the same rate *per capita* of pupils on the rolls as prevails elsewhere in that State, should be paid by the province concerned to such 'foreign' schools and colleges, and the payment enforced by the Union.

4. Catch the most promising lads of every province when young, throw them together in common mess life in the same (Central) institutions as in the case of military cadets, give them the same education at the same place, and then let them compete for the higher administrative services, which are all-Indian. Thus only can our future leaders be fused into one brotherhood, and India escape the Balkanisation on a colossal scale towards which we are rushing amidst the soul-enchancing music of *Ramdhun* and the rattle of a thousand *charkhas* coming from our Raj Bhavans.

A NEW FORCE FOR PEACE

By SOONG CHING LING (Mme. Sun Yat-sen)

THE old Asia is no more. The new Asia has arisen.

This is a fact of immense importance, encompassing the radically changed status of almost half the world's population. Whoever wants to judge events correctly must make it the premise of his judgment. The vast multitudes of Asia are moving forward to see that long-delayed justice is done, to better their fortunes according to their own design. Nothing can stop them from fulfilling these sacred obligations to themselves, to their countries and to history.

Arising from circumstances brought about by the character and results of World War II, a considerable group of newly-independent countries has emerged in Asia. The conditions under which they won their freedom, and the methods by which it was achieved, were different in many cases. Yet there was a factor common to all: the protracted and unrelenting struggle of the peoples against the foreign oppressors of their lands. This had revived on a new foundation, despite all obstacles, the ties that had bound these countries together from remote antiquity. Since winning independence, basing themselves on this priceless heritage, they have forged fresh links—born of the similarity of the problems they face in safeguarding their hard-won freedom, and of their peoples' efforts to throw off the blight of poverty and ignorance.

Having so much in common in their past and present, these nations find themselves of one mind on many vital issues as they take their place in regional and world affairs today. In expressing their own needs and aspirations, they invariably reflect those of the whole of resurgent Asia. This similarity of viewpoint, it is already apparent, is a new force which has come out of the East to influence the affairs of the entire world. Founded on the struggle for the right of self-determination by each people, it asserts the inseparable connection of this goal with the achievement of world peace. With the interweaving of these two struggles, history has entered on a new course.

In times past, it was typical for each nation to fend for itself. The new attitude is

a product of our own epoch, when the interdependence of peoples, nations and regions has been made sharply evident by the scientific advances of Man. It is highlighted with especial sharpness by the facts of life in Asia, where the peoples have suffered so long from outside intrusion and are still suffering from it, where all burn with the desire to lift themselves out of economic and cultural backwardness. As a result, countless millions have come, almost simultaneously, to high political understanding. They know that their progress must be based on a double foundation—*independence*, which releases the will and genius of each nation; and *world peace*, which makes possible the co-operation of equals for joint benefit.

The renowned Five Principles, or Panch Shila as they have come to be known in India, are the highest embodiment of this new force for peace. They are:

- Mutual respect for territorial integrity and sovereignty;
- Non-aggression;
- Non-interference in each other's internal affairs;
- Equality and mutual benefit;
- Peaceful co-existence.

The first international documents to make the Five Principles a guide to relations among States were the joint declarations issued by the Premiers of China, India and Burma in June, 1954. These historic statements grew from both the old and new links between Asian countries. They showed what role these countries have undertaken in present-day world affairs. From the outset, the Five Principles were advanced as a code of conduct not for Asian nations alone but for all nations. Since then, governments everywhere have been urged to state their attitude toward these principles, which can do so much to normalize conditions in the world, avert war, and open up bright prospects for the peoples. As Prime Minister Nehru has put it, Panch Shila is a challenge of Asia to the rest of the world and "each country will have to give a direct answer."

The Democratic Republic of Vietnam responded immediately. In the past year and a half, the Five Principles have been incor-

porated, in letter or spirit, in joint statements by China and the Soviet Union; China and Indonesia; India and Yugoslavia; Burma and Yugoslavia; the Soviet Union and Yugoslavia; the Soviet Union and India; Poland and India; China and Vietnam; the Soviet Union and Vietnam. Many other events have testified to their value, to the responsible chord they have struck among the peoples of the East and the West.

It was the idea of the Five Principles that formed the basis for the restoration of peace in Indo-China through agreements reached at Geneva in 1954. This settlement stipulated respect for the independence, sovereignty, unity and territorial integrity of the three States involved, and non-interference in their internal affairs. That the fuse sputtering in Indo-China did not set off a world-wide explosion was due in a large measure to the positive contributions of Asian States, mainly the Colombo powers and China. Clearly, the Geneva settlement was reached in the spirit of the Five Principles. Clearly, it is in this spirit that it is meant to be carried out.

India, Burma and Indonesia, three countries which subscribed to the Five Principles, joined with two other Asian States, Pakistan and Ceylon, to call the historic Asian-African Conference. Everyone feels now that this gathering has had worldwide influence. The Bandung Declaration on the Promotion of World Peace and Co-operation included ten principles which were an extension and development of the original five. It gave further evidence that the concept of peaceful co-existence, in the minds of the vast populations of Asia and Africa, is directly linked with their own national demands.

The Five Principles, and the results reached in Asia by their application, had their deep effect in helping to bring about the long-awaited meeting of the heads of governments of the Soviet Union, the United States, Britain and France at Geneva last July. One cannot separate from them the fact that the ambassadors of the United States and China sat down, in August, at the same table to discuss immediate outstanding problems.

What is the great hope that the Five Principles, reflecting the new forces for peace, arouse among the peoples? What is it that wins such world-wide confidence in these ideas, not entirely new in themselves, which have issued from the heart of Asia at this particular juncture in history?

The answers to these questions are connected with the facts of our time. True, such principles had been voiced as policy before, in the United Nations Charter for instance. But the peoples had seen them announced only to be side-tracked; they had seen the United Nations turned into a voting machine to rubber-stamp the actions of certain ambitious powers. They saw the resolving of important international problems impeded instead of being promoted. They saw relations between States deteriorate. They saw the Far East ablaze with two wars. The world seemed headed for a holocaust. But this ran counter to the hope and desire of the peoples, who had had more than enough of war. Because there had been an immense political awakening in all corners of the earth, the peoples began to speak out. A peace movement of tremendous proportions developed. There were States of a new type in the world, whose own interests required that the people's voice be heard at all times, that the nations return to negotiations as a way of settling problems, that every government pledge itself not to resort to force.

Taking impetus from the actions of the world-wide peace movement and of these States, the Five Principles emerged from the East. They appeared at a moment when the peoples, wearied by tension and fear, were seeking for an end to the "cold war" that poisoned all things, and an end to the monstrous threat of atomic slaughter. Moreover, the leaders and nations who put forward the Five Principles were obviously sincere. These ancient Asian lands, which have a long history of amicable relations with each other, and which need peace today for their own progress, were proposing a fair, simple way for all nations to live together in peace.

The answer to the peoples' urgent search for avoidance of world catastrophe came from an entirely believable source. It was no preaching from suspect mouths, no piece of fine-sounding but empty oratory. It was advanced as a guide to action by those already acting on it. The peoples, judging it to be a constructive step to peace, gave it confidence and support. Events soon proved them right, because the Five Principles not only sound well but, as the past year's events have shown, are very practical politics.

What has the application of the Five Principles proved? First, it has shown the validity of their basic premise: that while all peoples seek a fruitful, healthy existence, each

wants to pursue this goal in its own way, consonant with its own history and conditions. If this premise is accepted, all countries which observe the Five Principles in letter or spirit, no matter how they may differ in structure and customs, are honour-bound to treat and respect others as equals.

Secondly, practice has shown that where respect and equality exist, what the peoples have in common is stressed, and differences are not allowed to grow into antagonisms. When none wishes conflict, outstanding questions between States can be sincerely negotiated. What is more, observance of the Five Principles does not merely prevent antagonism and conflict. It leads positively to the enrichment of mutual understanding, it increases co-operation, it benefits the peoples, and it consolidates international peace.

This is the heart of the Five Principles. This is why they have captured public imagination on all continents and come to the forefront of the world scene.

It was three Asian States—China, India and Burma—which voiced the principles that have won such broad and growing support. In making their big contribution to extending the area of peace in the world, they greatly enhanced their own international position. Never in the modern era have the nations of Asia stood so firmly on their own feet as they do now, defending their own rights and at the same time showing how tolerance and wisdom may be exercised in foreign affairs. Asia has broken with the past, entered an entirely new phase of historical development, and in so doing helped the whole world in the solution of its problems.

Gone for ever are the times when Asian peoples had to tolerate dictation from the outside. Asia is no longer an echo in foreign policy, in deciding which way the world, of which it is so large a part, shall travel. Asia

has ideas of her own. They harmonize with those of others who seek peace, justice and co-operation among peoples. They are directly opposed to those of any government that seeks domination over the rest, that sees peoples and regions as war material for its own ends.

This harmony and this opposition are not fortuitous. They spring from life itself. They are a manifestation of the great positive fact of our twentieth century, the standing up of the peoples against oppression wherever and in whatever guise it appears.

It was in the process of the struggle to drive imperialist oppression from their soil and open the path to progress for their peoples that China, India, Burma and other Asian nations revived old links and forged the new ones from which the Five Principles sprang. Our friendship, maturing today, was born in that fiery crucible. Needing peace, knowing that peace coincides with the desires of the majority of mankind, our Asian nations have found how to use their own extensive areas of agreement to generate a new force for world tranquillity.

This has helped to create the climate for further relaxation of international tensions. We are proud that we have played our part in easing the hearts of the peoples. The way we advocate respects the sovereign rights of nations, and regards all as equal. We are sure, therefore, that it will make ceaseless headway in the settlement of outstanding problems.

My own country, China, will continue to seek good relations in this spirit with all nations, East and West. By word and deed, we will strive for the building of mutual confidence and for a relaxed world atmosphere. We will continue to act as the peoples of the world wish, and as the times demand. We will work for peace on earth, for the enjoyment by all peoples of the fruits of their labour and the joy of life.

DEMOCRATISATION OF EDUCATION

By SUSHAMA SEN GUPTA, M.A.,

Principal, Lake School for Girls, Calcutta

RECENTLY I came across a publication entitled *Seven Years of Freedom*, published by the Ministry of Education, Government of India, about a year ago. There is one chapter in it entitled "The Democratisation of Education." It says that

"With Independence and the Constitution that

embodied its triumph the democratisation of education had begun. This process of flinging wide the gates of learning to the millions is many-sided, and one of the most important of its aspects is the introduction on a large scale of scholarships at all stages of education."

Going through the article, I looked up the dictionary for the meaning of the word "democracy." I am a student of politics and

at one time, learnt the definition of the term and in these days of controversy between democracy and totalitarianism, there is no one in the world from the President to the *panwalla* who does not have a say about the word. Each of the two great political groups in which the world is divided today, calls itself "democratic" and there is no third superior body that may settle the dispute or convince either about the truth or otherwise of their claims and the common man is bewildered. Being a student of politics and also one of the crowd, I too have my ideas about this much-talked-of word, but still there may be other meanings which might have escaped me and so I consulted the dictionary. The dictionary says that it means *government of the people and also the principle that all citizens have equal political rights*. The word "democracy" though originally having only political significance has now come to be used also in the general sense of having equal rights and I take it that it was in this sense that the article mentioned above, has been written and so I shall discuss its contents in that light.

I find that the achievements in the field of this democratisation of education claimed by the ministry is divided into two parts, one is the "flinging wide" of "the gates of learning to millions" and the other is the provision of scholarships on a large scale for specialised education.

Unfortunately it is too well-known, how wide these gates of learning have been flung open for our millions. Not to speak of the poorer sections (the so-called lower classes) who yet do not bother about education or realise that education is a vital necessity for the fulfilment of man's aspirations and the realisation of his ultimate self, even the middle class people, the so-called *bhadra loks*, are at their wit's end when faced with the problem of educating two, three or four children, which they feel they must. I myself am the head of a Secondary school and I know how many children have to be refused free admission every year and how many are unable to pay regularly even when admitted as regular paying students and this is the case with every school and then there are not enough schools even for the children whose parents can pay.

If all our children and all our adults who had not the opportunity of education during an alien rule, have the equal right to education now, how is our government discharging their duty in the realisation of that right? We do not find the answer to that in this chapter,

which is entitled "democratisation of education."

The fact that the number of educational institutions has multiplied after the Independence and with it the number of pupils who are taught therein, has been proudly stated in the appendices given at the end of the book giving statistical figures. Do these figures mean anything? Schools have been established here and there, but not with a definite State policy, aiming at liquidation of illiteracy or providing adequate education for the masses, neither are most of these schools opened by the government. In this big city of Calcutta there are only four government schools for boys and two for girls and the rest are run by private enterprise. Some of these receive Government subventions which cover but a very small percentage of the total expenditure of these schools. But with all this enhanced number, it does not provide free education to children. Education is still out of reach of most of the common men, and keen as the middle classes are for giving education to their children, it is managed somehow at the cost of the health of children, by underfeeding them and denying them the minimum demands required for their health. The health of most of the school children is poor. Have the Government any reason to be proud of the increase of the general education of our children in this way?

True, for more than a quarter of a century, the Corporations, Municipalities and District Boards are entrusted with the task of providing free education to the children, but the number of the schools run by them is insufficient, and so far as Calcutta is concerned we know that the schools are ill-housed, ill-equipped and ill-cared-for, so that many who really care for their children's education are unwilling to send them there.

Where the children are given free education those who receive always suffer from an inferiority complex and those who impart it suffer from a sense of lofty superiority of doing charity. The poorer classes receiving free education, do not feel that they are enjoying a right and not receiving charity and so they are ashamed to complain, obliged as they feel for the little good that is done them.

This is how the gates of learning have been flung open to our millions. Then coming to the other aspects of democratisation, we find in existence in this country, various types of schools, the Government schools, the Public schools "run on lines of English Public schools," where they have "the chance to develop quali-

ties of leadership" and schools claiming high fees backed by rich people that have good buildings, better paid staff and equipments and then there are missionary schools and convents, etc., etc. Can we call this equal right and equal opportunity for all citizens to receive good education? Why the Government of India even after the achievement of Independence should allow all this distinction to remain is hard for the people to comprehend? Why should there be any school marked "Government schools" in a country that calls itself democratic? Is it not the government "of the people" and "for the people"? Has not the Government a duty and obligation to educate all its citizens and give all of them equally good education? Why should the Government provide all expenditure of some schools termed "Government schools" and why should the organisers of other schools who have spent their life-time in the cause of education, have to go about with a begging bowl throughout their life to improve the institutions built up by them? Good or bad work is not recognised, originality, freshness and vitality is not given any recognition, in the words of a Bengali proverb there is "the same rate for *muri* and *murki*."

Our Ministry informs us that the Public schools offer "the Secondary school child the special benefits of character-training, training in citizenship and the chance to develop qualities of leadership." Without going into the merits of the necessity of the existence of such highly expensive schools in the present background, it can be safely stated that the special chance of that special training is available only to a handful. The Ministry informs us that entry into this *sanctum sanctorum* has been made available by scholarships and in the year 1953-54, 57 candidates were selected out of a thousand candidates. About the total seats in the school there is no mention. The paper goes on to speak of other scholarships also, about research scholarship in humanities, science and technology, foreign scholarships, etc., and there the article ends, giving at the last paragraph again a statistical report of the increase in women's education, leaving us bewildered in a labyrinth to find our way to the democratisation of education.

These scholarships granted to meritorious students to secure places so far closely preserved for a favoured section of the people is regarded by our Ministry of Education as the *summum bonum* of democratisation and that is what made me look up my dictionary and

I leave it to my readers to judge how far the equal right of all to education has been recognised or followed according to this report and what is the sense of this glorious caption.

We do not understand why any special institution should be allowed to remain in this country which calls itself democratic. If any special educational method is invented to prepare a better kind of character or citizen, why that knowledge should not be made known or the method introduced in every school, passes our comprehension. Why even in these days of democracy "Vedas" which mean knowledge should be deemed to be unsuitable for "Sudras" which in modern days mean the unfortunate poor? As for the justification of the existence of these special institutions for preparing leaders, does it not sound like a huge joke to think of adorning the top floor, without laying the foundation? Great leaders in history sprang from the people and were not brought out ready-made from factories.

Coming recently from a country, the U.S.S.R., which is called an undemocratic country, I cannot but here put in a few words about what I have noticed there regarding education. There all the schools are run by Government, no private or special schools are allowed, there is no difference in the curriculum of any school, there are no different schools for man or woman, high or low, no school for preparing leaders though that country believed in dictatorship. There are one hundred and twelve languages in the U.S.S.R. and there are schools imparting education through the medium of all these languages. There are scholarships at the University stage, where education is not compulsory and 96 per cent of the University students are given scholarships. Education is at present compulsory for 7 years from the age of seven to fourteen and during the next five years' plan, from 1956 to 1960, the State is bringing in the whole of ten years' school-course within the span of its compulsory educational scheme. For those who have to leave school at the end of seven or ten years to earn a livelihood, there are elaborate arrangements of special education of various types, and people in great numbers at the field, factory or office avail themselves of the opportunity thus afforded. Examples are not rare where an ordinary labourer has risen to be the director of the firm by learning while earning. The people all over are enthused with a great thirst for knowledge and the State has made ample provision for them to quench their thirst. New,

attempts and experiments are being made every day on a huge scale to bring all the branches and stages of education within the reach of all. We could not but be struck with the real "democratisation" so far as education is concerned, that is going on there.

Twenty-five years ago, when Tagore visited that country he was struck with the vigorous attempt of that State, which was still in its infancy, in spreading education far and wide, not excluding the nomadic Mongolian tribes of the desert countries of Central Asia and he thought that there lay their salvation. He disliked dictatorship, but he said that if they wanted the continuance of dictatorship, if they wanted to continue methods of violence and oppression which was a natural consequence of revolution, disorder and turmoil, they would not have launched upon this huge programme of education of their people. And that is what we also heard today. When we asked the people of the U.S.S.R., if their State believed in democracy, they said:

"If our State did not believe in democracy it would not have cared to educate us in this way, we would have been kept ignorant as we had been kept during the Tsarist regime. Education develops power of understanding and people educated would naturally understand the difference between good and evil and criticise."

We have, however, seen them thirty-two years after they could stabilise themselves after the revolution, which they did in 1923. But it must be remembered that during this period their people had to withstand the holocaust that came in the trail of the onslaught of the mightiest military power ever conceived of. In spite of that they are now cent per cent educated, versed not only in 3 R's but educated in the real sense of the term that enables one to realise his position in a modern State. Even the blind and crippled are not lost sight of and we have seen how meticulously and tenderly these unfortunate children's education is looked after. Education to sick children who are suffering from chronic maladies is imparted at hospitals and along with doctors and nurses these hospitals are provided with teachers. We visited such institutions.

After a hundred and fifty years of slavery and servitude we have attained freedom. Now is the time to eradicate the evils of ignorance and illiteracy and that must be given top priority. We do not all at once want our children to have *pilau* and *kabab*, but rice and *dal* should first be provided to all, followed as

quickly as possible by fish, meat, milk, vegetables and fruits. Then and then only can we think of delicacies.

So in the case of education, is there any necessity in this poor country of ours for "Public schools after English models" at this stage? If we want to democratise education should not our first charge be free and compulsory education for all, and then when that has been achieved to go up step by step? To say that Indians are so fond of education that "compulsion" in education is not necessary, is to wink at facts. A poor parent would rather have his very young son and daughter earn something rather than study at school, they would also sometimes be afraid that by being educated their children might not want to take up 'low' work. So compulsion is necessary. While in U.S.S.R. we were asked over and over again what the Indian Government has done about educating the masses after the departure of the English. We were at a loss what to say, so we made excuses about our difficulties and so on and said that we are improving and hope to improve as time goes on. But at heart we were thoroughly ashamed and felt that we had nothing to say, nothing to be satisfied or speak about.

Our shortcomings are sought to be justified on the plea of the extreme youth of the State. But at the age of eight a child takes care of many of its things and it begins to show its genius.

What is to be mostly deplored is not that we have not achieved great things in so short a time, but there is no sign of a proper beginning. We may not expect a tree, but where is the shoot? The shortcomings or difficulties of the Government could have been appreciated if these were acknowledged with understanding, but the most dangerous thing is this self-satisfaction, this attempt to deceive self and others of having done a lot while doing practically nothing. This self-complacency of those in power makes us feel that we have very little to expect from our present Government.

We know that the first thing to make Independence and Democracy successful after providing food to its people is to provide education. All the peoples of the world, democratic or undemocratic, have accepted it and we wonder when India would fall in line with this great march of races towards knowledge and more knowledge, and knowledge as we in India know also is the only source of strength and salvation.

GEOGRAPHIC ENVIRONMENT OF INDIA

By PROF. C. B. MAMORIA, M.A., (Geog.), M.COM.

III

Flora and Fauna

FORESTS: TYPES AND RESOURCES

INDIA is very rich in forests, which cover 18 per cent of the total area (2,65,932 sq. miles) of the country. It is estimated that 25 per cent of the land area of a country under forests is normally adequate. North America covers 33.3 per cent; Central and S. America 38.9 per cent; U.S.S.R. 45 per cent; N. Europe 48 per cent; Central and S. Europe 22 per cent and Western Europe 17.7 per cent; Africa (excluding N. Africa) 22 per cent; S. and East Asia 23 per cent, and Pacific area 6.3 per cent,¹ while Indian forests cover only 18 per cent of the total land area. Compared with other countries this is a low proportion. Also the distribution of forests is erratic, e.g., the eastern region has 36.4 million acres or 20.63 per cent of land under forests while the north-western region only 29.87 million acres or 10.70 per cent; the central region 39.69 million acres or 29.92 per cent and southern region 43.5 million acres or 18.82 per cent.²

Let us have a brief idea of the forest types available in India. From the slopes of the Himalayas to Cape Comorin, and from the dry tracts of Rajasthan to the eastern limits of the Assam hills, there is an infinite variety of forest types.

(i) Where rainfall is adequate and its distribution satisfactory *Evergreen Forests* develop, consisting of lofty, dense and evergreen trees with numerous epiphytic ferns, mosses, orchids and aroids. These forests are found throughout the Western Ghats from Bombay southwards to North and South Kanara, Tinnevely, Mysore, Coorg, Coimbatore, Travancore and the Andamans; and in North-east India in sub-montane divisions of North Bengal, and the coastal strips of Orissa and Assam. The trees of economic importance are ebony, palm, bamboo, mahogany and sandalwood.

1. *The National Forest Policy of India* (1952), pp. 4-5.

2. *The First Five-Year Plan* (1951), p. 295.

(i) The Eastern Region covers Assam, Bihar, Orissa, West Bengal, Manipur, Tripura and Andaman and Nicobar Islands; (ii) The Central Region covers M.P., M.B., Bhopal and Vindhya Pradesh; (iii) The North-western Region covers V.P., Kashmir, Pepsu, Rajasthan, Saurashtra, Ajmer, Bilaspur, Delhi, Kutch and Himachal Pradesh; (iv) The Southern Region covers Bombay, Madras, Hyderabad, Mysore, Travancore-Cochin and Coorg.

Vide *India*, 1954, p. 9.

(ii) Under less copious rainfall *Deciduous Forests* occur, containing teak or *sal*, rosewood, kine, bamboo, terminalias, mulberry, *sisu*, myrabolans and a large number of valuable trees. This type is generally found along the eastern side of Western Ghats, in portions of M.P., Bombay and Madras and in drier parts of Coorg, the western portions of Mysore, Cochin and Travancore. In the north this type is distributed practically throughout Northern India, especially in U.P., Bihar, Orissa, West Bengal and Assam.

(iii) Where rainfall is still less, *Thorn Forests* appear in which the vegetation becomes sparse and consists of acacias, prosopis, tamarix and albizzias and other thorny bushes. This type occurs in Central India throughout the dry region of the Indian peninsula, to the lee of the Western Ghats, from the extreme south up to Indore and Bhopal, being prominent in Madras, Mysore, Hyderabad and Bombay; and in the S.-W. Punjab, Rajasthan and in portions of U.P.

(iv) In the *Himalayan Temperate and Alpine Forests*, pines, spruce, cypress, junipers, *deodars*, firs, oaks and chestnut flourish according to elevation and aspect.

Besides these types, there also occur four additional types of forests which are determined by edaphic factors. They are:

(v) The *Beach Forests* which extend all along the coast where a sandy beach occurs. Strong salt-laden winds render the habitat xerophytic. At other places, small evergreen and deciduous trees and numerous shrubs occur; where open, the maritime grass and other surface creepers which bind the sand are conspicuous.

(vi) *Tidal Forests* are found on ground near the sea coast which is flooded with slightly brackish water at high tide. Such forests occur at the mouths of the Mahanadi, the Krishna and the Godavari and in the Ganges and Brahmaputra deltas. The forest is closed evergreen, having species like *garan*, *bogla*, *sundri*, etc.

(vii) *Fresh Water Swamp Forests* occur above the salt water limit on wet alluvium at the head of big deltas of rivers in parts of Assam, Bengal, U.P. and Madras. These forests are rather an open crop of evergreen trees containing *kadam*, *pandanus*, etc.

(viii) *Riverine Forests* are confined to the banks of larger rivers consisting of new or fresh alluvium. The most characteristic trees are *khair*, *sissoo*, *tamarix*, growing throughout the northern belt from the Punjab to Assam.

EFFECTS OF FORESTS

Indian flora is rich both in composition and value. India has 2,500 species of wood of which about 450 are commercially used for extracting acetic acid, acetone, methyl alcohol, oils, valuable creosote and valuable drugs like sulphamide and chloroform. Forests are indispensable for national development and for the full growth of civilization. "Indeed, civilization has been nursed, nourished and grown to manhood in the regions of temperate natural vegetation." A French proverb rightly says, "Forests precede civilisation but deserts precede them." To an agricultural country like India, the importance of forests can hardly be exaggerated. They increase the fertility of the soil on which they grow. They have a moderating effect on temperature. Trees act as pumps tapping the ground water from considerable depths and transferring it as moisture to the air, thus increasing humidity. The sudden change in the climate of many parts of India is largely due to indiscriminate destruction of forests. By draining the marshy swamps they increase the water-holding capacity of dry soil and prevent floods.³ Apart from these indirect advantages, their direct advantages are also very numerous. Indian forests provide employment to millions of people such as wood-cutters, sawyers, carters, carriers and raftsmen.⁴ They provide fodder for about 13 million cattle, 3 million buffaloes and 9 million other animals. Grazing in States forests yields about Rs. 95 lakhs of revenue annually.⁵ They also give habitation to a number of hill-tribes and provide about 1.8 million tons of timber every year and other major forest-produce of the value of Rs. 171,648 besides supplying various raw materials like tans, dyes, bamboos, cane fibre, flosses and grasses, honey, lac, resin, wax, gums, etc., for our industries.

But in spite of so much importance to the national economy of India, the forest resources have not been fully exploited. The

basic causes responsible for the state of affairs are: Colossal destruction of forests by proprietary rights; inadequate protection from fire; plant diseases; over-grazing of cattle; incomplete utilisation of forest wealth due to the lack of a well-conceived system of working plans; general absence of facilities for seasoning and preserving timbers; inadequate research with regard to utilisation of forest produce; and above all the want of adequate trained personnel for conserving and developing forest wealth; lack of information regarding quantities of timber; undeveloped means of transport of the forest products available in our forests including high freight charged by railway for them and the inaccessibility of forest areas.⁶

In connection with forests, the most important problem in India is to increase the area under forests, to preserve the existing species of trees available in this country, and to introduce new possible species. In May 1952, the forest policy resolution of Government of India emphasized the need of developing and reserving Indian forests. The aim is to maintain one-third of the total area in the country under forests. In the Himalayas, the Deccan and the mountainous regions the proportion of land under forests will be as high as 80 per cent while in plains it would be about 20 per cent of the total. In its policy of forest development, the First Five-Year Plan provides for renovation of areas which were exploited during the war years; afforestation of badly eroded areas; development of forest communications; development of village plantations for overcoming the shortage of fuel; and increasing the use of non-conventional species after proper seasoning and treatment of chemical methods.

AGRICULTURAL PRODUCTION

India produces a wide variety of crops not only of the tropical and sub-tropical but also of the temperate zones. The most important among the tropical products are rice, coffee, millets, sugarcane, tapioca, pine-apple, jute, spices, cinchona and banana. The chief sub-tropical crops are cotton, tea, opium and tobacco. Of the products of the temperate zone, the most important are wheat, maize, barley, pulses, potato, hemp, flax and various kinds of fruits.

The periodicity of the season often allows of two and in a few cases three harvests in the year. The total cultivated area annually is

266 million acres. Double cropping is possible in about 36 million acres of the total cultivated area of India. The two main crops are *kharif* and *rabi*. The main *kharif* crops are rice, jawar, bazra, maize, cotton, sugarcane, sesamum, urd, mung, tobacco, forage grasses and leafy vegetables, and the main *rabi* crops are wheat, barley, gram, linseed, rape and mustard, peas and beans, scrub-fodder root and tuber vegetables. In humid regions, *zaid* or *catch* crops are also raised; the crops being melon, water melon, cucumber and leafy and tuber vegetables.

It is interesting to note that in India we have regional specialisation of crops. Rice is grown in the Ganges valley, the mountainous districts of the Punjab, U.P., Bihar, West Bengal, Assam, Western Ghats and the coastal belts of Orissa and Madras. Wheat is extensively cultivated in the Punjab, Pepsu, U.P., M.P., M.B., Ajmer and Eastern Rajasthan. Sugarcane is grown in the Gangetic Plain, Madras, Mysore, Orissa, Hyderabad and the Punjab. Oilseeds such as groundnut, linseed, castor, beans, rape and sesamum are grown in northern Madras and S.E. Rajasthan. Cotton happens to be a special product in specific regions of Bombay, M.P., M.B., Rajasthan, Mysore and the Punjab. Tea is cultivated mainly in the Assam Hills and the Darjeeling and Nilgiri Hills, while coffee is of special interest in Coorg, Madras and Mysore. Tobacco has spread itself over the whole of India, major contributions generally coming from West Bengal, Bihar, U.P. and Rajasthan. Jute is largely grown in Cooch-Bihar, Assam, West Bengal, Bihar and Orissa coastal regions. Rubber, pepper and cardamom plantations are to be found in the Annamalai and Cardamom Hills. Thick coconut groves along the Malabar coast yield coir and copra; the bulk of the country's supply of cashew nuts also comes from these parts.⁷

LIVE-STOCK

India is rich in live-stock and possesses nearly 1/7th of the live-stock population of the world excluding U.S.S.R. According to the 1951 Cattle Census, the total live-stock population in India is 292½ million, of which cattle are 155 million, buffaloes 43½ million, sheep nearly 39 million, goats 47 million, pigs less than 4½ million, horses and ponies 1½ million and donkeys 1½ million, camels 629,000 and mules 60,000. In addition to this we have 67.13 million fowls and 6.26 million ducks. But on

the whole, the quality of cattle and other live-stock in India is very poor. The average yield of milk per cow per annum in India is only 413 lbs. as against 2000-7000 lbs. in other countries of the world. There are in India some good-quality cattle. Among the best cows in India are *Sahiwal* (Punjab) and *Gir* (Saurashtra). The important breeds of bullocks are *Hisar* and *Hansi* (Punjab), *Nellore* (Madras), *Amrit Mahal* (Mysore), *Kankres* (Gujarat), *Kangyam* (Madras), *Malvi* and *Nimari* (M.P.), *Malvi*, *Nagori* and *Tharparkar* (Rajasthan). The best breeds of buffaloes are *Murrah* (Punjab), *Jefferabadi* (Saurashtra), *Mehasana* and *Surti* (Bombay). At the same time a large percentage of population is non-descript. They are uneconomic producers. Malnutrition is perhaps the greatest single factor responsible for the degeneration of cattle to their present state. Improper and insufficient care, ignorance and lethargy of the people and promiscuous mating are some of the atrocities which are also responsible for this degeneration. The result is that the ill-famished cattle are a drain on country's resources as they cannot drag the heavy plough nor work efficiently as draught animals.

Then there are a large variety of wild animals and birds but unfortunately "some of our notable animals such as, lions, rhinoceros, tragopan, cheetah are on the verge of extinction."

FISHERIES

The long coastline of India has numerous estuaries, salt water lakes and back waters for marine fish, and rivers, canals, tanks and inundated tracts for fresh water fish. Fisheries contribute to about Rs. 10 crores annually to the national income of India. The production of sea fish in India amounts to nearly 100 lakh mds. per annum while that of fresh water fish amounts to less than 50 lakh mds. per annum. Including imports the total supply of fish in India is nearly 270 lakh mds. per annum, out of which nearly 70 per cent is sea and estuarine fish and 30 per cent is fresh water fish. This gives a supply of 34 lbs. of fish per capita per annum which is completely insufficient. The per capita consumption of fish in Travancore-Cochin, West Bengal and Bombay is higher than in U.P., Bihar and the Punjab and negligible in M.B., M.P. and Rajasthan, etc. Of the total population only about 32 million people consisting of Vaisyas, Brahmins and Jains do not take fish because of religious injunctions. In many cases among the non-vegetarians, the

3. According to Mr. C. R. Ranganathan, President, F.R.I. and Colleges, Dehradun, "In defending the land against the evils of erosion, aridity and climatic excesses, forests perform services no less valuable and no more expressible in terms of money than those rendered by the defence forces of a country."—*Vide Our Forests*.

4. Census of India, 1951, Vol. I, A.P.

5. The First Five-Year Plan, p. 291.

6. C. B. Mamoria: *Agricultural Problems of India*, pp. 101-2.

7. Mamoria: *Op. cit.*, p. 38 and *India Reference Annual*, 1954, p. 9.

preference for vegetarian diet is due to non-availability of fish or its high price.

WATER RESOURCES

In India, there are enormous water resources as there are many rivers and some water-falls, but unfortunately they are not being properly harnessed for more than one reasons. Most part of the rainfall is concentrated in a comparatively short period. The rivers carry large volumes of water during this period, a large portion of which goes unutilized because it is neither physically possible to divert, nor economic to store, all but a small portion of this flow. Secondly, the volume of water, in the rivers, also varies from year to year, whereas development schemes can be executed only when the supply is assured for continuous use. Thirdly, in areas of high rainfall, irrigation is either not necessary or is needed only to a very limited extent. Nearly 1356 million acre feet of water flows down the rivers of India per year but only 76 million acre feet or 5.6 per cent of it is used for irrigation purposes. It is estimated that nearly 450 million acre feet of water can be utilised for purposes of irrigation. The area irrigated in India is nearly 51½ million acres, out of which nearly 21 million acres (41.2 per cent) are irrigated by canals, less than 15 m. acres (31 per cent) by wells, less than 9 m. acres (16.7 per cent) by tanks and a little more than 7 m. acres (11 per cent) from other sources. Out of this total irrigated area, grain crops occupy more than 30 m. acres. 41.4 per cent of the total irrigated area is under rice; 15.4 per cent under wheat; 23.6 per cent under other cereals and pulses; 5.9 per cent under sugarcane; 2.4 per cent under cotton and 11 per cent under other crops.*

As India is essentially an agricultural country, the need for sufficient water supply is always great. The uncertainty of rainfall distribution as regards both time and place and the irregularity in distribution throughout the year, the absence of winter rains and the necessity for more water for some crops like rice and sugarcane, are the chief reasons which make irrigation necessary. India occupies an important place in irrigation in the whole world. Roughly about one-third of the total irrigated areas of the world lies in India. The physical factors responsible for such development are:

(i) The rivers rising from the Himalayas are perennial and hence provide a constant supply of water.

* *Agricultural Situation in India* (November, 1954), p. 70.

(ii) The slope of the plain is so gradual that the canals which are taken out in the upper courses of the rivers can easily irrigate the land in the lower valleys.

(iii) There is an absolute lack of rocky ground in Northern India, and therefore canals are easily dug, but in Southern India, presence of rocky surface favours the construction of tanks and embankments.

(iv) The soil is fertile which makes the greatest use of irrigation for raising both food and non-food crops required for feeding the country's vast population and the newly developed industries.

These geographical factors have determined the predominance of particular types of irrigation in particular portions of the country. It is for this reason that the alluvial tract of North India, viz., U.P., Punjab, West Bengal, Bihar, etc., is specially suitable for canals and wells; in crystalline tracts like those of Mysore, Hyderabad, Madras, S.E. Rajasthan, irrigation from tanks and embankments is most extensive; and in certain other parts, especially East U.P., East Punjab, Rajasthan, Bombay, Madras, W. Punjab and M.B., considerable areas are cultivated under wells. The areas irrigated in India are distributed as 2.6 m. acres in the Himalayan regions, 25.2 m. acres in Northern Plain regions, 9.3 m. acres in Peninsular Hills and Plateau regions; 1.6 m. acres in the Western Ghats and Coastal regions and 10.0 m. acres in the Eastern Ghats and Coastal regions. In spite of it, India is not able to satisfy her entire demand for irrigation. Only 18 per cent of her total cultivated land gets irrigation.* Greater emphasis has, therefore, been laid on the extension of irrigation. By 1955-56 the schemes included under the Five-Year Plan will add 19.7 m. acres to 51½ m. acres already under irrigation, of which major irrigation projects would irrigate 8.5 m. acres and minor irrigation projects 11.2 m. acres.

Irrigation facilities have tremendously affected agriculture, population and trade in places of habitually deficient rainfall and the areas that lie in the famine zone. They have averted the great disaster that might have been brought about by chronic droughts and have saved millions of people from death. In fact, they have banished the grim spectre of famine, and brought peace, prosperity and a higher standard of living to the whole country.⁹

Secondly, increase in irrigated land has been a boon to the cultivators, for not only

9. The comparative figures for Japan are 55 per cent, Pakistan 48 per cent, China 46 per cent, Indonesia and Malaya, each 30 per cent and Ceylon 17 per cent.—*United Asia, Food Supplement*, 1950, p. 158.

10. Bernard Darley in *Economic Problems of Modern India*, Vol. I, p. 167.

the output of their fields is ensured in ordinary years of drought, but also the amount of produce is very largely increased in ordinary years at a comparatively low cost.¹¹

Thirdly, commercial crops have monopolised the irrigated zones, e.g., jute is confined to the fertile deltas of the Ganges and the Brahmaputra and sugarcane to U.P. and Bihar.¹² In a way, India adds, by means of canals, every year an Egypt to its land.

Fourthly, besides the above benefits, irrigation yields a handsome profit of 7 to 8 per cent¹³ to the Government.

WATER POWER

India's water power potential is estimated at 40 million k.w.; but the installed capacity amounted to only 2.30 million k.w. on January 1, 1954. This shows that having regard to the vast area of the country, its vast population and its great potential water power resources a very insignificant amount has been exploited so far. The ratio between the total water power development in various countries and their estimated power is: U.S.S.R. 34 per cent; France 32 per cent; Germany 54 per cent; Switzerland 67 per cent; Sweden 27 per cent; Norway 53 per cent; Canada 34 per cent; U.S.A. 24 per cent and India only 1 per cent. The per capita electricity production in Norway is 5,529 kwt.; in Canada 4,282 kwt.; in Sweden 2,904 kwt. and in U.S.A. 2,541 kwt. The use of electricity in India is very limited at present. The average per capita consumption of electricity is only 14 kwt. per year, as compared to 1,100 kwt. in the U.K., 2,207 kwt. in U.S.A. and 3,905 kwt. in Canada.¹⁴ In Switzerland, the production of electricity is 2,252 kwt.; in New Zealand 1,519 kwt.; in U.K. 1,229 kwt.; in Japan 505 kwt., while in India it is only 17 kwt.¹⁵ This is but natural in

the present state of industrial backwardness. The exploitation of hydro-power depends not only on the flow of water at the hydraulic head, but also upon the accessibility of the site to heavy machinery and its distance from load centres, the cost of storage and the manner in which it is proposed to use the power. The seasonal variation in the flow of most Indian rivers is a particularly important factor. The construction of dams to ensure an even supply of water throughout the year also adds considerably to the capital outlay.

The following power zones may be noticed:

(1) The most important region of potential hydro-electric power lies along the foot of the Himalayas from East Punjab to Assam. Here, the snow-fed streams debouch on the Indian plains and while descending they form waterfalls suitable for the generation of power. But having regard to the economic limitations of long distance power transmission it will not be possible for some time to come, to feed India's present major industrial centres with Himalayan power.

(2) The second power zone lies along the western boundary of the great Deccan Plateau. This region has contributed to about 80 per cent to India's total power production.

(3) The third water power region of much lesser intensity in comparison with the first two lies along the Satpura, Vindhya, Mahadeo, and Maikal Ranges in Central India and M. Pradesh.

(4) The fourth region, really speaking, is the thermal power region. It extends from Calcutta in the east to Nagpur in the west and embraces mostly the coalfields of Gondwana belt lying in West Bengal, S. Bihar, Eastern M.B. and M.P. This thermal power region overlaps a major part of the third hydel power region.¹⁶

Possibilities are, therefore, immense in India for the development of water power. It is estimated that the generating capacity would be increased by 1.1 m. kwt. within the Plan period and by 1.4 m. kwt. when the projects in hand are completed. The problem in India is not only to increase the supply of electric energy but to make it available at cheap rates so that the cultivator, the artisan and the factories might get an adequate supply of cheap power.

(To be continued)

16. The important Hydro-electric works in India with generating capacity are:

(a) In W. India: (i) Tata Hydro-electric Works, Bombay, 60,000 kw.; (ii) Andhra Valley Power Co., Bombay, 66,000 kw.; (iii) Tata Power Co., Bombay, 10,000 kw.

(b) In S. India: (i) Pyakara Power Project, Madras, 38,750 kw.; (ii) Mettur Hydro-electric Works, 40,000 kw.; (iii) Papanasam Project, 17,400 kw.; (iv) Pallivasal Hydro-electric Works in Travancore, 13,500 kw.; (v) Sivasamudram Hydro-electric Works, Mysore, 42,000 kw.

11. The Advisory Board of I.C.A.R. holds that the production of irrigated crops per acre is on an average 50 or 100 per cent higher than that of unirrigated crops in the same locality. (Vide, *Mamoria: Op. cit.*, p. 293).

12. C. W. E. Cotton: *Handbook of Commercial Information for India*, p. 146, p. 156.

13. C. A. Knowles: *Economic Development of British Empire Overseas*, Vol. I, pp. 367-68.

Cf. In some cases it is even more, e.g., in Madras, Cavery Delta System yields about 14 per cent on the capital outlay; Krishna Delta System, 16 per cent; Upper Bari Doab in Punjab, 21 per cent; Eastern Jamuna Canal and the Ganga Canals in U.P., 63 per cent and 25 per cent respectively.—Vide, *The First Five-Year Plan*, p. 371.

14. *The Five-Year Plan*, p. 345.

15. *United Nations Monthly Bulletin of Statistics for August, 1953*. In India, of the total production of electricity, 78 per cent is consumed as domestic light; 16 per cent as commercial light; 4 per cent as industrial light and only 2 per cent for irrigation. Vide *India* 1954, p. 191.

INDIAN FEDERATION

PROF. JATINDRA RANJAN DE, M.A.

"UNITARIANISM" means, according to Professor Dicey, "the habitual exercise of Supreme legislative authority by one central power" (*Law of the Constitution*, p. 139). The Central authority may delegate powers to local authorities. The relation between the Central and Local authorities then is the relation of principal and delegate. The local authorities owe their existence to and receive their authority from the centre. They exist and function at the discretion of the centre. They cannot claim any separate identity. The central authority is absolute and supreme. Its internal sovereignty is undivided. It is exercised by the Central law-making body and there are no subsidiary semi-sovereign law-making bodies. This is Unitary Government.

As opposed to this, "Federalism means the distribution of the forces of the State among a number of co-ordinate bodies each originating in and controlled by the constitution" (Dicey, p. 157). The constitution assigns power to both Governments—Central and State. Both are independent in their respective domain. The power of the Centre thus is limited by the autonomy of the State. The line of demarcation is defined by the constitution. Both owe their existence to and receive their authority from the constitution. This constitution is the main source of power of both. Hence in a federation firstly there is the supremacy of the constitution; secondly, there is the distribution of powers between the Centre and States which cannot be changed except on the authority of the constitution; and thirdly, one supreme Judicial authority to decide constitutional disputes that may arise over the domain of both Governments. In short we might say in a federation the internal sovereignty of the State is shared by two authorities—Central and local, and the Central authority does not exercise unfettered authority over the whole state. It is limited by some semi-sovereign bodies. This is federation.

Though the Swiss confederation (which took its birth in the Treaty of Westphalia in 1648 and since then it has a continuous life, being transformed in 1848 into a federal state and thoroughly revised in 1874) is the oldest of existing federal states, the U.S.A. Federal Constitution is the most complete one. Federations vary from state to state—some are more federal allowing greater sphere of autonomy to the units than others which centralise the power and give less sphere of autonomy to the units. Thus federations differ according to the respective powers of the federal authority and federating units. This is determined by two ways as to the method of distribu-

tion of powers between the centre and units; and as to the nature of the supremacy of the constitution.

The constitution of India has enumerated three lists of subjects of legislation and execution—(1) The Union list, (2) The State list, (3) the concurrent list. The Union Government has exclusive authority of legislation and execution over the Union list. The State Governments have exclusive authority over matters of the State list. Both have concurrent jurisdiction over the concurrent list. But if any law or any provision of it is repugnant to any Union law, the State law shall wholly or to that extent be void. The residuary powers belong to the Union.

Incorporation of concurrent list in our constitution may appear to be inconsistent with Federal Principle. The utility of a concurrent list in a federation has been very aptly expressed by the Joint Parliamentary Committee report:

"Experience has shown, both in India and elsewhere that there are certain matters which cannot be allocated exclusively either to a Central or to a Provincial Legislature and for which though it is often desirable, that Provincial legislation should make provision, it is equally necessary that the central legislature should also have a legislative jurisdiction to enable it in some case to secure uniformity in the main principles of law throughout the country, in order to guide and encourage provincial efforts, and in others again to provide remedies for mischiefs arising in the provincial sphere but extending or liable to extend beyond the boundaries of a single province." (*Joint Parliamentary Committee on Indian Constitutional Reforms*, 1934, para 51).

The U.S.A. Constitution has no provision for the concurrent list. The Australian Constitution designed on the U.S.A. model has assigned, enumerated or selected legislative powers to the Centre and the residue belongs to the States. But Section 51 enumerates 59 entries of power over which both may legislate and Section 109 says, "When a law of a State is inconsistent with a law of the commonwealth, the latter shall prevail and the former shall to the extent of the inconsistency be invalid." The Canadian Constitution also makes provision for the concurrent sphere though to a very limited extent of agriculture and immigration only, and in cases of repugnancy, the Dominion legislation prevails. The concurrent list does not in any way militate against the Federal Principles, rather it helps in

INDIAN FEDERATION

369

achieving the uniformity of legislation throughout the whole country over some affairs when it appears desirable and expedient, but allowing the states dominance over them as far as practicable.

As to the residual powers of the centre, it may be said that the three lists have almost exhausted the powers of administration because the Union list contains 97 entries, the State list 66 and the concurrent list 47. A very little scope is left to the centre to exercise authority by its claim to residual powers. It may not be discussed in details and can be closed with this reference that in a Federation the residuary powers may also belong to the centre as in Canada.

In our constitution some over-riding powers over the States have been given to the Centre. On four occasions the Union Parliament can legislate on matters of State list:

(1) If the Council of States has declared by resolution supported by not less than two-thirds of the members present and voting that it is necessary and expedient in the national interest (Article 249).

(2) If the Proclamation of Emergency is in operation (Article 250).

(3) If two or more States express by way of resolution of State legislatures that Parliament should legislate over any matter or matters of State list. But it shall be operative only in the States which desire it (Article 252).

(4) If necessity of the implementation of international obligations arises (Article 253).

The underlying principle of Federal Government is that none of the parties in a Federation should change the basic distribution of powers by its unilateral action. This has been violated in our constitution, because the over-riding authority has been given to the upper chamber of our Parliament. It is a Council of States, but in name only. It does not enshrine the Federal Principle as States are not equally represented in the council. The only silver line is that it shall require not less than two-third majority present and voting to alter the distribution of powers. Again as it is a permanent body and composed of elderly men it is presumed that it shall not be led by emotions and party spirit. There is another safeguard. That is, members of the Council of States are elected by the members of the State legislature. Every second year one-third of its members retire. And such resolution of the Council to change the distribution of powers shall have effect only for one year at a

time [Article 249(3)]. So after every two years State legislature shall have the opportunity to counteract such move of the Union Parliament by sending new members to the Council. After all, this provision bespeaks of Unitarianism in Federal Constitution. In no other federation such Unilateral power of action has been assigned to the Federal legislature, not even in Canada.

Even in time of emergency no other Federal Constitution gives the power of unilateral action in the hands of the centre. The distribution of powers cannot be changed except by an amendment of the Constitution. Such emergencies are met by other ways in other constitutions. During such period of national importance if the Federal Legislature frames laws for the peace, order and good government of a country, the Judiciary interprets the law in that way and does not stand in the way of Federal legislation even if it means that it may affect the distribution of powers. It is evident in the observation of the Privy Council in the case of *Pulp and Paper Co. vs Manitoba Free Press* (1923) in Canada:

"The general control of property and civil rights required for normal purposes remains with the Provincial Legislatures. But the questions may arise of reason of the special circumstances of the national emergency which concern nothing short of the peace, order and good government of Canada as a whole."

Of course it is true even in the U.S.A. that there has been an increasing demand on the part of a substantial section of the people to strengthen the Federal authority, so that it may cope with the ever-growing complexities of the national life of the Americans. Especially after the onset of the world-wide economic depression in 1929 till the end of the World War II, the demand was very much persistent. President Roosevelt was successful in the implementation of his "New Deal" which actually meant the over-riding of some state powers. "In its actual working, the American federal system is not, in 1949, what it was in 1789." (D. Basu: *Commentary on the Constitution of India*, p. 606). De Tocqueville's observation in 1835 that "Government of the centre was the exception, while Government of the states was the rule" does not hold good today because of growing powers of the centre. But one point is to be emphasized, that is, the ultimate competence of over-riding power does not lie with the Federal legislature alone, but with the Federal judiciary. The Federal legislature frames laws encroaching State powers to cope with emergent situations and the judiciary sanctions it when ever it thinks desirable.

The Federal legislature is not empowered to supersede the distribution of powers and to nullify the Federal structure of the constitution. But our Parliament can. If the President issues a Proclamation of Emergency and if it is supported by resolutions of Parliament, virtually that may mean the suspension of Federal structure of the constitution. Of course Article 353 does not refuse to State legislatures any power at all over State subjects under such a situation, rather they enjoy concurrent powers. Over them Union power shall prevail to the extent of repugnancy. There is another provision to afford a scope for Federal despotism, that is Article 356 by which the President may assume to himself all the powers of a State and delegate them to any authority on being satisfied that there is constitutional breakdown in that State. That is analogous to section 93 of the Government of India Act, 1935 which empowered the Governor of a Province to assume all power to himself acting in his discretion.

No such provision for supersession of State Government by the Federal Authority on the ground of constitutional breakdown exists in any Federal constitution. But if there is any violent resistance to the execution of Federal laws, the Federal authority may compel obedience to such laws as in America. President Lincoln did it during the Civil War (1861). This is similar to Article 356 of our Constitution. President Dr. Rajendra Prasad promulgated two orders under Article 356 on 20.6.51 assuming all powers of East Punjab to himself.

The necessity there arose due to the fact that after the resignation of Dr. Bhargava's Ministry no alternative ministry could be formed. There may be similar cases in future till the political training of the people of India takes a shape. Art. 356 might have a justification at this stage. But the fact remains—there is the scope of federal despotism in our constitution.

Parliament can legislate over a State subject if it is expressly desired by two or more states. Such Union law shall apply to the states which desire it. This is not trenching upon the powers of the states. It is innocent and deserves no detailed discussion.

The invasion of State power by Union legislature for the implementation of International agreement is not unknown in Federal Constitution. Art. VI of the U.S.A. constitution says: All treaties made, or which shall be made under the authority of the United States, shall be the supreme law of the land, and judges in every state shall be bound thereby, anything in the constitution or laws of

any state to the contrary notwithstanding. Art. 132 of the British North America Act has similar provision. Australian constitution has no such written provision, but a case law (*King vs. Burgess*, 1936) has made it clear that the Commonwealth Government can invade the state jurisdiction for the implementation of International agreement.

Another mutilating provision of Federal principle is the appointment of Governors or Rajpramukhas by the President. In the U.S.A. Governors are directly elected by the people and cannot be removed unless impeached by the State Legislature. Governors of Australian Provinces are appointed by the Crown and hold office during His Majesty's pleasure and cannot be dismissed by the Governor-General. In Canada Lieutenant Governors are appointed by the Governor-General and can be dismissed as well by him. So our Constitution in this aspect is Canadian and not American.

As to the Constitutional supremacy of our Federation it may be said that the constitution is sufficiently rigid in so far as the Federal nature of the constitution is concerned, but not as rigid as the American. The distribution of power cannot be changed by the general procedure of amendment of the constitution. It shall require the approval of at least half of the State legislatures. In the U.S.A. it requires the approval of $\frac{2}{3}$ of the States legislatures. In a complete federation, there is some amount of legalism, because the Federal constitution is nothing but a charter of contract by which the Federation comes into being. In a Federation the constitution is sovereign. Both the Governments owe their origin and receive their authority from the constitution. The sovereignty of the constitution is maintained by making it a rigid one. Our constitution is rigid to that extent.

The balance of power between the Federal and Unit Governments is held by a Federal Judiciary whose main function is to see that the constitution is respected especially in so far as the distribution of powers is concerned. It has already been said that the U.S.A., Australian and Canadian Courts have been given the power to act as arbitrator in this respect. Of them, the U.S.A. Supreme Court has almost absolute power of interpretation of the Constitution. One ex-Chief Justice of the U.S.A. Supreme Court, Mr. Hughes said, "The Constitution (of the U.S.A.) is what the Supreme Court says it is." So much legalistic attitude was not taken by the framers of our Constitution. But they have made our Supreme Court competent enough to declare

a law or a decree unconstitutional if it violates the constitution.

According to Dicey there are "three leading characteristics of completely developed federalism—the supremacy of the constitution, the distribution among bodies with limited and co-ordinate authority of the different powers of Government, the authority of the Court to act as interpreter of the constitution." (*Law of the Constitution*, p. 144). All of them are present in the Indian Constitution. Hence it is a federation in form. But the very essence of Federalism is that the distribution of powers cannot be changed by an unilateral action.

Dr. B. R. Ambedkar, the Chairman of the Drafting Committee of our Constitution, said:

"The basic principle of federalism is that legislative and executive authority is partitioned between the Centre and the States not by any law to be made by the Centre but by the Constitution itself. This is what the Constitution does. This is the principle embodied in our Constitution. There can be no mistake about it. It is, therefore, wrong to say that the States have been placed under the Centre. *Centre cannot by its own will alter the boundary of this partition.* Nor can the Judiciary." (Speech in the Constituent Assembly on 25.11.49).

Perhaps he forgot at the moment of his speech that he himself had drafted Articles 249, 250, 253 and 356 which belie this very essence of federalism. But it needs to be told that all these articles are meant for emergencies.

So long as the Centre thinks that there is no emergency, it shall work as complete Federal Government. But as soon as the Centre feels the emergent situation, the Constitution can be switched over to an unitary type by the unilateral action of the Centre. The switch is not in the hands of an impartial Judiciary like that of the American, Canadian or Australian Federations. So much legalism has been avoided in our Constitution. It is a federation so long as the Union Parliament wills it. In form it is federal, in essence it is unitary. Sir Ivor Jennings says:

"India has a federation with a strong centralizing tendency." (*Some Characteristics of the Indian Constitution*, p. 1.). P.G. Wheare says: "In the class of quasi-constitution it is probably proper to include the Indian Constitution of 1950." (*Modern Constitutions*, p. 29).

Dr. Ambedkar tried to justify the over-riding powers of the Centre in the course of the same speech:

"The first is that the over-riding powers are not the normal features of the constitution. Their use and operation are expressly confined to emergencies only. The second consideration is that: could we avoid giving over-riding powers to the Centre when an emergency has arisen?"

We do not discuss here the necessity and reason of such over-riding powers of the Centre in any scheme of Government for India with its present socio-political set-up. We only state what it is.

THE INDIAN LAW COMMISSION—ITS TASK AHEAD

By P. C. RAICHOUDHURI, M.A., B.L., W.B.C.S.

APPOINTMENT of an eleven-member Law Commission has been announced and it will soon begin its work. For the sake of expedition it will function in two sections, one in charge of the reform of judicial administration and another of the revision of the statute laws. Each section will have a Joint Secretary, Senior Deputy Secretaries, Research Officers and other necessary equipments. The Chairman of the Commission, Sri M. C. Setalvad, will be in immediate charge of the section dealing with the reform of judicial administration but will direct and co-ordinate the activities of both the sections. The terms of reference are: First, to review the system of judicial administration in all its aspects and suggest ways for improving it and making it speedy and less expensive; and secondly, to examine the central Acts of general application and importance and recommend the lines on which they should be amended, revised, consolidated or otherwise brought up to date.

imaginable: Sri M. C. Setalvad, Advocate-General of India; Mr. M. C. Chagla, Chief Justice of the Bombay High Court; Sri K. N. Wanchoo, Chief Justice of the Rajasthan High Court; Sri G. N. Das, retired Judge of the Calcutta High Court; Sri P. Satyanarayana Rao, retired Judge of the Madras High Court; Dr. N. C. Sen Gupta, Advocate, Calcutta; Sri V. K. T. Chari, Advocate-General, Madras; Sri Narasa Raju, Advocate-General, Andhra; Sri S. M. Sikri, Advocate-General, the East Punjab; Sri G. S. Pathak, Advocate, Allahabad; and Sri G. N. Joshi, Advocate, Bombay. But the task ahead is stupendous and the expectation of the Union Government that the Commission will submit its recommendation by the end of 1955 seems to be much too optimistic. It is doubtful if with all the resources at the disposal of the Government, and for the matter of that, of the Commission, it will be possible to find out the real ills in such a short time and suggest remedies. There is, of course, provision for

still better provision would perhaps be that the Commission should report early; for the very composition of the Commission is a guarantee against delay; and one needs just to be reminded that no time should be worse than lost by precipitation.

Law Commissions are not new to India. As soon as the East India Company felt that they were going to be the ultimate masters of this country they made provisions for codification of law, civil and criminal, substantive and procedural, including organisation of Courts. The first Law Commission set up in 1835 under the Charter Act of 1833 with Macaulay as its first Chairman did excellent work in drafting a Penal Code (1837), a detailed but unpublished work on civil law and, above all, the famous *Lex Loci* Report (1840). The times were, however, not propitious for law reforms and most of the times of the Government were taken up by the many wars that followed. In later years the Commission languished for want of encouragement and success. Its failure was admitted and by the Charter Act of 1853 a new Commission was set up with Lord (then Sir John) Romilly, a distinguished English Judge, as its head, and men like Sir Edward Ryan, Cameron and Macleod, as members. Unlike the First, the Second Commission was to work in England and to make its report within three years. This time limit could not be adhered to, but its contribution to the laws of India became memorable; the Codes of Civil and Criminal Procedure, the Limitation Act, the High Courts Act and the like were framed. Its work was, however, much hampered by constant opposition from the jealous Government of India and its unfinished task was taken up by the Third Law Commission appointed in 1851. Their output was so great that there arose a fear in this country of over-legislation. After laying the foundation of practically the whole of all-India laws necessary in those days this Commission resigned in 1870, dissatisfied at the supposed timidity of the Government of India. Even then in 1879 India witnessed another smaller Commission to assist in the act of legislation. In this century Commissions and Committees have from time to time investigated into, and reported on, various matters, the Civil Justice Committee (1924-25) being the most important amongst them from the judicial point of view.

The tremendous progress that India has made in recent years in every sphere of life has made the law and administration of justice much more complicated than before and the task of the present Commission is thus much more important and onerous. If a little less than a hundred years ago when conditions were very much simpler Sir Henry Maine, the then Law Member, found 423 enactments of the Regulation Law of Bengal alone 'to have expired or grown obsolete,' what conceivably may be the position today! Portions of many of the older codes have become stale, patch-works have complicated others and piece-meal legislation has made the position of the lawyer and judge extremely

difficult. Judicial pronouncements testify to the fact that many of the recent enactments were extremely ill-drawn, for they were drafted by inexperienced persons with inadequate skilled advice. Then, there is the lack of uniformity and system in the laws of the several States; and to systematise them will require undivided attention for years together. A whole-time Commission only is capable of tackling with all these problems within a reasonable span of time. Although the Central Acts of general application only are within the terms of reference concurrent legislation in the States makes the apparent simplicity of the task only illusory. It is not that the Government are not aware of the difficulties; they have, indeed laid down that one of the principal objectives of the Commission would be to consider such local variations with a view to re-introducing and maintaining uniformity. To ascertain if any provisions of law are inconsistent with the constitution, to suggest necessary alterations or omissions, to remove anomalies and ambiguities brought to light by conflicting decisions or otherwise, to consolidate Acts pertaining to the same subject and to suggest modifications for implementing the directive principles laid down in the Constitution are comparatively easier; but to simplify the laws particularly procedural, in a vast country like India with varied interests and innumerable local customs, is almost a baffling task.

Equally difficult is the reform of judicial administration. If by that is meant re-organisation of the Court system and revision of certain procedural laws it is simple enough; if, however, it is intended that justice should be speedy and less expensive it will require consideration of various factors relating to the time, the man and the Government (court fees). The time factor is the easiest and perhaps time limits may be put by law even in accordance with the other needs of justice. The Government may also conceivably be generous enough not only to abolish the Court fees but also to appoint as many judges and magistrates as are necessary, although the past history stretching back right up to the time of Lord Cornwallis does not encourage such a thought. But much more difficult to tackle with are the man element, that is the litigants, lawyers and judges.

Class wars, clash of individual interests, avarice, spirit of retaliation and other infirmities of fellow beings compel men to go to litigation and once they have plunged into it they would carry on till one of the parties or both have been engulfed in the whirlpool. Most often the passion is roused and they become almost mad. Victory by any means, fair or foul, becomes their motto. In most cases one of the parties is consciously wrong and the modus operandi it adopts is to take time by false pleas and thus to wear out the enemy, particularly if the latter is less solvent. The idea is that in this way the other party will be compelled to sue for peace. All being fair in love and war it is never felt that any stigma may attach to the character by such fraud upon the Court. By such a

person the salutary principle of appeal may be and is improperly employed for delaying justice often to the utter exhaustion of the opponent. It is not that he himself is not sometimes ruined but there is a morbid pleasure in inviting the deluge. Tricks and falsehoods are thus a potent cause of the delay of justice.

To this mad pursuit of dishonest litigants the forensic abilities of a skilful lawyer are both an asset and incentive. Euphemistically these gentlemen are called 'voaries of truth.' Unfortunately the law as administered in our Courts (as perhaps elsewhere) has no sanction of truth. "If law corresponds with truth only in so far as it reflects the social ideals of the day, the law we know must be pronounced to be very considerably removed from truth," said one of the high authorities who knew our Courts very well. In that circumstance even the most honest lawyer cannot do anything better than a compromise with untruth. As a matter of fact only a few lawyers can rise even so high in the ladder of morality. This unhappy state of things is in the very nature of the profession. It is, after all, a kind of business—a business backed by learning which man adores; and in business, generally, honesty is at a discount. "What litigant will brief a moral crank who will specially strive to present the facts as they are and purposely refrain from putting on them a complexion favourable to his client," asked the same authority. A single exhibition of this form of honesty and courage will end his career at the Bar. That is why the lawyer's task in our Courts is not so much to find out truth as to win a case. For that what is known as tactics is no less necessary than forensic knowledge. Prolongation of a bad case is a part of such tactics. It has got its economic side as well. A modern lawyer sells his knowledge and skill to the highest bidder, and so long as his fee is not fixed by law or he is permitted to command daily, instead of a lump, fee it is to his advantage to see that the litigation is prolonged. Just a few who are at the top of a ladder are surely an exception to this general rule but for the average 'swift justice' is harmful if not suicidal. The interest of this class, shrewd skilful and learned, must be looked into if any permanent result is intended.

The character of the average judge, generally a silent spectator of what is going on in his Court, is another factor contributing to delay. Indolence is one of his main infirmities. Judicial work is generally not pleasant but there is no escape, no occasion for relaxation: From day to day, from year to year, he does the same sort of work which is often nerve-breaking and brings him no reward except the satisfaction of his conscience. After some initial enthusiasm he loses all initiative and eventually becomes a mere automaton. Sloth and dozing come in as a matter of course. More harmful than this indolence is the tendency of the average judge to follow the line of least resistance. To withstand the wily litigants' persistent demand for

more and more time ostensibly for getting ready, requires a firmness which will very often bring upon him the opprobrium of being hard-hearted and end in 'breezes' between the Bench and the Bar. That is why he very often permits a case to drift listlessly in the file. Perhaps the worst of the judge's infirmities is his anxiety to be popular, and this, paradoxically enough, results in delay. Popularity in a court of law means almost the same as abdication in favour of the ministerial officers and lawyers conducting cases. In our country granting of adjournments is the same as being a 'good judge' and even the lawyer on the opposite side would not dislike them, provided some costs are allowed. Public disapprobation of such methods are unheard-of. In such an atmosphere delay is only natural. Over and above all these there are, on the criminal side, the timid Magistracy and the overbearing, police. The Magistrate's position may be improved by a complete separation of the judiciary from the executive but it is hard to mend the Police. Even now the real power is in the hands of the ill-paid Thana Officer who can make or mar a case. It must be realised that power and poverty go ill together; it requires long tradition and good environment for a poor man to be honest, if he has got power to improve his lot.

For reducing the cost of litigation and ensuring expedition in the despatch of business the Evershed Committee of England appealed to the lawyers and judges and sought their co-operation. That course has never been followed in our country. Efforts are being made from very high quarters to take the matter out of their hands and vest the Village Panchayats, and the like with judicial powers. While increasing association of the villagers with administration of justice in petty cases is extremely desirable the history of past experiments in that behalf (through Village Munsiffs, Panchayats and Union Boards and Courts) leads one to believe that the time has not yet come and that to drag justice down to the present unhealthy atmosphere of our villages means nothing but its death by asphyxia. To look to the Village Communities of ancient India for inspiration and example is a misreading of history; there can be no comparison between those days of placid rural simplicity and consideration for fellow brothers and those of class wars, communal interest and personal aggrandisement. Justice at some cost is perhaps better than cheap injustice.

For comprehensive amendment of law, for uniformity for rationalisation and for ensuring cheap and reasonably quick justice there must not only be close application deep studies and a clear grasp of the basic principles (which the Commissioners undoubtedly have) but also an earnest appeal to all concerned for co-operation; otherwise the labours of the Commission may be wholly lost. Peace and justice can be ensured not so much by law and its guardians as by self-imposed discipline.

THE STATES REORGANISATION COMMITTEE'S REPORT

By CHUNI LAL RAY

THE States Reorganisation Committee's recommendations have been extremely disappointing to Bengal, most of whose demands have been thrown out on somewhat flimsy grounds which cannot be reconciled with one another, and this after voluble expression of sympathy for West Bengal's difficult position, due to partition, to influx of refugees 35 lakhs in number and to the fact recognised by the committee that

"The present distribution of territories between Bihar and West Bengal is such as to give rise to real administrative difficulties from the point of view of West Bengal."

While separation of Chas thana from the rest of Purulia subdivision was evidently based on the 71.4 per cent Hindi and only 22.4 per cent Bengali in the Table of Tract Figures on page 41 of the Language volume of the Census Tables (Census of 1951, Paper No. 1 of 1954), the Committee had not a word of comment on the very strange circumstance that the Census Superintendent for Bihar who was so very keen about the innovation of thanawar figures for the Purulia subdivision, never thought of compiling similar figures for Dhanbad and Dhalbhum and even went the length of discounting the separate figures for Jamshedpur City shown in 1931, although these areas, along with the Purulia subdivision, had formed a bone of contention between Bengal and Bihar from a very long time back, from only a few months subsequent to the publication in *Bengalee* newspaper of 4th January 1912 of the letter signed by five Bihar leaders (Deenarayan Sinha, Nandkishore Lal, Parameswar Lal, Fakhruddin and Satchidananda Sinha) which said that

"The whole district of Manbhum and pargana Dhalbhum of Singhbhum district are Bengalee-speaking and they should go to Bengal the rest of the (Chota Nagpur) Division which is Hindi-speaking remaining in Bihar."

Within a few days after Census Paper No. 1 of 1954 became available in Calcutta in June 1954, the Secretary to the Nikhil Bharat Banga Bhasa Prasar Samiti wrote to Sri Ranchor Prasad, Census Superintendent of Bihar, requesting him to supply regional figures for different portions of Dhanbad and Dhalbhum, and separate figures for Jamshedpur City alone, similar to those published for the Purulia subdivision. His reply, sent in Development Department letter No. 239 DR dated 11th July 1954, was:

"I am not in a position to get the information compiled for you as the Census Office was closed nearly a year ago and no staff is available for doing this work."

In the absence of unequivocal official figures it is possible only to make guesses, on the basis of other official figures that are available of the comparative linguistic positions of different portions of Dhalbhum and Dhanbad subdivisions. Admitting for the sake of

argument the contention (implied) that the Chief Minister of Bengal's concession relating to Jamshedpur serves to operate as an estoppel in respect of this particular area, there should have been a very specially detailed scrutiny of figures for the remainder of the Dhalbhum subdivision. But, far from undertaking such special examination, the Committee clouded the issues to some extent by reference, irrelevant in connection with Dhalbhum to the preponderance of Hos in the district of Singhbhum as a whole ignoring the fact that Hos are a very negligible minority in Dhalbhum (in 1931, only 6851 in Dhalbhum rural, 2616 in Jamshedpur, in 1951, 12,188 for the entire subdivision). And the Committee never cared to enquire how the really autochthonous tribal of Dhalbhum, the Bhumij, had faded out from the 1931 figures, 22,521 in Dhalbhum rural, 307 in Jamshedpur, 7351 in Chaibassa and 6038 in Saraikela-Kharsawan, total for the district 35,212 to a mere 922 in the entire district in 1951. The 70:30 ratio laid down by the Committee may be quite sound for bi-lingual areas, but is meaningless in areas with 3 or 4 different languages commonly spoken; for such areas, the regional language should be that spoken by the most numerous linguistic group, particularly if its percentage to total population exceeds the percentages of other linguistic groups by substantial amounts 10, 15 or 20 per cent. For Dhalbhum excluding Jamshedpur, no figures having been supplied by the Census Superintendent for 1951, one can proceed only on the basis of the 1931 figures, and these are:

Out of total population 310,857.

Bengali 123,337 or 39.7 per cent.

Santal 96,555 or 31.7 per cent.

Oriya 35,849 or 11.5 per cent.

Bhumij 22,521 or 7.2 per cent.

Hindi 12,902, a mere 4.2 per cent.

Very large proportions of Santals and Bhumijes were reported to be bi-lingual, almost invariably with Bengali as the subsidiary language; and the total of persons speaking Bengali as subsidiary was 82,797 equal to 26.6 per cent. of the total population. (Persons speaking Oriya as subsidiary language numbered only 10,059 Hindi only 3,900). What better case there could have been for declaring Bengali intelligible to no less than 66.3 per cent. of total population, as the regional language (and therefore justifying transfer to Bengal), with only special minority treatment for Santali, Bhumij and Hindi. Some figures including those for Jamshedpur City, are shown in a pamphlet. Facts and figures issued by the Bihar Government "for official use only," and these also testify to the preponderance of persons with mother-tongue Bengali 185 thousand as against 128 thousand for Oriya and 125 thousand for Hindi. But the Committee have decided not for Bengali, not for Oriya, but for Hindi which had the weakest case. It has been definite negation of linguistic justice,

THE STATES REORGANISATION COMMITTEE'S REPORT

375

and recalls the Aesop's Fables story of the arbiter between two cats fighting over a piece of meat.

It is not understood how the previous history of Dhalbhum's connection with Bengal is described as tenuous! Dhalbhum is distinctly mentioned in the Ain-i-Akbari as appertaining to Sarkar Madaran, Chukla Medinipur in Suba Bangala (vide Jarrett's translation, volume II, page 141). Along with other parts of Midnapur, Dhalbhum was ceded to the British in 1760 (five years before the Diwani grant). Dhalbhum continued to form part of Medinipur district up to 1833 (it never went to Jungal Mahal district) in which year it was transferred to the newly-created Division of Manbhum in the North-Western Frontier agency (pages 40 and 213 of Singhbhum District Gazetteer). In 1845-46 Dhalbhum was taken out of Manbhum and tagged on to Singhbhum district (page 212, Singhbhum Gazetteer and page 67, Manbhum Gazetteer). Even up to very recent times, Dhalbhum people were disinclined to describe themselves as inhabitants of Singhbhum, preferring to keep that name only for the Singh Rajas' State (the country that was later split up into Porahat, Saraikala and Kharsawan States, page 2 of Singhbhum Gazetteer). Forty-five villages of Dhalbhum were, in the year 1876, re-transferred to Midnapur district (page 106 of Dhalbhum Settlement Report); and these villages, collectively known as Parihati, are still in Midnapur district, in thana Jhargram not very far from Gidni railway station.

Although Manbhum and Singhbhum (with Dhalbhum) went into the Chota Nagpur Division in 1854, they were, on various occasions thereafter, placed under the jurisdiction of the District and Sessions Judge of Bankura (in Burdwan Division) and this arrangement continued till 1910, when a separate Judgeship was created for Manbhum, Singhbhum and Sambalpur. Throughout this period, Bengali was the only Court language for Dhalbhum. Survey and Settlement Records for all villages of Dhalbhum (both within Singhbhum district and in the Parihati group in Midnapur district) were prepared in the Bengali language.

In November 1954 Hindi was prescribed as an alternative language in Courts, to suit the convenience of Hindi-speakers (between 40 and 50 thousand in number) who had come for employment in Jamshedpur. Unfortunately for Bengalees, who are still the biggest linguistic group, Hindi was made the only Court language (and Bengali was thereby banned) for Dhalbhum by a notification of 1948. This was an extremely bad case of suppression of the Bengali language, comparable almost to Nazi Germanisation methods. Dhalbhum people entertained fond hopes of redress, with declaration of Bengali as the regional language, and with consequent re-transfer to Bengal. But they have been thoroughly disillusioned.

And they have failed to understand the nature of implementation of the proposition that "in and around

Jamshedpur the population is so mixed that no State can legitimately claim the City." They see, in retention of Jamshedpur in Bihar State, no more of de-provincialisation than would have been involved by its transfer to Bengal. Are they to understand that, while attachment to Bengal amounts to provincialisation, attachment to Bihar is de-provincialisation? After Rourkela grows into a City as big as Jamshedpur now is, will it (and, with it, the surrounding district of Sundargarh) be taken out of the provincialising atmosphere of Orissa and attached to Bihar, with a view to de-provincialisation? And, when Bhilani matures, will that also be handed over to Bihar, for purposes of de-provincialisation, and a corridor provided. The only tangible reason why Chaibasa and Saraikela, with magnificent Hindi percentages of 5.0 and 13.4 respectively (6.7 for the two taken together) are to be retained in Bihar, is that they would form the corridor for Bihar's contact with Jamshedpur.

SARAIKELA

Talking of Saraikela brings up the point of one small portion of it, viz, thana Kandra in the extreme north-east, wherein the predominant language is Bengali, as in rural Dhalbhum to its east and in Chandil thana of Purulia to the north. This thana hugs round the railway stations Gomharia, Kandra and Sini which are all within 7 to 16 miles (within 8 miles in every case, in cross-country trek) of Chandil, which is the place where Acharya Vinoba Bhave halted for about a month, convalescing after recovery from fever, and teaching himself Bengali so that he could make his speeches intelligible to the local people. The relative percentage figures of different languages in Kandra thana must be intermediate between those of rural Dhanbad and of Chandil; and these work out at Bengali 47.4 Santali 21.6 (of which at least half are bi-lingual Bengali-speakers), Hindi 17.6, Oriya 6.0, Bhumij and Mundari possibly 3 per cent each. There is no valid reason (unless it be the necessity of mystic de-provincialisation) why Kandra thana should not hereafter be treated as part of Purulia district which is now to be shorn of thana Chas. The rest of Saraikela and Chaibasa have definite majority of Ho (46 per cent) and Oriya (18%).

DHANBAD

An examination of any map showing thanas on the Purulia-Dhanbad border, along with perusal of the Tract Figures for Purulia, reveals at once that

"West Dhanbad, consisting of police-stations, Topchanchi, Katras, Bagmara, Jharia, Kenduadi, Joga and Jorapukhur, which covers the entire Jharia coal-field except such portions as extend to Chas-Chandankari of Purulia subdivision and to Hazaribagh district immediately adjoin the Chas-Chandankari area of Purulia, wherein the Hindi percentage is said to be 71.4 and the Bengali percentage only 22.6.

"East Dhanbad, consisting of police-stations Sindi, Baliapur, Gobindapur, Nirsha, Chirkunda, (also thana Tundi) immediately adjoin the Raghu-

nathpur area of Sadar subdivision, wherein the Hindi percentage is only 23.8 (i.e., 47.6 less than in Chas) and Bengali percentage 57.3 (i.e., 34.7 per cent more than in Chas) and Santali percentage 18.7 (i.e., 13.1 per cent more than in Chas)."

From these data it is certainly not unjustifiable to conclude that, in Dhanbad subdivision also, the Hindi percentage in the west very much exceeds that in the east, and that the Bengali percentage in the west falls short of that in the east, by something between 35 and 48 per cent; for Santali, excess in the east over that in the west, about 15 per cent. Incidentally most of the Santals are bi-linguals, their subsidiary language being Bengali and not Hindi.

Yet another set of official figures leads to the same conclusion, these figures being of numbers of "persons employed in production other than agriculture" (which, for Dhanbad, practically means "employed in collieries or under railway administration"). The police-stations in West Dhanbad, with aggregate area 301 square miles and total population 437,261, have as many as 209,767 persons (48 per cent of total) under this head of "production other than agriculture." The police-stations in East Dhanbad have total area 489 square miles and total population 294,439, of whom only 33,518 (or less than 12 per cent) are under this category. It is chiefly the colliery and railway workers who are temporary immigrants, mere birds of passage from Hindi-speaking areas; and there is this further justification for concluding that the Hindi percentage in East Dhanbad is very considerably less than in West Dhanbad with its many collieries. In the few collieries in East Dhanbad, extension really of the Ranigunge coalfield,* the labour employed consists chiefly of permanent local residents; there are labourers from outside also, immigrating some from Hindi-speaking districts in the west, but others from the Bengal districts Burdwan, Bankura and Birbhum. The local labour, and also the immigrants from Burdwan, Bankura and Birbhum, have all mother-tongue Bengali or Santali, the latter group being bi-lingual, invariably with Bengali as the subsidiary language. It is only the labour immigrating from the western districts that have mother-tongue Hindi. It would be safe to conclude from these facts and figures that the Bengali-Santali-speaking percentage in East Dhanbad exceeds that in West Dhanbad by about 48 per cent (35 per cent Bengali and 13 per cent Santali), and that 43 per cent is also the measure by which the Hindi percentage in West Dhanbad exceeds that in East Dhanbad. It is a pity that these points were not taken into consideration, and that East Dhanbad did not get the same treatment as that

*This extension of the Ranigunge coalfield into the Dhanbad area is entirely in pargana Pandra. This pargana Pandra had been part of Birbhum at the time of the Diwani grant, and was again for several years subsequent to that, attached to Burdwan district. The local language in Pandra has always been Bengali and Santali—never Hindi.

meted to the Purulia Subdivision, viz., transfer from Bihar to West Bengal. East Dhanbad's linguistic distribution is not very different from those noted in page 41 of the Language volume of the 1951 Census for Manbazar and Kashipur-Para areas of Purulia subdivision, 45 per cent Bengali, 33 per cent Hindi and about 18 per cent Santali but very different from that of West Dhanbad or of Chas, Hindi exceeding 70 per cent. Bengali round about 20 per cent and Santali 5 per cent. The majority of 45 per cent Bengali and the 18 per cent Santali-speakers are permanent local residents tied to the soil, 35 per cent Hindi-speakers are mostly immigrant wage-earners with no permanent interest in the locality. Do a lakh and three-quarters of permanent residents deserve less consideration than only 30 to 50 thousand immigrants?

Bengali had been the only Court language for Dhanbad up to 1913, in which year a notification was issued No. 379 dated 21st August, changing 'Bengali' to "both Nagri or Kaithi and Bengali in Dhanbad Subdivision of Manbhum district." A notification of 1933 again changed this to "Hindusthani to be written in Nagri or Kaithi script" for Dhanbad and restricted Bengali to the Sadar (Purulia) Subdivision. The consequent banning of Bengali as Court language in Dhanbad, which had in 1933, and still has, more than 1½ lakh persons with mother-tongue Bengali was an act of very great injustice, which, comparable with Nazi methods of Germanisation, continues to the present day. Incidentally, the existence in 1913 of only 29,400 Hindi-speakers in Pakur, only 54,000 in Jamsheda, had been considered justification, rightly enough, for prescribing Hindi as an alternative Court language for the convenience of Hindi-speaking population, mostly immigrants of the nature of a floating population of wage-earners.

The S. R. Committee have spoken of the West Bengal Government's intention to put up a dam on the Kansai river as one of the reasons for arriving at their decision to recommend transfer of Purulia Subdivision to Bengal. There are two dams on the D.V.C. project, wherein also work will be facilitated by transfer of East Dhanbad to Bengal, viz., (1) the Maithon dam with its North-eastern end near Kalyaneswari temple in Burdwan district and its South-western end a few miles North-east of Kumardubi and (2) the Pachet Hill dam connecting the foot of the Pachet hill in Purulia Subdivision with a point about 5 miles South-west of Chirkunda in Dhanbad. Two different States at the two ends of the same dam may at times lead to administrative complications; and this is yet another reason though it may not, by itself be a very strong one, why the linguistic position in East Dhanbad and the desirability of its transfer to Bengal should be subjected to careful examination once again. There is a big gap between the Western end of the Ranigunge Coalfield and the eastern extremity of the Jharia Coalfield; and the Jharia field will not be

Left to right: Soong Ching Ling (Mme. Sun Yat-sen), Sri Jawaharlal Nehru and Chou En-lai, Prime Minister of China

The splendour that is the High Range

Periyar Lake in the High Range. On the shores of this mountain lake is the Royal Game Sanctuary, one of the finest National Parks in the world

the least affected by transfer of East Dhanbad to Bengal. In fact the inclusion of the entire Raniganj field under the same administration will be a definite advantage, just as bringing into West Dhanbad the portion of the Jharia coalfield that just into the Chas area will be a measure making for administrative convenience.

Very soon after traversing Dhalbhum, Purulia and East Dhanbad one gets close to the Ajoy river which the West Bengal Government propose to utilise for a project similar to the D.V.C., and then the Mayurakshi which has already been so utilised. Both these rivers rise in the Santal Parganas.

SANTAL PARGANA

Both Ajoy and Mayurakshi rise in the Santal Parganas and have only a few miles of course therein before they enter Bengal. The Mayurakshi system has its headwaters at Masanjor in the eastern end of the Dumka Subdivision of the Santal Parganas; and there has been much unpleasantness in the past between Bihar and West Bengal about financial arrangements for a project which gives most of its benefit to Bengal but costs Bihar quite a lot of money (although, in a recent deal, Bihar has realised from Bengal a pretty large amount for rehabilitation of people displaced by the dam). Transfer of the Masanjor area to Bengal would certainly conduce to smooth working, as represented by Bengal; but there is no reference to this in the S.R. Committee's Report (in the summary at least). Mention is made of "the case for transfer of the catchment areas or a portion of territory along the Ajoy", but this is dismissed with remark that it "will be admissible only if other factors are more or less evenly balanced" which "is not the case so far as this district is concerned." How this finding of "not evenly balanced" was arrived at is not very clear; but possibly one of the points was the assumption that Bengali influence is slight in the eastern end of Santal Parganas bordering on Bengal because for "the entire Santal Parganas district Bengali influence is very slight." The possibility (nay, almost certainty) of the "16 and 13 per cent Bengali percentage in Rajmahal and Pakur" being concentrated in the eastern end, on both sides of the railway line, is not examined; and Bengal's contention about 1931 Census figures for Jamtara, Dumka, Pakur and Rajmahal is summarily dismissed.

The Committee did not evidently care to notice how 67,021 Malto-speakers of 1931, with fair distribution between the sexes, could be mutilated by the 1951 Census into only 5,744 males lording over 18,030 females (total decrease nearly 65 per cent)* how the Santali

*The Mal Paharias who speak Malto are the real Adivasis of the district, just as Bhumijes are the real Adivasis of Dhalbhum, South Manbhum and adjoining portions of Bankura, Midnapur, Mayurbhanj. (The Santals are really immigrants who came in about the year 1800, having been pushed out of their original homes in pargana Chai of Hazaribagh district by "incoming" Hindusthanis from Bihar"). Are Adivasi Mal Paharias and Bhumijes becoming

figure could have gone up by nearly 30 per cent (from 761,068 to 982,170) in the Santal Parganas simultaneously with decrease by 33 per cent (from 73,377 to 49,205) in Dhanbad and a nominal increase of 9 per cent (from 97,119 to 105,586) in Dhalbhum, how Bengali figures in subdivisions at safe distance from Bengal border jumped up (in Deoghar from 13,609 to about 45 thousand or by 23%, in Araria from 1,210 to 15,256 or by 1,157 per cent, in Chaibasa from 6,412 to 30,270 or by 372 per cent) at the expense of languishing figures on the Bengal border Jamtara cut down from 73,091 to 15,877 or by 78%, Pakur from 68,792 to 32,120 or by 53 per cent, Kisanganj from 59,393 to 17,038 or by 70%; they ignored also the Bihar Census Superintendent's observations about "increased awareness among indigenous elements that the language spoken by them in their homes is a Bihari dialect" which should be coupled with his further assertion that "it is not easy to distinguish between these Bihari dialects and the Western Rarhi form of Bengali," with no reference whatever to non-existent similarity of these "dialects spoken at home" with any genuine dialect of Bihari or of any other form of Hindi.

It is indeed very strange that the S. R. Committee, realizing though they do, the desirability of "enabling West Bengal to control entirely one or more points at which the Ganga river can be crossed," could speak seriously about objection resulting from loss for Bihar of the Rajmahal coalfield. I have not been able to ascertain what the value of the Rajmahal coalfield is—it is not even mentioned in the typed copy that I could secure of the statement at the end of the Report of the Indian Coalfield Committee, 1946. The only coalfields in the Santal Pargana mentioned therein are Raniganj, 10½ million tons, and Jamtara, 4½ million tons, total 15½ million tons; and possibly Rajmahal, (carelessly omitted in the typed copy which reached my hands) does not exceed 10 million tons. These are microscopic figures compared with what Bihar has got in the districts of Hazaribagh, Ranchi and Palamau, more than 10,000 million tons and in the Jharia field 2,351 million tons. Will Bihar's economy be really affected by the loss of only about 2% of its huge coal resources whose quantity is larger than the aggregate of all the other States within the Indian Union? In fact, it is very doubtful if Bihar will be able to provide in the near future, or even in several future decades, either the man-power or the technical skill necessary for beginning the exploitation of its 12,000 and odd million tons. West Bengal has at present not more than 2,352 million tons and will, on transfer of Purulia, get possibly another 167 million tons (½ of the 502 million tons of the Raniganj coalfield within the present Bihar

extinct under Bihar Government's paternal administration? Or, is it only a case of an absolutely inefficient Census or of ill-conceived manipulation of Census figures? How long will it take Bihar's paternal Government to liquidate Santals, after they have ceased to be useful as a stick for thrashing the Bengalis?

border). Transfer of East Dhanbad's 335 million tons as well, and also of the entire Jharia coalfield's 2351 million tons, will not bring up Bengal's total to very much more than 5,000 million tons i.e., only about half of what would still be retained by Bihar even after transfer of the entire Dhanbad Subdivision. Calcutta is now the biggest industrial centre within the Indian Union; and it is for consideration by the Central Government whether West Bengal's or Bihar's need for coal resources is the more important and the more urgent.

PURNEA

The S. R. Committee's gift of a narrow corridor to the east of Mahananda river looks like a practical joke comparable only to that practised by a former Ruler of the Junagarh state on Lord Curzon who was presented with a dozen monkeys in response to a requisition for a seaport, (also Bandar in the vernacular). While the West Bengal Government and the West Bengal Congress submitted representations about their difficulties in respect of rail transport, the Committee, possibly out of present-day airmindedness, have given something which requires air transport before Barsoi is reached. And, even as a corridor, the strip offered is of no use, because "east of the Mahananda" does not reach up to Darjeeling district, it ends at a point on the Bihar-Pakistan border about 20 miles south of the southernmost point of Darjeeling district.

*Incidentally, it may be mentioned that "east of the Mahananda" is a very unfortunate and very incorrect expression which was first used in the Bengal Census Report of 1872, which made the further mistake of describing Mahananda as the Mahanaddy. This Report stated, "The thanas east of the Mahanaddy, Kaliagunge, Kisangunge and Balrampur, are purely inhabited by Bengalees, and large numbers of them are found on the right (i.e. west) bank of the river." Another statement is that "The Kosi river used to be the old boundary of Bihar, but Hindusthanis are the prevailing race for some distance beyond." "Some distance beyond" is presumably very much less than the wide expanse between the Kosi and the Mahananda; and this suggests that the Hindi-Bengali dividing line is somewhere near the middle of this wide expanse. And corroboration of this comes from the further statement that "If it were possible to draw a hard and fast line which should divide the country inhabited by Bengalees from that inhabited by Hindusthanis speaking a dialect of Hindi, it should perhaps run in a vertical direction through the police-stations of Amour Kusba and Kudba."

Grierson also made the mistake of noting on page 119 vol. V, part I of the *Linguistic Survey* that "the western limit of Bengali may be roughly taken to be the river Mahananda," although what he really intended was that Bengali extended to far beyond the western bank of the Mahananda, as described on page 139: "That (the Bengali) language, may be taken as

occupying the eastern third of the district (Purnea), that is to say, the whole of the Kisangunge and the eastern half of the Sadar subdivision. This dialect, closely resembling the Koch Bengali of Malda is called Kisanganj or Siripuria, and is returned as spoken by 603,623 souls."

Politicians in Calcutta, unacquainted with the geography of Purnea district, took up the cry of "east of the Mahananda," with the disastrous result that the so-called corridor fails to serve as a corridor. And, even over this insufficient corridor, the S. R. Committee have imposed certain conditions to be observed by West Bengal Government viz, (1) to recognise the special position of Urdu in this area and (2) to make a clear announcement that no displaced persons from Pakistan would be sent to this densely peopled area. They took no notice of (1) the Bihar Census Superintendent's observation that in "the district of Purnea on the Bengal and East Pakistan border, Urdu is practically unknown, except among educated Muslims, and the vast majority of the population (including of course Muslims) speak a mixed Maithili-Bengali dialect known as Kisanganjia, (2) the facts that Bihar Government's choice of place for refugees from Pakistan had been chiefly Purnea district and the still more densely-peopled district Champaran, that Bengalee refugees were never admitted to sparsely-peopled areas in east Santal Parganas or east Manbhum or east Dhalbhum, that Chakulia in Dhalbhum had been made available for refugees from West-Pakistan in 1947 but that as soon as the Punjab refugees left, the sheds were deliberately pulled down, to make it possible to report that no accommodation was available for refugees from East-Pakistan. Will the S. R. Committee which have asked for an announcement of no refugee infiltration for Purnea be good enough to ask the Bihar Government to announce that they would hereafter settle East-Pakistan refugees in East Dhalbhum and in Jamtara and Dumka subdivision of the Santal Parganas in large numbers, until density of population now ranging between 280 and 463 rises to 500 per square mile?

Will the Committee recommend the immediate restoration of Bengali as one of the Court languages in Dhalbhum and in Dhanbad, for the convenience, in either case, of more than 185 thousand persons with mother-tongue Bengali and 20 to 30 thousand bi-lingual tribals who speak Bengali as their subsidiary language (numbers not insignificant in comparison with that of the so-called Urdu-speakers in the so-called corridor to the east of the Mahananda river)? And, will they further request the Bihar Government to take such measures as may be necessary to stop the tribals' march towards extinction, march that has brought down the Bhumij number from 36,212 to 922, the Malpaharia number from 67,021 to 23,774 and in Dhanbad only the Santal number from 73,377 to 49,265, (reductions exceeding 24 to 44 times the number of Tibetans or Sikhs (or Kazaks?) that perished in the fateful Rupkund valley)?

ASSAM

I have no personal knowledge of condition on the Assam border, and cannot venture to offer any comment, except to note on only two points viz:

(1) As the aeroplane flies (though not as the crow flies), Dhubri is on the route from Calcutta. Transfer to Bengal of this subdivision alone of the Goalpara district would be of the greatest advantage.

(2) The observation in the Assam Census Report of 1951 about "the aggressive linguistic nationalism now prevailing in Assam, coupled with the desire of many persons among the Muslims as well as tea garden labour immigrants to adopt Assamese in the State of their adoption. It is not unlikely that some amongst the persons who have returned their mother-tongue as Assamese have done so from dubious motives, even though their knowledge of Assamese may not amount to much" reveals a parallel case with that of Muslims in Purnea who really ignorant of Urdu, return Urdu as their mother-tongue. And quite possibly Pakistani Muslims now in Assam will, after a decade or two, i.e., after they have securely established themselves by driving out Bengali-speaking Hindus, again change their decision about language to declare and return Urdu as their mother-language. Of course they would be speaking Koch Bengali all the time; Urdu will be as much a false declaration then as Assamese is now.

GENERAL

Just as this note is ready for the Press, reports arrive of the Union Minister for Commerce and Industry Mr. Krishnamachari's speech in Jamshedpur on 15th October, paying glowing tributes to the memory of an unassuming Bengali geologist Mr P. N. Bose whose bust still adorns the Park in Jamshedpur, and whose advice was the determining factor in changing Tata's selection of site for their Iron Works, from villages in the C. P. (now Madhya Pradesh) to villages Kalimati and Sakchi in the extreme north-western corner of Dhalbhum. The new project attracted practically no interest in Bihar for many years yet; and the preliminary work, from 1908 to 1911, was done almost entirely by local labour, Bengalees, Bhumijes and Santals, guided by a small party of Parsi and Bengali overseers under the general supervision of German engineers and from 1911, also by an American Foreman Mr. Tutwiler. There was practically no Hindi-speaking labour—in fact, the Hindi-speaking percentage in the district population in 1911 was only 4.9, a very small advance over the percentage 20 years earlier, 4.8 in 1891. The Hindi percentage in Dhalbhum was so small (possibly less than 2) as to be left out of account by

the Census Superintendent in his summary in para 722 of his Report. The Bengali percentage in Dhalbhum was 40, Oriya 11, Santali and Bhumij nearly 40, with a very considerable proportion of bi-linguals, the subsidiary language being invariably Bengali. Bengali-speakers still outnumber Hindi-speakers by nearly 50 per cent in Dhalbhum including Jamshedpur, possibly by 500 per cent if Jamshedpur City is left out of account; and it is no wonder that Bengalis feel sorely disappointed over retention of Dhalbhum in Bihar, and, on top of that, the banning of Bengali as a Court language.

But even more painful than the unjust decision of retention in Bihar has been the expression by the S. R. Committee of suspicion about the veracity of statements by Bengalis that a letter written in 1912 by five top-ranking Bihar leaders contained the words: "the whole district of Manbhum and pargana Dhalbhum of Singhbhum district are Bengali-speaking, and they should go to Bengal." The letter was published in the *Bengalee* newspaper on 4th January 1912; and one of its signatories Mr. Parmeswar Lal, Bar-at-law, Calcutta High Court, had 12 days earlier seconded Sapru's resolution in the Congress recommending re-adjustment of boundaries on the linguistic basis. The *Bengalee* of the 4th January 1942 is in the file maintained by the Indian Association, and would have been produced at once if any member of the Committee had only spoken about his suspicion to any one of the many representatives of West Bengal that appeared before the Committee. West Bengal, although very anxious to get back Manbhum and Dhalbhum, would not stoop to mean tricks like fake quotations alleged to be from District Gazeteers, manipulation of Census figures or riotous processions proclaiming *Janamat* or the kind recently demonstrated before cinema houses in Jharia.

The West Bengal Government's assent to the proposition that "in and around Jamshedpur the population is so mixed that no State can legitimately claim the City on cultural or linguistic grounds" does not certainly support the inclusion of Jamshedpur City in Bihar, any more than in West Bengal—and it had no reference at all to the vast area of Dhalbhum more than, say, 15 miles east, or 8 miles south of Jamshedpur. Jamshedpur has no contiguity with Bihar shorn of Purulia except through the very questionable corridor of Oriya-speaking (27 per cent) and also Bengali-speaking (24 per cent) Saraikela and Kharsawan, wherein Hindi-speakers form less than 13 per cent of the population, but all the same lucky Bihar wins the prize. And on some future day perhaps, P. N. Bose's bust will be pulled down.

A SURGEON WHO WAS A PAINTER

By E. M. J. VENNIYOOR

It is seldom that surgery and painting go together, but in the case of the late Dr. A. R. Poduval of Trichur, there was apparently nothing incongruous between his calling as a medical man and his devotion to the pictorial art. It was as a surgeon that he made for himself a name, but strangely enough, it is as an artist that he is remembered today, and will be, in the years to come. The paradox can be explained this way, that he never sought the limelight in the world of art during his lifetime, but painted solely for his own pleasure, to give

racy of circumstances, he could not go to Europe, and much against his will, joined the Medical College, Madras.

But he never gave up painting. The cherished desire of his life—a term of training in some European academy—was at last realised, when in 1916, he went to England to study advanced Medicine and Surgery. The short course he took there in painting proved subsequently the decisive factor in his evolution as an artist. Henceforth his themes would be presented in

Violinist, London

Girl at the Post-Box, London

expression to the joy that is in painting. It is not surprising, therefore, that many did not recognise the artist in him till, after his death, his pictures found their way into some of the exhibitions held in the South.

It was indeed much against his will that Poduval became a medical man. His early life was spent in the practice of art, obviously preparing for a career in its service. Even as a boy, he could win the favour of the royalty of Cochin with a portrait of a senior prince, and through the court, the acquaintance of Raja Ravi Varma who was then in the height of his fame. Ravi Varma, "greatly struck by the sketches and studies of animals and landscapes" done by young Poduval, particularly by their "originality and fidelity to nature," suggested to him to undergo a course of training in some academy in Europe. But, by a conspi-

techniques so skilfully developed by Western masters. He believed that art is a universal language, and hence had no hesitation in adopting those techniques that served him best in expressing his ideas. He saw service in Mesopotamia during the closing years of the First World War, and during this period, he sketched the landscapes of the land of the Caliphs. He went to Europe once again, and that was in 1928. Besides taking the Degree of M.D. from the Hamburg University, he visited all the famous art-centres of Europe, studying the latest trends and developments in painting. It was his desire to devote his entire time to art after retirement, but his death in 1940, two years after leaving service in the erstwhile Cochin State as Director of Public Health, put an end to all his planning.

As an artist, Poduval had his own preferences for

A SURGEON WHO WAS A PAINTER

media, subjects and schools. He has worked with water-colour, pen and ink, charcoal, chalk and crayon,

In the Rain, Trichur

The Artist, Dr. A. R. Poduval

but his predilection was for water colour. An endless variety of subjects has fascinated him—landscapes, human and animal forms, still lives, etc., but he is seen at his best in rendering landscapes. The influence of Western schools, particularly of Impressionism, is manifest in his pictures, but there is absolutely no trace of unimaginative imitation. The landscapes he has executed under the influence of Impressionism are perhaps his best paintings. His main concern is with the fugitive effects of light, and other details being treated as secondary. The reflections in water in some of his pictures show the minutest vibrations of light. This

Nude in Crayon

effect is achieved by the method of painting with broken touches. His studies of human and animal forms are different in that light is no longer "the principal person" in them. They give us an impression of rugged simplicity, of weight, density and solidity. His was a bold hand emphasising the outstanding features of the subject with a few strokes of the brush. His colours are bright, but never aggressive. On the whole, there is a sure touch of genius, of perfect mastery, and an unmistakable note of honesty and sincerity of purpose in all his works. The sympathy with which he has treated his human forms also cannot fail to make a strong impression on our vision.

THE HIGH RANGE—SCENIC PLAYGROUND OF INDIA

By K. P. PADMANABHAN TAMPY, B.A.

No person who is a lover of the mountains can afford to miss the delightful trip to the High Range in Travancore-Cochin. It is a mountain range resplendent with life, colour and charm. For a traveller whose heart is after new experiences, grave and gay, amid the grandeur of scenery acknowledged to be without peer, the High Range—the region of sunny plains, glistening mountains, singing woods, roaring torrents, full-blooded aborigines, unique and diversified fauna and flora, gigantic hydro-electric undertakings, vast tea, rubber and cardamom estates—offers a diversity of attractions. The manifold charms of the magnificent primeval

beautiful and under extensive cultivation. Tapioca, banana, pepper and vegetables are grown in abundance in these plains. The pepper gardens are a feast to the eye. The picturesque road traverses the rubber region and amidst entrancing brown and emerald mountains. From either side of the winding road rise the rubber gardens and it is like driving through lovely parks. In serried ranks the rubber trees stand sentinel looking cool and shady in the tropical sun. The rest of the journey is through dense jungles, interspersed here and there by tea plantations. Miles and miles of hilly slopes are covered by tea shrubs. On the summits of the vast tea

A mountain stream in the High Range.
Tourists are taking rest after hiking in the forest

Pallivasal Hydro-electric Project.
Pen Stock lines piercing the forest

forests are displayed at their best in the High Range, known also as the *Anamalais* or "Elephant Hills," for they are the favourite haunts of wild elephants. Anamudi, the loftiest peak in Southern India, is in the centre of the High Range and rises 8837 feet high. With a length of six miles and a breadth of three miles, the High Range includes five peaks, all over 7200 feet high. Just below the High Range are the Cardamom plantations in the hills, the height of which varies from 5099 feet to 7900 feet above sea level.

The journey to the High Range, through hills and dales, offers many thrills to the keen motorist and rider. The first stretch of way lies across fertile plains, most

plantations are perched beautiful bungalows commanding panoramic views all round. Ferns and other trees embellish the flanks of the road, often disputing the right of way with the traveller. All around the tourist is a conflagration of colours, and he is enraptured by the rhythm of the hills and dales, romantic ravines, and wide expanses. The quaint and lovely mountain villages in the fragrant forest glades with the picturesque forestfolk crowding the weekly bazaars make a lasting and delightful impression in the mind of the seeing and understanding tourist.

The High Range possesses the most wonderful and variegated scenery and a lovely climate during the dry

months when the landscape symphony is full and charming. The two older hill towns in the High Range are Munnar and Devicolum, and the most recent settlement is Chitrapuram. Situated almost on the summit of the High Range, the lovely little town of Munnar takes its name from its situation at the confluence of three mountain streams, called Kundala, Kanni, and Nallathanni. The Munnar Valley is 5000 feet above sea level, in the north-eastern High Range, and is the centre of tea plant-

small mountain stream at the foot of the hills. The and Bottom Stations, at either extremity of this ropeway are picturesque outposts from where the visitor may look over to other ranges of hills. From the Top Station could be seen the Palni Hills, and Kodaikanal is but 30 miles from these hills. To the pioneering spirit of the enterprising European planters, Munnar owes its birth and rapid growth. A beautifully laid-out town with all modern civic amenities, nestling amidst

picturesque hills, it has a population of about 40,000 and has a first-class and second-class rest-house where tourists could stay in comfort. The famous Pallivasal Falls, the main source of hydro-electric power in the State, is only four miles to the west of Munnar, and has an elevation of 3,800 feet. At Chitrapuram, not far from the Pallivasal Falls, are the quarters and offices of the staff attached to the hydro-electric works. The Kundala Valley, which is being converted into a sanatorium is situated above Munnar. The Pallivasal Hydro-electric Project is well worth a visit. Inaugurated in February 1944 this huge white coal generating enterprise is situated in a region where Nature revels in her wildest and grandest form. In this region where dense wood and profuse water mingle, man's handiwork

Chitrapuram—a, picturesque Hill Town in the High Range

ation and the most favourite summer resort. 92 miles from Kottayam and 82 miles from Ernakulam, Munnar is easily accessible from the plains by the Neriamangalam Pallivasal Road and is connected by a good motor road, turning off from the main central road at the town of Muvattupuzha. Munnar is also linked up with Coimbatore by a motor road through Pollachi and Udumalpet. A hundred miles long, this road is known as the Northern Outlet Road. On this road are the, picturesquely situated camp sheds at Thalliar and Chinnar. The 60 mile long Neriamangalam-Pallivasal Road which pierces the heart of dense forest, has made, through communication possible. A bridle path from Bodinayikannur to the Top Station also leads to the High Range. Bodinayikannur may be reached by train from Madura or by bus from the Kodaikanal Road. Sixty-five miles eastward on the Alwaye-Munnar Road is the viewpoint of Lockhart Gap, which affords a panoramic view of the Cardamom Hills and Chitrapuram.

Munnar is the headquarters of the tea industry in the State of Travancore-Cochin. It is a delightful pastime to drive round the beautiful, terraced tea-gardens through winding roads. The transport of tea is partly done over an aerial ropeway 18 miles long, one of the longest of its kind, and quite an ingenious mechanism which is worked by a turbine driven by a

Hill tribes inhabiting the High Range

has created a marvel of engineering skill in the Pallivasal Hydro-electric Project whose maximum estimated output of energy will be 29,000 kilowatts capable of turning out annually 200 million units.

Situated in the cool heights of the High Range, Devicolam is the queen of hill stations in the State. Devicolam (old) is ten miles to the south-east of

spot where the aboriginal tribes share the forests with wild beasts. Shooting game in the High Range is subject to the control exercised by the Peermade Game Association. In the many mountain streams and pretty lakes, masheer and trout fishing could be enjoyed. Elephant, bison, bear, tiger, leopard, sambur, deer, wild, boar, panther wild dog, wild doe, jungle sheep, these and

Cardamom plants in the High Range

Munnar and is easily accessible by a motor road. A sanctuary for the lover of nature, this place derives its name from a lovely idyllic lake with which is associated many stories and legends. Devicolam (new) is the head-quarters of the Taluk. Ideal weather prevails at Devicolam, rendering it one of the best hill stations in India. There is an excellent rest-house at Devicolam where the tourist could stay in comfort and see the terraced hills studded with tea shrubs nearby, and in the distance the virgin forest, and occasionally hear the angry growls of carnivorous animals and trumpeting of wild elephants, breaking the uncanny silence of the place. Oodumbanchola, 26 miles from Devicolam, situated in the heart of densest jungle, is a pretty forest village surrounded by a deep elephant trench. The intrinsic charms of the mountain range display themselves in the many hidden haunts, nooks and creeks.

The forests in the High Range form the natural habitat of a wonderful variety of big and small game. A happy hunting ground alike to the expert cameraman and the enterprising *shikari*, this region is a beauty-

Huts of hill tribes in the High Range

many other animals are found in large numbers in the primeval forests which present a sublime idea of Nature's infinite grandeur. A constantly changing variety of mountain scenery—hills and dales in quick succession, summits and peaks clothed with mist, rocky escarpments, woodlands, deep gorges, ravines, precipices, vast plateaus, many streams gurgling and careering, little brooks and rivulets, leaping and tumbling cascades—greet the tourist and provide him with a succession of changing thrills. The climate in the High Range has a languorous warmth in the summer. In the winter there is beautiful, scintillating sunshine, with a tinge of chillness which is bracing.

The High Range affords ample scope for research to the enterprising ethnologist and anthropologist, for the aboriginal tribes inhabiting the dense forests are so different from each other in appearance and mode of life, manners and customs. The hill-folk who live in and cultivate the forests are a set of very interesting people, primitive in dress, shy by nature, and generally contented. Divided into many tribes and exogamous clans, they have many curious customs and stories and legends steeped in the background of tradition which add

THE HIGH RANGE—SCENIC PLAYGROUND OF INDIA

to the colour and romance of their wild life. Some of the hill tribes, like the *Mala Uralis*, *Mannans* and *Muthuvans* are comparatively more civilised than their brethren in the other hills due to their contact with the planters. They take delight in wearing shirts, coats and turbans. Of extremely active habits and ever alert, they have developed a keen sense of smell which enables them to scent out wild animals with amazing ease. Their primary occupations are hunting in the dense forest and cultivation of hill paddy on the slopes of the mountains. They are highly superstitious and awfully afraid of their chieftains, medicine-men and priests and the primitive gods whom they speak of as the "S'iving Ones." Their folk-songs and community dances indicate their nearness to earth, their simplicity, and hoary belief in tradition. Pleasure and excitement expressed in wild dances and songs, oftentimes stimulated by intoxicating beverages, find their outbursts during festive occasions. If you want to know the good-natured freedom-loving, pagan forest folk, sun-bronzed and handsome in a wild sort of way, you should get into touch with these hill tribes who live in closest association with nature. Though rude in talk they are most hospitable and friendly, and of expert assistance to hunters and hikers. Their tree-houses called *Anamadams* (elephant huts) made of reeds and bamboos, serve as safety huts protecting them from marauding wild elephants. To share the tree-house with the forest folk and to bag wild game is an unforgettable experience for any *shikari* who is eager to adorn his home with magnificent trophies. If the tourist-shikari so chooses he could convert hunting expeditions into exciting stalks for shooting with the camera instead of the gun.

To the painters and hikers who spy out Nature's hidden moods and pranks and the poets with songs in their hearts who seek out the sublime in eternity, in the woods, clouds, waters and mountains, the High Range around Munnar constitutes a supremely lovely paradise for camping, picnic, hiking, mountaineering, angling, boating, shooting, and for recouping health and vigour. The best time to commune with the manifold charms of the High Range is between the months of December and June when dry weather prevails.

Blessed with exceptional climate privileges,

enchantingly beautiful mountain villages, transport facilities, cordial inhabitants, and an diversity of scenery, fauna and flora, the High Range is a goal for tourists, botanists, anthropologists, ethnologists, ornithologists and *shikaris*, and the influx of visitors to this region bears evidence to the unique charms of the High Range, the best known summer

Pallivasal water-falls in the High Range

resort in South India. There is nothing artificial about the place. The High Range is not a place essentially for the man who uses his legs. For a holiday that is very different and exceedingly charming, come to the High Range, the scenic Playground of India, a veritable palette of colour. He who has once communed with the bounteous charms of the High Range will ever long to visit it again.

"KOLO"—THE ENSEMBLE OF NATIONAL DANCES OF SERBIA

WHEN a citizen of Belgrade wishes to show any foreign visitor something he is particularly proud of, more often than not he will take him to the concert of the "Kolo," the Ensemble of the National Dances of Serbia.

Macedonian folk-dancers

The "Kolo" has developed out of the traditions of the peoples of Yugoslavia and the continuous intensive creative genius of the anonymous artist whose feelings and moods have been expressed in song and dance. For although the most beautiful examples of popular song and dance traditions probably belong to bygone days, nevertheless now and then masters of dance and brilliant interpreters of popular songs are still to be found among the population of towns and villages.

The programme of a performance of the "Kolo" is a picture of the variety and wealth of songs and dances prevailing all over the country. "What a geography course; what a lesson in sociology"—was the exclamation of a well-known Paris critic after the first "Kolo" concert in the Palais Chaillot.

And indeed, the Warlike Rugovo dance with its Yatagan duel for the lady is succeeded by the lively dance of Eastern Serbia followed by the ancient "Dumb Dance" of Glamoc, accompanied

only by the jingle of the jewellery; the famous Macedonian "Teskoto" succeeds the Montenegrin high-lander dances accompanied by singing; in the "Dalmatian jig" the lads swing the girls sweepingly around the "liyerka" instrument players; in the "Shota" the audience is impressed by ancient love lore; the pagan accents of the "Rusalija" evoke the realities of magic and charm, then followed by five smiling Vojvodina lads competing in a masterful measure around daggers stuck in the ground. People and countries unfold before us. Yugoslavia, the land of plains, mountains, sea-coasts, the tortured slavery under the Turkish yoke, the struggle for freedom and the heroic living traditions; men, proud, self-confident, exhilarated and sustained, always masters of dance; luxurious costumes of gold, silk and wonderful embroidery; all this and much else passes before our wondering eyes to be terminated—usually by two large dance suites. A Serbian and Croatian one—whose happy mood and the rapturous beauty of form and movement leave an unforgettable impression, and a longing to see it all again. For, in these dances there is nothing artificial, everything is genuine, sincere, everything comes straight from the heart and therefore conquers the hearts (Brugsch Handelsblad, Brugges). The visit to Switzerland in 1950 was a sensational one; the very next year the

Montenegrin folk dance in traditional costumes

"Kolo" won three first prizes at the Festival at Llangollen (Wales), for national dance, for solo national song and for solo national instrument. The Ensemble visited London three times (in 1952 alone 28 performances at

the Cambridge theatre), Holland and Switzerland; then follows a tour of Belgium, Austria, Greece, Turkey and Western Germany and, in addition to a tour of the whole of France, the "Kolo" gave fifty concerts at the Palais Chaillot in Paris on three occasions.

Unanimous in praise, the foreign critics, many of which are well-known experts in musical folklore, pointed out that the interpretation of national dances was rendered in a perfect form, and with a purity, precision and such a sincere animation that it constituted a great creation of art. "Every dance unfolds a new page of a richly illustrated book on the Balkans and we, like children, acclaim with joy and applaud every new scene,

and there is no end to our admiration and wonder"—writes, for instance, the *Duisburger Anzeiger*. Like many others, Cyril Beaumont, the English ballet expert, expressed the opinion that this Ensemble "will do more to bring nations together than a dozen diplomatic conferences." And indeed, youth talent and beauty, happily united in this Ensemble as the guardians of a traditional culture, unwittingly become the instruments of the great longing of humanity for peace, for, by the force of their art, speaking sincerely to all the peoples of the world, they remove the barriers among men and States.—*Yugoslav Embassy Bulletin*.

—O:—

SRI SUBRAMANYA BHARATI KAVISWARAM

The Great Tamil Poet of the South

By NARENDRA DEV

IN the vast domain of our poetry it is very difficult to define the position of a multivocal composer like the illustrious Tamil poet Sri Subramanya Bharati Kaviswaram who can be truly described as poetry personified.

From the stories and legendary lores surrounding his wonderful life-history we can easily gather that the Poet lived a divine life. He was well-versed in our sacred ancient literature in which is enshrined the wisdom of ages, the Vedas, the Upanishads, the Bhagabat Geeta, etc. He was also fully adept in all the best Kavyas and Puranas of our land. He lived virtually on that supra-mental plane of higher thoughts and ideas which was the preserve of the Rishis and sages of old.

Bharati worshipped Sakti or Mahakali, his great Mother and the Mother of this Universe, as the symbol of the immanent and transcendent force pervading all the creation.

As a poet Subramanya Bharati certainly impresses one with his boldness, his grand and beautiful conceptions, his noble ideas and subtle emotions, his powerful passions and sacred sentiments, his higher inspirations and joyous ecstasies. Going through the English translation of some of his best lyrics I am convinced that he was a poet of a very high order. He was also a popular poet, popular not only with the masses but also with the classes. His poems are easy to follow but they are pregnant with lofty visions and sublime ideals, with scholarly erudition and logical precision, with philosophical outlook and poetic emotion.

Great art is never born without an urge in the artist himself for self-expression. Poet Bharati had that

urge. He has expressed himself in the way, a creative genius always does.

He was an ardent lover of freedom. His great zeal for liberty turned him into a revolutionary patriot. He came into the field of literature during the exciting days of the Swadeshi Movement. The Movement was started in Bengal and spread itself in other provinces. It was a political upheaval in India in the early part of the twentieth century. He imbibed the strong and vigorous spirit emanating from the Vedas and the Upanishads. *Nayamatma balaheenena labhya*. This was the teaching of Swami Vivekananda the Sanyasi patriot and saint of Bengal, whose fearless and forceful ideas were followed by Lal, Bal and Pal, the great trio of the independence movement of India.

It is a matter of pride and pleasure for me to find that Subramanya Bharati passed his Entrance Examination from the Calcutta University; and from Bengal, the birthplace of All Freedom Movements, he was initiated in the service of his motherland.

I have learned from my Tamil friends that he has very ably translated the Bhagabat Geeta. He used to write short stories, sketches, articles on social and religious problems, he attempted to write a novel also. Bharati never wrote down his poems till he had made an extempore recitation of the same. He used to sing songs while composing them. This is a very extraordinary talent, and proves his great natural gift in the art of poetry and music.

Bharati's works may be classified under several headings, such as his patriotic songs and heroic sagas, his verses on social and religious inequities, his poems

of love and romance, his folk-songs and doggerel verses, and verses, almost personal, pertaining to God and Nature. The last but not the least, is his characteristic compositions based on fragments of the ancient epics.

Let me first refer to his patriotic poems and songs. One of his best poems, "Freedom," should be mentioned at the very outset. In it the poet demands freedom not only from political slavery but also from the very humiliating social tyrannies from which the Panchamas and other Harijans still suffer. The poet sings:

"Freedom! Freedom! Freedom!
To the Pariyas, to the Teyas, to the Palayas
Freedom!
To the Paravas, to the Kuravas, to the Maravas
Freedom!"

Freedom was the keynote of all his patriotic songs. Freedom first, freedom second and freedom always. In this poem the poet vigorously implores all his countrymen: "Come! Let us labour all, in the way of Truth and Light. None shall be oppressed." He boldly declares that

"Those who are born in this sacred land, are all of noble birth: Let us live like brothers all alike; equality in every walk of life. Man and woman shall have the same privilege in our land. Let us banish all ignorance. Let wealth and learning flow in every corner. In joy and bliss let us live peacefully."

Everyone of us who loves his land of birth and cares for his own people will certainly join in the chorus of the poet's song of Liberty, Fraternity and Equality.

In the poem "Our Wild Mother," the poet's conception is that Mother India herself is that *Para-sakti*, the Force Transcendent, all powerful and irresistible, fierce and inscrutably beautiful. Her spirit is wild. Her consort is Siva, the Great Natarajan who carries the flaming torch of life and dances the cosmic dance which raises waves of melody in the sea of song. The mother rides on the crest of the waves, that causes the woodland to be bright, with, blooming buds and divine beauty. She, being drunk with beauty, takes the flowers in both hands and reels on her tripping feet. She sings and the Vedas ring! She conquers death by brandishing the Trident.

The poet's imagination in this poem, though wild, is typically oriental, rather typically Indian. We seldom find any foreign ideas or expressions admitted in his poems. His similes and metaphors are all indigenous and are very unlike those of the modern poets. Again in another poem we hear the poet singing to awake Mother India from her deep slumbers of centuries. He whispers into her ears:

It is dawn,
The dark shade of evil have fled
Routed by our penance,
And the Sun of Light
Has flung his young golden beams across the world,
Thousands and thousands of thy sons
Are gathered here to pay thee homage,

To bless thy name and to serve thee.
How strange that thou should be wrapt in sleep!
Awake Mother! Awake!

It is a fairly long poem, very beautifully expressed and I feel tempted to quote every fine line of it, but our space is limited and I have to restrain myself very reluctantly.

His poem addressed "To Liberty," though it appears to be a bit of personal reminiscence of his prison life, reveals the poet's strong passion for freedom from all bondage that curbs the natural development of the human soul. In the poet's opinion, every success in man's life, his wealth, treasures, good name and fame are of no worth if he is not allowed to breathe in a free land.

Sri Subramaniya Bharati, though he is great in every branch of poetry, certainly excels in his patriotic poems.

As to his verses on social and religious subjects, I would like to mention only a few such as the "Gopi Song," "The Cottager and His Wife," his "Prayer" and his "Conquest," in which his deep reverence for and staunch faith in the gods and goddesses of his land have unquestionably been established. In the "Conquest" the poet has conquered self and come out victorious. In the "Gopi Song," the intense love of the Gopis for Lord Krishna has very cleverly been expressed only in a few simple lines:

"Now along the flowery grove
By the Champak's odorous pile
Eyes made visionful by love
See your deep alluring smile.
Koel's note from tree to tree
Speaks your voice with sweetest smart
And the dark blue rolling sea,
Tells the pushing of your heart."

This is something which we cannot but say wonderful and sublime!

In the poet's "Prayer" to Mother Sakti he entreats her, "Speak, Mother! Wilt thou deny me strength to live for the great world's betterment?" He prays on for "a life that regenerates itself ever anew, a life that for ever burns, a will unshaken wedded to its aim, a heart that yearns to sing your praise even if fire consumes the body's frame." Such a courageous and dauntless desire can only come from a brave soldier who has dedicated his life to the service of his motherland.

In his poem the "Cottager and His Wife," we are in the midst of a dark and severe stormy night when we overhear the cottager's request to his wife, "Unto the mother let us pray. May her grace save us apace, from the tearing elements' play!" But his wife who has stronger faith in the Divine Will, answers quite unperturbed, "But yesterday in yonder hut where we lay had we stayed tonight, what would have been our fate? It was held by Divine Might?" Such was the strong faith and implicit trust of the poet in fate or destiny, which only the Divine Will rules.

In his poems which deal with Love and Romance, Bharati has proved himself to be one of the greatest love-poets in our romantic literature, because his love is not only human but also divine.

God is the greatest lover. We find that when the feeling of loneliness came upon the poet it filled his heart with bitterness, but as soon as the sense of his lover's presence dawned on him, it overwhelmed his heart with delight. Thus the realisation of the Great Lover was a matter of infinite joy for him.

His "Love Message" wrings our heart. It reminds us of the beautiful love lyrics of Vidyapati and Chandidas, the twin love-bards renowned in Vaishnava literature, who have described so acutely the pangs and pathos of the agonised heart of Sri Radha, separated from her divine lover Sri Krishna. In Bharati's poem, a girl in her wounded pride and assailed dignity, beseeches her lady-friend and companion to go to her lover and probe into his heart to find out for what fault of hers he has become so indifferent to her and left her to suffer the ignominious sorrows of a heart smitten with pain born of this unbearable separation. In his "To the Beloved," the poet speaks of his intimate relations with the beloved; it transpires at the conclusion of the poem that his beloved is no other than that Great Lover. So it is again repeated, in his poem "Kannanna my Love."

"In the rolling ocean's wave I see thy face
And only thy face in the broad expanse of the sky,
And but thy face in the tiny bubbles' race,
Naught did I see but thy infinite grace!"

In his poems, the "Evening" and the "Tryst," we find the poet appearing in a very different mood. These two fine pieces of poetry are full of passionate but dignified feelings towards the opposite sex. We also find, in these lines, pictures vividly drawn of the delicate feelings and the pleasant warmth of the woman's heart, which are always more human than divine.

His folk-songs and allied verses are highly above the level of the poems by village signers. His word-music in the poem "Rain" is notable. His assertion as

to the unparalleled beauty of the Tamil language is worthy of being mentioned here. "Tamil is best and Tamil is lofty."

Bharati's compositions, based on the fragments from the ancient epics are almost epics themselves, as he is more in his own element in these writings. Some of them are much better than the original poems, more artistic and imbued with modern ideas, and as such these have a stronger appeal in them. The best of these tiny epics is "Panchali Sapathan" (The Vow taken by Panchali).

His magnificent poem "The Fire" takes us to the long-lost Ashramas of the old days where the Rishis used to perform *yajnas* by lighting the sacred fire to drive away the Asuras and other evil spirits who were in the habit of constantly disturbing the peace of the Tapovans. This poem appears to be an allegorical one, in which the Asuras seem to be the undesirable alien rulers, and the Rishis the leaders of India's Freedom Movement.

A very powerful and gifted poet as he was, he indulged in composing poems and songs in many different styles and embracing every possible subject. Some of them are mystic, some are symbolic, some are allegorical and some are realistic. A few of his poems can be classified as exclusively personal, such as "The Span of Earth" in which the poet deals with the idyllic picture of the simple life of a poet.

Bharati sacrificed his life to save a deadly frightened girl from the attack of a mad elephant who ran amok on the street. The girl was saved by him but he himself could not escape the rage of that mad beast who killed him on the spot.

Thus at the age of only thirty-nine, ended heroically the glorious career of this great Poet Subramaniya Bharati Kaviswaram, the father and creator of the modern Tamil language and literature.*

* This appreciation is based on the *Voices of the Poet*, an English translation of some of the Poet's best pieces, published by the Bharati Tamil Sangham of Calcutta.

"TRUE religion is not belief in God, but is trust in the good in man"—Swami Rama Tirtha

AMONG the latter-day saints, Swami Rama Tirtha's hallowed name is one to conjure with. He was a true descendant of the Rishis of yore, i.e., one of those whose noble mission is to direct the faltering steps of a frail humanity heavenward and teach it to walk in the way that leadeth to life.

He may, in a sense, be said to represent the third generation from Paramhansa Ramakrishna, in direct spiritual lineage. Ramakrishna is a world-renowned saint and needs no introduction to the readers; nor does his brilliant disciple Swami Vivekananda, who galvanised, with the superb wisdom of his Vedantic teaching and marvellous oratory, huge audiences at the magnificent Parliament of Religions in America.

Now, properly speaking, Swami Rama Tirtha, the proud Prince Rose in the garden of spirituality and saintliness, in the renowned Land of the Five Rivers was no disciple of Swami Vivekananda. Saints, like the proverbial poets, are born, not made. They are of God's own anointed ones. Rama Tirtha had caught the wholesome, generous infection from, and been under the special pupilage of, his friend and spiritual mentor and guide Dhanna Bhakta; but it is no less a fact that it was his meeting, at Lahore, Vivekananda, when the latter toured the Punjab, that proved the determining factor in, and set the seal on, the ultimate choice of Rama's vocation in life. He found his life-mission in the service of his country—rather humanity at large—by way of spiritual ministry. Like all Mahatmas of old, he realised that if it was gallant to rescue a man from drowning or even from the gallows, it was nobler to save mankind being submerged in the *Bhava Sagar* (the ocean of worldly Evil and Temptation); and to lead people to Heaven. And the contact with Swami Vivekananda crystallised his resolution, and made him definitely discover his manhood and full spiritual stature. Though in fairness to him it must be allowed that he was, by then, already in excellent making and had, so to say, gone more than half way to meet the brilliant disciple of Ramakrishna.

As pertinent to this point, it may be recalled that in November 1897, Swami Vivekananda visited Lahore and spent about a week there. He delivered many lectures, but the others faded into insignificance before the one in Vedanta delivered by him, at the instance of the young enthusiast Rama Tirtha, in a circus-pandal. The place was chosen, as being considered sufficient to accommodate the huge gathering that was anticipated and since a better one, equally suitable, could not be arranged for, at the moment. Vivekananda's divine eloquence, "burning renunciation, indomitable strength, dynamic personality and gigantic intellect" made a deep impression on the packed audience. Swami Rama, too, was profoundly moved and stirred to his spiritual depths.

The visit of Vivekananda, no doubt, strengthened the silent ambition of the youthful Swami Rama to lead the dedicated life of a monk and to go round the world, preaching Vedanta and propagating light, like Vivekananda.

The association of the two revered names, we mean those of Vivekananda and Rama Tirtha, tempts one to compare the two transcendental, fiery and flame-like personalities. It must be conceded that in literary scholarship and command of formal platform-oratory, Vivekananda excelled. Such accidental inferiority, however, is practically immaterial in the case of a spiritual philosopher, a seeker after Truth, one keen to pierce the thick veil of *Maya*, i.e., illusion and to attain "self-realization." The parallel of Tulasi and Kabir is a case in point. In spite of the abysmal difference between their respective learning, in the accepted sense, both pursued apparently separate ways, but equally successfully attained the common goal. Here, too, of course, Rama Tirthaji was well-versed in Vedantic, Sufi, and mystic philosophy. Verses from the Vedas and Upanishads, as well as lines from Persian poet-philosophers, like, let us say, Maulana Rumi and Shams-e-Ishraq, Hafiz and Omar, would, during his discourse, trip triumphantly from his eloquent lips. Even otherwise, the seeming inferiority of Rama was more than made up in the superior, crystal-clear magnetic current that gushed forth from the powerful personality of Swami Rama and had its inexhaustible source in the fount of Vedantic doctrine, of which he had drunk long and deep. So that he ever seemed inebriated by the heady wine of spiritual exaltation, which framed his fascinating face with the nimbus of a dazzling glow and glory. But both were "great and honourable" men of dynamic soulforce all compact.

We do not propose to deal herein, with the spiritual equipment and soul-loftiness, or the self-realization attained by Swami Rama Tirtha but just to afford a fugitive glimpse of my lively and unfading recollection of the saint's short visit to the historic city of Lucknow.

On September 1, 1905, Rama came down to the plains and after touring Bengal and Bihar reached Lucknow early in October. He was accompanied by his chief disciple Narain Swami and some others of the celestial band. He, with his party, was the guest of the revered B. Ganga Prasad Verma, the well-known editor and a prominent and highly popular public man. Shri Verma was a man of arduous application and a prodigious worker, but Rama proved a greater giant and easily eclipsed B. Ganga Prasad's multiform astounding activity. Swamiji spent about a fortnight here.

Every morning hosts of college students flocked to the Advocate Library to greet the dawning day with

melodious chants of *Om* in chorus with Rama. Thereafter, he would go out with his host for a walk. On returning, after a hurried bath and frugal repast, Rama met the waiting crowd, discussing and discoursing, which kept him busy during the greater part of the day. The afternoons were invariably devoted to addressing meetings of students in Colleges and High Schools. After five p.m. the people of Lucknow irrespective of caste and creed, age or sex, gathered in thousands on the spacious satiny lawns of Kaiserbagh, under the magnificent canopy of the heavens, with the dazzling October sun scorching their keen faces, squatted on the ground, waiting with eager impatience the appearance of Rama; to be blessed with his *Darshan* and to drink in, with avidity, the nectarine flow of unstudied but commanding eloquence from the inspired lips of the Mahatma.

The sweet reverberating hum, as of a myriad bees, from the southern gate of Kaiserbagh, electrifying the audience with anticipatory delight and fervid enthusiasm, announced the approach of the saint, with his pupils and band of admirers, forming a sort of a select bridal-party, with Swami Rama, vowed to life-long celibacy, as the bridegroom. An answering roar of *Om* went forth, as if to exorcise all vestige of evil from Lucknow. Rama surrounded by a number of saffron-clad, clean-shaven Sanyasins would suddenly emerge as if from nowhere, from behind the adjoining cluster of bushes and ascend the platform. On the one hand, the sun was setting behind red clouds and on the other, Rama's beaming benignant face and his body swathed in ochre-coloured garb, showed as if a rival sun had arisen. Rama began with the invariable singsong *Om*, the *Sadhus* bearing company and the congregation in sweet self-abandonment joined the swelling chorus that rose incense-wise heavenward, as a prayerful offering, from the altar of so many devout hearts, in thanksgiving for the right rare privilege of a *Darshan* of the saint. And in the over-wrought state of the mind and the atmosphere one might have been excused for the vivid imagining that, some distance behind and around, the gold-washed walls of Kaiserbagh looked like serried closed ranks of giant *beragis* echoing and re-echoing the sound *Om*, with the silent melody of their own. When the mounting, exultant intoxication had attained culmination, Rama would, at the tense, psychological moment open his lips, touched with the true Promethean fire, and veritable elixir streamed forth in an apparently ceaseless current. It was a sight and an occasion for the very gods and angles to rejoice over. This would go on literally for hours. The enraptured audience sat entranced under the spell, and the Swami, delivering under inspiration, unpriced pearls of wisdom which Solomon himself would have envied, equally oblivious, lost all count of the passage of time. After a seeming peroration, he would again pick up the thread and weave out a fresh pattern of a pleasing picturesqueness kaleidoscopically different from its predecessor,

He was a peerless weaver of spells and it was a wonderful improvisation. He would suddenly come to a stop as he had started, and the procession would return to escort him back home, at his host's residence, usually late enough to find his host in bed, while the guest found fresh claimants on his attention. But who can say what divine, exhaustless energy animated the Swami who would tackle the waiting visitors, and retire to rest usually after midnight and sometimes in the small hours of the morning, to resume his programme early, the next day.

His lectures and talks were always suited to the intellectual as well as the spiritual level of the audience and with his inimitable tact he had always something or other to say to appease the soul hung r of almost every single unit in the assembly, who should not have been far wrong if he considered that the discourse had been deliberately designed specifically for his particular behoof.

He never posed to be superior to the basic physical needs of the normal individual. He never boasted of powers to perform miracles, nor did he ever pretend to be above the common laws of Nature which he respected; though when the mood possessed him he would claim them to be subject to his *Will* and their operation, a process of his own ordering. While addressing students he particularly insisted on their holding their bodies as something as sacred as their souls. He favoured and advocated a harmonious evolution of human personality on all planes, physical, intellectual, moral and spiritual. He himself used to take regular exercise. So that, even physically, he was always in fine mettle, which contributed not a little to the magnificent perfection and balance of his mysterious, many-sided and magically magnetic personality.

Recalling some of the simpler aspects of his teaching we have already quoted under the title of this article, the substance of his moral teaching, raised to the level of a regular religious sentiment, viz., "Religion is not belief in God but is trust in the good in man," a text suitable to be prominently displayed in the meeting hall of the UNO. If those attending the meetings, frankly and honestly, treated it as a religious, moral and political tenet, about half of their vexing problems would, automatically, be solved.

As to religion proper, for the average householder, he said something in a public lecture, held in Victoria Park, to the following effect:

What God asks of us is our Faith and Love, that faith which comes as much from the heart, as from the head. Mere persuasion, mere conviction is of little value in His sight. The most assured results of argument and reasoning, as long as they spring merely from our minds, remain outside our real selves and supply no power to influence our character. What God wishes to see in us, is that faith which may spring, indeed, from the head, but whose home is in our heart, in our spirit, that faith, which is not indeed opposed to our

reason, but goes beyond into a region that is open to love, but closed to naked thought; that faith which can pierce beyond experience, beyond sight, and make real to us things that we hope for, and test the things that we have not seen and cannot see.

He was not one of the highbrows and spiritual bullies who by means of their oratory and argument,

sophistry and subtlety, compel a possibly unwilling, unsympathetic conviction and forcibly silence all doubt.*

* I must thank P. Brijnath Sharga Sahab Sharga, M.A., LL.B., a senior member of the Lucknow Bar, for allowing me to draw upon his brilliant biography of Swami Rama Tirtha, which those interested, will find not merely, eminently delightful reading, but a rich mine of information and inspiration.—K. N. Bajpai.

—O:—

COMMENT AND CRITICISM

"Portraits of Contemporary Men and Women"

To The Editor, *The Modern Review*,

Sir,—I have made the appeal before, and do so again, that our talented artists should record in adequate aesthetic forms the visages of our contemporary men and women, the makers of our modern history, our political leaders, and the leaders of thought in the realm of Art, Science and Literature. Whatever little that has been done, has been done in Bengal, the artists of the other provinces are too much engrossed in experiments in "isms" to look around them and to take any notice of our great contemporary personalities. The first move in this direction was made by Mukul De years ago with his *Twelve Portraits*, recording in impromptu pencil-sketches Sir Asutosh, Sir P. C. Ray and other great personalities. Then came Sri Pulin B. Dutt (of Bombay) with his series of portraits of Mahatma Gandhi. But the Father of the Nation and Pandit Nehru have not been immortalized in worthy effigies, though frequently caricatured in hasty and irresponsible sketches. They have been painted by non-Indian artists, but our national artists have not been able to give us masterly studies of these great men. Sarojini Naidu has passed into immortal life without being immortalized in any masterly portrait. In England, most of the contemporary leaders are represented in the National Portrait Gallery, and galaxy of able portrait-painters have paid their national homage to their national heroes and heroines. The contemporary portraits from the brush of Sir William Rothstein are striking examples of this fulfilment of a national duty. The recent portrait of Dr. Radhakrishnan by Elizabeth Brunner shown in the Delhi Exhibition in January last, though not a great masterpiece, has been a serious study by a competent and versatile artist. But we should like our national leaders to be immortalized by our national artists.

The Moghul and the Rajput portrait-painters have left wonderful portrait-studies of nearly all the great contemporary figures of their times. Most of them are masterpieces in the field of portrait-paint-

ing. It is said that our great leaders seldom commission our talented painters to paint their portraits; they probably expect that the artists should work free in order to fulfil a national duty. There is a movement on foot to remove the portraits of foreigners which now 'decorate' the walls of our Raj-Bhavans and to replace them by effigies of our great leaders. This is a movement in the right direction. But the commissions should be divided amongst a number of artists so that most of our artists could get a chance to present proofs of their talents.

Oil portraits are expensive ventures sometimes beyond the resources of the members of our middle-class society now on the verge of poverty. To meet this situation one could suggest that our artists should develop a school of miniature-portraits, so that men of moderate means could commission them. It is a pity that the talents of our artists are going to waste and are not utilized to record in worthy aesthetic presentations most of the leading figures in our social and political life. They are only represented in banal photographs, the machine-made abominations of the modern age.

The recent exhibition of Japanese colour-prints have also a relevant lesson to us. There were numerous fine masterpieces of portraits of popular actors of the Japanese stage. Why cannot our talented portrait-painters immortalize the darlings of our stage and cinema in superlative forms of beauty, demonstrated by the artists of the Ukiyoye School. If the artists do not come forward on their own initiative, the management of our stage-plays, who are running hundreds of nights of popular plays, could come forward to commission artists to paint the heroes and heroines in worthy aesthetic forms. The banal habit to commemorate our contemporary life, through mechanical or "art" photographs, must be replaced by hand-made presentations in worthy pictorial forms.

Yours faithfully,
O. C. GANGLY

PLANNING FOR THE "SOCIALISTIC PATTERN"

By PROF. SHRIMAN NARAYAN

THE informal meeting of the A-I.C.C. held in Delhi on the 3rd and 4th of September was unique in several ways. It was, perhaps, for the first time in the history of the Congress that we met informally in a business-like manner to thrash out issues of national importance, particularly about the economic development of the country. The splitting up of the meeting into three sub-committees, was also a new procedure in Congress meetings. These sub-committees worked for the whole day and reached a number of important conclusions after serious discussion. On the next day the reports of the sub-committees were presented to the full meeting of the A-I.C.C. After discussion these reports were referred to the Congress Working Committee for further consideration and necessary action. The A-I.C.C. meeting in Delhi was a systematic attempt to work out the details of the "Socialistic Pattern of Society" which we had resolved to establish in India at the Avadi Session of the Congress in January last. The nature and content of the Second Five-Year Plan has to be viewed in the light of our new objective.

The report of the sub-committee on the 'Plan-Frame,' presided over by the Union Planning Minister Shri Gulzarilal Nanda, made it very clear that the main objective of the Second Five-Year Plan should be the achievement of fuller employment in the country through the development of small-scale, village and cottage industries, on a very large scale. It also laid stress on creating a suitable atmosphere in the country for increasing tax resources for additional development projects. Unless an atmosphere of equality of opportunity and of sacrifice was created in the country, it would be difficult to secure the necessary finances for the Second Five-Year Plan. Special attention should be paid to the needs of the under-developed sections of the population and the requirements of backward areas and regions. The need for securing public co-operation in a large measure through local bodies and village Panchayats was also stressed. Attention was drawn to the necessity of building up basic industries and the development of transport and communications on an adequate scale for achieving proper distribution of increased production of consumer goods in the country. The report emphasised the need for the reform of the educational system on the basic pattern and pointed out the urgency of training the required personnel for the implementation of the Second Five-Year Plan in different sectors of national economy. The report

of the Committee on Village Industries and Co-operation, presided over by Shri Vaikunthlal Mehta, dealt with the question of organising industrial co-operatives throughout the country in order to produce the necessary consumer goods in the decentralised sector. It also gave certain concrete suggestions for evolving common production programmes in regard to cloth, hand-pounding of rice, edible oils, tanning and footwear so that unnecessary and unhealthy conflict between the large-scale and small-scale industries may be eliminated. The report of the third Committee on Organisational matters, presided by Shri Lal Bahadur Shastri, gave several valuable suggestions for the revitalisation of the Congress Committees which have to be toned up for serving as an effective instrument towards the attainment of the Socialistic Pattern of Society. The reports of the sub-committees on the Second Five-Year Plan and Village Industries and Co-operation will now be considered both by the Planning Committee of the Congress as well as the Planning Commission so that the details of the Second Five-Year Plan may be worked out in the light of the various suggestions contained in the reports. We would, however, like to draw pointed attention to certain aspects of the Second Five-Year Plan so that there may be no misconceptions about our basic policies.

Firstly, it must be constantly kept in view that the Second Five-Year Plan has to be in the nature of a definite step towards the establishment of a Socialistic Pattern of Society in the country. This means that during the next five years, we should be able to tackle the problem of unemployment, more particularly of the educated unemployed, quite effectively. While due emphasis has to be laid on the development of basic industries, the need for developing small-scale, village and cottage industries on a co-operative basis throughout the country cannot be over-emphasised.

Secondly, systematic attempts have to be made for providing equal opportunities to all sections of the population in regard to their social and economic progress. With this aim in view, glaring social and economic inequalities have to be reduced considerably during the next five years. There must be balanced development of the urban and rural areas. There should also be equality in taxation so that incidence of additional taxation may be just and equitable on the richer and poorer sections of the population. The recommendation of the Taxation Enquiry Commission

about bringing down economic disparities to the level of 1 : 30 has to be constantly kept in view. If possible, we should try to bring down these disparities to the level to 1 : 20 during the next ten years.

Thirdly, the implementation of the Second Five-Year Plan should not result in excessive bureaucratisation. We have to remember that planning under democracy can be successful only if adequate initiative is left in the hands of the public. We have to plan from the bottom upwards and not impose our plans from the top through a centralised bureaucracy. The need for developing the village Panchayat system in the countries, is, therefore, very obvious.

Fourthly, special attention will have to be paid to the integration of our educational system with the developmental projects. We know that a number of schemes under the First Five-Year Plan have not been completed for want of adequate trained personnel. This mistake must not be repeated in the Second Five-Year Plan. The Union as well as the State Governments will have to plan from now about providing the necessary training in different spheres for speedy and effective implementation of the next Plan.

Fifthly, the need for giving the highest priority to the felt-needs of the backward sections of population and scarcity areas should be constantly borne in mind. Mahatma Gandhi's idea of "Unto This Last" cannot be overlooked in the process of building up a socialistic pattern. For example, the slums in cities, particularly in Delhi, must be liquidated in a substantial measure during the next five years.

And lastly, the system of administration has to be reformed in such a manner that the people may have full confidence in the efficiency and integrity of the machinery for planning. It would be impossible to generate an atmosphere of confidence in the targets of the Second Five-Year Plan, if the people do not seriously feel that the additional taxes raised from them would be spent by the administration in an honest and economical manner. It is true that the prevalence of inefficiency and corruption in the services is often exaggerated and is, therefore, unfair. But the fact remains that there is enough scope for improvement in this direction.

We should also draw particular attention of the national planners towards the problem of Land Reforms in the country. Although some progress has been made in regard to the introduction of progressive

land reforms in India during the last five years, much still remains to be done. One basic principle which should be kept in mind in regard to land reforms is that the basic of ownership of land should be essentially labour and not capital. The Congress has always stated that the land should belong to the tillers of the soil and not to those who live on land by merely investing capital. From this point of view all those who are resuming land for "self-cultivation" without putting in certain amount of labour of their family, cannot be allowed to enjoy the fruits of land for long. Even living in the village for supervising cultivation is not enough. Land is a gift of nature and not the creation of human labour. It is fundamentally different from other commodities like factory goods. Land, therefore, should belong only to those who are prepared to work on it "with the sweat of their brow." Casual labour may be employed by the land-owning families at the time of special agricultural processes like ploughing, weeding and harvesting; but merely managing or supervising farm cultivation should not be regarded as an adequate condition for the ownership of land. Moreover, attempts should be made to evolve a system of land cultivation in which the village community gradually occupies a key position. Acharya Vinobaji's Bhoodan movement has now entered a new and revolutionary phase of *Gram Dan* in which the whole village community surrenders its land for equitable redistribution. This phase of Bhoodan movement should be carefully studied by the Planning Commission in order to evolve a new pattern of land-ownership and cultivation in India.

But economic equalities have to be brought about in both the rural and urban sectors. The imposition of the Estate Duty, the reform of the Managing Agency System, steeper Income Tax, etc., are steps in the right direction for scaling down inequalities in the urban sector. We have to remember, however, that all these economic reforms have to be introduced through peaceful and democratic processes. The Socialistic Pattern of Society in India must have its foundations on truth, non-violence and persuasion rather than on methods involving falsehood, violence and coercion. In the ultimate analysis, real national planning involves the planning of national character. The success of economic planning in India would ultimately depend upon the quality of men and women who participate in this mighty adventure of building up a new, prosperous and progressive India.

KASHMIR

By PROF. SUDHANSU BIMAL MOOKHERJI, M.A.

KASHMIR, the traditional land of saffron, of the stately cedar, of idyllic peace and romantic charm, has been a bone of contention between India and Pakistan for seven years and more. Mr. Prem Nath Bazaz has traced the history of Kashmir from the earliest times to the present day in a nicely printed, bulky volume of more than 700 pages with a de-luxe get-up.* The publishers' blurb says, "The author has masterfully presented the problem (of Kashmir) in a lucid and refreshing manner. His analysis of the accession issue is objective and dispassionate." We too certainly congratulate the author on his style and manner of presentation. We cannot however regard his performance as 'objective' and 'dispassionate.'

The history of Kashmir, according to Kalhan's *Rajtarangini*, begins in 2450 B.C. when Gonanda I laid the foundation of monarchy in Kashmir. It formed a part of the dominion of the Imperial Mauryas of Magadha, who were the first non-Kashmiri rulers of the valley of Kashmir. Buddhism, introduced by Asoka Maurya, produced revolutionary changes in the political, social and cultural life of Kashmir.

Kashmir threw off the Maurya yoke after the death of Asoka. It formed a part of the Kushana empire later on. It was a stronghold of Buddhism under the Kushana in the first and second centuries A.D. The Fourth Buddhist Council was held in Kashmir during the reign of Emperor Kanishka. Attempts to revive Brahmanism in the post-Kushana period resulted in the evolution of a new religious philosophy in the long run. This is Kashmiri Shaivism, also known as Trika Shaivism, which is a synthesis of Buddhism and Brahmanism.

The Hunas held sway over Kashmir for a time in the early 6th century A.D. The Huna Chief, Mihirgula, son of Toramana, was a heartless tyrant and is called *trikotila* (slayer of three crores). He persecuted the Buddhists and built Shiva temples and Brahmanical monasteries.

Lalitaditya Muktapada (695—732 A.D.) is one of the greatest kings of Kashmir. He was a great conqueror. He raised his country to the height of glory. Never before was Kashmir so great and powerful. The ruins of the temple at Martanda near

Anantanag and of his city of Panihaspura, fourteen miles from Srinagar, bear eloquent testimony to the greatness of Lalitaditya. That greatness was, however, built upon the miseries of his people. While the king and the nobility rolled in luxury, "the food of the common people was rice and *hakk* (*Sans. shaka*)."
Lalitaditya was a drunkard and followed Machiavellian principles in the administration of the country. His death was followed by a period of confusion during which his empire felt to pieces. Avantivarman, who ascended the throne of Kashmir in 855 A.D., tried to improve the condition of the people culturally and socially. Effective steps were taken to control the floods, which devastated Kashmir valley every year. The history of Kashmir after the death of Avantivarman (884 A.D.) is dark, dismal and, at times almost sickening. We read, for example, of the unscrupulous Queen Didda, who was the defacto ruler of Kashmir for more than 50 years (950—1003 A.D.). So great was her lust for power that to make her own position secure she procured the murder of two of her grandsons. She imprisoned a third for disobedience.

The unsuccessful invasion of Kashmir by Sultan Mahmud of Ghazni in 1015 marks the end of the ancient period of the history of Kashmir. Women were highly respected in ancient Kashmir. Seclusion of women was unknown. Queens of Kashmir, such as Yashovati, Sugandha and Didda, excelled as rulers. Kalhan speaks of women leaders of the army. The Supreme Council composed of ministers and feudal lords acted as a brake on the autocratic authority of kings. The Council could even make and unmake kings. Life was simple and, land, the only source of production. Ten per cent of the yield was the king's share. Slavery as such was not practised. The common man, however, was more or less a serf of the feudal landlord.

Ancient Kashmir was a great seat of art and learning. Hiuen Tsang, who visited the land in the middle of the 7th century A.D., observes that the Kashmiris were educated and lovers of learning. The earliest religion of Kashmir was an amalgam of Naga worship and the Vedic religion. Judaism, Zoroastrianism and Confucianism also played a part in the religious life of ancient Kashmir. Buddhism was introduced in the 3rd century B.C. Kashmir Shaivism replaced Buddhism later on. Ancient Kashmir produced a number of great intellectuals. Patanjali, the great grammarian and Charaka, the great physician,

* *The History of Struggle for Freedom in Kashmir—Cultural and Political—From the Earliest Times to the Present Day*: Prem Nath Bazaz. Published by Kashmir Publishing Company, 122, Kotla Mubarakpur, New Delhi. Price Rs. 20.

are believed by some to have been Kashmiris. Kashmir also made considerable progress in the domains of art and literature.

Rinchen, a Buddhist prince of Ladakh, who had taken shelter in Kashmir, seized the throne in or about 1319 A.D. He embraced Islam and took the name of Sadar-ud-din. The Hindu rule, restored for a time after his death in 1322, was finally overthrown in 1339 A.D. by Shah Mir, a Muslim from the Swat Valley. Muslims, it should be noted, did not enter Kashmir as conquerors or plunderers. The Muslim rule was established with the help of the Hindus. To quote Sir Aurel Stein, "Islam made its way into Kashmir not by forcible conquest."

Kashmir was annexed to the Mughal Empire by Emperor Akbar in 1586 A.D. The Mughal rule lasted till 1752 when Kashmir passed into the hands of Ahmed Shah Abdali.

The 500 years between the fall of the Hindu power and the Mughal conquest constitute an important land-mark in the history of Kashmir. Saints and seers like Lalla or Lal Ded and Sheikh Noor-ud-din (Nund Rishi) preached Religious Humanism, which was the basis of the Kashmir State and polity throughout the medieval period. Persian ousted Sanskrit from its place of honour and finally became the court language under the Mughals. Sanskrit, however, did not die out. Literary activities were considerable. Sanskrit as well as Persian were the medium of contemporary Kashmiri literature. Women also contributed their quota to the literary output. They had however lost much of their freedom. Most of the arts and crafts that flourish in Kashmir today owe their origin to the Muslim kings, particularly to Zain-ul-Abidin (Bud Shah), 1413-1470 A.D. He also introduced the use of fire-arms in Kashmir and employed a foreign expert to teach their use to the army.

Kashmir and the Kashmiris were not happy under the Mughals. Their cup of misery and humiliation was full under the Afghans. The country was economically ruined. Its womanhood was shamelessly dishonoured.

The Sikhs under Maharaja Ranjit Singh invaded Kashmir in 1814 A.D. The invasion was rolled back. Invited by the Kashmiris themselves, Ranjit Singh invaded Kashmir for a second time in 1819 A.D. and drove out the effete Afghans. The new rulers of Kashmir were no less "cruel, rapacious, short-sighted, intolerant and fanatical than the Afghans." A European visitor to the valley in 1824 observes:

"The Sikhs looked upon the Kashmiris as little better than cattle. The murder of a native by a Sikh was punished with a fine to the Government from sixteen to twenty rupees of which four were paid to the family of the deceased if a Hindu, and two if he was a Muhammadan."

The Kashmiris, the children of the soil, were victims of extortion and exploitation in all forms and varieties. The Kashmiri army was disbanded. Recruitment of the Kashmiris to the army had been already stopped by the Afghans. The Sikhs followed the Afghan precedent. Kashmir lay prostrate at the conqueror's feet.

Kashmir passed into the hands of Gulab Singh, the Dogra Raja of Jammu, and an influential noble of Lahore Court at the end of the first Sikh War in 1846. The Dogras ruled the country no better than the Afghans or the Sikhs. People suffered from want of food, clothes, medicines and education. Taxes literally broke their backs. Almost everything was taxed. Bribery was rampant and openly practised. The Kashmiris were shamelessly discriminated against. The Muslims, who constitute 78 per cent of the population, were the worst sufferers.

The oppression had its inevitable re-action. There were at first faint murmurs against the governmental oppression and exploitation. They grew and grew in volume till at last the All Jammu and Kashmir Muslim Conference came into existence in 1932. The conference was frankly a communal organisation. Its conversion into the National Conference on June 11, 1939, is the starting-point of organised nationalism in Kashmir. The National Conference under the leadership of Sheikh Abdullah soon came under the influence of the Indian National Congress. Kashmir was awake. A literary renaissance at the same reflected the hopes and aspirations of the submerged humanity in Kashmir.

Kashmir was invaded by tribal and Pakistani raiders in October, 1947. They looted and burned, killed maimed and raped as they advanced. Maharaja Hari Singh acceded to the newly created Dominion of India. The Indian army reached Kashmir not a day too soon to save it from the fanatical raiders. The enemy's progress was halted. In January, 1948, India complained to the Security Council against Pakistan. Maharaja Hari Singh had in the meanwhile run away from his capital Srinagar. The National Conference headed by Sheikh Abdullah came to power. Sheikh Abdullah fell from power in August, 1953 and was succeeded by Bakshi Golam Mohammad, his second in command. A part of Kashmir has constituted itself into an Azad Kashmir. It is in the grip of Muslim communalists, enjoys the patronage of Pakistan and stubbornly refuses to fall in line with the rest of Kashmir.

Mr. Bazaz narrates the above story at great length in very readable English and with distinctly anti-Indian and pro-Pakistani bias. It is not clear why he gave the name of *History of Struggle for Freedom in Kashmir* to the volume under review. We have more serious complaints against the author.

Inaccuracies and misstatements deprive his work of much of its value as a historical treatise. Thus, according to Mr. Bazaz, Emperor Asoka conquered Kashmir and reigned from 274 B.C. to 237 B.C. (p. 5). He quotes Kalhan in one place and says that Gonanda I ascended the throne of Kashmir in 2450 B.C. (p. 5). He speaks in another place of the rise of the Gonanda dynasty at the end of the Saka rule (p. 8). Many we fear, will not accept the learned author's view that

"The rule of the Muslims came as a blessing not only politically but intellectually and spiritually . . . politics had dehumanised Kashmiris; Islam made them men again" (p. 49).

Raja Man Singh, the famous general of Akbar, is said to have committed suicide in 1586 A.D. (p. 70). In the author's opinion, Pakistan is as much a secular State as India (p. 372). Instances may be multiplied. Reference may be made, for example, to pp. 76, 92 and 125.

Foreigners were invited on several occasions in the past by the Kashmiri leaders "to save the people from tyranny." Mr. Bazaz supports their conduct on the ground that they preferred 'freedom' (1) to 'independence' (p. 125). Strange logic! Are Mirzafar & Co. entitled to the gratitude of posterity?

We are taken out of our breath by the statement that three years of Congress rule (1937-39) in eight out of the eleven British Indian provinces "fired the Muslim intelligentsia with a spirit of Muslim nationalism" and that the Muslim intelligentsia in 1939 "were thinking of having a separate organisation of their own to ventilate their grievances against the Congress Raj as well as British Imperialism" (pp. 172-73). Mr. Bazaz, we feel, has hanged, drawn and quartered Darje History in the fewest possible words.

The learned author has hardly a kind word to say about any one of his well-known contemporaries in India. No man, we admit, can be above criticism. The pity, however, is that the author's language is often unrestrained and undignified. The reader's

attention is drawn in particular to his remarks on and insinuation against Shri Nehru and Mahatma Gandhi. Does 'Envy' really 'hate the excellence it cannot reach'?

Mr. Bazaz does not regard Kashmir as a part of India. Indians are foreigners in his eyes. Time and again he speaks of the Kashmiri culture, religion, philosophy and the like. But can Kashmiris claim to have any culture which is not essentially Indian? He is profuse in his profession of love for Kashmir. But he has not many words to condemn the tribal-cum-Pakistan raiders who wrought havoc in the smiling valley of Kashmir in 1947. Patriotism without a love for the compatriots is hypocrisy or self-delusion.

Time and again we come across such expressions as Hindu Imperialism, Indian Imperialism, Imperialist India, Expansionist India, Reactionary and Imperialist Hindu India and the like. The author holds that India's secularism is spurious, her nationalism fraudulent. "Nationalism of the Congress and communalism of the League are," according to Mr. Bazaz, "identical creeds. The former is the Nationalism of the Hindus and the latter Nationalism of the Muslims" (p. 376). He would have us believe that India is "culturally backward" (p. 376). Is she? We would like to draw the author's attention to a recent statement of Prof. J. B. S. Haldane in which the professor observes that in India "one has the absolute impression of being in a highly civilised community."

It is a pity that a volume, which bears an unmistakable stamp of its author's diligence and scholarship, has been deprived of almost all its value by misstatements, misinterpretations and the author's inability in not a few cases to see beyond his nose. One reason is that much of what has been narrated in the volume under reference is the part of a story, "a story which the Fates are still telling." It is, therefore, only natural that the author himself, a somewhat important character in that story, could not rise above passions and prejudices. He should have waited till the atmosphere was cleared of the heat and dust of current controversies.

A NEW ERA IN ARCHAEOLOGY

By MANINDRANATH SENGUPTA,

Archaeological Section, Indian Museum, Calcutta

THE gradual development and progress of modern science make the common people very much conscious of what lies still behind the curtain. It is rather a duty of science to let the people be aware of what they should be aware of, to let the people know what they do not know, to let them have the opportunity to get acquainted with those things which still lie beyond their imagination. Archaeology is one of the most important branches of that science. Archaeology helps people to be acquainted with the relics, remains and records of antiquity. What was the old civilisation and culture of an ancient country, say of Babylon or Greece, what was the exact life in those ancient countries in those old days, may we not have a little knowledge about that in the present days? Yes, we may have. There is archaeology, go and take its help, you will find the answer. That is the technique. Now, as a devotee of that great science of archaeology, I like to state something, relate a little experience that I gathered during my past excavation in Sind.

In India, Archaeology has developed to a great extent. In particular, I may refer to the potteries in ancient India, of which people came to know many things from our Mahenjodaro excavation. Now, to say something of the potteries. The most peculiar point which strikes me regarding the potteries in ancient India is 'the introduction of ceramic colours in the ancient potteries of India.' The most striking fact is regarding the texture and colours used in potteries, beginning from ancient times right up to the modern age, and I like to draw attention of the archaeologists of India to this aspect.

It was several years ago, when I was busy with the Sind Excavation. I accompanied the late Nanigopal Mazumdar and we arranged some trial diggings in the various sites of Sind. When I went to Hyderabad (Sind), I was lucky enough to get the information that on the other side of the river Indus there is situated a place called Hala, and pottery industry is still prevalent over there exactly as in Mahenjodaro. It was rather my curiosity which took me there, and I watched with great attention the types of potteries which they used to prepare. After noting them very carefully, it struck me that the potteries, prepared there, have a strange resemblance with those in Mahenjodaro. The red slips and black paints are exactly the same both in Hala and in Mahenjodaro, the only point of difference is with

regard to the motifs and wares. This resemblance in spite of the point of difference attracted me strongly and I liked to examine their techniques and the colours they use. So I visited their factories and had an opportunity to look to their colour-vats. After noting them, it was my belief that they at Hala were using some metallic oxides collected from natural ores. And these ores were compounded with sand clays with a little adhesive. Adhesives used by them were mainly *bihidana*, which were nothing but gelatinous seeds. Observing these compounds of colours and slips it struck me that these are nothing but ceramic colours.

During the excavation in different places of Sind, I had a good number of collection of potteries and I marked certain very important properties in them, viz.,

- (1) The colour and slips are not faded.
- (2) They (the colours and slips) stand weather wearing.
- (3) They are in excellent preservation, except in the cases, where the action of salt is brought on.

Now it is my turn to request all the readers to mark the second property stated above very carefully. You all know that vegetative colours and aniline dyes cannot stand weather-wearing. Now, at this stage, will it not be my inference, that the colour and the slips in those potteries are not vegetative colours? You may guess that it will be exactly so.

Now let us look to the third property. I request you all, to mark the line 'except in the cases where the action of salt is brought on' very carefully. The immediate question, which comes to our mind is, what is the action of salt on the colours and slips. To answer that, I had a number of examinations to carry on, and I got the answer. The action of salts on the body of the pottery is vigorous, leaving the paint and slips. Particularly, the reverse portion, where there is no paint or slip, is more affected. These paints led me to research works.

I came to the Indian Museum, and started studying in Geological Galleries. I used to study the various ceramic colours and its oxides by which the colour is made. There, I started analysing the potteries from Mohenjodaro and other sites of Sind. Analysis showed that my idea regarding the presence of silicate and metallic oxide, came to be true; it was also found that in each case, there is a percentage of silicate and metallic oxide. I was confirmed in my idea to some

extent. This confirmation greatly excited me and I went on analysing potteries after potteries from different parts of India, of different periods, varying from Calcholithic to Maurya, and lastly, followed by Islamic period. This analysis revealed a very interesting fact to me that there is a good percentage of Caoline composition similar to that of porcelain of modern age. I carried on my analysis with vase fragments, bangle fragments, etc., which were mainly considered so far as fiance (fiance is a soft stone of pale green colour, a rocky substance), and here is the result.

The substance under observation is a vase fragment (exhibited in the Indian Museum, N.S. 4537—A 470). After examination I found that there is a distinct mark of joining two portions together into one. Examination showed that the mark is nothing but a cement lining. The work is done in a way as if to connect the two in one, and the mass is made homogeneous in the outer border by fusion. Another interesting fact to watch is the presence of a linen impression inside. Wherefrom this linen impression comes inside? Had the substance been a rocky one like fiance, how was it possible to get the impression sketched inside? Despite all these questions, if any one calls the substance a fiance, I can but only pity him. After so much conclusive data, a child even can understand that the substance is not a fiance, but it must be something like clay. The lining of cement, the impression of linen are possible only in the primary stage of clay before fusion. Further, it was noted that in the outer border of this substance a glaze is present. The glaze is sufficient to prove the existence of silicate. Otherwise, in the absence of heavy percentage of silicate this glaze is never possible. This observation was followed by chemical analysis and it was found that there is a heavy percentage of silicate (SiO_2 87.84%) and aluminium, the composition being almost similar to that of Caoline.

This experiment with the vase fragment is rather sufficient to confirm my idea about the presence of silicate and metallic oxide, and that the so-called

idea of fiance (the vase fragments and bangle fragments) is wrong and those are actually some clay works.

Now, regarding the period of existence of these bangle fragments and the vase fragments, it was found that these belong to the calcholithic period ranging from 3500 B.C. as they were found along with the chert flakes and other pre-historic objects in Mahenjodaro. In Mahenjodaro, there were other finds, existing in the later period, and these were excavated by the great archaeologist, the late Rakhaldas Bhandopadhyaya, the discoverer of that site. In the *stupa* site the antiquities discovered on the first layer were found to belong to the Kushan period. Among those, there were a lot of potteries and painted pottery fragments. In the outer border, these fragments showed some resemblance with those in the Calcholithic period regarding the glaze. The glaze textures of these later findings were again analysed, and a strange fact came to light. Analysis showed a presence of a good percentage of silicate (SiO_2 48.64%) with colour. The difference between the substances in the two periods—Calcholithic and Kushan, turned a good focus to the world. It was found that in the findings of the later period, the percentage of silicate is higher than that of the former period. The immediate conclusion is that the ceramic industry has not grown abruptly, but is a gradual development from the early, primary stage onwards.

This gradual change and the advancement were recorded from other evidences. The texture of the pottery in the later period were found to be different from those in the earlier period. Husks were used along with clay in order to exert greater heat required to melt the silicate having a greater percentage. The actual analysis of the percentage showed a variation of 5 to 10 per cent in the Calcholithic period, and of 48 to 50 per cent in the Kushan period.

My idea of 'the introduction of ceramic industry in India' has thus developed gradually, and I like to continue it further in the near future with illustrations.

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.

Editor, *The Modern Review*.

ENGLISH

SOUTH INDIAN POLITY: By T. V. Mahalingam, M.A., D.Litt., Reader in Indian History and Archaeology, University of Madras. Published by the Madras University, 1955. Pp. x + 475. Price Rs. 13.

This is one of the most important works published so far in the *Madras University Historical Series*. It gives us the first critical and comprehensive account of the political institutions of the Hindu States to the south of the Vindhyas from the earliest times down to the fall of Vijayanagar (c. 1650 according to the author). It is based upon an exhaustive study of the original sources comprising material drawn from archaeology, indigenous (Sanskrit, Tamil, Telugu and Kanarese) literature and the notices of foreign (Greek, Chinese, and Arab) writers as well as modern works. In the Introductory chapter the author deals critically with the fundamental question of the influence of geography and social as well as religious institutions of the people upon their political life through the centuries. The following seven chapters deal very thoroughly and successfully with the different branches of the South Indian administration under the successive heads of Kingship, The Imperial (read, the State) Council and the Secretariat, Income and Expenditure, Law, Justice and Police, Military organisation, Provincial government and Local government. In the course of this description the author discusses frequently with reference to earlier authoritative views and in a spirit of scientific detachment a number of important questions relating to the various topics of the administration. Under this head we may mention the limitations on the power of kings (pp. 17-21), the constitution and functions of the groups of 'five' and 'eight' forming the kings' *entourage* in the Tamil classical literature (pp. 101-04), the rates of assessment of the land-revenue and the burden of taxation with special reference to the Vijayanagar empire (pp. 160-67, 186-89), the resemblances and differences between the feudal (*nayankara*) system of Vijayanagar and its counterpart in Mediaeval Europe as well as the merits and defects of the former system (pp. 327-30), and the question of ownership of the soil (pp. 360-63). The value of the book is enhanced by the addition of a very full Index.

Without detracting from the high merits of this work it is possible for us to offer a few criticisms. The author's statement (p. 2) denying the continuous flow of the culture and the institutions of Northern India into Southern India and *vice versa* is not borne out by the fact that social and religious movements emanating from the two zones have profoundly influenced each other from the earliest times. Nor again is it possible for us, in view of the important settlements of Roman and later of Muslim merchants in

the great ports of Western and Southern India to agree with the author's contention in the same context that "the foreign merchants who came to India for trade were comparatively few." The author's two statements that the influence of the South Indian village assemblies "was at its highest from the 9th to 16th centuries" (p. 10) and that these "village republics worked with great success from about A.D. 700-1400 and showed signs of decay and disruption in the fifteenth and sixteenth centuries" (p. 370) are somewhat inconsistent with each other. The author's view (p. 19) that "Hindu political theory did not postulate any institutional relationship between the ruler and his subjects," and that the only bond between them was conceived to be "the paternal feeling" of the one towards the other is contradicted by the references in *Manu-Samhita* and still more in the *Mahabharata* to the occasions for resistance in various degrees by the subjects against an evil or incompetent ruler. The statement (p. 198) that the *Dharmasastras* being "based upon the established usages" "received the respect and authority of the Vedas themselves" and that the customs of the people were taken into account "in course of time when the commentaries came to be written for the *Dharmasastras*" is inaccurate in all its parts. The rendering of *danda* as 'a goddess' (p. 190) in Manu's well-known verses is unfortunate. The author's account (pp. 201-03) of the laws of the South under four specified heads is based wholly upon the evidence of the contemporary inscriptions and takes no notice of the very valuable contemporary *Smriti* Digests like the *Mitakshara* of Vijnanesvara and the *Smriti-Chandrika* of Devana Bhatta which indeed do not figure at all in the Bibliography at the end. The long list of errata at the end is incomplete, as is shown, e.g., by the misprint of the title *Milinda-panha* on pp. 108n, 401 and 437.

U. N. GHOSHAL

LIFE OF MAHARAJA ALA SINGH OF PATIALA AND HIS TIMES: By Kripal Singh, M.A., Sikh History Research Department, Khalsa College, Amritsar. 1954. Pp. 224. Price Rs. 3.

Ala Singh Jat (1691-1765) was a remarkable man of his time. Son of an obscure landowner of less than half a dozen villages, he yet rose to be the founder of a principality which now forms the nucleus of the Pepsu. Example of small States like the Electorate of Brandenburg developing into a mighty State or small *jagirs* like Sasseram and Poona becoming the training-ground of the founder of kingdoms are not uncommon. But the instance of a village farmer turning into a sovereign ruler of a region by the eclipse and extinction of chiefs of considerable standing is a phenomenon very rare, indeed, even in

that age of political adventurers. Professor Kripal Singh, therefore, deserves the thanks of all for resurrecting, out of oblivion, the career of such an interesting personality as Ala Singh Jat.

Born in 1691, the first important event in his career was his marriage with Fateh Kaur which connected him with two important families of the locality, (i) of Gurbaksh Singh Kaleke, (ii) and of Bhai Dayal Das. A more important turn in his career occurred in 1722 A.D., when he shifted along with his brother Sabha Singh from Bhadaur to Barnala. The two brothers then held in their possession only ten villages, surrounded by the domains of influential chiefs, e.g., Rai Kalha of Rajkot and Jamal Khan of Mulerkot in the north, the Brans of Faridkot in the west, and the Bhatti chiefs in the south, headed by Muhammad Amin Khan of Bhatner. About eight years later (1730-31), Ala Singh repulsed an attack on Barnala made by the Manj Rajputs of the Cis-Satlaj territory and the Jalandhar Doab. This successful resistance at once raised Ala Singh to the rank of a chief. In the following years he further improved his position by holding his own against the attacks of the Bhatti chiefs of Budhlada and Harihao and acquiring certain other villages.

In 1748, he distinguished himself by leading forays against the foraging parties of Abdali's army, as Ananda Ram Mukhlis clearly states and won a *khilat* (honorary robe) from Prince Ahmad, who led the imperial army against the hosts of the Afghan King. (*Tazkirah-i-Ananda Ram*). A couple of years later, in 1750 A.D., Lal Singh, son of Ala Singh, took possession of Munak which became a spring-board for a campaign against the Bhattis. Backed up by the *Dal Khalsa*, Ala tested his strength with Muhammad Amin Khan at Khudal in 1755 A.D. and won a large part of Bhattiana. Three years later, in 1758 A.D., he again successfully met challenge of Muhammad Amin Khan, backed by Abdus Samad Khan, *faujdar* of Sirhind and beat them at Rampura, near modern Akalgarh. The successful contests and the acquisition of large tracts of land after each trial of strength raised Ala Singh to considerable importance.

Ala Singh's great distinction was that he supported the Marathas as against the alien Afghan invader in 1759, by attacking Prince Timur's army, during his march across Sirhind to Lahore, helping the Marathas with supplies during the siege of their encampment by Abdali in 1761 A.D., and finally giving the straggling Maratha fugitives shelter in his territory after their defeat at Panipat.

Politics in the Cis-Satlaj region assumed a new complexion after the Abdali victory at Panipat and the appointment of Zani Khan as the *faujdar* of Sirhind. The *Dal Khalsa* swept in successive bands across the region and practically wiped out the Afghan authority. Abdali repeated his inroad and massacred twelve to fifteen thousand Sikhs at Kup. Ala Singh's secret understanding with the *Dal Khalsa* and their unrestrained ravages into the imperial territory and the East Punjab made both the Afghan King and his lieutenant Najibuddaulah eager for his friendship. He no doubt used his influence to bring about an accommodation between the Ruhela and the Sikhs, but the statement made by Professor Kripal Singh that Ala helped Najib with a contingent of 1000 troops is very doubtful.

In 1763, Ala Singh reached the apogee of his career when the Abdali appointed him *faujdar* of Sirhind with the right to use *table-a-Alam* drum and standard. This high honour obtained by submission

to the Afghan King caused a rupture between him and the *Dal Khalsa* who made inroad into his territory. Ala stood up in arms against his co-religionists in 1765 and eventually through the mediation of Jassa Singh Ahluwalia, came to terms with them. However, before he could carry out the design of extending his arms to the Valley of the Jamuna, he was taken ill of fever and died on the 22nd August, 1765.

Such is in brief the outline of Ala Singh's career. Professor Kripal Singh has worked profitably among the printed documents and unpublished material in Persian, Gurmukhi and Urdu, preserved in the Khalsa College, Amritsar, and presented, on the whole, a fairly good account of Ala Singh's career, against the background of the varying political situation from 1715-1765. He has shown conclusively that Ala Singh was born in 1691 and that he was arrested by Ali Muhammad Khan Ruhela in 1745 and not in 1741 as was stated previously. There is hardly any doubt that the alleged *Firman* of the 21st *Ramzan*, 1127 A.H., in which Ala Singh is described as *Raja Ala Pahl* is a forged document. The words *Raja* and *Jalus*, and the date are enough to mark it as such and the author's laboured argumentation to prove it so was not perhaps necessary. The insertion of the photo-prints of the Vatjala Rajas has reduced the value of the monograph. The portrait of Ala Singh is certainly welcome, but the rest could have been profitably left out or at least appended at the end of the book.

The author has examined a large mass of documents and painstakingly collected the data scattered in them to reconstruct the career of the hero, but evidently through oversight he has stated certain facts which will not stand scrutiny. For instance, the story of Ala Singh's keeping the locks of his hair of head by paying Abdali a few lakhs of rupees is a myth. The anecdote is based on Ahmad Yadgar's *Tarikh-i-Salatin-i-Afaghina*, (published under the title of *Tarikh-i-Shahi* by the Asiatic Society, Calcutta, in 1939, which was composed between 1591-1611 A.D. (vide Elliot, V, 1-2). The sensational story has, therefore, been interpolated in the text and has to be rejected. Similarly, the grant of an *independent status* to Ala Singh by Abdali mentioned in pp. 104-105, is at variance with the statement on p. 124, describing him as a tributary. Then again, there is something to be said as regards the perspective with which the author has reviewed his hero's career. From the very beginning he takes him to be a considerable chief, and makes such misleading statements, as, "The conquest of village Nema had far-reaching consequences," (b) The battle of Barnala exalted him to the position of a powerful chief of the Cis-Satlaj territory and stream-lines the chapters, with such titles as *Extension of Territories 1748-1754* and *Sovereignty Short-lived*. Ala Singh was great because he rose from a husbandman to the position of a feudal lord and *faujdar* of Sirhind.

The Persian annalists mention of Ala Singh as "Ala Jat ka Upda az Jamidani-i-Sarhind bud" is no mean reflection. It would be better if the book were recast and reduced to half its size, by cutting out unnecessary observation, useless repetition, e.g., Chapter X and such an analogy as, "Just as Napoleon had benefitted by his marriage with Josephine, similarly Ala Singh substantially benefitted by his marriage with Fateh Kaur" and correcting all misprints and inaccuracies, e.g., Sirhind was *under* (in) weak hands, p. 40, Ala Singh helped the imperial

force away from his territory, p. 88, Ala Singh's successful companions rankled in his eyes (heart), p. 85, the Bhatti hordes gushed (poured) out of Pabha, p. 89, etc.,

N. B. Roy

THE PSYCHOLOGY OF THE OCCULT: By D. H. Ratchiffe, Derric Ridgway, London, 1952.

The author of the book has taken extraordinary pains to subject every form of the so-called occult manifestations to rigorous scientific analysis. The chief merit of the book lies in the fact that in it one can find a unique collection of all "occult" practices and "supernormal" phenomena current in every part of the world. It is a source book of all information relating to the subject. Hysteria, hypnotism, fire walking, crystal gazing, rope trick, E S P experiments, telepathy, etc., etc., nothing escapes the attention of the author. He radically denounces every one of them and utterly demolishes—to his own entire satisfaction—the spurious scientific justifications of the phenomena. He is astonished that some of the famous Universities of England, America, Germany, —Cambridge, Harvard, Bonn, for example to name a few,—should condescend to encourage studies on 'psychical research' by granting Fellowships and Doctorate degrees. He feels an urge within him to save this absurd situation from deteriorating further and therefore takes upon himself the task of scrutinising thoroughly the so-called 'facts' and exposing once for all the bias which blinds the investigators in this field and leads one, even trained scientists, to misinterpret natural events. Belief in the occult is as old as mankind but should not continue when reason develops. It is the author's thesis that a more critical exercise of the powers of reasoning and judging would expose the hollowness of the 'psychical' phenomena.

One can thoroughly share the author's general view that free exercise of reason may destroy many cherished illusions and hallucinations of mankind. The rapid advance of scientific studies has, in fact, changed our outlook in many fields. The mentally afflicted old woman is no more a witch and she is treated now in a mental hospital. Therefore it is good to be critical about psychic phenomena and not to take everything for granted.

We welcome the book for the serious attempt that has been made to consider critically the various forms of the occult. But while in many cases, the verdict is definitely against the existence of the phenomena, in other cases the counter arguments are not sufficiently adequate and the questions still remain open.

The reviewer is one with the author that the facts must be scientifically studied. But after rejecting many forms of the occult there would still remain some phenomena which cannot as yet be accounted for on scientific principles. Just as there may be a 'so-called occult phenomenon it should be remembered there may also be a 'so-called scientific procedure.' Approached from the psychoanalytical point of view many of the unexplained experiences can be more satisfactorily understood. A reference to Freud's writings on the subject would testify to that.

The book is a highly interesting one and maintains a challenging style throughout which keeps the reader always on the alert. But one question crops up in our mind: Is the author protesting too much?

S. C. MITRA

THE GRACE OF GOD: Edited by Swami Madhavtirtha. Published by the Vedanta Ashrama, Valad Post, Ahmedabad. Pp. 110. Price Re. 1.

This book contains the spiritual experiences of a South Indian devotee now residing in Saurashtra. It shows how from the ordinary ritual worship the devotee is gradually led through the grace of God to spiritual illumination. The five chapters into which the book is divided deal respectively with purification, illumination, bliss, realisation and integration. Swami Madhavtirtha, who is a distinguished monk and author of about a dozen thought-provoking books on Vedanta philosophy, has contributed an adequate introduction to this book. The two appendices of definition of a time-vision and singularity of soul are also written by him. These three compositions have definitely increased the worth of the book. The spiritual experiences are described in the form of questions and answers. The questions mentioned are raised by the questioning soul and their suitable answers were received through the grace of God. It is rightly stated in the Abadhuta Gita that by the grace of God a man gets undivided integral knowledge. This book is, therefore, rightly named and sure to impress upon the reader that ritual worship is never useless but very necessary for the aspirant as preliminary practices for spiritual life. The religious practices are, therefore, not to be discarded but slowly transcended when higher stages of spiritual unfoldment are reached by the devotees.

SWAMI JAGADISWARANANDA

SRI AUROBINDO: ADDRESSES ON HIS LIFE AND TEACHINGS: By A. B. Purani. Published by Sri Aurobindo Ashram, Pondicherry, 1955. Medium 8vo. Pp. 351. Price Rs. 6.

Sri A. B. Purani is a well-known disciple of Sri Aurobindo. He has dived deep into the spirit of his master. He is neither dogmatic nor superficial. In these addresses he has dealt with most of the works of Sri Aurobindo. From these lectures one can have an easy introduction into the works of Sri Aurobindo. It is encouraging that at least a few modern thinkers are being faithfully re-thought and re-lived by some of their followers, which alone can bring out the true import of the messages that have been ushered into the new age and thus benefit the coming generations.

SATI KUMAR CHATTERJI

CONTINUITY: By Taradas Chatterjee, M.Sc., B.L. Published by B. Mukherjee, 112, Amherst Street, Calcutta-9. Price Re. 1.

In this small philosophical discourse the author has presented almost all the prevailing philosophical and scientific ideas and touched almost all the scientific subjects, Physics, Chemistry, Geology, Astronomy, Biology, Psychology, History and Religion, in support of his theory that from the beginning of creation the life-process is in a state of continuity towards the evolution of man's mind. One would be amazed to find the vast amount of knowledge in almost all the branches of science incorporated in this small book. The author has marshalled the scientific facts with skill and the whole book has a persuasive strength of conviction.

KRISHNAMAY BHATTACHARYA

FRENCH

L'AVENIR DES PAYS SOUS-DEVELOPPES (The Future of the Under-developed Countries): By Michel Pontalowski. Collection de "L'Economie," Editions Seif, Paris. 1954. Bibliography. Pp. 139. Price 16-6.

Any book which contains, as this one does, in a short compass such a wealth of information on one of the liveliest economic issues of the day cannot but be, even when lacking in original thought, of immense value to laymen, students and administrators. It is a model of scholarly comprehension and logical presentation of difficult material, not to speak of lucidity and realism in which French writes peculiarly excel. But the book is endowed with original thought.

In the days of imperialism, the industrially advanced countries arrogated to themselves a divine right to invest much of their capital in their own colonies which were rich alike in cheap labour and in valuable raw materials. The two world wars have changed all that. Many of those under-developed countries have since attained political self-determination. The new nations do not wish to be developed except on their own terms. Even the most enlightened schemes of development, when such schemes emanate from foreign countries, are held in suspicion.

But the need for development is there. The urgency and necessity of developing the under-developed countries is much on the conscience of the relatively advanced countries. And contemporary political strategy has rendered the development of the former the necessary price of survival of the latter. Political self-determination has led to economic self-determination and since technical knowledge as well as the possibility of obtaining foreign aid have vastly improved, the hunger, poverty and ignorance which exist in these areas and the intimate knowledge of better standards of living elsewhere have driven the leaders of the under-developed countries to achieve progress at any cost.

The essence of the problem is not therefore whether the under-developed countries should be developed but how, or more pertinently, how best. To judge from the literary energy devoted to it, the definition of an under-developed country has been a thorny problem. What country is there which can cork a snook at development? The basic criteria which command the greatest measure of acceptance in defining the under-developed areas are insufficient utilisation of the known resources of the country and a very low standard of living. The emphasis is clearly on potentiality of development? It is now a commonplace of the extensive literature of the United Nations and the economic publicists that two-thirds of the entire population of the world are underfed, that about twice as many people as before the War now fail to have the minimum food ration of 2200 calories per day, that 85 per cent of the world's income is enjoyed by one-third of the population, that at the present rate of population growth a constant increase in the national income by 3 per cent to 5 per cent is necessary for reasonable improvement in the standard of living of the under-developed areas, that to raise the national income of this population by 2 per cent per annum there will be required a total annual investment of \$14,000 million.

Clearly, much has to be done, before capital on such a vast scale can be mobilized for investment in the under-developed areas. In the light of experience,

it looks as though short of adoption of an international statute defining the terms of international loans, investment will lag behind the level necessary. On the other hand, the economically advanced countries should be prepared to facilitate an expansion of trade by the under-developed countries by lowering tariffs and subsidies even at the risk of increasing competition and to stabilise the prices of primary products in the world markets on which the under-developed countries are excessively dependent. Clearly, the prejudice has to be broken down that the development of these areas will not be to the ultimate detriment of the lending countries. Clearly, the pace of development must not be set too high. The author emphasizes the risk inherent in forcing the tempo of changes in the social framework of the traditional pattern of life through such measures as drastic land reforms. Clearly, the essential equilibrium between agriculture and industrial production, between export goods and goods for home consumption, between saving and consumption, must be maintained. Caution is equally necessary against an uncritical application in the under-developed countries of economic measures based on Keynesian principles more appropriate to highly developed countries. Clearly, the health services and education must not be pushed ahead of the capacity of the country as a whole. Longer lives and extra mouths do not reduce but add to the problem.

Coming from a Frenchman the book has a good deal to say about the French colonies. The author warns his compatriots against the danger of economic paternalism since the colonies must be able, if they are to live, to buy on the cheapest market and sell on the dearest. But the excellence of the book lies above all in the selection of the soundest principles of development and in the clarity and cogency in stating them. Readers will be repaid for the extra trouble which may be entailed by the fact that the book is written in French.

MARGARET R. BASU

MARATHI

SHRIMAD BHAGVAD-GITA: Translated into Abhangha by Tukaram. Edited by V. S. Bendre. V. V. Patankar, Poona-2. Pp. 283.

The competent editor's illuminating introduction to the translation into Marathi *abhangha* of the *Bhagvad-Gita* (together with the original Sanskrit text) by saint Tukaram is bound to enhance the reader's joy and understanding of the scripture. Indeed, the *abhangha* form lends itself easily to a congregational singing of the Lord's song. For simplicity of idea and of expression constitutes its very soul.

G. M.

HINDI

TALASH: By Krishna Chandra. Hind Kitabs, Ltd., Bombay-1. Pp. 113. Price Rs. 2.

PANCHARANGI: By Krishna Chandra. Hind Kitabs, Ltd., Bombay-1. Pp. 74. Price twelve annas.

These are two collections of short-stories. Their author is today an acknowledged adept in the art of telling a tale from a peculiar angle and in a particular style, reminiscent of some of the European masters, but with a gusto, which never wearies the listener. However, satire, realism, non-conformity, suggestiveness, tantalization, idiomatic excellence—all these are there. Who can ever, for instance, forget the story, entitled "Coupon" in *Pancharangi*? Its rollicking

humour will resound in one's ears for many a long day. And so will the sights and sounds of Kashmir, in which *Talash* abounds, abide in his memory lingeringly. If literature is more of a mirror and less of a mentor, then Shri Krishna Chandra has achieved this objective admirably, indeed.

G. M.

GUJARATI

SURYA : By Gulabdas Broker. Published by the *Jivan Sahitya Mandir, Ahmedabad*. 1950. Illustrated cover. Thick card-board. Pp. 200. Price Rs. 3.

This is a collection of a dozen short stories, written in Shri Broker's chatty style, painting a realistic picture of our changed present life, social, domestic, and cultural. The reader will not fail to notice the points made by the writer, viz., that we are changing.

VIDYA PITHA READING SERIES, Books I, II, III : Published by the *Gujarat Vidya Pitha, Ahmedabad*. 1950. Paper cover. Illustrated. Pp. 58, Price As. 4; Pp. 106, Price As. 7; Pp. 138, Price As. 10.

In 1940, the Gujarat Vidyapitha had published a reading series. The present series is a modified form of the same, the modifications being prompted by experiences of the requirements of the students and the attainment of Swaraj in 1947. It is an admir-

able series, just the thing required for children and juveniles. The lessons are easy to pick up and follow, and the suggestions given at the end of each lesson to supplement its contents and impress the object of the lesson by means of relevant stories are the most important part of this otherwise very valuable series. Patriotism, duties as a citizen and as a member of society, with suitable national anthems and songs set out in them, add to their utility.

VIJNAN PRAVESH, Part I, II, III : By Hararaj Anmlakhray Desai, B.A.S.T.D.C., Bombay. 1950. Published by the *Ananda Book Depot, Ahmedabad*. Illustrated. Paper cover. Pp. 93, 116, 140 respectively.

These are introductory books to the study of science in Standards V, VI, VII of Primary and Standards I, II, III of Middle schools. Study of science was introduced as a compulsory subject in 1949 and these three small books written by one who has been a life-long educationist now retired after getting mature experience of teaching such subjects, have given the benefit of it to the students and teachers by prescribing lessons therein. The second sections touch topics like, breathing, diet, water, fire, flower and tree, the sky and the stars, the sun and the moon and furnish requisite, relevant and useful information about them with suitable drawings. The books are sure to prove useful.

K. M. J.

INDIAN PERIODICALS

Olive Schreiner

Olive Schreiner was one of those fascinating characters who both perplex and captivate their contemporaries. She was easier to love than to understand. She was a restless and solitary soul in the midst of her fame and her many friends. She combined a rationalist outlook with a mystical temperament, and was both a passionate crusader and a creative artist. Although an ardent feminist, she never lost her feminine charm and grace. Miss Dorothy Hewlett writes in *The Aryan Path* :

A Man's life of any worth is a continual allegory—and very few can see the Mystery of his life—a life like the scriptures, figurative.—JOHN KEATS.

In *The Story of an African Farm*, written in youth, Olive Schreiner gives us a story, an allegory, concerning a hunter who abandons the chase for a lonely search after Truth. He seeks Truth among mountains, climbing ever higher, hewing out the ascent painfully step by step, from hard rock. The search has been long; the Hunter grows old; at last, looking down at the comfortable valley far below, he pauses, panting in an air rarefied almost beyond human breathing. His "wizened, shrunken face looked out above the rocks."

It saw the eternal mountains rise with walls to the white clouds; but its work was done . . . If Truth had appeared above him in the clouds now he could not have seen her, the mist of death was in his eyes.

But others will follow, making the ascent by that stairway he had fashioned with so much pain. "My soul hears their glad step coming," he said, "and they shall mount! they shall mount!"

On reading this remarkable book we hardly need to be informed that the sensitive, suffering Waldo to whom a mysterious Stranger tells the story of the Hunter (interpreting a carving of the boy's own) is Olive Schreiner herself, or one aspect of her. The story, the allegory of her life, is here made plain.

She was born, the daughter of a German missionary and an English mother, among mountains, the Witteberg, the "Switzerland of South Africa," one hundred years ago, when life in these remote uplands was still primitive and the only transport by ox wagon. During her life, with much personal effort and pain, she was to hew steps for others to follow, as a feminist, as an advocate of justice and of world peace and, above all, as an apostle of love. "You know," she wrote, "We must love everyone in this world. It is only ignorance and darkness keeps us from it."

Her outlook was Christian but she was a freethinker from childhood; a freethinker nagged at and persecuted by brothers and sisters. The too close view of a narrow religion in a minister's household, among Boers leading a pastoral life with their flocks and herds, who believed

literally in the Bible—particularly in its harsher aspect—early sickened her of conventional religion: although inclining in later years towards Buddhism, she never subscribed to any faith. But in both heart and mind her yearning was towards the high hills.

In those hills Olive Schreiner breathed freer, not only mentally, emotionally, but physically: at sixteen she was struck down by an attack of asthma, a disease which was to dog her through life. But this nervous ailment was a symptom of a graver defect in health, almost a cleft in personality. She, who hated war, was torn apart by a conflict within herself.

The circumstances of her early life were frustrating: the endeavour to write while working as an ill-paid governess among ignorant Boer farmers, a lack of formal education with a feverish but unsystematic effort to fill up the gaps in her knowledge. But others have triumphed personally over such handicaps and attained at last to peace of mind, and in one way her path was made easy: fame came to her comparatively early with the publication of *The Story of an African Farm*. In England, and the centre of admiring friends, she might have settled down to continuous work, giving the world more books of the same calibre. But it was not only asthma which was to drive her back to African wilds and limit her output: that frequent concomitant of genius, a capacity for laborious work, seems to have been denied her. She could concentrate fiercely, but only for short periods of time.

And, apart from her work, Olive Schreiner was inhibited, incomplete. A woman physically strong, vital, beautiful, she was unable to respond naturally to the love of a man. "This celibacy," she wrote. Have-lock Ellis in 1888, "has not been good for me; but it would have been worse to marry any man I have ever seen . . ." When love did come to her in 1893, in her late thirties, Olive fought against it, doubting, returning to England on a visit to test her feeling. After her marriage in 1894, surrendering completely to a man worthy of her, she could not enjoy happiness to the full, being unable to live on the farm he worked and loved. The cruel asthma again struck her down. She was denied motherhood: her only child died a few hours after birth.

She might have got peace within herself, have been able to exercise her craft to the full, if she could have lived continuously with her husband, Samuel Cronwright, a man who, in the days of accepted male domination respected her both as genius and as individual. So strong was his admiration for his wife and her feminist views that he added her name to his, calling himself Cronwright-Schreiner. From the first he relieved her of all household cares.

In search of health for Olive he abandoned farming, consenting to live for two years on her small income so that she might have tranquillity to complete two other big novels already partly written, and which it was calculated, would bring in enough money to render her financially independent. But illness, or temperament,

did not permit his wife to keep her side of the bargain. His sacrifice of his work, or freedom, was made in vain; she wrote little. At the end of that time Cronwright-Schreiner was forced to take up the law seriously, thereby binding himself to a town, and eventually settled in Johannesburg, where she was unable to live in the summer heat. For most of their married life, therefore the two were parted; not only, in Cronwright-Schreiner's opinion, because of the recurring asthma but because, dearly though she loved him, Olive, a prey to deep-seated restlessness, was unable to live for long in one place.

As in work and marriage, so in other spheres Olive Schreiner's peculiarities, marred her life making those steps upward painfully hard to cut, and often ineffective. Her personal habits were so strange that existence was difficult anywhere except in the wilds of her native South Africa. She would sleep during the day and walk about half the night muttering to herself, disturbing other inmates of a house. She had little social common sense; during her five years in England as a young unmarried woman, at the height of her fame, she would receive men friends in her room, keeping them with her until late at night. This, in an age when the division between the sexes was still wide and behaviour conventional, outraged many landladies, who asked her to leave. She, a born rebel, refused to pander to convention. Once, when talking with a prostitute in the street, trying to help the poor soul to a purer life, she was nearly arrested by a policeman.

These misunderstandings, these hostilities, were particularly painful to one who loved her fellow men. "I can't live with people without loving them." Her arms were stretched wide to embrace the world and yet she was at odds with it. In relations with a number of closely attached (and long-suffering) friends there was again no compromise. She, an idealist with little sense of character, expected too much of those she met and, when they quite naturally failed her, was bitterly hurt and disappointed.

Yet Olive Schreiner's life was not all frustration, all tragedy: that outwardly uncompromising, "awkward" woman had a rich inner and private life. Her work, though she was humbly aware of a smallness of output in spite of intense effort, was the result of glowing fervour. Writing was to her, she told Havelock Ellis, "like being continually in love." This power of concentration, in a complete oblivion of surroundings, resulted in those minutely observed descriptions which are now, I suppose our chief pleasure in *The Story of an African Farm*—such as the behaviour of the chickens at the close of the book where she writes that Waldo drew his hat lower over his eyes, and sat so motionless that the chickens thought he was asleep, and gathered closer around him. One even ventured to peck at his boot; but he ran away quickly. Tiny yellow fellow that he was, he knew that men were dangerous; even sleeping they might awake. But Waldo did not sleep, and coming back from his sunshiny dream, stretched out his hand for the tiny thing to mount. But the chicken eyed the hand askance, and then ran off to hide under its mother's wing, and from beneath it it sometimes put out its round head to peep at the great figure sitting there. Presently its brothers ran off after a little white moth, and it ran out to join them; and when the moth fluttered away over their heads they stood looking up disappointed and then ran back to their mother.

But in Olive Schreiner's own day it was her allegories (as well as this powerful story in its novel setting),

her outspoken criticism of intolerance both in religion and social behaviour, and her plea for the freedom of women, which so excited interest and enthusiasm. There was, too, in that rather weary *fin-de-siècle* period, a zest in the book, a hope for life and the future, which inspired or stimulated earnest young people who saw salvation in the new socialism. But in socialism, though she outwardly adhered to it, Olive Schreiner with her wider vision foresaw danger, a danger which has become in our own time a frightening reality: the danger of regimentation. "Socialism," she wrote, "is only one half of the truth, individualism is the other half."

We, who accept so much, forget the newness of these pioneers, men and women who wrote and spoke for social justice, for the advancement of women; and who, like Olive Schreiner, pleaded pity for the criminal and the prostitute, seeing in their ill behaviour a disease. We accept a truer relation between the sexes, especially in marriage, forgetting that it was women like Olive Schreiner who first tore apart the veil of reticences, talking and writing of sex feelings to the investigating Havelock Ellis. Some of her pamphlets, like *Women and Labour*, had an immediate power of conversion, but it is the long slow influence of her ideas for which we have perhaps to thank her most.

And, apart from this triumph of doing what can we say of the frustrated life, the genius largely unexpressed, of this strange woman? Was she fundamentally dissatisfied, unhappy? In the main, I think, not. The power of intense concentration which fashioned her genius gave her moments of happiness, of ecstasy so intense that, when more than middle-aged she could find herself singing, dancing, clapping hands at the sight of a moving train. "Life," she wrote to her husband, "is such an awful delight to me if the physical and mental pressure is lifted a little."

She lies now, fitly as part of the allegory, in a high place at the summit of Buffels Kop beside those dearest, her husband, her baby and a favourite dog; in a high place chosen by her where, once, on a perfect summer's day, she had experienced one of those movements of concentrated, "awful delight" as soon after marriage, she watched with her husband beside her a swarm of butterflies feed on a spike of flame-coloured aloë.

The Land of the Kazakhs

Ivan Sergeyev writes in the *Soviet Land*:

It is said that the first impression is the strongest. And my first impression of Kazakhstan, which I had first seen in my youth, was remarkably distinct: nowhere have I ever had the feeling of such broad and limitless vistas as in the land of the Kazakhs. In that year of 1925 I covered thousands of kilometers over Kazakh territory, and it seemed as if there was no end to it.

True, this limitlessness can easily fit into ordinary geographical standards and concepts. The land of the Kazakhs stretched from the mouth of the Volga and the Caspian Sea to China, from West to East, and from the Siberian Steppes to the swamps and snow-capped mountains of Tien-Shan, from North to South. The territory occupied by Kazakhstan approximated the size of the territory of the Indian Republic today, but the population of Kazakhstan was only about one-fiftieth of the population of India.

That probably accounts for the impression of a limitless desert.

This impression was heightened by the peculiar nature of the country.

Steppes exposed to all the winds . . . level plains with barren lakes within flat shores . . . vast expanses dotted with small conic hills . . . the Kyzyl-kum sand desert . . . one could travel through this territory for a whole week, a fortnight, a month and two months, and still have before the eyes the same pictures of desolate steppes, barren plains with spots of lifeless salt lakes, dead depressing sands . . . rarely did we encounter tiny settlements, lone tents, filthy sheep flocks and camel caravans.

The region seemed deserted and vast also because we saw its truly vast proportions as pedestrians or horsemen.

The automobile was rare in that part of the country in those days, to say nothing of the aeroplane.

And there were very few roads in Kazakhstan.

Only one steel thread stretched from Central Asia to the North, towards Russia, along the shortest but the most boring route, through desolate steppes, sands and the barren bank of Syr-Darya river.

Dusty cities with small populations and paltry handicrafts industries were encountered along this sole railway.

But this story could perhaps be told best of all by the geographical maps of those days.

I had a map printed immediately before the Great October Socialist Revolution. In the few years between this significant date and the year of our trip nothing had changed on the map with the exception of the internal boundaries indicating the national demarcation of Turkestan, the name of which the vast region inhabited by the Kazakhs, Uzbeks, Tajiks, Kirghiz, Turkmen, the Kara-Kalpaks, Dzungars, Uigurs and other of the less numerous nationalities, was known in the recent past. The boundaries of the new states were defined in August, 1920. That year witnessed also the birth of the new republic of the Kazakhs the 35th Anniversary of which was observed recently.

The map kept us from going astray, and it also gave us a better understanding of the country, of its history and of the spirit of the people. We saw on the map the routes followed by caravans, dotted lines indicating the sands, dashes indicating swamps, winding ribbons of the few rivers and the rare circles of inhabited points. Only, in the South, at the Tien-Shan spurs, where the fields received water from the cool mountain streams, were these circles more numerous. We knew, however, that those villages were inhabited not by Kazakhs, but

by Russians who settled there in the second half of last century.

They cultivated the land, planted wheat and raised wonderful fruit orchards. There were very few Kazakh farmers. All the people, young and old were wandering through the limitless steppes with their herds.

"We are a nomad people and we shall remain nomads to the very end," was what an old Kazakh I had met when we pitched camp near a well told me in his leisurely way. He wandered through the steppes together with his two sons, their wives and children. The eldest boy was 11 years old.

In my notebook I still have the following record:

" . . . and will these children keep on wandering as their fathers and grandfathers had done? But how can a nomad life fit in with science and culture? With schools and universities? But perhaps nomads have no need for them? I heard that they have only two literate persons per 100 Kazakhs . . . It would be interesting to see what will become of these children some 25-30 years hence . . ."

Turning a few pages, I find the following:

"Life will change here as well within one hundred years or more. Some change is bound to occur. There will probably be roads and some settlements will spring into existence. After all, it is a rich region with deposits of coal, oil, copper, lead . . . but all this will not be tapped soon. I shall probably not live to see it."

My readers, you have probably never met any people who would sincerely rejoice over their own mistakes. But the author of this article belongs to that class of people. And my joy was especially great owing to the speed with which my error was disclosed.

UNION DRUG
CALCUTTA

It would take a long time and much space to give a detailed account of that. I shall therefore let you gather the story from the new map of Kazakhstan published in 1955.

On this map you will see numerous railways in the East and South, in the West and North of the republic. The Kazakhs call them roads of life, and they had truly brought an active, bubbling life to the formerly desolate expanses.

You can see its features in the black signs on the map next to the steel roads: They stand for the new ore and coal mines sunk in the barren steppes, for the new oil fields extending in the West next to the Caspian Sea, new factories and mills built in the heart of the desolate plains, on the low hills, on the lake shores, in the foothills and right in the mountains.

Equally striking are the changes in agriculture. The cultivated areas occupied a barely noticeable place on the pre-revolutionary map, whereas they occupy a vast territory today. It is especially large in the North, in the virgin steppes adjoining West Siberia and the Altai. The tiny spots of irrigated territories have grown manifold in the South of the republic where wheat, cotton, rice, tobacco, sugar beet, various technical crops and wonderful fruit (remarkably beautiful and tasty apples, honey pears, grapes and a wealth of raspberries used for making splendid raspberry wine) are growing today.

In the year when I made my first trip to Kazakhstan its production was limited to meat, wool and a small amount of grain.

The rich natural wealth of the republic was still dormant, whereas today nature's hidden treasure store is nurturing a powerful mining industry and many enterprises which process these minerals. Nor are they ordinary enterprises. The Karaganda coal basin is one of the leading of the USSR for its technical equipment.

The lead works at Chimkent are classed among the biggest in the world. The Balkhash copper refinery is the most powerful of its kind in European Asia.

I need not ask myself the question how it was possible for a typical land of nomads with a low cultural level, without machines or implements, to take such a leap in technical progress. But this question must arise in the mind of any person who has not had the good fortune of seeing the country and the character of its people change with such remarkable speed.

It has been the good fortune of the author of these lines to see all that with his own eyes.

I have made many trips to that country in the past thirty years. I have seen the construction of the Turksib, the first railway between Turkistan and Siberia, of the Chimkent colossus of the first hydro-electric stations in the mountains. I was present at the opening of the first Kazakh University and of the first opera theatre. And I saw with my own eyes the most wonderful change in the history of a people, the transition from a nomad to a settled existence.

This change from a mode of life which prevailed for many ages was not as simple and light a process as it may seem today. To most of the nomads it meant a difficult departure from age-old habits which had become traditions. And many difficulties had to be surmounted before the first villages came into existence.

The pioneer village appeared in the South of the Republic next to the Russian villages, and the nomads had a concrete example: the few Kazakh families there were far better off. Their life was more secure than the life of the wanderers in the steppe.

The Kazakhs who led a settled existence were

CF-48-55

always sure of food, warmth and shelter. They did not starve, did not freeze and they were not ailing as much as the nomads. Their children did not die in the first or second year of life for very few could endure the scorching heat in summer, the bitter cold in winter, the autumn rains and the cool spring when the steppe was swept by howling winds.

The Kazakh villagers had a school next to their homes, and a hospital where the sick were treated by doctors and not by incantation of the witch doctors in the steppes.

The new villages were growing like mushrooms after a summer rain. This growth was so quick that the villages were given numbers (11, 28, 46, 73, etc.) before names were found for them.

The Russians helped the Kazakhs to educate a national intelligentsia.

They also helped the Kazakhs prospecting their natural wealth, and they built the first factories and hydro-electric stations and mines.

These industries received young technicians, engineers and other specialists educated in the colleges of Moscow and Leningrad and trained in the ore mines of the Donbas and the Urals, in the factories of the Ukraine and Russia. A few years later a university and institutes were founded right in Kazakhstan. And the research institutions opened in Kazakhstan were subsequently turned over to the Kazakh Academy of Sciences.

Thus did the Kazakhs acquire their own scientists, professors and academicians.

Thus were Kazakh workers trained for the oil, mining, lead and copper refining and other industries. They learned to operate the machines which cultivate the soil and reap crops of grain and rice, cotton and tobacco and many other plants which found a new home in Kazakhstan.

The population of the republic has been growing year after year, this growth becoming especially rapid owing to the great decline in the mortality rate. And still the republic would be sure to suffer from a shortage of labour if it had not been for the powerful machines and other equipment which do the work of hundreds, thousands and even—tens of thousands of men.

These steel assistants of man required electric power. It is supplied by the fuel-driven stations built next to the coal and oil deposits and by the hydro-power of the swift mountain rivers.

Kazakh cities differ little today from many cities in the advanced republics of the USSR while such a garden city as Alma Ata, the capital of the Kazakh people, is superior to hundreds of other cities. It is perhaps one of the most beautiful cities of the Soviet Union.

During my recent trip to Kazakhstan I chanced to retrace the route of my first trip. I remember how I once regretted the fact that I did not make a note of

the name of the old herdsman and of the names of his sons and grandsons. Today, however, I think that it was not necessary, because their fate is inseparable from the general destinies of the Kazakh people. I am certain that there is not an illiterate member in that family because illiteracy has been banished from the Kazakh republic. And surely every member of that family has his trade or profession and place in life as does every Kazakh: We meet in their midst today, pedagogues and doctors, architects, writers, composers and astronomers.

In three and a half decades Kazakhstan has covered a great historic road. There is incalculable natural wealth in the vast territory of Kazakhstan. It is not without reason that the republic is called a land of unlimited possibilities. But its greatest asset is represented by its people who are cultivating the wealth of their native land, reclaiming millions of hectares of virgin land for agriculture every year, steadily advancing the culture of the rich and strong nation into which the Kazakhs, a nation of yesterday's nomads, have developed in the family of Soviet nations.

Why Russia Can't Attack Us Now

The "inside report" that Dr. David J. Dallin analyzes here is one of many trying to show that a Communist attack is imminent. Such "reports," often officially inspired, invariably lead to the conclusion that we must strike first. Dr. Dallin shows how flimsy are the premises for such stories; our readers can judge the intentions of those who circulate them:

A story called "Russia's New Strategy for War," written by an anonymous former military attache of a Western power, has been published in *U. S. News and World Report* and aroused considerable discussion. The story says that, under Khrushchev and Bulganin, the Soviet Union is out to regain the strength it lost after the war "thanks to Stalin's stiffness and Molotov's unimaginativeness." Since March 1955, the unknown author says, new and highly aggressive military plans have been developed, which Soviet "marshals and admirals" are now working out in detail.

The essence of the "new strategy," according to this analyst, is the belief that surprise nuclear attack would be decisive in any war. Therefore, it would be a "deadly error" for the Soviet to wait for such an attack by the West. Instead, the Soviets must "forestall the enemy by attacking by surprise" themselves. With appropriate quotations from Soviet sources, the author builds up the following picture of Soviet reasoning:

1. The Soviets, no longer encircled, are no longer bound to defensive strategy.
2. The West's war preparations and political-economic solidarity must not be underestimated.
3. The new thermonuclear weapons, employed by surprise, might decide any war.
4. Thus, the Soviets must avoid a surprise attack on the part of the West; they must continue building their own strength and weaken the West, so as to gain enough power for their own, decisive attack.

The wide circulation given this story recalls the forecast three months ago by a "highly authoritative source" in Washington that the Chinese Communists would attack Formosa in mid-April. Although that forecast was presumably based on intelligence reports, the attack never materialized. The "new Soviet offensive strategy" seems to have emanated from a similar source. Taken seriously, it would call for a complete revision of the policies of the Atlantic alliance; the logical consequence of such an analysis would be to prepare for a speedy "preventive" attack on the Soviet Union.

Fortunately, however, the analysis is not true to fact; its materials are culled from a much broader context which, on the whole, gives little cause for sudden panic on our part.

Soviet military doctrine, in its consideration of atomic warfare, has always distinguished between two

kinds of wars: (1) a war between a great power and a small nation, and (2) a war among two or more great powers with strong air forces using nuclear weapons. In the first type of war (a war similar to those between Italy and Abyssinia, Nazi Germany and Holland, the USSR and Finland), a surprise attack emphasizing airpower and the most modern weapons can be decisive. But in a war between two first-class powers, neither atom bombs nor hydrogen bombs nor a surprise attack utilizing both can be decisive. The *U. S. News and World Report* story quotes an article by Marshal P. Rotmistrov in *Red Star* (March 24, 1955), which says that "in some cases, surprise aggression might become a deciding condition for success not only in the initial phase of a war, but even for its final outcome." However, Marshal Rotmistrov goes on to say, such success would be possible only against a nation which could not properly resist or retaliate.

The molders of Soviet military strategy are experts and level-headed planners; they are controlled by a set of leaders who, though aggressive and ruthless, are not long-shot gamblers. Let us attempt to see this supposed "new offensive strategy" through their eyes.

Let us imagine that the Soviet surprise atomic attack has taken place and that it was "successful." Millions of Americans are dead, other millions are wounded, a number of cities lie in ruins, and death continues to devour thousands of victims. Has this successful attack meant victory for the attacker?

Moscow knows full well that the U.S. state, economy and defenses cannot be paralyzed even by several air attacks. Despite tremendous losses, a U.S. government, U.S. armed forces and a great number of dispersed U.S. bases and arsenals would survive. The Soviets have never doubted that, within 24 hours of its "surprise attack," a huge fleet of U.S. bombers would bring death and havoc to Russia. Because U.S. stores of nuclear weapons are admittedly bigger and better than the Soviet stores; because the U.S. has bases not only at home, but at a myriad of points around the Soviet perimeter; because the U.S. would be assisted by other nations whose combined forces are vastly superior to Russia's; and because Russia's radar screen is inferior—for these reasons, the destruction of Soviet cities would far exceed the losses inflicted a few hours earlier on the United States.

And then what? Not a single one of the nations involved in this apocalyptic struggle would be anywhere near victory. When the sun rose the following morning and made its way slowly from Siberia over Moscow, Berlin and London to New York, Washington and Chicago, everywhere its rays would be cast over mountains of corpses and heaps of ruins. Yet life would not cease, and victory would be just as far away as before the attack. When human and material losses were counted, Russia would be the biggest loser in any war started by her own government. And her chances of winning the war in subsequent stages would be almost nil. Belligerence and ruthlessness are not enough to win a war; this the world learned from the Axis in World War II.

Because of these atomic facts, the Kremlin cannot launch a surprise attack. Although the Soviets suffer from many misconceptions, an exaggerated belief in the decisiveness of atomic weapons is not one of them. Quite the contrary: This is one of our most widespread misconceptions. First came the illusion of "victory through air power" which facilitated dangerous cutbacks in our ground forces. Then came the illusion that the newest-model A-bomb alone could win any war for the nation possessing it. Behind these illusions was an unwillingness to face the imperative need for recruiting and equipping large-scale ground forces. Neither Stalin nor his heirs have made similar mistakes.

It is also inaccurate to depict Stalin as a "stiff" adherent of "peaceful co-existence," and to deem the Khrushchev-Bulganin course aggressive by contrast. Stalin was far more inclined toward risky international adventures than any of his collaborators or successors. He played with the fire of war from 1939 till the day of his death. It was Stalin who invaded Finland in 1939; who ordered his armies to hold the Balkans at the end of the war; who kindled the Communist upheaval in Northern Iran; who stayed in Manchuria long enough until Mao Tse-tung could successfully wage the Chinese civil war; who ordered the Berlin blockade; who initiated the war in Korea and so on. Since Stalin's death, his heirs have been trying to limit the scope of the conflict.

Were it true that the Soviets are preparing a surprise atomic attack, then their recent maneuvers would be all deception: the Austrian State Treaty, the rapprochement with Tito, the release of U.S. fliers from China, the *de facto* truce in the Formosa Strait, the easing of travel to and in Russia. Are these steps calculated simply to lull the West into a false sense of security? If so, the policy of this nation is a sequence of grave blunders. If we are to expect an atomic catastrophe soon, perhaps in the next few months then there is no place for careful, circumspect diplomacy; then the only intelligent men in Congress are the three Senators (Jenner, Malone, McCarthy) who voted against the Austrian Treaty.

But are such expectations of disaster reasonable? To be sure, "peaceful co-existence" is a hypocritical phrase in the mouths of the Soviets, and among the world's governments today, the Soviet regime is certainly the most quarrelsome, provocative and militant. At its first opportunity to make a real gain it would not hesitate to move its forces into a foreign land. That is why the armament of the free world is so essential, and present bones for effective disarmament so illusory.

Nevertheless, Soviet policy is not a mere cover for an imminent attack. There has been a real change in Soviet policies in recent months. It

is not a reorientation from "cold" to "hot" war. Though halfhearted and inconsistent the new Soviet course represents an effort to stabilize the *status quo*, to freeze present strategic and military relationships before new facts reduce the relative impact of Soviet power. The new Soviet policy is dictated by the realization of the weakening of Soviet and Communist positions all over the world, but especially in Europe.

Soviet spokesmen react bitterly to American comments that the new Kremlin policy is being dictated by the West's "situations of strength." Yet that is the fact nevertheless. There is a world of difference between the power of the United States and its allies in 1945-46 and their combined power now.

In addition to the fundamental military and economic changes induced by Western rearmament, there has been a basic psychological change. Something new has been growing: the Western will to

resist. It first emerged with the Berlin airlift, then again when we helped Tito after his break with Stalin. It emerged in full force when American troops entered the Korean War. Now the principle that Soviet encroachments must be resisted by force is a permanent and basic assumption of American and British policy. Strong will is itself a powerful force in world politics; Moscow understands its impact and is now trying to draw the consequences.—*The New Leader*, June 27, 1955.

Pilani—Combination of Gurukul and Varsity

K. K. Duggal writes in the *American Reporter*, September 14, 1955:

Pilani (Rajasthan).—On the arid soil of this remote village in the heart of the Rajasthan desert has grown an oasis—a 400-acre campus of rolling lawns, flower-studded parks, tidy cottages, and sprawling schools and colleges.

Here is afoot an uncommon experiment in education that combines the ancient Gurukul philosophy of austerity and the modern, uninhibited, congenial atmosphere of the American university campus.

In this ideal rural setting where no city noises distract the student nor cinema houses or luxury restaurants claim his time and energy, are groomed career engineers, economists, researchers and administrators. What is more important, they are taught to be self-reliant, enlightened democratic citizens who will help build the New India in the making.

What started as a two-student *pathshala* for Seth Shivanarayan Birla's grandsons 55 years ago has today grown into a first-rate academy of education where 4000 boys and girls pursue study courses in arts, sciences, crafts commerce, and engineering.

One of the 17 institutions that make up this "university town" of Pilani is the Birla Engineering College, which, within nine years of its birth, has assumed a truly international character. Here come scholars from countries as far as Burma, Malaya, Indonesia, Pakistan and Africa to acquire professional skills in varied engineering careers. And from here have graduated 700 engineers to man India's leading industrial plans and factories, the multipurpose river valley projects, and the Air, Naval and Army workshops in different parts of the country.

Recognition of the college's usefulness has come not only from the nation's private and public sectors and the Rajputana University but also from across the seas. Two years ago, the University of Wisconsin, U.S.A., entered into a TCM-sponsored teachers' exchange agreement with the Pilani college.

Under this programme a "mature, ripe teacher" (to quote Principal Lakshmi Narayanan) from the world-famous Massachusetts Institute of Technology (MIT), Prof. Boyd B. Brainard was assigned to the college faculty for one year. He left in May this year. Two more Americans—Prof. Franklin O. Rose and Prof. Lawrence A. Ware—will arrive shortly to teach mechanical engineering and electronics. Prof. Ware is an authority on electronics; he has written two text-books for American students.

The visit is being reciprocated by four Pilani professors—N. K. N. Murthy, B. L. Maheshwari, Indarjit Nagrath and R. P. Javath—who left for the United States by air on August 29 on a two-year study-cum-teaching grant from the University of Wisconsin. The grant includes free passage, free tuition, and free

maintenance. They will prepare for their doctorates at Wisconsin. Principal Narayanan also has been invited. He plans to leave some time next year on a six-month lecture tour.

Of the exchange programme, Mr. Narayanan said: "Cross-fertilization of ideas promotes Indo-American understanding and goodwill. From Prof. Brainard our students and staff learnt a good deal about American teaching methods and the American people in general. The visiting professor, in turn, enjoyed living at the Pilani campus. Both he and Mrs. Brainard made many friends with whom they continue to be in correspondence."

Prof. Brainard, recalls Mr. Narayan, was pleasantly surprised at the Indian students' level of intelligence. Once he remarked: "Indian students are more hard-working and devoted to their studies than their American counterparts."

CLOSE TIE WITH U.S.

The exchange programme is not Pilani's only link with the United States. A close study of U.S. campus layouts and curricula went into the college blueprints. "We tried to adopt as much of U.S. practices as we could," said the Principal. "That is one advantage," he smilingly added, "of starting from scratch. You are not hampered by traditional, outworn techniques."

U.S.-manufactured tools such as electronic gadgets, electric generators, Ford and Chevrolet auto-engines, graphs on nuclear science and the Argus-Wright airplane on which students learn aero-engineering, fill Pilani's well-equipped laboratories; books by American authors line the shelves of the 5,000-volume college library.

INDISPENSABLE FOR I.A.S., P.C.S. AND OTHER COMPETITIVE EXAMINATIONS

1. MODERN ESSAYS—Jyoti Swarup Saksena, Lecturer in English, University of Allahabad Rs. 5-8

(The essays have been carefully selected on the basis of the examination papers and each essay has been comprehensively dealt with)

2. PROBLEMS IN INDIAN ECONOMICS (1955 edition with an Appendix on The Second Five Year Plan)—P. C. Jain, Reader in Economics, University of Allahabad Rs. 10-12

(The most up-to-date and invaluable book dealing with all the current problems facing our economy)

3. A TEXTBOOK OF MODERN ECONOMICS Vol. I—P. C. Jain, M. A., M. Sc. (Econ) London, Reader in Economics, University of Allahabad Approx. Price Rs. 8

(It covers Introduction, Production, Consumption, Exchange and Distribution)

4. THE INDIAN PARLIAMENT (A symposium)—edited by A. B. Lal, Officiating Head and Reader in politics, University of Allahabad.

(The book includes articles from eminent scholars and parliamentarians)

* To be ready by the end of November, 1955.

Write for detailed information to-day.

The Vice-Principal, Dr. A. K. Chatterjee, who heads the Electrical Engineering Department, is an alumnus of Illinois and Cornell Universities. One bright student of the college, Jagdish Chander Snourie, is currently studying for Ph.D. at the University of Columbia, Missouri. Another graduate, Harish Chander Pandey, is leaving this month for the University of Purdue, Indiana, for higher studies.

Eastman—Author of Modern Photography

G. N. Radha Krishna writes in the same issue of the *American Reporter*:

It was the summer of 1888 and the *Hartford Courant* flashed the banner-line "Beware the Kodak!" on its front page. It added:

"The 'Kodak' has added a new terror to the picnic. The sedate citizen can't indulge in any hilarity without incurring the risk of being caught in the act and having his photograph passed around among his Sunday school children. And the young fellow who wishes to spoon with his best girl while sailing down the river must keep himself constantly sheltered by his umbrella."

The 'Kodak' brought a fortune to George Eastman and photography to millions. This catchy name was evolved one day when George Eastman was playing anagrams with his aged mother. The name Kodak raced round the world from the Hawaiian Islands to the remote hill tracts of Tibet. The newspapers outdid themselves in giving the name unprecedented publicity as demonstrated by the banner headline of the *Courant*.

Kodak's famous slogans, "You press the button and we do the rest," appeared in 1889 and release another whirl of publicity.

Eastman's interest in photography grew in an accidental way. When he planned a vacation trip to Santo Domingo, a fellow employee of his bank suggested he buy a camera and make a picture record of his trip. Eastman's interest was aroused and he started taking lessons at \$2 per lesson. It was the era of wet-plate photography. The plates had to be made and then photographed. The process was clumsy, slow and irksome.

From then on, Eastman became an ardent fan of photography. He pored through all technical literature and journals. An article in the *British Journal of Photography*, describing how dry glass plates are being used in England, drew his attention. He learnt the method and started making them in his own way and on a mass scale. He marketed them under his own trademark to the largest dealer in New York City. He was then working full time at the bank and gave his photographic business what attention he could, "between the hours of 3 p.m. and breakfast." His only rest was on Sunday when he slept, except for mealtimes, straight through the day.

All these ventures used up all his savings and he might have well gone bankrupt but for the boarder of his mother's one Henry Alvah Strong, a Civil War veteran who owned a buggy whip factory, who invested \$5,000 in the business. This enabled Eastman to resign from the bank and go in full steam ahead into the photography business.

Eastman entered photography at the close of the wet-plate era, passed rapidly to the use and manufacture of dry plates and then by a series of inventions and improvements, which he completed in 10 years, shoved the whole process forward approximately to modern photography.

In 1879, Eastman started mass-producing negative material on machinery. Later, there was a race to substitute glass with lighter, flexible material. This contest among rivals continued from 1880 to 1884 till Eastman patented the "American Film" in 1884. It was not like the film of today. It was a band of paper coated with two layers of gelatin, one of which was made sensitive to light by silver salts. After it was exposed and developed, the sensitive layer of gelatin was peeled off and became negative for printing.

In 1884, in collaboration with William H. Walker, his partner-engineer, he invented the spool to roll up the "American Film." Eastman's personal invention came in 1888, when he produced the Kodak Camera, which contained a lens, a roll-holder and spool of "American Film" with 100 exposures. The novelty of this invention was the revolving shutter which was operated by simply pressing a button. In 1889, Reichenbach, employed by Eastman, produced a material for making films without a paper-back support. This was used till 1940, when replaced by acetate film.

QUALITY AND CHEAPNESS

Apart from his inventive genius, Eastman proved his mettle in business. His ambition was to trade throughout the world and to capture all international markets. He achieved this by the quality and cheapness of his products. The first Kodak Camera was sold for \$25 in 1888; 10 years later a much improved model cost \$5. In 1900, Eastman brought out what he then considered as the ultimate in camera value—the \$1 Brownie with rolls of films for only 15c.

In 1925, when Eastman stepped out of the presidency of his company, its profits were \$18.5 million. In 1953 alone, it sold \$633 million worth of products and made a net profit of \$50 million after paying \$87.5 million in taxes.

George Eastman remained a bachelor throughout his life. His constant companion was his mother. Eastman spent his money as fast as he made it. As soon as he made his first million dollars, he began to give it away in large chunks. During his life, he gave away \$80 million and his will added public bequests of \$20 million more. If he had retained his capital and invested for personal gain, he might have died worth \$200 million to \$300 million.

NOTES

Our Guests

We have had a number of distinguished visitors from many lands, as State guests, within this last month or so. Mr. Lester Pearson, Canada's Secretary of State for External Affairs, arrived here at the end of October, with the specific invitation to open the Massanjore Dam of the Mor Valley Scheme. That pleasant function took place at the beginning of November, and will be remembered long, by the people of West Bengal particularly, as a lasting link of friendship with Canada.

The next to come were Their Majesties the King and Queen of Nepal, on a visit and tour of goodwill and friendship. They were given a rousing reception and they are still with us at the time of writing these notes.

Then came a flying visit of an old friend, Premier U Nu, on his way back home from a tour in the U.S.S.R. He arrived practically in time to add his personal felicitations to our Premier, on the occasion of his 66th birthday. In passing we may also record our good wishes, for an occasion that has, quite fittingly, now been recognised as a festival for the young custodians of our future.

Dr. Hatta, the Indonesian Vice President, had also arrived, and ended a prolonged tour of goodwill in the third week of November. His visit was a mark of the bonds of friendship that binds India and Indonesia.

Then came the long-awaited visit of the Russian leaders, M. Nicolai Bulganin, the Prime Minister of U.S.S.R., and M. Nikita Khrushchev, the First Secretary of the Soviet

Communist Party. They were welcomed with the greatest demonstrations of friendship ever accorded to any distinguished visitor, at New Delhi, Bombay, Calcutta, and indeed all over the country.

Lastly came the visit of King Saud of Arabia on a State visit. He was given a royal welcome at Bombay and Delhi, and is still on tour at the time of writing.

What is the significance of all these visits? That is the question over which foreign Powers, particularly of the Western Bloc, are racking their brains. The main point, of course, is the official tour by the two topmost executives of the U.S.S.R.

Here in India, as abroad, different views are being taken of these visits. Most people think that at last India is being put on the World Maps. Others again think that at last this country is finding friends, who are willing to help in raising India's status.

There are quite a few that are concerned with the fear that India might be forced, through the repercussions of these visits, to align herself with one of the warlike groups, and thus be obliged to abandon her neutrality. They point out the reactions of the extreme leftist parties, particularly the Communist Party of India. They also point out that with the exception of the Bombay S.R.C. incidents, the myriad functions and processions that have ensued out of these visits, have passed in calm and quiet, thereby clearly emphasising the source of all disruptionist activities.

It is too early yet to comment or to draw conclusions. We shall have to wait for the world repercussions.

The French Car Industry

The car industry remains one of the greatest of French industries. It directly employs 110,000 people and indirectly gives a living to more. Its turnover topped 350 billion francs in 1955 and will easily exceed this total in 1956. Every autumn French and foreign techniques can be compared at the French Automobile Show.

In 1938 the French car production ranked fourth in world production, with 358,000 vehicles of all descriptions. France came after the United States, Great Britain and Germany, and was closely followed by the U.S.S.R. and Canada. In 1953, with 497,757 vehicles, France kept the fourth place, having been outstripped, so it seems, by the U.S.S.R., but coming before Germany. During the first half of 1954 France turned out 301,965 vehicles, and was classified after the United States, Great Britain and Germany.

The characteristics of French car construction are closely connected with the needs of the population. France is no longer, as in former times, one of the richest countries in the world: for that reason luxury cars are less prevalent. On the other hand, the average customer is more attracted by this means of travel; but they demand cheap cars which consume very little petrol and oil.—*News from France.*

French Technology Abroad

J. G. Fevrier writes in the *News from France*, 15th April, 1955:

When one speaks of French commercial expansion abroad, one thinks chiefly of foreign trade statistics, that is to say, of the direct sale of goods. But there are many other ways in which French technical achievements reveal themselves successful in other countries. They can chiefly contribute to the industrial development of other countries by sending engineers and specialists, by drawing up plans for works, by the granting of patents and by delivering machines. This form of exportation creates stronger and more lasting ties between France and her customers than a mere exchange of goods. But this is not often known, and some still continue to represent France as a country only interested in the production of high-quality wines, fashion models, and the so-called articles from Paris.

Perhaps as illustration it would be worth mentioning that the fastest electronic calculating machine in the world (3 times as fast as those of rival countries) is of French invention and manufacture and that America has ordered them in large quantities (to a value of 2 billion French francs); and that the Egyptian government has signed an agreement with the great nationalized French firm, Electricite de France, for the organization in common of the production and the exploitation of electricity in Egypt.

It is not possible here to draw up a list of all the successes obtained by French technical achievements abroad in the last few years. But a few typical facts must be mentioned.

South America is a zone where international competition is particularly keen. In Columbia the highly important Iron-smelting works of the Paz do Rio will shortly begin production. They were built by French firms and engineers. French firms are also charged with supplying the town of Cali with drinking water. In Peru, a group of French firms associated with the Bank of Paris and that of the Low Countries, has been awarded the contract for the works which are to finish the building of the enormous Santa factory; these works comprise a saw-mill and a hydro-electric generating station, the total cost of which amounts to more than

15 million dollars. In Brazil the National Company of Alkali has ordered from French firms the materials necessary for the construction of an important factory of chemical products at Caba Frio, near Rio de Janeiro; in the same country, the firm, "Grands Travaux de Marseille," is charged through a local firm with the harnessing of the Cachoeira Dourada falls, on the Paranaiba river, the construction of the dam and the installation of a hydro-electric power plant.

Throughout the East, international competition is just as keen. We have already spoken of Egypt. In Iraq the Development Board Officially announced that the important works to be carried out on the Dokan river in the Kurdistan mountains (construction of dams and irrigation works) will be in the hands of French firms.

In India, at Jachali, near Bangalore a factory for the manufacture of electronic material will start work as from 1956; it will be administered by the Bharat Electronic Ltd. Twelve Indian technicians are at present going through a training course in Paris, at the General Company of French Broadcasting and Television, in order to form the technical nucleus of the factory. In Ceylon, a French firm, the Industrial Work Company, is carrying out the test of enlarging the port of Colombo. In Turkey, French industry has obtained a large number of orders. Three French firms have been awarded the contract for construction of several aerodromes. Etibank has charged the French firm, Merlin and Gerin of Grenoble, with the research, the supplying and the installation of 15 transformer sub-stations to supply a transport network with energy (15,400 volts) in the North and North-West of Anatolia. The whole of this order amounts to almost 200 000 French francs. The General Society for Tractors and Exploitation has signed an agreement for the construction of an underground railway line at Istanbul.

In the Far-East, except for China, which is economically dependent on Russia, French technical achievements have been just as successful. In a highly industrialized country such as Japan, the Shuan Machine Tool Company at Osaka is equipping itself for the construction of 20 precision lathes with a license from the French firm, Cazeneuve. These lathes are supplied with hydraulic copying devices. The Shouan Company will sell these lathes in Korea, Siam, the Philippines, Formosa, Indonesia and naturally in Japan itself. In Indonesia the firm Degremont is building installations for the purification and the complete treatment of the waters of the Bangir canal at Djakarta; the contract has a value of 200,000 French francs. In Australia the government invited tenders for the construction of an electric generating machine on the river Tumut. In spite of keen competition it was a group of 6 French firms which was awarded the contract for a total value of 3,900,000 Australian pounds. The generating station, situated in the region of the "Snowy Mountains," will be underground. It will be equipped with 4 generators each of 90,000 KW.

If we now turn to Africa we find that in Kenya two French firms are building a pipe-line, 150 miles long and for a value of 500,000 French francs. In the Belgian Congo, the Home and Colonial Firms have just finished a dam on arm of the Inkasi river. In South Africa, at Durban, a French firm has obtained a big order for the canalisation of water.

This enumeration is of course incomplete but at least shows that French production is not only turned towards specialities, it also manufactures which need the most modern equipment and the best technical achievements.

Mr. Bulganin and Mr. Khrushchev with a group of artists who participated in a Dance Concert, specially arranged in their honour, at Nangal, on November 22

Dr. Mohammed Hatta, the Vice-President of the Republic of Indonesia, at the Taj Mahal, Agra, during his recent visit to this historic city

Indo-Soviet Relations

The Indian people have given the heartiest welcome to the Soviet leaders, M. Bulganin and M. Khrushchev. The visit is historic in every sense of the term and Sri Nehru was not exaggerating a bit when he said on November 19: "This day on which we are welcoming the distinguished guests from our neighbour country, the Soviet Union, will go down in history as a very important event. I hope the result that will now flow from it will be significant not only for the Indian people, but the whole world."

In an editorial article on November 21, the *Hitavada* writes that though commercial, cultural and political relations had existed between India and Russia for centuries it was only since the achievement of Indian independence in 1947 that the two countries came really near to each other. The most notable feature of Indo-Soviet co-operation since that time was the initiation of the one-million ton Steel Plant at Bhilai. "This plant which is rapidly taking shape under Russian sponsorship represents a new and fruitful phase of Indo-Soviet collaboration in the industrial field. In the sphere of international relations there has been a Community of interests between the two countries based on the acceptance of Panchashila and on the need for lowering tension and promoting world peace."

Concluding the newspaper writes: "We are confident that the relations between the two countries, based as they are on the principles of mutual respect, non-interference and close co-operation, will grow still further as a result of the visit of M. Bulganin and his colleagues to this country. We also hope that the friendship and collaboration between India and the Soviet Union will serve as an example of the co-operation that is possible between States with different political and socio-economic systems."

Writing on 18th November just on the eve of the Soviet leaders' arrival in India the Soviet Communist Party daily *Pravda* (Truth) says: "The Soviet people, who gave a warm and generous welcome to Mr. Jawaharlal Nehru, Prime Minister of the Republic of India, in their own country a few months ago, unanimously welcome the return visit of Bulganin and Khrushchev to the friendly India."

"Through their leaders the Soviet people extend their warmest brotherly greetings to the great peace-loving people of India."

The newspaper recalls that Indo-Soviet re-

lations had all along been friendly and mutually respectful and writes: "The great Lenin, the founder of the Communist Party and the Soviet State, had a deep faith in the creative forces of the Indian people and in their inevitable victory in the struggle for freedom and independence."

The newspaper concludes: "The Soviet people have always sincerely wished and do wish the friendly people of India happiness and success in further strengthening their national independence and in their efforts for peace. Speaking at the meeting in Moscow Nikolai Bulganin said: 'The industry and talent of the multilingual four hundred million people of India, who have created immortal cultural monuments in the course of their centuries-long history, their steadfast striving for freedom and national independence, their invariable love of peace, have earned them the profound respect and warm sympathies of our country.'

"May Soviet-Indian friendship and co-operation gain in strength and scope for the good of the peoples of both countries, for the good of world peace and security."

The influential *Izvestia* of the same date writes: "Soviet-Indian relations are built on a firm and reliable basis. It is founded on the principles of mutual respect for territorial integrity and sovereignty, non-aggression, non-interference in the internal affairs of each other, equality and mutual benefit, and peaceful co-existence. Our relations with India convincingly confirm the correctness of the principles proclaimed by great Lenin on the possibility of peaceful co-existence and co-operation of states with different social and political systems."

"The Soviet people on their part highly appreciate the role played by India in the struggle for peace. With the active participation of India together with the Soviet Union and the Chinese People's Republic armistice was established in Korea and an end was put to hostilities in Indo-China. Like the Soviet Union India comes out for reduction of armaments and armed forces and for prohibition of atomic and hydrogen weapons. Our countries make joint efforts for the successful settlement of the problem of Taiwan with due regard paid to the national interests of the Chinese people. They struggle jointly for granting the Chinese People's Republic its legitimate place in the United Nations. The peace-loving peoples appreciate the fact that India was one of the countries that took the initiative in convening

the conference of Asian and African countries in Bandung, which was an important landmark in the struggle of the Asian and African peoples for their rights and independence, for strengthening universal peace."

Bulganin's Speech at Calcutta Airport

Marshal Bulganin and M. Khrushchev were received at the Dum Dum Airport by an address of welcome in Bengali by the Chief Minister, Dr. Bidhan Chandra Roy.

The *Hindustan Standard* reports: "M. Bulganin prefaced his reply to the welcome with the words 'Dear Friends' which drew loud applause from the crowd."

"M. Bulganin said that it was a great joy to be on the soil of Calcutta, which had played a great role in the history of India's national liberation movement and in the development of India's economy and culture. From their plane they had seen great fields, peaceful villages and big rivers. They had also seen the biggest city, Calcutta, with its smoking chimneys and factories."

"M. Bulganin added, riches of golden Bengal were unaccountable, and together with you we are glad that the people of Bengal are becoming masters of wealth created by them. They were participating in the great work of building up their motherland, he said."

"We shall be happy," M. Bulganin continued, "to have close acquaintance with the work and life of Bengal, with her achievements and success. We have brought to you the best wishes and the warm greetings from the multi-million people of the Soviet Union, who have been following the progress of independent India with great interest. Let us strengthen the friendship and fruitful co-operation between the peoples of India and the Soviet Union," he concluded.

The Soviet Leaders in Calcutta

Shri Krishan Bhatia, *Statesman* reporter, covering the Indian tour of the Soviet leaders writes: "The mammoth welcome which M. Bulganin and M. Khrushchev received in Calcutta on Tuesday has completely eclipsed the receptions given them in the other big cities of India." He adds, compared with the reception in Calcutta the other receptions including the one in New Delhi "appear small functions."

"That the breakdown in traffic arrange-

ments caused inconvenience to M. Bulganin and his companion is regrettable, but the Calcutta crowds were probably more orderly than in Bombay. On the Russians' arrival in Bombay, some parts of the city experienced a traffic jam which lasted over two hours. Many people were unable to reach the reception on that account."

"In respect of decorations on the road from the Air Port to Raj Bhavan, Calcutta did not impress those who had seen the decorations earlier in the tour."

An American newspaper correspondent who had travelled widely and had been in the profession for long time, told Calcutta reporters that his experience on Tuesday was "unique," the *PTI* reports. He had never seen such a large crowd.

The Soviet Leaders' Tour

As expected the present tour of the top Soviet leaders in India has had different reactions in the Western Press. Some have reacted strongly against the welcome accorded here, others have taken a more or less sober view. Thus writes the *New York Times*, International Edition, of November 20:

India is not Communist, nor is India on the road to communism. These examples of Communist activity throughout the country—and there is a mountain of others to choose from—actually show something quite different. And that is that the Communists have come to think of India as the major obstacle to a Communist Asia and have made India the target of their most intensive and integrated propaganda campaign in this part of the world.

In the past year Moscow has sweetened that campaign, at least publicly. For the time being it does not fit in with the Soviet Union's happy attitude toward India. But chances are that historians some day will decide that the Communist party of India lost nothing from the fact that Moscow so enthusiastically pursued Prime Minister Jawaharlal Nehru in the spring, summer and fall of 1955. All over India these days city folk and villagers are seeing motion pictures showing in detail the astoundingly warm reception received by Nehru wherever he went in Eastern Europe. Some of the glow felt here today the Russian people must be reflected on the Indian Communists.

Indians feel that all the emphasis on

communism, its growth or decline, overshadows the work being done by a non-Communist Government to build up the nation. "India is not just a Western problem," said a young Indian journalist, "it is our country."

But grant once that the story of India is what the Government and people are doing with their country, and not just what the Communists are trying to do to it, and most Indians would agree that they have been paid the compliment of having been selected as communism's No. 1 Asian target.

The United States and Britain carry on propaganda work in India, too. But the truth is that the West's propaganda work simply is not in the same league as the Communists, and can never be. The Americans and the British have some top-notch specialists in India doing diplomatic and information-service work, men who know the country and are warm to it. But they operate always, and must operate, as foreigners. They have to walk and talk softly; this is a country sensitive to the nerve-ends against being sold anything political from the outside.

Soviet Objectives

The same issue of the *New York Times* gives front page editorial space to a retrospect and survey of world politics titled "After Geneva," in which are the following comments on the objectives of the Soviets:

What were to be "the means short of war" by which the Soviets would pursue their objectives? The pattern had begun to unfold before the Foreign Ministers' conference. Russia clearly was embarking on a course in which it planned to use all its non-military resources—economic, political and diplomatic—to try to create trouble for the West and advance the frontiers of communism.

There are three main target areas at which the Soviets seem to be directing these tactics—Germany, the Mideast and Southeast Asia. This is the apparent Soviet strategy in each region, and the problems for the West:

Germany. Moscow clearly believes it is in the cat-bird seat on the German question and hence was in no mood to negotiate on Germany at Geneva. Russia alone, by her control over East Germany and her diplomatic relations with West Germany, has the power to negotiate unification.

Mideast. Russia is playing a complex and

dangerous game in the highly unsettled Mideast. The volatile conflict between Israel and the Arab States has stopped short of an explosion largely because the Arab nations are militarily weak and have been dependent on the West for economic aid and diplomatic support. Soviet offers, through its satellites, to sell arms to all comers in the Mideast; its hints that it might supply funds and technical aid for construction of a huge hydro-electric project on the Nile and another in Lebanon; and its alliance with Arab nationalists in the U.N. have brought Russia four-square into the Mideast picture.

Southeast Asia. The Soviets have begun to woo the "neutralist" Southeast Asian nations with diplomatic and economic overtures. Last week, as major step in that campaign, Soviet Premier Nikolai Bulganin and Communist party boss Nikita S. Khrushchev set off on a 5,000-mile "good-will" tour of India, Burma, and Afghanistan. In New Delhi Friday, an estimated 1,000,000 Indians turned out to greet and cheer the Soviet leaders.

In the matter of economic aid, Soviet capabilities are limited. Nevertheless, they appear to get maximum propaganda advantage out of every gesture they make. For example, a Soviet offer to send a team of oil experts to India received as much attention in the Indian press recently as the United States' appropriation of \$50,000,000 to India this year. Russia has also achieved a high degree of success in economic penetration of Afghanistan. There are about 500 Soviet technicians in the country which now sends 35 per cent of its exports to the Soviet Union. It is assumed the Soviet leaders will hold out some form of economic bait when they reach Rangoon.

In terms of economic aid, the United States is in a far better position than Russia to supply the money and goods the countries of Southeast Asia need. But in granting economic aid, the United States has to contend with political problems and pressures that are foreign to the Soviet rulers. John B. Hollister, director of the International Co-operation Administration which handles the Administration's foreign economic aid program, has gone on record as favoring a curtailment of foreign expenditures. In an election year, the pressures for budget balancing and tax reductions—and consequently cuts in foreign aid—are bound to be strong.

In short, the West is now confronted with

a diversified Soviet challenge that promises to provide some of the sternest tests in the history of East-West relations—tests that cannot be met with military alliances. The London *Economist* said last week:

What the free societies of both the West and Asia now face is a challenge to mortal combat—no less mortal for being largely nonmilitary.

Tata-Kaiser Steel Agreement

Under a recently concluded agreement one of the largest engineering and contracting firms in the United States Steel Industry, Henry J. Kaiser Company, would help the expansion programme of the Tata Iron and Steel Company of India. The designing procurement and construction of the expansion project would cost about 65 crores of rupees. The project would increase India's current steel plant capacity by about 45 per cent and raise the Tata plant's production from approximately 1.3 to 2 million ingot tons annually. It would be completed in about two and a half years' time.

A spokesman of the Kaiser Company announcing the conclusion of the agreement said on November 22 that the agreement was a "private deal and not government to government."

A U.S. Department of Commerce bulletin of November 22 disclosed that the U.S. steel mills were operating at 98 per cent of rated capacity in October, 1955.

Banks on Wheels

The State Bank of India would open several hundred branches in the rural areas in the near future. In this background the following news-item published in the 15th October issue of the *News from France* is of some interest. The periodical reports: "One of the problems which the French regional banks had to face was how to reach a scattered clientele, living at varying distances from the head office or even the branch offices. To have opened more branch offices would have involved too much expenditure on buildings and staff, which would not have been offset by the addition of new clients. So a new solution had to be found, and it has been found by introducing a system of travelling banks in vans, like travelling circulating libraries. These little banks on wheels visit a number of centres every-

day, and their itineraries and halts are fixed in advance and notified through the papers. These travelling banks are very well furnished, and contain both public counters and offices for the agent."

Indian Employees in Foreign Firms

The position of Indian employees in foreign firms operating in India over the past several years is available from the following table published in the *Hindu* of November 6, 1955:

Year	No. of Indians	No. of Foreigners	Total
1947	6,162	7,623	13,785
1948	7,902	8,052	15,954
1949	10,033	8,286	18,319
1950	11,803	8,318	20,121
*	*	*	*
*	*	*	*
1954	18,642	7,750	26,392
1955	21,242	7,526	28,768

The *Statesman's* special representative in New Delhi adds that the progress of Indianization of services in foreign firms were officially regarded as satisfactory and no legislative action had therefore been taken.

He further writes: "A new factor being taken into consideration is the demand for technicians created by the industrial boom in Europe which, together with the increase in taxes in India, has reduced the net inducement to work in India.

"Government policy, it is officially pointed out is not to push foreigners out in order to create vacancies but to ensure that a high proportion of posts falling vacant in the normal course are filled by Indians.

"A recent example of an agreement seeking this objective is with tea plantation companies in which the highest percentage of foreigners are employed. They have agreed to appoint Indians to three out of every four senior vacancies.

"Employment figures indicate that foreigners are now in an overall majority only in plantation companies. Jute companies, in which a similar position existed last year, have employed an overall majority of Indians this year."

Resources for Second Five-Year Plan

Recently the problem of raising financial resources for the Second Five-Year Plan was dis-

cussed at several authoritative levels. At the third meeting of the Standing Committee of the National Development Council, held recently in New Delhi, the question of raising financial resources for the Second Five-Year Plan was considered. The Committee reiterated its emphasis on heavy industries and proper integration between hand industries and large-scale industries producing consumer goods. The Committee also placed the target of expenditure at Rs. 4,300 crores and stressed the need for exploring additional methods of increasing revenues and savings for financing the Plan.

The Prime Minister emphasized that planning had to be on an all-India basis and said that the various draft Central and State Plans added up to more than Rs. 12,000 crores as against the plan provision of Rs. 4,300 crores. The raising of resources is a complicated problem and they will have to give serious thought to the question of adding to the resources for financing the Plan by 'normal' ways. They would also have to think about 'abnormal' ways of adding to the resources for the Plan.

Referring to the basis of approach for planning, Pandit Nehru said that the authorities had decided to lay emphasis on heavy industries and village and small industries. He has rightly pointed out that without heavy industries, the rate of progress would be low and a country remains dependent on imports from abroad. For instance, the shortage of steel is a great big hurdle to our expansion programmes not merely in respect of rail transport but in regard to housing and other schemes of development. Sri Nehru considers the development of heavy industries as vital to the nation's economy, and also of the small industries as an employment providing factor.

The Finance Minister put emphasis on the fact that the size of the Plan and the resources should be properly matched. From such calculations as had been made it appeared that if the ratio of public receipts to national income was maintained at the existing level, the Government should be able to provide altogether about Rs. 3,500 crores for the Second Five-Year Plan. As against this, the size of the development programme as indicated in the Plan frame papers, was Rs. 4,300 crores. The problem is how to raise another Rs. 800 crores so that the size of the Plan and of resources may be suitably adjusted. A part of this expenditure shall have to be raised

by taxation. The Finance Minister, however, stated that efforts would have to be made to devise new methods of raising loans and mobilising savings. In his view, a lowering of the size of the Plan in the public sector below Rs. 4,300 is not desirable. During the First Plan period the rate of increase in national income was about 3 per cent per annum. "This is the minimum to be kept before us as a target," he added. He pointed out that the Planning Commission had in view a target of 5 per cent increase in national income.

If the country continues to increase the national income at the rate of 5 per cent per year, the national income will be doubled in 14 years. Taking into account this long term prospect, the Finance Minister emphasised that the raising of resources to match the development programme was absolutely necessary. If there is a short fall in the resources, of Rs. 800 or Rs. 1,000 crores, what is to be achieved in five years will be achieved in six years and there will thus be a lengthening of the period for achieving a given level of development.

Reviewing the general position regarding iron and steel, the Union Minister for Commerce and Industry stated that, including the demand of the Railways, India would need about a million tons of imports every year to meet internal requirements. Some progress has been made in regard to the Russian and German steel plants and actual production will start in January 1959. The Government, however, is trying to speed up the production programme of these two plants. The Government has also expansion schemes for the Tatas and IISCO's plants. Production of Tata's plant will be stepped up by another 500,000 tons by early 1958 when the steel situation is expected to ease. Production at the Mysore Iron and Steel Works is also proposed to be stepped up from its present capacity of 25,000 tons to 100,000 tons and India's steel production would total 4.5 million tons by 1959.

The essential aspects of the main approach in the draft plan-frame are: (1) Planning is to be undertaken with reference to the physical needs and possibilities subject to financial considerations and especially foreign exchange requirements; (2) emphasis is to be placed on heavy industries, especially on the development of machine-building capacity; and (3) development of village and small-scale industries will be speeded up. The development of village

and small-scale industries is important from several points of view, notably, supply of consumer goods, employment, decentralisation of industry, avoidance of social problems such as slums, lower capital costs and smaller expenditure on overheads.

On the subject of financial resources for the Second Five-Year Plan, the outlay in the public sector has been divided broadly into two parts, namely, Rs. 900 crores on revenue account and Rs. 3,400 crores on capital account. It has been estimated that the balance from revenue and additional taxation could be brought up to a total of Rs. 700 crores. 'There is a gap in the share of the States in this amount which has to be made good. There is also a further gap to be met if the resources on revenue account are to be raised from Rs. 700 crores to Rs. 900 crores. The target of public loans and small savings over the next five years has been placed at Rs. 900 crores, i.e., an annual amount of Rs. 180 crores per year. As there will be a gap of Rs. 800 crores for a plan of Rs. 4,300 crores in the public sector, additional steps are needed to be taken to raise the amount to be obtained from public loans and small savings.

In considering the size of the individual State plans, the Planning Commission will take into account a number of factors such as population, commitments carried over from the first to the second plan, the level of development reached at the end of the first plan, the revenue position of the State and its ability to finance its plan on revenue account and the programme of irrigation and power which was determined largely on the examination carried out by the Technical Committee for Irrigation and Power.

As regards the employment aspects of the Second Five-Year Plan, 10 million jobs must be provided for new entrants to the labour force and there is also a considerable back-log to be made up. From such estimates as made by the Planning Commission, it appears that if the physical targets envisaged in the draft plan are achieved, in the non-agricultural sector employment opportunities to the extent of about 8 to 8½ million jobs may be realised. The Planning Commission also emphasises the need to devote special attention to the problem of educated unemployment. Special programmes are to be worked out for providing opportunities for the educated unemployed persons through work and training camps and other measures. The aim is to equip 1,00,000 educated

youths in the first year of the second Plan for productive work either in specific jobs in fields in which large-scale development was being undertaken and by way of self-employment.

During his Press conference at New Delhi in the first week of November, the Finance Minister of India gave the latest position regarding the financial resources of the Second Five-Year Plan. He expressed a sense of satisfaction with the progress of expenditure under the first Plan. His estimate is that nearly 85 to 87.5 per cent of the expenditure envisaged under the first Plan would be spent by the end of March 1956, that is, out of the target of Rs. 2,300 crores, as much as Rs. 2,000 crores would be spent. The achievements of the first five-year Plan include the ending of food scarcity, and the sufficient production of clothing and agricultural raw materials for industries. But the most disappointing failure under the first Plan is in the direction of providing employment at a much faster rate. The Finance Minister himself admitted that unemployment during the period of the first Plan increased by 4 million, although no correct estimate of unemployment is available. On the assumption that the creation of a job per person involves an expenditure of nearly Rs. 5,000 to Rs. 6,000, the Finance Minister estimates that additional employment to the extent of 4 to 5 million jobs must have been created in the first Plan, as against an increase of 9 million employable persons during that period. These figures indicate some idea of the magnitude of the problem. The population of India is increasing at the rate of 4.5 million per annum, and without the investments in the public sector under the First Five-year Plan, the unemployment situation would have worsened.

The Finance Minister estimated that of the amounts spent so far, Rs. 200 crores would represent deficit financing while by the time the Plan ended another Rs. 300 crores would have been spent by deficit financing making a total about Rs. 500 crores. Judging by the present level of prices, he felt that the deficit financing had been more or less matched by the additional production. He said that this deficit financing of Rs. 300 crores also included some of the expenditure planned for tackling the unemployment problem. The amount of deficit financing is nearly 25 per cent of the total outlay of Rs. 2,000 crores.

Dealing with the resources for the Plan, the

Finance Minister said that after taking note of the trade balances and the foreign assistance likely to be available, the deficit was expected to be of the order of Rs. 400 crores. Possibilities of floating a foreign loan had been explored in a distant way and he had some preliminary talks last year in Switzerland and he had made some tentative enquiries in the London money market. But for the moment India does not need to go in for loans and the question might become of some importance only during the second plan.

As regards the total outlay under the second Plan, the Finance Minister gave his personal opinion that the second Plan would be of the order of about Rs. 4,800 crores, thus representing an addition of Rs. 500 crores over the original estimate. This estimate he made from his association at various stages in the formulation of the Plans of the States and Central Ministries. In his view, the foreign exchange requirements would be of the order of about Rs. 1,500 crores. Of this amount, nearly Rs. 700 crores would be made up by way of foreign trade balances and about Rs. 400 crores by way of foreign assistance including loans from the International Bank for Reconstruction and Development. There would still be a gap of another Rs. 400 crores. Asked whether there was need for floating loans in foreign markets, when they had large sterling balances, the Finance Minister said that part of their sterling balances would have to be utilised as backing for their currency which would grow in the implementation of the second Plan on account of deficit financing. Taking all that into account, it would be found that the spendable surplus of the sterling balances would be small, even if nothing else happened.

To encourage the flow of foreign capital to this country, particularly dollar capital, the Government of India would take a decision on the American investment guarantee scheme in the not too distant future. The United States Government has suggested to the Government of India that India might participate in the scheme. Twenty six countries including the United Kingdom, Australia, Belgium, France, the Federal Republic of Germany, Italy, Yugoslavia, the Netherlands, Pakistan, Japan and the Philippines are stated to have joined this scheme. If India accepts this scheme, the payment of compensation to an American investor in this country in the event of nationalisation would not be justifiable matter in the sense it might have been

between a private party and Government, but would have to be settled between the two countries, namely, India and the USA by methods to be agreed upon as part of the scheme. The Finance Minister said that India would require foreign capital and foreign "know-how" in the field of those goods which our people cannot produce. In regard to the American investment guarantee scheme, the investment of the American investor would be in the private sector like the consumer industry which the Government of India is not thinking of nationalising.

In our view, India's foreign exchange resources can be increased by two ways, apart from those under contemplation of the authorities. Firstly, the gold holdings of the Reserve Bank should be revalued in line with present world price level. The old price of Rs. 21 per tola is much too unrealistic and uneconomic. By revaluation India should certainly get an additional sum of quite a substantial amount. The value of the present gold holdings is about Rs. 41 crores. We do not agree with the Finance Minister's views that sterling balances could not be spent as these are kept as currency reserves.

It is simply a wastage to keep gold or foreign exchange as a reserve against the issue of currency notes. Britain has adopted the system of entirely fiduciary issue which dispenses with the necessity of keeping gold or foreign exchange reserves and in consequence this system is the cheapest in the matter of note issue. It is time that India should switch on from the present costly system of proportional reserve to the fiduciary issue. The Bank of England's gold holdings are almost insignificant. There cannot be any better credit than that of the Government and gold is a costly substitute for that. In the socialistic pattern of economy, reserves of foreign exchange against currency issue seem to be an anachronism.

Trade Protection

The General Agreement on Tariffs and Trade was modified at the tenth session of the Contracting Parties who met at Geneva during the last week of October, 1955. For various reasons this session was important from the point of view of international trade. This is the first session after the admission of Japan into the GATT. Moreover, the deliberations and decisions at this session will pave the way for a freer and smoother flow of world trade. It

may be recalled that the Havana Trade Charter which was drawn up in Havana in March 1948 has remained inoperative since then and the GATT has continued to be applied provisionally by its signatories. In accordance with the provisions of the GATT, a review of its Articles became necessary in view of the changing conditions in the pattern of world trade. This review was undertaken at Geneva in the winter of 1954. The objectives of this review were firstly, to consider amendments to the GATT itself where necessary and secondly, to provide for the setting up of an Organisation to administer it, since the International Trade Organisation which was to administer the Havana Charter had not come into being.

Speaking broadly, the GATT has three objectives: firstly, to eliminate trade discrimination; secondly, to abolish unfair practices of all kinds, and, thirdly, to reduce the barriers to the smooth flow of international trade. India is in full support with the first two objectives. India does not believe in trade discrimination, and she allows imports from all parts of the world with the exception of dollar area. This is because on account of dollar shortage she has to be more restrictive. Likewise, in the matter of tariffs, she does not apply a discriminatory rate against those countries that do not have a Most Favoured Nation Agreement with us. Our country does grant preferences to certain specified goods originating in particular countries within and outside the Commonwealth. These preferences are being continued largely because so long as some countries enjoy preferences in particular markets, India cannot afford to give up our own preferences. The GATT prevents the creation of new preferences, and as a result of the tariff negotiations under the GATT the area of preference has been considerably reduced.

The second aim of the GATT is to provide a set of trade rules to regulate international commerce. In this category come matters such as the freedom of transit, methods of valuation for customs purposes and formalities connected with import and export. There are also provisions to deal with the questionable practices like subsidies and dumping. All these are matters where India can unhesitatingly subscribe to the principles of the GATT and the application of these principles are necessary for the interests of our own foreign trade. India does not give

subsidies, open or hidden, to her exports, and she does not dump goods in other markets. But if other countries do not follow a similar code, our exports and domestic industries are sure to suffer. So far as non-discrimination and trade rules are concerned, the GATT has the full support of India.

But when we come to the third principle, that is, the question of reducing trade barriers, we feel that the provisions of the GATT call for amendments. As a country with a substantial stake in international trade, India can certainly demand that there should be the minimum of obstacles to the smooth flow of her foreign trade. She has many industries dependent on export markets. These are important industries like the jute industry, the tea industry, the mica industry and the coir industry, to name but a few. It is quite undesirable that these industries should be allowed to suffer on account of unjustified trade restrictions.

The Government of India holds the view that in the course of our economic development it is inevitable that we should seek to discourage particular lines of imports in order that domestic industries producing similar goods may grow and expand. This point was recognised when the original GATT was drafted by providing Article XVIII for special measure to promote economic development. But the problem which the industrially developed countries have in this respect differ largely from those confronting a country which is in the early stages of its industrial development. This was the point which was overlooked by the old GATT. The old provisions of the GATT gave to its members a completely free hand except where the country concerned had during the course of tariff negotiations voluntarily agreed to give any tariff concessions in return for any concession which it had asked for and received. Although this was in no sense an unfair position, India felt that what was necessary was that there should be a suitable procedure to enable countries in the process of rapid economic development to withdraw concessions on particular items without too much difficulty or delay if such a course was found necessary in the interests of their development.

Further, the GATT stipulated that Quantitative Restrictions on trade should not be used except when a country is in balance of payments difficulties. Accordingly, the Indian delegation to the review session of the GATT was given in-

siructions to press for amendments to its articles to secure two objectives: namely, to enable under-developed countries like India to use quantitative restrictions on import in order to fulfil their programme of economic development and to assist the development of particular industries, and secondly, sufficient flexibility regarding the bound rates of tariffs should be secured to enable under-developed countries to make changes as and when new industries develop.

Accordingly, to meet the special position of the under-developed countries in the matter of extending protection to their growing industries, Article XVIII of the GATT has been wholly revised. Under the modified Article, member countries in the early stages of industrial development would enjoy additional facilities to enable them (a) to maintain sufficient flexibility in their tariff structure to be able to grant the tariff protection required for the establishment of particular industries and (b) to apply quantitative restrictions on imports to protect their balance of payments in a manner which takes full account of the continued high level of demand for imports likely to be generated by their programme of economic development.

*The modified Article begins with the recognition that there should be special facilities for the development of economies which can only support low standards of living and are in the early stages of development. There are thus two criteria laid down for use of these special provisions. If a country is under-developed in the sense that there are vast resources which have not yet been tapped but which has a high standard of living—for example a country like Australia, it cannot have recourse to all the facilities of Article XVIII. The same applies to a country which has a low standard of living but is well developed economically, as for example, Japan. The modified Article is really intended for countries which suffer from both handicaps like India, Pakistan, Burma, Indonesia and certain South American countries. Provisions for these have been incorporated in Section A, B, and C of the Article. Section D deals with countries still in the process of development but not having a low standard of living.

We on our part should, however, like to suggest that the protection of industries should be related to an overall plan of economic development; otherwise there may be unequal distribution of burdens and an unplanned

and uncoordinated development of industries. The criteria to be applied for granting protection to industries in the unplanned private sector should be the economic advantages enjoyed by the industry, its actual or probable cost of production, possibility of its development within a reasonable time and its ability to carry on successfully without protection or assistance and/or it should be an industry to which it is desirable in the national interest to grant protection or assistance, the probable cost of such protection or assistance to the community being not excessive. Protection must not be the protection of uneconomic and inefficient industrial units, nor protection should be an indulgence to recalcitrant and anti-social industries, as was the case with the sugar industry which was admittedly anti-social in the difficult days after the attainment of independence.

Another point which we should like to stress in this connection is that the authorities should not forget, while according protection to industries through import control, that the interests of the consumers would suffer if competition is totally shut out. A total prohibition in the import of particular consumer goods will lead to price racketeering at the cost of the State to the detriment of the consumers.

Why the Stubbornness over Goa?

The Soviet's standpoint on Goa has been very clearly expressed by our distinguished guests. It has had many repercussions in the West, and further reactions are likely. It would be interesting to note the background to it all as given in the *Worldover Press* for September 9, under the above caption:

On the face of it, Portuguese India, or Goa, is nothing but a relatively unimportant speck on the west coast of India. Its area is only 1,538 square miles, partly jungle; its population only some 640,000. Yet India is determined to acquire it, to wipe out this vestige of colonialism, and Portugal has an obvious—and an undisclosed—reason for hanging on. The little territory has every characteristic of colonialism—an idle clique of Portuguese socialites, the trappings of a virtual police state. If India gave firm guarantees, more than Nehru's personal assurance, that Indian possession would not detract from Catholic observances, local stubbornness might be assuaged.

As usual, however, there are factors that do not meet the eye. Even as far from Europe as

this, the drive to put Spain into NATO has had a lot to do with the controversy. Portugal's dictatorial regime is Spain's chief sponsor and unofficial spokesman. Britain has often gone along with Lisbon's boss, Dr. Salazar. Indians reason that if Spain gets into NATO, the nature of that alliance will change for the worse, and even as it is, India wants neutrality rather than backing for the NATO set-up. It sees Goa as a potential outpost of NATO in a future conflict, and can't tolerate the thought of even a theoretical military activity centered on its doorstep. In spite of its confidence that Goa could hardly, without NATO, ever be used as a springboard for interference with New Delhi policies, it hasn't forgotten that when the Portuguese first occupied Goa, their leader exclaimed: "If you lost the whole of India, from Goa you could reconquer it."

Behind the Worry over NATO

The same issue of the *Worldover Press* has also the following revealing comment which would explain a lot regarding U.S. sympathies for Portugal:

You can discount some of the moans lest NATO countries, in view of the changed Russian line and the spirit of the "Summit" Conference, "let down their guard." There is genuine concern because France has pulled troops out of West Europe to back its colonialism in North Africa. And though the Italian government backs U.S. plans, last March a popular poll showed 51 per cent of the Italian people for neutrality, and the tide in recent weeks has swelled.

Concealed behind the expressed alarm, however, is American frustration in Washington's attempts to get the Spanish dictatorship into NATO. When a House of Representatives committee voted for it, several NATO countries were angered. Norway said, "Never." Denmark ditto. And in recent days, off the record, other governments have manifested a strong displeasure.

West European countries which hate all forms of dictatorship have not yet recovered from their shock at a message sent last July 18, by President Eisenhower to Dictator Franco, congratulating him in effect on his 1939 overthrow of the legally elected Spanish Republic with the aid of Hitler and Mussolini. The triumph of Spanish Fascism is now celebrated as an annual holiday, though for 80 per cent of the people it is an ironic mockery. Yet Mr. Eisenhower said to Franco: "On this national holiday of Spain, it gives me

pleasure to convey to Your Excellency and to the people of Spain the best wishes and congratulations of the people of the United States." World-over Press informants inside Spain have reported the despair and dismay caused by this moral backing for the cruel and oppressive Madrid regime.

Singapore and Malaya

The background to the recent occurrences in Singapore and Malaya is provided by the following commentary in the *Worldover Press* bulletin:

Singapore.—Ever since early April, when David Marshall took over as Chief Minister in Singapore's first mainly elected government, there has been labor trouble. Criticized in the initial outbreaks as showing lack of firmness, the Chief Minister has lately been coming off better. At best his task has been extremely difficult.

What is going on in Singapore, a small island with 1,250,000 people, might not matter so much if it weren't for the important position it occupies in South-east Asia. What happens there, however, can easily influence the Federation of Malaya, Burma, Thailand, Indonesia, Borneo and Hong Kong. A lot hinges on Singapore's experiment in democracy.

The government's first big test came in late May. Workers at a Chinese bus company came out on strike because the company tried to break the men's union with a yellow union created by the firm itself. Thousands of Chinese students ranging from 11 to 22 years toured the streets singing songs and shouting slogans. Bloodcurdling speeches by strikers and students aroused hatred against the police. When rioting broke out, 20 badly hurt policemen were sent to hospital; two were beaten to death. In the senseless fury, an American correspondent, Gene Symonds, was also brutally murdered. Ironically, Gene was known for his sympathetic understanding of Asian aspirations.

Peace was restored when Mr. Marshall brought pressure on the bus company to dissolve the yellow union. But when he threatened to expel from school certain students he said were guilty of inhuman brutality, thousands of boys and girls staged a stay-in strike. There they remained until the Chief Minister changed his mind and set up a committee to go into the whole question of Chinese education in the colony.

Shortly after, 2,000 bus drivers and conductors came out in a sudden strike in sympathy with striking Harbour Board Clerks and a conductor charged with cheating the bus firm. At this stage, three trade union leaders threatened a general strike. They were Assemblyman Lim Ching Siong (aged 22), secretary of the Factory and Shop Workers' Union; Devan Nair, not long out of prison where he spent two years as a Communist suspect; and S. Woodhull, secretary of the Naval Base Union. At first, although sympathetic strikes are illegal, Marshall talked with these men, giving the impression he had made a deal. That night, however, the police arrested six trade unionists and raided the premises of Lim's union.

Enraged, the three unionists called a general strike. While 17,000 bus and factory workers came out, more than 100,000 workers—Mr. Woodhull's own union among them—ignored the call. To save face, the trio told workers to go back for eight days to see what happened to the six men who had been arrested and charged with planning subversive violence. Marshall refused to be intimidated. Nevertheless, on June 24 the last of the arrested men were released.

Lim, Nair and Woodhull are members of the anti-colonial, socialist People's Action Party. Consequently, his party has been blamed by Mr. Marshall and a strong section of public opinion for causing all the trouble. The three, in fact, did not have the party blessing. The party's policy is based upon constitutionalism. Neither its president nor its secretary gave any approval to the acts of Lim, Nair and Woodhull, and the secretary, Lee Kuan Yew, pointedly stayed on holiday.

There is an extremist group within the party, however, and a struggle between the party and the Labor Front government for control over the unions, for political purposes. Few trade union officials here yet understand the idea of unions democratically organized and operated.

Indonesian Elections

The first General Elections in Indonesia were held on September 29. Though the final results are not yet available a broad picture of the relative position of the contesting parties discernible which is not likely to be materially disturbed by the final figures.

The most notable outcome of the elections

is the disappearance from the political arena of the greater of the majority of the one hundred and ninety parties and organizations that took part in the elections. Even some of the parties with relatively large membership in the "provisional" parliament have failed to gain popular backing for them. So that for some time, at least, Indonesian politics is going to be a struggle for power between four parties—P.N.I. (Nationalist), Masjumi (Moslem), Nadatul Ulema (Conservative Moslem) and the Communist Party.

About 75 per cent of the 430 million voters actually took part in the elections in which the proportion of male and female voters were about equal. Despite a number of instances of malpractice detected it may safely be concluded that the elections were greatly successful.

Indonesia is soon to have another election based on adult franchise. On December 15 the citizens of Indonesia would elect a 520-member Constituent Assembly which would frame a constitution for the country.

UNESCO on South Asia

The second issue of the *South Asia Social Science Abstracts* covering the year 1953 was recently published in New Delhi by the South Asia Science Co-operation office of the United Nations Educational Scientific and Cultural Organisation. Following the classification in the first issue the abstracts are presented in five groups: Sociology, Social Anthropology, Social Psychology, Political Science and Economics. The abstracts cover 57 publications in three countries, India, Burma and Ceylon, but admittedly the greater majority of the abstracts come from Indian journals since the number of social science journals published in Burma and Ceylon were very small. The Abstracts showed that greatest emphasis was being given to Economics in the three countries, although Political Science also claimed some interest. Relatively little was published in the other social science disciplines.

A publication of this character, even with its present limitations, particularly as regards the number of countries covered, cannot fail to receive the heartiest welcome of all concerned with the study of social sciences.

Britain and Self-determination

Mr. Samuel Hoare, the British delegate in the United Nations Social Committee, urged the adoption of a motion sponsored by the three

powers—Britain, Australia and the Netherlands—to eliminate the first article of draft covenant on Human Rights which said that all peoples and all nations have the right to self-determination—namely, the right freely to determine their political, economic, social and cultural status. According to the view of the British Government there was a "fundamental difference between self-determination as to right as (as it was spoken of in the right) and as a principle (as it was referred to in the United Nations Charter)." The British Government accepted the principle but denied the right, which could give a handle to minorities in many countries to launch break-away movements and deal a blow at the sovereign rights of nations.

Speaking on a different occasion and at a later date U.S. Deputy Under Secretary of State Robert D. Murphy also echoed the British view. In a speech before the conference on "Africa and Asia in the World Community" sponsored by the Catholic Organization for World Peace, Murphy expressed U.S. sympathy for the colonial people's striving for self-determination. "We look forward," he said, "to the day when the remaining non-self-governing territories, large and small shall have attained the goal of self-government and where suitable, the status of independence." But "the Charter articles on self-determination should not be given the far-reaching interpretation of a general right for any people or country to break all ties with the mother country."

Mr. Murphy added that because of the various concepts of self-determination, the United States delegation to the General Assembly of the United Nations would propose that the whole question of the principle be made the subject of a "much more profound study to see if a substantial measure of agreement on the meaning and essential elements of the problem can be reached."

Reuter reported from New York on November 3: "India today appealed to opponents of the article on self-determination in the draft covenants on human rights—particularly the U.S.A.—to reconsider their position and join in a final attempt to reconcile differences on it."

Rev. J. D'Souza, the Indian delegate referred to the fact that the U.S.A. had joined with India, Belgium and Lebanon at Paris five years ago when it had been decided that there should be two separate covenants—one dealing with civil and political rights and the other with economic, social and cultural rights. The U.S.A. had then

agreed to welcome the covenant on political rights, but now it took a position that it could sign neither.

A Sample of "Civilization"

Southern Rhodesia in the continent of Africa is a British colony. Its membership in the 1953 Central African Federation did not materially change its political status. Despite general non-interference in the internal affairs of Southern Rhodesia by the British Government the approval of the latter was compulsory for any enactment relating to the African population.

Following the usual racial policy of the European settlers in other parts of Africa, Southern Rhodesia also had a system of racial segregation in operation within the country. Needless to mention that the best lands had been appropriated by the white settlers.

Recently two diplomatic and consular representatives from India and Pakistan went to Salisbury—the capital city of Southern Rhodesia—on official business. But in spite of great efforts they could not secure suitable accommodation for their offices. The two representatives were (at least to the British eyes) dark-complexioned; so they could not secure any premises in the area inhabited by the whites. The African-inhabited areas, on the other hand, being very poor had no suitable accommodation to offer from where diplomatic and consular activities could be carried on fruitfully. Eventually they were able to obtain temporarily an office for their purposes only with the personal intervention of the Prime Minister, Lord Malvern.

It may be mentioned here that it was not only in regard to residential accommodation that the Indians were subjected to such humiliating discrimination. Such discrimination extended to cinema houses, hotels and streets.

Middle East Security

The Egyptian Economic and Political Review, a monthly review of economic and political affairs in Middle East published from Cairo, writes in its leader of October, 1955, that the crumbling facade of the Turco-Yugoslav-Greek alliance over the Cyprus question conclusively demonstrated that "no serious defence of the Middle East can be assured without the collaboration and support of the

local populations;" that alignment in military pacts and defence structures being hopelessly incapable of rallying the required popular support was no solution at all.

Referring to the periodical Western accusations against Egypt and other Arab countries that the latter were irresponsible trouble-makers the review writes: "It is only fair today for us to accuse both the Turkish Government and whoever in Britain is responsible for the present Cyprus impasse of equal irresponsibility and disregard for Middle East security."

The magazine regrets the attacks on the places of Christian worship in the anti-Greek riots in Turkey and condemns these outrages, "for such deeds are not only condemned by the Faith, but the Moslem is required to protect and secure the churches of the Christians from attack." Even after all these riots the Cyprus issue was not nearer any solution and such disorders were clearly unnecessary, the paper notes. The Turkish Government's efforts to disclaim all responsibility and to put all the blame on the Communists are ridiculed in the editorial article. "In the Turkish police state hardly anything happens without the Government's knowing about it, for, in Turkey, there are more policemen and soldiers per inhabitant than in any other country in the world," it writes. The violence of the anti-Greek demonstrations was also "a reflection of the state of internal security in Turkey, where growing economic instability and political resistance is steadily increasing against the Government."

Criticizing the British stand on the Cyprus issue the editorial says that the main stumbling block to any agreement or compromise in Cyprus lay in the outlook of the British Colonial office "that Britain is in Cyprus for good." This indefensible stand upon permanent occupation of the island must at once be given up. Again if it was Britain's policy to stay on the island "there was really no reason at all for inviting Greece and Turkey to discuss a matter which must in such circumstances be an internal British affair."

The editorial assails the Turkish claim to represent the Cypriot Moslems in the following words: "Cyprus has never been Turkish, for Turkey is a product of the First World War. If, on the other hand, relationship with the former Ottoman Empire now inspires Ankara, one must assume that it is concern for fellow Moslems that moves them. Should this

be the case, one feels that other Moslem States whose relationship to the Empire was more definite than that of the 'Kemalist Turkey should also have been invited to London."

Refuting the argument that Turkish concern for Cypriot Moslems was related to the maintenance of her State security in the southern borders, the newspaper points to the fact that Caucasus area was far more important to her State security than is Cyprus. "There are certainly more Moslems of Turkish origin in Southern Russia than there are in Cyprus. It is easy to adopt martial attitudes when the attendant risk of retribution is small, but where the Caucasus is concerned Ankara no doubt considers that discretion is the better part of valour," the periodical writes.

A Philosopher's Sacrifice

The subjoined news-item sent by *Reuter* from Rome is a reminder of the cost of one single step forward in the genuine advance of humanitarian scientific knowledge: "Prof. Mario Ponzio, pioneer Italian radiologist, today (October 25, 1955) underwent his 18th operation in 30 years for cancer contracted in the course of his radiation studies. One of his disciples Prof. Achille Mario Dooliotti amputated two of the three remaining fingers on his right hand.

"The senior professor, whose condition is stated to be satisfactory, lost his left arm and part of the shoulder last July."

The Buraimi Oasis Crisis

For several years now the Buraimi Oasis has been an apple of discord in the relationships between Saudi Arabia and the United Kingdom. The question of the jurisdiction over the disputed area was submitted to a five-man arbitration tribunal in Geneva in July, 1954. The tribunal was to decide: (1) the location of the common frontier between Saudi Arabia and the British-protected Sheikdom of Abou Dhabi involving some 75,000 square kilometres of territory lying between Buraimi and Hofuf; and (2) sovereignty over Buraimi Oasis, an area defined for arbitration purposes as a circle containing about 2,000 square kilometres. Saudi Arabia considered Buraimi to be a part of her territory while the United Kingdom supported the claims of Obou Dhabi to part of the Oasis and the claims of the Sultan of Muscat, who also Britain represented, to the remainder. The British delegate on the tribunal, Sir Reader Bullard resigned on Septem-

ber 16 of this year alleging that the Saudi Arabia representative on the tribunal, Sheikh Yusuf Yas'in was not acting impartially as a member of the tribunal. Following the resignation of the British delegate the President of the Tribunal, Dr. Charles de Visscher of Belgium also resigned from the tribunal on September 23. The other members of the tribunal were Sr. Ernesto de Dihaigo of Cuba and Mr. Mahmud Hassan of Pakistan.

In a statement issued on September 18, the Saudi Arabian delegate, Sheikh Yusuf Yas'in refuted the charges of the British delegate. He pointed out that his official position in the Saudi Arabian Government had all along been known to the entire tribunal and his position had never been a cause for objection on the part of the neutral members although the tribunal had been in existence for nine months and had held two full sessions.

Following this disruption of the tribunal troops of British-protected Sultan of Muscat and of the Sheikh of Abu Dhabi occupied the disputed Budaimi Oasis on October 26, 1955. Disclosing this fact in the British House of Commons on the same date Sir Anthony Eden, the Prime Minister, said that the troops had occupied the Oasis up to a line proposed by Britain in 1935 but further modified in favour of Saudi Arabia in 1937. He added that the Saudi Arabia Government would be informed of the decision to reoccupy the Oasis up to the modified 1935 frontier line. "I hope in time the Saudi Arabian Government will accept the solution we have had to declare," he concluded.

The Saudi Arabian delegation to the United Nations denounced this action of the British Government and said that Britain was trying to force the Buraimi issue to an armed conflict rather than settle it by peaceful methods. The statement of the delegation issued on the night of October 2 recalled the fact that originally Saudi Arabia favoured a plebiscite in the disputed area to ascertain the wishes of the people whether they wanted to remain Saudi Arabian citizens or would like to join either Muscat or Abou Dhabi, "so-called British protectorates." It was only at the suggestion of the British Government that Saudi Arabia had accepted international arbitration. But at the moment the British Government "felt that the tribunal's decision was going to be unfavourable to her, she ordered the British

representative to resign in order to hinder the work of this international body and forestall any peaceful settlement of the dispute." Afterwards an official protest was lodged with the British Government against the forcible occupation of the Oasis.

In a statement issued from Cairo on October 29, Emir Faisal, the Saudi Arabian Prime Minister, warned the Persian Gulf chiefs, the Sultan of Muscat and the Sheikh of Abou Dhabi against the dangers of furthering British designs at the Buraimi Oasis.

The British Commonwealth Secretary, the Earl of Home, said in Peshawar on November 1, 1955, that the occupation of the Buraimi Oasis by British troops was an act under treaty obligations. Troops had been moved in only at the request of the Rulers of Muscat and of Abou Dhabi.

According to *Reuter* the permanent Saudi Arabian delegate to the United Nations reportedly said on November 2 that unless the British Saudi Arabian dispute over the Buraimi was solved peacefully "we might have to resort to force." The delegate, Sheikh Abdullah at Khayyal added the question of bringing the matter before the Security Council was under active consideration of the Saudi Arabian Government.

Commenting on the resignation of the British delegate to the arbitration tribunal the *Egyptian Economic and Political Review* writes that "on the British must rest the responsibility for the stoppage" of the work of the tribunal. However, it notes, the disruption of the tribunal was not surprising since clearly "the Buraimi question is of an importance and a magnitude which tends to place it above the competence of an arbitration court, for of such conflicts wars are made" (the editorial article was written before the British occupation of the territory in October, 1955).

It goes on to add: "It would appear that Sir Reader had counted far more than was prudent on his supporters in Muscat and Abou Dhabi and was in consequence taken by surprise when confronted with the evidence that many of these had supported the Saudi argument rather than his own. It is this that has brought forward the accusations of Saudi bribery, which has been broadcast with such vehemence during the last few weeks.

"It would be interesting to hear the British representatives' opinion on what they

consider is bribery. Bribery is a word easy to use but hard to prove and define. For the coercion of bribery can come in many forms but not least amongst them that of the military and financial support given to many of those whom Britain claims to represent in the *Persian Gulf*.

Referring to the bloodshed in the Buraimi area consequent on the armed attack on Saudi Arabian positions on October 26, the Moscow weekly *New Times* writes that evidently it was not the vassal states of Muscat and Abou Dhabi "that are interested in the annexation of Buraimi, but British oil companies which intend to operate the petroleum deposits of the area. The *London Times* wrote some two months ago that it was important to retain control over Buraimi, 'because it is supposed to contain rich oil deposit, because companies are prospecting there and because, if sovereignty cannot be determined, they will not be certain that their investment is made upon a safe foundation'."

The *New Times* notes the significance of the timing of the armed occupation of Buraimi and says that "it is in a way a demonstration of determination to act in the Middle East from 'positions of strength.' It is plainly a move to exert pressure on Saudi Arabia which, with some Arab States, is pursuing an independent foreign policy and upholding its national interests."

U.S. Air Bases in Pakistan

The New York correspondent of the *Madras Hindu* quotes the *New York Times* of November 18 to report that agreement was reached between the United States and Pakistan for use of 20 million dollars of American counterpart funds for improving air bases, port facilities and highways in Pakistan.

He adds: "General Talley, who was in charge of construction of American air bases in North Africa will, it is stated, proceed to Pakistan next week to supervise the operations there."

Traffic in Women

Press Trust of India reports that the Social and Moral Hygiene Advisory Committee appointed by the Central Social Welfare Board were presented in November 11 at the conference of the Chairmen of the State Social Welfare Advisory Boards in New Delhi by the

President of the Committee, Mrs. Dhanwanti Rama Rao.

The Committee laid greater emphasis on preventive steps rather than on detection and punishment in regard to trafficking in women. It also drew attention to the weak enforcement of the existing laws.

The Committee referred to the existence of a countrywide network through which this immoral business prospered. The existence of such a network was evident from the fact that in large cities women drawn from distant parts all over the country were lodged in what were freely pointed out brothel areas. These women could not have found their way unguided into those areas. "Most prostitutes operate only under the 'protection' of the *gharwalis*, *naikas*, pimps and procurers. A determined effort to break the system is the surest method of minimising this evil."

Though prostitution was regarded as primarily being an urban problem as many as 66.5 per cent of such women came from rural areas, the age group of prostitutes falling between 10 and 29 years on the average. On the causes of prostitution the Committee gave the following facts: 55.4 per cent took to prostitution on account of economic distress; 27.7 per cent due to domestic disharmony, inadequacy, ill treatment, desertion, widowhood, etc., and 16.9 per cent due to certain social and religious practices obtaining in some communities. "While figures for kidnapping and seducing are not available, it is estimated that even in respect of such women the original cause would fall under one or other of the above three heads," the Committee said.

Military Wealth of USA

Anthony Leviero writes in the *New York Times* that, according to an official estimate disclosed on October 29, the United States had \$123,900,000,000 tied up in armed forces properties and goods. This evaluation, however, did not include the investment in atomic energy which was valued at \$12,500,000,000 including \$6,000,000,000 in capital investment. The following categories were also excluded from the above estimate: Properties and equipment of the national industrial plant and equipment reserve, which were in the custody of the General Services Administration; supplies and equipment in overseas field Army

depots and some overseas Airforce depots that had not yet brought into the monetary accounting system, properties in the hands of the Civil Works Organization (rivers and harbours and flood control) of the Army corps of engineers and certain other minor items.

The bulk of the evaluated properties could be used up, wasted away or could become obsolete. The report of the Defense Department to President Eisenhower said: "Some 4,000,000 of different kinds of items aggregating well over \$100,000,000,000 of assets comprising the properties and material inventories owned by the Department of Defense are involved in these accounting and reporting systems."

Land, buildings and long-life equipment, such as ships were priced at acquisition costs. The total cost of the Government of real estate controlled by the Army, the Navy and the Air Force was thus valued at \$21,500,000,000 as on January 1, 1955. But that figure by no means indicated the present market value of the properties because some land had been acquired a century or more ago at a fraction of today's prices and some lands had been received as donations to the Defense Department. On the other hand, no allowances had either been made for loss in value as a result of depreciation. Moreover, since the data represented an inventory as of a given date, they did not include costs of structures which had been demolished or replaced prior to that date.

The Army portion of the total inventory holdings on the basis of cost was 39 per cent, Navy 34 per cent, and Air Force 27 per cent.

About 82 per cent of the holdings were in the continental United States.

"The Department of Defense," the report said, "though the three military departments controlled a total of 29,400,000 acres of land throughout the world on January 1, 1955. This included land owned, leased, used on temporary permit, and various occupancy rights (easements and foreign rights of different types)."

Recapitulation of the Inventory (Millions of Dollars)

As of December, 1954*				
Type of property	Total	Army	Navy†	Airforce
Grand total	\$123,866	\$34,082	\$56,428	\$33,356
Real property				
inventories	21,469	8,399	7,352	5,718
Machine tool inventories	2,883	836	1,084	963

Equipment & supplies in the supply system	50,643	20,729	17,680	12,234
Stock funds inventories	8,784	6,185	2,019	580
Appropriated funds inventories	41,859	14,544	15,661	11,654
Industrial funds inventories†	332	121	211	**
Major equipment in use	48,539	3,997	30,101	14,441

Peaceful Uses of Atomic Energy

A resolution on the peaceful uses of atomic energy and the establishment of an international atomic agency which was sponsored jointly by eighteen nations was adopted by the Political Committee of the United Nations General Assembly by a vote of 53 to 0 with 6 abstentions (Egypt, Iraq, Lebanon, Saudi Arabia, Syria and Yemen). The resolution made the following major points:

It recognised the necessity of ensuring that the agency and the nuclear material which might be placed at its disposal would be used exclusively for peaceful purposes; it suggested the convocation of a conference of all prospective members of the agency—all members of the United Nations or of its specialised Agencies—on the final text of the agency's statute; it requested the Secretary-General of the United Nations to draw up suggestions for the future relationship between the agency and the U.N.; it increased the number of drafters of the statutes of the agency from eight to twelve by the inclusion of Brazil, Czechoslovakia, India and the Soviet Union; it recommended the publication by the agency of a scientific periodical on peaceful uses of atomic energy; and the holding of a second international scientific conference within two or three years and technical conferences on specific subjects and it endorsed the continuation of the Atomic Advisory Committee of the UN Secretary-General.

Whaley-Eaton Service in Washington recently published the world's first catalogue of the more than 1000 scientific and technical papers submitted to the UN Atoms-for-Peace Conference in Geneva. The catalogue is available free on request by educational institutions, business firms and government officials.

* Except inventory in machine tools, which was as of March 1, 1955.

† Included marine corps. ‡ Consists of raw materials, supplies, work-in-process, finished goods, excess and salvage. ** Less than 0.5 million.

Radiation Study

The Political Committee of the United Nations General Assembly unanimously approved the establishment of a U.N. machinery for a scientific study of nuclear radiation levels, their effects on mankind and for setting uniform standards to measure them. The resolution sponsored by India and the United States was approved by 59 votes to nil on the 7th November. Earlier the Committee rejected several amendments, separately sponsored by the Soviet Union, India, Indonesia and Syria calling for a ban on nuclear weapon tests and for the participation of China.

The decision marked the second time within less than a month that the United Nations reached unanimity on a matter connected with peaceful uses of atomic energy. The earlier decision gave U.N. backing for international co-operation in the utilisation in medicine industry and agriculture.

Under the present resolution the Secretary-General of the United Nations would convene a committee of scientists from 15 nations to carry out the radiation study. After collecting and evaluating radiation reports from national sources, the Committee would make annual progress reports from national sources and would present a summary of its findings by July, 1958 at the latest.

The resolution called on all the members of the United Nations and its specialised agencies to co-operate with the committee and on the specialised agencies themselves to co-ordinate possible work in radiation research with the Committee. The countries making up the Committee were: Argentina, Australia, Belgium, Brazil, Canada, Czechoslovakia, Egypt, France, India, Japan, Mexico, Sweden, the United Kingdom, the U.S.A. and the USSR.

A USIS news release says: A Soviet amendment calling for a ban on nuclear weapon tests was defeated by a vote of 39 to 9, with 8 abstentions. A similar suggestion by Syria and Indonesia was turned down by 36 votes to 17, with 6 abstentions.

Another Soviet amendment to include China and Rumania in the scientific Committee was rejected by a vote of 40 to 9 with 9 abstentions. An Indian amendment not naming China but opening the door to active Chinese participation was defeated by a 23 to 25 vote with 6 abstentions.

The Political Committee by a vote of 43 to 0 with 11 abstentions accepted an amendment

sponsored by all the Latin American countries to add four nations—Argentina, Mexico, Belgium and Egypt—to the Scientific Committee originally projected as including eleven members.

The United States Atomic Energy Commission recently rejected a proposal for an "Atomic Summit" meeting in the Pacific made by one of its five members, Mr. Thomas E. Murray as "contrary to the best judgment of the AEC." The statement issued on November, 17, by Commissioner Lewis L. Strauss, Chairman, Willard F. Libby, John Von Neuman and Harold S. Vance said that the Commission had earlier rejected a similar suggestion of Mr. Murray to invite foreign observers, including Communist observers, to witness tests of nuclear weapons. The statement recalled that the Russians had been given an opportunity to witness the atomic explosion at Bikini in 1946. But that had not improved co-operation.

After the recent atomic explosion in Russia Moscow Radio announced on November 29 that the Soviet Union was ready to discontinue tests of nuclear weapons if other Powers would do the same.

American Big Business

Five hundred American business firms, comprising less than two-tenths of one per cent of the 360,000 mining and manufacturing companies in the United States, controlled more than half of the United States industrial production and approximately one-quarter of that of the non-Communist world. All but two of these five hundred firms had net annual sales of \$50 millions or more and together they accounted for 51 per cent of the sales of all manufacturing and mining companies in USA. Reaping 66 per cent of net industrial profits they commanded 56 per cent of all industrial assets although employing only 44 per cent of the country's industrial workers.

The report in the *A.I.C.C. Economic Review* from which the above facts have been taken adds: "By far the most imposing of these giants is General Motors Corporation, with sales in 1954 of nearly \$10,000 million. Second to General Motors come Standard Oil (N.J.) with sales of \$5700 million, and next probably Ford whose sales, although not officially published, are thought to beat those of U.S. Steel, \$3200 million, for third place.

"In many industries, three or four major con-

cerns dominate production and continue to hold the lead from year to year. Below these, however, the composition of the 500 largest firms varies a good deal from year to year. In 1955, for example, between 50 and 100 new firms may succeed in pushing others of the list."

A USIS news release, October 28, adds: "The world's largest private manufacturing enterprise, the General Motors Corporation (GMC), in the first nine months of this year has exceeded its earning for any full year in its history. The net income for the first nine months of 1955 amounted to \$912,887,537 larger by 13.3 per cent over its income in the whole of the year 1954.

Private U.S. investments abroad stood at \$26.5 billion at the end of 1954 registering a rise of nearly three billion dollars over 1953, disclosed the Office of Business Economics, U.S. Department of Commerce.

Most of the investments were mining and petroleum enterprises in Canada, Latin America and the Middle East. A striking development in 1954 and early 1955 was greatly increased purchases of European securities. Net purchases of European Corporate Stocks were \$100 million in 1954 and a further \$55 million were purchased in the first half of 1955. At the end of 1954 American holdings of foreign bonds and stocks were valued at \$5 billion in current prices sixty per cent of which was in Canada where by the end of 1954 U.S. direct investments were valued at nearly \$6 billion—\$2 billion being invested in mining and petroleum and \$2.5 billion in the manufacturing industries.

Direct investments in Western Europe were climbing at a rate of about \$200 million a year in recent years, mainly through reinvestment of earning. At the end of 1954 their value was \$2.6 billion, including \$1.4 billion in manufacturing and about \$700 million in petroleum enterprises.

Capital outflows for investments in foreign securities and short-and-medium-term foreign credits and assets reached a post-war high of \$860 million in 1954.

The following chart shows the different types of investment:

Private U.S. Investment Abroad, 1953 and 1954. (Billions of dollars; year ends).

NOTES

Russell Pushes Abolition of War

In view of the new turn in the cold war, the following interview that the *Worldover Press* correspondent, Maurice Cranston, had with Bertrand Russell is of interest.

It will be seen how even this philosopher-scientist had to change his views when the "other side" also got the "know how" and the technique of atomic weapons:

London.—Undeterred at the brushing aside of his appeal for the ending of war by some American scientists, Bertrand Russell talked to me about the importance he still attaches to that statement, backed by many eminent scientific figures and addressed to the governments of the world. Lord Russell does not intend to slacken his effort.

"Scientific methods of warfare," said the 83-year-old philosopher, "have had the unexpected result of making war absurd. War can no longer be used as an effective instrument of policy, because nuclear weapons will destroy most of the participants in any war and may even destroy the human race."

I asked Lord Russell whether he did not think the traditional moral justification of war was obsolete. He said it was. "We can no longer say it is right to go to war to defend freedom, because war can no longer defend freedom. It can only serve to destroy freedom together with almost everything else." He did not accept the view many people hold, that it would be a good idea to ban nuclear weapons alone. "To say 'Let us ban nuclear weapons' is as futile as saying 'Let us go back to bows and arrows.' We must outlaw war."

Asked whether, while it might be impossible to defend freedom by nuclear war, it might be possible to defend it by the threat of nuclear war, Lord Russell replied: "That was the view I put forward myself five or six years ago, when the West had an overwhelming superiority of atomic weapons, and I thought an atomic threat might force the Communist to come into an international organization for peace. But now, of course, one can see that the threat of nuclear war can be used

to uphold tyranny against freedom just as easily as to uphold freedom against tyranny. Behind such threats is the reality that neither side could achieve its object by acting on such threats. Both sides have the power to inflict enormous damage on the main cities of the other side in a matter of hours, but neither side has the power to destroy the other's power to retaliate with the same weapons. That is one reason why a nuclear war is a war which cannot be won."

Lord Russell did not suggest there was any prospect of international friendship eliminating all disputes; he only recommended that there should be international machinery for settling such conflicts by peaceful means. "This is a long and arduous task," he admitted, "and it is not likely to be completed quickly."

At a recent conference of scientists on nuclear warfare held in London, several eminent scientists said they were reluctant to sign such appeals as that drawn up by Lord Russell because they did not think the scientist as such had any authority to speak on moral questions. "I have never claimed that the scientist has any such authority; what I have said," declared Lord Russell, "is that it is the duty of scientists to warn mankind of the disasters war must inevitably bring to the world now that nuclear weapons have been devised. It is also the scientist's duty to tell mankind about the immeasurable benefits which science might bring if the danger of war is removed."

Lord Russell said it was certainly not for scientists to decide how their knowledge should be used; the statesmen and politicians would have to decide that, and they in turn would be guided by public opinion.

"We have reached a point in history where human beings must make the great decision," Lord Russell said. "On the one hand there is the prospect of war which may bring death not only to all mankind, but also to all living things on our planet. On the other hand, there is the prospect of peace and happiness, with scientific knowledge being used for the elimination of misery and want. That is the choice. I allow myself to hope that men will choose peace."

Film Awards

We have received the following communication from the Secretary, Sangeet Natak Akademi:

The Sangeet Natak Akademi has decided to

institute Akademi Awards in the field of films, similar to the awards for outstanding attainment in the fields of dance, drama and music. The first two film awards will be made along with the next Akademi Awards in early March, next year:

1. To the best producer or director of a feature film.
2. To the best actor/actress in a feature film.

Film organisations and institutions, film critics and other individuals connected with films are invited to recommend names of persons who, in their opinion, are qualified for the above two awards. In each case, full particulars of the person recommended and the reasons for the recommendation should be given.

Recommendations should reach the Secretary, Sangeet Natak Akademi, 70 Regal Buildings, New Delhi, not later than January 31st, 1956.

Inquiry into Suicides

Suicides have apparently assumed such disturbing proportions in Saurashtra that the Saurashtra Government have considered it necessary to appoint a seven-member board under the Chairmanship of Sri Maldevji Adodra, M.L.A., to inquire into the reasons for suicide in the State. The Board would enquire details of suicides in the next three months and recommends to the Government the steps to be taken, the *Bombay Chronicle* reports.

NEW YEAR'S SUBSCRIPTION TO THE MODERN REVIEW

Subscribers, whose subscriptions expire with the current December number, are requested to send the next year's subscription quoting their respective serial subscribing numbers before the 28th instant by money-order. Otherwise, unless countermanded, the January number will be sent to them by V.P.P.

Those who may happen to have sent their subscriptions immediately before the arrival of the V.P.P., should refuse the V.P. packet, as fresh packets will be sent to them by ordinary book post as soon as the money-order reaches this office.

MANAGER, *The Modern Review*.

SOCIAL REGENERATION IN INDIA

By RAJANI KANTA DAS, PH. D. AND SONYA RUTH DAS, D.LITT. (Paris)

A most important factor in the upbuilding of India's new civilization is her social regeneration. Indian society has for a long time been moribund and backward and more or less immobile and static, due to a number of causes such as poverty and disease, illiteracy and ignorance, caste and untouchability, superstition and prejudice, idolatry and priesthood, and invasion and conquest. Although the Renaissance and various other social movements have made great contributions to the awakening of national life, they have not yet touched more than a fringe of the vast society and its progress has been hampered by such factors as revivalism, communalism, separatism, colonialism, and imperialism. India is therefore urgently in need of reconstruction and reorientation of her cultures in order, first, to establish a solid moral and spiritual foundation of her new civilization and second, to build her social, political and economic life.

The most important factor in social regeneration of India is the achievement of national independence, which has been followed by the establishment of the democratic Republic. In the First General Election of 1950, India mobilized 176 million men and women of 21 years of age and over, by far the majority of whom were illiterate. It was not only the greatest event in the history of national election, but was also the greatest factor in the awaking of India's masses, who had remained asleep in the countryside since primordial times. There are, however, several other organizations and movements which have long been engaged in bringing about a veritable social regeneration of India, some of which have been discussed in the pages of this periodical.*

CULTURAL REORIENTATION

The greatest asset of society is its cultural heritage or social tradition coming down from time immemorial and supplying not only the

most of the techniques of group life—mores, beliefs, folklores, customs, laws, and institutions—but adding some kind of mysticism and sanctity to the social process and making life worth living. Social tradition in fact forms the basis of life, whether national, group, or individual, and gives it stability and solidarity. Moreover, its significance lies in the fact that it forms a subconscious part of human nature and exerts a great influence upon human behavior in all social activities.

RATIONALIZATION OF THE TRADITION

Like the human body, the human mind, as far as its social attributes are concerned, is a continuation of the past. Even before it becomes self-conscious the child absorbs social traditions from its parents and other members of the primary group and gradually comes under the influence of larger and larger groups. An important problem of cultural reorientation is the rationalization of the old traditions in order to create an objective attitude towards the world and to facilitate the acquisition of knowledge in its true perspective and significance. The greater the volume of scientifically ascertained social traditions of a community, the greater the possibility for its continued progress.

Both the volume and the value of social traditions are of great importance to the development of the individual and society. Although a living institution, social tradition has fallen into inertia and inactivity in India, and this is also the case in many old civilizations. In spite of its great achievements in art, philosophy, and science, India's cultural heritage suffers from a number of defects:

First, by far its largest volume was acquired during the pre-historic and ancient periods when superstition and mythology were the dominant features of social traditions. Moreover, unlike other religions, popular Hinduism is a mode of living consisting of customs, mores, practices, habits, laws, and institutions rather than a set of tenets or doctrines, compiled from the preachings of a prophet or the Sacred Book.

* See, for instance, in *The Modern Review* the writers' article on "India's Creative Recreation," (February, 1955), and "The Educational Movement in India" (June, 1956).

Second, Aryan and Dravidian cultures are extremely rich in literature, such as the Vedas, the Upanishads, the Puranas, the Mahabharata, the Ramayana, and other works which have become parts of Hindu religion practised by the common people. But during the medieval period India was invaded, conquered, and ruled by the Moslems, and this often involved the destruction of temples, palaces, and universities, the annihilation of royal dynasties, and the forcible conversion of Hindus into Moslem religion, all of which had deteriorating effects upon Hindu culture.

Third, during the modern period, India was conquered and ruled by the British. The very fact of domination by a foreign power thousands of miles away, discrimination by the British Government against the Indians in all high functions of the State, and the neglect of India's arts and crafts that might compete with Britain's growing industries, created an inferiority complex among the people and retarded their moral and spiritual development.

Hindu civilization has thus passed through many varieties of experience from pre-historic to modern times and has inherited not only the cultures developed by the Aryan and Dravidian peoples, but also indigenous aboriginal cultures and heterogeneous foreign cultures. It thus contains a large variety of cultural traits, some of which are of the highest social value while others are primitive, obsolete, grotesque, and contradictory.

An important problem of social regeneration in India is the rationalization of her cultural heritage. Research studies should therefore be undertaken in all the phases of India's cultural history from ancient to modern times. An immense amount of research has been done both in India and abroad and the results of these researches should be compiled. Moreover, a large amount of Buddhistic literature, which left the country immediately after the suppression of Buddhism in the 12th century, should be brought back to India and translated into various Indian languages.

While there should be some general collection of facts throughout all these periods to serve as a source book, what are more important are : First, a cultural history of India from the earliest periods up to the present time including the various epochs and periods—Vedic, Buddhistic,

and Hindu ; second, a history of Moslem rule and its contribution to Indian civilization ; third, a history of British rule and its contribution to Indian civilization ; fourth, effects of Moslem and British rule on Hindu civilization ; and fifth, such general subjects as religion, ethics, aesthetics, sociology, politics, economics, metaphysics, philosophy, mathematics, physics and chemistry, with an outline of the historical development and actual achievement in each case.

A very important step has been taken for the reorientation and reconstruction of India's cultural heritage by the appointment of a committee to prepare a history of Indian philosophy, and it is hoped that similar committees will be appointed for the study of each of the important subjects mentioned above, thus giving an authentic and comprehensive idea of India's cultural achievements to her own people as well as to the world at large.

ADAPTATION OF NEW CULTURES

The adaptation of new cultural traits is still another important method of cultural reorientation. These may be derived from a variety of sources, as indicated below :

First, primitive indigenous cultures, some of which have already been assimilated with the Dravidian and Aryan cultures, particularly during the Buddhist period. They and the Buddhistic culture formed an integral part of Hindu civilization and should be analytically and critically studied in order to adapt them to India's rising civilization. The cultural traits of the tribal groups, numbering about 20 million in 1951, had been derived from the influence of their natural environment for thousands of years and may form the nucleus of some new cultural traits and also help in amalgamating these groups with other parts of India's population.

Second, Moslem rulers made India their home and brought their arts and crafts and science and philosophy and other cultural achievements with them. While some of their cultural traits have been fused into Hindu or Indian civilization, others have still remained unassimilated or even neglected. It is time for the Indian people, especially the Moslem population, to study such cultural traits as can be adapted to the national life of India. Moreover, such cultural adaptation would help to bring Hindu-Moslem communities closer together.

Third, under the impact of the West, some

of the British and other western cultural traits have laid the foundation of modern political, juridical, economic, and educational institutions, and have already become India's cultural heritage. But many other cultural traits brought into India by the British and other Western nations still remain unassimilated, and attempts should now be made to ascertain their suitability for adoption into Indian national culture.

Fourth, some cultural traits of other countries should also be studied to determine their adaptability to Indian national life. The co-operative rural industries and mass education systems of China, the Japanese art of living with its simplicity, elegance and cleanliness, and the arts and crafts of Europe and elsewhere may be profitably studied for the same purpose.

POPULARIZATION OF LEARNING

Popularization of learning is still another method of cultural reorientation, especially in India, where foreign domination during the medieval and modern times retarded not only political and economic development but also moral and intellectual progress. Reference has already been made to dissemination of knowledge through various methods, and some of them require further discussion.

First, the issuance of publications by competent authorities on modern science, philosophy, art and literature in Hindi or the national language under the auspices of national universities and with government subsidies ; these should probably be of convenient size. Similar publications should also be prepared by provincial universities in provincial languages and with the help of government subsidies. Such publications should improve both national and provincial languages. Moreover, the professors at national and provincial universities should be required to deliver public lectures in their respective fields.

Second, the circulation of valuable works through libraries. An important step in this direction has been undertaken by what has been called the library movement in Bombay. "A library for every village" is the slogan of the movement, and it proposes to set up a network of libraries in the entire province. The first step was

taken on June 26, 1947, when the central library was opened in the city of Bombay. To carry out the project, the plans provided for : (1) Three regional libraries ; (2) a library at each district headquarters ; (3) a library at each *taluk* or *peta* (subdivision) ; (4) a library in every village having a population of 2,000 to 5,000 ; and (5) the gradual extension of the scope of the movement to include smaller and smaller villages. A similar step has been undertaken by Bihar and there is no doubt that similar measures will be taken by other provinces.

Third, the most significant social groups are what might be called the learned associations in science, philosophy, history, economics, politics, education, literature, medicine and other subjects, which have been increasing in number throughout the country for the last quarter of a century or more. These associations meet periodically and discuss important topics of their own research or of others both in India and abroad and often give suggestions as to the best means of solving some of the outstanding problems. They often guide social thought and it is through their constant efforts that society generally obtains scientific knowledge and directs its activities on progressive lines.

Fourth, the movement's like those of political parties, trade unions, employers' associations, agrarian movements and other organizations of different political and economic interest are also important factors in the dissemination of knowledge. Although most of these movements are guided by party interests, their activities are important in view of the fact that they bring group interests to the attention of the general public.

Finally, the press and the platform are also great institutions for national awakening, inasmuch as they supply necessary information on almost all social questions. While most of the journals and periodicals are party organs and often express partisan views, there are also others which are impartial and take an objective view of things. To these must also be added the platform for the propagation of religious, political, industrial, ethical, aesthetic ideals by different organisations or individuals. Both the press and the platform are of great help to the popularisation of knowledge.

IV

MULTI-PURPOSE PROJECTS

RECENTLY several projects have been undertaken by the Government, for power and irrigation in India. These projects are known as multi-purpose projects because of the manifold advantages they yield. They are designed not only to provide irrigation facilities for growing additional food and commercial crops, but also for hydro-electric power, flood-control, fish-culture, navigation, conservation of soil, afforestation, drinking water and recreation facilities. After the completion of these plans, India will be using about 10 per cent of her latent water power capacity, and about 28 million acres of land will become available for cultivation. About 153 projects are under execution in different parts of the country. Of these only six are multi-purpose, 104 irrigation and 43 power projects. 12 of these 153 projects are major. Of the major projects, 6 are multi-purpose, 3 power-schemes and 3 irrigation-schemes. The cost of these 12 major projects will amount to Rs. 439 crores and of the remaining 141 projects to Rs. 680 crores. The Five-Year Plan provides for the execution of 173 projects which will irrigate 8.53 million additional acres and provide a million kw. of additional hydel power. Eventually these projects will irrigate 16.94 million additional acres and generate 1.5 million kw. of additional power.²

TRANSPORTATION

The extension of facilities of transportation is the most essential condition for the successful commercial and industrial development of a country. In fact, transportation permits a country to utilize its economic resources to the best possible advantages. Various kinds of transport means are available

in our country. From the track animals of the mountains and the desert, the bullock-cart of the trackless agricultural areas, the country boats and crafts of alluvial water courses, to the railways that link up parts with important inland industrial and trading centres, the motor cars that have rendered door to door conveyance easy and economical, and aeroplanes that have reduced barriers of long distances to a minimum, India has become an epitome of all classes of transport. Transportation in India can be divided into four heads: (i) Roads, (ii) Railways, (iii) Waterways and (iv) Airways, all of which are influenced by the topography and climate of the country to a very great extent.

The road transport by its very nature touches the heart of the country and affects the well-being of the people at every turn. In India, road is the indigenous means of communication. Over a large part of India road-building of unmetalled type is a simple affair and presents no great difficulty. India has miles of roads. Over most of the country 40 to 75 per cent of the area is not served by road at all. Considering the size of the country this mileage is very meagre. We have only 73 miles of roads per 100,000 population compared to 2,411 miles in U.S.A., 4,398 miles in Canada and 934 miles in France.³ Of the total road mileage of 241,513 miles (1950) only 95,463 miles are hard-surfaced. More than half of the metalled roads is in Peninsular India where the old hard rocks facilitate the building of such roads. Of the unmetalled roads, 146,060 miles, on the other hand, about four-fifth lies

3. The following table gives an idea how deficient we are in road mileage in comparison with some other countries:

Country	Per sq. miles	Per 1,000 sq. miles	Per 100,000 persons	Remarks
Canada	..	160	4,938	..
Italy	0.89	1,467	376	Motorable
Japan	3.00	3,988	728	..
England	2.02	2,070	381	Motorable
France	1.84	—	934	..
U. S. A.	1.03	1,006	2,411	..
Germany	1.95	—	260	..
India	0.15	201	73	Only 35 p.c. motorable
Australia	—	168	6,602	..

GEOGRAPHIC ENVIRONMENT IN INDIA

441

in the Indo-Gangetic valley, where the soft alluvium, the great distance from which road metal has to be obtained and the frequent floods naturally favour the construction of the unmetalled road which is rebuilt chiefly after every rainy season. Want of adequate roads is keenly felt in rural areas. By far the greater portion of these roads is unbridged and heavy shower cuts off the communication whenever the stream crosses a line, and they are in many cases so unfit to stand the effects of the wheels while the surface is wet that in monsoon months they are out of use except for cattle or foot passengers.⁴

The best-served part of the country is South India and the areas worst served in this respect are Rajasthan, Assam, Orissa, Kutch and the Punjab. These are either too arid and thinly populated or too rainy and jungly with unbridgeable gorges and streams which intersect them.⁵

Indian roads are divided into five classes: (1) National Highways, (2) Provincial or State Highways, (3) District Roads, (4) Urban Roads and (5) Village Roads. The first are the important arteries of communication in the country.⁶

India's road system is insufficient for her needs and therefore in the Five-Year Plan a provision of Rs. 100 crores has been made for the purpose out of which 27 crores are to be spent on national highways and the rest mainly on State roads. The Plan envisages the development of nearly 3,000 miles of new roads and 16,000 to 17,000 miles of village roads through community effort.

RAILWAYS

The Indian railway system is by far the largest in Asia and the second biggest State-owned enterprise in the world. They employ about 9.23 lakh people, carry 123.21 crores of passengers, and 98.3 lakh tons of goods; consume about 10.8 million tons of coal; and their net earning is 66.55 crores of rupees. India has now 34,000 miles of railway lines,⁷ which operate on three different gauges: 6 ft. 6 ins.; 3 ft. 3½ ins. and 2 ft. 6 ins.⁸

4. D. R. Gadgil: *Modern Industrial Evolution of India*, p. 4.

5. *Indian Year Book*, 1945-46, p. 36.

6. At present there are 6 National Highways: running from (a) Calcutta to Bombay; (b) Delhi to Bombay; (c) Bombay to Madras; (d) Madras to Calcutta; (e) Calcutta to Bombay via Nagpur and (f) Delhi to Madras via Nagpur.

Of the total route mileage roughly about one-half is in the Indo-Gangetic Valley, which with its fertile plains and large population together with Calcutta naturally offers the most favourable conditions for railway development. The general characteristic of this route in this valley is that it is straight over long distances because of absence of hills. But while the level nature of the valley helps the railway, the heavy rainfall and the numerous streams necessitating costly bridges are a drawback. The frequent floods also raise the cost of maintaining the track. The railway lines in this valley are characterised by a large number of branch lines, which are particularly numerous in areas where the traffic is spread over the adjoining area. The railway lines running in Peninsular India are zig-zag. The broken topography of the south compels the lines to change their course and gradient from place to place, and also causes the making of tunnels at some places to get over obstructions. The mountains in the north and the Western Ghats also present considerable difficulties with regard to the construction of railway lines. The Satpuras and Vindhyas are low, and the railway lines can bypass the big ranges or cross them by means of tunnels. The Thar desert in Rajasthan with scanty population and resources make railway operation difficult and unprofitable. Thus in India, the railway pattern has been much influenced by the forces of economic geography.

The mileage of railways in India is very small as compared with that of other important countries. Large countries with comparatively small population, such as Canada and Australia, record a low territorial ratio, viz., 11 miles and 9 miles of railways, while smaller countries with dense population and a high degree of railway development show high ratios. U. K. has 206 miles of railway per 1,000 sq. miles; France 120 and Japan 87 for the same area. India with her large territory

7. On the eve of the partition, there were 40,524 miles of railways in undivided India of which 6,938 miles went to Pakistan and 33,586 miles remained in India.

8. Of the total mileage, 15,700 miles narrow broad gauge, 15,000 miles are metre gauge and only 3,300 miles narrow gauge. The metre gauge railways are seen mostly in the State of Assam, North Bihar, Rajasthan, Saurashtra and also in the northern part of West Bengal, in South India and some parts of U.P. The narrow gauge railways are in existence in mountains and in interior parts of the villages of West Bengal. In other parts broad gauge railways predominate.

1. In N. India: (i) Mandi Hydro-Electric Works, East Punjab 43,000 kwts.; (ii) Ganges Canal Hydro-Electric Grid System (U.P.) 12,000 kwts.

The important multi-purpose projects are:

(i) Damodar Valley Project; (ii) Bhakra Nangal Project; (iii) Koehi Project; (iv) The Hirakud Project; (v) Rhind & Nayar Dam Projects; (vi) The Tungabhadra Project; (vii) Machkund Hydel Scheme; (viii) Rampad Sagar Project; (ix) Tungabhadra Project and Chambal Project.

2. *The Five-Year Plan*, p. 351.

but with a moderate extent of railway development has only 28 miles of railway per 1,000 sq. miles. Distribution of railway mileage on the population basis presents an entirely different picture. Large countries with a small population such as Canada and Australia, show low ratios; while small countries with high population density, despite the relatively large route mileage, such as U.K. or Japan, stand comparatively low under the population ratios. India has but 10 miles of railway per 100,000 people.*

With a view to effecting economy and efficiency in administration, a scheme for regrouping the entire railway system, except a few privately owned light railways, was prepared by the Railway Board in 1950 and enforced during 1951-52. As a result of regrouping the six zones were created: (i) The Southern Railway, 6,017 miles with headquarters at Madras; (ii) Central Railway, 5,428 miles with headquarters at Bombay; (iii) Western Railway, 5,461 miles with headquarters at Bombay; (iv) Northern Railway, 6,007 miles with headquarters at Delhi; (v) North-Eastern Railway, 4,767 miles with headquarters at Gorakhpur and (vi) Eastern Railway, 5,667 miles with headquarters at Calcutta. And from August 1955, a seventh railway zone, viz., (vii) South-Eastern Railway zone is also going to be opened.

WATER-WAYS

India is a land of many rivers, and yet her water transport is not much developed. This is due to certain geographical drawbacks. Firstly, during the rainy season the rivers are in high floods and consequently have a strong current which is not easy to navigate. During the dry seasons, only the big rivers have water throughout their course, others become disconnected pools in which navigation is impossible. Secondly, even in big rivers the water is very shallow and there are sandbars due to silting which further reduce the depth of

S. Country	Routes mileage	Routes mileage per 1000 sq. miles	per 100,000 persons	Per capita passenger mileage	Electric traction routes miles
U. S. A.	227,244	60	118	224	2,708
U.S.S.R.	54,487	..	..	..	1,040
Canada	42,336	11	291	211	..
India	34,000	28	10	111	239
Australia	31,199	9	321	287	..
France	25,601	120	61	413	2,520
U. K.	19,357	206	38	411	905

Japan	12,572	87	15	568	3,591

*Vide *Directory of Railway Officials and Year Book*, 1952.

water. Thirdly, owing to the shifting of river courses, permanent jetties or wharfs cannot be made. Fourthly, the rivers usually enter the sea in shallow, sandy delta-mouths instead of deep and broad estuaries. In lower Bengal, Assam and in the river deltas on the east coast, there is enough water in the rivers and navigation is possible throughout the year. These regions are not well-supplied with roads or railways. This fact naturally makes navigation the only efficient means of communication. On the Ganga in Bengal and Bihar and on the Brahmaputra in Assam a large number of steamers ply.

There are other parts of the country where canal navigation is active. In Andhra and Madras States, the Godavari canals including the Dummagudan canal, the Kistna canals, the Buckingham canal, the Kurnool-Kuddaph canal, the West-coast canals and the Vedaranniyam canal; in Bengal, the Circular and Eastern canals; in U.P., the Ganges canals; and in Orissa, the Orissa canal, are important high ways for water-borne traffic. On the West coast the backwaters form the chief means of transport.

The total mileage of waterways in India is estimated to be 25,000 miles. Of these about 10,000 miles are rivers and 15,000 miles canals. But the approximate length of navigable waterways at present is only 5,141 miles distributed, as U.P. 745 miles; Bihar 715 miles; West Bengal 777 miles; Assam 920 miles; Orissa 287 miles; Madras and Andhra, 1,700 miles.*

India has a coastline of over 3,500 miles and merchant ships from all important maritime countries call at her ports. The sea routes radiate mainly from the five major ports of Calcutta, Vizagapatam, Madras, Bombay, and Cochin. The principal sea routes are the Suez route, the Cape route, the Australian route and the Singapore route.

At the end of 1952, the total tonnage of Indian ships of over 150 G.R.T. was 452,274 G.R.T. with 111 ships and 25 companies. The coastal traffic is reserved for the Indian fleet since August, 1950. According to the statement made by the Government in Lok Sabha in March 1953, 24.48 lakhs of deadweight ton cargoes were carried on the coast in 1951 and 24.66 lakhs of deadweight tons in 1952. In order to carry our coastal cargo 259,000 G.R.T.

**Times of India's Directory and Year Book* (1954-55), p. 260.

of Indian shipping was employed. Practically the entire coastal trade and 43 per cent of the adjacent trade is now being carried by Indian ships. The total freight earnings of Indian companies from the coastal trade amounted to Rs. 10 crores in 1951-52. Indian shipping companies have regular cargo services to the U.K., the Continent, the U.S.A. and Australia. By the end of 1952, the total tonnage employed in the overseas tradeway 173,000 G.R.T. The freight earnings of the Indian companies from overseas trade during 1951-52 was Rs. 9 crores, under the plan the total tonnage employed in the coastal and overseas trade will increase from 362,150 to about 600,000 G.R.T. by 1955-56 for an expenditure of Rs. 14.94 crores.¹¹

AIR TRANSPORT

India's place in Civil aviation is fourth among the nations of the world. As a meeting point of the air routes between the East and the West, India holds a key position in the international aviation. With its vast distances and favourable climate throughout the year, India provides an ideal field for air transport. But in spite of this fact, compared with U.S.A., U.K. and Canada the progress of Civil aviation in India is very modest.

There are three types of air-transport routes in India: (i) Trans-Continental trunk routes, (ii) Regional trunk routes and (iii) Local service routes. A typical trans-continental route is one which connects Bombay with Calcutta and is linked up with foreign and overseas air routes at Bombay and Calcutta. The regional trunk routes connects foreign and over-seas routes at Bangalore, Delhi, Nagpur and Hyderabad. The local service routes feed regional and trans-continental routes.¹²

11. India's share in the world's merchant shipping fleet is very insignificant as would be clear from the following figures:

Countries	No.	Gross R. Tonnage (000 tons)
U.S.A.	3,492	25,793
England	3,102	18,873
Norway	959	5,136
France	519	2,889
Holland	500	2,820
Italy	423	2,474
Denmark	307	1,116
Japan	423	2,783
Germany	174	476
India	111	452
World		872,000

—Vide *Eastern Economist Annual*, 1952, p. 1071.

India has three international aerodromes, Bombay (Santa Cruz), Calcutta (Dum Dum) and Delhi (Palam); seven major aerodromes at Agartala, Ahmedabad, Begumpet, Bombay (Juhu), Delhi (Safdarjung), Gauhati, Madras and Nagpur; 29 intermediate aerodromes and 37 minor aerodromes.¹³

The total route mileage is 27,763 miles of which 14,050 miles are domestic route mileage and 13,713 international route mileage.

CONCLUSION

In conclusion, we may say that India is a country unique in many respects. Within her own borders she presents every variety of natural features to be found on the surface of the earth. Snow-capped mountains, precipitous ravines, undulating hills, high plateaus, level plains, sandy deserts, verdant oases, mighty streams and rich fields diversify the surface of the country. India has been favoured bountifully from the permanent snows of the Himalayas and the glorious alpine regions of Kashmir to the rainless desert of western Rajasthan and the continental extremes of western U.P. and Rajasthan and the perpetual hot-houses of Malabar. India possesses great diversity of animals, vegetation products and minerals ranging from the heavily coated Kashmir sheep to the camel of Rajasthan, the tiger of Bengal and the elephant of South India; from wheat, fruits and fir trees of the north to the jute and rice fields of West Bengal and slender and elegant areca palms, banana, mango, and *dhupa* trees of Mysore, coconut palms of low-lying swamps and coastal regions; and from the coal and iron fields of West Bengal, Bihar and Orissa to the go'd region of Mysore, the manganese region of Madhya Pradesh, the salt lakes of Rajasthan and the oilfields of Assam.¹⁴ Diversity of

12. There are 14 Indian transport companies. These companies run air lines on 7 routes as follows:

Route No. 1 (Formerly Air Lines Ltd., Calcutta)—5 Services.
Route No. 2 (.. Bharat Air Ways Ltd., Calcutta)—7 Services.
Route No. 3 (.. Himalayan Aviation and the Kalinga Air Lines Ltd., Calcutta)—2 Services.
Route No. 4 (.. Indian National Airways, New Delhi)—7 Services.
Route No. 5 (.. Deccan Airways Ltd., Hyderabad)—4 Services.
Route No. 6 (.. Air India Ltd., Madras)—6 Services.
Route No. 7 (.. Air Services of India, Ltd., Bombay)—4 Services.

Besides these internal services, Indian Air Corporation maintains overseas services with U.K., Burma, China, Japan, etc.

13. *Times of India's Directory and Year Book*, 1954-55, p. 252.

14. Vera Anstey: *Economic Development of India*, pp. 5-6.

physical features and the climatic conditions have produced great varieties in population and the economic habits of the people. What different types are represented by the hard-working Deccanees of the peninsula, the ease-loving agriculturists of Bengal, the shepherd hill-men of the Himalayas, the traders and commercial magnates of Rajasthan and the primitive hunters of the hill regions!

What strikes us is the fact that though our economic life is rich in variety man in India has failed to profit adequately. The contrast between the bounties of nature and the poverty of man is here very striking. Nature has been very bountiful in bestowing her gifts lavishly but man has failed to play his part well. Hence, the usual statement, "India is a rich country inhabited by poor people."¹⁵ What is needed is initiative, enterprise, business skill, capital, government co-operation and above all

active population to use and exploit the dormant resources for material advancement and the raising of the standard of living of the masses. It is a happy augury to see that we are now fast on the road to development. India is not only reclaiming her marshy lands and bringing new lands under the plough with the help of tractors and bull-doers, enriching her soils by inorganic fertilizers and improved appliances, planning her agriculture and industries, developing her vast water resources, exploiting her forests and mineral wealth, fighting with her food and raw material shortages by every possible means, organising her railways and opening vast tracts of new lands by country roads but also developing her new outlook of life and devising various means of making the masses happy, healthy and prosperous.

(Concluded)

CHINA AND ASIAN STABILITY

BY DR. KALIDAS NAG, M.A., D.LITT. (Paris)

As Russia with the Asian Soviet forms the vast single block of diverse nationalities and languages inspired by a common ideology, so China, the compact mass of mankind dominantly Mongoloid is being transformed into the bulwark of Asian solidarity. But there is another fragment of Chinese party politics in Formosa under Chiang Kai-shek who with American support mainly is trying to perpetuate schism defying the People's Republic, fully functioning from 1949, with over 500,000,000 souls. Then the third element is represented by the Overseas Chinese numbering about 10 million: majority of them in Asia (with 2½ m. in Malaya and 1½ m. in Indonesia) and also in Oceania, Africa, Europe and America.

In religion the Chinese were cosmopolitan in spirit, harbouring the Jews in Honan, the Moslems counting 50 million and the Buddhists 150 million coming from outside. The rest are Taoists or Confucians but all religious groups are now subjected to the new communist drive to secularization. The resultant psychological types and their reaction to the new Government should be cautiously watched. The West has clashed with the East, in China as well as in India

for over three centuries of modern history started by the Manchu dynasty (1640 onwards). Emperor Ch'en Lung (1736-1795) was a contemporary of Clive and Hastings; so we may follow easily the quick transformation of China during the last two centuries. China invaded Tibet in 1751 and began controlling the succession of the Dalai Lama. In 1758 Keshgaria was conquered maintaining Chinese control over Central Asia. In 1781 the revolt of the Muslims were suppressed, the Formosan rebellion was crushed, and the Gurkhas of Nepal were vanquished (1792).

Between 1757-1842 China suspicious of the Christian westerners stopped them systematically from settling down in any Chinese port under the pretext of trade; Earl of Macartney was sent away (1793) from the Chinese Court of Peking; but the Americans luckily entered into a profitable trade in Canton (1784).

During the century of 1795-1895 we notice China declining through total refusal to take to modern science and industry which Japan accepted and, thus defeated China in the first Sino-Japanese War of 1893-94.

CHINA AND ASIAN STABILITY

In 1821 the Opium trouble started, for the East India Company began sending (defying Chinese Emperor's prohibition) 5000 chests of Indian opium to China. It was temporarily stopped (1834) with the end of the Company's monopoly of British trade with China. The Chinese burnt 30,000 opium chests and the British opened the Opium War (1841-42) and forcibly took Hongkong and opened other ports like Canton, Amoy, Foochow, Ningpo and Shanghai. Chaos reigned between 1850-64 when the Tai Ping rebellion led to ruthless destruction of life and property. The French took advantage of it and gradually grabbed Indo-China (1862 onwards).

In these gloomy days was born Sun-wen famed later on as Sun Yat-sen (1862-1925), a contemporary of Lenin. Dr. Sun tried to organise rebellion against the decadent Manchus (1895) but failed; he escaped *via* Hawaii to Europe and America and organised (since 1893) the overseas Chinese. Meanwhile Japan defeated the corrupt Manchu rulers of China and took Formosa (1895). The big Powers of Europe—France, Germany, Russia—began a scramble for "concessions" forming States within a State. So the hot-heads of China started the Boxer Rising (1900-1901) lowering the prestige of the Manchus who were driven out in 1911 by the Revolutionary Chinese who elected Dr. Sun Yat-sen their President (December, 1911). After a second revolution in July, 1913, Yuan Shi-kai was elected President; but he too tried to play the Emperor (1917) and lost his chance. Dr. Sun moved to Canton and made his Government in 1921. In 1915 Japan presented the notorious 21 demands during the First World War but the Washington Conference (February, 1922) guaranteed to China independence and territorial integrity. There was also the remission of the Boxer indemnity of 6 million dollars diverted to rehabilitate Chinese education by creation of the China Foundation for Promotion of Education and Culture. So U.S.A. sunk billions of dollars in China to conciliate the Chinese and to capture their vast market. But other factors went against U.S.A.

Soviet Russia in repudiation of the Tsar's ill-gotten gains gave up (1919-20) extra-territoriality, etc., at Tientsin and Hankow and balance of the Russian share of the Boxer indemnity to be used for the education of young Chinese in Russia who with many other Asians,

were invited to the first Pan-Asian Congress in Baku (1920). In January, 1924, the first Kuo Min Tang Congress at Canton with Sun Yat-sen as President admitted the Communists to the party which began to be influenced by Russian advisers, notably Michael Borodin; and Chiang Kai-shek (born 1887), himself trained in Japan, headed the Russian instructors in the new Whampoa Military Academy. He went to Russia for further experience and on return—when Dr. Sun died (March, 1925)—began destroying the Chinese communists, who, in their turn, waged a 30 years' war against Chiang championing outmoded feudalistic capitalism. Yet Chiang's master Dr. Sun propagated progressive socialism since 1904-1907 (a decade before the Russian Revolution of 1917). Before his death (12 March, 1925) he published his lectures—*San Min Chu I* or the three Principles of Nationalism, Democracy and Social Progress—all three betrayed by Dr. Sun's corrupt or incompetent followers, Chiang Kai-shek, Hu Han-min and Wang Ching-wei.

COMMUNIST CHINA

The dividing line between two historical periods was drawn by the youths of Peking who on May 4, 1919 called a huge demonstration against the supine and corrupt Government and thus began a truly nationalistic and cultural revolution. Few now remember that a young graduate of the Normal School of Changsha organised the New People's Student Union joining the Revolutionary movement. He was Mao Tse-tung, (born 1893) in Hunan Province where he joined as a boy a small Communist Party cell which had its ramifications in Hankow and Peking. Mao in 1918 took a small job in the library of the Peking University studying books, writing poems and he was elected delegate to the first Communist Congress in Shanghai and Chialing (July, 1921). Its second session met in Hangchow (July, 1922), which formally resolved to wipe out imperialism, warlordism, stressing Dr. Sun's Nationalism. They decided to join the Communist International and invited the third Congress to Canton (June, 1923) where Mao was elected Member of the Central Committee. The fourth Congress met in Shanghai (January, 1925) where the party resolved to organise the Farmers' and Labourers' movement and the youth and the women's organisations. Thus their youth corps had a good number and the Party had more than 1000 members. The fifth Congress in Hankow

(April, 1927) brought 100 delegates representing 500,000 members of the party. Mao took the lead in Land Reforms. The sixth Congress met in Moscow (July, 1928), for Chiang started his ruthless campaign to exterminate the Chinese communists who took up guerilla activities against Chiang's Kuomintang Government. Mao formed the first Red Army (1927-28) with the youths of Hunan, Fukien and Kiangsi whence Mao led the famous Long March (1934-35) to Yen-an (8000 miles). He also set up a Chinese Soviet and led the Agrarian Revolution seizing for peasants the lands of the idle landlords. Meanwhile the Japanese began occupying Manchuria (1931-32) and Mao appealed to the nation and made common cause with Chiang for the war of Resistance. In September, 1937 Mao kept back his communist propaganda and ordered his Red Army to fight the Japanese as part of the Chinese National Army which was strengthened under Chiang who concluded a non-aggression treaty between China and Soviet Russia (August, 1937). The Japanese and Russian forces clashed (August 1938) on the Manchuria-Korea-Siberia borders. The Japanese took Canton and Hankow amidst protests of the Western Powers but the Second World War broke out in full fury in 1939.

LIQUIDATION OF KUOMINTANG (1939-1949)

In August, 1939 Hitler and Stalin made a strange German-Russian Pact and in September England and France declared war on Germany invading Poland. In December, 1939, Russia was expelled from the League of Nations for distributing vital war materials to the enemies. In May, 1940 Churchill formed his Coalition Government with Labour Party in June, after French collapse, and America made a big defence programme with a "two-ocean navy" and offered warships to England in exchange for American naval and air bases in the British Empire by the agreement of September, 1940 when Germany, Italy and Japan entered into a Pact which encouraged Japan to attack Hawaii (December 1941). U.S.A. thus entered the war and England reopened the Burma Road to send supplies to China. But civil war raged in China (1941-45) and the seventh Congress of Chinese Communists met at Yen-an in 1945. Mao after Japanese surrender (August, 1945) flew with U.S.A. Ambassador Hurley to Chungking to conclude Peace, if possible, with Chiang. But in 1946 civil war again broke out in Mukden,

Kalgam and Yen-an. From 1948 Mao Tse-tung began his big offensive and totally defeating (1949) Chiang's forces, drove them to Formosa and occupied the Chinese mainland establishing the People's Republic of over 500 million souls.

In June, 1950 Chairman Mao Tse-tung delivered a memorable address on "Fight for a better turn in the Economic situation in China" and the whole nation began working as one man to develop a New Democracy in the East with Soviet friendly assistance. U.K., India, Burma, Ceylon, among others, promptly recognised the People's Republic which is showing throughout very cordial sentiments to India led by Premier Nehru who was most warmly welcomed as a guest of the Republic. The Chinese Foreign Member Chou En-lai naturally gave full support to the policy of Nehru in the Bandung Conference (July, 1955). Chou En-lai was born (1896) in Kiangsu who studied western diplomacy while in Paris as a student forming Chinese communist cells in Paris and other European cities. Returning to China in 1923 he helped Chiang and Mao in their anti-Japanese drive but when civil war broke out Chou retreated to Yen-an and finally emerged as Vice-Chairman of the People's Republic and administrative Councils and also as the Minister of Foreign Affairs helping Mao in all sectors.

Ten years senior to them is General Chu Te (born 1886), the Communist Commander-in-Chief. Graduate of the Yunnan Military Academy he formed the Revolutionary League taking part in the Yunnan uprisings. After that he visited Germany (1922) and fostered the Chinese Communist cells in Berlin and other places. He joined the North Expedition (1926) after his return to China where Kuomintang and Communists began clashing (1927). He helped Mao Tse-tung in building up the Red Army of Farmers and Labourers and led the Eighth Route Army and commenced the Long March (1935). Famed General and Vice-Chairman of the People's Military Council Chu Te is also Supreme Commander of the Chinese Forces.

Another great leader is Ku Mo-jo (born 1892), poet, novelist, critic and scholar; now Head of the Cultural Ministry. He began as a medieval student (like Dr. Sun Yat-sen) in Japan, publishing there his Poems (1921-22). On return to homeland he organised the "Creative Society" most influential in modern Chinese literature. In 1925 he was of the staff of the

Sun Yat-sen University, Canton. In 1927 he fostered Proletarian literature from Shanghai (1927) and thence escaped to Japan where he studied old Chinese history and wrote copiously (1927-37). In 1945 he visited Russia and in 1949-51 he was in Poland and France. On return he was elected Chairman of the Committee of Cultural-Educational Affairs, President of the Academia Sinica winning the Stalin Peace Award. He translated also from Goethe, Tolstoy, Upton Sinclair, etc., and wrote copiously on Political Science, Social Problems and Archaeology—a prolific and versatile writer who recently visited India.

This new generation, of course, got inspiration from progressive veterans of the last century some of whom I mention: The oldest to remember, I suppose, is Kiang Yu-wei (1856-1928), scholar and social reformer admiring western culture. Condemned by the Manchus he fled to Hongkong and then to Japan where he met Dr. Sun Yat-sen, but was against violent revolution. He rather followed Confucius and Buddha writing on the Theory of Compassion and Equality in the Buddhist Teachings, which should be translated by Indians.

His favourite pupil was Liang Chi-chao who invited Dr. Tagore to China in 1924. Dr. Sun Yat-sen's (I often met him and his colleagues) noble wife Sung Ching-ling (born 1890) helped Dr. Sun in his revolutionary works and later joined Chu Te, Chou En-lai, etc., of the Revolutionary Party. She could not pull on well with her brother-in-law Chiang Kai-shek. She travelled through Russia and other parts of Europe and America for the cause of World Peace and Chinese Democracy. She wrote in English *The Struggle for New China* and got the Stalin Peace Prize (1951). She should be invited by the Indian Women's Organizations, as she is the real disciple of Dr. Sun Yat-sen and now Chairman of All China Democratic Women's Federation of the Welfare Institute and also Vice-Chairman of the Chinese People's Republic. Her Federation helped to convene (December, 1953) the Conference of Asian Women with 165 Delegates from 23 Oriental countries contacting 76,000,000 women workers of different grades and ideals. Free India should invite another such Conference soon.

The People's Republic of China (proclaimed 21st September, 1949) passed the Organic Law

of the State led by the Communist Party with five million members (July, 1950) who strive for independence, democracy, peace and strength of China through unification. China (like India) is a subcontinent of 32 Provinces and 12 municipalities, covering an area of over 3,000,000 sq. miles. Food, clothing and housing problems are as acute as in India but within five years (1949-54) China has made tremendous strides through hard labour and honesty. By the Sino-Soviet Treaty of 1950, U.S.S.R. granted to China commodity credits of 300 million U.S. dollars to be repaid in 10 years (1954-63). With great zeal for science, new China is applying modern methods of agriculture, reafforestation and irrigation. Foreign air services have closed but the Sino-Soviet Civil Aviation Co. (1950) is operating lines from Peking to Central Asia and Russia has returned to China important railways to the East. Shipping industry is being developed and the Bureau of Navigation has regional centres at Tientsin, Shanghai, Tsingkao, Dairen and Canton. Before 1949 Communist victory there were many western trading agencies: 151 British, 142 American, 20 Swiss, 11 French, Belgian, Dutch, Italian, etc.; also 7 overseas Chinese. How many have resumed commercial relations are not definitely known. But Ceylon, India, Pakistan, etc., are doing good business with U.K. After U.S.A. and India, China is the third in the world's total cotton production, next in silk and tea. So manufactures relating to these articles are thriving. Coal and iron are there in plenty and will help developing heavy industries. China is also rich in minerals like gold, silver, copper, lead, zinc, tin, antimony, tungsten, etc., which are found in plenty. So oil is being extracted in Shensi, Kansu, Upper Yangtse and South Manchurian zones. Tin mining thrived in Yunnan with its vast tin ores. Sino-Soviet Joint-stock Companies are developing oil and non-ferrous metals in Sinkiang. Total trade union membership was over 4 million in 1950 and must have gone higher now. Like U.S.S.R. in the west China may develop into the biggest Labour Republic in the East benefiting most of the "under-developed" (yet over-populated) countries of Asia. On the livelihood and well-being of these teeming millions depend the permanent peace and stability of Asia.

THE CONSTITUTION OF INDIA—MORE UNITARY THAN FEDERAL

PROF. K. N. SINHA, M.A., LL.B.

It is interesting to note that although based on federal model our constitution does not contain any reference of the word 'federal.' Article 1 of the constitution describes India as a 'union' and not a 'federal union' of states. It seems to be a deliberate omission that strikes at the root of the intention of the fathers of the constitution. There is no doubt that the designation of units as 'States' and not 'Provinces' suggests that the Union is federal. But the Central Government under the new constitution has far more extensive powers than it had under the Government of India Act, 1935. Thus, the Prime Minister of India may seem to be "not merely a grand Moghal but a lion and the provincial Governments would be like lambs and goats which will tremble before him."*

"A serious complaint is made on the ground that there is too much of centralisation and that the states have been reduced to municipalities."*

These views might look apparently exaggerated, but a clear analysis of the relations between the Union and the States would make it abundantly evident that our constitution is more unitary than federal.

In every Federation there exists a clear demarcation of powers of the centre and the constituent units, for, as Professor Dicey has said:

"Federalism means the distribution of the force of the state among a number of subordinate bodies each originating in, and controlled by, the Constitution."

In India, too as, elsewhere, the legislative functions of the Union and the States have been placed under different heads. The spheres of activity for the Union and the States are precisely laid down by the Constitution itself, and within that particular sphere the authority of each is prescribed to the exclusion of the other in normal times. But the powers of the states are taken into consideration it becomes clear that our Constitution although given a federal shape has, at the same time, a very strong centre. The structure of

Government contained in the constitution of India is federal, but the structure is so tight that it is almost unitary.

Article 246 provides that the Parliament has exclusive powers to legislate over 97 items prescribed, in the Union List and the State legislature has power to make laws regarding 66 matters only, enumerated in the State List, while both the parliament and the state legislatures have power to make laws on 47 subjects referred to in the Concurrent List.

According to Article 248 the residuary powers of legislation (subjects not included in the Union, Concurrent or State Lists) are assigned to the centre, i.e., to the Parliament and not the Legislatures of the states. This is in contrast with the powers of states in U.S.A., and even Australia, although it conforms to the practice in the Union of south Africa and Canada. In U.S.A. and Australia the residuary powers have been given to the states, but in India as in Canada and Union of south Africa they have been vested in the Union Government in order to make it more powerful.

It has been pointed out that both Parliament as well as State Legislatures are empowered to make laws on the subjects in the Concurrent List. If Parliament as well as a State Legislature happen to make laws on the same subject in this List, and if it is found that the two laws are in conflict with each other, then the law made by the Parliament shall prevail and any provisions of the state law, which are repugnant to what has been enacted by the Parliament, will be null and void. Thus in the matters of Concurrent List the centre has been afforded a definite supremacy.

Normally the Union Parliament shall have no jurisdiction to make laws for those subjects which are in the State List, and in keeping with the essentials of a federal arrangement, a clear distribution of subjects between the Union and the States, has been made by the Constitution. But the Constitution also contains a further provision which will have the effect of empowering the Union Parliament to enact over a subject, enumerated in the State List, over which normally

the states have the exclusive jurisdiction. The constitution, lays down that if the Council of States passes a resolution by a two-third majority of the members present and voting declaring that in the national interest it is necessary or expedient for the Union Parliament to make laws with respect to any matter included in the state list, Parliament shall be empowered to legislate on that matter so long as such resolution remains in force. The life of such a resolution shall normally be one year, which if necessary may further be extended by periods of one year at a time by subsequent resolutions. Such a drastic power given to one House of the legislature is unique in the history of federations. It negates one of the most fundamental principles associated with federal polity, namely, that encroachment either by the Central Government or by the State Government on spheres which are exclusively assigned to the one and to the other will not be permissible.

Again, if the houses of the legislatures of two or more states pass a resolution that the Parliament may legislate for them, it shall have the power to do so. Any such Act passed by the Parliament shall apply to such states and to any other state also; by which it is adopted afterwards. Only Parliament shall have the power to amend or repeal any such Act, and the state to which it applies will, have no power to amend or repeal it.

Article 253 provides that the Parliament has also the power to make laws for the whole or any part of the territory of India for implementing any International treaty, agreement and convention or the like.

It is clearly stated that the executive power of every state shall be so exercised as to ensure compliance with the laws made by Parliament, and that the executive power of the Union shall extend to the giving of such directions to a state as may appear to the Government of India to be necessary for that purpose. Similarly, the executive power of every state shall be so exercised as not to impede the executive power of the Union. The Union can also give directions to a state as to the construction and maintenance of means of communication which are declared to be of national or military importance. It can also give directions to a state as to the measures to be taken for the protection of Railways within the state. If any state fails to comply with, or

to give effect to, any directions given by the Union, it shall be lawful for the President to hold that a situation has arisen in which the Government of the state cannot be carried on in accordance with the provisions of the constitution, and to take the requisite consequential action, i.e., he is empowered to take over the administration of that state in his own hand (Act. 265). Parliament also when it makes a law, which applied in any state, may confer powers or impose duties upon the state or its officers in respect of that subject even though it does not fall within the competence of the state legislature. Article 263 further authorises the Parliament to establish an inter-state council for settling inter-state disputes or discussing matters of common interest between them. Thus, in spite of the federal form given to the constitution, the responsibility for the faithful and adequate execution of the powers vested in the Union to operate within the territory of a state, is thrown on the shoulders of the State Government themselves.

Turning to the financial matters, it is found that certain sources of revenue are allotted to the states, but the power of imposing taxes or duties in regard to them is vested in the Government of India. The distribution of the proceeds of such taxes among the different states is to be determined in accordance with such principles as may be formulated by Parliament by law. The finance commission also is appointed by the President every five year.

To cope with national peril, such as in times of war, external aggression, internal disturbance, constitutional deadlock or financial stringency, the President of India has been armed with almost dictatorial powers. It is really during this period of emergency that the constitution becomes completely unitary. "The provision of Emergency Powers leaves in the hands of the President a loaded gun which can be used both to protect and to destroy the liberty of citizens." When a Proclamation of Emergency issued by the President is in operation, Parliament shall have power to make laws for the whole or any part of the territory of India with respect to any of the matters enumerated even in the state list. Such a law will continue to have effect during the currency of the Proclamation and for a period of six months thereafter. During such a period the Union Government can give direc-

* Shri Thakur Das Bhargava in the Constituent Assembly on November 15, 1949.

tions to any state as to the manner in which the state's executive power should be exercised.

Again, if the President is satisfied, or has been informed by the Governor or Raj Pramukh of a state, that a situation has arisen in which the Government of a state cannot be carried on in accordance with the provisions of the constitution, he may by Proclamation assume to himself all or any of the functions of the Government of the state and all or any of the powers exercised by the Governor, he may declare that the powers of the legislature of the state shall be exercisable by or under the authority of the Parliament.

In the event of a financial stringency in India or in any part thereof, the President by a Proclamation can give directions to any state which may include the provision of the reduction of the salaries and allowances of public servants belonging to the Union or the State. In such abnormal times all money bills passed by the state legislatures may be reserved for the consideration of the President.

Thus, in an emergency the centre can supersede the powers of the states. The contribution is unique in so far as "it is at once unitary and federal according to circumstances. Normally it is meant to be federal, but in emergencies it can assume a unitary character." Such overriding powers mean to some extent that the states have been reduced to the status of "glorified municipalities and corporations." In the opinions of some, "the provinces have been tied with new claims of slavery." But a power of this type is essential in times of national crisis. During the two world wars even in countries like U.S.A., Australia and Canada the tendency towards an enlargement of federal powers, in order to meet the grave emergency, was found in practice to be irresistible. Political thinkers believe that a federal form of Government is essentially weak more in the face of an emergency as it parcels power into too many hands.

"In the vein of a philosopher, critics allege that a house divided within itself cannot stand when the rains descend in torrents and the overwhelming floods come—when dissensions within and the aggressive shocks from without put its stability to the test".

Naturally, therefore, in a federal form of Government provision has to be made to meet the emergencies.

Like all federations, the federation of India

has created a dual polity, but unlike the U.S.A., which allowed the states to have the right to continue their own constitutions or to modify them or even to make them if the states were new, it has laid down detailed constitutions for its Constituent units. The states in India have therefore, no power or freedom to deviate from what has been prescribed for them in the same frame-work which has also prescribed the constitution of the Union.

Again, the component units in the 'Indian Union' have no power to secede from the Union. Once a state becomes a part of the Union, it is not competent to sever its relations from the Union. The constitution of U.S.S.R. also provides a 'Union of the Soviet Socialist Republics,' but it specifically allows the Republics to secede from the Union whenever they like. Our Constitution does not permit such a thing.

Our Constitution does not admit dual citizenship. Unlike the Constitution of U.S.A. it provides single citizenship. The creation of a dual polity has not resulted in the creation of a dual citizenship, with the aim to have uniformity in all fundamental issues for the consolidation of the Union. There is only one single citizenship for the whole country, namely, Indian citizenship, and there is no state citizenship. Thus another important characteristic of a federal constitution is absent in our Constitution.

Unlike other federal constitutions the Indian constitution provides a comparatively easy process of constitutional amendment, the initiative lying only in the hands of the Centre. Article 368 provides that if a constitutional amendment is passed by each house of Parliament by a majority of its total membership and by not less than two-thirds of the members present and voting, it shall be presented to the President for signature. Except for some matters enumerated in the above Article which requires its ratification by the legislatures of not less than one half of the states, the states have no initiative in constitutional amendments (unlike the constitution of the United States).

There is a single integrated judiciary, and uniformity in civil and criminal laws. The President appoints not only the judges of the Supreme Court but also of the High Courts. Article 222 empowers the President to transfer a judge from one High Court to another after consultation with the Chief Justice of India. Moreover, the Union Judiciary itself is not free from

the control of Parliament which has the power to get the judges removed by passing an address to this effect and presenting it to the President.

The Governors of the states are appointed by the President and shall hold office during his pleasure. The Governors and the Raj Pramukhs in the states are connected with the Centre in more than one way. Article 160 provides, that "the President may make such provision as he thinks fit for the discharge of the functions of the Governor." This and other such provisions shall knit together the State administration with the national Government almost on the pattern of a unitary system.

Discretionary powers of Governors would, in all probability, be exercised under the instruction from the President. The constitution makes an important reference to certain undefined powers of the Governors to be exercised in his discretion. Although silent on this issue the framework of the constitution makes it abundantly clear how this power would be exercised. A Governor is the nominee of the President and holds office during his pleasure, i.e., the President may withdraw his pleasure even before the fixed term of five years. Therefore, the Governor, by a curious position in which he is placed, has no option but to obey the directive of the President which ultimately means of the Prime Minister. Governors, that is why, are considered by many critics as "the watch-dogs of the centre." It is possible that directions may be issued similar to the Instrument of Instructions as provided under the Act of 1935. This may be an inevitable development of a constitutional convention necessitated by the silence of the constitution on a vital issue like this. In this connection it may be mentioned that in Travancore-Cochin when recently the Congress Ministry was defeated and the opposition requested the Raj Pramukh to give them a chance to form a ministry, the Raj Pramukh, while obviously acting according to the wishes of the centre, refused to give any such permission and dissolved the Assembly, and thus acted in his discretion.

The administration of Part C and D states shall be directly under the President. According to Article 239 and 243, they shall be administered as the President thinks fit, through a chief Commissioner or a Lieutenant Governor to be appointed by him or through the Government of a neighbouring state.

Moreover, the Election Commission, envisaged in Article 324, whose members are appointed by the President, will superintend, direct and control elections not only to the Parliament but also to the state legislatures.

Again, the Comptroller and Auditor General appointed by the President under Article 143 will keep a careful watch not only over the finances of the Union, but also of the states.

The Union Parliament has been authorised by Articles 2 and 3 to establish new states, increase or decrease the area of a state or even change the name of a state.

Article 169 (1) authorises the Parliament to abolish the legislative Council of a state or to create such a body where it does not exist, on a resolution of the Legislative Assembly of that State.

Articles 200 and 201 provide for the reservation of a bill by the Governor for the consideration of the President.

The Union Government is also authorised to impose restrictions on the trade and commerce in any part of India.

Moreover, during the Emergency period the President is empowered even to suspend the Fundamental Rights of the citizens. He has the power to declare that enforcement of such rights shall remain suspended for the period during which the Proclamation is in force.

At the same time, although the members of the state legislatures along with the members of the Parliament have the right to choose the President for their Union, the members of the Parliament alone have been given the power to remove him. In his removal the states have no say at all.

In a federation the upper chamber is intended to represent the states as units and their equality of status is embodied in the equality of their representation. In the U.S.A., for instance, every state, big or small, sends two representatives to the senate. In the Indian Federation, however, this principle has not been accepted. The Council of States which is the upper chamber, is not formed on the principle of equality of representation to the constituent units irrespective of their size or population. Besides, the President has been given the power to nominate 12 members in the Council of States. This is a clear instance of the emphatic preference for centralization that undoubtedly inspired the framers of

the Indian constitution, even though they endeavoured to give it the federal form.

Thus, it is obvious that the partnership is not among equals but the Union Government stands supreme over the state Governments. Every effort has been made to make the Union much stronger than what central governments usually are found to be in federal constitutions. The emphasis probably is more on the authority of the centre than on the autonomy of the units. As a matter of fact, even where that autonomy is supposed to be guaranteed, interference and dictation by the centre is not only prohibited, but authorized as a normal procedure of the functioning of the constitution. Thus our constitution is more unitary than federal in essence and spirit.

"It is like a pyramid which begins with a broad federal base and narrows upward to evolve into a singular unitary top."

India's federalism, a type by itself as it is, may well be termed as unitary federalism. A federation which can easily become a unitary state in times of crisis may ultimately prove to be a variety of constitutional form hitherto unknown to history. It may even be taken to be a distinctive contribution of this country to the theory and practice of federalism.

CREATION OF A POWERFUL CENTRE JUSTIFIED

This over-centralisation has retarded the spirit of federalism and has provoked much criticism. This grant of overwhelming powers to the centre has, however, been done under very compelling and strong reasons of diversity and vastness of the country. The national interests and the integrity of the country have always been the two dominating thoughts in the minds of the architects of the constitution. We can scarcely forget the colossal sufferings which we had long been subject to mainly due to the fissiparous and disruptive tendencies working in our country. India, being a land essentially of different languages, creeds and religions, rightly needed a cen-

tral machinery to control and maintain its component units. Moreover, the latest upheavals caused by the partition of the country have also made the creation of so powerful a centre a necessity. The issue of the economic development of India on a nation-wide scale and the problem of raising the standard of living of the citizens of India as a whole, all necessitated a strong unifying central control. The economic unity should necessarily follow the political unity. The units are truly autonomous except in cases of emergencies or when the national interests are being threatened. In fact, there is always a necessity of a strong unquestioned centralised authority to face the grave emergencies, when the interest of the nation is in question. On such occasions federations have proved to be a failure, and they are always weaker in tackling the immediate problems, which require quick, forceful and immediate action. Dr. Shyama Prasad Mookerjee endorsing the same view held that

"There should be power reserved to the centre, full and untrammelled both in the formulation of the policy and its execution to deal effectively with such emergencies. The constitution which ultimately emerged guarantees all this and guards against the dangers of disunity and turmoil."

The centralisation of authority in a country is needed, for it is only the centre and not the constituent units that can work for a common end and the general interests of the country. Dr. B. R. Ambedkar, the so-called Modern Manu, rightly remarked:

"Those who do not admit the justification for such over-riding powers to the centre even in any emergency do not seem to have a clear ideal of the problem which lies at the root of the matter."

It has to be admitted in the end, as Dr. S. P. Mookerjee said:

"Whatever may be the constitutional provisions, success in their practical working would, however, be not in riding roughshod over provincial feelings but in evolving a balance between the exigencies of unity and the requirements of provincial autonomy."

Mr. N. A. Bulganin, Prime Minister of the U.S.S.R., and Mr. N. S. Khrushchev, Member, Presidium of the Supreme Soviet, left Calcutta for Burma on December 1. They were seen off at Dum Dum airport by Sri Jawaharlal Nehru, Dr. H. C. Mookerjee and Dr. B. C. Roy

GOA'S LIBERATION : PROSPECTS AND POSSIBILITIES

By ELEUTERIO SOARES

RECENT developments in India have cast the Goa problem into an entirely new setting. While the determination of the Government of India to liquidate the foreign pocket is never in doubt, the question how and when the goal may be achieved has acquired a new angle following policy changes and adjustments. Old estimates are no longer valid and the situation calls for a complete reassessment of the prospects and possibilities of Goa's liberation in the context of the changed circumstances.

Broadly speaking, under the existing conditions the liberation of Goa depends either on a voluntary change in Portugal's colonial policy or on circumstances internal or external compelling the Portuguese to quit Goa. The former may come about as a result of self-enlightenment or the emergence of a new regime in Portugal while the pressure of world public opinion or economic sanctions or a resistance movement in Goa may induce the Portuguese to bow down to the inevitable. What chances there are of these possibilities being realised is of course a matter for investigation.

Now to begin with, the possibility of a voluntary change of heart on the part of the Portuguese ruling clique may be ruled out. The Portuguese are, to put it mildly, at least two centuries behind time in their political thinking and with their passionate attachment to past glories have failed to keep pace with the progress of ideas around them. It will need something more than a miracle to convince the Portuguese that the era of colonialism has ended and of the utter fallacy of their theory of "overseas provinces."

They cannot be expected, with their illusions about "civilising missions," to appreciate the fact that no amount of political juggling and high pressure propaganda can transform Goans into Portuguese or to recognise the justice of the contention that Goa's destiny must be decided not by the Portuguese National Assembly, wherein Goans have no representation worth the name, but by Goans themselves in the exercise of the inalienable right of self-the Goa issue.

determination. But then respect for democratic principles and the demands of justice are understandably not the virtues of dictators.

Furthermore, constructive statesmanship and foresight have never been the strong points of the Portuguese, much less so are they of the present rulers of Portugal. Consequently, while the untenability of their precarious position in Goa is evident to any sensible individual, and the Portuguese are not unaware of it, they will rather break in the process of sustaining their false pride and prestige than bow to realities and quit with grace and decorum. Goa is a striking example of the traditional blind fanaticism of the Portuguese and we see them clinging to a historical relic with a callous indifference to the serious consequences which such a sentimental stand entails upon themselves and much more so, the people of Goa.

A democratic regime at the helm of affairs in Portugal would have undoubtedly adopted a more realistic and liberal attitude towards the Goa problem but prospects of any change in the Portuguese political set-up are, at the moment, extremely dim. Opposition to the Salazar regime is undoubtedly growing in Portugal but in the face of official repression and the complete suppression of even the elementary fundamental rights it is comparatively ineffective. Only an army coup can dislodge Salazar from the pedestal of power, but the chances of such an event taking place, at least for the moment, being out of question, Goa cannot bank upon such an uncertain factor to free her from foreign bondage.

Reliance must, therefore, be placed upon more positive means and the mobilisation of world opinion against Portugal's unjust stand is one of the methods that suggest themselves. But here again the prospects are not encouraging. First and foremost international opinion is today so deeply influenced by the exigencies of regional security pacts and power-bloc loyalties and so little by considerations of justice and fairplay, that few nations can be expected to pronounce an unbiased verdict on

Indeed, with great powers like Britain and France actively engaged in suppressing colonial peoples it would be foolish to expect at least the Western countries to prevail upon Portugal to quit Goa, even if they are firmly convinced of the righteousness of India's stand. On the contrary, it would be in their interest to encourage Portuguese obstinacy, as, it is feared, is actually happening today; the conspiracy of silence on the Goa issue on the part of the major powers and the jaundiced eye with which the foreign press, the British press in particular, with a few rare exceptions, has been viewing the Goa problem, have their own tale to tell.

But even if international opinion were to express itself firmly and clearly it is extremely doubtful, whether that would help matters. The Portuguese dictators who, with their archaic political ideologies, have no respect for the wishes of their own people, can hardly be expected to show any consideration for the opinion of other nations. It would, therefore, be futile to hope that the pressure of international opinion will induce the Portuguese to quit Goa for such pressure does not exist and even if it did the Portuguese dictators would hardly be influenced by it. For similar reasons the talk of international mediation also does not inspire confidence.

The imposition of economic sanctions, however, holds out some promise of success. It is true that in view of the unhelpful attitude adopted by the Governments of Pakistan and Ceylon and the reported defection of some Indian merchants in finding devious ways to convey supplies to Goa, the Indian blockade loses much of its sting, but its effects on Goa's economy cannot be discounted. Whether the Portuguese admit it or not, the steps which the Government of India has so far taken and the suspension of remittances in particular, have created serious difficulties for the Portuguese in Goa. A continued stalemate can only add to their difficulties, for the expenditure involved in running long lines of communications and supplies, and maintaining a large standing army in Goa, is a heavy drain on Portugal's financial resources, although the Goan people are regrettably the worst sufferers in the process.

Fresh measures to tighten the economic cordon sanitaire are in the offing but it is too much to hope that such economic pressure, even

if Pakistan and Ceylon are prevailed upon to co-operate with India and other Asian countries like Japan fall in line, will bring about a speedy solution of the Goa problem. Only a complete economic collapse would be adequate to bring the obstinate Portuguese to their senses and even if a fool-proof blockade were imposed, it must take a considerable period of time to be effective to that extent. It has inevitably to be a long-drawn-out process demanding continued patience and forbearance from the Indian people and a capacity for sacrifice and suffering on the part of Goans.

There is also no promise of a resistance movement in Goa providing quick relief. No one who is acquainted with the conditions prevailing in Goa can expect a mass movement there to drive out the Portuguese in the near future. Not that there is no nationalist movement inside Goa. No matter what the Portuguese propagandist may proclaim Goan patriots have, in spite of the tremendous odds in their path, shown commendable courage and initiative, but in the face of the savage, inhuman repression let loose by the Portuguese they are compelled to function in disjointed groups indulging in nothing more than stray acts of sabotage and sporadic outbursts of fruitless agitation.

The inequality of the struggle is further enhanced by the comparative lack of political consciousness among the large mass of people. Discontent against Portuguese rule undoubtedly exists but centuries of foreign domination have virtually benumbed the Goan's sense of national pride and having become accustomed to be ruled by others he fights shy of the prospects of assuming the responsibility of managing his own affairs. And the existence of a police State in Goa, with no civil liberties and no freedom of expression, makes the task of breaking this paralysing lethargy extremely difficult, if not entirely impossible.

No amount of repression, however, can keep the people always in the dark and there are signs of a growing political awakening among the people of Goa, but in the prevailing conditions, it will be a fairly long time before this awakening spreads deep and wide enough to crown with success any positive effort to overthrow Portuguese rule.

There are also the Goan emigrants to be taken into account. Free as they are from the limitations, which their compatriots in Goa are

subject to, they have been in the very nature of circumstances in the vanguard of the struggle for Goa's freedom, but if they have failed to make to the cause of Goa's freedom a contribution commensurate with the opportunities and scope available to them, it must be mainly attributed to needless divisions and factions in the ranks of political workers. It is a crisis of leadership, and solution to this problem does not seem to be within sight. It is of course no exaggeration to say, the sooner the Goan people are able to find leadership which will be capable of cutting across petty rivalries and inspiring the confidence and co-operation of the masses the shorter will be the process of Goa's liberation.

In the ultimate analysis therefore the responsibility of shortening the birth-pangs of Goa's freedom devolves on Goans themselves. Certainly other possibilities may develop in course of time and even the factors we have examined may operate more favourably in a different set of conditions. The problem of Goa is also a part of the larger struggle against colonialism, and events elsewhere, whether in Cyprus, or Morocco, or East Africa or West Irian, are bound to influence the trend of developments in Goa.

In any case the cause of freedom is bound to triumph in the end but the point that must be borne in mind is that since police action is ruled out under any circumstances and *satya-*

graha by Indians is also taboo it is improper to expect a quick solution of the Goa problem.

That, of course, is not meant to be a criticism of the Government of India's Goa policy. The correctness of that policy is unquestionable for the approach to the Goa problem must fit into the frame-work of India's foreign policy. To ask for direct action in Goa is to demand a betrayal of the principles which India is doing so much to foster among the nations of the world. The cause of world peace and harmony and the prestige which India enjoys in the international councils cannot be sacrificed at the altar of Goa's freedom.

Not that India is not and should not be interested in the struggle for Goa's freedom. Far from it, India cannot rest until Goa is liberated, for it involves not merely a question of liquidating the last vestige of colonialism from India's soil but also of reclaiming a section of the Indian people who because of a queer twist of fate find themselves under the heel of a ruthless alien dictatorship. All possible means so far as they are consistent with the ideals which India has chosen to serve must and will be taken to achieve the object but it is at the same time necessary to view the various aspects of the problem in the proper perspective so that no false hopes, which only lead to a sense of frustration and disappointment, may be entertained.

RURAL UNIVERSITIES

PROF. P. K. SEN, M.Sc. (Cal.), Ph. D. (Lond.), D.I.C.,
Khaira Professor of Agriculture, Calcutta University

INDIA was at one time prosperous. Through her far and wide came on pilgrimage for her village order she distributed leadership all over message of peace. The basic principles of her the country making the best use of her lands and village civilization were self-help, respect for and men. The villages were her schools of others' rights and service before self. living. No knowledge material and moral Times changed. The leadership that circulated like life-blood through the entire body contributing towards life was unknown to them of the nation drifted away from the villages and every individual had the opportunity and leaving lands and men behind to fall into guidance to attain fulfilment through devoted disorder, disuse and poverty. Foreign domination work creating wealth for common good. The played no small part in bringing about this country, it is said, then flowed in milk and honey. She attained a height of glory in her ennobling change. Progress in science and humanities art, literature and architecture, and people from henceforth remained confined to a few cities and

towns here and there, primarily subserving the interest of the foreign rulers who did not recognise the oneness of life with the people of the land. Their distress grew from bad to worse.

Thanks to the genius of India that it did not fail to realise however that village reconstruction was the keynote of her resurrection. Her leadership came back to its own once again and mobilised the forces of life in the villages throughout the country to win freedom from foreign rule in order to achieve freedom from poverty and distress. No opposition could stand before the one will of the people. Political freedom won, India has set herself to reconstruct her village order keeping pace with the march of life in the 'one world' of today.

Free India's constitution, her friendly relation with the nations of the world, her development plans, community projects and village governments provide the frame-work on which to build her new life. And in order to make knowledge of science and technology, arts and literature, ethics and politics available to every citizen, to make every one of them mentally and physically well-equipped for making the best use of lands and his own imagination and enterprise for the good of all, a new orientation in her system of education has been conceived. Every boy and girl, by the time they are fourteen, will receive Basic Education, learning some useful craft, the principles of general science, hygiene, and community relations and some amount of history and literature.

The next stage of education for a period of three years will have two aims in view, firstly, to give more intensive training in a craft or a vocation together with some further general education and secondly, to prepare for University education.

A University conducts higher education in the different branches of knowledge of science, technology and humanities for training teachers and specialist workers, and carries our research to extend the bounds of knowledge. It thus

represents the highest institution that guides the life of a people not only for the present but also for the future. It is in this context that rural Universities assume their significance in the scheme of India's rural reconstruction. It will be for the Universities of India to lead her life today and in the days to come with the wisdom of her glorious past.

A rural University has no other meaning but that it is an institution of life as a whole and not of a group of knowledge or of a section of people. It has to deal with every branch of knowledge useful to make the best use of lands by men to achieve a happy life, and make itself a living example of progress inspiring imagination and enterprise of man eternally seeking truth, harmony and beauty.

The old Universities that came into being under conditions of foreign rule will now have the same objective as the new institutions in the reconstruction of India. They cannot remain in isolation although according to the conditions of time and place they may have their special features and functions and the country may have also Universities for special branches of studies such as technology, engineering, etc., pertaining to special requirements of her reconstruction programme.

A typical Rural University will deal with life directly based on agriculture. Its stress will be on the cultivation of sciences, and technologies pertaining to the best use of land and life under agrarian conditions. It has to deal with all branches of humanities and sciences and make special studies of (i) agriculture—in all its branches; (ii) rural industries; (iii) rural engineering—irrigation, electricity, sanitation, village planning, house building, etc., (iv) social administration; and (v) teachers' training. And in order that all students may get the opportunity of higher education and create confidence of self-help in them there should be scope for earning while learning in agricultural farms or industrial workshops.

THE STATES REORGANISATION COMMISSION'S REPORT

By CHUNI LAL RAY

II

THE work of the 4-man High Power Committee now sitting in judgment on West Bengal's and Bihar's conflicting objections to the recommendations of the States Reorganisation Commission will be very much simplified, if they will condescend to support the New Bengal Association's request (page 50 of the New Bengal Association's memorandum No. IV, dated 7th December, 1948, being a Rejoinder to Dr. Sachchidananda Sinha's memorandum submitted to the Constituent Assembly) to Dr. Rajendra Prasad (in his individual capacity, as he was in 1939 and in 1947, and not as President of the Indian Union, whom it will possibly be impertinent to address in a matter like this) to make clear what was intended by the two expressions 'Bihar proper' and 'areas bordering on Bengal where Bengali is spoken' which he used for his classification of different groups of Bengalees in Bihar, in the note submitted to the Bardoli Conference in January 1939, and also what were "the vast tracts in Bihar where Hindi was not widely spoken" mentioned in his speech in the Bihar Sahitya Sammelan in December 1947. It is understood that, in the returns which the Tata Iron and Steel Works are required to submit periodically to the Labour Department of the Government of Bihar, the expression 'Bihar proper' is used in a sense which excludes the whole of Chota Nagpur Division and also the Santal Parganas district. Was the connotation the same, or was it different, of the expression 'Bihar proper' as used in the note to the Bardoli Conference? And did "areas bordering on Bengal where Bengali is spoken" exclude any portions, and, if so, which portions, of pargana Dhalbhum, (specially mentioned in the Sahitya Sammelan speech) of the entire district of Manbhum, or of the eastern fringe of the Santal Parganas (also specifically mentioned in the speech), with a base about 20 miles wide at the southern end near Chittaranjan and Mihijam, but slowly tapering to only about 5 miles width near Sakrigali? I believe that Dr. Prasad's response to the request will dispense with the necessity of any further enquiry; but as I cannot count on the High Power Committee taking any notice of the request in the New Bengal Association's Memorandum. I find it necessary to proceed with my statement of facts that I have been able to collect and of arguments that may be based on the same.

As stated in the November number, Sri Ranchhor Prasad I.A.S. who had been Census Superintendent for Bihar in 1951, expressed his inability to supply figures of linguistic distribution separately for Jamshedpur City and for the rest of Dhalbhum subdivision and for other regions of Singhbhum district, as "the Census office had been closed, and no staff was available to compile the figures." But a pamphlet, *Singhbhum, Serai kella and Kharsawan through the Ages*, written by the Sarai kella Tikayat Nrupendra Narayan Singh Deo, speaks of such figures having been supplied to the

Government of Orissa, the figures being:

(See Table on the top of next page)

Strangely enough, the aggregate of total population (the last line) figures in columns 4, 5 and 6 only (which are supposed to take no account of population in towns other than Jamshedpur, shown as ? in column 7), 613,504+199,922+667,390 reaches the district total 1,480,816, leaving one wondering about the total population figures of the smaller towns and also doubtful about the accuracy of the other figures. The figures have, however, to be taken as they are; and they show that, in Dhalbhum, Bengali retains its position as "the largest language group", as the States Reorganisation Commission have observed in para 667 of the Report, in spite of the very large increase in the Hindi figure, by 75,484 which can be accounted for by heavy immigration from Hindi-speaking areas numbering 65,392 and of the still larger increase in the Oriya figure, by 83,852 which cannot be explained by the migrations from Orissa, only 31,083.

The surmise in the November number that the recommendation for retention of Saraikela in Bihar was chiefly, if not solely, for the purpose of providing without any justification whatever, a corridor for access of Hindi-speaking Bihar *cum* Chota Nagpur to Jamshedpur and Bengali-speaking Dhalbhum, has proved correct. Para 625 of the Commission's Report (not available to the public in Calcutta till the 19th October) contains the observation that

"In view of the recommendation for transfer of part of the Manbhum district to West Bengal, the transfer of the Saraikela subdivision, or of any portion thereof, to the State of Orissa will convert the Dhalbhum subdivision in the east into an enclave which will not be physically contiguous to the rest of Bihar."

The Commission evidently started with the predetermination that Jamshedpur must be kept for Bihar, whether there was justification for this or not, and that everything else must be subordinated to that consideration.

Why, in spite of Bengali being the largest language group in Dhalbhum and, in spite of Dhalbhum having contiguity with West Bengal, but not with Bihar and in spite of the previous history of Dhalbhum's uninterrupted contact with Bengal right up to 1910* (prior to the

*In addition to evidence on this point cited in the November number, the following also may be mentioned: (1) the words "In the district of Midnapore; Dhalbhum, including Ghatsila" occurring in the Regulation that constituted the South-Western Frontier Agency, XIII of 1833, and (2) in the Map of Acquisitions of British Territory in Bengal and the Burmese Provinces that formed the frontispiece to the first edition (1862) of Aitchison's *Treaties, Engagements, Sunnuds, etc.*, the south-western boundary of the Medinipur district of 1750 extending right up to the side of the old Porahat Raj acquired by the British in 1818 (which later broke up into Porahat, Kharsawan and Saraikela), and covering, therefore, the pargana of Dhalbhum.

Language	Jamshedpur City	Rest of Dhalbhum	Total Dhalbhum	Saraikela Rural	Chaibasa Rural	Towns other than Jamshedpur	Total
Ho	3,964	9,124	12,188	43,691	353,293	4,531	413,703
Oriya	18,710	109,782	128,492	49,309	104,849	15,049	297,699

Oraon	1,624	...	1,624	...	9,048	2,083	12,752
Mahli	...	...	...	5	2,435	72	2,512
TOTAL, including other groups	218,162	395,342	613,504	199,922	667,390	?	1,480,816

creation of a separate Judgeship for Manbhum-Singbhum-Sambalpur), and in spite also of contribution by Bengalees to the development of Jamshedpur having been very much more substantial than contribution by Biharees who turned up only from about the year 1920, the recommendation is for Dhalbhum's retention in Bihar and not for its transfer to West Bengal, the States Reorganisation Commission do not care to mention directly. Nor have the Commission clearly stated that they accept Bihar's contention (para 642 of the Report) that

"The transfer of this rich mineral-bearing and industrialised area to West Bengal is bound to dislocate the economy of residuary Bihar, and it will unsettle the balance between agriculture and industry."

One can only draw inference from the observation in para 659 that

"Dhanbad, like Jamshedpur, may soon attract a mixed population from all over India as it is further developed; West Bengal's claim to this area is, therefore, untenable." (*italics mine*).

The only possible inference appears to be that, in the opinion of the Commission, every place in the north-eastern region of India (if not, in the whole of India) which has the potentiality for development to an extent that would attract a mixed population from all over India, must be reserved for Bihar, whether there is contiguity or not, and must not be claimed by Bengal, even if there is contiguity, and even if the development be on the initiative of people of West Bengal. And the Commission, so solicitous about Bihar's economic needs, are presumably of opinion that West Bengal's economic difficulties, consequent on the influx of refugees from East Pakistan, a mere 35 lakhs in number, should solve themselves. The Commission's Report has very little to say about this problem of displaced persons, except that they are not to be sent to the Purnea corridor, where "the density of population is such that there is little scope for any resettlement of displaced persons." Strangely enough, the scheme for rehabilitation outlined by Bihar in the Eastern States Rehabilitation Ministers' Conference on the 21st October, assigned the first places to Shahabad and Champaran districts which have densities 610 and 706 respectively per sq. mile more than 50 to 70 per cent. in excess of that in the Purnea corridor, which is only about 405 per square

mile; and a subsequent report says that "the districts of Purnea and Champaran will be visited by high officials of the Central Rehabilitation Ministry shortly to conduct a preliminary survey." Other points stressed in the same Conference were that Bihar was trying to make some 25 to 30 thousand acres available for refugees, Assam 33 thousand acres, Tripura several thousand acres possibly quite as much as Assam or Bihar, but that Uttar Pradesh has offered to take charge of only 500 families (possible requirement of land, about 2,000 acres). It will be no wonder if several more of the 12 other States contemplated by the Commission follow Uttar Pradesh's lead, and restrict their offers to less than one thousand families each, the aggregate of the 12 reaching not even 10 thousand families consisting of about 60 thousand persons. Even the much more generous offers from Assam, Bihar and Tripura will not suffice for more than 2 lakh persons; and the net effect of all-India's profound sympathy for displaced persons will possibly cover somewhat less than 3 lakh persons or only one-twelfth of the number that has come over to West Bengal. At the most, the relief for West Bengal would not exceed 5 lakh persons, only one-seventh of the 35 lakhs that West Bengal is now faced with. West Bengal would still have on her shoulders the burden of over 30 lakhs of displaced persons. This is a point to which the S. R. Commission, talking big of the "preservation and strengthening of the unity and security of India," have chosen to direct only the blind eye. And another point that has been equally ignored is that rehabilitation of displaced persons, which is the responsibility of the entire Indian Union, not of West Bengal alone, is being practically left on West Bengal's shoulders alone.

How can West Bengal, forced by circumstances to shoulder responsibility 10 to 15 times more than its due, carry on, if even areas like Dhalbhum and East Dhanbad, immediately adjoining Bengal, and with Bengali as the biggest language group, are kept back on the ground that they are rich in minerals or that they are industrialised? Has West Bengal (or, for the matter of that, any other State which may be saddled with the problem of at least 25 to 30 lakh refugees, involving increase in density of population by 50 to 80 per square mile) no need for industrialised areas or areas rich in minerals? Is it not fair that the right to include Jamshed-

pur, the City of all-India importance, should carry with it the burden of shouldering the major portion of the all-India responsibility of rehabilitating the 35 lakh refugees now huddled up in West Bengal? If Bihar, getting Jamshedpur, is simultaneously saddled with the responsibility of taking over at least 25 lakhs of the East Pakistan refugees and of declaring Bengali as the regional language for the areas where these 25 lakhs are settled, there may be some excuse for asking West Bengal to stop grumbling, even though Jamshedpur has contiguity with Bengal and not with Bihar. But asking West Bengal to have the headache resulting from the burden of at least 30 lakh refugees, and giving Bihar the monopoly of drinking from the wells of Jamshedpur City would be the grossest injustice.

It has already been pointed out (in the November number) that the contribution of Bengalees to the development of Jamshedpur has been far more substantial than the contribution of Biharees; and it is worth mentioning that out of 37,976 men in Tatas' labour force in January 1955, as many as 13,046 were Bengalees forming 34.35 per cent, the largest single group. Of about 30 thousand students in the Jamshedpur and Jugsalai schools run by the Tatas, as many as 12,718 have Bengali as their medium of instruction; the numbers of those with medium Hindi and Urdu are shown as 12,626 and 3,601 respectively, but it is explained in the Tisco Education Officer's report for 1955 that "in the Hindi medium group, are included not only children whose mother-tongue is Hindi, but also children whose mother-tongue is neither Hindi nor any one of the three other languages Bengali, Urdu or Oriya," which means that Telugus, Tamils, Malayalis, Mahrattas, Kanarese, Gujratis, Punjabis and even West Pakistanis go to swell the number for which Bihar alone gets the credit.

The assertion in para. 641 of the Report that "in these bi-lingual areas Hindi is either the predominant language or at least is a very important language" is absolutely without foundation. In respect of Dhalbhum there is the S. R. Commission's own statement, in para. 667, that Bengali is the largest language group; and in respect of the corridor which is in the extreme east of the Purnea district, para. 648 says that Siripuria or Kisanganjia, the language spoken there, has close affinities with Bengali. The admission in para. 667 is no doubt qualified by the clause that Bengali is by no means predominant; but, will any one out of Bedlam seriously contend that, in Dhalbhum excluding Jamshedpur, Hindi, with its percentage of less than 9, is predominant (or is even a very important language), if Bengali, with percentage 33 for mother-tongue and a further 15 to 18 for subsidiary language spoken by tribals, total over 50 per cent, is not predominant? Even for Dhalbhum including Jamshedpur, the figure is 31 per cent. for mother-tongue Bengali, substantially in excess of 21 per cent each for Oriya and Hindi, and about 17 per cent Santali; and of the Santals, at least one-half speak Bengali as a subsidiary language.

It is true that Jamshedpur City has a large Hindi-speaking population, close upon 92 thousand out of the total of 218 thousand; but very considerable portions of these are from outside Bihar. The Census Tables show as many as 18 thousand to have been born in Madhya Pradesh, 12½ thousand in Uttar Pradesh, nearly 3 thousand in Rajasthan; and many more born in Jamshedpur must have been in families from these distant regions who had temporarily made their residence in Jamshedpur. Why should Bihar alone get the benefit of nearly 92 thousand Hindi-speaking people, having no better contiguity with Jamshedpur than Madhya Pradesh or Uttar Pradesh has? Of Bihar's less than 61 thousand, 32 thousand were born outside Singbhum district (not taking account of close upon 10 thousand from Manbhum district who presumably have Bengali or Santali as their mother-tongue), which means that the local Hindi-speaking population is within 30 thousand in number, which is far behind the number of Bengalees in Jamshedpur. And much larger percentages of immigrant Bengalees settle down permanently in Jamshedpur than immigrants from Hindi-speaking regions.

The S. R. Commission have, no doubt, given reasons why they disapprove the homeland idea and give equal preference to permanent residents and to immigrants who have come only as temporary wage-earners (para. 158 of the Report); but while they take account of aggregate population (floating as well as permanently resident) when arguing against West Bengal's demand (e.g., in reference to 65 per cent Hindi-speakers in Dhanbad in para. 650), they had no scruples whatever about invoking the homeland idea for ignoring the Tamil immigrants to Travancore-Cochin (para. 295). Nor can they plead *status quo* justification for recommending retention of Jamshedpur in Bihar, after having recommended the cutting off of big areas from Madras and from Madhya Pradesh, and the dismemberment of Hyderabad, on grounds no whit stronger than can be urged for Jamshedpur's transfer to West Bengal.

Of immigrants to Singbhum, almost every one destined for Jamshedpur, the largest number for any single district in all India come from Manbhum, the number being 9,771 in 1951. It may safely be assumed that every one of these came from the Purulia subdivision; for Dhanbad gets, instead of sending out, migrants. The 9,771 who had already arrived by 1951, and the few thousand more that may have increased the number during the next four years that have intervened, will presumably be the last batch of people from Purulia who would have the opportunity of earning their livelihood in Jamshedpur; for Bihar, having acquired the reputation of being one of the strongest Congress-minded States, appears to have earned the right to disregard flagrantly the directive in the Bardoli Resolution of 17th January, 1939 about non-interference with appointments by private employers—and Bihar draws

distinction not only between Biharees and non-Biharees, but also between men of 'Bihar proper' and Chota Nagpur men for which two groups Tatas have to submit separate figures in their periodical statements to Bihar's Labour Ministry. The transfer, in such circumstances, of Purulia subdivision to West Bengal, while Jamshedpur is retained by Bihar, will be of the nature of a left-handed compliment which may be described as a halting left-handed gift; surrender of the best opportunity of earning livelihood within easy distance from home is being demanded as the price for escape from constant advice gratis (and possibly pressure as well) that the language which they speak at home, although difficult to distinguish from the western form of Rarhi Bengali as spoken in Maubhum (as noted in page 40 of the Census Superintendent's Report) is in reality a dialect of Bihari (without any certificate of similarity with any other Bihari dialects known). This is most inequitable; and justice demands that Jamshedpur should share the same fate as the Purulia subdivision.* Purulia subdivision, shorn of thana Chas, and separated from Jamshedpur, would indeed be, economically, a liability for West Bengal, not an asset.

Yet another, and a very much stronger, ground why Jamshedpur and Purulia should go hand in hand is the fact, evidently not known to the S. R. Commission, that Jamshedpur's main supply of water is from a reservoir at a distance of a few miles, within thana Barabhum of Purulia subdivision. Jamshedpur in Bihar, and its water-supply in West Bengal, would be an anomaly very much worse than two of the D.V.C. dams (Maithon and Panchet Hill) having one end each in Bihar and the other end in West Bengal—an arrangement as defective as that which caused the fall of Singapore in 1942¹ thirteen fateful years ago.

Dhalbhum excluding Jamshedpur should also, of course, receive the same treatment as Purulia subdivision, and this should be the case also with Kandra thana of Saraikela, specially mentioned in the November number, where also Bengali is the biggest language group, much in excess of Hindi or Oriya or Santali. And West Bengal opposes most strenuously the mischievous move that has been made from a certain quarter that Saraikela would give up this thana to Bihar to serve as a corridor to Jamshedpur, as price for the rest of Saraikela's transfer to Orissa, by amicable arrangement with Bihar.

The rest of Saraikela has, as strong a case of transfer to Orissa as Dhalbhum (with or without Jamshedpur) has for transfer to Bengal. The S. R. Commission

* The transfer of both to West Bengal will not be any obstacle to Biharees with necessary qualifications getting employment in Jamshedpur, for West Bengal, in spite of not being very strongly Congress-minded, never interferes with appointments by private employers of labour, although on two occasions in recent years, it committed the high crimes of issuing about one hundred taxi-driving licences to Bengalees, after the first one thousand had been monopolised by Punjabees, Hindusthanees and Biharees, and of restricting appointments to the newly-established State Transport Service to Bengali-speaking refugees, from East Pakistan.

has, no doubt spoken of some reasons for Saraikela's retention in Bihar other than that of providing a corridor into Dhalbhum, but these will not stand much scrutiny. One of the points is Saraikela's intimate connection with Porahat; but, should Porahat itself remain in Bihar, unless the Census Superintendent can produce reliable figures showing more Hindi-speakers than Oriya-speakers in this area? Till now, the Census Superintendent has chosen to keep the information confidential. And, on the only figures that have seen the light of day which are for the entire Chaibasa subdivision, the Oriya figure, 104,779, is more than 3 times the Hindi number which is only 31,223. It is true that Oriya is far outnumbered by Ho, with 353,293 speakers; but that also is no valid reason why Chaibasa should be kept tagged to Bihar. One has only to look at the insignificant Ho figure for entire Bihar *cum* Chota Nagpur, excluding Singbhum; it is only 4,520. Contrast this with the numbers of Hos in Mayurbhanj (117,483), in Keonjhar (38,512), in Sundargarh, chiefly in the Bonai subdivision (13,334), in Dhenkanal (3,406), even in Cuttack (5,873) and in Balasore (2,395); and it will be perfectly clear that the Hos' homeland is certainly not anywhere in the Chota Nagpur plateau 2,000 feet above sea-level—it is in the country sloping down from height less than 1,000 feet to the comparatively elevated portions of Cuttack and Balasore, only a few hundred feet above sea-level. With what justification can any part of this area be kept separated from Orissa?

Another reason mentioned is that the erstwhile States of Saraikela and Kharsawan have been parts of Singbhum district since May, 1948. But a veil is cleverly drawn to shut out the facts that, in accordance with the ex-Rulers' wishes expressed in their Instruments of Accession, Saraikela and Kharsawan had, in the first instance, been merged with Orissa, with effect from 1st January, 1948 and that it was only after several months later, when a serious riot (said to have been engineered by interested parties) brought into prominence the point of Saraikela's want of contiguity with the rest of Orissa (into which Mayurbhanj had not merged till then), that the decision was taken for transfer of Saraikela and Kharsawan from Orissa to Bihar, with effect from 18th May, 1948. The situation has changed completely since then; Mayurbhanj is now an integral portion of Orissa. Saraikela's contiguity with Orissa has been fully established and Chaibasa subdivision touching as it does, Mayurbhanj to the south-east and Keonjhar to the south west, has also contiguity with Orissa. With Ho and Oriya as the principal languages spoken, how can Saraikela (excluding the Bengali-speaking Kandra thana) and Kharsawan and Chaibasa be kept out of Orissa, and with the imposition of Hindi as the only language of the Court, although Hindi is not the mother-tongue of even 6 per cent of the population in Chaibasa, of even 12 per cent in Saraikela-Kharsawan (only about 8 per cent for the whole area)?

THE HINDU COLLEGE

The Second Phase

By JOGESH C. BAGAL

In the previous article¹ I have dealt with the first phase of the Hindu College and brought the story down to 1826. Since the commencement of this session the College entered into a new career. The changes and improvements introduced by the Official Visitor Dr. Horace Hayman Wilson had already a perceptible effect on the progress of the students. These well-paved the way for the institution turning it into a full-fledged 'Academy,' or college in its modern connotation. At the public examination and prize-distribution ceremony of early 1826, the Indian and European gentlemen present were much impressed with the progress of the students in different subjects of their studies, especially with their acquirements in English language. Some new lines of approach were indicated on this occasion by the President of the General Committee of Public Instruction for the improvement of the College. This ceremony, therefore, deserves a detailed notice:

This year's prize-distribution ceremony of the College was held at the Calcutta Town Hall on 14th January. J. B. Harington, one of the original promoters of the Hindu College and now President of the General Committee of Public Instruction, presided over the meeting. He opened the proceedings by reading extracts from the Visitor's report of the previous annual examination which gave 'a favourable view of the progress of the students during the past year in the course of the English language, Arithmetic, and Natural and Experimental Philosophy, and bore testimony to the diligence and attentiveness of the pupils and preceptors.' He then intimated the disposition of the government to give the institution every reasonable encouragement. The munificent donations of Raja Baidya Nath Ray and others, the President declared, 'would be appropriated for the endowment of scholarships to the Institution under the control of the Committee in order to enable such scholars as have not the means of protracting their studies to maturity, to remain for a longer period in the college.'

The prizes were awarded to meritorious students. These included some who became famous in after-life as teacher, administrator, literary man and journalist. The recipients were: Atul Chandra Ganguly, Kashi-prasad Ghose, Harishandra Das, Krishnadhan Mitra, Debnarain Mukherjee, Krishna Hari Nandi, Rasik Lal Sen, Rasikkrishna Mallik, Abinash Chandra Ganguly and Haris Chandra Mitra. As an example of their ability in English composition, the President referred to the essay "On the Advantages of Education" before the meeting. Some students also gave

proofs of their proficiency in English by reciting portions from standard English works. Henceforward we find recitations forming an important feature of the ceremony.

In his concluding address the President expressed his satisfaction and that of the General Committee with the state of the College. He urged upon the Indian gentlemen present as well as the students of the college the importance of the pursuits in which this institution was engaged. He advised particularly the latter 'to persevere in a course they had so well begun, and to qualify themselves by perfecting the elementary knowledge they had acquired to become useful members of the public and respectable members of Society.' The President further observed that the importance of education appeared to be duly appreciated by themselves in the essays they had written on the subject, and it remained for them to exhibit a practical illustration of the justice of the principles they had advocated.²

Another important event was the transfer of the venue of the College to the new buildings, along with the Government Sanskrit College, at Pataldanga, College Square, on 1st May 1826. The rooms were commodious. There was a common room for the boys. On the date of the transfer Henry Louis Vivian Derozio, a young man of barely eighteen, was appointed teacher. A brilliant student of Drummond's Dhurrumtolla Academy, Derozio had already made his mark as a poet and literateur of considerable merit. Previous to his appointment in the Hindu College, he served as an assistant editor of the famous *India Gazette*. At this time there were eight teachers on the College staff. The system of instructing boys by those of the upper classes, called 'monitors', was abolished. The staff must have been augmented during the latter half of the year, because we find as many as fourteen teachers on the establishment by January following.

Something should be said of the finances of the Hindu College. The Managing Committee had invested *Sa. Rs.* 61,030 with Messrs. Joseph Barretto & Sons on an interest of 8 per cent for five years, the date of expiring being 13th April, 1825. But the House fell early this year, and the whole amount remained blocked for about two years. The Committee entered into correspondence with the surviving partners of the House, but to no effect. The College had a regular income from the fees, *Rs.* 5 each, from the pay scholars, which covered only a portion of the expenditure. The Committee had no other alternative but to depend more and more on the Government

1. *The Modern Review* for September, 1955.

2. Summarised from a detailed account which appeared in *The Government Gazette* (Supplement), 19th January, 1826.

Education Fund. The Government control and supervision also increased consequently.

II

With the augmented staff and the increased number of students the College had launched an unenviable career. In 1826, boys progressed in their studies so much so that the Visitor, always very critical, was constrained to report favourably of their acquirements. He now suggested the compilation of a compendium of the best English authors, suitable for the senior students of the College. Appointment of efficient teachers was mainly responsible for effecting such progress in their studies in so short a time. Here I give from the *Proceedings* the Establishment for the month of January 1827. It should be noted that of the fourteen teachers, two were for Sanskrit and Bengali and two for Persian. Ten European and Anglo-Indian teachers began to inculcate ideas and thoughts of the West through their English teaching, which were hitherto quite foreign to the soil. The Establishment was as follows:

J. J. D'Anselme	Head Teacher	350	Sa. Rs.
Geo. Mollis	2nd	200	"
R. Halifux	3rd	150	"
H. L. V. Derozio	4th	100	"
F. Johnson	5th	150	"
P. D'Rozario	6th	70	"
J. Ferme	7th	50	"
F. D'Rozario	8th	32	"
M. Lawrence	9th	24	"
F. Decasta	10th	24	"
Jogomuhun Pundit		24	"
Parbutty Nayalonkar		20	"
Mowlovy Roohelmy		40	"
Rayazuddin Moonshy		20	"
Secretary		50	"
Sitaram Sircar		10	"
Total		1310	"

From the Establishment we find the Secretary drawing Sa. Rs. 50 a month. Lakshminarayan Mukherjee, Secretary to the College, was drawing this amount as a monthly allowance since his appointment in 1823 after the death of his father Dewan Baidya Nath Mukherjee. The amount invested with the Barretts could not be realised in full; only Rs. 21,000 was recovered after a great deal of trouble. The Managing Committee approached Messrs. Mackintosh & Co. in April 1827 to act as Agents and Treasurers of the Hindu College. One addition was made to the instructing staff in the person of W. Woolstan. On a demand from the students to learn drawing, Woolstan was appointed drawing teacher on 7th March 1827 on a monthly salary of Rs. 100.

We have already referred to the rapid progress made by the students under new arrangements. The College was divided into senior and junior depart-

ments, consisting of thirteen classes. The prize-distribution ceremony was held in the new College buildings at Pataldanga, this time also presided over by the Hon'ble Harington. In a letter to Sir Edward Hyde East dated 9th February 1827, Raja Radhakant Deb, an enthusiastic and active member of the H. C. Managing Committee, gave a detailed account of the prize-distribution ceremony of this year. The prizes consisted of books, and cases of mathematical instruments and were distributed to the meritorious students by J. H. Harington, President of the General Committee of Public Instruction. Radhakant continued:

"On the presentation of the prizes to the four senior classes, the scholars afforded specimens of their proficiency in the English language, and their knowledge of Grammar and Geography. The two first classes also were examined, as to their proficiency in different branches of natural and experimental philosophy and the elements of Chemistry. The first class likewise gave proofs of their familiarity with the use of the terrestrial and celestial Globes, and such of them as had engaged in the study of Persian, during the last years, exhibited their progress in that language. The distribution closed with English recitations chiefly from Julius Caesar, and a whole scene from this play, the first of the fifth Act, was represented by five of the scholars, three from the first and two from the second class."

The President then addressed the elders of the pupils, as he did on the previous occasion, expressing the satisfaction of himself and the Committee with the results of the examination. From the endowment created by the donation of Raja Baidya Nath Ray and other benevolent Indians, scholarships were awarded for the first time this year 'to those boys of the first class, whose circumstances would not admit of their prosecuting their studies, to that degree of perfection, which perseverance alone was necessary to ensure.' These scholarships were usually ten in number, and to the amount of Sa. Rs. 16 each.

There are few records, henceforth, of the meetings of the H. C. Managing Committee. Members were not elected. We find a few new names now and then on the Committee, as signatories to the certificates given to students on the completion of their studies. In late 1827, there were the following members signing the certificate of Radhika Mohan Set: W. W. Wilson, Chandra Kumar Tagore, Radhakant Deb, Russomoy Dutt, David Hare and Shibchandra Das.

III

Just a decade had passed since the establishment of the Hindu College, Dr. Wilson, the Official Visitor and Vice-President of the H. C. Managing Committee, made a critical estimate of the acquirements of the students of the college, especially of those of the upper classes in different subjects in his report dated January 1828. He, however, with just pride,

"contrasts the state of the College in 1828, with what it was in 1824 when he first became officially connected with it. In 1824, the College contained 107 pupils, of whom only 25 were pay scholars. The pupils on the foundation were now the same as then, but the pay scholars were twelve times as numerous.' He added that the difference in point of acquirements was still more remarkable. The first class was then reading *Tegg's Book of Knowledge* and *Enfield's Speaker*; Arithmetic was scarcely taught at all, and the Rule of Three was the utmost limit of proficiency. He considered the fifth class now, to be fully equal to the first of that time. The acquirements of the classes above the fifth, were in general much superior to those of the first class of the earlier period, 'whilst' he added, 'those of the present first class, admit of no comparison with anything yet effected by the College, and far exceed the expectations which I then expressed or entertained'."

The General Committee of Public Instruction also expressed satisfaction at the progress of the students and observed that much of the progress which had been attained was due to the 'enlightened superintendence' of Dr. Wilson.

In the building up of the college to this stature, Dr. Wilson had a large share. Besides general supervision he personally guided the students in the matter of their English composition in prose and verse and lessons in English literature. The famous literary figure and journalist Kasiprasad Ghose has left an account of Wilson's services in this regard as follows:

"At the latter end of 1827, Dr. H. H. Wilson, the Visitor of that institution, desired the students of the first class to try their hands at poetry, and I was the only boy who produced any verse . . . About this time also, on the approach of the examination, Dr. Wilson desired me to write a review of some books, and accordingly, in December following, I submitted to him my '*Critical Remarks on the first four chapters of Mr. Mill's History of India*', portions of which were published in the *Government Gazette* of the 14th February, 1829, and afterwards reproduced in the *Asiatic Journal*."

By the end of 1827 some changes were effected in the General Committee of Public Instruction. John Herbert Harington, President of the Committee, retired and left the country for good. Harington had been an ardent supporter of the Hindu College since its foundation, and it was through his instrumentality that the institution received considerable monetary aid from the Government Education Fund. A true friend of Indian education, he carried his Committee with him, who in a body began to take unusual interest in the welfare of the College. William Butterworth

Bayley, seniormost member of the Government, succeeded Harington to the presidency of the General Committee. He remained in the post only for two years, but kept aloft the tradition so painstakingly fostered by his predecessor.

Dr. Horace Hayman Wilson

The annual prize-distribution ceremony of the College came off as before, this time at the Government House, on 12th January 1828, W. B. Bayley presiding. We have already been able to form an idea of the rapid and unexpected progress the boys of the College had made during the session 1827. Specimens of the best compositions of the upper five classes were arranged serially for public exhibition. Prizes were distributed by the President himself to the deserving students. Some of the students recited selected poems and pieces from the English classics to the satisfaction of the audience. This at once showed their proficiency in the English language.

The prize-distribution ceremonies of the College were duly noticed in the newspapers of the Metropolis and the neighbouring places. They took particular note of the boys' progress in English language and literature. Besides the Hindu College, there was the Anglo-Hindu school of Raja Rammohun Ray

3. *Review of Public Instruction in the Bengal Presidency, from 1835 to 1851. Part II.* By J. Kerr, M.A., p. 27, 1853.

4. *Hand-Book of Bengal Missions*, p. 508, 1848.

where also English was assiduously taught. Four hundred boys were studying English in the Hindu College alone. Counted together with the boys of other institutions, this number would be no less than a thousand in Calcutta. The *Samachar Darpan* of Serampore (26th January 1828) went so far as to say that the Government should now abjure Persian in favour of English in the law-courts. The paper also suggested that the Indian inhabitants of Calcutta should apply to the Government for this salutary change, because Persian was neither understood by the people, nor its study was favoured by them any longer.

Senior students of the College began to interest themselves in extra-academic affairs. Some were engaged in translating standard English works in Bengali, while others like Kashiprasad Ghose started writing for papers. Clubs and associations were also formed by 1828.

The Calcutta School Society's scholars in the College, who proved most meritorious and progressive, took prominent part in these activities. The Society naturally took pride in referring to these activities of theirs in the *Fifth Report* (1828) as we find in the following:

"Many of the young gentlemen appear very properly to appreciate the value of knowledge, and are endeavouring to improve themselves as much as possible; they have formed societies amongst their friends at some of which they debate and read essays of their own composition on literary subjects, and at others read and study English books and translate into Bengalee. They are at present employed in translating the *Elements of General History*, the *Wonders of the World* and the *Grammar of History*."

The famous Academic Association, of which I shall have to say later on, was instituted perhaps in early 1828 by the senior students of the College with their fourth teacher H. L. V. Derozio as president. Derozio had already endeared himself to the boys of the College by his amiable nature and excellent mode of teaching. To this Association the *India Gazette* referred in December 1830. The *John Bull* of 11th December 1830 quoted the *Gazette in extenso*. I make the following relevant extracts from it here:

"Not quite three years have past since an association was formed of the principal students of the Hindoo College, which met there once a fortnight for literary discussions. Notwithstanding the ability displayed by some members, and the propriety with which the proceedings were conducted, the institution was nipped in the bud, chiefly by the interference of the managers of the seminary, . . ."

IV

We have now reached the thirteenth year of the College. In early 1829, Dr. Wilson reported as usual

to the General Committee about the College. Therein he noted the continued improvement of the upper classes. 'During the previous year Russel's *Modern Europe* had been introduced as a class-book; the study of Geometry had been commenced, and the senior pupils had gone as far as the third Book of Euclid; and in Algebra, they had advanced to Quadratic Equations.'

But these remarks refer to the English department only. With regard to the vernacular—Bengali, Sanskrit and Persian—department, progress was not at all satisfactory. The cause of this was partly due to the unusual emphasis on the study of English; but, according to Dr. Wilson, the defective mode pursued in teaching these subjects was mainly responsible for this state of things. He observed with reference to the Bengali and Persian classes thus:

"It cannot be otherwise, so long as we have no other instructors than Moulvies and Pundits. The process of tuition is so tedious, that it demands the whole of the student's time, and the pupils of the Anglo-Indian College have little or no time to spare. Until, therefore, we can teach these languages through the medium of English, little good can be expected from their forming a part of the college course."

The Rev. Krishna Mohan Banerjee, later, referred to this difficulty he had had to face in studying Sanskrit while a student of the College; Dr. Wilson was inclined to the view that 'the study of Bengali is only to be profitably prosecuted through study of Sanskrit.'

The annual prize-distribution ceremony came off on 18th February 1829 at the Government House, the Governor-General, Lord William Bentinck, presiding. Lord Bentinck himself distributed the prizes to the students of the first class. Everybody was satisfied with the progress of the students in the English language and literature. Recitations from Shakespeare's dramas and other standard books of verse by the students elicited praise from the Europeans and Indians alike. Among those who took part in the recitations we find the following: Ramtanu Lahiri, Digambar Mitra, Krishna Mohan Banerjee, Ramgopal Ghose, Sibchandra Deb, Radhanath Sikdar, Harchandra Ghose and Rasikkrishna Mallik."

In a letter to the Government dated 18th May 1829, the General Committee of Public Instruction gave a detailed account of the state of the Hindu College in its various aspects (paragraphs 18-24). In the opening paragraph (18) the Committee wrote:

"The general character and condition of this Institution have been submitted to the notice of the members of Government in public distribution

5. *Review of Public Instruction*, etc., Part II, p. 28.

6. *Samachar Darpan*, 21 February, 1829. Cf. *Sombadpatre Sakaler Katha*, Part I, 3rd Ed., p. 34.

7. Quoted in the *MSS. Proceedings of the H. C. Managing Committee*.

of prizes held at the Government House on the 18th February last when questions in History and Science were promptly answered by the students of the first class, the production of the composition of the first five classes and the recitations from English authors by pupils of various classes from the first to tenth class evinced the great proficiency made by the pupils in the language and literature of Great Britain. Further testimony is furnished by the Report of the Visitor and other documents herewith submitted."

The number of scholars as stated in the above letter stood at 436 of whom 100 were taught gratuitously, the rest 336 paid for their tuition. These were distributed among 17 classes beginning with the letters of the alphabet and gradually and systematically advancing to the best authors in the English language in Prose and Verse, the first class being engaged in the perusal of Tytler's *Elements of General History*, Russel's *Modern Europe*, Milton and Shakespeare, being exercised in English composition both in Prose and Verse and being concurrently instructed in Algebra and Mathematics, Natural and Experimental Philosophy and Chemistry. In all of which they have made very respectable progress. Students' progress in the study of Mathematical science was also marked. It had practically commenced, the letter says, 'with the past year and it is satisfactory therefore to find that so much progress has been made under Tytler's tuition.' We have already had an idea of the views and suggestions of Dr. Wilson regarding the study of oriental languages in the Hindu College. Let us now hear the observations of the General Committee on the subject:

"The study of Persian, Bengali and Sanskrit in the Anglo-Indian College is obstructed by the almost exclusive demand upon the time of the students made by the English language and literature and by the very tedious and imperfect method of teaching according to the native system. The study of Bengalee never popular with those who speak it is now in the estimation of the Visitor to be beneficially prosecuted only upon a basis of Sanskrit, the acquisition of which in the Anglo-Indian College he considers hopeless unless it could be taught through the medium of the English language and in elementary works compiled for the purpose. For this object he proposes to endeavour to superintend the compilation of a short Grammar and Vocabulary in Sanskrit and English, and agreeably to European forms by which the acquirement of an elementary knowledge of Sanskrit may be much facilitated. These works will no doubt be of great utility, and looking to the poverty of the dialect of Bengal and its utter dependence for terms of Science and Philosophy upon the Sanskrit language we conceive them indispensable to the adaptation of Bengali to purposes of translation from English writings of an abstruse and speculative character."

The General Committee suggested that every

facility should be given to Dr. Wilson to prepare the proposed compilation. The committee had written to the Government, recommending the preparation of a systematic series of English Books, proposed by Dr. Wilson, 'to be printed for the purposes of education in the country.' The plan was generally sanctioned by the Governor-General in Council in the letter dated 2nd February 1828. The Committee had since adopted measures in concert with the School-Book Society for carrying out the plan. They now submitted an estimate of the cost amounting to Rs. 49,378 12as., half of which would be borne by

Henry Louis Vivian Derozio

the School-Book Society in exchange for half the number of books. The Committee also asked for the sanction of two small amounts for the purchase of class and scientific books for the Hindu and Sanskrit Colleges. The outlay incurred on account of prizes to the boys of the Hindu College amounted to Sa. Rs. 1500, in 1829 and the Committee requested the sanction of the Government to this amount. In reply to this letter (26th June 1829) the Government agreed to afford every facility for the compilations proposed by Dr. Wilson and referred to in the letter of the Committee, and sanctioned the amounts ungrudgingly.

V

The year 1830 was both glorious and troublesome for the Hindu College. Progress of the students in English language and literature was remarkable, and the *Samachar Darpan* of Serampore wrote to the effect that within ten years hundreds of young men

had acquired sufficient knowledge in English lore and some of them had gone so far as to practise their hands in English verse. Along with English language and literature the students also became acquainted with the Western ideas of progress. These had an immense influence on their minds. Their habit and mode of life were regulated by them unawares as it were. But the leaders of the Hindu Society, who were also the controlling authority of the College, could not foresee these possibilities, and they were taken aback at the conduct of the students receiving new education at the College. Hence serious troubles soon arose.

But before dwelling on these points let us turn towards the internal affairs of the Hindu College. As regards finance the College was now in a better position. The fee-income from the students was largely increased. The Government also made contributory grants every year, and non-recurring grants at times, as we have seen already. In 1827, the Government aid was afforded to the extent of Rs. 900 per month. The amount rose to Rs. 1250 per month in 1830.

The annual prize-distribution ceremony took place on 17th February 1830 at the Government House. This year's ceremony had some specialities. Many women headed by Lady William Bentinck graced the occasion. Amongst others present was Sir Edward Ryan, Justice of the Supreme Court of Calcutta (later High Court). Choice specimens of drawing by students were exhibited in the meeting for the first time along with the best compositions of the boys of the upper classes. W. B. Bayley, President of the General Committee, distributed the prizes to the most meritorious students. Recitations from Shakespeare gave utmost satisfaction to those present.

Between March and May several students left the College with certificates of proficiency in their studies. Amongst them, we find in the *Proceedings* mention of the following. Certificates were signed on the 13th March 1830 :

1st Class—Krishnamohun Banerjya, studied 5 years and a half.

do —Nubocoomar Chakrobarty, studied 3 years.

do —Rasikkrishna Mallik, studied 9 years.

2nd Class—Hurimohun Sen, studied 4 years.

In this connection one may be naturally curious to know something about the fate of the scholarships. We have found that these were awarded to the meritorious and deserving students in 1827. No mention is found to be made in subsequent occasions. But we can very well surmise that these were awarded annually from personal references by some of the students later, such as Radhanath Sikdar. It should be said, in passing that these scholarships were continued till 1841-42, when new arrangements were made by the Government.

Students of the Hindu College gave proofs of unexpected proficiency in English language and

literature. Newspapers of the time did not fail to notice this event in their columns. The *Parthenon*, of which I will speak presently and the correspondence, which occasionally appeared in the *India Gazette*, the *Bengal Hurkaru*, and the *Literary Gazette*, showed the capacity of these youths to write idiomatic and elegant English prose. One of them, Kasiprasad Ghose, published his book, *Shair and Other Poems*, which was favourably noticed in the papers, and welcome as the first attempt of an Indian in English metrical composition. The *Samachar Darpan* of Serampore, in its issue of 27th February 1830 felicitated the Bengali youths on their acquirements, which the previous generation could not attain for a long time :

"But within the last ten years, the language has been cultivated with such wonderful success that it could be easy at the present moment to point out between one and two hundred young native gentlemen in Calcutta to whom English is as familiar as their mother tongue. Some among them have given so intense an application to their English studies, as to produce works, which the great body of our countrymen would scarcely venture to attempt."

VI

The Hindu College students started some extra-academic activities by 1830. I have already referred to the Academic Association. Though this Association was 'nipped in the bud', according to the *India Gazette*, we may safely say on the authority of Pearychand Mitra, himself a prominent collegian and an active member of the Association, that it continued in some form or other, and never died out. But since early 1830, the Association's activities became more pronounced. Derozio was its President all along and Uma Charan Bose its Secretary. The erudite poet-teacher, Derozio attracted the students of the upper classes by his lovable nature and sympathetic and friendly treatment. They were no less enamoured with his highly efficient mode of teaching. Derozio's teaching roused in their minds a unique yearning for knowledge. According to the *India Gazette* :

"... not content with a conscientious discharge of his duties as a teacher of the College, he devotes his care and talents during a considerable part of his time out of school, to the improvement not only of those immediately placed under his tuition, but of all such native young men as come within his reach. He is connected with one society as president (i.e., the Academic Association), but with most of the others as members. In short, he lends a very able and active hand in raising the intellectual character of the native youth; and many of the young men who have enjoyed the advantage of his instructions have distinguished themselves by their proficiency."

8. Quoted by John Bull, December 11, 1830.

Under the guidance of such a devoted teacher and friend of the students, the Academic Association soon made its influence felt. Subjects discussed in its meetings were many and varied. They were broached and discussed with freedom which could not have been approached in the class-room. Free-will, foreordination, faith, the soundness of truth, the high duty of cultivating virtue, and the meanness of vice, the nobility of patriotism, the attributes of God, and the arguments for and against the existence of the deity as these have been set forth by Hume on the one side, and Reid, Dugall Stewart and Brown on the other; the hollowness of idolatry and the shams of the priesthood were the subjects, which stirred to their very depths the young, fearless, hopeful hearts of the leading Hindu youths of Calcutta, . . ."

The venue of the Academic Association was first President Derozio's house on the Old Lower Circular Road, and later the Manicktala garden-house of Sreekrishna Singh, a Manager of the Hindu College. David Hare was a regular visitor. Sir Edward Ryan, Justice of the Supreme Court and Colonel Benson, Private Secretary to Lord William Bentinck, Col. Beatson, and Dr. Mill of the Bishop's College attained the meetings occasionally. In the debates of the Association, such prominent students of the Hindu College, as Krishnamohun Banerjea, Rasikkrishna Mallik, Dakshinaranjan Mukherjee, Ramgopal Ghose, Ramtana Lahiri, Radhanath Sikdar, Madhab Chandra Mallik and Gobinda Chandra Bysak, took an active part. Inculcation of progressive Western ideas through Derozio's instruction in and outside the College-rooms, and particularly the institution of the Academic Association were responsible for a movement in the direction of starting unions and clubs for exchange of new thoughts and ideas, and for launching activities for the improvement of our countrymen. The *India Gazette* noticed this fact too:

"The spirit of union has spread itself, and in the course of a short time a great number of literary societies have been formed in Calcutta, consisting principally of the former and present leading students of the Hindu College, the School Society's English schools, and the seminary generally known by the name of Ram Mohun Roy's school. It has been ascertained upon enquiry that seven associations of this kind are now in existence, the proceedings of which are conducted exclusively in the English language. Most of them meet once a week, and some at longer intervals, for discussing questions in literature and science; and sometimes in politics; the number of members belonging to each varies from 17 to 50. At some of the societies written essays are produced, which become the subjects of discussion; at one of them lectures on intellectual philosophy are delivered in rotation by the members, and at another by the president, an East Indian gentleman of great

talents, whose name has been for some time familiar to the public ear as the author of some interesting poems."

This East Indian gentleman was no other than Henry Derozio. At this time he wrote an excellent sonnet on his students, the concluding lines of which are as follows:

O, how the winds
Of circumstance, and freshening April showers
Of early knowledge, and unnumbered kinds
Of new perceptions shed their influence;
And how you worship truth's omnipotence!
What joyance rains upon me, when I see
Fame the minor of futurity,
Weaving the chaplets you have yet to gain,
And then I feel I have not lived in vain."

Derozio's prophecy was more than fulfilled when we take into account the careers of his students both individually and collectively. Inspired by the ideal of service placed before them by Derozio, the students of the College brought out a paper called *Parthenon* in early 1830. Only its first issue was published. The paper contained an article on women's education, another on the necessity of colonisation of India by the British, and some adverse comments on the prevalent Hinduism as well as the unusual expenses at the law-courts. On the publication of the *Parthenon*, the Hindu Managers of the College took alarm, and Dr. Wilson forced the students to stop it. The second issue was in print, but could not be issued to the public. This was the first of a series of actions to counter-act the 'progressivism' of the Hindu College boys.

The Managers of the College issued two circulars in early 1830, one for the teachers and the other for the students. The latter, under the signatures of Chandra Kumar Tagore, H. H. Wilson, David Hare, Rasamoy Dutt, Radhamadhab Banerjea, Ramcomul Sen and Radhakant Deb, runs as follows:

"The Management of the Anglo-Indian College, having heard that several of the students are in the habit of attending Societies at which political and religious discussions are held, think it necessary to announce their strong disapprobation of the practice and to prohibit its continuance. Any student being present at such a society after the promulgation of this order will incur their serious displeasure."

In the other circular the teachers were particularly enjoined to abstain from any communication on the subject of the Hindu religion with the boys or to suffer any practices inconsistent with the Hindu notions of propriety such as eating or drinking in the school or class-rooms. If any deviation was found on the part of a teacher from this injunction, he was threatened with dismissal. The tension ended into a grim conflict.

METROPOLITAN PEOPLE AND PICTURES

By ALBERT TENEYCK GARDNER

THE Metropolitan Museum of Art in New York City has a collection of paintings, which has been growing for over 80 years and which has in that time developed a distinctive character and style. The story of that development is a fascinating part of the unwritten history of American cultural life, of the history of American taste and their relations to American philanthropy.

Economic historians tell us that in the half-century between 1880 and 1930, Americans spent more money spent by any comparable group in on art than had ever before been history. The social historians pursuing this thought, further conclude that in this same period, by gift to museums, the private art collections of the United States have been transformed into a vast national treasure.

Few American collections have held pictures in close seclusion and they are far outweighed by those who have generously given their pictures to the public. It is perhaps safe to venture that a constant record of public gifts, such a flow of art treasure from private to public hands, over such a long period, never before has taken place in any country. The gracious gesture of giving has long since become an American tradition rather than an occasional illustration of the old cliché, "princely gesture."

When the movement for the foundation of museums got fully under way in the United States in the 1870's and 1880's, the Metropolitan was one of the first institutions to be the beneficiary of the tradition. In the late 1880's, through the gift of the Catherine Lorillard Wolfe collection of modern pictures, and Marquand collection of paintings by the old masters, the development of its galleries really began to take definite form and direction. Marquand, by his gift of 50 old masters, set not only a standard of taste by the high quality of his acquisitions, but he also initiated the manner of giving with thoughtful and open-handed generosity. Because of the great interest aroused by his gift (the news widely publicized), both the quality and manner of his action made an impression that has never been forgotten.

Everyone with an interest in art knew the name of Henry C. Marquand, for he was one of the greatest

American patrons of art in his time. Throughout his life he was the friend of many American painters, designers and architects. His natural taste for the arts undoubtedly was stimulated by the interests and enthusiasms of such men who were the leading spirits of the conservative inner circle of the New York art world of 1850-1880.

Marquand was a New Yorker by birth. Two phases of his early business career had important and interesting influences on the development of his later activities in the art world. As a young man he managed the large real estate holdings of his brother and through this work he became aware of the ugliness and bad planning of American architecture, particularly the business buildings then being erected in New York City. His efforts to improve the appearance and utility of

METROPOLITAN PEOPLE AND PICTURES

401

those buildings brought him into contact with Richard Morris Hunt, then one of the most promising and best-trained young architects in the United States. The other phase of his business career which affected his activities as a collector was his experience as a partner in a jewelry firm where an eye for quality is a part of the essential equipment. From these pursuits he progressed into banking and railroads where he was eminently successful. In the 1880's he more or less retired from business to devote his time to building his Madison

enjoyed in privacy, but were given to the people of New York City and were on display as a loan at the Museum as soon as they arrived from London.

Marquand formed, during his later years, two important collections. These were brought together with two quite separate purposes in mind. One was made for the adornment of his home, the other for the specific purposes of the Metropolitan Museum. His house was in itself a work of art; in building and designing it Marquand employed the best modern artists and decorators to ornament the interior which he then filled with works of art of every description.

The collection of paintings in the Marquand house was for the most part the work of contemporary British and American artists, but there were a few eighteenth-century British portraits and one or two old masters. Among the modern paintings was Alma-Tadema's famous "The Reading from Homer" (now in the Philadelphia Museum) and a handsome view of Windsor Castle by John F. Kensett.

An idea of the extent and value of his collection is revealed by the fact that when it was sold in 1903 the auction lasted through nine days and the cash receipts amounted to over \$700,000. Marquand intended that these treasures ultimately should be given to the Museum but severe financial reverses in the last years of his life made that impossible.

The other collection made by Marquand expressly for the Museum was quite different, though in its own way it too reflected his refined and conservative taste. This group of works was based on the serious study of a very conscientious and enthusiastic Museum President. The guiding principles in Marquand's mind were also based on British precedent: the ideal art museum of the time was the South Kensington Museum (now the

Victoria and Albert) in London. This concept was one of a museum of art history brought together purposely for its practical educational value. This second Marquand collection of old masters, metalwork, glass, ceramics, was built up over a period of twenty years (1881-1902) especially to enrich the Metropolitan not only as a picture gallery, but also as an educational institution with the belief that American industry would profit by finding in American museums materials for the inspira-

Avenue mansion, buying works of art and giving serious thought to the development of the Metropolitan Museum of Art.

Marquand's first donation, quite aside from the beauty and historic value of the pictures in it, had one characteristic that makes it unique in the history of American collecting of that time. This is the fact that as soon as the pictures were brought together they were given to the museum. They were never

tion of her designers and craftsmen and manufacturers. Marquand selected the old masters to augment and complement the Museum's first group of old masters purchased in 1871 by William T. Blodgett, which were of the Dutch and Flemish schools.

The Marquand "Portrait of the Duke of Lennox" by Van Dyck is the very epitome of ducal elegance, a most impressive picture, and one that from 1889 to the present day has been one of the most popular pictures in the Museum's collection. The Hals portraits, of which there are three, show him in his most vivid and dashing style, while the Vermeer represents this rare master at his best. The Metsu, the two works by Peter Christus, the Rembrandts, the Cuyp the Ruysdael and other works of the Dutch and Flemish schools gave a new tone and strength to the Museum's paintings.

Added to these there were no less than four interesting portraits of the School of Velasquez perhaps among the first works from the studio of this grand Spanish master to come to anyone in the United States. With these was a group of British eighteenth-century portraits and landscapes, a Turner, a Crome and a Gainsborough, and three Italian works.

For 30 years, 1871 to 1902, the problems of the Metropolitan occupied increasingly more and more of Marquand's time and energy and thought. It was not unusual for him to advance substantial sums for various prosaic museum expenses, such as the payment of its coal bill, as well as to provide educational exhibits of the library and the general endowment fund. As President, he secured in 1896 an appropriation from the City for the building of the first section of the now well-known Fifth Avenue facade. It might be said that he found the Museum an odd rustic park structure with rather barren halls and walls, and left it in the hands of his successors a monumental structure filled with works of art that gave it a more than national importance. His intense interest in the general welfare of the Museum as an institution for the benefit of the public set a standard of service to the community.

In contrast to the Marquand Collection, perhaps that of Miss Catherine Lorillard Wolfe, received by the Museum in 1887, may stand as a characteristic group representing a sort of then general "standard" of taste for the private art gallery of the 1870's and 1880's. Miss Wolfe was the heiress to a hardware fortune, who had invested much of her inheritance in paintings which today have the appearance of bonbons. However, daringly

mingled with these were a few "advanced" Barbizon pictures, a very fine Corot landscape, two Daubignys, several by Diaz and a landscape by Theodore Rousseau. Her gift to the Museum was notably sweetened by being accompanied with a sizable fund for the upkeep and increase of her pictures. Through this thoughtful addition to her gift, the Museum has been able to purchase a number of French canvases by Ingres, Delacroix, David, Cezanne, Renoir, Vuillard and others.

At this time a number of Americans, following Marquand's lead or inspired by the same tendencies which seemed to be in the air, were beginning to purchase paintings by the old masters, but none of them followed Henry Marquand to the extent of collecting expressly for a Museum's immediate benefit. However the thought had been well established by his example

Paintings, sculptures and carvings of the Renaissance, and other periods enrich the Renaissance Galleries of the Metropolitan Museum of Art

Courtesy: Metropolitan Museum of Art

to flower in later years in the giving of collections of works of art to public institutions throughout the United States.

Marquand's gift of old masters probably accelerated a new trend, for in the decade 1880-1890 the Havemeyers bought their first Rembrandts and J. P. Morgan started to buy works of a more memorable sort.

A few months after Marquand's great gift to the Museum in 1889, another New Yorker—Ewin Davis—presented three pictures that struck a new prophetic note. These were the famous Manet, "Boy with the Sword," his "Woman Feeding a Parrot" and the "Joan of Arc" by Bastien Lepage. The Manets were accepted

calmly as the fine modern pictures which they are by the newspaper critics and everyone else.

The interests of the Havemeyer family in the Metropolitan began in 1883 when H.O. Havemeyer purchased and presented a Gilbert Stuart "Portrait of Washington" when he found that the Museum wanted it but had no funds. In 1891 the Museum received as a loan from them a notable group of 14 modern paintings and old masters. These were apparently lent while the Havemeyer house was being built, a house that was in time to become one of the most incredible private art museums ever brought together—the greater part of which was given to the Metropolitan in 1922.

The Havemeyer Collection, so rich in its Impressionist paintings, placed the Museum immediately in the front rank making it unrivalled even by the museums of France. Its two superb El Grecos, its Rembrandts,

the elegant Bronzino, the many Coyas and two Veroneses gave accents of the greatest distinction to the galleries of old masters. It contained, in addition to more than two hundred paintings, whole galleries full of Oriental art, paintings, screens, lacquer pottery, metalwork, as well as sculpture, prints and drawings.

During the long period, now happily at an end while the Museum's galleries were closed for rebuilding, the steady requests for paintings from the museum-going public have been a constant reminder of the great popular interest in paintings as well as the popularity of the Metropolitan's collection. These days the public asks for a quite different sort of pictures, not at all the thing that was in popular demand even a few years ago. Now they want to see the Impressionists, the moderns or the time-tested old masters. They like Goya, El Greco and Picasso.—From *Art News*.

THE FRENCH RIVIERA AND THE ALPS

Monte Carlo to Geneva

By A. N. SEN, M.A., B.Sc. (Glas.), M.I.E. (India)

MONTÉ CARLO, a little city of about 10,000 souls with two other cities totalling 8 square miles, forms the independent principality of Monaco, ruled by the Prince of Monaco. But there are no custom-barriers between France and Monaco. Lovely gardens, magnificent villas, Parisian shops, gay little tea-houses are

A general view of Monaco

located within a small compass on the very fringe of the promontory at the foot of the Alps. Gambling privileges yield so large a revenue that the people

Monte Carlo, Casino

of Monaco pay no taxes but they are not allowed to take part at the gaming tables.

The town of Monaco at the bulge, on a higher level, has the Prince's Palace at the centre and a remarkable museum of Ocean Wonders. It offers a charming view up to Nice on the West and to Menton on the East at the Italian frontier.

Monte Carlo is disproportionately small and yet famous throughout the world as the most attractive gambling centre. Gleaming white walls and tiled roof of the world-famous Casino or gambling hall, a wide terrace and a

Monte Carlo. The garden of Casino

Sisteron

Digne

splendid garden are worthy of admiration. Formerly it used to be the Grand Dukes and Princelings of Europe but now, more of the show business of Hollywood pattern invade and crowd Monte Carlo in summer. It has been called a city of staircases; the Mont Angel Golf Course, the most expensive in the world, built at a fabulous cost from out of the rocks, has to be reached by an endless spiral flight of stairs. The turf, secured from distant centres, was brought to such an excellent condition that a golfing expert, when asked about his opinion, said, "I am no-goat." There is, however, no chance in any of the holes for the ball to bounce about to eternity.

In the famous northward route from Nice, although the road was level and straight for a time, it

Grenoble

Gorges of the Mescla with tunnel

Annecy

Annecy

became very sinuous by the gorges of the Mescla with several tunnels. Passing through the cols (passes) of Vergons and Moria we reached Barrême on the Napoleon route, and followed it up to Sisteron passing

"Here is your Emperor; if any one would kill him, let him fire." This dramatic appeal won over the garrison at Grenoble and he began his triumphal march to Paris

through Digne. Then our route separated and we got excellent views of the Alps of Dauphiny until we passed the heights in the pass of Croix-Haute and descended gradually to Grenoble, one of the most beautifully situated towns of France. The Napoleon route passed through Grenoble and here he won over the soldiers who had been sent to capture him and began the triumphal march to Paris, which in 100 days ended in Waterloo. From Grenoble the drive was picturesque with views of distant mountains, through gorges and valleys to the famous spa of Aix La Bains (a fashionable and popular thermal spa and summer resort) and then to Annecy situated on the beautiful lake. Here to our regret, we missed Mr. Macdonald, late Principal of the Bengal Engineering College, who had come to spend his holidays here just a few days ago. Then through pretty gorges and phenomenal panorama of the passes and with magnificent views of both Lake Geneva and Mont Blanc, Geneva, the gateway to Switzerland, was reached.

—O—

THE EMERGENCE OF THE BUDDHA-IMAGES

By PANKAJ KUMAR ROY

ONCE Mahayana Buddhism succeeded in satisfying the growing needs of the common man in understanding the code of ethics and morality easily and clearly, no force could retard its popularity—a popularity achieved by the simple, humane, unorthodox and realistic principle of this creed. Influenced by the "Bhakti" movement to a great extent Mahayana shattered all its limitations that came by the way and went on progressing with leaps and bounds as the only practical and realistic religion of India of those times. Saivism was there and the "Sakti" cult was trying to gain a subtle position, and above all, Vaishnavism was showing all the signs of maturity. But Mahayana Buddhism overshadowed them all in its rapid propagation. Although the gaining of public approval, support and sympathy was the foremost consideration, there arose the question of how to maintain this popularity for decades to come. Early monastic Buddhism never allowed the Master to be represented in images—He was always translated through symbols. Much stress was laid upon *japa*, *upasana*, prayer and meditation and that too done in *viharas* and at *stupas* was the usual practice under that system. This presentation of Buddha in symbols might lead to the fact that the exponents of post-Buddha Monastic Buddhism thought Buddha-images might have lessened the gravity of the Master's significance. Bare *japa*, *upasana* and meditation never bring the devotee into a closer contact with the worshipped—there always remains a barrier of fear and formalities in between the worshipper and the worshipped. The devotee, a common man, practises all

these—*japa*, *upasana*, etc., mechanically day by day, gradually all these become nothing but a routine. And this state of affairs—religious practices done in a lifeless, formal way—brought the downfall of Hinayanism. A wheel, an empty throne or the Bodhi-Tree was sufficient to portray the Master in symbolic designs.

Mahayana Buddhism, when it came to play its part, realised this vital drawback of its counterpart, the Early Monastic Buddhism. It understood clearly that no symbol could produce devotional sentiment in the hearts of common men. Symbols could command respect and reverence, but neither complete self-surrender nor devotion. Mahayanism rightly noticed that to worship a super-human personality like Buddha only through his symbolic representations was not easy for the layman. And that is why the Hindu gods and goddesses are represented both in iconic and aniconic representations from the days of the Indus Valley Culture. Take for example the case of "Krishna". He is represented both as a "Salagramasila" as well as in anthropomorphic forms. Mahayanists thought the images of the Master would be an example to the devotees reminding them of the stages of Bodhisattva-hood. Gautama had to pass to become a Buddha, of the services he did to suffering humanity and his sacrifices to free the souls under bondage. Not only would these images be a reminder of Buddha's activities but they also helped men to follow and emulate them, if possible. But above all, a Buddha-image would help the devotee to think that he could also become a Bodhisattva then a Buddha and attain 'Nirvana' by constantly rectifying himself—by diminish-

ing his sins through the 'travail and error' method and through service to all living creatures; in one word, living and leading the life of devotion and sacrifice to all men. Further, a Buddha-image could be worshipped very easily at the devotee's home, requiring no hard and fast rule, and helping him to stop all formalities within the modes of devotion.

These factors played the role of leading forces in the evolution of the Buddha-images. The common worshipper now no longer was required to visit the monasteries, *viharas* and the *stupas* for formal and methodical ovations and prayers. The Master was now before his eyes in all his (Buddha's) character-features. Devotion thus naturally welled up in the sentimental heart of the common man who had for long been under rigorous formalities and this pure devotion led him to the path of complete self-surrender and the forsaking of all worldly bonds.

Two parts of India—Gandhara (the modern Kabul, Peshawar region) and Mathura—were the first to originate Buddha images, almost simultaneously. The chronology of the Gandhara art is still a vexed question and I leave it for the archaeologists to ascertain the correct date. Mr. Benzaime Rowland, Sir R. E. M. Wheeler, Karl Khandelwala, Mr. Cornington, Dr. Nihar Ranjan Ray and many others call this a "Graeco-Roman Art" while Mr. Vogel, Dr. Mrs. DeLlew, Mr. Foucher, Dr. Coomaraswamy and others call it "Graeco-Buddhist Art". Neither of these two views can be justified, supported and solicited faithfully. The theme of the art is Buddhist no doubt. Then how can scholars call it Graeco-Roman or Graeco-Buddhist? Many of the Buddha-images from Gandhara have close affinities to Hellenistic and late Antique phase of the Roman art. But can we say definitely that Gandhara was the borrower from the West and not vice-versa? It may be quite likely that there was cordial relationship between India, Rome and the Hellenistic countries in those days, and sculptors from one country might have visited another and helped to produce some of the images. But that can certainly not brand an art as the imitator of another. That is why the Buddha-images of the early Gandharan phase exhibited some resemblance to Graeco-Roman types but images of slightly later phases manifest a vast improvement towards indigenous ideas.

"It may be described from one point of view as representing an eastward extension of Hellenistic civilization, mixed with Indian elements from another point of view, as a westward extension of Indian culture in a western garb."—Dr. Coomaraswamy: *History of Indian and Indonesian Art*.

The Mathura Buddha-images show a fully indigenous finish.

Now to the Buddha-images. Mr. B. Rowland calls the Gandharan art "the official art" of the Kusanas and their successors. The Gandhara school is usually credited with the first representations of the Buddha in anthropomorphic form.

"The quality of devotion in the later Buddhist sects demanded a representation of the Master in an accessible human form. The earliest Buddha-images were a compound of icono-graphical and technical formulae"—Rowland: *Indian Art—Hindu, Buddhist, Jain*.

Typical Buddha-image (Mathura School)

Usually these images are of three types—Seated Buddha, Standing Buddha and Buddha as the Prince Siddhartha. In the first two types, Buddha is shown wearing a monk's garment (with folds of drapery). Adolescent features, wavy hair, elongated earlobes ('urna' and ushnisha) as also the definition of the third eye between the eyebrows are the other important features of Gandhara Buddha-images. All these images, according to Mr. Vogel, are shown in relief and never, as statues carved in the round. The right hand as a rule is raised to the height of the shoulder; the open palm

is turned towards the spectator as expressive of the Master's grant of "Abhaya." In the third type we find a young man in princely garb—turban, jewellery and muslin robe. He is Siddhartha. Another innovation of this art was the continuous representation of the Buddha legend in a series of separate episodes.

"The Gandhara reliefs show no less stylistic variety than the statues of Buddha and Bodhisattva. . . . Gandhara relief sculpture owes its rather puzzling character to the fact that it is technically an impossible mixture of archaic and developed styles of carving," writes Mr. Benzamine Rowland.

The carving is characteristic of the isolation of the figures against a plain background, although the

Typical Buddha-head
(Gandhara School)

forms themselves are related one to another by their postures and gestures. Such legends as the "Presentation of the Bride to Prince Siddhartha" or the "Nirvana" are only some of the examples of these richly carved relief panels.

Now to the other school, of Mathura.

"The great period of Mathura's florescence coincides with the great century of Kusana rule under

the reigns of Kanishka and his successors and this is exactly contemporary with the Gandhara school." —Rowland.

"The most obvious characteristic of the Kusana school in Mathura is the fact, by no means astonishing, that it represents in the main a direct development of the older Indian art of Bharhut and still older art of Besnagar."—Coomaraswamy.

Mr. J. P. Vogel also shares the same opinion along with Dr. Mrs. Lohuizen DeLew (authoress of *Scythic Period in Indian History*) and many others. The Mathura images are usually of red sand-stone; the sculpture is in the round, the head is shaven and never covered with curls, the 'usnisa' wherever preserved is spiral, there is no 'urna' and no moustache; the right hand is raised in 'abhaya' mudra, the left is often clenched and rests on the thigh in seated figures, or in standing figures supports the folds of the robe, the elbow being always at some distance from the body.

"The breasts are curiously prominent, though the type is absolutely masculine and the shoulders very broad. The robe leaves the right shoulder bare—the drapery moulds the flesh very closely and is arranged in schematic folds; the seat is always a lion throne, while in the case of standing figures there is often a seated lion between the feet. The gesture and features express enormous energy."—Coomaraswamy.

"The Buddha already conceived of as a transcendent, almost forced a reliance on preconceived ideals of divine beauty and a dependence on certain superhuman proportions and attributes which would properly assume the image's assuming an appropriately iconic aspect of divine perfection."—Benzamine Rowland.

Mr. Vogel, Mr. Foucher and Dr. Mrs. Llew support this view along with many others. According to Mr. Rowland the eyes of the Mathura Buddhas are fully open, the cheeks round and full, the mouth ample with lips drawn into a slight smile and the face has a warm, friendly expression. Sculpture in relief under the Kusanas at Mathura is in many respects an outgrowth of the styles of the archaic period, although at the same time it is undoubtedly influenced by innovations from Gandhara, notably in the inclusions of Buddha in anthropomorphic form. This is vouched by Dr. Coomaraswamy, Mr. Vogel, Dr. Nihar Ranjan Ray, Mr. Foucher and others. Mathura sculptors followed a shorthand manner of presentations by stripping off all details of action and setting from various episodes so that the event is often represented only by the figure of Buddha in characteristic pose and mudra.

The Buddha-images of Amaravati in the far South have resemblances to Mathura except the definition of the drapery by a combination of incised lines and overlapping ridges indicating the course of the folds and seams, which are reminiscent of Gandhara Buddha images. The face of the Amaravati Buddha is oval-shaped.

This process of the evolution of the Buddha-images

comes to its fullness in the golden days of the early Imperial Guptas and this classical type is the main source of all later forms both in and beyond the Indian boundaries.

"The Gupta type is characterised by its refinement."—O.

ment, by a clear delineation and definition of the features by curly hair, absence of urna, greater variety of mudras, elaborately decorated nimbus, the robe covering one or both shoulders, clearly revealing the figures."—Dr. Coomaraswamy: *History of Indian and Indonesian Art*.

REDRAWING INDIA'S MAP

By Prof. SHRIMAN NARAYAN

THE long-awaited recommendations of the States Reorganisation Commission are now before the general public. According to these proposals, the new map of India will have 16 federating units, all to be called "States" enjoying equal constitutional status, and these Centrally-administered areas to be known as "territories." All the existing C States are to disappear, all the B States, with the exception of Rajasthan and a truncated Hyderabad, are also to go. Uttar Pradesh continues to be the largest in population with 63.2 million, whereas the new State of Madhya Pradesh will be the largest in area with 1,71,000 square miles. The new Bombay State will be the second biggest State in population and the third largest State in area. The capital city of Delhi will now be a Centrally-administered territory with a Municipal Corporation on the lines of the London County Council. Status quo has been maintained for the present as regards Pondicherry and NEFA owing to the special circumstances under which they have been placed constitutionally. The recommendations of the Commission are unanimous except in regard to U.P. and Himachal Pradesh. Shri Panikkar wants an 'Agra' State to be carved out of portions of the existing U.P., Vindhya Pradesh and Madhya Bharat. Shri Fazl Ali is against the merger of Himachal Pradesh with Punjab and PEPSU as now provided, but wants it to be a Centrally-administered territory.

As was indicated by the Prime Minister in his broadcast to the nation on the eve of the publication of the Report, the recommendations of the Commission will now be considered by the State Legislatures and the public generally will also have "every opportunity for the expression of opinion." Of course, the ultimate decision on these recommendations will be taken by the Parliament. It is not very clear yet whether it would be possible to implement the proposals of the Commission for redrawing the boundaries of new States before the next general elections early in 1957. Reference has been made in the Report regarding the need for re-delimitation of Constituencies in a number of States. It is, however, generally believed that it should be possible to hold the general elections, more or less, according to present schedule after enacting the neces-

sary legislation in Parliament and redelimiting the Constituencies. All this would, of course, entail very heavy and onerous work for the administration. But it is being realised by all sections of public opinion that the general elections must not be postponed beyond the period of five years, as laid down in the Indian Constitution, except in very grave national emergency.

In his broadcast talk, Shri Nehru appealed to the people of India to read the Report "as a whole." No Report of this nature could possibly satisfy everybody. We have, therefore, to find out "what is good from the point of view of the country as a whole and has the largest measure of agreement and support." The Prime Minister wanted us to approach this question "with dignity and forbearance and in a spirit of dispassionate consideration."

"This is a hard test for us and our future might well depend upon how we face it and deal with." "I earnestly trust, therefore," said Shri Nehru, "that we shall consider this report in a manner becoming a great people fashioning their future."

The three distinguished members of the Commission have also expressed a similar hope at the end of their Report:

"Free India is now on the move. What has already been achieved can be viewed with a measure of legitimate pride. The manner in which the very difficult problem of Princely India was solved in the anxious and bewildering circumstances following partition, will by itself be a standing testimony to the political wisdom and strength of the Indian people and their firm determination to eradicate artificial barriers and cramping loyalties. We conclude in the hope that the scheme of reorganisation which we have proposed will be viewed against this background and that men of good-will will co-operate with those charged with the onerous responsibility of reconciling competitive claims and of balancing regional sentiments with national interests in giving effect to the decisions which might be taken in an atmosphere of tolerance and understanding."

The Commission have also done well in recommending a number of measures for safeguarding the rights of linguistic minorities and for forging the ties of national unity. They have recommended, for

example, that about fifty per cent of new entrants in any cadre of an existing All-India Service should be from outside the State concerned. Further that the training of probationers to the All-India and Central Services should be such that they should have a good introduction to the essentials of Indian geography, history, religions, customs and manners. Even in the case of High Court judges, it has been suggested by the Commission that at least one-third of the number should consist of persons who are recruited from outside the State. These are, indeed, useful suggestions for bringing about a proper atmosphere for national unity and solidarity. It must, however, be remembered that no proposals can achieve the desired objective unless there is real and sincere appreciation of the need for such unity in the minds and hearts of the people. We should also constantly bear in mind that the map of India is being redrawn primarily for the sake of administrative convenience so that the various State Governments may function through the language of the people of those areas. After all, the State will continue to be integral parts of the great Indian Union and it does not matter very much whether a particular Taluka or District is included in this State or that State.

It should also be clearly understood that the recommendations of the high-level Commission should be considered with due respect. It would be very wrong to treat the Report in a light-hearted manner and start fresh controversies or agitations over again. The Commission consisted of three very able men of this country who considered 1,52,250 documents, interviewed more than 9,000 persons and travelled 38,000 miles before coming to the conclusions. If we begin the whole process once again by agitating for our own

point of view, there would be no end to this discussion and controversy. It is true that the Prime Minister himself has been "a little surprised" at some of the recommendations. This only shows that the Prime Minister had absolutely no idea about the nature of the proposals of the Commission till a few days ago and that he keeps an open mind in regard to this difficult problem. But this does not mean that we should also begin imitating the Prime Minister by expressing our own 'surprises' and indulging in unending controversies. We should be prepared to accept the recommendations of the Commission in good spirit and think of certain changes only in very exceptional cases.

There are still some people in this country who feel that it was a mistake to have appointed this Commission. In fact, they regard the very idea of linguistic re-distribution of States as basically unsound and dangerous to the cause of India's unity. We do not agree with this view. We are of the definite opinion that the existing States are not rational and scientific; they were carved out by the alien rulers in accordance with the exigencies of the time. It is, therefore, desirable to redraw our map on more rational lines. As Acharya Vinoba recently pointed out, reorganisation of States, if undertaken in the proper spirit, should be able to promote our unity and national strength. But, if we do not show proper broad-mindedness and largeness of heart, this process of reorganisation may sow the seeds of national ruin and disaster. This is, therefore, a hard and momentous test for all of us and I earnestly hope that we will come out unscathed. May God give us the necessary strength to be worthy citizens of this great land of Gandhi and Nehru!

COMMENT AND CRITICISM

"The Educational Movement in India"

Sir,

I beg to, draw your kind attention to some solecisms and misstatements which occur in the paragraph on Hindi, on page 444, in the above article by Rajani Kanta Das, Ph.D. and Sonya Ruth Das, D.Litt. (Paris), published in *The Modern Review* for June, 1955.

The authors have spelt 'Chanda Bardai' as Chand Bardi, without any phonetic notations. It is a minor mistake; but it should not have occurred. This would lead all readers of the journal who do not know Hindi, to pronounce the name wrongly.

Then, 'Bhartendu Harischandra' has been shortened to B. H. Chandra. In this case Bhartendu has been taken to be a part of the name of the poet-dramatist, whereas it is only his title. When many of those familiar with Hindi and the history of its

literature had to pause for a moment before they could make out that B. H. Chandra stands for Bhartendu Harishchandra, how would those unfamiliar with the language and its literature get the name correctly? It appears that the significance of the honorific 'Bhartendu' escaped the notice of the learned authors. Or, does it show their utter ignorance of the subject they are writing about in rather a learned way!

Besides these, there are the following amazing misstatements which are unpardonably present in the paragraph:

The authors' remark that "The earliest Hindi author was Chand Bardi (sic), known for his poems on *Prithvi Raj Raso*," indicates that 'Prithvi Raj Raso' is the name of the hero, or the central figure on whom the poems (!) by Chanda were written.

The fact, however, is that 'Prithvi Raj Raso' is a voluminous epic running into 2500 pages—divided in 69 chapters; and is not a mere collection of poems. It has for its subject, the deeds of glory and exploits of Prithvi Raj, the Chauhan King (besides some traditional facts of Rajput History).

Another damaging remark which the authors make is about Tulsidas. According to them, Tulsidas "translated the Ramayana into Hindi". It is as preposterous a remark as to say that Milton versified the Bible in the *Paradise Lost*! It is a well-known fact that since the days of Valmiki, many great poems have been written not only in Hindi but also in many other Indian languages. Kalidas's *Raghuvansam*, Tulsidas's *Ramacharitamnas*, Keshavadas's *Ramchandrika*, and Maithalisharan Gupta's *Saaket*, to name only a few, are all devoted to the same theme. Though their theme is one yet

they are so different in their approach and style that the later ones can never be called a translation of the works written earlier. The same holds good about Tulsidas also. To say that he translated the Ramayana into Hindi is as far from truth as it can be. All that he did, as he himself says in the opening book of his great epic, was to collect some material from many Puranas, and Shastras and also from tradition for composing his immortal work. His treatment and style are entirely his own and he is absolutely original in every way.

I wish these mistakes had been corrected and the facts verified before the article was sent for publication.

This shows how dangerous it is to rely entirely on knowledge gathered through second-hand sources.

Shrirama Shrivastava, M.A., Visharad Lucknow.

POEMS

By IDA SARKAR (nee Stieler)

TO MY HUSBAND

Memories! Memories!
God's wonderful gift divine,
I hold you silent in my soul.
Years have passed by—
A wreath of tears I wind around the time.
In my dreams,
I weave your face immortal to a shrine.
You, my beloved with your sunny eyes,
Your forehead shone with radiant intellect bright.
You, whose kindness made all eyes fill with tears,
Your clear tranquillity of mind
Gave rest and peace to all.
You brought happiness to map in storm and stress.
Full of world-joy, yet so distant from world-lust
Your path moved on. You paved the way,
Inspired all hearts, who searched for truth.
Far like a dream are all the days gone by.
We shared life's happiness and joy.
Just like a spring your words run through my soul.
They carry force and strength through all my veins.
"Have courage, man must fight," how often did I
hear this phrase.
Again my own heart tells me in one solitary hour.
The fate of years.
In one moment, I visualise the dreams of my world.
I see milliards of stars high up in the sky,
Which no man can count.
I begin to see light after light.
All this has passed through my life,
While with you.
The stars shine and I do not feel lonely in my
loneliness.
You are ever and ever with me, my beloved.

All my gratitude to you come never too late.
You left me your warm heart, your strength stayed
with me
And leads me on my way.
You took with you your loving eyes,
Yet the sight of your soul was left to me.
You planted the seeds of knowledge and sacrifice,
In the green garden of this young generation,
From your fertile autumn days.
These seeds will grow for ever and ever
And with them will grow our love and admiration
for you.

TO MY BENOY

Fighter for the truth of all things,
Noble fighter thou beloved mine,
From the ruins of all I lost
Sing I to thee, Oh immortal one!
I see the world through those where death has passed.
I see the traces of thy greatest work,
I see thy life which had to suffer hard,
Before it even started full to live.
Out of the clouds of golden illusions
Thou resist and we feel thee ever near.
Thou still givest life from the eternal zones
To the down-trodden, whom thou lovest the best.
Thou weavest ever the robe of sacrifice
For the youth to come,
For the freedom which thou hardly felt.
Where thou art missing, life itself is dead,
Where thou art, there is immortality.

(Poems written by Mrs. Ida Sarkar, his wife, for the sixth death anniversary of Prof. Benoy Kumar Sarkar.)

W. C. BONNERJEE—FIRST PRESIDENT OF THE INDIAN NATIONAL CONGRESS

By MANIK LAL MUKHERJI

In the nineteenth century a galaxy of stars were born in Bengal. They were all eminent men who held the field in almost all spheres of life in India. Practically Bengal led and the rest of India followed.

Such a great man was born in Bengal on the 29th of December, 1844. He was W. C. Bonnerjee, a name which India can hardly forget.

W. C. Bonnerjee was born in Calcutta in his paternal house at Kidderpore. The house and the lands adjoining were subsequently acquired under the Kidderpore Dock Extension Project. W. C. Bonnerjee's parents originally hailed from Bagnan in the District of Howrah and finally settled in Simulia in Calcutta.

Like almost all great men he was unmindful of his studies in boyhood. He read up to the Entrance standard in the Oriental Seminary in North Calcutta. His father was a noted attorney of his time.

In his early age he had a great fancy for Westernism. He expressed his desire to his parents that he would like to embark on his voyage for England but was severely scolded. So one stormy night in the month of October (Bengali Aswin) in the year 1863 he slipped off from his home and found his way to London. He secured a scholarship from a Bombay millionaire but as he got the money very late he had to struggle very hard in England.

While studying at Lincoln's Inn Bonnerjee picked up the friendship of the late Dadabhai Naoraji. Both of them were nationalists to the very core of their heart. India was his constant thought but he chose the path of moderation in his political activities. He divided his time between India and England where he had his second home and most of his friends were members of the British Parliament. His personality had a charm for everybody and even the British Parliament could not escape his personal influence. He became so very popular in England that he was put up as the first Indian candidate from Walthamstow for election to the British Parliament but his illness stood in the way of his election. He had to withdraw his candidature.

He presided over the deliberations of the First Indian National Congress in the year 1885 and those who followed his speech could easily understand that his path was constructive. He breathed his last in London in June, 1906 and his death was mourned equally in India and England. From 1885 for several years practically Congress was W. C. Bonnerjee and Bonnerjee was the Congress. His influence with the Congress was great because he wrought for the ultimate freedom of India. He spent his money lavishly

for the Congress and exercised his influence to increase its members and workers on behalf of it.

So great was his foresight that even in the year 1892 he pleaded that India is in need of more engineers—a fact which is realised in free India today.

At a well-attended meeting held on July 26, 1906 the hall of Buxton Men's Club, Walthamstow, Hon. G. K. Gokhale said:

"... For more than a quarter of a century Mr. Bonnerjee's name had been a household word in India. He had laboured unceasingly for the good of his country, and his name would never be forgotten in that land. In him they had lost a champion of political reform, a great patriot and a wise statesman (applause)... he had come to England on behalf of the Indian National Congress of which Mr. Bonnerjee had been the First President which consisted of 100 delegates elected by the people, which met once a year and deliberated on important questions..."

The remains of W. C. Bonnerjee were cremated at Golder's Green. Before the coffin was transferred to the inner chamber the late Dadabhai Naoraji delivered a short funeral address which runs as follows:

"His patriotic fervour and zeal in youth was no less ardent than in later years. One of his earliest attempts to serve his country was the foundation of a London Indian Society now merged in the East Indian Association and on his return to India his career of public usefulness gradually broadened until it reached its appropriate goal in his election as the President of the first Indian National Congress. In that capacity his utterances were, as statesmanlike and far-seeing as they were modestly conceived. There was no undue elation but at the same time there was no shrinking from responsibility and none rejoiced more than he at the ample fulfilment of the hope he expressed for the stability and progress of the movement."

Traditionally India is never behindhand in hero-worship. It is but meet that we Indians should not forget to get a suitable memorial for that great departed soul who first lit up the torch of freedom.

Mourning his death Mr. A. O. Hume said:

"... Probably no other gentleman of modern times exercised so great an influence over his countrymen at large—not merely in Bengal but throughout India—as did Mr. Bonnerjee who from the first day that he put his hands to the plough of reform very early in 1885 never grudged his time, his talents or his money, that the cause of India's people might be in any degree aided or promoted by any or all of these..."

Shocked to hear of his sudden demise in England (Sir) Surendra Nath Banerjee said:

"... In him India has lost one of her foremost sons, and the legal profession one of its brightest ornaments and the Congress one of its founders and its first President..."

EDUCATION FOR CHILDREN

By SANTOSH KUMAR BANERJEE

After the independence of India everybody thought that great changes would come in the field of education for children. It is an admitted fact that a country's progress depends much on the educational advancement of her children. In the British days the then rulers of the country made such a provision of education in the schools and colleges that the students coming out of these institutions could swell the ranks of their clerks who were essentially required for the machinery of administration. In the beginning of the British Rule very few higher posts were offered to Indians as the top posts were enjoyed by their own men and so with the limited knowledge and incomplete education the people of our country, who were serving the British in their different organisations were satisfied with the clerical posts. With the passing of time the situation changed and the Indian people became more and more ambitious. They began to agitate for many demands which were up till now not granted to them. One of such demands was to get good education and be fit for higher posts. Gradually some of the Indian boys were able to compete in the higher recruitment examinations along with the British boys and could secure top places in order of merit. They had to be provided with some posts which were originally meant for British boys. When these young men of our country obtained such posts they were discouraged from mixing with their own men and made to feel that they belonged to a superior class. Thus these fortunate men were almost lost to the family, the society and the country to which they belonged.

Ever since that time these men had been able to satisfy their British rulers with loyal service and they did not care to know the real condition of the country or find out the means for effecting improvements in her different spheres, particularly in the sphere of education. They gave their children education in English schools and sent them to England to finish their education there so that they might also hold higher posts like them. Since independence of the country their angle of vision has not appreciably changed. They are still holding the key positions in the administrative machinery of the country and they know that so long as they can give their children a different kind of education, which the ordinary people of the country cannot afford to give to their sons and daughters, their children will continue to get prominent positions in life. The leaders of our country who were once associated with the everyday sufferings of the average man and woman and have got the contagion of this feeling from the higher officers, who are now in close touch with them, are also now having their children educated in expensive schools where the teaching is imparted

by teachers who are mostly foreigners. As a result of this both the leaders and the high officers of the country are not aware of the real condition of affairs in the ordinary schools meant for the middle class and the working class boys and girls. These schools are mostly ill-managed, ill-housed and have such teachers who cannot devote their wholehearted energy towards imparting education to the students due to their poor salaries. In this respect we depend too much on Government, but we do not realise that as citizens of this country we have our own duties to discharge. We can supplement the funds of the schools by raising donations and subscriptions and we can also entrust the management of these schools in the hands of well-trusted able men, who are above party politics. So far as getting the right type of teachers we are to make the salaries of teachers a little more attractive so that good men would not hesitate to come to this profession for fear of half-starvation.

It is a pity that in cities like Calcutta where hundreds of new cinema houses have been built with private enterprise, no funds can be raised to build some good houses for the accommodation of schools. So far as good teachers are concerned the writer has an humble suggestion to make. We find that many officers of Government, who were once brilliant students, do not seem to get opportunities of social service after retirement. Throughout their service career they do good to themselves and to their families by earning money and they do not come to any service to the society to which they belong. After their retirement and till their death, so long as they are physically fit, they can easily render voluntary service to a local school within the radius of one mile or so from their residence, just for an hour at least, to impart to the students, who are the future citizens of the country, lessons in subjects according to their choice. It will be better if they do it of their own accord without being forced by the Government by an Act of the Legislature to do so, as in this way they will at least be remembered gratefully by a number of young students for many years after death, when there is likelihood of their being forgotten by the members of their own families.

The film business magnets and the cinema house owners whose one of the main sources of income is from young students, should also consider seriously whether they should voluntarily offer some percentage of their income towards the education of the children of the country, who in future will increase the number of cinema-goers and thus bring more money in their pockets. It will look more generous on their part if they themselves come forward with such a proposal before they are forced by legislation to do so.

ROLE OF SATYAGRAHA IN FREE INDIA

By SURESH RAMABHAI

We, of India, are rightfully proud of our great motherland. But why do we do so? Is it a vain national feeling working behind this sentiment or some positive basis at its back? Is it our geographical or material wealth which we so much boast about? Surely, there are in the world rivers bigger than the Ganga or the Indus; there are soils more fertile than that of the Indo-Gangetic Valley; there are plateaus far richer in minerals than that of Chota Nagpur; there are ports far better than those of Calcutta, Madras or Bombay. Only we have, so to say, the Himalayas that are taller than any other mountains in the world. Then, does all our national pride stem from these snowclad rocks? What is it after all that made our ancients proclaim: *Durlabham Bharate Janamah* (Rare it is to be born in India)?

Opinions will naturally differ on this point. But many will agree that the most important find of our seers of yore was the doctrine of *Ahimsa*. As Gandhiji describes it in his inimitable language:

"The Rishis, who discovered the law of non-violence in the midst of violence, were greater geniuses than Newton. They were themselves greater warriors than Wellington. Having themselves known the use of arms, they realised their uselessness, and taught a weary world that its salvation lay not through violence but through non-violence."

A translation of this unique doctrine into practice led them to *Brahma-Vidya* on the one hand and to land-cultivation and animal husbandry on the other. This also accounts for the strange fact that of all countries in the world, only India declared her preference for vegetarian food and that even today there are millions of such Indian homes where meat is tabooed. It is this faith—supported by three pillars of *Brahma-Vidya*, non-injury to others and vegetarianism—which has been the perennial source of our spiritual and cultural heritage and activity and which distinguishes India from the rest of the world.

Again, in modern times, India alone discovered the doctrine of *collective non-violence* to which Gandhiji, its first exponent and scientist, gave the unique name of *Satyagraha*. True, we could not place before the world the pattern of an ideal and strong *Satyagraha*—we were found wanting in so many regards, yet it cannot be gainsaid that India has proved for all time that the principle of non-violence is capable of sound application on a mass scale and that *Satyagraha* is a potent instrument for countering injustice and throwing off political shackles. The non-violent fight that we gave, weak and poor though it was, clearly demonstrated the efficacy of *Satyagraha* as a weapon for working out the political revolution.

The question now arises whether there is any scope for *Satyagraha* in India now when she is free. Most of our political stalwarts, many of them holding

positions of power, are reported to have expressed on this point in the negative. They would have us believe that collective non-violence had little to do in any sphere other than political and that only State equipped with its military and legislative powers could bring about desired changes in the socio-economic sphere. That the arch-priest of *Satyagraha* did not think like this is evident from what he observed as early as in May 1929:

"This I know that, if India comes to her own demonstrably through non-violent means, India will never want to carry a vast army, an equally grand navy, and a grander air force. If her self-consciousness rises to the height necessary to give her a non-violent victory in her fight for freedom, the world values will have changed and most of the paraphernalia of war would be found to be useless. Such an India may be a mere day-dream, a childish folly. But such, in my opinion, is undoubtedly the implication of an India becoming free through non-violence." (italics mine).

It needs little reflection to state that in our fight for freedom our self-consciousness did not rise to the required height. Nor could we bring about any change in world values. The sanctions in the political, economic or social life of the post-British India are almost the same as in that of British India. We honour the same values today as we did eight years ago. To mention a few of them—disgust for manual labour, superiority of intellectual work to manual labour, the higher the income or salary the bigger the man, treatment of land as a marketable commodity, low status of the untouchable in general and of the *Bhangi* in particular, etc. etc. With the basic values remaining unaltered, India's political freedom has been more in the nature of a change of masters than in that of a revolution. And if the old values continue to hold sway, our further degradation and ruin is a certainty.

It may be argued that law will effectively introduce many a change. Would it could. Alas! it cannot. What has been the fate of the law banning child marriages? Untouchability is a crime by law. Yet there are important temples still closed to the untouchable. Law has very definite limitations. If stealing is an evil in popular opinion we can have a law condemning stealing as a crime—and that law would be honoured. But if smoking, though evil, is no evil in popular opinion a law condemning smoking as a crime will be honoured only in its breach. Likewise, since child-marriages and temple-refusal to the Harijans are no crime in popular opinion (rightly or wrongly, that is a different matter), law is helpless to stop them. Law can cover the beaten tracks but not the uncharted seas.

Where then is the way out? What shall succeed if law fails? The single and the surest answer is—*Satyagraha* or Civil Resistance. It has a two-fold objective—wean the Government from going astray and win the people

ROLE OF SATYAGRAHA IN FREE INDIA

483

to right thought and conduct. It is a rebellion on one hand and right education or *Nai Talim* of the masses on the other. It is a most powerful expression of a soul's anguish and an eloquent protest against the continuance of evil, perpetrated either by the Government or by the people. *Satyagraha* is, as Gandhiji called it, *dharma-yuddha*. Once dilating on this point, he once said:

"Here is the beauty of *Satyagraha*. It comes up to oneself, one has not to go out in search for it. That is a virtue inherent in the principle itself. A *dharma-yuddha* in which there are no secrets to be guarded, no scope for cunning and no place for untruth, comes unsought; and a man of religion is ever ready for it. A struggle which has to be previously planned is not a righteous struggle. In a righteous struggle God Himself plans campaigns and conducts battles. A *dharma-yuddha* can be waged only in the name of God, and it is only when the *Satyagrahi* feels quite helpless, is apparently on his last legs and finds utter darkness all around him, that God comes to the rescue. God helps when one feels oneself humbler than the very dust under one's feet."

Satyagraha is not like a garment to be put on and off at will. Nor a shoe to be hurled at on any off and on. Nor is it a mere philosophical principle. Its seat is in the heart. It is 'the rule and breath' of life. The spirit of *Satyagraha* requires 'long training in self-denial and appreciation of the hidden forces' within man. What is more: *Satyagraha* can only follow some real disinterested service, some heart-expression of love.

Judged by these tests, it is obvious that most of the '*Satyagrahas*' which we have witnessed during the last eight years were more in name than in fact and that the single campaign that satisfies all *Satyagraha* conditions is Acharya Vinoba Bhave's Bhoodan Yajna movement which would be referred to later on. Besides, it is also clear that there is far wider and deeper scope for *Satyagraha* in free India than during the British rule. Occupied as all people then were with getting rid of the political yoke, vast spheres of true selfless service had to be left untouched. Politics absorbed exclusive attention. Not so now when people can take to different fields according to their own taste and genius.

But what would be the model of *Satyagraha* in free India? Will it follow the pattern evolved by Gandhiji in order to face the British power? Or, will it be of a different cast? The conditions of India leave little doubt in this regard. India is now free when there is no question of 'snatching' political power from an alien exploiting agency. Only if the worst comes to happen and the party in power miserably fails to honour its pledges to the electorate, the latter can vote it out, or refuse to pay taxes and commit civil disobedience widely. What is, however, far more imperative is that the existing pattern of administration as also the socio-economic order must change. And that change must come from below. That is, a mere change of masters at the top will not usher in the new order: stagnant

values must change and the people should live the new values themselves. The task, therefore, becomes very hard. It is not a question of simply throwing an external adversary out, but of transforming the enemy within. People have to be educated, their energy directed along the rightfully new channels and then the whole order re-cast, not excluding the constitution.

The Bhoodan Yajna movement strictly follows these lines. It stands for entirely new values which may be summed up as follows:

(i) Land must cease to be a marketable commodity and should be owned not by any individual, not by the State, but by society;

(ii) Manual labour is on par with intellectual labour, both should bear the same value and status and both together should form an essential part of our daily life.

The walking tours, assiduously conducted by Vinoba and the scores of workers all over the country, are meant to enlighten public opinion, to educate it and instil new values in the village social structure. That the mission requires a lot of self-denial and sacrifice—not less severe than in facing the bayonet or courting imprisonment—goes without saying. It is *Satyagraha* in the fullest sense of the term. Only its nature differs from that of the British days. While the *Satyagraha* as expressed through non-co-operation was fast, the *Satyagraha* as expressed through Bhoodan Yajna is gentle. If need be, the fast pattern can be resorted to. That is our stock-in-trade. But if the present gentle form does not serve the required purpose, what then? Here is Vinoba's unequivocal reply:

"If our gentle *Satyagraha* does not yield the desired fruit, we must infer that there is something wanting in our gentleness itself. And we must, therefore, render it inner, gentler . . . Gentle, gentler, gentlest. If *Satyagraha* evolves forth in this manner, its vitality and effectiveness would grow on."

What form would Vinoba's gentler *Satyagraha* take, nobody can say. But it would doubtless be far more powerful in meeting violence, corruption, inequalities and the like. It shall be instrumental in humanising the present machinery and structure and in recasting it.

The role of *Satyagraha* in free India cannot, therefore, be too much emphasized. It offers a limitless scope of service among the masses and for tackling the fundamental problems of humanity. The whole is an uncharted sea. As the first pioneer in the field, Gandhiji has provided us with a rudder and compass in the form of inspiration for incessant activity and ceaseless search within. More navigators will follow and man march on splendid towards his cherished goal of becoming a better and greater man. With all humility, one can only pray with Gandhiji:

"Would that India, which through her Congress has subscribed to the policy of non-violence, will adhere to it and demonstrate to a world groaning under the curse of the sword that the spirit does triumph over the sword in national affairs as it has ever been shown to have triumphed, in individual affairs."

THE SAGA OF THE POTATO

By K. R. N. SWAMY

FROM the plunder of Peru came the first potato. But no priest or pirate of the Spanish Conquest ever guessed that the tuber he trod under foot on the upland Peruvian plain would spread to every corner of the temperate zone and would be worth more than all the mines of Peru. No dream of Inca gold, not even the very temple of the Sun itself would buy one year's potato crop today—amounting to over 250 million tons. A decade ago, the world output of potatoes was twice as much as wheat and thrice as much as rice.

We owe the first mention of the potato to Pedro de Cieza de Leon, who in 1538 the year after the Conquest settled at Cartagena, crossed the steaming isthmus of Panama and scrambled up the face of the Andes. There he discovered the mother of all potato chips, which instead of being cooked by heat, was cured by frost and then dried. This Chunu, as it was called and still is, the staple food of those Red Indians, who live above the zone where corn can be grown. Vast quantities of Chunu were stored for the Red Indian Army, for tribute to the Great Inca and against famine. Potato cultivation was greatly developed. Animal manure was brought from the coastal strips, an elaborate irrigation system was maintained, and many different varieties were grown.

For years after the Conquest, a motley mixture of priests, pirates and soldiers travelled homeward across the blood-soaked isthmus. Forty thousand couriers of Inca loot, perished there. On one of those trips, probably between 1580 and 1585, some one carried the first potato to Europe. From Spain it was to Italy, and by 1583 it was in the hands of Charles I'Elcuse, keeper of the botanical garden of Vienna. Neither Sir Walter Raleigh nor Sir Francis Drake brought the potato from Virginia to Ireland, for it did not grow in Virginia in their time. The Raleigh legend is pure myth, but the Romantic Irish have always clung to it fondly. The Germans insist that Drake is their man and today his statue stands in Offenbergl with an inscription reading:

SIR FRANCIS DRAKE

The Introducer of the Potato in the year of Our Lord 1580

The Raleigh and Drake canards, still widely current were based partly upon the groundnut and partly upon the sweet potato.

The potato like all new foods, was slow to overcome the prejudice of the people, in spite of the most exalted attention. Scientists not only wrote it up, but improved it. Marie Antoinette wore its blossoms in her hair. Scotch divines thundered against it, because it was not mentioned in the Bible and as such was the Forbidden Fruit, they said, that caused Adam's Fall.

English apprentices save for once in a week had it banned from their diet. Frederick the Great planted potatoes in the Instgarten and his grandson threatened to cut off the noses of all who would not plant them. There was even a potato war in Germany. The first potato breeder of note, Antoine August Parmentier, mixed a bit of propaganda with his science by giving a potato dinner at Paris to which Lavoisier and Benjamin Franklin were invited. The whole menu consisted of potatoes cooked in various ways.

Through all this fanfare, the potato gradually came into its own, because poor people of northern Europe found that if there was not much else to eat, potatoes would keep body and soul together. And nowhere was poverty so bitter and potato so welcome as in Ireland. The Irish lavished pet names upon the lowly tuber. Priests and altar boys marched up and down their field drenching the crop with holy water. They little dreamed that failure of the crop would oneday decimate their country.

In India the pioneer work in the introduction of this crop was done by the English people. According to Dr. Ainslie, as reported by Duthie, "The potato came to India originally from the Cape of Good Hope." The cultivation on the hills of Dehra Dun was started by Major Young, when Mussoorie was indicated on maps under the name of potato garden. The quality was afterwards improved by Captain Townend and by about 1839 potato cultivation became generally in the plains and on the Hills. The botanist Johnson mentions that "at the horticulture show in Calcutta during 1842, I saw potato exhibited, which would not have shamed potato growers of Lancashire, if mistaken for their produce. These were grown in the immediate vicinity of the City, and in the hills of Chirra Pangie (Cherra Punje?), though not far off the potatoes are grown finer still. They were an object of cultivation there during the Governor-Generalship of Warren Hastings (1772-1785) and alluding to that period one writer says, "Three score years ago, a basket of potatoes, weighing about a dozen pounds was occasionally sent, as the opportunity offered, by Warren Hastings to the Governor of Bombay and was considered an acceptable present."

"On receipt of the basket, the members of the Council were invited for dinner at the Government House 'to partake of the rare vegetable'."

The potato (Latin name *Solanum Tuberosum*) is called by various Indian names, such as Alu, Bilaiti, Batata, Urulai, Kilangu, Urulagudda and is cultivated more or less in all parts of India. A century ago, it was comparatively unknown in India, but today it is probably the most extensively grown of all vegetables.

THE SAGA OF THE POTATO

485

This is due in part to its mild flavour, which lends itself readily to combination with other foods. In the beginning, when potato was introduced the orthodox Brahmins objected to its use, just like their Scotch counterparts, due to its not being mentioned in the Holy Scriptures. But the prejudice against it gradually vanished and now it is used by all classes. In fact, on fast days, the Hindus in some parts consume it in large quantities as it is one of the root crops, which are included in the list of articles to be eaten during a fast.

In India, potatoes are mainly used for table purposes and not put to industrial use, e.g., in the production of starch. The annual net supply a decade ago, amounted to 53 million maunds and constituted less than 1 per cent of world supply. Of this production, 17 per cent was set aside for seed, .2 per cent exported to foreign countries, and the remaining 82.8 per cent was allotted for human consumption. Of this quantity, 10 per cent is estimated to be lost in storage and handling. Thus the actual quantity consumed amounts to 33 million maunds. On the average, the total production per capita was 8.6 pounds for the whole of India. The per capita consumption is highest in Uttar Pradesh (28 lbs per annum) followed by Bihar with 16 pounds per annum.

As regards food value, potato contains nearly 80 per cent water in its uncooked state. Most of the remainder consists of about 2 per cent protein and 18 per cent starch. The potato is one of the cheapest and most common sources of carbohydrate food. The food value of the potato is much less than that of wheat and rice. Potato gives 36 calories per oz, as compared with 102 for wheat and 114 per oz. of parboiled rice.

At present there is no demand in India for potatoes for industrial purposes or for any other use as cattle feeding, etc. In countries, where potatoes are largely used for industrial purposes, heavy yielding varieties with high starch content are specially grown, usually under contract with a factory. The factory is thus assured of a fairly long working season and an ample supply of cheap raw materials specially suited for the production of farina, alcohol, glucose, dextrin, etc.

Farina is used for laundry purposes and sizing in yarn in the textile industry and in the preparation of puddings, pastry, confectionary, custard powders, pie fillings and ice cream.

Alcohol manufacture is very extensively carried out in Germany. Approximately one ton of potato yields twenty gallons of 95 per cent alcohol. Apart from alcohol manufacture, the process is important on account of its offering a distillate residue, rich in nitrogen, potash, and phosphorus, which forms a good

ration for live stock. So far as is known potatoes are not used for this purpose in India.

With low yields per acre and correspondingly high cost of production, there does not appear to be much scope in India at present for manufacture of farina, alcohol, dextrin, glucose, etc., from potatoes. Rice contains 78 per cent starch from which 90 per cent can be extracted, whereas potato contains a maximum of 25 per cent starch of which only 65 per cent can be extracted. Therefore the price of potato, in order to be used for the above-mentioned purposes should be about one fourth that of low quality broken rice.

In India potatoes are grown in about seven and half lakhs of acres. Climate is an important factor in potato production and growing season varies from 60 to 75 degree fahrenheit.

The main areas of production are concentrated in the North. Uttar Pradesh, Bihar, Bengal, and Assam account for more than 80 per cent of the acreage. In Bombay the main area of production of potatoes is in the neighbourhood of Poona. Elsewhere in the South, the production of potatoes is mainly confined to the Nilgiri Hills and to a smaller extent to the plateau of Mysore, mostly around Bangalore.

The average yield is about hundred maunds per acre, but the record yield of 743 maunds per acre was obtained in 1953, enabling the particular cultivator to earn the title of *Krishi Pandit* for the year. In Germany the average yield of potato per acre is nearly twice that of India.

Generally two crops—one in winter and the other in monsoon—are raised in the plains and sub-montane tracts. The winter crop is by far the most important and represents 95 per cent of the total area in the plains. In the hills situated in the north of the country, only a summer crop is usually raised on account of the severity of the winter. In the Nilgiri Hills in the South however where the winter is mild, two or three crops are raised in the same year. In fact, the clearing of forests for potato cultivation has caused lot of soil erosion in Nilgiri Hills and in the words of an eminent Indian, the famous Ootacamund Hill Station may have to be renamed as Potamund. On the whole about 87 per cent of the total acreage in the hills is planted in summer and 13 per cent in winter.

Potatoes being a perishable commodity, high losses occur during storage and marketing. It is estimated that the value of potatoes rendered unfit for use in this manner exceeds two crores of rupees per annum. The solution apparently lies in improving existing methods of storage and in opening more cold storage depots as has already been done at some centres with commercial success.

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto be answered. No criticism of book-reviews and notices is published.

EDITOR, *The Modern Review*.

ENGLISH

INDIAN INHERITANCE, Vol. I: *Literature, Philosophy and Religion*. Bharatiya Vidya Bhavan, Bombay. 1955. Pp. xiv + 288. Price Rs. 1-4.

This is the first volume of a work which, as the chief general editor Sri K. M. Munshi says in his interesting Foreword, has been planned to provide for the immediate benefit of the university students in Uttar Pradesh, a cheaply priced publication dealing with different aspects of the Indian inheritance as interpreted by leading modern writers. A second volume dealing with history, culture and social development is promised in the back book-cover.

In the short space at our disposal it is possible to notice only the outstanding papers which have been selected for inclusion in this volume. In the section on literature the most profound contribution is that of Sri Aurobindo on *Valmiki, Vyasa and Kalidasa* from which we make no apology for quoting a few extracts. Their poems, we read, are "types of three periods in the development of the human soul," "types also of the three great powers which clash in the imperfect temperament" and at the same time are "pictures of three modes of our Aryan civilization, namely, the predominately moral, intellectual and material" (p. 111). *Valmiki* "gives us the picture of an entirely moralised civilization" with the immense material and intellectual development subordinated to the needs of purity of temperament and ideality of action" (p. 114). *Vyasa* is "the son of a civilization in which both morality and material development are powerfully intellectualised" (p. 116). *Kalidasa* lived in "the great age of formalised metaphysics, science, law, art and the sensuous luxury which accompanies the arts" . . . "Kalidasa stands for its representative man and genius, as was Vyasa for the intellectual mood of Indian civilization and *Valmiki* of its moral side" (pp. 117, 124). Next to the above may be mentioned the brilliant essay of Rabindranath Tagore on *Shakuntala* which is of course well-known to us in its original Bengali version. Justifying the famous eulogy of Goethe the writer says that "the motif of the play is the progress from the earlier union of the First Act, with its earthly, unstable beauty and romance, to the higher union in the heavenly hermitage of eternal bliss described in the Last Act" (p. 133). "This drama," we are further told (p. 135), "stands alone and unrivalled in all literature, because it depicts how restraint can be harmonised with freedom. All its joys and sorrows, unions and partings, proceed from the conflict of these two forces." In the section on philosophy Maulana Abul Kalam Azad (*Indian and Ionian Philosophy*) discusses with remarkable

clarity of thought and expression the old problem of the mutual influence of Ancient Greek and Indian philosophy and he concludes (p. 172) in the following noble strain: "Knowledge is above all limitations and boundaries. Whatever be the region of the globe where it first emerged, it is the common heritage of all mankind. All human beings, regardless of country or nation, can lay claim to it with equal right." This is followed by a thoughtful essay in which the writer, Sri C. Rajagopalachari, contends with considerable force that the Vedanta not only anticipates modern science in respect of its conception of God-head and the universe as well as its methodology but also that the code of conduct and spiritual values founded on its basis fully anticipated the socio-economic problems of modern civilization (pp. 174-75). The writer concludes with his explanation of the principal teaching of the Upanishads relating to man's happiness and the means of achieving the same. Then comes Dr. S. Radhakrishnan's paper on the *Bhagavad-gita* written in his usual brilliant style of exposition. "The Gita," he says, (p. 188) "stands midway between a philosophical system and a poetic inspiration. We do not have here the illimitable suggestiveness of the Upanishads, since it is a deliberately intellectual solution of the problem of life." The Gita, we are further told (p. 193), "attempts to derive a religion from the Upanishad philosophy . . . The Absolute of the Upanishads is revealed as the fulfilment of the reflective and the emotional demands of human nature." The fourth paper, that of Sister Nivedita on *The Web of Life*, traces a wonderfully wide sweep the great development of Indian religious and philosophical thought as represented by the successive landmarks, namely, the Vedas, Buddhism, Sankaracharya, the impact of Islam and Ramakrishna Paramhansa. The writer concludes (p. 207) by indicating the role of India as "one of the focal or polar points of the human race" and she presages a future Asia as "a single immense organism filled with the tide of one strong pulsating life from end to end, firm-rooted in the soil of common origins and common modes." The third and the last section contains two important papers, one on Sankaracharya by Sri C. P. Ramaswami Aiyar and the other on Tulsidas by the late Mr. F. S. Growse.

We cannot conclude without expressing our deep regret that no room could be found in this work for any of the great Buddhist masters of literature like Asvaghosha and Aryasura and of philosophy like Santideva and Vasubandhu. In this connection it is well to remember that the *Bodhicaryavatara* of Santideva has been compared with the *Imitation of Christ* by Thomas a Kempis.

U. N. GHOSHAL

THE LIFE AND TIMES OF HUMAYUN: By Dr. Ishwari Prasad, M.A., LL.B., D.Litt., M.L.C.; formerly Professor of History and Political Science, Allahabad University. Published by Orient Longmans Ltd. Pp. 422 + iv. Price Rs. 20.

This is a singular piece of research. It includes what it should have left out and tends to omit what it should have included. Thus it happens that in a professedly research volume on Humayun, one reads, curiously enough, more about Sher Shah, the organization of the Sur empire and its expansion, the successors of Sher Shah, the career of Bahadur Shah of Gujrat and Mirza Kamran. On the other hand, it leaves out of treatment a very interesting aspect of Humayun, viz., his skill as a poet; it fails to trace the genesis of his rivalry with his brother Kamran and its interaction on their respective fortunes. Similarly, it ignores entirely the dramatic episode of the Ottoman interference in the waters of the Arabian Sea and their landing on the Western Coast of India, in 1538 A.D. Humayun's interest in astronomy, his love of books and the traits of character which should form a separate chapter are discussed summarily in the concluding chapter and thus assigned a secondary place. The learned professor has omitted from the list of printed works, the name of Dr. S. K. Banerji's *Humayun Badshah*, M. S. Commissariat's *History of Gujrat*, Bainsi Prasad's English translation of *Qanun-i-Humayuni*, N. B. Roy's *The Successors of Sher Shah* and Dr. Sukumar Sen's *Humayun in Persia*. Yet he lustily claims that his work will "furnish much information to the advanced student, who can, with their help, pursue his researches further."

The other interesting feature of the book is that it does not advance our knowledge beyond what was already known. There is no doubt, tiresome narration of detail on Humayun's battles with Bahadur Shah, Sher Shah and Mirza Kamran, but the account is unrelieved by any masterly exposition of policy or strategy and survey of facts. The reader searches in vain for a felicitous remark like that with which Mr. N. B. Roy opens the account of Kamran's career in the *Vivra-Bharati Quarterly*, Summer, 1955, or a sprightly observation like that made by Mr. Commissariat, on page 350 of the *History of Gujrat*. Referring to the contributory causes of Bahadur's defeat at Mandasor, 1535, Mr. Commissariat refers to Rumi Khan's ascendancy in the councils of the Sultan and says, "As with Sir John Burgoyne before Sevastopol, the voice of the engineer prevailed over the bolder counsels of the cavalry leaders."

Nor would the learned professor state the ground for his views on moot points. Take, for instance, the battle of Chausa. Here S. K. Banerji following on the steps of Dr. Qanungo, showed that Humayun's and Sher's encampment were separated by a small stream, the former lying east and the latter west of the rivulet. Mr. N. B. Roy challenged this view in the *History of Bengal*, published by the Dacca University on the authority of Abul Fazl and Jaubar. Abul Fazl clearly states that the army made a bridge over the river and crossed it and when Sher fell upon the camp from the rear, Humayun rode to the bridge and found it broken. Moreover, if Sher Khan was strong enough to intercept the emperor's march by landing across his path, what need was there for haste to subterfuges and a most perfidious attack solemn violation of a treaty? Dr. Qanungo arbitrarily read the word *Mashriq* for *Maghrib* and

started this curious misapprehension. Dr. Prasad is content to asseverate the old view without stating the reasons.

Similarly, in his account of the battle of Kanaul, the author shows the disposition of the military commanders in a way different from that of S. K. Banerji. It is no doubt more reasonable, but he would not cite the authorities in support.

Thirdly, the author's bibliography, valuable though it is, is remarkably out of date. He acknowledges the work to have been handed to the publishers in 1944, but since that period there has been considerable research which has not been taken note of. Take for instance, the fragment of the *Tawarikh-i-Daulat-i-Sher Shahi*, published in the *Medieval India Quarterly*, Aligarh and its English translation by Mr. N. B. Roy in the *Journal of the Asiatic Society*, Calcutta. Special mention must be made of Mr. Roy's paper, the *Makhzan-i-Afghani and the Tawarikh-i-Majlis Arai* and their relative value as sources of history, *J.A.S.*, Calcutta, 1955 and the other paper *Some Interesting Anecdotes of Sher Shah from the MS. of Iazkirat-ul-Muluk*, *ibid.* 1954. Again Dr. Prasad's estimate as to the value of the *Waqiat-i-Mushtaqi* requires amendment. The reviewer was present in a meeting of the Asiatic Society, when Mr. N. B. Roy explained to the members the very great importance of this MS. as a source of Afghan history and pointed out that Sir Henry Elliot's view, re-echoed by Dr. Prasad was misleading. The fact is neither Sir Henry nor the present author had carefully studied the MS.

Dr. Ishwari Prasad was deemed to be a veteran in the field of historical research, but the present performance, judged by any standard, will demolish all his pretensions to that title, for the treatment of the subject, presentation as well as literary style, would hardly rank it above the level of an ordinary post-graduate dissertation.

SANJIV

SEX, SOCIETY AND THE INDIVIDUAL: Edited by A. P. Pillay, Bombay, and Albert Ellis, New York. Published by the *International Journal of Sexology*, Whiteaway Building, Bombay-I. 1953. Price not stated.

The book is a collection of 45 papers selected out of those contributed to the journals *Marriage Hygiene* and *The International Journal of Sexology* both edited by Dr. A. P. Pillay, O.B.E., M.B.B.S., the renowned Indian Sexologist. The list of contributors represents all the States of Europe, as also Australia, South Africa, Mexico, Japan, Siam and other places and includes such internationally famous names as R. L. Dickinson, Rene Guyon, E. Bergler, J. Lowenstein, A. Ellis, J. L. Gillin, A. M. Ludovici, A. Craig, C. Allen to mention only a few of them.

The articles deal authoritatively with various aspects of the sex problems from the individual as also from the social points of view. Both the physiological and the psychological aspects of the problems have been treated. More emphasis, however, has been placed on the former than on the latter. The section containing papers on 'Sex Offences and Sex Offenders' (Sec. III) should be read by all parents as also by the guardians of law, for sex crimes are on the increase and consequently a need has definitely developed to

devise ways and means of checking them. A revealing study has recently been made of sexual delinquency by Dr. N. Mukharji, Ph.D., on the basis of the materials collected by him from the Anti-rowdy section of the Calcutta Police. 'Sex in Literature' (Sec. IV) is a highly interesting section which would be read with pleasure by literary men and the section on Sex Deviations (Sec. V) will help students revise their views about some specific problems of deviation, e.g., Lesbianism, Masochism.

Many original studies and suggestions are found in the sections discussing 'Sex Disorders and Problems' (Sec. I) and the orgasm problem (Sec. II). The 'Dynamics of Sexual Motivation' by C. L. Lastrucci is instructive and informative. The trends of modern 'Researches on Sex' have been indicated in the last section of the book (Sec. VI).

The volume has a high academic value and deserves to be prescribed as a reference book by all institutions imparting scientific education on sex matters. The reviewer would have liked to see a few more articles included on the question of treatment. A section dealing with the methods of treatment and cure would have added much to the value of the book for the professional social workers. It is essential for them to have a thorough scientifically oriented training in sex matters because these matters are ultimately responsible for many of the prevalent ills of every civilised society.

S. C. MITRA

1. BRAHMA VIDYA VILAS: Pp. 421. Price Rs. 4-8.

2. HOW TO CULTIVATE VIRTUES AND ERADICATE VICES: Pp. 573. Price Rs. 6.

3. DIVINE STORIES: Pp. 102. Price Rs. 1-8.
All the three books are written by Swami Sivananda and published by the Yoga-Vedanta Forest University, P.O. Sivanandanagar, Rishikesh, Himalayas.

The prolific author of these books is a very publicised monk of our times. In the first book he deals with Brahma Vidya, defined by him as the science of sciences that enables man to know the very source of knowledge itself. This abstruse subject is treated here in the form of several delightful plays. About the mode of his treatment Sri C. Rajagopalachari as the Governor-General of India wrote to the author. "It gave me great pleasure to see your book. Gold beaten into all sorts of shapes gives joy. So have you beaten the Upanishads into new and artistic shapes! I am amazed at your energy." Brahma Vidya described in the Upanishads is the most precious heritage of our land and should be broadcasted by modern methods in this age. It is quite fit that *Brahma Vidya Vilas* of the distinguished Vedantist Sadashiva Brahminandra with Sanskrit text in Devanagari script followed by simple English rendering is appended.

The second book is divided into four parts and devoted respectively to eradication of virtues, Brahma-Charva and practical instructions. As many as 234 short chapters are written on the cultivation of virtues and eradication of vices. It will be very useful to the spiritual aspirants at every step. Repetition of thoughts and looseness of language however have marred the seriousness of the subject.

The third book contains 34 short stories of Nachiketa, Raja-Gopichand and others. The stories

are culled from the Sanskrit scriptures as well as modern literature and meant for the rising generation.

It is regretted that the get-up, paper and printing of all the three books are far from satisfactory, and even much below the general standard.

SWAMI JAGADISWARANANDA

FIVE ONE-ACT PLAYS: By Govind Das. Translated by Prof. Rajendra Verma, M.A. Introduction by Dr. Verrier Elwin, D.Sc. (Oxon). Progressive Publishers, 14-D, Feroz Shah Road, New Delhi. Price Rs. 4-8.

Seth Govind Das, one of the most devoted disciples of Mahatma Gandhi, spent many years in jail. During those years he wrote as many as eighty-four plays in Hindi. Here are five of them—all One-Act Plays—rendered into English. *Nazrana* presents before us the anachronism of the old landlord system in the modern context. *Endurance and Rivalry* deals with the position of women in society. *Id and Holi* reveals the foolishness of communalism and *The King and the Beggar-maid* holds before us the ideal of sacrifice through a mythological story. The author is one of the best writers in modern Hindi. The translator has fairly succeeded in retaining the spirit of the original.

D. N. MOOKHERJEE

SANSKRIT

NYAYAKUSUMANJALI, Part I: Edited by Narendrachandra Vedantatirtha, M.A., (Bagchi Bhattacharya Sankhyatirtha Mimamsatirtha Tattva-ratna Sastri), Lecturer in Sanskrit, Calcutta University. The Asutosh Sanskrit Series, No. IV. University of Calcutta. Price Rs. 3.

The *Nyayakusumanjali* is a highly esteemed and very important work of the famous savant Udayanacharya who wrote in the tenth century. It seeks to prove the existence of God through logical discussion in accordance with the Nyaya system of Philosophy. In consideration of the importance of the work and its extreme terseness numerous scholars wrote commentaries on it from time to time. Some of them have been published while a good number still await to be studied and brought to light in critical and scientific editions. New attempts in this direction are always welcome. Hence, scholars will be gratified to have the first instalment of two commentaries published in the decent volume under review. It contains portions of the commentaries of two writers of the 15th and 16th centuries covering the first chapter of the work. The commentary of Sankara is published on the basis of a single manuscript while that of Gunananda on two. The readings of the manuscripts were found to be faulty in some cases and the learned editor has suggested emendations which generally appear to be clearly demanded by the context. It is noticed that occasionally the readings of the text as adopted by one commentary differ from those of the other. There are also cases where the two commentaries agree in accepting readings which differ from those generally current and retained rather unusually in the text portion printed in the volume (p. 46). We hope the second part of the work will soon follow containing the remaining portions of the text and commentaries accompanied, among other things, by an account of the characteristic features of the commentaries published by the learned editor, two in the present volume and one in a previous volume of the same series (No. II).

CHINTAHARAN CHAKRAVARTY

HINDI

HAR DAM AG: By Krishna Nandan Sinha. Ajanta Press Ltd., Patna. Pp. 240. Price Rs. 2-8.

TUTE HUE DIL: By Ramapratap Bahadur. Hind Kitabs Ltd., Bombay. Pp. 151. Price Rs. 2-4.

PUKHARAJ: By Harishchandra Kaila. Vidya Mandir Ltd., New Delhi. Pp. 148. Price Rs. 3-4.

These are all collections of short stories, but each a "portent" and with a pattern of its own. In *Har Dam Ag*, stories have been fitted into the framework of socialist ideology, but with an ease and attitude which do not detract from the emotional and mental intensity of human interest. In some stories, the author has attempted the news-reel and camera-eye technique, which opened up a new avenue of endeavour for our writers of short stories. Shri Sinha is a rebel whose heart is afire with a vision of building up a new society, conditioned though the latter might be by the inevitability of pulling down many a pillar of the present-day social structure. *Tute Hue Dil* is now in the third edition, a proof of its popularity. And why not? For, its dozen stories are a prism which reflects our many-streaked society, particularly the red and the black of the "have's" and the "have-nots," and of the "heart-lit" and the "heartless." The author's pen is like a quickly-recording Kodak. *Pukharaj* is its author's first bow on the stage of short-story writing. And he has to be congratulated on his having acquitted himself so well. His effortlessness and self-unconsciousness are a testimony to his art.

G. M.

GUJARATI

ANTE E PARNI (She Married At Last): By Dr. B. J. Jhaveri, M.A., Ph.D. and H. S. Majumdar, B.Com. Published by N. M. Tripathi and Co., Bombay-2. 1951. Illustrated jacket. Thick card-board. Pp. 300. Price Rs. 3-8.

This is a translation of the well-known Marathi scholar and drama-writer, Mawa Warekar's novel. (Squaring the Accounts) *Tond Milavni*. It depicts the life-story of girls and boys of the Kalavant community of Goa. It is a well-known fact that on account of their beauty, grace, and ready wit, with love of dancing and singing, the girls become mistresses of the wealthy men of Bombay and the boys musicians; some of the women are attached to temples where they dance and sing before the deity. This community, low in morals, as it is, is looking up and fired by a desire to lead decent lives are getting themselves educated; and instances are not found wanting where mistresses have married their Sethias (masters or keepers). Mawa Warekar's choice of this book's title is significant. The Kalavant community is squaring up its accounts with society by regularising their relations with those who desire to associate with them. Champa, Saryu, Sharda, the heroines of this interesting story, represent each in her own life, the attractive facets of a gem, which the translators have done well in passing on to the Gujarati literature. Their further object, a laudable one, is to bring Marathi and Gujarati literatures as close as possible as they are neighbours, physically, geographically and linguistically.

JUST OUT!

JUST OUT!!

THE DISCIPLES OF SRI RAMAKRISHNA

(REVISED AND ENLARGED EDITION)

The volume contains lives of all the monastic (excepting Swami Vivekananda) and some representative lay men and women disciples of Sri Ramakrishna.

Pages: 506+xviii.

Size: Crown 8vo.

Price Rs. 6/8/-

Excellent get-up with portraits of Sri Ramakrishna and his thirty disciples (fifteen monastic, nine lay men and six women disciples)

ADVAITA ASHRAMA

4, WELLINGTON LANE, CALCUTTA-13

INDIAN PERIODICALS

Report of the States Reorganization Commission

Science and Culture writes editorially :

THE long awaited Commission has after all been placed before the public and has been a subject matter of intense and passionate discussion in all parts of the country.

We give below a dispassionate review of the report on account of its importance to the country's future.

What has struck the foreigner most after Independence is the great political stability of India as shown by the absence of large scale riots, conflicts or violence and the peaceful working for ten years of a system of government established by the people. It was held by many *pundits* amongst foreigners that the British bayonet was the only stabilizing force in India and once it was withdrawn, the people and races of India would fly at each other's throats, the Central Government would collapse and the British or some other western power will have to step in to restore law and order in this country. This was one of the stock arguments used by the Conservatives of England and reactionaries of other countries against the Independence of India. The fact that the first ten years after Independence have been tranquil has been a matter of chagrin and disappointment to this class. So diehard papers, both in England and America, in their disappointment are in the habit of magnifying the exploits of dacoits or small local disturbances to major conflicts. But such propaganda deceives nobody.

WHAT IS THIS POLITICAL STABILITY DUE TO ?

There are a variety of causes for this extraordinary political stability. First and foremost is the good sense of the people who have taken to heart the lesson of history that a disunited India can fall an easy victim to external aggression leading to soul-killing foreign domination as happened after 1200 A.D., and again after 1757 A.D. and nobody wants it. The second factor is that the late British rulers have left a system of centralised Government which has been strengthened by a democratic constitution deliberately aiming at the abolition of some powerful barriers to stability, viz. untouchability, and religious considerations in politics. It provides for development of the country directed from the centre.

BUT IS THE STABILITY REAL, OR ONLY APPARENT ?

But it should not deceive anybody that fissiparous tendencies have not altogether disappeared and if they are not dealt with firmly they may someday wreck the 'Unity'. Let us see what are these fissiparous tendencies ? What are the major dangers to the State ? Our first query is :

IS INDIA A NATION IN THE SENSE FRANCE OR ITALY IS A NATION ?

It is obvious to everybody that India is not a 'Nation' in the sense France or Italy is. The major requisites for nation-formation are "Commonality of Race, Language and Culture, Religion, Geographical

Contiguity of Parts and Economic Unity". These are fulfilled in France and Italy and they are perfect nations. Whenever a politically united area lacks one or more of these features, it falls short of being a perfect nation. Thus the U.S.A., though politically one nation, has a race problem, Switzerland has a language problem, Spanish South America has a geographical problem, etc., and hence these countries are not nations in the same sense as France or Italy is. Soviet is also not a Nation in the sense France or Italy is.

In India, after the separation of Pakistan we have no other barrier to 'Nation-formation' than that of 'Language.' We need not consider 'Culture,' for it is almost the same all over the country in spite of differences in language, and the British period has strengthened the unity of culture. The race problem persists in a fossilized state in that of castes, scheduled castes and Jungle tribes, but this is taken care of by the Constitution. If the Constitution is honestly worked, the problem will disappear in good time. The religious problem is neutralized by the provision in the Constitution that India is to be a 'Secular' State. The separation of Pakistan renders it very probable that the religious problem will disappear altogether. Geographical unity is there, and there is a sense of historic unity which is one of the main factors in 'Nation-formation.' The only dividing factor is 'Language' of which 14 are recognised to be fully developed with a number of dialects, and many ill-developed Adivasi languages. How to deal with this factor ?

The 'Language-factor' cannot be ignored, as past history has shown. So India has to be a 'Multi-lingual Nation.' The Constitution has provided for it, but has recommended that Hindi has to be developed as a Central language to replace English, and for the purpose of maintaining unity. The constitution has not ignored the role of the different languages of India as a factor of social progress, but it has not laid down any clause to deal with the fissiparous tendencies due to the existence of so many languages. Is it possible to form a single nation keeping intact the claims of different languages ?

The nearest case is that of Soviet Russia and Yugoslavia mentioned later which had shown that it is possible to form a stable 'Multi-lingual Nation' provided the country adopts socialism as its guiding policy, and ensures to every linguistic group its language and culture against the aggression of other groups. For this, it is necessary to organise administrative units solely on the basis of language. But has that been done in India ?

HISTORY OF PROVINCE FORMATION

To start with the provinces had been left very much as the British left them. But it has been recognised that they ought to be reorganised on rational basis. What are these rational basis ? For a long time, the only basis recognised was 'linguistic' and none else.

The powers that have governed or are governing India have been conscious of the language factor. We take only two pronouncements.
