A woman aged 51, who had chronic rheumatic heart disease, with aortic incompetence, mitral stenosis, and controlled auricular fibrillation, was admitted to hospital on May 25, 1954. There was a moderate degree of peripheral arteriosclerosis. She complained of severe pain, of sudden onset, in the right calf. The right lower limb was found to be cold and pale up to a handbreadth below the knee; the toes were deeply cyanosed, and gangrene appeared likely. The right popliteal pulsation was much weaker than the left and no pulsations could be felt at the right ankle. The right femoral pulsation and all pulses in the left lower limb were normal. A diagnosis of arterial embolism was made and treatment begun with analgesics and oral vasodilators (nicotinic acid, 100 mg., and tolazoline hydrochloride, 25 mg., both thrice daily). The affected leg was exposed and the foot supported in a right-angled splint.

On May 26 she complained of severe pain in the front of the right leg, and this region was seen to be swollen. The maximum calf circumferences were right 12 in. (30 cm.) and left 10½ in. (26.5 cm.), but measurements from the fibulae posteriorly round to the anterior tibial borders were equal. The swollen area was bright red in colour, fading a little in the lower third of the leg, and very tender. The patient was unable to dorsiflex the foot and toes. Voluntary movement was present in the peroneal and posterior tibial muscle groups but was limited by pain. The right ankle-jerk, which had previously been normal, was now diminished. Sensation to light touch and to pinprick was reduced in the lower part of the leg and was absent over the toes and dorsum of the foot.

Over the next three weeks the condition of the right leg slowly improved, though pain remained troublesome. The toes became normal in appearance and the temperature of the leg and foot increased slightly. A weak right posterior tibial pulse became palpable. The redness and tenderness diminished, becoming more localized in the upper third of the leg. There was some reduction in the swelling of the anterior tibial compartment, but dorsiflexion of the foot and toes remained impossible. Sensation returned to the lower part of the right leg and foot, though not to a small area on the dorsum of the foot proximal to the first interdigital cleft.

On June 16 the patient suddenly became unconscious and died after ten minutes. It was thought that a cerebral embolus was responsible, but permission for necropsy was not obtained.

Case 2

A woman aged 70, who suffered from mild hypertension and auricular fibrillation, was admitted to hospital on November 10, 1953. She gave a history of sudden onset of severe pain in the left calf, beginning seven hours before admission. Examination showed considerable peripheral arteriosclerosis. The left lower limb was cold and pale from the knee downwards and the popliteal and ankle pulses were absent. The left femoral pulsation and all pulses in the right lower limb were present and normal. The patient was unable to dorsiflex the foot and toes. The peroneal and posterior tibial muscles showed slight weakness. The left ankle-jerk was reduced and all forms of sensation were diminished below the left knee. A diagnosis of arterial embolism was made. Treatment consisted of analgesics, elevation of the head of the bed, and exposure of the affected limb. The foot was supported in a right-angled splint. Tolazoline hydrochloride was given orally—50 mg. thrice daily. Papaverine sulphate (60 mg.) was given by intra-arterial injection (Edwards *et al.*, 1952). Paravertebral lumbar sympathetic block was performed (Dr. G. Jackson Rees) on November 11 and 12.

On November 13 the patient complained of pain in the front of the left leg. Examination showed redness of the skin over the anterior tibial compartment with some swelling and acute tenderness. The redness gradually faded over the next three weeks, as did the tenderness. The swelling subsided in about six weeks and the anterior tibial muscles then felt woody. During this period the left leg and foot became warmer. The peronei and posterior tibial muscles regained normal power, but there was no recovery of dorsiflexion of the foot and toes. Sensation to light touch and to pinprick returned to the leg and foot.

By January 8, 1954, she was able to walk. Although passive plantar flexion of the left foot was partly limited by contracture of the anterior tibial muscles, the degree of foot-drop required a toe-raising spring. Domestic circumstances delayed her discharge from hospital until April 9. At this time the anterior tibial muscles still felt woody and showed no wasting. A weak left dorsalis pedis pulsation had become palpable, though the left foot remained colder than the right. She did not attend for follow-up, and inquiries revealed that she died at home on May 26, the cause of death being a cerebral vascular accident.

Discussion

Although these cases occurred in older patients, and although the main clinical features did not appear for two to three days after the embolism, they conform to the description of the anterior tibial syndrome. This syndrome has not previously been described following arterial embolism. Haimovici (1950) does not include it in a review of peripheral arterial embolism and its sequelae. Mufson (1952), discussing the neurological complications of peripheral vascular disease, does not mention the condition.

Two main views have been put forward to explain the production of ischaemic necrosis of the muscles of the anterior tibial compartment. The walls of the compartment do not allow of rapid distension, and Carter *et al.* (1949) suggested that a raised pressure within the compartment, produced either by the muscle trauma of unaccustomed exertion or by leakage of transfused fluid along the tendon sheaths, was the main causative factor and operated by reducing the blood supply to the affected muscles. Hughes (1948, 1949) considered that the syndrome had a primarily vascular basis and showed that the histological changes were similar to those found in Volkmann's ischaemia. He pointed out that an increased tension in the compartment should affect all muscles equally. There was in fact a varying incidence of damage to the three muscles in the anterior tibial compartment, and he suggested that this variation might be related to differences in their blood supplies. He concluded that segmental spasm of the anterior tibial artery was responsible for the syndrome.

The two present cases lend support to the view that the anterior tibial syndrome has its origin in vascular inadequacy. Profound arterial spasm is a well-recognized concomitant of embolic arterial occlusion. The appearance of the syndrome after an interval of two to three days may have been due to a delayed improvement, either spontaneously or as a result of treatment, in the blood supply to the leg muscles. This would cause swelling of the muscles, and in the anterior tibial compartment increased tension might well lead to further interference with blood supply. The cases described by Carter *et al.* (1949) following exertion or transfusion did not show any significant impairment of peripheral blood flow in the limbs affected, but the shortest interval between symptoms and examination was one week in nine of their ten cases. It seems possible that spasm of the anterior tibial artery may have occurred in these cases, passing off before the development of the syndrome. This explanation must remain hypothetical until similar cases are studied at the earliest stage.

Carter *et al.* (1949) differentiated the anterior tibial syndrome from cellulitis of the leg, osteomyelitis of the tibia, tenosynovitis, acute thrombophlebitis, and traction lesions of the lateral popliteal nerve. Ferguson and Liversedge (1954) described nine cases of ischaemic lateral popliteal nerve palsy. These cases differed in certain important respects from the anterior tibial syndrome (involvement of the peroneal group, muscle wasting, and electromyographic findings), though three cases appear to have followed acute arterial occlusion, and one developed after a transfusion and another after an injection into the saphenous vein.

In discussing treatment of those cases of the syndrome which followed undue exertion involving the legs, Carter *et al.* (1949) advised graduated training as a prophylactic measure. For the acute stage they suggested complete rest of the affected limb, and, if improvement did not occur, surgical decompression of the anterior tibial compartment by fasciotomy. The necrotic muscles are, however, prone to infection (Hughes, 1948). Decompression was considered in the two cases now described but not employed, as it was felt that the onset of gangrene might thereby be hastened. Psaki and Schields (1952) described improvement in muscle power following lumbar sympathectomy as late as eleven months after the first symptoms. If spasm of or obstruction to the anterior tibial artery is indeed a causative factor, measures

designed to relieve vasospasm or to promote vasodilatation will be valuable, particularly at an early stage. When there is clinical evidence of raised tension in the anterior tibial compartment surgical decompression would seem to be reasonable, if by so doing survival of the limb is not prejudiced.

Summary

Two cases in which the clinical features of the anterior tibial syndrome followed arterial embolism are described. Pathogenesis, diagnosis, and treatment are briefly discussed.

I am indebted to Dr. E. T. Baker-Bates (Case 1) and to Dr. C. S. McKendrick (Case 2) for permission to report these cases.

THE ROLE OF SULPHONAMIDES IN THE INFECTIVE DIARRHOEAS OF AFRICAN CHILDREN

BY

LORNA G. MACDOUGALL, M.B., Ch.B., D.C.H.
Medical Officer, King George VI Hospital, Nairobi

The problem of diarrhoea in infancy and childhood has been the subject of much research; owing to the multiplicity of causes a very careful clinical, bacteriological, and biochemical assessment may be required before an accurate diagnosis can be made and effective treatment selected.

In many tropical and backward countries immediate laboratory services are not always available, medical personnel is limited, and clinical examination alone may fail to reveal the presence of more than one disease. The discovery of otitis media or pneumonia in a child presenting with diarrhoea does not preclude the fact that there may be a coexisting bacillary dysentery even in the absence of blood and mucus in the stools.

The problem of selecting treatment is equally complex if one is to provide a satisfactory standard of therapy within the economic limits of a rapidly developing community.

In infantile gastro-enteritis in which no pathogenic organisms are isolated from the stools, sulphonamides are considered to be of doubtful value, and a regime of graduated feeding and parenteral fluids (with or without the more recent antibiotics) still forms the basis of treatment. In bacillary dysentery sulphonamides are widely used and the "non-absorbable" compounds have been accepted as the standard treatment in many countries.

Present Investigation

The original object of the present experiment had been to assess the efficacy of the "absorbable" sulphonamide sulphadimidine ("sulphamezathine"), as compared with the "non-absorbable" compounds, sulphaguanidine and phthalylsulphathiazole ("thalazole"), in the treatment of bacil-

lary dysentery in children. As it proved impracticable to await the result of a stool culture before beginning treatment, it was decided that all cases presenting with diarrhoea as their main symptom should be included in the trial.

Although the scope of the trial was thus widened to include many possible diseases and the scientific limitations were fully realized, it was hoped that the results might be of some value to others in assessing the efficacy of sulphonamides in the treatment of infantile dysentery and non-dysenteric diarrhoea, and establishing, if possible, the drug of choice.

Sulphaguanidine has become well established in the treatment of bacillary dysentery and is recommended as the most suitable drug in tropical countries because there is little or no danger of crystalluria, and it has the advantage of rarely causing unfavourable side-effects (Boyd, 1951; Scadding, 1944). It is considered most effective in the early stages of an acute attack, but of least value when treatment is started late in the illness (Lyon, 1943; Brewer, 1943). This is of considerable practical importance in communities who do not seek medical advice until local remedies have failed and the disease is in an advanced or chronic stage. A further disadvantage so far as children are concerned is the high dosage of sulphaguanidine which is recommended. In an acutely ill and dehydrated child there is often difficulty in ensuring that the appropriate dose is swallowed.

Poth and Ross (1944) claim that phthalylsulphathiazole is highly specific in Flexner dysentery and have also proved it of value in the treatment of non-dysenteric diarrhoea. This, however, has not been borne out by Brodie *et al.* (1946), who found that it took longer to effect a cure with phthalylsulphathiazole than with either sulphaguanidine or controls, but that it reduced considerably the number of bacteriologically positive cases during convalescence. Both sulphaguanidine and phthalylsulphathiazole have the disadvantage of failing to control a parenteral or secondary infection which may complicate or perpetuate the state of diarrhoea.

Since it is known that the dysentery organisms inhabit the mucous membrane lining of the intestinal tract, the "absorbable" sulphonamides have the advantage of reaching the source of infection both through the lumen of the gut and via the blood stream (Hardy and Watt, 1944).

From previous experiments (Hardy, 1945) sulphadiazine has been recommended as the sulphonamide of choice in bacillary dysentery, with sulphadimidine of almost equal efficacy. Watt and Cummins (1945), however, place sulphadimidine in the undesirable class of sulphonamide owing to the greater percentage of toxic reactions observed in their series.

Although the possibility of renal complications with "absorbable" sulphonamides must always be borne in mind, particularly in hot climates, sulphadimidine is reported to be more highly soluble in all urines than sulphadiazine (M.R.C., 1945), and was therefore chosen for use in the present trial.

Realizing, therefore, the various advantages and disadvantages of the drugs employed, the experiment was designed as follows:

Selection of Cases.—All infants and children entering the medical wards of King George VI Hospital, Nairobi, with the main presenting symptom of diarrhoea, were admitted to the series and each succeeding case was treated with phthalylsulphathiazole, sulphadimidine, and sulphaguanidine respectively.

Clinical Assessment.—The severity of each case on admission was classified as follows: mild, moderate, severe, or moribund. As it was rarely possible to obtain an accurate history from the parents regarding the length of illness and the number or character of the stools passed daily, the clinical assessment was made on the general appearance, toxicity, and hydration of the patient. This assessment and the subsequent daily records of progress were made personally to ensure uniformity throughout the series. The groin temperature was recorded twice daily.

Dosage.—Although all children in the present series were weighed on admission, it was realized that this could not always be done in out-patient departments and the more isolated hospitals. The scheme of dosage was therefore assessed according to age (Table I) and appropriate adjust-

Severe	31	40	30
Moribund	22	18	21

ments were made for emaciated and undernourished children. Each dose was given in the form of a suspension and the appropriate dose administered at six-hourly intervals.

A total of 317 African children were treated, with an average age of 1 year and 8 months. Table II shows the distribution of cases and the clinical condition on admission.

Results

Treatment was limited to a seven-day period, and if there was no response at the end of this time the trial drug was discontinued and other therapy instituted.

The response to treatment is shown in Table III; although the total number of cases in the sulphaguanidine series fit for discharge within the trial period was fewer than in either the phthalylsulphathiazole or the sulphadimidine series the figure is not significant.

In an assessment of the bacteriological results (Table IV) phthalylsulphathiazole appeared less effective in the cases of proved bacillary dysentery, but gave a higher percentage

TABLE III

	Phthalylsulphathiazole	Sulphadimidine	Sulphaguanidine
No. fit for discharge between 3rd and 6th days	24	30	17
No. fit for discharge on 7th day	49	44	46
No. still febrile on 5th, 6th, or 7th day	26	26	35
Total No. discharged within trial period	73 (68.2%)	74 (69.1%)	63 (61.1%)

TABLE IV

	Phthalylsulphathiazole	Sulphadimidine	Sulphaguanidine
Total No. with proved shigellae	50 (46.7%)	48 (44.9%)	48 (46.6%)
Shigellae present Day 1	44	41	43
Negative culture Day 5	17 (38.6%)	21 (51.2%)	20 (46.5%)
No pathogens Day 1 but shigellae isolated Day 5	6	7	5
Salmonellae, <i>B. proteus</i> , or <i>B. paracolon</i> isolated Day 1	18	22	19
Negative culture Day 5	10 (55.5%)	8 (36.4%)	9 (47.3%)
No pathogens throughout	39	37	36
Total No. deaths	15	16	13
No. showing shigellae	9	8	7

of negative cultures in the non-dysenteric group, whereas sulphadimidine showed a higher percentage of negative cultures in the Shigella group and less in the non-dysenteric series. The results with sulphaguanidine were similar in both groups. These figures, however, are not significant, and it can be said that the three drugs are of equal efficacy as regards both sterilization of stools and general clinical improvement.

Of the Shigella organisms isolated throughout the series, 70% were *S. flexneri*, 11% *S. schmitzi*, 4% *S. sonnei*, and 15% were classified as atypical Shigella organisms. No difference was noted in the efficacy of the three trial drugs against these different strains, and the few Sonne infections encountered were no more resistant to treatment than the Flexner or Schmitzi infections or the atypical organisms.

No oliguria, anuria, or other obvious toxic reactions were encountered with any of the drugs under trial, and the number of parenteral infusions required was the same for each group.

In the sulphadimidine series it was noted that other chemotherapy was required in a significantly smaller number of cases (Table V) than with either of the "non-absorbable" compounds, despite the fact that the incidence of parenteral complications was approximately the same in all groups.

Total	33	4	14	38	2	23	2

Table VI gives an indication of the variety of parenteral infections encountered among children presenting with diarrhoea and shows the incidence of dual infections among the cases of proved bacillary dysentery. From these figures it has been estimated that of the 146 cases of proved bacillary dysentery throughout the entire series 33.5% had a co-existing parenteral infection.

Summary and Conclusions

In tropical countries where diarrhoea is a common presenting symptom in children, and large numbers of cases are seen by a limited number of medical personnel, the problem of making a precise diagnosis can be very difficult, particularly if hospital and laboratory facilities are not immediately available.

Under these circumstances treatment must of necessity be simple, giving the optimum facilities to the greatest number of patients, whether treatment be undertaken in out-patient dispensaries, clinics, or district hospitals.

A survey was therefore made of 317 cases of diarrhoea in African children, each succeeding case being treated with phthalylsulphathiazole, sulphadimidine, and sulphaguanidine respectively, with the aim of establishing the relative merits of the "absorbable" and "non-absorbable" sulphonamides in the treatment of bacillary dysentery and non-dysenteric diarrhoea.

The average age group of the children in the series was 1 year and 8 months and the causes of the diarrhoea fell roughly into five groups: (1) proved bacillary dysentery; (2) enteric infections where salmonellae, *B. proteus*, or *B. paracolon* were isolated on stool culture; (3) enteric infections with no pathogenic organisms on stool culture and no obvious parenteral infections; (4) parenteral infections; (5) mixed enteral and parenteral infections.

It was found that all three drugs were equally effective in cases where *Shigella* organisms were isolated from the stools and gave similar results in the enteric infections of non-dysenteric origin.

If diarrhoea was found to be secondary to a parenteral infection or if mixed infections were present, sulphadimidine had a definite advantage in that, in many cases, it controlled both infections without additional chemotherapy.

Toxic reactions such as oliguria or anuria were not encountered with any of these drugs under trial, and no other undesirable side-effects were noticed.

The trial period for each drug was limited to seven days, by which time 68.2% of the cases on phthalylsulphathiazole, 69.1% on sulphadimidine, and 61.1% on sulphaguanidine were fit for discharge.

A point of considerable importance was the relatively high incidence of dual infections, showing that it was not enough to attribute the diarrhoea to an obvious parenteral infection or yet to conclude that the majority of cases would be dysenteric in origin, since the two might well coincide, with the symptoms of one sometimes overshadowing those of the other.

Therefore, in reviewing all aspects of the problem of diarrhoea in African children, and bearing in mind that not all cases are admitted to hospital or seen and treated by fully qualified medical personnel, it is essential to provide a regime of treatment which combines efficiency with ease of administration, simplicity, safety, and cheapness.

Since the "wide spectrum" antibiotics are not always available for routine use and the "non-absorbable" sulphonamides require the addition of penicillin or other antibiotics in the case of mixed infections, it is suggested that sulphadimidine could be used as a valuable general-purpose sulphonamide in the diarrhoeal diseases of African childhood.

My thanks are due to the Director of Medical Services, Kenya Colony, for permission to publish; to Dr. E. R. N. Cooke, Medical Research Laboratory, Nairobi, for the bacteriological work; and to the sisters and staff of King George VI Hospital, Nairobi, for their co-operation and help.

CHRONIC RECTAL BLEEDING DUE TO MILK

BY

F. P. ANTIA, M.D.Bom., M.S.Ill., M.R.C.P.Lond.
Associate Physician, B. D. Petit Hospital; Consulting
Gastro-Enterologist, Tata Memorial Hospital and
B. J. Wadia Hospital for Children, Bombay

AND

S. H. COOPER, M.B., B.S.

The following case of rectal bleeding probably due to an allergy to milk may be found of interest.

Case Report

A woman aged 38 was admitted to the B. D. Petit Hospital, Bombay, on November 15, 1953, with a history of bleeding per rectum for the past seven years. She had been operated on for both internal and external piles about six and a half years previously. She had been passing two stools a day, semi-solid, with no evidence of mucus. Blood was passed every day either mixed with stools or after the act of defaecation as frank blood or blood clots. The bleeding was not related to straining. She had been under observation in different hospitals for long periods, but bleeding per rectum persisted. There was no previous history of dysentery or diarrhoea. Her menstrual history was normal at first, but for the last three years she had a loss every three or four months for two or three days. Her father had severe asthma, and her son had allergic rhinitis. The patient had been married for 18 years and had twins, a boy and a girl, aged 17. Her husband was short-tempered, and at times used physical violence; consequently her married life was not happy.

Physical examination showed a well-built woman. Her blood pressure was 135/90 mm. Hg. No abnormality was detected in the cardiovascular, alimentary, or respiratory systems. The liver and spleen were not palpable. Vaginal examination showed no abnormality. A blood count showed: haemoglobin, 75%; red cells 3,100,000; white cells, 8,200 per c.mm. (polymorphs 82%, lymphocytes 18%). The bleeding time, coagulation time, platelet count, prothrombin time, and fragility tests were within normal limits. Seven years ago, when the patient was admitted to the same hospital, malingering was suspected because her husband was not treating her well at home, and traumatic bleeding from the rectum was supposed to be her device to stay in hospital. This time, however, every stool passed was semi-solid with mucus and frank blood not too well mixed. Microscopical examination showed many red blood cells. Urine analysis, gastric analysis and barium meal examination showed nothing abnormal. A barium enema suggested colitis of the descending and the sigmoid colon.

On November 18 a sigmoidoscope was passed 10 in. (25 cm.). At 2½ in. (6.3 cm.) an ulcer ¾ in. (1.9 cm.) in diameter was seen. The base was not raised. There were multiple punctate haemorrhagic areas ¼ to 1/6 in. (6 to 4 mm.) in diameter, the intervening mucosa showing only slight exudation of mucus throughout and no congestion. A smear from the mucous membrane did not show amoebae and the culture was negative for any pathogenic organism. Punch biopsy from the ulcerated area showed submucous infiltration with eosinophil and mononuclear cells.

Punctate haemorrhagic spots without evidence of inflammation of the colon suggested a diagnosis of allergy. Since the commonest allergen is milk (Antia, 1953), it was decided to exclude milk allergy. On November 20 the patient was put on fruit juice and water only. The bleeding per rectum stopped on November 22—according to the patient, for the first time in the last seven years. Two soft-boiled eggs were added on November 25 and biscuits on November 27,

without any passage of blood, either macroscopically or microscopically. On November 28, in addition, half a cup of milk with half a cup of tea twice a day was started, and on the 30th bleeding per rectum recurred, continuing until the milk was stopped on December 2. Then only fruit juice, soft-boiled eggs, biscuits, and mashed potatoes were given for two days, during which there was no bleeding. On December 5 three cups of milk were added to the diet, and next day bleeding recurred, and continued until December 8. Thereafter the patient was given the routine hospital diet except that milk was stopped in all forms: the bleeding did not recur. On December 16 sigmoidoscopy showed that the ulcer had completely healed and that the colon looked perfectly healthy.

It was decided to test the sensitivity of the skin to milk and to try to desensitize the patient by small doses. However, the husband was impatient to take his wife home and she was discharged with advice to start taking one drop of milk a day and to increase it daily by one drop, as advised by Andresen (1953). The patient reported again three and six months later, when she said that, by gradually increasing the amount of milk by one drop every day, she was able to take milk in her tea (she had not ventured to take a larger amount) and that the bleeding per rectum had stopped completely.

Summary and Conclusions

The case is described of a woman aged 38 with an unusual history of bleeding per rectum every day for seven years. Any possibility of malingering was dispelled by punctate bleeding all over the colon, which led to the belief that it was probably an allergic manifestation. Milk allergy was suspected.

All diet was stopped except fruit juice and water, and for the first time in seven years the bleeding stopped. Further tests showed that bleeding restarted whenever milk was given.

An apparent lag of 24–48 hours between bleeding and starting or stopping of milk might be explained by the products of milk digestion coming in contact with the mucosa of colon (Gray *et al.*, 1940).

The patient has apparently been desensitized to milk by gradually increasing the amount by one drop a day.

Our thanks are due to the Superintendent, B. D. Petit Hospital, for permission to publish this case

A good year, continuing the progress of the last few years, is reported by the British Empire Leprosy Relief Association for 1954. Every request for financial help to build homes for child patients was met, and by the end of the year 1,916 children were in the care of Belra in 23 different centres. The policy for treating adults has been to concentrate on out-patient care rather than on enforcing isolation, because the application of sulphone treatment depends on early diagnosis, which out-patient care facilitates. Two rural centres have been established in Tanganyika, a nurse has been posted to Northern Nigeria and a worker to Southern Nigeria to open treatment clinics throughout these neighbourhoods, and the number of Belra men on the Gold Coast working with the Government has been increased from one to eight. Many cases still need institution treatment, and for these a pilot leprosarium and a Red Cross Hospital are due to be opened in Tanganyika. Research on leprosy and in the allied field of tuberculosis is being carried on with the co-operation of the East Africa High Commission and the Medical Research Council.

Medical Memorandum

Ischaemia of Lower Limb as Cause of Motor Accidents

In view of the appalling number of road casualties in this and other countries, and the constant search for remedies, it is thought that the case described here will be of interest. It illustrates a possible cause of motor accidents which is not widely recognized.

CASE HISTORY

A lorry driver aged 58 was referred for medical examination because he had been involved in numerous minor accidents. The nature of these accidents suggested either that his eyesight was defective or that he was grossly careless. He denied any eye trouble, or that he was unfit in any other way. He attributed his accidents to "bad luck" or "bad judgment."

On examination he was a grey-haired, rather elderly-looking man. His visual acuity and colour vision were normal. The only abnormal physical signs were a grossly deficient blood supply to the right foot—the right dorsalis pedis and posterior tibial arteries being impalpable—and diffuse loss of sensation over the sole and medial four toes of the right foot.

After the examination he admitted that his foot occasionally felt numb, so that he was unable to feel the brake pedal or accelerator when he was driving. Henceforth he was not allowed to drive on the public highway, but only on his firm's private roads. His private doctor was told of the disability, but the patient was not referred to a hospital for further investigation.

Five months later his right big toe became septic after minimal trauma, and he was treated at a hospital casualty department. When he reported for work a few days later his toe was partly gangrenous: he was referred to another hospital, where he was admitted. Here he was found to have an inflamed swollen hallux with a slough of the top part of the nail-bed. The right dorsalis pedis and posterior tibial arteries were still impalpable; and there was impaired sensation over the sole of the foot, which was inconstant and disappeared when the foot was warmed. A radiograph showed bony destruction of the tip of the phalanx of the right hallux, but the results of other investigations were normal.

Subsequently the dead bone in the toe was excised, and after graduated exercises he was discharged. He was no longer allowed to drive.

COMMENT

Arteriosclerosis is so common and widespread a disease that cases similar to the one described are probably not uncommon; especially when so many old people are allowed to drive cars.

In this case it was thought that the impaired blood supply to the foot caused an ischaemic neuropathy. As Cohen (1954) has pointed out, patients with ischaemic nerve lesions can present with slipper anaesthesia of the foot, a delayed response to pain or pressure, or wasting and paresis of the intrinsic muscles of the foot. Recovery from an ischaemic nerve lesion is slow, and the sole of the foot may remain numb.

Doctors should bear in mind the potential liability of such patients to their employers, and their potential danger to the public if they are allowed to drive motor vehicles. Casualty officers should always look for peripheral vascular disease as a cause of chronic infection or ulceration of the feet and toes. A gangrenous toe is usually recognized as such; but the fact that it may indicate a major arterial block high up in the limb (Leriche, 1940) is not so widely appreciated.

Reviews

PHYSICAL SIGNS IN SURGERY

Demonstrations of Physical Signs in Clinical Surgery. By Hamilton Bailey, F.R.C.S., F.A.C.S., F.R.S.E. Assisted by Allan Clain, M.B., F.R.C.S. 12th edition. (Pp. 456+xii; illustrated. 38s. 6d.) Bristol: John Wright and Sons Ltd. 1954.

A book that has necessitated twelve editions and ten reprints and been translated into six languages must patently have exceptional virtues which have enabled it successfully to meet a great demand. Many successive generations of medical students have imbibed the teaching in Hamilton Bailey's *Demonstrations of Physical Signs in Clinical Surgery*, and there is no doubt that the present 12th edition (in which the author has been assisted by Allan Clain) will be even more popular. The reasons for this are to be found on any page of the book opened at random, for it will reveal, not only a concise description of a physical sign, but several very excellent and clear photographic illustrations of cases showing the sign or how it is elicited, and these have obviously been chosen with great care. How lavishly these illustrations are provided will be appreciated when it is recorded that there are no fewer than 681 of them in some 430 pages of letterpress.

Since the first edition was published colour reproduction has come into its own, and in the present edition there are, despite their great cost nowadays, a very large number of first-quality coloured illustrations; indeed, the publishers and printers are to be congratulated upon the truth of tint they have achieved, for it will go far to make the student feel that he has actually observed the cases. As it is quite impossible for a student to see examples of every condition during his curriculum, these illustrations form a very good and useful "second best."

At a time when eponymous designations are rather frowned upon by the pundits it is refreshing to find that the author commends their use; as he says in the preface, "In many respects this is an advantage, for an anatomico-pathological label is often cumbersome." But to enhance the mere name he gives in footnotes a few personal details; thus "Jean Martin Charcot, 1825-1893, Physician, Hôpital Salpêtrière, Paris." I regard this as entirely admirable, the only small criticism being that, in the case of some contemporary names, signs which have long been widely known and practised but are often of untraced origin are attributed to writers who happen to have mentioned them in their contributions. Nevertheless it is delightful, and instructive, to read: "Pierre Charles Alexandre Louis, 1787-1872, Physician in Paris. Some consider that it is Antoine Louis (1723-1792), Surgeon to the Charité Hospital, Paris, and designer of the guillotine, to whom the angle of Louis should be attributed." The latter certainly has the support of *Gray's Anatomy*.

Altogether this is an excellent production which can be strongly recommended to the student, and perhaps also to those who have to teach him.

NORMAN C. LAKE.

MORAL ASPECTS OF MEDICAL PRACTICE

Morals and Medicine. By Joseph Fletcher. Foreword by Karl Menninger, M.D. (Pp. 243+xvii. 15s.) London: Victor Gollancz, Ltd. 1955.

In this book a professor of "pastoral theology and Christian ethics" faces some of the moral problems encountered in modern medical practice which, though they have given the Roman Catholic Church "furiously to think," are still largely ignored by other Christian denominations and by the medical profession in general. Most moral systems are, as the author points out, anchored to some form of religious belief (and for him to the Christian religion), but it is through personality (which is a unique quality in every human being) that we obtain, he maintains, our knowledge

of the good. This book should therefore appeal to every practising doctor who believes that the conduct of medical practice must be based on moral principles.

Starting from this premise the author discusses the moral problems associated with contraception and sterilization; and exhibits little sympathy with Catholic doctrine. Indeed, he comes down clearly on the side of man's right to control parenthood, within reason, and to prevent sterility by artificial insemination when necessary, within the marriage bond. He even comes down on the side of euthanasia. Here, however, we cannot help feeling that, though he is well informed on medical matters, lack of first-hand experience of medical practice leads him to carry his argument too far. For he underrates the power of modern medicine to relieve pain and keep unconscious for long periods. Nor does he seriously discuss the growing problem (much more important than that of active euthanasia) of withholding the standard treatment for a disease when, in the doctor's judgment, it would merely prolong suffering. Further, his lack of medical experience is evident in his discussion on the patient's right to be told the truth—the part of his book which the average practising doctor will find much the most important. True that the truth should be told much more often than it is told. But so often what is the truth? Minor criticisms of this kind, however, should not be allowed to detract from the real value of this well-written book, which should be brought and thought about by as many practising doctors as can make the time to read it.

A. E. CLARK-KENNEDY.

CLINICAL ENDOCRINOLOGY

Clinical Endocrinology: For Practitioners and Students. By Laurence Martin, M.D., F.R.C.P., and Martin Hynes, M.D., M.R.C.P. Second edition. Foreword by Sir Lionel Whitby, C.V.O., M.C., M.D., F.R.C.P., D.P.H. (Pp. 253+ix; illustrated. 20s.) London: J. and A. Churchill, Ltd. 1954.

It is pleasing to see that a second edition of this excellent little book has now appeared six years after the first. The very comprehensive and concise survey of endocrinology has been brought well up to date by the inclusion of such topics as isotope methods of thyroid investigation and modern knowledge of adrenal function and dysfunction. The boundaries of endocrinology continue to expand until they infiltrate deeply into most branches of medicine, and it becomes increasingly difficult to know where to draw its limits; but some must be drawn, and the authors of this book have wisely omitted any account of the many non-endocrine diseases for which cortisone or A.C.T.H. is useful.

A very great deal of reliable and up-to-date information is contained within these 250 pages, and more still can be obtained by use of the lists of references at the end of each chapter, which are up to date, well chosen, and to accessible journals. The illustrations also are informative and well selected. The result is a book of high standard which the publishers have produced at a low price. In a rapidly advancing subject such as this many aspects change frequently, but most of the information here presented is likely to remain valid for years to come.

The book is primarily designed for practitioners and for students working for higher degrees, and to both it can be recommended as an excellent survey of the subject in very handy form.

C. L. COPE.

Cargoes on the Great Lakes, by Marie McPhedran (George G. Harrap and Co., Ltd., 10s. 6d.), is a book of great charm that tells the story of the freighters moving on the face of the sea-waters of Lake Superior, Lake Michigan, Lake Huron, Lake Erie, and Lake Ontario, on whose hospitable shores many British doctors are now gathering with their Canadian cousins in the combined meeting of the Canadian Medical Association and the B.M.A. Marie McPhedran guides the reader along these great waterways with an intelligent hand, skilled in narrative and selection of points of interest; and Dorothy Ivens brightens the pages with the apt illustrations. A useful, enjoyable, and informative book for old and young.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY JUNE 11 1955

THE A.R.M.

Despite the difficulties of travel imposed by the railway strike there was an excellent attendance at this year's Annual Representative Meeting of the Association in the Great Hall of B.M.A. House in London under the chairmanship of Dr. I. D. Grant, of Glasgow. There were some 251 motions and amendments on the agenda, and the meeting, under able direction from the chair, completed its work by midday on Saturday, June 4, within the allotted space of three and half days. The Chairman, who, with his deputy, Dr. A. Beauchamp, of Birmingham, was returned to office unopposed for another year, may perhaps find the Representative Body less attentive to business when it moves its tents from the businesslike atmosphere of Headquarters to the attractions of seaside Brighton in 1956.

On the domestic front the meeting supported the Treasurer in his attitude of cautious optimism towards the Association's finances, and, in voting against suggestions for modifying the subscription rate for some categories of membership, agreed that after a period of stabilization time must be allowed to build up a reserve. The course of the debate also showed that representatives and their constituents continue to give anxious thought to the dangers of sectionalism within the profession and, correspondingly, the Association. As various speakers made clear, the Representative Body's desire to preserve its position as the effective parliament of the whole profession sprang as much from the need for professional unity as from a properly jealous regard for the Association's prestige. The Chairman of Council summed the matter up when he said "there was only one British Medical Association, which included all kinds and conditions of men, and its doors were open to all." All they had to do, he went on to say, "was to take their place as doctors among other doctors" in the affairs of the Association.

The meeting was unsympathetic towards some motions under the General Medical Services Committee's business calling for an increase in remuneration for general practitioners because of the increased cost of living. The chairman of the Committee,

Dr. Talbot Rogers, had little difficulty in persuading his hearers that such ideas were out of touch with reality. But there was overwhelming support for a motion calling on the B.M.A. to continue to press for the right of private patients to receive drugs free of charge as part of the National Health Service. Several speakers rebutted the suggestion in the Cohen Report—and echoed by one sincere but solitary representative—that this provision would lead to two standards of practice. Dr. R. Green (Brighton) had the ear of the meeting when he urged that the essence of this matter was justice to the patients, of whom "some of the most impecunious have elected to remain private patients." In Dr. Rowland Hill's regretted absence through illness, Mr. Nicholson-Lailley took the bowling for the consultants and specialists and at the end of a long and patient innings received a well-deserved ovation.

The proposed ban of heroin by the Government came under fire after lunch on the third day of the meeting. The main burden of the protests in several motions and amendments was that the Association, as representing all branches of the profession, should have been consulted by the Government before taking action; that if heroin was to come under a ban it should apply only to its export; and that the banning of any drug of therapeutic value of whatever kind was a threat, even if a veiled one, to clinical freedom. Statesmanlike pleas from Dr. J. G. M. Hamilton and Dr. S. Wand that representatives should give due weight to the grave international aspects of the problem were attentively listened to, but the meeting registered by a majority its opinion that heroin should continue to be manufactured in this country, but not exported, and instructed the Council to approach the Government to seek a reversal of its decision.

Members of the public health service, disappointed by the recent award of the Industrial Court, should be heartened by the evident sympathy of the Representative Body. Dr. J. B. Tilley, chairman of the Public Health Committee, said that it was a matter of grave concern that medical men and women who chose to practise preventive medicine were paid less than they might expect to be paid in other branches of the profession. Speaking in the debate which followed, Dr. Guy Dain said that the first step in any medical service was the establishment of a preventive service, yet the reward offered to those in the public health service was so poor that young doctors were not coming forward to take the D.P.H. "We must do what we can to get them better conditions." Dr. Dain concluded, and the meeting passed a motion by Gateshead demanding urgent action to bring "remuneration in the salaried medical services of the

State and local authorities" up to a level comparable with that of the rest of the profession engaged in hospital and general practice.

One of the last matters to be discussed was the possibility of changing the arrangements at Annual Meetings, so that the Scientific Meeting and the Representative Meeting might be combined, thus enabling all members to have an opportunity of taking part in both the scientific and medico-political activities of the Association. Speakers recognized that this presented great difficulties, but the general opinion was that the suggestion was a useful one and well worth further investigation.

Though there were no fireworks this year, the A.R.M. dealt with the matters before it in a business-like way and much was achieved. The long hours of discussion were lightened by many pleasant social occasions, and by the labours of those who had the responsibility of arranging the meeting. In particular, thanks are due to the council of the Metropolitan Counties Branch, the Ladies Committee of the Branch, and the London Association of the Medical Women's Federation.

CORONARY DISEASE IN INFANCY

It has become evident that coronary thrombosis in young people is not so rare a disease as was previously thought.^{1,2} In 1942 N. Reitman, W. R. Greenwood, and J. H. Kler³ described 221 cases of coronary thrombosis in patients under 40 years of age, 34 being under 30 years of age. However, coronary artery disease was thought never to occur in infants until J. H. Bryant and W. H. White⁴ described a case in 1891. Since then about forty cases in infancy and childhood have appeared in the literature. The frequency of recent reports of coronary artery disease⁵⁻⁷ in young infants would suggest that arteriosclerosis and coronary thrombosis are not a natural process of ageing and "wear and tear," but due to some specific disease. The aetiology remains obscure, but infection, hyperparathyroidism, excess vitamin D, and inborn errors of calcium metabolism, such as idiopathic hypercalcaemia, have been suggested. Other possibilities that have been considered are drug therapy, rheumatic arteritis, allergy, and congenital abnormality of the arteries.

Pathologically, the findings in infants have been well tabulated and described.⁸⁻¹⁰ Many of the medium-sized arteries are affected. Calcification occurs in the internal elastic lamina of the media, with subsequent fibroblastic proliferation of the intima. In some cases, calcification follows necrosis and granulomatous proliferation.¹⁰ Myocardial

damage consists of subendocardial infarction, patchy replacement fibrosis, and often subsequent calcification. In contrast to the condition in adults, atherosclerosis is extremely rare. Most of the infant patients have been between 2 and 8 months of age. One case was reported¹¹ with myocardial infarction occurring at 10½ hours of age, and W. A. Stryker⁸ refers to abnormal vascular findings in a stillborn foetus.

Clinically, dyspnoea and pallor develop suddenly in a previously healthy infant; however, this acute picture may be preceded by intermittent vomiting and failure to thrive, or merely by a mild upper respiratory infection. On physical examination the child's condition closely resembles that of adults with myocardial infarction. Dyspnoea, shock, ashen-grey colour of the skin, and evidence of cardiac failure are prominent findings. Pulmonary oedema and hepatic enlargement are frequently present. Clinically and radiologically the heart is grossly enlarged. W. A. Cochrane and D. H. Bowden⁶ suggested that radiography of the neck might aid in the diagnosis by revealing calcification of the thyroid arteries, which are commonly affected. Few electrocardiograms have been done, but these are often typical of ventricular hypertrophy, myocardial anoxia, and infarction. Death is usually rapid—a matter of a few hours.

The differential diagnosis would include those conditions producing sudden collapse in young infants. Hence fulminating septicaemia, adrenal insufficiency, and congenital renal disease could be diagnosed by the usual diagnostic procedures. Certain congenital cardiac conditions which give rise to cardiac failure in young infants, such as patent ductus arteriosus, coarctation of the aorta, and transposition of the great vessels can be distinguished without much difficulty by present-day methods. However, endocardial fibroelastosis, acute interstitial myocarditis, and glycogen storage disease of the heart all produce marked cardiac enlargement and failure in young infants, and would be almost impossible to differentiate. Moreover, an aberrant left coronary artery from the pulmonary artery gives a similar clinical and electrocardiographic picture. Treatment has been very disappointing and the fact that the diagnosis has most commonly been made at the post-mortem table testifies to the inefficacy of oxygen, antibiotics, digitalis, mercurial diuretics, and the other drugs that have been tried.

CAUSE OF ITCHING

Since the work of Sir Thomas Lewis showing that a substance indistinguishable from histamine existed in a combined form in human skin, that histamine was liberated when the skin was damaged, and that histamine pricked into the skin caused itching, the view has been widely held that itching of the skin is due to the release of histamine. The view gained support from the observation that antihistamine substances relieved the rash and the itch of urticaria. Two years ago J. L. Broadbent¹ published an account of work with cowhage, which is the name given to the trichomes which cover the pod of a tropical plant, *Mucuna pruriens*. Cowhage is sometimes sold as itching powder, and it has been believed to cause itching mechanically. However, Broadbent came to the conclusion that cowhage caused a liberation of histamine in the skin, though cowhage itself did not contain histamine, as nettle stings have been shown to do.² He based his conclusion on the observations that extracts of cowhage produced a triple response (like histamine) when injected intradermally, that when cowhage was first extracted, the material left behind caused little itching, and that an antihistamine substance given by mouth reduced the itching caused by cowhage. Subsequently K. Bowden, B. G. Brown, and J. E. Batty³ showed that a crude extract of the trichomes of cowhage contains 5-hydroxytryptamine, and the authors stated that this substance probably accounts for the pain which occurs when cowhage is applied to the skin, though they could not say whether it was responsible for the itching.

Now comes a further development in a publication by R. P. Arthur and W. B. Shelley.⁴ They claim that the active principle in cowhage which causes itching is an enzyme called mucunain, and have described the results of testing a series of enzymes for their power to produce itching. They used the trichomes of cowhage to introduce these enzymes into the skin after first destroying the mucunain by "autoclaving at 250° C. for 30 min." They then soaked the trichomes in the enzyme solutions, which ranged in strength from 10% downwards. They found that when they introduced a single impregnated trichome into the skin, using a watchmaker's forceps and working under a microscope, a localized itch resulted which was "mild to intense." They tried a wide variety of enzymes, and found that only proteinases were active, and of these only the endopeptidases with activities in the physiological pH range. Thus among the active ones were papain, trypsin, and chymotrypsin, while pepsin and many others were inactive. The three active enzymes were studied as crystalline preparations; they caused itching with the shortest latent period (5 sec.) and the longest duration (30 min.). Arthur and Shelley believe that these enzymes cause itching by liberating another substance, but they believe that this is not histamine. Their reason for this is that the active

endopeptidases invariably elicited the pure sensation of intense itching without any weal or flare, whereas histamine and the potent histamine liberator 48/80 never produced itching in the absence of wealing.

B VITAMINS IN TOXIC STATES

Replacement therapy in actual or threatened deficiency states is the only theoretically valid indication for vitamins of the B complex. The average diet in this country contains ample vitamin B to meet nutritional requirements, and deficiency syndromes are very rare. When they occur, they are nearly always caused by defects of absorption such as the steatorrheas, the disorders which may follow gastro-intestinal surgery, or pernicious anaemia, which is due to a failure to absorb vitamin B₁₂. Vitamin-B deficiencies are difficult to induce in man, and prolonged deprivation is usually necessary. It is several years before vitamin B₁₂ deficiency becomes manifest after total gastrectomy, which removes the natural source of intrinsic factor; and clinical signs of pyridoxine deficiency cannot be deliberately induced in man unless a metabolic antagonist to the vitamin is given.¹ It is therefore unlikely that true deficiencies can arise in acute toxic states, and if the B vitamins have any beneficial effect it is probably due to some secondary action analogous to the vasodilator effect of nicotinamide. Thiamine and pyridoxine have long been popular in the treatment of radiation sickness, vomiting of pregnancy, and post-operative vomiting. Pyridoxine has been the more frequently used, but even in controlled trials the results have been conflicting,^{2,3,4} although response has been more convincing in radiation sickness than in other forms of nausea and vomiting.⁵ There is some evidence that patients with vitamin-B deficiency are abnormally sensitive to irradiation.⁶ Intravenous thiamine and pyridoxine have also been used empirically in the treatment of acute alcoholism.^{7,8} Nausea, vomiting, and anorexia are difficult symptoms to assess objectively, and a convincing answer can only come from large-scale blind trials in which neither patient nor doctor knows whether test substance or dummy is being used. If clinical impressions could be confirmed in this way it would not be the first time that successful treatment has been based on doubtful premises.

Vitamins of the B group have also been used in the treatment of acute and chronic liver disease. In cirrhosis of the liver they are indicated only in patients with alcoholism and associated malnutrition: in infective hepatitis their value has never been convincingly demonstrated. Campbell and Pruitt⁹ recently carried out a

controlled trial of vitamin B₁₂ and folic acid in soldiers with infective hepatitis and claimed quicker clinical recovery and more rapid improvement in liver function tests in the treated group, but Colwell¹⁰ was unable to confirm this. Latner¹¹ includes B vitamins in the treatment of acute liver failure, but Reynell¹² has shown that they are of no value in experimental liver failure in rats, and there is little theoretical justification for their use. It has yet to be shown that vitamin B therapy has any place in the treatment of liver disease as it is seen in this country.

ADVERTISING ON TELEVISION

The Independent Television Authority published last week a booklet entitled "Principles for Television Advertising" which is described as a general code of television advertising conduct. The rules are based on the recommendations of a committee appointed by the Authority, the Advertising Advisory Committee, on which Dr. Guy Dain serves as a representative of the British Medical Association. The general principle which will govern all television advertising is that it should be "legal, clean, honest, and truthful." It follows that false and misleading advertisements will not be allowed, and "no advertisement shall contain any reference which is likely to lead the public to assume that the product advertised has some special property or quality which is in fact unknown, unrecognized, or incapable of being established." Scientific terms must be used with a proper sense of responsibility to the ordinary viewer, and the irresponsible use of testimonials must be avoided. In so far as advertising on children's programmes is concerned, no product is to be advertised which might result in harm to children physically, mentally, or morally, and no method of advertising may be used "which takes advantage of the natural credulity and sense of loyalty of children." Among the particular safeguards specified is one which forbids any advertisement which encourages children to enter strange places or to converse with strangers in an effort to collect coupons, wrappers, or labels.

The advertising of medicines and treatments presents particular problems. The rules state that no advertisements will be accepted for specifics for slimming or bust development, contraceptives, smoking cures, and products for the treatment of alcoholism. In addition there are already statutory restrictions on the advertising of remedies for cancer, venereal diseases, tuberculosis, and other disorders. In general, advertisements for medicines will be accepted if they comply with "The British Code of Standards in Relation to the Advertising of Medicines and Treatments." This code,¹ which has the approval, among other bodies, of the Newspaper Proprietors Association, the Advertising Association, and the Proprietary Association of Great Britain, has helped greatly in recent years to improve the standard of patent medicine advertisements in newspapers and periodicals, and its strict application to television advertisements should be a

¹ "British Code of Standards in Relation to the Advertising of Medicines and Treatments," 1953, third edition.

useful safeguard against any tendency to unscrupulous advertising of medicines or methods of treatment. Finally, doctors will be relieved to know that "statements, gestures, or representations that give the impression of professional advice or recommendation should not be allowed."

SHOPLIFTING

Only very few of the many convicted shoplifters are referred to the psychiatrist. In the course of one year 3,400 persons were apprehended for shoplifting in five Chicago department stores; 4.5% were arrested, and for 25 of them psychiatric opinion was sought because they appeared to suffer from mental symptoms. Of 338 cases of shoplifting referred to a Chicago psychiatric institute,¹ 313 were females. 77% were labouring under a definable nervous disorder. Almost all psychiatric conditions were represented, mild depressions being the most frequent. Kleptomania (compulsive stealing) was found only in 4% of the group. Shoplifting was not related to economic status.

At a recent meeting of the Medico-Legal Society, Lindsay Neustatter² discussed some interesting cases of shoplifting. He pointed out that, contrary to generally held beliefs, "of all crimes, theft is at the same time the simplest and the most difficult to understand."³ The association of shoplifting with tension and sometimes with sexual excitement has been known for a long time. It has been found to be precipitated by unfulfilled craving for affection and by lack of sexual gratification. In each of Lindsay Neustatter's five cases the irrational theft had taken place in a state of tension and depression. Three of his patients showed evidence of an hysterical personality. In one of his cases the act of shoplifting had been preceded by a craving for sweets, which had resulted in an excessive gain in weight. This case recalled J. Wilder's⁴ account of shoplifting in states of spontaneous hypoglycaemia. In the view of many psychiatrists the abnormal behaviour of the offenders does not imply that they should necessarily get away without punishment.

Regrettably, there is little systematic knowledge about shoplifting as a neurotic symptom. The offence has become more frequent since the barriers between potential customers and the goods they are invited to buy have been completely removed in many places. Some people find buying things a pleasant relief in states of depression, and a similar mechanism, though more primitive, might be at work in shoplifting, where the mode of acquisition provides an added thrill. The coexistence of this abnormal manifestation of acquisitiveness with oral craving recalls a similar association among the so-called oral character traits. There is need for more systematic studies in this field. It might even pay the big department stores, which are the chief victims of this offence, to finance serious research into this problem.

PROLONGED PREGNANCY

The question of postmaturity arises often enough to perplex the obstetrician, and the question of how long a live pregnancy can remain in the uterus is of considerable medico-legal importance. Attention might therefore be drawn to a short paper recently published by Burrows,¹ in which he discusses the possibility that delayed nidation of the fertilized egg might account for some cases of prolonged gestation in the human. He points out that for some time biologists have known that blastocysts do not need an immediate attachment to the uterus for their survival. Most of the pertinent observations have been made on rodents. In mice gestation may be retarded by injury soon after coitus or by the occurrence of conception during lactation. But in other rodents, and perhaps in seals, delayed nidation is said to occur normally and in the absence of adverse factors, the blastocyst lying dormant for months before the development of the embryo is resumed. Further, Burrows himself noted that mice and rats occasionally bore two successive normal litters after a single mating. The explanation is said to lie in the retention of some of the blastocysts in the oviducts, their survival in a dormant state throughout pregnancy, and their subsequent entry into the uterus to develop as a second litter.

The possibility of deferred nidation occurring in the human raises several points of interest. It might explain cases of alleged superfoetation, either when twins of unequal maturity and size are born together, or the even rarer cases in which two babies of equal maturity are born within a few months of each other. It might also explain those cases in which, despite pregnancy being prolonged as measured by our present criteria, the foetus shows no signs of postmaturity either before labour or at delivery. One way of studying the question might be to make inquiries among women who became pregnant during lactation to see if the date of their conception could be determined accurately perhaps because of a single act of coitus. If the average interval between conception and delivery were found to be lengthened in these cases, it might afford relevant evidence.

PLEASE REPLY TO THE G.M.C.

Although the necessity for "getting registered" is well understood it is not so generally realized that, disciplinary procedures apart, it is occasionally necessary for doctors to take steps to keep registered. On two occasions² last year reminders to readers of the liability to erasure from the *Register* under the provisions of Section 14 of the Medical Act were published in the *Supplement*. Section 14 makes it the duty of the Registrars of the General Medical Council to keep the *Register* correct and "to erase the names of all registered persons who shall have died and . . . from time to time make the necessary alterations in addresses or qualifications of the persons registered." To carry out this duty the Registrars are empowered to write a letter to any registered doctor to inquire whether he has

ceased to practise or has changed his residence; and the Act goes on to say that if there is no answer to such a letter within six months "it shall be lawful to erase the name of such person from the *Register*." Some such powers as these are necessary if the General Medical Council—the body responsible for keeping the *Register*—is to carry out its essential task. A register which continued to include the names of deceased practitioners would fall into disrepute, not to mention the increased risk of impersonation which is sometimes attempted.

A letter at page 286 of this week's *Supplement* shows that at least one doctor is not clear about the procedure used by the Registrars in carrying out their obligations. At the beginning of each year about 10,000 doctors' names are selected alphabetically from the *Register* (the intention is to cover the entire *Register* in cycles of about five years), and they are circularized from the offices of the Council in London and Edinburgh by ordinary post with a request for confirmation of the correctness of the details already recorded on the *Register*. A detachable form is enclosed for reply. According to the President of the G.M.C.³ in one year one-third, and in no year less than one-sixth, of the practitioners circularized do not reply to this letter. A further—and registered—letter is sent in June to those practitioners who fail to reply to the first letter. During the summer and autumn the Council attempts to trace the practitioners who have not replied to either letter (and are therefore becoming liable to erasure) by seeking fresh addresses from the British Medical Association, the medical protection societies, the *Medical Directory*, and other sources. As a result of the co-operation, entailing not a little labour, of the bodies and persons consulted, the Registrars are usually able to establish communication with all except about 500 of the practitioners in question. In November or December of each year the names of the practitioners with whom it has not been possible to establish contact are erased.

Early in the present year every practitioner originally registered by virtue of an English, Scottish, or Irish qualification (other than a practitioner who became fully registered after January 1, 1954) whose name begins with a letter between I and N inclusive should have received a letter sent on behalf of the Council. Letters are not sent in the normal course to provisionally registered practitioners. Further registered letters were sent in May to practitioners who did not reply to the original letters. Any practitioner who has received a letter from the Council and has not replied would therefore be well advised to communicate with the appropriate office of the Council.

Medical men are supposed to be lax in filling up forms, replying to questionnaires, and so forth. It seems to be an occupational hazard. But it requires little imagination to see that the elaborate efforts made to trace the missing thousand or two names each year cost a great deal in time, money, and patience. Common courtesy, as well as self-interest, surely demands a prompt answer to the Registrars of the G.M.C.

EMERGENCIES IN GENERAL PRACTICE

PULMONARY EMBOLISM

BY

R. B. HUNTER, M.B.E., M.B., Ch.B., F.R.C.P.Ed., M.R.C.P.

Professor of Pharmacology and Therapeutics, University of St. Andrews, Queen's College, Dundee

Pulmonary embolism is thought to be the cause of death in 3% of hospital patients who are examined *post mortem*, but in only one-third of these is the diagnosis made before death. This fact stresses the difficulty in making the diagnosis of this serious and often fatal condition. In a significantly large number of cases pulmonary embolism is not the sudden dramatic incident of acute dyspnoea, chest pain, and circulatory collapse.

Aetiology

The one condition which is essential for pulmonary embolism is that a clot should form in any portion of the cardiovascular system peripheral to the pulmonary artery, and parts of this become detached and be carried by the blood stream into the pulmonary tree. The vast majority of emboli actually come from the deep veins of the legs, some from the pelvic veins, a few from the right side of the heart or from the venous channels in the upper extremities. The facts which are known about the disease are that it occurs principally in patients strictly confined to bed, and that it is rare in patients under 30 years of age. It is as common in medical as in surgical cases, with a notably high incidence among those with heart disease, though in 90% of these the origin of the clot is in the peripheral veins.

Two factors seem to be important in the initiation of deep vein thrombosis, one is slowing of the blood stream, and the other is injury to the vessel wall. Rest in bed produces slowing of the blood stream. Congestive heart failure also results in slowing of the circulation, and when due to mitral stenosis or myocardial infarction appears to be particularly apt to lead to venous thrombosis. Injury to the vessel wall may be of recent origin as in trauma, or there may be chronic insufficiency of the calf veins with distortion and dilatation of the venous channels. Such a state of affairs occurs temporarily during pregnancy, and predisposes the patient to thrombosis.

A small group of cases do occur in apparently healthy, ambulatory individuals, many of whom have recurring episodes of calf-vein thrombosis. It is said that this group, which is rare, is composed predominantly of males, but in my experience these patients are equally often females. Nearly one-third of them develop pulmonary embolism, and when this state of affairs occurs in ambulant patients it is important to consider the possibility of neoplastic disease and thromboangiitis obliterans.

Four events may result from sudden obstruction of the blood flow in the pulmonary arterial system: (1) the development of pulmonary infarction due to the obstruction; (2) the development of acute cor pulmonale because of a sharp rise in right ventricular pressure; (3) peripheral vascular collapse; and (4) the onset of certain cardiac disorders. It must be stressed, however, that pulmonary infarction, cor pulmonale, or cardiac disorders may occur without any dramatic incident. Anoxia may also result and be of sudden or gradual onset in any particular case.

Clinical Picture

The clinical features in any patient with this condition depend on the preponderance of the different factors mentioned, the size of the vessels occluded, movement of the emboli within the pulmonary vessels, and the state of the heart and lungs prior to the onset.

Pain may be due to disturbances in the pulmonary circulation, to pleural involvement, or to impairment of the coronary circulation. Fortunately from the diagnostic point of view, chest pain occurs in 75% of cases, in two-thirds of which it is pleuritic in nature, because of involvement of the pleura overlying the infarction, and in one-third anginal. It has been claimed that the latter is due to reduced coronary blood flow.

Fever occurs in over two-thirds of the patients and a sharp rise of temperature associated with leucocytosis may suggest a diagnosis of pneumonia. The fever does not, however, respond to the administration of antibiotics. Occasionally fever is the principal clinical manifestation of pulmonary embolism, perhaps associated with minimal chest signs on auscultation and a radiograph which is passed as normal.

Breathlessness may result from bronchospasm, immobility or diminished respiratory excursion of the diaphragm, anoxia, pulmonary infarction, or impairment of cardiac function, but it is important to remember that breathlessness may not be present.

Physical signs in the lungs may be absent in spite of chest pain and breathlessness, or, on the other hand, a massive area of infarction associated with a large pleural effusion may dominate the clinical picture, and if, as often happens, the pleural fluid is blood-stained, the diagnosis of pulmonary neoplasm may be entertained.

Cough is almost as common as dyspnoea, occurring in one-third of the patients, but haemoptysis, which is thought to be one of the classical features, is evident in only one-quarter of the cases.

Occasionally the presenting picture is one of acute cor pulmonale without any history of deep venous thrombosis or complaint of chest pain or haemoptysis. Under these circumstances there may be prominent pulsation over the pulmonary artery, dilatation and pulsation of the jugular veins, and cyanosis. In these cases a loud pericardial friction rub may be heard over the pulmonary area. This clinical picture may persist for days or weeks, or may be transient, particularly if right heart failure supervenes. Paroxysmal auricular fibrillation, paroxysmal auricular tachycardia, high-grade auriculo-ventricular block, and bundle-branch block may occur as part of the clinical picture.

Sudden chest pain and fever are therefore the commonest presenting features of pulmonary embolus and may on occasion be found without any other symptoms or signs. The diagnosis may be obvious or very difficult. I recently attended the post-mortem examination of a patient who was twice in my wards with "pneumonia." Pulmonary embolism was suspected because the response to antibiotics was unsatisfactory, but no confirmatory evidence could be found on detailed clinical, radiological, or cardiographic examinations. After her second admission she was sent to a convalescent home, where she died suddenly from a massive embolus. At post-mortem examination a solid clot extended from the deep calf veins to the inferior vena cava.

In the physical examination of the case of suspected embolism care has to be exercised, and on no account should the patient be asked to breathe deeply to facilitate auscultation of the chest. Death has occurred under such circumstances following the sucking of a large clot into the chest. The administration of adequate laxatives is also important to avoid straining at stool.

It will be evident from this account that the clinical picture may simulate many other disorders, more commonly pneumonia, acute myocardial infarction, pleurisy with effusion, pulmonary neoplasm, acute heart failure, or asthma.

Electrocardiographic examination is of great value in distinguishing acute pulmonary embolism from myocardial infarction, particularly when the patient complains of substernal pain. In pulmonary embolism there is usually electrocardiographic evidence of acute right ventricular stress. The changes are maximal within the first three days and may persist for weeks. In 15% of cases there is transient right bundle-branch block, making differentiation from myocardial infarction very difficult. A normal electrocardiogram, however, does not exclude pulmonary embolism.

Radiological Examination of the Chest.—When embolism occurs without infarction there may be a segmental area of increased translucency owing to absence of vascular shadows in the ischaemic area. Rounded or wedge-shaped shadows may be visible when infarction occurs. There may be no radiological signs or a massive area of consolidation. Radiological signs are so variable that I doubt the wisdom of moving a patient in domiciliary practice for this examination alone.

Diagnosis and Prognosis

It is obvious that a massive pulmonary embolus occurring without warning or signs of deep vein thrombosis cannot be anticipated and prevented. In my experience, however, more than half the cases which develop a pulmonary embolus have symptoms or signs before the major accident which are disregarded, some by the patient—such as pain in the calf; some by his medical attendant—unexplained pyrexia, slight chest pain, or a short attack of breathlessness—because many physicians still hesitate to consider the diagnosis without severe breathlessness, chest signs, and haemoptysis. The realization that pulmonary embolism may occur without dramatic symptoms and signs is all-important, and in such patients anticoagulant therapy should be instituted when deep vein thrombosis or a small pulmonary embolus is suspected. All seriously ill persons should have regular and frequent examinations of the calves for tenderness.

Published results suggest that 40% of patients who experienced a minor incident had a major embolism, and half of them died before the institution of anticoagulant therapy. In my experience, 18% of patients who had an embolus had a second one in spite of adequate anticoagulant therapy. The death rate in these treated cases was, however, greatly reduced, being in the region of only 2%. Anticoagulant therapy is therefore a major advance in the treatment of pulmonary embolism.

Treatment

Cases fall commonly into two clinical groups from the point of view of treatment. (1) The small embolus associated with chest pain, some rise of temperature, and perhaps slight breathlessness. Morphine, 15–20 mg. ($\frac{1}{2}$ – $\frac{3}{4}$ gr.), should be given initially by subcutaneous injection to allay distress and anxiety and anticoagulant therapy instituted. If such cases are not treated there is a risk of a second major embolus and also the danger of extension of the clot in the pulmonary tree giving rise to the gradual development of cor pulmonale or a large area of infarction without any further major incidents. Many cases in this category are diagnosed as pneumonia and are found resistant to treatment for that condition. (2) A large embolus, producing shock, acute breathlessness, pleural or substernal pain, cyanosis, and a fall of blood pressure. Morphine, 20 mg. ($\frac{1}{2}$ gr.), and atropine, 1 mg. (1/60 gr.), should be given by subcutaneous injection immediately and heparin is also urgent (see below). Morphine, 15 mg., may be repeated in one hour if considered necessary. Oxygen therapy is indicated if anoxia is marked.

Further treatment depends on developments. The patient may require treatment for cardiac failure or the intravenous injection of 0.5 g. of aminophylline for bronchospasm. In patients who have a large lung infarct it is wise to give antibiotics prophylactically.

When is it desirable to move the patient to hospital? Cases which have had a small embolism without shock or collapse can usually be moved at any convenient time, but they should be under the influence of heparin when this is done. Those who have suffered a massive embolism with shock and circulatory collapse are not fit to move. The temptation must be resisted to rush these cases to hospital for anticoagulant treatment. Difficult though the treatment may be to carry out in the home, therapy as detailed below should be carried out there until the patient is sufficiently recovered to withstand the stress of the journey.

Anticoagulant Therapy

Heparin is the drug of choice for the initial treatment of pulmonary embolism, and 15,000 units should be given intravenously by the practitioner whenever the diagnosis is made, and 10,000 units at six-hourly intervals thereafter. It is safe to administer heparin in this way, and control clotting times are unnecessary. Heparin prevents extension of the clot and promotes its resorption; it also has a vasodilator action. Its administration should be continued for three to five days. At a suitable time during this period the patient should be transferred to hospital for coumarin therapy. Heparin is of less value than coumarin-type anticoagulants in producing recanalization in the thrombosed vessel, both in the lungs and in the deep calf veins. It is unfortunate that coumarin treatment requires laboratory control, but it can be perfectly well carried out in the home if the laboratory facilities are at hand.

On the last day of heparin treatment 100 mg. of phenylindanedione (P.I.D.) should be given twice by mouth. The following morning the one-stage clotting test* is carried out, and further dosage of P.I.D. determined. During the first week of P.I.D. therapy daily estimations by the one-stage clotting test are required, but thereafter weekly or fortnightly estimations are usually sufficient. Over 70% of patients are maintained satisfactorily with a dose of 50 mg. a day. In the cases in which there are no further complications therapy should be continued till the patient has been fully ambulant for about a week or until there is resolution in the area of pulmonary infarction. The most remarkable improvement often occurs in an area of lung apparently irreparably damaged. When there is persistence of lung signs or evidence of acute cor pulmonale, treatment may have to be continued at home or in hospital with weekly laboratory checks for months. Some of our patients who required six to eight months' treatment have made a complete functional recovery.

In cases with recurrent pulmonary emboli, particularly when associated with mitral stenosis or migrating thrombophlebitis, permanent out-patient anticoagulant therapy should be considered.

Contraindications to Therapy.—Anticoagulant therapy is contraindicated under the following circumstances: if the patient is known to have a duodenal ulcer, malignant disease, advanced hepatic or renal disease, or any bleeding diathesis. It is also probably wise to avoid this form of therapy in severe hypertension if there is a history of cerebral thrombosis or if cerebral embolism has occurred within the previous fortnight.

Prevention

Early ambulation after operation or illness is desirable. Breathing exercises and foot and leg movements should be carried out in all patients confined to bed. These need not be elaborate, can easily be carried out in the home, and do not require the supervision of a physiotherapist. Flexion

*Quick, A. J., Stanley-Brown, M., and Bancroft, F. W., *Amer. J. med. Sci.*, 1935, 190, 501.

and extension of the ankle and knee-joints, together with clockwise and anticlockwise rotation of the feet, carried out two or three times a day is all that is required. In patients with a previous history of deep vein thrombosis, or thought to be likely subjects for thrombosis, knee-length elastic stockings should be fitted and worn during the period of bed rest. Thigh-length elastic stockings are undesirable because they wrinkle at the knee and may themselves traumatize the veins. Wilkins and his colleagues (*New Engl. J. Med.*, 1952, 246, 360) have shown that this simple procedure is sufficient to increase the blood flow in the calf veins and reduce the incidence of thrombosis. Patients with a history of deep venous thrombosis who are too ill to carry out leg exercises efficiently should be given anticoagulant drugs prophylactically and the foot of the bed should be elevated. A superficial vein thrombosis is not an indication for anticoagulant therapy. In fact, such treatment is contraindicated when phlebitis is present. But it must be remembered that patients in this group may also have damaged calf veins and may develop deep thrombosis. In pregnancy it is almost certain that patients have abnormally dilated deep veins and a careful watch must be kept when superficial thrombosis occurs.

Next article on Emergencies in General Practice.—"Serum and Anaphylactic Reactions," by Dr. D. A. Williams.

Refresher Course Book.—Copies of the second volume of collected articles from the Refresher Course for General Practitioners are still available at 25s. (postage 1s.) each. The first volume is now sold out.

Clinical Pathology Book.—"Clinical Pathology in General Practice," a collection of 39 articles on clinical pathology that appeared in the *Journal* as part of the Refresher Course for General Practitioners, is now available, price 21s. (postage 9d.).

Both these volumes are obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1, or through any bookseller.

THE QUEEN AT HAMMERSMITH HOSPITAL

To mark the jubilee of the Hammersmith Hospital and the twentieth anniversary of the inauguration of the Postgraduate Medical School of London, which is associated with it, the QUEEN paid a visit to both institutions on June 6. Her Majesty was received at the entrance to the hospital by the MINISTER OF HEALTH (Mr. Iain Macleod), and proceeded at once to the School, where she was first shown documents relating to its opening by George V in 1935, one of his last public engagements. She then proceeded to one of the wards, where postgraduate students, including those from the Commonwealth and Empire, were in attendance. Three special exhibits were inspected by Her Majesty. The first was the metabolic unit, built last year for the investigation of metabolic disorders, including the effect of radiation upon the human body. The second was the Medical Research Council unit, a new building containing besides research laboratories an 8-million-volt linear accelerator and a 45-in. (1.1-m.) medical cyclotron. The third was the exhibition illustrating the research work of the School in the fields of surgery, medicine, obstetrics and gynaecology, and pathology. In the surgery section a display which caught the eye was the artificial heart-lung machine. The effect of operation and anaesthesia on the circulation was also ingeniously shown. The medical exhibit included a mass spectrometer for the instantaneous analysis of respired gases. Another exhibit was designed to demonstrate advances in the treatment of hypertension with new drugs. In the pathology section there were displays of improved vaccines for the treatment of chronic staphylococcal infections, and of the mechanisms of inheritance and variation in bacteria. Finally, the Queen spent some time in the wards and paid a visit to the nurses' home.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

The Ban on Heroin

SIR,—The banning of heroin seems to have produced in your correspondence columns a good deal of heat without much light. On the one hand we have the decision of an international committee, composed of not inconsiderable clinicians and pharmacologists, including members of the Narcotics Commission of the U.S.A. whose exhaustive researches on the addiction problem entitle them to a careful hearing; on the other hand we have the conviction of a number of distinguished clinicians that heroin is sometimes the only effective analgesic. The path of therapeutics is strewn with rejected remedies once held to be of great clinical importance, but there has been more than one instance where hasty generalizations largely on negative evidence have led to the unjustified condemnation of a remedy. In two instances to which I am referring, cod-liver oil and liquid extract of ergot, clinicians persisted in using them, and eventually their effectiveness was objectively established by the discovery of the vitamin content of the first and the ergometrine content of the second. Heroin is, however, to be banned without evidence of the kind that could objectively establish whether the clinical impressions of your correspondents are soundly based or not. A final trial of an analgesic, as any pharmacologist who has worked with them knows, can only be carried out on the clinical case. The particular claim made for heroin would entail difficult and protracted work, but the issue at stake, the relief of the agony of the dying, is so important that an attempt at a controlled trial should be made. The size and nature of the list of substitutes for heroin suggested show that the kernel of the problem has been missed. These substitutes are, it is true, remarkably similar qualitatively. They all reproduce the specific actions of morphine, but there are quantitative differences in their action. For example, their relative action in depressing respiration is not proportional to their analgesic activity. There is an *a priori* reason for supposing that the claim for retaining heroin may be sound. The effect of the morphine group in alleviating pain is almost certainly not a specific annulment of the impulses transmitted through pain fibres but a cerebral action related to the sense of euphoria produced. It is just because of its outstanding euphoric effect and consequent addiction production that the use of heroin is to be abolished.

Is the social evil of heroin addiction in this country sufficiently large to outweigh the therapeutic advantage which heroin may possess? After all, the social evil of addiction to alcohol is far graver, not only in this country but in others, than addiction to narcotic drugs. The community has decided, however, that the solace the majority get from alcohol justifies the use of strict regulation rather than abolition as a means of diminishing its use by that abnormal section of the community which may become addicts.—I am, etc.,

London, N.W.1.

J. TREVAN.

"Half-minute" Thermometers

SIR,—I think it is universally believed not only by the medical and nursing professions but by the entire population that when a thermometer is inscribed as "half-minute" it indicates the manufacturer's assurance that it will register the temperature of a human being in that space of time. We all know that this is not true. But we have grown up to it from the nursery, and I have no recollection of hearing a discussion as to how the manufacturers arrive at this figure or if it has any other meaning.

I heard an explanation a year or two ago which was new to me. I was told that "half-minute" had nothing to do

with registering the temperature of a human being, but guaranteed that if the thermometer were placed in warm water about blood heat it would record the temperature correctly in that time. I have asked various medical friends, but I have met no one who has confirmed this explanation. It would be interesting to know if it is correct. If so, it is astonishing that it is so little known. If it is not correct, it would be interesting to know how the "half-minute" is measured, and what it does mean.

It is certainly surprising that the medical and nursing professions have shown no curiosity as to the origin of this strange inscription.—I am, etc.,

London, W.8.

HENRY TIDY.

Diversities of Sex

SIR,—I congratulate Dr. C. N. Armstrong on his article on diversities of sex (*Journal*, May 14, p. 1173). But I would plead for the dropping of the clumsy term "pseudohermaphroditism" in favour of the compact and easily understood one of "intersex," male or female as the case may be. I do not relish the task of explaining to an intelligent parent that our scientific knowledge is such that we can class his child as a "female-false-male-female." As is shown in the article of Mr. A. F. Bromwich in your issue of February 12 (p. 395), this term of pseudohermaphroditism makes it necessary to add the prefix "true" when talking of hermaphroditism, which seems to me to add confusion to an already complicated subject.

I would also join with Mr. Michael Oldfield (*Journal*, May 28, p. 1338) in pleading that unless we are very sure of our ground we should refrain from action, either surgical or medical. There is no space to go into particular instances, but I have several ex-patients leading contented lives as adults unaware of their good fortune in not having their adrenals removed, an artificial vagina constructed, or life-long cortisone prescribed. Finally, it is probably too much to hope that those who attend the birth of such children will refrain from giving confident and definite opinions on their sex unless they have studied the subject.—I am, etc.,

London, W.1.

DENIS BROWNE.

The Aftermath of Hysterectomy

SIR,—Dr. Winifred Coppard (*Journal*, April 2, p. 852) draws attention to the fact that some women who require hormonal treatment after hysterectomy are left without it. I, too, have met cases where serious results have thereby occurred. Reasons for the oversight are various.

(1) The patient reports to the out-patient department in six weeks. Climacteric symptoms may not yet have begun and the case is finally discharged. Or possibly a new houseman does not distinguish between climacteric and post-operative stress, so that premonitory symptoms are misinterpreted. (2) If climacteric stress occurs later, the patient may be told by her friends that this must be expected. Therefore she does not report to her doctor at all. (3) If she does report, her doctor may have received no specific instruction for post-operative treatment. Knowing that oestrogen is contraindicated in certain types of case, he may feel doubtful of giving such therapy. In any case, some practitioners are averse to the alleviation of menopausal symptoms, either because they have found the intricacies of oestrogen dosage too tiresome or because they have not experienced the trial of an exacting menopause themselves. Therefore the patient may be left with exhortation only, which can be poor comfort.

It is confusing that, although a subtotal hysterectomy should not theoretically cause an early climacteric, in fact the ovarian blood supply may be disturbed by operation and menopausal stress can start within even a few days. Again, it is not widely realized that when hysterectomy has been needed to correct conditions due to a high oestrogen balance (endometriosis, metropathia haemorrhagica, etc.) the patient will experience a far more severe hormonal imbalance than will an average woman. These are the subjects who need to take relatively large doses, even of the synthetic oestrogen preparations. It is well to remember

that the presence of flushes is not an essential criterion for the diagnosis of menopausal stress. Forty per cent. of women have no menopausal flushes, yet they may suffer from severe depression or other character and functional changes during this phase.—I am, etc.,

London, N.W.1.

JOAN MALLESON.

Food-poisoning

SIR,—The article by Dr. Christopher Hardwick (*Journal*, May 14, p. 1205) on the emergency of acute food-poisoning illustrates the limitations and inadequacy of the purely clinical and therapeutic approach to a preventable condition. We must surely do something more than "recognize and treat each case as it occurs," for, unless certain steps are promptly taken, the factors causing a food-poisoning incident may continue to operate and produce many fresh victims. It is therefore to be regretted that Dr. Hardwick failed to emphasize that it is a most urgent duty of any registered medical practitioner to notify forthwith the local medical officer of health when in the course of hospital, institutional, or private practice he suspects food-poisoning in a patient. It then becomes the statutory duty of the medical officer to investigate the possible causes and to prevent further incidents by using his respective powers of detention and seizure of suspected and incriminated food. He is, moreover, armed with the legal authority to search for infectious food-handlers and to suspend them from their occupation as long as they continue to be infectious.

To assist these investigations it is of great importance that the remains of any foodstuffs consumed prior to the onset of symptoms, and any related containers, should be retained for bacteriological (and possibly also chemical) examination, instead of being destroyed as usually happens. Specimens of both vomitus and faeces should also be promptly submitted to the bacteriologist. By co-operation in these matters the practitioner first called to the patient can play a most effective part in the sphere of preventive medicine.

Certain other comments must be made. Staphylococci, usually of human derivation, may be concerned in the production of infective as well as toxic food-poisoning. Duck eggs are not merely under a cloud but should not be consumed at all unless they have been sterilized by boiling for at least 10 minutes. Lastly, your weekly publication of vital statistics shows that dysentery has been widely epidemic for many weeks and that there were 1,053 cases in England and Wales in the week ending April 23, so that familial and other outbreaks of dysentery resembling food-poisoning are far from rare, as suggested by Dr. Hardwick.—I am, etc.,

Gateshead, S.

JAMES GRANT.

Salicylate Intoxication in Children

SIR,—We read the leading article on salicylate intoxication in children (*Journal*, May 14, p. 1201) with appreciation, except for your statement that in this country aspirin is not much used for the very young. We think, on the contrary, that it is widely and wisely used by many general practitioners and paediatricians, notably for relief of pain in teething and earache, and, furthermore, we think this is a proper use of a drug with a great margin of safety. The sleep which follows relief of pain is of benefit to the infant directly, and because his mother also is rested.—We are, etc.,

London, S.E.1.

Megaloblastic Anaemia of Pregnancy

SIR,—The recent important paper (*Journal*, May 21, p. 1245) from the Nuffield Department of Clinical Medicine, Oxford, is an apt reminder of the riddle of megaloblastic anaemia of pregnancy. It is indeed fortunate that, despite our ignorance of the nature of the disease, treatment is usually satisfactory. The main clinical problem is, however, early diagnosis, and it is commonly thought that the only sure method is marrow biopsy.

Recently, in a survey of anaemia of pregnancy in co-operation with Professor Fairlie and the staff of the maternity department at the Royal Infirmary, Dundee, I have been examining the buffy coat from the Wintrobe haematocrit as well as the sternal marrow. Thus far, I have found megaloblasts in the buffy coat in every case with a megaloblastic marrow. Time spent on microscopy is much less than is necessary in the examination of the ordinary blood films. The value of examination of the buffy coat in Addisonian anaemia is well known, and its application in the diagnosis of anaemia in pregnancy is one that I can fully commend.

The examination of the buffy coat from these pregnant women has revealed further points of interest. Thus erythrophagocytosis has been observed in significant degree in a number of cases. These positive findings seemed to be related either to the uterine activity of labour itself or to abdominal pain during the last few months of pregnancy, pain which might well have been due to uterine activity. The possibility that these uterine contractions forced foetal erythrocytes into the maternal circulation has already received some serological confirmation.—I am, etc.,

Dundee.

H. B. GOODALL.

SIR,—I was disappointed to find in the article on megaloblastic anaemia of pregnancy by Drs. J. Badenoch, Sheila T. Callender, J. R. Evans, and A. L. Turnbull, and Professor L. J. Witts (*Journal*, May 21, p. 1245), no mention of the recurrence rate of this condition in future pregnancies. I have recently looked after a gravida-3 patient aged 26, in whom the condition occurred with each successive pregnancy. With her first child in 1949 she had a normal antenatal period and confinement, but was discovered on the tenth post-partum day to have a haemoglobin of 23% with a typical megaloblastic blood picture. She responded well to transfusion, liver injections, and folic acid. In 1953 the anaemia was detected during the antenatal period and she was maintained in good health on folic acid.

Finally she was admitted to hospital earlier this year, one week before term, in cardiac failure and with a haemoglobin of 25%. She was given immediate transfusion of three pints (1.7 l.) of packed cells, and went into labour after twenty-four hours. She had a rapid easy labour of nine hours and delivered herself spontaneously of a live child with a haemoglobin of 112%. After delivery she was found to have complete achlorhydria, but responded to folic acid 40 mg. daily, and her haemoglobin rose to 73% after three weeks.

I wish to thank Mr. A. J. Wrigley for permission to report this case.—I am, etc.,

London, S.E.1.

A. O. RUSSELL.

Rauwolfia Serpentina in Psoriasis

SIR,—During the course of systematic study in an endeavour to find a satisfactory method of treating psoriasis, one line of approach led to the use of rauwolfia serpentina in this condition. The work on psoriasis was commenced ten years ago, and this brief report refers to only a small section of the study, which has embraced more than 1,000 cases. The results achieved with rauwolfia serpentina and the current interest in this drug, however, appear to justify a special communication.

Rauwolfia serpentina contains a large number of alkaloids of which many exhibit qualitative and quantitative differences in pharmacological action. Of these various effects the two considered to be of particular importance for the treatment of psoriasis are sedation and adrenolytic action. Sedation has been found to be of value in psoriasis, and this type of effect is shown by at least two rauwolfia alkaloids, reserpine and rescinnamine. Therapy involving adrenergic inhibition emerged from the larger scheme of the main study, and it was noted that a number of alkaloids, such as ajmaline and raupin, have been reported to act as sympatholytic agents. Certain alkaloids related to yohimbine have adrenergic blocking properties, and some of the rauwolfia

compounds appear to be medullary stimulants which may be capable of counteracting any depressant effects induced by the sedative alkaloids in susceptible individuals.

The drug used in this series was the powdered whole root of rauwolfia serpentina standardized by biological assay. It was administered in the form of 50-mg. tablets, and control groups were given placebo tablets of identical appearance. Cases were unselected and all types of psoriasis were included. Thirty patients were treated with active "raudixin" tablets, and of these 15 cleared, 10 improved, 4 showed no change, and one became worse. Thus, 83% were benefited. Fourteen patients were given the placebo tablets, and of these 2 cleared, 3 improved, 9 showed no change, and none became worse. Thus, 35.7% were benefited. The dosage employed was one tablet given four times daily. No undesirable side effects were noted, and the drug was well tolerated by all patients, many of whom reported a feeling of well-being as well as symptomatic improvement.

Psoriasis has always proved difficult to treat, and any drug which can relieve the condition without inducing harmful reactions is worthy of consideration. Rauwolfia serpentina appears to be a useful adjunct in treatment, and further investigations are justified. I am indebted to Dr. G. Harvey for permission to publish these findings and to Messrs. E. R. Squibb and Sons for generous supplies of "raudixin" and placebo tablets and for their co-operation in technical matters.—I am, etc.,

Glasgow.

G. LESLIE.

Cost of Treatment

SIR,—Some weeks ago, amongst my morning post, I received from a manufacturer of oxytetracycline a glossy, well-produced pamphlet summarizing the use of that drug in paediatrics. From it I learned of its use in whooping-cough, salmonella infections, etc., but the centre page, taking up one-third of the print, informed me that it was "preferred for threadworm infections (enterobiasis)." Lest this should escape my notice, detailed instructions were printed about the dosage for various ages, but, to make sure, I was exhorted to treat the whole family at the same time. As there was no indication of the cost of this treatment, I wrote to the manufacturers to inquire the price of their recommended treatment for a National Health Service patient aged 6 years. Their reply, excluding dispensing charges, varied from £3 to £3 11s. per patient per course, depending on the vehicle used for the drug.

Now, Sir, I have hitherto relied in some part upon literature from drug firms to keep me up to date with recent therapeutic advances. If, however, a firm of standing is prepared to advise busy practitioners to use preparations for relatively harmless conditions without at the same time indicating the crippling cost, then in future I shall throw all circulars into the wastepaper basket unopened. I may add that I have voiced my protest to the firm in question, but I have had no reply. I hope that shame is the cause of their silence.

In conclusion, I must add that I have ascertained that treatment of threadworms with piperazine hydrate—an exceedingly efficacious drug—is 3s. per course.—I am, etc.,

Newent, Glos.

K. M. TOMLINSON.

Malignant Granuloma of the Nose

SIR,—With reference to Mr. Maxwell Ellis's article (*Journal*, May 21, p. 1251) several disease entities, all of them clinically very serious, are covered by the above title and may be confused in treatment. First of all there is a genuine malignant growth, a sarcoma or carcinoma, which may be diagnosable with the help of an adequate biopsy for morbid histology. Next comes the group of genuine granulomas, tuberculous, syphilitic, para-syphilitic, fungous, protozoal (Leishmania), coccal (synergistic gangrene), and fuso-spirillary and perhaps bacillary (Perez). The so-called "granuloma" of giant cell type associated with periarteritis

nodosa or disseminated "temporal" arteritis should be placed in a class by itself.

The only safe guide for treatment is careful diagnosis, in which the morbid histologist and the bacteriologist each have a special part to play—often a very difficult part. The genuine sarcoma or carcinoma requires an adequate biopsy, not the necrotic fragment which is so often all that comes to the morbid histologist, however keen and enlightened. The genuine granulomas also require an adequate biopsy, part of which should be examined histologically and part bacteriologically. It is important that both specimens, but particularly the bacteriological one, should be accompanied by a very full clinical description and history. Smears of the exudate may be very useful for the bacteriologist.

In England and America the condition usually diagnosed as "malignant granuloma" is an ulcerating gangrenous mass in the nasal cavities which gradually eats through soft tissue and bone in a most horrifying manner. Although clinically resembling the advance of a malignant growth, the process is actually inflammatory, the most likely infection being the micro-aerophilic streptococcus of Meleney associated with a pyogenic staphylococcus. Both these organisms should be susceptible to antibiotics, but are probably insensitive to penicillin and the more popular forms taken by this therapy.

The infecting organisms should be isolated in pure culture and tried against all available antibiotics in the hope of finding one to which they are sensitive. When found, this effective agent should be administered in very large doses.

The use of "deep" x-ray therapy—as recommended by Mr. Maxwell Ellis and Mr. Gilroy Glass—is most valuable. X-rays at one time used to be employed against large carbuncles with effect. The young growing capillaries and dividing cells of granulation tissue are disrupted by the small dose of x-rays, and organisms protected by the cells are laid bare to antibodies made by the patient and to circulating antibiotics. In these cases A.C.T.H. or cortisone can be very dangerous because the natural body defences are hamstrung: these remedies, however, may be very useful for the periarteritis nodosa or giant cell arteritis phase of a granuloma, but the infective or inflammatory phase is the most urgent and should be cleared up by the methods described before A.C.T.H. or cortisone is used for the systemic phase of the condition. I have not given any references, because Mr. Maxwell Ellis has given many in his paper and I do not wish to add unduly to the length of this note.—I am, etc.,

Epping.

FRANK MARSH.

Prognosis in Cancer of Large Intestine

SIR,—I read with great interest your leading article (*Journal*, May 14, p. 1199) on this subject, especially the remark that "it is surely time the public were better informed about the early symptoms of the disease, for only thus can the main source of the delay be reduced." During the last two and a half years such education has been carried out in the "Yorkshire experiment," and an attempt has been made to assess the results statistically. Harnett¹ found that the delay in seeking advice varied with the position of the growth in the four parts of the rectum, but over 40% delayed for more than three months. Further, he stated that the three common symptoms were (1) chronic intestinal obstruction, (2) diarrhoea and/or bowel irritability, (3) discharge of blood and/or mucus, in that order.

In the Yorkshire experiment on education the symptoms emphasized were "rectal bleeding" and "changes in the bowel habit," but only the delay in cases of "bleeding" was assessed. The cases registered for this assessment were those in which cancer was proved, and those in which the complaint was rectal bleeding whatever the cause. It would be of little value to quote the "average delay" because the extremes were so far apart, especially in the latter category of cases not due to cancer—one man waited 40 years before seeking advice. Incidentally, the contrast in delay

TABLE I.—Combined Non-malignant and Proved Cancer

Duration of Delay	July to December, 1953		January to June, 1954		July to December, 1954	
	No. of Patients	%	No. of Patients	%	No. of Patients	%
0-1 month	13	16.9	56	33.7	68	43.8
1-3 months	17	21.9	33	19.8	20	12.9
3-6 "	10	12.9	23	13.8	9	5.7
6-12 "	4	5.1	15	9.0	17	10.9

Over 2 years	25	32.3	28	16.8	28	18.0
Total	77	99.4	166	99.7	155	99.6

TABLE II.—Proved Cancer

Duration of Delay	July to December, 1953		January to June, 1954		July to December, 1954	
	No. of Patients	%	No. of Patients	%	No. of Patients	%
0-1 month	1	5.8	18	33.9	12	38.6
1-3 months	3	17.5	16	30.1	5	16.0
3-6 "	4	23.5	9	16.9	6	19.2
6-12 "	2	11.7	6	11.3	4	12.8
12-24 "	5	29.4	3	5.7	2	6.4
Over 2 years	2	11.6	1	1.8	2	6.4
Total	17	99.5	53	99.7	31	99.4

of reporting haematuria and rectal bleeding is remarkable—over 70% report haematuria within one month. The result to date, after two years' education, shows some improvement in the delay in reporting rectal bleeding in three six-monthly analyses. The figures collected are small, particularly during the first six months of the experiment, and in such a small population (600,000) it will be a long time before there are sufficient "proved cancers" to be of statistical importance. Nevertheless, there is an improvement in the percentage reporting rectal bleeding within the first month, 16.9% to 43.8%. This, in my opinion, justifies an investigation on a far larger scale, if the local health authorities can be persuaded to take part.—I am, etc.,

York.

Longitudinal Research in Child Development

SIR,—In our recent article, "A Longitudinal Research in Child Development and Some of its Problems," we stated, "This is the first study of its kind to be started in Britain." We gather that certain readers have misunderstood this statement, and we therefore wish to clarify our meaning. What was intended was to convey that the combined study, described by us, was the first of this type of study, the two main points being that it is planned from birth to maturity, and it is a combined psychological and physical investigation.

It is of course by no means the first longitudinal study in Britain. A longitudinal study was started in Oxford in 1944 at the Social Medicine Unit, Oxford University, and ran for ten years.² A study was started in 1948 at the National Children's Homes, Harpenden, under the combined direction of the Ministry of Health and the Sherrington School of Physiology, St. Thomas's Hospital, London. This very comprehensive study is in progress. Before these, there were longitudinal studies made some time ago by Lowe³ and Fleming.⁴

It is hoped that what we intended to say will now be clear, and that our ambiguity will not have been thought discourteous to other investigators—a thing we should be most unhappy to feel.—We are, etc.,

Flat Foot

SIR.—Mr. T. T. Stamm's contention that in the flat-footed attitude the forefoot is "supinated" (*Journal*, May 21, p. 1279) is, in its context, unanswerable. However, his is an over-simplified description of flat foot, which is true only if by forefoot is meant metatarsus. In flat foot, not only is the foot pronated on the talus, but, at the mid-tarsal joint, the forefoot is pronated on the hindfoot. The navicular, cuboid, and cuneiforms are thus pronated, relative both to the leg and to the hindfoot, and the metatarsus only is inverted, at the tarso-metatarsal joints. Sometimes the medial cuneiform moves with the first metatarsal.

There is some truth, therefore, in the customary description of the forefoot as pronated, endorsed by Dr. J. McKenzie (*Journal*, April 30, p. 1068). The abduction element of pronation in flat foot is plain to see. Humphry,¹ a century ago, rightly indicated that rotation of the foot about its long axis (eversion) and rotation of the foot about a vertical axis (abduction) cannot occur independently as tarsal movements, but are always combined in the single movement which we call pronation.—I am, etc.,

London, E.C.1.

The Meaning of Social Medicine

SIR.—I must protest against Professor Thomas McKeown's smart aleck review of my book *The Meaning of Social Medicine* (*Journal*, March 19, p. 710). His introduction is flippant, and the rest of his brief treatment of my book is most cavalier. One is perhaps not warranted in expecting the professor to understand the meaning of social medicine, but surely simple decency would require him to treat an earnest work in a forthright and sober way.

His stuffy observation on "the recognition of a problem being mistaken for its solution," and his oh so superior query: why is it necessary to make exaggerated claims for a new subject?—reflect his own mind and have nothing to do with the substance or intent of my work. I am understandably grieved that my book, on the composition of which I worked so hard, has been so shabbily treated by your reviewer. Also, I feel that the readers of the *British Medical Journal* deserve something far better than the professor's boorish exhibit. I trust that not a few will take it upon themselves to see precisely what's what.—I am, etc.,

New York, 29.

IAGO GALDSTON.

Gonorrhoea Statistics

SIR.—A pro-forma has recently been circulated to V.D. clinics by the British Co-operative Clinical Group requesting statistics of certain points in connexion with cases of gonorrhoea attending for the first time in 1954. The information required comprises occupation, race and country, sex and status of contact, whether alcohol was taken, the incidence of reinfection, precautions taken, and the marital status of patients. It seems a pity that, when so many important questions in venereology need statistical investigation, so much time is wasted on relatively unimportant matters.

The problems we would like to see elucidated by a nationwide survey include the following: (1) The necessary period of surveillance in gonorrhoea. (2) The incidence, if any, of penicillin-resistant gonococci. (3) The sexual transmission of other infections such as non-specific urethritis and trichomonas infestation. (4) The optimum course of treatment for cases of acute syphilis—by no means agreed among venereologists. (5) The necessary period of surveillance in acute syphilis. (6) The optimum course of treatment for chronic syphilis including cerebrospinal forms. (7) Duration of treatment in latent syphilis. (8) The significance of doubtful serological tests in cases of pregnancy who have

had previous treatment. (9) Clinical opinions of the comparative value of the different serological tests for syphilis and possibly also the standardization of technique throughout the country.

With problems of such magnitude requiring elucidation, it seems to us rather trivial to employ our time finding out if an attack of gonorrhoea was got from a casual acquaintance or a close friend.—We are, etc.,

GERALD H. KNIGHT.

Varicella with Neurological Complications

SIR.—I was interested to read Dr. M. S. Pathy's memorandum on varicella with neurological complications in an adult (*Journal*, May 28, p. 1324). In July, 1954, I was called to see a male patient of 32 years who developed severe headache, vertigo, and intractable vomiting three days after the appearance of a typical chicken-pox rash. His symptoms were so intense that he had to be removed to hospital. While in hospital he was examined by both E.N.T. and general surgeons, with negative findings. C.S.F. was reported as being normal. The headache and vertigo ceased after two weeks, but the vomiting persisted to such a degree as to give rise to anxiety regarding the patient's electrolyte balance. He was discharged from hospital on August 30, 1954, six weeks after admission, and complained of depression for the next week or two. He has remained quite well since this time.

There seems to be little doubt that this was a case of encephalitis complicating varicella.—I am, etc.,

London, N.W.6.

D. S. GOLDFOOT.

Chloramphenicol

SIR.—Yet another coroner's inquest (*Daily Telegraph*, May 14, 1955) recorded a death due to aplastic anaemia following treatment with chloramphenicol. At the beginning of its clinical use the drug was considered a potential bone marrow toxin on account of its structure incorporating a nitrobenzene ring. Early in 1950 there were reports that chloramphenicol was responsible for certain blood dyscrasias. A nation-wide survey in the U.S.A.¹ covering the period 1949 to July, 1952, brought to light 55 cases of blood dyscrasia in patients treated with chloramphenicol alone; of these 44 had aplastic anaemia, causing death in 23. A further 95 cases of blood dyscrasia received chloramphenicol in addition to some other drugs, bringing the total to 150. The authors of this survey point out that the dosage regimen appeared to have little or no bearing on the development of the blood complications. This is also borne out by the case history reported in June, 1954, to the Société Française d'Hématologie by S. Tara, describing a patient who died from aplastic anaemia after treatment with only 3 g. of chloramphenicol. In this country, in 1952, the *British Medical Journal*² drew attention to this very grave complication of chloramphenicol therapy. A few instances of fatal aplastic anaemia were published in the same year by Hawkins and Lederer³ and Wolman.⁴ In 1953 more cases were seen over here⁵ and abroad: Erslev⁶ published 2 cases and reviewed 40 cases with 27 deaths collected from the literature. Koster and Groen⁷ published one case of aplastic anaemia from which the patient died. A survey in Great Britain in 1954 by Hodgkinson⁸ dealt with 31 hospital cases of blood dyscrasia associated with chloramphenicol: 28 had aplastic anaemia, which proved fatal in no less than 24 at the time of publication of the report. More recently Johnston⁹ reported a case of chloramphenicol aplastic anaemia in a woman kept alive by transfusion of polycythaemic blood using sequestrene. I have seen last year a child who died from aplastic anaemia after prolonged treatment in a fever hospital with chloramphenicol for whooping-cough.

There is no doubt that chloramphenicol is not safe for use in routine antibiotic therapy. This antibiotic is the more dangerous because of its low threshold of toxicity and

Obituary

C. W. BUCKLEY, M.D., F.R.C.P.

Dr. C. W. Buckley, of Buxton, Derbyshire, died on May 28, aged 80. He was an outstanding authority on rheumatic disease and its treatment, and his reputation extended beyond this country. By his writings and teaching and his half-century of practice in Buxton itself he did much to encourage a scientific outlook in a field of medicine where empiricism has been particularly prominent. Buxton and the Devonshire Royal Hospital, where he was senior physician for many years, owed much to him and were not slow to acknowledge the debt. When he was made an honorary freeman of Buxton in 1947 a fellow alderman declared that no one had rendered greater service to the town.

Charles William Buckley was born on October 10, 1874. His family had been long connected with Derby, and he held the hereditary freedom of that city by lineal descent. The greater part of his life was spent in Derbyshire, but he came to London for his medical studies at St. Mary's Hospital, where he was an entrance scholar and Kerslake scholar in pathology and bacteriology. He graduated M.B. London in 1898, and proceeded M.D. in the following year. After being house-physician at St. Mary's he worked in the fever hospital service of the old Metropolitan Asylums Board. But the early years of this century found him established in his native county and building up a reputation in the new field of rheumatology. His association as physician to the Devonshire Royal Hospital at Buxton began in 1912, and in 1917 he became a member of the management committee.

In the first world war he attended the Canadian Red Cross Hospital at Buxton, and was made honorary major of the Royal Canadian Army Medical Corps. It was as a result of his work and initiative that a large sum of money was placed at the disposal of the University of Manchester for rheumatism research, in which the Devonshire Royal Hospital assisted. By this time he had become known far beyond Buxton, and in 1923 he was elected president of the Section of Balneology and Climatology of the Royal Society of Medicine. For many years he was also associated with the Buxton and District Hospital, and among other posts which he held were those of lecturer on arthritis and chronic rheumatism to the British Postgraduate Medical School, London, examiner in hydrology to the Chartered Society of Massage and Medical Gymnastics (now the Chartered Society of Physiotherapy), and membership of the Scientific Advisory Committee of the Empire Rheumatism Council, which he did much to encourage. He became a Member of the Royal College

[Navana Vandyk, London]

because when bone marrow depression occurs it is usually irreversible and resistant to treatment. As there are at present antibiotics as effective and certainly less dangerous to life than chloramphenicol, I think it would be wiser to discontinue the use of chloramphenicol altogether.—I am, etc.,

London, W.10.

Notification of Measles

SIR.—During the past month I have notified upwards of a hundred cases of measles. No doubt many other practitioners have had a similar experience. Has any useful purpose been achieved by the notification of this disease?—I am, etc.,

Feltham, Middx.

G. T. RUTHERFOORD.

POINTS FROM LETTERS

Speaking Up

Dr. W. F. BENSTED-SMITH (Newton Ferrers) writes: There is one basic and infallible rule for unaided speech—speak always to the back row. The rest will then hear quite well.

Redundant Circulars

Dr. R. A. F. JACK (Bromsgrove) writes: My young family have helped me to deal with the surfeit of advertisements that daily swell my morning post. The elder two, who by now have lost all interest in opening them, content themselves with collecting the stamps and bemoan the fact that so many envelopes these days are franked. They then pass them on to the younger two, who, armed with a pair of scissors each, cut out patterns or any interesting figures or illustrations that take their fancy. They preserve all blotters for me; and all large white envelopes that can be ungummed are put aside for subsequent painting practice or for conversion into paper darts. The result is that my wife and I get an extra quarter of an hour's peace each morning, so that in one way or another we all benefit from the unremitting onslaught of the various drug houses.

Epistaxis

Mr. JULIUS FINE (Johannesburg) writes: With reference to the discussion by Mr. C. Gill-Carey on epistaxis (*Journal*, March 12, p. 662) I believe that . . . in hypertensive cases, where control cannot be obtained, the blood pressure should be deliberately lowered by adequate medication, using hypotensives, instead of waiting for exsanguination and shock, to be followed by blood transfusion. General practitioners have not the facilities to manage the patients in this manner, but otologists still plug away at the old stereotyped routine to the extreme discomfort of the patient. I have yet to find a case of anterior epistaxis where short-wave cautery has failed after removal of the emergency nasal packing. The modern treatment should be a bold attack, using plugs as a first-aid emergency only and deliberately lowering the blood pressure with medication before the body lowers it by exsanguination.

Fluoridation of Public Water Supplies

Dr. EVA HILL (Ruakaka, New Zealand) writes: The subject of fluoridation of water supplies seems to be causing a considerable controversy throughout the world. The solution of the problem requires only the use of a little common sense and intellectual honesty. . . . Fluorine is not essential for the development of sound teeth. No two people are alike in their response to any drugs. The proposed mass-medication is a departure from ordinary common sense that is indefensible and absurd. The dosage, being tied to water consumption, is quite incalculable. The fact that few doctors or dentists prescribe fluoride for their families or patients should cast grave doubts on the proposal to force it on everyone. Fluorine can be administered economically in accurate doses to those who are convinced of its necessity. But no man has the right to force another to take a dangerous drug against his will.

of Physicians in 1923 and was elected a Fellow in 1933. A life member of the Heberden Society, he was also an original member of the Association of Physicians of Great Britain and Ireland.

To the British Medical Association, to which he was first elected in 1902, Buckley gave liberal service. He was chairman of the Buxton Division in 1934-5, and president of the Derbyshire Branch in the same year. At the Annual Meeting of the Association at Eastbourne in 1931 he was a vice-president of the Section of Hydrology and Climatology, and a vice-president of the Section of Physical Medicine at the Centenary Meeting in 1932. The Association committees on which he served included the Committee on the Causes and Treatment of Arthritis, set up in 1932; the Practitioners of Physical Medicine Group Committee, of which he was a member for 18 years; and spa treatment.

In 1938 Buckley published his well-known book, *Arthritis, Fibrositis, and Gout*, and he was the author of many articles in the specialist journals and in the *Encyclopaedia of Medical Practice* and the *Index of Treatment*. In 1939 a new quarterly journal, *Annals of the Rheumatic Diseases*, made its appearance under the aegis of the Scientific Advisory Committee of the Empire Rheumatism Council. Buckley, who had been largely responsible for the annual reports of the British Committee on Chronic Rheumatic Diseases, set up by the Royal College of Physicians of London in 1934, was the obvious choice as editor; and for fourteen years, until the end of 1953, he put his great experience and knowledge into that publication—since 1944 published by the British Medical Association—so that it became known as the leading rheumatological journal of the world. For many years he was a valued contributor to the *British Medical Journal*.

Buckley never failed to take his part as one of the chief citizens of Buxton. He became a member of the urban district council in 1906, and when Buxton became a borough in 1917 he was appointed chairman of the finance and general purposes committee, a position which he held for thirty or more years. In 1923 he became one of Buxton's first aldermen, and in 1924 mayor of the borough. He took a primary part in the public inquiry and in the negotiations which preceded the acquirement by the corporation of the famous pavilion gardens. Buckley was one of the most likeable of men, although he never sought popularity. There was something about his occasional speeches, whether at the Royal Society of Medicine in London or in the council chamber at Buxton, which held the attention. No one can ever have been bored by him. His quiet manner, the dignity of his words, the occasional half-cynical wit, and above all the breadth of vision were always impressive. He married Miss Lilian Hughes, of Manchester, and had one son, who died last year, and three daughters. In his retirement he went to live at Ashbourne, still in the same county, where he could pursue his chief recreation of fly-fishing, but he continued in consulting practice and visited the Buxton clinics until his last year of life.

We are indebted to Dr. W. S. C. COPEMAN for the following appreciation: Buckley's inquisitive and critical mind and scientific outlook worked against a wider background of general medicine than was usual amongst spa practitioners in his time. He felt strongly that the study of the rheumatic group of diseases was largely in their hands, but that it had become empirical and divorced from the main current of scientific medicine. At a period when such an approach

was difficult and unusual he undertook the systematic observation of these diseases as they presented themselves in his hospital and private practice in Buxton over a long period. He was thus instrumental in advancing our knowledge of certain of these diseases, more particularly ankylosing spondylitis. In this way he laid the foundation for the infant specialty of rheumatology as a branch of internal medicine. His election to the Fellowship of the Royal College of Physicians in 1933 was a signal mark of academic approbation of his work: such an award to a provincial physician in such circumstances was unusual at that time. Although the most modest of men, he continued to take active pride in this distinction all his life.

He was active also in projecting his views into the international field, mainly through the medium of the International Society of Medical Hydrology, and later the International League against Rheumatism, whose congresses he invariably attended. It was at the Rome congress in 1925 that I first met him discoursing characteristically to a small group of slightly puzzled Continental physicians on the influence of fly-fishing on the progress of British medicine—for he was a great fisherman, and firmly believed that this pursuit reconditioned the intellect as nothing else could. In spite of my very junior status he managed to have me elected as medical secretary of both bodies "to keep the trend of their activities," as he put it, "within the framework of general medicine and outside that of formal spa therapy."

Buckley was a quiet, kind, thoughtful man, with a sly sense of humour which some of his "victims" never discovered. About the time of the advent of the National Health Service he retired from the Devonshire Hospital and also from private practice; and it evidently grieved him that no appreciation of his great services to Buxton over a period of more than forty years was voiced by the new regional authority.

He was an original member of the committee of the Royal College of Physicians on chronic rheumatic diseases, which was formed in 1932 under the chairmanship of Sir Humphry Rolleston, and which four years later became the nucleus of the Empire Rheumatism Council; and he acted as editor of their "Reports," which later became the *Annals of the Rheumatic Diseases*. He resigned from this office only last year, when a special number was dedicated to him on his 80th birthday: the last time most of us saw him was at a dinner held at the Athenaeum at which Lord Horder presided, when a beautifully bound copy was presented to him. He will be much missed in many circles.

Dr. HUGH BARBER writes: C. W. Buckley made a reputation in Derbyshire in which he had no rival. He was accepted as the leading authority on "rheumatic" and allied disorders. His skill and experience were valued by the profession, and his kindly wisdom made him an excellent consultant. He was, moreover, a good general physician—of which there is proof, because more than twenty years after taking his M.D. he could satisfy the Censors of the Royal College of Physicians by passing the examination for Membership. A good committee man because he could pick out the essentials, he was a clear and concise speaker in a lecture or at a medical meeting, keeping to the point and making his meaning clear. In consultation he had the art of explaining things clearly to the patient and relatives. He was a student of medicine for more than sixty years, and in this way he kept in touch with younger colleagues when he had outlived so many of his contemporaries. Although he may have seen some of the old type of spa practice go rather out of fashion, he had sufficient work among the residents to compensate for this, and wide professional interests outside his own county which always kept him busy. He had recently been made an honorary member of the East Midland Society of Physicians, and I know he was sorry that he was not well enough to attend the last general meeting. The friendships he formed in such professional contacts were a real pleasure to him, and he will be missed by his friends and by a younger generation.

R. L. LANGDON-DOWN, M.B., M.R.C.P.

Although he had withdrawn from the central work of the British Medical Association for many years, Dr. R. L. Langdon-Down, whose death on May 29 we record with much regret, will be well remembered at Headquarters. For more than 30 years he devoted a large amount of his time to the work of the Association, retiring from active participation in 1935, when he was made a vice-president. He was in his 89th year.

Reginald Langdon Langdon-Down, who was born on August 4, 1866, was the eldest son of the late Dr. J. L. H. Langdon-Down, who founded the mental home at Teddington which his son was later to direct for many years. From Harrow School he went on to Trinity College, Cambridge, where he took his B.A. with a first-class in the Natural Sciences Tripos in 1888. He continued his clinical training at the London Hospital, and after graduating M.B., B.Chir. in 1892 he served as assistant demonstrator of anatomy and house-physician at his own teaching hospital.

In 1894 he took the M.R.C.P. and then went into private practice in the Richmond, Twickenham, and Teddington district, and in later years he also had a consulting practice in the West End. His particular bent was towards psychiatric work, especially work in mental deficiency. He became physician to the National Association for the Welfare of the Feeble-minded. When his father died in 1896 he and his brother, Percival Langdon-Down, carried on Normansfield, a home for mental defectives at Teddington. Percival died in 1925, and Reginald then took sole charge of the home until it was taken over by the National Health Service. Langdon-Down had a great gift of human sympathy. He was the kindest of men, and approached the unfortunate cases with which he was so largely occupied from a human as well as from a scientific point of view. Thus his article on "Idiocy" in *Quain's Dictionary of Medicine*, with its careful suggestions for treatment, is far more hopeful than many writings on the subject. His interest in children was by no means limited to the mentally deficient. He was occupied in all phases of child psychology and generally in the care and treatment of children. He was one of the honorary secretaries of the Section of Psychological Medicine at the Annual Meeting of the B.M.A. at Oxford in 1904 and a vice-president of the Section of Psychology at Toronto in 1906; and he represented the Association on the Child Guidance Council.

In his later years Langdon-Down was chiefly known in the Association for his work in medical ethics. He was a member of the Central Ethical Committee for a quarter of a century, and for some years was its chairman. But in his earlier career he was interested at every point in medico-political activities. When he was only 37 he had become chairman of his Division—the Richmond Division. Later he was chairman of South Middlesex Division. In 1904 he became a member of the council of the Metropolitan Counties Branch, and eventually became Branch president in 1914. He served his Division as representative at no fewer than 30 Annual Meetings. During the period 1903 (the first A.R.M.) to 1934 he was absent from the Annual Representative Meeting on only two occasions. When he became a member of the Central Council in 1917, retaining his seat until 1937, a long period of active work at the centre began. His service on the Ethical Committee was conspicuous for the patience and skill he exemplified in the very delicate matters which come

before that body. His co-operation was also sought in any Association work which had to do with his own subject of psychiatry. He was the leading spirit in the preparation and submission of evidence to the Royal Commission on Lunacy Law and Mental Disorder which sat under the chairmanship of Lord Macmillan in the late twenties. In 1926-9 he had the difficult task of presiding over a special committee set up by the Association to consider the question of psycho-analysis. At times during those long and seemingly irreconcilable discussions on a subject of acute controversy it seemed as if the committee must throw in its hand, and that it eventually produced a useful report was due above all else to the patience, dignity, and courtesy of its chairman and his capacity for understanding widely different points of view. Another subject on which he was able to speak with authority was the law relating to patents, and he took part in conferences on that subject in 1931 and 1932. For a time he was a member of the Finance and Journal Committees. Indeed, the full list of committees on which he served would be tedious to set out, but it meant the expenditure of great energy over a long period of years and in subjects which were often of a special character, calling for unusual knowledge and experience.

Though he lived an exceedingly busy professional life Langdon-Down had many outside interests. An enthusiastic painter in water-colours, he was also an authority on Oriental porcelain. He was at one time chairman of the governors of Hampton Grammar School and a governor of Epsom College.

Langdon-Down was twice married. His first wife died in 1917. Five years later he remarried, and his second wife died in 1942. He leaves two sons and two daughters, one of whom, Lady Brain, is the wife of Sir Russell Brain, the President of the Royal College of Physicians.

R. S. FREW, M.D., F.R.C.P.

A well-known specialist in diseases of children, Dr. Robert S. Frew, formerly physician to The Hospital for Sick Children, Great Ormond Street, and since his retirement consulting physician, died at his home at Chipping Campden in Gloucestershire on May 30.

Robert Skeoch Frew was born in Newfoundland on August 22, 1881, and was educated at St. John's. For his medical training he went to the University of Edinburgh, where he graduated M.B., Ch.B. in 1905. He also studied for some time at the University of Berlin. After serving as house-physician at the Royal Infirmary, Edinburgh, and for a brief period as assistant to the professor of pathology there, Dr. Frew came to London to The Great Ormond Street Hospital, where he was medical registrar, pathologist, and clinical assistant in the out-patient department. Later he was appointed physician to the hospital, and practised also as a consultant in paediatrics in Wimpole Street. He proceeded M.D. in 1910, and in 1911 became M.R.C.P. London. He was at one time assistant physician to the East London Hospital for Children, Shadwell, and from 1914 to 1928 he was physician to the children's department, King's College Hospital, Denmark Hill. Other hospital appointments which he held for many years were those of physician to Lord Mayor Treloar Orthopaedic Hospital at Alton in Hampshire and consulting physician for diseases of children to the Bromley Cottage Hospital. During the first world war he served as major in the R.A.M.C.

Dr. Frew was an individualist in paediatrics, holding views which were not always shared by the paediatricians of his time. These he expressed particularly in his book, published in 1936, entitled *Diseases in Childhood: A Clinical Study*. The book deals solely with diseases of infants, and describes a long series of cases which had come under his personal observation. He was also the author of many articles on paediatric subjects in the general and specialist journals. One of his earliest contributions, in which he collaborated with the late Sir Archibald Garrod, consulting physician to Great Ormond Street, was on glycosuria in tuberculous meningitis. He became a Fellow of the Royal College of Physicians of London in 1919.

He leaves a widow and a daughter.

J.A.C. writes: In the sudden and unexpected death of Dr. C. A. R. McCAY (whose obituary was published on May 28, p. 1347), Oxford lost one of its oldest and best-loved family doctors. Residing and practising for over thirty years in the Headington district, he had with his sympathy and kindness endeared himself to many thousands of past and present residents of the area. Apart from being their family doctor he was their guide, counsellor, and friend, and nothing was too much trouble where his patients were concerned. His quick sense of humour, his ready smile, and his quiet understanding and attention often turned gloom and despair into hope and determination. Setting himself a very high standard in medicine and keeping himself up to date with regular reading, he was a fine example and inspiration to his younger colleagues. Apart from medicine he was a man of wide interests, among which were shooting, fishing, golf, photography, and the collection of antiques. But first of all he was a family man, and to his widow and children we tender our deepest sympathy.

Medico-Legal

LEGAL LIABILITY IN THE N.H.S.

Until recently the judiciary both in Scotland and in England shared the view held in the medical profession that doctors should unquestionably accept full and sole responsibility in law for the treatment of patients in their care. The courts held that, since hospital doctors were not in any legal sense servants of the hospital authority, the hospital authority was not vicariously responsible for the professional actions of these doctors. But a series of modern judgments in the courts of appeal in England, and latterly in Scotland, shows that judicial opinion, and thus the law, has radically altered.

For instance, Lord President Cooper in *Hayward v. Board of Management for Royal Infirmary of Edinburgh* (1954) said that "the old Scottish decisions... are no longer applicable to a fundamentally different situation. Under the new Act and regulations the obligation on the State is in my view to treat the patient and not merely to make arrangements for his treatment by and at the sole responsibility of independent contractors." And Lord Justice Denning in *Razzel v. Snowball* (1954), the defendant being a part-time consultant orthopaedic surgeon, gave his opinion that "whatever may have been the position of a consultant in former times, nowadays, since the National Health Service Act, 1946, the term 'consultant' does not denote a particular relationship between a doctor and a hospital.... Whether he is called specialist or consultant makes no difference. He, like the rest of the staff, is merely carrying out the duties of the Minister."

Hospital Doctors

The Central Consultants and Specialists Committee (Scotland) has circulated a memorandum for consideration by

hospital doctors, general practitioners, and local authority medical officers in Scotland, calling attention to the present position.

The memorandum says that there is no reasonable doubt that the N.H.S. Acts, whatever their intention, have established a State hospital service in which the participating doctors are in law State servants. The whole profession should recognize a situation which raises issues of the utmost importance, particularly as doctors agreed to enter into contract with the new hospital boards principally on the assurance that there would be no significant change in their relationships with hospital authorities.

The committee does not think that hospital boards would wish deliberately to interfere with clinical discretion, but that they will be compelled to lay down rules or procedure for certain categories of medical staff in order to safeguard public funds. In support of this belief it mentions a recent action in which the court assigned the whole liability for damages to the hospital authority because it had allowed a junior medical officer to give a particular anaesthetic with unfortunate results. Apart from its intangible effect on the teaching and practice of hospital medicine, the Committee says that such a development could seriously hamper everyday hospital work, and that it could not be assumed that such a process once started could be limited.

The effect of the new relationships has already become apparent in the confidential handling of medical records. Hospital authorities require medical records and reports for legal purposes to be submitted to their own solicitor before passing them on. The Department of Health, in response to inquiry, adduces as the reason for this the responsibility of the Secretary of State and his agents, the hospital boards, "for treating patients."

Doctors Outside Hospitals

So far, the memorandum continues, the effects of these judicial interpretations of the N.H.S. Acts have been confined to the hospital field, but it would be logical to extend the doctrine of State responsibility to include treatment of patients under the Acts outside hospitals. It is doubtful if general practitioners' contracts with executive councils—"for services," not "of service"—would be sufficient to prevent it. If this happened all doctors in the N.H.S. would be servants either of the central Government or of local authorities.

Necessary Action

The Central Consultants and Specialists Committee (Scotland) has invited the Joint Consultants Committee (Scotland) to take steps to secure re-establishment in law of the previous relationship of hospital doctors to the management of the hospitals in which they work. The latter committee has received certain advice on the steps which they should take. Broadly, these will involve seeking the agreement of the United Kingdom Joint Consultants Committee to a common approach to the Government urging the necessary legislative action. Since it would be necessary for Parliament to be satisfied that any change did not infringe or diminish a patient's legal right to damages when negligence is proved, it is considered probable that governmental agreement to this action would be conditional on the profession accepting an arrangement under which membership of a medical protection society (or equivalent insurance) was a condition of employment of medical staffs in N.H.S. hospitals. The element of compulsion in such a condition is fully recognized, but the consensus of opinion of both committees is that acceptance of it is justifiable in view of the risk of much more important infringement of professional freedom if nothing is done.

To ensure that the Scottish Joint Committee knows the feeling of the profession in Scotland, meetings of hospital doctors, general practitioners, and local authority medical officers will be asked to report the numbers in favour of and against action being taken on the lines indicated in the memorandum.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending May 21 (No. 20) and corresponding week 1954.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available. The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

CASES in Countries and London	1955					1954				
	Eng. & Wales	Land.	Scot.	N. Ire.	Eire	Eng. & Wales	Land.	Scot.	N. Ire.	Eire

* Measles not notifiable in Scotland, whence returns are approximate.
† Includes primary and influenza pneumonia.
‡ Includes puerperal pyrexia.

Vital Statistics

Infectious Diseases

The largest variations in the number of notifications of infectious diseases in England and Wales during the week ending May 21 were increases of 3,271 for measles, from 20,384 to 23,655, 194 for dysentery, from 1,038 to 1,232, and 49 for scarlet fever, from 571 to 620, and decreases of 192 for whooping-cough, from 1,805 to 1,613, and 64 for acute pneumonia, from 441 to 377.

The largest increases in the incidence of measles were 402 in Middlesex, from 1,314 to 1,716, 332 in Southampton county, from 948 to 1,280, 331 in Kent, from 856 to 1,187, 322 in Yorkshire West Riding, from 1,867 to 2,189, and 281 in Gloucestershire, from 585 to 866; the only large exceptions to the general rise in incidence were decreases of 101 in London, from 1,063 to 962, and 94 in Staffordshire, from 1,055 to 961. The only local variation of any size in the returns of scarlet fever was a rise of 26 in Lancashire, from 74 to 100. The largest fluctuations in the trends of whooping-cough were rises of 36 in Lancashire, from 164 to 200, and 35 in Lincolnshire, from 40 to 75, and falls of 73 in Yorkshire West Riding, from 149 to 76, and 30 in Warwickshire, from 123 to 93. 17 cases of diphtheria were notified, being 8 more than in the preceding week and the largest total for 9 weeks. The chief centres of diphtheria were Liverpool C.B. 5 and Birmingham C.B. 3. The largest returns for acute poliomyelitis were London 4, Somersetshire 2, and Essex 2 (Walthamstow M.B. 2).

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of certain diseases notified weekly in England and Wales. Highest and lowest figures reported in each week during the nine years 1946-54 are shown thus -----, the figures for 1955 thus ———. Except for the curves showing notifications in 1955, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

Medical News

Live Virus Reported in Cutter Vaccine.—According to the *Daily Telegraph's* New York correspondent, Professor L. P. GEBHARDT, professor of bacteriology at Utah University, has announced the recovery of live poliomyelitis virus from samples of Salk vaccine made by the Cutter Laboratories and used in the State of Idaho. Apparently only one of the three virus strains contained in the vaccine, Type I, was recovered in Professor Gebhardt's tests on monkeys. The Cutter Laboratories were one of the six firms originally supplying Salk vaccine for the mass poliomyelitis inoculations in the United States, and it was their product that was first withdrawn when cases of paralytic poliomyelitis occurred after vaccination (see *British Medical Journal*, May 7, p. 1166). The *Daily Telegraph's* correspondent also reports that court permission has been given to the parents of a child who developed poliomyelitis after vaccination to file a claim against the Cutter Laboratories. The amount claimed is stated to be £35,800.

Eighth World Health Assembly.—W.H.O.'s working budget for 1956 is to be \$10,203,000. This includes \$9,612,000 recommended by the Director-General, Dr. M. G. CANDAU, to finance W.H.O.'s activities, \$309,484 intended for the provision of supplies and equipment to the health services of countries participating in malaria eradication campaigns, and \$42,000 to launch W.H.O.'s work on the peaceful uses of atomic energy and the protection of populations against the effects of atomic radiation. A world-wide fund for the eradication of malaria is also to be set up. It will be devoted to the provision of supplies, equipment, and services to those governments whose needs cannot be met through W.H.O.'s regular and technical assistance budgets. Sudan was unanimously accepted as an associate member of W.H.O. This brings the total membership to 85, including four associate members.

Presentation to Children's Hospital of Philadelphia.—As part of the centenary celebrations at the Children's Hospital of Philadelphia, U.S.A., Professor A. A. MONCRIEFF, acting as the delegate and spokesman of the Hospital for Sick Children, Great Ormond Street, and other British paediatric hospitals, presented the American hospital with a block and gavel made from the wood of a plane tree from the garden of the Great Ormond Street hospital.

Faculty of Anaesthetists.—At a meeting of the Board of the Faculty of Anaesthetists on June 1 at the Royal College of Surgeons of England, Dr. FRANKIS T. EVANS (St. Bartholomew's Hospital) was elected dean and Dr. R. F. WOOLMER (Royal Infirmary, Bristol) was re-elected vice-dean for the ensuing year.

COMING EVENTS

Maternal and Child Welfare.—Annual conference of the National Association for Maternal and Child Welfare on June 22-24, at Church House, Westminster. Opening by Minister of Health. Particulars from the Secretary, N.A.M.C.W., Tavistock House North, Tavistock Square, London, W.C.1.

West London Medico-Chirurgical Society.—Annual banquet on June 23 at the Royal College of Surgeons.

Cambridge Graduates' Medical Club.—Annual general meeting and dinner at Jesus College on June 24. Details from Dr. T. B. ANDERSON, 1, Huntingdon Road, Cambridge.

G.P. Refresher Course at Bristol.—There are still vacancies in the course from July 11 to 16. Applications to Dr. A. H. GALE, director of medical postgraduate studies, the University, Clifton, Bristol, 8.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Application should be made first to the institution concerned.

Saturday, June 11

NORTH-EAST METROPOLITAN REGIONAL TUBERCULOSIS SOCIETY.—At Rochford General Hospital, 12 noon, Dr. E. G. Sita Lumsden: Pulmonary Tuberculosis and Diabetes Mellitus; 2.30 p.m., Dr. R. J. Powell: Ototoxic Effects of Streptomycin and Dihydrostreptomycin; 3 p.m., Mr. D. S. M. Barlow: Constrictive Pericarditis.

Tuesday, June 14

INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. J. O. Oliver: Serology and Laboratory Diagnosis of Syphilis.
●INSTITUTE OF OBSTETRICS AND GYNAECOLOGY.—12 noon, Dr. W. G. Oakley: Diabetes and Pregnancy.
●MIDDLESEX HOSPITAL.—4.30 p.m., Sanderson-Wells Lecture by Professor R. A. McCance, F.R.S.: Old Thoughts and New Work on Breads White and Brown.
ROYAL COLLEGE OF SURGEONS OF ENGLAND.—5 p.m., Hunterian Lecture by Professor W. J. Atkinson: Early Management of Head Injuries.

Wednesday, June 15

●HYPNOTHERAPY GROUP.—At Royal Society of Medicine, 8 p.m., Dr. H. J. Shorvon: Use of Drugs in the Induction of the Hypnotic State.
INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. H. Haber: Cutaneous Manifestations of Syphilis.
INSTITUTE OF DISEASES OF THE CHEST.—5 p.m., Dr. G. Simon: Some Pitfalls in Chest Radiology.
●INSTITUTE OF OBSTETRICS AND GYNAECOLOGY.—4.30 p.m., Mr. A. Good-will: Wertheim's Hysterectomy.
ROYAL SOCIETY OF TROPICAL MEDICINE AND HYGIENE.—7.30 p.m., annual general meeting. Address by Sir William MacArthur: An Account of Some of Sir David Bruce's Researches, Based on his own Manuscript Notes.
ST. MARY'S HOSPITAL MEDICAL SCHOOL.—5 p.m., Dr. P. H. Tooley: Lecture-demonstration in psychiatry.

Thursday, June 16

INSTITUTE OF CARDIOLOGY.—11 a.m., Dr. Lewis Dexter (Boston): Selection of Cases for Cardiac Surgery.
INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. H. Haber: Basal Cell Epithelioma.
INSTITUTE OF DISEASES OF THE CHEST.—5.30 p.m., Dr. P. V. Benjamin: Programmes for Tuberculosis Control in India.
LONDON JEWISH HOSPITAL MEDICAL SOCIETY.—At Medical Society of London, 8.30 p.m., annual general meeting and short papers by general practitioners.
OSLER CLUB OF LONDON.—At University College, W.C.1, 8 p.m., joint meeting with University College Medical Society in honour of Stephen Papet (July 17, 1855-1926). Professor G. P. Crowden, D.Sc.: Some Pioneers in Experimental Physiology; Dr. J. H. Baron: The Brown Dog of University College.
POSTGRADUATE MEDICAL SCHOOL OF LONDON.—4 p.m., Dr. I. C. Gilliland: Exophthalmos.
ROYAL SOCIETY.—4.30 p.m., Croonian Lecture by Professor C. H. Best, F.R.S. (Toronto): Dietary Factors in the Protection of the Liver, Kidneys, Heart, and Other Organs in Experimental Animals—The Lipotropic Agent.
ST. GEORGE'S HOSPITAL MEDICAL SCHOOL.—5 p.m., postgraduate demonstration in neurology.

Friday, June 17

INSTITUTE OF CARDIOLOGY.—At Barnes Hall, Royal Society of Medicine, 5 p.m., St. Cyres Lecture by Dr. Lewis Dexter (Boston, U.S.A.): Atrial Septal Defect.
●INSTITUTE OF DERMATOLOGY.—5.30 p.m., clinical demonstration by Dr. A. D. Porter: Light Sensitivity.
INSTITUTE OF DISEASES OF THE CHEST.—5 p.m., clinical demonstration by Dr. J. G. Scadding.
INSTITUTE OF LARYNGOLOGY AND OTOLGY.—3.30 p.m., Mr. W. D. Doey: Sinusitis and Chest Disease.
POSTGRADUATE MEDICAL SCHOOL OF LONDON.—2 p.m., Dr. A. C. Thackray: Mucous Gland Tumours.

Saturday, June 18

BIOCHEMICAL SOCIETY.—At Department of Biochemistry, Oxford University, 11 a.m., 341st meeting. Scientific papers.
SOUTH-EAST METROPOLITAN REGIONAL TUBERCULOSIS SOCIETY.—At Benenden Sanatorium, 10.30 for 11 a.m., address by Professor H. Trimble (California), followed by a clinical demonstration by Dr. A. L. R. Mayer and his staff: Carcinoma of the Lung as a Differential Diagnosis of Pulmonary Tuberculosis.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Barnes.—On May 30, 1955, at St. Helen's Hospital, Barnsley, Yorks, to Mary, wife of Roy Barnes, M.R.C.S., L.R.C.P., D.P.H., a daughter—Cyrena.
Beveridge.—On June 2, 1955, at Haywood Maternity Hospital, Stoke-on-Trent, to Cynthia, wife of Dr. T. S. Beveridge, a son—Anthony Michael Day.—On May 21, 1955, to Micky, wife of Michael H. Day, M.B., B.S., a son—Jeremy Paul.
Goodson.—On June 2, 1955, at Tacoma, Washington, U.S.A., to Leonora (formerly Taylor), and Michael P. Goodson, M.D., a daughter—Sarah.
McCallum.—On June 4, 1955, to Dr. and Mrs. D. I. McCallum (Dr. Isabel S. Smellie), of 27, Magdala Road, Mapperley Park, Nottingham, a daughter.
Sers.—On May 12, 1955, in Antigonish, Nova Scotia, to Dr. Phyllis Mary (formerly Neil), wife of Dr. Roif Sers, a sister for Robert—Larissa Anne.

DEATHS

Fothergill.—On May 6, 1955, at "Hensol," Chorley Wood, Herts, Claud Francis Fothergill, M.B., B.Ch., aged 77.
Vallance.—On April 21, 1955, at Woodend Hospital, Aberdeen, James Vallance, M.C., M.B., Ch.B., of Flebister, Sanday, Orkney.
Vaughan.—On April 28, 1955, at Shrubland, Norwich Road, Wymondham, Norfolk, Arthur Llewellyn Vaughan, M.R.C.S., L.R.C.P., late of Diss, Norfolk, and Great Yeldham, Essex, aged 81.

Any Questions?

We publish below a selection of those questions and answers which seem of general interest. It is regretted that it is not possible to supply answers to all questions submitted.

How Early can Mongolism be Diagnosed?

Q.—I shall be grateful if you would let me know what is the earliest age at which a child can be diagnosed as suffering from mongolism, and whether the condition can be diagnosed radiologically before the child is born.

A.—Mongolism can be diagnosed at birth, although it is by no means always possible to be sure of the diagnosis during the first days or even weeks of life. Except in the most typical instances, therefore, it is wise to suspend judgment until it has been possible to assess all the signs most carefully. Mongolism is essentially a condition in which mental deficiency is associated with a number of other congenital abnormalities, which commonly occur together in mongolism but any of which may be found in the normal. It is thus easy to be mistaken if a normal child shows some of the features of mongolism, especially in the first days of life.

The shape of the skull is very constantly abnormal in mongolism, and it is possible that the flattened occiput could be recognized radiologically before birth. On the other hand, this flattening of the occiput may be seen in the normal and be absent in the mongol. An observation that a child's skull *in utero* was an abnormal shape might legitimately arouse some suspicion of mongolism, but no more than that.

Clothing for Children in Hot Climates

Q.—In this relatively hot climate I advise mothers to dress their children in one layer of clothes only, preferably of "cellular" weave, so as to protect the child from the sun while at the same time allowing free circulation of air and evaporation of sweat. I condemn tight vests or layers of clothing of any form, especially during the rains, as this would lead to the formation of a moisture-soaked airlock between the garments and discourage the action of the skin. Is this advice sound?

A.—The only clothing required by a resting child when the ambient temperature is above 84° F. (28.9° C.) and he is sheltered from the wind is that dictated by decency; for an active child the limit will be lower. At temperatures below this, or when there is a breeze blowing on the body, first the skin and then later the whole body cools; hence the importance of seeing children are properly covered at night. Garments in a cellular weave when worn on the outside or as the sole garment are not demonstrably cooler, in experiments, than are other types, provided the cloth is no thicker; in general the thermal insulation of any cloth, of whatever weave, is proportional to its thickness, and cellular material, because of the way it is woven, is often thicker than other cloth of the same weight. For cellular material to be really cool when worn as an outer garment or in contact, through, for example, unzipped vents in a wind-breaker, with the outside air, the cells must be large in diameter, as in the Norwegian *brinje* garments.

The "moisture-soaked airlock" between two layers of clothing is only a reality when the outer layer is waterproof, or at least water-repellent; but if there is a lot of sweating and not much evaporation the fewer layers the better, and the advice your questioner gives to mothers is therefore good. He is also right to condemn tight vests; loose-fitting clothes are preferable, because there is then better pumping action between the clothes and the skin, giving more flow of air over the skin. Protection from the sun is certainly necessary; first, to avoid upsetting the heat balance—solar

radiation on the body can impose a heat load equal to the metabolic heat load of walking; and, second, to avoid sunburn. Your questioner might be interested in the dictum reputed to have been pronounced by the late Sir Charles Martin: "The rational dress for the Tropics consists of a sunshade and a pair of sandals only."

Chrome Ulceration

Q.—What is the latest treatment for chrome ulceration on the skin and eyes?

A.—It is assumed that appropriate preventive measures have been applied in the process concerned, and that personal protective measures are observed. Chrome ulceration can be prevented by covering any skin abrasion immediately with a waterproof dressing so that dust, mist, or solutions of chrome compounds cannot come in contact with damaged skin. No specific treatment is known for the ulcers, which heal slowly. The lesions should be inspected daily and care taken to avoid secondary infection.

The safest and most effective first-aid treatment following contamination of the eyes is adequate washing of the eyes with water. This should be started immediately and continued for at least twenty minutes. Except for the relief of pain, if necessary, by the insertion of homatropine and cocaine drops, or cocaine lamellae, no further treatment should be given until expert ophthalmological advice has been obtained.

Stewed Fruit and the Diet in Rheumatism

Q.—Are stewed fruits, cooked with sugar, unsuitable for "rheumatic" subjects, and, if so, why?

A.—There is no evidence to suggest that stewed fruits cooked with or without sugar are unsuitable for "rheumatic" subjects.

Dietary restrictions are generally not required in rheumatic disease, but obese patients may be encouraged to lose weight through a restricted calorie intake, since in this way damaged joints can be relieved of an unnecessary load.

Racial Differences in Runners

Q.—(1) A friend who is keenly interested in athletics tells me that he has heard it said that a narrow pelvis is an advantage to a sprinter. Is there any mechanical reason why this should be so? I should also like to know whether anthropomorphic surveys have shown a tendency for the pelvis in the black races to be narrower than in white races, which might account for the greater number of record-breaking sprinters found among the blacks. (2) I have also been told that exceptionally slow heart action is advantageous to the long-distance runner and that this is commoner among the inhabitants of cold climates, and hence the success of many Scandinavians in long-distance contests.

A.—It is incorrect to say that any single skeletal factor is advantageous to sprinters. The pelvic shape and size may be significant, but so also is the angle between the neck and shaft of the femur, the obliquity and length of the femora, and many other morphological factors. In surveys of the relationship between bicristal measurements and mean annual temperature Roberts' has shown that there is a tendency for the pelvis in black races to be narrower than in white races:

Bicristal Figures (as Percentage of Stature)

French, 16.9, 16.8; Norman, 16.4; West African, 15.1, 14.5, 15.2, 14.9; Central African, 14.5, 14.2, 15.6.

It is interesting that the growth rate of first-generation European children living in tropical climates falls approximately midway between that of indigenous European and indigenous African children. This suggests that environmental factors are in part responsible for observed "racial" differences in functional and anatomical measures.

(2) Inhabitants of cold climates do exhibit slower pulse rates than those of hot climates,² but the differences are only evident under basal conditions :

Relationship Between Basal Pulse Rate and Mean Annual Temperature

Cold Climates.—N. American Indians, 53 per minute; Mukden (Manchuria), 53 per minute; Miao (China, high altitude), 55 per minute; Peking, 61 per minute.

Hot Climates.—Javanese, 67 per minute; Hong Kong, 64 per minute; Bengal, 67 per minute; Australia (aborigines), 65 per minute.

An athlete is not a good long-distance runner simply because he has an exceptionally slow heart action. More often the converse is true, the slow heart rate being the result of prolonged athletic training. Athletic bradycardia is not confined to runners, but is frequently found in persons subjected to almost any form of strenuous physical conditioning, and is particularly marked in marathon runners and weight-lifters.³ Quantitative differences in training, and age differences, also play a part in the retardation of pulse frequency. Long-distance and marathon runners are usually older men with greater athletic experience than sprinters and middle-distance runners.⁴

It is unlikely that the success of Scandinavians in long-distance contests can be explained by "racial" bradycardia, and it is doubtful whether the heart action of Scandinavian runners is any slower than that of well-trained runners of any race. A more likely explanation is that a bigger proportion of Scandinavians train specifically for the long-distance events, and have consequently evolved training techniques superior to those of their rivals in countries where long-distance running is less popular. The importance to athletic achievement of improved training techniques and psychological factors has recently been stressed in this *Journal*,^{5,6} and must not be overlooked when trying to assess the value of natural anatomical and physiological advantages.

Inheritance of Marble Bone Disease

Q.—*The only child by the second marriage of a patient of mine has just died at 4½ months from Albers-Schönberg's marble bone disease. There is a normal child by the first marriage. How shall I advise my patient on the possibility of future children by the present marriage being affected?*

A.—The severe form of marble bone disease (usually causing death in childhood from anaemia or infection) is very probably due to a recessive gene. Milder forms, in many instances at least, are due to a dominant gene. Accordingly, if the parents are normal and the child was severely affected, as her death at 4½ months suggests, the advice to give the mother is that the risk of any future child of this marriage being affected is 1 in 4.

Possible Benefits of Removing Nicotine from Tobacco

Q.—(1) *In what form is nicotine present in tobacco? Is it possible to remove the nicotine without altering the tobacco's flavour for smoking?* (2) *What are the medical benefits of so doing?*

A.—(1) Nicotine is present in fresh tobacco leaf together with the minor alkaloids as soluble salts in the leaf sap, especially in the cell vacuoles. During curing and fermentation most of the nicotine is lost, passing into a mixture of pyridine compounds largely unidentified. Tobacco leaf from which nicotine has been removed can still be smoked with satisfaction by some people but not by others. The heavier smokers miss the nicotine.

(2) The factor in tobacco which is responsible for some cases of lung cancer and coronary thrombosis has not yet

been established. It is unlikely that nicotine has anything to do with the production of the first of these diseases, but it may well be a responsible factor in the second. If this is so, one could hope for an improved prognosis in some cases of angina pectoris and coronary thrombosis if it were possible to provide cigarettes which contained no nicotine. Removal of nicotine would, of course, eliminate the rare danger of amblyopia.

Hazards of Thorium X

Q.—*Is there any risk in the frequent and long-continued use of thorium X varnish or ointment?*

A.—Preparations of thorium X produce very superficial reactions in the skin, when applied to its surface, by the action of the alpha particles. Theoretically these are almost entirely obstructed by the thinnest of tissue paper and one would not expect any permanent damage to the epidermis, or especially the dermis. However, traces of beta and gamma rays have been observed in the dermis and it is evident that some of the radioactive material penetrates via the sweat and sebaceous glands. Sufficient time has elapsed since the introduction of this method of treatment to justify the dogmatic statement that the risk to a patient is negligible if not more than 20 applications of thorium X in a strength not exceeding 2,000 electrostatic units per ml. or gramme are applied at monthly intervals. In some clinics many more treatments have been given when the patient accepts the risk, and so far evidence of permanent damage to the skin is rarely found. As a guide in practice one might state that unless encouraging progress has been obtained at the end of 20 paintings at monthly intervals there is little further to be expected from this treatment.

NOTES AND COMMENTS

Nausea after Morphine.—Dr. P. W. NATHAN (London, W.C.1) writes: In answering a question on the best way of dealing with nausea and vomiting following the administration of morphine ("Any Questions?" May 7, p. 1169) your expert referred to an article¹ by myself. Since I wrote that article, chlorpromazine has become available. My experience in using this drug has been limited, but it is consistent. It is clear that this drug is most useful in stopping nausea and vomiting caused by many analgesics. I have found that 25 mg. twice daily is usually enough for this purpose; I have never had to give more than 25 mg. three times a day. This drug is said to potentiate the action of analgesics, and thus there is another advantage in using it. I hope that this information will be useful to any doctors who look after dying patients with severe pain.

EFFECTS OF DIETARY PROTEIN, LIPOTROPIC FACTORS, AND RE-ALIMENTATION ON TOTAL HEPATIC LIPIDS AND THEIR DISTRIBUTION

BY

C. H. BEST, M.D., F.R.S.; W. S. HARTROFT,* M.D., Ph.D.; C. C. LUCAS, Ph.D.

AND

JESSIE H. RIDOUT, Ph.D.

(From the Banting and Best Department of Medical Research, University of Toronto, Toronto, Canada)

[WITH SPECIAL PLATE]

Interest in the distribution of fat within the liver lobule has been stimulated by the observation that in the widespread disease kwashiorkor the stainable fat is found predominantly in the periportal regions. This subject has recently been reviewed by Brock (1954). It is, of course, a long step from the distribution of fat in the liver of the human infant to that seen in the rat, even when an attempt is made to utilize diets similar to those that produce the characteristic lesions in the human liver. The initial distribution of fat under standardized experimental conditions may not be the same as that which is seen at a later stage. Our lack of knowledge of the anatomy and physiology of the liver lobule prevents us from explaining the mechanisms which determine the localization of fat even when this is sharply defined and consistently reproducible. However, experimental work is steadily revealing new facts that are contributing to the solution of these problems.

In choline deficiency in the rat the first appearance of stainable fat is in the area around the central veins (Lillie, Ashburn, Sebrell, Daft, and Lowry, 1942; Glynn, Himsworth, and Lindan, 1948; Hartroft, 1950). In fasted rats given anterior pituitary extract the initial distribution of the fat is definitely periportal (Best, Hartroft, and Sellers, 1952). Some years ago Dible reported that in rats and rabbits during starvation the distribution of fat is sometimes mainly periportal (Dible, 1932; Dible and Libman, 1934). Shils and Stewart (1954a) have drawn attention to the periportal distribution of fat in the livers of rats fed corn-meal diets and remarked upon the similarity of the lesion to that described by many clinicians in children suffering from kwashiorkor. A similar distribution has been noted in rats consuming other plant materials, such as rice, cassava, and wheat flour (Shils, Friedland, and Stewart, 1954).

Several reports of fatty livers not responding to the usual supplements of choline or its precursors have appeared recently (Wang, Hegsted, Lapi, Zamcheck, and Black, 1949; Litwack, Hankes, and Elvehjem, 1952;

*Now Head of the Department of Pathology, Washington University, St. Louis, Mo., U.S.A.

Sauberlich, 1953; Singal, Hazan, Sydenstricker, and Littlejohn, 1953; Harper, Monson, Benton, and Elvehjem, 1953; Harper, Monson, Benton, Winje, and Elvehjem, 1954; Winje, Harper, Benton, Boldt, and Elvehjem, 1954). The basal diets fed to the rats in which this condition has been encountered have usually been low in protein. Under these conditions choline has often failed to maintain the liver fat within the normal range, although it has generally prevented any great increase in total liver lipids.

We wish to report some effects of varying the nature and amount of protein in the diet on the total lipids and distribution of stainable fat in the livers of rats and on the lipotropic effect of choline in these diets. Histological studies suggest that the abnormal lipid whose accumulation is not prevented by choline has a different distribution from that seen when the deficiency involves choline or its precursors. It was also noted, during a study of the accumulation and removal of stainable fat in periportal regions, that re-alimentation after diminished food intake due to dietary (protein) deficiency resulted in a transitory fatty liver, the demonstrable fat being exclusively periportal in distribution.

Methods

Five separate experiments will be reported involving some 300 albino (Wistar) rats. The animals were kept in individual cages with a false bottom of coarse wire screen. Fresh food and water were supplied each day; food intake was recorded daily and rats were weighed weekly. Unless otherwise stated, the animals were fed the diets *ad libitum* for three weeks and were then killed by stunning and exsanguination. Livers were removed at once and weighed. Portions were taken for histological examination, and the remainder of the tissue was analysed for total lipids (extraction with hot alcohol, rectification of the lipid residue with a mixture of petroleum ether and chloroform 3:1 v/v). The percentage composition of the basal diets fed in each experiment is shown in Table I. It should be noted that in these studies vitamin B₁₂ (300 µg. per 100 g.) was added to the vitamin mixture described by Ridout, Lucas, Patterson, and Best (1954), thus providing 3 µg. per 100 g. of ration. Basal diets are identified by the numerical suffix -0 (Tables I, II, III, and IV).

Histological Examination

The distribution of demonstrable fat in the livers was studied in frozen sections (5 μ) of formalin-fixed tissues using Wilson's trichrome-oil red O technique. Paraffin sections (5 μ) of Bouin-fixed tissues were stained with haematoxylin and eosin.

The sections were examined under a code number by one of us (W. S. H.). The amount of demonstrable lipid was graded from 0 to +++++ (Special Plate, Figs. 1 to 8). Although in Tables II, III, and IV the distribution of the lipid is recorded merely as periportal or centrolobular, the degree of localization varied considerably. The term "periportal" was applied not only when the fat-containing cells were restricted to regions immediately surrounding the portal vein and hepatic artery alone, but also when this distribution extended much farther towards the central vein but did not envelop it. In almost all cases, however, the lobular distribution of the lipid was remarkably clear and well defined, as shown in the figures. Often there was evidence of increased glycogen deposition, especially in the periportal regions (cf. Ramalingaswami, Sriramachari, and Patwardhan, 1954).

Dietary Conditions

In *Experiment I* the lipotropic effect of choline was compared in diets containing different amounts of protein (casein). In these diets (Ia, Ib, Ic, and Id, Table I) the total methionine was kept constant at 0.54% by adding sufficient supplementary DL-methionine. This amount of methionine is equal to that present in the last diet, which contains 18% casein. Groups of six male rats (weighing 70 to 90 g.) were fed these basal diets supplemented with choline chloride as shown in Table II.

In *Experiment II* the rats were fed an animal protein (fibrin), a vegetable protein (soya bean), and mixtures of the two (Table I). Again, in this experiment enough DL-methionine was added to all diets (except IIe) to bring the total to 0.54%. Groups of eight male rats (65 to 80 g.) were fed these basal diets supplemented with choline chloride as shown in Table II.

Experiment III permits comparison of the effect on the distribution of stainable fat in the livers of feeding a low-protein diet (3% casein) without supplementary methionine (Diet IIIa) and with supplementary methionine (Diet Ia). A similar comparison was made in high-protein diets containing less than half as much methionine (250 mg.) as does 18% casein (Diets IIb and Id respectively). Groups of ten female rats (65 to 90 g.) were fed the basal diets IIIa-0 and IIIb-0 (Table I), alone or supplemented with choline chloride (0.5%), as shown in Table III. Four groups were fed *ad libitum*; rats of the fifth group (IIIb-0 p.f.) were fed the same average amounts of food each day as were consumed by those in Group IIIa-0.

In *Experiment IV* the effect was studied of prolonged consumption of a diet very low in vegetable protein (soya protein 2% plus peanut protein 1%). This ration (IVa-0, Table I), which contains only 32 mg. methionine per 100 g. of mixture, was variously supplemented with choline chloride (0, 0.36%, and 1%, Table III) and fed *ad libitum* for 85 days to male rats (180 to 200 g.).

Experiment V was planned to supply data on the time relationships of both the accumulation of periportal liver lipids in rats on a low-protein diet and their removal when the animals were transferred to a "curative" diet high in protein (Table I, Diets Va and Vb respectively). Forty female rats (65 to 80 g.) were fed the low-protein diet (Va-0, 3% casein), which was supplemented with methionine to make it equivalent in that respect to the "curative" diet containing 18% casein; both diets contained 0.5% choline chloride. Pairs of rats were killed after being fed the low-protein diet for 2, 4, 8, and 16 days, respectively. The remaining 32 rats were transferred to the "curative" diet (Vb containing 18% casein). Groups of eight rats were killed after consuming the "curative" diet for 3, 7, 14, and

21 days, respectively. In addition 25 similar rats were fed a commercial stock ration ("master fox chow," Toronto Elevators, Ltd.). During the first 16 days these rats were pair-fed with those given the low-protein diet. Five rats were killed at the end of this time, and the remainder were then allowed to eat the chow *ad libitum*; groups of five rats were killed after 3, 7, 14, and 21 days, respectively.

Results

Livers from many normal rats of our colony have been examined during past years. The livers were subjected to chemical analysis and sections treated with oil red O were scrutinized carefully. Normal values for total liver lipids by our methods of extraction and rectification range from 5 to 8%, the mean and standard error being 6.62 ± 0.09 . The values for 20 male rats were 5.19 to 7.48, mean 6.31 ± 0.14 ; and for 38 females, 5.9 to 8.03, mean 6.79 ± 0.10 . No histologically demonstrable fat could be seen in most livers (Plate, Fig. 1a). Recently, since the above experiments were completed, we have been reinvestigating the "normal" rats of our colony and have found a more frequent appearance of fat in at least some hepatic parenchymal cells. This fat often occurs only as a few to many fine droplets per cell, but occasionally some cells (2 to 12 per high-power field) are seen to be filled with fat (Plate, Fig. 1b). These latter cells appear to be distributed at random within the hepatic lobules. This increased frequency of appearance of cells containing stainable fat is being investigated further.

Experiment I

Most of the stainable fat in the livers of rats consuming the basal diets low in casein (Ia-0, Ib-0, and Ic-0) was in periportal regions, with only a trace in centrolobular areas (see Table II and Plate, Fig. 2). It should be noted that these diets contained considerable methionine. We believe that adequacy of this choline precursor in these basal diets has been important in keeping the centrolobular areas clear. Even with 0.36% of choline chloride the amount of fat in periportal regions was not significantly reduced (cf. Plate, Fig. 2b). As the amount of protein in the diet was increased, less total lipid and periportal fat was observed: only traces of periportal fat could be detected when the diet contained 18% casein (Id-0). The lipotropic effect of a given amount of choline (as estimated by chemical analysis of liver tissue) improved as the protein content of the diet increased, but even large doses of choline were unable to prevent some deposition of abnormal fat so long as the protein in the diet was low.

Experiment II

The limited effectiveness of choline chloride in maintaining normal liver lipids is seen in other diets low in protein—for example, soya protein and a mixture of soya protein with fibrin. Diet IIa-0 (9% soya protein) gave total liver lipids of 9.0% (Plate, Fig. 3); even 0.36% choline chloride failed to reduce this value significantly. As in Experiment I, the deposition of centrolobular fat was prevented by choline, but the stainable fat in periportal regions was much less affected. Fibrin at 9% (Diet IIb-0) produced lower total lipids (by chemical analysis 6.7%) and considerably less stainable fat in periportal regions than did the soya protein, but the livers were not normal. Addition of choline chloride did not appreciably alter the findings (Plate, Fig. 4). A mixture of these two proteins at a total protein level of 9% (Diet IIc-0) also permitted the deposition of considerable periportal fat that was not affected by choline, although some prevention of lipid deposition could be shown analytically. Twice as much of the same protein mixture (that is, soya protein 12% plus fibrin 6%, Diet IId-0) resulted in a more nearly normal liver: only a trace of stainable fat could be detected in periportal regions and only a faint trace in the centrolobular area. Choline reduced the total lipid, but did not alter appreciably that seen in periportal regions.

The results when rats were fed Diet IIe-0 are of particular interest (Plate, Fig. 5). This ration was the same as Diet IId-0 except that the supplementary methionine was omitted. In the absence of this choline precursor the liver became very fatty (27% total lipids), the bulk of the stainable fat appearing in centrolobular position (+++ to ++++). Since the distribution of fat was diffuse throughout the lobule the amount in periportal regions was difficult to estimate, but it was recorded as +. A small supplement of choline chloride (0.12%) reduced the total lipids to 6.5%—that is, within the normal range—but a small amount of

stainable fat could still be seen around the central vein as well as in the periportal region. Had more choline been given, this centrolobular fat would probably have been eliminated.

Experiment III

The well-established fact that choline deficiency leads to an accumulation of fat in the centrolobular region was confirmed, as was the newer observation that stainable fat in the periportal region is connected with protein inadequacy. The ration containing 3% of casein without supplementary methionine (Diet IIIa-0) was not eaten well: it caused a

moderate loss in weight and resulted in the development of a fatty liver. The total lipids reached 19.9%; there was considerable fat in periportal regions, with even more in centrolobular areas (Plate, Fig. 6). A similar ration containing 0.5% choline chloride resulted in a liver almost free from centrolobular fat but with considerable fat remaining in periportal regions. The total lipids were, however, only 5.8%. Diet Ia-0, a similar ration but with added methionine, was eaten in almost identical amounts and resulted in much lower liver lipids (compare 12.5% with 19.9%), the difference being mainly due to absence of fat from the central areas, as might have been predicted. Diet IIb-0, methionine-poor but containing 18% of protein, was eaten more freely, permitted a fair gain in weight, and caused a fatty liver, with the abnormal lipids mainly centrolobular, as was anticipated. Paired feeding reduced the total lipids somewhat, but did not change the distribution of stainable fat appreciably. Inclusion of choline chloride (Diet IIb-1) improved slightly both food intake and gain in weight, and almost completely prevented any stainable fat from appearing in the centrolobular region; a little remained in portal areas.

Experiment IV

Prolonged consumption of a diet low in protein and free from choline produced a very fatty liver, some of the lipid appearing in periportal areas, but most of the abnormal fat being centrolobular (Table III). The centrolobular deposition of stainable lipids was prevented by choline. Thus the effects of a low-protein diet on stainable liver lipids were essentially the same whether the rats were fed for three weeks or three months.

Experiment V

Development of a fatty liver upon realimentation has been noted frequently (for example, MacFarland and McHenry, 1945; Best, Lucas, Patterson, and Ridout, 1951), but the distribution of stainable fat in the present experiment proved interesting, being exclusively periportal. The low-protein diet (3% casein) resulted in a decreasing food intake (Table IV), in spite of adequate vitamins (including choline) and methionine. Despite the diminishing caloric intake and consequent loss of weight, the livers became increasingly fatty, the deposition of fat occurring in periportal regions (Plate, Fig. 7). When the rats were transferred to a similar diet in which the protein was made more adequate (casein 18%) they ate twice as much and began to gain weight. Coincident with this sudden increase in food consumption during the first three days on the "curative" ration there was a dramatic increase in the total liver lipids (to 18%), all of it occurring in periportal regions (Plate, Fig. 8). With continued intake of about the same amount of food, however, the abnormal fat soon disappeared, the liver appearing normal both histologically and chemically at the end of three weeks. No such increase in liver lipids occurred following realimentation in rats pair-fed a commercial ration throughout both the period of decreasing food intake and of realimentation.

Discussion

The data presented above show that protein inadequacy leads to the prompt appearance of stainable fat in periportal regions of the liver. It is a well-established fact that choline deficiency results in a rapid accumulation of abnormal lipids, mainly glyceride in nature, in centrolobular areas; the present data confirm this. The essential difference in the lesions can best be recognized when the deficiency is of mild degree and of brief duration; more severe or more prolonged deficiencies lead to a more generalized distribution of stainable fat, often obscuring the original site of appearance of the lipid.

DESCRIPTION OF SPECIAL PLATE

Photomicrographs ($\times 133$) of frozen sections of rats' livers stained with oil red O to demonstrate fat.

Fig. 1.—Livers of young rats (Wistar) fed the stock ration ("master fox chow"). In our strain under these dietary conditions there is usually no stainable fat (Fig. 1a), but occasionally some cells contain fine droplets and a few are filled with fat. When present these fat-filled cells are distributed at random within the lobule (Fig. 1b).

Fig. 2.—Lipid distribution typical of rats fed rations low in protein (made adequate with respect to methionine): Fig. 2a without choline (Diet Ia-0), and Fig. 2b with supplementary choline (Diet Ia-1). The choline is without significant effect on the periportal fat (++ to +++).

Fig. 3.—In the livers of rats fed Diet IIa-0 (soya protein 9%) there is abundant periportal accumulation of fat (++ to ++++). This photomicrograph illustrates the mode (++++).

Fig. 4.—The periportal deposition of lipids was the least when fibrin (Diet IIb-0) was the protein fed. The figure illustrates the appearance of the liver when the ration is supplemented with choline (Diet IIb-2). The findings (+) are essentially the same in the absence of choline.

Fig. 5.—Stainable fat in relatively large amounts (+++ to ++++) present in centrolobular and non-portal regions of livers of rats fed rations low in choline (Diets IIc-0 and IVa-0).

Fig. 6.—Dual distribution encountered in rats fed rations low in both choline and protein (for example, Diet IIIa-0): stainable fat present in relatively large amounts (++ to ++++) in centrolobular regions of the liver, and in smaller quantities (trace to +) in periportal areas.

Fig. 7.—Stainable fat (+) present in periportal regions only. Rat consumed a low-protein ration (Diet Va-0) supplemented with both choline and methionine for 16 days; food intake was low. A portal field is just to the right of and below centre.

Fig. 8.—Abundant stainable fat present in periportal fields, but none occupies cells around central veins (one at left). A portal triad, cut longitudinally, is shown on the right. Rat consumed for three days excessive amounts of a ration containing 18% casein (methionine and choline believed adequate—Diet Vb-0). For 16 days previous to the three-day period the rat had eaten only small amounts of the same ration (Diet Va-0) as that consumed by the rat whose liver is shown in Fig. 7.

C. H. BEST ET AL.: HEPATIC LIPIDS

Glioblastoma of basal ganglia.

Glioma of corpus callosum.

Pinealoma.

Rapidly growing malignant glioma.

Astrocytoma cyst of a hemisphere.

Cystic astrocytoma of cerebellum.

For complete protection of the hepatic cells in the portal region the amount of protein necessary depends upon its nature, fibrin being much more effective than casein, which is better than soya protein. The deleterious effect of diets low in protein on the cells in the portal region may be related to some inadequacy of essential amino-acids (cf. Lucas and Ridout, 1955). The effect of protein on hepatic cells around the central veins appears to be attributable largely, if not solely, to its content of the choline precursor methionine. Protein inadequacy in regard to protection of the liver appears to begin at about 12% in the diet when casein is fed, and below 6% in the case of fibrin (cf. data of Winje *et al.*, 1954); choline inadequacy begins at about 0.12% (expressed as chloride). It should be emphasized that these values may vary considerably, depending upon the strain, age, and sex of the rat, upon the adequacy of the diet with respect to other essential nutrients, upon environmental temperatures, and on other factors less well understood.

These observations may help to resolve two anomalies in the literature—namely, the occasional discrepancy between the chemical and histological estimations of liver fat and the lack of response of certain types of dietary fatty livers to the lipotropic agents. The term "fatty liver" has somewhat different connotations according to the viewpoint of the user. To the pathologist who is concerned with the appearance of the organ the liver is described as fatty if fat is evident microscopically in suitably stained sections. Not every cell need contain stainable fat. Cells in certain regions only may be affected, yet the organ would be referred to as a "fatty" liver. The biochemist, on the other hand, is concerned with the results of the chemical analysis—that is, with the quantity of lipids extractable from the tissue. Only when the analytical figure is increased appreciably above the normal range of values for the species would the chemist describe the liver as "fatty." The pathologist may see stainable fat, sometimes in considerable amount, before there is any significant increase in the extractable lipids. An erroneous impression of the magnitude of the increase above normal may be obtained unless attention is paid to the extraction procedure used, and especially to the base to which the analytical data are calculated, whether it be to fresh tissue, dry tissue, fat-free tissue, or dry, fat-free tissue. We have discussed elsewhere the merits and disadvantages of each of these (Ridout *et al.*, 1952). There are situations—for example, in protein depletion—where the values might better be expressed as percentages of body weight, or, better still, referred to the desoxypentose nucleic acid (D.N.A.) content of the liver. Campbell and Kosterlitz (1948, 1950, 1952) found that, although ribonucleic acid and phospholipid are lost from the liver in protein deficiency, the D.N.A. content of the liver of the adult rat varies linearly with body weight and is not affected by the protein content of the diet. Where effects of variations in dietary protein are under study, and particularly where a considerable change in the number of functional liver cells is apparent (as in necrosis or cirrhosis), the D.N.A. content of the liver should prove a useful basis for comparing changes in lipids and other hepatic components. However, at present in our laboratory the common practice is followed of referring the data to the fresh weight basis. All values are also calculated to the dry, fat-free basis, as this sometimes permits more useful comparisons, but these data are not always reported.

In choline deficiency hepatic lipid values of 15 to 40% of fresh liver weight are commonly observed. Figures of 25 to 45% reported in rats fed diets low in protein (for example, Harper, Benton, *et al.*, 1954) are expressed as percentages of dry liver weight. When referred to the fresh weight the total hepatic lipids are no more than about 8 to 18% (usually below 14%). These are certainly fatty livers, but quantitatively they are of mild degree as compared with those seen in choline deficiency. A considerable amount of stainable fat may appear in periportal areas with minimal elevation of total lipids as determined chemi-

cally. It has been suggested (Lucas and Ridout, 1955) that this unmasking of normal structural lipids (fat phaneriosis)* may be caused by improper formation of lipoproteins due to protein deficiency. Protein deficiency may seriously interfere with the formation of many vital factors which the lack of choline might not affect to the same extent. (Cf. Campbell and Kosterlitz, 1948, 1950, 1952.) While fibrosis or cirrhosis has not yet been produced in our rats by protein deficiency in the presence of abundant choline, even after a year, it is possible that these lesions may appear in more prolonged experiments, as Ramalingaswami (1954) has suggested.

With regard to the second anomaly, our findings confirm and supplement those from other laboratories that fatty livers due to diets low in protein do not respond to lipotropic substances. However, it is not surprising that a fatty liver due to protein deficiency is not cured by giving supplements of choline or its precursors.

In our opinion it has been obvious for many years that the clinical use of choline and methionine to repair the liver damage produced by multiple deficiencies—that is, of protein, minerals, vitamins, etc.—is doomed to failure because most hospital diets supply an abundance of the lipotropic agents. This does not decrease in any way the potential clinical significance of experimental work on the lipotropic factors; it merely means that in the laboratory it is possible to make choline the limiting factor by the design of the experiment. The clinician rarely encounters so simple a situation. If he supplied the missing amino-acids other than methionine and made good the other deficiencies except that of choline, this substance would be the limiting factor in the clinical situation.

The importance of the balance of amino-acids in the diet in the study of fatty livers was noted in this laboratory 10 years ago by Beveridge, Lucas, and O'Grady (1944, 1945), who pointed out that the lipotropic activity of a protein is determined not only by its content of methionine but also by the nature and quantity of the other amino-acids present. While studying changes in liver composition during protein depletion Wang *et al.* (1949) fed protein-free rations to rats and observed a fatty liver not completely preventable by choline (at the dosage used, which was high—0.50% choline chloride in the diet). Dick, Hall, Sydenstricker, McCollum, and Bowles (1952) suggested that some fatty livers may result from failure of certain cell functions when protein anabolism is reduced—that is, they may represent a non-specific effect of protein deficiency rather than a specific lack of any one essential amino-acid. When Harper, Benton, *et al.* (1954) observed an anti-lipotropic effect of methionine in rats fed threonine-deficient diets containing choline, they too concluded that the extent of fat deposition in the liver depends on the balance as well as on the absolute amounts of amino-acids in the ration. The fatty livers caused by diets deficient in threonine and lysine (Dick *et al.*, 1952; Singal *et al.*, 1953; Harper *et al.*, 1953), even with moderate amounts of choline in the food, are examples of fatty livers of non-specific origin—that is to say, due to inadequate or imbalanced protein—and the lesions would doubtless prove to be periportal in distribution. Indeed, Niño-Herrera, Harper, and Elvehjem (1954), reporting upon the histological differentiation of fatty livers produced by threonine or choline deficiency, stated:

"In the livers of choline-deficient animals the fatty infiltration is diffuse and is most severe in the vicinity of the central vein. In the livers of animals receiving low-protein diets containing choline the distribution of fatty cells results in a network appearance in which zones of normal cells are interspersed among the zones of fatty cells and only occasionally is the fatty infiltration not

*This is not the place to attempt a full discussion of the vigorously debated subject of lipophaneriosis. Modern biochemical and physicochemical studies of the lipoproteins have revealed the possibility of dissociation of these compounds to give free lipids, but the conditions governing this process are not well understood.

severe around the central vein of the lobule. The magnitude of the fatty infiltration is much greater in rats fed a diet deficient in choline.*

Shils and Stewart (1954b) have observed a periportal distribution of fat in livers of rats fed diets consisting principally of corn meal, rice, or cassava, and found that lysine and tryptophan prevented this fatty liver. These observations are in agreement with our hypothesis that protein deficiency or amino-acid imbalance causes the periportal type of lesion.

Shils and Stewart (1954a) suspected that the periportal accumulation of lipids seen in rats fed corn meal may be due to some unique property of corn proteins. Since the lesion was later seen in rats fed corn, rice, wheat, or cassava, Shils, Friedland, and Stewart (1954) believed that it is typical of plant products. Our finding of this periportal type of distribution whenever the amount of dietary protein is low, regardless of the source of the protein fed, confirms and extends their results but alters the conclusions.

Shils and Stewart (1953) reported observing a sex difference in the distribution of stainable fat in the liver lobule: in male rats the total concentration of hepatic lipids was higher than in females and the lipid appeared first in periportal areas; in females the fat was found first in central areas. Female rats responded somewhat to threonine; males did not (Shils and Stewart, 1954b). In our experiments, admittedly with different proteins, we have not noticed any significant difference in the distribution of stainable fat in the livers of male and female rats.

In a personal communication Ramalingaswami, who with his colleagues has published several thoughtful and stimulating papers on liver injury in protein malnutrition (for example, Sriramachari and Ramalingaswami, 1953; Ramalingaswami *et al.*, 1954), has informed us that the fat content of diets low in protein and choline may influence the localization of the fatty deposits in the hepatic lobule. After rats were fed for about three months on a low-fat, low-protein, choline-deficient diet he observed that the microscopical appearance of the livers presented a striking similarity to the picture in kwashiorkor.

In our present study the observation that may be of greatest practical significance concerns the abrupt increase in total liver lipids associated with a sudden improvement in the quality and quantity of food intake, even when the "curative" ration is adequate in protein and rich in choline (Experiment V). Liver fat increased within three days from 9 to 18%, all stainable fat being present in periportal regions. This is the largest amount of extractable lipid ever observed by us when the stainable fat was present in periportal regions exclusively. A similar increase in liver fat was not observed in other rats pair-fed a commercial stock ration, suggesting that an unidentified factor prevents the sudden but transient increase in liver lipids confined to the periportal regions. These experiments, which may have their clinical counterparts in the treatment of alcoholic subjects with certain "good" diets, reveal the presence of factors in addition to protein and choline that may be concerned in the deposition and localization of fat in the liver.

Summary

In rats fed diets containing a moderate amount of fat and 9% or less of protein, supplementary choline failed to prevent completely the accumulation of fat in periportal regions of the liver.

Lack of adequate protein resulted in the appearance of fat in the periportal areas, while deficiency of choline (or precursors) caused an accumulation of fat in the

*The literature concerning the site of lipid accumulation in threonine deficiency is contradictory, however. Dick and his associates reported that it occurs in the cells around the central veins. Unfortunately the histological techniques used by Niño-Herrera *et al.* were unsuitable for lipid studies. Using histochemical methods, Kerbel and Casselman in this laboratory have repeated the experiments relating directly to threonine deficiency and have found that the distribution of fat is clearly periportal.

cells bordering on the central vein. Protein inadequacy has not produced the massive accumulation of hepatic lipids seen in choline deficiency.

When rats were transferred on to an "adequate" diet (containing 18% casein and 0.5% choline chloride) after a period on a low-protein ration (3% casein) there was a dramatic appearance of a transient fatty liver (total lipids 18%), the fat appearing in periportal positions only. During three weeks on the same ration the hepatic lipids returned to normal. Other rats pair-fed the same amounts of a commercial ration did not develop fatty livers, so that the transient appearance of periportal fat is not entirely due to the increased food intake. Certain points of potential clinical interest have been discussed briefly.

The expenses of this study were defrayed in part by a grant to the Department from the Banting Research Foundation. Our thanks are due to Mr. Gwen Hughes, of the Charles Albert Smith Co. Ltd., Toronto, and to Distillation Products Industries, Rochester, N.Y., U.S.A., for a generous donation of pure α -tocopheryl acetate.

We wish to thank Dr. W. G. Bruce Casselman and Dr. Jean M. Patterson for the exceptional amount of help they have given us in this study.

(A preliminary account of some of these findings was read at the 37th Annual Conference of the Chemical Institute of Canada, Toronto, June 21 to 23, 1954.)

In 1953 in England and Wales 40 people were killed in quarry accidents and in Scotland 5. In 1952 these totals were 49 and 4 respectively. The injured numbered 104 in 1953 in England and Wales and 11 in Scotland, as compared with 118 and 14 respectively in 1952. The average death rate per 1,000 persons employed in all quarries in England, Scotland, and Wales was 0.99 in 1951, 0.85 in 1952, and 0.73 in 1953.—*Report of H.M. General Hospital, Newcastle-upon-Tyne)

[WITH SPECIAL PLATE]

There tends to be a periodic lack of interest in the study of cerebral gliomata, though these neoplasms continue to inflict their havoc on the health and lives of far too many young and middle-aged people. This paper is therefore aimed at recalling attention to this important subject and reviewing certain facts and conclusions gained from our experience with a consecutive series of 700 patients with neoplasms of the brain, of which 466 were gliomata.

Surgical Pathology

The gross post-mortem appearances of gliomata are usually so distinctive that these neoplasms can be differentiated almost as well by the naked eye as by histological examination. Of the 466 gliomata in our series, 294 were completely solid and 172 partly cystic. In only 20 of the cystic cases was the neoplasm composed of a large cyst and a relatively small amount of tumour; in the other 152 the cysts were small in relation to the solid mass of the tumour.

The gliomata were classified histologically according to cell type as originally suggested by Bailey and Cushing (1926), this work being carried out by the late A. F. Bernard Shaw, Professor of Pathology in the University of Durham, and also by Professor R. Paterson Smith. The results were as shown in Table I.

In the unclassified group were placed neoplasms the histological appearances of which did not strictly conform to the criteria of diagnosis laid down by Bailey and Cushing: most were highly malignant. Even the most typical of the astrocytomata and oligodendrogliomata were not composed of a uniform type of cell; in the highly malignant types one zone differed considerably in cell content, cell size, mitotic activity, and vascularization. In no instance was it possible from the histological studies to reconstruct the general architecture of the growth and the way in which its mass was given cohesion. There were areas which seemed to be without any kind of histological pattern and yet did not appear to be zones of necrosis or of haemorrhage. A discrete edge to a glioma was never seen; brain tissue apparently reacts but little to the advance of a glioma. Cells presumably neoplastic in nature can nearly always be seen at considerable distances from, and entirely unconnected with, the main mass of the neoplasm.

*This paper was submitted for publication in December, 1952.

TABLE I

Type of Glioma (See Special Plate)	Adults	Children (Up to the Age of 12)
Astrocytoma:		
(a) Hemispherical	54	2
(b) Cerebellar	9	6
Astroblastoma	10	2
Spongioblastoma unipolare	5	2
Glioblastoma (spongioblastoma multiforme)	76	1
Oligodendroglioma	9	—
Ependymoma	7	6
Medulloblastoma	9	21
Haemangioblastoma	5	—
Pinealoma	3	2
Unclassified:		
(a) Partly cystic	66	2
(b) Solid	156	11
Papilloma	2	—
Total	411	55

As the appearance of a cell after it has been prepared for histological examination cannot possibly resemble that of its natural state, an effort was made to grow specimens in culture. This work was first carried out at the Christie Hospital and Holt Radium Institute, Manchester, with the help of Dr. Edith Ralston Patterson. The accompanying drawing, made by Miss D. Davison, depicts what was seen through a microscope at the edge of a culture of a glioblastoma.

There is now a tendency to classify gliomata according to their degree and type of malignancy. Theoretically this method may be an advance on the classification by cell type; in practice, however, it is doubtful whether it has any advantages, because, although precise criteria for classification can be laid down, tumour variations are so great that strict grouping according to the accepted rulings is difficult.

In the 231 cases in which the glioma was given a formal name the sites of occurrence were: frontal lobe, 49; temporal lobe, 66; parietal lobe, 44; occipital lobe, 12; third ventricle, 8; fourth ventricle, 6; brain-stem, 5; cerebellum, 41. In some instances the neoplasm was too large to be certain of the structure from which it originated, although it is obvious that most of the malignant types arose in the basal ganglia, vermis of the cerebellum, or corpus callosum. Also, although the bulk of many neoplasms occupied one lobe of the brain, extension had taken place into neighbouring zones. In no instance was there a metastasis outside the central nervous system.

The age incidence was as follows: 1 to 12 years, 42; 13 to 19, 18; 20 to 29, 31; 30 to 39, 43; 40 to 49, 44; 50 to 59, 44; 60 to 69, 9.

The microscopical aspect of cells growing from the edge of a culture of a glioblastoma. These appearances no doubt conform to the normal characteristics of cells before subjection to the processes of histological preparation.

The Problem of Early Diagnosis

In a case of cerebral glioma the clinical picture of course depends substantially on whether the neoplasm is in the early or the late stages of development. Moreover, in view of the many and widespread structures from which a glioma may arise, it will be obvious how difficult it is to consider a diagnosis without first grouping these neoplasms according to type and then subgrouping the types according to site of origin. For example, the clinical picture of cystic astrocytoma of the cerebellum is very different from that of astrocytomatous cyst of a hemisphere. Nevertheless this apparent need for subgrouping leads to a tendency to await a fully developed clinical syndrome before a firm diagnosis of cerebral neoplasm is risked. Late diagnosis may not be greatly detrimental therapeutically where a glioma is concerned, but has serious consequences in the case of meningioma or acoustic neuroma.

Here, in the interests of earlier recognition of a neoplasm, we will attempt to discuss diagnosis from the first symptom or sign in the group as a whole, without segregating the tumours into subgroups—for example, cystic astrocytoma of the cerebellum and the glioblastoma of the hemispheres. In the 231 cases in which the neoplasm was given a formal name we were able to classify the initial symptoms or signs as follows:

1. *Rise in Intracranial Pressure.*—In 142 instances headache, vomiting, dizziness, and papilloedema, singly or in combination, were the first signs or symptoms. Papilloedema was an early sign in 10 cases only, and, of course, was pathognomonic of a space-occupying lesion. In the remaining 89 cases a diagnosis was impossible on the characteristics of the headache, dizziness, or vomiting.

2. *Epilepsy.*—A sudden attack of epilepsy was the first sign in 40 cases; in 38 of these the seizures were major, and in the remaining 2 focal. All the attacks occurred in patients between the ages of 20 and 60 years. In 6 cases the seizures were followed by neurological signs from which the patient never fully recovered; in 4 cases there was hemiparesis, and in 2 a mild dysphasia. In every instance a lesion other than a glioma, or even a neoplasm, could have been the cause.

3. *Mental Change.*—Although in only 15 out of the 231 cases did mental change herald the presence of a cerebral glioma, it is probable that in many cases this symptom was overlooked or its significance not appreciated. Initially, mental change leads to minor and very subtle changes in behaviour that can be elicited only by direct questioning of an intimate relative or friend. A common first sign is a carelessness about personal appearance—for example, a man hitherto fastidious about his appearance may fail to shave cleanly, or a woman usually scrupulous about her hair may leave it unbrushed and untidy; again, a normally punctual person may start to get up late and show no concern about prompt arrival at work. Every change in behaviour cannot, of course, be regarded as having a sinister meaning. An intimate relative is quick to detect deterioration, but often withholds the information if not directly cross-questioned. The assessment of a minor change in behaviour makes heavy calls on the good judgment and experience of a general practitioner. Frank mental confusion and gross faults in behaviour, such as incontinence, are later signs of mental deterioration. Mental signs may, of course, be due to many kinds of pathological change, and when present can merely call attention to the possibility of a cerebral tumour and no more.

4. *Abnormal Neurological Signs.*—The appearance and persistence of an abnormal neurological sign was the first evidence of neoplasm in 34 of the 231 cases. All these signs, some of which developed rapidly and some slowly, could obviously have been caused by a lesion other than a tumour. They are as follows: hemiparesis, in 16 cases; dysphasia, 9; squint, 4; sensory loss, 2; ataxia, 3.

Differential Diagnosis

It will be apparent, therefore, that in most cases of glioma it is impossible to make a diagnosis on the first symptom or sign. Often it is difficult even to decide whether or not the brain itself is primarily affected. Also, to make diagnosis more difficult, other space-occupying lesions present more or less in the same way. In our series, for example, the gliomata had to be differentiated not only from vascular and degenerative lesions of the central nervous system, but from other types of space-occupying lesion, as shown in Table II.

TABLE II

Diagnosis	Adults	Children (Up to the Age of 12)
Glioma	411	55
Secondary carcinoma	62	2
Meningioma	59	—
Acoustic neuroma	25	—
Tumour of pituitary body or stalk	61	6
Epidermoid (cholesteatoma)	5	—
Granuloma	7	7
Total	630	70

In the few instances when the first symptom or sign throws strong suspicion on the possibility of a cerebral neoplasm it is probably wiser to proceed with special neurological investigations to establish diagnosis than to await the development of further confirmatory symptoms or signs. In the majority of cases, however, it is necessary to await possible developments before it can be decided that one is dealing with a progressive lesion of the central nervous system. But it is absolutely wrong to await the development of a fully established clinical syndrome before making a diagnosis or applying special diagnostic tests. For example, it is not necessary, in the case of a man who is forgetting an occasional word, to defer a diagnosis of glioblastoma until he is completely aphasic, disorientated, incontinent, and going blind with papilloedema. At the same time to swing violently from the policy of overwaiting to mere mechanistic methods of diagnosis is equally unsatisfactory. Obviously a multitude of patients with minor and purely transient disorders should not be subjected to the discomforts and dangers of special neurological investigations, nor should the usual simple clinical tests to eliminate conditions such as nephritis and hypertension be omitted.

Special Diagnostic Methods

Although straight radiographs of the head rarely reveal anything abnormal in the early stages of a space-occupying mass in the brain, they do occasionally show signs of pressure, hyperostosis, erosion, calcification, or dislocation of the pineal gland, and therefore should be made use of, particularly as this form of radiography is painless and without danger. Electroencephalographic investigation is also painless and without risk, and should be used routinely in the detection of neoplasms in their early stages. We have found electroencephalography to have limited value, however, as it tends to establish that a physical lesion is present without giving precise information concerning its pathology; but this should not preclude its free use.

Lumbar puncture may show that intracranial pressure is raised before there is clinical evidence of it. Occasionally a rise in the protein content of the cerebrospinal fluid is the first positive evidence of a cerebral tumour. In the early stages of a space-occupying lesion the value of lumbar puncture far outweighs its possible dangers.

When, in spite of the procedures referred to above, diagnosis is still in doubt, air encephalography, ventriculography, or cerebral angiography will be necessary to decide whether a neoplasm is present, and, if so, its nature.

In our experience, where there is little evidence of a rise in intracranial pressure, air encephalography is perfectly safe and is one of the most reliable methods for detecting a space-occupying lesion of the brain. Although we have performed air encephalography many hundreds of times during the last ten years we have not had one fatality or seen a single complication as a result.

Ventriculography is the safer method of air or oxygen replacement when there is obvious evidence that the intracranial pressure is raised. This procedure involves making two holes in the skull through which cannulae can be passed into the lateral ventricle, whereas with air encephalography it is necessary only to tap the spinal theca with a hollow needle at the lumbar or cisterna magna level.

Cerebral angiography is a most important procedure, by the aid of which it is possible not only to determine with great precision whether a space-occupying lesion is present and, if so, its location, but also to obtain valuable information concerning its pathology.

Neither cerebral angiography nor ventriculography is to be carried out lightly, as considerable danger is involved.

Operative Treatment

It is our purpose to summarize briefly the surgical methods of treatment we have employed in this series of 466 cases of glioma, of which 405 were operated upon, and to review our main surgical conclusions.

1. When once a cerebral tumour has been firmly diagnosed in its early stages, and provided the intracranial pressure is not high, no effort should be spared to establish its precise location and pathological nature, if necessary by air studies and angiography.

2. Burr-hole inspection and probing we have found to be useful in diagnosis for excluding chronic subdural haematoma or intracranial abscess, but taking a biopsy specimen through a burr-hole we have found to be of little value and often dangerous.

3. In the later stages of a cerebral neoplasm, when the intracranial pressure has been obviously high, we have often dispensed with air studies or angiography and chosen the site for exploration on the evidence of clinical symptoms and signs. Nowadays the removal of an osteoplastic flap for exploration of a tumour through the dura mater is a relatively benign procedure; it is often safer, quicker, and less dangerous to the patient than ventriculography or angiography.

4. To plan an exploration over the vault of the skull or in the posterior fossa merely to uncover a tumour without also taking into account the anatomical peculiarities of the area concerned will usually lead to unnecessary technical complications; for example, radical operations in the area of the frontal fossa are difficult unless the osteoplastic flap has been cut close to the edge of the superior longitudinal sinus and down to the floor of the frontal fossa. In operations in the area of the posterior fossa an angle tumour cannot be approached adequately through a midline exposure.

5. When operating to remove one of the more benign types of glioma the excision should be as radical as possible but without inflicting damage on those areas of the brain that must inevitably lead to severe incapacity. For example, we regard the surgical imposition of a hemiplegia as worse than failure.

6. Experience has taught us that piecemeal removal of a glioma is a waste of time. The only worthwhile type of internal decompression is the formal resection of a block of cerebral tissue—for example, excision of that part of the frontal lobe of the brain that lies within the anterior fossa.

7. Subtemporal decompression is to be avoided at all costs. For the last ten years it has been our practice, even if an osteoplastic flap is raised, never to open the dura mater unless there is reasonable certainty that it can be closed again; in other words, operability must be deter-

mined by the appearance of the brain through the dura mater or by probing. First to open the dura in the hope of being able to do something useful operatively will in only too many cases lead to the development of unsightly bulges on the head due to cerebral herniations.

8. When a diagnosis of malignant glioma can be established beyond reasonable doubt, a surgeon is justified in refraining from operating. With the help of special investigations, particularly cerebral angiography, a reasonably certain diagnosis can often be arrived at.

Prognosis

It will have been seen from the section on surgical pathology that every glioma is malignant. Indeed, the majority of gliomata are highly malignant and grow so quickly that they cause serious incapacity within a few months, and death within two years. A small percentage of neoplasms at the astrocytomatous end of the scale are relatively benign and may continue to grow for 10 to 20 years before fatally compressing the brain-stem. Some tumours, such as the cystic gliomata and haemangioblastomata of the cerebellum, although not naturally self-limiting, are so circumscribed that they can be totally excised and the patient cured. However, in the large majority of cases surgery cannot offer cures, and, this being so, it might with reason be asked why a neurological surgeon so often operates on the gliomata. Indeed, the taunt that his persistent efforts at surgical cure in these cases reveal "the triumph of optimism over common sense" has often been levelled. There is no doubt to prolong a patient's life in misery is poor surgical judgment. None the less, despite his knowledge and experience, a surgeon is often compelled to operate against his better judgment, by pressure of relatives or colleagues or by the uncertainty of the pathological diagnosis.

In reviewing the results of the operative treatment of gliomata a broad perspective must be maintained. For example, a patient's life can easily be prolonged by a wide but unsightly subtemporal decompression. In this connexion it might be asked what are the ethical responsibilities of a surgeon. His main object is, of course, to cure the patient or to relieve severe symptoms which are unaffected by simpler methods. However, a surgeon is quite entitled not to interfere with natural processes where he is confident he cannot favourably alter their course by his intervention. The more experienced a surgeon becomes the less frequently is he inclined to operate on gliomata.

Results

The results in our series have been as follows:

Cures.—Seven patients have been completely cured; in this group were 2 cases of haemangioblastoma and 3 of cystic astrocytoma of the cerebellum, and 2 of mucous cyst of the third ventricle.

Substantial Prolongation of Useful Life.—Twenty-three patients who were already completely incapacitated by the effects of cerebral compression were returned to useful life for the following periods: 4 with cystic glioma of the cerebellum, 5 years; 2 with oligodendroglioma of the frontal lobe, 5 years; 10 with cystic astrocytoma of a hemisphere, 2 years; and 7 with oligodendroglioma of a hemisphere, 2 years.

Substantial Relief of Symptoms.—In 52 cases distressing symptoms, such as severe pain and intractable vomiting, were relieved by operation when drugs, other than those interfering with consciousness, were of no avail.

Deep x-ray therapy, although found to retard the rate of growth of some of the more highly malignant of the gliomata, was never curative.

Conclusions

Though surgery has little to offer in the cure of cerebral gliomata, the diagnosis of these neoplasms, the care of patients suffering from them, and the management of near

relatives still remain the onerous responsibility, and the duty, of those doctors who choose to make the problem of cerebral neoplasia one of their primary interests. Moreover—and this is even more important—in our series of 700 unselected cases of cerebral neoplasm, although 466 were gliomata, there were 147 cases that were potentially curable by surgery; in other words, 21% of favourable cases. In cases of neoplasm of the brain the segregation of the favourable cases from those of glioma in the early stages is one of the main problems of differential diagnosis, and carelessness in the diagnosis and handling of the glioma cases will reflect unfavourably on the potentially curable group.

In a further group of cases we are already using the newer methods of diagnosis, such as with radioactive isotopes, and are experimenting with biochemical forms of treatment and deep x-ray therapy.

Summary

Experience with 700 cerebral neoplasms, of which 466 were gliomata, is reviewed.

The majority of these new growths are highly malignant and lead to death within two years. Early diagnosis is important. The initial symptoms and signs are raised intracranial pressure, epilepsy, mental change, and neurological signs, though it is generally impossible to base a diagnosis solely on the clinical evidence. X rays, electroencephalography, and lumbar puncture are useful diagnostic aids, but when these fail air encephalography, ventriculography, or angiography will be necessary to decide if a space-occupying lesion is present.

Surgical methods of treatment are summarized and discussed. It is emphasized that subtemporal decompression should be avoided.

Of the 405 patients operated upon, 7 were cured, 23 were returned to a useful life for periods of two to five years, and 52 relieved of distressing symptoms such as severe pain and vomiting.

The preparation of this work was assisted by a Research Grant from No. 1 Regional Hospital Board.

REFERENCE

Bailey, P., and Cushing, H. W. (1926). *A Classification of the Tumours of the Glioma Group on a Histogenic Basis with a Correlated Study of Prognosis*. Lippincott, Philadelphia.

The "Mental Health Facilities and Needs of Australia" were the subject of a report drawn up by Dr. ALAN STOLLER, Melbourne psychiatrist, with the assistance of Mr. K. W. ARSCOTT. The report was undertaken at the instigation of the Commonwealth Government and published by it. Its scope included examination of mental hospitals and auxiliary services, mental deficiency programmes, psychiatric services, and State legislation. Dr. Stoller sums up his findings on the hospitals: "Mental hospitals are hopelessly overcrowded, poorly maintained, and short-staffed. . . . Diagnostic and treatment equipment and facilities are sorely lacking. The hospitals are in no position to develop out-patient, training, and educational programmes, and research is virtually unthinkable." The average overcrowding percentage was 20%—at the main mental hospital for Queensland the figure was 95%. Victoria had the best mental health facilities, with active voluntary bodies, and residential centres for defective children. New South Wales provided four psychiatric clinics through the school medical service; elsewhere help for retarded children was extremely limited and legislation for them incomplete, so that often the number of such children was unknown. Early in May the Commonwealth Government announced a £A.30m. capital works programme to improve mental health facilities throughout the country.

BERYLLIOSIS: A CASE REPORT

BY

I. B. SNEDDON, M.B., Ch.B., M.R.C.P.

Consultant Dermatologist, Rupert Hallam Department of Dermatology, Sheffield

The hazards of dermatitis and respiratory disease from handling beryllium compounds were known in Europe before the last war, and Marradi Fabroni (1935) suggested calling the lung disease berylliosis. Various syndromes caused by beryllium were seen in considerable numbers in the United States of America during the last war, and these have been reviewed by DeNardi *et al.* (1953). In Great Britain, beryllium has been used, though not in the same quantities as in America, in the fluorescent lamp industry and in the form of beryllium-copper alloys in the manufacture of electrical equipment and special springs. It is remarkable, therefore, that there has been only one published case of delayed pneumonitis in a beryllium worker in this country (Agate, 1948) and one case of beryllium granuloma of the skin in a fluorescent-light-tube worker (Lederer and Savage, 1954).

The delayed chemical pneumonitis first described by Hardy and Tabershaw (1946) is perhaps the most interesting and elusive manifestation of beryllium toxicity. It is a slowly progressive sarcoid-like change in the lungs and liver which may come on after a very short exposure to beryllium compounds and after a latent period which may vary from a few months to eleven years. The clinical features are the insidious onset of weight loss, weakness, dyspnoea, and cough, with occasional febrile periods. The prognosis is grave, as the mortality in 35 cases reported by DeNardi *et al.* (1953) was 35%, and many of the remainder were severely disabled by pulmonary fibrosis.

The only British case (Agate, 1948) occurred in a physicist working on the development of tubular fluorescent lamps who was exposed to small quantities of zinc beryllium manganese. His symptoms did not develop until three years after his last contact with beryllium.

Although the first cases were described in a fluorescent lamp factory, it has also been reported in a brass foundry making and finishing beryllium-copper alloys (Jackson, 1950), and even in people who lived near beryllium extraction plants. Hardy (1951) lists 11 different industries in which chronic beryllium poisoning has been found. The incidence of chronic berylliosis is fortunately low. DeNardi *et al.* (1953) report 8 cases among 3,027 workers in three beryllium extraction plants, though 6 cases were found in 310 workers in the brass foundry (Jackson, 1950).

The following case is reported to draw attention to the possibility of delayed chemical pneumonitis due to beryllium in an industry hitherto regarded as safe. The case also shows the combination of unusual skin granulomata with lung lesions and would appear to be due to beryllium-copper alloy.

Case Record

A 25-year-old woman was referred to the skin department in August, 1954, for treatment of Raynaud's phenomenon of the fingers, from which she had suffered since the age of 10. It was noted that, as well as having cold blue fingers, she had numerous linear granulomatous papules on the fingers, palms, forearms, and legs (Fig. 1), and that she had a granulating wound on the dorsum of the left foot, which she

FIG. 1 (Above).—Leg showing linear sarcoid reaction. FIG. 2 (Below).—Patch tests with beryllium salts 48 hours after application.

stated she had cut at work four months previously and which had not healed. The granulomatous papules had appeared in the previous year. She also complained of a dry cough and increasing shortness of breath, which had so worried her that two weeks previously she had attended a mass radiography unit for a chest x-ray examination but no abnormality had been found. She had not lost weight, but had felt weak.

At the age of 10 she had had an attack of arthritis which had left some deformity of the right hand. Since the age of 10 she had had Raynaud's phenomenon of the fingers and toes. Her family history showed nothing relevant.

Occupational History.—For eight and a half years she had been employed by a firm of precious-metal smelters. For the first five years she was a backer in the rolling mill, handling gold, silver, and platinum sheets, and for the remaining three and a half years she operated a rotary shearing machine. This machine trimmed metal strip, a considerable quantity of which was 2% beryllium-copper alloy. She sustained frequent cuts and scratches on her hands, forearms, and legs from the sharp and jagged edges of the metal strip, and she could recall that the cut on her foot and several of the other linear granulomatous lesions had been caused by beryllium-copper strip. The machine which she operated was in a room by itself and she had no contact with fumes or dust from any other process. The shearing blade of the machine revolved only slowly, but fragments of the metal were occasionally thrown off.

On examination in August, 1954, she was not dyspnoeic at rest, but slight exertion produced rapid shallow breathing. Her fingers when cold were dusky blue and there was soft-tissue thickening around the right second and third metacarpophalangeal joints. On the back of the fingers and in the palms were numerous firm bluish-red papules, mainly aggregated in lines 0.5–1 cm. long. In the palms also were several superficial dry ulcers 2 mm. in diameter which resembled small chrome ulcers. On both forearms and on the lower part of the legs were more papules varying in colour from a yellowish brown on the forearms to a purplish blue

on the legs, which showed acrocyanosis. On the limbs the papules had obviously occurred along scratch marks. On the dorsum of the left foot was a healing laceration which showed a granulomatous lupoid change in the scar. No skin lesions were found on the trunk or face. No abnormality could be found in the cardiovascular system, nor were any adventitious sounds heard in the chest. There was no lymph-node enlargement, and the liver and spleen were not palpable.

Investigations

Histological examination of a papule from the left middle finger showed, in the dermis, numerous well-circumscribed nodules separated by dense fibrous tissue. The nodules consisted of foci of epithelioid cells, multinucleated giant cells, and small round cells. There was no caseation. Dark-ground and polarized-light examination of the section showed no foreign bodies. Histochemical staining for beryllium was negative. Mantoux test, 1/1,000 and 1/100—negative. The blood W.R. and Kahn test were negative. A blood count showed: Hb, 96%; white cells, 6,000 per c.mm. (polymorphs 60%, lymphocytes 30%, monocytes 8%, eosinophils 2%); E.S.R., 27 mm. in 1 hour; serum calcium, 9.8 mg. per 100 ml.; plasma proteins, total 7.3 g. per 100 ml. (albumin 4.8 g., globulin 2.5 g.). The E.C.G. was normal. Beryllium in urine, negative; beryllium in skin, negative.

Radiological examination of the hands and feet showed no abnormality. The lung fields showed a generalized very fine stippling; the picture was not the usual one seen in sarcoidosis, in which the stippling is usually dense and the hilar glands are more commonly involved. The evidence seemed to point to these changes being berylliosis rather than sarcoidosis, although differentiation is extremely difficult. Miniature radiographs of October, 1953, and August, 1954, did not demonstrate changes.

Skin patch tests were carried out with 1% and 2% solutions of beryllium sulphate and beryllium nitrate. In 48 hours a strongly positive eczematous reaction occurred beneath all four patches (Fig. 2). The inflammatory reaction was still present three weeks after the tests, and a skin biopsy was carried out from one area. There was a pronounced pseudo-tuberculous reaction in the dermis, made up of groups of concentric follicles. Each follicle was comprised of epithelioid cells, and most contained a multinucleated giant cell, some of these being very large with up to 50 nuclei. In one or two of the deeper follicles there was a necrotic centre. The epidermal changes were not significant. The follicles differed from the usual form of sarcoid in showing the central necrosis. No acid-fast bacilli could be found, nor optically active particles. Patch tests, using the same strength of solution carried out on 113 normal controls, were negative. One hundred of these patch tests were performed at St. John's Hospital for Diseases of the Skin (C. D. Calnan, 1955, personal communication).

Respiratory Function Tests.—Gaensler Timed Vital Capacity:—Total vital capacity, 2.19 litres, which is 75% of the predicted value for her age and weight; percentage of vital capacity expired in the first 0.75 second = 75% (normal). Helium mixing:—The rate of diffusion of the helium was slightly abnormal; there was some slowing of diffusion even in the best-ventilated part, and a small volume into which diffusion was slower still.

Progress.—The patient's dyspnoea and cough has become more marked during the three months she has been under observation. For several days after the patch tests the dyspnoea appeared to get worse than usual and moist rales were heard over both lungs for the first time. These have since disappeared. She has been removed from contact with beryllium and has been found a sedentary job which is within her capabilities.

Diagnosis

The presenting feature of sarcoid-like granulomata on skin damaged by beryllium-copper strip suggested at an early stage that at least the skin lesions were being produced by

beryllium, though lesions occurring as a Koebner phenomenon in sarcoidosis could not be excluded. The presence of small indolent ulcers clinically resembling chrome ulcers and previously described beryllium ulcers was, however, much in favour of berylliosis.

In 1953 DeNardi *et al.* reported the reliability of skin patch tests, which, they stated, showed an eczematous contact sensitivity in cases of berylliosis which had never shown any evidence of dermatitis. Patch tests were positive in 12 of their cases of chronic berylliosis, and results were negative in 5 other patients with various lung diseases, including sarcoidosis. The reliability of patch tests is also stressed by Van Ordstrand (1954), who states that, so far, he has no knowledge of a false-positive result. DeNardi *et al.* suggest four criteria upon which the diagnosis should be based: (1) history of exposure to beryllium; (2) clinical course of the pulmonary syndrome, including studies of pulmonary function; (3) radiographic evidence of granulomatosis of the lungs; and (4) patch tests.

The radiographic changes shown are those described by Wilson (1948) as stage I. He states that the earliest recognizable variation from the normal is a fine diffuse granularity presenting a fine sandpaper appearance, which under magnification of a reading-glass suggests a sandstorm. It is of interest that the miniature films taken by the mass radiography unit were incapable of showing this early positive change.

The patch tests were strongly positive, and it appeared that during the height of the skin reactions the lung lesions became temporarily more active. The initial change in the skin beneath the test patches appeared macroscopically to be an eczematous one, but a biopsy was not carried out immediately and there is no histological confirmation of this. Most significant, however, is the finding in the patch-test area three weeks later. Macroscopically the skin was still reddened and scaly and slight induration could be felt. Histologically, a sarcoid reaction was already present, and this extended deep into the corium. Histochemical staining to detect beryllium failed to demonstrate the metal in this tissue. Attempts to demonstrate beryllium in the urine and in skin papules from the forearm were also negative. Although unsatisfactory, there are a number of proved cases of berylliosis with similar negative findings (DeNardi *et al.*, 1953; Agate, 1948; Lederer and Savage, 1954).

Discussion

This case provides additional evidence that it is beryllium itself rather than beryllium in association with silicates which is responsible for the sarcoid-like granulomata of the lungs and dermis. It also supports the theory that berylliosis is an acquired allergy. In favour of the allergy theory are the low incidence among workers exposed to beryllium, the long latent period, and the minute amounts of the metal necessary to produce the disease.

It is difficult to determine in the present case how the beryllium entered the body, since the metal chips from the shearing machine were quite large and not likely to be airborne. That sufficient entered the body to produce an eczematous hypersensitivity is proved by the positive patch tests. It is perhaps strange that the patient did not show a contact dermatitis when handling the beryllium alloy, but the explanation may lie in the fact that metallic beryllium is very insoluble and until it has undergone some change in the body does not produce a response. Aldridge *et al.* (1949) have shown that beryllium ions attach themselves rapidly to protein, and it is likely that a beryllium-protein compound acts as the sensitizing allergen for the skin.

Of great interest was the sarcoid-like change in the dermis three weeks after application of beryllium nitrate solution to the skin. This reaction has not previously been reported in berylliosis. Although sarcoid reactions can be produced in sarcoid patients by the injection of extracts of lymph nodes and by tubercle bacilli and their extracts, I have been unable to discover a previous description of a sarcoid re-

action to substances applied to the skin. If the dermis responds to the presence of beryllium in this way, it is possible that the lung responds in the same way and the delayed chemical pneumonitis can thus be explained as an acquired hypersensitivity.

As has been stated, the prognosis of chronic berylliosis is poor and treatment has been disappointing, though there have been reports of benefit from the steroid hormones (Kennedy *et al.*, 1951). In the present case the symptoms are not disabling, and after removal from contact with beryllium the patient has been encouraged to continue working at a sedentary job within her physical capabilities.

Summary

A girl trimming 2% beryllium-copper alloy strip for three and a half years developed sarcoid-like granulomata on her hands and forearms, which had been scratched by the metal strip. She was found to have a pulmonary granulomatosis clinically similar to delayed chemical pneumonitis due to beryllium.

The case fulfilled all the criteria for diagnosis of systemic berylliosis and, in particular, illustrated eczematous hypersensitivity to beryllium shown by positive patch tests, to high dilution of beryllium salts, and a delayed sarcoid reaction in the skin used for the patch tests.

My thanks are due to Dr. Marjorie Clifton, of the Department of Medicine, Sheffield University, who carried out the respiratory function tests; to Dr. P. L. Bidstrup, of the London Hospital, for the estimations of beryllium in the urine and skin; to Professor D. H. Collins for the pathological reports; to Dr. J. M. Barnes, of the Toxicology Research Station, for the histochemical examination of the skin sections; to Mr. R. Brook for the photographs; and, lastly, to the patient, who submitted most willingly to the lengthy investigations.

[A short report of this case has already been published in the *Proceedings of the Royal Society of Medicine*, 1955, 48, 175.]

Progress in the various branches of science needed for pest control is reviewed in the Pest Infestation Research Board report for 1954 (H.M.S.O., 3s.). The biology section is studying the population of pests associated with buildings, such as invest birds' nests or bat roosts; and also the populations found on stored materials, particularly those of the Khapra beetle—a serious pest in the maltings of Britain. The laboratory successfully fumigated Nelson's H.M.S. *Victory* with methyl bromide. No major change is reported in the work of the insecticide section, which has made considerable progress in studying the relative susceptibility of insects to insecticides. Paradichlorobenzene, in a test where Service uniforms were exposed to infestation for eight weeks, was found to kill all adult carpet beetles and 90% of the larvae; eggs hatched, but the young larvae died. 2% chlordane in refined kerosene painted in 3-in. (8-cm.) bands along the foot of walls, pipes, sinks, etc., and 5% chlordane in a non-inflammable oil on the outside walls, rid a 17-ward tuberculosis sanatorium of Pharaoh's ant at a cost of £75. Pit storage of grain is being tested throughout Africa and Cyprus; a gas-proof sheeting material is being tried out for this in collaboration with the Ministry of Supply.

GUILLOTINE TONSILLECTOMY AND CURETTAGE OF ADENOIDS UNDER ETHYL CHLORIDE ANAESTHESIA

BY

J. C. CAMPBELL, F.R.C.S.Ed.

Consultant in E.N.T. Surgery, East and West Cumberland and Dumfries Hospital Groups

AND

D. HUNTER SMITH, F.F.A.R.C.S.

Consultant Anaesthetist, East Cumberland Hospital Group

(From the City General Hospital, Carlisle)

This paper had been completed before the recent correspondence on the guillotine operation appeared in the *British Medical Journal*. This correspondence confirms our impression of the misunderstanding which exists concerning the guillotine operation and the anaesthesia required for it.

The published objections to the operation for removal of tonsils and adenoids in children by guillotine and curette under ethyl chloride anaesthesia would lead one to suppose that it was a thoroughly unsatisfactory procedure. This conclusion is entirely at variance with our experience; we here attempt to explain why this should be so, and why these objections should have gained such wide currency. In addition, we examine the suitability and safety of ethyl chloride as an anaesthetic agent for this operation.

Introduction

Removal of the tonsils is an extremely old operation, and is believed to have been practised before 53 B.C. It is, however, difficult to suppose that complete enucleation was often achieved, or that any definitive operation was possible before the introduction of anaesthetics. Nevertheless, in view of the technical difficulties (apart altogether from any considerations of humanity), it is worth noting that removal of the tonsils and adenoids in children entirely without anaesthesia has been not only practised but actually recommended, both in this country (Sydenham, 1935) and in Egypt (Shaheen, 1935), a mere twenty years ago.

Nowadays tonsillectomy is performed either by planned dissection or with the guillotine. Either method may be used in children, except in the presence of peritonsillar fibrosis, where, as in adults, dissection is by universal consent the correct procedure. Waugh (1909) drew attention to the poor standard of work being done with the guillotine, and recommended dissection. More recently Jobson (1942) gave what we believe to be the correct answer—namely, "... undoubtedly a great deal of bad work is done with the guillotine ... [but if] Sluder can produce 99.6% of complete enucleations, the method cannot be at fault." Throughout the intervening years the controversy over the respective merits of the two procedures has been bitter; but it is not our purpose to argue in favour of the superiority of one or other. We are concerned merely to record our impressions of what we regard as a satisfactory operation.

Technique

We have used the guillotine operation extensively in children up to the age of about 14 years, except, of course, in those with obvious peritonsillar fibrosis, and the details of the technique employed are as follows.

The only pre-operative medication administered is atropine sulphate, 1/100 gr. (0.65 mg.) injected subcutaneously about 45 minutes before operation. The gag is not inserted before beginning the induction of anaesthesia.

The child is "coaxed" to sleep with nitrous oxide from a Boyle's machine, while the anaesthetist simultaneously utters simple phrases of explanation and reassurance. The mask is applied to the face only when unconsciousness has supervened, and a little oxygen is then admitted. After a few further breaths the nitrous oxide is turned off, and some 5–10 ml. of ethyl chloride is introduced gradually into the breathing-tube. The anaesthetist indicates that the depth of anaesthesia is suitable by raising the child's head and shoulders, while a nurse removes the mask with one hand and places a small sandbag under the shoulders with the other. The surgeon now inserts the gag on the left side and opens the mouth. From this point on, the anaesthetist controls the gag with his left hand, and with his right he modifies the position of the head from moment to moment to suit the manoeuvres of the surgeon.

The surgeon next introduces the guillotine and removes each tonsil in turn, the anterior faucial pillar being gently pushed off the tonsil by one or more partial closures of the blade before the guillotine is fully closed. Each fossa is then inspected and palpated. The adenoids are then removed, the curette being introduced as often as is necessary to achieve complete removal. The child is turned over on its right side, the throat is mopped out and reinspected and the gag is removed. The chin is pushed forward routinely lest, as sometimes occurs, the temporo-mandibular joints should have been subluxated.

The patient's face and neck are liberally sponged with cold water; and finally, when the protective reflexes have manifestly returned and the bleeding has abated, the child is carried back to the ward head down, and placed in bed in the lateral or semi-prone position.

Discussion

Certain aspects of this procedure merit some discussion.

1. Pre-anaesthetic Sedation.—We believe that the dangers (Jackson, 1951) of administering pre-operative sedatives to children have been exaggerated; and we are not opposed in principle to their rational use (Anderson, 1952) in order to achieve a carefully judged effect. However, children thus sedated may exhibit post-operative somnolence and later restlessness, demanding a degree of continuous individual attention for a variable period. We feel that the necessity for sedation can be virtually eliminated if the children are handled at all stages with a sensible mixture of tact and frankness, and if, above all, they are subjected to a considerate induction of anaesthesia.

2. Anaesthesia.—The considerate induction referred to is provided by nitrous oxide and oxygen, as described above, since we agree with Bromage (1950) that it is "... more acceptable to the apprehensive patient than the most humane ethyl chloride induction." The nitrous oxide/oxygen/ethyl chloride sequence has been described before in various forms by Westell (1941), Minnitt and Gillies (1948), and Bromage (1950), among others. We have found that the great majority of children accept it almost without a murmur, though the amount of encouragement and persuasion required varies considerably. A few are a little tearful, but if sufficient patience is exerted none need be terrified. This picture presents a happy contrast to scenes which many doctors must recollect with distaste. Though it may seem obvious, it is worth pointing out that the dose of ethyl chloride for any given child is that amount which is required to produce the desired level of anaesthesia. There is no standard dose, and it is wise to have available rather more than is thought will be necessary. There are three main grounds for advocating a pleasant induction:

(a) All creatures have the right to expect that unpleasant procedures to which they have to be subjected in their own interests shall be made as tolerable as possible. This applies with even greater force to children than to adults, in that the former are more vulnerable because of their immature level of understanding, and because they are of necessity less able to protest effectively against callous handling.

(b) Many authors—for example, Burstein (1953) and Capon (1954)—have called attention to the psychic trauma which may follow crude induction of anaesthesia in children. Jackson (1951) cites night terrors, temper-tantrums, destructiveness, and increased fears. Gorham (1935) wrote: "... children may change in character... becoming nervous, irritable and waking up at night screaming... in some cases these symptoms last a week or two, in others as long as nine months. Nocturnal sedatives have had to be administered for quite long periods." Deming (1952) believes that the normal emotional growth of children may be disturbed by fears, obsessions, and regressive behaviour resulting from unpleasant anaesthetic encounters.

(c) No doubt large numbers of normal well-balanced children who are subjected to disagreeable experiences escape actual psychic trauma, but it is evident that a persistent fear of hospitals and everything connected with them may result. The development of such an attitude, which at best prejudices adjustment to the crisis of illness and at worst endangers life itself—for example, in cancer (Aitken-Swan and Paterson, 1955)—must be countered by every possible measure.

As well as fulfilling the foregoing psychological criteria, the method described provides for the immediate and continuous availability of oxygen. The importance of avoiding anoxia in all circumstances, and particularly in the presence of a potentially toxic agent such as ethyl chloride, has been repeatedly stressed, and is now very widely appreciated (Bird, 1930; Bromage, 1950). It is disturbing to learn that the use of oxygen with ethyl chloride has been deprecated on the ground that it was responsible for a prolonged and turbulent induction (Kingsford, 1930).

3. *Use of Gag.*—The gag is inserted after the child is anaesthetized, because the conscious child dislikes the presence of a gag in the mouth—it is puzzling and frightening, and it hinders the accomplishment of a smooth induction. Also, it is often dislodged deliberately or inadvertently in early anaesthesia; and if not, teeth may be loosened or damaged if the jaws are clenched in the second stage. We have, in any case, never encountered any difficulty in introducing it after the required depth of anaesthesia has been attained. It is well known that spasm of the masseters may occasionally persist even in deep ethyl chloride anaesthesia. In this event, a combination of sustained downward pressure on the chin and counter-pressure on the forehead is employed to separate the teeth enough to permit insertion of the gag, which is then opened, assisted if necessary by the pressure of the surgeon's forefinger and thumb on the lower and upper incisors respectively.

4. *Inspection.*—Should the final inspection show, if ever, that a remnant has been left, anaesthesia is resumed with nitrous oxide, oxygen, and ether or trichlorethylene by insufflation through the side-tube of the Boyle-Davis gag, or (preferably) through a nasotracheal tube; and the surgeon then dissects out the remnant.

5. *Recovery.*—The use of cold water slightly accelerates recovery from the anaesthetic by reflexly stimulating the respiration. It is also thought to hasten the arrest of bleeding, probably by inducing reflex vasoconstriction.

Classical Objections Considered

The following selection is representative of the objections of the very numerous authors who have recorded their disapproval of the guillotine operation (the italics are ours throughout).

Sharp (1952) sums up thus: "The guillotine, in the hands of experts, usually results in a satisfactory removal of large pedunculated tonsils, but the buried fibrotic tonsils present difficulties, and removal of them results in damage to the pillars of the fauces; the *necessarily light anaesthesia* generally employed gives little time for a deliberate and considered removal of the adenoids." He also remarks that, while the dissection method is the more leisurely procedure and is the operation of choice, it must be undertaken with the co-operation of an *experienced anaesthetist*.

McKenzie (1951), discussing the question "Dissection or guillotine?" remarks that there are failures with both methods, but that poor results due to the guillotine are the more common. He goes on to give a graphic description

of how they occur: "Most people are right-handed, and they seize the guillotine in their right hand, so that the right tonsil is removed first. The mouth now fills with blood, the patient may be *lightly anaesthetized* and cough repeatedly, and the left tonsil is hard to grasp. In consequence, a tonsil remnant is more likely on the left side." This is indeed a terrifying picture.

Atkinson (1942) is even more dramatic: "... hurried manipulations terminating in a rising tide of blood... The *lightly anaesthetized* patient is turned over, and, against a tightening barrier of resistant palatine muscle, the curette is forced into the nasopharynx... The adenoids become a concluding gesture in a welter of blood and confusion."

Laurence (1942) states: "... one should use an anaesthetic which permits one to do all that one wants to do." But he considers that ethyl chloride emphatically does not fulfil this specification.

Scott Stevenson (1952), comparing the two methods, considers that, though the dissection method possesses the greater advantages, it is not easy, takes longer, and requires a longer and *deeper anaesthesia*.

The criticisms embodied in these views may be grouped under two headings:

(1) That it is difficult to be certain of removing the tonsils completely, especially if they are buried or fibrotic; and that the faucial pillars and the palate may be damaged in the process. We have not found this to be so, but we have no doubt that if the guillotine is used routinely there will be failures attributable to peritonsillar fibrosis. From the description of our procedure it should be evident that there is ample time for the careful removal, inspection, and palpation mentioned. The other essential, if the peritonsillar tissues are to escape damage and easy access to the adenoids is to be provided, is that the musculature of the faucial pillars and soft palate be well *relaxed*—and this leads to the second group of objections.

(2) That the supposedly inevitable lightness of the anaesthesia, by providing inadequate muscular relaxation and compelling the surgeon to hurry, increases the hazards mentioned under (1) and impedes access to the adenoids. We are driven to conclude from the opinions previously quoted that the respective authors have based their views on the efforts of anaesthetists inexperienced in the use of ethyl chloride.

The guillotine operation is often regarded as a trivial one, and until quite recently the anaesthesia was commonly entrusted to the most junior member of the surgical team. He usually approached his task with reluctance and fear. The only positive element in his attitude was a vague but correct belief in the potency of the agent. Consequently it became his fixed resolve to brave the surgeon's annoyance at an inadequate anaesthesia rather than to run the slightest risk of the fatal result which he dreaded. Conversely, an occasional death may be attributable to a perverse determination in the opposite sense. Thus, we interpret the prevalent dislike of the guillotine operation as being largely an oblique protest against the inexperienced anaesthetist.

It cannot be too strongly emphasized that, far from being light, the anaesthesia must, on the contrary, be *deep*—a little deeper initially than the average depth of the anaesthesia for the dissection operation. The coughing and swallowing reflexes must be suppressed and the pharyngeal and palatal musculature fully relaxed to permit deliberate surgery. Further, with an agent such as ethyl chloride, which is highly volatile, and rapid both in its action and in its elimination, the *duration* of anaesthesia is closely related to the *depth* attained by the time the mask is removed. Thus, apart from providing the necessary relaxation, a reasonably deep anaesthesia assists the surgeon by allowing him longer operating time.

Moreover, is expert anaesthesia so essential for the dissection operation? Certainly, the more experienced the anaesthetist the better—but sometimes a choice has to be made. If so, we believe that the more experienced anaesthetist should be allotted to the guillotine operation, and

the less experienced for the dissection. A competent E.N.T. surgeon can help a novice anaesthetist who gets into difficulties with an endotracheal tube; and if at any time during the operation the level of anaesthesia becomes too light he can stop and wait for a minute or two until the situation is corrected. Such delays may be irksome, but they do not jeopardize the essential success of the procedure. With the guillotine operation, however, the situation is reversed. The services of an expert anaesthetist can be used to imbue a trainee surgeon with confidence by allowing him to concentrate entirely on the surgical aspects and by safely providing adequate operating-time.

Estimates of the time required for guillotining the tonsils and curetting the adenoids, and also of the time which the single-dose administration of ethyl chloride provides for the operation, vary considerably. Thus, for the operation, times as short as 30 seconds (Shaheen, 1935) and 40 seconds (Newell, 1930) are declared to be ample. Bird (1930), on the other hand, estimated his average operating time at 115 seconds, and did not find this restricted by the anaesthetic technique. Others (Atkinson, 1942; Laurence, 1942) consider that ethyl chloride cannot be relied on to provide enough time for satisfactory surgery.

We find that the surgeon has an average time of about 90 seconds at his disposal, and that this is long enough for a trained operator to accomplish his task in comfort. If the surgeon so requests, the anaesthesia can be deepened more than usual before removing the mask, and the operating-time thereby safely increased to at least two minutes.

Dangers of Ethyl Chloride

Warning of the dangers of ethyl chloride are numerous. Thus, an authoritative textbook of pharmacology (Goodman and Gilman, 1941) states: "... although ethyl chloride is less toxic than chloroform, ventricular fibrillation and sudden cardiac arrest may occur." Stirling (1954) considers that atropine is essential to protect against primary cardiac failure due to vagal stimulation. Leigh and Belton (1946) recommend "adequate premedication" with atropine, but it is more than doubtful if their scheme of dosage fulfils their own criterion of "adequacy."

From recent experimental and clinical studies (Virtue and Pierce, 1951; Bush, Bittenbender, and Adriani, 1952) we conclude that, although these statements are probably applicable to the dog, they cannot be regarded as proved for human subjects. Even in light *chloroform* anaesthesia, the protective role of atropine is doubted (Clark, 1952).

It must be assumed that ethyl chloride has been commonly administered to patients who have not had atropine, or who have had it in theoretically inadequate dosage. Series of 40,000 (Sington, 1930), 30,000 (Hewar, 1930), and 11,723 (Kingsford, 1930) ethyl chloride anaesthetics without a fatality have been reported. None of these authors stated his views on the role of atropine, and we must therefore conclude that they did not employ it, or that they considered its contribution to safety insignificant.

Since, however, most surgeons regard a dry mouth as essential in tonsillectomy, there need be no further discussion of this point.

Various authors (Jobson, 1942; Macintosh and Bannister, 1947; Minnitt and Gillies, 1948; Deming, 1952) draw attention to the dangers and disadvantages of ethyl chloride, including its depressant effect on the myocardium, the narrow margin between the effective and the lethal dose, the liability of laryngospasm, post-operative vomiting, and liver damage, and its potency and the consequent risk of overdosage. In some schools these considerations have been taken so seriously as to lead to the abandonment of ethyl chloride. We have no doubt that this view is too extreme, but we do not enumerate the risks of ethyl chloride anaesthesia merely to dismiss them—rather to emphasize our point that it should be entrusted only to those who have become skilled in its use through proper training and supervision. With this qualification it has proved in our hands to be an admirable agent for the operation under discussion.

Mortality

During the ten-year period 1943–52 the operation of guillotine tonsillectomy and/or curettage of adenoids was performed on 12,038 children up to the age of 14 in Carlisle and the surrounding district by Mr. R. S. Venters or one of his registrars, without a single death.

The only other comparable series which has come to our notice is that of Martin (1922), embracing 14,960 cases operated on in a teaching hospital between 1907 and 1920 with six deaths. Minnitt and Gillies (1948) quote this series along with a personal communication from the author which brings the total number of cases to 23,960, and the deaths to eight. The series is not in fact strictly comparable to ours, because in a small number of cases (not stated exactly) the tonsils were dissected, and it was not wholly confined to children. Nevertheless, all eight deaths were in children undergoing the guillotine operation. In fairness we must state our belief that the contrast in the mortality between Martin's series and our own is largely due to the spectacular improvement in the health of the general population, and especially in that of the "hospital class," during the last two decades.

Summary and Conclusions

Guillotine tonsillectomy and curettage of adenoids carried out by an experienced surgeon, under ethyl chloride anaesthesia administered by a *competent anaesthetist*, is a satisfactory operation.

The procedure, as carried out by us, is described in some detail, emphasis being laid on the necessity for a considerate induction of anaesthesia.

Those who have recorded their objections to the operation base their opinions on an experience of inexpert anaesthesia, usually too light.

Contrary to widespread belief, the operation requires an anaesthesia of considerable depth.

The competent anaesthetist, who is aware of the dangers of ethyl chloride, can employ it safely.

A recent series of over 12,000 cases without a death is recorded, and contrasted with one of some 25,000 dating from the first quarter of the century, in which there were eight deaths.

We are indebted to Mr. R. S. Venters for making his records available to us and for his advice.

ANXIETY REACTIONS IN HYPNOSIS

BY

AINSLIE MEARES, M.B., B.S., D.P.M.

Melbourne, Australia

Many patients exhibit some minor degree of anxiety when the question of hypnosis is first put to them. This is a fairly normal reaction. It is of little consequence, and is ordinarily minimized by establishing good rapport with the patient before mentioning the idea of treatment by hypnosis.

At the Threat of Loss of Ego Control

A mild, transitory anxiety reaction in the early stages of induction is very common. This is associated with the relinquishing of voluntary control. The abandonment of volition is a threat to the ego. It would seem that, under these circumstances, anxiety functions as a warning that all is not well with the psyche. For example, when hypnosis is being induced by suggestions of relaxation, it often happens that the first few suggestions are accepted easily; the patient relaxes, the limbs become flaccid, the facial muscles lose their tone, and the lips tend to gape. At this stage, when the patient is just on the verge of abandoning ego control in favour of the therapist, there is an exacerbation of anxiety. It is manifested by a general increase in tension. The relaxation is not so complete; the naso-labial folds become more marked; there may be some degree of frowning of the brow and a slight tightening of the lips. If the anxiety is not recognized it may motivate the production of defences against hypnosis, particularly in the form of restlessness, which not only provides an outlet for the anxiety but also serves as an effective defence against hypnosis by relaxation. On the other hand, as soon as the anxiety shows itself the suggestions of relaxation can momentarily give way to suggestions of calm and ease and security. The patient becomes aware of the therapist's empathy; he is reassured; the affective relationship is intensified; and the anxiety is allayed.

This type of anxiety reaction occurs more frequently when rapport with the patient is inadequate. A satisfactory affective relationship with the patient prior to hypnosis makes it easier for him to introject the idealized figure of the therapist, and the abandonment of ego control becomes so much the smoother.

At the Sudden Awareness of Hypnosis

In other circumstances much more severe anxiety reactions may occur. Occasionally during the induction, patients experience a sudden violent paroxysm of anxiety. This is quite distinct from the mild anxiety described above. It occurs in patients who may have given verbal acquiescence to the idea of hypnosis, but who nevertheless really believed that they could not be hypnotized. The acute anxiety follows the patient's first awareness that he is in fact hypnotized and has lost voluntary control.

Some patients defend themselves against hypnosis by simulation. By consciously carrying out all the therapist's suggestions the patient feels that he obeys the suggestions voluntarily, and by so doing has avoided being hypnotized. Sometimes it is obvious that the defence is used in clear consciousness; at other times it would seem to be an unconscious mechanism. If the patient is allowed to persist with his defence he actually becomes hypnotized, but he is not aware of it until he is challenged. It is at this moment that acute anxiety may be precipitated. The reaction is accompanied by the physical signs of anxiety, pallor, tremor, sweating, dilatation of the pupils, and rapid shallow breathing. The pulse is rapid and may be thready or full and bounding. To this there may be added a certain degree of collapse. The suddenness with which the condition may

develop can be quite alarming. The natural impulse to terminate hypnosis and wake the patient must be resisted. Suggestions of relaxation, drowsiness, and eventually sleep are added. Provided the patient is kept hypnotized this episode is easily managed, but there is a tendency for the acute anxiety to bring the patient out of hypnosis. The anxiety comes on without warning, and develops very quickly. Accordingly, it is wise to deepen hypnosis immediately the first signs of anxiety are observed. It is obviously very important that the therapist does not communicate to the patient his own anxiety by any non-verbal or extra-verbal means.

A company director in his late forties sought relief from tension and depression. Two years previously he had been treated with narcoanalysis and E.C.T. without improvement. He was a hysteroid personality, and fancied himself as an amateur actor. On a verbal level he desired hypnosis. His first defence was by depreciation. He depreciated the whole situation. By non-verbal means he conveyed the idea that the whole thing was silly. Induction was made by arm levitation. On the first suggestion of lightness of his hands he immediately lifted his arms into the air. When movement was suggested he straightway waved his arms about. He was smiling all the time, and it was obvious that he was defending himself by simulation. Following suggestions, various antics were performed with his arms, and he was allowed to believe that the therapist thought him hypnotized. He was in no way challenged, and was dismissed without comment. The same procedure was repeated in the second session, and in the third session the patient was suddenly challenged to put his arms down. He was unable to do so, and immediately developed an acute anxiety reaction. The anxiety was controlled by a deepening of hypnosis, and by allowing the patient to lie down. Subsequent hypnosis was uneventful.

At the Sudden Awareness of Repressed Material

A more common type of anxiety reaction occurs when a patient suddenly becomes aware of repressed traumatic material. Of course, this kind of reaction may occur in any type of reductive psychotherapy, but it occurs more readily in hypnoanalysis because the hypnotic state can allow the sudden surge into consciousness of repressed conflicts. In this respect it is important to distinguish between release of repressed material and awareness of the material. It would seem that, so long as the patient remains reasonably deeply hypnotized, the release of repressed material, by verbal ventilation, by acting out, or by projective techniques, does not produce anxiety. The hypnotized patient can express the traumatic conflicts in words, he can abreact and express the emotion appropriate to the conflict without producing anxiety; but if, for one reason or another, the hypnosis becomes lighter and the patient is able to comprehend in consciousness what he is expressing, then there may be a severe acute anxiety reaction. There is danger in the therapist becoming too interested in the content of the repressed conflicts and failing to keep watch on the depth of hypnosis. Abreaction itself may lighten hypnosis to such an extent that the patient may wake spontaneously, and in such circumstances acute anxiety may result.

There is another factor. Sometimes the production of anxiety from the sudden awareness of repressed conflicts is dependent on the means by which the repressed conflicts are expressed. In hypnoanalysis the conflicts are ordinarily expressed in words. Material that is too traumatic to be borne in consciousness is dealt with by the various psychic defence mechanisms and is again repressed, so that, on waking, the patient may remember the less traumatic incidents but has a spontaneous amnesia for the more traumatic material. But in hypnography—a technique in hypnoanalysis in which the hypnotized patient projects his conflicts by painting or drawing—these defence mechanisms cannot work so easily. The spoken word is transitory; it is easily repressed and forgotten. The painted representation of a conflict has a degree of permanence. The patient is confronted with it, and it tends to impress itself much more on his conscious awareness. Although the paintings are removed before the patient is awakened from hypnosis,

experience suggests that this type of acute anxiety reaction tends to occur more often during hypnography than in verbal hypnoanalysis.

An inadequate, dependent young man was receiving treatment for loss of confidence. When hypnotized he was given a crayon and told that his hand would draw something that represented his problems. With a rhythmical movement he made a series of marks on the paper. He became more and more preoccupied with what he was doing. The rhythmical character of the movement became more pronounced. His expression was very intense, and it seemed obvious that the drawing was a sexual equivalent. He began to verbalize his thoughts, and the sexual nature of the activity was confirmed. He abreacted a good deal of emotion. Hypnosis became lighter. He suddenly turned very pale and started to sweat. He woke from hypnosis spontaneously. In a shaky voice he said that he thought he had woken up and thought he was going to vomit. He became intensely tremulous; the sweating was profuse; his pulse was rapid and of poor volume. He looked alarmingly ill. He was immediately rehypnotized and given suggestions of calm and well-being. His physical condition was restored in ten to fifteen minutes. In subsequent sessions care was taken to maintain an adequate depth of hypnosis, and no further complications were encountered.

At the Inability to Fulfil a Post-Hypnotic Suggestion

Post-hypnotic suggestion is the spear-head of suggestive therapy, but this extremely useful weapon may at times be the means of precipitating an acute anxiety reaction. There is an extremely compelling quality about a post-hypnotic suggestion, and if the patient is unable to carry it out an acute anxiety reaction may result. In this respect it does not matter whether the patient is prevented from fulfilling the suggestion by reason of outside environmental factors or by reason of psychic factors within himself.

Accordingly, in suggestive therapy, specific post-hypnotic suggestions are best used sparingly and only when it is as certain as possible that the patient has both the material and the psychic means of carrying out the suggestions. On the other hand, non-specific post-hypnotic suggestion has not the same power to produce anxiety reactions, but nevertheless can give suitable patients considerable symptomatic relief.

A man of obsessive personality sought relief from particularly intractable insomnia of many years' duration. The severity of the insomnia had been confirmed by the hospital night staff, who reported that the patient hardly slept at all. He had previously been treated by narcoanalysis, "somnifaine," and E.C.T. without benefit. At different times he had been addicted to both paraldehyde and chloral hydrate. He also complained of irritability and uncontrollable rages. He was easily hypnotized, and after several sessions he was given the strong post-hypnotic suggestion that he would sleep each night without sedative until I saw him in a week's time. He was unable to fulfil the post-hypnotic suggestion, and arrived for the next appointment in a state of acute anxiety and covered with a generalized dermatitis. He was given suggestions of calm and relaxation, and ordered to take a sedative at night. In a week's time both the anxiety and the skin condition had subsided. He subsequently gained almost complete relief from the irritability and rages, although the insomnia persisted.

Discussion

Recent British and American literature suggests that there is a revival in the use of hypnosis, not only by psychiatrists using specialized hypnoanalytical techniques but also by the profession in general. Fortunately, acute anxiety reactions are not common, but when they do occur they may be alarming on account of the severity and the rapidity of onset. During the hypnotic session such reactions may occur from the sudden realization of having been hypnotized, or following the sudden awareness of repressed material. In each case the situation is met by immediately increasing the depth of hypnosis or by rehypnotizing the patient. Hypnosis with suggestions of calm allows the usual psychic defence mechanisms to re-establish themselves, and material that is too traumatic at the present degree of insight is automatically repressed again. Any attempt to deal with this type of acute anxiety at a conscious level is likely to get out of hand, and is best avoided.

Anxiety reactions from the inability to fulfil a post-hypnotic suggestion usually occur in the absence of the therapist. Such reactions can be minimized by using non-specific post-hypnotic suggestion, where possible, in place of specific suggestion. Specific suggestion should be used only when it is reasonably sure that the patient has both the physical and the psychic ability to fulfil the suggestion.

TRAUMATIC RUPTURE OF THE PANCREAS

BY

WILLIAM BURNETT, M.B., F.R.C.S.

Lecturer in Surgery, University of Aberdeen

Traumatic subcutaneous rupture of the pancreas is a relatively rare condition. It was first reported by Travers (1827), whose patient was crushed by the wheel of a coach. The subject was reviewed by Stern (1930). Phillips and Seybold (1948) noted that the diagnosis was made pre-operatively in only 4 out of 15 cases found in the literature of the previous ten years. The pancreas lies deeply in the abdomen and is normally well protected against possible injury. However, Aldis (1946) pointed out that if the abdominal muscles happen to be flaccid at the time of injury the pancreas may be crushed against the vertebrae, even by mild force. A variety of other mechanisms may cause pancreatic injury; in a case described by Keynes (1944) rupture was apparently due to blast from an under-sea explosion. As might be expected, injury to the pancreas is often accompanied by damage to other abdominal organs, as in Travers's case, when both duodenum and jejunum were involved. This often complicates early diagnosis but makes operative treatment imperative. The case reported below was one of complete rupture of the pancreas occurring as an isolated injury due to an apparently minor blow.

Case Report

The patient was a young man, aged 20, in good health, with no previous medical history of note. About 24 hours before admission to hospital, while playing football, he had received a blow in the epigastrium from a player's knee. He felt "winded" and nauseated at the time. After a brief rest he returned to the field of play, but had to leave after a few minutes because he felt dizzy. He was able to go home after visiting the casualty department, where no serious symptoms or signs were found. Only slight epigastric pain was felt over the next few hours, but after a meal he vomited three times. The pain also became severe in the entire upper abdominal area. It was worse on moving and hiccuping. There was no pain in the shoulders or back. The pain and vomiting persisted during the night until his admission to hospital the following day.

When first seen he seemed in good general condition and had only moderate epigastric pain. The axillary temperature was 99.2° F. (37.3° C.), the blood pressure 120/80 mm. Hg, and the pulse 88. He was well coloured, the extremities were warm, and the veins were well filled. There was no wound or bruising of the abdominal wall. Only a minor degree of abdominal tenderness was present, generalized but more noticeable on the left side of the abdomen and in the left flank. No true rigidity was found, but there was some increase in muscle tone, again more pronounced on the left side. It was thought that a small amount of fluid was

present in the peritoneal cavity, as shifting dullness was elicited on the left side. Liver and spleen were not palpable. Bowel sounds were diminished, only an occasional sound being heard. Physical examination was otherwise negative. The urine was normal. Radiological examination of the abdomen showed slight gaseous distension of two loops of small intestine in the mid-abdominal region. During the next few hours an improvement occurred; the pulse remained between 70 and 80 and the temperature was 99° F. (37.2° C.). After drinking a cup of tea the symptoms returned; the pulse rose to 86 and the temperature to 101.6° F. (38.7° C.). There was a slight increase in abdominal tenderness and guarding. At this point, about 30 hours after injury, operation was carried out.

Under general anaesthesia, the abdomen was opened through a left paramedian incision. A mild peritonitis was present and a few ounces of blood was found in the left paracolic gutter and in the pelvis. A number of small white plaques were present in the mesentery of the proximal jejunum and in the retroperitoneal region, immediately to the left of the duodeno-jejunal flexure. Oedema and a dirty brown discoloration were seen in the lesser omentum and in the transverse mesocolon. On opening the lesser sac below the greater curvature of the stomach, the pancreas was found to have been completely transected from its upper to its lower border. This had occurred in the region of the portal vein and mesenteric vessels, so that the superior mesenteric artery could be seen pulsating, lying freely immediately behind the torn edge of the right segment of the pancreas. The two parts of the pancreas were separated by a distance varying from 1 to 2 cm. Very little blood was found in the neighbourhood of the injury and no active haemorrhage was occurring. The tail and distal part of the body of the pancreas were oedematous and felt hard and tense. The only other injury found was a small tear 5 cm. long on the costal surface of the right lobe of the liver involving little more than serosa. The abdomen was closed after leading a soft rubber drain to the site of rupture of the pancreas. No repair of the pancreas or pancreatic duct was attempted. The patient's condition at the end of operation was good, the blood pressure being 120/82 and the pulse rate 118.

Post-operative treatment was directed towards keeping pancreatic secretion at a minimum until healing of the pancreas had occurred, with a view to avoiding or minimizing pancreatic necrosis due to the liberation and activation of pancreatic enzymes. Little or no fluid was given by mouth for the first 48 hours after operation, and only 1.5 litres of intravenous fluid was given initially. Intravenous fluid therapy was then discontinued, as it was thought that the water administered might well increase the volume of fluid available for pancreatic secretion. In addition, propantheline bromide was given by mouth in a further effort to restrict the secretion of pancreatic juice. Dosage varied between 15 and 60 mg. daily, and a total of 390 mg. was given over

Serial observations of serum amylase in a case of rupture of pancreas. Values in Somogyi units. The period of propantheline therapy and the delayed onset of pancreatic fistula are also shown.

the first 10 days. On one occasion, 24 hours after treatment, the drug was temporarily stopped, as the blood pressure had risen to 170/120. This rise did not recur when treatment with the drug was resumed.

The progress of the pancreatic lesion was followed by frequent estimation of the serum amylase. On admission, before operation, the level was 4,180 Somogyi units, rising to 4,600 units after operation. The series of estimations are shown in the Chart. Morphine was not used to control pain, because of its tendency to cause spasm of the sphincter of Oddi. Pethidine was found to be effective, but was required in a dosage of 300 mg. daily for the first three days. By the fifth post-operative day the pain had practically gone, but the patient was very restless. He found it increasingly difficult to swallow fluids and became extremely dehydrated. His weight fell to 6 st. 6 lb. (40.8 kg.) from a normal of 9 st. 11 lb. (62.1 kg.). On the following day the axillary temperature rose to 100° F. (37.8° C.) and a degree of peripheral circulatory failure was apparent; the blood pressure was 104/90 and the pulse rate 120, the extremities were cyanosed, and there was very poor filling of the skin vessels. Examination of the blood gave the following results:

Serum Na ..	..	..	340 mg. per 100 ml.
Serum K ..	..	..	22 " " "
Serum chloride ..	..	..	620 " " "
Co ₂ combining power ..	..	..	46 vols. %

An intravenous infusion of dextran raised the blood pressure to 125/90, and water was given in the form of 5% glucose intravenously over the next 72 hours, by which time he was able to drink adequately and had made a striking clinical improvement. At the time rehydration was complete, coinciding with the end of propantheline therapy, a discharge of pancreatic fluid began from the drainage track. Little or none had occurred up to this point. Shortly after the fistula became active the serum amylase fell (see Chart). It had previously risen during the intravenous therapy. The clinical course now became uneventful, apart from a minor episode as shown by the last rise in serum amylase when the fistula became temporarily blocked. The fistula itself presented no difficulties in management, as only a small amount of pancreatic fluid was lost daily. The skin was prevented from digestion by aluminium paste. By the sixteenth day his weight had risen to 8 st. 8 lb. (54.4 kg.) and by the twenty-sixth day to 8 st. 11 lb. (55.8 kg.). The fistula healed and the patient was discharged after 33 days in hospital. When seen finally two months later, he was in excellent health and had no evidence of pancreatic dysfunction; his weight was static at his normal of 9 st. 11 lb. (62.1 kg.) and there was no radiological evidence of pancreatic calcification.

Discussion

Symptoms and physical signs following rupture of the pancreas can be very variable. They may occur early and be of a severity similar to those found in haemorrhagic pancreatic necrosis, or in others may be mild and delayed (Bockus, 1946).

Estimation of serum amylase may give valuable assistance in making the diagnosis, which should be suspected in all cases of upper abdominal injury. High values were found in all eight cases of a series described by Naffziger and McCorkle (1943). In the case described above, the amylase level seemed to follow the progress of the lesion with some fidelity. The treatment of the condition is operative, as otherwise it is impossible to decide with certainty what damage has been done to the pancreas or other organs. It would seem doubtful whether any operative repair of the pancreas should be attempted, as further pancreatic damage may be thus precipitated. It appears logical to attempt to cut down pancreatic secretion in the early stages to allow healing to occur. Both secretin and vagal mechanisms can be impaired to some extent by combining a reduction of oral intake with the use of a drug such as propantheline bromide. Care must be taken to avoid the production of a severe dehydration by this method.

Summary

A case of subcutaneous rupture of the pancreas due to an apparently minor injury is described. The treatment adopted was an exploratory operation followed by limitation of the secretion of pancreatic juice. The use of serial serum amylase estimations is recommended, both as a diagnostic test and as an index of the progress of the lesion.

CHLORPROMAZINE HYDROCHLORIDE IN INTRAOCULAR SURGERY

BY

A. B. NUTT, M.Sc., M.B., B.S., F.R.C.S.

Consultant Ophthalmic Surgeon

AND

H. L. J. WILSON, M.A., M.B., B.Chir.

F.F.A.R.C.S.

Consultant Anaesthetist

United Sheffield Hospitals

Anaesthesia for intraocular surgery presents many special problems, and until recently it has not received serious attention from anaesthetists. Ophthalmologists have evolved a very efficient local analgesic technique, and operative results have on the whole been good, but there has always been the risk of an uncooperative patient. Furthermore, patients requiring intraocular surgery are frequently elderly, and the clinical picture is complicated by a varying degree of arteriosclerotic cerebral degeneration, so that complete co-operation cannot be assured. In addition, any operation on the eye must be an unpleasant experience for a conscious patient, who may flinch or "squeeze" the eye in such a manner as to jeopardize the ultimate result—a possibility which must be a constant source of anxiety to the surgeon.

Good visual acuity will often make a great difference to the mental and physical well-being of these difficult patients, so that any improvement in technique is important if it simplifies the surgeon's task and gives a better chance of success. Many patients requiring surgical intervention on the eye are suffering from general medical diseases—hypertension, cardiovascular disease, diabetes, chronic bronchitis—to say nothing of senility; and in this unit the pre- and post-operative supervision of the patient by the anaesthetist has proved of the utmost value.

Anaesthetic Requirements for Intraocular Surgery

The main anaesthetic requirements of a patient undergoing intraocular surgery are: (1) The anaesthetic technique must in no way raise the intraocular tension at any stage, and in fact should lower it so far as possible. (2) No sudden increase in arterial or venous blood pressure must be permitted, and when possible some degree of hypotension is desirable to lower the intraocular tension still further. (3) A tranquil recovery period free from restlessness, vomiting, coughing, and "squeezing" of the eye is essential; in

fact a prolonged period of quiescence for at least 24 hours after the operation is an advantage and reduces the risk of ocular complications.

During the last few years we have endeavoured to improve the technique of anaesthesia for intraocular surgery. In the first place, a method was used whereby the patient was premedicated to such a degree as to produce almost light-plane general anaesthesia, and this was combined with local infiltration analgesia and general akinesia, using D-tubocurarine in sufficient doses to cause relaxation of the levator palpebrae muscle and paresis of the extraocular muscles. This method usually produced good results and eliminated the need for co-operation from the patient; it also overcame the hazard of "squeezing" of the eye during the operation and for some time afterwards, and furthermore it lowered the intraocular tension and thus reduced the chances of vitreous loss during extraction. The main difficulty was, however, to judge the patient's response to premedicant drugs. While in some cases the technique left little to be desired, in others the effect on the patient was such as to produce severe depression of the vital centres, particularly of respiration, so that the procedure became rather hazardous. Furthermore, some patients became excitable and unmanageable.

The Suitability of Chlorpromazine

Chlorpromazine hydrochloride ("largactil") has been used in anaesthesia as one constituent of the "lytic cocktail," a mixture of drugs calculated to depress tissue metabolism and inhibit compensatory autonomic reflexes, thereby reducing the amount of the agent required to induce and maintain anaesthesia; or it may be used to allow operation without a general anaesthetic at all, only local analgesia and a muscle relaxant being necessary. It has also been employed in psychiatric medicine for the treatment of conditions characterized by agitation and central psychomotor overactivity. It was on the last count that we thought that this substance might produce favourable circumstances for intraocular surgery and give more consistent results than the previous techniques.

Chlorpromazine hydrochloride has a variety of pharmacological actions; those important in intraocular surgery are: (1) production of sleep and general lowering of metabolic rate; (2) potentiation of the action of other analgesic and anaesthetic drugs; (3) depressant effect on the vomiting centres; (4) pronounced anti-adrenaline effect, and (5) some reduction in muscle tone. It has a prolonged action, during which the patient sleeps peacefully, returning gradually to full consciousness in 12 to 24 hours; further, although sleeping most of the time, the patient can be roused and answer questions rationally after one to three hours. There is a considerable degree of depression of cerebral activity, but, even so, the respiratory rate is not depressed as much as might be expected; actually the amplitude is slightly increased. The central depressive effect on the vomiting centre is particularly advantageous.

Its effect on the blood pressure in normotensive patients is not so marked, but the greater the degree of hypertension the more precipitous is the fall in blood pressure; however, in no case in the present series did a patient appear to suffer any ill effects as a result of this. There is often a preliminary rise in the pulse rate, but this soon settles at slightly above normal. The patient becomes pale, but the peripheral circulation appears good.

Technique

The night before operation patients receive sedation with quinalbarbitone ("seconal"), 1½ or 3 gr. (0.1 or 0.2 g.). One hour pre-operatively quinalbarbitone, 1½ gr. (0.1 g.) by mouth, and pethidine, 100 mg. intramuscularly, are administered; in some frail subjects the quinalbarbitone has been omitted. The patient is brought to the anaesthetic room 15 minutes before the operation is due to start. An intravenous injection of a mixture of 50 mg. chlorpromazine hydrochloride and 100 mg. pethidine diluted to 20 ml. with

sterile water is started. The injection is given slowly at the rate of about 1 ml. per minute until the patient falls asleep and can tolerate a lubricated artificial airway. The dose required varies from 20 to 45 mg. of chlorpromazine and 40 to 90 mg. of pethidine. During induction a few patients complain of thirst or palpitations, but these are of short duration. Patients even at this stage are often just capable of responding to shouted instructions, but in a most apathetic way, and their efforts are poorly maintained. On questioning afterwards they have no recollection of this; on the other hand, there appears to be no retrograde amnesia, and all remember coming to the anaesthetic room.

A regional infiltration with procaine is given, coupled with a retrobulbar injection. A long, narrow-bore tube connected to an oxygen cylinder is placed beneath the face towel so that the open end is in close proximity to the artificial airway in an attempt to keep the air circulating beneath the towels and increase the oxygen concentration.

The patient sleeps peacefully throughout the operation, and the operator can take as long as he wishes without the fear of a restless patient. After the operation patients cause the minimal amount of trouble in the ward, and the method has been well received by the ward sister. After one to two hours patients will often remove their own airways. Unless disturbed, they sleep for the remainder of the 24 hours. If roused they answer questions with progressively more enthusiasm, and quickly drop off to sleep again. Next morning they have all appeared normal, the majority having no recollection of the previous 24 hours.

Results

Since March, 1954, 80 patients have been anaesthetized in this way. Their ages ranged from 18 to over 80 years, the majority being between 60 and 80 years. Three-quarters of this number were undergoing cataract operations, and the remainder operations for glaucoma and corneal grafting. There has been no mortality or morbidity in this series, and the patients' post-operative condition has been excellent. Although the method has not been used on the extremely frail and those with severe cardiac disease, it has been used for nervous patients, and also in many cases with marked signs of arteriosclerotic cerebral degeneration where a purely local technique would have been dangerous.

In one case vomiting occurred four hours after the operation, but it was of very short duration, and in this case there was a history of many years' "gastric trouble." With this exception there has been no coughing or straining in the post-operative period and recovery has been extremely quiet and uneventful. Two cases of severe hypertension, both with a pre-operative systolic blood pressure of over 250 mm. Hg, caused some anxiety in the post-operative period. Soon after injection of the chlorpromazine-pethidine mixture the systolic blood pressure in both cases fell to between 70 and 90 mm. Hg, and it remained at this level for just over three hours post-operatively. Apart from the hypotension, the physical state of these two patients appeared satisfactory and the pulse remained slow and easily palpable. At the end of three hours the blood pressure began to rise slowly in each case, and returned to the pre-operative level in 12 hours. Both patients made an uneventful recovery.

Summary

A method of anaesthesia for use in intraocular surgery has been described, the agent being a mixture of chlorpromazine hydrochloride and pethidine.

The results obtained in 80 cases have been briefly recounted.

The main advantages of the method are: (1) no co-operation is required from the patient during the operation or for several hours afterwards; (2) it produces a low-tension eye ideal for intraocular surgery; and (3) the recovery period is extremely tranquil.

LIVER DAMAGE AND EOSINOPHILIA FOLLOWING CHLORPROMAZINE THERAPY

REPORT OF A CASE

BY

B. S. HARTNETT, M.B., M.R.C.P.Ed.
M.R.A.C.P.

Medical Registrar, Royal North Shore Hospital of Sydney

A relationship between chlorpromazine therapy and liver damage has been recognized. The extent of liver damage varies; at least one fatal case has been reported (Boardman, 1954). Lemire and Mitchell (1954) mention the occurrence of transient eosinophilia during chlorpromazine jaundice. The present case report also illustrates this unusual phenomenon.

Case History

The patient, a man aged 52, was of Jewish extraction. During the last four years, electric convulsion therapy had been given elsewhere on some 30 occasions for a recurring depressive state. Between March 31 and April 12, 1954, chlorpromazine was administered orally, the total dosage being 1.5 g. His previous medical history and family history were not relevant. About ten days after beginning this treatment he became nauseated. During the next three days he became febrile and began to vomit. He complained of pain in all his joints, frontal headaches, rigors, loss of appetite, and colicky abdominal pain; he developed a continuous burning pain in the epigastrium. Chlorpromazine was suspended. Admission was arranged to the Royal North Shore Hospital of Sydney on April 19.

Physical examination revealed a well-developed middle-aged man who was obviously jaundiced. His temperature was 102.2° F. (39° C.). The liver was not palpable, but there was generalized abdominal tenderness, maximal in the right hypochondrium. There were no splenomegaly, no glandular enlargement, and no abnormality on rectal examination. The blood pressure at the time of admission was 75/50. Subsequent readings were in the order of 100/70. The urine was very dark, and analysis revealed the presence of bile pigments, bile salts, and an excess of urobilinogen. The first faecal specimen examined after admission was pale.

On April 19 the leucocytes numbered 15,300 per c.mm., of which 49% were eosinophils. On the 20th the white cells totalled 14,900 per c.mm. (eosinophils 58%); the serum proteins were 7.9 g.%, the albumin-globulin ratio was 2.4:1; the thymol turbidity was 1 unit (normal range 0-4); the serum alkaline phosphatase was 12.8 modified Bodansky units (normal range 2.2-8.6) (Shinowara *et al.*, 1942); and the serum bilirubin was 3.8 mg. per 100 ml. The Casoni test was negative, and no ova, cysts, or parasites were found in the stools. The chest x-ray findings were normal; the plain x-ray film of the abdomen showed no gross abnormality; repeated examinations of the stools for occult blood were negative; and the Eagle flocculation test was negative. Three days after admission the temperature had fallen to normal. A slight subjective improvement had occurred but he remained deeply jaundiced.

By April 30 the diagnosis had not been established, so it was decided to perform liver biopsy by needle aspiration. This was done on May 3. The section showed bile pigment in the bile canaliculi, mainly near the centres of the lobules. There was no accumulation of bile in the bile ducts of the portal tracts. The liver cells appeared healthy throughout. Some of those near the centres of the lobules had bile in their cytoplasm. In the supporting tissue of the

portal tracts there were more lymphocytes and histiocytes than normal. The fibrous tissue was not increased. The Kupffer cells contained no bile pigment. A diagnosis of biliary obstruction was made.

Laparotomy was performed on May 10. The gall-bladder was normal and the common duct was not dilated. On opening the duct there was only a moderate flow of bile. A probe was passed towards the porta hepatis. However, neither the right nor the left intrahepatic duct could be entered, and it was thought that there was an obstruction at the origin of the intrahepatic portion of the common duct. The common bile duct was drained, using a T-tube. No abnormality was found on palpation of the other intra-abdominal organs.

Apart from a low-grade post-operative fever, due to a pulmonary infection, and mild colicky abdominal pain, convalescence was uneventful. The quantity of bile which drained ranged from 75 to 480 ml. daily from the first to the tenth post-operative days. These figures are within normal limits (Rundle *et al.*, 1955).

Nine days after operation (May 19) a cholangiogram was done. The gall-bladder and bile ducts filled well and appeared normal. The biliary drainage tubes were removed on May 26. At this time the degree of jaundice was lessening (serum bilirubin 3.8 mg. per 100 ml.) and the patient was beginning to regain his appetite and to feel well. The eosinophils had fallen to 5% of 16,300 cells.

Improvement was steadily maintained, and when discharged on June 12 the jaundice had almost completely subsided and the patient was feeling well.

When last seen, on December 23, he appeared to be perfectly well; in the interim further shock treatment had been given. The serum bilirubin, the serum proteins, and the thymol turbidity values were normal, but the urinary urobilinogen was still increased. The total white cell count was 10,950 per c.mm., and 6% of these were eosinophils.

Discussion

Both the patient and his wife were convinced at the time of admission that the illness had resulted from chlorpromazine, and his medical attendants at first thought that he was suffering from hepatitis. It was necessary to distinguish between an obstructive jaundice and a hepatocellular jaundice. In favour of the former were the presence of dark urine containing bile pigments and salts, the pallor of the stools, and the rising level of the serum alkaline phosphatase. However, it was difficult to explain the presence of excess urobilinogen in the urine if this really was an obstructive lesion.

The presence of eosinophilia suggested the possibility of an allergic process. Hodgkin's disease was considered, but there were no enlarged glands and the spleen was not enlarged. Parasitic causes of eosinophilia were sought but were not found.

The results of the liver biopsy suggested an obstructive lesion, but this could not be definitely demonstrated at operation. In fact, the post-operative cholangiogram showed the biliary tree to be normal. A careful review of sections of the liver biopsy has since been made and the appearances are now considered to be those described in the so-called cholangiolitic hepatitis (Watson and Hoffbauer, 1946; Goulston and Smith, 1951).

It would appear, therefore, that this patient was suffering from a form of hepatitis. The biochemical investigations may be explained on the basis of hepatitis with obstruction.

Infective hepatitis must be considered in the differential diagnosis, especially as it is common in the Sydney community at present. Eosinophilia does not appear to have been reported in this disease. On the contrary, it is stated (MacCallum *et al.*, 1951) that eosinophils are commonly absent in infective hepatitis. In this case the total number of eosinophils increased, attaining the high percentage of 58 at the height of the illness.

It is interesting that Lehmann and Hanrahan (1954) have noticed the occurrence of allergic reactions, such as urticaria and asthma. In their series of 71 patients treated over a period of four months with chlorpromazine, 13% showed such reactions. However, they do not mention eosinophilia. In our patient the eosinophilia may have been indicative of an underlying allergic reaction.

Lemire and Mitchell (1954) observed three cases of chlorpromazine jaundice in elderly people. In two of these patients a transient eosinophilia of 7 to 17% was noted. The liver-function tests revealed a hyperbilirubinaemia, an increased serum alkaline phosphatase, and a normal thymol turbidity. Two had liver biopsies performed, and all three were subjected to surgery. The authors consider that their patients were suffering from toxic hepatitis due to chlorpromazine, the mechanism of the complication being unknown. Their findings and conclusions correspond with our own.

Further observations will be necessary to establish whether our patient has sustained permanent liver damage as a result of chlorpromazine therapy. The presence of excess urobilinogen in the urine six months after apparent recovery does suggest this.

Summary

A case of hepatitis following chlorpromazine therapy is reported.

The occurrence of eosinophilia in this illness is discussed.

I wish to thank the General Medical Superintendent of the Royal North Shore Hospital of Sydney for permission to report this case; and Dr. F. A. E. Lawes, Mr. F. F. Rundle, Dr. I. D. Thomas, and Dr. K. Viner Smith for assistance in preparation of the paper.

Medical Memoranda

Anaesthesia Following Long-term Oral Chlorpromazine Hydrochloride Therapy

A review by Dundee (1954) of the pharmacology and applications of chlorpromazine hydrochloride records the widespread clinical uses of this drug outside hospital practice, and the increasing possibilities of anaesthetists meeting emergency admissions so treated. The following case is put on record so that others may avoid "anaesthetist's distress" in similar cases.

CASE REPORT

A feeble-minded man of 20, weight 11½ stone (73 kg.), was admitted in February, 1955, with a diagnosis of acute appendicitis. He was given ½ gr. (22 mg.) of "omnipon" and 1/150 gr. (0.43 mg.) of scopolamine one hour before operation, and was induced with thiopentone sodium 600 mg., and maintained with gallamine triethiodide, 100 mg., nitrous oxide and oxygen, and ether. There was a delayed return of normal respiration for three-quarters of an hour.

At operation a gangrenous retrocaecal appendix was removed. The operation lasted for one hour and he did not regain consciousness for the next four and a half hours,

tolerating an oro-tracheal airway during this period, the tube being necessary to prevent a valvular obstruction of his larynx by a mobile epiglottis.

His post-operation pulse rate rose to between 130 and 140 for the subsequent two days. There was no post-anaesthetic vomiting and he made an uninterrupted recovery.

COMMENT

The significance of the fact that this patient had been treated with oral chlorpromazine, 25 mg. three times a day, for the fourteen months previous to his admission was not appreciated at the time, and consequently he was given a normal anaesthetic for his age and weight, with the somewhat anaesthetically distressing results. The post-operation tachycardia and absence of vomiting are a well-known feature of chlorpromazine premedication. This case suggests that care should be exercised in giving normal doses of anaesthetic drugs to patients taking chlorpromazine.

My thanks are due to Dr. H. M. Bird for permission to publish this case.

Prolonged Coma in Simmonds's Disease

Patients with Simmonds's disease often die in coma, which may be induced by various factors, such as the following.

Hypoglycaemia.—A low fasting blood sugar, sensitivity to insulin, and repeated hypoglycaemic attacks are often features of Simmonds's disease (Sheehan and Summers, 1949, 1952; Alexander, 1953). While in mild cases recovery may be spontaneous or may follow administration of glucose, prolonged hypoglycaemia may result in damage to cerebral tissue which is irreversible and fails to respond to glucose. Although the length of hypoglycaemic coma which prevents a full degree of physical and mental recovery must vary from case to case, Lawrence *et al.* (1942) suggest that "coma of one to three hours is usually associated with complete recovery, while longer periods are dangerous." Convulsions in hypoglycaemia have been mentioned as an important factor in preventing recovery from that state (Grayzel, 1934).

Hypothermia.—The profound lowering of the body's metabolic rate that occurs both in Simmonds's disease and in myxoedema may lead to a reduction of temperature sufficient to promote coma. Sheehan and Summers (1952) have shown that in a patient in coma with a very low temperature rapid recovery took place following immersion in a hot bath.

Low Blood Pressure and Loss of Electrolytes.—The adrenals are commonly atrophied in Simmonds's disease, and in some cases coma may be ushered in by marked hypotension and salt depletion, suggesting Addisonian crisis (Sheehan and Summers, 1949; Wolff, 1950).

The case here described makes it apparent that deep coma of 40 hours' duration, associated with hypoglycaemia and convulsions, can be followed by full mental and physical recovery.

CASE REPORT

A woman of 41, who had been unconscious with convulsions since about 1 a.m., was admitted at 2.30 p.m. on June 22, 1953. She was lying deeply comatose, slightly sweating, and with shallow respirations, in a pool of her own excreta. Her limbs were spastic, her trunk in opisthotonos, while every few minutes she was seized with generalized clonic and tonic convulsions associated with coarse grunting noises. Her temperature was 101.6° F. (38.7° C.), pulse 88, B.P. 120/70. Plantar reflexes were extensor, corneal reflexes absent.

The patient was moderately well nourished, with pendulous breasts; her skin was waxy pale, axillary hair was

absent, and pubic very scanty. Following 50 g. of glucose intravenously, the convulsions became less severe, and on receipt of the blood-sugar report as 32 mg. per 100 ml. half an hour later, a further 100 mg. of glucose was administered intravenously with 100 mg. of cortisone acetate and 1 mega unit of penicillin intramuscularly. An intravenous 5% glucose-saline drip was set up. By 6 p.m. the blood sugar had risen to 86 mg. per 100 ml. and, although severe convulsions had ceased, she remained in deep coma, with extensor plantar reflexes. Cortisone, 100 mg. eight-hourly, was continued.

The next morning she was still deeply unconscious, and was incontinent of urine and faeces. The blood sugar was 140 mg. per 100 ml. During the day there were signs of improvement, and by 5 p.m. she had begun to stir and open her eyes. This was 40 hours after the known onset and 26 hours after the institution of treatment, during which she had been given 400 mg. of cortisone intramuscularly and about 260 g. of glucose intravenously.

From then on, progress was uneventful. On a regime of cortisone, 50 mg. daily by mouth, thyroid 1 gr. (65 mg.), and methyltestosterone, 15 mg., she asserted she had "never felt better."

The electrocardiogram on admission showed low-voltage and flat T waves, later reverting to normal. The electroencephalogram after recovery showed no convulsive organic abnormality.

The history, obtained subsequently, revealed that the patient had had three children, there having been serious post-partum haemorrhage after the last confinement 16 years previously, and subsequent total amenorrhoea. Simmonds's disease was diagnosed elsewhere in November, 1952, and she had been on testosterone and thyroid since then. She had never had fits, but had had one previous short coma, without convulsions, in January, 1953.

COMMENT

Of the known factors which can induce coma in Simmonds's disease, hypothermia and Addisonian crisis can be excluded in this patient, and the question then arises to what extent the hypoglycaemia was responsible for the prolonged coma. In fact, during the latter 24 hours of coma the blood-sugar levels were within normal range, but, as is known in insulin overdosage, the return of the blood sugar to normal may prevent neither permanent mental damage nor a fatal outcome. We have been unable to find a case recorded in which full recovery occurred after hypoglycaemia so deep and prolonged, and it is possible that in our case other factors were partly responsible for maintaining the comatose state.

While cortisone plays an important part in the maintenance therapy of Simmonds's disease, treatment of the coma with cortisone has not been universally successful. Thus Sheehan and Summers (1952) found that intravenous cortisone produced no appreciable effect in two cases of hypopituitary coma, although it is not clear to what extent hypoglycaemia was a factor in those cases. We feel that administration of cortisone as well as glucose to our patient was largely responsible for the successful outcome. Cortisone has been used to combat hypoglycaemia of various causes, such as pancreatic islet tumour and Addison's disease, and we feel encouraged to use it in prolonged hypoglycaemia of whatever aetiology.

Reviews

BRITISH SURGICAL PROGRESS

British Surgical Practice: Surgical Progress, 1954. Under the general editorship of Sir Ernest Rock Carling, LL.D., F.R.C.S., F.R.C.P., F.F.R., and Sir James Paterson Ross, K.C.V.O., M.S., F.R.C.S. (Pp. 348+vii; illustrated. 42s.) London: Butterworth and Co., Ltd. 1955.

This is essentially a continuation of the great work on *British Surgical Practice* edited by the same authors and brings that work up to date. It consists of three sections: original articles, critical surveys, and abstracts. They are all of a very high order, and either describe or provide access to the latest achievements of surgery.

The first article, by Rodney Maingot, is perhaps the most arresting. He describes in detail the injuries which may occur to the bile ducts and the results which may follow, often unfortunately as the result of surgical procedures. He explains how such mistakes may arise, and how they might have been prevented by a more accurate knowledge of the abnormalities which may occur and by more accurate technique. There follows an admirable account of the methods which have been evolved for the repair of such injuries, sometimes the most difficult problem with which a surgeon can be faced.

The article by Poole-Wilson on injuries of the urethra and bladder, fortunately of less common occurrence, is clear and the result of wide experience. It will be welcomed by all who have to deal with these difficult conditions. That by Paul Brand, of Vellore, on reconstruction of the hand in leprosy, is of far wider appeal than to his own special field, and all who have to deal with the restoration of the functions of the hand after nerve injuries will appreciate the value of his work.

Pelvic viscerectomy for advanced cancer is the subject of an article by Sir Stanford Cade, and is an example of the extraordinary lengths to which modern surgery can go. Such operations can, of course, be justified only in desperate cases and when undertaken by surgeons of quite exceptional skill and wide experience. But he shows that with these conditions they are fully justified and may give relief which can be obtained in no other way.

The article by G. A. Hay and F. W. Spiers on the application of electronics to clinical practice shows how dependent the surgeon of the future may be on physical science. One only hopes that it will be his servant and not his master. After all, one can use a microscope quite effectively without knowing anything about spherical aberration.

The critical surveys include several articles of value. Those on antibiotics and on blood transfusion show important progress in these fields. On carcinoma of the oesophagus Ross Robertson gives a full and well-illustrated account of what can be done with the resources of modern surgery. That many surgeons now question whether such operations are worth while in no way detracts from the value of the article. Norman Tanner gives an excellent account of the present position of carcinoma of the stomach and the encouraging results of modern technique. The abstracts furnish a brief account of progress in a large number of fields and afford ready access to the literature for those who desire to explore these subjects further.

We would like to congratulate the editors on the high level of material, and the publishers on the standard of production maintained throughout the volume.

HENRY SOUTTAR.

THE AUTONOMIC NERVOUS SYSTEM

Clinical Aspects of the Autonomic Nervous System. By L. A. Gillilan, Ph.D., M.D. (Pp. 316+xii; illustrated. 45s.) London: J. and A. Churchill, Ltd. 1955.

The intention of the author, who is associate professor of anatomy at the Graduate School of Medicine, University of Pennsylvania, is to assemble the facts known about the

autonomic nervous system and "arrange them in such a way that the clinician will be able to use them in his practice." Unfortunately he has not been very successful in his task; there is a clear account of the anatomy and elementary physiology, but the clinical aspects are dealt with much less satisfactorily and there are some inaccuracies. The common accompaniment of narcolepsy is cataplexy with sudden loss of muscle tone, and not, as the author says, catalepsy "with statuesque attitudes"; while it has often been demonstrated that the common lesion of the posterior inferior cerebellar artery is a thrombosis and not, as the author implies, a haemorrhage.

There is a fairly comprehensive account of the mechanism of visceral pain, but no satisfactory description or explanation of the curiously localized shoulder-tip pain of subphrenic disease.

The bibliography is adequate, but it is strange to read in the preface that the autonomic nervous system got its first firm footing in medicine in 1935 when Max Peet devised his operation for the relief of hypertension; Leriche for a number of years before this had drawn attention to the clinical importance of the sympathetic nervous system, and in 1934 Gask and Ross had published a monograph on its surgery.

J. W. ALDREN TURNER.

GRENZ-RAY THERAPY

Grenz Ray Therapy: Principles, Methods, Clinical Applications. By Gustav Bucky, M.D., and Frank C. Combes, M.D. (Pp. 204; illustrated. 60s.) New York: Springer Publishing Company Inc. London: Lange, Maxwell and Springer, Ltd. 1954.

Grenz-ray therapy is not much used in this country, but it might be applied with advantage to patients suffering from superficial lesions of the skin and accessible mucous membranes and of the eye. The great difference between this form of treatment and that by more conventional methods of irradiation lies in the fact that, even with relatively large doses, so little penetrates to the deeper layers that the damage to the subepithelial connective tissues—for example, the dermis—is very slight. Thus, a dose to the epidermis of 1,000 r will deliver to the vessels of the dermis at a depth of 2 mm. only about 10 r, so that chronic changes due to vascular damage will be slight or non-existent. On the other hand, the doses delivered to these vessels even by so-called contact x rays for the same surface dose of 1,000 r will be of the order of 500 r—a dose by no means negligible, and capable, as any radio-therapist knows, of permanent irreversible damage to the vessels.

This, in essence, is the burden of the first part of this book concerned with physical and biological principles. The measurement of dose is not very thoroughly considered, but the absorption curves in tissues, carbon, water, and aluminium are thoroughly discussed, and the effect of air absorption on the beam and of oblique entry of the radiation into the tissues is stressed. These are considerations of little moment in most conventional x-ray treatment; indeed, the chief rivals to grenz rays in their particular field are likely to be artificially produced radio-isotopes, which have their limitations in convenience of application, especially to large areas.

The authors give a long list of successfully treated clinical conditions, especially of the skin. The chief advantage of grenz rays is the safety of repeating treatment to such lesions, even with much higher surface doses than would be safe with more penetrating radiation.

Since beryllium window tubes are now readily available and of constant performance this book should be in demand as a guide to all who begin to acquire experience in this field. It is well produced, and, although somewhat diffuse and repetitive, gives the answers to most of the questions likely to occur to those undertaking grenz-ray therapy.

FRANK ELLIS.

BIOLOGICAL SCIENCE

The Human Machine: Biological Science for the Armed Services. By Charles W. Shilling. (Pp. 292+xii; illustrated. 55s.) Annapolis, Maryland: Naval Institute. 1955.

This book is primarily addressed to members of the United States Armed Forces, but much of its content will appeal to a wider audience. It is an expression of a view which is beginning to gain wide acceptance, particularly on the other side of the Atlantic—namely, that some general knowledge of human biology is of value to the ordinary man in his personal life and everyday work.

Part I is an orthodox elementary account of the structure and functions of the body, with some interesting observations on the potentials of human performance. Part II gives a reasonable and not too austere prescription for a healthy life. The reviewer would have been inclined to omit Chapter 9 altogether. It amounts to little more than a nominal list of diseases—a gloomy catalogue of disaster which does little to advance the book's general argument. The sections on first aid and emergency treatment follow generally accepted lines. It is noted with regret, however, that on page 31 the use of oxygen and carbon dioxide breathing mixtures is still advocated.

The third part will probably be new to many British readers and is the most interesting one in the book. Entitled "The Human Machine as Part of the War Machine," it deals with man in relation to the various special environments created by war and military equipment. It will probably engender in the non-medical reader a clearer appreciation of the importance of welding man, equipment, and operation into a single harmonious design. This is a lesson which has not yet been fully learned in all quarters.

The production and printing are of a high standard, though some of the diagrams will tax the presbyopic. Only one minor misprint was noticed.

J. M. HOLFORD.

VITAMINS

Vitamins in Theory and Practice. By Leslie J. Harris, Sc.D., D.Sc., Ph.D., F.R.I.C. Fourth edition. (Pp. 366+xxii; illustrated. 35s.) Cambridge: University Press. 1955.

It is a pleasure to welcome once more a new edition of this book, the previous edition having appeared as long ago as 1938. Many notable contributions to our knowledge of the vitamins have, of course, been made in the intervening period, but the text has been revised and brought up to date wherever necessary, and new chapters have been introduced to deal with some of the more important additions to our knowledge of the subject.

It is as well to point out, in view of the long interval which has elapsed since the notices of the previous edition appeared, that this account of the vitamins can be read with pleasure and profit by the "ordinary" reader, as well as by medical students, doctors, dietitians, and others with a professional background of interest in nutrition. The book is profusely illustrated and thoroughly deserves the continuation of the support it has received in the past.

S. J. COWELL.

POTASSIUM METABOLISM

Potassium Metabolism in Health and Disease. By Howard L. Holley, M.D., and Warner W. Carlson, Ph.D. (Pp. 131+xii; illustrated. \$4.50.) New York and London: Grune and Stratton. 1955.

This book provides a concise and readable summary of current information on normal and abnormal potassium metabolism. The two authors write from the Departments of Medicine and of Biochemistry in the University of Alabama and their collaboration has given us an exceptionally lucid account of the ways in which potassium metabolism influences and is influenced by energy metabolism. The part played by potassium in nerve and muscle activity is also outlined. Some exception may be taken to the authors' belief, implicit on page 17 and explicit on page 22, that "transfer of potassium between the intracellular and

extracellular compartments is a relatively slow process"; for isotope studies, both *in vitro* and *in vivo*, indicate that transfer of potassium across the cell wall takes place very rapidly indeed.

The various clinical causes of potassium depletion and excess are adequately summarized; overdosage with deoxycortone acetate is mentioned, but aldosterone is referred to by its "old" name of electrocortin, and Conn's new syndrome of primary aldosteronism has not been anticipated. There is an appendix giving the potassium content of foods, and even of the public water-supply in 150 American cities; from this it would appear that only in Aberdeen, S. Dak., Galesburg, Ill., and Kansas City, Mo., could anyone expect to get as much as 1 mEq of potassium daily from the tap. This evidence of painstaking preoccupation with the needs of American readers may console any British kaliologist who happens to notice that in a list of 41 references it has not been found necessary to include any British work more recent than that of Sidney Ringer in 1883.

D. A. K. BLACK.

MARRIAGE GUIDANCE

Your Marriage: A Book for the Married and the About to be Married. By Kenneth Walker, F.R.C.S. Foreword by F. A. E. Crew, F.R.C.P., F.R.S., and a psychological postscript by Peter Fletcher. Second edition. (Pp. 150+xvi. 8s. 6d.) London: For British Social Biology Council by Secker and Warburg. 1955.

Any Wife or Any Husband: A Book for Couples who have met Sexual Difficulties and for Doctors. By Medica (Dr. Joan Graham). Second edition. (Pp. 147. 10s.) London: William Heinemann, Ltd. 1955.

These books were first published within a few months of each other, and it is remarkable that their second editions appear almost simultaneously. For they have no obvious connexion except their subject, and even to this they bring a different approach.

Mr. Walker's book has changed its title from *Marriage*, the possessive adjective being added to give it a more personal appeal. A psychological postscript also appears for the first time and discusses the role of emotional independence of the partners, and of social and economic factors, in determining stability of marriage. Otherwise the book consists of a simple short account of sex, adolescence and its problems, the choice of a marriage partner, the consummation of marriage, coital technique, the having and the avoiding of children, and mothers-in-law and other threats to domestic bliss. All will regard Mr. Walker's views on premarital chastity as realistic and honest, but some may find them unnecessary, at any rate in this context. The subtitle of this work, "A book for the married and the about to be married," is important in that it indicates its scope and also that it is intended for lay readers.

Medica's subtitle is equally important and revealing and reads, "A book for couples who have met sexual difficulties and for doctors"—a phrase which intrigues by its several possible interpretations. Difficult though her task may appear, there is no doubt that the author, a grandmother herself, has written something which should prove of the greatest help to the general practitioner and gynaecologist, and yet it is sufficiently non-technical to hand on to patients of average intelligence for their profit. It does not anticipate trouble, but has something practical to say to those who have tried and failed. It describes and comments usefully on the common disorders of sex encountered by both men and women: impotence, frigidity, lack of orgasm, dyspareunia, homosexuality, and various forms of maladjustment. Moreover, it answers reassuringly the many doubts and fears which a host of patients have always had but which they are more likely to ventilate to the doctor now than in the past.

The two books cannot be compared; their individual appeals vary according to whether one believes that it is better not to jump fences until they are reached or whether one accepts that to be forewarned is to be forearmed.

T. N. A. JEFFCOATE.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY JUNE 18 1955

DIETARY DEFICIENCIES AND FATTY LIVERS

Fat accumulates in the liver for one of two reasons. It may do so as a result of mobilization of fat from fat storage depots throughout the body in response to increased demands for fat combustion, as in unstabilized diabetes mellitus, and in these circumstances the chemical pattern of the hepatic fat is not altered. Or it may do so in response to liver injury or dietetic disturbance, in which case the pattern of hepatic fat is abnormal. Whenever fat accumulates in the liver owing to alterations of the diet, the cause has nearly always been traced to dietary changes which have prevented or interfered with the hepatic synthesis of phospholipids. The part played by phospholipids in fat metabolism is to transport fatty acids throughout the body, and the most important phospholipid in this respect is lecithin. Lecithin consists of glycerol to which are conjugated two fatty acids, one saturated and the other unsaturated, and the phosphate ester of the quaternary ammonium base choline, whose molecule contains three methyl groups. In the absence of lecithin from the diet fat accumulates in the liver, and it disappears when lecithin is restored. This dispersal of accumulated fat by lecithin is called its lipotropic action, and depends on the presence in the lecithin molecule of choline.

Diets deficient in choline and protein also cause fat accumulation in the liver round the central lobular vein. When this happens the formation and turnover of phospholipids in the liver are decreased and there is a hold-up in the transport of fatty acids, which are then conjugated with glycerol and deposited as neutral fat in the liver cells. Restoration of choline to the diet permits the turnover of phospholipid to start again and the incorporation of fatty acids in them, with resultant decrease in neutral fat. When fat has accumulated in the liver as a result of choline and protein deficiency, the adding of protein, but not choline, to the diet has a lipotropic effect, though it may not be sufficient to disperse all the accumulated fat. This is due to the methionine in the protein. Methionine is a sulphur-containing amino-acid which also contains a methyl group; this can be split off

to form choline (methyl group donation). The lipotropic effect of proteins is partly dependent on the amount of methionine they contain.

Choline synthesis, and therefore synthesis of lecithin, can be interfered with in other ways than by the suspension of methyl group donation. For example, rats receiving diets containing adequate quantities of choline develop fatty livers when they are fed with guanido-acetic acid. This is because choline itself donates methyl groups to guanido-acetic acid to form creatine, being diverted to this from its usual role in the formation of lecithin. Similarly, the sulphur-containing amino-acids cystine and homocystine have a liver-fattening action which can be prevented by the addition of adequate amounts of choline or methionine to the diet. It is thought that this is due to the stimulation which cystine and homocystine exert on growth and appetite, causing an increased demand for choline by the organism.

In the opening pages of the *Journal* this week Professor C. H. Best and his colleagues in Toronto give experimental details confirming and extending previous work on these problems, which Professor Best also discussed in the Croonian Lecture which he gave before the Royal Society in London earlier this week. In the present paper he and his colleagues report having found that, whereas animals receiving choline-deficient diets developed fat accumulation round the central lobular veins, animals receiving protein-deficient diets developed fat accumulation in the periportal regions. Periportal accumulation of fat was not dispersed by adding choline to the diet. The different sites of fat accumulation were clearly defined only in the early stages of deficiency. When either choline or protein had been deficient for a long time, fat accumulation extended throughout the whole lobule. The significance of these findings is not clear, though Best and his colleagues think that accumulation of periportal fat when the diet is deficient in protein may be due to qualitative and quantitative alterations in the amino-acids present. They also noted a transient increase in periportal fat when an animal was transferred from a diet low in protein to one containing adequate quantities of protein and choline.

Unfortunately fatty livers in man are often the result of multiple dietary deficiencies and do not benefit from the administration of only one lipotropic factor. Furthermore, the curative merits of individual substances in human hepatic disease are hard to assess, since they are not unreasonably administered in a lipotropic blunderbuss. Professor Best's finding of periportal fat accumulation in protein-deficient rats is of special interest, because it is in those regions of the liver that fat accumulates in kwashiorkor, a perplexing disease of dietary origin which is widespread throughout the world.

SURGERY OF SIMPLE PULMONARY STENOSIS

It is now established that surgical treatment of congenital stenosis of the pulmonary valve is effective and not unduly dangerous. Pulmonary stenosis is one of the lesions which make up Fallot's tetralogy, the others being a patent interventricular septum, dextro-position of the aorta, and enlargement of the right ventricle. Pulmonary stenosis also occurs as a congenital lesion with an intact ventricular septum, in which case the term simple pulmonary stenosis is used. This is less common than Fallot's tetralogy. It is often an isolated lesion, when it is sometimes referred to as pure pulmonary stenosis. It may also occur with a patent interatrial septum (patent foramen ovale). This condition is sometimes called the trilogy of Fallot, a term which is perhaps best eschewed to avoid confusion with the tetralogy. Less usually a patent ductus arteriosus accompanies the stenosis.

Not long after the successful operative treatment of Fallot's tetralogy by anastomosis of the subclavian artery to the pulmonary artery (Blalock's operation¹) was accepted, the alternative operation of pulmonary valvotomy was described by Sir Russell Brock² and Mr. Holmes Sellors.³ The results of valvotomy in 100 cases of Fallot's tetralogy were described by Sir Russell Brock, Dr. Maurice Campbell, and Dr. D. C. Deuchar⁴ recently in this *Journal* and commented on in a leading article; one-sixth of the patients died, the remainder were improved, most of them greatly. Brock and Campbell⁵ have now published the results of valvotomy in 58 cases of simple pulmonary stenosis. In this series 8 patients died, but 5 of these were in the first 6 patients; good results were obtained in 46 of the 50 survivors. Many other, but mostly smaller, series have been reported, and on the whole with similar results.

In simple pulmonary stenosis, as in Fallot's tetralogy, the narrowing may lie at the valve or below it in the infundibulum. The former is more common. Occasionally both types are combined. In valvular stenosis the cusps are fused and thickened, forming a dome-like projection with a small lumen, beyond which the pulmonary artery is usually dilated. Infundibular stenosis is either a long, narrow myocardial stenosis, or less often a membranous diaphragm with a thin-walled post-stenotic chamber. The pulmonary artery may be hypoplastic. As a

result of the stenosis the pulmonary circulation is diminished and the pressure in the right ventricle raised, so that this chamber hypertrophies. If the interatrial septum is intact, the arterial oxygen saturation is normal and there is no cyanosis, except occasionally peripheral venous cyanosis. A systolic murmur is heard, best at the second left interspace, and often a thrill. There may be no symptoms. The most frequent is dyspnoea, usually noticed on exertion, with reduced exercise capacity; patients also complain of easily tiring and of failure to gain weight. According to the severity of the stenosis, the heart enlarges and eventually fails. The size of the right ventricle can be assessed by fluoroscopy and confirmed by the electrocardiogram, which in advanced cases shows inversion of T-waves in the chest leads. Cardiac catheterization reveals the rise of pressure in the right heart; when the catheter passes the stenosis the pressure suddenly falls. Blood samples from various levels analysed for oxygen show no evidence of a shunt from one side of the heart to the other.

If a patent interatrial septum is present, with a functional opening allowing the passage of blood from right atrium to left, central cyanosis may occur, especially on exertion; it often leads to polycythemia, raised haemoglobin, and clubbing of the fingers. The septal opening can be confirmed by cardiac catheterization, which will show evidence of a shunt with changes in oxygen saturation; the catheter may pass through the foramen.

Indications for surgery are not unanimously accepted. Many patients do not need operation. It is more dangerous in infancy and the adult than in childhood, or if the heart is greatly enlarged or the patient severely cyanosed. It is indicated if the symptoms are pressing, if the heart is enlarged or shows electrocardiographic evidence of right ventricular strain, or if the pressure in the right ventricle is high—say above 100 mm. Hg. The stenosis may be approached from above or from below—through the pulmonary artery or through the ventricle. The latter route has been more commonly taken, as in Campbell and Brock's series. A valvular stenosis is divided with a valvotome and enlarged with metal dilators; an infundibular stenosis must be resected with a special punch. Exact diagnosis of the level of the obstruction can be made only at operation, but it can be suspected beforehand from the radiological appearances and the pressure pattern at cardiac catheterization.⁶ The adequacy of the valvotomy is best confirmed by pressure measurements at operation. F. Therkelsen⁷ claims that the approach through the pulmonary artery is more direct, avoids risk of injury to coronary vessels, and allows more time. H. Swan and others,⁸ dissatisfied with the

variable results from transventricular valvotomy, have recently described transarterial valvuloplasty under direct vision, using hypothermia and temporary occlusion of the great veins so that the heart is virtually dry. They claim restoration of normal haemodynamics, and have had no deaths in seven operations.

Brock and Campbell, in their series of 58 patients, had 33 without cyanosis, of whom 1 died, and 25 with cyanosis, of whom 7 died. Operation greatly improved the colour and capacity for exercise in the survivors of this group, and reduction of right ventricular pressure was marked. Results in the acyanotic group were good in all but four. The heart was often strikingly reduced in size, and showed improvement in the electrocardiogram. There has been no evidence of recurrence of stenosis after operation; and pulmonary regurgitation has only rarely occurred, and then has not been of serious import.

NON-SPECIFIC ENTEROCOLITIS

Recent observations on non-specific inflammatory lesions of the gut involving both small and large intestines are helping to solve some clinical problems. Typically, non-specific ulcerative colitis begins in the rectum and lower sigmoid colon; it may then extend proximally to attack the whole colon. Even when the whole colon is affected the small intestine is commonly spared, though the terminal few inches of the ileum may show inflammatory changes attributed to "backwash" from the diseased colon. Regional ileitis, or Crohn's disease,¹ is classically a granulomatous lesion of the ileum in which there is mucosal destruction, thickening and contraction of the bowel wall leading to stenosis, and liability to abscess and fistula formation. The functions of the small bowel may be gravely disturbed; steatorrhoea may develop, and the patient suffer from deficient absorption of vitamins and other substances. Many authors have described patients in whom both small intestine and colon are simultaneously affected; the right side of the colon commonly shows the disease most severely—in contrast to what is usually found in ulcerative colitis. Some authors regard these cases as examples of regional ileitis extending into the colon, whereas others see them as unusual cases of ulcerative colitis affecting primarily the right side of the colon and extending proximally up the ileum.

In an important paper W. T. Cooke and B. N. Brooke² make a case for regarding non-specific ileocolitis as a disease in its own right. They describe a group of sixteen patients in whom both small and large intestines were affected. Some patients presented with the clinical picture and laboratory findings of steatorrhoea, but radiological examination indicated colitis. In other patients the symptoms were those of ulcerative colitis, but barium follow-through studies revealed an abnormal terminal ileum. The condition of the ileum at laparotomy or necropsy differed from that in Crohn's disease in that the bowel wall was not thickened and did not adhere to or form fistulae with other organs, and the abnormal changes were confined to the mucosa. The mucosal changes consisted of numerous small ulcers distributed throughout the distal part of the small intestine. The mucosa between the ulcers was oedematous. The authors consider these appearances to be quite different from those seen in ileitis secondary to ulcerative colitis, when "backwash" causes a uniformly granular mucosa affecting the last foot or so of the ileum.

It seems likely that ileocolitis as described by Cooke and Brooke is a different disease from Crohn's disease. It is less clear that it differs essentially from ulcerative colitis other than in its site of maximum intensity. A firm conclusion would be unwise in view of our present ignorance of the pathogenesis of ulcerative colitis, and the issue should be left *sub judice* until we have more aetiological information. From a practical viewpoint Cooke and Brooke have rendered a valuable service to clinicians who encounter these patients by stressing the need to avoid ileostomy when there is gross disease of the ileum. Unless ileostomy is being carried out as an emergency, it would perhaps be wise to have barium follow-through studies made beforehand to exclude the possibility of severe ileitis; and sometimes a fat-balance investigation may be indicated.

The medical treatment should take account of the derangement of both large and small bowels. The basic requirements are a bland low-fat diet, high in protein, giving adequate calories, correction of any electrolyte disturbances, repeated blood transfusion if the patient is anaemic, and vitamin supplements. Folic acid and large doses of calcium may be necessary if steatorrhoea is severe. Sulphonamides and antibiotics are unlikely to do more than reduce the risk of pyogenic complications. Corticotrophin or cortisone should certainly be given a trial, since these agents have been found beneficial in both regional ileitis and ulcerative colitis,³⁻⁷ and Cooke and Brooke have given them in some cases with good effect.

DOCTORS' SMOKING HABITS

"Do as I say, not as I do" may have been a useful adage for the Victorian parent, but it is unlikely to carry much weight with the Elizabethan patient. So whether the apparent connexion between cigarette smoking on the one hand and lung cancer and coronary thrombosis on the other will lead to any significant change in popular habits will depend primarily on the seriousness with which the profession takes its own warnings. Two recent papers from Britain and the U.S.A. throw light on the present attitude of medical men in this respect. The English investigation¹ was carried out on a small scale and was confined to the 217 doctors working in Oxford hospitals. It has the peculiar merit, however, that 211 (or 97%) replied to the questionnaire which was sent them. From the replies it appeared that slightly over a quarter had never smoked cigarettes, while another quarter had smoked cigarettes at one time but had subsequently stopped. Of those that stopped, 18 stopped during the four years preceding October, 1950, when extensive data were first published in this *Journal* linking cigarette smoking with the development of lung cancer,² and 22 stopped during the following four years. Reasons for stopping were many, the numerically most important being minor ill-health and expense. Eight gave the risk of carcinoma as the principal reason. In contrast with the 40 who had stopped smoking cigarettes during the last 8 years, 11 had begun to smoke them—including 9 beginning before October, 1950. Clearly, therefore, the effect of the new evidence on doctors' smoking habits has not been great, though it would appear to have played some part in reducing the proportion smoking cigarettes from 56.9% to 47.4% over the last four years—that is, by 17% of the initial figure. That the effect has not been greater may be partly because professional opinion is not altogether agreed upon the significance of the epidemiological data. Rather more than half (57%) of the doctors were satisfied with the evidence for an association between smoking and lung cancer, but 32% were not satisfied. But it is interesting that the proportion satisfied was considerably higher among those who had never smoked cigarettes (71%) than among those who had smoked cigarettes (52%), while it was lowest of all among those who continued to smoke them (46%). Whether this is mainly because non-smokers are over-ready to believe ill of a vice they do not share, or that smokers are hesitant to condemn a personal pleasure, remains a psychological problem of some delicacy.

The reaction among doctors in the United States would appear to be similar to that in Britain.³ From the much more extensive American data, which covered some 4,000 Massachusetts physicians, it appears that rather more than one-third did not smoke cigarettes. Of those who did not smoke at all, 65% accepted "that heavy smoking of cigarettes may lead to lung cancer," while among those who smoked the proportion was only

56%. Separate figures were obtained for practitioners in the different branches of medicine, and it is perhaps of significance that the highest proportions of non-smokers were found among those engaged in preventive medicine and public health and among thoracic surgeons. Among both these groups, moreover, a high proportion accepted the aetiological connexion with smoking (72% and 78% of smokers and 83% and 100% of non-smokers respectively). Of these Massachusetts physicians, 20% had reduced the amount smoked, or changed over to a pipe or cigars (that is, nearly a quarter of those who had previously been smokers): 72% of the smokers had made no change in their smoking habits. In contrast to the British doctors, the great majority of those who had changed gave as their reason the risk of carcinoma. New data obtained in this survey related to the type of advice which should be given to heavy cigarette smokers. As many as 32% of the doctors believed that they should be advised to stop smoking, 58% that they should be advised to reduce smoking with or without changing over to filter-tipped cigarettes (14%) or to a pipe or cigars (10%). But, unless more evidence appears that doctors themselves follow this advice, it may be doubted whether the public will pay much heed to it.

BONE CHANGES CAUSED BY NERVE LESIONS

Long-standing paralysis produced by lesions of the spinal cord or nerve roots may be associated with bone changes, both in children and adults. Poliomyelitis probably affords the best example of this, a severely paralysed limb in a child often showing osteoporosis and shortening as a result of diminished and prematurely arrested local growth. Bone changes of this type are found in a number of other neurological conditions, including spina bifida and traumatic paraplegia. Their general resemblance to the skeletal changes resulting from prolonged immobilization¹⁻³ suggests that "disuse atrophy" is an important factor in their genesis.

Recently C. L. Jeannopoulos,⁴ of New York, has directed attention to abnormal fragility of bone in this type of case and compared it with the well-known bone fragility of osteogenesis imperfecta. He describes three cases, all children, in which paralysis and sensory loss in the lower limbs resulted from lesions of the spinal cord or nerve roots; these conditions were associated with extreme fragility of bone. Repeated pathological fractures occurred, sometimes without any known injury. As other workers have noted, Jeannopoulos found that these fractures healed rapidly. Indeed, it is of interest that fractures in paraplegic patients often produce

very bulky masses of callus somewhat resembling the exuberant callus seen in osteogenesis imperfecta, and described by Fairbank and Baker.⁵

In neurofibromatosis, too, pathological changes in the nervous system are associated with skeletal abnormalities. In addition to the direct encroachment of expanding neurofibromata on bone, interference with skeletal development and growth, as shown by scoliosis or inequality of leg length, is sometimes observed. The immediate cause of this growth disturbance is not clear, and even more mysterious is the occasional association of another skeletal abnormality—osteomalacia—with neurofibromatosis.⁶⁻⁹

Another interesting skeletal complication of paraplegia, this time described in adult cases of long duration, is ossification in the tissues surrounding the hip-joint.¹⁰ This lesion seems to have some relation to spasm in the flexor muscles of the hip, and sometimes extensive bony bridges appear in the muscles on the anterior aspect of the joint, completely preventing movement. The disorder is probably to be regarded as a traumatic myositis ossificans rather than a specific result of long-standing denervation.

SALIVA AND CARIES

Since W. D. Miller put forward his chemico-parasitic theory of dental caries in 1890,¹¹ saliva has been the focus of much speculation and research. As the initial attack of dental caries is on the tooth surface, and surface conditions are of prime importance to the process, saliva can scarcely be expected to play no part. Both the oral content of acidogenic bacteria and the buffer capacity of the saliva are correlated with the amount of dental caries. However, many other factors are involved also.

Contrary to expectations, the physical properties of saliva seem to have little influence on dental caries. The volume of saliva secreted probably has a profound effect, for extirpation of the salivary glands or diminution of their function after radiotherapy causes extensive and rampant dental caries. But measurement of the volume of saliva secreted over test periods of 5 or 10 minutes shows practically no relationship between the volume of saliva secreted and the amount of caries in the individual.

A large amount of research has produced inconclusive results or has established only low correlation between salivary contents and the incidence of dental caries. The presence in the saliva of enzymes, co-enzymes, and anti-enzymes, amino-acids, and many trace elements such as fluorine, magnesium, and chlorine, has been investigated. It is of interest, therefore, that J. C. Muhler and W. G. Shafer¹² have recently

produced experimental evidence that feeding with desiccated thyroid has a marked caries-preventing effect on the rat, whereas lowering the level of the thyroid hormone in the blood with thiouracil increases the incidence of dental caries.

E. J. Ryan and S. Kirkwood¹³ suggest that the probable mechanism by which the incidence of dental caries is affected is through alteration of salivary flow. They state that "a convenient explanation of the results of Muhler and Shafer would be that it is the increased concentration of iodide ion in the saliva and/or the increased saliva flow resulting from the stimulation of the degradative processes in the salivary glands that accounts for the effect of feeding desiccated thyroid," and when thiouracil was fed the increase in dental caries "may well have been caused by a decreased level of iodide in the saliva and a decrease in the rate of saliva flow." Moreover, some evidence¹⁴⁻¹⁷ suggests that the salivary glands in the rat control the level of thyroid hormone in the blood stream by degrading it to iodide ion.

PRETIBIAL MYXOEDEMA

Often unrecognized, pretibial myxoedema is apt to be thought extremely rare. Moreover, only occasionally does it give rise to discomfort or disability, so that it assumes little importance in practice, though its pathogenesis is of great interest. The first description of the condition would seem to have been by P. Watson-Williams in 1895¹; his patient was a woman with Graves's disease. Since then it has chiefly been of interest to dermatologists until Trotter and Eden² published their excellent paper on the subject in 1942.

Localized pretibial myxoedema seems never to appear without past or present thyrotoxicosis, and it differs from the rare lichen myxoedematosus both in this respect and in clinical appearance, for the latter condition consists of small papules filled with mucin. About 3% of patients with toxic diffuse goitre suffer from pretibial myxoedema; most commonly they are between the ages of 40 and 48, and the male-female ratio is 1:1.8 in contrast to the ratio of 1:4.4 in toxic goitre. The course of localized myxoedema is so similar to that of progressive exophthalmos that they probably have a similar aetiology.³ In W. R. Trotter and K. C. Eden's series some patients developed both conditions simultaneously after thyroidectomy, but in half of them the pretibial myxoedema appeared before treatment of the thyrotoxicosis.

The clinical features are fairly constant. Exophthalmos is noted and the patient may be hyper- or hypo-thyroidic. R. S. M. D. Inch and C. F. Rolland⁴ found that two of their three patients had gross finger clubbing. Occasionally there is indefinite aching in the

legs. The lesions first appear on the antero-lateral aspect of the lower half of the legs, later extending sometimes as far as the knees and on to the back of the legs and the insteps. It is bilateral, and the skin is raised in irregular firm swellings, the surface being dimpled and faint pink or brown or unaltered in colour. Sweating at the site and the presence of coarse hairs have been noted. The lesions may disappear spontaneously in the course of years.

The aetiology is unknown. Hypothyroidism does not usually result in an increase of mucin in the skin, though the term "myxoedema" suggests that it does.² In pretibial myxoedema, however, a considerable amount of material is deposited which stains with thionine blue, a reaction regarded as specific for mucin. Exophthalmos does not appear to result from a similar deposition of mucin in the orbit but by retraction of the lids and oedema of the orbital tissues, though the problem of its cause is still unsolved.⁵ The common factor in the causation of exophthalmos and pretibial myxoedema has been thought to be overproduction of the thyroid-stimulating hormone of the anterior part of the pituitary gland.^{3,5} The hypothesis has also been suggested that localized myxoedema develops as the direct result of an unexplained insensitivity of the pretibial tissues to the action of the thyroid hormone. As Inch and Rolland⁴ point out, neither hypothesis has much evidence to support it at present.

The treatment of pretibial myxoedema is unsatisfactory. Thyroxine given by mouth or injected locally, radiant heat, massage, the injection of hyaluronidase—all have proved disappointing. Inch and Rolland⁴ found some temporary improvement from the combined systemic and local injection of cortisone acetate, but Zugerman⁶ failed to produce any notable improvement during three months in one patient treated with hydrocortisone acetate tablets and ointment. It is clear that we are still far from understanding this curious and interesting condition.

BIRTHDAY HONOURS

The advancement of Sir Horace Evans to G.C.V.O. in the Birthday Honours will be welcomed throughout the medical profession, especially by his colleagues at the London Hospital. The services he has rendered to the Royal Family with such distinction began with his appointment as physician to Queen Mary in 1946. His signature on a bulletin reporting King George VI's health first appeared in 1949 (he received the K.C.V.O. in the same year), and thereafter he shared with the King's other medical attendants the onerous duty of caring for his Majesty in the illnesses that afflicted him until his death in 1952. Since then Sir Horace has been physician to the Queen. Two doctors who have made signal contributions to public health in this country also receive promotion: Sir John Charles, chief medical officer at the Ministry of Health, becomes a K.C.B., and Sir Alexander Macgregor, formerly medical officer of health at Glasgow, becomes a K.B.E. The conferment of a knighthood on Mr. Geoffrey Keynes, consulting

surgeon to St. Bartholomew's Hospital, will give pleasure to his circle of friends and admirers both inside and outside the medical profession, for besides his attainments as a surgeon Mr. Keynes has earned distinction in the world of letters for his bibliographical and historical studies. In particular he is an authority on the poet and artist William Blake and on the portraiture of William Harvey. His contributions to surgical advancement have been unusually diverse, perhaps his principal interests being the treatment of breast carcinoma, blood transfusion, the surgery of the thyroid, and latterly the treatment of myasthenia gravis by thymectomy. In less obvious ways too he has rendered scholarly service to the profession by his devoted work at the Royal College of Surgeons, whose honorary librarian he was appointed in 1952.

Three Australians are also among the new Knights Bachelor. Mr. Albert Coates, until recently senior honorary surgeon to the Royal Melbourne Hospital, is at present Stewart lecturer in surgery at the University of Melbourne. In this capacity he has been in no small measure responsible for the establishment of the professorial chairs in medicine and surgery in the university. In the 1939-45 war Mr. Coates was senior surgeon to the Australian Imperial Force in Malaya, and his outstanding service as chief medical officer to the Allied Prisoner of War Hospital in Siam will never be forgotten by all who had the misfortune to be "guests of the Emperor of Japan" after the disaster of 1942. He has been twice president of the Victorian Branch of the B.M.A., and has played an active part in many other medical organizations. Professor Harold Dew, like Mr. Coates, is a graduate of Melbourne University. After service in the first world war he was engaged in research at the Walter and Eliza Hall Institute in Melbourne, notably with Sir Neil Hamilton Fairley. This work led to his classic monograph on hydatid disease (1928). Latterly he has been professor of surgery in the University of Sydney, and in recent years has been prominent in the development of medical education in New South Wales, at both student and postgraduate levels. He visited Britain last year as Sims Travelling Professor. Dr. Darcy Cowan graduated in Adelaide in 1908 and served throughout the first world war, for a time in the R.A.M.C. An honorary consultant physician to the Royal Adelaide Hospital, and an authority on diseases of the lungs, he was president of the South Australian Branch of the B.M.A. from 1935 to 1937. He has devoted a long professional career to the service of the community, and its recognition will be warmly welcomed by his colleagues.

Surgeon Rear Admiral S. G. Rainsford, Major General A. Sachs, and Dr. W. E. Chiesman (of the Treasury) receive the C.B. Among those appointed C.B.E. are Professor Max Rosenheim, director of the medical unit at University College Hospital, Mr. Frederick Roques, gynaecological surgeon to the Middlesex Hospital, and two members of the B.M.A. Council: Dr. Mary Esslemont for services to medicine in Scotland and Dr. J. A. L. Vaughan Jones for services to the Ministry of Labour; Dr. Roger Bannister also receives the C.B.E. for services to amateur athletics.

EMERGENCIES IN GENERAL PRACTICE SERUM AND ANAPHYLACTIC REACTIONS

BY

D. A. WILLIAMS, M.D., M.Sc., F.R.C.P.

Physician, United Cardiff Hospitals

Almost any protein material or organic compound, by combining with body proteins, may produce severe allergic reactions. Although the use of serum and consequently the reactions from serum have been considerably reduced, these reactions still occur, and new treatments have brought new hazards. There are no more distressing emergencies than those which result from one's own treatment; their avoidance is most desirable, while their prompt recognition and treatment are essential.

It is not the purpose of this paper to discuss reactions to those substances which are used only occasionally and which only very exceptionally cause reactions, but rather to those substances which the practitioner may well use often in the course of his work. Nor is the value, or otherwise, of serum sensitivity tests dealt with, as this subject was fully discussed by Laurent and Parish in a previous refresher course series.*

There are three main types of reactions: local reactions, anaphylactic reactions, and serum sickness.

Local Reactions

An area of local redness at the site of injection of an allergenic substance is not unusual and therefore gives rise to no concern, but when such reactions are large the gap between a local and a general reaction is being narrowed, and this must be remembered if further similar injections have to be given.

Anaphylactic Reactions

Anaphylactic reactions always come on soon after the injection of the allergen, sometimes immediately, and the earlier the reaction the more likely is it to be severe and dangerous. A reaction occurring within a few minutes of the injection will be severe, and possibly fatal, while a reaction occurring after thirty minutes to an hour, although it may be quite troublesome, is rarely, if ever, dangerous.

The earliest symptoms of severe and dangerous anaphylactic reactions may be sweating, a feeling of heat throughout the body, a generalized pruritus, or an urticarial rash rapidly becoming generalized; an irritating cough, dyspnoea and wheeziness, a choking sensation, substernal oppression, or a feeling of constriction in the chest; retching or vomiting with cramp-like pains in the abdomen, sometimes diarrhoea, occasionally severe abdominal distension; and/or headache, giddiness, or sudden unconsciousness, in some cases followed by convulsions; while acute circulatory collapse and death may occur rapidly. The pulse is at first of good volume, slow and bounding, but in the dangerously ill patient it becomes rapid, weak, and thready, and there is a marked fall in blood pressure.

Serum Sickness

In serum sickness the symptoms occur only after a definite incubation period, usually six to twelve days, commonly ten days. Symptoms may be mild or severe. They consist of fever, skin eruptions, glandular enlargement, and arthritis, often in this order. The fever ranges from 99 to 104° F. (37.2 to 40° C.). Skin eruptions are the commonest manifestation, the large majority being urticarial weals or, in the

severer cases, angioneurotic oedema. A morbilliform type of rash is also fairly common, and different parts of the body may present different appearances at the same time. The scarlatiniform type of rash occurs infrequently. When generalized angioneurotic oedema occurs the urine may contain albumin, but rarely blood. The presence of albumin need not cause undue concern, for after the serum disease has subsided the albumin disappears.

When severe pains in the joints occur it is almost always towards the end of the illness, and although these are a fresh and sometimes frightening addition to the patient's symptoms they usually herald the last phase, when the acute stage is nearing its end. In the more severe reactions there may be difficulty in swallowing and a feeling of a heavy lump behind the sternum, while cramp-like abdominal pains, with or without diarrhoea or vomiting or both, are also not uncommon and may last for several days.

Stiffness of the joints, especially after use, and an urticarial type of skin reaction after pressure may persist for weeks and sometimes for many months. One of my own patients, six months after his penicillin reaction, still developed pain and swelling of the feet and ankles after a brisk walk, and was unable to use his hands for heavy manual work.

Neurological complications are rare but of special interest. The commonest is an affection of the brachial plexus or part of the brachial plexus, resulting in a scapulo-humeral paralysis. The patient often complains of neuritic pains in the shoulder regions, and these are followed fairly rapidly by a flaccid paralysis with the usual tenderness and hyperaesthesia. Recovery usually occurs within six months.

Treatment of Anaphylactic Reactions

Before any therapy by injection is given, adrenaline should be near at hand; before any potent antigenic substance is used, adrenaline, intravenous aminophylline, and an intravenous antihistaminic, together with the necessary syringes, should be made instantly available. Immediately reaction occurs 5 to 10 minims (0.3 to 0.6 ml.) of adrenaline (1:1,000) should be injected subcutaneously. If practicable, a tourniquet should be applied above the site of the sensitizing injection, where a further 3 to 5 minims (0.2 to 0.3 ml.) of adrenaline should be injected. The dosage of adrenaline varies according to the severity of the reaction, and frequent doses may be necessary. In worsening cases the dose should be repeated in ten minutes or so and local massage used to help to expedite absorption. Intravenous adrenaline in a strength of 1:1,000 is contraindicated because of its danger.

In those cases not responding to adrenaline intravenous aminophylline and/or an intravenous antihistamine should be given. The intravenous aminophylline (0.48 g. in 20 ml.) should be given slowly over five to ten minutes. I have several times had most satisfactory results with this therapy. Intravenous antihistaminics—diphenhydramine hydrochloride, 50 mg., or promethazine hydrochloride, 25 to 50 mg.—must also be given very slowly. If intravenous therapy is impracticable intramuscular therapy with an antihistaminic (dosage and solutions are the same as for intravenous therapy) and/or aminophylline (0.5 g. in 2 ml.) is advisable.

Treatment of Serum Sickness

Antihistaminics and ephedrine, $\frac{1}{2}$ gr. (32 mg.) three times a day or as required, are the drugs most commonly used.

*British Medical Journal, 1952, 1, 1294.

In patients confined to bed the hypnotic effect of diphenhydramine hydrochloride, 25 mg. three or four times a day, or promethazine hydrochloride, 25 to 50 mg. at night with 10 mg. once or twice a day, is helpful; in severe cases larger doses, 50 mg. up to six times in twenty-four hours of the former or 50 to 75 mg. at night with 25 mg. once or twice a day of the latter, may be indicated. For those who are ambulant antihistaminics causing drowsiness might be reserved for use at night. During the day chlorecyclizine hydrochloride, 50 mg., or phenindamine, 25 mg., may be given as required.

In severe and persistent cases which do not respond to the above measures, corticotrophin (A.C.T.H. gel) 60-80 units or cortisone 25-50 mg. six-hourly may well be indicated and are very effective. Intravenous hydrocortisone gives promise of being the most rapid form of hormonal therapy. Before considering corticotrophin or cortisone it is well to exclude the presence of a contraindication, especially a history of gastric or duodenal ulcer or of tuberculosis.

Immunization to Tetanus

In the same way as diphtheria has been reduced to a rare disease by active immunization, so can tetanus be reduced. Certainly all allergic individuals should be given tetanus toxoid, which carries for them no special risk. L. Unger gives each of his patients a card to carry with them certifying that he or she is highly allergic and has received tetanus toxoid. "In case of injury," it reads, "do not give tetanus antitoxin; please inject instead 0.5 ml. of tetanus toxoid."

Administration of Horse Serum

Before serum is given inquiry must be made of any previous serum therapy, of any known sensitivity to horse-dander or horse serum, and of any personal or family history of asthma, infantile eczema, hay-fever, urticaria, or food or drug allergies.

When there is a negative history intramuscular serum is, for all practical purposes, safe, but observation for half an hour afterwards is always advisable. If there has been previous serum therapy a trial dose of 0.2 ml. of the serum is given half an hour before the full intramuscular dose.

Ideally, allergic subjects should not receive serum, but when necessary those without special sensitivity to serum or horse-dander should be given 0.2 ml. of the serum diluted one in ten subcutaneously, followed in half an hour by 0.2 ml. of the undiluted serum, followed in a further half an hour by the full dose and the usual post-injection observation. Never give intravenous serum before intramuscular serum has been tried—the interval between the two is ideally two hours. (The above is essentially an abstract from the article by Laurent and Parish.)

When there is a history of previous serum and horse-dander sensitivity, preliminary testing should be with 0.05 ml. of 1:20 serum subcutaneously with a few minims of adrenaline followed by half-hourly injections of small but increasing doses of serum (0.1, 0.2, 0.5, 1, 2, and 4 ml., until the total amount has been given) either with a few minims of adrenaline with each dose or with adrenaline every hour or as necessary.

Skin Testing and Hyposensitization of Allergic Patients

Severe anaphylactic reactions from skin testing do occur, especially in the highly allergic individual. It is therefore advisable to carry out skin tests by the prick method before doing any intracutaneous tests.

If a known allergen can be avoided hyposensitization should only rarely be advised. Hyposensitization is widely practised for hay-fever and with other inhalant allergens causing asthma. The initial dose should be one-tenth of that which just produces a definite positive intracutaneous reaction.

The injections are given subcutaneously, usually every few days or weekly. If any constitutional reactions occur, subsequent dosage must obviously be considerably reduced

and great care taken in subsequent increases. It is also important that any local reaction should be looked for and reported to the doctor before the next injection is given. If there is a local reaction the size of half a crown or more the next dose should be reduced to that which produced no reaction previously and subsequent increases in dosage made more gradually. The patient should be asked if he has a cold or sore throat or any other illness, for the presence of influenza or sore throat or other infection reduces the patient's tolerance to the allergen and it is as well temporarily to reduce the dose to at most one-tenth of that previously given, or even to omit the injection. After the infection has cleared the dose should be rapidly increased again. The dose should not be increased if the interval since the last injection is two weeks and should be reduced if the interval is over four weeks. The patient must be strongly advised not to leave the doctor's surgery for at least thirty minutes after any injection. As has already been pointed out, a reaction coming on half an hour or more after the injection is not likely to be dangerous, but one which comes on sooner usually requires immediate treatment.

It is vitally important when allergenic substances are being given that the label on the bottle should be carefully read and fully understood. If a nurse is giving such injections the doctor should check the bottle and the dose in the syringe; if a doctor has several bottles of different strengths for hyposensitization, only one at a time should be given to the nurse and the others kept under his personal care.

Another reason for constitutional reactions is too rapid absorption of the allergen, due either to the injection having been given in error intravenously or to "seepage"—that is, the rapid entrance of the allergen into small vessels pierced by the injecting needle. To minimize these possibilities, before any injection the plunger should always be pulled back and a momentary pause made to see that no blood appears. After the injection has been given firm pressure should be applied with a cotton swab immediately and for a few moments so that "seepage" into dilated vessels is unlikely. Patients should be advised against strenuous exertion for a few hours after the injection.

Reactions Following Penicillin

Severe anaphylactic reactions and death following penicillin therapy are, unfortunately, being reported with increasing frequency. The symptoms, the same as those already described under anaphylactic reactions, often come on with dramatic suddenness; the more violent reactions begin within minutes, or even seconds, of the injection. Post-mortem findings have recorded acutely distended emphysematous lungs, oedema of the glottis, and in some cases mucoid secretion in the bronchi and bronchioles.

These reactions occur more often in allergic than in non-allergic persons—that is, in those with a history of asthma, hay-fever, or of food, inhalant, or drug allergies. Those who had previous reactions from penicillin are especially at risk, particularly those with previous accelerated or immediate reactions.

Before injecting penicillin it is important to find out if the patient has had any previous penicillin therapy, any untoward incidents in connexion with penicillin, or any allergic illnesses. I do not, however, agree with the withholding of penicillin when indicated in an asthmatic unless there has been a previous reaction to penicillin.

Skin testing as a means of excluding those at risk is not altogether satisfactory, for a negative skin test does not invariably exclude a serious reaction, nor does a positive reaction indicate that an anaphylactic reaction will always occur. In view of the difficulties and lack of precision inherent in skin testing, Siegal has suggested giving orally a penicillin tablet (50,000 units) ten minutes before the intramuscular injection. Another practical suggestion is to inject at first only a drop or two of penicillin and wait for

forty-five seconds before completing the injection, in order to try to avoid those particularly severe reactions that come on suddenly. Injecting in the arm rather than in the buttock is also recommended so that a tourniquet can be applied if necessary.

"Serum sickness" reactions following penicillin therapy are now widely known and recognized. The incubation period and symptoms are exactly the same as in the classical serum disease, and in the same way the severity varies widely. Although penicillin is non-toxic, its administration carries a risk of hypersensitivity estimated at 2-8%.

The indiscriminate use of penicillin is to be condemned, for reactions occurring when there is little indication for penicillin are indeed unfortunate, nor must we forget the possible sensitizing effect of initial injections. It has been suggested that procaine penicillin is more allergenic than crystalline penicillin, but some authorities are not of this view.

Reactions to Insulin

Severe generalized systemic reactions are very rare, and so far as I know death has not been recorded. Reactions usually consist of local redness and swelling with pruritus which may be quite troublesome but which usually subsides after a few weeks with the continuation of insulin. Anti-histaminic drugs are helpful, both prophylactically and for symptomatic relief, until spontaneous recovery occurs.

Reactions to Bee- and Wasp-Stings

The frequency of death from a bee- or wasp-sting is difficult to estimate, although such reports in the lay press are not unusual. The post-mortem findings are the same as those found in anaphylactic deaths from other antigens—laryngeal oedema and acute pulmonary emphysema. The early signs and symptoms are the same as those occurring in any severe anaphylactic reaction.

Successive reactions often become progressively worse, and those who are allergic to bee- or wasp-stings should be advised of this possibility. Every person who knows that he is allergic to bee- or wasp-stings should do all he can to avoid being stung. If this risk cannot be avoided, he should carry with him some tablets of ephedrine ($\frac{1}{2}$ gr.) or isoprenaline sulphate (20 mg.) and an antihistamine such as chlorcyclizine hydrochloride (50 mg.). If he is stung he should at once take one or two tablets of ephedrine (or half to one and a half tablets of isoprenaline) and one or two tablets of the antihistamine. Successful hyposensitization has been carried out in individual cases and a scheme of hyposensitization is given by Mueller and Hill.* Bee venom is an extremely potent antigen, and such procedures may well be left to experts. Further work is required on bee and wasp hyposensitization before the risks and benefits can be accurately assessed.

Miscellaneous Reactions

Reactions to vaccines prepared from chick embryos, such as most influenza, typhus, and yellow-fever vaccines, have been observed in individuals who are extremely allergic to egg; in these patients avoidance of such vaccines is necessary.

That occasional but rare reactions to local analgesics such as cocaine occur has long been recognized, and before carrying out bronchograms sensitivity tests are common practice.

Severe anaphylactic reactions following the injection of vitamin B have been recorded, and indicate the advisability, whenever practicable, of giving therapy by mouth rather than by injection.

Next article on Emergencies in General Practice.—"Uterine Inertia," by Mr. Clifford Kennedy.

MEDICAL BIRTHDAY HONOURS

The names of the following members of the medical profession were included in a Birthday Honours List published in *Supplements to the London Gazette* on June 9:

G.C.V.O.

Sir HORACE EVANS, K.C.V.O., M.D., F.R.C.P. Physician to Her Majesty the Queen.

K.C.B. (Civil Division)

Sir JOHN ALEXANDER CHARLES, M.D., F.R.C.P., D.P.H. Chief Medical Officer, Ministry of Health, Ministry of Education, and Home Office.

K.B.E. (Civil Division)

Sir ALEXANDER STUART MURRAY MACGREGOR, O.B.E., M.D., LL.D., F.R.E.P.S., D.P.H. Medical Officer of Health for Glasgow from 1925 to 1946. For services to public health in Scotland.

Knighthood

ALBERT ERNEST COATES, O.B.E., M.D., M.S., F.R.C.S., F.R.A.C.S. For services to the medical profession in Australia. DARCY RIVERS WARREN COWAN, M.B., B.S., F.R.A.C.P. Honorary Consulting Physician, Royal Adelaide Hospital.

HAROLD ROBERT DEW, Sc.D., M.B., B.S., F.R.C.S., F.R.C.S.Ed., F.R.A.C.S., Professor of Surgery in the University of Sydney. For services to medicine in Australia.

GEORGE LANGDON KEYNES, M.D., F.R.C.P., F.R.C.S., F.R.C.O.G. Consulting Surgeon, St. Bartholomew's Hospital.

C.B. (Military Division)

SEYMOUR GROVE RAINSFORD, D.S.C., M.D., D.P.H. Surgeon Rear-Admiral. Honorary Physician to the Queen.

ALBERT SACHS, C.B.E., M.D., M.R.C.P. Major-General, late R.A.M.C. Honorary Physician to the Queen.

C.B. (Civil Division)

WALTER ERIC CHIESMAN, M.D., F.R.C.P. Medical Adviser, H.M. Treasury.

C.M.G.

BENJAMIN KEITH RANK, M.B., M.S., F.R.C.S., F.R.A.C.S. Chief Plastic Surgeon, Heidelberg Military Hospital, Victoria, Australia.

ALLAN ROBERT STANLEY VICKERS, O.B.E., M.B., Ch.M. For services to the Flying Doctor Service in Australia.

C.B.E. (Military Division)

ALBERT FREDERICK COOK, O.B.E., L.R.C.P.&S.I., D.P.H. Air Commodore, R.A.F.

ALLEN LEOPARD CROCKFORD, D.S.O., O.B.E., M.C., T.D., M.B., B.Chir. Brigadier, late R.A.M.C., T.A. Honorary Surgeon to the Queen. Secretary to St. Thomas's Hospital Medical School.

C.B.E. (Civil Division)

ROGER GILBERT BANNISTER, M.B., B.Chir. For services to amateur athletics.

PHILIPPE LESLIE CARO CARRIER, M.D., M.R.C.P., D.P.H. Senior Medical Officer, Home Office.

CHARLES WILLIAM ATKINSON EMERY, M.B., B.Ch. Principal Medical Officer, Ministry of Pensions and National Insurance.

MARY ESSLEMONT, LL.D., M.B., Ch.B., D.P.H. General Council Assessor to the University Court of the University of Aberdeen since 1947. President of the Medical Women's Federation, 1953-4. For services to medicine in Scotland.

RICHARD THOMAS BONDFIELD GREEN, M.D., D.Sc., D.T.M. Senior Bacteriologist, Institute for Medical Research, Federation of Malaya.

JOHN LEWERS GROVE, M.D. A prominent physician in Launceston, Tasmania.

JOHN ARTHUR LEWELYN VAUGHAN JONES, M.B., Ch.B. Regional Medical Adviser, East and West Ridings Region, Yorkshire. For services to the Ministry of Labour and National Service.

WILLIAM CALDWELL McCLELLAND, M.B., Ch.B. For services to sport in Australia.

FREDERICK GRANTLEY MORGAN, M.B., Ch.B. Director, Commonwealth Serum Laboratories, Royal Park, Victoria, Australia.

FREDERICK WILLIAM ROQUES, M.D., M.Chir., F.R.C.S., F.R.C.O.G. Consultant in Gynaecology to the Royal Air Force. Obstetric and Gynaecological Surgeon, the Middlesex Hospital and the Royal Masonic Hospital. President of Section of Obstetrics and Gynaecology, Royal Society of Medicine, 1954-5.

MAX LEONARD ROSENHEIM, M.D., F.R.C.P. Professor of Medicine in the University of London and Director of Medical Unit at University College Hospital Medical School.

JAMES LESLIE ALLAN WILL, M.B., Ch.B., F.R.C.S.Ed., F.R.A.C.S. Orthopaedic Surgeon, Christchurch General Hospital, New Zealand.

M.V.O. (Fourth Class)

WILLIAM HILGROVE LESLIE MCCARTHY, D.S.O., M.C., M.D., M.R.C.P., D.P.H. Coroner to the Queen's Household.

O.B.E. (Military Division)

GEORGE GREGG, M.D., F.R.C.P.I. Lieutenant-Colonel, R.A.M.C., T.A. Consulting Physician in Physical Medicine in charge of Department of Physical Medicine and School of Physiotherapy, Royal Victoria Hospital, Belfast.

LILIAN GERTRUDE MOORE, M.B., B.Ch., M.R.C.P.Ed. Wing Commander, R.A.F.

WILLIAM MUIR STEWART, M.B., B.Ch., D.P.H. Lieutenant-Colonel, R.A.M.C.

JAMES CLARKE TAYLOR, M.B., Ch.B., F.R.C.S., D.P.H., D.I.H. Wing Commander, R.A.F.

ALISTAIR ROBERT CAMERON YOUNG, M.R.C.S., L.R.C.P., D.M.R.D. Wing Commander, R.A.F.

O.B.E. (Civil Division)

WILLIAM ROY BILLINGTON, M.D. For medical services in Uganda.

ARTHUR DOUGLAS BRIGGS, M.B., Ch.B. Medical Superintendent, Stobhill Hospital, Glasgow.

DAVID ERIC CAMERON MEKIE, M.B., Ch.B., F.R.C.S.Ed. Professor of Surgery in the University of Malaya.

SIMON EZIEVUO ONWU, M.B., Ch.B., D.T.M.&H. Deputy Director of Medical Services, Eastern Region, Nigeria.

EDWIN ALFRED TRIM, M.D., D.T.M.&H. Deputy Director of Medical Services, Kenya.

M.B.E. (Military Division)

CLARK NICHOLSON, M.C., M.D. Major, R.A.M.C., T.A. Honorary Surgeon, Moreton-in-Marsh District Hospital.

CHARLES GEOFFREY WHITE, B.M., B.Ch. Squadron Leader, R.A.F.

M.B.E. (Civil Division)

NEVILLE GEORGE DAVID CAMPBELL, B.M., B.Ch. Medical Officer, Sierra Leone.

DONALD GORDON DUFF, M.C., M.B., Ch.B., F.R.C.S.Ed. Surgeon-Superintendent, Belford Hospital, Fort William, Inverness-shire.

MOHAMED FAQUIR, Medical Officer, Uganda.

SAMUEL MAURICE BARKLIE HILL, M.B., B.Ch. Regional Medical Officer, Northern Region, British European Airways.

ABIEZERI KYABASINGA KIBAYA, Medical Officer, Uganda.

VISHWANATH SITARAM NIJASURE. Senior Sub-assistant Surgeon, Tanganyika.

JOHN TODD, M.C., D.F.C., M.B., Ch.B. For medical and missionary services in Northern Rhodesia.

Miss Ina Lindsay Cook, M.A., LL.B., Assistant Secretary of the Royal College of Physicians of London, has been appointed M.B.E. (Civil Division).

Nova et Vetera

ROYAL SOCIETY OF MEDICINE SESQUICENTENNIAL

History has a habit of repeating itself, with necessary variations. Fifty years ago, on May 27, 1905, the then Prince of Wales (afterwards George V) was admitted an Honorary Fellow of the Royal Medical and Chirurgical Society, shortly afterwards to change its name by supplemental charter to "Royal Society of Medicine." There followed a banquet which we are told in the official history was a "tremendous success," attended by 457 Fellows and guests. On June 7, 1955, the Duke of Edinburgh was similarly admitted an Honorary Fellow, and again there was a banquet, this time with an attendance of close upon 1,000. The President 50 years ago was Sir Richard Douglas Powell; on this recent occasion he was Sir William Gilliatt.

The Duke of Edinburgh declared once again his admiration for the medical profession; he said that he believed the whole essence of medicine to lie in the personal relationship between doctor and patient. He was prepared to put

up with all the disadvantages and perils of this age—strikes and the threat of the H-bomb—"if I can be looked after by the kind and brilliant men around me." He went on to propose the health of the Society, which was responded to by Sir Francis Walshe, the immediate past president. Sir Francis described the Society as the inheritor and hard-pressed sustainer of the greatest medical library in the Old World as well as of an extremely active forum for the exchange of medical knowledge by discussion and communications, oral and written.

To the toast of "The Guests," proposed by Sir Arthur Porritt, there were two replies, one from the Marquis of Salisbury, Lord President of the Council, and the other from Lord Adrian, President of the Royal Society. The former paid a tribute to medical research, while the latter, in praising the Royal Society of Medicine, said that if it were dissolved there would be no immediate dramatic change in medical services, yet the loss would be immeasurable.

History of the Society

One feature of the dinner was the presentation to the Duke of Edinburgh of a copy of the handsome volume which has been written to commemorate the occasion.¹ The author is a medical historian of distinction, Dr. Maurice Davidson. His book takes us back to the origin of the Society, which was not 50 but 150 years ago. It began its life in a tavern in 1805, when 26 disgruntled members of the Medical Society of London, indignant at the autocracy of the seemingly irremovable president, one James Sims, decided to form a new society to be called the Medical and Chirurgical Society of London. Among those present at that determined meeting were John Abernethy and Sir Astley Cooper, but the real founders were William Saunders, the first president, Alexander Marcet, and John Yelloly, the first secretary, all Fellows of the Royal Society. The early meetings were held at Verulam Buildings, near Holborn. On May 28, 1806, a paper by Dr. Pearson, on the treatment of hooping cough [*sic*] was discussed, and a fortnight later the Society had a field night with discussions on tinea capitis, chronic croup, and the use of cold in gout, as well as a note on hydrophobia in a horse. The picture is in odd contrast with the sectional meetings of to-day, where, to take the most recent diary card, there are discussions in one week on the bacteriological diagnosis of pertussis, on antibiotics in bacillary dysentery, on intramuscular administration of "penidural," and on the treatment of paraplegic bladder.

The Royal Medical and Chirurgical Society—it became "Royal" in 1834 and William IV was its first patron—presently was concerned with bringing about a union with itself of the various specialist societies which began to be formed in the latter half of the nineteenth century. It took a lot of doing. In 1870, for example, some of the societies were prepared to come in, but others trembled on the brink. The idea was to have a comprehensive society under some such high-sounding name as the "Royal Academy of Medicine." The word "Academy" was still favoured by many, even down to the time of the actual amalgamation. This was in 1904, when at a meeting held at the Royal College of Physicians, with Sir William Church in the chair, 150 members of different societies resolved to fuse their societies into 16 sections in the newly named Royal Society of Medicine. The sections now number 26, the youngest being the Section of General Practice.

The Society's House and Library

Having got the name, it remained to find the local habitation. Some still living will remember the old meeting-place at 20, Hanover Square, now a commercial house. This building had been acquired by the Society in 1899, but very soon new premises were sought. A site was acquired at the corner of Wimpole Street and Henrietta Street, and the

Correspondence

Coal-workers' Pneumoconiosis

SIR,—Dr. Horace Joules, in his letter (*Journal*, May 14, p. 1222) commenting on our article (*Journal*, April 23, p. 994), asks for the evidence on which "approved conditions" are based. When the Industrial Injuries Act came into force in 1948, provisional figures for approved levels of dustiness (in terms of particles of respirable size per cubic cm.) were agreed by the various interested parties after reviewing all the evidence, including that contained in the M.R.C. Special Reports Nos. 243 and 244 on "Chronic Pulmonary Disease in South Wales Coal-miners."^{1,2} Evidence that the provisional figures are indeed low enough can only be obtained by following up, by periodic x-ray examination, groups of miners in representative pits in all parts of the country in which continuous surveys of dust conditions are also being made. This is being done as part of the Pneumoconiosis Field Research Scheme of the National Coal Board, which is by far the most ambitious field investigation in pneumoconiosis being undertaken in any part of the world. As pneumoconiosis appears and progresses so slowly it is inevitable that a number of years must elapse before any valid conclusions can be drawn, but the earliest opportunity is being made to get an indication of the adequacy of the provisional figures by study of our own follow-up surveys, some of which now extend over a period of more than five years.

In his second paragraph Dr. Joules suggests that reliable figures for morbidity from chronic bronchitis are available nationally and it should, therefore, be possible to assess the effect of mining on this disease. We are actively investigating the problem, but believe that the answers are less easily obtained than his letter suggests. The national statistics apply to spells of sickness and not to individuals, and not to those over the age of 65, and thus do not include all retired miners, and they are also unfortunately not available broken down by occupation within the regions. As there are big differences in the mortality figures from chronic bronchitis in different areas, we believe that if we are to obtain reliable information it is necessary to compare miners and ex-miners with other men living in the same community who have never worked underground. Two community surveys of this type have been made—one in South Wales and one in Lancashire—and the results will be published shortly. The findings in these two areas are quantitatively different and, therefore, suggest caution is necessary in generalizing too widely from investigations in one area. Dr. A. L. Cochrane has recently analysed the death rates in relation to the category of pneumoconiosis in his "follow-up" of the Rhondda Fach. This also will be published shortly.

We support fully Dr. Joules's plea for a more intensive drive to eliminate tuberculosis from the mines, but we doubt whether it is practicable to employ the method used in the Rhondda Fach (which was essentially a research project) on a much wider basis. Success in eliminating tuberculosis by treating all infectious cases can only be achieved if all these are detected, which requires x-raying a very high proportion of the community. We wonder whether it would not be a good policy to follow the example set in certain States of Australia, where periodic x-ray examinations of the chest have been made compulsory in the community and, as a result, a much higher proportion of the population has been examined than was possible previously on a voluntary basis.

Dr. H. R. Thomson's description (*Journal*, May 21, p. 1280) of the type of chest pain among the Durham miners with pneumoconiosis coincides exactly with our observations in South Wales. We agree the symptoms are much commoner in the miners, and particularly those with complicated pneumoconiosis, than in cases of emphysema and bronchitis. We are often uncertain of its cause. It would be interesting to know whether it is related to the degree of pulmonary hypertension.—We are, etc.,

Penarth, Glam.

J. C. GILSON.

great building arose which was opened by George V in 1912. It appeared at the time to be ample for all the Society's needs, with its two meeting halls, its council chamber and committee-rooms, and the noble reading-room for the library. Sir Francis Walshe recalled the fact at the dinner the other evening that there were at that time 20 dressing-rooms where Fellows could change. But even then some far-seeing persons saw that future extension might be necessary, and provision was made for the raising of the roof. An extra floor was added, through the generosity of the Wellcome Trust, during Lord Webb-Johnson's presidency in 1950-2. It was certainly needed if only to house the ever-expanding library, which now contains over a quarter of a million volumes, has 50,000 occupants in the course of a year, and employs a staff of 26. What a contrast to the library at the time the Medical and Chirurgical Society was founded. It had between 400 and 500 books, was open two hours a week, and two books were allowed each member at one time. The Duke of Edinburgh was told that, like any other Fellow, he could now take out eight books at once.

Of the many personalities connected with the Society one name stands out conspicuously, that of Sir John Macalister, its secretary for 38 years. His work for the Society was a life's devotion; his hand was felt in every part of its organization, *Proceedings*, and library and all. To him is due perhaps more than to anyone else the successful emergence of the Society 50 years ago into a body covering every branch of medical practice and research. He was succeeded in the secretaryship in 1925 by Mr. Geoffrey Edwards, selected out of 462 applicants, under whom the Society flourished yet more and made several successful new ventures.

Dr. Davidson's commemorative volume ends with brief biographies of the 24 Presidents of the Society since 1907. To name only those who have passed on, and only a few of those—William Selby Church, Humphry Rolleston, John Bland-Sutton, St. Clair Thomson, James Berry, Dawson of Penn. The Society has been fortunate in commanding the disinterested service of some of the most distinguished medical men in succeeding generations.

APPROVED NAMES

Approved names are devised or selected by the British Pharmacopoeia Commission, and the intention is that if any of the drugs to which these approved names are applied should eventually be described in the *British Pharmacopoeia* the approved name should be its official title. The last supplementary list of approved names was published in the *Journal* of October 30, 1954 (p. 1045).

Approved Name	Other Names
Chlorhexidine	Bis - p - chlorophenyldiguanido-hexane. "Hibitane."
*Diethylthiambutene	3-Diethylamino-1:1-di-2'-thienylbut-1-ene. "Themalon."
*Dimethylthiambutene	3-Dimethylamino-1:1-di-2'-thienylbut-1-ene.
*Ethylmethylthiambutene	3-Ethylmethylamino-1:1-di-2'-thienylbut-1-ene.
Methyl phenidate	Methyl 1-phenyl-2-piperidylacetate. "Ritalin" is the hydrochloride.
†Phenindione	2-Phenylindane-1:3-dione. Phenylindanedione. "Dindevan."
Polymyxin	Antimicrobial substances produced by <i>Bacillus polymyxa</i> . (Specific substances are designated by a terminal letter; thus, polymyxin E.)
Streptonicozid	A compound formed by interaction of a suitable streptomycin salt and isoniazid. "Streptohydrazid."
Tripolidine	<i>trans</i> - 1 - 2'-Pyridyl-3-pyrrolidino-1-p-tolylprop-1-ene. "Actidil" is the hydrochloride.

*Not intended for use in human medicine; diethylthiambutene is of interest in veterinary medicine.

†Replaces phenylindanedione as the approved name.

Vagotomy with Gastroenterostomy for Duodenal Ulcer

SIR,—In their interesting article on "Vagotomy and Gastroenterostomy for Duodenal Ulcer" (*Journal*, May 14, p. 1183) Mr. M. J. Bennett-Jones and Mr. S. O'Donnabhain mention a patient, Mrs. M. B., aged 58, upon whom Professor Wells recently performed a revision gastrectomy operation, her fourth operation. Mr. Bennett-Jones agrees that it would be interesting to record the result of this procedure.

In 1951 vagotomy and gastroenterostomy were performed for duodenal ulcer. This was followed by epigastric pain unrelated to food, but relieved by the vomiting of bile. The gastroenterostomy was converted to a Billroth II gastrectomy, and this was later altered to a Billroth I anastomosis without improvement in the symptoms. In October, 1954, the gastrectomy was revised to the Roux-en-Y type. Pain and bile vomiting were immediately relieved, and the patient has, so far, remained free from dyspepsia. She has gained two stones in weight since the last operation.

It is our belief that certain cases of bilious vomiting following Polya gastrectomy are due, in part at least, to pre-existing retraction of the cardia with incompetence of the cardio-oesophageal sphincter mechanism. In such cases the operations of enteroanastomosis or jejunoplasty, which still allow bile to enter the stomach, may fail to relieve the symptom. Conversion of the gastrectomy to the Billroth I type, whilst improving an associated deficiency state, also permits bile reflux into the stomach and thence to the oesophagus. In the last year we have, in 12 cases of severe bilious vomiting after gastrectomy, diverted the duodenal contents from the stomach and provided free drainage of the afferent loop by conversion of the anastomosis to the Roux-en-Y type. If not already performed, abdominal vagotomy is also carried out.

The failure of this patient to gain relief from any procedure other than the Roux anastomosis seems to us to support the belief that gastro-oesophageal reflux was an essential factor in the causation of her symptoms. Attention has already been drawn to this possible combination of circumstances.¹ The series of twelve cases mentioned above, which overlaps those already reported, will be presented as a separate communication.—I am, etc.,

Liverpool, 3.

"Half-minute" Thermometers

SIR,—Your correspondent Dr. P. Gilbert (*Journal*, May 7, p. 1158) has raised a point of great importance. It is known that the times stamped on clinical thermometers bear no useful relation to the time taken to reach a constant reading, but it is not nearly well known enough to medical men and nurses. It is such a commonplace to have a thermometer inserted only for a bare half-minute that one cannot help having serious doubts about the value of temperature records in many hospitals, and in much of general practice. This trade practice of marking unrealistic times on clinical thermometers has been unfavourably commented on before, and it is time it was dropped.

May I suggest a standard "time-in-mouth" of two minutes? It would be easy to test all hospital thermometers, new or old, at two and five minutes in a constant-temperature bath under standard conditions. Any rising more than 0.1° F. after two minutes should be returned to the makers.

There is a related matter which seems to me worth attention. According to Best and Taylor¹ the range of normal oral temperatures in humans is 96.6°–100° F. (35.9°–37.8° C.). The medical profession seems to assume that the normal in all human beings is 98.4° F. (36.9° C.). This is inevitable in hospitals for new patients, never seen in health, and as a first approximation in general practice. Is it too much to expect one's practitioner to have some more accurate idea of one's normal temperature, especially when there are signs—for example, a high or low B.M.R.—

pointing to "abnormal normality"? (This is not a rhetorical question.)

These two factors combined, it seems to me, could lead to errors in diagnosis, possibly serious errors. I write from some experience; it is particularly irritating to be told, when feeling rather ill, that at 99.8° F. (37.7° C.) one has "not really got a temperature," when (a) it is really 100.6° F. (38.1° C.), and (b) one's normal figure is 97° F. (36.1° C.).—I am, etc.,

London, W.5.

Potassium Permanganate Ulceration

SIR,—Further to the article by Drs. E. A. J. Alment and C. S. Nicol (*Journal*, October 3, 1953, p. 759) and the subsequent correspondence (*Journal*, October 31, 1953, p. 994), it may be of interest to record another instance of the misguided use of tablets of potassium permanganate as an abortifacient.

I saw recently a girl of 17 who said she had been bleeding profusely per vaginam since the morning and had passed many large clots; this was accompanied by severe continuous pain in the hypogastrium and she thought she was pregnant. Her last menstrual period had begun about five weeks previously and she had never been pregnant before. On examination she was poorly nourished and somewhat shocked; there was moderate rigidity to palpation in both lower abdominal quadrants, but no evidence of peritoneal irritation or of free fluid in the abdomen. Vaginal examination was inconclusive owing to lack of co-operation. Under anaesthesia several handfuls of clotted blood were removed from the vagina and the true state of affairs revealed. There was no pregnancy in the uterus, which was rather small, with a long thin cervix and nulliparous external os. The whole of the right lateral fornix and the vaginal wall on the same side were denuded of epithelium and presented several scattered black eschars. The right side of the cervix was largely eroded, leaving an area of deep ulceration with irregular but sharply defined margins terminating medially at the external os in a black eschar the size of a farthing and shading off laterally into the more superficial ulceration in the fornix. The following morning the haemoglobin was found to be 5 g., and the girl revealed that she had been given some tablets by her cousin which she had inserted herself and soon after had noted the onset of pain and bleeding.

Discussion with my colleagues confirms that this is not an unfamiliar clinical entity locally, and no doubt its popularity with the ignorant is due in part to the rapid onset of severe bleeding which follows insertion of the tablets. I am grateful to Dr. Edward I. Salisbury, medical director, United Fruit Company, Boston, for permission to publish.—I am, etc.,

Panama.

C. C. EWING.

Status Bonnevie-Ullrich

SIR,—Drs. J. B. Barlow and S. E. Levin (*Journal*, April 9, p. 890) in their article on status Bonnevie-Ullrich assert:

"In over a hundred patients reported in the English language literature, however, we have found reference to oedema in only two case reports. Silver (1951) stated that the feet of his patient, aged 2 years and 8 months, were described as having been 'swollen' at birth; and Vulliamy (1953), in his report of an 8-year-old girl, described 'unexplained oedema of hands and feet at birth, persisting in the feet for the first three years.' Pitting oedema was a very prominent feature in our patient and was, in fact, the reason that the mother sought medical advice. It is difficult to understand how, if it were present, such a conspicuous abnormality could have been so frequently overlooked. Ullrich (1949), however, stated that the swelling disappears during the first two years of life. As our patient is the first under the age of 2 years whose case is described in the English literature this may well explain why oedema has so seldom been mentioned."

Permit me to draw their attention to two important inaccuracies and to refer them to my article, "The Bonnevie-Ullrich Syndrome," published in the *Australian Medical Journal*.¹ In the case I published there was marked congenital lymphangiectatic oedema of the dorsum of the hands and feet, and, moreover, my patient was under 2 years of age. Therefore, when they state that in over 100 patients reported in the English language literature they found refer-

ence to oedema in only two case reports, they were incorrect in so far as my case brings the total to three cases. Furthermore, they are incorrect in asserting that their patient is the first under the age of 2 years to be described in English literature, as my patient was only 13 months.—I am, etc.,

Broken Hill,
New South Wales, Australia.

Idiopathic Pulmonary Haemosiderosis

SIR,—Further to Dr. J. M. Cliff's letter (*Journal*, May 28, p. 1340), cases of idiopathic pulmonary haemosiderosis in adolescents are reported by Waldenström¹ and Walton and Williams² in which recurrent acute episodes resulted in death after about three years. These cases are similar to the original descriptions of the condition in children.

The cases described by Kerley,³ Cliff,⁴ and in my recent article (*Journal*, April 23, p. 1008) differ in showing long periods with minimal symptoms and no anaemia, though some had initial acute attacks. It is in these that it is suggested that the outlook is generally good. Clarification of the prognosis must, of course, await the publication of additional cases.—I am, etc.,

London, N.W.8.

Megaloblastic Anaemia following Anticonvulsants

SIR,—The interesting article on two cases of megaloblastic anaemia following anticonvulsants by Dr. N. Berlyne, Dr. M. Levene, and Dr. A. McGlashan (*Journal*, May 21, p. 1247) prompts me to publish a preliminary note on similar observations on two patients treated with primidone.

(1) A woman, aged 37, was first seen by me on May 1, 1954, when she gave a typical history of temporal lobe epilepsy of 13 years' duration. Barbiturates and bromides had not controlled her fits, and she was therefore changed over to tab. primidone 250 mg. three times a day on May 4. Four and a half months later her general practitioner requested a consultation on account of the patient's lassitude, anorexia, weight loss, ulcerative gingivitis, and stomatitis. The fits had ceased. The patient appeared rather ill on September 15, when she had a smooth tongue, stomatitis, and a blood count as follows: red cells 1,420,000; haemoglobin 37%; colour index 1.3; white cells 4,550. A number of late megaloblasts were seen in the film. The bone marrow was megaloblastic. Free hydrochloric acid was present on gastric analysis. Glucose tolerance, fat balance, and liver function tests were within normal limits.

Folic acid 20 mg. daily was commenced on September 17, with a good reticulocyte response. On November 23 red cells numbered 4,500,000 with a haemoglobin of 91% and a colour index of 1. Folic acid was discontinued that day. Since admission to hospital she had received no primidone. This was, however, restarted on January 7, 1955, without addition of folic acid. Full blood counts have been carried out every fortnight since. On May 17 her red cells numbered 4,250,000, the Hb 94%, and the colour index was 1.1. The red cells appeared macrocytic.

(2) A woman aged 44. This patient gave a history of epileptiform fits since 1950, caused by an oligodendroglioma of the left hemisphere, proved on biopsy and treated by x-ray. Epilepsy persisted after x-ray treatment, but was much better controlled after September, 1952, when she was put on tab. primidone twice daily. In January, 1953, the dose was increased to four tablets daily, and prior to admission to hospital on February 3, 1955, she had taken five tablets daily. No phenytoin or any other drug was given to her after September, 1952. In autumn, 1954, she began to feel tired, lost her appetite, had dizzy spells, and became dyspnoeic. Her private doctor (Dr. Gibson) arranged for a blood count (December 2, 1954), which was as follows: red cells 1,200,000; haemoglobin 32%; colour index 1.3; film: occasional early and late megaloblasts seen. She was thought to be a case of pernicious anaemia, and received first "cytamen" and later "anahaemin" injections without benefit. A blood count on February 2, 1955, was reported as: red cells 1,030,000; haemoglobin 22%; colour index 1.1; white cells 4,850. She entered hospital on the following day, and was so ill that she had several pints of blood during the first week. A fractional test meal showed free hydrochloric acid. The bone marrow was megaloblastic.

Fat balance tests in the faeces gave normal results. The liver function tests were normal. She received 20 mg. folic acid daily as well as 750 mg. primidone from the day of admission. There was a good reticulocyte response and she recovered steadily. Her blood count at the end of April was: red cells 4,360,000; haemoglobin 92%; colour index 1.05; white cells 5,300. The patient left the hospital on April 25. The treatment was then changed from primidone to barbiturates with the intention of continuing so well beyond the period of protective effect of folic acid previously given. It is planned to prescribe primidone again later without additional folic acid but with the safeguard of fortnightly blood counts as in the case of our first patient.

Primidone is now widely used all over the world, and it was therefore somewhat of a surprise to find only one case of megaloblastic anaemia following primidone published by Chalmers and Boheimer.¹ This patient, however, had previously received various other anticonvulsants, including phenytoin. Case 2 of Berlyne, Levene, and McGlashan also had phenytoin until three to four months prior to development of a severe degree of anaemia. I entirely agree with the writers that the effect of phenytoin and primidone leading to a megaloblastic anaemia seems most probable in their cases, but further definite proof of this relationship is desirable.

Dr. Moorhouse and I hope to be able, by continued clinical and haematological review of the two patients mentioned in this paper, to obtain more detailed information about the potential danger of a most valuable drug in the treatment of epilepsy. Our two patients seem to be particularly suited for the investigation related to primidone, as no phenytoin had been prescribed previously in either case.—I am, etc.,

Measles

SIR,—In reply to Dr. J. F. Lund's letter (*Journal*, May 21, p. 1279) I should like to support the opinion of your leading article (*Journal*, April 23, p. 1018) that the prophylactic use of antibiotics in measles is wasteful and unnecessary, provided that any complications that arise are treated early and effectively.

During the recent epidemic I have attended 105 cases of measles. None of these has had routine prophylactic treatment. Two cases developed signs suggestive of early bronchopneumonia, but responded quickly to antibiotics and neither developed the full clinical picture of bronchopneumonia. There was one case of acute otitis media, which resolved rapidly and completely with antibiotic treatment, and two or three mild cases of otitis media, which did not require any specific therapy.

I would submit that, in this small series of cases, these children have been saved trauma, their attendants trouble, and the country about £50; and that none of them is any the worse off as a result.—I am, etc.,

High Wycombe.

J. McLUSKIE.

SIR,—I should like wholeheartedly to support Dr. John Fry's stand (*Journal*, June 4, p. 1389) against the indiscriminate prophylactic use of antibiotics in the treatment of measles. Surely we require a little common sense in this matter. The only two complications of importance which antibiotics can prevent are acute otitis media and acute chest infection. The acute stage of measles, when these complications are likely to occur, lasts only some three to four days. This necessitates at least two visits from the general practitioner, on each of which occasions adequate warning of the onset of these complications can be obtained by the examination of ear-drums and chest respectively. Furthermore, the mother can be warned to inform the doctor immediately should the child complain of earache or should the cough worsen, when a further examination can be made.

The first visit is usually requested when the rash appears. If I find any injection of the drums or any signs in the chest on this occasion, I put the child on to oral penicillin, although this is seldom necessary. My second visit is made on the third day, when the rash is at its height or already

beginning to fade, when the same procedure is repeated. Any infection arising on the second day, even if it has passed unrecognized by a forewarned mother, is unlikely to have reached very severe proportions by the third day, when antibiotic treatment can be still highly effective.

Certain children are probably predisposed to secondary infection by factors which we do not yet fully understand. Administration of antibiotics prophylactically to these individuals will do nothing to increase their resistance to such infection; in fact it is more likely to have the opposite action. There is then a danger of infection with resistant organisms which have been allowed to flourish, owing to elimination of their antibiotic-sensitive competitors. We should aim for early and effective antibiotic treatment of complications in measles and should not allow any relaxation of our vigilance over them from a false sense of security in antibiotic prophylaxis.

On one point I would disagree with Dr. Fry. I consider that every case of acute infective otitis media, no matter how mild, should be treated with antibiotics. Although a number of these cases will clear up without such treatment, it is impossible to differentiate those which will go on to suppuration, with all its possible dangerous complications, from those which will not. It is just these cases which require intensive antibiotic therapy, and the earlier it is given the better. This also applies to the treatment of the inflamed throat when the infection is other than catarrhal. To withhold antibiotic therapy from a case of streptococcal tonsillitis, even if this infecting agent is only suspected, is to court the risk, however slight, of serious complications such as acute nephritis and acute rheumatism. There would seem to be no contraindication to the widespread use of oral penicillin for this purpose, as there have been no reports of any fatal reactions to penicillin by this route, such as have occurred, albeit rarely, after intramuscular injection.—I am, etc.,

Twickenham, Middlesex.

DAVID WHEATLEY.

Drug Eruption from Carbronal

SIR,—Our attention has been drawn to the article entitled "A Purpuric Drug Eruption Caused by Carbronal," by Dr. Peter Borrie (*Journal*, March 12, p. 645). In opening this article the author states that carbronal is closely related chemically to chloral. This might be taken to imply that it may therefore have some similar effects. Carbronal cannot possibly be described correctly as closely related chemically to chloral. The chemical relationship of these compounds gives no grounds, therefore, for expecting similar physiological action.—I am, etc.,

W. M. WOLF,

Darlington.

Director,
Chemical Compounds Ltd.

Varicella with Neurological Complications in an Adult

SIR,—Dr. M. S. Pathy's case report (*Journal*, May 28, p. 1324) of a patient under the above title recalls a similar experience of my own early last year.

A man of 43 (also a bank cashier) contracted varicella from his wife and daughter on January 8, 1954. Their attacks were both very mild, but he had a most severe haemorrhagic confluent rash, and developed a bronchopneumonia, with headache, weakness of arms and legs, and intense toxæmia. He was transferred to hospital on January 15. By that time he was almost comatose and incontinent—temperature 101° F. (38.3° C.). There was slight nuchal rigidity; knee and ankle jerks were absent, but arm tendon reflexes were normal. He was too ill for cerebrospinal fluid to be taken, but a virus pneumonia and encephalitis were diagnosed, and he was given 1 million units of penicillin four-hourly, and chloramphenicol, 2 capsules four-hourly. Two days later chlor-tetracycline 1 capsule four-hourly was substituted for the chloramphenicol, but penicillin was continued until January 21. He also received 50 mg. ascorbic acid three times a day, and "ribothion" 2 dr. (7.8 g.) every four hours from January 20 owing to a severe hypochromic anaemia (R.B.C. 3,000,000, Hb 52%, W.B.C. 10,700—polymorphs 91%, lymphocytes 5.5%, eosinophils 0.5%, monocytes 2%). For insomnia and restlessness he received 5 ml. paraldehyde intramuscularly.

By January 29 he was able to speak and incontinence had ceased; speech was slow and laboured, and there was delayed cerebation. He made a slow recovery, but was able to return home on March 7. He now exhibited a spasticity of both legs, which gradually recovered to a great extent, and a bilateral inferior hemianopia, with central sparing, making it impossible for him to read or to add up figures. The anaemia yielded to "ribothion," and his haemoglobin, which rose to 79% before discharge, was 95% in March, 1955. He now has still much exaggerated knee-jerks but no clonus; the fields of vision have not improved. He has had to relinquish his banking career, but is able, with his wife's help, to conduct a small business. His power of concentration, however, is still poor, as is his memory.

I am grateful to Dr. John Mills for treating him in hospital, and to Dr. Graveson and Mr. F. Heckford for their assistance and advice in treatment of his neurological and eye symptoms respectively.—I am, etc.,

Ryde, I.W.

L. FIRMAN-EDWARDS.

Professional Secrecy

SIR,—Dr. Robert Forbes (*Journal*, May 28, p. 1339) has criticized the new instruction on carnal knowledge of certified defective girls (H.M.(55)46), and, on the face of things, there must be support for the complaint in his last paragraph. It would have shown a fuller appreciation of all the aspects of the problem, and a suitable courtesy to those who guard the ethical standards of the profession, if at least some communication on the proposal had been made.

But reflection shows that the problem is not quite simple. Whatever may be the strict position in law or in medical ethics, the medical superintendent is not only the doctor who has medical care of the defective whose order has sent her to his hospital. He is also very much *in loco parentis*, as the patients themselves so often admit. They are very defenceless and very much children, and he must protect them in every necessary way. Again, there is no legal sanction at all for this, but it is necessary for the good of the service and the ultimate benefit of all patients that he should run his hospital so that it is recognized as giving a fair and honest as well as kindly deal to those entrusted to it.

Many years ago I was worried about a related problem and put it to a friend of much experience with the question, "Am I my brother's keeper?" The immediate reply was, "I'm afraid you are in this case," and I knew it was true. From this broader point of view, I think the medical superintendent must protect the particular patient, and, through her, all others who may suffer like trouble, by giving the police the chance to take action if there is a good case. Whether this is done indirectly through the Board of Control or directly by report to the police may not really be so very different a matter.—I am, etc.,

Wimbledon.

NOEL H. M. BURKE.

Anxiety Neurosis

SIR,—May I comment on one aspect of Dr. Ronald A. B. Rorie's excellent article (*Journal*, April 30, p. 1062) on "Anxiety Neurosis: Treatment by the General Practitioner"? Dr. Rorie describes the melancholy process by which the patient attends several specialists, the diagnosis being made "in a negative manner, by exclusion of organic disorder, rather than in a positive recognition of the various neurotic syndromes." While it is clear that prolonged investigations, which themselves cause worry and eventually trail away into a dismal anticlimax of phenobarbitone, are undesirable, it is even more harmful to ascribe early organic disorders to neurosis. The diagnosis is not always easy, and this way the major tragedy lies.

Further, to convince the modern anxious patient of the nature of his symptoms—and he is to-day rather sophisticated about x rays and the like—may require a negative barium meal, chest x-ray, blood count, and so on. Indeed, such investigations are often most desirable if the physician is to exclude organic diseases. How, then, can we avoid the pitfall of endless specialists?

In most cases the general practitioner quickly realizes the probability of functional aetiology; often his past

knowledge of the patient and family serves him here. Special investigations may be required. Now if the practitioner can arrange these himself directly with the appropriate pathological or radiological department, then he can explain the purpose of the tests to be done and their probable negative result, and throughout the investigation he, the G.P., remains the doctor in charge of the case. His patient's confidence in him is enhanced, and his explanations, advice, and reassurance are well received by a receptive, co-operative individual. It is therefore perhaps appropriate to end with a plea to the hospital authorities to make direct access to diagnostic facilities universally available, and to general practitioners to use them.—I am, etc.,

London, E.6.

DAVID H. LEWIS.

Dermatomyositis

SIR,—A recent personal study¹ of nine cases and a review of the literature of dermatomyositis has convinced me that this diagnosis covers at least three separate entities which can be distinguished on natural history and clinical features rather than biopsy findings.

(1) *Chronic progressive dermatomyositis* (Petges and Cléjati): This, the true pattern of dermatomyositis, may present acutely in children, but more commonly an insidious onset leads to irreversible changes before it is clearly recognized. Early features include low-grade fever and tachycardia, erythema and scaling mainly of exposed surfaces, transient oedema particularly of the orbits; and periarticular pain and tenderness from involvement of tendons. Later tender muscles undergo a slow inexorable progression to generalized atrophy, woody fibrosis, and contractures with grotesque deformities. In parallel the affected skin develops changes of the poikiloderma atrophicans vasculare type with leashes of telangiectasia especially of the eyelids and sternum. A peculiarly expressionless alabaster facies is common, later becoming almost cadaveric. Other inevitable features are the Raynaud phenomenon with secondary sclerodactylia and calcinosis, diffuse or as localized peritendinous nodules. Renal involvement does not occur, but polyserositis, splenomegaly, and involvement of the bowel wall may be seen. In more than one typically deformed patient evidence of pulmonary hypertension and right heart failure has appeared, and has been shown² by exclusion to be due to an obliterative process in the smaller pulmonary arteries. Long-term prognosis is poor, and A.C.T.H. or cortisone therapy seems only to give temporary symptomatic improvement without halting this progress of reparative fibrosis. Very rarely in these cases one sees the hide-binding of scleroderma, a variable cutaneous symptom of, and not a synonym for, progressive systemic sclerosis of which this type of dermatomyositis is probably a variant.

(2) *A symptom complex associated with coincident visceral neoplasm*: Since Bezecky's³ paper in 1935 there have been over 50 recorded examples in the relevant age group of the association of a relatively acute dermatomyositis with neoplasm of any organ or tissue, including Hodgkin's disease and other reticuloses. Two of my cases had bronchogenic carcinoma, one an oesophageal neoplasm. The skin lesions may resemble closely a disseminated lupus erythematosus in appearance and distribution, and atrophic weakness rather than tenderness is shown by the muscles, which tend to be those of the girdles and proximal limb groups. Associated visceral lesions can be attributed to the neoplasm or metastases. An awareness of this association, together with the fact of reported instances of recovery with successful treatment of the neoplasm, demands exhaustive visceral investigation of cases of dermatomyositis in this age group.

(3) *A polymyositic form of polyarteritis nodosa*: Typically this is a hyperacute, fulminating, or self-limiting condition, commonest in young adults, which quickly follows a recognized infection with or without treatment with sulphonamides, etc. Extreme early malaise, high fever, and disproportionate tachycardia are usual. A general distribution and extraordinary pleomorphism characterize the skin

lesions, which vary from erythema fugax, multiforme, or nodosum to livedo reticularis and haemorrhagic necrotic or gangrenous lesions. Painful and tender swellings occur and, if periarticular, make distinction difficult from acute polyarthritides, which occurs in some cases. Oedema is excessive but limited to the area of affected muscles or to the orbits, where the combination with erythema gives a heliotrope bloating which has been likened to cadaveric decomposition. Generalized oedema suggests renal damage or cardiac failure. Muscle involvement is generalized, causing exquisite pain on movement and marked tenderness and swelling. Polyneuritis may cause some of the ensuing weakness and wasting, which are, however, reversible. Ischaemia or infarction may affect any organ, and renal lesions commonly lead to hypertension and uraemia. Polyserositis, hepatomegaly with jaundice, splenic enlargement or infarction, and retinal lesions have been described. A high E.S.R. and a high polymorphonuclear leucocytosis are the rule—one of my cases had a W.B.C. total of 125,000/c.mm. without significant eosinophilia. Creatinuria is also excessive—1,000–2,000 mg. per day.

These cases are an urgent indication for the asbestos cover of A.C.T.H. or cortisone, and, as in systemic lupus erythematosus, the daily controlling dosage may initially be 150 mg. or more of A.C.T.H., or equivalent amount of cortisone, with slow reduction to prevent escape.

Dr. Hillas Smith⁴ has clearly described a case of this last type with, *inter alia*, an episode of bowel or mesenteric infarction and severe renal damage. I would plead that future authors should attempt—if only in retrospect—to classify their cases into these divisions which have, too, important therapeutic implications.—I am, etc.,

Aberdeen.

Mistaken Capsules

SIR,—The recent correspondence on the treatment of barbiturate intoxication prompts me to call attention to a cause of accidental barbiturate overdosage which I have not previously seen reported—the taking of "carbrital" capsules by mistake for "chloromycetin." The mistake is readily made, and two cases have been seen in this hospital.

The first occurred when a house-physician with a severe upper respiratory infection wished to treat herself with chloromycetin and helped herself from the ward stock. When she recovered consciousness she realized that she had taken capsules of carbrital in error. The second case was that of a woman with acute sinusitis for whom capsules of chloromycetin were prescribed by her doctor. After 24 hours of the treatment she became unconscious and was admitted to hospital, where marked drowsiness and nystagmus were the only abnormal signs. The cerebrospinal fluid was normal and the patient recovered spontaneously overnight. When she came to herself she was shown capsules of carbrital and capsules of chloromycetin, and unhesitatingly identified the former as those which she had been taking before she lost consciousness.

Carbrital contains pentobarbitone 1½ gr. (0.1 g.) and carbronal 4 gr. (0.26 g.) in a white capsule marked by a single navy-blue band. Chloromycetin is put up in a slightly smaller white capsule marked with a grey band. In a poor light the colours of the bands are not readily distinguishable. These cases show how easily confusion may occur and suggest that some more obvious distinguishing mark should be applied to the capsules, which are both marketed by the same firm.

I am grateful to Sister M. A. Woodman, who first made me aware of this problem, and to Dr. T. H. Boon for permission to report the two cases.—I am, etc.,

Newcastle-upon-Tyne.

R. E. IRVINE.

Care of McGill Tubes

SIR,—Complaints have been made from time to time about the poor attention given in operating theatres to the sterility of anaesthetist's appliances—for example, McGill tubes—but from the medico-legal report in the *Journal* of May 28 (p. 1347) it would appear that the pendulum has swung, and that these tubes are now being autoclaved. It is to be hoped that this practice will not spread, for many of the tubes now supplied are already of hard rubber with chisel-like ends, well calculated to do damage in the nose (false passages have been reported). I would suggest that McGill tubes must never be autoclaved, but that they should be well boiled to ensure that they are soft.—I am, etc.,

London, N.W.8.

R. J. CLAUSEN.

The Ban on Heroin

SIR,—May I add my protest against the intended ban of the manufacture of heroin? No drug gives such relief as does heroin in the advanced stages of tuberculosis both for the incessant cough and for the equally troublesome gastric symptoms. If our legislators inquire more fully into the merits of the drug they must be convinced of the foolishness of their ill-advised ban.—I am, etc.,

Birmingham, 33.

W. H. OSBORN.

Coat the Pill

SIR,—With the manufacturers of proprietary medicines constantly on the look-out for new preparations and new forms of old ones, may I, through your *Journal*, draw their attention to the need for a more palatable form of such antimalarial drugs as mepacrine and proguanil? These are notoriously bitter in taste, and I have known several children absolutely refuse to take their daily paludrine whichever way it has been served. I think this difficulty would easily be overcome if these tablets were sugar-coated.—I am, etc.,

Enugu, Nigeria.

F. M. OWERS.

Lumbago

SIR.—Mr. V. B. Green-Armytage asks (*Journal*, May 28, p. 1341) why men get lumbago so much more often than women—an observation that certainly tallies with my own experience. The reason appears simply that men lift heavy weights and thus, by attrition and compression, crack the annulus. Sudden subluxation of this loose fragment is then apt to cause lumbago—a recurrent phenomenon as in internal derangement at other joints.

Women, by contrast, do much stooping, which, in the course of years, causes a gradual retropulsion, leading to intermittent backache coming on after keeping the back bent for some time. Later, permanent backache from a small constant protrusion may result. In my view the different behaviour of the disk in the two sexes merely reflects the difference in the work men and women normally perform.—I am, etc.,

London, W.1.

JAMES CYRIAX.

Gorleston Holiday Camp for the Handicapped

SIR,—The above camp is to be held again this year in the last two weeks of September. There is already a waiting-list for both weeks, so it is obvious that the camp fulfils a long-felt want amongst disabled people.

I should like to ask for the co-operation of the family doctors of those who are going to attend the camp in sending me as full particulars as possible on the confidential form which each handicapped applicant has received. It is quite a serious undertaking to care for a large group of severely handicapped people, and any information about their medical condition and usual treatment would be invaluable to the local general practitioner who acts as medical officer to the camp. A clear statement of the exact nature

of the handicap will also be most helpful to the organizers, who have to allocate sleeping accommodation and arrange for voluntary help.

Any members of the British Medical Association who may be on holiday in the neighbourhood would be welcome visitors to the camp.—I am, etc.,

Norwich.

IRENE B. M. GREEN,
Vice-chairman, Norfolk Voluntary Association
for the Welfare of the Physically Handicapped.

POINTS FROM LETTERS**Hot-water Bottles**

Mr. M. J. HORGAN (Tralee, Co. Kerry) writes: The hot-water bottle is a dangerous convenience. . . . To the infant, aged, and anaesthetized it is a burning problem. It suffers sporadically and surprisingly from enuresis. Thirdly, and possibly uniquely, it has now been convicted of bony injury. I was recently consulted by a lady who told me that, lying half awake, she noticed something strange about her little toe. She made a quick movement with her leg which provoked excruciating pain in her little toe. She had insinuated it into the hole in the stopper of the bottle and the sharp movement had fractured the basal phalanx. Subsequent radiological examination showed a spiral fracture of the middle of the proximal phalanx. I make no claim to originality in this description. Presumably if others have encountered the condition they will let us know of it. In the meantime I should like to feel that I have described my only original syndrome. I shall christen it "hot-water bottle toe," or, perhaps more simply, "Horgan-toe."

Papilloma of the Bladder

Dr. C. HORWITZ (London, N.1) writes: I am wondering whether the following case constitutes a record in the number of diathermies for recurrent papilloma of the bladder? A man aged 56 years employed as a printing manager has been under my care since 1947 for recurrent papilloma of his bladder. He has been admitted to hospital on 29 occasions and on each he was found to be suffering from a recurrence. The last time he was admitted to hospital was on April 24 when for the first time he was found to be free from papilloma of his bladder. He is to be readmitted in three months' time for observation.

An Occupational Hazard

Dr. R. BAUER (Cardiff) writes: I should like to point out that the injury as described by Dr. Edith Faulkner (*Journal*, May 7, p. 1158) closely resembles those incurred by pig-slaughtermen, and known on the Continent as "pig-stabber's injury." The injured part is generally the femoral vein, and the fatal outcome caused by air embolism. In these cases if the injured man was not brought to hospital with his hip maximally bent, but with the leg stretched, the vein was kept open and air was aspirated.

The Changing Face of Medicine

Dr. W. F. BENSTED-SMITH (Newton Ferrers) writes: As a tail-piece to Mr. Clifford Kennedy's article on the changing face of medicine (*Journal*, April 30, p. 1045), might I suggest that if "the State" had to pay the costs of both sides in lost free legal aid cases a way would soon be found to thin out the number of such cases brought to court?

A Convenient Measure

Dr. MARY G. H. EDWARDS (New Milton) writes: I have always found it tiresome, especially when short of time, to measure the distance of the apex beat of the heart from the midline of the sternum. Tape-measures tend to fall off one's knee and the figures are not easy to see in a bad light at night. I have therefore adopted a simple, time-saving method. Adhesive strapping, one inch (2.5 cm.) wide, is stuck on the tubing of the stethoscope, covering alternate inches. Three bands, so placed, enable one to measure 5 inches (12.7 cm.). The stethoscope is always there. The marks are visible by any light and not a second is wasted.

Hospital Improvements

Miss OLIVE MATTHEWS (Coaley, Glos) writes: In response to my offer (*Journal*, May 14, p. 1223) to give away *Hospital Improvements*—how to improve the daily life of the patient in the ward—I am pleased to say that 28 doctors have written to ask for it (duly enclosing fourpence to cover cost of postage and envelope). I would like to ask the recipients to send me their comments, and especially any constructive criticism.

Obituary**JOHN EVERIDGE, O.B.E., F.R.C.S.**

Mr. John Everidge, consulting urological surgeon to King's College Hospital, died at his home in London on June 8. He was 71 years of age.

John Everidge was educated at King's College School and in the medical faculty of King's College, London, where he was junior scholar in 1904, winning the Alfred Hughes prize for anatomy. At King's College Hospital he won the senior scholarship in 1907, and qualified M.R.C.S., L.R.C.P. in the following year. After holding the appointment of house-surgeon at King's College Hospital, he became Sambrooke surgical registrar and surgical tutor in 1912, the year in which he obtained the F.R.C.S. During the first world war he served with distinction in France as a surgical specialist, with the rank of major, being mentioned in dispatches and, at the end of the war, being appointed O.B.E. for his services. "The Major" was the nickname by which he was known to students for several decades.

Everidge returned to King's in 1919 as junior urological surgeon, becoming the senior surgeon in his department and lecturer on urology when the late Sir John Thomson-Walker retired in 1929. From then on he gave up general surgery, though he never lost his interest in it. His fame as a urological surgeon spread far beyond his own hospital, and he held numerous consultant appointments in and around London, including those of consultant to Queen Alexandra Military Hospital, Millbank, and to the London County Council. The author of numerous papers on his specialty, he contributed articles to *Rose and Carless's Textbook of Surgery* and to *Modern Operative Surgery*, and for some years he was chairman of the editorial committee of the *British Journal of Urology*. He was also a member of the council of the British Association of Urological Surgeons, and for some years the treasurer of that body. His slight deafness made him refuse the presidency, but he worked hard for urological interests throughout his career. At the Royal Society of Medicine he was president of the Section of Urology in 1939-40. During the second world war he was one of the senior staff at Horton Emergency Hospital, and at the end of the war, when he was due to retire from the staff of King's, he was appointed active consulting urological surgeon, and in 1953 the title of emeritus lecturer was conferred on him by the council of King's College Hospital Medical School in recognition of his long and valuable services to the school. Three years before this he had been made a Fellow of King's College.

In his younger days Everidge was an accomplished tennis player, being a member of King's "six" in 1906, and in later life he showed a similar aptitude for golf, which, with fishing, became his favourite recreations. He married Miss Kathleen I. Robertson and had one son and one daughter.

We are indebted to Mr. J. G. YATES-BELL for the following appreciation: John Everidge was one of England's leading urological surgeons. At King's his splendid teaching, imparted with wit without crudity, attracted large throngs to his clinics. In surgery he was a pioneer in trans-urethral prostatic surgery as long ago as 1927, and played a part in the development of the modern resectoscope. He was always helpful to his juniors, and it was a matter of pride that so many of his old house-surgeons held consultant

posts. His personal charm was outstanding, and he was held in the highest esteem by his colleagues and friends; patients were devoted to him by virtue of his sympathy.

He had many interests outside his work, lawn tennis in his early days, and in more recent years golf at Epsom and Deal, while many week-ends were spent fishing with urologist friends. He was a member of the Flyfishers' Club.

He always remained young—in surgery by keeping up to date with new procedures, and in private life by his enjoyment of all student activities, dances, and fast cars. His after-dinner speeches were always polished and entertaining. He will be greatly missed as a surgeon and as a friend.

R. N. SALAMAN, M.D., F.R.S.

We record with regret the death on June 12 at his home at Barley, Hertfordshire, of Dr. Redcliffe Salaman at the age of 80. A scholar and research worker of great distinction, Redcliffe Nathan Salaman was for a short time director of the pathological institute at the London Hospital, but he soon turned towards genetic and agricultural research, and for the whole of his life had a host of other interests which brought him renown in many countries of the world.

We are indebted to Professor CHARLES SINGER for the following tribute: As I have known Redcliffe Salaman since childhood I venture to send you some account of this most remarkable man. His accomplishments are too varied for detailing here, but his distinguished career has points of medical interest, not least of which was his extraordinary success in combating his early disability. He was an unusually handsome man who, till a very few weeks ago, gave the impression of an alert, genial country gentleman, a lover of the open air, but also one with a wide knowledge and kindly estimate of men and of affairs. All these things he was, but he was much more. I wish that I could convey in words the impression of cheerful, breezy, combative, intelligent optimism that his presence exhaled.

He was a member of a Jewish family, the progenitors of which came to England from Holland in the mid-eighteenth century. Born in London in 1874, he was educated at St. Paul's School and at Trinity Hall, Cambridge, of which he was a scholar and later an Honorary Fellow. He took a first in the tripos and was much influenced by the physiologists Michael Foster and Gaskell, the anatomist Macalister, and the anthropologist Haddon, all of whom remained his friends throughout their lives. He entered the London Hospital as a student and found time for research even before becoming qualified in 1900. As house-physician to Henry Head, F.R.S., he was naturally drawn to experimental pathology, and spent the years 1901-2 in research on those lines at Würzburg and Berlin. On his return he became director of the pathological institute of the London Hospital and a little later pathologist to the Zoological Gardens. In these capacities he did much important work which he was actively publishing when,

(Walter Stoneman)

in 1904, he developed pulmonary tuberculosis. He immediately entered a sanatorium in Switzerland, where he remained for eighteen months. On his return to England he decided to live in the rural surroundings of Barley, in Hertfordshire. He took there a house which remained his dwelling for the rest of his life. With due care his health steadily improved and he began the series of activities which, by their variety and the vigour with which they were prosecuted, made him a well-known and much-liked, if sometimes controversial, figure in widely different circles.

Undoubtedly his most important scientific work was on the genetics of the potato, on which he became the leading authority. He began his researches on this line in 1906 and continued them to the end of his life; his last paper on it appeared in the present year. It is characteristic of the man that he treated the subject on the very broadest lines, at once theoretical and practical, economic and physiological, literary and historical. His largest single contribution was the fascinating volume of 1949, *The History and Social Influence of the Potato*. Recognized as a classic from the day of publication, it is a most attractive storehouse of original research and observation, fresh in outlook and presentation. It is no small achievement to have made a moving romance of this dull-looking vegetable.

From the middle nineteen-twenties Salaman took an interest in the rising study of viruses. In 1926 he became director of the Cambridge Potato Research Station, a position that he occupied until 1939. The scientific work done in this and kindred capacities led to his well-deserved election as Fellow of the Royal Society in 1935, and to his chairmanship of the National Institute of Agricultural Botany in 1928 and later years. His greatest positive agricultural achievement was the introduction of potato strains with relative immunity to certain viruses and a high yield. Altogether he was the author of over fifty scientific papers on various aspects of the biology of the potato. This by no means exhausted his contributions to agricultural science. Thus he wrote on the inheritance of fur-types in rabbits (1922), and contributed to a Royal Society discussion on ultra-microscopic viruses in animals and plants (1929) and on the state of the "Theory of Natural Selection" (1936). Elsewhere he developed the themes of virus diseases in plants in general (1936) and on economic application of Mendelian methods (1936). He had also an intense interest in anthropological problems, and was the author of a whole series of works dealing largely with the physical anthropology of the Jewish people. Of special medical bearing were his views on the relation of the virus diseases of man and animals to those affecting plants in a communication to the *Lancet* (1937), and on deformities and mutilations of the face in ancient Peruvian pottery in the *Journal of the Anthropological Institute* (1939).

Salaman always devoted a large portion of his activity to public service. He became a J.P. for Hertfordshire in 1907 and was on the bench for 43 years, during 23 of which he was chairman of one of the divisions, member of the quarter sessions appeal court, and member of the county agricultural committee. He was also a Commissioner of Taxes. He combined all this with innumerable other public enterprises. He was almost from the beginning in 1933 a very efficient and attentive member and for long the treasurer of the council of the Society for the Protection of Science and Learning. This body seeks to maintain in active work scholars and

scientists who are refugees from oppression of any sort, regardless of their race, religion, colour, or politics. Salaman's widely generous sympathies here found a very natural and useful outlet.

Something must be said on Salaman's special activities on behalf of the Jewish people, since his interest there, too, was specially in the encouragement of science and learning, and, not least, of higher health standards. He was president of the Jewish Historical Society (1920), and for the last forty years of his life was on the council of the Jews' College, a theological foundation. He was a founder of the Jewish Health Organization (1923), was largely responsible for the founding of a chair of Rabbinic studies at Cambridge (1925), and was a member of the board of governors of the Hebrew University of Jerusalem, which he visited many times and served in many capacities.

Salaman had a singularly happy domestic life. His first wife, Nina Davies, the daughter of a distinguished scholar, was a scholar and poetess in her own right. She was particularly successful in her translations of mediaeval Hebrew poetry and devotional literature, and many of her efforts have become standard. She was a lady of quite exceptional beauty, charm, and wisdom. She bore her husband five children, two of whom are medical men, and died in 1925. He was no less fortunate in his second union with Gertrude Lowy, who survives him.

JAMES HUDSON, M.D.

We record with regret the death on May 17 of Dr. James Hudson at his home at Watermillock, Penrith, Cumberland, at the age of 90. Dr. Hudson, who was in general practice at Newcastle-upon-Tyne for over fifty years until he retired in 1948, was a member of the Council of the British Medical Association for fourteen years and a past president of the North of England Branch.

James Hudson was born at Dumbarton on December 27, 1864, and studied medicine at Glasgow University, where he graduated M.B., C.M. in 1889, proceeding to the M.D. five years later. He first entered general practice as an assistant in a mining district in Lanarkshire, and for a time acted also as senior assistant medical officer to the Coltness Iron Company. In 1893 he settled at Newcastle-upon-Tyne and remained in practice there until 1948, when he retired to Watermillock.

Hudson, a man of boundless energy, always took an active interest in professional affairs, and by regularly attending medical meetings and lectures he kept himself well informed about current medical thought. He was honorary secretary of the Newcastle-upon-Tyne Division of the B.M.A. from 1915 to 1921 and chairman from 1915 to 1918, and president of the North of England Branch in 1925-6. From 1925 to 1938 he represented the Branch on the Council of the Association, and from 1928 to 1940 he was a member of the Central Ethical Committee. He also represented his constituency at eleven Annual Representative Meetings from 1921 to 1939. When the B.M.A. held its Annual Meeting at Newcastle-upon-Tyne in 1921 he acted as one of the honorary secretaries of the Section of Venereal Diseases, and in the following year at Glasgow he served as a vice-president of the Section of Medical Sociology. He was chairman of the local medical war committee throughout both the first and second world wars. He was also a life member and a past president of the Newcastle Medical Society and a past president and

treasurer of the North of England Glasgow University Club. He is survived by one daughter, Mrs. Hudson having died last year.

Dr. GEO. P. HARLAN writes: Much regret will be felt by very many people, both medical and lay, at the death of Dr. James Hudson. He retired to Watermillock after a long, useful, and active life spent in practice at Newcastle-upon-Tyne. He often told me of his experiences as an assistant in Lanarkshire, where, before the days of cars, he made his calls on horseback, then a previously untried form of transport for him. While he was in this assistantship he had to help to deal with a severe epidemic of typhoid fever. On another occasion a mother told him that all her children died in the first few weeks of life. He felt very sceptical of the mother's statement, having just delivered her of a fine healthy child, but after a time the apparently healthy infant developed spasms and died. The condition was diagnosed as tetanus, and infection had arisen from infected water drawn from a barrel which stood outside the door, the water having been used to bath the child and infection having occurred through the umbilicus. James Hudson did not agree with the panel system introduced under the National Insurance Act of 1911 and so remained in private practice, and he adopted the same attitude when the National Health Service came into operation in 1948. I appreciated very much his friendship, as he was an excellent example for a young man. He was of the finest type of general practitioner, for he was not only the doctor but also the friend of the family, and he has left behind him a reputation of which anyone might be proud. Many of his old patients still remember him and all he meant to them. In 1948 he retired to Watermillock to enjoy a well-earned rest. With his inherent enthusiasm and energy, however, he could not be idle, and so he identified himself with the affairs of the village, becoming one of its leaders. Certainly he will be very much missed by all the inhabitants. It is good to think that after his long and busy life at Newcastle-upon-Tyne he was able to exercise his many gifts for the welfare of others at Watermillock.

R. A. LYSTER, M.D., B.Sc., D.P.H.

Dr. R. A. Lyster, formerly county medical officer for Hampshire, died at his home at Bournemouth on June 3 aged 82.

Robert Arthur Lyster was educated at King Edward's School, Birmingham, and at Queen's College and Mason University College in the same city. He took the B.Sc. of London in 1893, and with the help of scholarships and exhibitions he went on to study medicine at Birmingham University, qualifying in 1900. Having determined on a career in public health, he continued to study bacteriology, chemistry, and hygiene as a post-graduate, taking the D.P.H. in 1901, the degrees of M.B., B.Ch. in 1902, and the B.Sc. (public health) in 1905, and proceeding M.D. in 1908. One of his first public appointments was as bacteriologist to the West Riding County Council, but in 1906 he returned to Birmingham as medical officer of health for the Handsworth Urban District. During these years he was lecturer in public health and forensic medicine to the University of Birmingham, but he had to give up this teaching work shortly after his appointment in 1908 as county medical officer, chief school medical officer, and chief tuberculosis officer for Hampshire. He retained this post until his retirement in 1929. During his years in Winchester he saw great changes in the public health service, and in particular he will be remembered for his efforts to extend the facilities available for the treatment of tuberculosis.

Lyster's enthusiasm for preventive medicine won him renown all over Britain. He was editor of the journal *Public Health* from 1918 to 1925, and president of the

Society of Medical Officers of Health during 1925-6 and of the Association of County Medical Officers of Health during 1926-7. An examiner in public health to several universities, he taught the subject himself at St. Bartholomew's Hospital and was a member of the faculty of medicine and board of studies in hygiene in the University of London. He also served on numerous advisory committees to Government departments, was a member of the Central Midwives Board from 1921 to 1930, and was sent as a delegate from this country to several international conferences. During the first world war he served in the R.A.M.C. as a specialist sanitary officer in the Winchester area.

Before he resigned from the public health service Lyster served on several B.M.A. committees, including the Public Health Committee, and was a member of Council from 1925 to 1927. In the years before the first world war he had attended several Annual Meetings as a Representative of his Division. In 1928 he was adopted as Parliamentary Labour candidate for Winchester, but he was unsuccessful in the elections of 1929 and 1931. He was also unsuccessful as the Labour candidate for Preston in 1935. After his retirement from the post of county medical officer of Hampshire in 1929 he went to live in Bournemouth, where he was a very active member of the town council for many years, serving as chairman of the general purposes committee.

E. C. CLEMENTS, C.B.E., M.R.C.S.

Group Captain E. C. Clements, formerly consultant in ophthalmology to the Royal Air Force, died at Horsmonden, Kent, on May 19, at the age of 81.

Edward Cecil Clements, who was born on April 20, 1874, received his medical education at the Middlesex Hospital, qualifying M.R.C.S., L.R.C.P. in 1901. He then studied ophthalmology at Moorfields, and later was engaged in ophthalmic practice at Lincoln. Appointed to a commission in the R.A.M.C. (T.A.) in 1908, he was mobilized on August 5, 1914, for service in the first world war, during which he served with the Royal Flying Corps. Later he was seconded to the Royal Air Force as an eye specialist.

He soon found in pilots the same tendency to lose the power to maintain binocular single vision as he had observed in civilian practice in bank clerks and technicians using precision instruments. Recognizing the importance of such a defect on the judgment of distance when landing aircraft, he set up in July, 1918, at the Hampstead Aviation Candidates Medical Board what is believed to have been the first school for the treatment of heterophoria in London, making use of the then recently invented Maddox rods for diagnosis and Black's amblyoscope for treatment.

In 1919 Clements was appointed to a permanent commission in the Medical Branch of the Royal Air Force in the rank of squadron leader. He was promoted wing commander a year later and group captain in 1928. Employed in his specialty throughout his service, he became consultant in ophthalmology in 1931. He was appointed O.B.E. in 1919 and promoted to C.B.E. in 1934, the year in which he retired.

Although his standards for acceptance for aircrew have been criticized as being too rigid, there can be no doubt that the orthoptic training instituted by Clements increased the confidence and reduced the wastage of pilots undergoing training. His pioneer work holds an honoured place in the records of aviation ophthalmology.

D. Y. SOLANDT, M.D., Ph.D., F.R.S.C.

Dr. Donald Young Solandt, who died in Toronto on March 30 at the age of 48, was professor and head of the department of physiological hygiene and professor of physiology, University of Toronto. An outstanding authority on the biophysical aspects of physiology, he made a special study of muscles, of the special senses, and of environmental conditions. His publications appeared in many medical and biophysical journals, and he was author of a textbook entitled *Highways to Health*.

Donald Solandt was born in Ottawa, Ontario, and entered the University of Toronto in 1925, remaining closely associated with the university until his death. He was a brilliant undergraduate, and his work gave promise of future achievements. He graduated in medicine in 1933, and his interests then led him to post-graduate research in the University of Pennsylvania and later in Britain. In 1936 he obtained his Ph.D. degree from the University of London and returned to Toronto to assume his duties in the department of physiology, where he was in charge of biophysical research. He retained his professorship in this department when, in 1941, he was appointed professor and head of the department of physiological hygiene. During 1941-5 he was on active duty with the Royal Canadian Navy as surgeon commander in the Medical Research Division. In recognition of his contribution to the protection of night vision he was awarded, in 1947, the Medal of Freedom with Bronze Palm by the U.S. Government.

Many committees of the National Research Council of Canada benefited from Dr. Solandt's active interest. He also served on the Advisory Committee of the Department of National Health (Canada) and on committees of the American Public Health Association. He was a member of several scientific societies in Britain, Canada, and the United States and was an honorary fellow of the American Medical Association.

A loyal friend, Solandt was held in high esteem by all who knew him. His great store of knowledge in many fields made him a stimulating companion. He will be remembered for his keenness and adaptability of mind and his never-failing courage in the ill-health which sapped his energy in his early undergraduate days and throughout the rest of his life. He is survived by his widow, formerly Barbara Garford, of London, and three daughters.

Professor RONAN O'RAHILLY writes from Wayne University, Detroit: As a former student, demonstrator, and friend of the late Professor D. T. BARRY (whose obituary was published on May 7, p. 1161), I would like to contribute my personal appreciation. In his long research career he was probably best known in the field of cardiac perfusion, and it was my good fortune to assist him in many experiments. He possessed an indefatigable enthusiasm for physiology and contributed numerous publications to a wide variety of scientific journals. In London, more than a dozen years after his retirement, he was still interested in receiving reprints. In his younger years he was a skilful exponent of chess, bridge, squash, and golf. He had a keen sense of humour, and to a student who informed him during an oral examination that she passed 1,500 litres of urine daily he merely remarked, "How very awkward!" Although students were sometimes awestruck in his presence, he was a very stimulating confrère to those who were fortunate enough to know him outside of the classroom. To these his friends, as to the long line of students who learned in his laboratory, his passing will be a sincerely felt loss.

Dr. B. HIRSH writes: I was deeply moved to read in the *Journal* of June 4 (p. 1393) that Dr. W. J. GRANT, of Shrewsbury, had passed away. I referred to his inspiring leadership in a speech at the recent Annual Representative Meeting. It is tragic for me to think that while I was referring to him he was already dead. Allow me to pay tribute to a great fighter—in the face of tremendous odds—against what we considered to be injustice.

Medical Notes in Parliament

Safety and Welfare Legislation

The Queen's Speech, with which the new Parliament was opened on June 9, promised active promotion of the development of nuclear energy for peaceful purposes, and legislation to safeguard the health and provide for the safety and welfare of those employed in agriculture and industry, and to reduce the pollution of the air by smoke and other causes.

Mr. ATTLEE, Leader of the Opposition, commenting on the health legislation, described it as an extraordinarily meagre instalment of the recommendations of the Gowers Report. The Trades Union Congress had been in consultation with Ministers for a long time, and had been led to believe that a far more comprehensive measure would be introduced to deal with office workers and non-industrial employees, who were totally unprotected.

Sir ANTHONY EDEN, the Prime Minister, explained that there had been a considerable increase in accidents in agriculture and forestry. This was due to the introduction of machinery on a scale unparalleled anywhere in the world. This country had the most highly mechanized agriculture there was. It therefore seemed necessary to the Government to start with this particular measure. But that did not mean that they proposed to stop there. They had considered whether proposals for the railways might be included, but as it was not certain that it would be possible to get the necessary separate Bill through in this session it was thought wiser not to include it in the programme.

The Ban on Heroin

Two Ministers were questioned on June 13 about the ban on the manufacture of heroin. Mr. SOMERVILLE HASTINGS (Barking, Lab.) and Mr. NIALL MACPHERSON (Dumfries, Nat. Lib. and Con.) asked the Minister of Health on what evidence the department held that there was an efficient substitute for heroin in the treatment of disease; what consultation he had had with medical practitioners before deciding not to license its manufacture; and on what grounds he took his decision.

Mr. IAIN MACLEOD said that the British Pharmacopoeia Commission were of the view in 1950 that a suitable alternative existed, and deleted the monograph on the drug from the 1953 edition of the *British Pharmacopoeia*. His Standing Medical Advisory Committee were specially consulted and entirely endorsed this view. As a result he advised the Home Secretary that there was no obstacle from this standpoint to his responding to the appeals of the World Health Assembly and the Economic and Social Council to prohibit the manufacture of the drug.

Mr. HASTINGS asked if there was any evidence of addiction in Britain, and whether the Minister had ever had, as he had had, an intractable cough which nothing but heroin would relieve. Mr. MACLEOD said that the answer, happily, was "No." There were people who believed that for a limited range of afflictions there was no true substitute for heroin. That had to be weighed against the larger claims of the Government playing their part in combating something which was a substantial social evil throughout the world. Although there might be little evidence of addiction in Britain it was entirely desirable that if they could get international agreement they should prohibit the manufacture of the drug everywhere.

Dr. EDITH SUMMERSKILL (Warrington, Lab.) asked whether the substitute was as effective as and much cheaper than heroin. Mr. MACLEOD said that was in dispute, but most people would agree with her. Mr. MACPHERSON asked whether supplies could not be made available to practitioners in those cases where it could be shown there was no adequate substitute, and whether, if he produced evidence of such cases, the Minister would consider it. Mr. MACLEOD said "Yes." The Home Secretary was going to receive a deputation from the British Medical Association, and these matters could be examined then.

Mr. WALTER ELLIOT (Glasgow, Kelvingrove, Con.) said that the drug was of great use in certain cases and could not be dispensed with. He urged the Minister to bend his utmost efforts to see that supplies were made available to reputable practitioners, as had been done before with many drugs as dangerous as this one. Mr. MACLEOD said that he would take that into account. All he could do was to take the best advice available: that was from his Medical Advisory Committee, which included the Presidents of the Royal Colleges, the Chairman of the Council of the B.M.A., and the President of the General Medical Council. Their view was one to which the greatest attention had to be given.

Deputation to Home Secretary

Sir ROBERT BOOTHBY (Aberdeenshire, East, Con.) asked the Home Secretary whether, in view of the protests of the British Medical Association and of the medical profession throughout the country against the threatened withdrawal of heroin, he would permit the manufacture of the drug in limited quantities for use by medical practitioners, and subject to a ban on its export. Sir HUGH LUCAS-TOOTH, Under Secretary, stated that the Council of the B.M.A. had asked the Home Secretary to receive a deputation on this subject, and he had agreed to do so.

Sir ROBERT BOOTHBY asked that the Home Secretary should bear in mind that, in the opinion of the majority of the medical profession, this drug alone could bring relief to certain types of pain, particularly connected with inoperable cancer. As there were only 40 heroin addicts known in this country, would he bear in mind that it was most undesirable that avoidable suffering should be inflicted on thousands of cases if adequate control of the drug could be devised? Sir HUGH LUCAS-TOOTH said the Home Secretary would prefer to discuss the matter with the deputation first.

Poliomyelitis Vaccine

Dr. BARNET STROSS (Stoke-on-Trent, Central, Lab.) asked the Minister of Health when it was proposed to vaccinate groups of children in Britain against poliomyelitis; and what type of vaccine was to be used. Mr. MACLEOD replied that a member of the staff of the Medical Research Council had just returned from a visit to the United States, where he had been studying the latest developments. His report was at present being considered. He expected to make a fuller statement to the House at an early opportunity. Dr. STROSS asked whether some of the tragic results of the use of the Salk vaccine in the United States had been due to the fact that the virus had not been completely killed. If it was used here, would the greatest care be taken to ensure that no such accident occurred? Mr. MACLEOD replied that it seemed probable that the explanation of the Cutter vaccine incident had been that it contained live virus. The Ministry of Health would be content only with the highest standards before they went ahead here.

Cost of Drugs Inquiry

Mr. A. BLENKINSOP (Newcastle-upon-Tyne, East, Lab.) asked the Minister what further progress had been made in discussions with the pharmaceutical industry regarding the cost of drugs and appliances prescribed through the Health Service. Mr. MACLEOD stated that the manufacturers both of standard drugs and of the main types of surgical dressings had been informed that the results of

the cost investigations did not suggest there was any call at present for intervention by the Government, subject in the latter case to certain assurances. As regards the prices of proprietary preparations, since the special provisional reductions which were mentioned on January 31 discussions had been continuing with the industry on the general principles to be followed. Basic drugs, which could not be dealt with separately, were still under investigation, and meantime the firms themselves had continued to reduce the prices of some important drugs. Mr. BLENKINSOP asked if the Minister could give any indication when the discussions would end. Mr. MACLEOD said that he did not particularly envisage them coming to an end at all. It seemed to be a continuing pressure that ought to be kept up over a long period. He added that he thought it would be possible to keep effective and reasonable control over the costs, but there were very considerable problems to reconcile with the need for economy.

Antibiotics

Dr. BARNET STROSS asked the Minister of Health what was the extent of the emergence of strains of diseases now resistant to the common antibiotics such as penicillin, and what was the extent to which uncontrollable allergies to penicillin were appearing. Miss PAT HORNSBY-SMITH, the Parliamentary Secretary, said the Minister was advised that it had been established that strains resistant to penicillin, and in varying degree to certain other antibiotics, were emerging, and that allergies to penicillin were appearing, although it was not yet certain how far any of these was uncontrollable. The Minister was not at present competent to give any more detailed figures or particulars in these matters.

Regional Board Audit Staff.—In answer to a question the Minister of Health said that the staff employed in the audit of the accounts of all National Health Service hospital authorities, executive councils, and certain other authorities conforms with comparable audit services in the Civil Service, where a professional accountancy qualification is not required.

Universities and Colleges

ROYAL COLLEGE OF OBSTETRICIANS AND GYNAECOLOGISTS

The following candidates were successful at the April examination for the Diploma in Obstetrics:

Jessamine M. Akhurst, J. Alexander, H. C. Allen, Anne J. Anderson, M. J. Barnard, C. T. H. Barrett, Renuka Basu, A. G. Blyth, J. G. Blyth, Beryl M. Bromham, J. W. Brown, Jane Buchanan, C. D. Campbell, Margaret E. Chitty, A. R. Chrispin, Elinor B. Clark, Priscilla A. Clark-Maxwell, J. S. Clayton, Elinor M. Cleland, W. M. D. Clements, Mary Clothier, W. G. Cooke, R. L. Coppock, D. C. Cornish, Florence M. Cousley, P. H. Crosskey, Lois R. Davidson, D. W. Davis, D. A. De Renzy-Martin, G. W. Donaldson, D. M. du Toit, C. E. Elliott, Constance H. Ellis, Lucy M. Ellis, E. W. Evans, Joan M. Evans, J. R. Eve, H. T. Fay, Helena M. Fehily, G. Findlay, Kathleen T. Flanagan, J. McC. Forrester, R. W. Galloway, W. F. P. Gammie, R. E. M. Geldart, J. A. Gibson, R. M. Goddard, H. R. Gompertz, J. R. Gough, Sheila M. Gough, J. L. Graham, F. V. Griffiths, A. B. Guest, A. T. G. Gunn, E. A. Haddock, H. N. Hardy, Adeline Kwee-Hong Heah, J. Heffernan, R. M. Hodges, W. S. Hossack, D. S. Iles, Katharine I. Jack, Elizabeth M. Jennings, A. H. John, Isabel D. Johnson, Vivian K. Jones, A. R. Jordan, K. Kelly, A. S. L. Kennedy, Esther S. Kerr, B. Kirsch, W. Lang, L. A. Lees, C. S. Leithhead, H. C. Leslie, E. R. Lester, N. H. Logan, P. Los, R. H. Mackay, B. N. McAdam, Kathleen M. McArthur, Doreen E. McConnell, W. E. H. Maekelberghe, J. M. Manners, Muriel J. Martin, J. F. A. Maskell, H. McL. Morgan, Eleanor Morrison, Mary I. Mossman, K. A. Naylor, Margaret A. Norman, Jean M. North, J. W. Parkin, Rena E. Partridge, W. F. Paveley, J. A. Payne, Mary Phillips, H. R. Playfair, T. A. Plumley, J. G. Powell, Elizabeth M. Price, M. N. Prichard, Margaret J. Purser, Olga M. Rampersaud, Amla Rama Rao, A. M. Reader, D. M. Reader, E. G. Rees, H. F. Reichenfeld, Rosalind M. Rewcastle, D. P. W. Roberts, Margaret J. L. Robinson, R. S. B. Rogers, J. N. Roper, A. D. Rowlands, Hilary M. Rowson, Margaret C. Russell, Dorothy Sanderson, T. A. Sanderson, K. Scott, R. W. Scott, Jane M. Scott-Brown, Jean M. Shields, M. J. Sill, H. R. Simpson, W. S. Sinton, G. H. Smerdon, R. J. Smith, J. H. Spurway, R. M. Stanford, Hilary K. R. Steen, Phyllis A. Stevens, Audrey B. Stevenson, D. Stewart, J. Stewart, T. F. Stoyte, Heather B. Thompson, J. Thompson, D. Tingle, Annemarie D. Tupper, J. Walker, Patricia G. Wallis, W. W. Watson, J. W. S. Webb, J. R. Welsh, B. F. Whiteley, Sheila Wighman, Gladys M. H. Williams, J. R. Wood, W. J. Wright, W. O. C. Young.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending May 28 (No. 21) and corresponding week 1954.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available. The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

CASES in Countries and London	1955					1954

* Measles not notifiable in Scotland, whence returns are approximate.
† Includes primary and influenza pneumonia.
‡ Includes puerperal pyrexia.

Vital Statistics

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of certain diseases notified weekly in England and Wales. Highest and lowest figures reported in each week during the nine years 1946-54 are shown thus -----, the figures for 1955 thus ————. Except for the curves showing notifications in 1955, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

Infectious Diseases

The largest fluctuations in the trends of infectious diseases in England and Wales, during the week ending May 28, were increases of 1,815 for measles, from 23,655 to 25,470, 153 for dysentery, from 1,232 to 1,385, 46 for acute

pneumonia, from 377 to 423, and decreases of 158 for whooping-cough, from 1,613 to 1,455, and 11 for scarlet fever, from 620 to 609. 10 cases of diphtheria were notified, being 7 fewer than in the preceding week.

25 cases of acute poliomyelitis were notified, and these cases were 4 fewer for paralytic and 10 more for non-paralytic cases than in the preceding week. The largest returns were Yorkshire West Riding 5 (Barnsley C.B. 2), Lancashire 4 (Liverpool C.B. 3), and London 3 (St. Pancras 2).

Medical News

Drug Addiction in U.S.A.—The Federal Narcotics Commissioner, Dr. HARRY J. ANSLINGER, testifying before a Senate Judiciary subcommittee in Washington on June 2, gave the number of narcotic addicts in the United States as about 60,000, according to the *New York Times*. This represents an incidence of slightly under 1 in 3,000 of the population, and is based on figures collected since 1953 by the Bureau of Narcotics. New York State accounted for 9,458 of the addicts, and New York itself was stigmatized by the commissioner as "the centre of much of the illicit traffic in heroin." Half the group of "confirmed addicts" were in the age group 21-30 years.

Official Report on the Salk Vaccine.—At 1 a.m. on June 10 the Department of Health Education and Welfare released Dr. L. A. Scheele's report on the Salk vaccine. This followed news that the copy of the report was already in the hands of the *New York Times*. Dr. SCHEELE, Surgeon-General of the U.S. Public Health Service, aided by a committee of experts, has been carrying out a five-week investigation into the reasons for the occurrence of paralytic poliomyelitis in over a hundred of the inoculated children. The report, according to newspaper accounts, makes it clear that inactivation of the three types of virus in the vaccine when undertaken on a commercial scale posed new and difficult problems, and this together with the haste in bringing the product to the public precluded complete safety. The report discloses that on several occasions before Dr. Salk's field trials last year live virus was recovered from some of the batches of vaccine. It seems that the five licensed manufacturing firms had similar troubles, but as such batches were not submitted to the Public Health Service for clearance the authorities were insufficiently aware of the hazard. To deal with this a new Division of Biological Standards has been created and the screening procedure tightened. The report is against the view that the cases of poliomyelitis were due to the injections themselves (post-inoculation poliomyelitis), on the grounds of their geographical distribution. Although no final decision is reached in the report on the question of the banned Cutter vaccine, no good alternative is offered to Professor Gebhardt's explanation that live virus was responsible (see *Journal*, June 11, page 1436). Indeed, in a television interview Dr. Scheele confirmed Professor Gebhardt's claim to have found live virus in one sample of Cutter vaccine.

American Medical Association.—Some 16,000 American doctors, with their wives, attended the 104th annual meeting of the American Medical Association at Atlantic City, New Jersey, from June 6 to 10. Besides the general scientific sessions and the twenty or so specialist sectional meetings, there were colour television programmes of operations and demonstrations from the Hospital of the University of Pennsylvania at Philadelphia, continuous film shows, and a large scientific exhibition. This last had 350 exhibits grouped under scientific sections. A very popular exhibit was the all-day demonstration by six pathologists on fresh post-mortem material; other exhibits were on such things as the chorio-retinal lesions from atomic bomb flash, syphilis in human volunteers, and the electronic analysis of gastrointestinal sounds. In another part of the exhibition the

American Academy of General Practice had cubicles where any doctor could have an immediate chest radiograph and an electrocardiogram. This is expected to become an annual feature. The three principal themes in the scientific sessions were the medical aspects of atomic energy, cardiac surgery, and poliomyelitis.

Nuffield Chair of Child Health at Durham.—Dr. S. D. M. COURT has been appointed to the Nuffield Chair of Child Health at Durham University, left vacant by the death of Sir James Spence a year ago. Dr. Court, who graduated at Birmingham in 1936, has been Reader in Child Health at Durham since 1948. He had previously held appointments at Great Ormond Street and the Westminster Hospital.

Sims Commonwealth Travelling Professors.—The Royal College of Surgeons announces the appointment of Mr. GEOFFREY KEYNES, consulting surgeon to St. Bartholomew's Hospital, and Sir LIONEL WHITBY, Regius Professor of Physic at Cambridge, as Sir Arthur Sims Commonwealth Travelling Professors for 1956. Mr. Keynes will visit Canada and parts of Africa. Sir Lionel Whitby will go to Australia and New Zealand.

Royal College of Surgeons.—At the council meeting on June 9 Mrs. MITCHNER presented the College with two badges of office for the vice-presidents, in memory of her husband, the late Mr. Philip Mitchner. The Jacksonian Prize was presented to Mr. C. W. D. LEWIS (Cardiff).

Lady Tata Memorial Trust.—In addition to the customary personal grants and scholarships for research on leukaemia and allied diseases, the trustees announce this year a block grant of £1,000 to the Social Medicine Unit at Oxford, directed by Dr. ALICE STEWART, for a pilot inquiry into possible environmental factors in leukaemia.

International Society for Human and Animal Mycology.—This society was founded last year during the eighth International Congress of Botany by a group of scientists from ten nations. The committee is as follows: president, P. REDAELLI (Milan); vice-presidents, C. W. EMMONS (Bethesda), G. T. AINSWORTH (Exeter), P. NEGRONI (Buenos Aires), G. SEGRÉTAI (Paris); general secretary, R. VANBREUSEGHEM (Antwerp). Those interested in joining the society are invited to write to Dr. R. Vanbreuseghem (Institut de Médecine Tropicale, 155, rue Nationale, Antwerp, Belgium) giving details of their qualifications and a list of their scientific publications.

Care of the Elderly.—The Medical Society for the Care of the Elderly made the following elections to the executive committee at the annual general meeting on May 7: president, Lord AMULREE; hon. vice-presidents, Dr. J. H. SHELDON, Dr. E. L. STURDEE; hon. treasurer, Dr. W. MORION; hon. secretary, Dr. A. N. EXTON-SMITH; hon. deputy secretary, Dr. P. ARNOLD; other members, Drs. J. AGATE, O. T. BROWN, K. J. G. MILNE, L. NAGLEY, O. OLBRICH, M. WARREN, T. S. WILSON, and Professor R. E. TUNBRIDGE.

Composition of Flour.—Persons or organizations wishing to put evidence before the Government Panel on the Composition and Nutritive Value of Flour are invited to send it in writing before July 9 to the secretary, Miss B. M. Shedden, 10, Whitehall Place, London, S.W.1. Sir HENRY COHEN is chairman of the panel (*Journal*, May 14, p. 1298).

Sweets and Dental Caries.—In the first five years of the Health Service about £100m. was spent on providing artificial teeth. This is stated in a Ministry of Health Circular (11/55) to Local Authorities on the Maternity and Child Welfare Dental Services. In an appendix on the promotion of dental health, the circular blames the greatly increased consumption of sweets as "undoubtedly one of the main causes of the increase in dental decay." The circular quotes in support of this charge the Swedish investigations showing that sugar between meals increases the incidence of caries (see *British Medical Journal*, May 21, p. 1265).

Tour in British West Africa.—There is an opportunity for several United Kingdom medical graduates under the age of 25 on October 31, 1955, to join a small party of young

people visiting British West Africa from November, 1955, to January, 1956. The tour is under the auspices of the Prime Minister's committee on overseas travel parties for youth, which administers moneys allocated from the South African Aid to Britain Fund. Those interested should apply immediately to the tour organizer at 37, Bedford Square, London, W.C.1.

COMING EVENTS

N.A.P.T. Commonwealth Health and Tuberculosis Conference.—The fourth conference will be opened on June 21 at 10 a.m. by the Minister of Health at the Royal Festival Hall, London. After the conference there will be visits to sanatoria, hospitals, and clinics.

Hospitals' Symphony Orchestra.—Concert in the Great Hall of B.M.A. House, Tavistock Square, London, W.C.1, on June 25 at 7.30 p.m. Works by Haydn, Brahms, Dvorak, Sibelius, and Berlioz. Tickets (10s. to 3s. 6d.) from Miss M. A. Whipp, Almoners' Department, St. Thomas's Hospital, London, S.E.1.

Oxford Graduates' Medical Club.—The Summer Dinner will be held in Oriel College, Oxford, on Friday, July 1, at 7 p.m. with Dr. F. G. Hobson, D.S.O., F.R.C.P., in the chair. Members may bring medically qualified guests of either sex. Tickets (price 35s.) from RONALD MACBETH, F.R.C.S., Department of Otolaryngology, Radcliffe Infirmary, Oxford.

Irish Medical Association.—Members of the B.M.A. will be welcome at the annual meeting of the I.M.A. at Trinity College, Dublin, July 4-8. Details of the clinical sessions from the secretary of the I.M.A., 10, Fitzwilliam Place, Dublin.

Collegium Internationale Allergologicum.—Symposium on migraine and vascular allergy at Basle, July 3-8.

Royal Medical Benevolent Fund.—Annual general meeting on July 28 at 5 p.m. at 11, Chandos Street, London, W.1.

NEW ISSUES

Journal of Neurology, Neurosurgery and Psychiatry.—The next issue (Vol. 18 (New Series), No. 2) is now available. The contents include:

STUDIES IN TRAUMATIC EPILEPSY, PART 3: VISUAL FITS. W. Ritchie Russell and C. W. M. Whitty.
THE ARTERIAL SUPPLY OF THE SPINAL CORD AND ITS SIGNIFICANCE. D. H. M. Wooliam and J. W. Millen.
ENCEPHALITIS IN LOA-LOA FILARIASIS. L. van Bogaert, A. Dubois, P. G. Janssens, J. Radermecker, G. Tverdy, and M. Wanson.
OBSERVATIONS ON THE REACTION TIME TO CUTANEOUS THERMAL STIMULI. P. P. Lee and D. C. Sinclair.
CHRONIC PROLIFERATIVE OSTEOITIS OF THE SKULL. J. E. M. Button and G. L. Alexander.
THE ASSOCIATION OF DEMENTIA WITH RADIOLOGICALLY DEMONSTRATED CEREBRAL ATROPHY. R. H. Gosling.
CHOROID PLEXUS PAPILLOMA CAUSING SPONTANEOUS SUBARACHNOID HAEMORRHAGE. J. Ertisling.
THE USE OF DEHYDROISANDROSTERONE IN PSYCHIATRIC PRACTICE. E. B. Strauss and W. A. H. Stevenson.
ISCHAEMIC SENSORY LOSS IN PATIENTS WITH SPINAL AND CEREBRAL LESIONS. R. W. Gilliat.
ANXIETY AND AN AUTONOMIC REACTION TO PAIN. Malcolm Piercy, Alick Elithorn, R. T. C. Pratt, and Margaret Crosskey.

Issued quarterly; annual subscription £2 2s.; single copy 12s. 6d.; obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1.

British Journal of Pharmacology and Chemotherapy.—The new issue (Vol. 10, No. 2) is now available. The contents include:

THE ACTION OF HYPNOTIC DRUGS ON FROG SKELETAL MUSCLE. J. P. Quilliam.
THE ACTION OF THIOPENTONE SODIUM ON SKELETAL MUSCLE. J. P. Quilliam.
ACTION OF PROGUANIL AND ITS METABOLITE ON NEUROMUSCULAR AND SYNAPTIC TRANSMISSION. Marcel J. Dallamagne and E. Philippot.
EXPERIMENTAL CHOLERA IN INFANT RABBITS: A METHOD FOR CHEMOTHERAPEUTIC INVESTIGATION. N. K. Dutta and M. K. Habbu.
PROTECTION AGAINST ANAPHYLACTIC SHOCK BY VARIOUS SUBSTANCES. H. Herxheimer.
A POSSIBLE MECHANISM OF ADRENALINE STABILIZATION IN THE ADRENAL GLAND. Douglas G. Humm, Martin Roeder, Miriam Landew, and Eloise E. Clark.
A SERIES OF POLYMETHYLENE BIS-ACETOXYETHYLDIMETHYLAMMONIUM SALTS. R. B. Barlow.
THE ANTICHOLINESTERASE ACTIVITY OF POLYMETHYLENE BIS-QUINOLINIUM SALTS. R. B. Barlow and Jean M. Himmis.
THE PHARMACOLOGICAL ACTIONS OF CAPSAICIN AND ANALOGUES. C. C. Toh, T. S. Lee, and A. K. Kiang.
OBSERVATIONS ON HISTAMINE-INDUCED PRURITUS AND PAIN. J. L. Broadbent.

MODIFICATION BY DRUGS OF THE RESPONSE OF THE RAT'S UTERUS TO ADRENALINE. Margarette Holzbauer and Marie Vogt.
THE SCHISTOSOMICIDAL ACTIVITY OF SYMMETRICAL DIAMINODIPHENOXY-ALKANES. C. G. Raison and O. D. Standen.
A SLOW CONTRACTING SUBSTANCE IN NORMAL HUMAN URINE. Fernando P. Gomes.
THE MODE OF ACTION OF SULPHONAMIDES, PROGUANIL, AND PYRIMETHAMINE ON PLASMODIUM GALLINACEUM. I. M. Rollo.
THE RELEASE OF HISTAMINE BY POLYMYXIN B AND POLYMYXIN E. S. R. M. Bushby and A. F. Green.
PHASE-BOUNDARY POTENTIALS AND GANGLION-STIMULANT ACTIVITY. K. A. Exley and P. Hey.
ACTION OF THE HISTAMINE-RELEASE POLYVINYLPIRROLIDONE ON CAPILLARY PERMEABILITY IN DOGS. B. N. Halpern, E. Musso, and Th. Nevchi.
BRONCHODILATOR AND BRONCHODILATOR ACTIONS OF ANTIHISTAMINE DRUGS. D. F. Hawkins.
A STUDY OF TWO METHODS FOR TESTING LOCAL ANAESTHETICS IN MAN. J. L. Mongar.
PRESENCE OF ACETYLCHOLINE IN THE MALAYAN JACK-FRUIT. ARTOCARPUS INTEGRA. Robert Chui Yu Lin.
RELEASE OF HISTAMINE BY A SUBSTITUTED BUTYLAMINE (I. 1955): COMPARISON WITH COMPOUND 48/80. W. Feldberg and J. Lecomte.
STUDIES ON THE MECHANISM OF PITUITARY-ADRENAL ACTIVATION BY MORPHINE. Robert George and E. Leong Way.

Issued quarterly; annual subscription £4 4s.; single copy 25s.; obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Application should be made first to the institution concerned.

Monday, June 20

BIRMINGHAM MEDICAL INSTITUTE: SECTION OF PSYCHIATRY.—At Central Hospital, near Warwick, 2.30 p.m., clinical meeting.
POSTGRADUATE MEDICAL SCHOOL OF LONDON.—4 p.m., Dr. Lewis Dexter (Boston): Cor Pulmonale.
ROYAL COLLEGE OF SURGEONS OF ENGLAND.—5 p.m., ophthalmology lecture by Dr. D. R. Lucas: Retinal Dystrophy.

Tuesday, June 21

INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. O. L. S. Scott: Hypostatic Ulcers.
ROYAL COLLEGE OF PHYSICIANS OF LONDON.—5 p.m., Ernestine Henry Lecture by Dr. K. M. A. Perry: Pulmonary Disease Associated with Metallic Oxides.
ROYAL COLLEGE OF SURGEONS OF ENGLAND.—3.45 p.m., Arnot Demonstration by Dr. S. Engel: Post-natal Development of the Child's Lung.
SOUTH-WEST LONDON MEDICAL SOCIETY.—At Bolingbroke Hospital, 8.30 p.m., annual general meeting.

Wednesday, June 22

INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. R. W. Riddell: Subcutaneous Mycotic Infections.
ROYAL SANITARY INSTITUTE.—2.30 p.m., Mr. P. G. Shute: Role of Mosquitoes in the Spread of Myxomatosis and Some Suggestions for their Control.

Thursday, June 23

INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. H. Haber: The Reticuloses.
POSTGRADUATE MEDICAL SCHOOL OF LONDON.—4 p.m., Dr. J. C. Gilson: Rheumatism and Lung Disease.
ROYAL COLLEGE OF SURGEONS OF ENGLAND.—5 p.m., Hunterian Lecture by Professor A. C. Bingold: Benign Fibrous Tumours of Single Bones.
ST. GEORGE'S HOSPITAL MEDICAL SCHOOL.—5 p.m., postgraduate demonstration in psychiatry.
●WEST LONDON MEDICO-CHIRURGICAL SOCIETY.—At New Hall, Royal College of Surgeons of England, 7.30 for 8 p.m., annual banquet.

Friday, June 24

CAMBRIDGE MEDICAL SOCIETY.—At Addenbrooke's Hospital, 3 p.m., Mr. S. G. Clayton: Post-mortem.
●INSTITUTE OF DERMATOLOGY.—5.30 p.m., clinical demonstration by Dr. P. F. Borrie: Leg Ulcers.
INSTITUTE OF DISEASES OF THE CHEST.—5 p.m., clinical demonstration by Dr. J. G. Scadding.
POSTGRADUATE MEDICAL SCHOOL OF LONDON.—(1) 2 p.m., Mr. J. Bruce: Regional Enteritis. (2) 4 p.m., Mr. P. McG. Moffatt: Use of the Ophthalmoscope in Medicine (II).

Saturday, June 25

CAMBRIDGE UNIVERSITY MEDICAL SCHOOL.—10.30 a.m., symposium: Laboratory Aids to Diagnosis and Treatment.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Clarke-Williams.—On June 8, 1955, at the General Hospital, Rochford, Essex, to Shirley (formerly Hinton), wife of Michael Clarke-Williams, M.B., M.R.C.S., a brother for Marion-Adam Richard.
Dobson.—On June 1, 1955, to Dr. Margaret J. Dobson (formerly Barker), wife of Sydney F. Dobson, Stockport Road, Marple, Cheshire, a second son.

MARRIAGES

Torley-Hausmann.—On December 21, 1954, at The Cathedral, Minden, John Torley, M.B., Ch.B., to Marlies Hausmann, of Minden, Westfalen, Germany.

DEATHS

Gribbell.—On April 13, 1955, at his home, "Torridon," Yelverton, Devon, William Ernest Gribbell, M.R.C.S., L.R.C.P., Surgeon Captain, R.N., retired, aged 78.
Griffiths.—On May 6, 1955, at Ruthin Castle, John Tudor Griffiths, L.R.C.P.&S.Ed., L.R.F.P.S., J.P., of Leaton, Gronam Road, Prestatyn, Flint.
Kilgour.—On April 25, 1955, at 37, Abercon Place, London, N.W., William Robert Kilgour, M.R.C.S., L.R.C.P., aged 71.
Marsh.—On May 4, 1955, at 85, Appleby Lodge, Manchester, Lancs, Frank Needham Marsh, M.B., Ch.B.

Any Questions?

We publish below a selection of those questions and answers which seem of general interest. It is regretted that it is not possible to supply answers to all questions submitted.

Medical Hazards of Travel in France, Spain, and Italy

Q.—I am planning a motoring tour in France, Spain, and Italy. (a) Is the tap-water safe to drink, and, if not, what precautions are advised? (b) I am told that enteric upsets are particularly common in some parts of France and Spain. Would it be a good idea to take a supply of sulphaguanidine? (c) Am I likely to encounter malaria in these countries, and, if so, what prophylactic measures are advised?

A.—(a) Piped water supplies may generally be regarded as safe throughout France, Spain, and Italy. There is, however, a minimal risk entailed in drinking water from wells or pumps. The risk is so small that most travellers accept it, but it may be eliminated altogether by boiling the water before drinking. This is much more satisfactory than chlorination, which is uncertain and tedious to carry out. If, however, it is desired to chlorinate water, 30 mg. (½ gr.) chloride of lime (calcium hypochlorite) should be dissolved in 1 gallon (4.5 litres); the water is allowed to stand 30 minutes and to it 15 mg. (¼ gr.) sodium thiosulphate (hyposulphite) is then added. The crystals are thoroughly dissolved and the water allowed to stand for a further 30 minutes. The sodium thiosulphate does not play any part in sterilizing the water; it removes excess chlorine and renders it more pleasant to drink.

(b) Most enteric upsets acquired by travellers on the Continent are transient, settling down in a day or two without treatment, but some of them may be cut short by taking standard doses of sulphaguanidine or phthalyl sulphathiazole.

(c) The risk of contracting malaria in France, Spain, or Italy is now so small that it may be ignored.

Mild Hookworm Infections

Q.—If hookworm ova are found in the stools (of a European) is this a definite indication for treatment even though the infestation is light, the blood picture normal, and symptoms absent? What is the prognosis if the case is left untreated?

A.—No. In such cases the patient will suffer no harm from the presence of the parasites, and they are best ignored. The prognosis is good, though the natural life of the worm may be one of several years. Hookworm infections are difficult to eradicate completely, and to attempt this by repeated courses of treatment is not only usually unsuccessful but also causes anxiety to the patient.

Formalin Fumes

Q.—A sanitary inspector tells me that the fumes of strong formalin solutions can cause "softening of the brain," and he therefore advises his assistants to handle such solutions only in the open air. Is there any scientific basis for this belief? Are there any other dangers from formalin fumes?

A.—The vapour of formalin is a powerful upper respiratory irritant, and it is clearly advisable, whenever possible, to prevent a high concentration in a closed space. It is certainly a wise precaution to remove the risk by handling such solutions in the open air. The fluid produces dermatitis of the hands which varies widely in severity. In an appreciable proportion of those who handle fluid formalin an unmistakable degree of hypersensitivity develops, and under these conditions the vapour will aggravate the skin condition. There is no evidence of any association between the inhalation of formalin vapour and "softening of the brain."

Coitus Interruptus and Ejaculatio Praecox

Q.—What is your expert's opinion of coitus interruptus? A man who has been practising it for several years is now complaining of ejaculatio praecox. What, if any, is the association?

A.—Coitus interruptus is unsatisfactory because it is an unsafe method of contraception and because, in some couples, it leads to nervous tension and unsatisfied sex urge, with possible psychological and physical reactions. These occur mainly in the wife, but can also present in the husband. Nevertheless it must be admitted that coitus interruptus is the most commonly practised method of contraception, and few of its adherents seem to come to harm.

The suggestion that premature ejaculation in the man in question is a possible psychological reaction to the practice of coitus interruptus over many years is impossible to refute, but it is not very likely. Premature ejaculation is to be regarded as a form of impotence. In early marriage it is often caused by nervousness and inexperience, but after several years of marriage its more probable causes are advancing age with too frequent attempts at coitus, overwork, and the stresses of life in general. Perhaps coitus is attempted with too weak an erection. There may also be hidden factors of a sexual or emotional nature.

Post-mortem Diagnosis of Death from Air Embolism

Q.—A pathologist found a few air bubbles in superficial cerebral veins at post-mortem examination of a woman who had died suddenly seven hours after colporrhaphy. There was no other abnormality. The coroner accepted his opinion that the death was due to air embolism. Surely it is physiologically impossible for air introduced at the operation site to have reached the cerebral veins.

A.—It is possible for air to reach the cerebral veins as the result of air embolism in certain cases. This is particularly well seen in abortions due to the use of a Higginson's syringe, when the air is forced into the uterine veins under such pressure that it passes through the right heart and against the stream of blood in the jugular veins to reach the cerebral sinuses and veins. In these cases the sinuses contain very obviously frothy blood, and similar froth will be found in the right heart and jugular veins. The same changes can be found in air embolism due to attempted insufflation of the Fallopian tubes or faulty blood transfusions.

Air may be found in the cerebral veins at post-mortem examination as the result of the tearing of pial and meningeal vessels during the removal of the calvarium. Indeed, it is difficult to avoid the introduction of an occasional bubble of air into these veins, even when considerable care is exercised. For air to persist for seven hours in the cerebral veins between colporrhaphy and death is, in my opinion, impossible. For air to reach the cerebral veins it would have had to be introduced in such volume that it would kill immediately, and its presence would be blatantly obvious in other veins. While air embolism from suicidal cut throat and operations on the neck has occurred as the result of negative pressure in the jugular veins during inspiration, it is difficult to envisage anything like the same mechanism occurring during or after colporrhaphy even in a high Trendelenburg position. The actively contracting pregnant or recently pregnant uterus may trap air and force it into the circulation, but again such conditions do not obtain during colporrhaphy.

To justify a diagnosis of air embolism it should be possible to trace air from a recognized and probable portal of entry, through the veins (in this case the inferior vena cava), to the heart; or to have a clear clinical history of convulsions, transient palsies, haemoptysis, etc., such as are seen in air embolism resulting particularly from artificial pneumothorax procedures. In the absence of air elsewhere in the blood stream, the presence of a few air bubbles in superficial cerebral veins does not justify a diagnosis of air embolism.

Reason for Avoiding Bleeding During Smallpox Vaccination

Q.—A number of writers describe the technique for smallpox vaccination. All those I have consulted mention that blood should not be drawn in making the scratch. None state the reason. Is it because the blood dilutes the lymph and the vaccination is less likely to "take," or is it more likely that such a scratch will lead to a severe general reaction, with possible generalized vaccinia?

A.—In the scratch method of vaccination, bleeding is undesirable mainly because blood may wash the virus out of the scratch and also dilute the vaccine, thus reducing its effectiveness. It is unnecessary to scarify deeply, because the "dermal" virus strain employed is adapted to growth in the skin. When the epidermis only is penetrated, as is desirable, a slight oozing of blood-tinged serum may be observed, but little or no blood. The adoption of a technique involving a minimum of trauma may also reduce the risk of post-vaccinal encephalitis and other complications.

The multiple-pressure method of vaccination has now replaced the scratch as the technique of choice in Britain, the United States, and elsewhere. Its advantages include less general "messiness" (with no bleeding) and less risk of septic infection.

Itchy Eruption on a Woman's Shoulders

Q.—What investigations and treatment are indicated for a healthy woman of 25 whose shoulders are covered with the weals of scratches secondary to lichen simplex or neurodermatitis? The area of spread is over the shoulders and back (latterly improved), and now more marked over waist, hips, and thighs.

A.—This question does not allow a direct answer. The diagnosis depends as always on the history, including the past history of the patient and that of her family, as well as on the examination. In this way it may be determined whether the condition is a primary eczematous dermatitis or urticaria with secondary eczematization caused by scratching (weals are mentioned). Dermographism may be present. The possibility of lichen planus must be remembered.

If the condition is thought to be eczematous the possibility of allergic sensitization such as occurs with nickel dermatitis from suspender buckles with secondary spread, or rubber dermatitis from a corset or belt, should be considered. On the other hand, the condition may be "constitutional" and related to impairment of general health or to mental stress. The treatment depends on the diagnosis and cannot be discussed here.

Bacterial Flora of the Mouth

Q.—What is the normal bacterial flora of the mouth and throat? Should one endeavour to eliminate any bacteria found unexpectedly in a routine swab—for example, a *staphylococcus*?

A.—The mouth and anterior part of the throat have the most profuse and varied flora of any part of the body with the single exception of the colon, and the inquirer should consult a textbook for a full account of it. Among organisms regularly or frequently found are a great variety of streptococci, *Staphylococcus albus*, strains of *Neisseria*, *Haemophilus* and *Bacteroides*, and spirochaetes (*Treponema dentium*).

Whether an attempt should be made to eliminate any organism found depends: (1) on whether it is potentially pathogenic (a *staphylococcus* need not be considered further unless it is known to be coagulase-positive); (2) on the likelihood that its presence is connected with anything of which the patient is complaining. A third consideration is the possible risk to other people if a patient is shown to be a carrier of haemolytic streptococci of Lancefield's group A or of virulent diphtheria bacilli.

Kosher Diet and Peptic Ulcer

Q.—Is there any difference in the incidence of peptic ulceration in those on a strict kosher diet and those who are not?

A.—There is no direct evidence to suggest that the incidence of peptic ulcer is different in those who take a strict kosher diet and those who do not. Certainly peptic ulcer is common among orthodox Jews.

NOTES AND COMMENTS

Tuberculosis in Pet Monkeys.—Professor E. G. T. LIDDELL, F.R.S. (Oxford), writes: It is well to remember that monkeys in captivity ("Any Questions?" May 14, p. 1232) may be very heavily infected with non-pulmonary tuberculosis and will appear to be in quite good health until a day or two before death. The tuberculin test, even intradermal, is not entirely reliable.

OUR EXPERT replies: What Professor Liddell says is, of course, quite true, but in my reply I said that a negative tuberculin test did not exclude infection and that all pet monkeys should be examined clinically. Such an examination would, of course, include among other things a search for tubercle bacilli in the excreta. Pet guinea-pigs also can suffer from widespread tuberculous infection without showing obvious signs, and, like monkeys, can be a source of infection to their owners. Further, in guinea-pigs the tuberculin test is of little or no value in excluding tuberculosis. Indeed, pet animals of almost any kind are capable of harbouring infections pathogenic to man. I do not, however, consider that this is a valid reason for not keeping pets. Pet-keeping has so many advantages of its own, especially for children, and, provided these risks are realized, the chances of acquiring infection from pets are almost negligible. It is possible to be so obsessed with these risks as to preclude pet-keeping altogether.

Pityriasis Rubra Pilaris.—Dr. DAVID I. WILLIAMS (London, W.1) writes: In the answer to the question on the treatment of pityriasis rubra pilaris ("Any Questions?" May 14, p. 1233) vitamin A in doses of 24,000 units two or three times daily is suggested for treatment. I have found that this dose is often inadequate: a daily total of 480,000 units may be necessary to remove and control the clinical evidence of the disease. I am, of course, aware of the risks, which are not very great, of toxicity with a dose as great as this; but patients prefer to take any risk if their skin condition is completely controlled.

OUR EXPERT replies: The dose mentioned by Dr. Williams is very much higher than is normally considered advisable. It may be that the variable response to vitamin A therapy in this disorder results from inadequate dosage in some cases.

Lack of Beard.—Dr. G. G. SHERRIFF (London, W.8) writes: It was astonishing to read the suggestion of testosterone cream for the healthy man worried by his lack of beard ("Any Questions?" June 4, p. 1399). Surely better advice would have been reassurance and congratulations on his relative freedom from the nuisance of shaving.

Correction.—In the opening paragraph of Dr. M. S. Pathy's medical memorandum on varicella with neurological complications in an adult (May 28, p. 1324), the sentence beginning, "Of the 108 cases with neurological complications . . ." should have been, "Of the 138 cases with neurological complications. . . ."

Books of "Any Questions?"—The second and third volumes of "Any Questions?" are available, price 7s. 6d. (postage 6d.), from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1, or through any bookseller. Each contains some 200 selected expert answers, and the third volume a cumulative index to the three published books.

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 4499. TELEGRAMS: Atitology, Westcent, London. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the British Medical Journal alone unless the contrary be stated.

Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors overseas should indicate on MSS. if reprints are required, as proofs are not sent abroad.

ADVERTISEMENTS should be addressed to the Advertisement Manager, B.M.A. House, Tavistock Square, London, W.C.1 (hours 9 a.m. to 5 p.m.). TELEPHONE: EUSTON 4499. TELEGRAMS: Britmedads, Westcent, London.

MEMBERS' SUBSCRIPTIONS should be sent to the SECRETARY of the Association, TELEPHONE: EUSTON 4499. TELEGRAMS: Medisecra, Westcent, London. B.M.A. SCOTTISH OFFICE: 7, Drumsheugh Gardens, Edinburgh.

BRITISH MEDICAL JOURNAL

LONDON SATURDAY JUNE 25 1955

British Medical Association

ONE HUNDRED AND TWENTY-THIRD ANNUAL MEETING, TORONTO, CANADA, 1955

President's Address

LEST WE FORGET

"I will set down what comes from her, to satisfy my remembrance the more strongly."—Macbeth, v, i, 35.

BY

THOMAS CLARENCE ROUTLEY, C.B.E., M.D., LL.D., F.R.C.P.C.

On behalf of the members of the Canadian Medical Association may my first words be to welcome most heartily all who have paid us the compliment of coming to Toronto. The British Medical Association last met in this city forty-nine years ago, and on that occasion Professor Irving Cameron welcomed our visitors in the words of an old Indian greeting, which is so appropriate that I will repeat it to you now. "It is good for us, O Brothers, that you came so far to see us." To our open hearts and wigwams you are welcome! May the Gitche Manitou [the Great Spirit] have you in his keeping while you sojourn with us, and bring you, returning with filial piety and devotion to the care and protection of your own lares and penates, safe again home."

We in Canada are proud of our place in the British Commonwealth of Nations and are anxious to do our full share, whatever it may be, in strengthening the ties which bind us together. Last year our Prime Minister, the Right Honourable Louis St. Laurent, encircled the globe in order that he might extend Canada's greetings to various parts of the Empire (I still like that word) and learn, first hand, of the problems which await solution in promoting and building better understanding and closer co-operation between us. Surely a gathering such as this, which brings outstanding representatives of many parts of the Commonwealth together, can and will do much to foster and advance our common desires and aspirations.

Again let me say how very happy we are to extend the right hand of fellowship not only to our brothers and sisters of the Commonwealth but also to our only slightly more distant relatives from south of the border. In 1930 a speaker at the British Medical Association meeting in Winnipeg referred to the duty and also the privilege of Canadians to endeavour to interpret the British Commonwealth to the United States of America. We are happy to think that we do constitute a friendly link between these two important elements of the free world, and that we may play some small part in advancing harmony and understanding between them.

My next words must be to thank you most sincerely for the great honour you have done me in electing me

to the Presidency of the British Medical Association. I like to think of this honour as one that I share with the members of the Canadian Medical Association, who so kindly nominated me for the position, and who, together with me, constitute your hosts at this meeting. On their behalf I can promise one thing—that I shall serve you as best I can without holding back my time or my strength. I am yours to command for any service which you may consider to be appropriate to this high office.

Of the duties which you lay upon me in the coming twelve months, few will present such difficulties as the address which, by custom, the President gives at his installation. The *British Medical Journal* once said: "Presidents must find it increasingly difficult as year follows year to find anything to speak about that has not furnished matter for the eloquence of preceding orators. . . . There is not for the moment, in the somewhat narrow sphere which custom allows the President of the Association, any new thing on which he can discourse." These words were not written recently for my encouragement or comfort, but in 1897 when the B.M.A. first met in Canada. Since then, close upon sixty Presidential Addresses have been given, and the field has, if possible, been even further narrowed. If, then, there is nothing new that I can say to you with profit, let me take example from the Man of the Century, Sir Winston Churchill, and look into the past as a guide to the future.

The British Medical Association has met three times previously in Canada—in 1897 in Montreal, in 1906 in Toronto, and in 1930 in Winnipeg. Now to our great joy you come back to us again. The year 1897 seems very far away to us; perhaps I can indicate how far away and yet how near it is by relating it to one man whose name I have already mentioned, and whose career spans all of this epoch. In 1897 Winston Churchill was a soldier serving his country in India, and already had been mentioned in dispatches for his valour. In 1906, when last you met in Toronto, he had exchanged his cavalry saddle for the leather bench of Westminster and was Under-Secretary of State. In 1930 he had just relinquished the office of Chancellor of the Exchequer,

and to the undiscerning his day was done; for as the public said, "He is already middle-aged." How wrong the undiscerning were! How amazingly wrong people sometimes can be!

A Look into the Past

May we, then, take a look into the medical past and, without venturing too far into fields of science into which my feet are not accustomed to stray, recall something of the medical scene at the time of the three previous meetings in Canada.

It is interesting to note the names of some of the sections of these meetings. In 1897 all of the basic sciences—atomy, physiology, pharmacology, pathology, and bacteriology—were represented, although for some curious reason the anatomists were discussing anaesthesia. By 1906 the anatomists had parted company with the physiologists, and by 1930 they had bowed themselves off the stage altogether, while the physiologists had allied themselves with the pathologists and bacteriologists and had got the worst of the bargain, for there was little pure physiology on the programme. Now all these sections are gone. I do not quite understand what their departure portends unless it be that, though nameless themselves, they have assumed roles of importance within other sections.

In 1897 the subject we now call preventive medicine had a section called Public Medicine, and the talk was all of sanitation—pure water, pure milk, sewage disposal. We whose countries are represented at this meeting have outgrown that limited concept of public health, though I would remind you that elsewhere within our Commonwealth, and in a great many underdeveloped parts of the world, such problems still require solution, as witness the motto for World Health Day this year—"Clean water for better health." By 1906 the section had changed its name to State Medicine, suggesting that this was a part of medicine for which the State, and not the individual, should be responsible. Since those days the State has developed various ideas in various countries as to its responsibility, and the name of the section has veered round to what most members of the profession would consider to be its proper title—namely, Preventive Medicine.

Another significant change through the years has been the replacement of the name "Diseases of Children" by "Child Health," in line with the positive definition of health as propounded by the World Health Organization.

In 1897 there was a Section of Psychology, which discussed the evolution of the mind. By 1906 its field was what we might now call neuropsychiatry, for it discussed neurological topics like epilepsy, as well as hallucinations and delusions. By 1930 the separation of neurology from psychiatry had begun, and the section was called Mental Diseases and Neurology, though a discussion on mental changes at the menopause was opened by a neurologist. Now the divorce of the neurologists from the psychiatrists is complete, and I doubt whether either would care to invade the territory of the other.

Of the sectional newcomers to the field since 1930, one at least has a very ancient lineage. I refer to the Section of General Practice. As you know, of recent years the general practitioner has begun to realize that the branch of the profession which he follows is as much a specialty as the practice of surgery or psychiatry, and that he must give heed to the development of his specialty, to the training necessary for good general practice, and to the means of gaining the maximum intellectual satisfaction from his job. In the United States of America, in the United Kingdom, and in Canada he has taken steps by the formation of a College or Academy to foster these laudable aims. We are happy to see that this meeting is to make a contribution towards this fundamentally essential movement.

I should like to mention another section, that of Occupational Medicine, which has grown up since 1930. Like the practice of psychiatry, which has marked off its territory

and expanded out of all recognition in the last few decades, the specialty of occupational medicine, embracing a relatively new programme of rehabilitation which has been described as the third phase of medicine (preventive and curative being the first two phases), surely merits a section of its own. Indeed, might we not say that occupational hazards now confront not only the industrial worker, a person of growing importance in our economy, but also, with the increasing use of toxic pesticides, the agricultural worker, on whose efforts the wealth of Canada and many other parts of the Commonwealth so greatly depends? And fresh hope appears to be rising for that vast army of persons who, because of physical or mental disability, have so frequently been written off as expendable.

Two sections have disappeared since 1930. One, labelled rather strangely as "Medical Sociology and History of Medicine," concerns me personally, as I was invited to open a discussion at the Winnipeg meeting on migration within the Empire, a subject which, from time to time over the years, has attracted varying degrees of attention. In passing, one wonders whether, at our next conjoint meeting in Canada, there will be included a section on Social Medicine (not Socialized Medicine) as a successor of Medical Sociology, or whether the difficulty in defining this field will preclude its separation from the existing specialties. There is need for clear thinking and sound leadership by the medical profession in the broad field of social medicine, embracing as it does the important aspects of public relations and medical economics.

The other section no longer with us is that of Tuberculosis. Over many phases of the 1897-1906 meetings the white plague cast its dark shadow. In 1930 no fewer than three sessions were devoted to this disease; they met at a time when the Lübeck tragedy had just occurred. You will recall that, through a tragic error, a large number of Lübeck children met their death after B.C.G. vaccination. This event cast an unwarranted suspicion on a method which is currently being employed successfully on millions of persons every year. Since you last met in Toronto the picture of tuberculosis has been considerably modified, mortality having declined by more than 80%. Early diagnosis, the discovery of antibiotics, the progress in chest surgery, and the development of rehabilitation services have gone far towards lifting the terror from this one-time scourge and given us courage to think that tuberculosis can be conquered completely. However, until that happy eventuality occurs we must not be lulled into complacency and there must be no let-up in the attack upon the disease.

Surgery, 1897-1930

What were the surgeons talking about at these meetings? In 1897 the emancipation won for them by Lister, a most popular figure at the Montreal meeting, was being chiefly applied in abdominal surgery. Surgeons were vying with each other in daring excisions of abdominal organs. Christopher Heath, in an address, complained that surgeons were not troubling to diagnose but were operating "to clear up the case." A contemporary remarked that the names of the new gall-bladder operations were simply terrible and fit only for Welsh villagers! Surely this was a left-handed compliment to our Welsh friends, who are so adept in the handling of curious-looking words.

By 1906 the surgeons had begun to invade the skull, and the surgical star at the Toronto meeting was Sir Victor Horsley, the pioneer neurosurgeon of whom someone said, "He does not quote the literature; he is the literature."

By 1930 the surgeons had discovered the autonomic nervous system, and the age of "physiological repair" had begun. They had also penetrated the chest, and a major theme at the meeting was thoracic surgery. Now even the secret places of the heart are no longer a mystery to them, and one is pleased to note that the profession on both sides of the water is well represented on the symposium on cardiovascular surgery which is to be held this week. What worlds are left for surgery to conquer? I do not

know, but I am certainly not rash enough to suggest that there are none. Who in 1897 or 1906, or even as late as 1930, could have predicted some of the amazing advances that have taken place in the broad field of medical science since then? Hope springs eternal, and surely history reveals that hope has been considerably rewarded during the past 50 years in the fight against disease.

Revolutionary Changes in Therapeutics

In 1897 the President of the Section on Internal Medicine lamented the fact that scientific therapeutics had very little influence on treatment, but predicted hopefully and confidently a brighter future. In 1906 Dr. R. A. Reeve still lamented the fact and took a somewhat dim view of the progress being made. One might recall that even the first of the magic bullets of chemotherapy, salvarsan, was still unknown. Indeed, as someone said in 1897, "The microbe of syphilis is still wanted by the scientific police." The 1906 meeting was not sure that the spirochaete, then exacting a terrible toll we scarcely realize to-day, was the cause of this disease. As a sidelight on the revolutionary changes in therapeutics, one might point out that none of the ten drugs discussed at the British Pharmaceutical Congress of 1897 is regularly prescribed to-day, and some are absolutely unknown to modern students; not one of the hypnotics recommended in 1897 in the treatment of insomnia has stood the test of time.

In his delightful historical address appearing in the *British Medical Journal* of January 1, 1950, Sir Henry Dale, whose presence at this meeting is such a joy to us all, in discussing the progress of medical science for the first half of this century, reminds his readers that shortly after the turn of this century therapeutic empiricism was still strongly entrenched. Listen to his words. "Look back, those who can do so, to the beginning of this century, and recall again the state of medicinal treatment 50 years ago. Heart tonics, purgatives, diaphoretics, analgesics—such, indeed, were in use, and could be reasonably credited with the promotion of a natural function, or the relief of a distressing symptom; but there was a wide range of remedies then still current for which nothing more definite than a generally 'tonic' or even 'alterative' action could even be suggested. The idea that a remedy could directly remove or neutralize the cause of an illness was still a startling innovation, and neither physician nor patient had yet learned to expect a medication which would go thus to the root of the trouble."

Continuing, Sir Henry said: "Our successors, viewing the times in which we live from the longer perspective of history, are likely to recognize the first half of the twentieth century as the period in which civilization first began to feel, for good or ill, the full impact of progress in the natural sciences. . . . The end of the nineteenth century found medicine still a body of largely empirical knowledge." In 1900 it was "not unreasonable for the student then entering the wards to receive, as I did, the authoritative warning that it was his duty to forget the teachings of the experimental sciences of physiology and to accept those of medicine as still an empirical art."

"The remedies which were being administered in 1900 had almost all come into use as the result of empirical observation. . . . I don't pretend to explain it, but I have seen it do good."

Since that time the improvement in morbidity and mortality statistics pays glowing tribute to the advances made in medical science, and the acceptance of this knowledge by the medical profession.

The rapidity with which new and effective therapeutic agents appear is dramatically revealed by the fact that 70% of the drugs prescribed on this continent last year were unknown fifteen years ago.

At the Cross-roads

At the 1930 meeting the profession stood at the cross-roads with regard to the therapy of infections. The participants in the Winnipeg meeting were obviously sceptical of

therapeutic vaccines and sera, but for another five years, until Domagk produced the first sulphonamide, there would be nothing to put in their place. In 1906 typhoid fever was beginning to show signs of being on its slow way out, although the 1930 meeting referred to an epidemic in Canada of serious proportions in the previous year. In 1930 diphtheria was definitely losing its hold; and Canada, as represented in particular by the City of Hamilton, can take credit as a pioneer in its eradication by toxoid. And now, on the threshold of this meeting, comes the heartening news of the success which has attended the efforts of Salk and his fellow workers in the fight against anterior poliomyelitis. I am sure we all join with a grateful world in extending words of appreciation and praise to those responsible for this newest advance in the conquest of one of the most terrible of all diseases.

The Degenerative Diseases

As infections one by one were being brought under subjection, the degenerative diseases gained in importance. Obesity and coronary diseases are down for discussion at this meeting. In this connexion one might recall the dictum of Sir James Barr, in his address on overweight at the 1906 meeting, that "a life of indolence and luxury is more deleterious to the circulation than the work of a navvy." Coronary disease was still quite a novelty in 1930, while to-day the well-informed layman speaks of it with considerable familiarity.

There is one disease which has been with us at all previous meetings, is with us here, appears to have grown steadily commoner since 1897, and, sad to say, is still undefeated. I refer to cancer. We all long for the day when it will no longer appear on the scientific programmes as an unsolved problem; may that great day come soon. But the picture is not all dark. We know that bits and pieces of scientific knowledge gained in painstaking research are being put together, offering some hope that this death-dealing riddle may be solved in the not-too-distant future.

Medical Education

What of medical education? It has appeared in some shape or form on all three previous programmes here in Canada. I say in some shape or form because on no occasion was the subject discussed as an integral whole. Individual sections sniped at their medical schools, but largely from the standpoint of their own specialty. Thus, in 1897, Japp Sinclair, the obstetrician, said: "Students learn surgery which they will never practise, and will practise midwifery which they have never learned." In 1906 the anatomists agreed that they should "avoid entangling the student in a superfluity of detail." Obstetricians were still dissatisfied, and complained that poor teaching was a result of the "ingrained idea that labour is a natural process."

In 1930 the emphasis was on teaching in public health, but a full-scale discussion on the curriculum as a whole awaited the First World Conference on Medical Education organized by the World Medical Association, and held in London under the auspices of the British Medical Association in the autumn of 1953, and about which I propose to speak in some detail a little later on in this paper. In passing, it is interesting to note that there will be a Second World Conference on Medical Education held under the auspices of the World Medical Association on this continent four years hence. Meanwhile, I shall be surprised if someone at this meeting does not voice his dissatisfaction with the present curriculum.

Debt to the Motherland

At this point I should like to place upon the record the great debt we in Canada owe to the Motherland for the help, stimulation, and guidance given to medical education in this country. Indeed, history reveals that in the basic essentials many of our medical schools adopted from the

Motherland not only your methods of teaching and curriculum but also imported a considerable number of your graduates as faculty members. We are proud of the standard attained by our twelve medical schools, and we thank you for the part which you have played in helping to develop and strengthen them.

You may wish to recall something of the organizational aspects of the Association at the dates about which we have been speaking. In 1897 the British Medical Association was a flourishing organization, but it had its critics, for an editorial in *The Times* of London dismissed it as an "inert mass," and stated that it had done little "either for the benefit of the medical profession or for that of mankind." This is neither the first nor the last time that the Press has erred in the statements upon which it has based its criticism of the profession. However, here in Canada we are rather proud of our relations with the Press, though I would not for a moment wish to convey to you the impression that they always compliment us. On the contrary, they sometimes take us to task; but our knowledge of each other's obligations and responsibilities has increased and improved, particularly in recent years, and we rely upon the Press to assist us in spreading helpful information and facts bearing upon the health of the people.

In 1906 the British Medical Association was applying for a Royal Charter. It was also talking of reforming its constitution. I understand that such reform is again under consideration, though I have no intention of entering into the discussion.

Six years prior to the Winnipeg meeting the present relationship in which the B.M.A. and the C.M.A. became affiliated had been reached. In the words of the late Dr. Alfred Cox, "A marriage between the two Associations, with the word 'obey' left out, was arranged in 1924." And here let me say that much credit for the affiliation must be given to Sir Jenner Verrall and Alfred Cox, who, as ambassadors from the British Medical Association, visited Canada for the purpose of discussing the subject, and by their knowledge, skill, and diplomacy were very largely responsible for the consummation of a marriage which, for more than thirty years, has been so happy and harmonious.

At the 1930 meeting there was much preoccupation with medical costs. "The economic organization of medicine," said the President, Dr. Harvey Smith, "has not kept pace with scientific progress. In my judgment there is only one possible solution—voluntary health insurance, instituted, organized, and controlled by the medical profession, and widely applied."

Plans for health insurance were already under study in some of the western provinces of Canada, and the British Medical Association at home was discussing a medical service for the nation. On both sides of the Atlantic we have gone a long way since then; and later on in this meeting Canadians will hear with interest something of the present position in the United Kingdom. We in Canada have witnessed a remarkable growth in the voluntary plans of health care during the past 25 years, with more than one-third of the population now covered in whole or in part by such schemes.

International Medicine

Two outstanding international events in medicine have taken place since 1930, and it has been my privilege to play a small part in both, right from the beginning. I refer to the founding of the World Health Organization and the World Medical Association. A precursor of the former was the Health Division of the old League of Nations, which in the opinion of some observers formed the most effective part of the League, while the precursor of the latter was L'Association Professionnelle Internationale des Médecins, which was organized in 1926 with the support of a number of medical associations, mostly in Europe, and which did good work until forced to disband in 1939 with the outbreak of the second world war. It seems appropriate to say something about these two organizations on

this occasion for two reasons—firstly, because of their great importance in their respective fields, and, secondly, because of the vital part which the medical profession has played, and must continue to play, in their usefulness. Here may I interpolate that I am indebted to Dr. M. G. Candau, Director-General of the World Health Organization, for much of the information I have used in speaking of that organization.

The World Health Organization

Combining the functions of former organizations in the field of international co-operation on health matters, the World Health Organization, one of the specialist agencies of the United Nations, was founded at an International Health Conference in New York in 1946. For two years it functioned under the direction of an Interim Commission, emerging as a full-fledged organization in 1948, when its constitution had been ratified by the required number of nations. Dr. Brock Chisholm, a Canadian who had acted as Secretary of the Interim Commission, was appointed its first Director-General, a post which he filled with great distinction for five years. It is the first world-wide body of its kind in history. In amplifying its title, it defines health as "a state of complete physical, mental, and social well-being, and not merely the absence of disease or infirmity." With this definition one thinks that the medical profession will concur, as the traditional frontiers of health are pushed forward and enlarged and the close relationship between health problems and economic and social conditions is fully recognized.

The Organization's objective is "the attainment by all peoples of the highest possible level of health." Its functions are: (1) to co-ordinate international health work; (2) to propose and administer international regulations on health matters; (3) to provide technical services, including reporting of epidemics; (4) to assist governments in strengthening their health services; (5) to foster mental health activities; and (6) to promote and conduct research in the field of health. It is important to note that the World Health Organization is not a supranational public health service. It works for, with, and through governments in raising health levels, and is responsible to the United Nations.

The Organization, although not 10 years old, may look with pride to a number of achievements. Time will permit of but a brief reference to some of them. It has promoted maternal and child health and welfare services in many parts of the world, particularly in the underdeveloped and war-devastated countries. In the fields of nutrition, sanitation, and environmental hygiene, and in the fight against widespread infections such as tuberculosis, venereal disease, malaria, and yaws, it has assisted in saving many thousands of lives. Opportunities by way of fellowships for advanced training in various branches of the healing arts have been provided to hundreds of students, many of whom have had the privilege of studying in foreign countries, thus gaining not only new technical knowledge but also a broader outlook on the world as a whole. In the fields of sanitation, vital statistics, medical nomenclature, and biological and pharmaceutical standards much useful work has been accomplished. And its work has only begun. Granted that it receives adequate financial support, adheres to its laudable purposes, is allowed to work out its destiny without undue political influence or interference, and continues to merit the respect, confidence, and support of the healing professions, it can look forward hopefully to a future of much usefulness.

The World Medical Association

Paralleling the development of the World Health Organization, the World Medical Association had its inception in London in the autumn of 1946, when, upon the invitation of the British Medical Association, 100 delegates from 32 national medical associations, meeting together for a week,

unanimously decided that a world-wide organization of national medical associations should be established so that medicine might speak with a united voice.

The aims and objectives of the Association may be summarized as follows:

To raise the standards of medical education and care throughout the world.

To raise the level of public health throughout the world.

To improve the standards of industrial and occupational health programmes in all countries.

To co-operate with the World Health Organization, the International Labour Organization, and similar bodies on matters of mutual interest.

To assist all mankind to attain to the highest possible level of health and in the pursuit of its objectives to promote world peace.

To-day, fifty-one national medical associations are members of the World Medical Association, and the number is growing yearly. As one of our outstanding members put it, "If there weren't a World Medical Association, one would have to be invented, because there is necessity for the medical profession to be heard at the international level."

The Association has no selfish motives, covets no preferment, and is not interested in a *quid pro quo*. Opportunities to protect and to improve health and to save lives is all that it seeks, fully believing that a healthier and happier world population is more likely to live at peace with its neighbours.

"Does the World Medical Association overlap the World Health Organization?" is a question one not infrequently hears. The answer is, decidedly not at all. On the contrary, W.M.A. is just as essential to W.H.O. as electric power is to a transmission line. Together they can accomplish much. And W.M.A. is committed in its constitution to co-operate fully with W.H.O. in those areas of mutual interest which require the services of the medical profession.

Among the accomplishments of the Association in its relatively short existence may be listed the following:

Establishment of a head office in New York City with a well-organized secretariat under the capable direction of Dr. Louis H. Bauer, a Past President of the American Medical Association.

Formulation and adoption of an International Code of Medical Ethics.

Adoption of a modified Hippocratic Oath, known as the Declaration of Geneva, which has found ready acceptance in most of the free world.

Publication of a bi-monthly journal in the three official languages of the Association—English, French, and Spanish.

Publication of reports of studies on medical education, medical man-power, medical advertising, social security, and others.

Aid in the establishment of new national medical associations in countries where hitherto none had existed.

Establishment of liaison with the World Health Organization, the International Labour Organization, the International Red Cross, and other international bodies who require the sympathetic co-operation of the medical profession to accomplish their purposes.

Supply of badly needed equipment to hospitals and medical schools in war-ravaged countries.

The holding of an Annual Assembly in a different part of the world each year, thus facilitating the discussion of medical problems on a global scale.

World Conference on Medical Education

To this list must be added one other accomplishment thought by many to be the most important activity yet undertaken by the W.M.A. I refer to the First World Conference on Medical Education, which was held in London

in August, 1953, devoted to undergraduate medical education. More than 600 delegates registered, representing 127 universities and medical schools from 62 different countries. Approximately 200 participated in the discussions, which, by simultaneous translation, were heard in English, French, and Spanish. The proceedings, now available in book form, provide for the first time not only an assessment of medical education on a global scale but also a stimulus and a guide to all medical educators who may be concerned about the quality and quantity of undergraduate medical education in their various countries.

The theme for the Conference was to be found in the admirable addresses of the President, Sir Lionel Whitby, and one of the honoured guests, Sir Richard Livingstone.

Sir Lionel said, "It is not difficult to draw a brief picture of the ideal medical student; cultured, broadly educated in the humanities, intelligent and intellectual, of transparent integrity, humane and sympathetic, and, above all, one who will love his profession as well as his fellow men and all their weaknesses, their joys, and their sorrows."

Speaking of the timber from which doctors are made, especially of what he happily chose to call the first-rate, Sir Richard Livingstone said, "The human being is a work of art, capable of a quality and beauty of its own, quite apart from any practical purposes to which its powers are put."

In the foregoing two quotations we find surely a superb definition of the ideal doctor. Is it too much to hope that in the days that lie ahead the glory and tradition of our noble profession will be enriched and elevated by generation upon generation of ideal doctors, who will be content with nothing less than the first-rate from themselves and their colleagues? One feels certain that the British Medical Association wholeheartedly and unreservedly stands committed to the support of such a laudable ambition.

Conclusion

And now, one more Presidential Address is ready for the archives. To those who have listened to it, and to any who may read it, let me say once again that while it may contain nothing new it will have served its purpose if it has portrayed, even in a sketchy way, some of the remarkable changes and advances which have been made in the science and the art of medicine since your first meeting in Canada, and also if it conveys to you the deep sense of pride and satisfaction of your Canadian colleagues that the British Medical Association has for the fourth time honoured us by meeting on our soil. Again let me say, "To our open hearts and wigwams you are welcome," now and always.

The Portsmouth Group Hospital Management Committee—one of the largest non-teaching groups in the country—has just issued for the first time a clinical report. This deals with the work of the hospital during the year 1953, and contains much of interest to clinicians and hospital administrators. For instance, the details given about infectious diseases illustrate the changes in the incidence and severity of these infections. The beds available for the treatment of infectious diseases numbered 126. During 1953 76 patients were sent to hospital with a diagnosis of poliomyelitis; in 20 of these cases the diagnosis was confirmed. Six patients admitted because of suspected meningitis proved to be cases of poliomyelitis. There was no case of diphtheria admitted to hospital during the year. Seventy-seven children with pertussis were treated, and three of these died, two of the deaths being in patients under 6 months of age. There were also three deaths from measles, but the total number of patients with this disease amounted to 110. Two hundred and three patients were admitted for the treatment of intestinal infections: the most important clinical group was the so-called acute infectious gastro-enteritis of infancy. Of 61 infants in this group under 3 months of age, four died.

CORTICOTROPHIN INTRAVENOUS INFUSION THERAPY IN RHEUMATIC CONDITIONS

BY

J. W. BEATTIE, M.D., M.R.C.P.

AND

S. J. HARTFALL, M.D., B.Sc., F.R.C.P.

(From the Department of Clinical Medicine, University of Leeds; the General Infirmary at Leeds; Meanwood Park Hospital, Leeds; and the Royal Bath Hospital, Harrogate)

It has long been known that temporary improvement may be observed in rheumatoid arthritis during pregnancy and jaundice due either to obstruction or to hepatitis. Less effective remissions have sometimes been associated with febrile reactions induced by the administration of foreign proteins. Comparable alleviation has also occasionally been observed following surgical procedures. Finally it must be recognized that from the very nature of the disease spontaneous remissions unrelated to any specific therapy may occur. This potential reversibility was discussed by Hench (1949), who indicated retrospectively the reasoning which led to the experimental administration of certain adrenocortical and anterior pituitary hormonal compounds in rheumatoid arthritis. It was in September, 1948, that the now classical experiment of the administration of the adrenal cortical hormone (17-hydroxy-11-dehydrocorticosterone) compound E, or cortisone, to a patient with severe rheumatoid arthritis was undertaken. In 1949 Hench *et al.* reported the rapid and striking improvement in the clinical and other features of the disease from both cortisone and corticotrophin (A.C.T.H.). Later, confirmation of these results followed with the experience of other groups—Thorn *et al.* (1949), Markson (1949), Elkinton *et al.* (1949), Ragan *et al.* (1949), Spies and Stone (1949), and Spies *et al.* (1949) with corticotrophin; Boland and Headley (1949) with cortisone; and Freyberg (1950), Hench *et al.* (1950), Rosenberg (1950), and the speakers at the Seventh International Congress on Rheumatic Diseases at New York, 1949 (1952) (Freyberg, Boland, Rosenberg, Holbrook, and Bauer), with corticotrophin and cortisone.

In all these original reports the corticotrophin was administered by intermittent intramuscular injections. However, a new therapeutic technique of prolonged administration by slow intravenous infusions was later described by Gordon *et al.* (1950), Renold *et al.* (1951), Mandel *et al.* (1951), and Jelliffe *et al.* (1951). The results obtained by these authors in rheumatoid arthritis and other conditions were so rapid and impressive as to suggest a superiority over the usual method of administration. This new method then seemed to be promising as a means of utilizing small amounts of corticotrophin and achieving maximum results. In this respect, 10–25-mg. doses of the ordinary soluble preparations available, administered slowly by the intravenous route, were reported as more effective than 100 mg. daily in divided doses by intramuscular injections. Moreover, it might be argued that this procedure seemed to imitate more closely the natural method of secretion as compared with intermittent (six-hourly) injections.

This paper records our experience with corticotrophin administered by slow intravenous infusion in the treatment of rheumatic conditions, as employed by us since August, 1951, at a time when both this hormone and cortisone were scarce.

The investigation was carried out amidst the ordinary day-to-day working of a busy rheumatic centre. For ethical reasons all the usually accepted methods of treatment have had to be employed—rest, correction of anaemia and other general measures, application of physiotherapeutic procedures, including manipulation, plaster corrective and occupational therapy, and general rehabilitation regimes. The corticotrophin infusions have thus been only a part of the general therapeutic scheme. However, the type of improvement is characteristic enough to present no great difficulty in differentiation and assessment. Our prime endeavour, therefore, was to ascertain how far the employment of the technique in conjunction with other routine methods would augment the total rehabilitation of the patient. A stage has now been reached where sufficient experience has been obtained to enable us to form some conclusions on the place and value of this method of treatment in the general problem of the therapy and rehabilitation of rheumatic patients. We have had to concern ourselves not only with the immediate response of the patients to the course of treatment as recounted here, but, in addition, with methods of maintaining the initial effects where favourable, their duration, and the incidence of relapse. These features will be the subject of further observations and later report.

Material Investigated

Our observations have extended from August, 1951, until October, 1953. All patients admitted to the rheumatic unit were considered for treatment; after diagnosis no selection was made either for the administration of the hormone or in the analysis of results. Although we were mainly concerned with the effects in rheumatoid arthritis, a few other rheumatic conditions were treated—psoriatic arthritis, ankylosing spondylitis, osteoarthritis, "frozen-shoulder" syndrome, and a miscellaneous group consisting of "fibrositis," Paget's disease, rheumatic fever, palindromic rheumatism, psychogenic rheumatism, and Raynaud's syndrome.

Altogether 425 patients (involving 516 separate periods of admission) were treated; their allocation to the various diseases according to sex and age groups is indicated in Table I.

TABLE I.—Different Diseases Treated

Disease	No. of Patients	Age Groups (Years)							
		20–29		30–39		40–49		50–59	
		M	F	M	F	M	F	M	F
Rheumatoid arthritis	90 239	5	19	15	43	26	56	33	77
Psoriatic rheumatism	7 4	—	—	—	—	2	1	—	—
Spondylitis	4 44	1	1	4	2	1	1	—	—
Osteoarthritis	4 44	—	—	—	—	2	12	2	19
Frozen shoulder	5 8	—	—	—	—	1	2	2	5
Miscellaneous*	3 15	—	—	1	3	—	—	1	5
Total	109 316	6	25	20	48	28	63	39	101
	425	31	68	91	140	78	17		

* Fibrositis, psychogenic rheumatism, Raynaud's syndrome, Paget's disease, rheumatic fever, palindromic rheumatism.

The rheumatoid arthritis group was the largest, comprising 90 males and 239 females—329 in all. A detailed description of these patients is presented in Tables II and III. The age groups most affected were 40–49 years (82 patients—26 males and 56 females) and 50–59 years (110 patients—33 males and 77 females). The duration of the disease was two to five years for 79 patients (23 males and 56 females), five to ten years for 88 patients (23 males and 65 females), and ten to twenty years for 76 patients (19 males and 57 females). Only 30 patients (10 males and 20 females) had the disease for less than one year.

In the rheumatoid arthritis group the duration of inpatient treatment varied from one to sixteen weeks. The usual periods were two to four weeks for 122 patients (22 males and 100 females) and five to eight weeks for 115 patients (22 males and 93 females). Only 25 patients (7 males and 18 females) were admitted for longer than twelve weeks. In the above group of 122 patients gold had previously been administered to 60 (9 men and 51 women), and in the group of 115 patients to 56 (8 men and 48 women). In the whole rheumatoid arthritis group of 329 patients, 165 (44 males and 121 females) had received previous gold therapy. Readmission for further infusion therapy on account of relapse was considered necessary on one or more occasions for 59 patients. This must not be regarded, of course, as the full relapse proportion.

Treatment

The great majority of our patients received the Armour Laboratory preparation "acthar," others the Organon, Wilson, or Crookes Laboratory material; some patients received preparations from two different laboratories according to the availability of supplies. With the usual precautions the ordinary (intramuscular) powdered hormone was dissolved in sterile normal saline (about 2 ml.), which was injected into the manufacturer's rubber-capped phial (for the Organon hormone sterile water had to be employed, as this particular material was supplied diluted with sodium chloride). The corticotrophin solution was then transferred to the infusion flask containing the vehicle. Nearly two-thirds of the patients received a total quantity of one litre of fluid in each infusion, the remainder one pint (568 ml.). After preliminary trials with various vehicles, the final choice was normal saline. More than one-half of the patients received infusions with normal saline as the vehicle.

In the beginning blank infusions were administered for control and comparison in some cases. No benefit was obtained by the patients from such administrations. In fact, the difference was apparent to them as well as to us through the absence of certain trivial but well-recognized accompaniments of the corticotrophin infusions.

Variations were made in the amount of corticotrophin in the infusions ranging from 25 mg. down to 5 mg. in an attempt to find the optimum dose for maximal clinical effect. We observed clinical responses with low dosages, such as 5 mg. Eventually, in view of variations in individuals, as well as possibly in material, 20 or 25 mg. was regarded as the standard dose, administered in one litre of normal saline. The entire 425 patients treated received a total of 1,490 infusions, and the total amount of corticotrophin used was no more than 28.12 g. Of the 1,231 infusions administered to the rheumatoid arthritis group of 329 patients, 738 infusions each contained a 20-mg. dose of corticotrophin and 229 a 25-mg. dose.

During any one admission the number of infusions administered to a single patient varied from 1 to 11; the total dosage of corticotrophin ranged from 10 to 227.5 mg. The most usual practice was to administer three infusions; actually this was the procedure in nearly one-third of the admissions.

As there was some experimental evidence that infusions prolonged beyond eight hours were more effective in terms of adrenocortical stimulation, variations were also made in the duration of administration. In a few instances the administration was prolonged even up to 72 hours. On the whole, the patients tolerated this well. A few permitted themselves little sleep or movement in their desire not to disturb the needle and connexions; some became apprehensive about the successful delivery of the drip during such lengthy periods. Further, these prolonged drips often resulted in local venous thrombosis. When all these factors were taken into account the optimum period was considered to be 18 to 24 hours. Thus, in actual practice, of the 1,231 infusions administered to the rheumatoid arthritis group, 507 were of this duration; 484 were of shorter and 240 of longer duration.

Second and subsequent infusions were given according to the individual response and the possible tendency to early relapse. The usual number of clear days intervening between the cessation of one infusion and the beginning of the next was six (four to seven). The duration, frequency, and number of infusions given were individualized according to the aims of treatment in relation to the particular problem presented by each patient. The necessity for administration of another infusion was thus indicated by (1) an obvious decrease in the beneficial effect obtained by the previous infusion, or (2) the desire to continue therapy until no further real benefit was obtained, or (3) in some cases an attempt to obtain amelioration, if possible, in a residual refractory joint. It will be appreciated that, no matter how much relief of pain and freedom of movement is obtained from an infusion, repair and re-education of atrophied muscles necessarily require some considerable time. Thus this therapy must be complemented by physiotherapeutic and rehabilitation procedures, which in turn are facilitated by reinduction of a waning remission.

In the early stages efforts were made to minimize the most frequent complication—local venous thrombosis—first by the change of glucose-saline to saline as the vehicle, and secondly by the addition of heparin to the infusion solution. This latter procedure resulted in flocculation; as heparin readily unites with protein compounds, it was then felt that an undesirable chemical interaction might have occurred, and the method was abandoned. Later, however, Linquette *et al.* (1952) apparently successfully added heparin, 200–400 mg., to each infusion. Recently heparin has been added to the infusion material without any apparent *in vitro* reactions. As indicated above, we now routinely use normal saline as the vehicle. Local thrombotic complications are now much less frequent.

In the beginning, because of the fear of sodium retention and oedema, restriction of salt in the diet was enforced, but later, when this procedure was relaxed, no untoward effects were observed. A full generous diet was allowed to all patients, unless suffering from obesity.

Attempts have been made to maintain improvement achieved by the corticotrophin drip method by the subsequent employment of certain other measures—for example, intermittent injections of adrenaline in oil or hyperduric adrenaline, gold compounds, or long-acting corticotrophin compounds, oral administration of para-aminosalicylic acid, sodium salicylate, or phenylbutazone, and in some instances frequently repeated corticotrophin infusions or cortisone. These procedures are still being studied and modified, and it is hoped that the results will be reported later.

Accompaniments, Side-Reactions, and Complications of Therapy

In a total of 1,490 separate infusions no serious complications have arisen. On three occasions a moderately severe reaction took place, consisting of feelings of malaise and coldness, shivering, and pyrexia. This may have been due to impurity of the particular preparation in its protein content. Subsequently infusions were successfully given to these patients. More recently, a patient experienced a similar but very mild reaction with one particular preparation, but an alternative preparation of different manufacture was satisfactory.

The most annoying complication of the technique was the development of local venous thrombosis. Following multiple infusions this resulted in increasing difficulty. In advanced deformed and difficult cases, where repeated courses of treatment might be desired, it could be the limiting factor so far as the intravenous route was concerned. Full use therefore had to be made of the small veins on the dorsum of the hand in some cases. On one or two occasions it was necessary to resort to the venesection technique or to a subcutaneous infusion with the aid of hyaluronidase. The possibility that both corticotrophin and cortisone may alter the coagulability of the blood has received consideration by others. Rawls (1951), in a large series of patients treated with ordinary corticotrophin or cortisone, found the incidence to be 3%. Ragan (1952) and Chatterjea and Salomon (1954) also have drawn attention to the development of thrombo-embolic phenomena. During corticotrophin or cortisone therapy, Cosgriff *et al.* (1950) and Cosgriff (1951) observed an increased coagulability of the blood, which persisted for several weeks after withdrawal. However, the work of Smith *et al.* (1950) and McGraw *et al.* (1952) suggested two opposing coagulation effects; while Fahey (1951), and more recently Sussman *et al.* (1954), found no alteration in blood coagulability.

Oedema, production of hypertension, aggravation of existing hypertension, alteration in facial contour, and changes in mineral metabolism were not encountered. Abdominal cramps occurred in one patient during two successive infusions, but not in other patients receiving material from the same batch. At least three patients with a definite dyspeptic history were treated without ill-effect; one had had a partial gastrectomy, and one suffered from cardiospasm.

Mild glycosuria during the day of the infusion and sometimes part of the following day was often noted. No permanent disturbance of sugar tolerance was observed; indeed, we have applied the method to known diabetic arthritides without any particular troubles other than some slight modification of insulin dosage for a day or two.

Certain other accompaniments were often reported—a temporary feeling of fullness or tightness in the frontal and temporal regions of the head, a "salty" parched taste in the mouth, and feelings of heat and flushing, especially of the face and extremities, often with sweating, and lasting several hours during the infusions. A feeling of hunger some hours after the start of the administration was frequently mentioned. All the patients took their meals well,

and all but the very apprehensive generally slept well while the infusions were running.

We have had no experience of the development of potassium deficiency. Muscle weakness, fatigue, or paraesthesiae which would indicate such a complication were not complained of by the patients. Blood potassium serial estimations and electrocardiograms would be helpful if a particularly long course of frequent high-dosage infusions was contemplated.

In summary it may be said that the method has been found safe. There has been no hesitation in its use when this was justified by the rheumatic condition. It has been withheld only in extreme cases of congestive cardiac failure. Hypertension, diabetes mellitus, and impaired renal function have not been regarded as contraindications. Signs of hypercorticism were never induced. In this respect it may be noted that only after daily infusions in doses of 5 to 20 mg. for periods of 6 to 25 days, yielding total dosages of 68 to 500 mg. of corticotrophin, did Cohen and Sulman (1954) find mooning of the face in five out of eight patients. Early signs of hypercorticism were observed by Mandel *et al.* (1951), who also employed daily drips in a similar dose range and total corticotrophin amount. It will be observed that our total dosage range was much smaller than that employed by either of the above groups, and, moreover, was administered intermittently in fewer infusions spread over a longer period of hospital admission.

Scheme of Analysis of Results

In our recognition of the importance of using some generally appreciated standards by which judgment could be passed on the therapeutic efficiency of the technique, we decided to employ, with a slight modification, the scheme recommended by the American Rheumatism Association (Steinbrocker *et al.*, 1949) so far as the cases of rheumatoid arthritis were concerned. Thus, according to this scheme there has been recorded the anatomical stage (which rarely was altered), the activity, and the assessment of the functional capacity before and after treatment. It is, of course, well recognized that a considerable degree of functional improvement may occur and yet the anatomical stage of the disease remain unaltered. It is therefore the induced remissions and the improvement in pain, stiffness, mobility, and hence the functional capacity, which have been of most interest to us.

Briefly, the anatomical stages were delineated by the following criteria: in Stage I (early), no destructive changes, radiologically; in Stage II (moderate), radiological evidence of osteoporosis with or without slight subchondral bone destruction, slight cartilage destruction, and limitation of joint mobility without deformities; in Stage III (severe), radiological evidence of cartilage and bone destruction and osteoporosis and joint deformity; and in Stage IV (terminal), fibrous or bony ankylosis. While the rheumatoid process usually advances to an approximately similar degree in multiple joints, sometimes two or more stages may exist in different joints in the same patient. It has been recommended that the stage should be determined by the state of the worst joint. We have modified this in so far as one advanced single joint—for example, an ankylosed interphalangeal joint—or a terminal condition of certain joints in a patient requiring treatment because of active, less advanced, but progressive arthritis in other joints has not determined the anatomical stage for the patient as a whole.

For the classification of functional impairment, the American scheme has been modified by the division into three subgroups (II, II+, and III-) of Class 2 (functional capacity adequate to conduct normal activities despite the handicap of discomfort or limited mobility of one or more joints). The classification utilized in this investigation was therefore as follows:

Class I.—Complete functional capacity, with ability to carry on all usual duties without handicaps.

Class II.—Functional capacity adequate to conduct normal activities despite handicap of discomfort or limited mobility of one or two joints.

Class II+.—Functional capacity adequate to conduct most or all of the usual duties and activities with considerable discomfort or limited locomotor ability of joints.

Class III-.—Functional capacity adequate to conduct some of the normal duties with considerable discomfort or limited locomotor activity of joints or ability to carry out some handwork with little or no locomotor ability (for example, kneeling, climbing) or fair locomotor activity with little or no handwork.

Class III.—Functional capacity adequate to perform only little or none of the duties of usual occupation or self-care.

Class IV.—Largely or wholly incapacitated, with patient bedridden or confined to wheel-chair, permitting little or no self-care.

Some of the basic features, of which full details are given in Tables II and III, may now be summarized. Of the total 329 rheumatoid arthritis patients, 120 (32 males and 88 females) were graded as Class III- and 99 (28 males and 71 females) as Class III. In the age groups 40 to 49 years 26 patients (7 males and 19 females) were in Class III-, and 25 (7 males and 18 females) in Class III; and in the age group 50 to 59 years, 45 patients (14 males and 31 females) were in Class III-, and 32 (13 males and 19 females) in Class III.

In the 2 to 5 years' duration group, 23 patients (8 males and 15 females) were in Class III-, and 23 (7 males and 16 females) in Class III; and in the 5 to 10 years' duration group, 30 (8 males and 22 females) and 27 (6 males and 21 females) were in Class III- and Class III respectively.

Results

Where benefit accrued from the treatment, the majority of the patients experienced a striking improvement after the first infusion, which subsequent infusions maintained with little or no increase; however, as indicated above, recovery and repair of atrophied muscles show a relatively slow progress, and the maintenance of the improved status is necessary for rehabilitation. Some few others showed gradually increasing benefit from a succession of infusions. A few patients who had shown no improvement with intramuscular administration of the hormone derived benefit following infusions.

Euphoria was a feature induced in most patients. We regarded this as a valuable contribution in the rehabilitation of a patient previously depressed and apathetic. Relief of joint pain and tenderness were obtained with resulting ease of movement. In some cases the actual increase in the range of movement was not great, but the ease of movement, the resulting feeling of satisfaction, and the recognition of what was still functionally possible in the diseased joints were of extreme importance in the encouragement of the patients, the improvement of their outlook, and the simultaneous development of a physiotherapy regime. Other important features were the sense of increased physical well-being, improvement in appetite, and the dissipation of malaise.

Experimental confirmation of the effect on the peripheral circulation was obtained. The resting digital circulation, as indicated by serial skin temperatures, was increased, and the previously sluggish induction of peripheral vasodilatation in the thermal response test of indirect heating was improved following a corticotrophin infusion (Beattie and Woodmansey, 1953).

As might be expected in rheumatoid arthritis, in general the anatomical status of the patient was not notably altered. At most an occasional patient might be assessed as passing from one stage only to the one above. An alteration in the anatomical stages occurred 25 times among females and 11 times among males—a total of only 36.

In rheumatoid arthritis the greatest alteration occurred in the functional capacity. The detailed assessments before and after treatment are presented in Tables II and III with reference to age groups and duration of disease respectively. The overall improvement in the functional assessments can be appreciated from Fig. 1 and Table IV. No patient was designated as of Class I status functionally before treatment, but attainment of this class occurred in 15% of the whole group. An elevation after treatment up to Class II or I was

obtained in 57% of the whole group. Improvement of some degree was obtained in 89% of cases. Both males and females showed a similar response. Patients previously treated with gold reacted in a similar manner to those who had not had this therapy (Fig. 1).

Owing to the absence of selection of patients it was not possible for the results to be assessed in sufficient detail

FIG. 1.—Change in functional capacity after treatment. The number of cases in the various classes previously treated with gold is indicated by the broken line, both in the shaded portion (before treatment) and the unshaded portion (after treatment) of the histogram.

in the ordinary way, so that the attempt was undertaken by means of simple scoring, before and after treatment of each particular group as a whole. For this purpose tables of assessment and treatment data already compiled were utilized. The six functional classes—I, II, II+, III-, III, and IV—were allocated the arbitrary values of 6 to 1 respectively; the scores of each group before and after treatment were obtained from the product of the class values and the numbers in the classes; an improvement factor was represented by the difference in the scores before and after treatment, and this could be expressed as a percentage improvement factor. The fact that a group showed improvement does not, of course, imply that every member of the group improved by the same amount, but it does allow some comparison to be made between unselected groups.

Analysis along these lines showed the greatest improvement where the disease had been present for less than one year, with a gradual decline as the duration increased, but a further marked rise in improvement in cases of over 15 years' duration (Fig. 2). This latter effect may be related to the possibility that the disease at this time tends to be burnt out and that pain, soft-tissue stiffness, and apathy may be the cause of poor functional capacity. On the other hand, all age groups showed fairly comparable improvement (Fig. 3). For the functional classes as a whole, previous gold therapy did not affect the responses.

Again, using the simple scoring method, we investigated certain features regarding the infusions. Where the average duration of the infusions was about 18 to 24 hours the

response appeared to be maximal, and there was not much evidence of further improvement when the time was increased. There did not seem to be any clear evidence of greater improvement the larger the total amounts of corticotrophin administered. Increasing the overall average concentration above 0.9 mg. per hour did not result in increased efficacy. Further, there was no real evidence that increasing the number of infusions beyond three produced any better results. So far as the scoring figures go, they tend to support our clinical impression that the maximum effect was

FIG. 2.—Improvement in functional capacity in relation to duration of disease.

FIG. 3.—Improvement in functional capacity in relation to age groups.

practically obtained by one infusion of 18 to 24 hours' duration (containing 20 to 25 mg.). However, other factors, such as the poor condition of the muscles and pain, necessitated continuance of the infusion therapy while the appropriate remedial treatment proceeded. There was also some indication that the best interval between infusions was three to six days.

With regard to the other conditions treated, certain features are of interest. In two of the four cases of psoriatic arthropathy a dual remission was obtained, although the skin condition responded more slowly than the arthritic. In the other two cases the skin condition was resistant and the improvement in the arthritis was much less marked. Ankylosing spondylitis also showed some response. A remission occurred in two cases and considerable alleviation in seven others. An attempt was also made in osteoarthritis to apply the functional classification; considerable improvement was obtained in 25 patients, and 9 more were rendered symptom-free. Thus, in all, 34 out of 48 patients showed a favourable response to therapy. Of the 13 cases of the frozen-shoulder syndrome, six, all of whom were of the early acute type, showed complete or nearly complete relief. The response in the more chronic type was much less satisfactory.

Discussion

Apart from the initial classification of our material as shown in Table I, no further subdivisions of the rheumatoid arthritis group were attempted. As Sclater (1942-3) pointed

out, rheumatoid arthritis can no longer be described as predominantly a disease of young females, and the condition in about half the cases may start in joints other than the fingers and wrists. Further, Cecil and Kammerer (1951) found that in the aged (over 60) the condition does not essentially differ from that in the younger age groups. Our experience is in agreement with these views.

In all age groups and in both sexes satisfactory improvement was often obtained. The response in the older age group was especially gratifying. In fact, there was not much alteration in response in relation to the different age groups. However, at this stage we have not been able to say why some patients failed to respond. This lack of response did not appear to be related to any obvious clinical feature such as age, onset, acuteness, rapidity of development, or any other easily recognizable clinical feature.

Our clinical observations in this series, when compared with our previous experience of intermittent intramuscular injection therapy for these conditions, have confirmed the initial reports of Mandel *et al.* (1951) and Renold *et al.* (1951) regarding the superiority of the infusion technique in respect of the rapid and often striking symptomatic relief produced. The later reports of Linquette *et al.* (1952) and Prosiegel *et al.* (1953) have also produced similar evidence.

The duration of the disease in the past has been regarded as of importance in the determination of response to the usual lines of treatment. Sclater (1942-3) noted the steady anatomical deterioration with increasing duration, while the reports of others—for example, Cecil and Archer (1926), Steinbrocker (1946), and Short and Bauer (1948)—have indicated the more easily obtained and more satisfactory response of early cases. On the contrary, we have found that while there is a gradual decline in improvement with increasing duration, yet in cases where the disease has existed for a long time—over fifteen years—considerable functional improvement has been obtained. As indicated above, this latter effect may be associated with a burnt-out state of the disease at this duration and major disability resulting from pain, soft-tissue stiffness, and apathy.

It has not been possible to make a comparison between our present results in this short-term in-patient study of rheumatoid arthritis and those presented in our previous long-term out-patient survey with gold salts (Hartfall and Garland, 1935, 1936; Hartfall *et al.*, 1937). In the latter investigation the present newly adopted mode of classification was not used, and since then there have been changes in the social status of hospital patients as well as a greater realization of the importance of intensive rehabilitation.

It seems that corticotrophin does little or nothing to alter the established anatomical status of rheumatoid arthritis, except perhaps in the earliest stages. Applied to early cases, it may in some circumstances arrest and apparently induce suppression of the disease, at any rate temporarily. In most cases it appears to be a valuable method of producing alleviation of the symptomatic disabilities, of procuring maximum co-operation from the patient by indicating potentialities for improvement still resident in the body, and of promoting the early and intensive initiation of a rehabilitation regime. Quite apart from its use in the early, moderate, and severe cases in good anatomical and physical condition, there is a place for it in the more advanced and even crippled cases. In the latter, the main purposes are to reduce pain and induce euphoria. It is thus a valuable means of obtaining in some cases a quick and sometimes a striking temporary suppression of symptoms which may allow increased mobility and other forms of maintenance treatment, including a more rapid and more thorough development of a physiotherapeutic regime.

As a means of initiating a rapid response in any acute or subacute exacerbation the method has been very useful. We have employed it as a preliminary to some other form of maintenance therapy such as a phenylbutazone or chrysotherapy regime.

A useful field of employment has been to cover orthopaedic procedures, including manipulation for the breaking down of adhesions and for the correction of deformity.

In conjunction with cortisone therapy its use has been threefold: as a preliminary to routine cortisone maintenance to bring the patient under control quickly, from time to time to gain additional symptomatic improvement during the cortisone therapy, and to re-stimulate the pituitary-adrenocortical mechanism in those who seem to be losing ground on a dose hitherto nearly adequate to control symptoms.

With regard to the other conditions treated, it may be mentioned that in the few cases of psoriatic arthropathy the uncertain skin and joint responses observed were similar to those reported by Boland (1950a) and Hench *et al.* (1950) with ordinary corticotrophin therapy.

In osteoarthritis there may be theoretical arguments against the successful employment of corticotrophin (usually lack of inflammatory changes). We have treated 48 cases of osteoarthritis, and it seems clear that improvement has resulted. It may be, of course, that this has occurred in cases in which there has been some local superadded severe painful (inflammatory) condition, perhaps with accompanying effusion. We have no doubt that in painful osteoarthritis consideration should be given to the use of corticotrophin even if only as a temporary symptomatic therapeutic expedient. Dale (1950), Bauer (1950), and Dale and Amil (1953) have all noted a definite improvement following ordinary corticotrophin therapy in this condition.

In ankylosing spondylitis the method may be extremely valuable, the drips being interspersed in the course of a more prolonged therapeutic and rehabilitation plan. Infusion therapy has also been used by us in conjunction with deep x-ray therapy. Boland (1950b), McEwen and Bunim (1950), and Hart (1952) have found ordinary corticotrophin to be a potent weapon for short-term treatment of acute painful episodes in spondylitis. West and News (1954), however, thought that prolonged adrenal stimulation was justified only in the most severe cases.

In the acute cases of the frozen-shoulder syndrome with severe pain, occasionally a striking and rapid improvement is achieved, permitting the earlier initiation of a physiotherapeutic regime and sometimes producing an early termination of what is often a lengthy rehabilitation. In the more chronic cases with severe fixation or tissue calcification the results are usually poor and disappointing, and even when used before and after manipulation the results have not been impressive. Stein *et al.* (1953) were impressed with the acceleration of recovery when intravenous corticotrophin or an intramuscular long-acting preparation was used after manipulation.

About the small group of miscellaneous conditions we do not propose to make any definite comments except to say that we have not been successful in the relief of pain and stiffness in Paget's disease, but have had beneficial results in fibrositis and psychogenic rheumatism. From our general experience in cases with poor peripheral circulation we feel this technique might be useful in cases of Raynaud's syndrome.

In conclusion, it may be emphasized that there can be no doubt regarding the enhancement of the therapeutic effect when corticotrophin is administered by intravenous infusion. Moreover, a response can apparently be obtained upon occasions when no benefit has previously resulted from ordinary intramuscular administration. Further, there is a great economy in the material used and the labour involved when the regular intramuscular injections are superseded by the spaced intravenous infusions. There has also, upon analysis of our results, been confirmation of our clinical impressions that the more prolonged effusions of 18 to 24 hours were of greater efficacy; that there was no indication for dosages per infusion greater than 20 to 25 mg. or concentrations greater than 1 mg. per hour; that in general there was nothing to be gained by many frequently repeated infusions, the maximal effect being gained by the first few infusions; and that three to six days was a satisfactory interval period between infusions.

Summary

The application of a technique for corticotrophin therapy in rheumatic conditions by spaced intravenous infusions has been described.

The procedure has been found safe, economical, and free from side-effects such as hypercorticism, sodium retention, or permanent disturbance of carbohydrate metabolism.

Observations are recorded on the effects of this therapy, in conjunction with routine general supportive, physical, and rehabilitation regimes, on 425 patients.

The results obtained in the different conditions treated are presented: rheumatoid arthritis, 329 patients (90 males and 239 females); psoriatic arthropathy, 4 females; ankylosing spondylitis, 13 patients (7 males and 6 females); osteoarthritis, 48 patients (4 males and 44 females).

In the rheumatoid arthritis group, improvement of some degree was obtained in 89% of cases, and maximum improvement to complete functional capacity in 15% of cases.

The indications for the employment of this therapy and its value as part of the programme for rehabilitation in rheumatic conditions have been briefly considered.

For the supplies of corticotrophin made available in this investigation we are indebted to the Joint Committee of the Medical Research Council and Nuffield Foundation on clinical trials of cortisone, A.C.T.H., and other therapeutic measures in chronic rheumatic diseases. We wish to thank Dr. C. W. Dixon for statistical advice and Mr. H. G. Lumby for preparing the figures.

TREATMENT OF PERIARTHRITIS OF THE SHOULDER WITH HYDROCORTISONE

BY

E. J. CRISP, M.D., D.Phys.Med.
Physician

AND

P. HUME KENDALL, M.B., D.Phys.Med.
Registrar

(From the Physical Medicine Department, Guy's Hospital)

Periarthritis of the shoulder, first described by Duplay (1872), of Paris, is a chronic inflammation of the various soft tissues that form the shoulder-joint. Codman (1909) described it as a process essentially involving the rotator-cuff system of the muscles and subacromial bursa that surround the shoulder-joint, but pointed out that it was an extremely difficult condition to treat. It was also a generally held view that the prognosis was excellent and that there was nearly always complete recovery within a year (Codman, 1934; Wilson, 1943); but Simmonds (1949) showed that, in a series of cases followed up for three years, only 30% had regained normal function, a further 30% had some weakness or loss of movement, and as many as 40% had both weakness of the joint and persistent pain.

Heat, mobilization exercises, the injection of local analgesics, manipulation, arthrotomy for section of the adhesions, and excision of the acromion or even arthrodesis have been recommended in the past, and practised, usually with relatively poor results (Steindler and Marxer, 1946).

Pathology

The condition begins as an acute non-specific inflammation following major or minor trauma, and, when untreated, progresses in severe cases to the condition of "frozen shoulder" (see Fig. 1).

The microscopical appearances have been well described by Neviaser (1945) and by Simmonds (1949), the latter showing that the earliest lesion is an area of abnormal focal necrosis in a degenerative tendon. This is typified by the picture of extreme vascularity and round-cell infiltration. If unchecked it progresses to a generalized chronic inflammatory reaction of the whole rotator-cuff mechanism and the capsule of the shoulder-joint. At this stage the shoulder is immobilized by painful protective spasm and shows every sign of an acute inflammation. With rest this will subside, and as fibrosis ensues the "frozen shoulder" results.

FIG. 1.—Diagram illustrating the pathology of periarthritis of the shoulder.

Theoretically such a pathological condition should respond to the effect of cortisone or hydrocortisone. The

actions of the hormone are twofold: anti-inflammatory and fibrinolytic; the former action might well be expected to take effect in the earlier stages of the cycle (A in Fig. 1) when the inflammation is acute, and the latter action in the late stages (B in Fig. 1), where fibrosis is already progressing as in the typical "frozen shoulder."

The first reports, however, of the treatment of such lesions with the hormone showed widely varied results. Cyriax and Troisier (1953) stated that hydrocortisone was of no value in the treatment of "freezing arthritis," whereas Robecchi and Capra (1953) considered that their results indicated that it had a place in the treatment of such lesions.

Early experience in this hospital showed mixed results (Crisp and Kendall, 1955), but with the evolution of a new technique greater success has been attained.

Technique

It is clear from the pathology that any local inflammatory lesion of the cuff rapidly becomes generalized; thus it has been our policy not only to inject the point of maximum tenderness or maximum pain on resisted movement, but to introduce the hydrocortisone into several points around the shoulder-joint to ensure the greatest possible contact with all

FIG. 2.—Showing injections of the shoulder-joint: (1) into the joint space, (2) into the subacromial bursa, and (3) into the region of the long head of the biceps.

layers of the rotator cuff and the capsule. The injections were therefore sited at three different points: anteriorly into the subacromial bursa; antero-laterally into the region of the long head of the biceps; and posteriorly into the joint capsule (see Fig. 2).

The injection itself comprised 50 mg. of hydrocortisone in a 2-ml. suspension, with the addition of 1,000 units of hyaluronidase to ensure maximum dispersion and contact. Also added to the injection was between 2 and 3 ml. of 2% procaine hydrochloride, which had the function of increasing the volume of the injection and which assisted the patient by temporarily relieving pain. Previous control experiments had already shown that procaine and hyaluronidase injected into the shoulder lesion gave little more than temporary relief; in fact, Simmonds (1949) attributes to it "all too frequently . . . a year or more of misery."

The acute cases received no other treatment except the advice to use the shoulder as normally as possible; the chronic "frozen shoulder" group were given vigorous actively assisted and manually resisted shoulder exercises regularly throughout the course of the injections, which were repeated at weekly intervals until recovery.

Results

For the purpose of analysing our results we have divided the cases treated into separate groups, the acute and the chronic. The former comprises all those in the earlier stages of activity, and includes such local conditions as supraspinatus and subscapularis tendinitis. The latter group refers to the long-standing cases in which fibrosis and

limitation of movements are the prime features and in which the symptoms of acute inflammation have subsided.

Of 50 acute cases treated (see Table), 36 obtained complete relief of symptoms from the injection of hydrocortisone alone within 7 to 14 days. Only three cases failed to improve at all.

Treatment of Periarthritis of the Shoulder with Hydrocortisone

	No. of Cases	Complete Recovery	Partial Improvement	No Change
Acute lesions	50	36	11	3
Chronic "	23	13	5	5

In the chronic group the results were not nearly so good, presumably as the inflammation had subsided and the fibrinolytic action was less powerful. Nevertheless 13 out of 23 cases progressed to a complete recovery with hydrocortisone injections and exercises over a period of four to six weeks.

Conclusions

In the treatment of the various acute and chronic soft-tissue lesions within and around the shoulder-joint hydrocortisone has led to a new method of approach to what was previously a most difficult therapeutic problem.

The majority of both local and generalized acute shoulder lesions showed a dramatic response to hydrocortisone injections into the various components of the rotator cuff.

Although we have had a lower percentage of cases with full relief of symptoms than Robecchi and Capra (1953), we nevertheless feel that the use of the hormone is indicated, at least for a trial period, in every acute case.

The results in the more chronic shoulder lesions, where fibrosis is a prominent feature, have not been so good. This would indeed be expected from consideration of the pathology. In association with routine physiotherapy, however, improvement of the condition has been obtained in a sufficiently high percentage of cases to warrant further trial of the method. Other forms of treatment, so notoriously unsuccessful in the experience of the majority of authors that we feel that hydrocortisone provides a marked advance in what Cyriax and Troisier call the "apparently endless search for effective treatment of 'freezing arthritis'."

Summary

The pathology of periarthritis of the shoulder-joint and the theoretical effects of hydrocortisone in its various stages are discussed.

The technique of treatment by the injection of hydrocortisone, hyaluronidase, and procaine hydrochloride is described.

Of the acute cases treated by this method 72% progressed to complete recovery in 7 to 14 days and a further 22% were improved.

Of the "frozen shoulder" type of case 56% regained full function in four to six weeks, following hydrocortisone injections and shoulder exercises; 22% were improved.

We consider that the use of hydrocortisone is a notable advance in the treatment of soft-tissue shoulder lesions.

Our thanks are due to Miss M. Waldron, of Guy's Hospital Department of Illustration, for Figs. 1 and 2.

LOCAL HYDROCORTISONE IN DE QUERVAIN'S DISEASE

BY

B. G. B. CHRISTIE, M.B., B.S.

Registrar, Department of Physical Medicine and Rheumatism, the Middlesex Hospital

In 1895 Fritz de Quervain, a Swiss surgeon, described five cases of stenosing tenosynovitis at the radial styloid, the prominent symptom of which was pain in the region of the wrist-joint. Subsequent writers have observed that the pain may be referred up the arm as high as the elbow, or downwards to the dorsum of the thumb. The pain appears to be due to movements within the thickened and stenosed synovial sheath, containing the tendons of abductor pollicis longus and extensor pollicis brevis, as it passes under the extensor retinaculum of the wrist in the first dorsal compartment. The thickening of the sheath in some cases is so marked as to be easily visible, and in the majority is palpable. The condition is common, and often the cause of considerable disability to the housewife and worker. Analogous stenosis has been described in all the remaining five tunnels beneath the extensor retinaculum, in most of the sheaths of the flexor tendons, and in the tibialis anterior and peroneal tendons.

Most authorities agree that stenosing tenosynovitis is often due to mechanical factors or trauma, and that histologically the signs of inflammation in the sheaths or tendons are rare.

Since the original description many methods of treatment have been suggested, operation holding pride of place and having been suggested by de Quervain himself. Surgical treatment entails incision of the tendon sheath, or, if this is greatly thickened, excision of a portion. Other more conservative methods of treatment still in use are the injection of various substances, immobilization of the wrist and thumb in a plaster or elastic splint (Thompson *et al.*, 1951), and the application of physiotherapeutic measures. Injection of sheath with fluids and local analgesics had also been tried. Although strongly advocated by Ellis (1951), injection rarely seems to give a lasting cure, and the same applies to physiotherapy. Immobilization often relieves the pain, only to be followed by a recurrence of the symptoms when activity is resumed. According to Wiles (1949) it is doubtful whether many cases recover without operation.

The recent reports of the value of local hydrocortisone in "tennis elbow" and soft-tissue lesions seemed to merit the controlled trial of its use in the present condition. Howard *et al.* (1953) describe its use in three cases of de Quervain's disease and 11 cases of tenosynovitis, and Cyriax and Troisier (1953) report a favourable result in one case of tenosynovitis of flexor carpi radialis following two injections of hydrocortisone. In view of these findings it was felt to be justifiable to treat a number of patients by this method and compare the results with cases treated by injection of local analgesic alone.

Material

The series consists of 20 consecutive cases of de Quervain's disease referred to the Department of Physical Medicine and Rheumatism of the Middlesex Hospital.

Three criteria were held as essential before such a diagnosis was made. These were: (1) Tenderness on palpating the tendons of abductor pollicis longus and extensor pollicis brevis as they lie along the lower outer border of the radial styloid. (2) Pain, radiating up the forearm and down the thumb, on active abduction and extension of the thumb and aggravated by the resisted movement. Passive movements were invariably painless. (3) Pain on flexing the thumb into the palm and closing the remaining fingers around it. This is further aggravated by forced ulnar deviation of the hand at the wrist (Finkelstein's (1930) test). All cases in the present series conformed to these criteria.

In none of the 20 cases reviewed was there any obvious predisposing factor, although in three the symptoms were aggravated by occupational factors (tailor's cutter, sempstress, and poster artist) involving frequent repetitive movements of the thumb. Sixteen of the cases (80%) occurred in females. The right and left hands were affected approximately equally, although all the patients were right-handed. The age incidence varied from 18 to 74 years, there being rather more patients in the younger than in the older age groups. The symptoms had been present for periods varying from four weeks to three years (average six months).

It is interesting to note that crepitus was not elicited in any of these cases in the region of the tendon sheath, either on palpation or on active or passive movements. The thickening of the tendon sheath was visible only as a tumour in one patient, in whom it was very marked. This completely disappeared over a period of five weeks following one hydrocortisone injection with complete return of function, the patient returning to her work as a sempstress entailing continuous use of the thumb.

The patients were divided into two groups: (1) Group A, receiving 1 ml. (25 mg.) of a suspension of hydrocortisone acetate into the tendon sheath following infiltration with 1 ml. of 2% procaine hydrochloride; and (2) Group B, injected with 1 ml. of 2% procaine hydrochloride alone and observed over the ensuing period—when relief was no longer experienced these patients were treated in the same manner as Group A. There are therefore 20 cases in Group A and 10 in Group B, the latter acting as the control series.

Method

The method adopted in all these injections, whether of procaine or hydrocortisone acetate, was standardized as follows. With the patient seated facing the operator, the point of the needle was introduced through the skin about 1 cm. distal to the tip of the radial styloid in the line of the tendon of abductor pollicis longus. An intradermal bleb of local analgesic was raised, and through this the needle was passed, it being directed upwards over the radial styloid so as to enter the common sheath of the tendons concerned. The contents of the syringe were then discharged, with the production of a longitudinal "sausage-shaped" tumour, which was clearly defined and taken as evidence that the injected fluid had actually entered the tendon sheath. In those cases that received both procaine and hydrocortisone injections at the same attendance the procaine was given first, being immediately followed by the hydrocortisone, a second needle and syringe being used.

It was found easier to insinuate the needle into the tendon sheath if the patient adopted a position of moderate ulnar deviation. In all cases the skin was first swabbed with surgical spirit and a small dressing applied after the injection. Patients were instructed to use their wrists normally and informed that no special precautions were necessary.

Results

The patients treated with procaine and hydrocortisone injections (Group A) can be further subdivided into those treated in this manner initially and those treated following procaine injections alone. In seven out of the first ten

patients there was complete relief of symptoms for one hundred days or more following the combined injection. For the purposes of the report this was regarded as a clinical cure. The three remaining patients relapsed at intervals after injection, but were relieved by a further injection. One of these, because of his regular relapses, has been referred for surgery, and it seems that the other two may have to be referred in a similar manner.

The patients in Group B showed relief of symptoms varying from one hour to one to two days, gradually waning, so that after five days there was a complete relapse to the original state in all cases. The average duration of the relief was about two days. Although the pain disappeared in all cases immediately after the injection it was often accompanied by a dead feeling of the wrist, which was not experienced when hydrocortisone was used. These patients were subsequently added to Group A.

Of these latter patients when treated with hydrocortisone and procaine injections, one relapsed during the eighth week and is now symptom-free following a second injection. The remaining nine patients have no pain at periods varying from five and a half to fifteen weeks after the injection.

During the treatment of these cases no serious complications were encountered. In two cases there was a complaint of dull aching pain in the wrist following hydrocortisone injection, but this subsided in a few days without treatment. One case developed a superficial thrombophlebitis, which responded to strapping for ten days.

Discussion

The recent use of hydrocortisone in other soft-tissue lesions prompted this survey of its use in de Quervain's disease. The results of this small series are encouraging and seem to merit further trial of the method. It appears that hydrocortisone has a place in the treatment of this troublesome condition and may be used as an alternative to surgery in many cases. With supplies of hydrocortisone becoming more plentiful this simple method of treatment may become more widespread, thereby making it unnecessary for most patients to undergo operation. In those cases in this series in which treatment has succeeded, full function has been restored and all pain relieved almost immediately after the injection, although in one or two there was a time interval of several days before full relief was experienced. It is difficult to retain patients for long periods of observation when complete relief of symptoms has ensued. Nevertheless, although relief for one hundred days has been regarded as a cure for the purpose of this series, it is known that several patients have had no relapse for periods approaching six months. It is suggested that cases of de Quervain's disease should first be treated by local hydrocortisone injection, and that those who relapse within a short period be referred for operation in the usual way. It will also prove valuable in patients not wishing to undergo surgery and has the great advantage of leaving no scar. If further experience substantiates these findings it would appear to be the treatment of choice in de Quervain's disease and in tenosynovitis occurring at other sites.

Summary

De Quervain's disease is described and various methods of treatment are reviewed. Attention is drawn to the fact that analogous stenosis occurs in many other sites.

Twenty cases have been treated with local injection of 1 ml. (25 mg.) of a suspension of hydrocortisone acetate and 1 ml. of 2% procaine hydrochloride solution. Ten controls were treated with an injection of 1 ml. of 2% procaine alone.

The figures show an advantage in favour of local injection of hydrocortisone, 70% of the patients having remained free of symptoms for periods exceeding three months following one injection.

The results of this small series are encouraging, and seem to merit the further trial of hydrocortisone in de Quervain's disease and in tenosynovitis occurring at other sites.

I wish to thank Dr. A. C. Boyle for permission to quote these cases and for his interest and many helpful criticisms at all stages of the survey; Mr. Philip Wiles and Mr. P. H. Newman for kindly referring cases; and Roussel Laboratories for generously supplying all the hydrocortisone used.

EFFECTS OF MODIFIED E.C.T. ON THE ELECTROCARDIOGRAM

BY

RONALD GREEN, M.B., F.F.A.R.C.S.

AND

ARNOLD WOODS, B.M., M.R.C.P.

From St. George's Hospital, London

There have been several investigations into electrocardiographic changes during electric convulsion therapy (E.C.T.). Most of them were carried out before the use of muscle relaxants, and consequently the records could be taken only after the end of the convulsion. The purpose of this paper is to record our findings in patients whose convulsions were attenuated by muscle relaxants to such an extent that the electrocardiogram (E.C.G.) could be recorded during the convulsion, thereby providing further information regarding the safety of the procedure.

Method

Relaxation was achieved by the use of suxamethonium chloride, but, as the slightest movement of the limbs during stimulation interfered with the tracings and made their interpretation difficult or even impossible, doses far in excess of those normally used for routine treatment had to be employed. Four milligrams of suxamethonium per stone (0.6 mg. per kg.) of body weight gives adequate attenuation of the fit for routine treatments in the majority of patients, but for our purpose it was necessary to administer up to 10 mg./stone (1.6 mg. per kg.) to obtain the degree of relaxation required.

Every patient was fasted for at least four hours and was given atropine, 1/100 gr. (0.65 mg.) hypodermically half an hour before treatment.

After explaining to the patient the nature of the investigation, a resting E.C.G. was taken. (At the beginning of the investigation the three standard leads were recorded on a three-channel Elmquist; later, a direct-writing Cambridge electric cardiograph was used and Lead II recorded.) A "sleep dose" of intravenous thiopentone was administered slowly, 0.25 g. seldom being exceeded. It was followed immediately by a large dose of suxamethonium from a different syringe, but through the same needle. As soon as apnoea developed the lungs were inflated with oxygen through a face-mask and bag. A second recording was then taken to assess the effect of the relaxant. As the changes noted were slight and were regarded as of no significance, the relaxant was discontinued after 74 records had been taken.

The electric convulsion shock was given with a Plexicon electroplex unit, while a further tracing was recorded. Except for a short period during the application of the electrodes and the insertion of the Multitone mouth gag as described by Back (1952), which at the same time permits the maintenance of a good air-way, the lungs were inflated with oxygen from the beginning of the apnoea until adequate respirations returned.

Material

We recorded 214 E.C.G.s from 105 patients who received E.C.T., 57 of the patients being investigated on more than one occasion. In 14 records, in spite of the use of the relaxant, there was interference gross enough to make interpretation difficult or even impossible; this occurred mainly in the early cases, before it was definitely known how much suxamethonium was needed to ensure complete inertia. In 50 records there was slight interference, which did not seriously affect the reading of the tracing, whilst 150 were good.

There were 37 males and 68 females in the series, and their ages ranged from 16 to 78. Just over 50% of the female patients were in the age group 30-50, and almost twice as many were under 50 as over 50, whereas amongst the males the cases were almost equally divided between those under 50 and those over 50, with the majority also about equally divided between the 30-50 and 50-70 age groups (see Table).

Age Incidence

	Under 30	30-50	51-70	Over 70	Total
Male	4	15	16	2	37
Female	10	35	19	4	68
Total	14	50	35	6	105

Most of these patients had normal hearts, but in 10 a cardiac abnormality had been recognized clinically or was suspected from the appearance of the control E.C.G. Two men, aged 57 and 77, gave a past history of cardiac infarction and had abnormal E.C.G.s, one showing a right bundle-branch block pattern. In a woman aged 61 there was also a right bundle-branch block picture but no history of cardiac pain and no other electrocardiographic abnormality. In three women, aged 50, 55, and 66, the control E.C.G. suggested old posterior cardiac infarction. Two women, aged 34 and 58, had clinical evidence of mitral stenosis, although not of a severe degree. In a man aged 60 there was evidence of left ventricular hypertrophy, and complete heart block was found in the control record of a woman aged 31.

Results

Effect of Suxamethonium

In the first 74 records the effect of the suxamethonium was studied. The rate became faster in 41, slower in 13, and remained unchanged in 20; in no case was the change in rate marked. There was slight depression of the ST segment or flattening of the T wave in 5 cases, possibly due to temporary inadequate oxygenation immediately following diaphragmatic paralysis. There were no premature beats and no significant conduction changes.

Effect of the Shock

Rate.—In the control records the pulse rate was under 100 in 48% and under 130 in 87%, although a sinus tachycardia of 160 was encountered in 4 cases and of 170 in one case. A marked tachycardia developed within a few seconds of the shock being given. This usually lasted about 30 to 45 seconds, and in 65% of the cases the rate was over 130. In 37% it was between 140 and 160 and in 10% it was over 160, the most rapid rate recorded being 180. In nearly all instances the rate had returned to pre-convulsion figures within two minutes. In a few cases the sinus tachycardia was preceded by a sinus bradycardia lasting two to three

seconds. In nine cases a marked sinus bradycardia occurred shortly after the convulsive stage. In 17 cases there was no appreciable change in rate, and in several of these there appeared to be no convulsion at all—that is to say, the electrical stimulus had produced a stun or sub-convulsion.

Arrhythmias.—In 7 cases premature beats were present in the control, five being ventricular and two auricular. Amongst the 200 records which were clear enough for analysis, arrhythmias were encountered in 79 (39.5%), all being due to premature beats, except for one case of nodal rhythm. In 55 (27.5%) the arrhythmias were ventricular in origin, in 22 (11%) auricular, and in one case nodal. The ventricular premature beats were often multifocal and occurred singly, in groups of three or four, or at every alternate beat, coupling resulting in 19 cases (9.5%). Both auricular and ventricular premature beats were found in the same records in two cases. In a number of cases unusual waves occurred. At first sight they resembled those of a ventricular tachycardia occurring regularly at 150 a minute, but they were due to muscle contractions in patients who had had doses of suxamethonium insufficient to prevent muscular activity. In others in which the attenuation was greater, but still insufficient, a picture resembling an auricular tachycardia was produced. None of these abnormal waves was seen when the convulsion was completely attenuated or when the convulsive stage had passed. They occurred between 5 and 30 seconds after the shock was given.

Disturbance of Conduction.—In the one case of complete heart block in the control record frequent ventricular premature beats and coupling developed during the convulsive stage. In only one case was the P-R interval abnormally lengthened, and then only temporarily, increasing from 0.16 sec. in the control to 0.24 sec. for four complexes. This occurred after a stun in a woman of 28; but on three subsequent occasions, shortly afterwards, when the shock was repeated in the same patient with a successfully modified convulsion, there was no disturbance of the P-R interval. In no case was prolongation of the QRS complex caused by the shock. In the two patients in whom there was a prolonged QRS complex in the control record it was not altered during the convulsion.

ST Depression.—Slight ST depression was present in the control records in 21 patients, in 16 of whom it was associated with tachycardia, while in 2 cases the presence of pathological Q waves suggested old infarction. Some degree of depression of the ST segment was found in 63 E.C.G.s recorded in 37 patients after the shock was given. In 42 records from 25 patients it was considered to be due to the Ta wave, secondary to tachycardia. In the other 21 from 12 patients the characteristics of the ST depression were such that it was judged to be ischaemic in origin. The age of these 12 patients ranged from 42 to 70, and in two the possibility of posterior cardiac infarction had been noted in the control curves.

T Waves.—As was to be expected, slight lowering of the T wave was often encountered with the development of tachycardia, but in 7 cases the waves were flattened, and in the case of a woman aged 40 they were inverted in two records.

U Waves.—In 91 records U waves became visible during the period of slowing following the cessation of the convulsive stage. They usually appeared when the rate had fallen below 100, and were often prominent even when they had been small or absent in the control. On no occasion was inversion of the U wave found.

Discussion

Anaesthesia and Relaxation

All the established muscle relaxants have been used to mitigate the fits which are produced during E.C.T.; but there are few anaesthetists who do not recognize the great contribution which has been made by the introduction of the ultra-short-acting group of relaxants, particularly when the frail and elderly patient is being treated. By the use of

these drugs complete relaxation can be ensured, if necessary throughout the whole period of stimulation, and yet rapid recovery can be expected. Because of this degree of relaxation we have obtained electrocardiographic tracings, free from interference, covering the period of treatment from beginning to end.

One of two relaxant drugs is now commonly employed; either suxamethonium chloride ("scoline," "anectine," succinylcholine chloride) or suxethonium bromide ("brevital E"). Suxethonium has the advantage of a slightly shorter action (Wolfers, 1953), but as the degree of relaxation it produces is less reliable than that produced by suxamethonium, we chose to use suxamethonium throughout this investigation.

Suxamethonium appears to be a safe relaxant for E.C.T. provided adequate oxygenation is maintained throughout its short period of action. Adderley and Hamilton (1953) stated that some rise in blood pressure invariably occurred after a single dose of the drug, but considered this to be of little importance. Calvert and Morgan (1954), in a study of 57 patients during 200 consecutive convulsions, were unable to find any rise in blood pressure after administering the drug, and they thought that any rise that does occur is due to carbon dioxide accumulation and not to a direct pressor action of the drug. Using suxamethonium as a continuous drip, Green (1953) found that in most patients no rise in blood pressure occurs until at least 500 mg. of the drug has been administered, provided adequate ventilation is maintained.

Attempts have been made to use this drug alone to modify the convulsion, but the painful contractions which precede the relaxation and the unpleasant sensation of progressive paralysis make the procedure too unpleasant for the patient, as retrograde amnesia following the shock is never sufficient to cover this period. The relaxant drug is therefore always preceded by thiopentone. It is not sufficient to mix the two drugs together, as then the suxamethonium begins to take effect before unconsciousness occurs. The thiopentone is given slowly and in minimal doses, particularly in the elderly, so as to avoid undue lowering of the blood pressure.

In spite of the large doses of relaxant used, no very prolonged period of apnoea was recorded, 12 minutes being the longest.

Cardiovascular Effects

E.C.T. in the treatment of psychiatric patients has been practised for 15 years, and from the first it was felt that it might prove a severe strain on the cardiovascular system (Myerson, 1942). In spite of the frequent use of this form of treatment, however, fatalities involving the heart have only rarely been recorded. Ebaugh, Barnacle, and Neuburger (1943) report the death of a 57-year-old man from coronary thrombosis an hour and a half after the convulsion; he had already had twelve treatments, and, although a previous E.C.G. had been regarded as normal, extensive coronary disease and a recent thrombosis were found at necropsy. Kauntze and Parsons-Smith (1948), in 63 electric convulsions on 51 patients, found no evidence of any serious cardiovascular effects, but thought that coronary disease was a strong contraindication. Plice and Pfister (1950) believed that certain electrocardiographic abnormalities were caused by psychiatric disturbances, and described improvement in ST segments and T wave changes following E.C.T. Magendantz and Shortleeve (1951) found that in many cases ST depression and T wave changes were due to anxiety and disappeared after rest and reassurance.

In our series ST and T wave changes were rarely present in the control records except in association with tachycardia, and even then they were slight. In the convulsive stage a marked auricular T wave associated with tachycardia occurred in 37 records (18.5%), but 21 records (10.5%) in 12 patients showed temporary ST depression which, adopting the criteria accepted by Wood *et al.* (1950), we regarded as ischaemic. Such a change can be due to anoxia from inadequate ventilation, but every effort was made to maintain adequate oxygenation, and in the six patients who had

more than one treatment the change was usually consistent. Furthermore, the ages of the 12 patients ranged from 42 to 70 years, with an average of 53; and, in two, changes suggesting coronary disease had been present in the control records. It was therefore concluded that the changes might possibly indicate latent coronary artery disease. It is, however, noteworthy that no ischaemic ST changes developed in the two patients who gave a history of cardiac infarction.

Lowering of the T wave was generally encountered only with considerable tachycardia, but an ischaemic cause was suggested by the inversion of T in Lead I in a woman of 40 in whom the control showed slight ST depression and a diphasic T in Leads I and II, for in this case the rate rose to no more than 120 a minute.

The frequency of U waves, which are thought to represent a process of repolarization of the interventricular septum (Zuckermann and Cabrera, 1947; Goldberger, 1953), is not considered to be of pathological significance, for they were upright in all cases; but it is interesting to note that they often became visible or accentuated in the stage of recovery following the convulsion. That they cannot be seen until the rate slows to less than 100 is of course due to the shortness of the T-P interval while tachycardia is present. Their increased prominence in many cases soon after the convulsion suggests a temporary change in the relative intraventricular pressures, for it has been shown that the U wave is influenced by changes which unilaterally alter the pressure on the septum (Zuckermann and Cabrera, 1947).

Anoxia was regarded by Kauntze and Parsons-Smith (1948) as the possible cause of the slight auriculo-ventricular conduction delay noted in half their cases and the intraventricular delay which occurred in 4%. In our series the P-R interval was abnormally prolonged in only one instance, and then after a sub-convulsion, and on no occasion did intraventricular delay result. The difference in these results can probably be accounted for by the greater ease with which we were able to inflate the lungs of our patients with oxygen during the convulsive stage.

Tachycardia was the principal effect of shock therapy, and this was always sinus in origin. In a few cases it was preceded by a sinus bradycardia for a few seconds, and in a few others bradycardia followed the convulsive stage; this was considered to be a vagal effect.

The absence of any change in rate was thought to be helpful in recognizing stuns, for their recognition is, of course, made more difficult by the use of large doses of muscle relaxants. In obvious stuns there is no change in rate, while only in a few cases with a definite convulsion was there no such disturbance.

The frequency of ectopic beats (39.5%) in our series is in contrast to that of Kauntze and Parsons-Smith, in which they occurred in only 8%. This is probably because in their series E.C.G.s could be taken only after the convulsive stage, during which the majority of the ectopic beats take place. Phillips (1954) has reported frequent ventricular extrasystoles following the administration of suxamethonium in the conscious patient, but only rarely when the relaxant was preceded by a sleep dose of a barbiturate. No premature beats were found after suxamethonium in our series of control records.

When two or more convulsions were studied in the same patient there was a relatively constant effect with regard to the presence and type of rhythm abnormality as well as to the degree of tachycardia which resulted. The rhythm changes, although frequent, were not marked, and in most cases were of short duration.

Conclusions

It seems probable that E.C.T. results in much less strain on the cardiovascular system than was originally anticipated. As in the majority of other recorded series, our cases have for the most part shown no evidence of any cardiac abnormality. The few that did show clinical or electrocardio-

graphic evidence of such abnormality suffered no ill effects from the convulsion. Nevertheless, if frequent premature beats can occur so readily in normal hearts, more serious arrhythmias which are potentially harmful might occur in diseased hearts. It is therefore suggested that quinidine or procainamide ("pronestyl") may prove of prophylactic value in such cases, and one of these should be readily available for intravenous injection should a serious arrhythmia occur. Severe coronary artery disease, and in particular recent infarction, and evidence of any considerable degree of heart failure should still be regarded as contraindications to the use of E.C.T. Should treatment be considered essential on psychiatric grounds, however, it is unlikely that there would be any serious outcome, provided the precautions were taken of using a short-acting muscle relaxant, of ensuring adequate oxygenation, and of preventing the development of serious arrhythmias by means of procainamide.

Summary

A series of 105 patients were submitted to 214 electric convulsions which had been modified by the intravenous injection of ultra-short-acting muscle relaxants. Electrocardiograms were taken before, during, and after the convulsive stage.

In 10 cases with clinical or electrocardiographic evidence of heart disease, no serious cardiovascular disturbance occurred.

A marked degree of sinus tachycardia was usual. Nodal rhythm developed in one case and premature beats were recorded in 39% of the cases.

In view of the frequency of premature beats, it is suggested that quinidine or procainamide may be used prophylactically in cases in which the onset of gross arrhythmia is expected or feared.

We are very much indebted to Dr. Desmond Curran for stimulating this investigation. We wish to thank the medical and nursing staffs of the Psychiatric Departments of St. George's Hospital and the Atkinson Morley Hospital for their kind co-operation, and Drs. N. C. B. Trapps, D. J. Coleman, and B. L. Day for administering some of the anaesthetics. We should especially like to acknowledge the great help given by Miss Bromley and Miss Hurst, who recorded all the electrocardiograms.

Dr. J. A. MACFARLANE, dean of the Faculty of Medicine at the University of Toronto, has some remarks to make in his report on the 1953-4 session about the teaching problems raised by new trends in methods of investigation and treatment. "This school," he writes, "has tried to hold an even balance between the constantly changing and more complicated methods of laboratory investigation and the system of bedside teaching and theatre clinics, with emphasis on the careful taking of history and painstaking physical examination. There are so many human ills that cannot be measured by any laboratory calculation. The student of medicine has much to gain from sound clinicians who still practise the art of medicine with a full knowledge that the techniques of university laboratories and their experts are immediately available when they are indicated."

PHYSIQUE AND THE GRAMMAR SCHOOL ENTRANCE EXAMINATION

BY

R. W. PARNELL, D.M., M.R.C.P.

G. E. PEIERLS, B.A.

C. C. STANDLEY, M.A., B.Litt.

AND

C. K. WESTROPP, D.M., M.R.C.P., D.C.H.

To obtain standards for somatotyping children by physical anthropometry at the age of 11, 371 boys and 421 girls were measured by one of us (C. K. W.) as an additional part of the routine medical examination in the City of Oxford schools during the period January, 1953, to March, 1954. Following the discovery of significant relationships between physique and final honours class results among Oxford undergraduates (Parnell, 1954a), it was decided to compare children's physique with their marks in the grammar school entrance examination. This report covers our findings: it reveals those somatotypes who are most often successful in gaining grammar school places, showing a trend towards more frequent selection of less-muscular children; it also shows that significant relationships exist between physique and performance on intelligence tests, while significant physical trends also appear in the proportion of children with better than average achievement in English and arithmetic.

Somatotyping Children

The children's physiques were classified according to Sheldon and Tucker's (1940) somatotype method, with two important differences. First, since it was impossible to photograph the children, the estimates were based on physical measurements alone, whereas Sheldon uses mainly photoscopic methods. Secondly, since he has not yet published photographic standards for children, it seemed dangerous to adopt his terminology; therefore, while keeping to a classification with three components each on a scale of half points from 1 to 7, the components themselves are renamed. The first component, endomorphy, was called Fat (F), the second, mesomorphy, indicating bone and muscle development, was termed Muscularity (M), and Linearity (L), was substituted for the third component, ectomorphy.

The somatotype estimates can be plotted on Sheldon's (1954) chart with its centre 444 and extremes of 711, 171, and 117. The sectors have been named according to the primary and secondary dominance of the types falling within these sectors by capital and small type respectively. Thus an Mf child would be one who was predominantly muscular, but also fat (cf. endomorphic mesomorph). Occasionally the estimates could not be plotted directly on Sheldon's chart. In these cases, while retaining relative dominance between the components, each component was reduced or increased by one-half—for example, 336 plotted as 2½2½5½, 3433½ as 4½4.

To estimate children's somatotypes a "deviation chart" was drawn up similar in design to that employed when

typing undergraduates by physical anthropometry (Parnell, 1953, 1954b). The first step was to calculate means and standard deviations of all the measurements. Next the results for boys and girls were combined on the empirical grounds that the differences between them were, except in the case of the fat measurements, too small to make separate scales practicable. The central column of the deviation chart (see Fig. 1) contains the mean value of each measurement. Values of these measurements at half standard deviation intervals are arranged on each side of the centre. There are six columns on each side, so that the outside columns correspond to measurements three standard deviations above and below the mean. In the case of fat measurements, logarithmic scales are employed to relieve skewness in the distribution.

A "profile" was drawn for each child by ringing the appropriate value for every measurement. This gave a general impression of the physique (see Figs. 1-4). Numerical estimates for each component were obtained as follows:

Fat (Endomorphy)

The total of the three fat measurements taken was plotted on a logarithmic scale (based on the mean total fat), and "F" estimates were given according to Table I.

Muscularity (Mesomorphy)

I. First Estimate.—For children of average height a "bone and muscle" point was found corresponding to the average standard score of the humerus, femur, and muscle girth measurements. A rating was given according to the number of columns (half-units) the "B.M." point lay from the central column of mean values, which was rated 4. Children *not of average height* presented a problem, because bone and muscle measurements are determined by size as well as by body shape. This was dealt with by calculating somatotype 444 bone and muscle measurements for each half-unit of height assuming a linear relation between height and bone muscle measurements—that is, by multiplying the mean bone and muscle measurements by actual height. From these 444 somatotype measurements a corresponding 444 "B.M." point was found for each height. Fig. 5 shows a section of the deviation chart with lines linking the 444 somatotype measurements with each unit of height. The muscularity rating was allotted according to the number of columns an individual's "B.M." point lay from the 444 point for his height. Thus a child of height 61.5 in. and with humerus 6.7 cm., femur 9.1 cm., biceps 20.5 cm., and calf 30.2 cm. would have a "B.M." point at the position of the cross (x), which is one column, or a half standard deviation, from the 444 point (marked 4); he would receive a provisional rating of 4 minus ½, or 3½, in muscularity.

II. Correction for Fat.—There is the further complication that measurements of bone and muscle girth are affected by the amount of fat present, bone slightly but girth rather more; unless allowance is made for this, fat people would be overestimated in muscularity, thin people underestimated. Corrections were made for fat according to the lower part of Table I. This was based on the assumption that there is a linear relation between the amount of fat and its effect on bone and muscle measurements. Since the F scale was based on logarithmic increases of fat, corrections for fat to the muscularity scale increase in the same way and have been rounded off for convenience.

TABLE I.—For Estimating F Rating, and Appropriate Correction for Fat to Estimate M for Muscularity

Total fat (mm.): Midpoint Limits	12 <12	14 13-15	17 16-18	20 19-22	24 23-26	29 27-31	35 32-38	42 39-46	50 47-55	60 56-66	72 67-79	87 80-95	104 96+

Correction to M rating	+	+	+	+	0	0	-	-	-	-	-	-	-

Linearity (Ectomorphy)

The ponderal index (height over the cube root of weight) was used as the basis for rating linearity as shown in Table II. The somatotype distributions of boys and girls may be compared in Figs. 6 and 7.

FIG. 5.—Somatotype 444 measurements according to height.

For the purpose of the present analysis, sector Mf includes types 343, 252, etc.; Ml includes 344, 244, etc.; in other words, viewed from the central 444, each sector includes its right-hand margin.

Findings

The "11-plus" examination consisted in 1953 of three papers—an intelligence test, English, and arithmetic—to which the Peel test of practical ability was added in 1954.

Complete results were not available for two groups of children—those who scored less than 70 in the intelligence test and those absent from one or more papers. The former were automatically excluded by their low mark from taking any further papers, and therefore cannot figure in this sample: their physique distribution will, however, be analysed in the intelligence test section of the boys' part, since all these very low scorers were boys. Those who were absent will also be removed from the sample after discussion of their somatotype distribution.

Absence

Five per cent. of the girls and 6.2% of the boys were absent at one or more papers. Physique seemed to play a part here; among the girls with a fat rating of 6 or more (the body-build associated with an easy-going comfort-loving temperament), 16.2% were absent as against 3.9% in the remainder of the sample (Difference = 2.0).*

Analysis of the boy absentees yielded a similar result, but with a different emphasis: this time it was the linear boys (in sectors Lm, Lf, and Fl) who were noticeably present, with only 1.9% absent for one or more papers, as against 7.9% in the other sectors (Difference = 2.8).

Girls' Results

The children's results were analysed in terms of those scoring above and below the mean for each subject. In the girls' results the most outstanding feature was

*If two proportions differ by more than twice the standard error of the difference (S.E. Diff.), the difference is said to be "significant"—that is, such a difference would arise by chance, roughly, once in 20 times.

that the less muscular sectors (in particular Lf), consistently in all the tests, contained a greater proportion of girls scoring above the mean than the rest. The muscular-linear girls (Lm and Ml) varied in performance, while the muscular-fat ones (Mf and Fm) always had a lower percentage of high scorers than the whole sample. The results are given in detail in Table III.

FIG. 6.—Somatotype distribution of 371 boys aged 11 years. (A schematic two-dimensional projection of the theoretical spatial relationships among the known somatotypes.)

FIG. 7.—Somatotype distribution of 421 girls aged 11 years. (A schematic two-dimensional projection of the theoretical spatial relationships among the known somatotypes.)

The less muscular girls gained the most grammar and technical school places, not surprisingly considering their performance in the individual tests (Lf 35% compared with 18.5% of the rest; $\frac{\text{Diff.}}{\text{S.E. Diff.}} = 2.5$) (see Table IV). The fat-muscular girls received significantly few places (15.1% compared with 24.9%; $\frac{\text{Diff.}}{\text{S.E. Diff.}} = 2.4$).

In the intelligence test 66.9% of the Lf and Fl girls scored above the mean compared with 39.7% of the rest ($\frac{\text{Diff.}}{\text{S.E. Diff.}} = 5.3$). Histograms contrasting distribution of

TABLE V.—Difference in Proportion of Less Muscular and Other Girls with Above Average Test Scores

Test	Sectors Lf and Fl	Remainder	Diff. S.E. Diff.
Intelligence test (Moray)	% 66.9	% 39.7	5.3
House	63.0	41.5	4.1
Arithmetic	66.9	45.6	4.0
English	66.9	39.6	4.2
Peel practical ability test	64.6	39.6	4.2

I.Q.s between the better somatotype sectors and the others are shown in Fig. 8. There was a significantly large proportion of high scorers in the same less muscular sectors (Lf and Fl) in both the arithmetic and English tests (see Table V). A similar result was also found among those girls who took the Peel practical ability test.

In all these tests stocky and tubby girls in sectors Fm and Mf did significantly poorly compared with the others. It is interesting that many lean girls (Lm) did well in the intelligence and English tests, but few did so in arithmetic and the practical ability test. The slightly more muscular and less linear girls of sector Ml, on the

FIG. 8.—Histogram contrasting distribution of girls' I.Q.s in sectors Fl and Lf.

other hand, performed well at arithmetic and in practical ability, but poorly on English and the intelligence tests.

Boys' Results

The boys' results were not as highly significant as the girls'. This is almost unavoidable with samples of 13 and 5 in the two less muscular sectors. There was, however, a consistent trend throughout all the results. The fattest boys (Fm) were the most successful of the larger samples, and the muscular ones with secondary fat dominance the least successful. In the case of the two small groups, the Lf were outstandingly good (as among the girls), but out of the five boys in Fl none achieved a place at grammar or technical school, see Table IV. The neighbouring sectors were noticeably but not significantly successful in achieving places.

In the intelligence test 12 boys did not take the other papers because of intelligence quotients of less than 70. Of these, 7 were in the Mf sector, representing 7.8% of its population, compared with 1.9% of the rest of the boys ($\frac{\text{Diff.}}{\text{S.E. Diff.}} = 2.0$). Considering all the boys with I.Q. above the mean, again the Mf sector did comparatively badly with only 35.5% falling into this category, compared with 48.5% among the other physiques ($\frac{\text{Diff.}}{\text{S.E. Diff.}} = 2.2$).

In both the English and arithmetic test results, the fat and less muscular boys taken together (Lf, Fl, and Fm) contained more with marks above the mean than the rest of the sample. In arithmetic the proportions were 60% to 46.7% ($\frac{\text{Diff.}}{\text{S.E. Diff.}} = 2.0$), in English 63.1% to 45.3% ($\frac{\text{Diff.}}{\text{S.E. Diff.}} = 2.8$).

In the Peel test of practical ability (which was taken only in 1954) the most remarkable feature was the poor performance once again of "north-western" muscular boys with secondary fat (42.9% in Mf compared with 56.8% of the rest).

Athletic Ability

Ratings of athletic ability were obtained through the kindness of head teachers on 285 boys and 306 girls. There were thus several observers, and the proportion of children said to possess athletic ability varied widely from school to school. Only rough conclusions may therefore be drawn, but it was found that for the sample as a whole there was a higher proportion of children (both boys and girls) considered to be good at games among place winners than among the remainder.

Discussion

The finding that low-level performance of both boys and girls was specially associated with a fat-muscular (Mf) type of physique is in striking contrast to the high-level performance associated with fat-linear (Lf) types. Further subdivision of each sector into central and peripheral types showed the average score of central types in these sectors to be higher than those more peripheral. While the establishment of normal variation in intelligence scores according to finer shades of physical classification must await larger samples, it is interesting to note that central Lf boys had a mean I.Q. of 111.9, and 37 girls of similar physique a mean value of 105.6. The lower average scores for peripheral Mf children were: boys 99.3 (n=38) and girls 99.7 (n=16). That central Lf children did best is interesting because in an older group of undergraduates (Parnell, 1954a) the outstandingly good performers in final honours class examinations were endomorphic ectomorphs, whose physique was similar when determined by the appropriate deviation chart for their age. It cannot, of course, be

*Both proportions are below 50% owing to slight skewness in the distribution.

assumed that children typed at 11 would necessarily have the same type allotted to them at the age of 21 even when a comparable method is used; any attempt to compare the prevalence of this physique in school and university population in an exact way is likely to be unreliable; nevertheless, the impression has been gained that men of this physique are relatively much more common in the university population, a situation which could be brought about by progressive academic test selection. The trend is important because the high disposition to psychological difficulty and breakdown shown by men with this particular physique is now well established, whereas it is also known that student endomorphic mesomorphs at Oxford, whose physique is most comparable to that of Mf children, show little disposition to breakdown (Parnell, 1955).

Summary and Conclusion

Groups of 371 boys and 421 girls were measured at the age of 11 to obtain standards for somatotyping children by the deviation chart method.

The technique of this objective method of assessing physique in terms of fat, muscularity, and linearity is described, bringing out the points of similarity to and difference from Sheldon's method of somatotyping.

The grammar school entrance marks of 336 boys and 400 girls are compared according to their body build. The slightly smaller sample is accounted for by examination absentees and those who, having scored less than 70 in the intelligence test, did not complete the other papers.

The following conclusions are reached:

1. Absence from the examination was significantly greater among girls with a high fat rating; it was significantly uncommon in boys of linear build.

2. Less muscular girls, and especially those in sector Lf who were linear too, showed significantly high proportions with above-average scores. Their results were consistent for all tests—arithmetic, English, intelligence, and the Peel test of practical ability.

3. A similar trend was found among the boys, although the results were not so highly significant.

Among 12 boys with intelligence scores below 70, there were 7 in the Mf sector, and the lowest proportion of boys scoring above the mean was found in the same area. The same was true of the Peel practical ability test.

Fat and linear non-muscular boys (Lf, Fl, and Fm) did significantly better than the remainder in English and arithmetic.

4. In spite of the tendency to select less muscular children, there was evidence that a higher proportion of those selected, both boys and girls, were considered good at games compared with children failing to obtain places.

5. Certain points of similarity exist between test results at the age of 11 and those discovered in a group of Oxford undergraduates taking their final honours class examination. At both ages linear subjects with more than average fat for their weight were best at examinations. Undergraduates with this type of physique are known to possess comparatively high disposition to psychological breakdown; thus it is not altogether surprising to find high prevalence rates for psychological upset as an associated consequence of intensive academic selection.

We wish to thank Mr. C. F. L. Piggott, Chief Education Officer, City of Oxford, for allowing us access, for the purpose of statistical analysis, to the examination marks, which are otherwise confidential. Dr. J. F. Warin, Medical Officer of Health and

Principal School Medical Officer, City of Oxford, gave us valuable help and advice. Our thanks are also due to the head teachers, without whose kind co-operation the inquiry could not have proceeded so effectively. Miss W. Hunt, of the School Health Department, and Mr. A. D. Hewitt, of the Education Department, also assisted us greatly with practical details. Mrs. G. A. Rainbird kindly drew the diagrams. It formed one part of the research programme at the Warneford Hospital, Oxford, to study methods of physical assessment and the relationship between physique and behaviour, both normal and abnormal.

FAVUS: A REPORT OF SEVEN RELATED CASES

BY

J. HANSELL, M.R.C.S., L.R.C.P.

Senior Registrar, Department of Dermatology, Central Middlesex Hospital, London

AND

B. M. PARTRIDGE, M.A.

Assistant Mycologist, Department of Medical Mycology, Institute of Dermatology, London

Favus, or tinea favosa, is a ringworm infection of the scalp, skin, and nails rarely seen in Britain, though it commonly occurs in Eastern and Central Europe, in the Mediterranean countries, and in the Near East. The majority of British infections have been sporadic and have occurred in widely scattered areas, but small outbreaks have been reported from urban districts. It has been stated that favus is becoming progressively more rare in this country (Whittle, 1947). Walker (1950) isolated the causative fungus, *Trichophyton schoenleini*, on 42 occasions among 2,473 ringworm cultures. These were grown from specimens received from various parts of Britain. We have been unable to trace any reports of this disease in the London area during the last ten years, and it was not diagnosed mycologically among 760 consecutive patients suffering from ringworm infections seen at the Institute of Dermatology in London (Partridge, 1952). Recently, the diagnosis of favus in a London infant led to the discovery of six unsuspected cases and enabled the source of infection to be traced to another town. This outbreak is reported in order to stress the ease with which the nature of the disease may be overlooked.

In an attempt to trace the source of the infection, attention was directed to a day nursery attended by the affected infant (Case 1). All available contacts were examined under Wood's light, with the result that a second case of scalp infection was discovered (Case 2). Finally, it was learnt that the original child had spent three months in the home of a relative in Kent, where, on inquiry, one adult (Case 3) and four children (Cases 4, 5, 6, and 7) in a single family were found to be suffering from favus. Hairs taken from all six of these patients contained fungous mycelium, and *T. schoenleini* was cultured from five of them.

Case Reports

Case 1.—A female child aged 14 months, living in London, was first brought to hospital in October, 1952. She had suffered from a scurfy condition of the scalp since birth, and on examination was shown to have a number of crusted lesions, but no broken hairs, alopecia, scarring, or scutula. A provisional diagnosis of ringworm was made after microscopy had revealed fungous mycelium in extracted hairs, though cultures were unsuccessful. Whitfield's ointment appeared to control the scalp condition, and after six months only two scaly erythematous patches approximately 1 in. (2.5 cm.) in diameter remained. Under Wood's light, however, a greenish fluorescence was observed along the entire length of many hairs distributed in groups over the whole scalp. These hairs were found to contain fungus, and on this occasion *T. schoenleini* was grown from them. While the condition was being re-investigated local treatment was discontinued, and this resulted in the appearance of typical scutula on the scalp (Fig. 1); there was also spread of the infection to one knee.

Case 2.—This 1-year-old boy had a single small scaly patch $\frac{1}{2}$ in. (1.3 cm.) in diameter on the occipital region of his scalp. The lesion, which had been present for six months, was first observed two months after he had been attending the day nursery, where he was a close companion of Case 1. Though hairs growing from the affected area appeared normal, they fluoresced a dull green colour under Wood's light.

Case 3.—A woman aged 33, the aunt of Case 1, had suffered from scalp trouble since the age of 5, resulting in bald patches since she was 18. Various therapeutic measures had been tried without success. She had lived in Yorkshire, but had never resided outside Britain and was unable to explain the source of her infection. Examination showed a large scarred bald area—5 by 4 in. (12.5 by 10 cm.)—over the left parietal region with erythema, scaling, and

FIG. 1.—Case 1. Typical scutula on scalp.

FIG. 2.—Case 3. Large scarred bald area, with erythema, scaling, and scutula at its periphery.

scutula at its periphery (Fig. 2). The hairs in this zone were grey and lustreless, and under Wood's light fluoresced along their entire length. A definite "mousy" odour was detectable.

Case 4.—A girl aged 12, the eldest daughter of Case 3, had had crusting of the scalp since she was 6. She presented with several areas of atrophy and alopecia showing peripheral erythema and scaling, and long fluorescent hairs were again seen.

Case 5.—A second daughter of Case 3, aged 8, had suffered from a scaly scalp since shortly after birth. She had received hospital treatment for this during the previous year, but favus had not been suspected. On examination a widespread scaly condition of the scalp and several small scutula were found; long fluorescent hairs were demonstrable with Wood's light.

Case 6.—A third daughter of Case 3, aged 6, was found to have several scaly patches associated with scutula over the vertex of her scalp; within these areas long fluorescent hairs were found.

Case 7.—The twin sister of Case 6 presented no clinical evidence of favus. Careful examination of her scalp under Wood's light revealed two fluorescent hair stumps in the occipital region which showed the characteristic appearances of *T. schoenleini* infection when examined microscopically. The fungus was not grown.

All these patients, except the last, were treated by hair removal with x rays. Complete epilation was achieved except in Case 3, in which a few remaining infected hairs required removal with a diathermy needle. No infected hairs reappeared except in Case 5, in which some infected hair stumps developed; these were treated by follicular cauterization. Case 7 was successfully treated by manual epilation of the hairs involved.

Discussion

The familiar characteristics of a typical case of favus of the scalp represent late manifestations of the disease. Scutula, alopecia, and atrophy were present in Cases 3 and 4, in which the disease had persisted for 28 and 6 years respectively, but no alopecia or atrophy occurred in Cases 1, 2, 5, and 6. Broken hairs are rarely found in this disease, though they were the one diagnostic feature in Case 7. Initially the hairs are usually macroscopically normal, but later lack lustre; under Wood's light a dull, greenish fluorescence may be seen along their entire length—an invaluable method of detecting early infection. This feature is useful, too, in distinguishing favus from *Microsporum* infections, in which bright yellow-green fluorescent hair stumps occur, and from other *Trichophyton* infections where fluorescence is lacking. The mild symptoms and signs of this disease and its insidious progress lead to delay in seeking medical advice. The appearances may be unlike typical ringworm and may resemble those of psoriasis, impetigo, seborrhoeic dermatitis, folliculitis decalvans, and sometimes lupus erythematosus and lupus vulgaris. Consequently, failure to prescribe adequate treatment is not uncommon, and local applications prescribed haphazardly may further confuse the clinical picture.

In all doubtful cases, unequivocal evidence of favus can be obtained only by microscopy and culture. Microscopical examination of hairs in potash reveals mycelium and chains of spores within the shafts, and characteristic elongated air-spaces are seen at the sites of degenerated mycelium. Colonies of *T. schoenleini* grown at 26° C. on Sabouraud's agar are deep cream in colour, compact and glabrous, and have an irregularly corrugated surface. Their rate of growth is very slow, taking about three weeks to reach a size sufficient for macroscopic identification. Microscopical examination of the partially submerged growth may reveal characteristic antler-like hyphae after ten days.

Favus is essentially a human infection caused by *T. schoenleini*, and should not be confused with mouse favus,

caused by *T. quinckeanum*. When the latter infection occurs in man it produces acute, vesicular, and circinate lesions within a few days. In man, hair infections are rare, and the scutula seen in murine infections do not occur.

Unlike most other varieties of ringworm of the scalp, untreated favus may, as in Case 3, persist beyond puberty into adult life; spontaneous retrogression occurs only occasionally. Treatment is effective if administered before atrophy and permanent alopecia supervene; epilation with x rays is accepted as the most satisfactory method of treatment. Examination with Wood's light is necessary in order to detect infected hairs which have not fallen, and to exclude reinfection of new hairs. Local applications are sometimes successful in early cases but necessitate close supervision.

The group of infections in the family living in Kent appeared to be the source of disease in the first case. The fact that so few children were involved in the day nursery is explained by the low infectivity of the fungus. As in the outbreak described, it is a disease of the family rather than of the school. Every effort should be made to trace the source of infection, since the disease may otherwise go unnoticed and cause disfigurement.

Summary

Seven cases of favus of different degrees of severity are reported from the London and Kent areas. Their diagnosis and the identification of the source of infection are described.

Acknowledgment is made to Dr. G. B. Dowling, Dr. R. H. Meara, Dr. H. T. H. Wilson, and Dr. R. J. Cairns for access to their patients, and to Dr. R. W. Riddell for advice and criticism.

A TABLET TEST FOR BLOOD IN URINE

BY

E. J. WATSON-WILLIAMS, M.B., B.Chir., M.R.C.P.

Registrar, Medical Unit, Cardiff Royal Infirmary; formerly S.H.O. in Clinical Pathology, United Sheffield Hospitals

Many chemical tests for blood in urine have been described (Caplan and Discombe, 1951), but because they are insensitive or inconvenient none is in general use. The most sensitive are modifications of the *o*-tolidine method, first described by Ruttan and Hardisty (1912): a blue colour results from the oxidation of *o*-tolidine owing to the peroxidase activity of haemoglobin. The modifications previously described include those of Zwarenstein (1949, 1952) and Baron (1951), but all require the use of glacial acetic acid and are therefore unsuitable for use at the bedside. In the test here described the reagents are compounded into a tablet, and it is only necessary to add water.

Experimental

Tablets were made, each containing citric acid, 50 mg.; barium peroxide, 35 mg.; *o*-tolidine, 12.5 mg.; and sodium carbonate, 2.5 mg. If the tablets are kept in a container with a screw cap, and the cap is replaced immediately one is removed, they have been found to retain their full sensitivity for at least twelve months.

Tablet Test.—Various quantities of urine were tried (see Table I), and the following method was selected as giving the best results. One drop of the urine to be tested (0.05 ml. from a teated pipette) is placed on an inch square (2.5 by 2.5 cm.) of filter paper (Whatman No. 1) and allowed to

TABLE I.—Various Methods of Performing the Test Compared (Time in seconds after moistening the tablet for a definite "positive" to appear)

Method Used	No. of Red Cells per c.mm.				
	500	50	25	12.5	0
1 drop urine followed by 2 drops cold water	40	110	200	240	15 min.
2 drops urine followed by 2 drops cold water	35	80	150	180	15 "
1 drop urine followed by 2 drops hot water (60° C.)	15	40	110	140	3 "
1 drop urine followed by 2 drops urine	60	140	180	200	15 "

spread. Then one reagent tablet is placed on the centre of the paper and two drops of cold tap-water are allowed to flow over the tablet. If a significant amount of haemoglobin is present a blue ring develops around the tablet within two minutes; any colour appearing in the paper after this interval and any discoloration of the tablet itself are disregarded.

Microscopy.—The tablet test was used to examine 100 specimens of urine sent to the laboratory for routine investigation, and the results were compared with those of microscopical examination. 10 ml. of urine was centrifuged at 1,500 revolutions per minute for five minutes, and after 9.5 ml. of supernatant fluid had been removed the deposit was examined as an ordinary wet film with the $\frac{1}{4}$ -in. (4-mm.) objective; twenty fields were examined and two or more red cells per field was considered abnormal.

Urine Specimens.—Blood from the same volunteer was added to freshly voided urine to produce a series of dilutions from 1:1,000 to 1:1,000,000, giving a concentration of 5,000 to 5 red blood cells per c.mm.

Results and Discussion

The results are shown in the tables, and, unless otherwise stated, all tests were performed by the described method on urine without alteration of pH or temperature.

A definite blue colour appears around the tablet within two minutes if the urine contains at least 50 red cells per c.mm. or the equivalent concentration of haemoglobin (150 μ g. per 100 ml.). If a smaller quantity is present a blue colour develops after two minutes; and if none is present the tablet and filter paper remain colourless for at least fifteen minutes.

The test is equally sensitive throughout the temperature range 4–37° C. If the urine is heated to 60° C. or boiled, the test is much less sensitive (Table II).

TABLE II.—Effect of Temperature (Time in seconds after moistening the tablet that a definite "positive" appears)

Treatment of Specimen	No. of Red Cells per c.mm.				
	500	50	25	12.5	0
Room temperature (20–25° C.)	40	110	200	240	15 min.
60 min. refrigeration at 4° C.	55	110	180	250	15 "
30 min. incubation at 37° C.	45	100	180	230	15 "
30 " " " 60° C.	100	15 min.	15 min.	15 min.	15 "
60 " " " 60° C.	15 min.	15 "	15 "	15 "	15 "
1 min. boiling	80	15 "	15 "	15 "	15 "
1 " " "	15 min.	15 "	15 "	15 "	15 "

TABLE III.—Influence of pH (Time in seconds after moistening the tablet that a definite "positive" appears)

pH	No. of Red Cells per c.mm.				
	500	100	50	25	0
10	15	90	180	300	15 min.
9	15	90	180	300	15 "
8	15	60	90	240	15 "
7	25	60	100	140	15 "
6	30	60	100	120	15 "
5	35	60	120	150	10 "
4	40	70	150	200	8 "
3	40	80	150	200	8 "

Variation of urinary pH within the range of pH 5–8 has no significant effect on the sensitivity, which is, however, slightly reduced if the urine is either very alkaline or very acid (Table III). This can be avoided, if necessary, by adjusting the pH until just acid or alkaline to litmus. In practice it is of little consequence.

If the ascorbic acid content of the urine being tested is high some false negatives may be encountered (Table IV). This is of little importance, however, for, unless ascorbic acid is being administered, the urinary concentration is rarely above 5 mg. per 100 ml. In order to achieve 10 mg. per 100 ml. it was found necessary to give 200 mg. daily for four days; and to achieve 100 mg. per 100 ml., 800 mg. daily for four days.

TABLE IV.—Effect of Ascorbic Acid (Time in seconds after moistening the tablet that a definite "positive" appears. All specimens incubated for one hour at 37° C. before testing)

Ascorbic Acid, mg. per 100 ml.	No. of Red Cells per c.mm.				
	5,000	1,000	500	50	25
0	5	20	35	110	200
5	5	20	40	120	240
10	35	80	100	300	15 min.
25	40	80	120	15 min.	15 "
50	40	100	240	15 "	15 "
100	40	120	280	15 "	15 "

False-positive results occurred if the urinary concentration of iodide was greater than 20 mg. per 100 ml., a level that is obtained if the patient is taking Lugol's iodine, 10 minims (0.6 ml.) three times daily, or such mixtures as mist. stramon. et pot. iod. N.F. $\frac{1}{2}$ oz. (14 ml.) three times daily. In such cases the urine should be boiled for one minute and immediately retested. If the colour is due to iodide it will now be deeper, whereas if due to blood a "negative" will be obtained.

Pus (unless red cells were also present), bromides, and sweat gave negative results, but any oxidizing agent will also give a false positive.

The desirable sensitivity of a chemical test for blood in urine depends upon the number of red cells that may be excreted by normal persons. It has been estimated by Larcom and Carter (1948) that up to 2 red cells per c.mm. may be present in the urine of normal adult males. Comparable figures for normal females are not available, but from the results obtained with the tablet (see below) it would appear that the figure may be ten times as great.

It has been shown that the tablet test will detect 50 red cells per c.mm. To demonstrate the rarity of significant haematuria below this level, and to show that a more sensitive test would give positive results with many normal urines, three separate series of experiments were made.

Series I.—One hundred specimens of urine sent to the laboratory for routine investigation were tested with the tablet and 42 gave positive results. Confirmation was obtained by microscopy of the centrifuged specimen. Neither false positives nor false negatives were encountered.

Series II.—Ordinary urine specimens from 100 male and 50 female patients, without known haematuria, were tested with the tablet and 13 gave positive results. In every case further investigation showed a pathological cause.

Series III.—It was found that, when 12.5 ml. of urine to which had been added 5 red cells per c.mm. was centri-

TABLE V.—To Demonstrate that Urine from Normal Females may Contain 5–50 Red Cells per c.mm. (Series III in text)

Before Concentrating				After Concentrating			
Male		Female		Male		Female	
Pos.	Neg.	Pos.	Neg.	Pos.	Neg.	Pos.	Neg.
0	50	0	50	0	50	32	18

The concentration of red cells in the urine specimens was increased tenfold by centrifuging 12.5 ml. at 3,000 revolutions per minute for ten minutes and removing 12 ml. of supernatant fluid.

fuged at 3,000 revolutions per minute for 10 minutes, and 12 ml. of supernatant fluid was pipetted off, the deposit gave a positive result with the tablet and presumably contained at least 50 red cells per c.mm. One hundred ordinary specimens, which on routine microscopy were not abnormal, were treated in this way and the deposits tested with the tablet. The results showed that urine from normal females frequently contains between 5 and 50 red cells per c.mm. (Table V).

Conclusion

The tablet has been used during the last six months as a routine test in a general medical ward and in the casualty department of a teaching hospital. In no case has haematuria been found by the pathological laboratory when the tablet had given a negative result. The tablet has been found particularly valuable as corroboratory evidence in a clinical diagnosis of cystitis or pyelitis, and as a daily test to discover when known haematuria ceases. It has also been found useful as an additional safeguard to prevent overdosage with anticoagulant drugs.

Summary

A tablet to detect the presence of blood in urine is described. The test is sensitive to a minimum concentration of 50 red cells per c.mm. or of 150 μ g. of haemoglobin per 100 ml. of urine. It is reliable and simple to perform.

The influence of pH and temperature is described, and has been found to be small.

It is considered that the tablet is useful as a screening test and to decide when known haematuria ceases.

I wish to thank Professor C. H. Gray and Dr. Arthur Jordan for their advice and encouragement, and Mr. J. E. Cocking, chief pharmacist at Sheffield Royal Hospital, for help in preparing the tablets. While this work was in progress it was discovered that Messrs. Ames Co. Inc. had prepared a similar tablet. This tablet has been examined and found identical in all its properties, except that a negative remains colourless for only five minutes. It is hoped that their product will be available soon. My thanks are due to Messrs. Ames Co. (London) Ltd. for their co-operation and for supplies of both their own and my tablet.

Medical Memoranda

Myxoma of the Auricle

Upwards of one hundred cases of myxoma of the auricle have been reported in the literature; the present case is described not so much on account of its unusual features as to stress once again the importance of keeping in mind the possibility of a cardiac neoplasm. A diagnosis prior to necropsy is still virtually impossible, but the time must surely come when this condition will be revealed at thoracotomy in a case mistakenly diagnosed as mitral stenosis.

CASE REPORT

A well-nourished man of 35 was first seen in February, 1953, complaining of dyspnoea on exertion for the past month. He had had a brief attack a year before. He was troubled by nausea and fairly frequent vomiting, loss of weight, and a sensation of great weakness. There was no history of rheumatic fever. He had a slight malar flush and slight cyanosis; the pulse was small and regular; there was no thrill, and the apex beat was 3 $\frac{1}{2}$ in. (9 cm.) from the

midline in the fifth space. A faint blowing systolic murmur was heard at the apex, and the faintest diastolic rumbling murmur was heard just inside the apex only when the patient was lying on the left side. There was no evidence of congestive failure. Radiologically the transverse diameter of the heart was increased and its left border straightened. Screening with a barium swallow showed moderate simple enlargement of the left auricle. Neurofibromatosis was also present in the form of small nodules on arms and back, with café-au-lait patches. A diagnosis of mitral stenosis was made: the prognosis was considered to be favourable.

He was seen again a month later, by which time the vomiting had stopped and the diastolic murmur had become inaudible. He seemed well enough to carry on with his job as a fitter. On April 30 he was still at work. The systolic murmur had become much louder.

On July 23 he was admitted to hospital in cardiac failure with gross oedema of the ankles, raised neck veins, hepatomegaly, and an apex beat 4 $\frac{1}{2}$ in. (11.4 cm.) from the midline. The low-pitched diastolic murmur had reappeared and triple rhythm was apparent. He had had a "chill" in May and on getting up from bed after five weeks had first noticed that his ankles were swollen. He was treated with digitalis and mercurial diuretics but failed to respond, and after he had been ten days in hospital we began to doubt the accuracy of the diagnosis, casting about in our minds for an explanation of such acute cardiac failure without any new features in the heart sounds, apart from the triple rhythm, and without evidence of pericarditis or a recurrence of acute rheumatic carditis.

An x-ray film of July 29 showed gross generalized cardiac enlargement, small pleural effusions, and the appearance of an infarct in the right lower lobe. Little did we realize the true state of affairs. Steady deterioration, in spite of treatment, ended in death on August 16, the pulse remaining regular, and the anasarca increasing day by day.

NECROPSY REPORT

External Examination.—The body was that of a young man showing gross oedema from the waist downwards. There were scattered café-au-lait spots and occasional neurofibromatous nodules in the skin. Some cyanosis was present.

Internal Examination.—C.V.S.: There was excess clear yellow fluid in the pericardial sac. The heart was enormously enlarged, mainly from hypertrophy of the left auricle, right auricle, and right ventricle. The myocardium was somewhat flabby but free from obvious lesions. The valves were normal except for some incompetence due to the dilatation. The whole of the left auricle was occupied by a shiny, sessile tumour measuring 7.5 by 6 by 4 cm. attached to the interauricular septum above the rim of the annulus ovale (see photograph). So tightly was the wall of the auricle stretched over the tumour that it was impossible to approximate the cut edges after the tumour had been exposed. The main vessels were normal, but the aorta appeared hypoplastic. **Respiratory System:** The larynx, trachea, and main bronchi contained blood-stained mucus. Both lungs showed numerous large infarctions and were grossly oedematous. About one pint (570 ml.) of clear yellow fluid was present in each pleural cavity. There was some fibrinous deposit over

Photograph showing the tumour.

the larger infarctions. *Abdomen*: The liver showed chronic nutmeg change with early cardiac cirrhosis. The spleen was about one and a half times normal size. The remaining abdominal organs were normal. *Lymphatic System*: The glands of the neck and chest were grossly oedematous and much enlarged, but the cut surface appeared normal. The brain was not examined. Cause of death: (a) congestive cardiac failure, and (b) myxoma of left auricle.

COMMENT

Viewing this case retrospectively, it is unlikely, even if the true diagnosis had occurred to us as a possibility, that we would have been disposed to retreat from the diagnosis of mitral stenosis, since the clinical pattern could be fairly well correlated with its aetiological type and the signs of failure were not disproportionate to the physical findings. Like most cases of cardiac myxoma, however, this one presented with severe cardiac failure, relentlessly and rapidly progressing and failing to respond to any treatment. A large proportion of the cases in the literature presented with systolic and diastolic apical murmurs. Several of the features frequently found in myxoma of the heart were absent: namely, preference for lying flat for the relief of the dyspnoea; embolic phenomena from fragments of the tumour; sudden onset with fainting attacks; and sudden death.

The E.C.G. did not show enlarged P waves and right ventricular strain as reported in some cases.

The deceptive resemblance of this case to one of mitral stenosis, when considered feature by feature, was quite remarkable.

Our thanks are due to Mr. J. Corbett, of the Worcester Royal Infirmary, for the photograph. We are indebted to Dr. F. Kurrein for the necropsy notes.

Sudden Operative Death Due to Tumour Embolism

Sudden and unexpected death on the operating table is, fortunately, a rare occurrence. The following unusual case is reported.

CASE REPORT

A man of 63 gave a history of repeated vomiting for nine months, during which time he had lost about 2 st. (12.7 kg.) in weight. There were no urinary symptoms.

On examination he was thin and had obviously lost weight. He was 5 ft. 4 in. (163 cm.) tall and weighed about 8 st. 12 lb. (56.2 kg.). There were two upper abdominal scars from previous operations. His first operation was probably for closure of a perforation and the second was a gastro-enterostomy performed in 1931. The right kidney was enlarged. The left kidney, liver, and spleen were not palpable. Clinical examination of the respiratory and cardiovascular systems showed no abnormality except mild hypertension (B.P. 160/90). The Hb was 83% (Sahli). The W.R. was negative. Pyelography revealed a gross filling defect of the right renal pelvis and calices, suggestive of a renal tumour. Chest x-ray examination showed no evidence of metastatic disease. As a result of these findings a right nephrectomy was undertaken.

The patient was given morphine, $\frac{1}{2}$ gr. (11 mg.), and atropine, 1/100 gr. (0.65 mg.), subcutaneously an hour before operation. Anaesthesia was induced with thiopentone, 400 mg., and D-tubocurarine chloride, 15 mg. After inflation of the lungs with oxygen, a cuffed endotracheal tube was passed under direct vision. Anaesthesia was maintained with cyclopropane and oxygen, respiration being assisted for about 10 minutes but controlled thereafter.

With the patient in the lateral position, an incision was made parallel to the right 12th rib, extending round into the right iliac fossa. The muscles were divided and the perinephric fat was exposed. A very large irregular hypernephroma presented; it was exceedingly difficult to mobilize.

On its surface were numerous large distended veins suggesting obstruction of the renal vein.

The patient's condition was quite satisfactory and his blood pressure was well maintained until about half an hour after the start of the operation, when his pulse ceased suddenly. Confirmation of the absence of the heart beat was obtained by palpation of the aorta. At this point the tumour had been mobilized and all but delivered through the incision. Methedrine (30 mg.) was injected intravenously, the veins being still prominent, and cardiac massage attempted, but without effect. Death was apparently immediate. There was no bronchospasm, since inflation of the lungs was uniformly easy at all times.

The main finding at necropsy was a large tumour embolus in the right pulmonary artery, completely occluding this vessel. There were no metastatic deposits in the lungs. The para-aortic glands, from the coeliac axis to the bifurcation of the aorta, were invaded by tumour, and metastases were present in the bodies of the 12th thoracic and first three lumbar vertebrae. The right kidney had been removed at operation. No tumour was discovered in the remaining small proximal portion of renal vein and there was no evidence of tumour in the inferior vena cava. Apart from the above findings and the presence of a long-standing gastro-enterostomy and one or two old adhesions between the duodenum and coils of jejunum, there were no other pathological findings.

The specimen removed at operation consisted of a kidney and tumour weighing 945 g. It measured 6 by 6 by 3 in. (15 by 15 by 7.5 cm.). Only the upper pole of the kidney with two pyramids remained intact. The rest of the kidney was invaded, and stretched over a mass of tumour which had compressed and distorted the renal calices and pelvis, but had not appeared to invade them. Externally the tumour had caused coarse lobulation of the kidney; much of it was necrotic and haemorrhagic, and the best-preserved portion consisted of lobules of soft greyish-white tumour tissue. The growth was confined laterally by a peripheral zone of renal substance and renal capsule; medially it had extended towards the midline and projected $2\frac{1}{2}$ in. (6.3 cm.) beyond the normal pelvi-ureteric junction. No invasion of renal veins could be seen on naked-eye examination of the specimen.

Microscopically the tumour was a renal carcinoma which, in the better-preserved areas, was composed of large cuboidal cells arranged both in a coarse papilliferous manner and in solid sheets of cells. The nuclei were vesicular, and many of them contained a single prominent nucleolus; mitotic figures, although present, were few in number. Necrosis and haemorrhage were widespread throughout the tumour. Although no tumour was seen in the renal vein on naked-eye examination, it was obvious microscopically that several larger veins at the hilum of the kidney had become involved.

The embolus in the pulmonary artery was composed of tumour cells similar in appearance to those of the primary growth in the kidney.

The cause of death in this case was a massive pulmonary embolus of tumour tissue which presumably had been dislodged from the renal vein during operation.

Comment.—We have been able to find only two published reports (Pettersson, 1941; Mimpriss and Birt, 1949) of death due to tumour embolism at operation, which is surprising in view of the frequency with which hypernephroma spreads into the renal vein and even into the inferior vena cava.

We wish to thank Mr. W. A. D. Adamson for permission to publish this case, and Professor A. M. Drennan and Dr. John Gillies for helpful advice.

Reviews

PAEDIATRICS FOR PRACTITIONERS

Paediatrics for the Practitioner. Under the general editorship of Wilfrid Gaisford, M.D., M.Sc., F.R.C.P., and Reginald Lightwood, M.D., F.R.C.P., D.P.H. Volumes I, II, and III + Index. (Volume I—pp. 563 + xv + 34 pp. index; Volume II—pp. 533 + ix + 32 pp. index; Volume III—pp. 632 + xi + 38 pp. index; Index—pp. 119 + v. Illustrated. £13 10s. the set.) London: Butterworth and Co. Ltd. 1953, 1954, and 1955.

The last of the three volumes of this work has now appeared along with an index volume, and a set is completed that will be of value to practitioners in many lands. The articles are written by experts in the different subjects, and naturally the descriptions of diseases and their diagnosis and treatment are authoritative.

The books are said to be planned and written for the family doctor, but they constitute a small reference library to the present practice of paediatrics in its medical, dermatological, psychiatric, and other branches. Surgical conditions and the diseases of the eye, nose, ear, and throat are dealt with—and rightly so in a comprehensive work on the health and diseases of children. Tropical conditions and illnesses are well described. Throughout the work pathology, by intention, is dealt with very briefly, and only the more important references are given.

About sixty contributors from Britain and other parts of the Commonwealth have written the various chapters, but the volumes have been well edited and the multiple authorship is not very noticeable, although some of the articles are better written than others. Rubrics and the good index make the volumes easy of rapid consultation, and the plentiful photographs and radiographs will prove very helpful to practitioners.

The three volumes and the index are printed on good art paper and are well bound. The price is high, however, and one wonders if it could have been reduced by getting the articles and the index into, say, two volumes. The repetition of the appointments held by the contributors and the needless list of contents at the heads of the chapters, however small, might have been dispensed with and space thereby saved.

Family doctors will consult these good books with profit to their patients and pleasure to themselves, and the initial cost appears less when it is remembered that the work is to be kept up to date by regular supplements.

JOHN CRAIG.

RADIOBIOLOGICAL RESEARCH

Biological Effects of External X and Gamma Radiation. Part I. Edited by Raymond E. Zirkle. (Pp. 530 + xxvi; illustrated. 58s.) London, New York, Toronto: McGraw-Hill Book Company Inc. 1954.

This book is an account of some of the radiobiological research carried out in the United States at the Metallurgical Laboratory of the University of Chicago and the National Cancer Institute, Bethesda, during the war between September 1, 1942, and June 30, 1945. The various chapters are based on reports issued, with one exception, between June, 1946, and April, 1947; many of the reports have been included in the well-known MDDC series. In a number of the chapters more recent experimental evidence has been added. As the editor points out, the work was subject to the usual disadvantages of wartime research and development, especially haste and security regulations, but "on the other hand it proceeded under very advantageous financial support." It was inevitable that most of the writing was done rather hurriedly, because immediately after the war many of the authors were returning to their civilian positions.

The first six chapters deal with effects of long-continued total body gamma irradiation of mice, guinea-pigs, and

rabbits, and are a valuable summary of the experiments carried out by the late Egon Lorenz and his colleagues. Of particular interest is Chapter 4, on the effects of chronic irradiation on the breeding behaviour of mice. Chapters 7 to 13 deal with studies of total body irradiation of rabbits and are a useful summary of the work of Leon O. Jacobson and his colleagues. It is unfortunate that Chapter 13, entitled "Heparinemia (?) An Anticoagulant in the Blood of Dogs with Haemorrhagic Tendency after Total-body Exposure to Roentgen Rays," appears only in abstract form. Although it has been published in full elsewhere (*J. exp. Med.*, 1948, 87, 71), it is an interesting piece of work and it would have been useful to include it in this volume. Of the biochemical work reported in Chapters 14 to 20 the studies of the effects of x rays on the activity of enzymes and on tissue metabolism, by E. S. Guzman Barron, are now recognized as classical contributions. Interesting information not otherwise easily available is given in Chapter 21 on the effectiveness of drugs in preventing or alleviating x-ray damage.

It would be easy to criticize this book as hastily written and inadequately edited. However, such criticism would be unfair, because it would not have been possible to produce this volume without these inevitable and essentially minor defects. Although most of the work described is no longer new and has already been incorporated into current knowledge, it is useful to have these reports collected together in a single volume.

The book as a whole is a valuable contribution to radiobiology, and is a tribute to the wisdom of Professor Arthur H. Compton and Dr. Robert S. Stone in the planning and carrying out of a major wartime project of radiobiological research.

J. S. MITCHELL.

CLINICAL DIAGNOSIS

Clinical Diagnosis. By Elmer G. Wakefield, B.S.A., B.Sc., M.D., F.A.C.P. (Pp. 1,611 + ix; illustrated. \$22.50.) New York: Appleton-Century-Crofts Inc. 1955.

Professor Wakefield here presents an imposing and beautifully produced volume which really combines instruction in clinical methods with a description of diseases such as is normally encountered in a textbook of medicine. The arrangement of the contents is unusual and must be studied in order to obtain full value. Thus regional diagnosis with emphasis on history, examination, and descriptive terms is followed by chapters on systemic diseases. The third part is headed "The Body as a Whole," and here we must search for infectious diseases, allergy, and other constitutional maladies. The author through his work shows originality of thought and presentation and can rest assured of success.

A. H. DOUTHWAITE.

THE PULMONARY CIRCULATION

The Auxiliary Heart. By William Walter Wasson, M.D. (Pp. 184 + xix; illustrated. 75s.) Springfield, Illinois: Charles C. Thomas. Oxford: Blackwell Scientific Publications. 1954.

The "auxiliary heart" referred to in the title of this book is the pulmonary circulation. This monograph studies the events which take place in the thorax—breathing and so forth—to help the flow of blood from the right side of the heart to the left. Without these the author believes that the circulation through the lungs could hardly be maintained. The anatomy of the lungs is discussed and then the physiology. There are a number of good diagrams and pictures of models; also some sections oddly called microphotographs. Much importance is attached to measurements of the thickness of the wall of the right ventricle, but no explanation is given of the method of measurement—important when one remembers what the wall of the ventricle is really like. Here and in the chapter on physiodynamics there are plenty of facts, but they come ill arranged and lack clear and orderly presentation. There is nothing about the important matter of the control of the pulmonary

arterioles. The chapter on the evaluation of the x-ray film rather loses its value, for the films shown in illustration have little worth. The chapter on the diaphragmatic syndrome leaves one in the dark as to its nature. The name of Hitzenger is looked for in vain. The historical sketch omits the name of Osler in connexion with Servetus. It is satisfactory to note that someone in 1943 realized that Harvey discovered the pulmonary circulation; but this chapter is perhaps the best in the book.

TERENCE EAST.

EXTRACELLULAR FLUID

Chemical Anatomy, Physiology and Pathology of Extracellular Fluid: A Lecture Syllabus. By James L. Gamble. Sixth edition. (Pp. 164; 68 charts. 18s.) Cambridge, Massachusetts: Harvard University Press. London: Oxford University Press. 1954.

J. L. Gamble must be reckoned as one of the founding fathers of electrolyte studies, and the appearance of a new edition of his monograph on extracellular fluid represents the republication of a classic. His diagrams have been much used and widely copied, and their very excellence has now made "Gamblegrams" familiar. The present edition contains 68 charts, of which three are new. Chart 3 shows the "osmolar equality of body fluids"—a matter not beyond controversy. Chart 55 documents very clearly the reciprocal relationship between sodium and potassium balance. Chart 67 expresses the results of Carl Schmidt (1850) and von Bunge (1873) in modern terms. There has been some minor revision of the text, and in Chart 2 sodium has been admitted into intracellular fluid. Otherwise there is little alteration since the 1942 edition, and to some extent this reflects the stability of the foundations which were then laid.

In some ways revision could profitably have been more radical; in other words, it is now almost impossible to describe extracellular fluid in comparative isolation from cellular metabolism and renal tubule-cell function. Darrow's work on potassium depletion and extracellular fluid composition is not dealt with, nor are the studies of Pitts and others on the effects of fixed acid and alkali, and of carbon-dioxide tension, on the composition of the urine and so of extracellular fluid. These seem to me important omissions in judging a current monograph, but I would not wish to obscure the solid merits of a work which has served decades of students, and which many who have not been able to obtain previous editions will wish to possess.

D. A. K. BLACK.

CONSULTING-ROOM GYNAECOLOGY

Office Gynecology. By J. P. Greenhill, B.S., M.D., F.A.C.S. Sixth edition. (Pp. 517; illustrated. 60s.) Chicago: Year Book Publishers Inc. London: Interscience Publishers Ltd. 1954.

The prospective reader of this book should realize that it is not a textbook of gynaecology. It is an American volume written as a guide to those doctors (not necessarily gynaecological specialists) who have to deal with gynaecological problems in their practices. As its name implies, it gives an account of all those procedures of diagnosis and treatment which can be carried out in the consulting-room or "office." Naturally it reflects Transatlantic opinion, and in regard to the subject-matter more than in any other respect the differences between American and British practice can be judged, for it deals with some procedures—for example, culdoscopy—which gynaecologists in this country would scarcely consider suitable for the consulting-room.

The author's eminence in his specialty and his reputation in the literary field are well known. It is not surprising, therefore, that this book is now in its sixth edition. For this it has been thoroughly revised and enlarged, while the production remains of a high standard, and the illustrations are adequate. It contains much up-to-date and essentially practical information on the majority of gynaecological topics, while it deals with some matters—for

example, contraception, psychosomatic gynaecology, and premarital examination—which are not adequately dealt with in most gynaecological textbooks.

This is a "different" book which could be read with benefit by many practising gynaecologists. In particular it should prove useful to registrars, house officers, and others who may be embarking on the practice of gynaecology and require guidance on practical problems.

MOSTYN P. EMBREY.

WILLIAM AND CHARLES MAYO

The Doctors Mayo. By Helen Clapesattle. Second edition, condensed. (Pp. 426+xiii; illustrated. 38s.) Minneapolis: University of Minnesota Press. London: Oxford University Press. 1955.

William Worrall Mayo was an impetuous youth who left Salford to try his fortune in America. He had received some medical training in England and obtained a diploma in America. After many vicissitudes he settled in general practice in Rochester, Minnesota, where he began to do some surgery. He married Louise Abigail Wright, a wise and clever woman whose balanced judgment and common sense offset her husband's impatient and quixotic temperament. Their two sons, William and Charles, were brought up in a surgical atmosphere, and after qualification joined their father in practice. Surgery was just about to take a big leap forward, and the two sons were clever, modest, enterprising, eager to learn, courageous, and hard-working. Both were excellent technical surgeons, and their good results were freely discussed in the local papers. They travelled anywhere to learn new techniques, their reputations deservedly and rapidly increased, and their surgical clinic was run on business lines.

This might have sufficed for most men, but William Mayo was an administrative genius, a man with far-seeing vision who could "lay out broad policies," and gradually the busy clinic was organized on a gigantic scale. It was a business concern with large profits; but the mind of William Mayo was benevolent, and he and his brother were inspired by the teaching of their father that "any man who has physical strength, intellectual capacity, or unusual opportunity, holds such endowments in trust to do with them for others in proportion to his gifts." Thus arose the Mayo Foundation and the vast scheme for postgraduate medical education in connexion with the local university.

The story told in this interesting book is remarkable, but the opportunity could never happen again. We are sorry to see that the erroneous statement is made on page 75 that Henry Wellcome married the daughter of Mr. Burroughs. On page 247 we think "Peterson" should read "Paterson." Line 29 on page 236, which reads "professor of the common duct," is obviously wrongly set up.

We would like to recommend to all who are about to make a speech the advice given by William Mayo—advice which should be written in letters of gold on the walls of every hall in which meetings are held: "Begin with an arresting sentence; close with a strong summary; in between speak simply, clearly, always to the point; and, above all, be brief." William Mayo followed his own advice. He was a wise man.

ZACHARY COPE.

The Medical Directory for 1955 (J. and A. Churchill Ltd., London, 72s.), which is now available, follows the form adopted last year of listing the 83,192 names in alphabetical order without any topographical distinction. The first volume gives details about medical periodicals, medical trades, the General Medical Council, and so on. The second volume contains the "local lists," and the usual information about health departments, colleges, medical schools, postgraduate institutions, the hospitals of the various regions, and a "late list" of newly qualified practitioners and changes of address notified too late for inclusion in the main alphabetical list. Messrs. J. and A. Churchill are to be congratulated on the continuing high standard of accuracy of this work.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY JUNE 25 1955

THE PRESIDENTIAL ADDRESS

Dr. T. C. Routley's official career as General Secretary of the Canadian Medical Association having just ended, his colleagues in Canada have shown their appreciation of his notable services by nominating him President not only of the Medical Association of the great Dominion but also of the B.M.A.—the latter nomination receiving the unanimous endorsement of the Representative Body when it formally elected him at the Cardiff meeting in 1953. During the first four days of this week Dr. Routley has been presiding, at Toronto, over the Joint Annual Meeting of the British Medical Association, the Canadian Medical Association, and the Ontario Medical Association in Toronto, and the presidential address which he gave last Monday evening appears in our opening pages. This is the fourth time that the British Medical Association has met in Canada, and Dr. Routley, by examining the records of the three previous meetings—in 1897, 1906, and 1930—clearly shows how the rapid assimilation of new knowledge revolutionizes medical practice, yet at the same time complicates rather than simplifies the task of the doctor. In spite of great successes in the preventive and therapeutic fields, the weight of medical responsibility is probably heavier than it has ever been—the recent difficulties with the mass vaccination of children against poliomyelitis might be cited as a case in point—and it is therefore all the more important that the medical profession as a whole should be able to speak with one voice. In seeking to bring this about Dr. Routley has been a great and beneficent force in welding Canadian doctors into a harmonious unity and in promoting those things that matter in the life of an organization of professional men and women. But, more than that, he has been an ambassador at large for his own country wherever doctors have gathered together in professional conferences. For years he has been a familiar figure at the annual meetings of the American Medical Association, and he has many times been with us at our meetings in Britain.

Dr. Routley has never let his vision be distracted by over-preoccupation with the daily tasks of administration. He has wisely seen these as means,

not as ends. And the principal end has been co-operation among doctors the world over to promote health and to alleviate suffering; and also to foster relationships between medical men of differing nations—in other words to spread the idea of Commonwealth among the medical men and women of the world. So it was not unexpected to find him an active force in the formation of two important international medical organizations—the World Health Organization and the World Medical Association, both of them having their origins in bodies established in the years between the two world wars, and both of them, in effect, having a renaissance in the year after the end of the war, in 1946. Dr. Routley outlines the objects of these two organizations in the latter part of his address, and draws timely attention to the fact that co-operation with W.H.O. is an active aim of the W.M.A. The World Health Organization is an intergovernmental specialized agency of United Nations. It receives its funds from its member states; it has a large central administration in Geneva; its concern is principally with the promotion of public health measures. The World Medical Association is an international organization of national medical associations. Its funds come partly from the subscriptions of its member organizations and principally from benefactors and medical men and groups in the U.S.A. It has a small, hard-worked secretariat in New York; its concern is largely with the problems of medical care for the individual sick person, involving as this necessarily does the education of the doctor and his code of ethics. As Dr. Routley points out, these two international medical organizations are complementary to each other, not duplicating mechanisms. Their evolution owes much to the President of the B.M.A. for the coming year, and the W.M.A. in particular is a witness to his foresight and his faith in internationalism in medicine. The world of medicine is much indebted to him.

ELECTROLYTE BALANCE IN CARDIAC FAILURE

The disturbances of electrolyte balance in congestive cardiac failure are complex,¹ but retention of sodium by the kidneys is an early important feature. A proportional amount of water is also retained in an attempt to preserve the normal osmotic pressure of the extracellular fluid. This leads to expansion of the extracellular compartment, and a fall in the concentration of sodium. The passage of the excess sodium ions into the cells replaces potassium ions, which pass out of the cells and are

rapidly excreted. The passage of sodium ions out of the extracellular space in excess of chloride ions produces a relative acidosis. There is therefore sodium retention, potassium deficit, slight acidosis, and oedema, but the serum sodium is low because of dilution. In these circumstances the administration of mercurial diuretics and a diet low in salt is usually dramatically effective. The diuretics act on the renal tubules to produce diuresis primarily of chloride but secondarily of sodium and water.

But overenthusiastic use of mercurial diuretics, especially in conjunction with a diet very low in sodium, may result in disaster. H. A. Schroeder² described a syndrome consisting in falling urinary output, rising blood urea, low concentrations of serum sodium and chloride, restlessness, drowsiness, hypotension, and circulatory collapse due to excessive depletion of body sodium ("low-salt syndrome"). While this occurs occasionally, a much commoner electrolyte disorder following mercurial therapy is hypochloraemic alkalosis, caused by depletion of chloride in excess of sodium. This leads to alkalosis, often associated with hypopotaemia, and to resistance to mercurial diuretics. Attempts to force a diuresis by administering more diuretics are ineffectual and may even be dangerous, as D. Newman³ has recently pointed out. As well as cardiac failure persisting, the symptoms and signs of potassium deficiency may appear—weakness, hypotonia, and (especially if the patient is on digitalis) frequent ventricular ectopic contractions. Sudden death from a cardiac arrhythmia may then follow.

Some knowledge of the broad outlines of the biochemical deviations apt to accompany congestive failure is essential for the efficient management of patients with this condition. In general, it is wise not to administer mercurial diuretics more frequently than twice a week. A falling urinary output in patients so treated indicates the need to seek the cause of the failure to respond to mercurials rather than to increase the frequency of their administration. Usually some degree of hypochloraemic alkalosis will be the cause, and this can be corrected by administering acidifying agents, especially ammonium chloride, either regularly or before each injection of diuretic. Since hypopotaemia is apt to appear in congestive failure, and since mercurials cause a potassium diuresis, there is much to be said for administering potassium salts by mouth to patients receiving these drugs regularly: 2–3 g. a day can safely be given orally, provided renal function is not seriously im-

paired. Should these measures fail, oedema may be reduced by substituting cation exchange resins for mercurial diuretics. These resins inhibit the absorption of sodium from the gut, and also cause an acidosis. Indeed, diuretics and resins might be effectively alternated over periods of a few weeks.⁴ This regime would avoid the dangers both of prolonged resin and of prolonged mercurial diuretic therapy.

The grossly oedematous patient who fails initially to respond to mercurials often presents a formidable therapeutic problem. The electrolyte pattern of the body fluids is usually very abnormal: the blood urea is high, and the sodium and chloride concentrations of the extracellular space are considerably reduced, the chloride usually more than the sodium. Such a patient may be improved by the well-established practice of draining the oedema fluid through multiple punctures in the back of the feet while being nursed in the sitting position; diuretics must be discontinued. However, large amounts of electrolytes may be lost in the fluid drained in this way, and sodium, chloride, and potassium supplements to the diet may be necessary. When the oedema has largely resolved, and the electrolyte pattern and blood urea have returned towards normal again, diuretics may be cautiously begun.

Patients with long-standing congestive heart failure, or acute severe failure, terminally develop irreversible electrolyte disruption: they become severely oedematous, the serum sodium and chloride are markedly reduced (owing to dilution), the blood urea is raised, and all measures fail to avert a fatal outcome. It is often difficult to judge exactly when this state has been reached, but, when repeated readjustments of the therapeutic regime and attempts to correct the electrolyte imbalance produce either an increase in oedema or further depression of the extracellular electrolyte concentration, the heart is usually irreversibly damaged and the prognosis hopeless.

Newman³ points out that the so-called low-salt syndrome is probably the result of a combination of genuine salt deficiency and salt dilution. Salt deficiency can be due to loss of salt from sweating, diarrhoea, removal of ascitic or oedema fluid by paracentesis, or treatment with mercurial diuretics, combined with a low salt intake. Administration of excess of water without salt causes further dilution, and aggravates the condition. The syndrome differs from hypochloraemic alkalosis in that the deficiency is principally of sodium rather than of chloride, and there is therefore an acidosis rather than an alkalosis. Not infrequently the two conditions may be combined, and hypochloraemic alkalosis may lead to the low-salt syndrome. The treatment of the true salt-

deficiency syndrome consists in the intravenous administration of small amounts of hypertonic saline, but this may precipitate pulmonary oedema in a patient suffering from hypochloraemic alkalosis and salt dilution. Hypertonic saline is therefore rarely indicated, because true salt deficiency without dilution is a rare condition.

Much can be done to avert the biochemical complications of congestive cardiac failure and the hazards of excessive treatment by keeping them constantly in mind. When possible, facilities for biochemical analysis should be available if patients fail to respond to mercurial diuretics. Administration of these should be stopped until the biochemical abnormalities can be accurately assessed.

IN TORONTO

The paralysis along the quays of Liverpool and Southampton prevented only a few from reaching Toronto for the Joint Annual Meeting of the B.M.A., the Canadian Medical Association, and the Ontario Medical Association. Determined to get to their chosen destination, doctors and their wives gallantly journeyed back by road to their homes and thence to other ports or to airfields. Somehow or other they all got safely to Toronto, where the warmth of Canadian hospitality and the Ontario climate made them speedily forget their ordeal of travel.

A meeting of the British Commonwealth Medical Conference from June 14 to 16 preceded the main meeting, and the delegates from eleven Commonwealth countries met under the chairmanship of Dr. T. C. Routley to discuss such subjects as medical education, rehabilitation, public relations, and the medical care of native populations. It is hoped to publish subsequently an account of this conference, the value of which was much enhanced by a day's visit to the three divisions of the Connaught Medical Research Laboratories under the guidance of the director, Dr. R. D. Defries. The Commonwealth group were entertained throughout last week by the Academy of Medicine of Toronto, the Ontario Medical Association, the executive committee of the Canadian Medical Association, and the Connaught Laboratories. They were also entertained by the Lieutenant Governor of Ontario and Mrs. L. O. Breithaupt in the Parliamentary buildings of Toronto, and by Dr. J. A. MacFarlane, Dean of the Faculty of Medicine, in Hart House, a building in most beautiful surroundings which provides for students the same kind of facilities as do the Unions of Oxford and Cambridge. The foretaste the few had of Canadian hospitality and friendliness had prepared them for the magnificent arrangements that were to unfold themselves.

In the Royal York Hotel on June 20 the long queue of those waiting to register never seemed to diminish in spite of the most efficient system for this necessary operation. Even so, groups of 200 and more were attending the round-table conferences at 9 a.m., and

there must have been between 1,500 and 2,000 persons attending the first plenary session on "The Present Status of Chemotherapy of Bacterial Infections," a report of which appears at page 1525 this week. The morning's sessions over, a large company assembled at a luncheon held in honour of Sir Henry Dale, O.M., who was awarded the Medal of Honour of the Canadian Pharmaceutical Manufacturers' Association. Dr. G. F. Strong, President of the Canadian Medical Association, was in the chair, and he was accompanied at the high table by leading representatives of the pharmaceutical industry, of the Medical Exhibitors' Association of Canada, and what Sir Henry Dale subsequently described as a "posse of presidents." Mr. C. H. Wilkins, of Toronto, after giving a comprehensive survey of Sir Henry's career, presented him with a solid gold medal embossed with the figure of the Winged Goddess of Samothrace. After more sessions in the afternoon Monday came to a close with the induction of Dr. T. C. Routley as President of the British Medical Association for 1955–6. His induction as President of the Canadian Medical Association followed on Wednesday. The Presidential Address appears in our opening pages this week.

PRE-WAR DIET IN BRITAIN

Shortly before the outbreak of the second world war Sir John (now Lord) Boyd Orr planned an extensive dietary survey which was intended to provide further evidence on relationship between poverty and malnutrition. This survey was handsomely financed by the Carnegie Trust, and was carried out by a team under Mr. David M. Lubbock: its computers were stationed at the Rowett Research Institute, Aberdeen. Particulars of the amounts of various foodstuffs purchased, and of the money spent on food, were collected from over 1,300 households, comprising nearly 8,000 persons, in 16 areas in England and Scotland. The list of places included small country villages and large towns, with rural or industrial activities. On the outbreak of hostilities the survey was stopped and the team dispersed for war duties. After a lapse of seventeen years, however, Dr. D. Harvey, of the Commonwealth Bureau of Animal Nutrition, has shown commendable perseverance in compiling a comprehensive, if belated, report.¹

In a preface Lord Woolton commends the work of the survey, and previous observations by Orr, as having guided him in the food policy which assisted so much in preserving the health of the nation during the war. The report is indeed valuable for its detailed evidence of the amounts of food which were being eaten in 1938, before our consumption of the various foodstuffs (and their distribution between different social classes) was altered by the impact of the war and by official policy. In that year, as now, a low expenditure on food implied a low intake of "protective foods" such as meat, fruit, and green vegetables, but not of "energy foods" such as bread and potatoes. On modern standards, however, the evidence for widespread deficiencies of vitamins A

and C is not very convincing. For vitamin C the estimate of the daily requirement was admittedly taken very high, and it was only just attained in the wealthiest class. For vitamin A the contributions made by the various foodstuffs were calculated from a table in an unfamiliar Danish textbook. No attempt seems to have been made to separate the highly potent carrots from the rest of "root vegetables, other than potatoes," which are all negligible as sources of vitamin A. Liver is not distinguished from other forms of meat. Few will dispute that in the days before the fortification of margarine the vitamin A intake of the poorer classes at least required anxious consideration. But the evidence included in this report does little towards converting this suspicion into solid historical fact.

MODIFICATIONS OF CORTISONE

Carefully controlled clinical trials¹⁻³ designed to study the value of cortisone in the treatment of rheumatoid arthritis have failed to show that it has any advantage over aspirin when two strictly comparable groups of patients are compared, the one receiving cortisone and the other aspirin in large doses. Despite some reports to the contrary, describing observations on uncontrolled groups of patients, there is now general acceptance of the view that, at least for something over 90% of patients with rheumatoid arthritis, there is no indication for instituting long-term cortisone treatment, and it clearly offers little in the way of direct help to the mass of sufferers. No decisive data are yet available on whether the same applies to prolonged adrenal stimulation by means of corticotrophin, and in view of the disappointing findings with cortisone this merits further trial: an encouraging report from Dr. J. W. Beattie and Professor S. J. Hartfall appears elsewhere in this issue (p. 1494). In the meantime the recognition that apparently minor changes in the structure of the steroid molecule may profoundly modify the clinical and biochemical effects of these substances has stimulated the chemists' imagination and led to the trial of numbers of such variants. The first successful one was hydrocortisone (Kendall's Compound F), which became available in 1951. Boland⁴⁻⁵ estimated that hydrocortisone (free alcohol) was 50% more potent milligram for milligram than cortisone acetate or cortisone (free alcohol), although hydrocortisone acetate was less effective than either, and he suggested that hydrocortisone was less likely to cause side-effects such as sodium retention. However, the advantages of hydrocortisone over cortisone have been almost entirely utilized for intra-

articular injections.⁶⁻⁸ The injection of hydrocortisone into soft-tissue lesions is also meeting with some success, and in this issue of the *Journal* we publish a paper by Drs. E. J. Crisp and P. Hume Kendall on its use in peri-arthritis of the shoulder (p. 1500) and another by Dr. B. G. B. Christie describing the treatment of twenty cases of de Quervain's disease with the local injection of hydrocortisone acetate (p. 1501).

The halogenated derivatives of hydrocortisone have also come in for some attention since animal studies suggested that these have a higher glycogenic activity: 9-alpha-fluoro-hydrocortisone had apparently ten times the activity of cortisone in this respect.⁹ Boland and Headley¹⁰ have reported that doses of 3 to 8 mg. per day—less than one-tenth of the equivalent effective dose of cortisone—had a considerable anti-rheumatic effect in patients. Unfortunately the salt- and water-retaining effect was enhanced also,¹¹ and to apparently a greater extent than its anti-rheumatic action, thus making the substance useless for practical therapy. This steroid was also effective when given by intra-articular injection,¹¹ but again so potent was its sodium-retaining property that this militated against its practical use. Another variant, hydrocortisone t-butyl-acetate, was, however, found by Hollander and his colleagues¹² to be more effective. Although of no immediate practical consequence, studies such as these did point the way to the possibility of improved clinical results. Against this background recent preliminary reports by Bunim and his colleagues,^{13,14} Dordick and Gluck,¹⁵ Gray and Merrick,¹⁶ and others,¹⁷ all from the U.S.A., are of interest. The variant tested apparently differs from cortisone only in the addition of one double bond and is known as metacortandrecin ("metacorten") or prednisone. It is reported to have, dose for dose, five times the initial beneficial effect of cortisone in rheumatoid arthritis and other rheumatic conditions, while electrolyte studies showed its salt-retaining properties to be slight and its effect on diabetes to be comparable to that of cortisone. However, in three of eighteen patients treated¹⁴ a duodenal ulcer developed, and in a fourth case a frank depressive psychosis was precipitated in an unstable subject. These are only preliminary studies, and it remains to be seen whether prednisone can overcome the fundamental difficulties in the way of controlling a disease such as rheumatoid arthritis by means of steroid administration, or whether the difference is largely quantitative rather than qualitative.

STERILIZATION OF ANAESTHETIC APPARATUS

On more than one occasion^{1,2} during the last few years doubts have been expressed about the efficacy of methods of sterilizing anaesthetic apparatus as they are carried out in daily practice, and a recent report³ by W. L. J. McDonald, H. J. Welch, and J. E. Keet does little to dispel them. The authors describe carefully controlled experiments designed to assess the value of

certain chemical methods of sterilizing endotracheal tubes and face masks. They smeared tubes and masks with sputum containing pathogenic organisms which had been isolated from the respiratory tract, and then, after cleaning and sterilizing the tubes and masks by standard techniques such as are commonly used in hospitals, took cultures from them. In most experiments the organisms were found to have survived. Of the methods used, the only one consistently to produce sterility of the endotracheal tubes was scrubbing the inside and outside of the tubes for one minute each with "PHisoHex solution," a preparation containing hexachlorophene. Unlike antiseptics containing phenol, PHisoHex when used in this way for over six months in clinical practice did not give rise to any mucosal or skin irritation.⁴

It is perhaps a pity that these authors did not include in their survey the practice common in Britain of boiling endotracheal tubes or of immersing them, after washing in running water, in a solution of biniodide of mercury. They dismissed autoclaving as described by M. S. Prenzlau and M. Karp⁵ as unsuitable because of its deleterious effect on rubber. So far as boiling is concerned, the life of rubber tubes sterilized in this way is appreciably shortened, even when non-greasy lubricants only are used. However, when tubes have been used on, for example, tuberculous patients, it is essential to make certain of sterility even at the expense of shortening the life of the endotracheal tube or face mask; any risk of cross-infection with tubercle bacilli must be eliminated.

That sterilization of anaesthetic equipment is desirable hardly needs statement. Items like endotracheal tubes come into intimate contact with perhaps highly infected parts of the patient. The need does not seem to be so much for effective methods of sterilization, since many by heat or chemicals are known, as for their proper use. For endotracheal tubes and similar rubber parts the ideal solution to the problem would be disposable units, like the "polymask" oxygen mask, and the infusion sets used in the United States. These would impose no extra strain on a busy operating-theatre staff. Until then the same care should be given to sterilizing anaesthetic equipment as is given to surgical instruments.

POST-MORTEM HOMOGRAFTS

The risk to life associated with extensive burns of the body is twofold. First is the phase of immediate shock: secondly, perhaps fifteen to twenty days later, comes the phase in which the loss of integrity of the skin cover is reflected in general systemic disturbances of great severity, which are aggravated by the ever-imminent risk of bacterial invasion. For the past fifteen years or so attention has been focused chiefly on the problems created by shock. More is now known both of the changes which occur and of the means of combating them, though the basic cause still remains unknown. However, increased knowledge does save the lives of an increasing number of patients, though it cannot be assumed that life is saved until the skin is completely healed again, for not until then is the patient safe.

In many cases either the area of the burn is so great that it leaves insufficient normal skin from which autografts may be taken, or the patient's general state will not permit of the simultaneous preparation of the recipient area and of the cutting of the necessary skin grafts. Nowadays the latter state is perhaps less important, but the former remains as a challenge to surgical skill and ingenuity. To solve the problem it is customary to tide the patient over the danger period by the application of homografts. These can be applied by themselves or in conjunction with autografts derived from such skin as the patient can provide for himself. The use of the homografts is merely a measure whereby time can be borrowed, for the "grafts" themselves will disappear within twelve to fifteen days: but the protection they afford during that period can notably improve the general state of the patient. There is the added advantage that the patient's own donor areas are again available for use at about the time when the homografts have disappeared.

The donors of homografts are often other patients already undergoing grafting. The skin can be stored for some weeks in an ordinary domestic refrigerator and will retain its viability if it is kept moist, sterile, and unfrozen. Other methods such as freeze-drying are under investigation, but it is too early to say whether the disadvantage of the graft's apparently slightly shorter "life" is outweighed by the advantage of its capacity for almost indefinite storage.

J. B. Brown and M. P. Fryer¹ suggest the use of skin derived from post-mortem sources, and affirm that if this skin is taken within a few hours of death it behaves in the same manner as a homograft from a living patient. The usual precautions must be taken to guard against the transmission of diseases, and clearly the consent of relatives must be obtained. Such a procedure could have national advantages. It is not difficult to envisage a state of affairs in which living but burned members of armed forces or even of a civilian population might have need of a greater amount of skin to save their lives than was available either from themselves or from such of their fellow survivors as could be spared to act as donors. The possibility of obtaining skin therefore from the recently dead deserves consideration, though administrative difficulties might be considerable. These could be overcome only by much preliminary public instruction and by much investigation and documentation to ensure the avoidance of any possible cross-contamination. Whether such an elaborate organization could be justified must depend upon the results of much more work by surgeons entrusted with the problems of treating burns, but if their findings are favourable there appears to be no reason why the process of cannibalization should not be taken further than it is to-day. We already borrow one man's blood to save the life of another: we borrow his skin, his bone, and his cornea to restore function to another. Until now it has been mainly the cornea which has been taken after death, but if the present work is substantiated a person who dies may, as Brown and Fryer point out, save the life of another person even after his own death.

EMERGENCIES IN GENERAL PRACTICE

UTERINE INERTIA

BY

CLIFFORD KENNEDY, M.B., F.R.C.Sed., F.R.C.O.G.

Consultant in Obstetrics and Gynaecology, the Royal Infirmary, Edinburgh

In recent years there has been a tendency to recognize in disordered uterine action an increasing number of separate and distinct clinical entities. It is perhaps not unnatural that this should be so when it is remembered that writers have described a complete atonia of the whole uterus, body and cervix, or, alternatively, a state of spasm which may affect the upper and lower poles at the same time. Again, an inefficient upper segment may be associated with increased tone in the middle and lower zones and with an associated resistance to dilatation of the cervix. And there are further variations of the types just mentioned.

It is not surprising, therefore, that attempts to arrange these disorders in their respective and appropriate groups have become more comprehensive, and for that very reason perhaps more confusing. The following classification is suggested:

1. *Inertia: Hypotonic (Uterus and Cervix).*
2. *Incoordinate Action (Uterus):* (a) hypertonic inertia, (b) normotonic inertia, (c) asymmetrical contraction, (d) constriction-ring dystocia.

3. *Incoordinate Action (Cervix):* cervical achalasia.

Such a division may represent an over-simplification of a highly complex and controversial subject, but there has been a tendency to over-elaborate and to give to minor clinical manifestations undue regard and emphasis, even to the extent of labelling them as quite separate conditions; those less obvious disorders are merely a stage of a more generally accepted form of disordered action. That is why "colicky" uterus and "spurious" labour have been omitted from the classification, for it is thought they are phases of, or at any rate incapable of being separated completely from, hypertonic inertia. Under the term "cervical achalasia" is included primary rigidity of the cervix, in the belief that it may be possible in the majority of cases to differentiate clinically one from the other. Secondary cervical rigidity has been deliberately omitted from the list because it is felt that here the problem is a mechanical difficulty rather than a neuromuscular upset.

Normal Uterine Action in Labour

Several writers using the tokodynamometer, with the receptors placed over the fundus, middle uterine segment, and lower uterine pole, have recorded the relative strength of the uterus at different levels. The resulting charts show a gradient of contractibility from above downwards—sometimes referred to as fundal dominance, gradient of activity, or uterine polarity. There has been much argument in recent years about the role of the cervix in labour. Nixon, Karlson, and Sauter believe that the cervix is able to contract, and the last two maintain that the cervix dilates in labour through contraction of its own muscular tissue; the more synchronous these contractions are with those of the uterine body, the quicker does the cervix dilate. This new conception is hard to accept. It is preferred rather to hold to the old view that the part played by the cervix in normal labour is entirely passive, and recent research gives strong support to this hypothesis. If such were not so, uterine polarity would have little or no place in labour.

Definition and Types of Uterine Inertia

In this article it is not proposed to discuss "secondary" uterine inertia, which may result from mechanical obstruction, and should be referred to as "uterine exhaustion," but rather to concentrate on the so-called "primary" inertia. This latter condition is difficult to define but might be described as a prolonged labour, in the absence of cephalo-pelvic disproportion, where the delay is the result of weak and infrequent or, on the other hand, disordered uterine contractions. It is urged, therefore, that when a lack of advance and slow cervical dilatation are evident at the end of 12-18 hours the patient should at once be labelled "inertia" and thereafter investigated and treated as such.

Three forms of inertia exist: hypotonic inertia, normotonic inertia, and hypertonic inertia. The first and last are the more important and more frequent varieties. Hypotonic inertia is characterized by a loss of tone in both upper and lower segments. It is therefore a true inertia with feeble activity of the uterus as a whole. In the hypertonic form, the commonest inertia, there is an increased tone and resistance to dilatation of the lower uterine pole associated with weak action of the upper segment. This is referred to as reversed polarity, and, although the condition comes within the ambit of inertia, it is more suitably classified as an example of incoordinate uterine action.

Aetiology

The aetiology is uncertain and must include many factors. There is a general consensus of opinion that primigravidae are more often affected than multiparae and that freedom from difficulty in subsequent labours indicates the temporary nature of those conditions as they may affect the uterus or its innervation. Because it is realized that in most cases the frequency and intensity of uterine contractions are influenced profoundly by the pressure of the presenting part on the lower segment, malposition, malpresentation, and deformed or contracted pelvis are said to predispose. It is probable that a lack of normal stimulus to the cervix and pelvic plexus may in such cases affect the upper segment by the nervous route. Indeed, a high presenting part may indicate incomplete lower-segment formation and may be a timely warning of impaired uterine action. Some maintain that the condition is encountered more often in the elderly primigravida, and that advanced age therefore plays a part, or where rupture of the membranes has occurred before or in the early stages of labour. The short and obese patient who shows masculine characteristics is more liable to fall victim to inertia. Extensive damage to the uterine wall, as in accidental haemorrhage, may prevent efficient contraction of the uterine muscle, but fibroids and underdevelopment are not in themselves adequate cause. Hydramnios and multiple pregnancy are said to be quite often associated with inertia, but I believe that this is not so, because the premature and short labours which characterize both conditions do not suggest any loss of tone. The third-stage bleeding which may follow a twin delivery is due not to inertia but rather to the mechanical difficulty in separating and in expelling the larger placenta.

The extent to which hormone activity may provoke or influence these disorders has inevitably excited speculation. Oestrogenic principles circulating during pregnancy are in an inactive state, and this suggests the existence of some mechanism which is protective in so far as the hormone is prevented from sensitizing the uterus prematurely. If such

be true, it may be that some cases of inertia are due to a persistence of this mechanism and any oestrogenic hormone given will be inactivated and rendered useless. Csapo and others have, however, provided a new approach to this subject. They have shown that the contractions of voluntary muscle depend very largely on the presence in the muscle of a fibrous protein complex called actomyosin and of a high-energy substance adenosine triphosphate (A.T.P.). This actomyosin-A.T.P. complex is present in the myometrium just as in striated muscle. It is thought that the main function of certain electrolytes and enzymes is the breakdown of these phosphates. In this way energy is released and restored to the contracted actomyosin, which is able to relax in a charged state ready for another contraction.

Compared with the non-pregnant uterus, the uterus just before labour has a relatively high actomyosin concentration and in labour this is much higher in the upper segment than in the lower. This is as it should be if the theory of uterine polarity be correct; indeed, it may go a long way towards explaining the difference in function of the two uterine poles. It has been shown further that oestrogens are responsible for the development of the biochemical contractile system of the uterus—actomyosin, high-energy phosphates, and the rest—and in pregnant rabbits the hypothetical curve of active oestrogen bears great similarity to that representing actomyosin concentration and A.T.P. activity. Progesterone, too, plays a part in that it modifies the energy-giving part of the contractile system by redistribution of the potassium ion through an alteration in permeability of the cell membrane.

It is believed, however, that fear is one of the most important causes of inertia. The patient has been terrified by the unknown ordeal which lies ahead, and by keeping this fear to herself she may have lived for months in a state of suppressed anxiety. It is probably true that there is nothing more difficult to assess than the mental attitude of the woman to her forthcoming labour, and it is often the woman who is casual and outwardly unperturbed by what lies before her, determined not to give way to her fears or to confess to them, who becomes the victim of inertia.

No one can describe with absolute certainty the nerve supply of the uterus and its function. It is accepted that the uterus, under appropriate conditions, can contract as an isolated organ. It is therefore difficult to understand the functions of its nervous connexions. Few now believe in the presence of an intrinsic nervous plexus, which was formerly thought to co-ordinate the actions of different parts of the uterus. There is, however, a rich supply of sympathetic (adrenergic) nerves which travel via the superior hypogastric plexus (presacral) nerve and the inferior hypogastric plexus. The motor fibres of those nerves appear to be largely inhibitory, in so far that contractions elicited by their stimulation mainly affect the lower segment. It is also said, although some doubt it, that the uterus receives a parasympathetic (cholinergic) supply from the second, third, and fourth sacral nerve roots, and that this also reaches the uterus via the inferior hypogastric plexus and the paracervical ganglia. Stimulation of these nerves is said to cause a contraction of the detrusor muscle of the upper segment.

According to this concept, the parasympathetic brings about evacuation of the uterus, whereas the sympathetic tends to prevent it, good uterine action depending on a balance between the two. It may be that sympathetic stimuli cause an increase in uterine tone while parasympathetic stimulation has the opposite effect. If uterine tone is reduced, then uterine contractions would increase in amplitude and efficiency. If, on the other hand, there is no parasympathetic supply to the uterus, efficiency must depend on a balance between the inherent muscle activity under the control of hormonal factors and the sympathetic nervous system. If the substance of this be true, there is the possibility that fear, acting on the sympathetic, maybe through adrenal stimulation, brings about a "tightening-

up" process in the region of the lower segment and circular fibres of the internal os area. Adrenaline B.P. consists of adrenaline and noradrenaline, and it has been shown that a solution of adrenaline will, in very low dosage, inhibit uterine action while noradrenaline stimulates it. It is possible that the pattern of uterine activity can be considerably distorted by some upset of balance between the two, and it is suggestive that the adrenaline level in the blood is raised in women showing a severe degree of uterine inertia.

This whole question is a very difficult one. For instance, the patient who is afraid and has a troublesome first labour should have a greater fear and even more difficulty in a subsequent confinement. This rarely happens and shows that fear is not the only factor involved. Again the division of the uterine wall into longitudinal and circular fibres is obviously incomplete when no account is taken of the oblique middle layer, the thickest of all. Likewise the variable response which the uterus gives to stimulation of the sympathetic under different conditions invalidates any general conclusion concerning the function of that part of the autonomic nervous system.

There is one further point. Three years ago Dr. T. L. Adamson and I carried out a clinical investigation into certain problems relating to uterine inertia. This showed, what some writers have denied, that the incidence of primary dysmenorrhoea was higher in the inertia group (28.3%) compared with the control group (16.6%).

Clinical Picture

The clinical picture naturally varies with the type of inertia, but it is true to say that a fairly accurate diagnosis can be made by the bedside of the patient without resorting to the tokodynamometer or other "backroom" method of assessment. The patient with hypotonic inertia has little or no pain, but when pain does occur it is felt mostly in the abdomen and only slightly in the back—in other words, the pain distribution of normal labour. It may be difficult to say definitely that labour has started, and certainty may come only with a very slow cervical dilatation, a "show" or rupture of the membranes. The patient's general condition remains good, there is no distress or tiredness, no elevation of the pulse or temperature, and not enough discomfort to cause the patient worry or any appreciable loss of morale, at any rate in the earlier stages. After 24 hours the bladder and colon may become distended, the result of an associated atonia.

With hypertonic inertia the picture is very different. Here part of the uterine wall is in spasm, and as a result the intrauterine pressure is raised. In normal labour this pressure between first-stage contractions is 5-6 mm. Hg, but where the uterine contractions are colicky the resting pressure may be raised to 15-18 mm. Hg or more. In other words, the interval pressure approaches the level of pain production. Constant pain is therefore one of the main features, this pain being present and becoming aggravated before a contraction is evident and remaining after the contraction has passed off. The contractions are intermittent and infrequent. Backache, which may have been present for several days before labour began, and which persists during labour, denotes a resistance to dilatation of the lower pole and gives the patient more distress than the abdominal discomfort. Cervical dilatation is slow. The desire to "bear down" in the first stage, a feature which is often quite disconcerting, is thought to be due to spasm of the pelvic colon or rectum. Little advance is made, and in time the patient becomes conscious of this. Her morale deteriorates, she begins to worry, she becomes more tense, and the vicious circle is complete. Eventually she becomes exhausted and the pulse and temperature rise.

Maternal and Foetal Risks

Badly chosen and ill-timed operative obstetric procedures—"heroic obstetrics" of which more will be said later—are responsible for severe trauma to the mother's soft tissues. Shock and haemorrhage may follow and have even greater significance in the woman already tired from

prolonged labour and depressed by a lengthy anaesthetic. Too much delay in deciding on the correct method of treatment and too many examinations and manipulations predispose to infection. The increased incidence of post-partum haemorrhage, retained placenta, and manual removal of the placenta must ever be borne in mind.

In prolonged labour there is also the chance of infection of the amniotic sac, with intranatal or neonatal death. Injury or death to the foetus may result from birth trauma or from uterine spasm: as already stated, when the uterine contractions are colicky, the resting intrauterine pressure is raised and is in fact often higher than the blood pressure in the placental sinuses. Such asphyxia may occur even with intact membranes.

Remote Prognosis and Prophylaxis

According to Holmes, about one-third of the women who have experienced uterine inertia deliberately avoid a further pregnancy. It is generally accepted that inertia does not often recur in subsequent labours, and that uterine efficiency improves with each pregnancy. This improvement would seem to depend largely on the degree of cervical dilatation reached in the previous labour. If half dilatation has been attained the probability is that efficient uterine action will be the rule.

Prophylactic treatment includes advice regarding mental and physical relaxation; exercises are not of much avail. Great attention should be paid to inquiring into and discussing any points about which the patient may be anxious. She should be reassured as far as is possible. It is important, too, although difficult to carry out always in hospital practice, that the patient should, during the antenatal period, get to know and trust the doctor who is to manage her confinement.

Treatment

It is of first importance that the patient with inertia should be dealt with in hospital. She should be transferred there if after 12-18 hours of labour she has made little or no advance. It is realized that a patient may have a "stuttering" type of labour for 12 hours or so and then suddenly true labour becomes established and she is soon delivered. Despite that a time limit is required and it is better to err on the safe side. There is no place for the treatment of inertia in the home if hospitalization is possible.

As soon as hospital is reached three things are done: (1) The physical and the mental conditions of the patient are assessed; (2) any mechanical factor such as malposition, disproportion, etc., is confirmed or excluded; and (3) the type of inertia is determined on clinical grounds; the tokodynamometer, if one is available, should take second place to clinical judgment.

It is of primary importance that each case should be considered on its own merits; it is therefore impossible to lay down a hard-and-fast scheme, but whichever type of inertia is present the general rules of any prolonged labour should be observed. Fluids and carbohydrates should be given freely, the bladder and rectum be emptied regularly, the pulse and temperature watched carefully, and every effort made to support morale. The patient should not be left unattended for too long.

Hypotonic Inertia

The following plan of management is recommended:

- (1) Allow the patient up during the day.
- (2) Sedatives at night may range from a mild barbiturate, such as butobarbitone "soneryl," 3 gr. (0.2 g.), to morphine, $\frac{1}{4}$ gr. (16 mg.).
- (3) Test the urine for acetone after 12 hours and four-hourly thereafter. If the test results are positive, 1,000 to 1,500 ml. of 5-10% glucose should be given intravenously.
- (4) Castor oil, 2 oz. (60 ml.), an enema, and a hot bath may be of advantage on the second day.
- (5) If labour has been allowed to drag on so long, prophylactic sulphonamide, 1 g. thrice a day, and penicillin,

250,000 units twice a day, may be indicated on the third day, or before that if the membranes rupture early.

(6) When labour advances to a certain stage—half dilatation of the cervix—malposition may be corrected or the membranes may be ruptured with good effect.

(7) There is a small place only for "heroic obstetrics"—for example, cervical incisions or manual dilatation of the cervix with subsequent forceps extraction, when the head is very low in the pelvis.

Two further points require special mention:

(8) If the uterus is hypotonic a pitocin drip infusion may be started at any time (30 drops a minute of a solution made up of 10 units of pitocin per litre of 5% glucose). This is a much safer method of administering pitocin than by injection, where there is not the same control; the infusion can be stopped at any moment and so the risk of maternal and foetal injury is minimized.

(9) The place of caesarean section is an important one. If the patient is an elderly primigravida, if the membranes have been ruptured for 24 hours or more, if the patient has been in labour for 36 hours, or if there is evidence of maternal or foetal distress, or if more conservative treatment has failed, section must be given very serious consideration.

Hypertonic Inertia

The same general rules as above obtain here, with the following additions:

- (1) The patient is best kept at rest.
- (2) Intense medication with morphine, pethidine, or other analgesics is essential. Pethidine, given in a dose of 100 mg. at three to four-hourly intervals up to a maximum of 400 mg. or intravenously (Jeffcoate has given as much as 800 mg. in 24 hours), is best throughout the day, and morphine at night.
- (3) Even more stress should be laid on detection and correction of acetonaemia.
- (4) Labour should not be allowed to proceed so long as to necessitate the administration of sulphonamides or antibiotics.
- (5) Here the uterus is already in spasm and the tone high, so a pitocin drip infusion is contraindicated.

Two final points should be stressed:

(6) In the last three years and in specially selected cases, dihydroergotamine has been used. This has a sympathocolytic effect and brings about a striking relaxation of the cervix. It reduces uterine tone without paralysing the uterine musculature and without interfering with normal contractions and rhythm. (The "strong and incessant contraction" described by Moir has not been noted. It is true, however, that as the basal tone is lowered the amplitude of the contractions is increased.) As already stated, fear produces an overactivity of the sympathetic, with a resulting inhibiting effect on the mechanism of labour, and the use of dihydroergotamine depends on this assumption. The drug has no effect on the inactive uterus, and therefore has no place in hypotonic inertia. It is advised that dihydroergotamine be given when the cervix is 5 to 6 cm. dilated. The dose recommended is 0.25 mg. administered by intramuscular injection. The action of the drug is often seen in about half an hour, but two hours may pass before the maximum effect is appreciated. A similar dose may be repeated with safety in four hours, as the action of the drug wears off within that period of time. Some writers condemn the use of dihydroergotamine.

(7) Caesarean section must again be considered for the indications already described. In hypertonic inertia, however, the morale and general condition of the patient deteriorate more rapidly and section may be demanded therefore at an earlier stage of labour.

"Acute Retention of Urine," by Mr. Alec W. Badenoch.

British Medical Association, Canadian Medical Association, and Ontario Medical Association

JOINT ANNUAL MEETING, TORONTO, 1955

SUMMARY OF PROCEEDINGS

FIRST PLENARY SESSION—"THE PRESENT STATUS OF CHEMOTHERAPY OF BACTERIAL INFECTIONS"

The first of two plenary sessions was held in the Royal York Hotel on Monday morning, June 20, and was opened by Sir JOHN MCNEE, the outgoing President of the B.M.A., who introduced Professor L. P. GARROD (London) as the chairman and opening speaker.

Chemotherapy of Bacterial Infections

After giving a chronological diary of the "new chemotherapy," with the overlap between the sulphonamides and the antibiotics, Professor GARROD pointed out that the new

Preparations of Penicillin: Blood levels vary inversely with duration of effect

and older sulphonamides had similar antibacterial activities, whereas the various antibiotics were much more selective, except that members of the tetracycline family ("aureomycin," "terramycin," "achromycin") acted very similarly. Amidst the present profusion of chemotherapeutic drugs it was difficult for the clinician to decide which was the best to use. Even penicillin was prescribable in 46 different forms, and the doctor might give injections of penicillin preparations whose effect lasted for periods varying from a few hours to several weeks (see Figure). Professor Garrod was inclined to support Eagle in his preference for longer-acting preparations.

Indications for Different Antibiotics

The indications for the use of antibiotics in different diseases could be divided into the "immutable" and the "unpredictable." In the former category penicillin was a "safe bet" for scarlet fever, lobar pneumonia, gonorrhoea, and syphilis, and for certain infections derived from animals such as anthrax and actinomycosis; streptomycin was effective in plague and tularaemia, besides tuberculosis; chloramphenicol in typhoid fever; and the tetracyclines or chloramphenicol in typhus and other rickettsial infections. In the unpredictable group were the infections where the organism might or might not be sensitive to the drug of choice, as was the case with staphylococcal infections in a hospital environment; or the physician might have to deal with clinical syndromes caused by a variety of micro-organisms, such as bronchopneumonia, meningitis, urinary tract infections, and wound sepsis. Under these circumstances the wise course was to use at once the most likely drug, after having arranged for a suitable specimen to be bacteriologically examined and tested for antibiotic sensitivity with the disk technique. A result would be available within 24 hours or earlier if an urgent report were needed. The advantages of this procedure were improved therapeutic results and economy in the use of expensive drugs.

Drawbacks and Dangers

It was well to stress the drawbacks and dangers in the indiscriminate use of chemotherapy. The main misuses were in (1) the administration of these drugs to undiagnosed cases or to insusceptible infections, particularly those due to viruses, (2) their prescription for trivial conditions such as colds and catarrhs, and (3) their too frequent use prophylactically. Besides being wasteful misuse of these chemotherapeutic drugs could lead to drug-resistance in the parasite and sensitization in the host. There was also the risk of toxic effects with certain preparations, such as eighth-nerve involvement from prolonged use of streptomycin, aplastic anaemia as a rare complication of prolonged or repeated use of chloramphenicol, or staphylococcal enterocolitis following destruction of the normal flora of the gut by the tetracyclines.

Prophylactic Use

Professor Garrod felt that in surgery chemoprophylaxis might be limited to major chest, abdominal, and cranial operations, extensive injuries, and complicated labours. Penicillin or a similar drug was indicated during dental extractions or tonsillectomy in patients with rheumatic heart disease, and for long-term use in the prophylaxis of rheumatic fever relapses. Antibiotics should not be used in everyday surgery, normal labour, clean wounds, or mouth operations, although in Britain at present the hospital doctor was tempted to a wide prophylactic use of these drugs as a protection against litigation should any untoward incident happen.

Resistant Strains of Bacteria

Dr. T. E. ROY (Toronto) discussed the increasing incidence of antibiotic-resistant strains of bacteria. Many species once susceptible to certain antibiotics now appeared to be largely insensitive to these same drugs. The degree of change varied in different localities, depending on the frequency of use of each antibiotic. The change was seen particularly in staphylococci, which were becoming increasingly resistant to many of the commonly used drugs. In the Hospital for Sick Children, Toronto, among the pathogenic staphylococci isolated during 1954 nearly two-thirds were resistant to penicillin, and about one-third to streptomycin and the tetracyclines, whereas the incidence of strains resistant to chloramphenicol and erythromycin was still very low, partly perhaps because of their relatively infrequent use. Similar trends were apparent in *Bact. coli*, which showed an increasing resistance to streptomycin and the tetracyclines, while *Proteus* and *Ps. pyocyanea* were only occasionally sensitive. However, the situation was not too discouraging. Many important species were remaining uniformly susceptible to most of the drugs to which they were formerly sensitive. These included the β -haemolytic streptococcus, the pneumococcus, the meningococcus, the gonococcus, type B *Haemophilus influenzae*, the spirochaete of syphilis, and others.

The change was particularly evident within hospitals and was considerably less marked in the community at large. For example, in their experience at the Children's Hospital in 1954 about two-thirds of the staphylococci from in-patients and about one-third of the strains from out-patients were penicillin-resistant. The corresponding figures for the tetracyclines were 34% and 8%. There were indications that, as the practice of antibiotic use became stabilized, so did the incidence of resistant strains within and without hospitals.

The mechanisms underlying these changes depended partly on the degree of use of the drugs. Treatment with antibiotics selected resistant mutant cells and allowed them to survive treatment. It also failed to suppress any naturally resistant strains which might be present. The dissemination of these strains followed by way of healthy or convalescent carriers or by other processes of cross-infection.

Fully effective solutions of the problem were still not known. The avoidance of indiscriminate, inadequate, or prolonged courses of treatment, and the use of suitable drugs in combination, might help. The use in rotation of selected antibiotics for prolonged periods of time seemed impracticable and of doubtful value. Better techniques for the control of cross-infection and for dealing with healthy and convalescent carriers were needed.

Choice of Antibiotic

Dr. K. J. R. WIGHTMAN (Toronto) dealt with the various factors that the physician must consider in deciding on the drug of choice in a particular case. So far as the patient was concerned, the severity, character, and accessibility of the infective process, the local and general capacity of the host's tissue to deal with infection, and his previous reactions to antibiotic therapy all required careful evaluation. In severe infections a drug which could safely be given in large doses and could quickly reach effective concentration in the tissues should be used. If the lesion had a poor blood supply, or was accompanied by early necrosis, venous thrombosis, abscess formation, or fluid exudate, a highly diffusible and preferably bactericidal drug was needed, perhaps combined with local chemotherapy. Again, in a malnourished or cachectic patient, in an infant or elderly man, or in the blood dyscrasias, the body defences were poorly equipped to help in overcoming infection, and in some specific fevers an adequate antibody response seemed essential for recovery without relapse.

Apart from factors due to the host, preference should be given to the bactericidal drugs—e.g., penicillin and streptomycin. So far as drug sensitization was concerned, the chance of severe and even fatal reactions to penicillin and streptomycin was sufficiently common to cause alarm, and this complication could best be guarded against by careful questioning of the patient beforehand.

Although in many patients the clinical features of the case might indicate the drug of choice, Dr. Wightman stressed the need for close co-operation with the laboratory for rational and effective chemotherapy. In deciding on a particular drug, besides the sensitivity of the infecting organism, such factors as absorption and diffusibility, mode of action (bactericidal or bacteriostatic), the risk of toxic effects or of superinfection, the ease and flexibility of administration, and even the cost to the patient in cash and discomfort, all had to be considered.

Classification of Antibiotics

He divided the antibiotics into three broad groups according to their antibacterial spectrum. In the first group, particularly active against the Gram-positive bacteria, was penicillin in its various forms. Crystalline penicillin should be used in large doses for relatively inaccessible lesions like those of subacute bacterial endocarditis, procaine penicillin and the various penicillin esters for more prolonged effects. Erythromycin was an alternative drug for penicillin, useful particularly in penicillin-resistant staphylococcal infections, although the staphylococcus could also become erythromycin-resistant following prolonged use. Bacitracin, because of its nephrotoxic effect, should be used only in severe infections. It had a synergistic action with penicillin and was a useful drug for topical use because of the low risk of sensitization.

The second group active against Gram-negative organisms included streptomycin and dihydrostreptomycin, of limited applicability because of the early development of drug resistance and the risk of eighth-nerve involvement from

prolonged use; neomycin, a nephrotoxic drug to be used systemically only in very severe infections but like bacitracin useful for topical application; and polymyxin, also a toxic drug and active particularly against the pseudomonas family.

In the third group were the broad-spectrum antibiotics, bacteriostatic in action, apt to produce gastro-intestinal upset, and potentially dangerous because of the risks of superinfection in the alimentary tract with such organisms as the staphylococcus, coliform bacilli, and yeasts. This complication was much less likely to happen with chloramphenicol, and, as the risk of blood dyscrasias with this drug had perhaps been exaggerated, he recommended its use in any condition where the indications were clear.

Dr. Wightman also discussed the indications for combined chemotherapy, of which the two most important were to prevent the emergence of drug-resistant variants and to obtain a synergistic action as in the combined use of penicillin and streptomycin in resistant cases of bacterial endocarditis.

Chemotherapy of Tuberculosis

Professor J. W. CROFTON (Edinburgh) reviewed the present procedures in the chemotherapy of tuberculosis. After showing in graphic form the remarkable fall in mortality rates from pulmonary tuberculosis in different countries since 1947, when streptomycin was first used, up to the end of 1952, a year after the introduction of isoniazid (see Figure), Dr. Crofton summarized some of the results

The Figure shows the slight change in mortality for tuberculosis in the eight years 1939-46, the marked drop in the five years following the introduction of streptomycin, and the further drop in the year following the introduction of isoniazid. The mortality figures are from the paper by F. Blanco. (*Bull. Un. int. Tuberc.*, 1954, 24, 289.)

obtained from the large-scale Medical Research Council trials in Britain and from his personal experience.

With "good chemotherapy" the following claims might be made: (1) Tubercle bacilli could be eliminated from the sputum within six months with the emergence of practically no drug-resistance, and the sputum could be kept negative even in the presence of persistent cavities; (2) most patients could get back to work within 12 to 18 months, although chemotherapy might have to be continued in a modified form in a proportion of these cases. Under these conditions the relapse rate should be very low. "Good chemotherapy" included such combinations as streptomycin 1 g. once daily plus isoniazid 100 mg. twice daily, or streptomycin 1 g. daily plus P.A.S. 5 g. four times daily, for patients under 30 years of age. On this regime older patients were more likely to suffer from giddiness, and for them and indeed for patients of any age an alternative course of treatment would be streptomycin 1 g. twice weekly plus isoniazid 100 mg. twice daily plus P.A.S. 5 g. twice or four times daily. The combination of P.A.S. and isoniazid was recommended for the less severe cases or for the follow-up period. "Risky treatment" Professor Crofton characterized as streptomycin twice weekly with either isoniazid or P.A.S. in full doses daily, since with such treatment resistance to one

or both drugs would develop in a proportion of cases. "Bad treatment" was the use of any of these drugs by itself.

"Salvage treatment" was to be used in patients with tubercle bacilli resistant to one or more of the three main drugs. In such cases the drug to which the organism was still sensitive could be used along with viomycin or oxytetracycline or pyrazinamide. These latter drugs were both more costly and more toxic than those commonly used. Chemotherapy should be continued in most cases for 9 to 12 months, when tubercle bacilli would be eliminated as shown by cultural tests or so reduced in numbers that the patient could deal with the situation. If cavities were present, chemotherapy should be maintained for 9 to 12 months after the last positive sputum or until the cavity appeared to be closed.

With "good chemotherapy" deaths were rare unless the patients were treated very late or death occurred from cor pulmonale or post-operatively. Of 107 patients under his personal care, of whom 31 had advanced, 48 moderate, and 28 minimal phthisis, observed over a period of one to three years, only two deaths occurred. All others became sputum negative and 97% were fit for work.

THE SECTIONS

SECTION OF GENERAL PRACTICE

Monday, June 20

Management of Abortion

Dr. IAN D. GRANT (Glasgow) occupied the chair when Dr. JOHN MANN (Toronto) opened a symposium on "Problems in the Management of Abortion." He said that the incidence of spontaneous abortion was about 10% of all pregnancies. Most of these were due to defective germ plasm, and a simple explanation to this effect should be given to the patient. Hormonal imbalance and general and local maternal disease were of lesser aetiological importance. Various methods of treatment were all likely to be successful, because any vaginal bleeding early in pregnancy was ascribed to threatened abortion, whereas in fact it was often of extrauterine origin. Criminal abortion occurred as often as the spontaneous type, but accounted for almost all the mortality and the great majority of the morbidity attendant on abortion.

Dr. MARY ESSLEMONT (Aberdeen) discussed abortion as seen in an urban general practice in Scotland. She believed that emotional disturbances could sometimes initiate abortion, perhaps by interfering with the hormonal balance. The aetiological importance of retroversion and of fibroids was probably over-stressed. It was sometimes difficult to be sure of the diagnosis of threatened miscarriage, especially if one wished to avoid vaginal examination. In treatment, the psychological effect of close attendance on the patient might be more valuable than any specific form of therapy. It was also difficult to decide which cases of abortion could be treated at home. Social circumstances often made hospitalization necessary in her practice, and about 40% of abortions were transferred to hospital.

Mr. J. R. NICHOLSON-LEAILEY (Taunton) dealt with the problem of the recurrent abortion. He emphasized the need for careful history-taking and thorough examination of wife and husband, for if the cause could be found and treated the outlook was good. In particular he stressed the necessity for careful repair of any deep cervical laceration. During pregnancy trauma and excitement should be avoided and the patient should retire to bed at the times of the suppressed menses. Attention to diet and to the early detection of toxæmia were important. If the urinary output of pregnadiol were low the implantation of 120 mg. of progesterone obviated the necessity for repeated injections. He then outlined some problems in the differential diagnosis of abortion, and concluded by advising complete bed-rest and adequate sedation when abortion threatened. In answer to a question, he said that in inevitable abortion he preferred conservative treatment unless there was serious bleeding or infection.

Dr. JOSLYN W. ROGERS (Toronto) detailed the indications for therapeutic abortions performed in a large non-sectarian hospital. He said that gynaecological and obstetrical complications, except carcinoma of the cervix and early but severe toxæmia, rarely necessitated termination of an otherwise normal pregnancy. Psychiatric and neurological conditions presented the greatest difficulty. Modern methods of treatment had diminished the necessity for intervention in patients with cardiac disease or phthisis. Diabetes mellitus was an indication for interference only when nephritis co-existed or when retinitis proliferans was present but without complete loss of vision. He would perform therapeutic abortion for carcinoma of the breast, but there was controversy over the advisability of the operation when rubella complicated the first trimester of pregnancy. In most cases, where a pregnancy was terminated, sterilization was a natural corollary.

TORONTO'S WELCOME

The scientific discussions at the Joint Annual Meeting began on Monday, but for some days beforehand Toronto had been welcoming delegates to the British Commonwealth Medical Conference and members of the B.M.A. as they assembled for the meeting. Toronto doctors and their wives most generously opened their homes to the visitors and over the week-end showed them something of the friendly city and more especially of the meaning of Canadian hospitality. The city's official welcome to the members of the three Associations was on Saturday, June 18, when at a civic reception Mayor Nathan Phillips spoke of the pleasure given to the Corporation of the city of Toronto by the presence of so many distinguished medical visitors. After the reception a concert was given by the Hart House Orchestra, which was conducted by Dr. Boyd Neel, who is now Principal of the Royal Conservatory of Music at Toronto and Dean of the Faculty of Music at the University. On the previous evening Lady Eaton had invited members of the British and Canadian Medical Associations to a reception and supper at Eaton Farm Hall, King, Ontario. The journey out to King was made in motor buses—not without some unexpected excitements—and with a heat-wave on in Toronto Lady Eaton's guests were particularly appreciative of her lovely garden.

On Sunday evening after the official religious service in St. James's Anglican Cathedral and celebration of Solemn Vespers at St. Michael's Cathedral, visiting members and their wives met their Toronto colleagues at numerous informal supper parties.

NEW HONG KONG UNIVERSITY OBSTETRIC DEPARTMENT

NEW MATERNITY HOSPITAL

On June 13 His Excellency, Sir ALEXANDER GRANTHAM, opened the new Tsan Yuk Maternity Hospital which will be the centre for teaching obstetrics to medical students of Hong Kong University.

The University was incorporated under a local University Ordinance in 1911 and opened in 1912. Prior to this the Hong Kong College of Medicine, which owed so much to Sir Patrick Manson and Sir James Cantlie, was responsible for medical education. The founder of the Chinese Republic, Dr. Sun Yat Sen, was one of their students.

The Old Tsan Yuk Hospital

This hospital was opened in 1922 in a densely populated part of the city to provide a maternity service for the Colony and establish a training school for Chinese girls who wished to become midwives. It contained 30 beds, and admissions during the first year were 436. The original

staff consisted of a doctor, matron, two nurses, six student midwives, and five amahs.

Through the munificence of the Rockefeller Foundation in 1926 clinical chairs were established in medicine, surgery, and obstetrics. Professor R. E. Tottenham was appointed to the chair in obstetrics. Realizing the value of the Tsan Yuk Hospital for the training of medical students as well as midwives, he effected a liaison between this hospital and the Department of Obstetrics and Gynaecology of the University. In his report of 1929 he wrote, "To my mind the University Obstetric Department and the Tsan Yuk Hospital are dependent on one another, and their union should lead in time to the development of one of the best midwifery clinics in the Far East." This hope was fulfilled, and the link between the hospital and the university has been maintained by Professor W. C. W. Nixon and later by Professor Gordon King.

In 1934 the hospital, which had hitherto been administered as part of the Chinese Public Dispensary system, became a

Government hospital and the number of beds was increased to 60, and later, after the second world war, to 85. Over the years admissions have increased considerably, and in 1954 the record figure of 7,164 was reached, which is about 10% of the total births in the Colony.

Antenatal clinics were first started in 1929. During the period 1936-41 only 14.5% of mothers received antenatal care, and the remaining 85.5% were "emergency" admissions without antenatal supervision. During the period 1945-54 this position was reversed and 87% of the 50,149 admissions had antenatal care, leaving only 13% as "emergency" admissions. In 1954 as many as 97% of the mothers delivered in the hospital had attended the antenatal clinics.

Further analysis of these periods shows a remarkable reduction in mortality figures. Maternal mortality was 5.02 per 1,000 for the 25,678 deliveries during the period 1927-41, whereas from 1945-54 (47,029 deliveries) the rate dropped to 0.89 per 1,000—a figure which compares very favourably with that found in large maternity hospitals in other parts of the world. Over the years there has also been a steady reduction in perinatal mortality (stillbirths and neonatal deaths). For the year 1954 there was a remarkably low stillbirth rate of only 12.9 per 1,000 and a neonatal death rate of 17.4 per 1,000.

The New Hospital

In 1952 the Hong Kong Jockey Club decided to donate a sum of £250,000 to meet the cost of building a new maternity hospital on a site close to the old hospital. On October 28, 1952, the foundation stone was laid by Her Royal Highness the Duchess of Kent.

The new hospital is an 8-story building containing 200 beds, with accommodation for a resident staff of 7 doctors, a matron, 28 nurses, 72 pupil midwives, and 88 amahs. In

addition, residential facilities are provided for final-year medical students during their obstetric clerkship.

The antenatal department is on the ground floor, where there are six examining-rooms with equipment, so that eleven patients can be seen at a time. It is estimated that between 150 and 200 patients will be examined at each session of three hours' duration. Each examining-room has a coloured plaque on the door so that patients who cannot read are guided to the right room by a similar colour on their registration card and on the back of the seats in the waiting-hall. The x-ray department, blood bank, laboratory, administrative offices, and a lecture room, with a modern projector, are also on the ground floor.

The wards, named after great figures in British obstetrics, are on the first four floors. There are two wards to each floor, which is self-contained with its labour and delivery rooms. The first and second floors are for normal cases. The third floor is for antenatal cases and for those cases which might need operative delivery such as caesarean section. There is also on this floor a trial labour room, two operating theatres, a nursery with 18 electric incubators for premature babies, and a cooling-off room with six cots. The remaining two floors are the resident quarters for doctors and nursing staff.

The hospital's benefactors can be assured that their investment in this building will be of enduring benefit to countless mothers and children.

NEW YORK CONFERENCE ON NUTRITION IN INFECTIONS

A two-day conference on "Nutrition in Infections," sponsored by the Section of Biology of the New York Academy of Sciences, was held in New York on May 24 and 25 under the chairmanship of Dr. W. A. WRIGHT, medical director of Pfizer Laboratories. Some 200 doctors, veterinarians, and other scientists attended it, a number of them from abroad. The two sessional chairmen were Dr. NORMAN H. JOLLIFFE, director of the New York Health Department's bureau of nutrition, and Dr. HENRY WELCH, director of the antibiotics division of the Food and Drug Administration.

Nutritional Status and Resistance

The conference opened with a review by Dr. S. L. HALPERN (New York Medical College) of the role of nutrition in the prevention and treatment of disease. This was a subject on which there were conflicting views, he said, and critical evaluation of the evidence was overdue. The results of both basic and clinical research in nutrition were difficult to assess because of the many extraneous factors, and discredit followed over-optimism and the unrealistic application of new advances. However, despite these caveats, Dr. Halpern himself came down firmly in favour of the old beliefs. In his view "nutrition therapy" was often of primary importance in the treatment of disease. Indeed, he went even further, claiming that nutrition, "in a non-specific manner, participates in the prophylaxis against most acute infections." Dr. Halpern ended his address by warning against the injudicious application of nutrition therapy. The nature and phase of the illness, the drugs being administered, and the potential toxicity of the nutrient itself and its balance with other nutrients were all factors that must be taken into account.

Dr. FRANCISCO GRANDE (University of Minnesota, from Madrid), after reviewing some interesting Spanish experimental work on lathyrism,* cautioned against too ready acceptance of the dictum that good nutrition confers enhanced resistance to infectious agents. Opinions differed. In one recent textbook Dr. Ancel Keys could be found

*A condition similar to lathyrism had been produced in rats, which are resistant to *Lathyrus sativus* itself, by feeding them on two allied seeds, from one of which the responsible agent had been identified as β -amino-propionitrile. So far as Dr. Grande knew, however, this substance had not been demonstrated in *L. sativus*.

saying that there was no proof of this relationship in man, while elsewhere in the same book Dr. Tisdall held that nutrition was the main factor in determining resistance to infectious agents. The broad problem of infection had been narrowed to one of immunity, or formation of antibodies; unfortunately the problem was far more complex. In Germany, for instance, malnutrition had not been associated with any great increase of infectious diseases despite some minor changes in the immunological responses of individuals.

Local Vitamin Requirements and the Location of Lesions

Dr. M. K. HORWITT (Elgin State Hospital, Illinois) had been engaged in a series of two-year controlled investigations of single nutritional deficiencies in groups of 30 human subjects, but these did not help him to relate the course of most infections with any given nutritional state. Instead he presented what he called an interpretative paper. In nutrition there was a great need for sounder laboratory techniques. For instance, insufficient attention had been paid to the effects of partial as distinct from total deprivation of a nutrient, or the profound catabolic effects of bed-rest alone might have been forgotten in assessing results. Using his own experiences of experimental ariboflavinosis in man as a text, Dr. Horwitt then discussed the possible role of trauma in deciding the location of lesions. Signs of ariboflavinosis could regularly be obtained if daily intake were restricted to below 0.6 mg. riboflavin for five months. The most characteristic lesion in his experience was the scrotal dermatitis. This developed readily and was equally easily cured by the administration of riboflavin. But why was that site particularly affected? The only reasonable explanation seemed to be that the rugose skin of the scrotum was specially liable to friction and abrasion, with consequently a high local rate of epithelial destruction and repair. In the depleted subject the body's riboflavin reserves would be insufficient to meet this specially high demand, so that local metabolism would be interrupted and the lesion develop.

The nutrition of the aged was an ill-understood subject. Recent studies at the Elgin State Hospital suggested that the similarities between the nutritional needs of the young and the old were greater than the differences. But old people might find the quest for food a less satisfying experience, and violate the safety margins for protein and vitamin intake. The loss of muscle mass usual in advanced age was an indication of their decreased nutritional reserve against emergency. This long-term nitrogen loss—and the similar calcium loss—was very reminiscent of what was seen after short periods of bed-rest in younger people, and perhaps the decreased activity of the aged was an important cause.

Dr. WILLIAM W. FRYE (Louisiana State University School of Medicine) discussed host-parasite relationships, particularly as they affect parasites whose adult life is spent in the intestinal tract. Resistance to a parasite might be natural—that is, present at birth or developing with the host's maturity—or acquired after the first exposure. Dr. Frye reviewed experimental work on animals illustrating the effect of various dietary factors in modifying resistance to helminthic infections. This suggested that in omnivorous animals severe protein restriction and deficiencies of vitamins A, B complex, or D lower their resistance. He went on to discuss the question of protozoal infections, particularly *E. histolytica*, again with reference to the influence of diet, and also other factors such as inter-current infection and strain variation, on susceptibility to infection and its severity. Currently, he and his colleagues were studying the effect of giving dietary supplements and extra vitamins to children with amoebiasis and helminthic infections who were receiving antibiotic therapy.

The next two papers were by veterinary workers. Mr. C. H. HILL (North Carolina College of Agriculture and

Engineering) described original work on the effects of vitamins in high dosage on the resistance of chicks to fowl typhoid. In well-controlled tests with 40 birds to each experiment it was shown that high levels of all the known required vitamins increased the chick's resistance. However, the dosages varied considerably. To achieve maximum effect some vitamins, such as vitamin K, had to be increased over the growth requirement many more times than others. With these high dosages supplementary antioxidant was needed, and here diphenyl phenylene was as effective as ascorbic acid. It was also shown that over-supplementation with vitamins could reduce resistance below the maximum. Professor R. W. LUEKE (Michigan State College) read a paper describing the good effects of adding vitamin B complex and antibiotics to the rations of pigs with swine enteritis.

Specific Vitamin Deficiencies and Antibody Formation

Dr. A. E. AXELROD'S (University of Pittsburgh) paper on the relationship of vitamins to antibody formation was of outstanding interest. Although the immune response did not necessarily correlate with clinical resistance to infection, the classic antigen-antibody response was generally thought to play a significant part in this intricate mechanism. He and his colleagues had therefore studied systematically the effects of specific vitamin deficiencies on antibody production, using the albino rat as the experimental animal. Simple inanition was repeatedly shown to have no effect on antibody production, a finding parallel to that observed in field studies in man. Some specific deficiencies (e.g., of thiamine), while causing marked inhibition of the rat's growth, depressed antibody formation only slightly; other deficiencies (e.g., of pteroylglutamic acid) had exactly the reverse effect. Using purified diphtheria toxoid as antigen, they had found that deficiency of pantothenic acid, pyridoxine, biotin, and vitamin D all caused marked impairment of antibody synthesis, but thiamine and vitamin A deficiency had little effect. Further, deficiency of pantothenic acid resulted in a very low anamnestic (booster) response to a second dose of diphtheria toxoid. Although these striking effects on antibody production were obtained with certain specific vitamin deficiencies, serum complement levels were unaffected, a finding that suggested a different mechanism for its biosynthesis. Dr. Axelrod's paper was discussed by Dr. K. S. HETZEL (Dean of the Faculty of Medicine, Adelaide) and by Dr. A. B. STAVITSKY (Western Reserve University, Cleveland). Dr. Stavitsky, who had worked with Axelrod, had applied the latter's observations to tissue culture and homotransplantation experiments with rat spleen cells. Cells from normal immunized animals continued to produce antibody on transfer to animals whose own antibody production had been blocked—for example, by x rays, cortisone, or pantothenic-acid deficiency—but failed to do so in normal animals, perhaps owing to the production of antibodies against the foreign cells. Cells from immunized, but pantothenic-acid deficient, animals failed to produce antibody either on culture or on transplantation. Dr. Stavitsky interpreted these findings as providing evidence for the autonomy of the cells so far as antibody production was concerned.

Miscellaneous Studies

Dr. B. M. KAGAN (Michael Reese Hospital, Chicago) described the effects of sterile abscesses on the vitamin A levels of small numbers of albino rats. There was lowering of the serum and liver vitamin A levels, and in some animals an increase in urinary excretion. The results were the same whether turpentine or sweet almond oil was used to induce the abscesses. The liver vitamin A reserves were rapidly restored after oral dosage. The last paper of the day was by Professor JOACHIM KÜHNAU (University of Hamburg), who discussed fluid, electrolyte, and protein changes during infection.

During the second day, under the chairmanship of Dr. HENRY WELCH, there were two reports on small uncontrolled

clinical trials of combined broad-spectrum antibiotic and multiple vitamin preparations. Dr. AARON PRIGOT (Harlem Hospital, New York) had treated 35 severely ill surgical patients and remarked on the absence of side reactions. The other was by Dr. MAX B. MILBERG (Maimonides Hospital, Brooklyn) and Dr. MAX MICHAEL, jun. (State University College of Medicine, New York). They were interested in the gastro-intestinal complications of orally administered broad-spectrum antibiotics, and were trying out "fortified" oxytetracycline and tetracycline in a mixed group of medical conditions.

Among other subjects discussed at the conference were deficiency diseases in the Tropics, diabetes, and the nutritional care of surgical patients.

Recapitulation and Prospect

Dr. HOWARD A. SCHNEIDER (Rockefeller Institute for Medical Research, New York) had been chosen to sum up the proceedings, and he did so with frankness and charm. He confessed he found this a difficult task. He had been rather disappointed by the irrelevance of some of the papers to the real problems involved. There were three fallacies in nutritional research to be guarded against. First, the implicit assumption that the anthropocentric view was correct. Secondly, the view that "supernutrition leads to a happy end." This might not be true, and Dr. Schneider gave examples of work which had shown that vitamin, fat, or protein supplements could exert an adverse effect on the course of infections. Adding things was not necessarily harmless. The last fallacy was the assumption that there is such a thing as general resistance. There was no such thing. The question should be, resistance to what? There was still much to learn, Dr. Schneider concluded, but in order to succeed Nature must be obeyed, not commanded.

The members of the conference were entertained by the New York Academy of Sciences to dinner on the first day, and after it Dr. HANS SELYE gave a most entertaining account, illustrated largely from his personal experience, of some common pitfalls in the interpretation of scientific data. The proceedings of the conference are to be published by the New York Academy of Sciences.

JOINT MEETING OF BRITISH AND FRENCH ORTHOPAEDIC ASSOCIATIONS IN PARIS

The British Orthopaedic Association and the Société Française d'Orthopédie et de Traumatologie held a joint meeting in Paris from May 5 to 7, under the chairmanship of their respective presidents, Professor BRYAN MCFARLAND and Professor P. PADOVANI. The principal subjects discussed were the surgery of the paralysed lower limb and osteochondritis of the hip. This account is limited to a brief report on the papers on tendon transplantation given in the session on the paralysed lower limb and to the discussion on Perthes's disease.

Tendon Transplantation in the Paralysed Leg

Mr. J. M. P. CLARK (Leeds) discussed tendon transposition in the buttock and thigh. The revulsion that had followed the first enthusiasm for the work of Robert Jones and Tubby was now on the wane, he thought. But certain important principles must be realized: it was impossible to replace a completely paralysed muscle; no muscle training would ever alter muscle imbalance; and deformities might recur even after arthrodesis. Tendon transposition was best done to prevent deformity. Transplants needed protection for at least six months after operation.

Replacement of hip abductors was most difficult; the ilio-psoas transplant was satisfactory if a normal gluteus maximus and sartorius were present, but it was a severe

operation. In the presence of a good gluteus maximus the backward shifting of the origin of tensor fasciae femoris could help a weak gluteus medius. In adduction deformity, tenotomy, neurectomy, and osteotomy all had a place. In preventing recurrence of the deformity he had successfully tried a new procedure in which the adductor origin was detached from the pubis and mobilized with its nerve supply intact, transposed under the rectus femoris, and attached to the ilio-tibial band. In the case of the knee, transplants into the quadriceps could be done to prevent buckling, to allow a calliper to be discarded, or to prevent flexion deformity. They were most effective when the foot was stable, any knee deformity had been corrected, and in the presence of strong hamstrings and at least fair glutei. Semitendinosus and gracilis medially, and biceps laterally, were all used, but semimembranosus must be left intact. Mr. Clark stressed the importance of the normal coupled action of the hamstrings with the knee extensors in the last part of the movement of straightening hip and knee, which therefore made the transplant a good one. The use of sartorius and tensor fasciae femoris had not been satisfactory.

Mr. D. M. BROOKS (London) spoke on the use of tendon transplantation for the prevention of foot deformities. The operations were easy, could be done early, and did no irreparable damage, but unfortunately at least one-third failed in their purpose. It was necessary to know accurately the power of the muscles and which were causing deformity, a difficult matter to assess before the age of 5. It was useless to employ a muscle as a transplant whose automatic phase of function was at variance with that of the recipient; hence the futility of transplanting tibialis anterior to the calf. The essential principles were that full passive correction should be possible, the deforming force must be removed, and the paralysed muscle action must be replaced.

Of forty-nine transplants of the peronei to the calf in cases of calcaneocavus, with or without valgus, over half had been failures, continued Mr. Brooks. Transplanting extensor hallucis longus to the first metatarsal neck had failed in twenty-four out of thirty-nine cases of pronation of the forefoot, and in a similar proportion transposing peronei to the dorsum of the foot failed to improve plano-valgus. The most successful group were the equinovarus deformities, in which only nine out of twenty-two failed to show improvement, six of the failures being due to the detachment of the transplant from its new site. In all groups secondary deformity was not uncommon. However, in spite of the many failures, he thought tendon transposition a useful mitigating procedure in carefully selected cases, provided the cause of the original deformity had been eradicated; indeed, it was doubtful if it was ever worth shifting a muscle which was not itself causing the deformity.

Mr. T. T. STAMM (London) described the surgical measures for the relief of paralysis of the intrinsic muscles of the toes. After discussing the Lambrinudi procedure of multiple interphalangeal fusions he proceeded to review the indications for tendon transplantation operations. If there was fixed extension of the metatarso-phalangeal joints multiple tendon transplants of the long flexors of the toes to the extensors was a better operation, but was contraindicated in the presence of much fixed flexion of the proximal interphalangeal joints. The two procedures were complementary and should not be looked on simply as alternatives for any given case. The operation of transplanting the extensor tendons into the metatarsal necks was a poor one, he thought; it was unsound physiologically because the timing of the automatic action of these muscles was wrong for the new function required of them, and in any case the tendons seemed to return as if by magic to their original insertions.

In the subsequent discussion Mr. H. J. SEDDON (London) stressed the need for independent assessment of a surgeon's results from tendon transplants in the foot; the basic idea was good, but fewer cases than imagined were really worth operating on.

Perthes's Disease

Dr. J. LEMOINE opened the session by describing an experimental study by Dr. R. LAGRANGE and himself, largely done at Oxford. While ligation of the anterior circumflex vessels in 2-3-weeks-old rabbits produced only minimal changes, ligation of the round ligament was followed by varying degrees of enlargement of the femoral head, with flattening, increased radiological density, and often some subluxation. Angiograms showed an increased vascularity of the head. The neck of the femur often thickened, and both macroscopically and microscopically the changes were very similar to those seen in Perthes's disease in man.

Professor M. FÈVRE (Paris) reviewed a series of cases of Perthes's disease. Eighty per cent. had occurred in boys. The ages ranged from 4 to 13 years, with a maximum between 4 and 7 years. He had not found trauma or infection elsewhere to be important antecedents, nor pre-existing coxa valga. He divided cases into two groups, depending on whether changes started in the top of the femoral head or around the margins of the epiphysis. The former he considered due to interference with the blood supply from the round ligament, the latter with the supply from the circumflex vessels.

Dr. P. PETIT (Paris) discussed the association of Perthes's disease with congenital dislocation of the hip. He had seen 23 instances of osteochondritis in 87 congenitally dislocated hips, although some had reported an incidence as high as 50%. He had not seen the condition on the normal side. Prognosis was impossible during the first year of life, and in some of the youngest patients there had been complete disappearance of the head. Ten out of eleven cases under the age of 1 year treated by manipulative reduction and fixation in the Lorenz position had been complicated by osteochondritis. Among the possible causes of the condition, he considered important forcible reduction, too powerful traction (the condition being commoner in high dislocations), and above all pressure on the femoral head associated with poor articular contact and torsion of the capsule and its vessels from fixation in the extreme positions. The younger the patient the greater the danger of osteochondritis; the femoral heads of older patients seemed more resistant.

In the discussion Sir REGINALD WATSON-JONES (London) emphasized that Perthes's disease was a disorder from loss of local blood supply. Rest in bed for two or three years could prevent deformation of the femoral head, but one had to wait at least 20 years in order to know whether later degenerative arthritis had in fact been avoided. Still, three years' bed-rest in childhood was a small price to pay to avoid the 50 years of later disability which otherwise followed Perthes's disease with such certainty.

Professor J. TRUETA (Oxford), after illustrating the histological and vascular changes to be seen in experimental osteochondritis in the rabbit, proceeded to describe the development of the blood supply to the femoral head in man. At the age of 18 months none was provided via the round ligament; almost all came from the outer side. By the age of 4, vessels could first be seen entering the head from the round ligament, but only after fusion of the capital epiphysis did these vessels anastomose with the major supply from the outer side. After the age of 16 the anastomosis was adequate and the danger of Perthes's disease past. It had been shown by arteriograms that extreme positions of the hip obstructed the circulation to the femoral head.

Mr. A. H. C. RATLIFF (Edinburgh) gave the results of a late follow-up on 49 cases of Perthes's disease, followed for an average period of 17 years. Apart from a few who received no treatment, all had been treated by frame fixation. Three-quarters of them were fully active and free from pain, although only 38% had good x-ray appearances. Of the nine untreated cases only one had a good hip. The most important factor affecting the prognosis was the state of ossification of the head—the younger the child, the better the prognosis. A good immediate result was likely to be maintained for at least 25 years, even though half of such cases had an unsatisfactory x-ray appearance.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

The Changing Face of Medicine

SIR.—The publication of two articles, by Mr. C. Kennedy and Dr. C. P. D. Grant (*Journal*, April 30, pp. 1045 and 1049), has drawn attention to an uneasiness and cleavage in our profession which merits more discussion.

In our area we have a scheme whereby students in their final year are appointed to practitioners for a short time to observe practice. Whatever benefit it may confer on the student, it does provide the general practitioner with some contact with the modern student and an insight into his activities. One is impressed by the intensity of his course, with his remarkable knowledge of abstruse theories that seem unimportant to us, and, most of all, with a sense of relief that we are not beginning our medical career. Is there not a danger that the intense academic course will leave the student no time to relax or to engage in social and cultural activities? Are we tending to produce a doctor stuffed full of theories but unfitted for his task because he has been trained to deal with disease as distinct from human beings?

As a G.P. one is diffident about criticizing the appointment of full-time professors and teachers, but it is difficult to see how a teacher completely divorced from clinical medicine outside the hospital is of necessity the best teacher of medicine. G.P.s have been interested spectators of the merit awards, and I am sure their sympathies are with the hard-working conscientious clinicians who apparently are passed over for the "ready pens." Might we suggest that the committees who sit in diabolical secrecy might take note of the out-patient lists of consultants? The popularity of the latter is based on the service he provides for practitioner and patient—as good an assessment of merit as any, in my opinion. Is there any good reason why professors of medicine and surgery should be debarred from private practice? I suggest these points are well worthy of consideration, as they would benefit consultant, practitioner, student, and patient.

The increasing problem of medical litigation has been well set out by Mr. Kennedy. I feel strongly that the control of the doctor-patient relationship is to a great extent in the hands of the doctor himself. All that has been said and written about the teaching and training of the undergraduate has a direct bearing on this relationship. Having a limited experience on disciplinary committees of the executive council, I have been impressed with the numbers of cases that need never have come to committee hearing if the doctor concerned had exercised control of his temper and ordinary tact. I say this fully aware that it is only by the grace of God that I have escaped sitting in the defendant's seat, and also conscious of the great injustice to doctors when confronted by a malicious patient aided by free legal aid, but I am convinced that never was ethical conduct of medicine in the true Hippocratic tradition more necessary than it is to-day.

The G.P. perhaps hears criticism of hospital attention from his patients, and I have no doubt hospitals could say the same thing about G.P.s. But, here again, the divorce between hospital and general practice is almost complete, and most of the difficulties are minor and quite capable of being resolved by ordinary good ethical relationship between the doctors concerned. In my area we have a discussion group of neighbouring practitioners which meets monthly. We have tried in a small way to improve the hospital-G.P. relationship by inviting teachers from the medical schools to spend an informal evening with us. Perhaps we flatter ourselves, but it did seem that the enjoyment was mutual, and one of our full-time professors said he was delighted to have the only opportunity afforded him of meeting and getting to know practitioners in his area.

A word of praise for the stimulating article "Youth Looks at Medicine." The writer obviously accepted general practice as a challenge, and eventually found it absorbingly interesting and worth while in spite of the Welfare State. He is perhaps fortunate

in that he has had to make less adjustment to his obstetrical activities than the middle-aged practitioner. The facility with which maternal blood loss can be restored in hospital has profoundly affected the conduct of domiciliary midwifery, and we have been grateful for the clear-cut advice from consultants on what they consider to be the safe limits of domiciliary obstetrical procedure and instrumentation. While time has in no way dimmed my admiration for the skill and judgment of the G.P.s who introduced me to domiciliary midwifery, I have no hesitation in accepting the limits laid down by eminent obstetricians. An attempt is being made in our area to harmonize the relationship between local authority and practitioner. I believe that the service is capable of great improvement if the local authority is prepared to encourage practitioners in domiciliary midwifery and if the practitioner is prepared to accept the local authority's statutory commitments in the service.

I am ever grateful to the B.M.A. for affording me an opportunity of listening to other medical opinion. The penalty for expressing opinion in local B.M.A. sessions is to be stuck on various committees. Committee-sitting is time-consuming, occasionally boring, but seldom time-wasting. The committee-sitter has ample opportunity of studying lay reaction to his own profession, and he must always be impressed by the ability and almost superhuman tact and diplomacy exercised by these oft-maligned permanent Civil Servants of medical administration. I mention these outside activities because I feel that some of our difficulties are self-produced. Considerable space has been devoted in the *Journal* to the difficulties of the intermediate hospital groups. This problem must command general sympathy, but I think that these groups would command much more sympathy and support if they showed more enthusiasm in attending B.M.A. meetings, and more willingness to take part in the routine work of Divisions which affects the conduct of medicine as a whole.

One other factor in the doctor-patient relationship that we cannot ignore is the attitude of the Press. It is irritating to note our misdemeanours in the headlines, but it is the fact that "wrongdoers" are a minority that gives them news value. Our standards and ethics of medicine would perhaps get a better press if we were slightly less aloof. The public relations department of the B.M.A. has done much useful work, but half of this is wasted if the periphery does not avail itself of the advice freely given, and in any case medical news in the lay press must always be a challenge to our conduct and practice of medicine.

In concluding these random reflections of a middle-aged practitioner, I hope to have made some small contribution to the solution of difficulties.—I am, etc.,

Sheffield 6.

ANDREW STEPHEN.

SIR,—During the past few weeks your correspondence columns have contained various letters criticizing general practice from various aspects. Most of them have been from the younger or recently qualified practitioner, who would appear to have become rather embittered as he experiences the difficulties of obtaining the practice of his choice. Others have criticized general practice in more detail, and would appear to be dispirited as they experience the disparaging conditions under which general practice is sometimes conducted. I am sure that there are still remaining some practices which do show some of the happier features of general practice.

I do not claim that my practice is quite the *beau idéal*, but I do think that I am one of the few fortunate ones who are practising medicine under conditions as good as they are ever likely to be. Mine is a single-handed practice which leaves me some leisure for social and other activities. Other practitioners, who have the time, have the opportunities for anaesthetics, tonsils, or other specialties. The practice is, needless to say, situated on the south-west coast and in a seaside resort of some 18,000 people. The cottage hospital, in which all the practitioners in the district participate, has some 50 beds, including private and amenity beds, a children's ward, a first-class x-ray department, physiotherapy department, and a casualty but no out-patients

department. Each of us has the care of our own patients, and we diagnose and treat according to a standard which is comparatively high. The major surgery is performed by visiting surgeons, but some of the surgery is done amongst ourselves.

We have a first-class pathological service, and every modern investigation is available, from simple haemoglobin estimations to pathological investigations such as electrophoretic separation of serum proteins. First-class physicians, surgeons, neurologists, and psychologists, etc., are available for domiciliary consultations or consultations at our hospital. We are fortunate in the hospital in that it has the right number of beds for the district it serves, and it acts as a pleasing diversion for the consultant who cares to hold a session here. Again, it is fortunate in that we have no beds available locally for midwifery cases, and this has induced a very high standard of domiciliary midwifery. Here it is standard to have the W.R., Kahn, haemoglobin and full count, rhesus, and blood group performed in most pregnancies. Most of my midwifery cases are x-rayed at the 36th week, and an excellent midwifery service is helped by the co-operation of the district nurses. Rarely is emergency aid required under these conditions, and it remains a point of interest that very few mothers ask for or require hospital maternity care. We are able under these conditions, when further advice is needed, to refer the patients to the particular consultant at the county hospital complete with the x-ray films and any other pathological report likely to be needed.

These conditions help materially in the answer to that difficult question which, indeed, can be very personal: "Could anything more have been done?" This, I think, is competitive medicine working satisfactorily within the National Health Service. The purpose of this letter is to point out that there exist practices where keen, interesting clinical medicine still flourishes, and to stimulate the idea that some of these conditions could be encouraged in the more highly industrialized parts of the country.—I am, etc.,

Exmouth.

PHILIP WADE.

Prevention of Stasis in Trauma of the Ankle Joint

SIR,—Probably the most common immediate treatment for incomplete tears of the fibular collateral ligaments, where bone injury has been excluded, is the application of a cold compress, with or without the addition of some type of supportive strapping. When treating this type of injury among professional footballers I have found it most difficult, if not impossible, to strike a happy balance between tolerability and efficiency. Either the strapping is too tight to bear, particularly when the patient retires to bed, or it is too slack to perform its functions of support and the prevention of oedema. Besides being the cause of a large proportion of the discomfort felt by the patient, it is obvious that oedema about the site of the injury must considerably retard the rate of healing. While it is widely recognized that massage and elevation can disperse the swelling, only too soon after the foot is returned to its normal dependent position the oedema also returns.

It was in an attempt to find some method of increasing the speed of recovery of footballers suffering from this, probably their most common occupational injury, that, with the encouragement of Dr. E. J. Pike, the Portsmouth Football Club's medical officer, I experimented with a latex sponge rubber pad incorporated inside an elastic adhesive strapping. This, I thought, would exert compression to the sulci around the external malleolus, and perhaps also have a mildly beneficial auto-massage effect whenever the patient moved his foot. The results have exceeded my expectations. For example, a simple tear of the anterior talo-fibular ligament treated in this manner (details of which follow) shows no oedema at all when the strapping is removed the following day. Sharply delineated by the borders of the pad, however, is a variable but generally large

ecchymosis. The actual site of the tear is naturally tender on palpation, but below the area covered by the sponge pad there is no oedema.

Should there be a delay of, say, 24 hours before the patient is seen, and during which time the ankle has swollen to the recognized proportions, this type of compression support has precisely the same effect—namely, that within a further 24 hours a large area of ecchymosis is apparent

FIG. 1.—Latex pad in position. Edges other than those adjacent to fibula should be bevelled. FIG. 2.—With strapping applied.

and the oedema has disappeared. Consequently, not having to compete with a distended ankle, subsequent treatment to the partly torn ligament is quicker and much more effective. In addition, the possible or imagined assistance of the auto-massage effect occasioned by the tightening and relaxing of the supportive strapping on the sponge pad when the patient walks or moves his foot seems to act beneficially in hastening the process of healing.

In practice this method has the distinct advantage of being both comfortable and effective when applied. After the support has been in position for 9 to 12 days it can be removed and dispensed with. Generally the patient is then able to perform all activities other than the most strenuous. The more severe cases may demand a further period of support, but the majority will require very little, if any, further treatment to ensure their complete rehabilitation.—I am, etc.,

Southsea.

S. P. BARNARD.

Chronic Appendicitis

SIR,—I must comment on the letter of your correspondent Dr. W. Silber (*Journal*, May 28, p. 1341) when he supports the contention that "the clinical and pathological correlation of chronic appendicitis is still far from satisfactory." If the clinical investigation of the case has included a careful and sufficient x-ray examination then there should be no doubt at all about the normality or abnormality of an appendix. By a careful and sufficient x-ray examination I mean either a barium meal (or a caecal meal) followed through for at least 48 hours, or a barium enema with at least a picture taken on the following day, if not also on the second day. Either of these investigations will show the presence or absence of one or more of the following in connexion with the appendix: (1) Relative stasis, (2) segmentation, (3) inequality of the width of the lumen, (4) complete or partial fixation, (5) an irregularly bulbous end, (6) kinking, (7) definite non-filling, (8) tenderness on palpating over the structure. I maintain that the experienced radiologist will be able to give a correct diagnosis in practically 100% of cases with the help of the above information.

The reason why hospital investigation of the appendix is so often unsatisfactory is that, through lack of time, a 48-hour film is seldom taken in the case of a barium meal and a 24-hour film is seldom taken in the case of a barium enema. Also, in those cases where the appendix has not been visualized in a barium meal investigation, it is not supplemented sufficiently often by performing a barium enema investigation and vice versa. In conclusion, I am

convinced, from long personal experience, that a careful and sufficient x-ray investigation will always help the clinician to decide about the state of health of an appendix. I am, etc.,

London, W.1.

ISAAC EBAN.

Gonorrhoea Statistics

SIR.—As Chairman of the British Co-operative Clinical Group set up by the Medical Society for the Study of Venereal Diseases to obtain statistical information relating to all aspects of the venereal diseases in this country, I should like to place on record my disagreement with Drs. Gerald H. Knight and W. Fowler (*Journal*, June 11, p. 1430), who regard the study of the epidemiology of gonorrhoea as a relatively unimportant matter. The fact that, despite the excellent remedies available, the incidence of gonorrhoea is not falling in this and other countries is a very important matter for which the explanation is not apparent. Any investigation into this problem must include a study of the epidemiological factors concerned, and that is what the Co-operative Clinical Group had in mind in circulating a pro-forma to those in charge of V.D. clinics.

The problems enumerated by Drs. Knight and Fowler are all very important ones, but none of them seem to lend themselves to collective investigation of the type which the Group can undertake. The Medical Society for the Study of Venereal Diseases exists for the study and discussion of all these problems and holds meetings frequently. As President of that Society I can say that we should welcome more support from, and more frequent attendance of, our colleagues in Birmingham.—I am, etc.,

London, E.1.

A. J. KING.

Cyst Formation Following Hernia Repair

SIR.—With considerable interest I read the article by Mr. A. G. Rutter entitled "Cyst Formation Seven Years After a Cutis Graft Repair of Hernia" (*Journal*, April 16, p. 951). Mr. Rutter remarks that experimental work by Zimches¹ showed that a piece of skin inserted free into muscle tissue tends to curl up into a U shape and regularly to form an inclusion cyst. May I add that just half a century ago I proved this fact by experiments and histological work?²—I am, etc.,

Budapest, Hungary.

Intramuscular Chloroquine

SIR.—Dr. Abdul Wahab Ariff's letter (*Journal*, May 14, p. 1218) and the increasing use of chloroquine by the parenteral route prompt me to place on record what I believe to be the first recorded fatality due to overdosage by chloroquine.

In April this year I performed a necropsy on a male Caucasian child, aged 1½ years, weight 10 kg., who had died following the inadvertent injection of two ampoules of "resorchin" solution (0.3 g. chloroquine base) by the intramuscular route. The history and clinical details made available to me are as follows. The patient, who had had an attack of malaria about 12 months previously, was admitted to an out-station hospital on the evening of April 11, 1955, with a temperature of 103° F. (39.4° C.), slight cough, no diarrhoea, no convulsions. The child had been given two tablets of resorchin the previous evening, which he had immediately vomited. A second medication of one tablet of resorchin given on the morning prior to admission had also been vomited. Clinical examination showed the child to be in good general condition with no abnormal physical signs. The next day the temperature was 100° F. (37.8° C.), W.B.C. 6,000, Hb 75% (Sahli). Scanty malarial parasites in a thick blood film. No albumin in the urine. An intragluteal injection of two ampoules of resorchin was given that evening. About four minutes later the patient momentarily rolled his eyes and moved the right arm in a strange way and then appeared normal and was laughing and eating. The rolling of the eyes was repeated two or three times. Five minutes later the child suddenly collapsed, was pale, deeply unconscious, respiration irregular, pulse rapid and

feeble. A few seconds later respiration ceased and in spite of artificial respiration the child died. A necropsy was performed 40 hours later. The only abnormal findings were a little vomitus in the trachea and bronchi and slight splenic enlargement. Histologically the lung tissue showed moderate congestion and no malarial parasites were demonstrated in the brain.

Chloroquine by the parenteral route is known to produce a fall in blood pressure, and presumably the high dosage in this case, four times the recommended dose, caused a pronounced hypotensive attack. It is essential to give this drug on the basis of 5 mg./kg. of body weight, at which dosage it is a safe and most effective antimalarial.—I am, etc.,

Kumasi-Ashanti.

F. C. HARRIS.

Labelling the Container

SIR,—I wholeheartedly support Dr. H. Ucko's plea (*Journal*, June 4, p. 1392) for the labelling of bottles. In consulting-rooms and clinics bottles are clearly labelled, but when dispensed for home use the bottle is labelled "the drops" or "the mixture." Patients are often advised to use two drugs—for example, atropine and sulphacetamide—at the same time, one of which is to be used, say, once a day and the other twice. Both solutions are colourless and mistakes can and do occur. In writing the prescription the direction "Label bottle with name of drug" may be given and it is carried out sometimes.

I have previously made the plea for labelling, but the matter was not pursued as I had hoped.—I am, etc.,

Liverpool, 1.

Measles

SIR,—Dr. J. F. Lund's letter (*Journal*, May 21, p. 1279) prompted me to review the incidence of complications in measles in our practice. We do not use sulphonamides or penicillin prophylactically. We merely prescribe aspirin gargle or some other sedative. But at the first suggestion of any complication—that is, pain in the ear or chest or any localizing physical signs in the chest—the patient is put on a full course of penicillin or sulphonamide.

My partner and I have notified 148 cases of true measles in the present epidemic, and, using the above criteria, we have not had to give any antibiotics to more than 10 patients, and in every case the single suspected complication has cleared immediately and the course of the measles has been unaffected. It would seem to us that careful observation by the medical attendant, with timely intervention, is called for rather than the routine use of antibiotics.—I am, etc.,

Enfield, Middlesex.

H. R. SHEPHERD.

SIR,—The use of antibiotics in measles obviously depends upon how serious we believe the disease to be and how probable the complications. I was brought up to regard it as a severe illness which was frequently followed by otitis media and sometimes by bronchopneumonia. Nor have I ever read anything to contradict this. But I am bound to say my 35 years of general practice have not confirmed these gloomy views. I cannot from my own experience regard the complications of measles as either frequent or serious. Perhaps I have been lucky. I have only had one death from measles bronchopneumonia—about 25 years ago in a mongol aged 2 years. In 1932 I attended 33 measles boys at a preparatory school; one had a recurrence of an old otitis media, but none of the others had complications. That was before the sulphonamides.

Is measles worse in infancy, childhood, or adult life? The question would be answered without hesitation by most doctors. I have known more than one mother catch measles from her children, and in every case she seemed to me to have it worse. Whether adults really suffer more than children one cannot say, but certainly they make very much more fuss. I have seen measles in an infant of one month, and it was so mild that I should not have diagnosed it had not three other children in the family been down with it.

Do people really get measles twice? The difficulty is one only has the patient's word for it. The present attack is measles, you are quite certain about that, but you did not see the previous illness. I have always kept notes, and since the Health Service started I have tried to record every single consultation and visit on the medical record card.

In November, 1948, I paid three visits to an only child, A, aged 1, with measles. Brother and sister, X and Y, were born in 1949 and 1950. On March 11, 1952, A developed measles again and on March 21 and 22 X and Y came out with it too. With my note of A's previous attack I went most carefully into all these cases. There could be no doubt about A's second attack, but what about his first? I subsequently discovered that only three other cases had been notified in November and December, 1948, none of them within two miles of my case. Further, on June 3, 1953, X and Y went down with rubella, but A did not get it. Was A's first "measles" really rubella? I did not think so at the time, and I have seen a lot of cases. To sum up: in 35 years I have documentary evidence of only one patient who I myself have seen twice with measles, and on re-examination of the evidence I cannot ask you, Sir, to accept it.

Ought one to attempt to isolate measles children (a pretty hopeless task in most houses), and should one be careful to keep children away from infection? Is quarantine worth while? I have not forgotten what I was taught, but my actual experience has not borne it out. Is it worth attenuating measles with convalescent serum? I was once asked by a consultant to do this for his son of 13; he then went off to London and left me to face the complaints of the boy and his mother. After the attack I had to collect 13 oz. (368 ml.) of blood from the boy to make more serum—a good way of starting convalescence! I have not done that any more. Is measles a serious disease in large English country towns at the present time? I cannot say that it is. "A bad cold plus a rash" is what I tell inquisitive patients, and we all know the rash does not matter.

Sir, I apologize for my heterodox opinions, but, let the statisticians say what they will, I suggest that one's views should be based upon observation rather than authority.—I am, etc.,

Norwich.

FREWEN MOOR.

SIR,—I have recently had the experience of seeing two children of the same family have measles twice with an interval of about 14 days between attacks.

There has been a general outbreak of measles in the village. The children concerned share a bedroom. The boy, aged 5, fell sick on May 18. He was a contact from the first case in the village, who was in the same form. I saw him on May 21 and diagnosed measles (cough, running eyes, and Koplik spots). The course of the disease was normal, though he only developed a very slight rash. On May 27, after two or three days up, he again returned to bed with malaise and cough and on May 31 the rash came out in full. Since then his convalescence has been slow but steady. The sister, aged 3, developed her first attack on May 26 and was up and about by June 5. On June 12 a second typical attack developed.

I am satisfied that none of the attacks could have been anything but true measles—certainly neither german measles nor scarlet fever. If the sister had not developed a second attack I should have suspected that I had made a mistake over the boy's first attack.—I am, etc.,

Freshwater, I.W.

Neon Lighting in Hospitals

SIR,—Though in his letter (*Journal*, March 12, p. 666) Dr. William B. Bacon may have been mistaken in referring to fluorescent lighting as neon lighting, I readily endorse his poor opinion of it. With regard to the letter of Mr. C. F. Share (*Journal*, April 30, p. 1093), until recently I was working in a new twin theatre unit in the U.K. which was opened only last summer, and the design of which must have been the subject of close scrutiny by the architects of both the Ministry of Health and the metropolitan regional board concerned. The expenditure on its construction and equipment was lavish to an extreme degree. No daylight was

permitted in the operating theatres because of the alleged loss of heat through glass windows; the floor and lower half of the walls were lined with green terrazzo, and the ceiling and upper part of the walls were painted green. The only lighting in the actual theatre, apart from the central operating light, was provided by fluorescent tubes in the ceiling cornices, and the result was disastrous, being a worry to the anaesthetist and a danger to the patient. How much of this colour distortion could be attributed to reflection from the ceiling and walls, or how much was due to the colour of light from the fluorescent tubes, I could not be certain, but, judging from the position in the anaesthetic rooms, where a window was provided, I would lay the blame on both factors.

We have no need to simulate daylight over its whole colour range, but we are interested primarily in the red-pink part of the spectrum, and I have yet to be shown that for this an incandescent light can be improved upon. Could a lighting engineer corroborate this? We do need more direct and precise information and not second-hand administrative opinions.—I am, etc.,

Ibadan, Nigeria.

M. W. GLOSSOP.

Anterior Tibial Syndrome Following Arterial Embolism

SIR,—In his interesting article Dr. D. C. Watson (*Journal*, June 11, p. 1412) describes two cases of the anterior tibial syndrome following arterial embolism.

A similar case occurred some months ago in a middle-aged man who had suffered an acute myocardial infarct a few days previously. He had experienced severe pain in the front of the right leg. On admission to hospital he had a patch of icy cold and pallid skin overlying the anterior tibial compartment. The ankle pulses could not be felt, and dorsiflexion of the foot was impossible. He was treated with anticoagulants and also intra-arterial tolazoline. This was noted to produce a diffuse flush to the limb, but more particularly to the area of skin overlying the anterior tibial muscles. This area eventually became persistently flushed and eventually an area of demarcation formed, with eventual sloughing of the whole of the overlying skin. It was considered that an embolus from an endomural clot in the heart had been responsible for the entire damage, but the vasodilator may have caused excessive swelling in the anterior tibial compartment, and contributed to the local necrosis. The patient ultimately succumbed to another acute myocardial infarct.—I am, etc.,

Dewsbury, Yorks.

GODFREY B. TAIT.

B Vitamins in Toxic States

SIR,—I should be grateful if you would allow me to comment upon your annotation (*Journal*, June 11, p. 1421). In spite of the obvious advantage of applying a polyvalent concept to the cause of disease, Pasteur's idea of a "single aetiological agent" still largely dominates our thinking in medicine, although single causative factors have failed to explain fully even the aetiology of microbial diseases. Thus you reason that actual, or threatened, deficiency states form the only theoretically valid indication for vitamins of the B complex to be applied. Following this trend of thought you consider it unlikely that true deficiencies could arise in acute toxic states, as only prolonged deprivation can produce vitamin B deficiencies. In support of this view you quote the well-known observation that it takes several years before vitamin B₁₂ deficiency becomes manifest after total gastrectomy. But Mollin and Ross¹ have shown that in patients suffering from pernicious anaemia the serum vitamin B₁₂ levels may be below normal for at least 1 to 2 years before a definitely abnormal blood picture can be found. As the tissues of a healthy adult may contain 1,000–2,000 micrograms of vitamin B₁₂,² during the latent period between total gastrectomy and clinical manifestations of vitamin B₁₂ deficiency these reserves, mainly from the liver, will be utilized. Indeed, Pitney and Beard³ showed that, whilst the serum levels of vitamin B₁₂ became subnormal only between 8–16 months after total gastrectomy, it is wise to

assume a state of vitamin B₁₂ deficiency from the day of total gastrectomy.

I find also some difficulty in accepting your presentation of the use of B vitamins in liver diseases, though I am in agreement with you that no definite relation has been found as yet between liver disease and B vitamins. I may perhaps recall the manifold functions of the liver cell in storing glycogen, proteins, and also vitamins; as it happened, medical experience invoked glucose and protein administration in turn for the treatment of liver diseases during the past few decades—perhaps with little scientific justification. It is also probable that the success claimed by Ralli *et al.*⁴ in severe liver cirrhosis with ascites after intravenous administration of large doses of potent liver extracts was due to its high vitamin B₁₂ content, which enhanced the regeneration of the still intact liver cells. Even before Latner's publication⁵ I—and probably others—found B vitamins intravenously administered useful in such a desperate condition like acute hepatic failure. As to your remark on Reynell's⁶ results, he gave B vitamins not intravenously but by mouth and in experimental liver failure in rats. Moreover, he very cautiously commented on the extensive metabolic effects of liver injury. Similarly both Colwell⁷ and Campbell and Pruitt⁸ found in infective hepatitis a more rapid return to normal appetite after vitamin B₁₂ administration. As the therapy of infective hepatitis consists mainly of a diet rich in proteins and carbohydrates, quick recovery of the patient will obviously be accelerated by a quick restoration of his appetite. It appears therefore that, whilst in your opinion "there is little theoretical justification for their use," the ill patient is greatly helped by those B vitamins.

Lastly, Sir, B vitamins have been used with great success by many of us in severe and less severe toxic states. Together with Mr. R. S. Corbett and others, we gave large doses of B vitamins included in the drip as a routine in cases of post-operative confusional states since 1941 and the results were very satisfactory. There is no need to go into further details about the manifold application of B vitamins in other toxic states, as impressive accounts have recently been published by Gould.⁹—I am, etc.,

London, W.1.

Coma Following Dental "Gas"

SIR,—Dr. J. G. Bourne (*Journal*, May 14, p. 1223) wishes to discover the cause, nature, and incidence of failure immediately to regain consciousness after nitrous oxide gas has been administered. Curiously enough, Dr. Bourne has supplied his own answer when he states at the end of the first paragraph that "the nitrous oxide is almost always given with oxygen, though, of course, the oxygen is very much restricted."

It is not, and never has been, permissible to produce anaesthesia with nitrous oxide, or any other agent for that matter, by reducing the oxygen content of the mixture below atmospheric concentrations. In days gone by, this was frequently the only way in which it was possible to obtain unconsciousness with nitrous oxide for dental procedures in the unpremedicated out-patient. To-day we have at our disposal a variety of supplementary agents which can be added in small doses to the nitrous-oxide-oxygen mixture, reinforcing it in such a way as to induce anaesthesia without the necessity of restricting oxygen, and yet not interfering with the speed of recovery and the patient's ability to return home. One of a variety of such supplementary agents available is trichlorethylene, which I have personally used as an adjuvant to nitrous oxide in many hundreds of dental out-patients with most gratifying results.

I am quite certain that there is no inherent property in nitrous oxide which will produce post-anaesthetic coma as long as nitrous oxide "anaesthesia" is induced and not nitrous oxide "asphyxia." The tendency of "very much restricting the oxygen" must be absolutely resisted.—I am, etc.,

Saskatoon, Canada.

GORDON M. WYANT.

"Half-minute" Thermometers

SIR,—Referring to Sir Henry Tidy's letter (*Journal*, June 11, p. 1426), isn't it about time this misleading and dangerous inscription was forbidden by law as are much less important inscriptions on food labels? As life or death may depend on correct temperature recording, it is really shocking that so little attention is given to it. In one large hospital I know temperature-taking is left to the student nurses, as it probably is in many others too, and to see them flicking thermometers in and out of patients' mouths is really laughable if it was not so serious. When I pointed out the futility of this procedure I was told: "Well, the thermometers are marked half-minute, and that is all the time we are allowed for taking temperatures."—I am, etc.,

Gosport, Hants.

G. W. FLEMING.

Press Publicity

SIR,—From time to time the Medical Defence Union are approached by members who have been affronted by the unauthorized and unwanted use of their names in the lay press. Only too often it is necessary to advise that there is no legal remedy. However, in the issue of the *People* of January 9 last there appeared, under the headline "Man's Heart Patched in Hospital Miracle," an account of an operation performed by a thoracic surgeon at the Churchill Hospital, Oxford. Not only did the surgeon in this case object to the unauthorized use of his name and to certain inaccuracies in the article, but perhaps still more unfortunate in his eyes was the fact that the tone of the article was such as to rouse unfair hopes in the minds of patients who might think he could perform similar "miracles" on them. In this case action was possible, for the article was libellous: proceedings were accordingly instituted and a correction and apology appeared in the issue of the *People* of April 24.—I am, etc.,

London, W.C.1.

ROBT. FORBES,
Secretary, Medical Defence Union.

POINTS FROM LETTERS

Swallowed Open Safety-pin

Dr. A. Fry (London, S.E.25) writes: Reading the recent correspondence in the *Journal* about swallowed hair-grips reminded me about a case which I had some years which may be of some interest. A female baby, aged 9 months, was brought with a history of having swallowed an open safety-pin. An x-ray film of the abdomen showed the open safety-pin present in the left lumbar area—probably in the stomach—with its angle downward and pointed end upward. There were no symptoms. Three days later the safety-pin was seen in the right iliac fossa—probably caecum. The pointed end was directed upwards. No aperients or other treatment was given. The following day the open safety-pin passed through the anus without any incident. It is remarkable that such a difficult foreign body should pass through the whole gastro-intestinal tract without any complications.

Forward Looking

Dr. REGINALD FISHER (Kings Langley) writes: Perhaps this case may be worth recording. A patient, who has suffered from arthritis of the spine for several years, has been fitted with a plastic jacket support which fixes the spine, both lumbar and cervical, and keeps her chin up. This relieved her pain but she could not see the ground nearer than 8 ft. (2.4 m.) from her feet, which made her walking difficult and uncertain, more so as she is of a nervous disposition. I thought that a prismatic lens in her spectacles might bring her line of sight nearer her toes. Mr. Hope Gunning kindly calculated the lenses required and Messrs. Clement Clarke made the spectacles, which have helped her a good deal. She now walks about with confidence. I had not heard of this complication before and perhaps others also may not have done. The prisms for distance were 5D base down and for reading 15D base down.

Obituary

D. B. BLACKLOCK, C.M.G., M.D.,
D.P.H., D.T.M.

We record with regret the death at his home at Mawnan, Cornwall, on June 10 of Professor D. B. Blacklock, who was professor of tropical hygiene in the University of Liverpool from 1934 to 1945. He had previously occupied the chair of tropical diseases of Africa and the chair of parasitology in the university. He was 77 years of age.

Donald Breadalbane Blacklock was born at Oban, Argyllshire, on January 7, 1879, the son of the Rev. John Blacklock, a minister of the Presbyterian Church. He was educated at Fettes College and at Edinburgh University, where, after a distinguished career both in studies and in sport, he graduated M.B., Ch.B. in 1902, proceeding to the M.D. in 1909. He took the Diploma in Public Health (London) in 1907, and the Diploma in Tropical Medicine (Liverpool) in 1911, when he was appointed research assistant to the Liverpool School of Tropical Medicine's research laboratory at Runcorn, then under the directorship of Warrington Yorke. He worked at the Runcorn laboratory until 1914, when he was appointed, first, director of the laboratory, and, later, lecturer in parasitology to the Liverpool School, where Warrington Yorke had recently been appointed Walter Myers professor of parasitology. During the first world war Blacklock served in the R.A.M.C. from 1915 until 1919. With the rank of lieutenant he was medical officer in charge of malaria wards at the Belmont Road auxiliary military hospital from 1916 to 1918, where he worked under the late Professor (temporary lieutenant-colonel) J. W. W. Stephens, F.R.S.; from 1918 to 1919 he held the rank of captain.

In 1921, when the Sir Alfred Lewis Jones Research Laboratory was opened by the Liverpool School at Freetown, Sierra Leone, Blacklock was created professor of tropical diseases of Africa by the University of Liverpool and was appointed the first director of the laboratory. He worked at Freetown for eight years, during which time he built up and established the laboratory on a firm and stable footing, and carried out and directed a very large volume of research, including work on beriberi, schistosomiasis, malaria, trypanosomiasis, goitre, *Onchocerca volvulus*, and metazoan immunity (for which a three-years' grant was made by the Empire Marketing Board), as well as carrying out a survey of the diseases of Sierra Leone on behalf of the Sierra Leone Government. His most noteworthy achievement was the proof that *O. volvulus* is transmitted to man by *Simulium damnosum*, a small biting fly. This for the first time allowed methods of control to be applied to a disease which causes much suffering in many parts of the tropical world. In 1929 he returned to Liverpool from Freetown, to succeed Professor Yorke in the

[Elliott & Fry]

Walter Myers chair of parasitology, a position which he held until 1934, when he was appointed the first holder of the newly established chair of tropical hygiene. On his retirement from the chair in 1945 the title of emeritus professor was conferred upon him.

In the second world war Blacklock was called upon by the Government in 1940 to undertake a special mission in Sierra Leone to investigate certain problems of malaria which had arisen there under war conditions. With the rank of surgeon-captain in the R.N.V.R., and at the same time holding an appointment as senior medical officer (special mission) under the government of Sierra Leone, he carried out investigations from August, 1940, until October, 1941. The work was eminently successful, and in 1942, in recognition of his notable services, he was appointed C.M.G. In September, 1945, after being in charge of the Liverpool School of Tropical Medicine for two years and four months, following the death of Professor Warrington Yorke, its previous director, Blacklock retired under the age limit. He was presented with the Mary Kingsley medal by the school in 1949.

He took part in the school's 32nd expedition, despatched in 1914 to Sierra Leone to study sleeping sickness and other diseases. In 1935 he was awarded a Leverhulme research fellowship to carry out "a study of the present practice of hygiene (including rural hygiene) in certain Eastern countries." Accompanied by his wife, who held a similar fellowship for "a comparative study of the organization for the improvement of health of women and children in Eastern countries," he visited China, Malaya, Burma, India, Ceylon, and Palestine on a tour which lasted from July, 1935, to January, 1936. When he retired from the chair of tropical hygiene in the Liverpool School of Tropical Medicine in 1945, after an association with the school lasting 34 years, he went to live in the West country.

Blacklock's clear and incisive mind marked him out as an excellent lecturer, and his textbook, *A Guide to Human Parasitology*, written in collaboration with T. Southwell, has gone through many editions, and bears witness to his powers as a teacher. A member of the British Medical Association for nearly 50 years, he was twice president of the Sierra Leone Branch (1923-5 and 1926-7). Earlier, he acted as one of the honorary secretaries of the Section of Tropical Medicine at the Liverpool Annual Meeting of the Association in 1912, and at Cambridge in 1920 he served as a vice-president of the same section.

In 1922 he married Dr. Mary Georgina Thompson, of Bellaghy, Co. Derry, whose work in medicine both at home and overseas was recognized by the Government in 1945 by her appointment as C.B.E. Mrs. Blacklock survives him. There are no children.

Professor G. MACDONALD writes: Blacklock enjoyed adventure, and he had plenty in the discovery of Africa both in the physical and medical senses. He was one of the most travelled persons in West Africa at a time when to travel was to walk and to be out of touch for long periods. He was fascinated by the country and its people and by the people's lives, habits, and humour. But most particularly he was fascinated by the riddle of the diseases which beset them, for even the broad outline of their pattern of incidence was almost unknown, and in many cases there were great gaps in our knowledge of aetiology, transmission, and epidemiology. His fascination led to many studies: a medical survey of the protectorate in which he took serological and cultural techniques to the remote village; researches on malaria, blackwater fever, schistosomiasis, trypanosomiasis, and other conditions, and experiments in

village sanitation in the almost unknown hinterland. In all of these he added to knowledge, but running through the diversity of interests there was one main stream of work—the study of *Onchocerca volvulus* and its transmission, which all the world now knows, through him, is by flies of the genus *Simulium*. His conviction of its importance at a time when most disregarded it completely anticipated the present estimation; his studies were necessarily largely carried out in almost inaccessible places and in temporary camps with limited equipment, but their design, the form of the work over several years, and the demonstration of findings were as precise as those of any purely laboratory experiment. This was his major single contribution to knowledge which entitles him to an honourable place among the pioneers of tropical medicine, for it was a brilliant work carried out under arduous conditions demanding the highest intellectual and technical ability. However, his establishment and management of the first British permanent medical research laboratory in Africa was in the end probably equally important; it led to the accumulation of much knowledge of which he was the origin though not necessarily the author. Those who worked with him in it will always remember his high intellectual stature, his warm-heartedness, and his good will to all whom he thought sincere. They remember too the support which Mrs. Blacklock gave him in his life and work and their joint kindness to all with whom they came into contact. The Blacklocks, by their scientific work, introduction of concepts of maternal and child care, and generous natures, left an indelible memory in a very wide circle of friends, African and European, who will sympathize very deeply with Mrs. Blacklock in her loss.

C. E. RHODES, M.B., B.S.

We record with regret the death on June 16 of Surgeon Lieutenant C. E. Rhodes at the age of 27. He lost his life in circumstances of great gallantry. Surgeon Lieutenant Rhodes, a National Service medical officer in the R.N.V.R., was serving in H.M.S. *Maidstone*, a submarine depot ship lying in Portland Harbour. When an explosion occurred in H.M. Submarine *Sidon*, which was alongside the *Maidstone*, he immediately boarded the submarine and without hesitation went below to help the injured. He succeeded in rescuing at least one of the crew, but when the order was given to abandon the sinking submarine he did not return. In the words of a colleague, "Either he never heard that order or he chose, true to his calling, to stay below tending the injured." The *Sidon* sank some twenty minutes after the explosion. Charles Eric Rhodes was born at Whitworth on April 3, 1928. He received his medical training at the London Hospital and qualified M.R.C.S., L.R.C.P. in 1952, taking the London degrees of M.B., B.S. in the same year. He then held the appointments of house-physician at the London Hospital and house-surgeon at Harold Wood Hospital before entering the R.N.V.R. as a temporary surgeon lieutenant on December 31, 1953, for the period of full-time national service. After a short time at R.N. Barracks, Portsmouth, he was appointed to H.M.S. *Maidstone* on February 8, 1954. He was sports officer of the depot ship and a keen yachtsman. He leaves a widow and a three-weeks-old daughter.

Dr. A. E. CLARK-KENNEDY writes: Rhodes was a student when I was dean of the London Hospital Medical College, and when he qualified he became my house-physician. So it was my privilege to know him well, and the good fortune of others to know him well, too. For through his personality he left his mark on the College, and, had this disaster never happened, he would still have been among those we all remember and always rejoice to meet again. Why was he so much liked? For his ready willingness to help others,

I think; for his kindly tolerance of incompetence in the beginner; for his ever readiness to organize activities so that others might enjoy themselves; for his ability as a leader often of the lesser men; for his quiet competence in getting things done; for his love of helping others to do the many things which he so rightly thought worth while doing himself. Reasons such as these led him to become the first non-playing secretary of rugby and, although exceedingly short-sighted, a pillar of the second fifteen. All in the know agree that our present high standard at the game is largely due to his energy and enthusiasm. But his intimate friends will remember him, not on the rugby field, rather on summer seas; in a dinghy instructing a beginner in the art on the estuary at Burnham, or more than pulling his weight in a larger boat on some ocean race. Quietly he organized me. His patients loved him, and he was always ready to give a helping hand to the diffident clerk. Intellectually he was not exceptional, but what mattered that? Far more important his energy and enthusiasm for everything he touched turned him into a first-class all-round doctor, and, had he lived, he would have found his rightful place among the *élite* of general practitioners. But that was not to be. His love of the sea took him, when the time came, into the Navy, and when the call came he did exactly what, as so many have said to me, they would have expected Rhodes to do under the circumstances with which he was so suddenly confronted. So he died true to the profession in which he had so recently started, true to the tradition of the Navy in which he was privileged temporarily to serve, above all true to himself as a man and to the sea on which his heart was set. The deepest sympathy of all at the London go out to his widow in her pride and her distress.

With the death of Dr. ARTHUR DAVIDSON on January 20 the medical profession in Australia, and in New South Wales in particular, has lost one of its most energetic workers and wisest counsellors. A member of the council of the New South Wales Branch of the British Medical Association from 1930 to 1946, he will be remembered by members of the United Kingdom delegation to the 103rd Annual Meeting of the Association at Melbourne in 1955 as the president of the Branch which first welcomed them on their arrival at Sydney. Born in October, 1891, Arthur Madgwick Davidson was educated at Brisbane Grammar School and at Sydney University, where he graduated M.B., Ch.M., in 1915. After active service with the Australian Imperial Force in the first world war, during which he was mentioned in dispatches and, in 1919, appointed O.B.E., he established the general practice at Enmore, New South Wales, which he was to serve until his death. Service was, indeed, the keynote of his career; he became honorary surgeon to the Marrickville District Hospital, honorary obstetrician to the Bethesda Hospital, senior medical officer to the Braeside Maternity Hospital, and honorary medical officer to the Moore Theological College, in addition to a variety of other appointments of a public nature. It was inevitable that a man of such tireless energy and attainments should acquire a most successful practice. Dr. Davidson had the ability both to think and to speak clearly and logically, and this ability enabled him to give opinions which were invariably sound and criticisms which were always constructive, qualities which were particularly valued by his colleagues of the Australasian Medical Publishing Company—the publishers of the *Medical Journal of Australia*—of which he was a director for a number of years. These qualities, coupled with his ready grasp of financial affairs and his experience of the problems of general practice, led to his being largely responsible for the formation of the British Medical Agency in New South Wales, and almost wholly responsible for the organization of Medical Finance, Ltd., a company formed with the object of assisting young graduates returning from service in the second world war to enter practice. Dr. Davidson leaves a widow, two daughters, and three sons, two of whom are members of the medical profession.

Dr. H. C. S. WOODWARD died in a Coventry hospital on March 22 at the age of 86. Born on July 15, 1868, the son of Canon Matthew Woodward, of Folkestone, Herbert Croker Sperling Woodward was educated at St. Edward's School, Oxford, and at Downing College, Cambridge, receiving his clinical training at St. Thomas's Hospital. At Cambridge he was junior demonstrator of anatomy for a time, and after graduating M.B., B.C. in 1903 he held the appointment of house-physician at the Victoria Hospital for Children, Chelsea. In 1904 he entered general practice at Worksop, Nottinghamshire, becoming also honorary assistant surgeon to the local Victoria Hospital and medical officer to the Post Office. He settled at Kingston Bagpuize, near Abingdon, Berkshire, in 1907, and there he was appointed district medical officer and public vaccinator. When he retired from practice in 1933 he continued to live in the same village and often took posts as a locumtenent, mainly for colleagues in the neighbouring counties. Dr. Woodward will be remembered by those who knew him as a fine example of a professional man of the old school. He leaves a widow and two sons.

The death has occurred in Edinburgh at the age of 73 of Dr. POLLOK DONALD, who was in medical practice at Leith for over 35 years. Pollok Donald was born on November 12, 1881, and was educated at George Watson's College and at Edinburgh University, where he graduated M.B., Ch.B. in 1907. Six years later he obtained the Manchester D.P.H. After serving as house-physician at Leith Hospital, he took up an appointment under the late Sir James Mackenzie in Burnley. During the first world war he served with the R.A.M.C. in Greece, and on demobilization he joined his father, the late Dr. George Donald, in practice at Leith, and continued to work there until his retirement last year. He succeeded his father as parish doctor to North Leith, and was visiting physician to the Poor House Hospital at Seafeld, now the Eastern General Hospital. He was on the board of management of Leith Hospital, and during the last war he was keenly interested in Civil Defence and commanded a first-aid unit.

Dr. C. C. ROBSON writes: As one who was privileged to be a close friend of the late Dr. Donald for the last thirty years, I was in a position to appreciate fully the richness of his character and the sincerity of his nature, which so endeared him to his many patients and friends. Throughout his long career of practice in Leith he was ever the wise and kindly counsellor, and the well-known term "family doctor" could be applied to Dr. Donald in the fullest and most lovable sense. His wide knowledge of medicine and of world affairs enriched his friends, and, as this knowledge was linked with an innate modesty and shyness, one seemed to value his advice all the more. When on holiday his favourite pursuits were golf and fishing, and he was also a water-colour painter of considerable merit. He practised all of these pleasures with a lightheartedness which made him the ideal holiday companion. After a long and distressing illness borne with that fortitude which one could expect from such a fine man, Dr. Donald has left behind him a memory which will live long in the minds of his many patients and friends, by whom he will be sadly missed. To his wife, to his son who has succeeded in the practice, and to his daughters is extended the fullest measure of sympathy in their irreparable loss.

The death occurred on June 2 of Dr. E. R. WEIR, who practised in Glasgow for many years. He was 81 years of age. Edward Roberts Weir was born on October 4, 1873, and was educated at Glasgow University, where he graduated M.B., Ch.B. in 1897. Two years later he obtained the Edinburgh degree of B.Sc. in public health. After graduation he held appointments at the Kennedy Street and Belvidere branches of the City of Glasgow Fever Hospital. Later, he worked in the Glasgow public health service before entering general practice in Glasgow, becoming also an assistant physician to H.M. prison at Barlinnie. Towards the end of the first world war he left Glasgow for Innellan.

Medical Notes in Parliament

Poliomyelitis Vaccine Trials Deferred

It has been decided to postpone trials in this country with the American poliomyelitis vaccine following the Medical Research Council's investigation of the Cutter vaccine incident. This decision was made known on June 17 by the Minister of Health in a written reply to Mr. D. W. WADE (Huddersfield, West, Lib.).

Mr. IAIN MACLEOD stated that a member of the staff of the Medical Research Council had just returned from a visit to the United States, where he had been studying the latest developments. No explanation for the Cutter vaccine incident had yet been found, but it was possible that certain batches contained live virus. He understood that the safety tests to be applied to the vaccine in the United States had been greatly multiplied, including a closer control of manufacturing processes. Pending the introduction and application of similar measures here, the Medical Research Council had, he understood, postponed the start of any field trials. This would probably involve a postponement until the late autumn of this year—that is, until after the normal epidemic season for the disease. There were a number of questions arising out of the production and use of poliomyelitis vaccine in this country, and its possible export abroad, such as the determination of the age groups to which the vaccine should be offered when mass immunization was possible. The Secretary of State for Scotland and he were asking the Central and Scottish Health Services Councils to advise them upon this and similar matters.

Mr. A. BLENKINSOP (Newcastle-upon-Tyne, East, Lab.), questioning the Minister about this decision on June 20, said that all welcomed the fact that they were to proceed with care and proper research before using the vaccine, and asked if the Minister was satisfied with the facilities and provision of appliances for the research. Mr. MACLEOD said that was one of the matters on which the Medical Research Council would advise. Mr. SOMERVILLE HASTINGS (Barking, Lab.) asked if the vaccine was still being manufactured here by the two firms the Minister had named. Mr. MACLEOD replied that he thought it was only in active production by one of them.

Heroin Addicts

The HOME SECRETARY informed Mr. SOMERVILLE HASTINGS (Barking, Lab.) on June 16 that 52 heroin addicts were known in England and Wales and two in Scotland. There were no persons in respect of whom addiction was suspected but not proved. Drug addiction was not compulsorily notifiable, but he had no ground for thinking that there was any substantial hidden addiction. From January 1, 1950, to date, 23 persons were convicted in respect of 24 offences involving heroin, one person having been convicted twice. Of these 23 persons, 15 were known heroin addicts and one person, who had since left the country, was suspected to be addicted to the drug.

The number of convictions for offences involving heroin since 1950 had been:

1950—3	persons convicted, all addicts.
1951—4	" " , of whom 2 were addicts.
1952—2	" " , of whom 1 was an addict and 1 a suspected addict.
1953—5	" " , of whom 3 were addicts.
1954—7	" " , (1 of them twice), of whom 3 were addicts.
1955—3	" " , of whom all 3 were addicts.

Price Reductions of Drugs

Mr. A. BLENKINSOP (Newcastle-upon-Tyne, East, Lab.) asked the Minister of Health whether he would give information regarding recent voluntary reductions of prices of proprietary and basic drugs and dressings prescribed under the Health Service. Mr. MACLEOD replied on June 17 that since May, 1953, of the 73 most expensive and frequently

Argyllshire, and from 1925 to 1932, when he returned to Glasgow, he was in practice at Dunoon, where he was also medical officer to the Duncutha and King Street Homes and to the Post Office. In his younger days Dr. Weir was a keen golfer, and up to the end of his life enjoyed a game of bowls. He took a considerable interest in politics, and he was a great lover of English literature, being widely read in Scott, Dickens, and R. L. Stevenson. By his death there has passed away a lovable and happy personality, and those who knew him best miss him most.—J. C.

Dr. J. J. SILKE, a well-known general practitioner of Sutton Coldfield and the Erdington district of Birmingham, died suddenly in Queen Elizabeth Hospital, Birmingham, on June 2 at the age of 53. James Joseph Silke was born on August 22, 1901, and graduated M.B., B.Ch. from the National University of Ireland in 1924. He was demonstrator in anatomy and physiology at University College, Dublin, and, later, house-surgeon at St. Vincent's Hospital and Dispensary, Dublin. He then came to England and was in practice at York from 1927 to 1933, when he moved to Coventry. In 1937 he settled at New Oscott, Erdington, where he remained in practice for the rest of his life. During the second world war Dr. Silke served as a medical officer in the Home Guard, and the local first-aid organizations and industrial ambulance services also received his whole-hearted support. A staunch Roman Catholic, he was a past president of the City of Birmingham Circle of the Catenian Association. In his younger days Dr. Silke was a notable athlete, winning a number of Irish sprint championships, and he also played Rugby football as a member of the Irish trial fifteen. He leaves a widow and two young children.

The obituary of Professor PETER PATERSON was printed in the *Journal* of March 19 (p. 735). Dr. GEORGE A. GRAND-SOULT writes from British Guiana: I should like to record my humble tribute—belated because I am several thousand miles away—to Professor Peter Paterson, an able surgeon and excellent teacher. I was one of his students before the first world war, and in the early days of the war was honoured when he made me his outdoor house-surgeon, during which period I acquired much knowledge from him and his assistant, the late Mr. Milne McIntyre. These two (P. P. and M. M., as they were endearingly spoken of) will always be revered by their students, many of them now scattered over the surface of the globe.

Medico-Legal

AMERICAN RESOLUTION ON A.I.D.

The following statement was approved by the American Society for the Study of Fertility at a meeting held in Atlantic City on June 4. The Society has a membership of 500 specialists.

"If it is in harmony with the beliefs of the couple and the doctor, donor artificial insemination is a completely ethical, moral, and desirable form of medical therapy.

"Conditions under which donor artificial insemination is acceptable include: (1) Urgent desire of the couple to have such therapy applied to the solution of their infertility problems. (2) Careful selection by the physician of a biologically and genetically satisfactory donor. (3) The opinion of the physician, after thorough study, that the couple will make desirable parents.

"Those physicians who have carried out donor insemination for several decades can attest that in many cases it is a more desirable procedure for acquiring a family than adoption. One great advantage of donor insemination is that it provides the opportunity for the husband to share the months of his wife's pregnancy and her childbirth. From observation over many years the membership is impressed by the almost universal good results achieved in respect to children and the entire family unit. The fact that, in some instances, patients have returned for as many as four children by donor insemination is further proof of the happiness it bestows."

prescribed proprietary preparations, 29 had been reduced in price (many by between 20% and 50%), some of these reductions reflecting in part reductions in the basic drug prices. In addition, special provisional reductions (mentioned in a reply on January 31), ranging up to 20%, were recently arranged with manufacturers in the prices of 19 proprietary preparations. During the same period the prices of certain important basic drugs and their corresponding products had been reduced, some of them several times. These voluntary reductions include some recent ones (since June, 1954), ranging up to 20%, in the prices of penicillin, streptomycin, chloramphenicol, hormone, and vitamin products. There had been no recent reductions in the prices of the main types of surgical dressings used in the Health Service.

A Birmingham Doctor's Action

Mr. J. BAIRD (Wolverhampton, North-east, Lab.) asked the Minister of Health on June 20 what position Dr. Brian Taylor, of Birmingham, held under the Health Service. Mr. MACLEOD said it was that of a part-time consultant to the Board of Governors of the United Birmingham Hospitals and to the Birmingham Regional Hospital Board.

Mr. BAIRD said that one of his constituents, a footplate-man who was on strike, whose wife was a patient of the doctor, received a letter from him saying, "I am afraid my principles prevent me from seeing patients on strike, except in cases of emergency. Do you mind postponing the visit with your wife? If you will phone for an appointment when the strike is over I will try to fix a convenient date." Was the attitude of the doctor not completely unethical, and was this not a case of political discrimination? Would the Minister ensure that the doctor changed his principles or that his name was withdrawn from the list?

Mr. MACLEOD said that Mr. Baird knew of the difficulty he was in. If there was any question of a breach of contract within the Service that was a matter for which he was answerable and which he would be glad to answer. The question of medical etiquette was not for him, nor was the matter of the private arrangements a doctor might wish to make with his private patients.

Mr. BAIRD said that the doctor had said that his principles did not allow him to see these people. Surely his principles must operate in the Health Service as a whole. What he was saying was that he would never see a patient on strike. Mr. MACLEOD said equally there was a matter of principle in his reply. He could not answer on matters for which there was no Ministerial responsibility. Mr. HERBERT MORRISON (Lewisham, South, Lab.) asked the Minister to consider whether a medical practitioner who made this discrimination about a man who was on strike—and on official strike—was suitable to be practising in the Health Service. Mr. MACLEOD said he did not think he could go beyond what he had said. He did not make the rules of the House, and if there was a matter in which there was no Ministerial responsibility he did not see how he could offer comment on it in the House. Mr. BAIRD gave notice that he would raise the matter again.

Mental Defectives and Sexual Acts

Mr. KENNETH ROBINSON (St. Pancras, North, Lab.) asked the Minister of Health why, under Circular H.M.(55)46, of May 10, 1955, he now required the police to be informed of sexual acts by certified mental defectives, in addition to the normal report to the Board of Control; whether he was aware that medical superintendents had been informed by his department that such reports to the police were still discretionary; and if he would revert to the earlier procedure by withdrawing the circular. Mr. MACLEOD stated that the circular was issued after consultation with the Home Secretary because the earlier procedure, which had only been in force since 1951, did not have sufficient regard to the duty of the police to investigate criminal offences. The circular advised but did not require cases to be reported to the police. He was aware of no good reason for its withdrawal.

Mr. ROBINSON observed that the Minister was surely not suggesting that the police should prosecute in cases like this. The old arrangement had been working satisfactorily. Why did the Minister want to place this additional obligation on medical superintendents? Mr. MACLEOD explained that there were cases which, under the 1913 Act, were criminal offences which came within the terms of the circular. They were getting back to the practice that applied before 1951. This was a matter of doctor-patient relationship, and the final decision whether the police should be notified was left with the medical superintendent.

Hospital Medical Officers.—In May, 1954, the latest date for which detailed information is available, there were 2,266 senior hospital medical officers in England and Wales.

Chiropody Service.—In Scotland 11 local health authorities are employing chiropodists to provide a service for old people, and nine others are making contributions to voluntary bodies who do so. In addition, many more voluntary bodies are undertaking the work with contributions from local authorities.

Vital Statistics

Infectious Diseases

Infectious diseases were less prevalent in England and Wales during the week ending June 4; the falls in the number of notifications included 873 for measles, from 25,470 to 24,597, 581 for dysentery, from 1,385 to 804, 252 for whooping-cough, from 1,455 to 1,203, 165 for scarlet fever, from 609 to 444, and 39 for acute pneumonia, from 423 to 384.

The largest falls in the incidence of measles were 584 in Yorkshire West Riding, from 2,092 to 1,508, 305 in Staffordshire, from 1,135 to 830, 259 in Kent, from 1,551 to 1,292, 238 in Leicestershire, from 1,480 to 1,242, 197 in Warwickshire, from 1,148 to 951, and the largest rises were 327 in Southampton, from 1,204 to 1,531, 221 in Essex, from 1,345 to 1,566, 150 in Bedfordshire, from 99 to 249, 138 in Derbyshire, from 361 to 499, 137 in Devonshire, from 356 to 493, 97 in Sussex, from 670 to 767. The number of notifications of whooping-cough was the lowest for two and a half years; the largest declines during the week were 79 in Lancashire, from 143 to 64, and 60 in Yorkshire West Riding, from 125 to 65. Scarlet fever reached the lowest level for almost nine months; the largest falls were 57 in Lancashire, from 97 to 40, and 41 in Yorkshire West Riding, from 76 to 35. 7 cases of diphtheria were notified, 3 less than in the preceding week, and 3 of these cases were notified in Birmingham C.B.

There was an increase in the week of 6 in the notified cases of acute poliomyelitis, from 25 to 31. There were 14 more for paralytic and 8 fewer for non-paralytic. The largest returns were Yorkshire West Riding 6 (Barnsley C.B. 6), Cheshire 4 (Stockport C.B. 3), London 4 (Bethnal Green 2), and Warwickshire 3 (Birmingham C.B. 3).

The number of notifications of dysentery was the lowest for 18 weeks. The largest centres of infection were Surrey 178 (Croydon C.B. 161), Lancashire 130 (Blackpool C.B. 24, Oldham C.B. 22, Manchester C.B. 16, St. Helens C.B. 13), Durham 78 (South Shields C.B. 18, Stanley U.D. 16, Seaham U.D. 10), Middlesex 50 (Heston and Isleworth M.B. 31), Yorkshire West Riding 49 (Huddersfield C.B. 22), London 47 (Southwark 10), Northumberland 39 (Newcastle-upon-Tyne C.B. 12), Cambridgeshire 28 (Cambridge M.B. 28), Norfolk 26 (Norwich C.B. 18), Yorkshire North Riding 21 (Middlesbrough C.B. 18), and Somersetshire 20 (Bath C.B. 20).

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of certain diseases notified weekly in England and Wales. Highest and lowest figures reported in each week during the nine years 1946-54 are shown thus - - - - -, the figures for 1955 thus ———. Except for the curves showing

notifications in 1955, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending June 4 (No. 22) and corresponding week 1954.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available.

The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

* Measles not notifiable in Scotland, whence returns are approximate.

† Includes primary and influenzal pneumonia.

‡ Includes puerperal pyrexia.

Medical News

450th Anniversary of R.C.S.Ed.—As part of the 450th anniversary celebrations of the Royal College of Surgeons of Edinburgh on June 20 and 21, the DUKE OF EDINBURGH was made an honorary Fellow of the College. Later, at the anniversary banquet he was presented with a silver replica of a bleeding-cup. A full account of the proceedings will appear in next week's issue of the *Journal*.

Golden Wedding.—Sir ROBERT and Lady HUTCHISON will celebrate the golden anniversary of their wedding on June 27, and all his old students and colleagues at the London Hospital and at the Hospital for Sick Children, Great Ormond Street, will wish to join us and their many other friends in hoping they will have a very happy day. Sir Robert Hutchison, who is a past President of the Royal College of Physicians of London, the Royal Society of Medicine, the British Paediatric Association, and the Association of Physicians of Great Britain and Ireland, is now in his 84th year. He first met Laetitia Norah Moore-Ede at the London Hospital Medical College, where she was a medical student, and they were married in 1905, the year after Dr. Moore-Ede obtained the London M.B. The singular success of this medical partnership has been a joy to all their friends.

Obstetric Medicine Research Unit at Aberdeen.—The Medical Research Council announces that, in collaboration with Aberdeen University and the North-eastern Regional Hospital Board for Scotland, it is establishing a unit for research in obstetric medicine at Aberdeen, under the honorary directorship of Professor DUGALD BAIRD. The term "obstetric medicine" in the unit's name is to indicate, in the words of the announcement, "that general health problems, of the type which are the concern of the research physician, have become as important as the surgical aspects of obstetrics." For some years now Professor Baird has headed a research team at Aberdeen which has been studying maternity problems by a combined epidemiological, clinical, and laboratory approach. The Scottish Hospitals Endowment Research Trust has promised a substantial grant to the university for the construction of a building adjoining the Aberdeen Maternity Hospital to house the unit.

Commonwealth Health and Tuberculosis Conference.—The fourth Commonwealth Health and Tuberculosis Conference was opened at the Royal Festival Hall, London, on Tuesday, June 21, and continued until Friday. Most of those present represented local authorities in the United Kingdom, but a very large number came from the British Dominions and Colonies, as well as from over 50 other countries. The Minister of Health, Mr. IAIN MACLEOD, opened the Conference. In many areas, he said, the waiting-list for tuberculosis beds had virtually disappeared and elsewhere waiting time had been substantially reduced. There were now twice as many mass radiography units operating as at the start of the National Health Service. In the future they must look more to the preventive side. The DUCHESS OF PORTLAND, chairman of council of the National Association for the Prevention of Tuberculosis, presided over the first session of the Conference, which had as its subject for discussion, "How social environment can combine with specific medical measures to prevent the disease." In later sessions child hygiene and infection and the choice of drugs in the medical and surgical treatment of tuberculosis were among the subjects discussed.

Measles Virus.—In an address at Harvard, U.S.A., last month Professor JOHN F. ENDERS, who shared the 1954 Nobel Prize for Medicine for his work on the culture of poliomyelitis virus, reported an important advance in the identification of measles virus. Using similar tissue culture

techniques, Professor Enders and his colleague Dr. T. C. PEEBLES reported in May, 1954, the successful propagation of cytopathogenic agents from the blood and throat washings of patients with typical measles (*Proc. Soc. exp. Biol.* 1954, 86, 277). These survived serial passage in cultures of human or monkey renal cells, and showed properties strongly suggesting that they were indeed measles virus. They produced a characteristic cytopathogenic effect *in vitro*, similar to that seen in the body in acute measles, and this effect was neutralized by the addition of convalescent measles serum. Further, antigen was evolved during cultivation which reacted specifically in complement fixation tests with convalescent serum. But final proof of identity was lacking. This has now been provided. Professor Enders now reports the production of clinical measles in wild cynomolgus monkeys after inoculation with tissue culture material that had undergone repeated passages *in vitro*. It was necessary to use freshly captured monkeys from the Philippine Islands as nearly all the laboratory monkeys examined were found to have measles antibody in the serum. This work may open the way to the development of a measles vaccine, particularly as so far there appears to be only one type of measles virus to contend with.

Clinic for Alcoholics.—The Society for the Study of Addiction, acting jointly with the National Association for Mental Health and the Church of England Temperance Society, has opened a clinic at 14, Gloucester Place, London, W.1 (telephone: Welbeck 5222) for the treatment of alcoholics. The clinic is staffed by a panel of doctors from the Society for the Study of Addiction, who provide their services free, and there is a full-time psychiatric social worker. Hours of attendance are from 2 to 5 p.m. on Tuesdays and Fridays, and there is no charge. Doctors referring patients to the clinic are asked to send clinical details beforehand.

New Journal on Alcoholism.—Blackwell Scientific Publications, Oxford, has just issued the first number of the *International Journal on Alcohol and Alcoholism*. It is the official organ of the International Institute for Research on Problems of Alcohol. Besides original papers in English, French, German, Italian, and Spanish, each issue will contain lists of contents of current journals on alcoholism, and it is intended to publish classified bibliographies of the world literature on special aspects of the subject. The journal will appear three times a year at an annual subscription of 30s.

Honorary Degrees at Toronto.—To mark the occasion of the joint meeting of the British, Canadian, and Ontario Medical Associations in Toronto, on June 17, the honorar LL.D. of the Toronto University was conferred on six of the participating doctors, three from Britain and three from Canada. They were Professor STANLEY GRAHAM, Dr. E. A. GREGG, Sir JOHN MCNEE, Dr. T. C. ROUTLEY, Dr. G. F. STRONG, and Dr. W. P. WARNER.

Clinical Thermometers.—On June 21 the British Standard Institution held a press conference at which the merits of the British Standard thermometer (No. 691) were stressed. The B.S. thermometer is marked "quick," "medium," or "stubby," and bears no reference to time on it.

Mementos of the War Memorial.—Picture postcards and some copies of *In Memoriam 1939-1945*, the illustrated booklet prepared for the unveiling ceremony of the War Memorial in the Court of Honour at B.M.A. House last November, are available from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1; at 6d. and 2s. 6d. each respectively (post free). Besides full-page photographs of the memorial and the individual statues with the sculptor's explanation of their symbolism, *In Memoriam* contains the names of the medical men and women of the British Empire and Commonwealth who are commemorated by the memorial.

Retirement of Coroner to Royal Household.—The retirement of Lieutenant-Colonel W. H. L. MCCARTHY as coroner to the Royal Household will take place on June 30. He

has held this position for 21 years. Educated at Trinity College, Dublin, and St. Thomas's Hospital, London, Colonel McCarthy served with distinction in the R.A.M.C. during the 1914-18 war, being awarded the D.S.O. and M.C. Later he was M.O.H. for Chelsea. Besides being medically qualified Colonel McCarthy is a barrister-at-law and a J.P.

Chairman of Royal Sanitary Institute.—Dr. A. PARKER, D.Sc., director of the Fuel Research Station of the Department for Scientific and Industrial Research, has been elected chairman of the Institute and will take office in October. Dr. Parker, whose subjects are physical chemistry and thermodynamics, has been closely connected with recent investigations into the causes of "smog."

Dr. L. G. Edey, until recently chief medical officer to the Ministry of Health, Gold Coast, and before that director of medical services there, has accepted a two-year W.H.O. appointment in Nepal. His job will be to establish a school for the training of health assistants in Katmandu.

COMING EVENTS

British Association.—The 17th annual meeting will be held this year in Bristol, August 31-September 7, under the presidency of Sir ROBERT ROBINSON, O.M., F.R.S. His presidential address will be on "Science and the Scientist." Preliminary programmes are available from the secretary, British Association for the Advancement of Science, Burlington House, London, W.1.

Vitamin E Congress.—Third International Congress in Venice, September 5-8. Details from Professor Dr. EMILIO RAVERDINO, Via Pietro Verri 4, Milan.

International Union of the Medical Press.—The second congress will be held at the Faculty of Medicine, Paris, on October 21 and 22, under the chairmanship of Professor LOEPER. Details from secretariat, I.U.M.P., 12, rue de l'Ecole de Médecine, Paris, 6^e.

NEW ISSUES

British Journal of Ophthalmology.—The new issue (Vol. 39, No. 6) is now available. The contents include:

INCIDENCE OF HUMAN INFECTION WITH ONCHOCERCIASIS IN DIFFERENT COMMUNITIES IN RELATION TO THE INCIDENCE AND TYPE OF THE OCULAR LESIONS. F. H. Budden.
SEDATION FOR OPHTHALMIC SURGERY. COMBINATION OF CHLORPROMAZINE, PROMETHAZINE, AND PETHIDINE. R. A. Burn, D. A. B. Hopkin, G. Edwards, and C. M. Jones.
BINOCULAR DIAPHRAGM. R. H. P. Fernandez, O. P. Edmonds, and T. A. Hunt.
ELECTRORETINOGRAM DURING DEVELOPMENT OF HEREDITARY RETINAL DEGENERATION IN THE DOG. H. B. Parry, Katharine Tansley, and L. C. Thomson.
KERATOME OR KNIFE INCISION FOR CATARACT. ASSESSMENT OF 180 CASES. Howard Reed.
SEX OF NUCLEI IN OCULAR TISSUES. Christopher Pedler and Norman Ashton.
CALIBRATION OF TONOMETERS. C. R. S. Jackson.
HEREDITARY POSTERIOR POLAR CATARACT WITH REPORT OF A PEDIGREE. C. G. Tulloch.
RETINAL IMAGE IN AXIAL AND REFRACTIVE AMETROPIA. Joseph I. Pascal.

Issued monthly; annual subscription £4 4s.; single copy 8s. 6d.; obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1.

British Journal of Preventive and Social Medicine.—The new issue (Vol. 9, No. 2) is now available. The contents include:

OBSERVATIONS ON 1,078 PERINATAL DEATHS. A. M. Stewart, J. W. Webb, and D. Hewitt.
MUSTARD GAS POISONING, CHRONIC BRONCHITIS, AND LUNG CANCER. AN INVESTIGATION INTO THE POSSIBILITY THAT POISONING BY MUSTARD GAS IN THE 1914-18 WAR MIGHT BE A FACTOR IN THE PRODUCTION OF NEOPLASIA. R. A. M. Case and A. J. Lea.
INJURIES IN THE AGED. A. J. Fisher.
SOME FEATURES OF LEUKAEMIA MORTALITY. D. Hewitt.
FERTILITY AND REPRODUCTIVE HISTORY OF MOTHERS OF MONGOLOID DEFECTIVES. A. Smith and R. G. Record.
SOCIAL MEDICINE STUDIES BASED ON CIVILIAN MEDICAL BOARD RECORDS. III. PHYSICAL AND OCCUPATIONAL CHARACTERISTICS OF MEN WITH CERTAIN SKIN DISEASES. A. M. Stewart, J. W. Webb, and D. Hewitt.
EMPLOYMENT OF RECOVERED TUBERCULOUS PATIENTS. A. Barr.
A FURTHER STUDY OF A-B-O BLOOD GROUPS AND DIFFERENTIAL FERTILITY AMONG WOMEN IN TWO AUSTRALIAN MATERNITY HOSPITALS. R. L. Kirk, J. W. Shield, N. S. Stenhouse, Lucy M. Bryce, and Rachel Jakobowicz.

Issued quarterly; annual subscription £2 2s.; single copy 12s. 6d.; obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Application should be made first to the institution concerned.

Monday, June 27

POSTGRADUATE MEDICAL SCHOOL OF LONDON.—4 p.m., Dr. R. Bing (Alabama): Metabolism of the Heart.

Tuesday, June 28

INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. P. D. Samman: Follicular Keratotic Disorders.

Wednesday, June 29

INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. H. Haber: The Dyskeratoses.

Thursday, June 30

POSTGRADUATE MEDICAL SCHOOL OF LONDON.—4 p.m., Dr. J. F. Goodwin: Mitral Valve Disease.

RENAL ASSOCIATION.—At 41, Portland Place, London, W.1, 4.30 p.m., Dr. Alexander Leaf and Dr. O. M. Wroong: Control of the Volume of the Body Fluids.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—5.30 p.m., otolaryngology lecture by Dr. T. A. Davies: Relationship of Syphilis to Otolaryngology.

Friday, July 1

INSTITUTE OF DISEASES OF THE CHEST.—5 p.m., radiological demonstration by Dr. J. W. Pierce.

INSTITUTE OF LARYNGOLOGY AND OTOTOLOGY.—3.30 p.m., Mr. Wallace Black: Congenital Deafness.

POSTGRADUATE MEDICAL SCHOOL OF LONDON.—(1) 2 p.m., Professor H. A. Magnus: Reticulosarcoma of Bone. (2) 4 p.m., Dr. W. W. Burdett: Rheumatic Carditis.

APPOINTMENTS

CROSBY, GEORGETTE, M.R.C.S., L.R.C.P., Assistant Medical Officer of Health, East Ham.
MCCARTHY, DENIS, M.B., B.Ch., Clinical Assistant at City Maternity Hospital, Gloucester.

MANCHESTER REGIONAL HOSPITAL BOARD.—P. Jewsbury, M.D., F.R.C.S., Consultant Thoracic Surgeon to Blackpool and Fyde Hospital Centre and to Northern part of the Region; G. K. Tutton, Ch.M., F.R.C.S., Consultant Neurosurgeon to Preston and Chorley Hospital Centre and to Northern part of the Region; D. A. Chadwick, M.B., Ch.B., F.F.A., R.C.S., Consultant Group Anaesthetist to North and Mid-Cheshire Hospital Centre; A. E. Smith, M.B., Ch.B., F.F.A., R.C.S., Consultant Anaesthetist, Bolton and District Group of Hospitals; S. S. Chatterjee, M.B., B.S., M.R.C.P., Whole-time Assistant Chest Physician, Baguley Hospital, Manchester; P. Chandra, M.Ch.Orth., F.R.C.S., Senior Casualty Officer, Burnley and District Hospitals; E. Cooper, M.B., Ch.B., Senior Casualty Officer, Stockport and Buxton Hospitals; J. R. Kirby, M.B., Ch.B., D.M.R.D., Consultant Radiologist to Wigan and Leigh Hospitals; J. O'Regan, M.B., B.Ch., D.P.H., Tuberculosis Physician (S.H.M.O.) to Preston and Chorley Hospitals; Thelma B. Hoyle, M.B., Ch.B., D.A., Assistant Anaesthetist (S.H.M.O.) to Burnley and District Hospitals; W. H. Helm, M.R.C.P., Consultant Chest Physician, Burnley and District Hospitals.

MANNING, ANGELA M. M., M.R.C.S., L.R.C.P., Assistant Medical Officer of Health and School Medical Officer, Warrington.

PARRY, WILFRID, H., M.B., Ch.B., D.P.H., Senior Assistant Medical Officer of Health for the City and Port of Liverpool.

PHILLIPS, THOMAS ALUN, M.B., Ch.B., D.P.H., Medical Officer of Health, Caernarfonshire Combined Sanitary Districts, Southern Division.

WILLSON, G. F., M.D., D.P.H., Deputy Medical Officer of Health and Deputy School Medical Officer to City of Oxford.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Middleton Price.—On May 31, 1955, at West Middlesex Hospital, Isleworth, to Daphne, wife of John Middleton Price, M.B., F.F.A.R.C.S., a daughter—Helen Rosemary.

Shotts.—On June 16, 1955, at West Middlesex Hospital, to Barbara (formerly Layman), and Alan Shotts, M.R.C.S., L.D.S., a brother for Paul—Jeremy Guy.

Welch.—On June 7, 1955, to Dr. Margaret Louise (formerly Fisher), wife of Dr. Gordon Welch, of Canfield Gardens, London, N.W., a daughter—Estelle Gillian.

Westcott.—On March 4, 1955, at Durham, North Carolina, U.S.A., to Joan (formerly Williams), wife of Dr. G. F. Westcott, a son—Robert David.

Wyman.—On June 11, 1955, at Westminster Hospital, London, S.W., to Joan (formerly Beighton), wife of Dr. J. B. Wyman, a sister for Peter and Michael.

DEATHS

Allan.—On May 11, 1955, at the Warneford Hospital, Oxford, Kenneth Bruce Allan, M.B., B.S., of 11, St. Mary's Road, Leamington Spa, Warwickshire.

Day.—On May 10, 1955, at Ryde, Isle of Wight, John Roberson Day, M.D., aged 98.

Ferguson.—On March 26, 1955, at Hanover, Germany, George Boothe Ferguson, M.B.E., M.D., of South Mountain, Ontario, Canada, aged 69.

Fowler.—On May 13, 1955, at the Royal Hospital, Putney, London, S.W., Isabella Jane Fowler, M.B., Ch.B., D.P.H., D.T.M.

Jackson.—On May 13, 1955, in hospital, James Eustace Jackson, M.R.C.S., L.R.C.P., of 8, Wilkie Road, Birmington, Kent.

Meachen.—On May 12, 1955, at Ashley Heath, Ringwood, Hants, George Norman Meachen, M.D., M.R.C.P., aged 79.

Miller.—On May 4, 1955, Ernest Alfred Miller, M.B., of Flat 17, Windermerc, Lynton Grove, London, S.W., late of Upper Richmond Road, London, S.W.

Milne.—On May 5, 1955, at 9, Carmel Road North, Darlington, Co. Durham, Robert Alexander Milne, M.B., C.M.

Penny.—On May 11, 1955, at Weymouth, Dorset, Frederick Septimus Penny, C.M.G., D.S.O., M.B., D.P.H., Colonel, A.M.S., retired, aged 85.

Wallace.—On May 1, 1955, at Derwen Dda, Crickhowell, Breconshire, Harold Douglas Wallace, M.B., Ch.B., M.F.Hom., late of Bredbury.

Any Questions ?

We publish below a selection of those questions and answers which seem of general interest. It is regretted that it is not possible to supply answers to all questions submitted.

Prognosis after Puerperal Depression

Q.—I have a patient aged 26 who has had a puerperal depression following her second pregnancy. After her first pregnancy she was mildly depressed, but this cleared up without treatment. This time she had a course of E.C.T. (six treatments) which effected a considerable improvement, and she was then discharged. After a week (two weeks after the last shock) she was readmitted, as she had relapsed. She has now started on chlorpromazine. Her personality is described as hysterical. What is the prognosis with or without further pregnancies?

A.—The fact that this patient has suffered a depressive state after both her pregnancies suggests that the illness is unlikely to be related to temporary stress factors in her marriage, home, or career situation, and that constitutional factors must be playing a part. One would suspect a morbid family history in such a case, and certainly there will be a liability to further attacks of depression with or without further pregnancies, but the latter would be a serious risk. Puerperal depression recurring with each pregnancy tends to become more severe and to damage the personality as time goes on. In cases where there is a clear liability to manic depressive psychosis further pregnancies are contra-indicated because of the risk of a full development of this condition. In any case an interval of at least five years before the next pregnancy is to be recommended.

The prognosis for the present attack of depression will depend to a certain extent on the degree to which it is a response to adverse circumstances and to stresses in the life situation of the patient and the extent to which she has a severe hysterical personality disorder. If the depression continues and is associated with early morning waking, loss of appetite and weight, any degree of self-reproach, and there are no phobias, a further course of E.C.T. should be considered. Recovery should be anticipated in the absence of phobias and a severe personality disorder.

Salt and Water Requirements in the Tropics

Q.—How much salt and water should an average-sized man take in the Tropics each day? Are salt tablets recommended?

A.—It is not possible to lay down any firm figures for salt and water requirements which would be universally applicable. Sweating varies with temperature, humidity, exposure to radiation, and degree of activity. The only safe rule is always to drink enough water to produce 1 litre of urine per day, and this urine should never be chloride free. As a rough guide the sweat rate of a 70 kg. man in an "average" tropical climate will not exceed 100 g. per hour in bed at night; at midday indoors sweat losses may rise to 250 g. per hour, and in light shade resting outside it may be 500 g. per hour. Individual variation is high, but in general the sweat rate is proportional to the 2/3 power of the body weight. Exercise may increase the sweat rate to 750 or 1,000 g. per hour, but such high rates are generally not sustained for long. The radiation heat load, either direct from the sun or from hot bare land surfaces, may call forth as much sweat as a brisk walk; extra sweating may also result from the specific dynamic action of a heavy meal. Sweating is least in the early morning when the air is cool and the body temperature is low; exercise in the evening, when the body temperature is already slightly raised, results in more sweat-

ing than in the morning even though the air may be as cool. A moderately active man in a hot climate can easily lose 5 litres of sweat a day and possibly twice as much.

The salt losses in the sweat are not prodigious; the sodium chloride content ranges from approximately 0.15 to 0.30%, higher concentrations being found only in experimental situations and in abnormal subjects. Normal European diet as it comes to the table probably provides 10 g. or more of salt daily, hence there is little need for large amounts of extra salt. Salt tablets are not recommended; some brands are practically insoluble and may set up a gastritis; if they are freely soluble, there is a danger of the subject becoming "oversalted" unless he drinks plenty of water, and of his having a sudden collapse. In general the rule should be, no extra salt unless water is plentiful. Provided the adrenal cortex is properly functioning, the salt losses in the sweat are nicely adjusted to the salt intake. In vast areas of the world, in Asia and Africa, the indigenous tropical population consume considerably less salt than do Europeans in temperate climates but apparently do not suffer from salt deficiency; the high intake of salt by Europeans and their "inability" to get on with less may well be a craving for a luxury.

Loss of weight in hot weather sometimes occurs with a low salt intake, resulting in "salt deficiency dehydration"; but in general it is easier to take too much than too little salt. Losses of other minerals and of vitamins in the sweat are negligible and no allowance need be made for them.

Is Mouthbreathing Harmful?

Q.—What are the medical objections to mouthbreathing? When is active treatment indicated, and what should it consist in if there is no demonstrable nasal obstruction?

A.—Mouthbreathing indicates that all, or more often most, of the inspired air passes to the lungs without the benefits of nasal conditioning. A perfectly functioning nose delivers to the lungs air free from dust and living organisms, of constant temperature, and at optimum humidity. Partial or complete loss of any of these qualities renders the mouth, pharynx, and entire lower respiratory tract more vulnerable. Sudden lack of moisture in the inspired air, by causing ciliary paralysis in the trachea and bronchi, leads to a breakdown in local defence mechanisms. Such effects are observed after total laryngectomy, when the inspired air is not adequately moistened. In time, extra moisture produced by the trachea, but never in sufficient quantity to make up for the loss of nasal function.

Active treatment to restore loss of nasal function is always indicated where there is a chance of success, partial or complete. The causes and methods of treatment of nasal obstruction are well known. Mouthbreathing, in the absence of nasal obstruction, is due to defects in the development of the jaws. Loss of nasal function in such cases is usually partial, and orthodontic treatment should be carried out at an early age. It must be remembered that obstruction due to nasopharyngeal diseases and developmental defects is often difficult to demonstrate.

Preparing Theatre for Clean Surgery

Q.—What steps should be taken to render an operating theatre which has been used for "dirty" operations safe for "clean" abdominal surgery and orthopaedic operations the next day?

A.—The precautions to be taken under these circumstances are very ordinary common-sense ones such as are carried out regularly in an operating theatre which has to serve for both clean and dirty cases and which, in any case, are applied periodically in all theatres. It is presumed that the septic operations have been performed with reasonable care, to see that infected swabs, etc., are placed straight away after use in proper receptacles and removed from the theatre

at the earliest possible moment. The question seems to imply that it is the structure and permanent furniture of the theatre rather than the instruments, bowls, and dressings with which we are concerned. To some extent the method used will depend upon the nature of the walls and floor, but for the usual tiled walls and terrazzo floor washing with an antiseptic solution such as lysol or "dettol" is adequate. The metal surfaces of the operating table should be similarly dealt with and the Sorbo table-pad also, care being taken in this instance to dry the surface with a sterile towel to prevent undue action of the antiseptic on the rubber.

The interval of a night between operations is of great value in allowing dust to settle, especially if the floor of the theatre be left damp with antiseptic. If possible, therefore, this cleaning should be done on the evening before rather than the morning of the clean operations.

In some clinics ultra-violet light has been used to destroy bacteria, but it is doubtful if it is as efficient as the simple methods here indicated.

Idiosyncrasy to Barbiturates

Q.—A patient of mine who has an anxiety state is sensitive to barbiturates. I have already tried quinalbarbitone, amylobarbitone, and phenobarbitone, all of which have the desired sedative effect but produce a maculo-papular rash on the body. There are also joint pains. Is there any possible way of desensitizing this patient against barbiturates?

A.—Barbiturates may produce rashes of varying types in patients who have an idiosyncrasy. Usually the rash is of no great importance and disappears when administration of the drug ceases. Very rarely the rash may progress to produce an exfoliative dermatitis. Phenobarbitone is specially apt to give rise to a serious form of eruption which may continue to extend after administration has ceased. The rash may be accompanied by severe constitutional disturbance and the condition may end fatally.¹ It is clearly undesirable to continue to give barbiturates to patients who have developed acquired hypersensitivity even if this is shown solely by a skin rash and joint pains. There is no certain and safe way of desensitizing patients who are liable to rashes. It would seem better to try alternative sedative drugs such as chloral hydrate in small and repeated doses, carbromal, or methylpentynol.

Classification of Tuberculous Patients

Q.—What are the criteria for the classifications (i) "active," (ii) "quiescent," (iii) "arrested," and (iv) "recovered" in patients with tuberculosis? Is a case still having artificial pneumothorax refills "active"?

A.—(i) A case of tuberculosis is regarded as "active" if the disease is such that it requires a modification of the patient's mode of living, or active treatment, or if the patient may be a danger to others.

(ii) A case is regarded as "quiescent" if the general condition and exercise tolerance are good, having regard to the extent of the lesion; if there is no evidence of toxæmia; if no tubercle bacilli have been found on three consecutive monthly examinations by stained film; and if changes revealed by other clinical investigations and by serial radiographs point to retrogression of the tuberculous lesion.

(iii) A case is regarded as "arrested" if the disease has been quiescent for a continuous period of at least two years, or, if non-respiratory, the disease is "quiescent" and there is reason to believe it is unlikely to recur.

(iv) A case is regarded as "recovered" if the state of quiescence has continued uninterrupted for a period of five years. These descriptions are in accordance with Ministry of Health definitions. Nowadays most clinicians would

prefer the sputum to be negative on culture before calling the case quiescent. A case still having artificial pneumothorax refills can be regarded as quiescent if it falls within the above definition.

Effect of Previous Passive Immunization on Response to Active Immunization

Q.—What effect on the antibody response to active immunization have previous injections of the corresponding antitoxic serum?

A.—Active immunization with diphtheria or tetanus prophylactics may be less effective, or in some circumstances ineffective, if the first dose is given soon after, or at the same time as, an injection of the corresponding antitoxic serum. The antitoxin neutralizes some of the toxoid in the prophylactic, and thus brings about a reduction in the effective dose. The extent of interference with immunization is dependent on the number of units of antitoxin given and the time elapsing between this injection and the first dose of diphtheria or tetanus prophylactic.

There is little reliable evidence of the time intervals which should elapse between an injection of antitoxin and the first dose of a course of active immunization. It is, however, probable that: (1) If a dose of 1,500 units of diphtheria or tetanus antitoxin is given at the same time as, or at any time within three weeks before, the first dose of the corresponding prophylactic, the latter will have little effect, and should be followed by a full course of three injections starting one month later. If active immunization is delayed until four weeks or more after the injection of antitoxin, it should be satisfactory to proceed with the normal course. (2) If a dose of 5,000 units is given, active immunization should be delayed for seven weeks or more. (3) In cases where patients have received large therapeutic doses of 200,000 units of tetanus antitoxin, active immunization with tetanus toxoid should not be attempted until at least four months have elapsed since the last injection of antitoxin.

It is extremely important to ensure that a full course of active immunization is given, followed by the normal boosting doses.

Chlorine Gas Poisoning

Q.—I am medical officer to a factory where new processes are to be introduced which involve the possibility of chlorine gas poisoning. I should be grateful, therefore, if you could give me details of the latest methods of treating such cases.

A.—The latest treatment for gassing by chlorine is to be found on Label A of the excellent series of labels for gassing casualties issued by the Association of British Chemical Manufacturers, 166, Piccadilly, London, W.1, and the inquirer is recommended to obtain a supply of these labels, one of which should be attached to each case of gassing sent to hospital. The following are the details recommended on Label A:

First Aid Already Given (after Removal from Exposure).—(a) Remove contaminated clothing. Loosen remaining clothing. (b) Keep lying down and warm. (c) Mouth-wash and gargle with sodium bicarbonate (1 dessertspoonful to 1 pint (560 ml.) of water). This solution of water may be used for eye or skin irrigation when necessary. (d) Give hot drinks—for example, milky tea or coffee. (e) Transport by car, stretcher, or ambulance.

Immediate Treatment Recommended (in Addition to Above).—(a) Oxygen through a face mask. (b) Inhalation of friar's balsam (1 teaspoonful to 1 pint of water). (c) Linctus diamorphinae camphoratus (B.P.C., 1934) 1 drachm (3.5 ml.) repeated as often as needed. Of use in mild cases only. (d) Venesection 10–20 fl. oz. (280–560 ml.) blood where there is evidence of right heart embarrassment. (e) Cardiac stimulants if indicated—for example, nikethamide 1–3 ml.

Subsequent Treatment Recommended (after Immediate Distress has Subsided).—(a) Rest in bed until respiratory embarrassment has ceased. (b) Repeat oxygen inhalation if respiratory stimulation is necessary. (c) Careful observation for onset of pulmonary oedema. (d) Expectorant mixture as required.

Treatment of Disseminated Sclerosis with Histamine and Curare

Q.—I would be grateful if I could have some information about the treatment of disseminated sclerosis with histamine and curare. Have these drugs a place in rational therapy?

A.—Daily intravenous injections of histamine diphosphate were used in the treatment of disseminated sclerosis by Horton and his colleagues¹ in 1944. There was improvement in some patients especially in the early stages of the disease, and this was attributed to vasodilatation, but the difficulty of evaluating the results on account of the possibility of spontaneous remissions was realized. Curare has been used in an effort to reduce spasticity in cases of spastic paraplegia whether due to disseminated sclerosis or other disorders of the spinal cord. The results have on the whole been disappointing, and toxic side effects are fairly frequent.² A carefully controlled study³ of the use of D-tubocurarine in oil and wax given by intramuscular injection in the treatment of spasticity resulting from spinal cord injuries indicated that no beneficial results were obtained.

Senile Warts

Q.—What is the cause and treatment of pigmented spots on the forehead of a woman which have appeared since the climacteric and are increasing in size? She is in excellent health, but her employment is such that she should look attractive. She can disguise the spots with make-up, but is worried about their increase in size.

A.—The pigmented spots are probably seborrhoeic (or senile) warts, which usually have a yellow, brown, or black greasy and slightly rough surface. If there is any doubt of their identity, biopsy would be wise. Seborrhoeic warts may be treated by gently rubbing the surface with a cotton applicator moistened, but not dripping, with trichloroacetic acid, the normal skin around being protected by a film of petroleum jelly and care being taken to protect the eyes. Alternatively, they may be curetted after the base of the lesion has been infiltrated with local analgesic. Freezing with solid carbon dioxide snow is sometimes useful.

Noradrenaline in Cardiac Infarction

Q.—Is noradrenaline useful in the treatment of shock following cardiac infarction? If so, how should it be given?

A.—Yes. The drug should be given by intravenous injection in a strength of 2 to 8 ml. of 1/1,000 L-noradrenaline bitartrate per half to one litre of 5% dextrose saline, and at a rate of 30 to 60 drops a minute. For further information see the recent paper by Dr. K. Shirley Smith and Dr. A. Guz.¹

Drug Claimed to Influence Cholesterol Metabolism

Q.—A French drug, containing phenylethylacetamide is alleged to have an inhibitory effect on endogenous cholesterol metabolism, and thus to be indicated in arteriosclerosis. Is there any scientific basis for such a claim?

A.—There is no scientific basis for the use of phenylethylacetamide which is in any way established, but a hypothesis has been put forward by Cottet, Mathivat, and Redel¹ suggesting that this substance might act in the body as a competitor for acetyl groups taking part in the formation of acetylcoenzyme A. They suggest that the combination phenylethylacetylcoenzyme A might be particularly stable. The formation of such a substance, stable but inactive, would lessen the formation of the higher fatty acids, and in some such way reduce the formation of cholesterol. The authors have administered phenylethylacetamide to groups

of patients who had a raised blood cholesterol, and they record a mean fall in the cholesterol in these groups during the course of four to eight weeks. The administration was oral, and was unattended by any side-effects apart from slight disturbances of digestion. The results would seem to require confirmation.

NOTES AND COMMENTS

Effects of Prolonged Thyroid Administration.—Mr. V. H. RIDDELL (London, S.W.1) writes: In the answer to the question under this heading ("Any Questions?" April 30, p. 1106) I think attention should be drawn to the danger of Graves's disease arising after prolonged thyroid administration. Seventy such cases have recently been collected and reported by E. C. Bartels and Gordon K. Huggins.¹

REFERENCE

- ¹ *Lahey Clin. Bull.*, 1955, 9, 81.

OUR EXPERT replies: As the effect of thyroid therapy on the thyroid gland is to render it inactive, I find it difficult to believe that such treatment may eventually result in overactivity of the gland and be, as Bartels and Huggins assert, an aetiological factor in the production of Graves's disease. If thyroid therapy were an aetiological factor we should see the occurrence of Graves's disease during and after its use far more frequently than is reported. In my opinion the occurrence of Graves's disease in these circumstances is fortuitous.

Prognosis in Aplastic Anaemia.—Dr. GEORGE DISCOMBE (London, N.W.10) writes: With reference to your question and answer on this subject (May 28, p. 1353) the following remarks may be of interest. I suggest that the patient who needs 50 pints (28 litres) of blood in four months suffers not merely from a pancytopenia but also from some occult haemolytic (or haemoclastic) process: since the average life of a red cell is about 116 days, the expected requirements of simple aplasia are about 1 pint every nine days, or about 14 bottles in four months. One of our patients was admitted almost in extremis and needed 17 bottles in the first 42 days after admission, but during the next 63 days he needed only 9 bottles; during the last 163 days he received only 19 bottles, and is earning his living, having received 65 bottles in 13 months.

When we find transfusions cause distress, due either to apprehension or to severe physical reactions, we cross-match every bottle of blood with the greatest care in saline, albumin, and by the antiglobulin technique; and administer, about an hour before the transfusion is started, an antihistamine such as mepyramine maleate (50 or 100 mg.) or promethazine hydrochloride (25 mg.). Apprehension is allayed and reactions are minimized.

In some drug-induced pancytopenias we have seen a similar picture of combined aplasia and blood destruction: the haemoclastic process was not accompanied by jaundice and was not affected by A.C.T.H. or cortisone. In one case splenectomy was followed by a dramatic reduction in the need for blood, though the platelet count remained low and the patient died a few weeks later from cerebral haemorrhage. Some patients with pancytopenia may be benefited by splenectomy, as emphasized by Whitby and Britton (*Diseases of the Blood*, 7th ed., p. 472).

Correction.—In the medico-legal report (*Journal*, May 28, p. 1347) and in Mr. R. J. Clausen's letter (*Journal*, June 18, p. 1478) "Magill tubes" were incorrectly referred to as "McGill tubes."

Books of "Any Questions?"—The second and third volumes of "Any Questions?" are available, price 7s. 6d. (postage 6d.), from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1, or through any bookseller. Each contains some 200 selected expert answers, and the third volume a cumulative index to the three published books.

GENERAL MEDICAL SERVICES COMMITTEE STANDARD OF SURGERY AND WAITING-ROOM ACCOMMODATION

An all-day meeting of the General Medical Services Committee was held on December 16, with Dr. A. TALBOT ROGERS in the chair.

It was reported that, out of 138 local medical committees, 128 had up to now replied on the question of undertaking an inspection of surgery and waiting-room accommodation, and of this number 116 had agreed to co-operate. Various reasons were given by the few which had decided not to proceed on the lines suggested, the chief being that the investigation should be the responsibility of executive councils. The Deputy Secretary was asked to make a further appeal to these committees.

The Committee agreed as to its further procedure with an outline proposed by Dr. WAND: where the accommodation was found to be inadequate a request should be made to the practitioner to improve it; a progress report to be made to executive councils merely stating the number of surgeries inspected (without names), the fact that recommendations for improvement had been made in a given percentage, and that it was proposed to inspect these again at a later date; in due course a further investigation of these surgeries to be made to ascertain whether the necessary improvements had been effected, and, only as a final step, the names of doctors who had refused to take any action to be reported to executive councils. No names would be mentioned except in this very last stage, and then only to executive councils.

A further circular letter proposed to be sent to local medical committees on the subject was approved. Some discussion took place on the cost of the investigations, and it was held to be a proper local medical committee expenditure.

Matters of Report

The CHAIRMAN reported that he, with the chairman of the Private Practice Committee, had had an interview with the Minister of Health at which the Association's claim that private patients should be entitled to drugs and appliances under the N.H.S. had been pressed. It was common ground that this was a matter which would need an amendment of the Act. The Minister had promised at the interview that he would embody his views in a statement which would in the first instance be placed before the Council of the Association. A full report of the interview would also be made to the next meeting of the Committee.

The question of the closure of the Springfield Maternity Home, which had deprived general practitioners in the Blackburn area of their only accessible maternity beds, had been raised at the same meeting, and also would be the

subject of the statement from the Minister which would be reported at the next meeting.

The Committee had been invited by the Council to submit a report on the steps taken to implement the decisions of the Special Representative Meeting in 1951 on the reform of the National Health Service, and to indicate the success achieved, or the arguments advanced by the Ministry where no progress had been possible. The Deputy Secretary (Dr. STEVENSON) said that he had drafted a factual statement which the Committee might like to send to the Council and to the Amending Acts Committee. It was agreed that the statement be sent forward.

Another memorandum prepared by the Deputy Secretary concerned the question whether sufficient protection against the introduction of a whole-time salaried service was afforded by the existing safeguards in the N.H.S. (Amendment) Act, 1949, sects. 10 and 12. The CHAIRMAN considered that the present position was as strong as the profession was likely to secure, while yet allowing a certain elasticity whereby modifications could be made of regulations found to be unsatisfactory. It was decided to keep the memorandum as a committee statement and to make a short report to the Council.

Mileage in Scotland

Dr. C. J. SWANSON, chairman of the Scottish Subcommittee, asked for consideration of the present allocation of the mileage fund with a view to additional moneys being made available for the Highlands and Islands. He said that since the introduction of the Act the 200 or so practitioners in the Highlands and Islands had been receiving mileage payments not in accordance with any mileage scheme operating in other areas of Scotland or in England and Wales. They had been paid on estimates made by the Department of Health having regard to payments to practitioners before the introduction of the service, and also in the light of certain figures obtained from them in 1949. If the mileage schemes in operation elsewhere were applied to these practitioners an additional £20,000 would be required. He suggested that this additional money for the Highlands and Islands be made up from the rest of the mileage fund for the Lowlands and for England and Wales unless the total of mileage payments for the United Kingdom could be increased.

After discussion it was agreed to suggest to the Ministry of Health that this matter be referred to a joint meeting of the English and Scottish Mileage Committees.

Matters Discussed with the Ministry

Report was made on a number of matters which had been the subject of conversation between the Chairman and other members of the Committee and representatives of the Ministry of Health.

The Ministry had agreed to advise executive councils that on the formation of a new partnership they could allow the partners up to nine months to bring their lists within the maximum permitted by the allocation scheme.

On the elimination of inflation the CHAIRMAN said that the desirability of a central register had been pressed on the Ministry. He could not think of any other expedient of comparable value.

Members who had waited on the Ministry had pressed that with the rise in the cost of living and the increase in assistants' salaries some increase should be made in the salary grant paid to the trainee under the trainee general-practitioner scheme. The Ministry had promised to consider the request.

The Ministry had sent for comment the draft of an E.C.L. on the treatment as temporary residents of Service men on leave. The DEPUTY SECRETARY explained that the Ministry appeared to have extended the facilities and had made certain suggestions. The Ministry had suggested that in certain Army establishments where there was a medical officer but no hospital or medical inspection room to provide drugs the medical officer should be entitled to use form E.C.10. That was something against which the Committee had always held out, and he thought the Private Practice Committee would wish to comment on the proposal. The document was criticized on various grounds, and it was agreed that the Ministry be asked to convene a further meeting between representatives of the General Medical Services and the Private Practice Committees and officers of the Ministry of Health and the Service Departments concerned.

Acceptance of Patients of a Vacant Practice

At the last meeting of the Committee a statement was presented by its chairman and the chairman of the Central Ethical Committee setting out the position of a whole-time locum tenens specially engaged for the purpose of keeping a vacant practice in being until the appointment of a successor. The statement said that he "should not within a period of five years from the termination of the locum-tenency set up in opposition in the area of the practice concerned."

Dr. DAIN suggested that the Ethical Committee might be asked to reconsider this interval of five years. Although it appeared in the ethical rules, it was an unreasonable period and probably unenforceable in law. A reasonable time would be one year. Dr. L. RUSSELL agreed that one year would be reasonable; it was in the first few months that any considerable danger of illegitimate acceptance of patients occurred. Dr. NOY SCOTT pointed out that the five-year period had been accepted by the Annual Representative Meeting. Dr. M. SORSBY said that unless something very specific in the way of a time limit was put in a recommendation there would be doctors who would rebel at the narrow restriction and take other practitioners' patients. Dr. J. C. ARTHUR thought that the "reasonable period" would have to be defined having regard to local circumstances.

It was agreed to await the further views of the Central Ethical Committee. The general feeling was that the period should be much less than five years.

Employment of Salaried Assistants

A long discussion ensued on a resolution of the Assistants and Young Practitioners Subcommittee at its last meeting (see *Supplement*, December 11, p. 221):

That the General Medical Services Committee be informed that the Subcommittee is gravely disturbed that after three years, and in spite of substantial concessions on its part, the G.M.S. Committee has rejected *in toto* the proposals put forward in respect of the employment of salaried assistants. It further deplores the grounds upon which the objection was made. In view of the very strong feeling expressed by assistants and others on this matter, both in the *Journal* and in the subcommittee, it requests that the parent committee give an indication of what steps it proposes to take to find an equitable solution to the problem.

Dr. FRANK GRAY, chairman of the subcommittee, said that this was a very strong resolution. The young practitioners felt that they had been badly treated. They felt that the parent Committee had recognized their problem but had not treated it in the unbiased way which might have been expected and had turned down their proposals, and they asked that the Committee now put up its own solution.

The CHAIRMAN said that he did not like the suggestion that the debate which had previously taken place in the Committee was biased. So far as he was concerned he had tried all the time to avoid any bias. It was true that the majority decision was against the proposals of the young practitioners, but the fact that it had not been possible to convince a majority did not mean that unbiased consideration had not been given. If any alternative scheme were put forward it would receive full consideration.

Dr. GRAY, after a further protest had been made by Dr. WAND against any imputation of bias, said that nevertheless it was the view of the "unestablished" members of the subcommittee that the parent committee had shown such bias. The proposals of the subcommittee had been before them on a number of occasions, and had been referred back with suggestions, which had produced the impression that the Committee at least recognized that there was a problem in the maintenance of lists so large as to preclude the possibility of the assistant ever becoming a principal. Therefore, the complete rejection of their proposals at the October meeting had seemed to the young practitioners not to be in line with what had already been said.

The CHAIRMAN pointed out that there had been no undertaking that any scheme put forward would necessarily be accepted, but they were getting nearer to agreement and it must not be assumed that the matter was closed.

Dr. J. A. PRIDHAM said that obviously, from the correspondence columns in the *Supplement*, this was a matter which had engendered a considerable amount of heat. He suggested that in advance of the Conference, at which apparently this matter must come forward, the Committee should be furnished with a report of the whole history of the subject, and that this should be put down for discussion at the meeting after next. Some of the fires which had been burning would have a chance to cool.

Dr. DAIN said that they should look at this matter on its merits. Was it a good thing to employ assistants, and, if so, under what conditions? The advantages and disadvantages should be set out in a properly considered document at the Conference, and assistants should be asked to take part in the debate.

Dr. F. M. ROSE thought that the attitude of the young practitioners was justified. While he was in agreement as to the advantage of assistantships in general practice, he thought the young practitioners had made out a case that all was not well in the running of assistantships. The Committee should not throw the ball to the Conference, because the Conference was not the appropriate body to argue out a case of this sort. The final proposals must come from their own Committee, and in the interval a lot of thought should be given to the subject.

The CHAIRMAN said that they owed it to the young practitioners that there should be an opportunity to debate this matter at the Annual Conference in May. It was therefore necessary for something to be done before the March meeting of the Committee. At some time between now and the next meeting certain members of the Committee should work out a basis for discussion; a report on the history of the whole matter should be prepared.

Dr. L. RUSSELL, as representing the young practitioners, said that Dr. Gray had expressed most moderately the feeling in his subcommittee. The grounds on which the young practitioners' proposals had been turned down appeared to be loss of income for large-list practitioners. Surely the subcommittee was entitled, after having had this question sent back to them, to assume that the parent committee was genuinely seeking a solution and not just playing for time. There was a problem, although it was difficult to

formulate, but what his colleagues felt was that no practitioner should be in the position of being able to employ an assistant when his list was so large that he could take a partner. They also wanted to prevent any doctor exploiting an assistant.

Dr. SUTHERLAND suggested that four or five members of the Committee should meet the Young Practitioners Subcommittee, but the CHAIRMAN pointed out that already on that subcommittee there were three or four senior members of the parent committee.

Dr. WAND said that the subcommittee's resolution on which the present debate centred contained the words "... an equitable solution of the problem." He had asked Dr. Russell what the "problem" was, and he answered, "The problem of preventing a doctor maintaining a list of such extent as to preclude an assistant from becoming a principal," and he had suggested that that problem be investigated. But they should first ask the young practitioners whether they wished to eliminate assistantships. Did they feel aggrieved at supposed exploitation, or were they anxious about their entry into practice?

The CHAIRMAN said that originally the spokesmen for the young practitioners seemed to dislike assistantships altogether, but they had moved from that position and now recognized the value of assistantship, particularly as a method of entry into practice. They had also recognized that there were certain practices which, though not inordinately large, could not be carried on without the help of an assistant, and again that apparently there were some people who were willing to work indefinitely as assistants. They did not want it to be possible for a man to go on employing an assistant or a series of assistants when a permanent place could be made for another principal. He could follow them completely in that respect, but he was less happy about the word "exploiting." It was quite possible for a man to be exploited, not as an assistant, but as a partner. He had known senior partners exploited by their juniors.

Dr. GRAY said that the next move was with the General Medical Services Committee. "It is on your doorstep. The subcommittee should not be asked for anything more. They have put the challenge quite clearly to you."

It was agreed to set up a subcommittee to consider the whole problem and to report back to the parent committee at the March meeting.

The Committee sat from 10.30 a.m. to 6 p.m.

MEDICAL WHITLEY COUNCIL COMMITTEE "C"

ARBITRATION FOR PUBLIC HEALTH SERVICE MEDICAL OFFICERS' CLAIM

At a meeting of Committee "C" of the Medical Whitley Council held on December 21 Dr. John Riddell was elected chairman of the Committee for the session.

The claim put forward by the Staff Side, and submitted in a memorandum on October 29, for a review of remuneration of medical officers in the public health service was the only item of business. After prolonged and detailed discussion agreement was not reached. The Staff Side then formally requested that the matter should be referred to arbitration under the Industrial Courts Act. The Management Side agreed to this course, and the Joint Secretaries of the Committee were instructed to take the necessary formal action.

In Denmark drugs are classified into three main categories according to their importance. The more essential drugs are supplied free of charge, or on payment by the patient of a quarter of the cost. The patient is required to pay proportionately more for drugs in other categories. It is, however, possible for a doctor to certify that a particular drug in a low category is essential for a specific illness, and it may then be supplied free or at the minimum charge.

PRIVATE PRACTICE COMMITTEE

BONUS SHIFT ONE-DAY CERTIFICATES

A meeting of the Private Practice Committee was held at Headquarters on December 15, Dr. ALEXANDER BROWN presiding. Fully two hours of the meeting were occupied with a renewed discussion on one-day certificates for miners, following the resolution of the Annual Representative Meeting at Glasgow demanding the abolition of one-day certificates for absences from employment.

Information gathered from B.M.A. Divisions in colliery areas was laid before the Committee, and some members spoke of the uses and abuses of these certificates. One member, Dr. E. J. REES, who was absent, wrote that in his area the problem was a lessening one, that the majority of men applying for such certificates had been genuinely ill, and that very few practitioners would agree never to issue such certificates even should that become the policy of the Association.

In the course of discussion the abuses of the system were stressed. It was stated that in one practice 19% of the consultations in the course of one month related to these certificates. It was suggested by one or two members that the National Coal Board be approached with a proposal that the scheme be withdrawn, but Dr. R. FORBIS pointed out that this was a question of national politics, that the bonus shift system was inaugurated to accelerate production, and that the certificates were intended to protect the miner who was genuinely ill. He also said that, altogether apart from any bonus scheme, there was no reason why a doctor should not do as he had always done and issue one-day certificates.

The CHAIRMAN demurred at the proposal to approach the National Coal Board unless some alternative scheme could be put forward. Another argument which weighed with the Committee was that, although the withdrawal of the scheme would stop the abuses which were said to be so prevalent, it would penalize the genuine cases.

After a very long discussion it was proposed by Dr. A. BARKER that a report be made to the Council to the effect that the Committee had considered the whole question very thoroughly, and, in view of the lack of support in certain sections of the profession in the coal-mining areas for the abolition of the one-day certificate, recommended that at the present time no useful action could be taken to implement the resolution of the Representative Body. This was agreed to, and it was also agreed that the recommendation be accompanied by a balanced statement setting out the arguments on both sides.

As a rider to this it was proposed to suggest to the Council that an approach on this subject be made to the National Coal Board and possibly also to the Ministry of Fuel and Power, but this was not carried.

Reports to Employers

The DEPUTY SECRETARY (Dr. Stevenson) attended to report on a question which had engaged the attention both of the Private Practice Committee and of the General Medical Services Committee. The medical officer of a local authority had requested a practitioner to give an indication of the prognosis of a sick employee which would assist the authority in deciding whether to grant him additional monetary benefits. The practitioner supplied the information and rendered an account, whereupon it was explained to him that local authorities had no funds from which to meet charges of this nature; moreover, no question of a report, such as the practitioner had supplied, was in their minds, but only a brief indication of when the man might be expected to be back at work. The opinion of the General Medical Services Committee was that in this particular case, without prejudice to other cases in which the circumstances might be different, the information was such as a doctor might be expected to give on behalf of his patient without a fee.

The Private Practice Committee concurred in this view. If a full report was needed it would be a different matter.

Life Assurance Examinations

The CHAIRMAN gave an account of a meeting with representatives of the Life Assurance Offices' Association in connexion with the resolution of the Representative Body calling for an increase from 1½ guineas to a minimum of 2 guineas in the standard fee for medical examination and report for life assurance, and one guinea for report without examination. A long discussion had taken place and the reply was awaited.

A letter was read from a member calling attention to the practice of an assurance company when requiring a "report without examination" to ask for information about the parents of a person seeking assurance. It was pointed out that while the proposer could give the practitioner permission to discuss his health with other persons he could not, of course, give permission to discuss that of his relatives. It was agreed to take this up with the companies concerned.

Other Business

The action of the Ministry of Pensions in increasing the number of cases called to medical boards without prior consultation with the Association, to which attention was drawn at the previous meeting, evoked a long reply from the Ministry. The Ministry said that it considered it to be its duty to arrange the allocation of cases to sessions in such a way that so far as possible the proper time was made up. There was certainly no intention of making sessions run for longer than 2½ hours.

The Committee discussed the Treasury proposals for fees and salaries paid by various Government departments for part-time services provided outside the N.H.S. A number of amendments were suggested by the Committee and will be transmitted to the Treasury.

A satisfactory result was reported concerning concessions to doctors in "yellow band" areas in London (see *Supplement*, December 4, p. 212). The Commissioner of Police for the metropolis has issued a general order reminding the police that the "No waiting" and unilateral parking regulations provide exemption for anything done with the permission of a police officer in uniform, and that doctors are to be given whatever assistance is possible if they seek the advice of a police officer on where to leave a vehicle when visiting a patient or attending hospital or attending court to give evidence. The members of the deputation which waited upon the Commissioner were Dr. R. D. Summers, Dr. Annis Gillie, and the Assistant Secretary (Dr. W. Hedgcock). The form of the membership card, already approved in principle by the Council, was discussed in this connexion.

Slight exception was taken to a resolution of the Clinical Pathologists Group which had asked the Committee to recommend to the Home Office, in connexion with the signature of confirmatory certificates for cremation, that where there had been a post-mortem examination the pathologist who performed it was "the" appropriate person to sign the certificate. This was replaced by "an appropriate person." Dr. L. W. BATTEN said that the most appropriate person to sign the confirmatory certificate was a detached practitioner unconnected with the case who interviewed the people concerned.

Much other detailed business was before the Committee.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

OPHTHALMIC GROUP COMMITTEE

REFRACTIONS FOR SCHOOLCHILDREN

A meeting of the Ophthalmic Group Committee of the Association was held on December 10, with Mr. GAYER MORGAN in the chair. The business was brief and the meeting lasted less than an hour and a half. It was reported that the Minister of Health had agreed to receive a deputation from the Committee on the following Wednesday on the subject of the sight-testing fee.

The question was considered of seeking a revision of a paragraph in a Ministry memorandum concerning the refraction of schoolchildren. This paragraph stated that ophthalmologists and opticians would be working together as a team, and ophthalmologists in charge of eye clinics or departments should *normally* (our italics) delegate refraction work to ophthalmic opticians. Such an arrangement should not, however, preclude an ophthalmologist from himself refracting individual patients or examining them after refraction. Nor should any arrangement for delegation preclude an ophthalmic optician from referring back to the ophthalmologist patients concerning whom the optician felt he wished to have the benefit of medical advice.

The Deputy Secretary (Dr. STEVENSON) pointed out that it looked from the paragraph as though only in exceptional cases was the ophthalmologist expected to carry out the refraction himself. In theory it appeared that this work should be delegated.

Mr. E. G. MACKIE suggested that the word "normally" was their safeguard. Dr. V. H. INGRAM said that in his area (Newcastle-upon-Tyne) the hospitals had been circularized and with one exception had said that they did not want an optician service for this work. Dr. J. MARSHALL thought that an attempt should be made to get the paragraph altered on the ground that the ophthalmological staff objected to it. The CHAIRMAN pointed out that the reply might be made that they were questioning something which was quite unobjectionable. Dr. J. J. HEALY said that originally a memorandum was drawn up by the Committee and the Faculty in conjunction with the opticians and the Ministry, in which this point was discussed, and eventually a paragraph was inserted to the effect that all this work should be done by the ophthalmologist; but this was altered on the specific request of their own Group and of the Faculty, who said that it was impossible for ophthalmologists to be responsible for all schoolchildren; they must be able to delegate some work to opticians.

The CHAIRMAN asked whether they could say that no children should be seen by opticians unless specifically delegated by ophthalmologists. Mr. NIGEL CRIDLAND asked whether they were willing to let even that pass out of their hands. They should be able to control the school eye service.

The DEPUTY SECRETARY said that the general effect of the circular was probably along the lines they wanted. Was the small point of objection worth pressing? Mr. MACKIE said that the important thing was to get all school clinics under the hospital service. Dr. INGRAM said that in his area the hospital sessions were already full, and the Board would have to appoint more staff to cover the work.

It was decided to leave the paragraph as it stood and to await events.

A brief report was presented by Mr. NIGEL CRIDLAND of a meeting of the British Standards Institution, which he had attended, concerning standards for lenses and frames. It was not expected that anything would be in production for about two years.

It was intimated that the Council of the Association, which had met this year in advance of the meeting of the Group Committee, had left to the Committee the nominations for the Standing Ophthalmic Advisory Committee of the Central Health Services Council. Mr. Gayer Morgan and Mr. Tudor Thomas were nominated.

MEDICAL ETHICS

The Central Ethical Committee, meeting recently under the chairmanship of Dr. ROBERT FORBES, had a long agenda before it. One item was to consider a suitable form of wording for obtaining the consent of psychiatric patients to disclosure of their medical history to a medical officer of health in order that suitable "after care" visits might be arranged.

In accordance with the views of the Occupational Health Committee, it was agreed that there was no objection to an industrial medical officer issuing recommendations for sight tests provided that he obtained the consent of, or had a prior understanding with, the employee's own doctor. Also in the commercial field, the Committee considered that it would not be unethical for a medical practitioner to accept payment for carrying out clinical trials of a company's products, but that there should be an understanding that the practitioner would not be mentioned by name, and that he would have an opportunity of reading the text of any proposed advertisement prior to its publication.

In considering a question on the advisability of a doctor giving medical attention to a near relative, the Committee thought that this was not unethical, and it would not always be practical to make alternative arrangements, but it was undesirable to attend a near relative in a serious illness, and should be avoided wherever possible.

Other matters discussed included the International Code of Medical Ethics, a draft memorandum on the legal position of nurses, and certain medical aspects of the Mines and Quarries Bill.

MEDICAL STUDENTS' PROSPECTS

Writing in the December issue of the *Manchester University Medical School Gazette*, Mr. R. L. NEWELL, Dean of Post-graduate Medical Studies at Manchester University, discusses the prospects of the medical student. At present in this country there is one doctor to approximately 900 people, a higher ratio than in any country except the U.S.A. and Soviet Russia. Even so, many G.P.s and consultants are overworked, but this, Mr. Newell says, is inevitable if the freedom of the patient to consult the doctor of his choice is maintained. To destroy this freedom, Mr. Newell adds, would shake the foundations of medicine and of the principles of freedom on which this country has always existed.

Establishment Fixed

Mr. Newell thinks that economic factors will fix the medical establishment at about its present level for many years, and, however desirable an unlimited number of doctors and nurses might be, it would be difficult to justify any large increase in medical personnel. During the first four years of the Health Service 1,000 additional consultant appointments were made. There was an increase of 839 general practitioners in 1953, and the maximum list has been reduced from 5,000 to 3,500, averaging one doctor to 2,300 patients. More than half of the G.P.s are under 45, and 80% of partners are under 55. Even if the number of G.P.s were doubled to-morrow there would be the fear that a limit might be imposed on the Central Pool and a consequent lowering of the doctors' income. Mr. Justice Danckwerts made his award on the number of doctors in the Service at that time.

Excess Over Requirements

Mr. Newell goes on to quote the average yearly addition to the *Medical Register* over the last 10 years of 2,048. Allowing for normal wastage, there is an excess of registrations over requirements running into several hundreds a year. In 1959, if the medical schools continue their present intake, the cumulative excess might amount to 5,000 to 6,000 doctors. Mr. Newell thinks that the prospects in the consultant field are even more hazardous. He urges the Ministry to inquire into the situation without delay.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Local Health Authority Nursing Services

SIR.—The article on local health authority nursing services published recently (*Supplement*, November 20, p. 187) raises a number of questions, and there is much to challenge in many of the points put forward. Doubtful statistics and general statements are insecure foundations for constructive building. The writers were no doubt voicing their personal opinions, and I am encouraged to hear that these are not acceptable to many people, that not only district nurses but health visitors, doctors, and others are distressed by such views.

The most distressing factor in the article is the complete lack of regard for people as persons. The suggestion is that the ill person, or patient, whose needs are so many-sided, may be served by those whose limited intellectual capacities prevent their entrance to higher spheres of service. What would our great nursing leaders think of such an attitude, particularly one of our greatest, Mary Gardner, who, with the wider vision of an earlier age, wrote: "Nursing in its widest sense must include nurture of mind and spirit as well as of body; health education as well as administration to the sick; care of patients' environment, social as well as physical, and of health services to the family and community, as well as to individuals."

In the future, perhaps, we too may come to understand that it is not good that we should work entirely in the field of sickness, or of health, but that we shall do better service, both in keeping people well and in caring for them during temporary absence from health, if we, as nurses, serve the family as a whole, as the good doctor does, and has always done. Our patients may be old, may be needing injections only, may be suffering from long and handicapping illnesses, but they are *people*, not diseases, and need in those caring for them, in whatever capacity, the approach which comes from a sensitive human understanding of their needs as persons. The outlook shown by the writers of the article can do nothing but perpetuate the present division between hospital and domiciliary services, and must inevitably widen the gaps that exist in some places in the domiciliary services themselves. It is also a sad reflection on the attitude of one branch of the domiciliary nursing services towards another.—I am, etc.,

London, S.W.3.

DOROTHY GOODWIN.

Hospital Staffing

SIR.—All who are concerned with problems of senior hospital medical staffing have reason to be grateful to your correspondent who signs himself "Senior Hospital M.O." (*Supplement*, December 11, p. 227) for the points which he raises. As I understand him, he sees a simple choice before us: (a) to perpetuate the existing arrangement whereby many men are inadequately paid, or (b) to incorporate the S.H.M.O. grade into the ladder of promotion to consultant, with increased status and remuneration. I have no doubt that he credits himself with the social conscience referred to early in his letter, so one may legitimately conclude that the first alternative is repugnant to him. In the second alternative he seems to see a solution to our S.H.M.O. ills, and finds that the majority report of the Strachan sub-committee represents an honest attempt to solve the problem to this extent.

I have studied the Strachan report with some diligence, but I have failed to find any suggestion along the lines indicated by your correspondent. On the contrary, having listed the different categories, which together constitute

an intermediate grade between house officers and consultants, it goes on to define registrars and senior registrars as trainees for consultant rank, and says the intermediate grade should be sufficiently wide to provide a career grade for others of lesser talents or ambitions. While I do not question your correspondent's right to express any individual views which seem to him proper, or to use a pseudonym if he prefers to withhold his name, I think it should be pointed out that there is a complete lack of evidence that he is expressing the views of any considerable body of S.H.M.O.s when he asserts that there is a significant amount of support among them for the recommendations of the Strachan Subcommittee. Up to the present, the only means for the expression of their views and grievances have been through meetings convened for the purpose in London and elsewhere, and through press correspondence, and these have shown that they are overwhelmingly opposed to the Strachan recommendations. The most recent expression of S.H.M.O. opinion was reported in the *Supplement* of December 11 (p. 224). A large meeting of S.H.M.O.s agreed with your correspondent that the underpaying of men for consultant work was wrong, and that all promotion to consultant rank should be through a specialist grade so long as it existed. It was precisely because they agreed with his conclusions that they were resolved that the Strachan proposals should be rejected.—I am, etc.,

Cambridge.

C. B. V. WALKER.

Fining the Doctor

SIR,—I read with horror the recent proposal that a young G.P. should be relieved of £600 for alleged over-prescribing (*Supplement*, November 20, 1954, p. 191). As a doctor who has recently resigned from the National Health Service, having built up a reasonable N.H.S. list in a couple of years, and then been obliged for family reasons to move to another county, I am now able to see the N.H.S. set-up in perspective. Sir, we doctors are in a preposterous position. We are divided among ourselves, first, into consultant and G.P. services, then into those on committees and those not, into large- and small-list practitioners, and into smaller and smaller divisions, none of whom has any feeling but antipathy towards others, though sometimes if financial circumstances are suitable this is tinged with some patronizing interest.

In my own experience of building up a new practice in an industrial area, I did have to prescribe far more heavily than I had done as an assistant in a middle-class residential district in the same county. In a new practice one gets a far higher proportion of patients who are ill, far more panic calls from the helpless and hopeless, but none the less seriously ill, besides the inevitable "surgery butterflies" who flit to each doctor in turn, and the neurotics who lap up a beneficial but fortunately cheap diet of bromide and valerian.

The penalty was out of all proportion to the misdeed, if such it was, in Lancashire. Let us as a profession pull ourselves out of the hopeless muddle into which we have wandered. Let us realize that patients are not average, that doctors are, in the main, good men with a sense of decency, and that any man works better in an atmosphere of freedom and trust rather than in one which is reminiscent of the police State.—I am, etc.,

London, N.10.

D. MARJORIE HOWELLS.

SIR,—It was refreshing to read the vigorous common sense of Dr. Paul R. Saville's letter (*Supplement*, December 18, 1954, p. 241) on the question of fining doctors for improper prescribing. The few cases which achieve publicity—for example, 300 square yards of lint to provide curtains—are presumably only the small upper parts of the vast iceberg of wasteful and irrational medicine. Perhaps this passage in the letter from Drs. L. Ballon and W. Brown (*Supplement*, December 11, p. 226) illustrates the kernel of

the problem: "If . . . Mrs. A arrives at the surgery wanting treatment for a cold and a cough and is accompanied by her children John, James, and Mary, all of whom give orchestral corroboration of being infected, *if so requested* [my italics] the doctor must write out four prescriptions. If he refuses to do so he is rightly in peril of being charged with a breach of his terms of service. . . ." On the contrary, if the doctor considers medicine unnecessary, not only is he justified in refusing it, but prescribing it should be regarded as a breach of his terms of service.—I am, etc.,

London, W.8.

GEOFFREY G. SHERRIFF.

Merit Awards

SIR,—This correspondence seems likely to go on until your patience is exhausted; and there does not appear to be any chance that the Distinction Awards Committee will budge from its present position. Its members believe, so Sir Horace Hamilton says (*Supplement*, October 23, 1954, p. 153), that there is "certainly no evidence that consultants generally regarded the awards system as being worked unfairly." This is, of course, true because we are not allowed to know how it works. Sir Horace goes on to tell us that "if the names of consultants with awards were published, the public might press to be seen and treated by consultants with awards and that this might be unfair to those who had not yet got an award." If there is any substance in this, it would be well if Her Majesty be petitioned to keep the names of those doctors whom she honours *in petto*. I may say that I have never been invited to attend any meeting of consultants, nor have I been asked to act as (I hope Sir Horace will forgive the word) an informer.

Is there now any reason why Dr. Frederick Dillon's suggestion (*Supplement*, July 31, 1954, p. 85), that the names of recipients should now be published, is not carried into effect? One gets the impression that the members of the Committee have now taken up the attitude that, once the malcontents have blown off steam, the old system will be able to go on—and they are probably right: we are a docile lot. It is alleged that critics of the system of merit awards "do themselves a bit of no good," and, as this view, whether well founded or not, is widespread, it is only the elderly who are likely to write over their own names.—I am, etc.,

London, W.1.

A. PINEY.

Senior Hospital Medical Officers

SIR,—Dr. C. B. V. Walker's letter (*Supplement*, December 11, p. 227) deserves commendation and support. Many S.H.M.O.s have been doing consultant work without supervision since the Health Service began, and in some cases (my own included) before July 5, 1948. There is no doubt at all that the work we are doing differs in no respects from that of other consultants, and we know that the moment we leave our jobs they will be advertised as consultant posts. How our colleagues ever agreed to the S.H.M.O. grading is a mystery, unless one extends the old adage of "man's inhumanity to man" to "doctor's inhumanity to doctor."

Middle-aged S.H.M.O.s have very little to look forward to in the future: they are not only underpaid now, but, their superannuation payments being much less than their consultant colleagues', they must of necessity endure a poor pension in their old age.—I am, etc.,

Liverpool, 1.

S. CANTER.

The Medical Whitley Council Committee "B" has agreed that the terms and conditions of service for hospital medical staff should be amended so that the salary at which an officer becomes entitled to six weeks' leave a year, instead of four, should be raised to £1,050. The amendment will take effect in the annual leave year beginning April 1.

H.M. Forces Appointments

ARMY

Colonel E. J. S. Bonnett, late R.A.M.C., has retired on retired pay.

ROYAL ARMY MEDICAL CORPS

Captain E. Aldous-Ball to be Major.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Colonels J. Bruce, C.B.E., T.D., and M. L. Rosenheim to be Honorary Colonels of an Army Emergency Reserve unit.

Lieutenant-Colonel I. W. Buirski, from T.A.R.O., to be Lieutenant-Colonel.

Major J. H. Dean, from T.A.R.O., to be Major.

Captains (Acting Lieutenant-Colonels) R. A. Shanks and H. K. Meller, M.B.E., to be Majors.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Major T. T. S. Hall, M.B.E., T.D., has resigned his commission, retaining the rank of Major.

Captain (Acting Lieutenant-Colonel) D. D. Cranna to be Major.

Captain R. C. M. Dingwall to be Major.

ROYAL AIR FORCE

ROYAL AUXILIARY AIR FORCE

Squadron Leader E. C. Gross has relinquished his commission, retaining the rank of Wing Commander.

Association Notices

ASSISTANTS AND YOUNG PRACTITIONERS' SUBCOMMITTEE

The following practitioners have been elected to fill vacancies for representatives of assistants on the Assistants and Young Practitioners' Subcommittee of the General Medical Services Committee. With the exception of Region 4, the candidates were returned unopposed.

Region 1.—Dr. J. B. Gilmore (Plymouth). Region 3.—Dr. G. B. Brown (Wallasey). Region 4.—Dr. Mary I. Foreman (Derby).

OCCUPATIONAL HEALTH PRIZE

The Occupational Health Prize Essay Competition was established by the Association for the purpose of encouraging interest and research in the field of occupational health. The Council of the British Medical Association is prepared to consider the award of an Occupational Health Prize, which consists of a certificate and £50, in the year 1955. Any member of the Association who is engaged in the practice of occupational health, either whole-time or part-time, is eligible to compete for the prize. Candidates may select their own subject.

The essays submitted must include personal observation and experiences collected by the candidates in the course of their work. If no essay entered is of sufficient merit no award will be made. Candidates in their entries should confine their attention to their own observations rather than to comments on previously published work on the subject, though reference to current literature should not be omitted when it bears directly on their results, their interpretations, and their conclusions.

Essays, or whatever form the candidate desires his work to take, must be sent to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1955. No study or essay that has been published in

the medical press or elsewhere will be considered eligible for the prize, and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work. A previous prizewinner is not precluded from entering. If any question arises in reference to the eligibility of the candidate or the admissibility of his or her essay, the decision of the Council on any such point shall be final. Preliminary notice of entry for this competition is required, on a form of application to be obtained from the Secretary.

Each essay must be typewritten or printed on one side of the paper only, and accompanied by a note of the candidate's name and address. No definite limits are laid down as to the length of essays, but the Council anticipates that for this competition essays should consist of between 3,000 and 10,000 words. Inquiries relative to the prize should be addressed to the Secretary.

PRIZE ESSAY COMPETITION FOR MEDICAL STUDENTS, 1955

The Council of the British Medical Association is prepared to consider the award, in 1955, of prizes to medical students for essays submitted in open competition. The subject of the essay will be: "The Recreational Activities of a Medical Student."

The purpose of this competition is to promote systematic observation among medical students, and in awarding the prizes *due regard will be given to evidence of personal observation*. No study or essay that has previously appeared in the medical press or elsewhere will be considered eligible for a prize. Previous prizewinners are eligible for a second award.

Any medical student who is a registered member of a medical school in the United Kingdom, Commonwealth, or Empire at the time of submission of the essay is eligible to compete for a prize. If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association will be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made. The prizes offered will normally be of the value of £25, but, in determining the number and exact amount of prizes to be awarded, the number and standard of essays received will be taken into consideration by the Council, which reserves the right to vary the number and amount of the prizes.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and the medical school of the entrant. Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1955. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

PRIZE ESSAY COMPETITION FOR PROVISIONALLY REGISTERED PRACTITIONERS, 1955

The Council of the British Medical Association is prepared to consider the award, in 1955, of prizes to provisionally registered practitioners for essays submitted in open competition. The subject of the essay will be: "A Discussion on the Influence of John Hunter on Medicine."

The purpose of this competition is to promote systematic observation among provisionally registered practitioners, and in awarding the prizes *due regard will be given to evidence of personal observation*. No study or essay that has previously appeared in the medical press or elsewhere will be considered eligible for a prize.

Any provisionally registered practitioner in the pre-registration year at the time of submission of the essay is eligible to compete for a prize. If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made. At least one prize of £50 is offered. In determining the number of prizes to be

awarded, the Council will take into consideration the number and standard of essays received.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by note of the name and address of the entrant. Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1955. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

SCHOLARSHIPS IN AID OF SCIENTIFIC RESEARCH

The Council of the British Medical Association is prepared to receive applications for research scholarships as follows:

An Ernest Hart Memorial Scholarship, of the value of £250.

A Walter Dixon Scholarship, of the value of £250.

Four ordinary research scholarships, each of the value of £200.

These scholarships are given to candidates recommended by the Science Committee of the Association as qualified to undertake research in any subject (including State medicine) relating to the causation, prevention, or treatment of disease.

In addition, applications are invited for the award of the following research scholarship:

The Insole Scholarship, of the value of £250, for research into the causes and cure of venereal disease.

Each scholarship is tenable for one year, commencing on October 1, 1955. A current scholar may apply to be re-appointed for a further year, though no scholarship will be renewed more than twice. A scholar is not necessarily required to devote the whole of his or her time to the work of research, but may be a member of H.M. Forces or may hold a junior appointment at a university, medical school, or hospital, provided the duties of such appointment will not, in the opinion of the Science Committee, interfere with his or her work as a scholar.

Applications for scholarships, including renewals, must be made not later than March 1, 1955, on the prescribed form, a copy of which will be supplied by the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, on application.

Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated.

MIDDLEMORE PRIZE

The Middlemore Prize, which consists of a cheque for £50 and a certificate, was founded in 1880 by the late Richard Middlemore, F.R.C.S., of Birmingham, to be awarded for the best essay or work on any subject which the Council of the British Medical Association may from time to time select in any department of ophthalmic medicine or surgery. The Council of the British Medical Association is prepared to consider an award of the prize in the year 1955 to the author of the best essay on: "Allergy in Relation to Eye Disease." Notice of intention to enter for the competition should be made on the appropriate entry form, copies of which can be obtained from the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

Essays must reach the Secretary on or before February 1, 1955. Each essay must be unsigned and accompanied by a slip containing the name and address of the author. Previous prizewinners are not precluded from entering. In the event of no essay being submitted of sufficient merit, the prize will not be awarded in 1955, but will be offered again in the following year.

A. MACRAE,
Secretary.

Branch and Division Meetings to be Held

CAMBERWELL DIVISION.—At King's College Hospital, Denmark Hill, S.E., Sunday, January 9, 10.30 a.m., clinical meeting. Members of the Lambeth and Southwark Division are invited. Non-members are equally welcome.

EAST KENT DIVISION.—At Winter Gardens, Margate, Friday, January 7, 8.30 p.m. to 2 a.m., annual supper and ball in aid of the Royal Medical Benevolent Fund.

ENFIELD AND POTTERS BAR DIVISION.—At The Firs Hall Ballroom, Green Lanes, Winchmore Hill, N., Saturday, January 8, 6.45 p.m.: reception, 7.30 p.m. Dinner and dancing. Ladies and medical guests are invited. Principal guest, Dr. A. Macrae (Secretary, B.M.A.).

HASTINGS DIVISION.—At Nurses' Home, Royal East Sussex Hospital, Hastings, Tuesday, January 4, 8.15 p.m., meeting. Address by Dr. S. P. Hall-Smith: "Some New Concepts and Old Precepts in Dermatology" (illustrated by slides).

KENSINGTON AND HAMMERSMITH DIVISION.—At St. Charles's Hospital, Ladbroke Grove, London, W., Friday, January 7, 3.30 for 4 p.m., clinical meeting.

LEWISHAM DIVISION.—At Lewisham General Hospital, High Street, Lewisham, S.E., Friday, January 7, 8.30 p.m., meeting. Dr. W. R. S. Doll: "Social Factors in Mortality—The Registrar-General's Evidence."

SOUTH BEDFORDSHIRE DIVISION.—At Warden Tavern, Luton, Wednesday, January 5, 8.30 p.m., annual general meeting.

WEST HERTS DIVISION.—At Large Town Hall, Watford, January 5, 8.30 p.m. to 1.30 a.m., annual ball.

Meetings of Branches and Divisions

GLASGOW DIVISION

A meeting was held in the Institution of Engineers and Shipbuilders on October 27, 1954. Dr. W. D. Anderson took the chair and 24 members attended. Thanks were extended to Sir John McNee, Dr. Rennie, Mr. Kay, the Secretary-Conveners, the Corporation, and the University, and all who had contributed to making the annual meeting such a success. Dr. J. Baird Forrester reported that, of the sum of £700 collected for the Annual Meeting Hospitality Fund, £471 had been spent in various ways, including the provision of souvenir spoons. The honorary secretary read a letter from the Liverpool Division, in connexion with the questionnaires on peripheral organization sent out by the Association's Constitution Committee, asking for the larger Division's views with regard to the possible reductions in voting power and in the number of representatives. The final answer to the letter was deferred until after the executive meeting.

AN ANALYSIS OF THE PROFESSION

The staff of the British Medical Association analysed the Emergency Register of the civilian medical profession in Great Britain as at December 31, 1953. The register is maintained by the Association on behalf of the National Medical Manpower Committee and the Central Medical Recruitment Committees. The profession was analysed by sex, six age groups, and twenty-one occupational categories. The following is a summary of the analysis.

Predominant Employment	Total Men and Women (to Nearest 100)
General practitioners:	
Principals in partnership with or without assistant(s)	11,200
Principals with assistants	1,000
Single-handed principals	8,700
Assistants	1,500
Consultants	6,400
Senior hospital medical officers	1,600
Senior registrars	1,200
Registrars	2,300
Junior hospital medical officers	200
Senior house officers and house officers (including provisionally registered practitioners holding house posts)	4,800
Research and teaching:	
Professors	300
Others	1,000
Other hospital and university medical staffs	200
Public health medical officers	2,400
Government service	600
Nationalized industries and industrial medical officers	400
Dentists (medically qualified)	400
Provisionally registered practitioners whose work is unknown	500
Partially retired	1,700
Wholly retired	5,100
Unclassified	7,100
	58,600

The group of 7,100 doctors who were unclassified on December 31, 1953, was subsequently analysed further, with the following result (figures correct to the nearest 50):

General practitioners (including 500 assistants)	800
Hospital and university medical staffs (including 250 consultants, 250 senior registrars and registrars, and 500 house officers)	1,200
Public health medical officers	50
Government service; nationalized industries and industrial medical officers; dentists (medically qualified); provisionally registered practitioners whose work is unknown	100
Retired	150
Unclassified occupations (including 700 doctors on leave from overseas; 350 locums, 350 doctors engaged in postgraduate study, 250 members of the staff of the Medical Research Council, 150 officials of medical organizations, and 100 ship surgeons)	3,000
Doctors about whose occupations no information was available between December 31, 1953, and August 31, 1954	1,800
	7,100

The age and sex breakdown of the Emergency Register was as follows:

Men:	Under 30	30-39	40-49	50-59	60-69	70 and over	Total
	5,700	14,000	10,000	8,800	5,000	4,200	47,700
Women:	Under 30	30-39	40-49	50-59	60-69	70 and over	Total
	2,500	3,200	1,600	2,500	700	400	10,900
							58,600

The Central Medical Recruitment Committees—one for England and Wales and one for Scotland—are representative of the whole profession and succeeded the Central Medical War Committees in 1952.

CENTRAL CONSULTANTS AND
SPECIALISTS COMMITTEE (SCOTLAND)

ANNUAL REPORT

The Central Consultants and Specialists Committee (Scotland), under the chairmanship of Dr. J. G. M. HAMILTON, with Dr. I. D. EASTON as deputy chairman, has published its annual report for the session ending October 1, 1954. The following members represented the Committee on the Central Consultants and Specialists Committee during the session 1953-4: D. M. F. Batty, J. Dunbar, I. D. Easton, A. T. R. Hamilton, J. G. M. Hamilton, D. M. Hart, A. Lyall, J. C. Macarthur, F. H. Robarts, and R. de Soldenhoff. The Committee's representatives on the Scottish Joint Consultants Committee were J. G. M. Hamilton, A. Lyall, H. MacLennan, and A. Smith.

Legal Liabilities of Hospital Authorities

The Committee has continued the consideration, which it began in its previous session (*Supplement*, December 12, 1953, p. 226), of the problem of the legal liabilities of hospital authorities under the N.H.S. (Scotland) Act, 1947. For some years in England a series of judgments in the courts has been establishing that a hospital authority can be held vicariously liable for the clinical actions of practically all members of its medical staff. Hitherto, under Scots law, the responsibility for his clinical actions has rested solely with the doctor; but a recent judgment in the Court of Session indicates, the Committee reports, that there is every likelihood that Scots law will be assimilated to English law in this respect. This would have the effect of placing the doctor in a master-servant relationship with the hospital board and fundamentally alter his relationship with his patients. The Committee was unanimous that such a change would be likely to be detrimental both to the status of the profession and to the actual medical service provided for the community. The Committee therefore invited the regional consultants and specialists committees to discuss the problem and submit an expression of opinion regarding the action which should be taken. At the same time the Scottish Joint Consultants Committee asked the Scottish royal medical corporations for their views on the subject. These inquiries showed that, with the exception of one of the corporations, which considered that discussion would serve no useful purpose at present, the opinions expressed were unanimously in favour of all possible steps being taken to preserve the present Scottish position. The Scottish Joint Consultants Committee informed the officials of the Department of Health of this opinion on April 29, 1954. The Chairman of the Joint Committee pointed out that the profession in Scotland naturally wished to avoid any interference with the patient's right to proper redress in case of grievance, but that undoubtedly a factor in the increase of litigation in both England and Scotland was the fact that the hospitals are now public bodies. Patients generally were less ready to sue the doctor than to sue the hospital. If the sole responsibility of the doctor were established, it might be necessary, in order to ensure that patients were assured of legitimate redress in proper cases, to make appropriate insurance a condition of appointment to medical posts in the hospital service.

The Committee was unable to report further on this matter except to say that it would take all possible steps to make known in appropriate quarters the deep concern felt by the profession.

The General Practitioner and the Hospital Service

The report says that discussions were held at the Department of Health's invitation between the Department and the Scottish Joint Consultants Committee on the implementation of the Scottish Health Services Council's recommendations on the general practitioner and the hospital service.

The Joint Committee was in general agreement with the Department, but stressed that not only should some general practitioners be encouraged to take up hospital work, but some holders of hospital posts must equally be encouraged to engage in general practice. The Committee therefore supported the introduction of a system of part-time registrarships. The future of most part-time registrars would probably lie in general practice, but the future consultant would also gain valuable experience if, during his hospital training, some time could be spent in general practice. The Committee suggested that a preliminary pilot survey might be made to determine the probable number of assistantships in general practice which might be combined with part-time hospital appointments. The Department agreed with this proposal, and surveys in some areas are proceeding.

Seconding Nurses to the Tuberculosis Service

The Committee reports that its Tuberculosis and Diseases of the Chest Subcommittee has gone into the urgent problem of obtaining nursing staff for sanatoria. Details were given to the Subcommittee of schemes for the secondment of student nurses from general hospitals to tuberculosis units, which are operating most successfully in the north-eastern and south-eastern regions. Chest physicians think that the main reasons for the small numbers of nurses volunteering for duty in sanatoria are (a) the proprietary attitude of some matrons in general hospitals towards their staff, and (b) the anxiety of parents about the risk of infection.

An attempt is being made to obtain a comprehensive survey of the incidence of tuberculosis among nurses in sanatoria during the last few years, together with facts and figures on the protection given by B.C.G. vaccination. It is felt that these figures may well show that the risk of infection is greater amongst nurses working in general hospitals, where the extra protection given to nurses in sanatoria is perhaps lacking. The Committee thinks that, should the survey prove this to be so, publication of the fact may encourage parents to allow their daughters to volunteer for work in the tuberculosis service.

The Subcommittee, in combination with the Public Health Subcommittee of the B.M.A.'s Scottish Committee, is also investigating the difficulties in resettling tuberculous patients. Yet another activity of the Tuberculosis and Diseases of the Chest Subcommittee, and noted in the Committee's report, is an inquiry into the difficulty in filling junior medical staff appointments in sanatoria.

Staffing Problems in Anaesthetics

The Committee's Anaesthetic Services Subcommittee has completed a survey of the anaesthetic service in Scotland. This shows that in the western region the senior staff establishment is far below requirements and out of proportion with other regions. The Subcommittee made the following points: (a) Many junior members of the anaesthetic staff are having to undertake work which should only be done by fully trained anaesthetists. (b) In the assessment of sessions for anaesthetic staff there should always be included notional assessment of the time necessarily spent in ward visits. This time allowance will vary according to circumstances and the type of work being undertaken in the hospital. (c) There is difficulty in defining the dividing line between an S.H.M.O. and a consultant in anaesthetics. The Subcommittee agreed to the following suggested definition: "An S.H.M.O. is competent technically and has enough experience to make him reliable. A consultant is competent technically, but with his wide experience is able to advise his colleagues about new techniques." (d) In view of the shortage of anaesthetists, general-practitioner anaesthetists should be employed in rural areas, but their employment should be limited in the cities.

The Profession and Hospital Authorities

Among other matters mentioned in a comprehensive report of the year's business is that a sympathetic Department of Health has once again been urged, and has agreed,

to press regional hospital boards to consult regional consultants and specialists committees on the administration of the hospital service, particularly in connexion with medical establishments. The disquiet of the profession in Scotland about the medical membership of regional hospital boards and boards of management was again taken to the Department of Health. The Department showed that the proportion of medical members appointed to hospital authorities remained substantially unaltered, but that, as a result of deliberate policy, regional hospital boards had been reduced in size. An undertaking was given that where medical representation was already small it would not be further reduced. The Committee intends to continue discussion on this problem.

BREACH OF TERMS OF SERVICE

E.C.10 FOR PATIENT NOT ON LIST

The East Suffolk County Executive Council agreed by a majority vote to the recommendation of its Medical Service Committee that 100 guineas be withheld from the remuneration of Dr. "A." Representation to this effect will be made to the Minister of Health.

Dr. "A" had been attending on a fee-paying basis a patient living in West Suffolk and registered on the list of a local doctor who had been certifying him regularly every 13 weeks as being unfit for work on account of schizophrenia. Dr. "A" was not under contract with the West Suffolk Executive Council to provide general medical services in its area. He had been attending the patient in question privately for about 10 years for "psychological reasons," seeing him regularly about every six weeks. Dr. "A" admitted that on one of his visits he had prescribed for the patient on the official form, because he had a cold; Dr. "A" agreed that form E.C.10 should not be used for private patients. The patient's own doctor said that he knew Dr. "A" was visiting his patient, but he did not request or authorize Dr. "A" to issue a script on his behalf, nor was he told that Dr. "A" had done so.

Service Committee Findings

The Medical Service Committee found that a breach of clause 7(10) of the Terms of Service for Medical Practitioners had occurred in that the script (form E.C.10) was improperly issued by Dr. "A" and without consultation with the patient's doctor who was responsible for treatment, and who was at the time certifying the patient as incapable of work. Either the patient's own doctor or his deputy had been available when required.

The Committee, in recommending the fine, advised the Executive Council to take a very serious view of the case.

Note.—Clause 7(10) of the Terms of Service reads as follows: "The forms provided shall not be used for persons other than the patients who are under treatment by him." Clause 1 of the Terms of Service interprets "patient" as meaning a person for whose treatment a practitioner is responsible under his terms of service.

COMPARATIVE PRESCRIBING STATISTICS

During this month general practitioners in some areas will receive a statement of their prescribing costs for the month of October, 1954, and comparable figures for the area. The statement will show the average number of prescriptions issued per person on the doctor's list during the month and the average for other doctors in the area, the average cost (in pence) per prescription issued by the doctor and by the others in the area, and the average cost—also in pence—per person on the doctor's list and that of his colleagues in the area.

This marks the start of arrangements whereby gradually every G.P. will receive from time to time a note of his prescribing costs and the average for his area for a particular month. It is a reintroduction of a practice followed under the National Health Insurance scheme and which doctors at that time found helpful.

PRESENT NUMBER OF SENIOR
REGISTRARS TO BE MAINTAINED
STATEMENT BY MINISTER AND JOINT
CONSULTANTS COMMITTEE

The Minister of Health has been reviewing the training plan for senior registrars instituted in 1951 in the light of the numbers actually employed and the factors which will affect the number of vacancies likely to occur in the higher grades in the period in which persons who enter the senior registrar grade in the next few years will be completing their training.

After discussion with the Joint Consultants Committee as representing the medical profession, the Minister has come to the conclusion that generally the intake of senior registrars in the various specialties is for the time being sufficient to meet future needs, and that the present number employed should be maintained pending the outcome of the discussions in which he and the Joint Committee are engaged on the general subject of the medical staffing structure of the hospital and specialist services.

Accordingly, in a letter of December 13, the Minister has asked hospital boards to maintain their senior registrar complement, in total and in each specialty, at the number at which it then stood, subject only to a few minor alterations.

Extension of Appointments

When a senior registrar completes the tenure of his present appointment, whether this is in a post within the training plan of 1951 or in a "transitional" post, the employing board is left free to extend his appointment for an additional year so that he may have more time to compete for a higher post if it is satisfied that his potentialities are such that he is likely, given more time, to obtain one. When a post becomes vacant, boards are expected to appoint to it a new senior registrar in the same specialty. As hitherto, there is nothing to prevent an existing senior registrar from obtaining another senior registrar post in the same or a different specialty and holding it for the usual term.

Senior registrars whose tenure is extended under these new arrangements will, of course, continue to be free to compete for higher posts. It is emphasized, however, that their retention as senior registrars will not give them any special claim or constitute any guarantee that they will be successful. The Joint Committee has expressed its agreement with these arrangements.

LIVERPOOL LOCAL MEDICAL COMMITTEE

Relations between the general practitioner and local authority health services in Liverpool have improved remarkably in the past year or two. In welcoming the change, the *Liverpool Local Medical Committee Bulletin* of December, 1954, states that no decision affecting both services is now made without discussion between the general practitioners' representatives and the medical officer of health.

With reference to the inspection of surgeries, the committee reports the passing of a resolution: "That all the members present at this meeting of the Liverpool Local Medical Committee are unwilling to inspect doctors' surgeries unless at the request of the doctor concerned." The committee explains its attitude to this matter by saying that where inspection is needed it should be done by the executive council, and that an official of the committee could accompany the inspectors if the doctor concerned wished, in order to see that his interests were properly safeguarded.

Commenting on proposals that general practitioners might with advantage draw up appointments systems, the committee says that, in spite of the incredulity with which such ideas are greeted by busy practitioners, reports continue to appear suggesting that an appointment system can work, and it would be interested to hear from any local practitioner who is running such a scheme. The *Bulletin* reminds its readers that 10 years ago an appointments scheme for hospital out-patients was considered a fantastic suggestion.

SENIOR HOSPITAL MEDICAL OFFICERS
GROUP

As reported in the *Supplement* (December 11, 1954, p. 224), the steering committee of the new S.H.M.O. Group recommended that a Group council should be elected, consisting of two representatives from each hospital region. Final approval of this plan must wait until after the next meeting of the Council of the Association, but, in anticipation of this, meetings of S.H.M.O.s in each region are now being arranged. These meetings, in addition to appointing representatives to serve on the Group council, will afford S.H.M.O.s an opportunity of discussing their immediate problems and future activities. An S.H.M.O. in each region has undertaken to act as convener for the initial meeting, and announcements will be made in the *Supplement* of times and places of the meetings. It is hoped that these will all take place during the months of February and March.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Anonymity in Broadcasting

SIR,—May I humbly suggest that the Central Ethical Committee's repeated warnings against broadcasting under one's own name (*Supplement*, December 25, 1954, p. 245) have no legal backing whatsoever? It would be impossible to prove that broadcasting under the conditions observed by the B.B.C. constituted advertising by a registered medical practitioner with a view to his own gain, and it is contrary to the public interest that responsible medical men should be prohibited from speaking or appearing in person in sound and visual broadcasting. I am even doubtful whether the Association would be justified in expelling a member on this account.—I am, etc.,

Oxford.

L. J. WITTS.

Local Health Authority Nursing Services

SIR,—I have read with great concern the article by Miss J. M. Akester and Miss F. M. Mawson (*Supplement*, November 20, 1954, p. 187), which I feel shows a tendency to underestimate the incomparable work done by district nurses and to indicate that this could be done by less intelligent and less highly trained women. Miss E. J. Merry in her letter (*Supplement*, December 4, p. 213) very rightly says: "At present the patients know what they are getting when the family doctor says he will send along the Queen's or Ranyard nurse." I should like to endorse this and to emphasize that the doctor, too, knows what he or she is getting.

As a consultant who has had the privileged experience of working for many years with district midwives and nurses, I find that it is because of the extent of their training and the breadth of their experience that I have such confidence in them. There are many cases one allows to remain at home, or to be sent home from hospital, because one knows that the district nurse has the qualifications to spot sudden changes, to report progress, and to carry out one's instructions so accurately that she can be trusted implicitly.

It seems strange to me that curtailment of this training should be suggested. To start with, how does one pick out the candidates for this? Surely, few girls make the choice of district nursing as their career until they have finished their training and seen what branch they prefer. I should be interested to learn why, in this article, the health visitors give the impression that they should be so much more highly intelligent and specialized in comparison with their colleagues. It is just as important that all the domiciliary staff should be intelligent and specialized. In many ways

they have far greater responsibilities and opportunities than nurses in hospital. A good percentage of their work is connected with social problems and health teaching. I can hardly believe that it could be possible for a nursing orderly to visit a patient for washing and for a health visitor to arrive shortly afterwards for teaching purposes. Who is better able to do it than the district nurse who spends so much time in the home at a moment when both patient and relatives are receptive to advice? Why, for instance, should the health visitor be the one to advise the household about admission of a patient to a sanatorium if the district nurse is already attending the case, as with the present district nursing training this side of the work is incorporated?

Their statement regarding the health visitor having to take Part 1 C.M.B. is astounding. At present, part of the duty of the health visitor is to advise on infant feeding after the midwife has unfortunately ceased to be responsible on the 14th day after birth. I consider that this work can only be done really adequately when the health visitor has not only taken Part 1 but has qualified and practised as a midwife. Domiciliary midwifery would also give them a far deeper "understanding of family life" than anything else. I think that I can speak for many obstetricians when I say that no antenatal advice or instruction should be permitted by any health visitor who has not practised midwifery; indeed, it should always be given by midwives where possible.

Miss Akester and Miss Mawson say that the duty of the district nurse is to care for the sick. Their duties are not only washing. However, what task needs more skill than the washing of a hemiplegic and the prevention of bed sores, or the washing of anyone so crippled with arthritis that any movement is agonizing, let alone an inexperienced movement? In addition there is the nursing of patients with diabetes, cardiac disease, and advanced carcinoma, and also much work is being done to rehabilitate the chronic sick and so save valuable hospital beds. As another correspondent has said (Dr. O. Ll. Lander, *Supplement*, December 11, p. 229), the district nurse often has far more responsibility than the ward sister.

With regard to the suggestion made that doctors should have lay attendants at their clinics, I feel that there are many doctors who would agree with me that this would be most unsatisfactory. Apart from possible medico-legal aspects and professional secrecy, the speed and efficiency with which one can conduct a clinic depend a good deal on the help and efficiency of the attendant nurse (in hospital it would be the out-patients sister). When a trained nurse and doctor work together there is also a valuable exchange of knowledge, and also, by being with the doctor when the patient is examined, the nurse is more able to give help afterwards to the patient or the parents.

What Miss Akester and Miss Mawson call "team leaders" surely exist at present in the persons of the superintendent of home nursing and the superintendent nursing officer. At present these "leaders" have wide experience in all branches of nursing, and also a specialized knowledge of the requirements of domiciliary work. To be a successful leader one must have had adequate experience, with the attendant understanding of difficulties, as well as academic knowledge of all the work to be done by those one has to lead. Their article does not appear to recognize this fact sufficiently. I should like to say that I have learned a very great deal from district midwives, nurses, and health visitors, and I am deeply grateful to them all, perhaps in particular to members of that great association of Queen's Nurses, who are, indeed, the specialists in domiciliary work.—I am, etc.,

Chichester.

EVERELL M. SHIPPAM.

SIR,—It would appear that considerable interest has been aroused by the article by Miss J. M. Akester and Miss F. M. Mawson (*Supplement*, November 20, 1954, p. 187) on the future training of nurses. This constructive contribution on the subject should surely not arouse any real anxiety as to the future standard of nursing. It is accepted as a

Fining the Doctor

SIR.—I agree with Dr. Paul R. Saville (*Supplement*, December 18, 1954, p. 241). Careless and extravagant prescribing does exist, and, with whatever motive it is done, it does constitute a sabotage by the offender against the Health Service and against his fellow-practitioners. Unchecked, it can wreck the scheme financially and it can also make life infinitely harder for a conscientious colleague. One can hardly blame a patient for demanding expensive and unnecessary antibiotics for some trifling ailment if he has been encouraged by another doctor to consider these essential. It is a common experience to hear that "the baby only had a cold after all, but the doctor gave penicillin as a precaution." A colleague of mine says that he knows which travellers have visited the surgery by the flood of "fancy prescribing" which then flows from the pen of his assistant.

Some check on costs of prescribing existed for years under the National Insurance scheme and I never heard then any bitter complaints of injustice. Some control was necessary then as it is necessary now, and for the same reason—that is, that, as Dr. Saville rightly says, we are not all saints and angels. Times may change and modes of practice with them, but human nature does not change.—I am, etc.,

London, E.12.

D. E. PEAKE.

SIR.—Certainly £600 seems a large fine, but there is one aspect which has not struck doctors who have so far written about it. It is quite evident that the executive council's opinion was that the doctor concerned had attracted patients by over-prescribing. It can be, and is being, argued that it is unreasonable to penalize a doctor for this, but, assuming for the moment that it is reasonable, is the fine excessive?

It is hardly likely that the executive council would have come to its conclusion unless it had thought that the number of patients attracted was somewhere in the region of 200 to 400, possibly more. The increased remuneration from these patients is not for one year only, and the true benefit to the doctor is probably, depending on how long he practises, something between $200 \times 17s.$ less tax for 10 years, and $400 \times 17s.$ less tax for 30 years—that is, between £925 and £5,550 (if income tax drops these sums would be larger). Even a fine of £600 can hardly be called a deterrent. Surely, too, other doctors in the district deserve some consideration. The loss of patients to some of them might well mean the loss of a holiday every year, or once in every two or three years.

I do not think the doctors who have written would be so ready to defend over-prescribing if they had come across it in a neighbour or a locum. One of my locums prescribed 40 proprietary tablets (I have forgotten the name) for vomiting of pregnancy. The chemist had to get a pack of 100 at a cost of just under £10. The patient took only five, as they did no good, and stopped vomiting on calcium lactate tablets which I gave her on my return. Another locum put all my heart cases on digitalin granules, costing four times as much as the digitalis preparation they had been having. Not one patient was any better, and one or two said they felt worse. No doubt freedom is essential to good practice, but is it any more a loss of freedom to be bound by at any rate some rules when prescribing than to be bound by rules of asepsis when practising surgery? Or are we, as one letter seems to suggest, to give medicines whenever a patient asks for them? Surely this is a worse loss of freedom.—I am, etc.,

Bracknell, Berks.

L. G. JACOB.

SIR.—While not attempting to comment on the particular case of Dr. "X" (*Supplement*, November 20, 1954, p. 191), it seems to me that the correspondence on the whole aspect of prescribing costs and their control prompts the following questions: (1) Can we prescribe adequately, even on occasion employing new and expensive substances when their use is indicated, and at the same time keep prescribing

fundamental principle that good nursing is essential to every branch of our profession, and, so far as the general practitioner is concerned, the statement by the Minister of Health—that we should be considered as the "leaders of the team"—has been implemented and given every encouragement in providing ancillary services, including those in the nursing field. In the latter, two working parties have been appointed—one is concerned with seeing to it that the highest possible standard of nursing will be available in what is almost entirely the family doctor service; the other, we may take it, will be investigating every possibility of implementing in our sphere the services of the health visitor. Let us not forget, too, that the Royal College of Nursing keeps a very watchful guard on the standard of nursing in all its phases.

With regard to the doctor-nurse relationship, surely it is everywhere acknowledged that the nurse in all her spheres is invaluable. So far as the health visitor is concerned, the value of her services is becoming much more widely recognized, and in the tripartite division of the public health nurse into the categories of district, obstetric, and health visitor she is taking her place with the others in a comprehensive health service.

In my own area, and adjacent ones, we keep a list on the desk of the manifold ways in which the health visitor can assist us, and we have facilities to telephone these problems direct to a nursing officer. May I add, too, that such list bears the authority of the medical officer of health and the local medical committee, which shows as nothing else can what an excellent liaison has been accomplished and that the scheme has the universal support of the profession.

One thing is certain—that in those areas and in those practices where the health visitor's duties are understood they are gratefully accepted and give much help to the busy doctor when faced with the problems of social and preventive medicine. It has been said that the fact that we are the guide, counsellor, and friend of the patient is in itself a justification for our existence. It is for that reason that we have been hallowed with the title of the "family doctor," and in these days, when for a diversity of reasons it is impossible to have the same contact that we did of yore, we need all the support we can get to help us know our families.—I am, etc.,

London, E.12.

STANLEY THOMAS.

Assistants in General Practice

SIR.—I gather "Principal's" main fear, in opposing the introduction of the Assistants and Young Practitioners Subcommittee's recommendation regarding the reduction in the size of a principal's excess list, is that the measure will not serve the best interests of assistants. The reduction of a principal's list in the manner recommended most certainly will help young doctors to gain entry into practice. While it is true that some of the "shed" patients may sign on with the next most popular doctor, this doctor may be anxious and willing to take in another man, and the influx of new patients may provide him with extra income to do so.

If some partnerships are unhappy affairs it is not infrequently due to the senior partner. Parsimonious shares and excessive wait for parity are potent causes of discontent which can be remedied by an enlightened senior. "Principal" recommends as a satisfactory way of entry into general practice that young doctors should put up a plate and be subsidized. The facts are that the few doctors who have made a success of this hazard have done so because of exceptional local conditions—new housing estates, etc. Most fail to a greater or lesser degree due to frustration and financial exhaustion. A significant cause of failure by this method of entry is the existing doctor-transfer arrangements, which reinforce the average patient's inertness and lack of mobility, even though he realizes he is not getting a square deal from his own doctor.—I am, etc.,

"ASSISTANT."

costs within reasonable limits? (2) Is it a fact that a small minority of our colleagues are not above trying to secure and maintain the good will of patients by prescribing lavishly, not caring overmuch about the real needs of the case?

If the answer to both these questions is "Yes," then as a profession we must continue to insist on clinical freedom to prescribe whatever we believe to be in the best interests of our patients. This does not mean that we must hold up our hands in horror if, in the future, action is taken against those who would squander public money in an attempt to further their own unethical ends.—I am, etc.,

Belfast.

H. J. CRONHELM.

SIR.—When a general practitioner is found guilty of excessive prescribing or some breach of his terms of service, an arbitrary sum may be deducted from his or her remuneration. If a hospital doctor is sued for neglect (expensive prescribing not coming into it, though it is he who often sets the ball rolling) his damages are paid either by the hospital or by his defence society, the bulk of whose contributions are paid by general practitioners. Where is the justice of this? The answer may be simple, but whether it is or not I should very much like to know it.—I am, etc.,

Brighton.

G. L. DAVIES.

SIR.—The recent report regarding the fining of a young general medical practitioner recommended by an executive council on account of reputed over-prescription has properly raised a considerable amount of protest, but it is doubtful whether the protest is thoroughly informed of the circumstances of the judgment. On the face of it it would appear as if the young practitioner built up his practice by industrious attention to his patients just as much as by over-generous prescription, and it should be remembered that such an inexperienced practitioner is liable to seek consultant advice frequently and that consultants are liable to prescribe expensive drugs. Indeed, a general-practitioner colleague of mine has been so alarmed by the numerous expensive drugs he has been advised to prescribe that he has taken to endorsing the prescription "as prescribed by Dr. So-and-So, consultant." This is a useful precaution which might well have protected the young practitioner in question from what is apparently gross "over-fining."

However, the point which I should like to make does not concern this judgment in particular, but concerns the control of the numerous committees with which the whole fabric of medicine is at present beset. I would suggest that all committees are required to publish the minutes of their meetings to those whom they are supposed to represent, and that in all cases such as the one under consideration the executive council should be required to make known the full details of the case and the grounds for judgment to the local general practitioners. It would then be possible for the local medical men at least to know whether one of their number has been victimized or properly chastised.—I am, etc.,

Burton-on-Trent.

RANDLE LUNT.

H.M. Forces Appointments

COLONIAL MEDICAL SERVICE

The following appointments have been announced: E. G. Q. Bannerman, M.B., Ch.B., Principal Medical Officer, Gold Coast; R. M. F. Charles, L.R.C.P.&S.Ed., D.P.H., Medical Officer, Grade A, Trinidad; G. Graham-Cumming, M.B., Ch.B., Deputy Director of Health Services, Hong Kong; F. C. Harris, M.R.C.S., L.R.C.P., D.C.P., Pathologist, Ministry of Health, Gold Coast; N. A. Nobbs, M.R.C.S., L.R.C.P., Assistant Tuberculosis Officer, British Guiana; E. B. Smart, M.B., F.R.F.P.S., D.P.H., Specialist, Hong Kong; P. W. W. Branch, M.B., B.S., Medical Officer, Barbados; J. D. Finlayson, M.B., Ch.B., Medical Officer, Sarawak; J. S. Hogg, F.R.F.P.S., Senior Medical Officer, Gilbert and Ellis Islands; J. Hunter, M.B., B.Ch., B.A.O., and W. J. D. Murphy, M.B., B.Ch., B.A.O., Medical Officers, Tanganyika; R. A. J. Webb, M.B., B.S., Medical Officer, St. Vincent.

Branch and Division Meetings to be Held

- BLACKPOOL AND FYLDE DIVISION.—At Savoy Hotel, Blackpool, Wednesday, January 12, 7.15 p.m., dinner; 8.30 p.m., lecture by Professor W. I. C. Morris: "Diseases of the Vulva."
- BURTON-ON-TRENT DIVISION.—At Bretby Golf Club, Ashby Road, Burton-on-Trent, Tuesday, January 11, 7.45 p.m., dinner. Address by Dr. J. H. Sheldon: "General Problems of Old Age."
- CHESTERFIELD DIVISION.—At Station Hotel, Chesterfield, Friday, January 14, 7.30 for 8 p.m., annual dinner; 9 p.m., talk by Mr. F. J. Milward: "The Diagnosis of Urological Disease."
- CROYDON DIVISION.—At 43, Wellesley Road, Croydon, Tuesday, January 11, 8.30 p.m., general meeting. Address by Mr. Ralph Marnham: "Modern Trends in Surgery."
- DARTFORD DIVISION.—Thursday, January 13, meeting. Mr. J. B. Blakley: "Domiciliary or Hospital Midwifery?"
- DUMFRIES AND GALLOWAY DIVISION.—Sunday, January 16, Mr. R. S. Venters: "Tinnitus and Aural Vertigo."
- DUNDEE BRANCH.—At Royal British Hotel, Dundee, Friday, January 14, 8.30 p.m., meeting. Mr. Martin Fallon: "Thoracic Surgery"; Dr. W. M. Shearer: "Anaesthesia in Thoracic Surgery." Members of Perthshire Branch are invited.
- EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, January 13, 7.30 p.m., dinner; 8.45 p.m., Dr. Alan Barker: "Shock in Obstetrics."
- GUILDFORD DIVISION.—At Mitchell Hall, Royal Surrey County Hospital, Guildford, Thursday, January 13, 8.30 p.m., meeting. Dr. G. H. Newns, Dr. J. P. M. Tizard, and Dr. S. J. R. Macoun: "Paediatric Brains Trust."
- HAMPSTEAD DIVISION.—At Hampstead General Hospital, Hampstead Hill, N.W., Wednesday, January 12, 8 p.m., clinical evening.
- HENDON DIVISION.—At Hendon Hall Hotel, London, N.W., Tuesday, January 11, 8.45 p.m., meeting. Dr. F. E. Camps: "The Gunman in London." Friends, of both sexes, are invited.
- KESTEVEN DIVISION.—At George Hotel, Grantham, Thursday, January 13, 7.15 for 7.45 p.m., dinner. Guest speaker, Sir Gordon Gordon-Taylor. All medical practitioners and their wives are invited.
- KINGSTON-ON-THAMES DIVISION.—At Kingston Hospital, Tuesday, January 11, 8 for 8.30 p.m., meeting. Dr. F. J. Bach: "Diagnostic and Therapeutic Measures that can be Applied in General Practice."
- METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C., Tuesday, January 11, 5 p.m., meeting. Lecture by Dr. T. Rowland Hill and Dr. A. Talbot Rogers: "The Difficult Years from Qualification to Establishment." All senior students and recently qualified practitioners are invited.
- SCARBOROUGH DIVISION.—At Out-patients' Hall, Scarborough Hospital, Thursday, January 13, 8.30 p.m., meeting. Lecture by Dr. Michael Ward: "Everest."
- SOUTH SHIELDS DIVISION.—At Ingham Infirmary, South Shields, Friday, January 14, 8.30 p.m., meeting. Address by Dr. W. C. Barnsley: "Bronchial Carcinoma."
- TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tunbridge Wells, Tuesday, January 11, 8.30 p.m., meeting. Mr. T. Holmes Sellors: "Surgery of the Heart."

L.C.C. HEALTH REPORT DOMICILIARY SERVICES

In 1953 the number of domiciliary confinements in the county of London, which had been declining since 1948, again fell from 11,026 in 1952 to 10,472. In his report for the year 1953, recently published by the London County Council, the county medical officer of health and principal school medical officer attributes the decline partly to the decreasing birth rate and partly to the attraction of hospital confinements. He considers it problematical whether or not the recent increase in maternity benefits, particularly the introduction of the special home confinement grant of £9, will have any effect in halting this trend. Progress in the use of analgesia in home confinements has been rapid. In 1946 it was administered in 3% of cases and in 1953 to over 77%. Since 1950 all midwives employed by the L.C.C. have been qualified to administer analgesia.

District Nurses and Health Visitors

An average of 369 health visitors were occupied in connexion with the various health services, apart from the tuberculosis and school health services. Home visits numbered 832,500. The report shows continuing progress in integrating the work of health visiting and school nursing, and in extending the function of the health visitor to cover the care and welfare of the family as a whole. There was increased co-operation between health visitors, general practitioners, and voluntary and statutory organizations serving families.

Over 1,724,000 visits were made during 1953 by the district nursing associations which carry out home nursing on the council's behalf. This was an increase of about 110,000 over 1952. About 44% of persons whose treatment was completed during the year were over 60 years old. The average number of cases in the care of a nurse at any one time was 22.5. An exceptionally heavy demand for home nursing in the first quarter of the year was occasioned by a sharp rise in the number of respiratory diseases resulting from the severe fogs at the end of 1952 and beginning of 1953 and by an outbreak of influenza in February.

Extension of Home Help Services

The domestic help service was further expanded in 1953. At the end of the year nearly 3,000 full-time and part-time home helps were employed, and over 30,000 persons were assisted, three-quarters of whom were aged and chronic

sick. The report mentions two new extensions of the council's domestic help service. The first was a service of night helps to attend chronic sick patients in their own homes to relieve the patient's relatives of duties, other than nursing, normally performed by them for the patient, between 11 p.m. and 7 a.m. The second service provided child helps to care for two or more children in their own homes when temporarily deprived of the care of both parents and with no other adults in the home at night. The service aims at avoiding the emotional disturbance often caused to children by their having to be taken away from their homes in these circumstances.

Care of Mothers and Young Children

In the year under review 85% of children born in London attended a maternity and child welfare centre at least once in their first year of life as compared with 84% in 1952, 82% in 1951, and 79% in 1950. These children usually attend the welfare centres in their first year about 12-15 times. The report states that educational activities at these centres, including mothercraft training and health education, have been expanding year by year, and in 1953 there were record attendances of 34,977. The council's antenatal clinics were attended by 43% of all expectant mothers, others obtaining antenatal care through the hospitals or family doctors. At the end of 1953 there were 110 day nurseries accommodating over 6,000 children under 5. In addition, 854 children were being cared for by registered child-minders.

London Ambulance Service

The demand on the London ambulance service was again very great in 1953. Patients conveyed by the general section (including agency and supplementary services) numbered 868,826, compared with 810,002 in 1952. Over 5,000,000 miles were involved in these arrangements. In the accident section there were 90,896 calls with a mileage of 458,602.

School Health Service

In reviewing the L.C.C. school health service the report states that 449,597 medical inspections were carried out during the year, and 15.8% of the children examined required to be referred for further medical advice or treatment, compared with 16.2% in 1952, 17% in 1951, and 17.6% in 1950. The number of dental inspections in schools greatly increased in 1953, being about two and a half times the number in 1952. This resulted in an increased amount of dental attention for children.

RESIDENTIAL ACCOMMODATION FOR
HOSPITAL STAFF

Following discussions with the Joint Consultants Committee about the current shortage of junior hospital medical staff, during which representations were made to the Minister that provision of more residential accommodation might help to solve the problem, the Ministry of Health has issued a circular (H.M. (54)115) to hospital authorities noting the Minister's policy on this matter.

Although the Minister has powers to provide residential accommodation for hospital staff, he considers that, in view of the limitation on capital expenditure, as little as possible should be spent on acquiring or building such accommodation. Hospital authorities should provide residential accommodation only where the staff must, because of the nature of their duties, live on or near the hospital premises, or where the hospital is remotely situated and no other suitable accommodation can be obtained locally. Where these criteria apply, quarters may also be provided for married staff. The Minister suggests that hospital authorities should assist their staff in all possible ways to get accommodation when this is not provided by the hospital.

MEDICAL PRACTICES COMMITTEE

AMENDMENT OF CLASSIFICATION OF AREAS

The following have been reclassified by the Medical Practices Committee (October 1, 1954, to January 1, 1955) as "designated" areas:

Derbyshire.—Urban District of Heanor.
Ipswich.—Whole of County Borough.

The following as "intermediate" areas:

COUNTIES
Cumberland.—Cockermouth.
Derbyshire.—Borough of Chesterfield.
Durham.—Urban District of Blaydon.
Essex.—Borough of Romford.
Hampshire.—Rural District of Stockbridge.
Kent and Canterbury.—Urban District of Crayford; Urban District of Northfleet.
Lancashire.—Middleton (except Langley Estate).
London.—Borough of Kensington: Kensington North; Borough of Lambeth: Princes and Oval Wards; Borough of Lewisham: Culverley and St. Andrews Wards; Borough of Woolwich: Dockyard, St. Mary's, River, St. George's and Herbert Wards.
Middlesex.—Borough of Harrow: Harrow Weald Ward.
Urban District of Staines: Staines Ward.
Northumberland.—Shiremoor (Seaton Valley).
Wiltshire.—Swindon.
Yorks (W.R.).—Urban District of Bentley with Arksey.

COUNTY BOROUGHS

Kingston-upon-Hull.—East District.
Swansea.—East District.

The following as "restricted" areas:

Cornwall.—Perranporth.
Norfolk.—Rural District of Depwade.
Nottingham County and City.—Selston.
Somersetshire.—Rural District of Yeovil.

CLASSIFICATION OF PROPRIETARY
MEDICINES

A revised list of proprietary medicines classified by the Standing Joint Committee on the Classification of Proprietary Preparations and the Joint Committee on Prescribing in categories 1, 5, and 6, and dated November, 1954, has been issued by the Ministry of Health and the Department of Health for Scotland. The list replaces those issued in July, 1953, and January, 1954.

WHITLEY MACHINERY IN THE HEALTH
SERVICEPROFESSOR BEDSON'S ADDRESS TO LABORATORY
TECHNICIANS

The November, 1954, issue of the *Gazette of the Institute of Medical Laboratory Technology* reports an address by Professor S. P. Bedson to the London Branch of the Institute. Professor Bedson is adviser in pathology to the Ministry of Health, but he made it clear that on this occasion he was speaking as a private individual.

Professor Bedson, by request, talked mainly about the present conditions of service of laboratory technicians and, among other things, of Whitley machinery. With the advent of the National Health Service and with the week worked by the technician being regulated by statute, trade union practice, he said, now permeated the service. Professor Bedson gave some details about the operation of the Whitley Council for the Health Services. Some such machinery was necessary to ensure equitable and uniform terms and conditions of service, and it was also necessary to have a court of appeal to deal with alleged injustices. He thought that in theory at all events the Whitley Council was an adequate system for the purpose, but in practice he sometimes wondered whether the spirit in which Whitley negotiations were conducted was all that it might be. As a member of the Management Side of a Whitley Committee, Professor Bedson thought that his colleagues on the Management Side were fair-minded and anxious to come to the right decision. Delays, he thought, were probably due to lack of mutual trust, and he looked forward to the time when the Management and Staff Sides would approach their work with a sense of urgency and a spirit of co-operation.

Treasury Influence

Professor Bedson said that there was no doubt that one factor affecting Whitley Council deliberations was the influence of the Treasury, but, bearing in mind its responsibility, he hardly knew what could be done about that. Commenting in the same issue on the influence of the Treasury on Whitley negotiations, the *Gazette* remarks that it is a heavy one. All taxpayers, it says, can appreciate that the taxpayer's interests must be safeguarded, but "that argument by itself will not stand." "If the State takes over a service," the *Gazette* goes on, "it should not prove itself an indifferent employer on the grounds that there is insufficient money to be otherwise. If the State finds that it cannot meet its self-assumed obligations to the public and be a just employer, then, whatever may be the implications, it should say so. Some may think, in any case, that the Treasury exercises an uneven hand both within the National Health Service and as between the various Ministries."

"AUTHORITY" TO PRESCRIBE

General practitioners sometimes try to cover themselves against a possible charge of excessive prescribing by asking executive councils to "authorize" in advance the prescribing of some preparation of an expensive kind. Executive councils have no power to give this authority or to say what should or should not be prescribed. The responsibility for prescribing is entirely the doctor's. If a doctor is asked to justify to the local medical committee his use of a particular drug, and it is one which he prescribed on the advice of a consultant, the consultant's opinion should be given to the local medical committee in support of the case for justification.

The London Local Medical Committee has informed the London Executive Council that in the circumstances of a case referred to it for decision "sanatogen" was not prescribable as a drug under the N.H.S. Regulations.

C.B.E. FOR A CHAIRMAN

Mr. E. C. Elliott was among those who received the C.B.E. (Civil Division) in the New Year Honours. Mr. Elliott, a chartered accountant, is chairman of the Interdepartmental Committee on the Distribution of Remuneration of General Practitioners (England and Wales), which allocates to executive councils the sums required for the payment of G.P.s, and also of the International Distribution Committee, which allocates to England, Wales, and Scotland their share of the total money available in the central pool for the whole country. These committees are made up of representatives of the Ministry and of the general practitioners, and Mr. Elliott is an independent chairman.

NO SOCIALIZED MEDICINE

President Eisenhower said in his recent message to Congress on the state of the Union that his proposals for improving the health services would continue to reject socialized medicine. In *The Times* account of the speech, the President is reported as saying that his administration followed two simple rules: the Government should perform an essential task only when it could not otherwise be adequately performed; and in performing that task the Government must not impair the self-respect, freedom, and incentive of the individual.

The President will put forward a co-ordinated programme to strengthen and improve existing health services on January 24.

HOUSE OFFICERS' SALARIES

It has been agreed in Committee B of the Medical Whitley Council that, as all fully registered house officers will now have been qualified for one or more years, there should be one rate only—£525 per annum—for all fully registered house officers, whether or not they have held previous house appointments. Provisionally registered house officers are paid at the rate of £425 a year for their first post and £475 a year for the second; Committee B has also agreed that an employing hospital authority should have discretion to pay the second-post rate to a provisionally registered practitioner holding his first post if he has already had equivalent hospital experience outside the National Health Service—for example, in a hospital appointment in another country. In each case the deduction of £125 per annum for board and lodging will be made.

The Ministry has sent a circular (M.D.B. Circular No. 20) to this effect to hospital authorities.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.
Urban District Councils.—Houghton-le-Spring.

Questions Answered

Tax Relief for Clothing

Q.—What expenses are allowable for income-tax purposes with regard to clothing?

A.—Expenses must have been incurred wholly and exclusively for the purposes of the profession. For example, the cost of special garments for surgery use is allowable, but the cost of clothing of the normal kind is regarded as excluded from allowance.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Practice in the Highlands and Islands

SIR.—In forming a special Highlands and Islands Practitioners' Subcommittee to deal with the subject (*Supplement*, November 6, 1954, p. 171), the B.M.A. has shown itself aware of the special problems associated with medical practice in the remoter areas of Scotland. Having only a few weeks ago given up practice in Unst, the most northerly of the Shetlands, after five years there, perhaps I may be allowed to make a few remarks on the subject.

It is idle to say one is isolated professionally. No one who is not prepared for isolation should take up practice in such an area. But isolation brings in its train several unfortunate consequences, some but not all of which could be mitigated by administrative changes. Working single-handed on an island with a list of 1,000 one is literally never off the chain. My nearest colleague was on an adjacent island, but to ask him—a busy man—to stand in for me more than very occasionally would have presumed too greatly on his helpful attitude. In any case, the time it would have taken him to reach an emergency precluded one's leaving the island except very rarely. With no let-up or change of scene an annual holiday becomes almost essential to combat staleness, but the cost of this is beyond reason. Further, the present paucity and independence of local domestic labour make provision for a locum very difficult indeed, and, even though a locum is available on the mainland of Shetland (and there may well not be one), the steamer and railway fares for oneself, one's family, and probably the locum add up to a high total, and incidentally add at least a week to one's holiday time. It may be a dangerous principle to admit—but could the State not take cognizance of this unusually high expense and make some provision for it?

In outlandish parts it is recognized by the Department of Health for Scotland that it is impossible for a doctor to find his own accommodation. Accordingly the Department acquires a suitable house and rents it to the practitioner of the moment. A case can easily be made out for an extension of this principle to the provision of furnishings of the surgery and waiting-room. I envisage the Department owning such articles as a dispensing table, examination couch, and the minimum of chairs and cupboards and tables to make the whole a going, if frugal, concern. These would be rented along with the house at charges to be fixed by the Department. This would ensure that between doctors there would be no awkward interregnum until the incoming practitioner can arrange his affairs. It is manifestly impossible to give the incoming man first refusal of all furnishings, which, should he not require this or that, would be left on the hands of the outgoing doctor.

A great fillip to morale could be given if specialists visiting the local parent hospital would make a point of occasionally going round outlying areas—and doing so with an inquiring attitude of mind and not merely robot-like seeing a few patients and dashing off again. In my five years on the island one medical specialist took the trouble to come and see conditions for himself, and Professor Craig, of Aberdeen, came on from Lerwick and repeated a lecture he had given there and which I had been unable to attend. It should further be a point almost of honour that specialists appointed to the local hospital visit all outlying practitioners within, say, six months of appointment. I make these observations in no carping spirit, but merely in the thought that were these points conceded it would still further add to the attractions of practice off the beaten track.—I am, etc.,

Beer, Devon.

JAMES GUTHRIE.

Local Health Authority Nursing Services

SIR.—There have appeared in your columns recently several letters criticizing the local authorities health services, and the opinion expressed by those writers appears to be broadly that the work of the school medical officer might well be taken over by the general practitioner. Why this change is suggested does not seem quite clear. It is now generally accepted that the early detection and treatment, if necessary, of physical and mental abnormalities, and their prevention as far as possible, is beneficial to the individual and community as a whole. Many doctors agree that the medical examination of schoolchildren, with this end in view, should be carried out.

Who is the doctor best suited to undertake this? The family doctor certainly knows the background of many of those on his list, but what of those who have never consulted him on some specific point, or those who have felt that their problem must appear too trivial for the family doctor in his busy surgery to attend to? The school doctor can ascertain much, if required, from the health visitor, who will be with him at the examination, and from other departments if indicated. He can also consult the family doctor on any point. The school doctor also has the opinion of the teaching staff readily available on such things as speech defects or behaviour problems, and, of course, he has the parent with him at the examination.

As to the method and thoroughness in performing an examination, surely this varies with individual doctors, and efficient or inefficient work is not confined to any one branch of the medical profession. A good school doctor may be quite as able to examine a child as a general practitioner, and vice versa. Tact and discretion, too, are not the monopoly of any one section of doctors, and a school doctor may quite well know what to tell parents of children concerned. Indeed, surely it is part of their training to be able, if only in a small way, to help wisely to educate the public in health matters. Are not, too, two opinions sometimes helpful in considering the problems, mental and physical, of growing children? "Considerable anguish" may be caused by any inconsiderate doctor, whether he be working as a school doctor or general practitioner.

Should the extra duties of the school doctor be added to those of the general practitioner, some of whom appear to have considerable work already on their hands, where would the examination be held and at what times? Would there be a succession of general practitioners visiting the school during school hours to examine those schoolchildren on their lists, or would the family doctor send out appointments for parents to attend the surgery with their children? Would a busy practitioner wish to add this considerable amount of practice and clerical work to his already sufficient duties? Some overlapping of work is inevitable between various branches of a profession, and if it is seriously suggested that general practitioners should take over the school doctors' work, then it may equally well be considered whether school doctors should not be permitted to take over the treatment of schoolchild patients and preventive medicine affecting other groups of the community.—I am, etc.,

Norwich.

C. H. B. LAWFIELD.

SIR.—Dr. M. G. Philpott (*Supplement*, December 25, 1954, p. 247) does not present the purpose and obligations of the school health service in their modern setting. Its objects are to detect defects in their early stages (and to arrange suitable treatment) and to advise the schools and parents with regard to any special regime which a particular child may require for his well-being and education. The school medical inspection offers an ideal opportunity for the diagnosis of a number of conditions, the significance of which may not be realized by the parent and may be unknown to the family doctor. Among these are deafness (which may be progressive and become permanent), visual defects, orthopaedic troubles, and behaviour problems, partly medical and partly educational in origin; if not treated at the earliest stage possible, all these may result in loss of education and incapacity in adult life.

A second important function of the service is that of looking after those children who have been ascertained as

handicapped—a statutory group. I suggest that the school medical officer is the person best able to assess fully the educational requirements of these children and to advise the school authorities on their day-to-day management. The Ministry of Education shows considerable interest in this matter. Dr. Philpott mentions heart murmurs and the distress caused to parents when a consultant opinion is asked for. Most frequently these do turn out to be innocent murmurs, but there is the doubtful case where the school medical officer wishes to be assured that the stresses and strains of games and physical training are not going to be harmful.

I find it difficult to see how a busy general practitioner could find the time to examine every child on his list with these objects in mind, even though he will already be aware of some defects in children whom he has examined. Reciprocal interchange of information on these matters between the family doctor and the school medical officer is much more likely to serve the interests of the child than saddling the former with a host of further duties.—I am, etc.,

Wolverhampton.

N. A. JEVONS.

SIR.—The letter by Dr. M. G. Philpott appearing under the above heading (*Supplement*, December 25, 1954, p. 247) should not be allowed to pass without protest and challenge. The medical staffs of local authorities deal with the beginnings of defects in health in children by investigation and detailed medical examinations from the date of birth to school-leaving age. The main object of this work is prevention. As a medical officer of health and school medical officer with practical experience of general practice I submit that no G.P. is qualified to form an unbiased opinion on this work without having had practical experience in the work and a training in preventive medicine.—I am, etc.,

Southport.

S. T. BEGGS.

Hospital Staffing

SIR.—I have read the wholly commendable contribution by Dr. W. J. Abel and also the letter from Dr. G. D. Wild (*Supplement*, December 25, 1954, p. 247). Dr. Wild states that my previous letter (*Supplement*, December 11, p. 227) is "wrong factually"; this can hardly be so, since it is an expression of opinion and not of fact. He refuses to allow me to claim that there exists a significant degree of support for the recommendations of the Strachan Subcommittee "until the final proposals" are made, and then he goes on to express his opposition to the recommendations. This is hardly fair—if he makes the rules, he must abide by them. Further, he asserts that he has yet to meet an S.H.M.O. who favours the proposals—to this I would reply that he should travel more widely. Dr. Wild objects to the proposals because they do not take into consideration the impending pay claim for S.H.M.O.s. They could hardly do so, since this claim has yet to be considered. However, Dr. Wild admits that he would like to see the S.H.M.O. grade converted into "the necessary pre-consultant grade," so perhaps he is in favour of the Strachan proposals after all.—I am, etc.,

"SENIOR HOSPITAL M.O."

Assistants in General Practice

SIR.—May we, many of our members also being members of the B.M.A., make a brief comment on this subject, which has already produced a most interesting and provocative correspondence? The sympathetic support, by a large minority of the G.M.S. Committee, for the resolution to reduce the extra list allowed a practitioner who employs an assistant certainly shows an evolution in the attitude of the established profession to the assistant. This association, which started as the Unestablished Practitioners Group in 1948-9, has consistently campaigned for this reform, and encourages its members to take an active part in all bodies where suggestions for improvements in the status and service of general practice may be of help in formulating policy. The present assistantship system, as many detailed letters to

us from assistants prove, is a source of frustration and disappointment to many otherwise enthusiastic and useful young doctors. Their number is actually increasing annually, and their difficulties have been the subject of numerous articles in the daily papers. Now is not too soon for the problem to be faced and solved.—I am, etc.,

ROBERT JOHN,

President.

London, N.W.6.

The General Practice Reform Association.

Fining the Doctor

SIR.—I have followed with interest the correspondence in your columns under the above heading and would like to make a few comments. Apart from the high cost and the increasing use of the newer remedies that are continually being introduced, it would appear to me that there are other and more important factors at work leading to excessive prescribing and the consequent enhancement of the already high cost of the N.H.S.: (1) Since July, 1948, neither doctors nor patients have had any direct financial interest in the cost of medicaments prescribed. (2) The belief, which amounts almost to an instinct, pervading all classes of society, members of Parliament not excluded, that to swallow something is "good for you." In consequence doctors are under continual pressure to prescribe this something. (3) The conviction on the part of a great many patients that their demands for medicines, however unreasonable such demands may seem to the doctor, must unquestionably be met; and they often attempt to enforce their demands by hints or even threats that non-compliance will cause them to transfer their patronage elsewhere. (4) The doctor's income varies directly with the number of patients on his list. (5) The activities of a very small minority of black sheep in our profession who, by imposing on the ignorance, credulity, and superstition of the public, have deliberately exploited the N.H.S. in order to attract patients to their lists.

It is the conduct of these individuals that achieves the headlines of the lay press, but I believe that their activities, when compared with some of the other factors that I have mentioned, play only a small part in maintaining the high cost of the N.H.S. Nevertheless, I consider that it is only just that the fines to which some of your correspondents take exception should be levied, for it is only by "making the punishment fit the crime," or in other words by making it financially unprofitable for them to continue these practices, that they will be made to see the error of their ways.—I am, etc.,

Ebbw Vale.

F. BANDO.

SIR.—The number of letters which you have published concerning the fining of a doctor, recommended by the Lancashire Executive Council for excessive prescribing (*Supplement*, November 20, 1954, p. 191), is a measure of the deep disapproval which many doctors must feel at the savage penalty, a penalty, as is openly admitted, not to recover excessive expenditure but to teach the practitioner the error of his ways.

I write to emphasize the fact that this disapproval is not confined to general practitioners, and to express my repugnance of this principle that a practitioner's prescribing must conform to some "areal average" which ignores entirely the extent of treatment and responsibility for treatment which any individual doctor is willing to accept. It has been pointed out that some of the expensive drugs prescribed had been given on the recommendation of consultants. It would seem but common justice that such excess as can be so ascribed should be deducted from the fine and allocated to the individual consultants concerned.

Since any individual variation from the average is to be condemned, it is clear that an investigation is now called for into the comparative levels of prescribing in hospitals. An "areal average" must be calculated and those who infringe it suitably fined. It would be wise also to compare the number of radiological and laboratory investigations requested to be sure that these comply strictly to the mean.

Reasonable economy is our duty and well recognized by the vast majority of practitioners, but this process of leveling down to the lowest common denominator, appealing as it is to administrators, is a blow at the very foundations of our profession.—I am, etc.,

Heswall.

H. G. FARQUHAR.

SIR.—On this subject no one seems to have mentioned that it is apparently only the G.P. among the medical servants on the N.H.S. who is subject to be fined heavily for various misdemeanours—including excessive spending of the Treasury's funds in treatment. The consultant and the hospital medical staff seem singularly free or immune from this infection. Are they a more perfect species than the G.P.? Can Sir Cartwright-Tanker, senior surgeon of St. Matilda Hospital, be asked to explain why he uses twice as much catgut of proprietary brand as Sir Euan McLorne of Castleside Infirmary, who has always used that prepared in the hospital? Sir Euan might be asked to explain why his abdominal sections spend one and a half times as long in hospital at £X per week than Sir Cartwright's. Can the M.O.H. recover the excess cost from Sir Cartwright of his excessive use of proprietary catgut, and from Sir Euan the cost of keeping his patients in hospital longer than Sir Cartwright's, and also add a fine to each which will make them remember that "Big Brother is watching them" as well as the G.P.? Is this a subject for research by our new College of General Practitioners? In the meantime, should this college consider presenting white gloves to the sister colleges for the perfection of their members' behaviour?—I am, etc.,

Sheffield, 11.

JOHN P. HOPE.

The Individual in Health Service

SIR.—Lord Beveridge's address on the subject of the individual in health service (*Journal*, December 11, 1954, p. 1371), and his reference to the missing health centres, recalls to my mind a letter of mine published in the *Supplement* on December 2, 1944 (p. 134). In that letter I quoted some words on page 10 of the Government White Paper on the subject of a health service. "The subject of health, in its broadest sense, involves not only medical services but all those environmental factors—good housing, sanitation, conditions in school and at work, diet and nutrition, economic security, and so on—which create the conditions of health and prepare the ground for it. All these are fundamental . . . ; and from this I went on to say: "The Government gives away with both hands the disingenuous proposals of its White Paper. Surely there is someone in the Government who can tell his fellow conspirators that one does not begin to build anything without first laying the foundations. If all those things which create the conditions of health are fundamental, then why not begin with the fundamentals? The whole Paper suggests political trickery of the 'ninepence for fourpence' order." I wrote this with reference to the proposed attempt which was to be made to convert the profession into a branch of the Civil Service. And I wonder what's in the wind now. Perhaps Lord Beveridge knows. Of his interest in the health of the nation I suppose there is no room for doubt, for was not the "Beveridge Report" his? I feel grieved that his lordship did not follow up my letter with his powerful support.—I am, etc.,

London, S.W.3.

A. R. EATES.

HOSPITALITY

Austrian doctor, living near Austrian-Swiss border, would like daughters, aged 18 and 16, to stay with two families in southern England, not too far from one another, from July 15 to September 15. In return they would help in the homes, or two English girls could stay in Austria, possibly for winter sports. Would anyone interested please communicate with Brigadier H. A. Sandiford, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). The only charge made is for postage of books. A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

- Anning, S. T.: Leg Ulcers: Their Causes and Treatment. 1954.
Anoxia of the Newborn Infant. A Symposium Organized by the Council for International Organizations of Medical Sciences. 1953.
Bailey, H.: Demonstrations of Physical Signs in Clinical Surgery. Twelfth edition. 1954.
Bailey's Textbook of Histology. Thirteenth edition revised by P. E. Smith and W. M. Copenhaver. 1953.
Bakwin, H., and Bakwin, R. M.: Clinical Management of Behaviour Disorders in Children. 1953.
Bender, L.: Aggression, Hostility, and Anxiety in Children. 1953.
Boes, L. R.: Fundamentals of Otolaryngology. Second edition. 1954.
Bookmiller, M. M., and Bowen, G. L.: Textbook of Obstetrics and Obstetric Nursing. Second edition. 1954.

Diary of Central Meetings

- JANUARY
- 17 Mon. Psychological Medicine Group Committee, 2 p.m.
17 Mon. Geriatrics Joint Subcommittee, Central Consultants and Specialists, Public Health, and G.M.S. Committees, 2.15 p.m.
18 Tues. Rehabilitation Film Subcommittee, Rehabilitation and Film Committees, 4 p.m.
19 Wed. Council, 10 a.m.
20 Thurs. G.M.S. Committee, 10.30 a.m.
20 Thurs. Evidence Committee on Divine Healing, 2 p.m.
25 Tues. Staff Side, Committee B, Medical Whitley Council, 10.30 a.m.
25 Tues. Medical Students and Newly Qualified Practitioners Subcommittee, Organization Committee, 2 p.m.
25 Tues. Full Committee B, Medical Whitley Council, 2.30 p.m.

- 26 Wed. Planning Subcommittee, Occupational Health Committee, 10 a.m.
27 Thurs. Chairman's Subcommittee, Constitution Committee, 10.30 a.m.
27 Thurs. Rural Practices Subcommittee, G.M.S. Committee, 2 p.m.
28 Fri. Scientific Programme Subcommittee of Arrangements Committee, 11 a.m.
28 Fri. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
28 Fri. Scientific Exhibition, Subcommittee of Arrangements Committee, 2 p.m.

FEBRUARY

- 2 Wed. Occupational Health Committee, 10 a.m.
2 Wed. G.M.S. Subcommittee to consider Report of Central Health Services Council's Committee on General Practice within the National Health Service, 2 p.m.
3 Thurs. Central Consultants and Specialists Committee, 10.30 a.m.
3 Thurs. Committee on Homosexuality and Prostitution, 2 p.m.
4 Fri. Library Subcommittee, Science Committee, 12 noon.
4 Fri. Science Committee, 2 p.m.
10 Thurs. Subcommittee on Service Committee and Tribunal Regulations, G.M.S. Committee, 2 p.m.
11 Fri. Joint Subcommittee on Professional Secrecy, Public Health and Central Ethical Committees, 11 a.m.

Branch and Division Meetings to be Held

ASHTON-UNDER-LYNE DIVISION.—At Broadoak Hotel, Ashton-under-Lyne, Wednesday, January 19, 8.45 p.m., meeting. Principal topic for discussion: "The Admission of Patients to Hospital and Especially Difficulties in Admission of Medical Patients."

BARNET DIVISION.—At Hadley Wood Golf Club, Friday, January 21, 7.30 for 8 p.m., dinner-meeting. Dr. F. E. Camps will speak on the Christie case.

BIRMINGHAM DIVISION.—At 154, Great Charles Street, Birmingham, Tuesday, January 18, 8.30 p.m., meeting. Lecture by Dr. W. H. P. Cant: "The Vomiting Infant."

DORSET DIVISION.—At Dorset County Hospital, Herringston Road Annexe (The Sanatorium), Dorchester, Friday, January 21, 8.30 p.m., meeting. Lecture-demonstration by Dr. A. E. K. Salvi: "Pulmonary Tuberculosis and Some Other Lung Conditions, with particular emphasis on Early Pulmonary Tuberculosis and the Cases Suitable for Surgery."

HALIFAX DIVISION.—At Alexandra Hall, Halifax, Wednesday, February 2, 8 for 8.30 p.m., annual dinner-dance.

KENSINGTON AND HAMMERSMITH DIVISION.—At St. Charles's Hospital, Ladbroke Grove, London, W., Friday, January 21, 3.30 for 4 p.m., clinical meeting.

NORTH MIDDLESEX DIVISION.—At Coroner's Court, North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, January 18, 8.45 p.m., meeting. Paper by Dr. D. F. Hutchinson: "General Medical Services." A discussion will follow.

OLDHAM DIVISION.—At Albion Club, Queen Street, Oldham, Monday, January 17, 9 p.m., meeting. Lecture by Sir Harry Platt: "Whither Medicine?"

SCUNTHORPE DIVISION.—At Scunthorpe and District War Memorial Hospital, Thursday, January 20, 8.30 p.m., meeting. Professor C. H. Stuart-Harris: "Use and Abuse of Antibiotics."

SOUTH ESSEX DIVISION.—(1) At Dagenham Civic Centre, Friday, January 14, 9 p.m., meeting. (2) At Warley Hospital, Brentwood, Sunday, January 23, 10.30 a.m., clinical meeting.

SOUTH-EAST ESSEX DIVISION.—At Southend General Hospital, Thursday, January 20, 8.30 p.m., meeting. Address by Dr. H. D. Crosswell: "Gastro-enteritis."

SUNDERLAND DIVISION.—At Royal Infirmary, Sunderland, Friday, January 21, meeting with Pharmaceutical Society, Sunderland and District. Address by Dr. H. Davis.

SUTTON COLDFIELD DIVISION.—At Town Hall, Sutton Coldfield, Tuesday, January 18, 9 p.m., annual dance.

SWANSEA DIVISION.—At Morriston Hospital, Swansea, Thursday, January 20, clinical meeting.

WEST LOTHIAN DIVISION.—At Bangour Hospital, Thursday, January 20, 8 p.m., meeting. Address by Dr. W. D. A. Callan: "Abnormal Uterine Bleeding."

WOOLWICH DIVISION.—At Woolwich Memorial Hospital, Shooters Hill, S.E., Tuesday, January 18, 8.30 p.m., meeting. Lecture by Dr. Colin C. Edwards: "Epilepsy." Members of the Greenwich and Deptford Division are invited.

S.H.M.O. Meeting

A meeting of Senior Hospital Medical Officers in the Sheffield Region will be held on Saturday, January 29, at 3.15 p.m. at the Lecture Hall of the Medico-Chirurgical Society, 64, St. James Street, Nottingham.

CIVIL SERVICE MEDICAL OFFICERS

JOINT COMMITTEE'S EVIDENCE TO ROYAL COMMISSION

The Civil Service Medical Officers Joint Committee—a joint committee of the British Medical Association and the Institution of Professional Civil Servants—has given evidence on behalf of Civil Service medical officers to the Royal Commission on the Civil Service. There are about 600 medical officers employed whole-time in the Civil Service.

The salary scales proposed to the Royal Commission by the Joint Committee are set out in the following table, together with the present salaries for comparison.

Grade	Present Salary £	Claim £
Chief Medical Officer, Ministry of Health	4,000	6,000
Chief Medical Officer, Department of Health for Scotland	3,000	At a point immediately below Chief Medical Officer, Ministry of Health
Chief Medical Officers, Colonial Office, Ministry of Pensions and National Insurance, Treasury Medical Adviser	2,850	
Deputy Chief Medical Officers, Ministry of Health	3,000	4,500
Deputy Chief Medical Officers, Ministry of Pensions and National Insurance, Department of Health for Scotland, Senior Medical Senior Commissioner of Board of Control	2,600	Not less than £500 above Principal Medical Officers
Principal Medical Officers	2,300	3,500
Senior Medical Officers	2,200	3,100
Medical Officers	1,500 (age 35) 75-1,800 100-2,100 (Scale is age-pointed to age 40)	1,600 (age 35) 120-2,800

The Howitt Committee

In presenting its evidence the Joint Committee outlined the history of the negotiations for improved pay for Civil Service medical officers. It reminded the Royal Commission that in 1948 the Treasury had been asked in general terms to apply the findings of the Spens Reports to the medical Civil Service, and that the Treasury had denied that such an application should necessarily follow. The Joint Committee then referred to the setting up of the Howitt Committee to examine the rates of pay of medical officers in the Civil Service, and the condemnation of the terms of this Com-

mittee's report in August, 1951, by the Joint Committee and by the medical profession generally (*Journal*, November 17, 1951, p. 1206).

The evidence also called the Royal Commission's attention to the B.M.A.'s attitude as expressed in the resolution of the Representative Body in 1952 (*Supplement*, July 19, 1952, p. 53). "That, in view of the refusal of the Treasury to carry out an early review of the salary scales recommended by the Howitt Committee, all advertisements of civil medical appointments under Government departments be refused publication in the *British Medical Journal*; and that such appointments, if advertised elsewhere, be included in the 'Important Notice.'"

This ban on advertisements for Civil Service medical posts was not lifted until March, 1954, when an interim agreement was reached with the Financial Secretary of the Treasury under which increases of pay were given to Civil Service medical officers on the following understanding: (a) Both parties remain free to ask the Royal Commission on the Civil Service to consider any proposals they think fit to make about the remuneration of all grades in the medical officer class. This particularly applies to the rates of pay for senior and principal medical officers, the increases in which both sides regard as purely token. (b) The scale now agreed for the basic grade cannot be regarded as establishing any particular relativity between that grade and any grade or grades in other classes in the Civil Service. (c) No new arrangements made in the remuneration of medical work outside the Civil Service—for instance, in the remuneration of consultants or other hospital medical staff in the National Health Service—will be made the basis of a claim to the Treasury prior to the publication of the Report of the Royal Commission, but this in no way limits either party's freedom of action in using any such factors in its submissions to the Royal Commission, or in using any other new considerations in fresh representations either before or after the Royal Commission has reported.

The Joint Committee's Case

It was against what is described as "this very unhappy" historical background that the Joint Committee made its submissions to the Royal Commission. It had long been contended by the Institution of Professional Civil Servants that the information available on the remuneration of medical men outside the Civil Service should be applied to the salaries of those inside the Civil Service. This should be a reasonably clear and straightforward procedure of calculation, and now the Spens Committees had simplified the matter by establishing standards of remuneration for the medical profession. It was a reasonable inference, the Committee

argued, that the recommendations of the two Spens Committees should affect the whole profession, of which the Civil Service medical officers were a part. On this contention the Joint Committee based its evidence.

In support of its proposed salary scales, the Joint Committee took certain fixed points in the Civil Service salary scale where the relationship to remuneration in other branches of the profession seemed clear, and from these the intervening salary scales were filled in. The salary of the Chief Medical Officer of the Ministry of Health was taken as the first keypoint, and it was contended that it should at least equal that which could be attained by senior consultants in clinical practice. In making the comparison, the evidence allowed for a top merit award and for an amount earned in private practice by the consultant. The second keypoint taken was the salary of the deputy chief medical officers of the Ministry of Health. Taking this as three-quarters of that of the chief, the proposal of £4,500 was made. The third keypoint was that of the principal medical officers' salary. This, the evidence submitted, should correspond to a consultant with the smallest merit award. In each calculation an amount was allowed for the difference between the superannuation arrangements in the Civil Service and those in the National Health Service.

The next keypoint taken in the evidence was that of a basic grade medical officer. The salary proposed for them in the Joint Committee's evidence was calculated in relation to general practitioner earnings. It was submitted that, if recruitment was to be satisfactory, the lowest salary that could be offered to a medical officer aged 35 was £1,600, and that at the top of the scale (£2,800) it was right that the Civil Service medical officer should have the prospect of earning as much as he would have done had he remained in practice.

From these four fixed points the Joint Committee filled in its proposals for the remaining two groups, as shown in the Table.

Other Considerations

The Joint Committee also provided the Royal Commission with detailed information on the duties of the various medical branches of the Civil Service and the qualifications demanded of them. The evidence dealt at length, too, with the question of internal relativities within the Civil Service and gave reasons why the basic grade medical officer should have a higher salary than an assistant secretary.

In concluding its evidence, the Joint Committee said: "It is the submission of the Joint Committee that in making its representations on medical pay the Royal Commission should make explicit the natural tie between the medical profession inside the Civil Service with that outside, and that steps should be taken in fixing the remuneration of Civil Service medical officers that would preclude a recurrence of the five years of bitter controversy that has marked the relationship between the Treasury and the medical Civil Service."

Dr. A. J. Owston, senior medical officer of the Ministry of Supply, is chairman of the Civil Service Medical Officers Joint Committee.

SCOTTISH HEALTH SERVICES COUNCIL APPOINTMENTS

The following new medical and dental members of the Scottish Health Services Council have been appointed until December 31, 1957: Dr. J. T. Baldwin, general practitioner, Penicuik; Dr. C. Harrower, general practitioner, Glasgow; Dr. S. I. A. Laidlaw, medical officer of health, Glasgow; and Dr. Douglas Miller, obstetrician, Royal Infirmary, Edinburgh. Dr. P. K. McCowan, physician superintendent, Crichton Royal Mental Hospital, Dumfries, and Professor G. M. Wishart, Dean of the Faculty of Medicine, Glasgow University, have been reappointed following the expiry of their terms of office on December 31, 1954.

EXCHANGE VISITS WITH CANADA AND THE U.S.A.

The scheme for exchange visits between members of the American, British, and Canadian Medical Associations, which has the approval of the Bank of England, will be continued during the financial year April 1, 1955, to March 31, 1956.

Procedure

Three doctors from Britain may visit Canada in exchange for three doctors from Canada. Each doctor from Britain will be required to make all his own travel arrangements and will also be required to deposit up to £200 with the B.M.A. in London. On arrival in Canada he will receive the equivalent of his deposit in Canadian dollars. Similarly, each Canadian doctor on arrival in Britain will receive the sum deposited in sterling.

Three doctors from Britain may visit the U.S.A. in exchange for three doctors from the U.S.A. Each doctor from Britain will be required to make all his own travel arrangements and will also be required to deposit up to £200 with the B.M.A. in London. On arrival in the U.S.A. he will receive the equivalent of his deposit in U.S. dollars. Similarly, each U.S. doctor on arrival in Britain will receive the sum deposited in sterling.

Duration of Visits

The duration of the visits is left to the discretion of the doctors concerned. The American, British, and Canadian Medical Associations cannot accept any responsibility for a doctor who allows his visit to outlast the money placed at his disposal.

Applications are invited from members of the B.M.A. to take part in such exchanges. Medical practitioners in all branches of the profession, including general practice and public health, are eligible. Each applicant must state the object of his intended visit, and should also give the approximate date on which he hopes to depart. (Successful applicants will in due course be required to furnish exact dates and details of travel.) Applications must be received by the Secretary of the Association by March 1, 1955.

ARRANGEMENTS IN OUT-PATIENT DEPARTMENTS

MANCHESTER REGIONAL BOARD'S REPORT

Following some local comment last year, critical of the arrangements and the lack of proper appointment systems at certain hospitals, and the Ministry's memorandum on the same subject, the Manchester Regional Hospital Board has examined the present out-patient practice in all its general hospital groups. In a report approved by the General Purposes Committee of the Board, the Board is emphatic in its agreement that an out-patient appointment system should be universal—with the possible exception of the small, isolated rural hospital—and it hopes that a minority of previously unenthusiastic consultants will give their co-operation. Appointment systems of one kind or another are the almost invariable rule at the hospitals in the Manchester Region.

Dealing with the widely held belief that appointment systems lead to a considerable lengthening of the waiting time for an appointment, the Board does not accept that this need always be the case. If the organization of the parts is more efficient, the capacity of the whole appointment system should not be diminished thereby. If it is diminished the reasons should be studied, and such an investigation would be a piece of fruitful research. The Board avoids recommending any particular form of appointment system, such as the "individual" or the "block" type,

since the needs of hospitals vary, but management committees are asked to experiment.

Unpunctuality

The report goes on to discuss the punctuality of staff, and, while recognizing in this connexion the difficulties of medical work, asks management committees to be vigilant and report cases of persistent unpunctuality to the Board. In pointing out that patients can be sinners in the way of unpunctuality, an analysis by one management committee of 198 patients who attended a series of medical clinics is quoted as an example. This analysis showed that, of the 178 with booked appointments, only 48 attended at the specified time, 42 attended up to an hour early, 68 attended up to 1½ hours late, while the remaining 20 failed to attend at all.

In conclusion the Board has some words to say about the reception of patients, and that it can conceive of no more effective method of improving hospital service public relations than a well-organized and sympathetically run out-patient department.

HOSPITALITY

A French doctor in French West Africa would like his son, aged 18, and daughter, aged 16, to stay as paying guests with two English families, not too far apart, from July to mid-October, 1955. Would anyone interested in this request please contact Brigadier H. A. SANDIFORD, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Questions Answered

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

New Premises

Q.—I have recently bought new premises for my consulting-rooms, and have had to pay for a considerable amount of alteration and decoration. How much of this expense is the inspector of taxes likely to allow?

A.—The cost of acquiring new premises, or of adding to or improving existing accommodation, is regarded as an outlay of capital and not as an expense allowable for income-tax purposes (there is a special allowance for new "industrial" premises which is not applicable to premises used for professional purposes). The additional premises will presumably be assessed in due course to property tax—that is, income tax under Schedule A—and the amount on which that tax is payable should be claimed as a *quasi* rent.

Car Expenses in Partnership

Q.—In calculating the net profits of a partnership for division between the partners in accordance with their shares for the time being, what is the usual method of dealing with the maintenance and running costs of the cars used by the partners?

A.—It is usual for each partner to be responsible for his own individual car expenses. He will, of course, claim tax relief on that proportion of the cost that is a practice expense. In other words, only those payments which are listed in the agreement as partnership expenses should be deducted from the gross receipts in order to arrive at the net profit for distribution.

It is perhaps not generally known that patients who have become permanent residents in a private nursing-home are entitled to domiciliary consultations under the National Health Service scheme.

Correspondence

Negotiating for the Profession

SIR.—It was with considerable interest that I read the short report (*Supplement*, January 8, p. 11) of the meeting held of the Joint Consultants Committee with the Minister of Health. It would appear to follow the pattern of so many others—the gentle political response which leaves the Committee in exactly the same place as it was prior to the meeting, and offers no satisfaction to the main body of consultants, even if it has appeased our representatives.

The political importance of medical men and their value as pawns should be realized, and I think it is time that once again the question of a more militant body to represent the profession should be considered. Doctors, as a body, no longer appear to have any great say in their own destiny, apart from one or two who, through personal contacts, would appear to have made decisions for the many without consulting them. It is time to appreciate the use of the weapons that the rest of the country's workers know so well how to use. We perhaps shall need them when the effect of the inflationary spiral in the salaries of industrial workers and railwaymen is felt by the rest of the country.—I am, etc.,

RICHARD DE SOLDENHOFF.

Anonymity in Broadcasting

SIR.—I am glad that at last someone has pointed out the absurdity of the Central Ethical Committee's attitude to broadcasts by doctors. Professor L. J. Witts (*Supplement*, January 8, p. 12) says it would be impossible to prove that broadcasting under B.B.C. conditions constituted advertising with a view to personal gain. He might have gone further and asserted that, where the doctor's income does not depend on the number of patients he sees, it cannot possibly do so.

On page 9 of the same issue of the *Supplement* you show that, of 58,600 practitioners, 22,400 are in general practice and 6,400 are consultants. The latter figure will include whole-time salaried consultants—but let us assume that the livelihood of all depends on their ability to attract patients. Subtract from the total the 400 medically qualified dentists, and it emerges that, of 58,200 doctors, 29,800 are either remunerated by salary or in retirement. In other words, over half of the profession (or at least of those whose occupations were analysed) could not conceivably increase their professional income by broadcasting or any other form of publicity.

So far as I know, no other profession has attempted to impose such a ridiculous restriction on the presentation to the public of the views and personalities of its members. To do so in the name of "ethics" is surely to impose a strain on the meaning of an honourable word. The decision on whether to broadcast under one's own name or not, if invited, is one which must be left to the judgment and good taste of the doctor concerned. In the conditions of fifty years ago there might have been some justification for the Central Ethical Committee's apparent fear that publicity would lead to his stealing his colleagues' patients; but the figures quoted show that the conditions of medical employment have changed profoundly, and the Committee should study them and recognize, too, that broadcasting provides unrivalled opportunities for the doctor as a health educator which are vitiated by anonymity.—I am, etc.,

Birmingham, 3.

F. H. TYRER.

Hospital Staffing

SIR.—The plans for the recruitment, training, and deployment of new consultants and specialists have gone sadly awry. The training scheme for aspiring consultants and specialists has been carefully worked out, but frustration and heartache lie ahead for the majority of keen, highly

trained, and technically efficient registrars, senior registrars, and S.H.M.O.s. They have reached a dead end, with no assured future. As a recently retired consultant with no axe to grind, I should like to suggest some constructive, if somewhat heterodox, proposals for improving the prospects in the hospital service.

Let us concede that, if opportunity allows, these men and women are capable of specialist responsibilities. To keep them hanging around the hospitals in subordinate posts is a futile waste of first-rate personnel. It is accepted that the number of consultant and specialist posts is well below that originally planned. I suggest therefore that first a differentiation is made between a consultant and a specialist and that then all vacancies in the Service be advertised as specialist (not consultant) posts with full clinical responsibility and charge of beds, and that the number of posts be increased forthwith up to the full needs of the Service as planned. To offset the cost of this, I suggest that the newly appointed specialists be given a salary range lower than the present consultant rates. I feel sure that all registrars and other grades would welcome this chance of clinical responsibility and freedom, albeit at a temporarily lower range of pay, and they would be able to give the best and most active period of their lives to unfettered work for the hospitals. A specialist should serve about ten years before he is considered for promotion to consultant status.

I would define a consultant as a man of 40-45, whose ten years as a specialist must have given him wide experience, an ability to profit by his mistakes, and a fund of wisdom as opposed to mere knowledge. Time will have shown whether he is a good mixer able to fit in with his colleagues and sympathetic to his patients. Technical skill and professional ability are easier to weigh up than personality, and the leap from senior registrar or S.H.M.O. to full consultant is indeed a hazardous gamble, but ten years in the fourth decade as a specialist should be long enough to show if a doctor is worthy of the status of consultant and to be recognized as such by colleagues and by patients. A minority of these ten-year specialists would not make the grade, but they would still have an assured career, with all the opportunities that hospital and private specialist practice allows. I have enough faith in my profession to believe that the work and not the pay is the governing factor in their philosophy of life.

The total number of consultants should be considerably restricted—possibly one-third of the present total, corresponding roughly to the numbers of those receiving merit awards. The scheme would have the important though incidental advantage of bringing out into the open the allocation of merit awards, for naturally they would be given to consultants only.

This plan does at least put forward constructive proposals with the dual aims of providing a first-class corps of consultants and of giving hope of assured prospects for the large body of trained registrars and S.H.M.O.s for whom under present conditions the future is indeed black. It is hardly necessary to add that no change in the position and prospects of those already in the consultant and specialist service is contemplated.—I am, etc.,

Coventry.

NORMAN DUGGAN.

SIR,—We are grateful to you for publishing the admirable survey of surgery given by Sir Heneage Ogilvie to the Manchester Medical Society (*Journal*, December 18, 1954, p. 1435). His assessment of recent advances and the outline of possible future developments were most stimulating and stirring, and all thoughtful surgeons are indebted to him. "This dangerous adventure calling to the stout of heart"—to use Sir Heneage's words—is now an integral part of a nationalized service. There would be to-day no hope for Mayo Robson and Rutherford Morison, as, in the machinery of State medicine as functioning to-day, there is no road from general practice to a surgical calling, any more than there is a path from surgical registrar to the place of surgical partner in general practice. The "heartbreaking problem" of the registrars is to some extent a problem of

S.H.M.O.s as well. It is not lack of ambition or talent, as has been suggested (para. 207, Supplementary Report of Council, *Supplement*, May 22, 1954, p. 250), that has led an increasing number of ex-registrars to accept an iniquitous designation, and to bury themselves voluntarily in a "dead-end" job. It has been the devotion to the "dangerous adventure" of their chosen surgical vocation which Sir Heneage rightly finds so necessary for the future of surgery that has made them accept such a status. Thus, when faced with the lack of consultant vacancies, they were at least able—even if sometimes in a limited sphere—to remain surgeons.

Is it not unfortunate that these men, many of whom gave long years of service to the Forces, should be condemned to the bleak prospect of remaining for the whole of their professional life under the supervision of a colleague? We feel that Sir Heneage's call for a grade corresponding to the major and specialist in the Army would provide the answer for S.H.M.O.s and registrars. This grade should have a dignified designation denoting the experience, skill, judgment, and qualifications of the holder, and surgical specialist or assistant surgeon would appear suitable. There should be responsibility for beds and out-patients, and the grade should be established as the normal stepping-stone to full consultant status. As suggested by Sir Heneage, access when required to an opinion of a more mature nature would be welcome to any reasonable surgeon. Let the specialist grade be worthily established, and then let it play its essential role within the hospital service, which even now would break down without the labours of this group of workers who have long passed their apprenticeships. This problem is not peculiar to surgery; it confronts those concerned with the future of medicine, obstetrics, and all other specialties.—We are, etc.,

H. J. HAMBURY.
J. H. THOMAS.

Swansea.

SIR,—I note with interest that in the annual report of the Central Consultants and Specialists Committee (Scotland) in the *Supplement* of January 8 (p. 10) the Anaesthetic Services Subcommittee had some little difficulty in distinguishing between the work of the S.H.M.O. and the consultant. They finally decided that a consultant "with his wide experience is able to advise his colleagues about new techniques."

With all due respect, I would like to point out that a good many S.H.M.O.s, particularly transferred officers, have also wide experience, and in many cases considerably more experience than a consultant appointed between the ages of 30 and 32 years, many examples of which can be given. The real answer is that until the S.H.M.O. grade can be abolished the Ministry is employing cheap labour to do its work. It is therefore up to the consultants to leave no stone unturned to help their colleagues in their dilemma and to ensure that the many injustices which have been done are rectified.—I am, etc.,

Coventry.

A. GORDON EVANS.

Local Health Authority Nursing Services

SIR,—As there seems to have been some misinterpretation of our paper "Local Health Authority Nursing Services" published on November 20, 1954 (*Supplement*, p. 188), we should like to correct any wrong impressions which may have been given by the correspondence.

We have no wish to lower district nursing standards, or give the public an inferior service. It was out of our concern for the patient and the community that this paper was written. It would be easy to plan an ideal service if we had an unlimited number of suitably educated candidates, but, as we have endeavoured to explain, nursing services must be planned against the background of the woman-power situation and the limited number of grammar school candidates available. For this reason we stressed the need for more assistants, or, as we would prefer to call them, enrolled nurses, and for their wider use, believing that

after a sound two years' training they can be, not an inferior grade, but bedside nurses in the truest sense of the word. We feel sure that full recognition of their present and potential value, both in hospital and outside, would substantially help to solve our staffing problems. Their range of duties would be more limited, but, within its scope, their work should be equal in standard to that of their registered colleagues. Because nursing, not teaching or social work, is their chief interest, they would serve the sick, particularly the chronic sick, better than health visitors would.

We are a little surprised that it should be necessary to remind some of your correspondents of the village nurse midwives—women of limited training who have yet served the villages with a true sense of vocation, and have, indeed, cared for the bodies, minds, and spirits of their patients. Women of this kind are still needed in district nursing, and it would be regrettable if the scramble for longer training, more qualifications, and improved status were to result in the loss of their services.—We are, etc.,

J. M. AKESTER.
F. M. MAWSON.

Leeds, 1.

SIR,—There must be many of us who are grateful to Dr. Everell M. Shippam (*Supplement*, January 8, p. 12) for so accurately putting into words our thoughts on this subject. As a country general practitioner of some 35 years' experience, about a third of it without nurse or midwife, I endorse all she writes and particularly her final paragraph.

One potent deterrent to the recruiting of district nurses is the ever increasing burden of "records" arbitrarily imposed by the local health authority. Duplicate registers, treble entries, a monthly questionnaire of 60 items are not likely to attract those who want to *nurse*. Incidentally, a modicum of planning and the use of carbon paper with loose-leaf journals would eliminate half the present scribbling, and abstracts should be done centrally and not at the periphery.

I have no direct knowledge of city conditions, but in the country health visitors are severely handicapped by not living among their patients. Unless you *know* your patient you are only half-way and can be completely misled.—I am, etc.,

Newton Ferrers.

W. F. BENSTED-SMITH.

Fining the Doctor

SIR,—The problem of "over-prescribing" at the cost of the taxpayer demands a fundamental ethico-economic solution. The guiding principle should be: "He who prescribes must be directly responsible for the cost."

As a mixed prescriber-dispenser I believe that the compromise adopted at present for the payment of dispensing doctors points the way. This scheme, however, only affects a small minority of the population—those who reside in the country outside the one-mile radius of a chemist. The doctor is paid an additional dispensing capitation fee of 9s. 9d. per annum for all such patients who prefer to obtain their medicines or dressings from the surgery. With various exceptions the doctor pays for everything supplied, and he may have to pay a dispenser's salary. The average lay politician, who can hardly be expected to understand the complexity of general practice, assumes that economy of medicines which profit the doctor must automatically penalize the patient. Consequently, the dispensing doctor is frowned upon as potentially dangerous and would be abolished if it were possible. However, such distrust of doctors must be paid for by voters, since pampered patients raise taxes. Any slight increase of income to economical doctors would nevertheless, under my principle, be infinitely cheaper to the State than the present system of free prescribing.

Let us frankly face the ethical question: "Do dispensing doctors 'under-dispense'?" Yes, I think they do, though such economy need have no ill effect on their patients. Politicians should realize that even doctors have consciences, and moreover they know that unsatisfied patients can always transfer their patronage elsewhere. But is it really in the

financial interests of doctors to retard the recovery of their patients? With petrol around 4s. 6d. a gallon would they deliberately risk over-visiting? With their income from capitation fees would they welcome long surgeries? No, the truth of the matter is that in general practice the details of treatment are relatively unimportant. Our medical function is sound diagnosis and co-operation with specialists where necessary. In most other directions the ancient art predominates over newfangled science.

I believe that neither empty appeals nor £600 threats will materially alter the present prescribing pattern. Human nature needs a more constant reminder, and I seriously commend to our legislators the extension of the principle of country dispensing—i.e., all capitation fees to be increased by 50% and every doctor to have deducted from his quarterly cheque the actual cost of his prescriptions.—I am, etc.,

Bungay, Suffolk.

HUGH CANE.

SIR,—We agree fully with Dr. Geoffrey G. Sherriff (*Supplement*, January 1, p. 6) that unnecessary prescribing is wrong, but fail to understand why he considered it necessary, in order to prove this axiom, to resort to the ancient device of isolating from its context a passage in our letter (*Supplement*, December 11, 1954, p. 226). We were not writing in defence of indiscriminate prescribing, as Dr. Sherriff would have noted had he read on; indeed, we mentioned the right of the doctor to refuse improper requests for prescriptions, but suggested that he should not be penalized merely on account of the number of prescriptions he issues, provided each is for a *bona fide* purpose. To pursue the example mentioned in our previous letter and quoted by Dr. Sherriff, one could, of course, treat one's cases of coryzal bronchitis with contempt—we treat ours with medicines, which may be more expensive but is certainly more effective.—We are, etc.,

LESLIE BALLON.
WILLIAM BROWN.

Huddersfield.

SIR,—Most of your recent correspondents on fining the doctor seem to have missed the most dangerous aspect of recent proceedings. I refer to the imposition of what may well be a vicious fine by an executive council on the advice of a local medical committee composed of the defendant's competitors and perhaps not wholly unbiased. The defendant may have been guilty of wanton extravagance, which may have merited the penalty imposed, but it is not enough that justice should be done, it must most clearly be seen to be justice. Surely the accused is entitled to a proper trial before a properly constituted court of law before being exposed to such vicious penalties.—I am, etc.,

Newick, Sussex.

J. R. CALDWELL.

SIR,—Having read the correspondence provoked by some recent executive committee decisions, one is impelled to ask why this petty tyranny is allowed to take place. Even in feudal times the unjust decisions of inferior tribunals were called up by the prerogative order of the Crown and quashed. Later the protection afforded to subjects by this supervision was even more firmly established when this power was transferred to the superior courts, which still exercise it by the great prerogative writs of the common law—e.g., mandamus and certiorari. Recent oppressive legislation has, however, drastically restricted the operation of this protection, and the powers given to executive committees and the restrictions on appeal to the courts from their decisions are a notorious example. It is inherent in our sense of justice that when a body is empowered to inflict serious punishment the accused person should be afforded the full protection of the law. However, doctors appearing before executive committees and denied legal representation are often in considerable jeopardy as a result of unjust procedure. I have in mind the case of a professional colleague who was accused by a patient of a breach in his terms of service. Although acquitted (the charge was without any foundation) he thought that the procedure adopted at the committee hearing was somewhat peculiar.

When he described it to me I was able to inform him that as a result of this extraordinary procedure he had been placed in considerable danger at the hands of a malicious patient, and that such a travesty of justice would not be permitted in any other country this side of the iron curtain. When Dr. Edwards referred in his letter to the Star Chamber (*Supplement*, November 20, 1954, p. 193) he may indeed have pointed to the last occasion in our history when arbitrary conduct of this kind was allowed to go unchecked.

As a legally qualified general practitioner I would urge all doctors serving under the National Health Service to pay close attention to two recent events of great importance to them. First, Lord Justice Denning has advocated the setting up of tribunals each consisting of a judge and two assessors with power to review certain types of executive decision. When an eminent member of the judiciary suggests a fundamental change in basic constitutional principles it is abundantly clear that there must be serious injustice taking place under the present system. Secondly, the Crichton Down affair, resulting from an executive decision which I consider to be no worse than some recent executive decisions affecting doctors under the National Health Service.

Intentional or reckless breaches of terms of service must be punished, and, provided a just procedure is followed and a bona fide case made out, a fine of as much as £600 is not excessive. It is, however, essential to correct the unjust methods used in reaching the decisions to inflict these penalties and to prevent the punishment of inadvertent breaches of terms of service.—I am, etc.,

Lowestoft.

JOHN HAVARD.

SIR.—The correspondence under the heading "Fining the Doctor" has shown that there is some misgiving amongst G.P.s concerning the way in which their terms of service are enforced. Two points, I think, stand out: the first, that these terms, especially in regard to prescribing, are too vague and must be set out in absolute form if we are to have any peace of mind; and the second is that the adjudication of these questions, involving sometimes fine points which require considerable elucidation, is not suitably entrusted to an untrained tribunal to settle in a few hours.

The executive councils are prosecutors in these matters, and they should not be responsible for appointing their own judges, with a right of appeal only to the Minister, who is *a fortiori* inclined to sympathize with the executive council. Our relationship with the executive councils is a contractual one, and, if a breach is committed by either side, there is a well-tried machinery in the county courts for dealing with it.

Most of us, I am sure, accept the need for some control over the way in which we carry out our duties and over the cost of prescriptions, but we must have some feeling of security as well. As long as the tribunals are left to make their own criteria and to adjudicate without regard to the principles of "natural justice," our anxiety for our own financial position will continue to choke our concern for the welfare of our patients. The "rule of law" has been part of our national heritage, but it is rapidly becoming a topic for nostalgic reference by constitutional lawyers.—I am, etc.,

Sheffield, 10.

Branch and Division Meetings to be Held

BOURNEMOUTH DIVISION.—At Royal Victoria Hospital, Bournemouth, Friday, January 28, 8.15 p.m., meeting. Symposium and discussion by Dr. A. S. Ogden, Mr. N. Ross Smith, Mr. H. A. Cowan, and Dr. Doris M. Odum: "Fibrositis—Does it Exist?"

BRISTOL DIVISION.—At Main Physics Lecture Theatre, Royal Fort, Wednesday, January 26, 8.30 p.m., meeting. Dr. Stewart Smith: "A Morbid View of the Over Sixty-fives" (illustrated).

CHELSEA AND FULHAM DIVISION.—At St. Stephen's Hospital, Fulham Road, Chelsea, S.W., Friday, January 28, 8.30 p.m., meeting. Annual B.M.A. Lecture by Dr. K. Shirley Smith: "Some Clinical and Therapeutic Aspects of Hypertensive Heart Disease." Members of the Kensington and Hammersmith Division are invited.

CITY DIVISION.—At Hackney Hospital (G5 Ward), Homerton High Street, E., Wednesday, January 26, 2 p.m., films: (1) "The Conjoined Twins of Kano"; (2) "Surgery of Varicose Veins."

DONCASTER DIVISION.—At Parkinson's Café, Doncaster, Tuesday, January 25, 7.30 for 7.50 p.m., dinner. Joint meeting with Doncaster Medical Society. Professor R. E. Tunbridge: "Some Problems of Diabetes Mellitus."

EAST NORFOLK DIVISION.—At Green Lounge, Bell Hotel, Norwich, Wednesday, January 26, 8 p.m., social evening.

GREENWICH AND DEPTFORD DIVISION.—At Miller General Hospital, Greenwich High Road, London, S.E., Wednesday, January 26, 8.30 p.m., meeting. Annual B.M.A. Lecture by Dr. F. S. Cooksey: "Rehabilitation." Demonstration of appliances used in the management of everyday disabilities.

HOLLAND DIVISION.—At The Galleon Restaurant, Sheep Market, Spalding, Saturday, January 29, 7.15 for 7.45 p.m., supper; 9 p.m., address by Mr. Ralph Shackman: "Some Aspects of Research in the Surgical Department of the Postgraduate Medical School, University of London" (illustrated by films).

LAMBETH AND SOUTHWARK DIVISION.—At Lambeth Hospital, Brook Drive, Kennington Road, S.E., Sunday, January 23, 11 a.m., clinical meeting.

MID-ESSEX DIVISION.—At Out-patient Department, Chelmsford and Essex Hospital, London Road, Chelmsford, Wednesday, January 26, 8 p.m., meeting. Film by Dr. Leonard Carr: "Allergic Diseases in Man," followed by a talk on "Allergic Diseases in Man—Their Diagnosis and Treatment."

MIDLAND BRANCH.—At General Hospital, Birmingham, Friday, January 28, 8.15 p.m., clinical meeting.

SHROPSHIRE AND MID-WALES BRANCH.—At Royal Salop Infirmary, Shrewsbury, Wednesday, January 26, 8 p.m., meeting of Clinical and Pathological Section. Discussion: "The Pneumonias."

SOUTH BEDFORDSHIRE DIVISION.—At Luton and Dunstable Hospital, Wednesday, January 26, 9 p.m., meeting. Professor Ian Aird: "The Conjoined Twins of Kano" (slides and film).

SOUTH STAFFS DIVISION.—At Star and Garter Hotel, Wolverhampton, Tuesday, January 25, 8 p.m., supper, followed by colour film and lecture: "Allergy."

SOUTHAMPTON DIVISION.—At Royal South Hants Hospital, Southampton, Wednesday, January 26, 8.30 p.m., extraordinary general meeting to discuss and complete the Questionary of the Peripheral Organization of the Association.

STOCKPORT DIVISION.—At Alma Lodge Hotel, Stockport, Thursday, February 10, 7.30 for 8 p.m., annual B.M.A. dinner and dance.

WEMBLEY DIVISION.—At Wembley Hospital, Fairview Avenue, High Road, Tuesday, January 25, 9 p.m., meeting. Film: "Cerebral Palsy," presented by Mrs. Eirene Collis and Dr. W. F. Dunham. Nursing staff and physiotherapists are invited.

British Medical Association

PROCEEDINGS OF COUNCIL

A meeting of the Council of the Association was held on January 19, with Dr. E. A. GREGG in the chair. It lasted from 10 a.m. until 6 p.m.

The deaths of three former members of Council were announced—namely, Dr. G. W. Miller, of Dundee; Mr. R. J. Willan, of Newcastle; and Dr. J. B. Miller, of Bishopbriggs. The last-named was a vice-president of the Association and a past chairman of the Representative Body. The Chairman also referred to the death of Sir Arthur Keith, who had been so notable a figure in the medical profession. The members stood in silent tribute and authorized the Chairman to send letters of condolence to the families.

The congratulations of the Council were conveyed to the members of the Association—38 of them—whose names figured in the New Year Honours List. The Chairman drew attention to the inclusion of the Deputy Chairman of the Representative Body, Dr. A. Beauchamp, who received the O.B.E. for services to the Ministry of Health.

The Council sent a message of sympathy to Dr. Agnes Kelynaack, Assistant Secretary, in her illness, and its hope for her speedy recovery.

It was reported that a reception was given to the party of doctors from the U.S.S.R. who have been recently visiting London. The Chairman of Council, accompanied by the President of the Medical Women's Federation, had received the guests. A letter had been received from the chairman of the Medical Section of the Society for Cultural Relations with the U.S.S.R. stating that the visitors had asked him to convey their thanks for the hospitality. "They greatly enjoyed meeting you and your colleagues, were interested in what they saw of medicine in this country, and impressed by the need to increase future contacts between specialists in the two countries and the exchange of medical information."

Annual Meeting, 1957

The Secretary reported on his visit to Newcastle-upon-Tyne with a view to investigating the hotel accommodation and other facilities for the Annual Meeting, 1957, and the Deputy Secretary reported on a visit he paid to Manchester for a similar purpose. It was pointed out that the last meeting in Manchester was in 1929, whereas the last held in Newcastle was in 1921.

On the motion of Mr. WELDON WATTS it was agreed that the invitation to Newcastle for 1957 be accepted. The

Annual Meeting, 1956, will be held at Brighton, and the Annual Meeting, 1958, at Margate.

Medical Education

The Council considered the terms of reference for the proposed study group appointed to consider the *Proceedings* of the First World Conference on Medical Education and to make suggestions for the programme and deliberations of the Second World Conference. It was stated that Sir Lionel Whitby had agreed to act as chairman.

It was resolved to include in the terms of reference "such other matters as may be considered relevant." Another matter referred to this group or committee was one arising from a letter from the Registrar of the General Medical Council, who stated that the G.M.C. was proposing to consider the revision of the recommendations on the medical curriculum which they had adopted in February, 1947, and would be glad of any observations or suggestions, which the Association might wish to offer.

Part-time Consultants and Income Tax

A report was made on the position with regard to contributions from other bodies towards the cost of the legal actions which are to be instituted to test the validity of the assessment of part-time consultants under schedule E. It was stated that one of the defence societies was considering with its solicitor that day the extent of its proposed commitment in this respect.

Dr. ROWLAND HILL said that he hoped the urgency of this matter would be borne in mind. If it was not possible immediately, as had been proposed, to proceed with both test cases, he thought they should proceed with one case. He also urged that the Board of Inland Revenue be approached at once with a view to holding up the matter until the test case had been decided.

Dr. WAND suggested that the position was so complicated at the moment that any direct approach to the Board of Inland Revenue would be unwise. The matter should be left in the hands of a small body of people to proceed as they thought best according to developments.

It was agreed to give a free hand to the Chairman of Council in consultation with others to take such immediate action as might seem desirable in the light of the discussion with the legal advisers. The CHAIRMAN OF COUNCIL added

that this was a matter of such great importance that the Association would have to go through with it even though a considerable financial liability had to be faced.

Association Coat of Arms

Mr. S. F. L. DAHNE said that he was happy to report, in view of the Scottish controversy over the Association Coat of Arms which was mentioned at the last meeting, that he had had a very happy discussion with Dr. Hamilton, chairman of the Scottish Committee, and Dr. Walker, the Scottish Secretary, and that the Clarenceux King of Arms and the Lord Lyon King of Arms had now reached agreement about a suitable form of lion. He exhibited the revised design for the inspection of the Council. He was grateful to all concerned for their co-operation in arriving at a design acceptable to both heraldic courts. Dr. HAMILTON then moved formally:

That the Council approves the present design of the proposed armorial bearings of the Association, requests the Clarenceux King of Arms to make a grant of these arms to the Association, and requests the Lord Lyon King of Arms to matriculate these arms.

This was agreed unanimously.

Mr. TUDOR THOMAS said that the Council, and indeed the whole Association should be very grateful to Mr. Dahne for the great amount of work he had done in this connexion. It would be a very proud day when they had a design embodying such appropriate references to medicine and to their own Association.

Dr. HAMILTON said that he wished also to say how grateful he was for the co-operative and helpful manner in which Mr. Dahne had handled a situation which might have proved to be very troublesome. It was a credit to the Association to have a coat of arms pictorially decorative and heraldisically acceptable throughout the British Empire.

Provision of Drugs for Private Patients

Dr. TALBOT ROGERS, chairman of the General Medical Services Committee, reported that Dr. A. Brown, the Deputy Secretary (Dr. Stevenson), the Assistant Secretary (Dr. Hedgcock), and himself had met the Minister of Health to press the Association's claim that private patients should be entitled to drugs and appliances under the National Health Service.¹

The outcome was that, while the proposal was not repugnant to Conservative principles and the door was by no means shut, the Minister said he could give no undertaking that the change either could or would take place.

Dr. A. BROWN, as one who had attended the meeting with the Minister, said that the matter must be kept alive, but nothing was to be gained by proceeding in the matter further at the present time.

Dr. W. WOOLLEY said that he hoped they would not merely mark time until it was possible to do something with the Government. In the interim period something could be done in preparation for the passing of an Act allowing for such provision.

In reporting other matters from the General Medical Services Committee, Dr. TALBOT ROGERS said that his Committee had long maintained that one of the most effective methods of combating high prescribing costs would be a return to the system of areal averages which obtained before the National Health Service. Although it had not been possible to resume this practice on a national scale, he was pleased to report that a start was now being made by circularizing comparative prescribing costs to doctors in certain areas. Similar information would be collated and distributed for other areas from time to time.

"British Medical Journal"

Dr. J. G. HAMILTON, chairman of the Journal Committee, presented the Journal Budget for 1955. It showed a reduction in the surplus as compared with the expected surplus

¹ A report of the discussion with the Minister will be found at page 31 of this Supplement.

for 1954. The price of paper was increasing and other printing costs were up by something like 4%. In fact, the publishing activities of the Association were reaching a position in which a surplus might be problematical, and he considered it necessary for the Journal Committee to inform the Council of these trends. While there were grounds for optimism, prudence demanded that they should think only of a modest surplus if not a small deficit.

Association Finance

Mr. L. DOUGAL CALLANDER, the Treasurer, presented revenue and capital budgets for the Association for 1955. Total expenses were some £10,000 above the figure for 1954, the biggest estimated increase being in the cost of central and representative meetings. The total estimated surplus for 1955 was much below that for 1954. After making provision for special legal costs, redemption of loans, and contingencies, the balance to be earmarked for the general reserve fund was £16,306.

Dr. WAND said that if the increased expenditure due to the activities of the Association in many directions continued it might well become impossible to reduce the six guineas subscription. In that event it should be made clear to members that a reduction of subscription would mean a cheeseparing policy on the part of the Association.

On other matters arising on the Finance Report the TREASURER said that it was hoped to undertake this year the redecoration of the Council chamber and the improvement of its lighting, ventilation, and acoustics.

Industrial Health Advisers

Dr. J. B. TILLEY, chairman of the Public Health Committee, brought forward a report, with recommendations on one of which certain discussion arose. This was a recommendation supporting the application of the Society of Medical Officers of Health to the Minister of Labour that the Society be included in the list of nominating bodies, and thus ensure representation of the public health service on the Industrial Health Advisory Committee. At its last meeting the Council had adopted the recommendation of the Occupational Health Committee concerning the nomination of Dr. J. A. L. Vaughan Jones and Dr. L. G. Norman to fill the two places allocated to the B.M.A. for membership of the committee.

Dr. VAUGHAN JONES said that if there had been a request for a third member, to be appointed from the Public Health Committee, he would have supported it, but he was bound to point out that the policy of the Society of Medical Officers of Health in regard to occupational health had not run in agreement with the policy of the B.M.A. In its evidence to the Guillebaud Committee the Society had made certain statements in relation to occupational health which were not reconcilable with B.M.A. policy. He was prepared to support the recommendation now before the Council provided the Society fell in with B.M.A. policy in this respect. If they were going to have divided policies among the medical people on this Advisory Committee it was easy to foresee what would happen. An assurance should be obtained from the Society.

Dr. H. D. CHALKE said that Dr. Vaughan Jones was a little unfair when he said that the Society was opposed to the policy of the B.M.A. On many occasions the Occupational Health Committee and the Society had carefully considered each other's documents, and the Society had gone generally more than halfway to meet the views of the Committee. He felt that it would not be right to add to the present recommendation the proviso that the representative of the Society on the Advisory Committee should say only what the B.M.A. wanted him to say. There was no desire on the part of the Society for controversy, and the carrying of the recommendation would be a further means of cementing the arrangement between the two bodies.

Dr. TILLEY said that he had no knowledge of any substantial difference between the policy of the Society and of the Association.

The recommendation was carried.

Certain further matters arose on the Public Health Committee's report. One of these concerned the transfer of the functions of the Ministry of Food in relation to food hygiene. The Council expressed the strong view that the transfer should be to the Ministry of Health rather than to the Ministry of Agriculture and Fisheries.

The Association Library

The principal matter in the report of the Science Committee, presented by Mr. J. R. NICHOLSON-LAILEY, was a memorandum on the future of the Association's library. The Council had previously approved a recommendation that the library should remain in the Garden Court wing, that increased accommodation should be made available for it there as soon as possible, and that eventual reconstruction be considered. The Council had asked for a statement showing the use made at present of the lending and reference sections, and this was now forthcoming.

Dr. FRANK GRAY said that he fully supported the view that the Association's library should stand on its own feet and not merge with other medical libraries, but he thought there might be an opportunity for a central pool, to which it and other libraries would contribute, for old and rather rare books. He suggested that that point be considered.

Dr. WAND suggested that the Science Committee should consider the question of microfilming some of its books in order to save space. Mr. LAILEY said this was being considered.

One-day Incapacity Certificates

Dr. A. BROWN, chairman of the Private Practice Committee, submitted a report of which the principal item concerned the discussion on one-day incapacity certificates which occupied the meeting of the Committee on December 15 and was reported in the Supplement (January 1, p. 3). The Annual Representative Meeting in 1954 had called for the abolition of the one-day certificate for absence from employment, but after a careful consideration of the matter and a canvass of Divisions in colliery areas with a view to discovering what proportion of colliery practitioners would refuse to issue any one-day certificates at all (apart from those required for N.H.S. purposes) if so requested by the Association, the Committee had reached the following recommendation to Council:

That in view of the lack of support from a section of the profession, no action be taken at the present time to implement the resolution of the Representative Body.

Dr. J. C. ARTHUR said that this matter was occasioning a great deal of trouble in the North, and had been the subject of a resolution of the North of England Branch Council. The real demand for these certificates was extremely variable, but in certain areas, whether because of the attitude of the local branch of the National Union of Mineworkers or not, it was very definite. The National Coal Board disliked these one-day certificates just as much as the medical profession. He suggested that the Private Practice Committee should take the matter up again with the National Coal Board and seek a satisfactory solution.

Dr. A. BARKER considered that the recommendation was the only practicable course. The matter had been discussed at great length on many occasions. The answer of the National Coal Board would be, "If you, the doctors, are not satisfied, do not give the certificates."

Dr. I. D. GRANT said that the National Coal Board, for political reasons, was not prepared to help in any way. Their attitude was, "If you do not think you are justified in giving a certificate, don't give it," and to that, of course, there was no answer.

Mr. D. S. PRACY supported the recommendation. Dr. O. C. CARTER hoped that the Council would not lightly say that nothing more could be done.

An amendment that the recommendation be referred back to the Committee was lost, and the recommendation, that no action be taken at the present time, was agreed to.

On further recommendations from the Private Practice Committee it was agreed to ask the Treasury to increase

the sessional fees for members and chairmen of medical boards to three guineas and four guineas respectively, also for certain increases in fees for part-time medical services performed on a sessional or case basis on behalf of Government departments.

International Relations

Dr. J. A. PRIDHAM, chairman of the International Relations Committee, presented a report on the finances of the World Medical Association. The Secretary-General of the W.M.A. had circulated to member associations a questionnaire on financial contributions present and prospective, and Dr. Pridham said that his committee believed that the Council would wish to offer constructive advice when replying, and with this in mind had asked the Treasurer and Financial Comptroller of the B.M.A. to examine the financial statements and other relevant documents of the W.M.A. In the light of their report answers had been formulated to the questions. In the Committee's view the crisis which had come upon the W.M.A. was serious enough to justify an immediate and thorough examination of the organization and activities, and after effecting such economies as were practicable the council of the W.M.A. should work out a programme of activity within the revenue it could reasonably expect to receive.

The answers to the questionnaire as drafted by the International Relations Committee were approved.

It was agreed that the Council send two delegates and two alternative delegates to the meeting of the General Assembly of the W.M.A. at Vienna later this year, and that the chairman of the International Relations Committee be one of those appointed.

B.M.A. Lecture Scheme

General J. C. A. DOWSE, chairman of the Armed Forces Committee, in presenting a report, said that the suggestion had been made to his committee that the B.M.A. lecture scheme, under which each home Branch and Division of the Association was entitled to one B.M.A. lecture annually, should be extended to enable groups of Service medical officers in large Service establishments in the United Kingdom, in areas isolated from the main centre of a B.M.A. Division, to apply for such lectures. It was not proposed that it should apply to any but the larger isolated establishments such as Catterick. An expenditure of £150 in the first year was probably a generous estimate.

The Finance Committee took no exception to this, but suggested that for the "pilot" year the expenditure be limited to £100. General Dowse accepted this limitation, and the recommendation was agreed to.

Gift to the Association

Three beautiful examples of cloisonné ware, intended for the Hastings Room, the gift of Mr. D. S. PRACY, a member of the Council, were on exhibition in the Council chamber. They were formerly in the Bowes collection, and were first-class examples of Japanese work. The warm thanks of the Council were extended to Mr. Pracy.

The Toronto Meeting

The Council agreed that the officials of the Association, in addition to the Secretary and Editor, to be included in the official party for the Toronto Meeting, 1955, should be Dr. J. W. P. THOMPSON, Dr. W. HEDGCOCK, and Mr. W. S. GILES, and that Dr. Hedgcock be commissioned to visit the American Medical Association's scientific exhibition at Atlantic City during the week preceding the meeting.

It was reported that a considerable number of additional applications had recently been received from members wishing to attend the Toronto meeting, and the Treasury had agreed to increase from 250 to 350 the number of members for whom dollar exchange facilities would be provided.

Other Committee Business

For the Film Committee Dr. R. P. LISTON reported the setting up of a joint subcommittee of the Film Committee with the Rehabilitation Committee concerning a proposed film on rehabilitation. This film will be a long-term undertaking and, it is thought, will prove of great value to the injured and disabled. It is hoped to obtain the co-operation of other national bodies concerned with the problems of rehabilitation. Dr. LISTON is chairman of this subcommittee, which has three representatives from each parent committee.

On the recommendation of the Arrangements Committee for the Brighton Meeting, 1956, it was agreed that the Annual Meeting registration fee of one guinea should be abolished.

The following committees made interim or routine reports: the Constitution Committee, which is reviewing the structure and functions of the Representative Body; the Committee on Remuneration Policy, which is continuing the collection of information; the Amending Acts Committee, which is engaged on an uncompleted study of a memorandum by one of its members (Dr. A. C. E. Breach) on means of extending private practice; the Scottish Committee, which reported a successful conference of divisional and public relations secretaries in Scotland and its decision to hold a similar conference in 1955; the Public Relations Committee, which announced the appointment of Mr. P. M. Hubbard as senior assistant to the Public Relations Officer; the Committee on Homosexuality and Prostitution; the Evidence Committee on Divine Healing, which is now taking evidence, and the Joint Committee with the Magistrates Association, which is considering draft sections of its report on cruelty to and neglect of children.

It was agreed that the Secretary (Dr. Macrae) should attend a proposed conference of secretaries of National Medical Associations attached to the World Medical Association, to be held in New York immediately after the Toronto Meeting.

Dr. Mary Esslemont was appointed representative of the Association on the Council of the Queen's Institute of District Nursing, and Lord Horder as representative at the annual conference of the Cremation Society.

**EXECUTIVE COUNCILS' ASSOCIATION
(ENGLAND)****FURTHERING SECTIONAL PROFESSIONAL
INTERESTS DEPRECATED**

The Management Committee of the Executive Councils' Association (England) at a recent meeting considered extracts from reports of the Council of the British Dental Association to the Representative Board. One extract, printed in the *Supplement to the British Dental Journal* of November 16, 1954, stated that arrangements were made for the 15 dental delegates attending the Annual Conference of the Executive Councils' Association in Southport on October 14 and 15 to meet before the conference began so that the official policy of the association might be supported when certain resolutions dealing with the general dental services came before the conference, and went on to say that this meeting had proved most useful and it was hoped that similar meetings would be arranged in future.

The Management Committee deprecated strongly the introduction of sectional interests into the conference. It thought the National Health Service as a whole would view with disfavour any attempt to use the Annual Conference of the Executive Councils' Association as a means of furthering professional interests, and decided to send a protest to the British Dental Association.

The eighth Annual Conference of the Executive Councils' Association will be held at Brighton on October 20 and 21.

**JUNIOR HOSPITAL POSTS AFTER
NATIONAL SERVICE****OXFORD REGIONAL BOARD SCHEME**

The Oxford Regional Hospital Board, which has had difficulty in finding junior staff for some of its hospitals, is introducing into some of its hospitals a scheme to meet the needs of young doctors who, on completion of their National Service, desire to extend their experience before entering general practice or being selected for training as specialists. Many of these young doctors are married and find themselves unable for financial and other reasons to take up short tenure posts in the hospital service.

The scheme provides for the creation of a limited number of rotating intern posts in the salary grade of junior hospital medical officer (£775 by £50 to £1,075) to take the place of existing posts on the junior hospital staff. They will be tenable for from two to four years, and will be held in the Reading and Northampton Group of hospitals (four posts in each group). Every effort will be made to provide married accommodation in or near the hospitals at an economical charge. Holders of these posts will be expected to serve for approximately six months in each of the major departments of the hospital (medicine, surgery, paediatrics, and obstetrics) and to assist in the other departments as circumstances in the day-to-day running of the hospitals may require.

Alternative Choice

It is thought likely that the majority holding these posts for two or more years will enter general practice, and that a minority will wish to train as specialists. The latter (if selected by their consultant) will have the opportunity to take up posts in the special departments of their own or other hospitals in the region, retaining the salary increments in their grade.

The Regional Committee of the Executive Councils has expressed its interest in this project and willingness to co-operate in facilitating the entry of doctors trained under the scheme into general practice.

ANNUAL MEETING, BRIGHTON, 1956

The Arrangements Committee met recently under the Chairmanship of Dr. Alexander Hall to consider proposals for the Association's Annual Meeting to be held at Brighton in 1956.

The Religious Service

It was suggested that the official religious service should be held on the Sunday morning of the meeting, thus leaving the Tuesday afternoon normally reserved for the service free to be added to the scientific meeting—possibly for an extra plenary session. There would be no difficulty in holding this service on the Sunday morning, but it was clear that it would become part of the ordinary morning service. The feeling that the tradition of the Association's own dignified service should be continued led to the decision that the official service should, as in previous years, be held on the Tuesday afternoon, though there was support for the proposed change.

Several of the social functions of the meeting were reviewed, and it was decided to recommend that the annual dinner should be held as early in the meeting as possible, preferably on Tuesday evening.

The Registration Fee

A registration fee of one guinea was instituted for the first time at the Cambridge meeting in 1948. This fee has become increasingly unpopular, especially amongst members who were able to attend only one or two sessions, and the Committee agreed to recommend its abolition. In doing so, the Committee was mindful that it was likely that the recruitment of new members would be encouraged, especially

locally, in view of the fact that the meeting is restricted to members of the Association. The Council confirmed this recommendation at its meeting on January 19.

The Status of the Scientific Meeting

The annual scientific meeting of the Association is the largest scientific meeting of the whole profession in this country, but, in the Committee's view, its importance and status were not sufficiently recognized. It was decided to try to remedy this by propaganda, among scientific medical organizations and individual members of the Association through Divisions and Branches.

Subcommittees were set up to choose subjects and speakers for plenary sessions, to make nominations for officers of scientific sections, and to plan the detailed arrangements for the scientific exhibition.

DRUGS FOR PRIVATE PATIENTS**DEPUTATION TO MINISTER**

As reported in the Proceedings of Council on p. 28, the Minister of Health received an Association deputation last December (Drs. A. T. Rogers, A. Brown, D. P. Stevenson, Deputy Secretary, and W. Hedgecock, Assistant Secretary) on the question of drugs under the N.H.S. for private patients.

The deputation put the Association's views on this question with emphasis. Dr. Rogers said that the Association realized that an amendment of the Act would be required and that this might not be possible at the present time. He referred to the very considerable amount of feeling in the profession that the present state of affairs was inequitable. It seemed quite unnecessary to regard prescribing as an inseparable part of general medical services, and the profession had always been led to believe that patients would be free to use separately any part of the services which were provided under the Act. It would not be difficult to devise satisfactory machinery which would prevent any abuse, and the fear that it might lead to two standards in general practice was quite unfounded.

Dr. Brown said that he appreciated to the full the difficulties in the political field and the lack of time available for legislation at the moment. What he would like to know was whether the Government accepted the view that a private patient was entitled to drugs under the Service. Once that principle had been decided any administrative difficulties could be examined.

The Deputy Secretary said that the suggestion that the proposal would introduce two standards in general practice had given rise to considerable resentment in the profession, and, in his view, such a situation might well exist in reverse to-day when many private patients were unable to afford the drugs necessary for their treatment. The Association would be only too willing to discuss the introduction of measures to prevent abuse, and, indeed, some form of contract and some ultimate sanction had always been envisaged. As regards cost, it was quite possible that any increase in the drug bill would be offset, at any rate to some extent, by an increase in the amount of private practice, with a consequent reduction in the amount of public funds which went into the central pool.

The Minister's Reply

In answer, Mr. Macleod said that there had been no change either in the situation generally or in his own views on the subject. It had been suggested that there was a breach of faith on the part of the Government in not giving effect to a promise which was contained in an election manifesto. This was not so. The pamphlet issued by the Conservative Party which had advocated this right for private patients had appeared in July, 1949. This pamphlet was in no way a form of election manifesto, and, indeed, the proposal had been dropped completely from the Party's electioneering programme which appeared some six months later. Again, in

the 1951 election no mention of it had been made at all. The Conservative Party's reason for withdrawing from its original position was that it realized the impracticability of making any concession on the lines suggested when the full and mounting cost of the Health Service became apparent. So far as the Cohen Committee was concerned, the Parliamentary Secretary's reply in the House of Commons to the effect that the Cohen Committee was unanimous on this particular point was made in perfectly good faith. No minority report or anything of a similar nature had appeared when the report was published, and if any members of the Cohen Committee had had any reservations it would have been proper for them to have stated this when they were considering their report in its draft form.

Door Not Shut

From the Government's point of view the question raised three difficulties, those of legislation, finance, and administration. The door was by no means shut. The proposal which was made in the 1949 leaflet was withdrawn purely because of the financial position of the National Health Service, and it had never been restored. He found himself in no position to give any undertaking of any sort that the Government would commit itself to allowing private patients to be supplied with drugs under the Service either at present or any future time. So far as the administration difficulties were concerned, they were formidable but not insurmountable. He did not necessarily agree with the views of the Cohen Committee on this particular point, and, if the Government agreed to give private patients this right, then there was little doubt that any proposals would be discussed with the profession in advance.

In brief, Mr. Macleod said that the situation could be summarized—that the proposal was not repugnant to Conservative principles and that the door was by no means shut. He could, however, give no undertaking that the change either could or would take place.

DANISH DOCTORS' VISIT TO SCOTLAND

The Scottish Committee's invitation for a party of Danish doctors to visit Scotland in the Autumn of 1955 has been accepted by the Danish Medical Association. A programme of visits to the main medical centres between September 5 and 17 is being arranged.

HOSPITALITY

A Swedish doctor's daughter, aged 17, would like to stay as paying guest with a British medical family with children of similar age, from mid-June to mid-August, preferably near the sea.

A French girl, aged 21, would like to stay *au pair* for three months with a family in or near Cambridge. She would help with secretarial or household duties.

A German doctor's daughter, aged 18, living in Kiel, would like to arrange holiday exchange during summer with a boy or girl.

Would anyone interested please contact Brigadier H. A. Sandiford, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

The Minister of Pensions and National Insurance has fixed the dates from which the new increased pensions and other national insurance and industrial injuries benefits provided by the National Insurance Act, 1954, will be payable. The increased retirement pensions, widows' benefits, guardian's allowance, and industrial death benefits will be payable from the first pay-day after April 25; maternity benefits after May 16; unemployment, sickness, and industrial injury and disablement benefits after May 19. The higher National Insurance and Industrial Injuries contribution rates will be introduced on June 6.

Questions Answered

Income-tax Rebate Claims

Q.—Can you advise me on the income-tax rebate claims that may be made in the following circumstances, and the procedure for making them? I am commencing a full-time D.P.H. course lasting one academic year. During this time, for reasons of ill-health, I shall be using my car. I am married, with no children. My income will be derived from disabled Army officer's pension and allowances, interest from capital investments, and the rents from house property.

A.—As there will be no professional earnings during the next 12 months there is no income against which the motor expenses can be set, and no allowance can be claimed for them while those circumstances apply. The Army pension is apparently of the class which does not rank as income for tax purposes, and the only income during the next year will be from investments and property. The tax payable on that income is subject to the usual personal allowance of £210 and the deduction for National Insurance contributions. The questioner should, however, bear in mind that the income-tax year ends on April 5, and the 12 months of the D.P.H. course will presumably overlap into the two years ending April 5, 1955, and April 5, 1956. Earnings, if any, before the course began, in the income-tax year ending April, 1955, and earnings after the course finishes, in the income-tax year ending April, 1956, will have to be taken into account in the result of applying the personal allowances to the income of each financial year.

Replacement of Instruments

Q.—I have just commenced an assistantship with view to partnership, having already completed eight months in general practice. I wish to replace some old instruments. Would the tax authorities allow me relief now if I bought replacement instruments, or must I wait until I become a partner?

A.—One point to be borne in mind is that, while the cost of replacement of instruments is normally allowable—at least under Schedule D—in so far as the cost is incurred to improve the set of instruments as compared with the set replaced, that part of the cost is regarded as additional capital outlay and is not allowable. If, for instance, the original set was largely second-hand when acquired and is replaced by new instruments, only the cost of replacement by second-hand instruments is legally allowable. If the claim is made for replacement during a period of employment the statutory rule applicable is that embodied in Schedule E, and the claimant would have to show that the terms of his employment required him to maintain in suitable condition the instruments replaced. On the whole, and provided that it does not unduly postpone the replacement, it is thought advisable for the questioner to wait until he becomes a partner before incurring the cost.

Principal's House Expenses

Q.—I am a principal engaged in full-time general practice from my own house. What allowances can I reasonably expect to be made against income tax?

A.—The basis of the allowance of expenses which have a dual purpose is that the amount claimed as incurred for professional purposes shall be reasonable having regard to the actual circumstances of the case. Circumstances vary so much that it is not possible to lay down any specific ratio to be applied to such general expenses. For instance, a not uncommon ratio to be applied to rent and rates is one-half, but that may be inadequate in special cases where the rent includes a relatively high "site" factor in a professional quarter. In any case, the professional part of the premises, including the garage, will be on the ground floor, which is

the most valuable part of the premises. Other "dual-purpose" expenses, such as heating and lighting, domestic service, telephone, upkeep of furniture and decorations, can only be dealt with on an estimate based on the facts, but failing any other basis of calculation it may be possible to apply the ratio adopted for rent and rates, subject to such modifications as may be appropriate.

Local Government Superannuation

Q.—Normally the additional contributions required when years are added under Regulation 12 of the Local Government Superannuation (Benefits) Regulations, 1954, are payable up to 60 years of age. Do these added years count in assessing the pension payable if the employee retires prematurely on grounds of permanent incapacity, or if he dies before reaching 60 years of age and there is entitlement to a widow's pension?

A.—Yes. Provided the employee has completed at least 10 years' contributing service exclusive of the added years, the added years will be reckoned in full for the purpose of an incapacity or widow's pension, and no further contributions will be required from the employee (or his widow).

Q.—When an employee is granted added years under Regulation 12 of the Local Government Superannuation (Benefits) Regulations, 1954, do the additional contributions required qualify for income-tax relief?

A.—Yes. But if the normal contributions plus the additional contributions for added years amount to more than 15% of the employee's annual income, the excess does not qualify for relief.

Correspondence

University Teachers' Salaries

SIR.—We note that as yet there seems to have been no correspondence following your report on university teachers' salaries (*Supplement*, December 4, 1954, p. 213), and we can only assume that, lacking any dissentient voice, the opinions expressed by the Full-time Non-professional Medical Teachers and Research Workers Group Committee of the B.M.A. have the tacit approval of the profession.

We feel that the situation of the preclinical medical teachers is more serious than has been expressed in this report, and we should like to draw attention to the increasing discrepancies between the salaries of these teachers and those of other members of the profession. These differences in salary scale are becoming more evident as members of each group advance in seniority, and they are not merely perpetuated, but even accentuated, in the new salary scales recommended for the country (*Journal*, November 27, 1954, p. 1300). In some universities the increments are considerably less than in the clinical group, which means that the maximum is reached after a much longer time, with a consequential detriment to superannuation. We feel, as preclinical medical teachers, that the marked contrast in our financial circumstances as compared with those of our colleagues in other spheres of medicine will deter any young doctor, despite his innate interest in the subject, from entering academic anatomy or physiology. General practice, hospital clinical medicine, and even pathology, where the work is most similar to our own, will all appear much more attractive. Unless the profession is prepared to accept the position that the training of medical students in the basic medical sciences is to be almost entirely in the hands of teachers, otherwise however able, who have not themselves trained in medicine—a position that many would surely regard with disfavour—steps must be taken to ensure that the rewards are such as at least to attract a fair share of the best medical brains into the teaching of these subjects, certainly not to repel them.

Let no one suppose that, as the salaries might suggest, university terms give an academic worker an unpaid holiday for half the year and the opportunity to take up a more lucrative occupation in the vacations. Most university teachers are fully engaged during these periods in their own lines of research. It is essential for future advance in medical knowledge that they should be able to pursue such work free from undue financial strain. Research in pre-clinical medicine, unlike that in other more technological sciences, does not offer a commercial sideline, nor does it offer the opportunity of a merit award (if these are ethically desirable).

If this anomalous position is to be perpetuated, many teachers, in view of the expenses of the education of children and the increasing cost of ordinary living, must seriously consider their ability to afford to continue in academic pre-clinical medicine. This will become a "luxury" only possible to those, becoming fewer in number, who are provided with substantial private means. Certainly the perpetuation of such inferior salaries will soon so discourage recruitment that fewer and fewer of the more intelligent teachers and research workers will enter the unremunerative fields of academical preclinical medicine. Only to a limited degree can congenial surroundings be balanced against financial sacrifices, and this limit has already been reached.—We are, etc.,

Medical Service in the Armed Forces

SIR.—I was deeply interested in the B.M.A. Medical and Dental Services Committee report (*Supplement*, September 11, 1954, p. 111), but I would heartily disagree with Dr. J. Stuart Whiteley's comments (*Journal*, September 25, p. 128) that it is a corollary of present R.A.M.C. practice that commanding officers of a hospital or field ambulance should lack clinical ability. As a prematurely retired officer of the late Indian Medical Service, with nearly 12 years' service, I cannot recollect that I was ever in the position ascribed to these officers by Dr. Whiteley. I held appointments giving a very wide experience of the Army medical services, and in all the posts which carried both administrative and military responsibility I was able to devote a reasonable amount of time to professional work. Much of this was operative surgery, which at that time was my main interest, but far more was of the nature of general practice, and it is from this angle I would like to emphasize a few opportunities that a Service life provides.

General practice is the basic medical science, accepting all types of disease as they occur in nature, sorting them out for diagnosis and treatment or for reference. The general duty officer will have opportunity for a very wide experience of this type of scientific interest, and, more fortunate than his civilian colleagues, he will both be able and have time to study disease in relation to environment in an infinitely varied and interesting background. He will at times have opportunities to modify the background within limits and watch the result. He will find these occasions particularly in the task of regimental medical officer, an appointment which should not be given to the recently qualified, and which will be appreciated more when knowledge of men and medicine has increased with time. But whatever the appointment one can always find some aspect of medicine to study and practise in the Army if one's vision is wide enough. The disdained administrative work when carried out by doctors, as it should always be, is only another aspect of general practice applying medical principles to bulk problems of handling patients and their attendants, surroundings, and equipment. This is an aspect of general practice to which the officer with administrative responsibility must devote a good deal of time, but he will find it of real professional value.

Officers holding command, as I have proved, are always free to spend at least some time among the patients of their units. In the I.M.S. I think we preserved a tradition of this balance between administrative and clinical work, for I noticed that several commanding officers under whom I served did so habitually. Staff officers, in addition to finding ample clinical interest in the information reaching them day by day, have the opportunity of initiating research on a wide scale, with the help of senior specialists and advisers, whose valuable work must needs be administered by someone if it is to benefit large numbers. If, in addition, staff officers were to give one morning a week to clinical work they would carry a far more alert professional outlook into their administration, and above all on their tours of inspection, where they themselves face the critical eye of junior officers.

If a well-balanced attitude of this nature could be officially inculcated and encouraged throughout the Corps by the Army Medical Department at the War Office, and taught by the R.A.M.C. College to both junior and senior officers' courses, it could slowly and surely rehabilitate the professional standing and appeal of an Army medical career, without sacrificing any military or administrative efficiency. I have used the word "taught" deliberately, because it seems that many National Service M.O.s have no idea of any other type of medical work than that which they have seen in hospitals; and perhaps it is also true that some of the more senior officers have gradually given up this interest in clinical work for lack of encouragement and personal initiative. Both classes need to be shown the very wide possibilities of general practice type of medical work in all the usual spheres of Army life.—I am, etc.,

Nairobi, Kenya.

R. Y. TAYLOR.

Merit Awards

SIR.—I have not read all the correspondence on this matter, but need not apologize for putting forward the view that the method used for the distribution of merit awards concerns the profession as a whole. Prior to nationalization, the discussion groups of consultants and specialists were largely separated from those of general practitioners—the old story of "divide and rule." What Division of the B.M.A. would care to sponsor a resolution on the method of distribution of merit awards at the next A.R.M.? I surmise that a vote of the whole profession would produce a very different result than a vote confined to a group—the majority, recipients of these awards—but that by the way.—I am, etc.,

Belfast.

DOUGLAS BOYD.

Remuneration and Arbitration

SIR.—The daily press constantly reminds us at the present time that we are enjoying an era of unprecedented prosperity, and the *Sunday Express* of January 9 asks its readers on page 1: "Are you cashing in on the boom? The year 1955 promises to be the most prosperous in Britain's history." Many of your readers must have been impressed with the remarkable speed with which a solution has been found to the threatened railway strike, and the determination and alacrity manifested when the Government has been faced with any problem of remuneration which directly involves the convenience of the public and thus indirectly their voting potential. The interim report of the Court of Inquiry even goes as far as stating: "Having willed the end, the nation must will the means. This implies that employees of such a national service shall receive a fair and adequate wage. . . ."

It so happened that on the same morning I was looking through the *Supplement* of July 2, 1949, and there, on page 15, is reported the proceedings of the A.R.M. of that year in which the chairman of the Central Consultants and Specialists Committee of that time is reported as follows: "It was represented to the Ministry that the betterment factor was quite insufficient. The Minister had refused

to alter this factor, and what was more ominous was his statement concerning Whitley Council machinery. The present meeting had already given a very strong expression of opinion on the question of arbitration. He regarded this as of fundamental importance and a battle which they must win."

Six years later the battle has not been won, and, despite innumerable committee meetings consisting of the most eminent and presumably intelligent members of our profession, nothing more has been achieved than an *ad hoc* increase which was not retrospective, giving a consultant at the maximum of the scale a betterment factor of 24% over the scale recommended as applicable sixteen years ago. During this period a world war has come and gone, with its inevitable depreciation in the purchasing power of money and heavy increase in taxation.

We have not even obtained, as yet, the fundamental right to present our disputes for arbitration: a measure which is essential for a body of individuals whose occupation denies to them the resort of the working man—the strike. Surely, as a profession, we must stand condemned for all time as the most incompetent, inept, and inadequately represented of all nationalized occupations, and, whether we like it or not, this is precisely what we have become. We must indeed be the laughing-stock of all those bodies who negotiate with the Government on behalf of their members.

By nationalizing the medical and dental professions the Government is the owner and the employer, and we are the employees, induced to enter employment under specific terms and promises which have not been fulfilled, and, I would venture to suggest, never will be fulfilled unless a far more realistic policy is adopted in the future. Collective bargaining and concerted action are the first steps towards securing our future and putting an end to the political chicanery which has characterized negotiations in the past. Is it too much to hope that 1955 will see a clear ratification of the political pledges of 1948 and unbiased arbitration of our unassailable claims so that a just conclusion may be reached and peace of mind established in the future?

Lest it should be forgotten, we will not, in that case, be "cashing in on the boom" but securing at long last what has been denied to us for some seven years by political intrigue of the lowest order.—I am, etc.,

Andover.

N. L. ROWE.

Hospital Costing Returns

SIR,—You refer (*Journal*, January 8, p. 92) to "some interesting speculation" that the current issue of National Health Service costing returns may provoke, and point out some fallacies to be avoided. There would be less speculation on some items if clear instructions had been given as to what costs should be included in a particular column. When one studies columns 25, 26, and 28 under "Gross Salaries and Wages" for comparable mental hospitals, one finds the following extraordinary variations: (25) "Administrative and Clerical"—Zero to 4s. 11d. (26) "Professional and Technical"—9d. to 5s. 8d. (28) "Others"—2s. 5d. to 9s.

It is, pretty obvious that different groups have included utterly different items in the various columns. As these read now they are valueless and represent a waste of paper, print, and labour.—I am, etc.,

Basingstoke.

I. ATKIN.

REFERENCE

¹ *National Health Service Hospital Costing Returns, Year Ended March 31, 1954*, p. 65. H.M.S.O.

Hospital Staffing

SIR,—I have noted the recent correspondence in your columns on the Strachan report and in particular the letters of Dr. G. D. Wild (*Supplement*, December 25, 1954, p. 247) and "Senior Hospital M.O." (*Supplement*, January 15, p. 18). The report (*Supplement*, December 18, 1954, p. 236) of the meeting of the Central Consultants and Specialists Committee made it quite clear that the proposals were still under

consideration, and I therefore agree with Dr. Wild that no final decision on their merits can yet be reached. It is no secret, however, that the provisional S.H.M.O. Group, while recognizing the necessity for staff reorganization and appreciating the hard work put in by the Hospital Staffing Subcommittee, felt that the Strachan report as it stood originally was less than fair to present S.H.M.O.s. In that sense we did not approve of the report and our views have been confirmed by S.H.M.O.s individually and at meetings all over England and Wales. Every opportunity has been taken to put the views of S.H.M.O.s at Headquarters. We must now await the final proposals.—I am, etc.,

W. J. WILSON,

Hon. Secretary.

Sheffield, 10.

Provisional S.H.M.O. Group Committee.

Local Health Authority Nursing Services

SIR,—Miss Everell M. Shippam (*Supplement*, January 8, p. 12) considers that the work of advising a mother on infant feeding after the midwife has left on the fourteenth day can only be done adequately when the health visitor has not only taken part I but has qualified and practised as a midwife. May I ask why? Why should not advice in infant feeding be given by the health visitor, who has received in her training so much more instruction on this branch of nursing work than the midwife?—I am, etc.,

Smethwick.

HUGH PAUL.

Association Notices

SCHOLARSHIPS IN AID OF SCIENTIFIC RESEARCH

The Council of the British Medical Association is prepared to receive applications for research scholarships as follows:

An Ernest Hart Memorial Scholarship, of the value of £250.

A Walter Dixon Scholarship, of the value of £250.

Four ordinary research scholarships, each of the value of £200.

These scholarships are given to candidates recommended by the Science Committee of the Association as qualified to undertake research in any subject (including State medicine) relating to the causation, prevention, or treatment of disease.

In addition, applications are invited for the award of the following research scholarship:

The Insole Scholarship, of the value of £250, for research into the causes and cure of venereal disease.

Each scholarship is tenable for one year, commencing on October 1, 1955. A current scholar may apply to be re-appointed for a further year, though no scholarship will be renewed more than twice. A scholar is not necessarily required to devote the whole of his or her time to the work of research, but may be a member of H.M. Forces or may hold a junior appointment at a university, medical school, or hospital, provided the duties of such appointment will not, in the opinion of the Science Committee, interfere with his or her work as a scholar.

Applications for scholarships, including renewals, must be made not later than March 1, 1955, on the prescribed form, a copy of which will be supplied by the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, on application.

Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated.

MIDDLEMORE PRIZE

The Middlemore Prize, which consists of a cheque for £50 and a certificate, was founded in 1880 by the late Richard Middlemore, F.R.C.S., of Birmingham, to be awarded for the best essay or work on any subject which the Council of the British Medical Association may from time to time select in any department of ophthalmic medicine or surgery. The Council of the British Medical Association is prepared to consider an award of the prize in the year 1955 to the

author of the best essay on: "Allergy in Relation to Eye Disease." Notice of intention to enter for the competition should be made on the appropriate entry form, copies of which can be obtained from the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

Essays must reach the Secretary on or before February 1, 1955. Each essay must be unsigned and accompanied by a slip containing the name and address of the author. Previous prizewinners are not precluded from entering. In the event of no essay being submitted of sufficient merit, the prize will not be awarded in 1955, but will be offered again in the following year.

Election of Representative Body, 1955-6

The Council hereby gives notice that Representatives and Deputy Representatives for 1955-6 must be elected by the Constituencies (see below) not later than Thursday, March 31, and their names received at the head office not later than Wednesday, April 20, 1955.

It is a matter for the Executive Committee of the Division (or, where a Constituency comprises more than one Division, for a joint meeting of the Executives of the Divisions) to decide whether the Representative(s) and Deputy Representative(s) shall be elected by a General Meeting of the Constituency or by Postal Vote. The meeting of the Constituency must be called (and, where the election is by voting papers, these must be issued) by the Secretary of the Division (or, in the case of Constituencies comprising more Divisions than one, by the Secretary of the Division containing the largest number of Members).

I. CONSTITUENCIES IN GREAT BRITAIN AND NORTHERN IRELAND

The Council has formed the Divisions in Great Britain and Northern Ireland into the Constituencies for election of the Representative Body, 1955-6, shown below.

II. BRANCHES IN THE REPUBLIC OF IRELAND

The Branches in the Republic of Ireland (Irish Medical Association) comprise one Constituency, entitled to not more than three Representatives.

III. CONSTITUENCIES NOT IN GREAT BRITAIN OR IRELAND

Each Branch outside Great Britain and Ireland is an independent Constituency.

CONSTITUENCIES IN GREAT BRITAIN AND NORTHERN IRELAND FOR ELECTION OF REPRESENTATIVE BODY, 1955-6

Divisions bracketed together form one Constituency

Diary of Central Meetings

JANUARY

- 25 Fri. Scientific Programme Subcommittee of Arrangements Committee, 11 a.m.
28 Fri. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
28 Fri. Scientific Exhibition, Subcommittee of Arrangements Committee, 2 p.m.

FEBRUARY

- 1 Tues. Organization Committee, 2 p.m.
2 Wed. Occupational Health Committee, 10 a.m.
2 Wed. G.M.S. Subcommittee on Assistants in General Practice, 10.30 a.m.
2 Wed. Central Ethical Committee, 2 p.m.
2 Wed. G.M.S. Subcommittee to consider Report of Central Health Services Council's Committee on General Practice within the National Health Service, 2 p.m.
2 Wed. Radiological Services Subcommittee, Radiologists Group Committee, 2 p.m.
3 Thurs. Central Consultants and Specialists Committee, 10.30 a.m.
3 Thurs. Committee on Homosexuality and Prostitution, 2 p.m.
4 Fri. Library Subcommittee, Science Committee, 12 noon.
4 Fri. Science Committee, 2 p.m.
8 Tues. Trainee General Practitioner Subcommittee, 2 p.m.
9 Wed. Private Practice Committee, 12 noon.
9 Wed. Psychological Medicine Group Committee, 2 p.m.
9 Wed. Public Relations Committee, 2 p.m.
10 Thurs. Subcommittee on Service Committee and Tribunal Regulations, G.M.S. Committee, 2 p.m.
11 Fri. Joint Subcommittee on Professional Secrecy, Public Health and Central Ethical Committees, 11 a.m.
11 Fri. Public Health Committee, 2 p.m.

Meetings of Branches and Divisions

- ALDERSHOT AND FARNHAM DIVISION.—At Northfield Hospital, Tuesday, February 1, 8.15 p.m., meeting. Wing Commander F. Latham: "Medicine in Aviation."
COVENTRY DIVISION.—At Chace Hotel, London Road, Willenhall, Tuesday, February 1, 8 p.m., supper meeting. Lecture by Dr. A. C. Cooke: "Adrenalectomy for Hypertension."
FINCHLEY DIVISION.—At Finchley Memorial Hospital, Granville Road, N., Tuesday, February 1, 8.30 for 9 p.m., meeting. Dr. F. E. Camps: "Burning People Don't Sit Still."
GREENWICH AND DEPTFORD DIVISION.—At Miller General Hospital, Greenwich High Road, London, S.E., Wednesday, February 2, 8.30 p.m., meeting. B.M.A. Lecture by Dr. F. S. Cooksey: "Some Recent Developments in Medical Rehabilitation." Members' wives are invited. Also members of Lewisham and Woolwich Divisions. (The notice in the *Supplement* of January 22, stating that the lecture would be delivered on January 26, was printed in error.)
GUILDFORD DIVISION.—At Assembly Room, Lion Hotel, Guildford, Thursday, February 3, 7.30 p.m., informal dinner; 8.30 p.m., joint meeting with Guildford and District B.D.A. Squadron Leader D. G. V. Whittingham, R.A.F.: "Aviation Medicine."
HALIFAX DIVISION.—At Alexandra Hall, Halifax, Wednesday, February 2, 8 for 8.30 p.m., annual dinner-dance.
HAMPSTEAD DIVISION.—At Hampstead General Hospital, Haverstock Hill, N.W., Wednesday, February 2, 8.30 p.m., meeting. Mr. A. Lawrence, Abel: "Some Impressions from Overseas." (Illustrated by slides and a coloured talking film.)
HARROGATE DIVISION.—At Royal Bath Hospital, Cornwall Road, Harrogate, Friday, February 4, 8.30 p.m., meeting.
HARROW DIVISION.—At Rayners Hotel, Rayners Lane, Harrow, Tuesday, February 1, 8.30 p.m., meeting. Symposium: "Control of Blood Pressure." Speakers, Professor Clifford Wilson, Mr. J. P. Bentley, and Dr. J. Wilson Muggoch.
HASTINGS DIVISION.—At Royal East Sussex Hospital, Hastings, Tuesday, February 1, 8.15 p.m., meeting. Address by Dr. J. S. Anderson: "Infectious Diseases and the General Practitioner."
HYDE DIVISION.—At Pack Horse Inn, Mottram, Wednesday, February 2, 8.30 p.m., clinical meeting. Dr. S. H. Jackson: "Pathology and the General Practitioner—Hospital Facilities and Otherwise."
LEWISHAM DIVISION.—At Lewisham General Hospital, High Street, Lewisham, S.E., Friday, February 4, 8.30 p.m., meeting. Dr. Noel G. Harris: "The Uses and Abuses of Hypnotism."
MID-HERTS DIVISION.—At Noel Burke Hall, Cell Barnes Hospital, St. Albans, Friday, February 4, 9 p.m., meeting. Film of operation by Professor Ian Aird: "Conjoined Twins of Kano."
NORTH STAFFS DIVISION.—At North Stafford Hotel, Stoke-on-Trent, Thursday, February 3, 7.15 for 7.45 p.m., annual dinner-dance.
ST. PANCRAS DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Tuesday, February 1, 8.30 p.m., meeting. Dr. Ethel Dukes: "Marriage Guidance." Members of the City Division are invited.

SCUNTHORPE DIVISION.—At Scunthorpe and District War Memorial Hospital, Thursday, February 3, 8.30 p.m., meeting. Dr. I. Reubin: "Tuberculosis—Modern Tendencies."

STRATFORD DIVISION.—At Queen Mary's Hospital, West Ham Lane, E., Tuesday, February 1, 9 p.m., meeting. Lecture by Dr. F. S. Cooksey: "Some Recent Aids for the Physically Handicapped."

WANDSWORTH DIVISION.—At Berkeley Rooms, Zeeta House, Putney, S.W., Friday, February 4, 8.30 p.m., joint meeting with South-west London Chemists' Association. Dr. Donald Teare: "Poisoning—Homicidal, Suicidal, and Accidental."

WEST SUSSEX DIVISION.—At Beach Hotel, Littlehampton, Thursday, February 3, 6.30 p.m., meeting. Lecture by Dr. G. B. Mitchell-Heggs: "Use of Cortisone and A.C.T.H. in Skin Disease."

WOOLWICH DIVISION.—At Woolwich Memorial Hospital, Shooters Hill, S.E., Tuesday, February 1, 2.30 p.m., seminar on paediatrics: "Problems for Diagnosis."

S.H.M.O. Meeting

A meeting of Senior Hospital Medical Officers in the South-east Metropolitan Region will be held on Saturday, February 5, at 2.30 p.m. at the Town Hall, Maidstone, Kent.

H.M. Forces Appointments

ROYAL NAVY

Surgeon Captain R. G. Anthony has retired.
Surgeon Commanders A. Long and J. M. Reese, O.B.E., to be Surgeon Captains.
Surgeon Commander L. P. Spero has retired.
Acting Interim Surgeon Commanders R. S. P. Hawkins, C. L. T. McClintock, R. W. Tipple, and G. A. S. Anthony to be Surgeon Commanders.
Surgeon Lieutenant-Commander F. R. Aston to be Surgeon Commander.
Surgeon Lieutenant S. D. Walsh to be Surgeon Lieutenant-Commander.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenant-Commanders G. M. Pearson, D. K. T. Wallace, M.B.E., and A. W. Haggart to be Surgeon Commanders.
Surgeon Lieutenant-Commander A. J. Ward has reverted to the Temporary R.N.V.R. in the rank of Temporary Acting Surgeon Lieutenant-Commander.

ARMY

Major-General J. C. Collins, C.B., C.B.E., Q.H.S., late R.A.M.C., having attained the age limit for retirement, has retired on retired pay.
Brigadier (Temporary Major-General) F. J. O'Meara, late R.A.M.C., to be Major-General.
Colonel (Temporary Major-General) E. H. Hall, O.B.E., late R.A.M.C., to be Brigadier.
Brigadier R. J. Rosie, C.B.E., Q.H.P., late R.A.M.C., has retired on retired pay.
Lieutenant-Colonel C. A. Levy, from R.A.M.C., to be Colonel.

ROYAL ARMY MEDICAL CORPS

Major R. P. Leake, E.R.D., to be Lieutenant-Colonel.
Captains J. M. Adam, E. T. O'Dwyer, and W. F. Belsham to be Majors.

Short Service Commissions.—Captain P. C. Barry to be Major.
Captain C. Voigt has relinquished his commission on account of disability, and has been granted the honorary rank of Major.

REGULAR ARMY RESERVE OF OFFICERS

Major-Generals W. Foot, C.B., M.C., and Sir Edward Phillips, K.B.E., C.B., D.S.O., M.C., late R.A.M.C., having attained the age limit of liability to recall, have ceased to belong to the R.A.R.O.

ROYAL ARMY MEDICAL CORPS

Captain (Honorary Major) T. H. Baillie has ceased to belong to the R.A.R.O., retaining the honorary rank of Major.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Major (Honorary Lieutenant-Colonel) J. A. Simons, from R.A.R.O., to be Major, and has been granted the acting rank of Lieutenant-Colonel.
Captain (Acting Major) J. Marshall, from A.E.R.O., National Service List, to be Captain, and has been granted the acting rank of Lieutenant-Colonel.
Lieutenant (War Substantive Captain) W. H. Myers, from Emergency Commission, to be Captain, and has been granted the acting rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Majors E. Shipman and A. L. Stalker have been granted the acting rank of Lieutenant-Colonel.
Captain (Acting Major) R. T. G. Craig has relinquished the acting rank of Major.
Captain D. A. N. Hoyte has been granted the acting rank of Major.

SWEDEN'S NEW HEALTH INSURANCE SCHEME

BY

DAG KNUTSON, M.D.

President of the Swedish Medical Association

Sweden has introduced a new and compulsory insurance system covering the whole population for sickness, industrial injuries, and motherhood. The principles of the scheme were accepted in 1946, but owing to financial and other circumstances its introduction was postponed. In the early spring of 1954, however, that year being a year of important elections, Parliament decided that the scheme should be introduced on January 1 of this year. As a number of questions involved in the new system remained unanswered, the time available was very short indeed.

Before the start of the new scheme, voluntary sickness insurance was financially, as well as administratively, separate from the insurance against industrial injuries. Eligibility was governed by state of health, age, and annual income—though the latter two conditions had become less rigid and the age limit as well as income limit had been raised repeatedly. About two-thirds of the population had joined this voluntary insurance scheme in a comparatively few years and the percentage was steadily rising. Costs were covered by contributions from the insured, from the communities, the State, and employers. Total expenses (1951) were about 200 million crowns (about £15m.), and of this amount 37% was spent on financial benefits, 8% on hospitalization, 15% on refunding part of doctors' fees, 5% on pharmaceutical benefits, and 12% on administration. Eight per cent. was allotted to maternity benefits and children's supplement. Industrial injury benefits, financially and administratively separate, were very much higher, and the evil effects of over-insurance had become noticeable. Under the new combined system sickness benefits have been increased in scope and value but compensation for industrial injuries has become lower. It remains to be seen whether, from political reasons, this arrangement

will last. Comparatively little has been said about this and the man in the street has up to now known as little about it.

Benefits Under the Scheme

Every Swede—and every foreigner living in Sweden—having attained the age of 16 has now to become insured. Children under 16 are automatically insured through their parents, generally the father.

The benefits are as follows:

(1) Medical benefit, which includes (a) payment towards cost of medical attendance, (b) free hospitalization, (c) payment of costs incurred travelling to a doctor or hospital and back home, and (d) pharmaceutical preparations free of cost in certain cases, and at a discount in others.

(2) Sickness benefit.

(3) Maternity benefit.

Medical Benefit

Reimbursement of the patient for costs of medical attendance is according to a schedule of fees. The patient receives a refund of three-quarters of the amount indicated if the fee is the same or higher than the tariff. If it should be lower, the patient gets three-quarters of the actual fee paid. The district doctors in rural areas, who for more than 200 years have been paid partly by salary and in return for this had their fees tied to tariffs, will continue to follow the new tariff. Others are free to charge whatever fee they feel to be justified. Thus the law has not encroached upon this freedom of the profession so far.

The principle of the new tariff of fees—but not the figures—has been put forward by the Swedish Medical Association and differs radically from the old idea of adding together individual and separately priced items. It is intended to form a basis for fixing the fees of the said district doctors, but also, in a more general way, to introduce a new system for reimbursement to patients from the sickness funds.

The new tariff of fees is divided into three main groups, scaled according to the type of service rendered. The first group includes uncomplicated services taking little time, or some simple service like re-dressing a wound or taking an albumin test. The second group includes an ordinary routine examination of a patient, such as is done on a patient's first visit to the doctor's office, and further examinations. The third group includes services involving special techniques and those which are especially time-consuming. This group is subdivided into three for easier classification of the kind of service rendered. The doctor may not charge fees for services under more than one group of the tariff for any one consultation. If services are rendered which come under two or more groups, the fee is based on that of the highest group.

Doctors not tied to any tariff—that is, all G.P.s other than the rural district doctors, and all practising specialists—are supposed to evaluate their services on the same principle which underlies the schedule. This gives them a considerable freedom, but also a responsibility.

The charges in the tariffs decided upon by the National Insurance Board are at a level which is supposed to correspond with to-day's average fees in general practice, and at a level higher than the district doctor's. As a result doctors in general, if not actually asked to adjust their fees to the reimbursement tariffs, are at least supposed to do so. The authorities have not found it possible, for the time being, to transform the medical profession into one within the Civil Service, but want on the other hand the closest possible relation between actual fees and reimbursement tariffs. How this will work out in practice it is, of course, too early to tell, but the general tendency has for a long time been evident—doctors have on the whole taken the reimbursement tariffs into consideration when they have set their fees, even under the old system with much lower tariffs.

Hospital Benefit

The insurance pays the costs for the insured person's treatment in a general ward of his "home hospital." If this institution for some reason cannot provide the treatment needed, the insurance pays for the patient in another hospital, though at the lowest possible rate only. If a patient wants to be placed in a private ward he has to pay the extra costs himself, and these are nowadays considerable, as costs of running a hospital bed have mounted to 50 crowns (about £3 15s.) or more a day.

Travelling Costs

The rules given for compensating travelling costs are complicated. In making a claim a patient has to declare that the main reason for the journey was to consult a doctor. The patient must also travel by the cheapest means available, and that which his state of health allows him to use. He cannot take a taxi if he is fit to go by tram. For the first trip to the nearest doctor the patient has to pay 4 crowns (about 6s.) out of the total cost himself, and for any further trip 1 crown (about 1s. 6d.). Of any costs above these the insurance pays 75%. If the patient is so ill that he has to be accompanied by another person, also an object for the doctor's certification, the costs incurred thereby are refunded in the same way. If the insured person is sent by a doctor to the nearest hospital or goes there after having been called, for instance in order to be taken into the ward, all the travelling costs are refunded. On going home again the insurance pays the total cost minus 4 crowns, which the insured has to pay himself—and so on.

The Swedish Medical Association has felt and is still feeling doubtful about the wisdom of all this, and nobody has really any idea what the cost will amount to. It may also be difficult for the doctor to refuse to endorse travelling expenses; the patient, and especially his relatives, may be panic-stricken and make the choice of means of transportation in perfect good faith before the doctor is seen, so the dilemma will often be his.

Pharmaceutical Benefit

Specified drugs, arranged according to active principles, for 15 listed "qualifying" diseases in need of prolonged treatment—such as diabetes, pernicious anaemia, asthma, bronchitis, heart failure, and various forms of cancer—are to be given free of charge. In prescribing these the doctor has to use a special form which the insured takes to the insurance office, there filling in another form, before the chemist can deliver the remedy. For any other remedy of a licensed nature—which in Sweden means that it is sold only at the licensed chemist's shop—the doctor uses a different form and the patient has to pay the cost up to 3 crowns (about 4s. 6d.) himself, the State paying 50% of any cost above that amount. An extensive administration has been made necessary, and endless discussions about who should provide the unavoidable documents have been held.

In practice this means, so far as the non-specified remedies are concerned, comparatively little to the insured. Statistics show that, out of 20 million prescriptions, over 7 million cost 3 crowns or less, and another third less than 5 crowns (about 7s. 6d.).

Sickness Benefit

The daily sickness allowance is another complicated matter. Every insured gets a basic sum of 3 crowns daily. On top of this there is for all persons with a salary exceeding 1,800 crowns (about £125) a year, but below 14,000 crowns (about £1,000) a year, an additional daily allowance graded in proportion to the size of the salary. Those earning 14,000 crowns or more have to pay extra contributions to insure themselves for an additional daily amount of 17 crowns (about £1 4s.), which, with the basic 3 crowns, comes to a total of 20 crowns (about £1 10s.).

Three points should be stressed. First, after 90 days the daily allowance is cut down for all classes except the lowest. The man who starts with 20 crowns thus finds himself reduced to 12 (about 18s.). Secondly, this allowance is free of tax. Therefore, a person who retains all or part of his salary during illness will suffer a deduction therefrom greater than the sum he receives as daily allowance from the insurance. Thirdly, during hospital care the daily allowance is reduced by 3 crowns, or, if this would mean more than half, just the half of it. Married women, students, and self-employed persons receive only the basic 3 crowns but may, up to certain amounts, voluntarily insure themselves for additional daily benefits.

The daily allowance is payable for one and the same disease for 730 days, which may be made up from periods added together if intervals are shorter than two years. For old-age pensioners, however, 90 days are set as the limit. If somebody has been working for more than two years at a stretch, slight and occasional illnesses not counted, a relapse into the old disease will be counted as a new affliction. No daily allowance is paid for the first three days of a disease, with certain exceptions for relapses within 20 days. Finally, a children's supplement from 1 to 3 crowns is added, in proportion to the number of children in the family.

Maternity Benefit

The maternity benefit is composed of two parts. One covers medical costs in connexion with childbirth, the other is on principle similar to the daily item and can be paid for 90 days to any woman who has an employment if she does not work during that period. All mothers receive, furthermore, a special grant of 270 crowns (about £18), increased to 405 crowns if the birth is multiple, and may claim, for the 10 first days, about 2 crowns per day if there are children under the age of 10 years at home.

General Considerations

This, then, is a condensed report on the new Swedish insurance system. New items of note are the allowance for travelling to and from doctors and hospitals, pharmaceutical

preparations in connexion with "qualifying" diseases free of cost, and the State contribution for licensed remedies. The outstanding features of the new scheme are that it is compulsory and covers all the population. Previously existing benefits have on the whole been increased in value, with the exception of those in connexion with industrial injuries.

Especially costly will be the daily allowance. This, where lower-income groups are concerned, and taking into consideration the children's supplement, will come dangerously near the point from which over-insurance starts.

Who Pays?

The reader will here ask how much the whole thing will cost, and who pays. Calculations—probably as reliable as they have been in other countries in similar circumstances—have come to a total of 816 million crowns (about £61m.), to which may have to be added some 20 or 30 million crowns (about £1½m. to £2¼m.) for pharmaceutical benefits. It is estimated that 44% will be borne by the insured themselves through contributions, 27% by the employers by adding 1.2% of their pay roll, and 29% by the State.

Under the old system the average annual contribution of the insured was, in 1951, 38 crowns (about £2 17s.), but, of course, benefits were smaller and insurance against industrial injuries was not included. Under the new system every insured person will have to pay 25 crowns (about £1 17s.) annually for medical attendance, hospitalization, and travelling, and a further 50 crowns (about £3 15s.) for the basic daily allowance. Every salaried person will have to pay an additional contribution for increased sickness benefit in proportion to his income—in the highest group about 100 crowns (about £7 10s.) or a little more—and this will come to somewhere in the neighbourhood of 200 crowns (about £15) a year. Non-salaried and self-employed people wanting to insure for extra sickness will have to pay 12 times its value, and this will result in the highest group paying somewhere in the neighbourhood of 300 crowns (about £22 10s.). On top of this comes, of course, the patient's proportion of the medical fee, travelling expenses, and medicine, and, finally, his contribution as a taxpayer. The latter item may be hidden somewhere in the tax papers, in the bottle or the packet of cigarettes, or, in fact, in everything else that leaves gold dust on the fiscal fingers.

Professional Reactions

The Swedish Medical Association fought the plans up to the day of the final decision, mainly for three reasons. The first one concerned the psychology of compulsion in the field of social security, and its consequences. The second one derived its strength from the fact that fields within the sphere of health care other than that of insurance sorely and urgently need what millions could eventually be made available. The third one concerned the certain increase of administrative work, which would come to weigh heavily on all concerned.

The Swedish Medical Association has of course been studying the experiences of other countries, and the relations between the medical profession and social security institutions where conditions seem to be at all comparable with those in Sweden; and it has not forgotten what the World Medical Association has had to say about medical aspects of social security. All this, together with practical experience already of extensive arrangements for the welfare of the people, created a scepticism whether the new system would contribute as noticeably to better physical, mental, and social well-being as it would towards an increase of costs—and demands.

VISIT TO WEST AFRICA

The secretary of the Overseas Committee, Dr. E. Grey-Turner, is to visit the three West African Branches of the Association in March. He is expected to be in the Gold Coast on March 4-5 and 8-10; in Sierra Leone on March 6-7; and in Nigeria on March 11-19.

GENERAL MEDICAL SERVICES COMMITTEE

A meeting of the General Medical Services Committee was held at Headquarters on January 20, with Dr. A. Talbot Rogers in the chair. A tribute was paid from the chair to the late Dr. J. B. Miller.

The CHAIRMAN mentioned that he had been invited by the Council to represent the Association at the Australasian Medical Congress in Sydney in August, following the meeting in Canada, which would entail his absence from three or four meetings of the Committee. On the proposition of Dr. I. Innes, seconded by Dr. Howie Wood, Dr. S. Wand was invited to be acting Chairman during that period.

General-practitioner Institutional Midwifery

The question of the Springfield Maternity Home, Blackburn, again came forward. The CHAIRMAN said that an interview had taken place with the Minister of Health, who, though obviously conversant with the background of the case and with the difficulties of general practitioners in the area who had been deprived of certain of their institutional maternity facilities, had indicated that he did not feel justified in overruling the decision which had been taken locally. He felt obliged to accept the position that beds could not be provided for this purpose in Blackburn itself without sacrificing very badly needed chronic sick beds or spending capital resources much more urgently needed for other purposes. But this did not mean any change of front on the part of the Ministry with regard to general-practitioner midwifery.

A situation which had arisen at the Portway maternity hospital, Dorset, was reported by Dr. J. A. PRIDHAM. Here, at the end of the war, a large obstetric department was opened, a specialist obstetrician and gynaecologist appointed, and the accommodation was such that every woman in the district who applied was freely admitted, the result being that general practitioners found that domiciliary midwifery had almost disappeared. The question of putting aside a ward for patients where they could be attended by their own general practitioners had been mooted, but objections had been made by the hospital management committee, the idea being to keep the institution as a training school for obstetricians and midwives.

It was agreed at Dr. Pridham's suggestion that a further approach should be made to the regional hospital board, and that the Deputy Secretary should visit the area on behalf of the Committee and give any assistance possible.

On the general question Dr. G. P. WILLIAMS said that local medical committees should be forewarned as to the possibility of the withdrawal of general-practitioner facilities in their area. Dr. WAND spoke on the need for co-ordination between local medical committees and hospital management committees and regional boards.

In reply to a suggestion that all general practitioners on hospital management committees should be circularized on the subject the DEPUTY SECRETARY pointed out that this would have little effect, as they were always in a minority. He suggested that it be represented to the Ministry that, quite apart from the case of Springfield, they were very much concerned about the future, and desired the Ministry itself to communicate with regional boards to the effect that local medical committees should be consulted before any changes were contemplated in the provision of general-practitioner beds and services. It was agreed to proceed on these lines.

Economy in Prescribing

The proposed arrangements for distributing doctors' prescribing statistics were discussed. These had been the subject of some general observations to the Ministry by the Deputy Secretary. It was pointed out that one adverse factor in arriving at a true picture was that in areas in and around London there was no guarantee whatever that patients would get their prescriptions dispensed in the area of the doctor's

surgery. Some way must be found of getting much more accurate information for London. The arrangements proposed would be of value only in a self-contained town.

It was agreed to bring to the notice of the Ministry the possibility of misleading impressions unless certain modifications were made.

Practice Vacancies

A local medical committee transmitted the copy of a letter which had been sent at its instigation by the executive council to the Ministry of Health protesting against the decision of the Medical Practices Committee to approve the application of a practitioner to practise in the area. This practitioner had been locumtenent in a death vacancy for a period of four months; he had been an unsuccessful applicant for the vacancy, the filling of which was delayed by the withdrawal of the candidate first selected. The proposed address of the applying practitioner (the former locumtenent) was only one-third of a mile from that of the practice, and it was thought that this would have a harmful effect on the practice, which had a list of only 1,600 patients. There were already eight doctors who had surgeries within one-third of a mile of the new doctor's proposed address.

It was agreed to set up a subcommittee consisting of the Chairman and Drs. Arthur, Mathias, and Wand to consider all aspects of the problem raised, of which this was by no means an isolated example.

Limited Lists

It was reported that the Scottish Subcommittee had been in consultation with the Department of Health concerning difficulties which had arisen in the case of practitioners with limited lists. It appeared that a limited-list practitioner—say a school medical officer—who had even only one patient outside the establishment to which his limited list applied might be remunerated as an unlimited-list practitioner. Dr. SWANSON said that a solution proposed was that when a practitioner with a limited list had other patients in addition, and when the numbers on his limited list exceeded 25% of the total of both lists, he should for the purpose of remuneration be deemed to have two lists, one carrying the restrictions provided by the distribution scheme and the other subject to no restrictions.

The CHAIRMAN said that in Scotland the Department of Health was prepared to agree to this. Was there a strong opinion that it should be taken up for operation in the rest of the country? Dr. WAND considered that if this were done they might be opening a very wide door, and on balance, while he sympathized with the Scottish anxiety to put matters on a proper level, he thought it would be unwise to make representations about it.

On the motion of Dr. Wand, seconded by Dr. Hutchinson, it was agreed to take no action.

Post-mortem Examinations

The Annual Representative Meeting had referred to Council for consideration the opinion that arrangements should be made for a practitioner to have a post-mortem examination made by a consulting pathologist on any patient who was of particular clinical interest to the practitioner, the cost to be borne by a research grant of the National Health Service.

Dr. A. B. DAVIES said that in the majority of cases with which he himself had dealt the post-mortem examination had been made at the request of the coroner, who had an interest overriding that of all other bodies—general practitioners, hospitals, police, etc. Many cases of clinical interest did come within the ambit of the coroner. A second large group were those within the ambit of the hospital—that is, cases of clinical interest in which the patient had died in hospital, and the registrar or consultant asked the consent of the relatives—which must be obtained and was

rarely refused—for a post-mortem examination. A third group consisted of ex-hospital cases with regard to which the general practitioner if in doubt could ask the hospital authorities to conduct a post-mortem examination, and a certificate could be given in proper form without reference to the coroner. The fourth class of cases were those which had been attended by a general practitioner for a time, and concerning which he could communicate with the coroner, who would order a post-mortem examination, the cost to be defrayed from public funds, and again a certificate might be given without an inquest. The fifth class comprised cases in which relatives or executors might wish for a post-mortem examination, and here it was wise and a matter of courtesy to advise the coroner. Dr. Davies thought that practitioners who felt that there was some public value or clinical information to be derived from a post-mortem examination should be able to obtain what they wanted through one of these channels.

The CHAIRMAN said that this would be reported to the Representative Body. They did not feel that there was any large residual group where there was difficulty in obtaining a post-mortem examination or that there was need for any further regulation.

W.M.A. and Social Security

Dr. PRIDHAM, chairman of the International Relations Committee, brought forward a memorandum on the relations between social security institutions and the medical profession. The memorandum had been prepared by the World Medical Association. He said that the W.M.A. had taken certain action with regard to doctors in European countries who thought that they were exploited under social security schemes. He hoped that the Association would give a considered reply in view of the outstanding experience of Great Britain in this field.

Dr. WAND suggested a number of ways in which the document might be modified to bring it into line with the British point of view, and it was agreed that these modifications first be submitted to the B.M.A.'s International Relations Committee for its comments, and then brought back to the General Medical Services Committee.

Other Business

Objection was taken to a clause in a development plan submitted by Birkenhead Borough Council in seeking an amendment of proposals originally made under Section 22 (Care of Mothers and Young Children) of the National Health Service Act. This plan required a woman who desired to book a domiciliary midwife first to see the medical officer of the antenatal clinic and then to be referred to her own doctor and advised to consult him. Exception was taken to the suggestion that it should rest with the medical officer to advise on arrangements for the confinement. The scheme interposed the domiciliary midwife between the patient and the doctor. It was agreed to inform the local medical committee of the objection to the proposed arrangement.

Dr. HOWIE WOOD brought forward the question of a circular which the Medical Practitioners Union had issued to assistant and trainee general practitioners concerning a proposed section of the Union which was to be inaugurated to look after their interests. It was stated in the circular that the professional organizations had failed, by and large, to see the problems of entry into general practice from the assistant's point of view. Dr. Howie Wood thought it a pity, since the two bodies were working together in the Committee, that such a circular should have been sent out without an opportunity for its perusal by the Committee. Dr. CARDEW, on behalf of the Medical Practitioners Union, said that it would not be fair to his organization to make a hurried reply. He undertook to consult his council about the representation which had been made, and it was agreed to place the matter on the agenda of a subsequent meeting.

Among other matters considered by the Committee was a memorandum prepared by the Pharmaceutical Society concerning the accidental poisoning of children; a dispute over the payment of temporary resident fees in a holiday camp in Wales; various applications for the inclusion of appliances in the prescribed list; and a draft E.C.L. on the treatment of Service personnel on leave, revised after a meeting of representatives of the General Medical Services and Private Practice Committees, the Ministry of Health, and the Service departments.

National Insurance Defence Trust

Sitting as trustees of the National Insurance Defence Fund, the members again considered, on a particular case, the use of the Fund for setting up financial arrangements to make possible the retirement from the service of aged and infirm practitioners whose means were straitened and against whom in consequence of such age or infirmity complaints had arisen or were likely to arise. A resolution that the fund be used in this way was carried at the 1938 Annual Conference but rescinded at the 1943 Conference.

Dr. H. G. DAIN said that in his view money should be used for this purpose. It was not a charitable purpose, but concerned the reputation of the service. He hoped the Conference would be asked to go back on its later decision, and to agree that some of the money—it would not be a large amount, and the need for it would disappear in the course of years—would be allocated for this useful service. Dr. F. M. ROSE expressed a contrary view. The fund consisted of moneys collected for a particular purpose, not a charitable one. Medical benevolence should be the object of a separate fund.

After a short discussion it was agreed that an endeavour be made to ascertain the number of such cases and the prospective liability, and to consider the matter again at a further meeting of the Trustees.

SCOTTISH MEDICAL PRACTICES COMMITTEE

SIXTH REPORT

For the first year since the National Health Service started the average number of patients on doctors' lists throughout Scotland has fallen below 2,000. The Sixth Report of the Scottish Medical Practices Committee reviews the year ending June 30, 1954. It shows that at that date there were 2,543 general-practitioner principals in Scotland compared with 2,503 in 1953 and 2,424 in 1952. There has been a steady trend towards partnership, and about 60% of doctors in 1954 were in partnerships of two doctors or more. More young doctors are being admitted as junior partners than are setting up on their own.

Over 800 Applicants

There were 26 vacancies during the year that were not partnership vacancies. These were filled after advertisement, and over 800 applications were received. Commenting on this, the Report says: "Some applicants will, of course, have applied for more than one vacancy. An analysis of the advertised vacancies shows the average age of successful applicants during the year was 36, the range of ages being from 27 to 56."

The Committee has not classified any executive council area or part of an area as being entirely closed to new doctors, since, in its view, each application for admission to a medical list should be considered in the light of circumstances prevailing at the time of application. But many areas continue to be, in the Committee's view, underdoctored. More doctors are needed in Cumnock/Auchinleck; Irvine; Dumbarton; Burntisland; Cowdenbeath/Glenraig/Kelty/Lochgelly/Cardenden; Crossgates; Cupar;

Stranraer; Airdrie; Bellshill; Larkhall; Motherwell; Shotts; Bathgate; Linlithgow/Bo'ness; Kirkwall; Johnstone; Renfrew; Falkirk; Polmont; and Grangemouth. In these districts the average number of patients on doctors' lists is 2,731.

Doctors who are interested in setting up practices in any of these areas are asked to write to the executive council concerned.

Goodwill Reminder

The Committee draws attention to the fact that an exchange of practices is one method of enabling an established doctor to move to another area, and if both executive councils approve of an exchange the Committee normally will not object.

Those concerned in partnership agreements are reminded that the sale of goodwill is prohibited no matter how indirect that sale may be. The performance of services for an unreasonably low return is deemed to constitute the sale of goodwill whatever the intention of the parties may be.

Notes and News

The Minister has directed that £300 should be withheld from the remuneration of Dr. "X" because of his excessive prescribing. The Lancashire Executive Council had represented to the Minister in this case that a deduction of £600 should be made from Dr. "X's" remuneration (*Supplement*, November 20, 1954, p. 191).

The Government Actuary in his first five-yearly review of the National Insurance scheme covering the period July, 1948, to March, 1954, reports that injury benefits, which are the main item of expenditure, although of short duration, are keeping steady at about 750,000 a year and are unlikely to increase much in the future. Before the National Insurance Act, 1954, raised the benefits, industrial injury insurance contributions were 14% less than was necessary in order to keep the scheme solvent. The increase in contribution rates which accompanies the increased benefits has been so comparatively slight that the rates are now 18% below solvency level, and the Actuary predicts that the accumulated balance is likely to be exhausted by 1984.

According to the *Manchester Guardian* the chairman of the Manchester Regional Hospital Board complained, at a meeting of the board, that information needed for replies to Parliamentary questions had to be obtained nearly always at very short notice over the telephone, and under great pressure. This was particularly so when detailed statistics were involved. He was commenting on a recent instance where the board had been asked by telephone in the morning to supply information about tonsil and adenoid operations and waiting-lists in Manchester by telephone the same evening to enable the Minister to answer questions in the House of Commons the next day. In order to do this the board's officers had to get many figures affecting eight hospitals, and in the hurry errors were made by two hospital management committees and passed on by the board.

The Royal Masonic Hospital is proposing to spend about £500,000 on building a large extension to the hospital premises, which will provide 80-90 extra beds. At the annual meeting of the hospital Mr. Justice Hilbery, who presided, said that it was hoped to start work on the extension before the end of the year, and that it should be ready for occupation by the end of 1958. During recent months the waiting-list for the hospital has been about 600. Patients admitted during the year ended June 30, 1954, numbered 2,685—185 more than the previous year.

Extract from a regional hospital board agenda (reports of committees): "Mr. ——— expressed the hope that a catchment area would be introduced for female patients in the very near future."

TELEPHONE NOT REQUIRED BY TERMS OF SERVICE

EXECUTIVE COUNCIL DECISION

In a case heard before the Medical Service Committee of the London Executive Council recently the complainant alleged the failure of the respondent practitioner to visit and treat her daughter when so required. After hearing the case, the committee found the following facts: (1) That Dr. "D," acting as deputy for Dr. "C," visited the 8-year-old daughter of the complainant on June 9, 1954, diagnosed tonsillitis, and prescribed accordingly; (2) that on June 11, 1954, the child's condition worsened and the attendance of a doctor was necessary; (3) that the complainant did not wish to leave the child alone, and as the respondent practitioner had no telephone available to patients she was unable to call him by that means, and another doctor was asked to visit; and (4) that the complainant incurred expenses for medicine and treatment in respect of treatment provided privately by the doctor who attended on June 11.

In view of conflicting statements by the parties, the committee was unable to find that the practitioner did not comply with the terms of service. A general medical practitioner was not required by his terms of service to provide a telephone at his residence or surgery, nor, if he has a telephone, was he required to permit its use by persons on his National Health Service list. The committee decided to recommend to the executive council that there was no failure on the part of the practitioner concerned to comply with the terms of service for medical practitioners participating in the National Health Service.

The London Executive Council at its last meeting agreed with this recommendation.

COMMITTEE ON HOSPITAL SUPPLIES

Following a recommendation made in the report of the Central Health Services Council's Committee on the Internal Administration of Hospitals, the Council has appointed a Committee on Hospital Supplies "to investigate and report on the organization of all forms of hospital supplies, including their purchase, storage and issue, throughout the National Health Service."

The members of the Committee are: Sir Frederick Messer (Chairman of the Council), Professor Sir Henry Cohen (Vice-Chairman of the Council), Alderman A. F. Bradbeer, Mr. P. H. Constable, Sir Basil Gibson, The Hon. Sir Arthur Howard, Mr. F. S. Stancliffe, Mr. H. Lesser, Sir George Martin, Mr. T. E. Parker, and Captain J. E. Stone.

Persons and organizations interested in the subject are invited to forward memoranda of evidence to the Secretary of the Committee, Mr. L. B. Jacques, Ministry of Health, Savile Row, London, W.1.

Correspondence

University Teachers' Salaries

SIR.—The forthcoming increase in salaries of university staff has raised interest once again in the discrepancies which are apparent in the remuneration of those whose work brings them into contact with both university and hospital. That the situation was causing concern was well seen at a recent meeting of the Full-time Non-professional Medical Teachers and Research Workers Group Committee of the B.M.A. (*Supplement*, December 4, 1954, p. 213). This group is representative of both non-clinical and clinical teachers and of full-time medically qualified research workers whether employed by a university or by an independent body such as the M.R.C. Even within this group there are considerable differences in remuneration between people with

approximately equal qualifications and responsibility. The main result of these discrepancies, which invariably lead to a lower rate of remuneration than that obtainable in the N.H.S., is an increasing difficulty in recruitment of suitable personnel either for training or to replace those already trained who have moved to more remunerative posts in other branches of medicine.

The young fit medical graduate must of necessity be 27 years of age before he can begin his training in one of the specialties. At this age he is not going to be greatly attracted by the commencing salaries offered by most university or research posts. These posts are more and more being filled by non-medical graduates to whom, at the age of 22 or 23, the remuneration is not unduly out of step with what they can get elsewhere. It would be a pity if in the future most of the medical research work and preclinical teaching were to be in the hands of non-medically qualified workers, and unless something is done to make the position more attractive this is likely to happen. Regarding the fully trained established worker, no medical graduate wishes other than that remuneration should be of the same order for both medical and non-medical, provided the work done and the responsibility undertaken is of a similar standard.—I am, etc.,

Newcastle-upon-Tyne, 1.

IAN RANNIE,

Chairman,
Full-time Non-professional Medical Teachers and
Research Workers Group.

Assistants in General Practice

SIR.—May I add my weight to the recent correspondence on the status and remuneration of the new entrant into general practice, for it seems that, in spite of the assistants' obvious plight, there are still eyes that do not recognize the insecurity, exploitation, and professional subjugation to which this branch of the medical profession is subjected.

In my opinion the entrant into general practice should, in a well-balanced community, be able to expect a preliminary settling-down period or assistantship of approximately 12 months, followed with a fair degree of certainty by a post in which he receives adequate and fair reward (sufficient to support a home, wife, and family), security of tenure, and scope to develop his own clinical judgment, ideas, and methods. It is obvious that few assistantships fulfil these requirements, but a junior partnership is much nearer the goal. Further, in order to maintain standards, I should say that in this partnership he should not be expected to look after more than 2,500-3,000 patients. This figure is now quoted by several authorities as being the maximum number that can properly be cared for.^{1,2}

To return to the criteria of the second paragraph. The question of remuneration has been gone into extensively of late, and I need now only add another voice of protest against the action of the General Medical Services Committee on October 21 (*Supplement*, November 6, 1954, p. 169) in turning down the recommendation of the Assistants and Young Practitioners Subcommittee. In an attempt to be constructive I would suggest that the G.M.S. Committee reconsider and adopt, instead of rejecting, this motion. Secondly, that as a long-term policy the whole capitation system should be geared to accent the attention given to individual patients rather than the collection of large lists. This could be done by an expansion of the principle of an extra fee for extra service—e.g., allow extra payment for, say, minor surgery in the same way that extra payment is made for obstetric care and anaesthetics. This would allow principals with moderate lists to be in a stronger financial position and encourage them to take partners without an addition to their lists. Thirdly, as an interim measure, the salaries of senior house officers should be on a par with those of an assistant in general practice (£850-£1,000 per annum without deductions for residential emoluments). This would make it possible for a married man with a family to spend longer in hospital and encourage him to take postgraduate qualifications to diploma standard. It

would also ease the shortage of hospital residents and absorb some of the excess assistants who are now drifting round general practice.

As for the future, if it is assumed that ideally lists are between 2,500 and 3,000 and that there is ideal distribution, then how many more doctors can general practice absorb? And at equilibrium after the ideal distribution has been reached how many more will be needed each year? How do these figures compare with the number of doctors qualifying each year? If the standards mentioned earlier cannot be maintained for every graduate because even with ideal distribution there are too many of them, then we must know about it so that those unable to obtain a post in civilian practice in the U.K. may consider emigrating, joining one of the armed Services, or joining the Colonial Service. I for one am no longer content to follow a peripatetic existence as an assistant. If there is hope then let us strive to reach our ideals, but if there is none, either through excess numbers or lack of sympathy on the part of those in control, then let us abandon general practice as a career and go elsewhere.—I am, etc.,

Oxford.

G. E. LANGLEY.

SIR.—For some time I have been a persistent applicant for assistantships with a view to partnership, and I wonder whether I may bring to your notice one aspect of these applications.

Despite a request for return of copies of testimonials and a stamped addressed envelope on each occasion, the applications to private advertisers seem almost invariably to vanish into thin air. I have seldom received either acknowledgment of the application, notification of (presumptive) failure, or the return even of my stamp. This contrasts markedly with the kindness of the retiring principals of executive council vacancies, from whom I have always received prompt and helpful replies to my requests for information. Copies of particulars and testimonials professionally prepared may cost two shillings or more each, and it would seem only courteous to notify a candidate of possible success or certain failure without delay, and comply with a request for return of testimonials, if he has provided the means without extra work or expense to the advertiser.

Applicants will wish to inform an advertiser if they are no longer interested in the vacancy and must, of course, arrange appointments for interview at the principals' convenience, keep them punctually, be prepared to take and communicate firm decisions without delay, and stand by these decisions. It is difficult to notify a prospective employer of withdrawal if one knows of him only as a "box number" some weeks ago in a journal. To hold oneself free for interview at short notice indefinitely may be financially impossible or disrupt an employer's arrangements, and a firm decision is made more difficult by uncertainty whether an application for a more attractive-sounding vacancy has been rejected or the principal merely procrastinating over short-listing.

I would suggest that for the sake of good relations within the profession the maximum of courtesy should be exhibited between advertiser and applicant, even if it be shown only by early return of papers and duplicated rejection slips.—I am, etc.,

"NIL DESPERANDUM."

Ship Surgeons

SIR.—I should like to raise the matter through your columns of the employment by shipping companies of non-uniformed doctor holiday trippers in place of ship surgeons—a Merchant Service post which has been in existence since the time of Drake—thus excluding from employment the regular surgeon. The situation is satisfactory from one point of view only, that of the holiday tripper himself,

and is justified from none. If shipping lines find it the easiest way to acquire a doctor this is offset by the disadvantage to the master, who has virtually no control over his "surgeon," and to the crew whom he has to treat free. A doctor dressed as a passenger will inevitably think of himself as a passenger and will act accordingly. Can one imagine any shipping company carrying a bookkeeper or accountant free or paid in return for his services as purser, or a telegraphist as a non-uniformed radio officer? Why, then, should the position of surgeon be treated with such casual offhandedness? Is there any other profession that would permit the encroachment into it of the amateur (nautically speaking)? Would the Navy take any doctor for a cruise to look after the crew? The biggest lines do insist on uniform, but many do not. Again, the Merchant Navy surgeon is debarred from employment on the Australian run of at least three companies, the Blue Star, Port Line, and China Navigation Company. I believe it is true to say that the first two never pay a surgeon but rely on doctors who want a free trip to the U.K. and back, and the latter uses Australian holiday trippers and pays them as much, and sometimes more, than it pays its regular surgeons retained for pilgrim ships. On the home line the Blue Funnel takes the holiday-maker and does not insist on uniform.

Casual labour inevitably brings the profession of Merchant Navy surgeon into disrepute, propagating the idea that anything is good enough for the job. But there are many doctors anxious to make the sea a career. As the B.M.A. tends the interests of doctors in other spheres, is it not time it turned its attention to this problem? A pool for surgeons might be formed to mutual advantage which would help eliminate the need of the holiday tripper and the retention of doctors who have retired from practice and seek the social life and cheap gin of ships (and there are not few of these). Again, too, the stabilization of wages would help to encourage the surgeon to remain permanent. The disparity of rates is great, nor is it often in any way comparable to shore wages. The lowest-paying line offers £45 a month, the highest starts the surgeon at £57, second voyage £67, and third £72, thus making in one year a difference of £27 a month in two shipping companies. Further, some lines refused the recent National Maritime Board pay award to their surgeons alone of officers out of their whole fleets, with the result that in at least one company the surgeon found himself (a 3-striper) paid less than the second mate (a 2-striper) who might or might not have a master's ticket.

The solution lies in the associated efforts of the National Maritime Board and the B.M.A. both for the benefit of the surgeon and for those whom he has to treat. At least three important points might first be dealt with: that rates of pay be stabilized as are those of other ships' officers; that no surgeon be employed on a ship without uniform; and that any surgeon found drunk while at sea should be treated no less severely than is a watch-keeping officer in similar circumstances. There is no other way that the status of the ship surgeon can be restored to its once-respected place from that of holiday tripper and the gin-drinking "Doc" of book and film.—I am, etc.,

Sydney, Australia.

MICHAEL DILLON.

Consulting-room Privacy

SIR.—A disquieting practice is increasing in hospital out-patient departments. It is now common for consultants to have a stenographer with them in their consulting-rooms whose duty it is to take down the letters to general practitioners, and even in some cases the actual clinical notes themselves. Apart from decreasing the privacy of the consultation, it appears to me to be obnoxious to dictate a letter in front of the patient (surely frankness must suffer sometimes or harm be done), and even worse to dictate it in front of another patient: this does happen, incredible as it may seem.—I am, etc.,

Bushy, Herts.

D. G. WILSON.

H.M. Forces Appointments**REGULAR ARMY RESERVE OF OFFICERS****ROYAL ARMY MEDICAL CORPS**

Colonel W. M. Evans, O.B.E., M.C., T.D., from Army Emergency Reserve of Officers, to be Colonel.

Major (Honorary Lieutenant-Colonel) P. H. Shorthouse has ceased to belong to the R.A.R.O., on appointment to the Southern Rhodesia Territorial Force.

ROYAL AIR FORCE

Air Commodore J. C. Neely, C.B.E., Q.H.S., to be Air Vice-Marshal.

Group Captains D. A. Wilson, A.F.C., and L. M. Corbet, C.B.E., to be Air Commodores.

Wing Commanders, S. R. C. Nelson, O.B.E., and J. B. Wallace, O.B.E., to be Group Captains.

Squadron Leaders T. N. N. Brennan, D. S. Grant, and D. M. Keir to be Wing Commanders.

Association Notices**SCHOLARSHIPS IN AID OF SCIENTIFIC RESEARCH**

The Council of the British Medical Association is prepared to receive applications for research scholarships as follows:

An Ernest Hart Memorial Scholarship, of the value of £250.

A Walter Dixon Scholarship, of the value of £250.

Four ordinary research scholarships, each of the value of £200.

These scholarships are given to candidates recommended by the Science Committee of the Association as qualified to undertake research in any subject (including State medicine) relating to the causation, prevention, or treatment of disease.

In addition, applications are invited for the award of the following research scholarship:

The Insole Scholarship, of the value of £250, for research into the causes and cure of venereal disease.

Each scholarship is tenable for one year, commencing on October 1, 1955. A current scholar may apply to be re-appointed for a further year, though no scholarship will be renewed more than twice. A scholar is not necessarily required to devote the whole of his or her time to the work of research, but may be a member of H.M. Forces or may hold a junior appointment at a university, medical school, or hospital, provided the duties of such appointment will not, in the opinion of the Science Committee, interfere with his or her work as a scholar.

Applications for scholarships, including renewals, must be made not later than March 1, 1955, on the prescribed form, a copy of which will be supplied by the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, on application.

Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated.

A. MACRAE,
Secretary.

Branch and Division Meetings to be Held

CHESTERFIELD DIVISION.—At Walton Sanatorium, Chesterfield, Friday, February 11, 8.45 p.m., meeting. Talk by Dr. R. T. Gaunt: "Recent Advances in Medicine."

CROYDON DIVISION.—At 43, Wellesley Road, Croydon, Tuesday, February 8, 8.30 p.m., general meeting. Address by Dr. Samuel Oram: "Some Recent Advances in Cardiological Treatment."

DARTFORD DIVISION.—Thursday, February 10, clinical meeting. EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, February 10, 7.30 p.m., dinner; 8.45 p.m., symposium: "Management of Pain." Speakers, Miss Jean R. C. Burton-Brown, Dr. D. G. Sheffield, Mr. P. R. Wright, Dr. R. Wylie Smith, and Mr. W. E. C. Wynne.

ENFIELD AND POTTERS BAR DIVISION.—At St. Michael's Hospital, Chase Side Crescent, Enfield, Wednesday, February 9, 8.15 for 8.30 p.m., meeting. Clinical papers by (a) Dr. L. E. L. Ridge: "The Doctor's Bag"; and (b) Dr. A. Coady: "The Registrar in Out-patients."

GRIMSBY DIVISION.—At Scartho Road Infirmary, Grimsby, Tuesday, February 8, 8.30 p.m., meeting. Lecture by Dr. E. C. Ritter: "The Problem of Eczema." All medical practitioners in the area of the Division are invited.

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, February 10, 8.30 p.m., meeting. Dr. M. Ball: "With Sir Edmund Hillary in the Himalayas."

HENDON DIVISION.—At Hendon Hall Hotel, London, N.W., Tuesday, February 8, 8.45 p.m., meeting. Mr. S. H. Wass: "Chronic Pain in the Right Iliac Fossa."

KENSINGTON AND HAMMERSMITH DIVISION.—At St. Charles's Hospital, Ladbroke Grove, London, W., Friday, February 11, 3.30 for 4 p.m., clinical meeting.

LEICESTERSHIRE AND RUTLAND BRANCH.—At Grand Hotel, Leicester, Saturday, February 12, 7.30 for 8 p.m., dinner-dance.

METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C., Monday, February 7, 5 p.m., meeting. Lecture by Sir Arthur Porritt: "The Olympic Games." All senior students and recently qualified practitioners are invited.

MONMOUTHSHIRE DIVISION.—At Westgate Hotel, Thursday, February 10, 7.30 for 8.15 p.m., annual chairman's dinner. Members are invited to bring wives and friends.

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Silver Street, Edmonton, E., Tuesday, February 8, 8.30 p.m., meeting. Paper by Dr. Macdonald Critchley: "The Reevaluation of Oscar Wilde's Guilt." Dr. Critchley will also show his collection of Wildeana. Members of the Division are invited to take one or two guests.

NORTH STAFFS DIVISION.—At Grand Hotel, Hapley, Tuesday, February 8, 8 p.m., supper meeting. Talk by the Lord Bishop of Lichfield, The Rt. Rev. A. S. Reeve: "Some Thoughts on the National Health Service."

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, February 8, 8.30 p.m., meeting. Lecture-demonstration by Dr. A. A. Mason: "The Use of Hypnosis in Medicine."

SCARBOROUGH DIVISION.—At Scarborough Hospital, Thursday, February 10, 8.30 p.m., meeting. Mr. R. W. Nevins: "Ulcerative Colitis."

SOUTH-EAST ESSEX DIVISION.—At Southend General Hospital, Wednesday, February 9, 8.30 p.m., meeting. Film and address by Professor Ian Aird: "Conjoined Twins."

SOUTH ESSEX DIVISION.—At Oldchurch Hospital, Romford, Friday, February 11, 9 p.m., meeting. Annual B.M.A. Lecture by Dr. Melville D. Mackenzie: "World Health Organization."

SOUTH-WEST ESSEX DIVISION.—At Connaught Hospital (new Out-patient Department), Orford Road, Walthamstow, E., Wednesday, February 9, 8.30 p.m., meeting. Annual B.M.A. Lecture by Dr. J. Smart: "Carcinoma of the Bronchus."

SUNDERLAND DIVISION.—At Royal Infirmary, Sunderland, Friday, February 11, 8 p.m., address by Dr. A. W. Woodruff: "Management of Tropical Disease in Britain."

TEES-SIDE BRANCH.—At Darlington Memorial Hospital, Tuesday, February 8, 7 p.m., clinical meeting.

TUNBRIDGE WELLS DIVISION.—At Sevenoaks Hospital, Wednesday, February 9, 8.30 p.m., clinical meeting.

WEST SUFFOLK DIVISION.—At Everard's Hotel, Bury St. Edmunds, Tuesday, February 8, 8.30 p.m., annual meeting.

S.H.M.O. Meeting

A meeting of Senior Hospital Medical Officers in the North-east Metropolitan Region will be held on Tuesday, February 8, at 7 p.m. at the Finsbury Health Centre, Pine Street, E.C.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crews.

Urban District Councils.—Houghton-le-Spring.

OCCUPATIONAL HEALTH**REMUNERATION OF PART-TIME INDUSTRIAL MEDICAL OFFICERS**

An all-day meeting of the Occupational Health Committee was held at B.M.A. House on February 2. Dr. J. A. L. VAUGHAN JONES presiding. The Committee considered a revised draft statement on the remuneration of part-time industrial medical officers. Dr. J. ROGAN, chairman of the subcommittee concerned, said that, after careful comparison with the scales for whole-time officers already put forward to the Council, his subcommittee had felt that there was a rough equivalence. Payment of part-time industrial medical officers by annual salary rather than by sessional fees was preferable, as it seemed to offer a better opportunity for the part-time man to be integrated into the undertaking. His subcommittee had been in some perplexity over the question of consultants. It was difficult to define the role of a consultant in industrial medicine, and it must be appreciated that a number of industrial hazards might well call for the service of consultants who had had no experience in industrial medicine. The conclusion was reached that the remuneration of the consultant services to any industrial undertaking should be a matter of private negotiation between the consultant and the firm concerned.

The point of chief discussion in the draft statement was the setting up by the Association of an advisory panel of practitioners experienced in occupational health services which would be available to give guidance to individual managements if required. Professor I. G. DAVIES expressed some misgiving about this arrangement, which, he said, would call for the utmost care if the functions of the panel were not to be exceeded by recommending individual applicants for posts. Other members also disliked the suggestion of some central body being set up as arbiter in such situations.

Dr. ROGAN agreed that mismanaged and badly run advisory panels might become an abuse rather than a benefit. But it must be borne in mind that many managements did not know much about industrial medicine, and might be only too pleased to acquire merit in the eyes of the Government by setting up an unsuitable and ill-thought-out industrial medical service. He thought that managements should have some authoritative body from which they could obtain information about their commitments, the sort of appointments that would be necessary, and the nature of the team required. He was not advocating that any panel should adjudicate on individual appointments; this would be outside its terms of reference. Many managements, however, were in real difficulty and would welcome advice in general terms.

Dr. J. A. A. MEKELBURG said that, over the years, he had received quite a number of inquiries from managements on

what sort of service they should install, and he had sometimes been in a quandary as to the advice he should give. He was therefore much in favour of a panel restricted to giving advice on the sort of service required. He would not agree that the panel should recommend individuals for appointments.

The draft statement, with some verbal amendments, was approved.

Occupational Dermatitis

Dr. H. ALEXANDER brought forward recommendations from a subcommittee which had been considering occupational dermatitis in relation to the National Insurance (Industrial Injuries) Act. The first recommendation was that the Ministry of National Insurance should be informed that there was reason to believe that in certain areas not all persons claiming industrial injury benefit on the ground of occupational dermatitis were being referred to an examining medical practitioner, and called for an investigation of this position throughout the country; also that the Ministry should be asked for information about the proportion of cases of dermatitis which are accepted by insurance officers as occupational on certification by the industrial medical officer or a hospital.

Dr. C. H. WHITTLE said that the main interest in this matter was to get the employees seen at the commencement of the illness. This affected the ultimate prognosis as regards both the disease itself and the morale of the patient. The earlier consultation was entirely in the interests of the employee.

The recommendations were agreed to, and it was also agreed that further representations should be made to the Ministry that all cases claiming to be suffering from occupational dermatitis persisting after 21 days be referred automatically to a dermatologist. The Ministry is also to be asked to arrange for examining medical practitioners to receive notification of the dermatologist's diagnosis when they themselves had made no diagnosis or their decision had been reversed. Another request to the Ministry is to arrange for routine notifications, with the consent of the employee, to be sent by the insurance officer to the employing firm and to the local inspector of factories in any case in which there has been a diagnosis of the condition.

Certain other recommendations with regard to post-graduate study in a skin department for doctors without experience in dermatology who have been appointed as examining medical practitioners were referred to the Dermatologists Group Committee.

Sectional Representation in the R.B.

Dr. L. S. POTTER, secretary of the Organization Committee, attended for a discussion on a matter which has been before several committees of the Association concerning

the advisability of sectional representation in the Representative Body. The proposal had been made to the committee which is considering the Association's Constitution on the ground that, with entirely territorial representation as at present, minority opinion might not be able to find expression. On the other hand, it had been pointed out that the proper place for such sectional representation was on the standing committees, of which Occupational Health was one.

The CHAIRMAN said that sectional representation might lend itself to pressure group formation. Some members of the Committee expressed the view that the Representative Body was not as knowledgeable as it might be on matters of occupational health. Another point of view was that if any sectional representation were admitted there might be a demand from other quarters, including the specialist groups, for similar representation.

The general opinion of the Committee was adverse to the proposal; it was pointed out that the chairman of the Committee (or, failing him, the deputy chairman) was a member of Council and as such attended Representative Meetings, and this was considered to be a sufficient safeguard.

Other Business

The Committee considered the arrangements for the second conference of Advisory Councils on Occupational Health, to be held on April 20, when the topic for discussion will be "The Adolescent in Industry."

Suggestions were made for nomination as Mackenzie Industrial Health Lecturer for 1956. It was suggested that, as the meeting of the Association of Industrial Medical Officers will be held in London, the lecture should be held in the Great Hall of B.M.A. House in London, and with a view to attracting a lay audience.

It was reported that a Bill to make specific provisions for health, welfare, and safety in shops, offices, catering establishments, and other places had been introduced into the House of Commons, but had not yet been printed. The Committee agreed that at its next meeting, by which time presumably the Bill would be available, the committee should give it an early place on its agenda.

COST OF DRUGS AND MEDICINES

COMPTROLLER AND AUDITOR GENERAL'S REPORT

The results of a number of investigations by accountants of the Board of Trade on behalf of the Health Departments are noted in the Comptroller and Auditor General's report in the *Civil Appropriation Accounts, 1953-4*.¹ One investigation covered four selected main groups of basic drugs—antibiotics, hormones, insulin, and vitamins—which cost the health service in England and Wales some £10m. annually. A wide diversity of trading results was found for hormones and certain antibiotics, some firms appearing to have made losses while some of the larger suppliers seemed to have made 30% and 40% profit on selling prices. The manufacturers, however, expressed fundamental disagreement with the basis normally adopted by the Government for computing both costs and capital employed.

The Ministry of Health had told the Auditor General that it considered that the general level of prices charged by secondary manufacturers of non-proprietary drugs and wholesalers—averaging 7.4% on capital employed, the highest being 24%—not to be excessive. Discussions with the industry are continuing.

Proprietary Preparations

Reports were also received from the accountants on 19 firms covering 76 proprietary preparations out of the total of 91 selected for investigation. The cost to the National

¹ *Civil Appropriation Accounts (Classes I-V), 1953-4. H.M.S.O., London.*

Health Service of these 91 preparations had been estimated by the Ministry at £4.7m., apart from the hospital usage, the extent of which was not known. The investigating accountants found difficulties in segregating figures for particular products and for home and export markets, and in making appropriate allowances for expenditure on research, advertising and sales promotion, and for the financial arrangements of some firms with foreign associates. Their calculations of the profits obtained on the various preparations gave figures ranging up to 60% on selling prices. Where information was made available from which to calculate capital employed the returns ranged up to more than 100% on capital.

Memorandum from Industry

The Ministry informed the Auditor General that a memorandum had been received from the Association of British Pharmaceutical Industry dealing with the complexities involved in attempting to find an acceptable basis for calculating prices reasonable for the Exchequer to pay and at the same time economically fair to the industry. Because of the far-reaching effects upon the whole economy of the pharmaceutical industry of the prices paid for health service supplies, the Ministry was satisfied that the action to be taken and the principles to be applied required examination and discussion with the industry as a whole. Three firms had made priced reductions estimated to save the Exchequer about £850,000 per annum. Further price reductions were expected in response to a recent approach by the Ministry.

Prescribing Costs

The Comptroller and Auditor General reports that in England and Wales prescriptions of proprietary preparations rose from 18% of all prescriptions in 1950 to 27% in 1953, representing 44% and 58% respectively of the total costs of ingredients prescribed in those years. In February, 1954, a sample analysis indicated that the proportion of proprietaries had increased to 29%. The monthly average cost of prescriptions, after some decrease towards the end of 1953 and early months of 1954, rose in August, 1954, to 4s. 3.73d., the highest figure recorded since the inception of the N.H.S.; in 1949 the average cost was 3s. 1d.; in 1947, under the more limited scope of the National Health Insurance scheme, it was 1s. 8d.

In reply to an inquiry whether any further steps were to be taken to reduce prescription costs, the Ministry informed the Auditor General that the main cause of the increase in average prescription costs, apart from the element of the remuneration of chemists and appliance contractors at present under inquiry, was the introduction of an increasing range of expensive preparations designed to treat conditions that in the past had not been, or not to the same extent, medically treated. Antibiotics in particular had added to the cost of the general pharmaceutical service, and trusses and elastic hosiery had not been prescribable under the National Health Insurance scheme. Lastly, as the cost of some of the more widely prescribed preparations—for example, penicillin—was reduced additional and improved preparations were produced. These, while having certain medical advantages, were more expensive; and there was continuous publicity directed to doctors about new preparations.

The Ministry further stated that it continued to be its policy to bring all relevant facts to the notice of doctors and to ask for their co-operation. In addition to circulating the information referred to and periodical *Prescribers' Notes*, a start had been made in providing them at regular intervals with a cost of their prescriptions compared with the average cost in the area. More detailed reports would be prepared for those whose prescribing costs appeared unnecessarily high; these doctors would be visited by the regional medical officer and where it seemed justified a warning letter would be sent. Where there was no improvement, the matter would be referred to the local medical committee.

IRISH MEDICAL ASSOCIATION

At a recent meeting of the Irish Medical Association's Central Council Dr. J. C. McFeely was appointed as representative to the Council of the B.M.A. in response to an invitation by the British Medical Association. Drs. P. T. O'Farrell, P. Moran, and J. C. McFeely were appointed to attend the B.M.A.'s Annual Representative Meeting to be held in London on June 1-4.

The current issue of the *Journal of the Irish Medical Association* also reports that the association, at the request of the Minister of Health for Eire, has appointed Dr. A. McCarthy and Mr. T. C. J. O'Connell to act on an advisory committee which the Minister proposed to appoint in connexion with the institution of a national voluntary health scheme. Following a discussion on voluntary health insurance, the council of the I.M.A. passed two resolutions: (1) that a special subcommittee be appointed by the executive to advise on this matter; and (2) that the provisions of the Health Act, 1953, as it stands militate against the success of any voluntary insurance scheme.

EXCHANGE VISITS WITH CANADA AND THE U.S.A.

The scheme for exchange visits between members of the American, British, and Canadian Medical Associations, which has the approval of the Bank of England, will be continued during the financial year April 1, 1955, to March 31, 1956.

Procedure

Three doctors from Britain may visit Canada in exchange for three doctors from Canada, and three doctors from Britain may visit the U.S.A. in exchange for three doctors from the U.S.A. Each doctor from Britain will be required to make all his own travel arrangements and will also be required to deposit up to £200 with the B.M.A. in London. On arrival in Canada or the U.S.A. he will receive the equivalent of his deposit in dollars. Similarly, each Canadian and U.S. doctor on arrival in Britain will receive the sum deposited in sterling.

Duration of Visits

The duration of the visits is left to the discretion of the doctors concerned. The American, British, and Canadian Medical Associations cannot accept any responsibility for a doctor who allows his visit to outlast the money placed at his disposal.

Applications are invited from members of the B.M.A. to take part in such exchanges. Medical practitioners in all branches of the profession, including general practice and public health, are eligible. Each applicant must state the object of his intended visit, and should also give the approximate date on which he hopes to depart. (Successful applicants will in due course be required to furnish exact dates and details of travel.) Applications must be received by the Secretary of the Association by March 1, 1955.

TUBERCULOSIS AND NATIONAL SERVICE

In a Ministry circular (H.M. (55) 13) dated February 3, boards of governors and hospital management committees are asked to send to the appropriate local office of the Ministry of Labour and National Service particulars of all men born in 1937 who are shown by chest clinic registrars to have a tuberculous history.

The particulars, which are to be given on a special form, are to be treated as confidential. Information to be given includes full name, last known usual place of residence, year of birth, localization of disease, if treatment is still being received, and, if not, the last date of treatment. The form is to be signed by the physician in charge of the chest clinic.

REGRADE OF APPOINTMENTS

SUCCESSFUL APPEALS

A consultant anaesthetist's recent appeal to a regional hospital board against the grading of his S.H.M.O. appointment has been successful. In 1951 this anaesthetist's personal grading was changed on appeal from S.H.M.O. to consultant, but his improved status carried no increase in remuneration, as the grading of his appointment remained that of S.H.M.O. Although he had made representations to the board that the work he did was of a kind normally done by a consultant anaesthetist, involving all types of major surgery, it was not until the autumn of 1954 that his case was heard under the regional Whitley appeal machinery and the regional board reversed its previous decision and designated his appointment as a consultant appointment. The change was made retrospective.

A similar appeal took place in Bristol. An S.H.M.O. anaesthetist appointment was held by a consultant on the staff of a teaching hospital. The anaesthetist appealed for the regrading of his appointment, and after some delay this appeal also was allowed.

Questions Answered

Vaccination Certificates

Q.—I am sometimes asked by N.H.S. patients to vaccinate them or give T.A.B. injections because they are going overseas to work or for a holiday. Although I give these injections free under the N.H.S. can I charge for filling up the appropriate international certificate? Can the vaccine be prescribed on an E.C.10 form?

A.—The injections themselves come within the terms of service of a general practitioner if the patient is on his list, but the practitioner may charge a fee for the international vaccination certificate. The vaccine should be obtained from the local authority.

Hire Purchase of Car

Q.—I am an assistant in general practice and receive a car allowance which was settled at the time I accepted the post. I have since purchased a new car. Can I claim tax relief for the interest payable on hire-purchase terms and depreciation allowance on the car?

A.—The interest element in the payments to be made under the hire-purchase agreement and the annual allowance for depreciation of the car would be allowable—apart from any restriction for private use of the car—if the contract of employment placed on the employee the burden of the cost of keeping a car for professional use. But in this case the questioner receives an allowance for that purpose from his principal, and in general that would debar him from claiming the deductions mentioned. If he were employed by an authority on the normal terms that would be conclusive (see the decision in the case of Hamerton v. Overy), but in the actual circumstances the questioner might be able to prove that the allowance he receives is inadequate and could then claim the excess of the total allowable amount over the allowance paid to him—but the prospect of success is not thought to be very good.

Pre-registration Appointments

Q.—Is there a definite ruling that pre-registration candidates must be given preference in making an appointment to a post recognized for pre-registration purposes?

A.—There is no definite ruling that pre-registration candidates must be given preference. The Ministry of Health has, however, informed hospital management committees that in general it deprecates the appointment of registered practitioners to these posts to the exclusion of pre-registered practitioners.

Correspondence

Practice in the Highlands and Islands

SIR,—I should like to join with Dr. James Guthrie in his remarks (*Supplement*, January 15, p. 17), particularly in relation to holiday relief. He says: "It may be a dangerous principle to admit—but could the State not take cognizance of this unusually high expense and make some provision for it?" I cannot see the danger when the Department of Health used to contribute towards a locum's expenses for a month, I think every second year. This is something Dr. Guthrie may not know, or may have forgotten. The Department of Health's attitude would appear to be that we are now all in the same boat, and that a practice in the Highlands is the same as a practice anywhere else in the State service, so much so in fact that it seems to think it reasonable to pay the Highlander (on the average) 1s. 6d. a unit for mileage instead of the 2s. paid to the rest of the country; and this is still so after nearly seven years of State medicine. This may be rectified eventually, but all one can hope for is parity with the rest of the country. When one remembers that the roads are worse, petrol, oil, repairs, etc., are all dearer, that a car must be replaced more frequently because of the effects of road and climate, that there is even an extra £20 or £30 "delivery" charge, and that in most practices a second vehicle is necessary as a standby, parity still leaves the Highlander with the worse bargain.

The Highlander's list is limited, not from choice but by geography. He cannot "poach" a bigger list from his neighbour, and so fares badly under the "loading" scheme. He likewise cannot take advantage of the group practice loans, or the notional list, to provide a partner to share the load and give him a "locum free" holiday. Telephone bills, education costs, freight charges, etc., are all heavier than average, and are but a few of the extra financial burdens the Highlander must carry. His only obvious advantage is his house, but this is for the benefit of the practice, not the doctor; let there be no doubt about that. There is, of course, the inducement grant, but that is a vexed question which would take too long to go into here. Suffice to say it is not the answer.

There is no doubt (as the recent storms have surely proved) that the Highland doctor can and does work hard, and it takes a special type of doctor to look after the Highlands and Islands. I think that this job is best done by a man of the Highlands, trained in and for the Highlands, and I mean no offence, and make no apology for saying so. It is in the best interest of the Highlands and Islands not only to attract but to retain in these areas the most suitable men for them.

I feel that the reintroduction of the old Highlands and Islands holiday relief scheme, with (most important) the Department assuming responsibility for the locum, would go a long way to achieve this and to offset some of the adverse effects which the loading and notional lists, etc., have had on the Highland practices and practitioners.—I am, etc.,

Lochinver, Sutherland.

R. S. C. FERGUSON.

Assistants in General Practice

SIR,—The Assistants and Young Practitioners Subcommittee can certainly congratulate itself on the support it enlisted in the G.M.S. Committee (*Supplement*, January 1, p. 1), especially as no relevant statistics were forthcoming and its unsound claims and arguments were not difficult to rebut. Of course, the arguments are helped considerably by constant socialist propaganda which perceives in a reduction of lists a further step to a salaried State Service. The aversion of principals to airing their views, whether from feelings of delicacy or apathy, may be penalized by a small minority gaining its objective. Both the Working Party and the Central Health Services Council report¹ considered the present limits fair and reasonable. The principal with an

assistant and a full list has already suffered financial loss through the Danckwerts award without comment. It would seem advisable, before further reductions were contemplated, to approach the principals concerned to ascertain how many partnerships would eventuate after the reductions. The number might be negligible, and the only result to swell the lists of neighbouring popular practices. Patients who are forcibly transferred from the doctor of their choice are aggrieved and resentful.

I would suggest that any help should come from the profession as a whole—for example, abolition of the 14 days' waiting period to transfer, help to elderly practitioners to retire earlier from practice and to young doctors accepting small-list vacancies, notification of whether a view to partnership is offered (a long succession of assistantships with view being suspicious); in other words, positive rather than restrictive measures.—I am, etc.,

London, S.E.4.

T. RICHARDSON.

REFERENCE

¹ Central Health Services Council. Report of the Committee on General Practice within the National Health Service, 1954, para. 42. H.M.S.O., London.

Doctors' Telephones

SIR,—The recent statement by the London Executive Council that a doctor need not have a telephone (*Supplement*, February 5, p. 42) surely is not a decision of that council but a ruling of the National Health Service. The council could also have added that a doctor need not have a car—another ruling of the National Health Service. But the statement has caused one leading article in a national newspaper (*Daily Express*, January 29, 1955) to comment that: "Most doctors make arrangements to ensure that they can be reached by phone. All of them should do so. If that is hard on their leisure time, the alternative might be far, far harder for some unfortunate patient."

Do we really deserve this rebuke? If a doctor, in whole-time service, installs a telephone for the use of his patients and his hospitals, he does so at his own expense, and must meet almost all of the essential services and maintenance costs out of his own pocket. If, in addition, he purchases a motor-car and places this too at the full-time service of his job, he will be very considerably out of pocket each year. Since the ruling of the National Health Service is that neither "are essential to his employment," he will receive no consideration from the income-tax authorities. If the "full-timer" is a consultant surgeon and the director of a large and busy emergency hospital service, his telephone will be used constantly by his and other hospitals, general practitioners, patients, and, indeed, by officials of the health service itself. His car must be always available to his job. At the end of the year these services will represent a considerable amount from his gross income. If he has the time to jot down the pennies for the relatively few official calls he makes, or the energy to add up the mileage of his car when he returns home from an emergency, he may be returned 20% of the cost of these services.

Although these matters have been known in the National Health Service for years, a statement that a telephone or a car is essential to any medical man engaged in full-time clinical work is still refused. One wonders where such terms of service will lead medicine. Past generations have been trained to sacrifice their leisure time to their patients. If the National Health Service asks, in addition, a considerable financial sacrifice, what type of medical men will future generations know?—I am, etc.,

Birmingham 15.

WILLIAM GISSANE.

Drugs for Private Patients

SIR,—The present Minister of Health—Mr. Iain Macleod—has held his important office for a longer time than most of his predecessors, and I think the reason is that he has all the qualities which make for the success of the consultant physician. He told the delegation of doctors who waited upon him with regard to the question of N.H.S. drugs for private patients that the proposal was not repugnant to

Conservative principles, and that the door was by no means shut. On the other hand, he could give no undertaking that a change either could or would take place.

There was once a very successful physician who, when he came to give his prognosis to the awed and spellbound relatives of the patient involved, used to say that there were three courses the illness might take: (1) that the patient might get better; (2) that the patient might get worse; (3) that the patient might continue just as he was.—I am, etc.,

Camberley.

LESLIE HARTLEY.

H.M. Forces Appointments

TERRITORIAL ARMY

Lieutenant-Colonel (Brevet Colonel) (Acting Colonel) O. G. Prosser, M.C., T.D., R.A.M.C., to be Colonel.
Lieutenant-Colonels (Acting Colonels) E. H. Evans, C. J. Wells, M.B.E., and R. G. W. Ollerenshaw, T.D., R.A.M.C., to be Colonels.

Majors (Acting Colonels) J. B. Mackay, M.B.E., T.D., and W. Milburn, M.B.E., T.D., R.A.M.C., to be Colonels.

ROYAL ARMY MEDICAL CORPS

Colonel (Acting Brigadier) W. R. Ward, T.D., Q.H.S., to be Brigadier.

Lieutenant-Colonel J. V. Todd has been granted the acting rank of Colonel.

Majors (Acting Lieutenant-Colonels) M. I. Silvertown, T.D., M. N. S. Duncan, T.D., C. W. Healey, M.C., T.D., R. West, J. L. Cardwell, C. H. Tonge, T.D., D. D. Cranna, D. L. Nicholls, W. K. McCollum, T.D., S. A. Bower, T.D., and A. C. D. Parsons to be Lieutenant-Colonels.

Captain (Acting Major) C. Weymes has been granted the acting rank of Lieutenant-Colonel.

Captain J. Montgomery has been granted the acting rank of Major.

TERRITORIAL ARMY RESERVE OF OFFICERS; ROYAL ARMY MEDICAL CORPS

Colonels T. F. Arnott, O.B.E., T.D., and L. J. Haydon, T.D., have ceased to belong to the T.A.R.O., retaining the rank of Colonel.

Colonel M. MacEwan, D.S.O., O.B.E., D.F.C., T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the rank of Colonel.

Lieutenant-Colonel (Honorary Colonel) J. A. Bingham, O.B.E., T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the honorary rank of Colonel.

Lieutenant-Colonels F. R. Bettley, T.D., and R. A. Read, T.D., have ceased to belong to the T.A.R.O., retaining the rank of Lieutenant-Colonel.

Major (Honorary Colonel) A. C. Crawford, T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the honorary rank of Colonel.

Majors (Honorary Lieutenant-Colonels) J. K. Steel, T.D., M. S. Good, T.D., D. MacD. Lyon, O.B.E., S. Gifford, B. G. Macgrath, R. B. Brew, T.D., R. J. Ormsby, J. M. Scott, O.B.E., I. MacPherson, R. D. Holloway, T.D., W. P. Purvis, T.D., J. J. M. Brown, O.B.E., D. L. C. Bingham, A. L. Potter, and M. B. Hallam have ceased to belong to the T.A.R.O., retaining the honorary rank of Lieutenant-Colonel.

Major (Honorary Lieutenant-Colonel) P. J. May, M.B.E., T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the honorary rank of Lieutenant-Colonel.

Major W. G. Ferguson, from the Active List, to be Major, and has been granted the honorary rank of Lieutenant-Colonel.

Majors J. L. Fraser, T.D., T. McCarroll, M.C., and H. Bloom, from the Active List, to be Majors.

Majors A. W. Forrest, P. Walsh, T. A. Danby, T.D., and L. C. Bousfield have ceased to belong to the T.A.R.O., retaining the rank of Major.

Captain (War Substantive Major) (Honorary Colonel) M. E. D. Roberts has ceased to belong to the T.A.R.O., retaining the honorary rank of Colonel.

Captain (Honorary Lieutenant-Colonel) R. W. Hendry has ceased to belong to the T.A.R.O., retaining the honorary rank of Lieutenant-Colonel.

Captains (Honorary Majors) C. W. A. Kimbell, W. I. Walker, E. G. Collins, D. L. Charters, M.B.E., J. E. S. Stephens, J. C. Gibson, F. C. Angior, H. A. Constable, H. B. Stallard, M.B.E., R. Walmsley, J. Parkes, H. F. Patrick, and J. M. Henderson have ceased to belong to the T.A.R.O., retaining the honorary rank of Major.

Captain (Honorary Major) H. E. Blake, T.D., has relinquished his commission, retaining the honorary rank of Major.

Association Notices

ELECTION OF MEMBERS OF COUNCIL

Notice is hereby given that nomination of candidates for election as members of Council, 1955-6, (a) by the following Divisions and Branches, (b) by public health service members, and (c) by women members, must be forwarded in writing so as to reach me not later than Wednesday, March 16, 1955.

Forty Members by Branches in Great Britain and Northern Ireland

Group	England and Wales	No. of Members of Council to be Elected by Group
1	North of England Branch: Tees-side Branch	2
2	East Yorkshire Branch: Yorkshire Branch	3
3	North Lancashire and Westmorland Branch	1
4	Divisions in Cheshire: Birkenhead and Wirral; Chester; Crewe; Hyde; Macclesfield and East Cheshire; Mid Cheshire; Stockport; Wallasey	1
5	Lancashire Divisions of Merseyside Branch: Liverpool; St. Helens; Southport; Warrington. Isle of Man Branch	1
6	Lancashire Divisions of South Lancashire and East Cheshire Branch: Ashton-under-Lyne; Bolton; Bury; Leigh; Manchester; Oldham; Rochdale; Salford; Wigan	1
7	Derbyshire Branch: Nottinghamshire Branch: Lincolnshire Branch: Leicester and Rutland Branch	2

Public Health Service Members

Two members of Council are nominated and elected by members of the Association employed in the public health service as defined in By-law 1 (3). Candidates must be members of the public health service as so defined.

One Woman Member

One woman member of Council is nominated and elected by women members of the Association.

Nominations

The nominations must be on the prescribed forms, copies of which can be obtained on application to me. In the case of the 40 members to be elected by Divisions and Branches, the nomination may be by a Division or Division-Branch as such, or by not fewer than three members of any Branch in the Group.

A notice will be published by the Council in the *British Medical Journal Supplement* on March 26, 1955, of the candidates nominated. Where contests occur, voting papers containing the names of all duly nominated candidates will be issued on March 30, 1955, from the Head Office, British Medical Association, Tavistock Square, London, W.C.1. to each member in the Group, or to the public health service members, or to women members. A notice will be published by the Council in the *Supplement* of April 23, 1955, giving the results of the elections where there have been contests.

A. MACRAE,
Secretary.

Election of Members of the Council by Branches not in Great Britain or Northern Ireland

As a result of the nominations received for the election of members of Council by Branches overseas, the following have been elected for the three years 1955 to 1958:

Branches in the Republic of Ireland ..	J. C. McFreely, Dublin.
New Zealand and Fiji ..	C. J. C. Britton, London.
New South Wales and Queensland ..	Isaac Jones, London.
South Australian, Tasmanian, Victorian, and Western Australian ..	Myles L. Formby, London.
Grouped African Branches ..	P. C. C. Garnham, Slough, Bucks.
West Indian Branches ..	C. Belfield Clarke, London.

No nomination has been received in respect of the Far Eastern Group of Branches.

A. MACRAE,
Secretary.

Diary of Central Meetings**FEBRUARY**

11 Fri.	Ophthalmic Qualifications Committee, 1.30 p.m.
11 Fri.	Ophthalmic Group Committee, 2 p.m.
15 Tues.	Amending Acts Committee, 2 p.m.
16 Wed.	Office Committee, 3.30 p.m.
17 Thurs.	G.M.S. Committee, 10.30 a.m.
18 Fri.	Scientific Programme Subcommittee, Arrangements Committee, 10 a.m.
18 Fri.	Arrangements Committee (Brighton, 1956), 11 a.m.
18 Fri.	Tuberculosis and Diseases of the Chest Group Committee, 12 noon.
18 Fri.	Overseas Committee, 2 p.m.
22 Tues.	Subcommittee on Practice Vacancies, G.M.S. Committee, 2 p.m.
23 Wed.	Finance Committee, 2 p.m.
23 Wed.	Practice Accommodation Subcommittee, G.M.S. Committee, 2 p.m.
24 Thurs.	Evidence Committee on Divine Healing, 10 a.m.
24 Thurs.	Journal Committee, 2 p.m.
25 Fri.	Full-time Non-professional Medical Teachers and Research Workers Group Committee, 2 p.m.

Branch and Division Meetings to be Held

BIRMINGHAM DIVISION.—At 154, Great Charles Street, Birmingham, Tuesday, February 15, 8.30 p.m., meeting. Lecture by Dr. V. Mary Crosse: "Round the World with Premature Babies."

BUCKINGHAMSHIRE DIVISION.—At Griffin Hotel, Amersham, Friday, February 18, 8.30 p.m., meeting. Address by Dr. P. H. Addison (Assistant Secretary, Medical Defence Union): "The Law as it Affects Medical Practitioners."

CITY DIVISION.—At B.M.A. House (Committee Room C), Tavistock Square, London, W.C., Tuesday, February 15, 8.30 p.m., meeting. Annual B.M.A. Lecture by Sir Geoffrey Marshall: "The Problems of Chest Diseases in General Practice." Members of the St. Pancras and Tower Hamlets Divisions are invited.

DUDLEY DIVISION.—At Bell Hotel, Market Street, Stourbridge, Thursday, February 17, 7.45 for 8.15 p.m., annual dinner. Principal guest, Dr. A. M. Nussey.

EAST SOMERSET DIVISION.—At Reception Room, Bristol University, Friday, February 18, 5 p.m., public meeting for purpose of forming West of England Branch of Multiple Sclerosis Society. All medical practitioners in the area of the Division are invited.

GUILDFORD DIVISION.—At the Mitchell Hall, Royal Surrey County Hospital, Guildford, Thursday, February 17, 8.30 p.m., meeting. Dr. M. Ball: "With Sir Edmund Hillary in the Himalayas." Doctors may bring their wives. (Meeting postponed from February 10.)

KINGSTON-ON-THAMES DIVISION.—At Griffin Hotel, Kingston-on-Thames, Wednesday, February 16, 7.30 for 8 p.m., dinner meeting, followed by a Brains Trust. Panel, Mr. A. Lawrence Abel, Mr. Michael Barsley, His Honour J. D. Casswell, Q.C., and Mr. A. Dickson Wright. Guests are invited.

MID-ESSEX DIVISION.—At Out-patient Department, Chelmsford and Essex Hospital, London Road, Chelmsford, Wednesday, February 16, 8 p.m., meeting. Talk by Mr. M. Leigh-Taylor: "The Law and the Doctor—Legal Problems and Medical Practice."

NORTH OF ENGLAND BRANCH.—At Royal Victoria Infirmary, Newcastle-upon-Tyne, Thursday, February 17, 7.15 p.m., clinical demonstration by Dr. H. G. Miller: "Modern Treatment in Neurology"; 8.45 p.m., address by Professor C. A. Wells: "Clinical Applications of Research."

ROCHDALE DIVISION.—At Birch Hill Hospital, Monday, February 14, 8.30 p.m., clinical meeting. Symposium: "Diseases of the Gall Bladder." Short papers by Dr. R. J. Cowden, Dr. J. F. Knox, Dr. J. L. Taylor, and Mr. D. H. Teasdale. A general discussion will follow.

SHROPSHIRE AND MID-WALES BRANCH.—At Royal Salop Infirmary, Shrewsbury, Wednesday, February 16, 8 p.m., meeting of Clinical and Pathological Section. Films: (1) "Senile Obliterative Arteritis of the Legs"; (2) "Treatment of Infections of the Hand."

SOUTHAMPTON DIVISION.—At Royal Hotel, Southampton, Wednesday, February 16, 8.30 p.m., general meeting. Address by Dr. D. P. Stevenson (Deputy Secretary, B.M.A.).

SOUTH-EAST ESSEX DIVISION.—At Southend General Hospital, Thursday, February 17, 8.30 p.m., meeting. Dr. H. D. Crosswell: "Gastro-enteritis."

SOUTH SHIELDS DIVISION.—At Ingham Infirmary, South Shields, Thursday, February 17, 8.30 p.m., meeting. Medical films, followed by discussion and questions aimed at Dr. A. Gillis.

SUNDERLAND DIVISION.—At Bay Hotel, Sunderland, Thursday, February 17, annual dance.

SUTTON COLDFIELD DIVISION.—At Sutton Coldfield Hospital, Thursday, February 17, 9.15 p.m., meeting. Talk by Dr. Frangcon Roberts: "Food, Medicine, and Population."

SWANSEA DIVISION.—At Osborne Hotel, Swansea, Thursday, February 17, 7.30 for 8 p.m., informal supper. B.M.A. Lecture by Dr. G. B. Mitchell-Heggs.

WILLESDEN DIVISION.—At Cavendish Lounge, Willesden High Road, N.W., Friday, February 18, 8.30 p.m., joint meeting with Willesden pharmacists.

S.H.M.O. Meeting

There will be a meeting of Senior Hospital Medical Officers in the Welsh Region on Saturday, February 19, at 3.30 p.m. at B.M.A. House, Cardiff.

As from April 25, when the new retirement pensions become payable, residents in old people's homes will have their pocket money allowance raised from 6s. 6d. to 7s. 6d. weekly. At the same time the minimum weekly charge for board and lodging will be raised from 26s. to 32s. 6d. No additional cost will, however, fall on the old people themselves. Those who cannot pay the new minimum charges and at the same time retain 7s. 6d. as pocket money will be put in funds by the National Assistance Board. Homes for old people established under the National Assistance Act provide full board and lodging, together with clothing and other amenities. Except in the very few cases where a resident has sufficient resources to pay the full rate, the difference between the actual cost of maintenance and the amount paid by the resident is met wholly by the local health authority. The full cost of maintenance averages about £5 a week.

CENTRAL CONSULTANTS AND SPECIALISTS**HOSPITAL JUNIOR STAFFING: REVISED REPORT**

An all-day meeting of the Central Consultants and Specialists Committee was held on February 3, with Dr. T. ROWLAND HILL in the chair. The business which led to the principal discussion of the day concerned a revised report on the question of hospital junior staffing. At the previous meeting the Committee had referred back to the Medical Staffing Subcommittee a report on this question for further consideration in the light of comments and criticisms which had been made.

Professor G. I. STRACHAN, chairman of the subcommittee, now presented a report, a number of paragraphs of which had been revised. The proposals were summarized as follows:

The medical staffing of hospitals should be based upon the following five grades:

- (i) House Officer.
- (ii) Junior Medical (or Surgical) Assistant.
- (iii) Medical (or Surgical) Assistant.
- (iv) Senior Medical (or Surgical) Assistant.
- (v) Consultant.

The appointment of Medical (or Surgical) Assistant should initially be for a term of four years, and thereafter on an indefinite basis, except in teaching hospitals, where the appointment should be determined after four years and not normally be renewable.

Posts of Medical or Surgical Assistant or Senior Medical (or Surgical) Assistant, and especially the latter, should be whole- or part-time according to the needs of the service and the preference of the officer.

Professor STRACHAN reminded the Committee of the occasions on which this subject had already been debated, the criticisms and alternative suggestions which had been made, and the minority report by one member of the subcommittee, representing the registrars, Dr. Forrester. An endeavour had been made to find a greater measure of agreement. Some of the differences were only in emphasis, and these had been put right so far as possible. He called special attention to one paragraph, which read:

"Responsibility for the treatment of hospital patients must remain in the hands of practitioners of consultant status. The first step to be taken, therefore, is to examine and review in every hospital the volume of work which should be undertaken only by consultants."

The question of nomenclature for the intermediate grades had received much consideration. Such titles as "intermediate hospital medical officer" and "senior medical

officer" had been discarded. Inasmuch as the medical staff in question would assist consultants in their work it was now proposed that they should be called "junior medical (or surgical) assistants," "medical (or surgical) assistants" and "senior medical (or surgical) assistants." It was to be understood that in no circumstances should the appointments in these higher categories, even in the highest levels of the proposed salary range, be regarded as an effective substitute for the appointment of consultants. Part-time appointments in these grades, particularly in the upper reaches, should be encouraged. Such posts would provide general practitioners with an opportunity to practise a specialty under general consultant supervision, but with an appropriate degree of clinical responsibility. They should also be stepping-stones for the general practitioner aspiring to become a consultant. All existing S.H.M.O.s should be redistributed between the consultant establishment and the new senior assistant establishment according to their qualifications and experience, while senior registrars and registrars should be redistributed in the various levels of the intermediate grade. He added that one point of great satisfaction was that after these further discussions Dr. Forrester and his colleagues had agreed to withdraw their minority report.

The CHAIRMAN said that in future discussions with the Ministry of Health a certain openness of mind would be necessary, for assuredly the Ministry would have its own proposals and arguments to bring forward.

Mr. J. R. NICHOLSON-LAILEY moved that the revised report be approved and forwarded to the Joint Committee. It had been discussed and amended, and he thought Professor Strachan and his subcommittee had done all they could to meet the criticisms. If this revised report had to meet the barrage of criticism again, he thought that nothing remained except to appoint a new subcommittee and start all over again.

The Registrar Point of View

Dr. R. M. FORRESTER said that his withdrawal of his minority report was a personal decision and not done under instruction. He had undertaken to get in touch with the secretaries of the regional registrars' groups, and the general opinion was that at that particular moment it was the right and proper thing to withdraw the minority report, because its continued existence was likely to cause division and to bar active discussions and negotiations at Joint Committee level. In response to a circular to the regional committees, two had stated that they could not accept the revised report and they stood by the minority report.

Others were prepared to go forward though making certain reservations. He drew attention to a statement in the revised report to the effect that the policy of specifying a certain category of medical staff for training of consultants and of fixing hospital establishments in relation to prospective consultant vacancies was wrong and should be abolished. But there was also a later statement, which went in at the instance of the registrars, that, in order to make it possible for the majority to remain in the hospital service long enough to reach the highest levels of the intermediate grade and ultimately achieve consultant status, the ratio between the numbers in the consultant and intermediate grades in each specialty should be agreed between the Ministry and the profession. Thus in one place in the report it was affirmed that the ratio was essential, and yet in another it was stated that it was purely the local needs of the hospital which should be the determining factor. He found it difficult to reconcile those two propositions. Dr. Forrester criticized the report in other respects. The proposals looked feasible on paper, but he feared that difficulties might arise in their practical application, and it was not easy to see how the future of hospital staffs would be made better as a result of this report.

A general discussion on the report then ensued, and Professor STRACHAN replied to detailed questions. Dr. ALEX SMITH, on behalf of the Scottish representatives, said that members of the Central Consultants and Specialists Committee (Scotland) had not had an opportunity of seeing the new document, nor had the regions seen it. It should receive proper consideration at the periphery before it went forward. He asked that it be referred to the Scottish Committee and to the regions. Meanwhile it might be sent to the Joint Committee for information.

A Basis for Discussion

In the course of further discussion, Mr. H. H. LANGSTON supported the view taken by Mr. Nicholson-Lailey. He did not imagine that this document would be the one ultimately discussed with the Ministry of Health, but he believed it was a document which in a general way they could approve as a basis for further discussion.

Mr. B. N. BROOKE appealed to the registrars to consider this whole problem on a much broader basis. Mr. A. STAVELEY GOUGH supported the reference to the Joint Committee, and stated that all who knew anything about hospitals, especially peripheral hospitals, were aware of the need for an intermediate grade. Mr. J. R. BLACKBURN pointed out that the reference to regions had produced only minor amendments. Members of the Committee represented regions and should be competent to make up their minds on the document. He felt it should come back to the Committee after discussion in the Joint Committee.

Mr. R. NEWTON expressed the opinion that the subcommittee had done nearly as much as was humanly possible. He supported the suggestion that the matter should be referred to Scotland, even if this involved delay. Eventually the view should be conveyed to the Joint Committee and to the Ministry that this report was not the whole answer. He expressed dislike of the name "senior medical or surgical assistant," and suggested that the words "assistant physician or surgeon" should be used instead.

Professor G. I. STRACHAN intervened to express his readiness to accept this suggestion.

Dr. S. R. F. WHITTAKER, dealing with the problem of general practitioners doing part-time work in hospitals, stated that it should not be too readily accepted that there was overwhelming enthusiasm on the part of all general practitioners for their colleague general practitioners in the area to be undertaking hospital work. He indicated that there was fear in some quarters of difficulties arising from general practitioners acting in a dual capacity in an area. It had already been asked that this point should be considered by the General Medical Services Committee.

Mr. A. N. GUTHKELCH, after asking for certain verbal amendments, agreed with the document on behalf of the

Manchester Region, as also did Dr. G. ORGANE, subject to the safeguard that it should not be regarded as a final one.

Registrars and General Practice

Dr. TALBOT ROGERS said that the minority report had drawn attention to the necessity for some integration between consulting and general practice, but the first report of the subcommittee had done nothing to make that easier. It was said that some registrars would never be competent enough to become consultants and that they would drift into general practice. He did not appreciate that point of view. It was true that the skills were different, but it did not follow that a registrar who was not competent to be a consultant would have the necessary competence for general practice, and it should not be taken for granted that a registrar who had been for many years in hospital could necessarily find a place in general practice satisfactory to himself or to others. He went on to speak of the opportunity which should be given to general practitioners in hospitals to practise a specialty and ultimately to become consultants. The CHAIRMAN pointed out that this was provided for in the report, in its reference to part-time appointments in this grade and the opportunity for general practitioners.

Professor STRACHAN said that his subcommittee had entertained no such idea as that people unfit for consultant practice would necessarily be fit for general practice. Dr. TALBOT ROGERS said that he happened to work in an area where the employment of general practitioners in hospital had been a matter of tradition, and there were still a number of general practitioners employed as S.H.M.O.s. One of them, for example, held the F.R.C.P.Ed.; that type of man could well be regarded as a consultant, and indeed he was looked upon by them as such.

Not Final

At the end of a long discussion the CHAIRMAN suggested to the Committee that the revised report be referred to the Joint Consultants Committee in the hope that the Central Committee would have the advantage of the Joint Committee's comments before submitting its proposals in final form; but that the report itself should not go forward as an official report to the Ministry until it had been fully approved by the Central Committee. In due course, when discussions with the Ministry of Health had reached an appropriate stage, any proposition from the Ministry should be referred to the Central Committee for consideration before implementation was considered.

The course suggested by the Chairman was formally proposed by Professor STRACHAN and agreed to by the Committee, none dissenting. It was also agreed to refer the report to the Central Consultants and Specialists Committee (Scotland) and to the regional committees.

The CHAIRMAN added that the Government was bound to desire discussions with the Joint Committee in the future, and the present report would be used, but it would not at this stage be brought before the Ministry as an official document.

The Expense Levy

Dr. ROWLAND HILL reported that the Executive Committee had given further thought to the method of introduction and operation of the proposed expense levy and its relation to the Hospital Medical Staffs Defence Trust. Their colleagues representing the Royal Colleges on the Joint Committee were anxious to play their part in bearing the necessary costs and in sponsoring an appeal for funds. The executive proposed accordingly to broaden the objects of the defence trust, to drop the word "defence" and rename the Trust the "Hospital Medical Staffs Trust," at the same time inviting representatives of the Royal Colleges in some way or other to join the trustees. Their work was done in close partnership with the Royal Colleges, and he thought the latter would agree to the body of trustees continuing as at present (the members of the Central

Committee), with two or perhaps three representatives from the other constituent bodies of the Joint Committee added to the Trust officers.

The Committee generally agreed to this course, and later, sitting as the trustees of the Hospital Medical Staffs Defence Fund, formally ratified the proposal.

"Moral Obligation" and Displaced Consultants

The CHAIRMAN said that cases continued to be brought to their attention in which consultants who had been displaced or had had their sessions reduced as a result of hospital reorganization had experienced difficulty in obtaining alternative employment because they had been required to apply in open competition for vacant appointments. When the "moral obligation" clause in para. 16 of the terms of service was agreed between the Joint Committee and the Ministry it was also agreed that in order to assist in finding alternative sessions for displaced consultants they should be offered suitable vacancies without advertisement. This decision was conveyed to the hospital boards, and the Ministry had on more than one occasion confirmed that this policy still applied.

It was agreed to ask the Joint Committee to remind the Ministry of this agreement and urge that instruction be given to hospital boards that consultants or S.H.M.O.s whose sessions were reduced owing to reorganization should, where suitable alternative employment existed, be offered the vacancy without the necessity of applying for the post in open competition.

Procedure for Appointments

The CHAIRMAN reported that the Joint Committee had discussed with the Ministry in general terms the question of revision of the N.H.S. (Appointment of Specialists) Regulations with a view to giving the senior medical staff of the hospital concerned a greater voice in the appointment of their future colleagues. The Ministry had asked for specific proposals, and the matter had been referred to a subcommittee for detailed consideration.

Mr. NICHOLSON-LAILEY stressed the importance of having some means of getting across to selection committees the point of view of the people who had to work with those newly appointed. Mr. C. E. KINDERSLEY said that it was sometimes forgotten that the happiness of the medical staff reflected on their work, and unless the staff had some voice in the selection of their colleagues it would not conduce to happiness.

The CHAIRMAN said that he was sure the Joint Committee was right in its proposed action. After all, the consultant was a man chosen on the advice of his own profession.

Disciplinary Procedure

Dr. S. COCHRANE SHANKS, chairman of the Medico-Legal Subcommittee, said that his subcommittee had been considering a suggestion for the setting up of an informal disciplinary machinery by regional consultants and specialists committees, but it was unanimously of opinion that any such arrangement would be inadvisable, as it might endanger the present discussions regarding the procedure for investigating complaints involving the personal conduct or professional competence of members of hospital medical staffs.

The Committee concurred in the view that this question should not be pursued.

On a question raised at a previous meeting concerning an instruction by a regional hospital board that consultants should not delegate to the nursing staff the duty of making appropriate entries in hospital operations registers, Dr. SHANKS said that his subcommittee took the view that it was of no legal significance whether the surgeon and anaesthetist completed the entries in the register personally or delegated them, provided that in the latter event the entries were verified and initialled by the surgeon and anaesthetist concerned.

It was agreed to pass on this opinion to the regional committees.

Constitution of the Committee

Finally the Committee discussed its own constitution. Mr. H. H. LANGSTON presented a report from the subcommittee which has been considering the structure of the Central Committee with a view principally to reducing its size. Strong opposition had been expressed by the group committees to the proposed complete abolition of group representation. Therefore it was now suggested that groups should retain their representation in the Central Committee, each group appointing one representative, but that group representatives should have no voting power. It was also recommended that the number of representatives appointed by the Central Consultants and Specialists Committee (Scotland) should be reduced from ten to six, that the provision for the election of five members engaged partly in consultant practice and partly in some other branch of medical practice—a provision which had never come into force—should be withdrawn, and that in future the number of registrars' representatives should be reduced from two to one, to bring them into line with S.H.M.O.s, who have only one representative.

The registrars' representatives objected to this last proposal, pointing out that they were the representatives with the shortest duration of office, and that if their representation were halved there might well be a break in continuity.

The whole matter was referred back to the subcommittee for further consideration.

JOINT CONSULTANTS COMMITTEE

A meeting of the Joint Consultants Committee was held on January 26 at the Royal College of Physicians under the chairmanship of Sir RUSSELL BRAIN. The Committee was largely occupied in reviewing the progress of discussions with the Minister of Health and officers of his Department on a number of outstanding subjects.

Medical Advisory Machinery

The Committee welcomed the Minister's assurance that he sympathized with its wish for close co-operation between hospital boards and their consultant staffs through the establishment of satisfactory medical advisory machinery, and noted his request for evidence of the unsatisfactory nature of the present arrangements. It was reported that the B.M.A.'s Central Consultants and Specialists Committee was endeavouring to obtain such information through its regional organization.

The Committee felt that it would be helpful if it could be given an opportunity of discussing the problem with the chairmen of hospital boards, and it decided to ask the Ministry whether this could be arranged.

Development of Consultant Services

Figures supplied by the Ministry in the course of discussions on hospital establishments had given the Committee some cause for concern at the lack of balance between the estimated number of consultant sessions and the number of senior registrars in training in the various specialties. It had seemed to the Committee that there was a need for improved overall planning of the consultant services of the country. This view had been put to the Ministry, which had expressed its desire for consultation on all aspects of the question. The Ministry's offer to supply all available information to enable the Committee to study the problem further was noted.

Provision of Residential Accommodation

At a previous meeting with the Ministry the importance of residential accommodation, and particularly married quarters, in connexion with the problem of shortage of hospital medical staff had been stressed. The Committee therefore welcomed the Ministry's circular (*Supplement*,

January 15, p. 16) encouraging hospital authorities to take all practicable steps to increase residential accommodation, and suggesting that hospital authorities should approach local housing authorities and other landlords on behalf of members of their staffs. The Committee decided that the question should be borne in mind for further discussion with the Ministry in connexion with the forthcoming negotiations on hospital staffing.

Option for Whole-time or Part-time Service

It was reported that the Ministry had undertaken to consider the publication of an agreed statement in the medical press for the information of the profession on the granting to consultants of the option of whole-time or part-time service. A draft statement which had been submitted to the Ministry for its approval was presented to the Committee.

Domiciliary Consultation Arrangements

The Committee received a report from its subcommittee which, after discussions with representatives of the General Medical Services Committee of the B.M.A., had urged the Ministry to extend domiciliary consultation arrangements to patients in nursing-homes. The Ministry had been told of the hardship inflicted upon patients of modest means who entered nursing-homes for domestic reasons and because of lack of adequate hospital accommodation, and were deprived of the benefit of consultant advice under the National Health Service. Although the Ministry was considering the proposal, its first reaction was reported to be that the Minister's statutory obligation to provide a domiciliary consultant service was specifically limited to the patient's home.

Appointment of Consultants and S.H.M.O.s

A report was received upon the discussions with the Ministry on the procedure for the appointment of consultants and S.H.M.O.s. The Ministry, while acknowledging that the existing procedure was open to criticism, was reluctant to amend the Regulations if improvements could be achieved by administrative action. It had asked the Joint Committee for specific suggestions so that the question could be studied further. The matter was referred to a subcommittee for detailed consideration.

Other Matters

Other matters discussed by the Committee included the employment of hospital staff on pneumoconiosis medical panels, the recommendations of the Bradbeer Committee on hospital administration, the loan of hospital records to Government departments, and the possibility of arranging facilities for the interchange of registrars between the United Kingdom and countries overseas.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.
Urban District Councils.—Houghton-le-Spring.

There are about 14,500 hospital beds in New Zealand—seven for every 1,000 people. Health Department annual statistics show that the average number of persons occupying beds at any time is 5.5 per 1,000. Over 10% of the population received treatment as hospital in-patients during the year. The number of out-patients who received treatment was more than one-third of the population. There are 6,631 nurses in public hospitals, of whom 2,700 are trained, and 129 male nurses.

COST OF MEDICAL CARE IN THE U.S.A.

As reported in the *Journal* (February 5, p. 365) President Eisenhower has again asked Congress to enact a health programme expanded a little from the one which it rejected last year. The main purpose of the programme is to encourage private insurance companies to offer better protection against the expenses of illness and to extend sickness insurance to cover more of the population.

An article in the *New York Times* of February 6 says that last year the nation's medical bill ran to over \$10 billion, an increase of \$3 billion since 1948. Of this amount only about 25% was covered by some form of prepaid health insurance. To ease the financial strain the President has proposed a Federal health reinsurance plan. Broadly speaking, the plan would commit the Government to assume much of the financial risk that private health insurance groups might incur by extending coverage and benefits. It was substantially the same proposal that was defeated in the last Congress under criticism by the Democrats that it would achieve little, and warnings by the American Medical Association that it might give "socialized medicine" a foot in the door. Nor were the insurance companies enthusiastic.

The *New York Times* article points out that, in spite of the rapid growth of private health insurance in the United States, it has not caught up with the increasing costs of treatment, and there is a lengthening between the total bill and the insurance cover. It is reported that the number of persons covered jumped by 38,000,000 between 1948 and 1953, but in the same period private medical bills not covered by insurance increased by \$1.4 billion. Sixty million people have no coverage. Despite the figure of 100,000,000 people covered in some way, only 4,500,000, or 3% of the population, have anything like complete protection.

For the remainder of the population coverage ranges from what the article calls "good to skimpy." Only 24% of the nation has hospital, surgical, and physician's bill protection; 28% has only hospital and surgical, and 8% hospital insurance only. On the average a person covered by hospital insurance in 1953 had to pay 19% of his bill out of pocket. The average person covered by a plan for meeting doctors' bills that year got benefits paying 46% of his bill. Those protected by both hospital and physician's insurance were covered on only 64% of the bill. Rural areas are virtually untouched by private plans, and only 25% of those with annual incomes under \$2,500 have any degree of protection.

In principle the idea behind the Federal health reinsurance scheme, the article explains, is that the Government should insure more liberal policies by the private insurance funds to pay more of the costs of serious and expensive illness than most present policies. The administration would set up a \$100 million fund for this purpose. The administrative agency would offer to insure new and more extensive plans for private funds which at present hesitate to offer broader, cheaper coverage without security against the increased risk of abnormal loss. The private funds would pay a Government premium for Federal reinsurance, and this would go to create a revolving fund to free the plan ultimately of Federal subsidy. In return the Federal reinsurance agency would assume responsibility for a high percentage of the private companies' abnormal losses on the more liberal coverage.

The President has also asked for an appropriation of \$20 million for public assistance cases. Other proposals are for better medical facilities and nursing staffs; vigorous measures to combat mental illness; improved services for crippled children and for maternal and child welfare; Federal grants for the prevention and treatment of juvenile delinquency; better protection of consumers under existing pure food and drug laws; and improved measures against water and air pollution.

GENERAL MEDICAL SERVICES SUBCOMMITTEE (SCOTLAND)

A meeting of the General Medical Services Subcommittee (Scotland) was held at the Glasgow B.M.A. Regional Office on January 27, with Dr. C. J. SWANSON in the chair.

Dr. SWANSON announced that Drs. W. D. Anderson (Glasgow) and A. E. Sandison (Dumfries) had resigned from the subcommittee owing to their no longer being in general practice, and a resolution was passed recording appreciation of their services.

Mileage Payments

The amount made available from the mileage fund for payment to practitioners in the Highlands and Islands area was again discussed, and proposals were considered for submission to a forthcoming meeting of the Scottish and English mileage subcommittees of the advisory distribution committees. These proposals are designed to bring the payments made to practitioners in the Highlands and Islands area into line with those being made in other parts of the United Kingdom.

Surgery and Waiting-room Accommodation

Further proposals from the Department of Health in connexion with a survey of surgery and waiting-room accommodation were considered. Dr. SWANSON reported that the matter had been discussed very fully with the Department. The subcommittee agreed with the Department's suggestion that in areas where no review of accommodation had already been carried out it should be undertaken by executive councils in consultation with local medical committees.

Notification of Change of Address

It was reported that the Department had agreed to the subcommittee's proposed alteration of the medical card to enable the holder to notify the executive council of a change of name and/or address. In addition, the Department had undertaken to provide tear-off pads for doctors to use for notifying executive councils of changes of name and address of patients. It was hoped that these arrangements would help to keep practitioners' lists more accurate and up-to-date. The subcommittee has also suggested to the Department that registrars of marriage should notify executive councils of changes of name.

Doctors' Houses in the Highlands and Islands

The CHAIRMAN reported that he and the Assistant Scottish Secretary, together with two representatives of the Highlands and Islands Practitioners' Subcommittee, had had a meeting with the Department of Health to discuss the general question of maintenance of houses owned by executive councils and leased to practitioners.

General Practitioners and the Hospital Service

The subcommittee endorsed a recommendation by the Joint Subcommittee with the Central Consultants and Specialists Committee (Scotland) requesting the Department to advise the setting up of joint committees between executive councils and hospital boards to examine the relationship of general practitioners and the hospital service.

Agreement has been reached between the Association of Scientific Workers and a Committee on Technical Staffs, set up by the Committee of Vice-Chancellors and Principals, for an increase in the pay of laboratory and workshop staffs employed in universities and university colleges in the British Isles. The scales of pay are increased by £25 a year, rising to £30 a year—juniors receiving increases of 5s., rising to 7s. 6d. a week.

YOUNG PRACTITIONERS OF LEEDS

B.M.A. GROUP FORMED

In common with other university centres, the Leeds Division of the B.M.A. has for some years past entertained the newly qualified doctors to lunch. This year it has gone further in the interests of young practitioners and has formed a special group for them within the Division. The young practitioners group is open to all members of the profession under 35 years of age working in the area in whatever form of practice.

The first meeting of the group was held on January 19, and 32 members listened to a talk by Dr. L. S. POTTER, B.M.A. Assistant Secretary, on the problems of the young practitioner. A committee of 10, representative of all branches of medicine, has been elected and the committee in turn has elected a chairman and secretary.

Another project, fostered by the Leeds Division, and which now, after three years, has become an established event, is a joint meeting of final-year students with the members of the Division executive committee. An address on careers in medicine is given, and the students are able to question not only the speaker but also the committee members over cups of coffee.

SERVICE PERSONNEL ON LEAVE

TREATMENT AS TEMPORARY RESIDENTS

It has been agreed between the Health Departments and the Service Departments, in consultation with the representatives of the profession, to allow under certain circumstances Service personnel on leave and those temporarily living away from their units to use the National Health Service for treatment. The arrangements, which will come into force on April 1, are set out in a circular to executive councils.

Under the new arrangements Service personnel on leave, if they are more than two miles from the nearest Service hospital or unit at which a Service medical officer is posted for duty, may be accepted and treated as temporary residents under the National Health Service arrangements.

Personnel Temporarily Living Away from Units

It has also been agreed that Service men or women living temporarily away from barracks, command stations, or other Service establishments or units, who are also more than two miles from the nearest hospital or unit at which a Service medical officer is posted for duty, and who seek treatment from civilian doctors, may be accepted for treatment within the National Health Service as temporary residents.

Where Service personnel are away for over three months from medical facilities provided by Service Departments, it may be necessary for doctors to accept them on their permanent lists. In these exceptional circumstances executive councils will ask the persons concerned to return their cards and notify the council as soon as they move, or otherwise wish their names to be removed from the doctor's list.

Provision of Drugs

Where Service personnel are accepted as temporary residents or taken on a doctor's list, the doctor will be entitled to prescribe for them on form E.C.10 or to supply drugs or appliances if he is a dispensing doctor. Prescription charges will be payable by the patient in respect of medicines, but a receipt on form E.C. 57 should be given on request so that the question of refund can be taken up with the Service unit.

It has also been agreed that, at Service stations where in particular cases the provision of drugs from Service sources is not possible, Service doctors and civilian doctors under contract with the Services may use the prescribing machinery

of the National Health Service. For this purpose special Services prescription forms similar in lay-out but different in colour from those used in the National Health Service will be used, and chemists in contract with executive councils will dispense prescriptions on these forms and submit them for pricing in the usual way. Service doctors will be advised of the general conditions which apply to prescribing in the National Health Service.

General

There are a small number of Service personnel who are not members of the regular Army but who are employed full-time as adjutants/quartermasters with the Territorial Army or Home Guard units. These persons are not serving members of the regular Army and will not need therefore to be regarded as coming within the arrangements mentioned above. They may, of course, be accepted for treatment as civilians under normal N.H.S. arrangements. The dependants of Service personnel are, as they always have been, at liberty to apply to doctors for treatment within the National Health Service.

SERVICE PERSONNEL ON LEAVE

TREATMENT BY PRIVATE PRACTITIONERS

In conjunction with the agreement with the Ministry of Health on the treatment of Service personnel on leave as temporary residents, agreement has also been reached with the Service Departments on the fees to be paid to private practitioners who provide treatment of this kind. Previously the fees of 5s., 7s. 6d., and 15s. for a surgery attendance, day visit, and night visit respectively have included the provision of all except specially expensive drugs and dressings necessary for treatment. As from April 1, 1955, however, the actual cost of drugs and dressings dispensed will be claimed from the Service Department by the private practitioner concerned. Non-dispensing doctors will issue private prescriptions where necessary. For the treatment itself the fees will be:

	s.	d.
For attendance at the surgery	6	0
For a day visit	10	0
For a night visit	15	0

In addition, the private practitioner will be able to claim mileage at 1s. per mile each way in excess of two miles, and a fee of 1s. for a certificate. The claim forms used by the Services are being amended accordingly.

When on leave Naval personnel will continue to be instructed to report sick to the nearest Admiralty surgeon and agent, if at all possible, and in all cases the appropriate mileage allowance will be paid by the Admiralty if the agent visits men who are resident more than two miles from the doctor's surgery and no payment for mileage has been received from any other source.

SUPPLEMENTARY ESTIMATE FOR HEALTH SERVICE

In the Supplementary Estimate¹ for the year ending March 31 next the Government asks for a further £4,848,000 for the Health Service in England and Wales and £1,233,000 for Scotland. The main items for which extra money is required are for increased expenditure of regional hospital boards (£2,172,000 England and Wales and £987,000 Scotland), pharmaceutical services (£2,028,000 England and Wales and £250,000 Scotland), and general dental services (£1,701,000 England and Wales and £200,000 Scotland). But for expected savings in the year of £3,009,000 and £88,000, south and north of the border respectively, the supplementary estimates would have been higher.

This is the first supplementary estimate for the National Health Service since 1949-50.

¹ Supplementary Estimate, Civil Estimates, and Estimates for Revenue Department. H.M.S.O., London. 5s.

HOSPITAL BUILDING PROGRAMME, 1956-7 AND 1957-8

It has been decided, subject to the voting by Parliament of the necessary funds, to begin an expansion of the hospital building programme in 1956-7 and 1957-8. This initial expansion will take two main forms: (i) a programme for the replacement or redeployment of worn-out, obsolete, or inefficiently disposed plant involving the expenditure of £2m. in 1956-7 and £4m. in 1957-8; and (ii) the starting of major building projects to a total value of £7½m. in 1956-7 and £10m. in 1957-8.

It is intended that the programme under the first section shall so far as possible be completed within the two-year period.

PRIVATE PRACTICE COMMITTEE

The meeting of the Private Practice Committee on February 9, with Dr. A. BROWN presiding, was as usual occupied with a variety of detailed matters—treatment of Service men on leave, the position of professional premises under the new Landlord and Tenant Act, the assessment of professional premises as business premises, fees for private certificates, fees for the examination of Borstal boys and of boarded-out children, fees for police calls, as well as such standing subjects as bonus-shift certificates and the use of E.C.10 in prescribing for private patients. On this last point a report of the recent discussion with the Minister was before the Committee, and note was taken of Mr. Macleod's statement (*Supplement*, January 29, p. 31).

Admiralty Surgeons

Some time was spent on the remuneration of Admiralty surgeons and agents, a matter referred to the Committee from the London Local Medical Committee. Dr. A. N. MATTHIAS suggested certain detailed increases. For visiting patients on board a ship which was not alongside he contended that payment should be calculated on a time basis from the doctor's residence or the landing-stage. For each patient seen while on board the fee should be 12s. 6d. by day and £1 1s. by night as a minimum. Vaccination fees should be 7s. 6d. for each item. For examination for fitness for special duties, which might be most complicated, an appropriate fee should be assigned to each type of examination.

It was agreed to approach the Admiralty on these matters. The Committee considered a letter from the honorary secretary of the Medical Officers of Schools Association, which had been asked for its views concerning arrangements made by some boarding schools for all pupils to be put on the N.H.S. list of the school medical officer. The view of the school medical officers was that all pupils and such staff and dependants as elected to do so should be placed on the list of the school medical officer, but it was acknowledged that this was a matter for the individual school to decide.

After considerable discussion it was resolved to invite the honorary secretary of the Medical Officers of Schools Association to the next meeting and meanwhile to invite the comments of the General Medical Services Committee.

Alcohol and Road Accidents

At a previous meeting the Committee had decided to refer to the associations of local authorities certain recommendations made by the Alcohol and Road Accidents Committee calling for the encouragement of doctors to undertake the work of examining intoxicated motorists by the appointment of doctors suitably qualified for this purpose; the prevention of unnecessary loss of doctor's time in court, and the provision of adequate facilities at police stations for the conduct of examinations. The views of the relevant associations of local authorities were that each police authority must decide for itself whether and to what extent it should apply the recommendations in its area.

It was decided that the B.M.A.'s recommendations should be brought to the notice of the appropriate Divisions and Branches so that they might be taken up with the local police authority.

On the question of examination of boys for fitness for Borstal it was agreed to approach the Treasury with a view to laying down a minimum fee of one guinea per case. The present fee for a single examination is 15s., but there is a maximum of £3 15s. in respect of all examinations carried out on one day.

The Committee considered the proposals for sectional representation in the Representative Body referred by the Constitution Committee and expressed itself satisfied that no useful purpose would be served by altering existing arrangements.

PUBLIC HEALTH COMMITTEE

A meeting of the Public Health Committee of the Association was held on February 11, with Dr. J. B. TILLEY in the chair.

The Committee endorsed the action of its Chairman in proposing to the Council that the appropriate Government departments should be informed that in the Association's view the functions of the Ministry of Food relating to food hygiene should be taken over in due course by the Ministry of Health.

It was reported that representatives of the Committee had discussed with the Society of Medical Officers of Health the revision of the various Milk Regulations dating from 1949, and that full agreement had been reached.

Salaries Claim

It was further reported that the Staff Side claim for a revision of salaries of medical officers in the public health service had not been agreed between the Staff and Management Sides of Whitley Committee C, and it had been decided to take steps to refer the differences to the Industrial Court (*Supplement*, January 1, p. 3).

A letter was considered claiming a need for London weighting on the ground that the cost of living for doctors in London was in excess of that in other parts of Great Britain. The letter was accompanied by much detailed information about house purchase, rent, domestic help, telephone rentals, gas, coal, electricity, travel, car insurance, and entertainment, all of which were higher in London than in four cities taken as examples. The Public Health Committee accepted the figures, but agreed to leave the matter for the present. It was thought that the present time was inopportune to press such a claim.

The D.P.H. Course

A letter was read from the registrar of the General Medical Council inviting the Association to send representatives to discuss certain general questions concerning the revision of the rules for courses and examinations for the D.P.H. It was agreed to accept the invitation, and representatives and deputies were appointed.

On a question, which had previously been before the Committee, concerning the possible effect on the health of the public of the proposed introduction of additional diesel-oil buses in London, inquiry had been made about action being taken by the Medical Research Council. The Public Health Committee decided to recommend that the matter be referred in the first instance to the Association's Science Committee.

The Committee had before it a report that a local authority had taken no action to remedy its failure to implement the decision of a regional appeals committee. It was decided to invite the authority to agree to a reference of the dispute to the Industrial Court.

School Medical Service

Dr. S. C. GAWNE presented the report of the Consultant, General Practitioner, and Public Health Liaison Committee, and said that the recommendations of the Public Health Committee concerning the school medical service and co-ordination with general practitioners and consultants had been approved. This matter had been referred to the Joint Consultants Committee with a view to its being brought to the notice of the Ministry. The first of a number of recommendations was that when a general practitioner referred a schoolchild to a consultant for investigation or treatment, and when special treatment or any facility provided by the local authority was necessary, a copy of the report sent to the general practitioner should also be forwarded to the school medical officer.

Dr. H. D. CHALKE, chairman of the Geriatrics Joint Subcommittee, presented the lengthy report of that body, and the report, with a minor amendment, was approved for submission to the Council.

Dr. J. FENTON, a member of the Committee, supplied some interesting information on the risk to public health involved in the use of bacterial pesticides. A letter was read on this subject from Professor G. S. Wilson, director of the Public Health Laboratory Service. The Committee agreed to take up with the Ministry of Agriculture the possibility of discouraging and ultimately preventing the use of bacterial rodenticides. In the meantime so long as they continue to be manufactured certain limitations and safeguards should be imposed.

Questions Answered

Two Cars

Q.—For over 20 years I have run two cars in practice and been allowed depreciation on both every year. My present accountant is of the opinion that I cannot claim for two cars. Am I entitled to depreciation on both or not?

A.—If, in fact, both cars are used in the practice the capital allowance for wear and tear applies to both. If, on the other hand, one of the cars is held in reserve or for private use and is not actually used in the practice the allowance would not apply to that car. A point to be borne in mind is that the Inland Revenue officers might regard the ownership of two cars as indicating a more substantial private use than if only one car were kept, and that might affect the proportion of the annual depreciation by wear and tear of the cars regarded as applicable for income-tax purposes.

Hire Purchase of Car

Q.—I am an assistant in general practice. I have bought a car through a hire purchase company, to be paid for by 36 monthly instalments of £24. What income-tax allowances am I entitled to?

A.—When a car is bought on hire purchase terms the ordinary practice is to regard the cash price of the car as the basis for calculating the amount of the capital allowances, and the difference between the cash price and the total amount payable as an allowable expense. That difference would be spread equally over the period of payment, and the amount allowable for any one year would be the aggregate of the amounts becoming due during that year. The hire purchase contract will no doubt show the appropriate figures. If, for instance, the cash price of the car was £690 and £750 the total amount payable, the difference of £60 would be allowable at the rate of £20 per annum over the three years covered by the contract. If, however, the questioner's principal makes him a car allowance, the Revenue authorities will take the view that it includes the necessary cost of running a car, including depreciation, and a capital allowance will be refused on the strength of the decision in the case of *Hamerton v. Overy*.

Correspondence

Ship Surgeons

SIR.—As one of Dr. Michael Dillon's despised "holiday trippers," I feel that I am in a position to make a few comments on his unjustified complaints (*Supplement*, February 5, p. 43). My experience only relates to the Australia-England route, but, from the shipping companies mentioned, I feel that this covers most of the field. The ships on this route may be divided into two classes: the large passenger ships and the cargo ships (with or without passengers). The former carry two surgeons, one more or less permanent, uniformed, and usually signed on in England, the other a "holiday tripper." The cargo ships almost always have a "holiday tripper." The term "holiday tripper" is so wide of the mark as to be too ludicrous for words. Should Dr. Dillon care to make even a few inquiries he would soon ascertain that 95% or more of his "holiday trippers" were in fact young graduates travelling to England to seek postgraduate training in one or other of the various branches of medicine. This is about the only way that the postgraduate student is able to get to England (except a fortunate few), for his lot is not a very pecunious one, particularly if he is married.

There is a very important point which Dr. Dillon seems to have overlooked. It is by these "holiday trippers" coming from the Dominions to England, where they learn what is new in the various branches of medicine, that first-hand knowledge of these advances can be taken back to the Dominions, thereby enabling them to keep abreast of the rest of the world in medical progress. In this respect the shipping companies are to be highly commended for providing these opportunities for postgraduate students (my thanks go to the Shaw Savill line). If Dr. Dillon were to persist in his bid to drive these men from the seas, he would only be standing in the road of medical progress.

Whilst uniforms are desirable in the interests of discipline, from personal experience they are by no means essential. Just as a uniform is not necessary for a good sailor, so the standard of one's medicine should not be dependent on the number of "rings" on one's sleeve. With regard to making medicine at sea a life career, from experiences as assistant surgeon on one of the not so large passenger ships I would say that anyone so desirous must ask to be called a "holiday tripper." The duties are not arduous (total daily surgery would rarely exceed three hours) with ample time to enjoy the tropical sun and, if so inclined, the cheap gin. No, if the title "holiday tripper" must be bestowed on anyone it should be on those who seek permanent employment at sea; definitely not on the impecunious postgraduate student. Finally, I would like to add that at least two professors of the Melbourne Medical School were once "holiday trippers."—I am, etc.,

Chertsey, Surrey.

D. McLAREN.

SIR.—It is rarely that I am moved to writing letters to the press, but the ideas expressed by your correspondent, Dr. Michael Dillon, under the title "Ship Surgeons" (*Supplement*, February 5, p. 43) are such that might stimulate criticism from the most placid of readers capable of viewing more than one side of a question.

In that he proposes just rates of pay and adequate discipline (concerning drink) I have no argument with him, but I am impelled to take him to task over the matter of those to whom he refers as "doctor holiday trippers" and "casual labour." I have no doubt that there are those who avail themselves, as ship surgeons, of free trips for purely holiday purposes, but your correspondent has completely failed to mention, even unfavourably, the boon of ship surgeon positions to those of moderate means who wish to travel abroad for the purpose of postgraduate study. Of those desiring "a free trip to the U.K. and back," the majority travel

there to further their professional experience, and many of these would be unable to do this if it were necessary for them to pay for their passage.

The "doctor holiday tripper" is also referred to as an "amateur (nautically speaking)," and it is stated that the bookkeeper or telegraphist would never be similarly employed as purser or radio officer. These latter ship's officers, however, are concerned with the vital function of the ship, with its provisioning, finance, and communications, without due attention to which the ship would be greatly hampered. They are then, surely, more truly "nautical" than the doctor can ever be. The surgeon's function is "medical," and this function, ideally, should vary little whether the doctor is on sea or on land. In that his primary duty is to his individual patient rather than to the ship as a whole, one would rather see the doctor who is a nautical amateur than the one who is a medical amateur. Some shipping firms have preferred temporary surgeons for the reason that the wider experience available on shore may have enabled them to avoid becoming medical amateurs. The best way to preserve the reputation of the ship surgeon may, therefore, be to allow him frequent access to the experience available on land.

Finally, may I add that this preoccupation with the matter of uniform rather suggests too great an interest in the hierarchy of the sea and ships? I say this in no defamatory sense, but simply suggest that a love of the life at sea might better be requited by embarking upon a nautical than a medical career.—I am, etc.,

London, W.1.

W. H. WOLFENDEN.

SIR.—As one of those doctors retired from practice (in my case, 21 years in West African service), with no special aversion to the social life and cheap gin of ships, whom Dr. M. Dillon wishes to eliminate from the Merchant Navy, I must express disagreement with nearly everything he says (*Supplement*, February 5, p. 43). I would ask him to come down from the clouds and consider the following points. (1) Shipping companies are commercial concerns which have to pay their way by giving and getting the best value they can for money. That "there are many doctors anxious to make the sea a career" would mean nothing at all to them. (2) With the rising tide of medical unemployment, and the increasing number of refugees from the N.H.S., there is no shortage of applicants. Hence the bargaining position is not strong. (3) Only on ships over 14,000 tons, carrying 400 or more passengers, does the actual medical and health work of the surgeon constitute a full-time job, comparable with average practice or hospital work. There are about sixty such ships in the fleet. (4) On the cargo passenger liners, carrying 40 passengers or less, the work of the surgeon will rarely exceed one or two hours a day. Would anybody consider sitting on such ships for 40 years a career? No one can expect full-time emoluments, whether in cash, kind, or status, for what is often considerably less than full-time work. (5) Many such cargo-passenger liners carry surgeons, not because their owners or commanders consider them essential, but because every ship with over 99 souls aboard is legally obliged to carry a surgeon. Were this figure changed to 49, a large number of niches would vanish, now pleasantly occupied by young holiday-trippers, or elderly doctors who like to feel they are part of something useful. (6) The "doctors who want a free trip to the U.K. and back" are mostly young Australian graduates coming over to take higher qualifications. Many might otherwise have difficulty in finding £200 to £300 for fares. (7) No reputable company would have anything to do with a surgeons' pool. It would do nothing to raise status. Rather it would tend to lower it towards that of those stewards, etc., who hop from ship to ship, and have no feeling for or interest in the company they are serving at the moment. (8) Surgeons get fees from passengers, while other officers do not. Hence, stabilization of rates of pay would be a difficult problem, there are so many different factors involved. Generally, the more valuable ships go by seniority in a company's service and merit; which is fair

enough. (9) A commander, chief officer, purser, or anyone else who commits such a breach of the Articles as "being found drunk while at sea" is much more likely to get away with it and continue his career uninterrupted than is a surgeon.

I would say that no young doctor should consider making the sea a career, except in the Royal Navy. A third to a half of his working life, at the beginning or the end, in the Merchant Navy perhaps; but not the whole. It should not be forgotten that merchant seamen see less of their wives and families than almost any other class of worker, and that medical staff are outside the superannuation schemes. Certainly there are points in terms of service and general treatment which the B.M.A. should take up with the leading companies, but such effort should be confined to what is reasonable and practicable.—I am, etc.,

Bristol, 8.

GEORGE L. ALEXANDER.

Remuneration Policy

SIR.—I should like to put forward a suggestion for the consideration of the Committee on Remuneration Policy ("the Hamilton Committee"). It is essential to have, in the medical negotiating machinery, the means of comparing and equating remunerations and conditions of service for consultant staffs, general practitioners, and public health and Civil Service medical officers. It is desirable to have similar machinery in respect of medical and dental remunerations. This cannot be obtained by the present three independent Committees A, B, and C, on the medical side, and an independent dental committee. It is essential to have a national Whitley Council Committee for negotiating medical and dental salaries and conditions. This it would do through subcommittees A, B, and C, and perhaps D for dentistry, E for the Civil Service, and F for university medical staffs. But the decisions of each subcommittee would be submitted to the main committee for approval, and the balance would thus be held between the various branches of medicine, and between them and dentistry.

Without such an arrangement, the various groups of medical and dental practitioners will continue the struggle to go one better than their colleagues in other branches. A struggle of this kind cannot be the best thing for all. Some group will always be left behind, and the pay of such a group will always be a target to which those anxious for retrenchment will seek reductions.—I am, etc.,

Elgin.

I. C. MONRO.

"Dictated but not Read"

SIR.—When one asks a consultant for a considered opinion and advice it is somewhat disconcerting (and rather insulting) to read the above at the end of his letter. Is this an attempt to avoid responsibility, or simply a sign of "bad manners"? The sooner it stops the better for the hitherto honourable profession of medicine.—I am, etc.,

"DICTATED BUT UNSIGNED."

Merit Awards

SIR.—Dr. A. Piney (*Supplement*, January 1, p. 6) predicts that the Distinction Awards Committee will remain indifferent to criticism—"silent upon a peak in Darien." If so, will this not be just an attempt to postpone the day of judgment? There are, it is true, impressive precedents for the policy of imperviousness. When the cook in *Alice* threw the frying-pan at the Duchess, Her Grace just went out of the room, evidently treating the incident with disdain. A frying-pan, however, has distinct limitations as an instrument of controversy, particularly in its inability to convey the *mot juste* and any sort of finesse. Informed criticism, on the other hand, such as has been brought to bear on the subject, is liable to puncture self-satisfaction and complacency.

It will surely now be evident, in the light of the correspondence on the subject, that Lord Moran (*Supplement*,

July 17, 1954, p. 69) was over-optimistic in felicitating the profession on the "remarkable achievement" of the success of the merit awards scheme. Sir Horace Hamilton's arithmetical argument (*Supplement*, October 23, 1954, p. 153) that as only seven consultants, up to the date of his letter, had written criticizing the system there would seem to be no widespread dissatisfaction with the way it was working, could clearly be countered, if necessary, by pointing out that, as no one (except the chairman and vice-chairman, of the committee) had written approving of the scheme, there would seem to be no widespread enthusiasm for it. The truth is that the Distinction Awards Committee has been given an impossible task and should relinquish, with what grace it can, an invidious duty designed to create and maintain discord within the profession—not least because of the secrecy with which it is deemed necessary to enshroud its decisions. It might have been manifest from the outset that a scheme such as this would inevitably lead to disagreement among colleagues. There are better things, I would suggest, that could be done with the sum of money in question.—I am, etc.,

London, W.C.1.

FREDERICK DILLON.

SIR.—Dr. Douglas Boyd's letter (*Supplement*, January 29, p. 33) suggests that the question of merit awards concerns the whole profession. Surely it concerns the whole community? The whole concept is an abomination: a few superior persons, aided by secret informers, are doling out a million and a quarter pounds of the taxpayers' money yearly to unknown specialists for unspecified services. Why, there has been nothing like that on that scale in this country since the most corrupt period of the eighteenth century!—I am, etc.,

Rye.

C. G. LEAROYD.

The Incentives of Freedom

SIR.—In 1949 during the Congress in Rheumatology in New York it was of great interest to listen to the enthusiastic questioning by the Americans on our personal opinions of the welfare services so recently started in England. Without hesitation I urged those I met who asked me, to resist the State control of all medicine in America. Obviously this was one lone voice in a desert of non-committal silence.

At the Annual Meeting of the American Medical Association, which occurred during the same period as the Congress, and which discussed the possibility of a whole-time medical service in America, the American audience appeared to be apathetic to the dangers of such a service. Therefore it was with delight that I read of President Eisenhower's recent message epitomized in the *Supplement* of January 15 (p. 17) and in *The Times* that week. May he long continue this strength of character to fight for freedom and the individual incentive; encouraging the patients to choose for themselves the greater dignity of paying for treatment, and the doctors with the incentive which goes with private or voluntary treatment.

A free gift is never so much appreciated as something paid for, except in the case of the deserving poor. Oh, that the people of England would ask for less and give more time and trouble to their own work, without the sole incentive of greater remuneration! Many more doctors would then have their vocation as their greater pleasure.

There is much waste of money on expensive and luxurious drugs and appliances, when as efficient though more economical treatments would serve as readily to bring health to the patient. How can the present indiscriminate prescribing without due regard for cost encourage the continuation of private practice; the few remaining high-spirited British private patients having to pay for an expensive preparation which is given *ad lib.* to State-aided ones for 1s. per time? Sometimes the greater part of the medicine is thrown away, the recipient not realizing its financial worth. What is little paid for will be little valued. Well done, America!—I am, etc.,

London, W.1.

M. M. DOBSON.

H.M. Forces Appointments**COLONIAL MEDICAL SERVICE**

The following appointments have been announced: H. M. Carson, M.B., B.Ch., and H. B. L. Russell, M.R.C.S., L.R.C.P., D.P.H., Senior Medical Officers, Ministry of Health, Gold Coast; J. Lomaz, M.B., Ch.B., Medical Officer (Anaesthetist), Federation of Malaya; M. T. Read, M.R.C.S., L.R.C.P., Administrative Medical Officer, Grade A, Federation of Malaya; G. J. Clarke, M.R.C.S., L.R.C.P., Senior Medical Officer, St. Helena; E. C. B. Hall-Craggs, M.B., B.Ch., Medical Officer, Uganda; P. N. Griffin, M.B., Ch.B., Medical Officer, Dominica, Windward Islands; S. R. W. Moore, M.B., B.Ch., B.A.O., Medical Officer, Sierra Leone; C. W. E. Murphy, M.B., B.Ch., B.A.O., D.P.H., Special Grade Medical Officer (Anaesthetist), Aden; Margaret J. Purser, M.B., B.S., Medical Officer, South Pacific Health Service, Fiji; T. Rajcoomar, M.B., B.S., D.T.M.&H., Medical Officer, Mauritius; R. A. F. Schoyerer, M.D., Medical Officer, Gold Coast.

Association Notices**SCHOLARSHIPS IN AID OF SCIENTIFIC RESEARCH**

The Council of the British Medical Association is prepared to receive applications for research scholarships as follows:

An Ernest Hart Memorial Scholarship, of the value of £250.

A Walter Dixon Scholarship, of the value of £250.

Four ordinary research scholarships, each of the value of £200.

These scholarships are given to candidates recommended by the Science Committee of the Association as qualified to undertake research in any subject (including State medicine) relating to the causation, prevention, or treatment of disease.

In addition, applications are invited for the award of the following research scholarship:

The Insole Scholarship, of the value of £250, for research into the causes and cure of venereal disease.

Each scholarship is tenable for one year, commencing on October 1, 1955. A current scholar may apply to be re-appointed for a further year, though no scholarship will be renewed more than twice. A scholar is not necessarily required to devote the whole of his or her time to the work of research, but may be a member of H.M. Forces or may hold a junior appointment at a university, medical school, or hospital, provided the duties of such appointment will not, in the opinion of the Science Committee, interfere with his or her work as a scholar.

Applications for scholarships, including renewals, must be made not later than March 1, 1955, on the prescribed form, a copy of which will be supplied by the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, on application.

Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated.

A. MACRAE,
Secretary.

Diary of Central Meetings

FEBRUARY	
22 Tues.	Subcommittee on Practice Vacancies, G.M.S. Committee, 2 p.m.
23 Wed.	Catering Committee, 11 a.m.
23 Wed.	Finance Committee, 2 p.m.
23 Wed.	Practice Accommodation Subcommittee, G.M.S. Committee, 2 p.m.
24 Thurs.	Evidence Committee on Divine Healing, 10 a.m.
24 Thurs.	Journal Committee, 2 p.m.
25 Fri.	Medico-Legal Subcommittee, Central Consultants and Specialists Committee, 11.30 a.m.
25 Fri.	Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
25 Fri.	Full-time Non-professional Medical Teachers and Research Workers Group Committee, 2 p.m.
25 Fri.	Medico-Legal Subcommittee, Central Consultants and Specialists Committee, with Ministry of Health (at 23, Savile Row, London, W.), 2.30 p.m.

MARCH

2 Wed.	Council, 10 a.m.
3 Thurs.	Homosexuality and Prostitution Committee, 10.30 a.m.
4 Fri.	Joint Committee of the B.M.A. and the Magistrates' Association, 10.15 a.m.
8 Tues.	Constitution Committee, 11 a.m.
10 Thurs.	Psychological Medicine Group Committee, 2 p.m.
17 Thurs.	Charities Committee, 2.15 p.m.
30 Wed.	Committee re Remuneration Policy, 2 p.m.
31 Thurs.	Conference of Honorary Secretaries of Divisions and Branches, 10.30 a.m.

Branch and Division Meetings to be Held

BATH, BRISTOL, AND SOMERSET BRANCH.—At Royal United Hospital, Bath, Wednesday, February 23, 8.30 p.m., meeting. Professor Bryan L. McFarland: "Congenital Deformities."

BOURNEMOUTH DIVISION.—At Board Room, Royal Victoria Hospital, Boscombe, Friday, February 25, 8.15 p.m., meeting. Address by Dr. R. M. B. MacKenna: "Common Skin Diseases" (a lantern lecture).

COVENTRY DIVISION.—At Out-patient Department, Coventry and Warwickshire Hospital, Tuesday, February 22, 8.15 p.m., clinical meeting.

DARLINGTON DIVISION.—At Darlington Memorial Hospital, Tuesday, February 22, 8.30 p.m., meeting. Lecture by Dr. Robert Orton: "Menopausal Depressive States."

DARTFORD DIVISION.—At Livingstone Hospital, Dartford, Thursday, February 24, 8.45 p.m., business meeting.

DEWSBURY DIVISION.—At General Hospital, Dewsbury, Friday, February 25, 8.30 p.m., meeting. Mr. John Foster: "Early Diagnosis of Intraocular Disease."

DONCASTER DIVISION.—At Danum Hotel, Doncaster, Thursday, February 24, jointly with Doncaster Medical Society, annual dinner and dance.

DUNDEE BRANCH.—At Queen's Hotel, Dundee, Tuesday, February 22, 8.15 for 8.45 p.m., annual dinner-dance.

EASTBOURNE DIVISION.—At Princess Alice Memorial Hospital, Eastbourne, Tuesday, February 22, 8.30 p.m., meeting. Talk by Dr. T. A. Morrison: "Organization at the Periphery," with special reference to the advantages of co-operation between Division and Branch.

ISLE OF WIGHT DIVISION.—At St. Mary's Hospital, Newport, Thursday, February 24, 8 p.m., meeting. Address by Dr. R. Forbes (Secretary, Medical Defence Union): "Medical Litigation—A Dagger." An open discussion will follow. Members of the legal profession are invited.

KENSINGTON AND HAMMERSMITH DIVISION.—(1) At Princess Louise (Kensington) Hospital for Children, St. Quintin Avenue, W., Tuesday, February 22, 8.30 p.m., meeting to which all medical practitioners in the area of the Division are invited. (2) At St. Charles's Hospital, Ladbroke Grove, London, W., Friday, February 25, 3.30 for 4 p.m., clinical meeting.

KESTEVEN DIVISION.—At Red Lion Hotel, Grantham, Thursday, February 24, 7.15 for 7.45 p.m., dinner; 9 p.m., Dr. Marjory W. Warren: "Geriatrics and Future Developments."

LINCOLN DIVISION.—At Board Room, County Hospital, Lincoln, Thursday, February 24, 8 p.m., meeting to discuss questionnaire on peripheral organization of the Association, Part III.

MIDLAND BRANCH.—At Dudley Road Hospital, Birmingham, Friday, February 25, 8.15 p.m., clinical meeting.

OLDHAM DIVISION.—At Albion Club, Queen Street, Oldham, Monday, February 21, 9 p.m., meeting. Lecture by Dr. L. A. Liversedge: "Some Medical Complications of Sport."

SOUTH-WEST WALES DIVISION.—At Boar's Head Hotel, Carmarthen, Saturday, February 26, 7 for 7.45 p.m., dinner. Annual B.M.A. Lecture by Sir Heneage Ogilvie: "Bile and the Biliary Passages."

TOWER HAMLETS DIVISION.—At St. Andrew's Hospital, Devons Road, Bow, E., Friday, February 25, 3 p.m., clinical meeting. Mr. J. R. M. Whigham: "Bleeding from Duodenal Ulcer."

WEMBLEY DIVISION.—At Gymnasium, Wembley Hospital, Tuesday, February 22, 9 p.m., meeting. Lecture by Dr. R. Donald Teare: "Modern Poisoning." Members of the Willesden and Hampstead Divisions are invited.

WEST LOTHIAN DIVISION.—At Lea Park Hotel, Grangemouth, Wednesday, February 23, 7.45 for 8 p.m., second annual dinner-dance.

S.H.M.O. Meetings

There will be a meeting of Senior Hospital Medical Officers in the Western Region of Scotland on Wednesday, February 23, at 4.15 p.m. in the Hall of the Royal Faculty of Physicians and Surgeons, St. Vincent Street, Glasgow, C.2.

A meeting of Senior Hospital Medical Officers in the South-west Metropolitan Region will be held on Saturday, February 26, at 11 a.m. at B.M.A. House, Tavistock Square, London, W.C.

A meeting of Senior Hospital Medical Officers in the Cambridge Region will be held on Saturday, February 26, at 3.15 p.m. at the Rutland Arms Hotel, Newmarket.

A meeting of Senior Hospital Medical Officers will be held in the Oxford Region on Sunday, February 27, at 3 p.m., at the Maternity Department Lecture Theatre, Radcliffe Infirmary, Oxford.

JOINT ANNUAL MEETING—TORONTO, JUNE 20-24, 1955

President-Elect: THOMAS CLARENCE ROUTLEY, C.B.E., LL.D., M.D., F.R.C.P.(C).

PRELIMINARY SCIENTIFIC PROGRAMME**Monday, June 20****Round Table Conferences**

9 to 10.15 a.m.—(a) The Management of Prostatic Obstruction. Chairman: Dr. C. L. Gosse,* Halifax. (b) Pain. Chairman: Dr. Frank Turnbull,* Vancouver. (c) The Role of the General Practitioner in the Diagnosis and Treatment of Glaucoma. Chairman: Dr. A. J. Elliot,* Toronto. (d) The Problem of the Anaemias. Chairman: Dr. E. S. Mills,* Montreal.

Plenary Session

10.30 a.m. to 12.15 p.m.—The Present Status of Chemotherapy of Bacterial Infections. Chairman and Opening Speaker: Professor L. P. Garrod, London. Speakers: Dr. T. E. Roy,* Toronto; Professor J. W. Crofton, Edinburgh; Dr. K. J. R. Wightman,* Toronto.

Tuesday, June 21**Round Table Conferences**

9 to 10.15 a.m.—(a) Surgery of the Lungs. Chairman: Dr. R. M. Janes,* Toronto. (b) Is Prenatal Care Worth While? Chairman: Dr. Elinor F. E. Black,* Winnipeg. (c) The Prevention and Treatment of Poliomyelitis. Chairman: Dr. C. E. Van Rooven,* Toronto. (d) Alcoholism in Industry. Chairman: Dr. W. Harvey Cruickshank,* Montreal.

General Session

10.30 a.m. to 12.15 p.m.—(1) The Blackader Lecture—Professor Stanley Graham, Glasgow. The Changing Pattern of Paediatrics. (2) Professor Sir Geoffrey Jefferson, Manchester. Title to be announced. (3) Dr. R. M. B. MacKenna, London. Acne Vulgaris and Adult Pre-menstrual Acne.

Wednesday, June 22**Round Table Conferences**

9 to 10.15 a.m.—(a) The Management of Coronary Thrombosis. Chairman: Dr. Harold Segall,* Montreal.

Canadian speakers are denoted by an asterisk ().

(b) Deafness. Chairman: Dr. W. J. McNally,* Montreal. (c) The Management of Rheumatoid Arthritis. Chairman: Dr. Wallace Graham,* Toronto. (d) The Recognition and Management of Depressive Reactions. Chairman: Dr. R. O. Jones,* Halifax.

Plenary Session

10.30 a.m. to 12.15 p.m.—The Clinical Application of Physiology to Medicine and Surgery. Chairman and Opening Speaker: Professor Sir Henry Cohen, Liverpool. Speakers: Dr. Joseph Doupe,* Winnipeg; Sir Henry Dale, London; Dr. J. S. L. Browne,* Montreal.

Panel on National Health Service

3 p.m.—Chairman: Dr. R. W. Richardson,* Winnipeg. (1) Dr. E. A. Gregg, London. Background of the Service. (2) Dr. A. Talbot Rogers, Bromley. The Family Doctor Service. (3) Dr. T. Rowland Hill, London. The Hospital Service. (4) Dr. S. C. Gawne, Preston. The Public Health Service.

Thursday, June 23**Round Table Conferences**

9 to 10.15 a.m.—(a) The Management of Bronchia. Asthma. Chairman: Dr. Bram Rose,* Montreal. (b) The Care of Premature Infants. Chairman: Dr. J. F. McCreary,* Vancouver. (c) Anaesthesia for the Aged Patient. Chairman: Dr. Harold Griffith,* Montreal. (d) Problems in Dermatology. Chairman: Dr. George S. Williamson,* Ottawa.

General Session

10.30 a.m. to 12.15 p.m.—(1) Professor Sir Robert Macintosh, Oxford. A Plea for Simplicity in Anaesthesia. (2) Professor Dugald Baird, Aberdeen. Indications for the Use of Caesarean Section. (3) Dr. William Pickles, Aysgarth, Yorks. The General Practitioner and the Laboratory.

Friday, June 24**Round Table Conferences**

9 to 10.15 a.m.—(a) The Value of Mass Radiography. Chairman: Dr. G. C. Brink,* Toronto. (b) The Treatment

of Burns. Chairman: Dr. S. D. Gordon,* Toronto.
(c) Lumbar Pain. Chairman: Dr. R. I. Harris,* Toronto.
(d) Rehabilitation Following Industrial Injury. Chairman:
Dr. Bruce Young,* Toronto.

General Session

10.30 a.m. to 12.15 p.m.—(1) The Gordon Richards Memorial Lecture—Mr. J. Ralston Paterson, Manchester. Why do Cancer Patients Delay? (2) Sir Heneage Ogilvie, London. What Not to Do in Gall-bladder Surgery. (3) Dr. Desmond Curran, London. The Place of Psychology and Psychiatry in Medical Education.

SECTIONAL MEETINGS**ANAESTHESIA***Wednesday, June 22*

2 to 5 p.m.—(1) Dr. C. Langton Hewer, London. Physiology and Complications of the Trendelenburg Position. (2) Dr. H. R. Griffith,* Montreal. Whither Now in Anaesthesia? (3) Dr. A. R. Hunter, Stockport. Antidotes to Curarizing Drugs. (4) Dr. Leon Longtin,* Montreal. A New Technique of Intubation for the Prevention of Contralateral Infection During Lung Surgery. (5) Quiz Session. Moderator: Dr. B. C. Leech,* Regina.

Thursday, June 23

2 to 5 p.m.—(1) Dr. D. A. Buxton Hopkin, London. Chlorpromazine. (2) Dr. H. J. Shields,* Toronto. History of Anaesthesia in Canada. (3) Dr. Ronald Jarman, London. The Anaesthetic and the Anaesthetist. (4) Dr. Fernando Hudon,* Quebec. Considerations on Recovery Rooms. (5) Dr. R. W. Cope, London. Anaesthesia for Children and the Newborn. (6) Dr. Philip R. Bromage, Emsworth. Spirometry in the Assessment of Analgesia after Abdominal Surgery.

CHILD HEALTH*Tuesday, June 21*

2 to 5 p.m.—Some Problems of the Neonatal Period:—(1) Dr. Mary Crosse, Birmingham. Dr. Jean Webb,* Ottawa. Vital Statistics—Causes of Neonatal Mortality and Morbidity. (2) Professor W. S. Craig, Leeds. Anoxia and Respiratory Failure. (3) Dr. Peter Spohn,* Vancouver. Retrofetal Fibroplasia. (4) Dr. Bruce Chown,* Winnipeg. Erythroblastosis. (5) Dr. Wm. Donohue,* Toronto. Causes of Death in Prematurity. (6) Professor Alan Moncrieff, London. Congenital Malformations, Causation and Prevention. (7) Mr. Denis Browne, London. Congenital Malformations, Surgery.

Wednesday, June 22

2 to 5 p.m.—(A) Problems of Gastro-enteritis:—(1) Dr. Frances Pressick,* Montreal. Bacteriology. (2) Dr. B. E. Schlesinger, London. Drugs and Antibiotics. (3) Dr. W. W. Payne, London. Fluid and Electrolyte Balance. (B) Respiratory Diseases:—(1) Professor W. F. Gaisford, Manchester. Experiences with B.C.G. (2) Dr. Gladys Boyd,* Toronto. Bronchiectasis.

DERMATOLOGY*Wednesday, June 22*

2 to 5 p.m.—(1) Dr. D. I. Williams, London. The Whitfield Tradition in Modern Therapy. (2) Dr. R. Mason Bolam, Newcastle-upon-Tyne. Acute Skin Diseases in General Practice. (3) Dr. Britain Sanders,* Toronto. Ringworm of the Scalp. (4) Dr. B. Usher,* Montreal. Further Studies on the Pathogenesis of Rosacea.

Thursday, June 23

2 to 5 p.m.—Clinical session at Toronto General Hospital presented by the Section of Dermatology, Academy of Medicine, Toronto.

GENERAL PRACTICE*Monday, June 20*

2 to 5 p.m.—Symposium:—The Management of Abortion in General Practice. Moderator: Dr. John Mann,* Toronto. Participants: Dr. Joslyn Rogers,* Toronto. Additional speakers to be announced.

Thursday, June 23

2 to 5 p.m.—(1) Dr. Ian D. Grant, Glasgow. Problems in the Management of the Aged. (2) Dr. Alistair McCrone, Glasgow. Let me see your Tongue: Why? (3) Dr. F. M. Rose, Preston. Problems of Hypertension in General Practice. (4) Dr. Harold F. Robertson,* Toronto. Occluding Arterial Lesions of the Leg. (5) Dr. J. A. McDonald,* Glace Bay. Subject to be announced.

MEDICINE*Monday, June 20*

2 to 5 p.m.—(1) (a) Dr. H. Garfield Kelly,* Kingston. The Mechanism of Heart Failure. (b) Dr. Stephen Whittaker, Warwick. The Treatment of Heart Failure. (2) Dr. Paul David,* Montreal. Indications for and Results of Mitral Valvulotomy. (3) Dr. Hugh Stansfield,* Vancouver. Electrocardiographic Patterns in Atypical Acute Coronary Occlusion. (4) Dr. Kenneth Harris, London. Clinical Aspects of Atypical Coronary Disease. (5) Dr. William Evans, London. Treatment of Cardiac Infarction—Immediate and Late.

Wednesday, June 22

2 to 5 p.m.—(1) Dr. E. R. Cullinan, London. The Essential Nature, Effects, and Treatment of Simple Obesity. (2) The Sprue Syndrome: (a) Professor A. C. Frazer, Birmingham. Idiopathic Steatorrhoea. (b) Dr. Douglas Cameron,* Montreal. Secondary Steatorrhoea. (3) Dr. A. W. Bagnall,* Vancouver. Post-Menopausal Osteoporosis. (4) Dr. Guy E. Joron,* Montreal. Diagnosis and Treatment of Acute Pyelonephritis in Diabetes Mellitus.

Thursday, June 23

2 to 5 p.m.—(1) Dr. David A. Long, London. The Aetiology of Rheumatic Fever. (2) (a) Dr. E. C. Warner, London. The Nature of the Physiological Disturbance in Chronic Pulmonary Emphysema. (b) Dr. T. H. Aaron,* Edmonton. The Modern Treatment of Chronic Pulmonary Emphysema. (3) Dr. William I. Morse,* Boston. Investigation of the Haemorrhagic Diatheses. (4) Dr. John P. Gemmell,* Winnipeg. Choice of Treatment in Hyperthyroidism.

NEUROLOGY*Monday, June 20*

2 to 5 p.m.—(1) Dr. Hugh Garland, Leeds. Diabetic Neuropathy. (2) Sir Charles Symonds, London. Cough Headache—A Benign Syndrome. (3) Dr. E. H. Botterell,* Toronto. Hypothermia in Cerebral Vascular Surgery. (4) Dr. W. M. Loughheed,* Toronto. Hypothermia for Neurological Surgery: Evaluation of the Method. (5) Dr. W. Ritchie Russell, Oxford. Observations on Interstitial Neuritis. (6) Dr. T. Rowland Hill, London. Some Problems of Peripheral Neuropathy.

Wednesday, June 22

2 to 5 p.m.—(1) Mr. D. W. C. Northfield, London. The Results of Treatment of Cervical Spondylosis with Neurological Manifestations. (2) Professor Sir Geoffrey Jefferson, Manchester. The Integration of Coma. (3) Dr. Wilder Penfield,* Montreal. The Results of Cortical Excision in the Treatment of Focal Epilepsy. (4) Dr. Macdonald Critchley, London. Observations on Aphasia. (5) Dr. Douglas McAlpine, London. Some Observations on the Diagnosis and Treatment of Multiple Sclerosis.

OBSTETRICS AND GYNAECOLOGY*Tuesday, June 21*

2 to 5 p.m.—(1) Dr. Douglas Frew,* Edmonton. What is Adequate Prenatal Care To-day? (2) Mr. S. Bender, Liverpool. Infertility. (3) Dr. F. L. Johnson,* Hamilton. The Management of Breech Presentations. (4) Mr. John Peel, London. The Management of the Diabetic Patient in Pregnancy. (5) Dr. Otto Schmidt,* Winnipeg. Induction of Labour—Its Use and Abuse.

Thursday, June 23

2 to 5 p.m.—(1) Dr. Carl Tupper,* Halifax. The Management of Spontaneous Abortion—A Combined Approach. (2) Mr. Malcolm Donaldson, London, and Dr. Paul Latour,* Montreal. The Early Diagnosis of Cancer of the Cervix. (3) Miss Gladys Hill, London. Functional Bleeding. (4) Professor David Stewart, Jamaica. Treatment of Suppression of Urine Following Eclampsia.

OCCUPATIONAL MEDICINE*Tuesday, June 21*

2 to 5 p.m.—(1) Dr. A. H. Sellers,* Toronto. The Procuring of Comparable Industrial Medical Statistics. (2) Dr. J. E. Goodwin,* Toronto. Indicating in Advance a Susceptibility to Noise. (3) Dr. Ian Urquhart,* Toronto. Problems of Resuscitation in Industry. (4) Dr. J. H. Baillie,* Toronto. Some Considerations of Sickness Absenteeism in a Non-hazardous Industry. (5) Dr. J. J. O'Dwyer, London. The Contribution of the Doctor to the Management Team.

Thursday, June 23

2 to 5 p.m.—(1) Dr. John Rogan, London. The Health of the British Coal-miner. (2) Dr. R. Appleford,* Oakville. The Detection of Diabetes on Preplacement Blood Examinations. (3) Dr. C. G. Shaver,* St. Catharines. Silicon Carbide as an Industrial Hazard. (4) Dr. S. G. McLean, London. Some Aspects of Health in the Oil Industry. (5) Surgeon Commander F. P. Ellis, R.N., Washington. Environmental Health in the Royal Navy. The Changing Scene.

OPHTHALMOLOGY*Monday, June 20*

2 to 5 p.m.—(1) Mr. James H. Doggart, London. Vessels of the Ocular Fundus as a Guide to Prognosis. (2) Mr. J. W. Tudor Thomas, Cardiff. On Advising a Corneal Graft. (3) Dr. I. Lloyd Johnstone, Worcester. The Operative Treatment of Abducens Palsy. (4) Dr. Charles Dyson, London.* Chordomata of Ocular Interest. (5) Dr. Howard Reed,* Winnipeg. Some Observations on the Results of Cataract Extraction. (6) Dr. C. D. Baird,* Chatham. Diseases of the Meibomian Glands.

ORTHOPAEDIC SURGERY*Wednesday, June 22*

2 to 5 p.m.—(1) Mr. H. Jackson Burrows, London. Replacement of Bone by Internal Prostheses. (2) Dr. J. Bateman,* Toronto. Management of Acute Nerve Injuries. (3) Dr. J. M. Janes,* Rochester. Peripheral Vascular Surgery from the Standpoint of the Orthopaedic Surgeon. (4) Mr. J. P. Jackson, London. Results of Chemotherapy in Bone and Joint Tuberculosis. (5) Dr. George Pennal,* Toronto. The Thomas Splint. (6) Mr. H. H. Langston, Winchester. A Plea for a Rational Outlook on the Internal Fixation of Fractures. (7) Dr. A. Jousse,* Toronto (Chairman). Symposium on Traumatic Paraplegia.

Thursday, June 23

2 to 5 p.m.—(1) Mr. Philip Wiles, London. The Aetiology of Postural Defects. (2) Mr. Denis Browne, London. The Causation of Certain Congenital Deformities and Their Treatment by Controlled Movement. (3) Dr. L. P. Roy,* Quebec. Bone Tumours. (4) Dr. F. P. Patterson,* Vancouver. Complications of External Pin Fixation in Orthopaedic Surgery.

(5) Dr. G. L. Burke,* Vancouver. Some Observations on the Feet and Legs in Childhood. (6) Dr. A. A. Butler,* Montreal. Evaluation of the Use of Hydrocortone in Orthopaedic Surgery. (7) Mr. J. P. Campbell, Nottingham. Treatment of Osteoarthritis of the Hip by Osteotomy. (8) Dr. R. Garipey,* Montreal. The Surgical Management of Osteoarthritis of the Knee-Joint. (9) Dr. J. N. Swanson,* Toronto. Some Orthopaedic Problems Connected with Gouty Arthritis.

OTOLARYNGOLOGY*Tuesday, June 21*

2 to 5 p.m.—(1) Dr. David H. Ballon,* Montreal. Review of Foreign Body Endoscopy Over a Period of Thirty Years. (2) Dr. R. E. Greenway,* London. Results of Cobalt Therapy in Malignancies of the Nose and Throat. (3) Dr. J. A. Sullivan,* Toronto. Clinical Testing of Vertigo. (4) Mr. Victor Negus, London. Air Conditioning Mechanism of the Nose.

Wednesday, June 22

2 to 5 p.m.—(1) Mr. Terence Cawthorne, London. Facial Palsy. (2) Mr. Ronald Macbeth, Oxford. The Treatment of Oesophageal Varices in Portal Hypertension by Means of Sclerosing Injections. (3) Dr. Edward Tremble,* Montreal. A Few Highlights Concerning Respiratory Cilia. (4) Dr. Howard McCart,* Toronto. Parotid Tumours.

PREVENTIVE MEDICINE*Monday, June 20*

2 to 5 p.m.—(1) (a) Professor R. Cruickshank, London. The Epidemiology of Upper Respiratory Tract Infections. (b) Dr. G. Dempster,* Toronto. Acute Respiratory Disease. (c) Dr. Elizabeth Chant Robertson,* Toronto. Ultra-violet Radiation in the Control of Respiratory Disease. (2) *Occasional Paper*—Dr. John Gardiner,* Toronto. The Heart Registry.

Wednesday, June 22

2.30 to 5 p.m.—(1) Dr. H. J. Parish, London. Combined Immunization. (2) Dr. A. R. Foley,* Quebec, and Dr. James M. Mather,* Vancouver. Combined Immunization from the Viewpoint of the User in the Field. (3) Dr. P. J. Moloney,* Toronto. Antigenic and Immunological Aspects of Combined Immunization.

PSYCHIATRY*Tuesday, June 21, and Thursday, June 23*

2 to 5 p.m.—(1) Dr. A. E. Moll,* Montreal. The Psychopathology of Suicide. (2) Dr. G. C. Sisler,* Winnipeg. The Treatment of Suicidal Attempts. (3) Dr. Wm. C. Gibson,* Vancouver. Basic Sciences in Psychiatry—Physiology. (4) Dr. John W. Lovett Doust,* Toronto. Basic Sciences in Psychiatry—Psychology.

(Names of contributors from the United Kingdom not yet available.)

RADIOLOGY*Wednesday, June 22*

2 to 5 p.m.—*Diagnosis*:—(1) Dr. L. R. Harnick,* Toronto. Diodrast Arthrography of the Knee, and Surgical Correlation. (2) Dr. R. A. Macpherson,* Winnipeg. Ulceration of the Duodenal Bulb without Deformity—A Clinical-Radiological Correlation in (number) Cases. (3) Dr. Guillaume Gill,* Montreal. Ureteral Block and Kidney Function.

(Names of contributors from the United Kingdom not yet available.)

Thursday, June 23

2 to 5 p.m.—*Therapy*:—(1) Dr. Ethlyn Trapp, Vancouver. (2) Dr. Jean Bouchard,* Montreal. (3) Dr. Ronald Burr,* Kingston. Intracavity Irradiation of Carcinoma of the Bladder.

(Names of contributors from the United Kingdom not yet available.)

SURGERY

Monday, June 20, and Tuesday, June 21

2 to 5 p.m.—Two sessions of the Section of Surgery are planned for Monday, June 20, and Tuesday, June 21. The complete list of speakers from the United Kingdom and Canada is not yet available.

UROLOGY

Wednesday, June 22

2 to 5 p.m.—(1) Mr. H. P. Winsbury-White, London. Early Signs of Bladder-neck Disease. (2) Dr. John K. Lattimer, New York. The Role of the General Practitioner in the Treatment of Genito-urinary Tuberculosis. (3) Mr. Leslie N. Pyrah, Leeds. The Use of the Ileum in Genito-urinary Surgery. (4) Mr. A. W. Badenoch, London. Haematuria. (5) Dr. Thomas Russell,* Toronto. Urinary Tract Infections.

GENERAL MEDICAL SERVICES COMMITTEE

EXTRAVAGANT PRESCRIBING: DISCIPLINARY MACHINERY

At the monthly meeting of the General Medical Services Committee on February 17, Dr. A. TALBOT ROGERS presiding, discussion took place on the disciplinary machinery designed to discourage extravagant prescribing. The matter arose on a resolution from the Birmingham Local Medical Committee expressing disquiet at the apparent viciousness of the fine recommended in a recent case reported in the *Supplement* (November 20, 1954, p. 191, and February 5, p. 41), and requesting the General Medical Services Committee to consider this important matter very fully.

The CHAIRMAN said that, altogether apart from the case cited, the disciplinary machinery in these cases deserved some attention. It had to be acknowledged that in spite of every effort made by the Committee and by the Ministry there had been in the last recorded year a further increase of 4,500,000 in the number of prescriptions issued, and a rise of one penny—a smaller rise than usual—in average cost. The "big fine" case reported in the *Supplement* had led to a good deal of correspondence, and dissatisfaction had been expressed at the way in which it was dealt with. But there might have been factors in the case which were not brought out in the report; for example, it was not stated whether the practitioner had received any previous warning. He reminded the Committee that if there was reason to believe that a practitioner was grossly over-prescribing his attention was first drawn to the matter by a visit from the regional medical officer. This was followed some months later by another examination of the practitioner's prescribing, and in the great majority of cases, of course, the records showed that the practitioner had profited by the warning. He understood that it was only if it could be shown, after that first informal visit and the subsequent re-examination, that the practitioner's extravagance had continued that disciplinary action was taken.

Dr. D. F. HUTCHINSON said that he suspected that the procedure which the Chairman had just outlined was unknown to the majority of practitioners, and Dr. HOWIE WOOD suggested that opportunity should be taken to circulate local medical committees on the subject.

It was agreed that the procedure followed in the investigation of alleged over-prescribing—the preliminary warning and the disciplinary action only after the warning had been shown to have no effect—should be publicized as widely as possible.

Payments to Elderly Doctors

The question of supplementary annual payments for elderly doctors came forward on a report by the Chairman of a discussion which he and the Deputy Secretary had had at the Ministry with Dame Enid Russell-Smith. The suggestion had been previously made to the Ministry on the recommendation of the Working Party that the central com-

mittee should rely on the views of local medical committees in deciding whether or not doctors of 75 years and over were providing full general medical services. The Ministry had expressed some dubiety at this, feeling that members of local medical committees would be reluctant to take any action which might penalize their elderly colleagues. It was stated that there were about 80 practitioners of 75 and over in single-handed practice who appeared to be eligible for consideration. So far over 50 of these had applied for supplementary payments, and in no instance had the executive council or the local medical committee expressed doubt concerning the applicant's fitness.

The CHAIRMAN stated that at the interview he and Dr. Stevenson had pointed out that it would not be possible, except in the most patent cases, for any visitor from the central committee to decide the fitness of a practitioner. Members of the local medical committee would be in a much better position to make an assessment of all the circumstances.

The Committee endorsed the action taken by the Chairman, the understanding being that the initiative rested with the local medical committee, and only when doubtful cases came forward would it be proper for a member of the central committee to join with a member of the local committee in seeing the practitioner. It was pointed out that in these cases much depended upon the locality of the practice and the degree of local competition. If there were other doctors available and an elderly doctor was obviously unfit, the patients themselves would more or less solve the problem. It was also felt that the elderly man, given adequate deputizing arrangements and relieved from night work, could quite happily carry on and no difficulties were likely to arise. The view was expressed that the medical profession had no need to adopt the arbitrary retirement age of the Civil Service, which was intended, not to displace inefficient seniors, but to facilitate the promotion of juniors. It was also questioned whether the criterion of fitness to carry on should be solely that of age, and one member suggested that if it came to a question of retirement there were some younger practitioners who might well be retired. It was agreed that appropriate advice on the matter should be sent to local medical committees.

Employment of General Practitioners in Hospitals

Dr. A. N. MATHIAS, who had been requested to attend as a representative of a meeting of the Medical Staff Subcommittee of the Central Consultants and Specialists Committee, reported that two members had raised an apparently quite serious objection affecting the association of general practitioners with hospitals in the smaller towns—namely, that general practitioners not on the staffs of the hospitals were sometimes unwilling to send patients to a hospital staffed by specialists who were also general practitioners in the area.

The CHAIRMAN said that the policy of the Committee had always been to encourage the employment of general practitioners in hospitals in any capacity for which their training and experience fitted them, even to the extent of taking clinical charge of a department or out-patient clinic. A consultant mentioned to him one general practitioner whose training and experience were such as to make him a considerable asset to the hospital, but objection had been taken by two other practitioners of a rival firm, both of whom held appointments in the hospital. The Chairman asked whether, if this were at all a general attitude, they were justified in hoping for the integration of general practice with hospital posts. He did not wish to be the spokesman of a policy there was no hope of implementing.

Several members gave their experiences in this respect. Mr. NICHOLSON-LAILEY said that there had always been some general practitioners who had objected, just as there were some consultants who would banish general practitioners from hospitals altogether. Notwithstanding that, they had in his area some first-class general practitioners in hospitals, and some of the hospitals could not have continued without

their help. Dr. H. C. FAULKNER said that the attitude of these few general practitioners was incomprehensible. This was a red herring which ought not to affect their judgment. Many general practitioners enriched their clinical experience by taking part in hospital work.

On the motion of Dr. MATHIAS, the Committee reaffirmed its policy.

The Assistant in General Practice

Dr. BRUCE CARDEW introduced the report of a subcommittee which was appointed at the December meeting to investigate the employment of assistants. He said that this problem had been under discussion in the Committee for two years. The real problem did not lie in the size of the list; it was encountered equally in the case of a principal with quite a small list. Exploitation of assistants was more likely to occur when the assistant was obliged to undertake more than a fair share of the work of the practice or was not paid a salary commensurate with the work he did, and no reduction of the extra list could remedy cases of that sort. The subcommittee held the view that there was nothing improper in a principal enjoying a monetary reward in respect of the indefinite employment of an assistant, provided that the salary and allowances paid were commensurate with the responsibility undertaken and that the assistant had had no reason to believe that the appointment would lead to a partnership.

From this the subcommittee had proceeded to try to find a solution to deal with cases which did not conform with these provisos. Its first recommendation, an uncontentious one, was that further efforts should be made, through the deans of medical schools, to ensure that final-year students and newly qualified practitioners were fully informed of the importance of entering into a formal agreement when accepting a post of assistant. Secondly, it was found to be in the power of an executive council to lay down how many extra names on his list a principal should be permitted by virtue of employing an assistant, and it was recommended that executive councils should, in consultation with local medical committees, periodically review all cases in which consent had been given, and should have power, again on advice of local medical committees, and after reasonable warning, either to withdraw their original consent to the employment of an assistant or to modify the number of additional patients permitted. It was proposed also that an appropriate letter be sent to local medical committees drawing their attention to the proposed arrangements and offering general guidance when advising their executive councils. The final recommendation was that a principal implementing a "view" registered with the executive council should have the right to claim retrospective payment on the basis of notional lists for a period up to a maximum of one year. In presenting the report Dr. Cardew paid a tribute to the Deputy Secretary, who was responsible for its drafting.

The CHAIRMAN said that the report would go to the Assistants and Unestablished Practitioners Subcommittee for its observations, and Dr. L. RUSSELL, representative of assistants on the main Committee, said that he would reserve any comments for the subcommittee. Certain amendments of phraseology in the recommendations were suggested. Dr. C. M. SCOTT wanted it to be stated that the number of additional patients permitted to a principal by virtue of the employment of an assistant should normally be 2,000, but Dr. Cardew said that he could not agree with this suggestion; he did not think this was the proper place to insert anything about the size of the list. Dr. WAND said that he felt it should be indicated in the recommendations that the normal situation still remained—that is, a figure of 2,000 additional patients for an assistant—although action in the terms set out might be taken by the executive council in individual instances. One member used the word "concessions" in relation to the report, but Dr. J. A. PRIDHAM, a member of the subcommittee, took objection to this, saying that the subcommittee had made what it thought to be a proper statement of the position, with certain recommendations.

After various suggested rephrasings it was agreed to refer the report to the Assistants and Unestablished Practitioners Subcommittee for its comments.

Other Business

On the motion of Dr. KATE HARROWER, seconded by Dr. A. BEAUCHAMP, it was unanimously agreed to invite the Minister of Health to address the Annual Conference in May.

A letter was read from the secretary of the Medical Research Council in reply to the resolution of the Representative Body on the subject of general-practitioner representation on the Clinical Research Board. Sir Harold Hims-worth said that the Council was most anxious to encourage medical research by each and every branch of the profession. Membership of the Board was based on representation of fields of medical knowledge and personal merit in research. Both these principles were compatible with a general practitioner being appointed, but neither was compatible with a proposal that any particular branch of the profession should have a pre-emptive right to a seat on the Board. The CHAIRMAN said that this was a helpful letter, and it was up to general practitioners as a section of the profession to show that there were general practitioners who justifiably might be considered for their own merit.

Following a matter which arose at the last meeting, a letter and circular by Dr. Cardew, secretary of the Medical Practitioners' Union, concerning the establishment by the Union of a section to deal with assistants was before the Committee. It stated that the policy of the new section would be determined by its members, and the final policy agreed on by the section and the council of the Union would be submitted to the General Medical Services Committee for its consideration. In view of the misunderstanding which had arisen the Union had postponed a meeting which had been arranged. This did not imply any change of policy with regard to the new section, which was now in being. The CHAIRMAN said that he himself was very gratified by the letter, and the incident closed without further discussion.

Following a joint meeting of representatives of the Mileage Subcommittees for Scotland and for England and Wales, consideration was given to a claim for an increase in the amount of mileage allocated to the Highlands and Islands, which constitutes a charge on the global mileage fund for Great Britain. It was recommended, and the Committee agreed, that the allocation be increased by the sum of £20,000.

POSTGRADUATE COURSES IN THE BAHAMAS

With the agreement of the Chief Medical Officer of the Bahamas, a scheme has been launched to provide short postgraduate courses (mainly for general practitioners) at Nassau, Bahamas, from April, 1955. Accommodation, including an auditorium, will be available in the British Colonial Hotel, and cases will be shown in the Bahamas General Hospital. Prospective applicants are asked to indicate the subjects in which they would be interested. Inquiries should be addressed to Dr. B. L. Frank, 1290, Pine Avenue West, Montreal, Canada.

REMUNERATION OF MEDICAL OFFICERS IN PUBLIC HEALTH SERVICE

March 29 has been fixed as the date of the hearing by the Industrial Court of the dispute in Committee C of the Medical Whitley Council over the remuneration of medical officers in the public health service referred for arbitration (*Supplement*, January 1, p. 3).

CONSULTANT AND OTHER SPECIALIST STAFF IN NATIONAL HEALTH SERVICE HOSPITALS

The tables printed below have been made available by the Ministry of Health and Department of Health for Scotland. All the figures relate to Great Britain.

Table I shows the age distribution in 1954 of consultants and senior hospital medical officers practising in the various specialties. Some, especially those in the older age groups, have contracts for only a small number of sessions, and it therefore does not follow that each retirement would provide a vacancy for a new recruit.

Table II shows the increase in the number of consultants in each of the specialties between the end of 1949 and June 30, 1954.

The corresponding figures for senior hospital medical officers are not available.

Table III shows the number of senior registrars in each specialty in 1954 at the various stages of their training. The column headed "Others" includes those holding "transitional" posts.

DRUG PRICES NOT EXCESSIVE TREASURY'S VIEW

A Treasury minute in a report from the Committee of Public Accounts of the House of Commons states that the investigation of the cost of standard drugs and preparations has been completed. A scrutiny of the margin of profit, turnover, and capital employed of a sample of 19 companies with an annual turnover of about £24m. showed that the annual percentage of profit to capital employed was 13.6%.

The minute says that the problem of deciding what prices the Health Service should fairly and reasonably pay for pharmaceutical products is one of considerable complexity. Only one-third of the output of the pharmaceutical industry is supplied to the Health Service, the rest being privately sold or exported. The proportions are difficult to ascertain accurately, and prices fixed for Health Service supplies must also apply to supplies to other purchasers, including exports.

Bearing in mind the substantial volume of business unrelated to the Health Service included in the turnover of the firms concerned, the minute continues, it seemed to the Departments and to the Treasury "that the general level of profits earned did not suggest that the level of prices in this field had been excessive or that intervention by the Departments was called for."

Discussions with the industry on the general principles on which it would be reasonable to fix prices for proprietary preparations are continuing.

NUMBERS OF DOCTORS

As reported in this week's Parliamentary news (*Journal*, p. 546) the Minister of Health and the Secretary of State for Scotland have appointed a committee of inquiry into the numbers of doctors likely to be needed in the future. In January, 1954, the Council of the Association approached the Minister of Health asking him to set up a Working Party for this same purpose. The following letter, explaining the Minister's decision to appoint a committee and not a Working Party as suggested by the B.M.A., has been received by the Secretary of the Association from Sir John Hawton, Permanent Secretary of the Ministry of Health.

"Since you wrote to me on January 20, 1954, the Minister and Secretary of State for Scotland have given careful consideration to the suggestion, made by the Council of the Association, that

¹Special Report from the Committee of Public Accounts, Session 1954-5, 1955. H.M.S.O., London.

the Association and various other bodies concerned should appoint representatives to a working party to make a detailed inquiry into the future number of medical practitioners and students.

"So far as the need for a detailed inquiry is concerned, the Ministers are in full agreement with the view expressed by the Council. They do not, however, consider that a representative working party of the kind suggested in your letter would be the best method of undertaking such an inquiry. Your letter mentioned by name an appreciable number of bodies that have an interest in this matter, but you made it clear that the list you gave was not intended to be exhaustive, and in the Ministers' view it would be quite impracticable, on the basis of full representation for all interests, to secure a body sufficiently compact for an efficient detailed study of a problem of this nature. The Ministers have therefore come to the conclusion that it would be preferable for them to appoint a small committee, before whom all the interested bodies can be given full opportunity of laying their views.

"As you will recollect, this method of proceeding was informally discussed with officers of the Association before a final decision was taken, and, following a suggestion that was then made, the Ministers agreed that the committee—although small—should include two general medical practitioners. As, however, it was felt to be proper that in accordance with the usual practice the first announcement of the Ministers' intentions should be made to the House of Commons, prior consultation with the Association could not take place in any more formal manner. For the same reason and because of the large number of bodies that could claim an interest in future medical manpower, it was not practicable to have formal consultations about the membership of the committee."

See annotation at p. 529.

SENIOR HOSPITAL MEDICAL OFFICERS GROUP

The following is a list of S.H.M.O.s who are acting as regional conveners for the recently formed S.H.M.O. Group of the Association:

<i>Region</i>	<i>Name and Address</i>
Newcastle	Dr. A. T. G. Evans, 26, Roker Park Road, Sunderland, Co. Durham.
Leeds	Dr. James Tyrrell, 23, Woodthorpe Lane, Wakefield, Yorks.
Sheffield	Dr. Gwyn Howells, 11, Shaldon Drive, Littleover, Derby.
East Anglia	Dr. C. B. V. Walker, Church Lane, Shepreth, Royston, Herts.
North-west Metro- politan	Mr. R. Hochhauser, Barnet General Hospital, Barnet, Herts.
North-east Metro- politan	Dr. P. J. Feeny, 150, Harley Street, London, W.1.
South-west Metro- politan	Dr. F. A. Nash, Mass Radiography Service, Grove Hospital, London, S.W.17
South-east Metro- politan	Dr. D. L. Pugh, 85B, London Road, Maidstone, Kent.
Oxford	Dr. J. Rankin, "Hunter's Moon," Shinfield Green, Reading.
South-western	Mr. George Lowe, Clare House, Tiverton, Devon.
Wales	Dr. G. M. L. James, 10, Long Oaks Avenue, Swansea, Glam.
Birmingham	Dr. F. E. Griffiths, 21, Station Road, Kenilworth, Warwick.
Manchester	Dr. T. F. McCarthy, The Residence, Nab Top Sanatorium, Marple, Cheshire.
Liverpool	Dr. W. D. Gray, 5, Brockholme Road, Mossley Hill, Liverpool, 18.
Western (Scotland)	Dr. J. F. Swan, Eldon Place, Greenock, Scotland.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Doctors' Telephones

SIR,—I could not agree more with my friend Mr. W. Gissane (*Supplement*, February 12, p. 48) that a telephone is necessary to a whole-time clinician. In pre-war days the L.C.C. had a ruling that a non-resident whole-time physician or surgeon must be on the telephone. If this rule were shown to one's income-tax inspector the rental was allowed as a necessary expense.

Mr. Gissane's logic, however, is not clear over the question of a motor-car. A whole-time director of a hospital service must get to his hospital, sometimes quickly, and not always at regular times. This, in legal eyes, is only a question of getting there and he is not in the performance of his duties until he is within the curtilage of the hospital. If a whole-time consultant could claim, as a necessary expense, the cost of travelling from his home to hospital, the logical deduction from this is that every single worker in Britain should be allowed to claim his fares for travelling from home to his place of employment. This point was argued in the High Court of Justice in 1930 (case of *Norden v. Walters*). If the consultant has to make an urgent journey to hospital outside his regular sessions he is entitled to reclaim the cost of this journey from the regional board or board of governors.

It is sometimes stated that a consultant holding a part-time contract under the N.H.S. is treated differently in this matter. If the consultant lives (as many do) some considerable distance from his consulting-rooms where he carries on practice, then he is not legally entitled to claim travelling expenses from his home to his "place of work." If this principle were allowed one could foresee, in the not-far-distant future, a surgeon, wishing to live many miles from his hospital and having a perfect right to claim as expenses the cost of travelling to hospital by helicopter or aeroplane.—I am, etc.,

London, W.1.

HENRY K. VERNON.

Filling Practice Vacancies

SIR,—Since you publish practice vacancies in your columns you may be interested in the following account. If not, perhaps some of your readers who apply for similar vacancies may like to know how things are likely to go.

A practice was recently offered for a husband and wife, experienced general practitioners. From about 70 candidates a short list of 9 couples were interviewed. Four of these were husband and wife partnerships, two couples at least having spent over five years in general practice already. The "sitting tenants" were asked to make a recommendation, and they chose a couple who had been seven years in general practice with obstetric experience, and both, incidentally, with a record of war service. The executive council finally allotted the practice to two men, one who had been one year in general practice and the other who was still a registrar in hospital. At the interviews heavy weather was made of the fact that the wives had children. But this surely is not unusual among married couples, nor even need it be a handicap. All the wives admitted to having good domestic help, and, as there were not two full lists but only one and a half, the practice need not have suffered.—I am, etc.,

"WOMAN PRACTITIONER."

Correction.—The member of Council for Branches in the Republic of Ireland for 1955-8 is J. C. McFeely, not J. C. McFreely as printed in the *Supplement* "Association Notices" (February 12, p. 50).

Branch and Division Meetings to be Held

BROMLEY DIVISION.—At Bell Hotel, Bromley, Wednesday, March 2, 7.45 p.m., annual general meeting; 8.15 p.m., discussion on the examination of surgery premises introduced by Dr. Stephen Taylor.

HARROW DIVISION.—At Rayners Hotel, Rayners Lane, Harrow, Tuesday, March 1, 8.30 p.m., clinical meeting. Symposium: "Modern Therapeutic Agents in Psychiatry." Speakers, Dr. W. A. H. Stevenson, Dr. D. E. Sands, and Dr. Jonathan H. Gould.

HARTLEPOOL DIVISION.—At Staincliffe Hotel, Seaton Carew, Wednesday, March 2, 8.30 p.m., meeting. Lecture by Dr. Michael Ward: "Physiology of Everest."

HASTINGS DIVISION.—At Nurses' Home, Royal East Sussex Hospital, Hastings, Tuesday, March 1, 8.15 p.m., meeting. Address by Mr. Norman Capener: "The Changing Pattern of Orthopaedics."

LAMBETH AND SOUTHWARK DIVISION.—At Lambeth Hospital, Brook Drive, Kennington Road, S.E., Sunday, February 27, 11 a.m., clinical meeting.

LEWISHAM DIVISION.—At Lewisham General Hospital, High Street, Lewisham, S.E., Friday, March 4, 8.30 p.m., meeting. Dr. Alistair R. French: "Medico-Legal and Ethical Problems, or When Doctors meet Lawyers."

MID-HERTS DIVISION.—At Wellington Court Clinic, Bricklet Road, St. Albans, Friday, March 4, 8.45 p.m., meeting.

ST. PANCRAS DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Wednesday, March 2, 8.30 p.m., meeting. Miss Gladys Hill: "Menstrual Disorders"; Dr. Mary E. Egerton: "Vaginal Smear Techniques in the Treatment of Some Cases of Menorrhagia." Members of the City Division are invited.

SCUNTHORPE DIVISION.—At Scunthorpe and District War Memorial Hospital, Wednesday, March 2, 8.30 p.m., meeting. Professor H. N. Green: "Cancer—The Present Position."

TODMORDEN DIVISION.—At the Medical Centre, Todmorden, Thursday, March 3, 4.15 p.m., business meeting.

WOOLWICH DIVISION.—At St. Nicholas' Hospital, Plumstead, S.E., Tuesday, March 1, 8 p.m., clinical meeting. Members of Greenwich and Deptford Division are invited.

S.H.M.O. Meetings

A meeting of Senior Hospital Medical Officers in the Liverpool Region will be held on Monday, February 28, at 8 p.m. in the Medical Institution, Mount Pleasant, Liverpool, 3.

A meeting of Senior Hospital Medical Officers in the Leeds Region will be held on Friday, March 4, at 5.30 p.m. at the Clinical Lecture Theatre of Leeds General Infirmary.

A meeting of Senior Hospital Medical Officers will be held in the Birmingham Region on Saturday, March 5, at 3 p.m. in the Nurses' Lecture Room at Marston Green Maternity Hospital, near Birmingham. The hospital is best approached from A452 between Castle Bromwich and Stonebridge.

Meetings of Branches and Divisions

CHELSEA AND FULHAM DIVISION

The annual B.M.A. lecture was held at St. Stephen's Hospital, London, S.W.10, on January 28. Colonel Harnett took the chair and 40 members were present. The lecture was delivered by Dr. K. Shirley Smith, who spoke on "Some Clinical and Therapeutic Aspects of Hypertensive Heart Disease."

THE EMPLOYMENT OF ASSISTANTS

NEW PROPOSALS WELCOMED AS A FIRST STEP

For nearly three hours on February 25 the Assistants and Young Practitioners Subcommittee (which consists of representatives of assistants and unestablished principals elected on a regional basis and of certain members of the General Medical Services Committee) considered a report of a special subcommittee under the chairmanship of Dr. Bruce Cardew on the employment of assistants in general practice. This report was considered at the last meeting of the G.M.S. Committee and referred to the Assistants and Young Practitioners Subcommittee for its comments (*Supplement*, February 26, p. 65).

Safeguards against Exploitation

The special subcommittee's recommendations, briefly summarized, were as follows:

A. That further efforts should be made, through the medical schools and local medical committees, to ensure that final-year students and duly qualified practitioners were fully informed of the need for entering into a formal agreement when accepting an assistantship.

B. That an amendment to the terms of service should be sought to make it clear that executive councils (acting in this as in other respects in consultation with local medical committees) shall periodically review all cases in which consent had been given to the employment of an assistant; and that it be pointed out to executive councils that, while the normal maximum additional list by virtue of the employment of an assistant is 2,000, the councils have power, again after consultation, where they are satisfied that reasonable cause exists, to withdraw the original consent to such employment or modify the number of additional patients admitted under their allocation scheme.

C. That the attention of local medical committees be drawn to the proposed arrangements and that they be offered general guidance on the principles they should adopt in advising executive councils.

D. That a principal implementing a "view" registered with the executive council should have the right to claim retrospective payments on the basis of notional lists for a period up to one year.

Dr. L. RUSSELL, who, with Dr. H. P. Hilditch, represents on the General Medical Services Committee the interests of assistants and young practitioners, said that he saw no major objection to these proposals, except that he thought they were unlikely to provide a full solution to the problem. He would not even go so far as to say that they presented a basis for discussion; no alteration of mere wording within this framework would solve the problem. There must be further steps.

The CHAIRMAN: You mean this is only the *hors d'œuvre*? Dr. HILDITCH said that if this went to the Conference it must not be presented as offering a full solution.

Dr. STEVENSON (Deputy Secretary) reminded the subcommittee that the parent body had been so impressed by its

representations that it had taken the unusual step of setting up this new subcommittee. If now the assistants were going to say that the report was unacceptable they would be putting back the clock.

Dr. TALBOT ROGERS, chairman of the General Medical Services Committee, said that discussions would have to take place between the Committee and the Ministry, perhaps necessitating the calling together of the Working Party, so that even if the scheme were accepted by the forthcoming Conference months would be required to obtain full agreement.

Dr. RUSSELL repeated that he and his colleagues had no objection to the report as it stood, except on the ground of adequacy. The proposals might prevent glaring cases of exploitation, but on the whole they would be ineffective.

It was agreed, however, to proceed with the discussion of the recommendations. On the question of a formal agreement when accepting a post, with or without a "view," the view of the Subcommittee was that this was always desirable.

Incomplete Answer

The Subcommittee accepted all the recommendations set out above, with one or two verbal amendments. The CHAIRMAN, explaining the last of the recommendations (D), said that it was intended as an inducement to a principal to take the assistant into partnership.

The main discussion having concluded, the Chairman asked the assistants' representatives to decide whether they were going to say that the recommendations were inadequate and they were going to consider further proposals straight away, or that if the recommendations when implemented proved inadequate they would then proceed further.

Dr. RUSSELL replied that while he and his colleagues accepted the recommendations they did not think they were the complete answer, and therefore, without waiting for their implementation, they should consider and put forward certain alternative proposals. He was unwilling that the report should go forward even as offering an interim solution. It must not be taken to the Conference as conveying that implication.

The CHAIRMAN said that they could not ask the General Medical Services Committee to put up something to the Conference as only a part solution; the Conference would send it back at once, and indeed he doubted whether it would get through the Committee.

Dr. J. GILMORE moved the following resolution:

That the Subcommittee welcomes the recommendations contained in the report as a first step in the solution of the problem, which it will continue to study.

Although a number of amendments were moved, this resolution was finally carried without dissent. It will go to the next meeting of the G.M.S. Committee.

FURTHERING PROFESSIONAL INTERESTS

BRITISH DENTAL ASSOCIATION'S DENIAL

The Management Committee of the Executive Councils' Association (England) at a meeting last December (*Supplement*, January 29, p. 30) criticized an extract printed in the *Supplement* of the *British Dental Journal* of November 16, 1954, stating that arrangements were made for the 15 dental delegates attending the Annual Conference of the Executive Councils' Association in Southport on October 14 and 15 to meet before the conference began so that the official policy of the British Dental Association might be supported when certain resolutions dealing with the general dental services came before the conference.

The Secretary of the British Dental Association has now written to the honorary secretary of the Executive Councils' Association expressing regret that the action which it took in connexion with the Executive Councils' Association's last Annual Conference might have been misunderstood. The aim of the council of the British Dental Association throughout, the letter states, has been solely to serve the best interests of the patient and in no sense to further sectional or professional interests. The letter goes on to say: "Your Management Committee will recall that there were three Resolutions affecting dentistry before your last Annual Conference. The first proposed to increase the contributions payable by many patients towards the cost of dental treatment; the second proposed to abolish the right of the patient to be supplied with immediate dentures under the general dental services; and the third was not controversial. It was clear to my [the B.D.A.'s] council that, if the proposals in the first two resolutions were adopted, the result would be to do damage to the dental health of the population as a whole. For that reason my council felt bound to take steps to ensure that dentists who were delegates to the Conference should be given an opportunity of hearing the council's objections to the policies which the resolutions proposed."

A copy of the memorandum which the British Dental Association sent to each dentist delegate at the time of the Conference was enclosed with the letter with the comment that the executive committee of the Executive Councils' Association would be able "to verify therefrom that our objections to these resolutions were certainly not based upon the fear that they might damage the interests of the dentist."

MEDICAL ETHICS

The Central Ethical Committee, under the chairmanship of Dr. Robert Forbes, had a long and detailed agenda before it at a recent meeting. The main business centred in a discussion on ethical policy concerning certain of the medical profession's main points of contact with the general public. After a lengthy debate, ranging over broadcasting on medical subjects, publications for the lay public, and professional secrecy, it was decided to set up a special subcommittee to review all these important matters of policy, and other related subjects. It was anticipated that this would take time and that a report to the main Committee would not be available for some months.

The ethical problems caused by the interval between the resignation of a general practitioner in the National Health Service and the installation of a successor have been the subject of protracted discussion between the Central Ethical and the General Medical Services Committees. Their agreed views have recently been referred back by Council for further consideration. The Central Ethical Committee has now decided to delay reviewing this difficult problem until the special Subcommittee set up by the General Medical Services Committee to examine the problem has reported. Dr. Forbes is a member of this Subcommittee.

Other matters under consideration include the relation of registered medical practitioners to those who offer spiritual aid; and also problems of cancer registration schemes.

NURSES' PAY INCREASE

The Industrial Court has awarded an increase in salary to nurses and midwives employed in the National Health Service by hospital and local authorities. Their current salary scale is increased by £25 a year, and at the same time board and lodging charges are put up. Assistant nurses get a £20 increase. The award is retrospective to December 1, 1954, and will cost about £4m.

Scottish News

SOUTH-EASTERN COUNTIES DIVISION

A meeting was held at Peel Hospital, Selkirk, on December 12, 1954. Dr. CLARK took the chair and 24 members were present. Dr. FLEMING, from the Department of Health, as guest speaker, opened a discussion on the future development and relationship of the specialist, public health, and general medical services within the National Health Service. The increasing expense of the hospitals was a major problem, said Dr. Fleming, and he suggested that economy could be effected in hospitals if there were some control of prescribing as with general practitioners, and thought a "hotel charge" for hospital accommodation should be considered. The unnecessary use of beds could, to this extent, be remedied by carrying out certain investigations in out-patient departments, and closer co-operation with the general practitioner would enable more convalescent and incurable patients to be treated at home. He stressed the importance of adequate diagnostic facilities for general practitioners, and of the "time factor" in general practice, and suggested that lists should be still further limited. General practice should attract the best recruits. Dr. Fleming pleaded for greater co-operation between the three services, and for full implementation of ideals a complete reintegration of the Health Service might be necessary. Dr. BORTHWICK, for the specialists, deplored the trend towards ultra-specialization and the widening gap between G.P. and specialist. He thought health centres might help to co-ordinate the work of specialist and general practitioner. He criticized the overcrowding in hospitals, and the insecure position of registrars which was having an adverse effect on adequate staffing of junior specialist posts. He thought it might be feasible to have general practitioners on the hospital staffs. Dr. MCCOUBREY, for the medical officers of health, also pleaded for greater co-operation between the services. He said that local authority medical officers were doctors first and officials afterwards, and that their whole outlook was that of the former. Dr. MACGREGOR, of Kelso, as a general practitioner, felt alarm at the increasing abuse of the Service by many of the public, whose demands on the doctor were becoming more and more unreasonable; he wondered if a fee per service would help to mitigate this nuisance, and advocated a "vital list of drugs" which alone could be prescribed free. He preferred the idea of diagnostic centres to health centres, which he thought were too impersonal.

A discussion followed, in which Drs. BALFOUR, MCGREGOR, of Hawick, STEWARD, GLOVER, and DUFF took part. The abuse of the Health Service was stressed, and there was one plea for a salaried service. But by and large, it is reported, the clamours remained hidden in the thatch and the heather unignited. The discussion was serene in its orthodoxy.

In answer to a question on February 15 the leader of the London County Council, Mr. I. J. Hayward, said that the General Purposes Committee was inviting the views of other committees of the council on the possibility of returning to metropolitan borough councils certain of the personal services including maternity and child welfare, vaccination, day nurseries, and foot clinics. Also the exercise of concurrent powers with the council for the provision of domestic help and the employment of health visitors for the purposes of the services which borough councils would administer.

MEDICAL PRACTICE IN INDIA

There are 60,000 qualified doctors for a population of 360,000,000 in India, as against a probable 600,000 practitioners of other types. Dr. S. C. Sen, president of the Indian Medical Association, makes this statement in an article in the January 6 issue of the *New England Journal of Medicine*, in which he reveals some of the problems of modern medical practice in India.

"Quackery flourishes in India for various reasons," writes Dr. Sen, "the main ones being poverty of the people, lack of education, faith in age-old methods and imperfection of the modern system. It must be remembered that modern medicine—in both its diagnostic and its therapeutic aspects—is very expensive and not within easy reach of the poor." Except in two States in India, there is no restriction on medical practice; anybody, whether trained or untrained, qualified or unqualified, can set up in practice openly and can compete with the best qualified people. Even indirect restrictions against unqualified practice are not effective, since birth and death certificates are not compulsory in most parts of India.

Of the 60,000 properly qualified physicians practising modern medicine, about 15% are in some form of public service such as Government hospitals and dispensaries and municipal health services. Some are full-time and others are salaried but with the right of private practice. The remainder are in private practice.

Much Work—Little Return

The consultants in private practice who hold honorary hospital appointments have a difficult time because the hospitals, mostly Government maintained, are usually open free of charge to rich and poor alike, particularly to Government servants. The consultants therefore do a great deal of free work even for the richer section of the community. There are but 100,000 hospital beds of all kinds in the country. Most doctors are, however, in general practice and do their own dispensing. Dr. Sen writes that fees are low and the G.P. has to work very hard and look after more patients than he can do justice to. The crux of the problem lies in the poverty and ignorance of the people, the rising costs of medical care, and the flourishing competition of the unqualified practitioners.

A social security scheme has been started in a few centres only. On the whole the payment offered to doctors in the health part of the scheme was so low that the medical associations rejected it. The Indian Medical Association has offered its services to help establish a "panel system." The authorities, however, are in favour of a whole-time salaried service, and it is as yet uncertain which system will ultimately prevail.

Correspondence

Practice in the Highlands and Islands

SIR,—Recent letters to the *Supplement* have drawn attention to the problems of practice in the Highlands and Islands area. We are a very small body—about 200, mostly island practitioners and certainly all remote—living simply and, proud of our great traditions, maintaining under conditions sometimes of great difficulty a standard of general practice nowhere excelled. We came probably in search of freedom, certainly not wealth, and all that we ask is that our specific problems should be examined and recognized as they were under the old Highlands and Islands medical service. Hitherto this has been denied us by the Department of Health, which, with the passion of the Civil Service for establishing drab uniformity, has bulldozed us into the national scheme regardless. It may surprise many to learn that no compensation was paid to the Highlands and Islands practitioner when taken over. He had a free house or

housing allowance. In 1951 this too was without warning taken from him. The house was tied and rent arbitrarily demanded. Under the old H. and I. scheme daily mileage was recorded and payment made accordingly. After vesting date a mileage grant was fixed for each practice, presumably on the old records, and has remained unaltered to this day. The grant, which represents payment for time as well as travelling expenses, is, needless to say, now miserably inadequate.

In my own case, according to the last census, I am at risk for over 1,300 persons, although the number with which I am credited is under 1,200. During the summer season the population is at least doubled. My mileage grant is £300 per annum. That represents the entire difference between the payment I receive and that which an urban practitioner would receive for the same number. Considering that the working time involved is probably treble in my case it will be seen how inequitable is the position. To make this point clear, I am attending at present a midwifery case 11 miles distant. The fee I shall receive for that is 7 guineas, and a temporary resident at an isolated farm nine miles away involving a six-miles very rough walk will bring an addition of exactly 17s. to my quarter's cheque.

I have been called to a meeting of the Highlands and Islands Committee in Glasgow this month. This will entail absence for two days from practice and payment of a locum for three days. I shall receive from the B.M.A. a cheque probably for over £6 towards personal expenses, but over and above that I shall have to meet the locum's costs—£15 to £20. This is a measure not only of our difficulty in securing release from duty but also of our difficulty in organizing any effective representation.

It is impossible in a letter to deal with the varying aspects of this many-sided problem. The problem in itself varies from practice to practice. I think it should be obvious that our case should command urgent consideration. Furthermore, as a result of our fewness and difficulty in organization we must look to our colleagues and to the B.M.A. for support in securing justice.—I am, etc.,

Isle of Islay.

ALASDAIR MCL. SMITH.

Springfield Maternity Home, Blackburn

SIR,—We, the general practitioners of Blackburn, wish to bring to the notice of the profession the following facts.

On January 8, 1954, Springfield Maternity Home, Blackburn, was closed by the Blackburn and District Hospital Management Committee. This decision was made by the hospital management committee without consultation with the executive council and the local medical committee. This projected decision had already been the occasion of a storm of protest from the public bodies concerned. The actual closure of the home was effected as follows. The secretary of the hospital management committee visited the wards of the home at 8 p.m. on January 7 and announced, to the great surprise of the patients, that they had the option of being transferred the following morning to a maternity home seven miles away or of being returned to their own homes. Some of the medical advisers of these patients were informed by the same person at 9 a.m. the following morning by telephone that their patients were in the process of transfer. One doctor, whose patient had been delivered a few hours previously, on hearing a rumour that Springfield was closing, telephoned the home at 10 a.m. for information. He was informed by the secretary that the transfer of patients was already in progress. His energetic protest that his patient was not fit to be moved was brushed aside, with the observation that his views were irrelevant.

In spite of deputations to the Ministry and the Minister himself from local B.M.A. representatives and the G.M.S. Committee of the B.M.A., and strong protests from the floor of the House of Commons, this flagrant overriding of the doctor's clinical responsibility for his patient by a lay official has been consistently condoned by the Minister of Health. This unprincipled attack on the fundamentals of medical practice raises issues of national import. We

therefore feel it our duty to state that we have no confidence whatsoever in the present Minister of Health, and wish to alert the profession to this new tendency to subordinate the doctor's clinical judgment to the irresponsible dictates of the lay administrator.—We are, etc.,

Assistants in General Practice

SIR.—Dr. G. E. Langley (*Supplement*, February 5, p. 42) has spoken for many of us. At the moment there are too many assistants, the number being given as about 1,500, which I take to mean assistants pure and simple (an apt phrase). We are the displaced persons of the Health Service. Presumably this situation will improve after 1958, but I believe till then we should adopt the best of Dr. Langley's suggestions—that is, that as an interim measure registrars should be given better salaries, enabling them to support a wife and stay in hospitals without being forced to leave early because of financial pressure. Meanwhile, as an indefinite and ever-changing body, we have little say. Unlike the railwaymen (or even the Sabine women) we cannot down tools. We may query the sense of the large university classes, or watch the exploitation of our kind, but I personally feel it is unlikely we shall ever have enough political or professional influence to alter our conditions.

To end on a lighter note, as I intend to sign this, it is only fair to my employers to say that I am neither overworked, underpaid, nor disgruntled, but consider myself lucky. I am an assistant without view, and it would be interesting to hear a few figures from people in my position. In 18 months I have made seven or eight applications, been interviewed once (out of 120 applicants), and am still hopeful of finding paradise. This to my mind is in the country or a country town midway between an Auxiliary Air Force squadron, a motor racing circuit, a good book-shop, and a comfortable pub or hotel.—I am, etc.,

Wisbech, Cambs.

G. R. C. D. GIBSON.

Branch and Division Meetings to be Held

BURTON-ON-TRENT DIVISION.—At Bretby Golf Club, Ashby Road, Burton-on-Trent, Wednesday, March 9, 7.45 p.m., dinner. Annual B.M.A. Lecture by Mr. N. R. Barrett: "Indications for Cardio Surgery."

CITY DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Tuesday, March 8, 8.30 p.m., meeting. Mr. D. W. C. Northfield: "A G.P.'s Problems as Seen by a Neurological Surgeon."

COVENTRY DIVISION.—At Gymnasium, Coventry and Warwickshire Hospital, Wednesday, March 9, 8.30 p.m., meeting. Lecture by Dr. K. Sicher: "Applications and Results in the Treatment of Radiotherapy."

CROYDON DIVISION.—At 43, Wellesley Road, Croydon, Tuesday, March 8, 8.30 p.m., general meeting. Address by Dr. F. E. Camps: "Medical Aspects on Detection of Crime."

DARTFORD DIVISION.—At Royal Clarendon Hotel, Gravesend, Wednesday, March 9, 8 for 8.15 p.m., annual dinner.

DUMFRIES AND GALLOWAY DIVISION.—Sunday, March 13, Professor L. J. Davis: "Bronchitis and Emphysema."

EAST HERTS DIVISION.—At Hertford County Hospital, Tuesday, March 8, 8.30 p.m., meeting. Medical films.

EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, March 10, 7.30 p.m., dinner; 8.45 p.m., Mr. A. Lawrence Abel: "Some Common Diseases of the Rectum and Anal Canal."

ENFIELD AND POTTERS BAR DIVISION.—At Chase Farm Hospital, The Ridgeway, Enfield, Wednesday, March 9, 8.15 for 8.45 p.m., meeting. Films: (1) "Relief of Pain in Childbirth"; (2) "The Conjoined Twins of Kano." Members of the North Middlesex and East Herts Divisions and nurses and student nurses in the area are invited.

FINCHLEY DIVISION.—At Finchley Memorial Hospital, Granville Road, N. Finchley, N., Tuesday, March 8, 8.30 for 9 p.m., meeting. Talk by Mr. V. J. Downie: "The Virtues of Going to Bed."

FURNESS DIVISION.—At Duke of Edinburgh Hotel, Barrow-in-Furness, Friday, March 11, 7.30 for 8 p.m., annual dinner; Principal speakers, Sir Ian Fraser, who will propose the toast of the B.M.A., and Dr. D. P. Stevenson (Deputy Secretary, B.M.A.), who will reply.

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, March 10, 8.30 p.m., meeting. Lecture by Dr. W. G. Oakley: "Modern Treatment of Diabetes."

HAMPSTEAD DIVISION.—At New End Hospital, Hampstead, N.W., Tuesday, March 8, 8.30 p.m., meeting. Discussion: "Present-day Views on Thyroid Disease." Speakers, Dr. Rosalind Pitt-Rivers, Ph.D., F.R.S., Mr. J. E. Piercy, and Dr. W. R. Trotter.

HENDON DIVISION.—At Hendon Hall Hotel, London, N.W., Tuesday, March 8, 8.45 p.m., meeting. Dr. W. E. Snell: "The Changing Scene in Tuberculosis."

KENSINGTON AND HAMMERSMITH DIVISION.—At St. Charles's Hospital, Ladbroke Grove, London, W., Friday, March 11, 3.30 for 4 p.m., clinical meeting.

KINGSTON-ON-THAMES DIVISION.—At Kingston Hospital (Nurses' Home), Tuesday, March 8, 8 p.m., meeting. General practitioners' debate: (a) "Blood Pressure"; (b) "Is Penicillin Abused in General Practice?"; (c) "Is the Home the Ideal Place to Have a Baby?"; (d) "The Common Cold and Influenza."

LAMBETH AND SOUTHWARK DIVISION.—At Brockwell Primary School,ulse Hill, London, S.W., Thursday, March 10, 8.15 p.m., meeting. Film by Professor Ian Aird: "Conjoined Twins of Kano" and also his extra slides of still photographs. Mr. Selwyn Taylor will talk about the film and operation. Nurses and health visitors are invited.

LANCASTER DIVISION.—At Midland Hotel, Morecambe, Saturday, March 12, 7.30 for 8 p.m., annual dinner.

LEIGH DIVISION.—At Courts Hotel, Church Street, Leigh, Tuesday, March 8, 8.30 p.m., meeting. Address by Dr. E. E. Prebble: "Non-specific Urethritis."

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, March 8, 8.30 p.m., meeting. Annual B.M.A. Lecture by Professor J. Chassar Moir: "Immediate Hazards of Childbirth."

SCARBOROUGH DIVISION.—At Scarborough Hospital, Thursday, March 10, 8.30 p.m., meeting. Lecture by Professor R. E. Tunbridge: "Rehabilitation" (illustrated with lantern slides).

SOUTH BEDFORDSHIRE DIVISION.—At Luton and Dunstable Hospital, Friday, March 11, 9 p.m., meeting. Annual B.M.A. Lecture by Sir Heneage Ogilvie: "Pitfalls in Surgical Diagnosis."

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tunbridge Wells, Tuesday, March 8, 8.30 p.m., meeting. Dr. E. A. Bennet: "Treatment in the Neuroses."

WILLESDEN DIVISION.—At Wykeham School, Aboynce Road, Neasden, N.W., Thursday, March 10, 8 p.m., public meeting on Air Pollution. To be addressed by Dr. Horace Joulès, Dr. S. Leff, Mr. R. S. Forster, and Councillor S. C. Piddington.

S.H.M.O. Meeting

There will be a meeting of Senior Hospital Medical Officers in the North-west Metropolitan Region on Saturday, March 12, at 3 p.m. at B.M.A. House, Tavistock Square, London, W.C.

Correction.—In the answer headed "Vaccination Certificates" under "Questions Answered" (*Supplement*, February 12, p. 47) it should have been added that T.A.B. vaccine for prophylactic injection may be prescribed on form E.C.10.

British Medical Association

PROCEEDINGS OF COUNCIL

Wednesday, March 2, 1955

A meeting of the Council was held at the House of the Association, Tavistock Square, London, on March 2, with Dr. E. A. GREGG in the chair.

Preliminary Business

The deaths of two former members of Council, Sir Charles James Martin and Dr. A. E. Hamerton, were reported, and the Chairman was authorized to send letters of condolence to the relatives.

The Council sent congratulations to the former Sir Godfrey Huggins, Prime Minister of Southern Rhodesia, a member of the Association, on being made a Viscount.

It was instructed that letters of sympathy be sent to Dr. I. G. Innes, a member of Council, on an accident which had befallen him, and to Dr. Agnes Kelynnack, Assistant Secretary, on her prolonged illness.

The CHAIRMAN reported that he had invited Dr. T. Rowland Hill to represent the Association at the International Hospital Congress in Lucerne; that Lord Horder had agreed to act as the Association's representative at the annual conference of the Cremation Society, and that Dr. L. S. Gibbons had accepted his invitation to serve as one of the Association's representatives on the Medical Advisory Board of the National Marriage Guidance Council, in place of Dr. W. S. Macdonald.

Dr. H. D. Chalke was appointed the Association's representative to the Commonwealth Health and Tuberculosis Conference, arranged by the National Association for the Prevention of Tuberculosis, to be held in London in June.

Professor Bryan McFarland, president of the British Orthopaedic Association, who would be in South Africa at the time for a meeting of the South African Orthopaedic Association, was asked to represent the B.M.A. at the annual meeting of the Medical Association of South Africa in Pretoria in October.

It was decided to recommend to the Representative Body that Sir John McNee, who would then be the Immediate Past-President, should be invited to act for the President on all appropriate occasions during the session 1955-6, in the absence of the President, Dr. T. C. Routley, of Toronto.

The Council agreed that the dates of future Annual Meetings should be as follows: 1957, July 11 to 19, at Newcastle-upon-Tyne; 1958, June 19 to 27, at Margate; 1959, July 16 to 24, at Edinburgh.

It was reported that the South African delegate to the British Commonwealth Medical Conference, to be held in Toronto in June, proposed to suggest the discontinuance of the holding of this conference triennially in one of the Commonwealth countries. The South African view was that it might take the form of an annual meeting of the delegates from Commonwealth countries at the time of the General Assembly of the World Medical Association. It was pointed out in the Council, however, that some Commonwealth countries were not members of the W.M.A., and might not wish to send a delegate to a meeting following the Assembly in perhaps a European capital. On the proposition of Dr. S. WAND it was agreed to recommend that the Medical Conference continue to be held in a Commonwealth country.

It was agreed that the Chairman of Council and the Chairman of the Consultants and Specialists Committee should be delegates to the General Assembly of the W.M.A. in September next; that the Chairman of the International Relations Committee and the Secretary should be alternate delegates, and that Dr. Mary Esslemont be invited to attend as an observer.

The Council received and approved the 20 nominations from certain committees of the Association for membership of the Central Medical Recruitment Committee for England and Wales. The Council itself appoints a further seven members, and the following six were reappointed: Dr. Janet Aitken, Sir Zachary Cope, Lord Haden-Guest, Mr. H. H. Langston, Dr. W. Rees Thomas, and Dr. D. I. Williams. The seventh retiring member, Dr. A. Weston, did not wish to stand again, and in his place the Council appointed Dr. Morgan Evans, of Hounslow.

The Advisory Bureaux

Mr. L. R. BROSTER, chairman of the Empire Medical Advisory Bureau and of the International Medical Visitors Bureau, attended to present the annual reports of those two organizations. Summaries of the work of these Bureaux

will appear in the Annual Report of Council to be published in the *Supplement* of March 19. Mr. Broster said that both of them could report an increased number of inquiries and visitors, a greater dissemination of information, and intensification of activities in every direction. He paid a warm tribute to the work of Brigadier H. A. Sandiford, the medical director of both Bureaux.

The CHAIRMAN OF COUNCIL said that these were extremely interesting and encouraging documents. He thanked Mr. Broster for his work as chairman and associated himself and the Council with the tribute paid to Brigadier Sandiford. The Council also received the annual report of the Medical Practices Advisory Bureau, which stated that the volume of work in all departments had been maintained. The number of assistants successfully introduced during the year with a view to partnership was 139, and the number of other assistants and trainees, 449. The number of locum tenens supplied to general practitioners and to hospitals during the year was 2,427, corresponding with the average for the past four years.

The Chairman expressed the Council's thanks to Dr. L. S. Potter, Medical Director of the Bureau, for the tremendous amount of detailed work involved.

"Family Doctor"

Dr. O. C. CARTER, chairman of the Family Doctor Committee, in presenting the report, said that the Council would note with satisfaction that there was a surplus on the *Family Doctor* account at the end of the financial year. He thought he could say that the periodical got more and more widely accepted and approved, though it still had to achieve the solid basis of circulation they desired. Increasing support was given by medical officers of health throughout the country by permitting the magazine to be sold direct to the public in their clinics and maternity and child welfare centres. It was now on sale in approximately 800 such centres. A further extension of the *Family Doctor's* activities in the field of health education was in the form of the fourteen pamphlets now available, of which 17,500 copies had been sold in 1954.

Dr. Carter also drew attention to the *Family Doctor* exhibit at the current *Daily Mail* Ideal Home Exhibition, an exhibit due to the enterprise of the Business Manager, Mr. Edsall. The stand had caught the interest of H.M. The Queen when she attended the preview two days previously.

During this year *Family Doctor* was looking forward to an increase in the number of pages. Printing and paper costs would be increased, but it was hoped that this would be more than offset by the additional revenue.

Dr. VAUGHAN JONES congratulated Dr. Carter and his committee and all associated with him on last year's results. Dr. D. F. HUTCHINSON said that he had visited the Ideal Home Exhibition and had been most impressed with the *Family Doctor* exhibit. Dr. E. C. DAWSON and Dr. F. M. ROSE spoke in similar congratulatory terms.

The CHAIRMAN OF COUNCIL added his congratulations to the Chairman, the Committee, and the staff.

Danger of Whole-time Salaried Service

Dr. H. H. D. SUTHERLAND, chairman of the Amending Acts Committee, said that the question had arisen whether section 10 of the National Health Service (Amendment) Act, 1949, afforded the profession sufficient protection against the introduction of a full-time salaried service. His committee's conclusion was that under that section as now worded it would be possible for any Government to introduce by legislation and without amendment of the Act a service in which practitioners received up to 50% of their remuneration by way of salary. This would be contrary to the resolution adopted by the Special Representative Meeting in December, 1951: "that the remuneration . . . shall not be by fixed salary." Accordingly, his committee proposed that the opinion of counsel be sought regarding the extent of the protection afforded by the section.

Dr. TALBOT ROGERS said that, whatever the opinion of counsel, it was not likely that any Government would give the profession greater protection than it had at the moment. He did not think that at present there was any danger.

Dr. D. F. HUTCHINSON said that the General Medical Services Committee was of opinion that it would be very unwise to make any movement in this connexion at the present time. The important thing was to ensure that there was complete unanimity in the profession on this matter. That was where their strength would lie should any future Government try to bring in such a regulation.

Dr. FRANK GRAY said that they all knew perfectly well that possibly another Parliament might take a long step in this direction. If any Government wanted to introduce a salaried service it could do so by amending legislation. If counsel's opinion was that the section did not afford sufficient protection, what could they do about it? They were all—except a negligible minority—opposed to any salaried service, and their strength lay in their unity.

Dr. SUTHERLAND, in reply, reminded the Council that the Guillebaud Committee had not yet reported. Its report might be the starting-point for new activity.

The recommendation to take counsel's opinion was lost.

Decisions of Special Representative Meeting, 1951

The Amending Acts Committee asked the Council to give consideration at an early date to methods of arranging co-ordinated action with the Ministry of Health when the time arrived to put forward suggestions for amendment of the National Health Service Acts, bearing in mind the resolutions of the Special Representative Meeting, 1951. Dr. SUTHERLAND said that his committee had noted with anxiety that a number of the resolutions of that meeting had not yet been implemented, although more than three years had elapsed since their adoption, and in some instances decisions had been taken which were contrary to the wishes of the Representative Body.

Dr. WAND said that the phrase "co-ordinated action" had been used. They might look once again at the decisions made in 1951. Take the matter of arbitration: it seemed to him that they would have to consider that once more. The first interim report on the reform of the National Health Service, as approved by the Representative Body in 1951, laid it down that the court of arbitration should be composed of a legally qualified independent president appointed by the Lord Chancellor on a permanent basis, with other members having special knowledge of the subject matter and being selected in equal numbers by the Lord Chancellor from panels nominated respectively by the Management Side and the Staff Side of the Whitley Council. If, being equal numbers on both sides, they disagreed, who was to give the final decision? A nominee of the Government, someone appointed by the Lord Chancellor. That might be a dangerous thing. Before the recommendation of the Amending Acts Committee for co-ordinated action was considered they should look again at the recommendations passed in 1951 and decide which of them required action to be taken, which should be altered, which were now out of date, and which had already been implemented. He proposed that the recommendation be referred back.

Dr. HALE-WHITE said that it was in the minds of many of them that they ought to be able to say something to the Representative Body about what had happened to the resolutions passed more than three years ago.

Dr. WAND hoped that the Council would refer the recommendation back rather than turn it down, first because it would be more courteous, and secondly because if it were turned down it might be interpreted as meaning that they had in mind no action on the other items decided by the Representative Meeting in 1951.

The motion to refer back was agreed to.

Evidence to Royal Commission

Dr. NOEL H. M. BURKE, chairman of the Psychological Medicine Group Committee of the Association, attended to

present the draft memorandum of evidence proposed to be given by the Association to the Royal Commission on the Law relating to Mental Illness and Mental Deficiency. The memorandum was of considerable length and contained some 70 recommendations. Dr. Burke said that in its preparation his committee had maintained a close liaison with the Royal Medico-Psychological Association, and although it had approached the problem from a wider angle than purely psychological medicine it nevertheless found a very considerable measure of agreement with the R.M.P.A., and the memorandum varied little from that already submitted by the latter body. He then briefly summarized the recommendations, which related to out-patient and in-patient treatment of mental disorder, the protection of persons exercising duties, the handling of temporary and reception order patients, the powers and duties of the medical superintendent, criminal patients, mental disorder in old age, and the provisions for the mentally defective. A special section dealt with psychopathic states. It was recommended that the powers of courts under the Criminal Justice and Magistrates Courts Acts should be extended to enable psychopathic offenders to be placed under care and treatment, and that there should be provision, subject to special safeguards, for dealing with psychopathic persons who could not be charged with any particular offence, but whose behaviour was such that they required care and treatment, for the protection of others. It was also recommended that treatment should be provided for alcoholics and drug addicts. Until special institutions were available use should be made of specially selected hospitals.

Dr. W. E. DORNAN congratulated the Committee and its chairman on the production of the memorandum. It was difficult to get a complete grasp of all its implications. About a quarter of the matter in this document was substantially different from the memorandum of evidence of the Royal Medico-Psychological Association, and if there was no great urgency he hoped that final approval might be left to the next meeting of Council, by which time the members would have had an opportunity of digesting what was put forward. Dr. A. BROWN spoke to the same effect. Dr. BURKE, however, said that the Commission had already extended the date of submission and expected to receive the evidence by the end of March.

Dr. S. F. L. DAHNE thought the memorandum a most excellent one and that it could go in as it stood. Dr. J. A. PRIDHAM called attention to the proposals relating to patients under judicial order. It was proposed to have two medical recommendations for an order, one by a practitioner specially approved, and the other by a practitioner not connected in any way with the mental hospital. Why should not the second practitioner be the family doctor? The same applied to the second medical practitioner who supported a request for admission without order.

Dr. F. M. ROSE wondered whether the powers proposed for the protection of the patient's property were sufficient.

Dr. ROBERT FORBES said that there was a suggestion in the memorandum that there should be an extension of protection at present afforded to doctors against unfounded litigation. But the Committee did not say in what way it considered other doctors giving advice or information should be protected.

Dr. WAND, who had been a member of the Committee, asked Council not to delay approval of this document. The differences between the Committee and the R.M.P.A. were very small, at least as concerned matters of principle. This was a very humane document and one that would stand out in the history of the treatment of mental diseases in this country. When compared with the sort of document which would have appeared 30 or 40 years ago it marked a great advance.

Dr. BURKE, in reply, said that it was, of course, the intention that the second recommendation should be by the family doctor. The trouble was that it was difficult to define the family doctor. With regard to protection, the Committee thought that protection should be extended to all

persons concerned in giving advice or information in a professional capacity in connexion with the procedure under the Act. The various points brought forward would be borne in mind in giving the oral evidence.

The memorandum was approved for submission to the Royal Commission. Dr. Burke was warmly thanked for his presentation, and he with Dr. M. J. Brookes, Dr. H. M. Cohen, Dr. Doris Odum, and Dr. S. Wand were appointed to give oral evidence.

Association Finance

The TREASURER (Mr. L. DOUGAL CALLANDER) presented the draft annual financial statement. He said that during the year the Association had been able to keep within its budget. The income last year was £270,797, made up of subscriptions, rents, and interest on investments, and the surplus for the year, earmarked for debt redemption and carried to the accumulated fund, was £65,074. In reply to questions Mr. Callander said that, having regard to the commitments of the Association, they could not possibly consider any proposal for the reduction of subscription at present.

Dr. I. D. GRANT asked whether the Treasurer could say that if the basic subscription was maintained at six guineas, this, together with rent and investments, would provide sufficient income to run the Association as they would wish to see it run. In future they must not expect the same windfalls from the *Journal* as in the past. If the *Journal* made money, well and good, but they must not arrange their affairs on that assumption.

Mr. CALLANDER said that, without extravagance, the Association could be run on the income Dr. Grant had suggested.

Dr. TALBOT ROGERS said that in recent years the expenses of the General Medical Services Committee had been met from the N.I.D.T. Fund except for a sum of £1,000 which was provided by the Association. There was now a suggestion that this latter sum be raised to the level at which it stood before the financial crisis occurred.

Dr. HAMILTON, chairman of the Journal Committee, considered that members of the Association should be warned that there was no guarantee that the large surpluses on the publication account to which they had been accustomed in former years would be continued.

The CHAIRMAN OF COUNCIL drew attention to a paragraph which will appear in the Annual Report:

" . . . while the Council will keep the matter continually under review, it regrets that in present circumstances it cannot advise the Representative Body that it would be wise to contemplate a reduction in the standard rate of subscription in the immediate future."

Those words, which were the result of careful consideration in the Finance Committee, covered the whole matter.

The draft annual financial statement was approved, subject to audit.

Private Practice

Dr. A. BROWN, chairman of the Private Practice Committee, submitted a report of his committee. The matters dealt with were mostly covered in the report of the meeting on February 9 (*Supplement*, February 19, p. 56). A recommendation that practitioners engaged predominantly in private practice be asked whether they wished to prescribe for private patients on Form E.C.10, and, if so, would agree to submit to any reasonable safeguards, was withdrawn after Dr. TALBOT ROGERS pointed out that this concerned also practitioners in the National Health Service who had private patients, and that the General Medical Services Committee would like to study the repercussions of it.

It was agreed that representations be made to the Treasury concerning a scale to be adopted for the medical supervision of Government establishments, and to the Admiralty for increased fees for certain items of service.

Dr. BROWN said that representatives of the Committee had met representatives of the Life Offices Association in Edinburgh and had arrived at an agreement for the payment of

a fee of two guineas for an ordinary examination and report for life assurance as from March 15. This was regarded as satisfactory, and it was also agreed to recommend to members of the Association that a suitable minimum fee for a report without examination for purposes of life assurance was one guinea.

Hospital and Consultant Services

A very long report from the Consultants and Specialists Committee was presented by Dr. T. ROWLAND HILL. On his proposition it was agreed that a Forensic Medicine Subcommittee of the Private Practice Committee be appointed, consisting of three members of the Private Practice Committee, three police surgeons, and three forensic pathologists, with power to co-opt, to represent members of the Association engaged in forensic medicine and to advise the Council on matters affecting practice in that field.

The Council had before it the revised report on Hospital Medical Staffing, the work of the subcommittee of which Professor G. I. Strachan is chairman, and which was referred to in the report of the meeting of the Consultants and Specialists Committee (*Supplement*, February 19, p. 51). The Committee had decided, in view of the importance of this matter and its serious implications for the profession, to take no final decisions before seeking the views of its constituents. It had therefore forwarded the report to the Regional Committees and to the Scottish Central Consultants and Specialists Committee, and, to avoid delay, had also sent it to the Joint Committee as a basis for discussion.

Dr. S. F. L. DAHNE, as one who had been very critical in the past of the original Strachan report, said how much he admired the revised report. If it was eventually accepted, with very minor modifications, it would give new hope to everyone in the hospital service, breaking the dead ends alike in the Registrar and in the S.H.M.O. groups. With a pardonable mixture of metaphors, Dr. Dahne said that it would "give more reasonable rungs to the ladder and abolish various bottle-necks."

Dr. ROSE hoped the Committee would consider the feasibility of arranging for some period in general practice before the hospital officers concerned reached the final grade.

Dr. ANNIS GILLIE specially welcomed the suggestion that some of the routine clinical work could well be done on a part-time basis by married women doctors who could spare the time from their domestic duties for regular sessions. Steps should be taken to encourage women doctors to come forward and do this work.

On another matter raised in the report from the Central Consultants and Specialists Committee, concerning the resolution adopted by the Representative Body last year, that diagnosis should not be disclosed on domiciliary consultation certificates, the report stated that "the matter is being pursued by the Ministry, but there is no great strength of feeling among consultants that a change should continue to be pressed. There are bigger issues than this to tax our energies."

Dr. W. WOOLLEY, as a member of Council elected by the Representative Body, took grave exception to this attitude. Surely issues raised by the Representative Body should not be dismissed in this fashion. Dr. Rowland Hill had spoken earlier of "the consultants' world." Dr. Woolley wondered sometimes whether the consultants' world was part of this world.

Dr. O. C. CARTER also took exception to these words, and Dr. ROWLAND HILL agreed to their deletion.

Questions were asked and answered on various other sections of the Committee's report, which included S.H.M.O. posts, medical advisory machinery, internal administration of hospitals, general-practitioner maternity hospital beds, senior registrars and additional consultant posts, and accommodation of medical superintendents outside the hospital, all of which will be found set out in the Annual Report in the next issue of the *Supplement*.

Organization

Dr. J. A. PRIDHAM introduced the report of the Organization Committee, which contained a number of recommendations designed to clear up little anomalies and difficulties, in most cases by an amendment of the by-laws. One proposal was for a composite subscription for the first five years of membership after qualification. The idea was that a practitioner joining on qualification might have an option to pay the subscriptions for the first five years in one sum of ten guineas, thus saving two guineas over the period.

Dr. FRANK GRAY took exception to this proposal. Some kind parent might pay the first subscription, so that the young practitioner joined the Association without himself having paid any subscription whatever, and then at the end of the period he would be asked for six guineas. If he had previously paid something he would have become subscription-minded, but if he had paid nothing he might be put off by this sudden demand to the extent of resigning from the Association.

Dr. R. G. GIBSON said that the great difficulty before the Organization Committee was to attract the newly qualified man or woman; if he or she could be got in for the first five years, membership was more likely to be continued.

On a show of hands the recommendation was carried.

Dr. PRIDHAM reported that the membership was now 66,537, as compared with 65,553 at the corresponding date last year, an increase of nearly 1,000. The percentage of membership in the United Kingdom to the total profession was 71, and to the working profession (that is, excluding retired), 80.

Science Activities

Mr. J. R. NICHOLSON-LEALEY presented the report of the Science Committee, which contained recommendations for the award of the Association prizes, and these were approved. The Science Committee was empowered to set up an *ad hoc* committee to inquire into the problem of accidental death and ill-health from coal-gas poisoning, and to make recommendations. The problem had been brought to the notice of the Committee by the Consulting Pathologists Group.

Dr. R. S. F. Schilling, editor of the *British Journal of Industrial Medicine*, was invited to deliver the 1956 Mackenzie Industrial Health Lecture, to be given at the B.M.A. House in London.

On the subject of crash helmets, which had been discussed at two previous meetings of Council, the Science Committee now brought forward a recommendation, which was adopted without discussion, approving the taking of all possible steps, including a press conference, to promote the more general wearing of crash helmets by motor-cyclists and their pillion and side-car riders.

Other Committees

Dr. TALBOT ROGERS briefly reported for the General Medical Services Committee, which had held two meetings since the last meeting of Council (*Supplement*, February 5, p. 39, and February 26, p. 64). The only recommendation, which was carried, was one renominating Dr. P. J. Gibbons, of Liverpool, for a further period on the Standing Pharmaceutical Advisory Committee.

Dr. VAUGHAN JONES, in reporting for the Occupational Health Committee (*Supplement*, February 12, p. 45), presented a revised statement on the remuneration of part-time industrial medical officers, which was recommended to the Representative Body for approval. The memorandum on "Terms of Service for Industrial Medical Officers," previously approved by the Council, had been revised in two particulars, and the revised memorandum was approved.

General J. C. A. DOWSE submitted a report from the Overseas Committee. This stated that a delegation from the Committee had met Colonial Office officials to discuss the revision of salaries in the Government Medical Service in East Africa. It had been agreed that new scales should

be given a fair trial and the situation reviewed after about a year, when it might be possible to assess the effect of the new terms upon recruitment. General Dowse said that his committee had learned with much pleasure that the annual meeting of the Middle East Branch this month in Damascus would be addressed by Sir Charles Symonds. This was the first appearance of the Branch in Syria, and the Committee considered that the Branch was fulfilling a most important function in maintaining the prestige of British medicine in that part of the world.

Dr. J. G. M. HAMILTON, for the Journal Committee, presented realization statements for last year for the *British Medical Journal* and the various special journals and other publications, compared with the budget figures for 1954 and the actual figures for 1953. Attention was drawn to the increasing cost of production.

A report was submitted from the Arrangements Committee for the Brighton Meeting, 1956. The subjects proposed and accepted for the three plenary sessions were, respectively, handicapped children, the present position of A.C.T.H. and cortisone, and recent advances in the knowledge of cancer.

Dr. MARY ESSLEMONT, for the Evidence Committee on Divine Healing, stated that the Committee had given further consideration to the preparation of the evidence and had received additional memoranda from members of the profession with special experience of the subject.

Dr. ROBERT FORBES, for the Central Ethical Committee, brought forward a statement on the loan of hospital records to Government departments. He said that it really amounted to a modification of the resolution which was passed by the Annual Representative Meeting in 1954. The Council agreed to recommend the revised statement to the Representative Body, and it will be found set out in the Annual Report of Council.

On the report of the Public Health Committee, presented by Dr. H. D. CHALKE, the Council agreed to support the recommendations of the Working Party on precautionary measures against toxic chemicals used in agriculture, with a view to the ultimate banning of bacterial rodenticides, and to raise this matter with the Ministry of Agriculture and Fisheries.

Further Business

It was agreed that a banner bearing the Coat of Arms of the Association be presented to the Canadian Medical Association at the Joint Annual Meeting in Toronto.

The Chairman of Council reported that a meeting of the Legal Actions Committee had been held in the course of the day, and it had been decided to go forward with the proposed appeal to the Courts to test the validity of the assessment for income tax of part-time consultants under Schedule E. It had yet to be determined which of a number of cases should be chosen to go forward as test cases.

Messrs. Hempsons were reappointed solicitors to the Association for one year from April 1, 1955.

It was reported that the Joint Committee of the B.M.A. and the British Veterinary Association had considered the revised memorandum on meat production and control submitted by the latter body, and that several amendments proposed by the B.M.A. representatives, clarifying points on which the policy of the Associations appeared to differ, had been accepted by the B.V.A. The possibility of a meeting of the representatives of the two bodies and of the Society of Medical Officers of Health and the Sanitary Inspectors Association, with a view to obtaining further agreement on the control of meat inspection and the responsibilities of veterinary surgeons and sanitary inspectors, was being explored.

A letter was read from the New York Academy of Medicine asking for the co-operation of the Association in arranging for a number of addresses by prominent British medical men to be included in the postgraduate radio-programme of the Academy. The co-operation of the B.B.C. had been promised to the extent of providing a talks director and a recording studio. The Academy suggested certain names of speakers and topics which would be particularly welcome for

broadcast talks in America. The Council approved the idea of co-operation and decided to request some further information about the arrangements.

The question of admission of students to medical schools was discussed at the last meeting of Council. A report was now presented to Council on the setting up by the Minister of Health and the Secretary of State for Scotland of a committee of inquiry into the number of practitioners likely to be engaged in all branches of the profession in the future, and the consequential intake of medical students required.

It was decided that the presentation of Association prizes, which ordinarily takes place at the Adjourned Annual General Meeting, to be held this year in Toronto, should take place during the next Council meeting in London.

The Council rose at 6.40 p.m., having begun its sitting at 10 a.m.

NATIONAL OPHTHALMIC TREATMENT BOARD ASSOCIATION

At the 38th meeting of the committee of the National Ophthalmic Treatment Board Association held on February 11 variations in the interpretation by ophthalmic services committees of the ruling on re-examination in *non-tolerance* cases was discussed. It was unanimously agreed not to seek any alteration in the ruling laid down in E.C.L.25/50 dated March 1, 1950, under Section (b), which reads:

To ensure that sight is not tested without the permission of the Ophthalmic Services Committee, if it has been previously tested within the preceding twelve months, except in those cases in which (i) in the view of the ophthalmic medical practitioner or ophthalmic optician the need for a further sight test appears to be urgent, or (ii) the patient's general medical practitioner has been informed that the patient should revisit his ophthalmic medical practitioner or ophthalmic optician with a view to a further examination within six months of the previous sight test.

Following a suggestion that a spare pair of glasses should be authorized through the National Health Service in certain approved cases where adults had a very low visual acuity and spectacles were essential, it was decided that the administrative difficulties were too complex to enable a workable scheme to be drawn up, and further that it was primarily the duty of the adult in question to accept his disability and to make arrangements accordingly. Dispensing members pointed out that in an emergency some appliance could usually be provided which aided such a patient.

Formation of Area Committees

Consideration was also given to a recommendation to set up area committees of the association to increase local interest and to hold area meetings on the lines of the helpful meeting held last year in Birmingham. It was decided to send fuller details to all members and refer both points to the annual general meeting.

The date of the annual general meeting was arranged for April 1 at B.M.A. House, London, and the preliminary agenda was drawn up for early issue.

FRIENDLY SOCIETIES IN 1953

The Chief Registrar of Friendly Societies reports¹ that those societies without branches, that provide sickness benefits, had a further small drop in membership, from 2,952,000 to 2,893,000, in 1953. An encouraging feature, however, was the rise in juvenile membership, which had suffered the sharpest fall during recent years.

In spite of the general decline in membership, the friendly societies' funds have continued to increase. The total for all societies without branches was £155,811,000 at the end of 1953 compared with £151,869,000 at the end of 1952. During 1953 these societies paid £3,205,000 sickness benefits, an increase of £230,000 on the previous year.

¹ Report of the Chief Registrar of Friendly Societies for the Year 1953, 1955, Part 2. H.M.S.O., London.

OPHTHALMIC GROUP COMMITTEE

A meeting of the Association's Ophthalmic Group Committee was held on February 11, with Mr. O. GAYER MORGAN in the chair.

Sight-testing Fee

When the salary scales of medical staff in the hospital service were revised in April, 1954, the Ophthalmic Group Committee, as previously reported (*Supplement*, June 12, 1954, p. 317), submitted a claim to the Ministry of Health for an increase in the sight-testing fee, and a deputation went to the Ministry in July to discuss the matter. The Ministry, however, was not prepared to admit the validity of the claim. The Committee pressed for a reconsideration of the matter and finally requested a personal interview with the Minister. This was granted, and a deputation consisting of the chairman (Mr. O. GAYER MORGAN), Mr. G. W. BLACK, Mr. J. H. DOGGART, and the deputy secretary of the Association (Dr. D. P. STEVENSON) met the Minister and senior officers of the Ministry and the Department of Health for Scotland on December 15, 1954.

The Minister later replied that, in consultation with the Secretary of State for Scotland, he had given careful consideration to the facts and arguments put before him, but could not agree that there were grounds for increasing the fee.

The Ophthalmic Group Committee regretted that, in spite of the strongest possible representations, it was not able to report a satisfactory conclusion of the negotiations.

Registration of Opticians

A memorandum from the N.O.T.B. Association invited the Group Committee to reconsider a number of points in connexion with the recommendations of the Crook Committee on the statutory registration of opticians. The general feeling of the Committee was that as the whole matter had already been carefully considered no useful purpose would be served by reopening it at this stage. In any case the Committee will have a further opportunity of reviewing its attitude when the terms of any draft Bill are available.

Sight-testing of Children

The Committee's attention was drawn to a report that in one area of the country the local education authority had decided that preliminary sight-testing of schoolchildren at 5 years of age should be discontinued and carried out later, between the ages of 7 and 8, by the head teacher's clerk or someone else called in by the head teacher for the purpose.

In the Committee's opinion the discontinuance of sight-testing at 5 years of age was a retrograde step, and, although the work was of a comparatively unskilled nature, being solely preliminary testing to ensure that a child could see reasonably well, it should be undertaken by a nurse or health visitor who had first received a certain amount of training.

The Committee decided to write to the school medical officer on both these points.

Supplementary Ophthalmic Service Records

The Committee discussed correspondence with the Ministry of Health about the period for which records of prescriptions under the supplementary ophthalmic service should be retained by executive councils. The Ministry stated that it had noted the Committee's request that it would like to be consulted in connexion with any proposals which might be made for changing the present procedure.

Service Ophthalmologists

The Committee was informed that the Ophthalmic Qualifications Committee was endeavouring to find a solution to the difficulty experienced by Service ophthalmologists in qualifying for admission to the central list of medical practitioners entitled to test sight in the supplementary ophthalmic service. Discussions on this matter are proceeding with the Government departments concerned.

EXPLAINING ABOUT OUT-PATIENTS

To explain the problems of out-patient departments and why time-tables get upset, the Bromley Group Hospital Management Committee has produced a handbook for patients attending hospitals in the Bromley Group. In a foreword the chairman of the Committee says that more than three-quarters of the Group's out-patients are seen within half an hour of the time booked for them. The booklet shows how patients can help to overcome the difficulties in the way of still greater improvement, and explains the basis on which the appointments system works and how it is affected by the types of cases seen and by emergencies. Ten patients out of every hundred given an appointment fail to attend without sending word.

FEES FOR LIFE ASSURANCE REPORTS

As reported in the proceedings of Council, under "Private Practice," at page 75 of this *Supplement*, agreement has now been reached with the Life Offices Association that the fee for medical examination and report on the ordinary form carried out on or after Tuesday, March 15, 1955, will be increased to two guineas. This is an increase on the present fee of £1 11s. 6d. agreed in 1947. As in the previous agreement, it has been accepted that the new fee shall cover the giving of subsequent information (whether or not involving a further examination) required by an office in elucidation of, or to remedy omissions in, the original report. A suitable fee, however, should be forthcoming when information additional to that sought in the original report is required.

Reports without Examination

During the recent negotiations the Association also proposed that the fee for a report without examination should in future be at least £1 1s. The Life Offices would not accept this suggestion, and thus the present position is unchanged. At the recent meeting of Council it was agreed to recommend to B.M.A. members that a suitable minimum fee for a report without examination for purposes of life assurance is £1 1s.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Consultant and other Specialist Staff in N.H.S.

SIR,—I have found the tables giving figures for consultant and other specialist staff in National Health Service hospitals (*Supplement*, February 26, p. 66) interesting and alarming.

It would appear that the training plans for senior registrars are geared to the total number of consultants in the Service and not to the number of appointments likely to become available. The crux of the problem lies in the very uneven age distribution of consultants, and this applies particularly to the more recently developed specialty, such as my own of orthopaedics. It will be seen from Table I that in the years 1956 to 1965 53 orthopaedic surgeons can be expected to reach retiring age, whereas the two following ten years show 155 and 170 respectively. The present training plan for senior registrars (Table III) would appear to provide for an even flow of approximately 125 trained consultants every 10 years. Some allowance can be made for the premature demise of myself or some of my colleagues, and further allowance can be made for the fact that some of the senior registrars have come from overseas and can be expected to return home on completion of their training. Even so, it would appear that there will be at least 100

trained orthopaedic surgeons available for no more than 60 posts. Examination of the next 10-year period shows an entirely different picture, and during this time the present training plan will fall short by some 50 candidates for the appointments likely to become vacant.

It is suggested, therefore, the solution might be to establish 50 temporary consultant appointments in orthopaedics during the next 10-year period, these appointments to cease in 1970. This scheme would have the twofold advantage of retaining in orthopaedics those who have completed their training as consultants, and would eventually even up the age distribution throughout the specialty. Unless this is done we are going to be faced with a recurring difficulty.—I am, etc.,

London, W.1.

GUY RIGBY-JONES.

SIR,—In your *Supplement* (February 26, p. 66) you publish some tables concerning the employment of specialist staff, issued by the Ministry of Health. Study of Tables I and II allows some deductions to be made relating to the proportion of S.H.M.O.s in the various specialties.

Plastic, thoracic, and neurosurgery are almost 100% consultant specialties, and doubtless rightly so (but spare a thought for the four outcasts in these groups not so graded). General physicians and surgeons and pathologists are about 80% consultant grades, with radiology and the orthopaedic surgeons a little higher at about 83%, and paediatricians right up with the leaders at 95%. Of the "poor relations," anaesthetists can manage little over 70% consultant status, and mental health a precise 60%. And then to the bottom of the ladder, with chest physicians having only 45% consultant grades, their sole companions in misfortune being the small, and often associated, specialty of infectious diseases physicians.

While it is neither practical nor desirable that all specialties should be similarly graded, yet it does appear that the chest service is very much the "Cinderella," and the prospect at present offers very little attraction to prospective recruits, and even less hope to its established servants of S.H.M.O. rank who had aspired, one day, to achieve consultant rank. Surely an urgent review is called for, that not only may justice be done, but, unlike the instance of the merit awards, it may also be seen to have been done.—I am, etc.,

Exmouth.

G. E. ADKINS.

Assistants in General Practice

SIR,—In the *Supplement* (November 20, 1954, p. 193) there appeared a letter from Dr. W. L. Templeton referring to the difficulty of entry into general practice for young doctors, and suggesting a remedy—that is, that the older doctor should not be compelled to work for ten years before qualifying for a pension, but should be allowed to retire at any date before the termination of ten years, being paid a proportionate pension.

I agree that the delayed retirement of older practitioners must be handicapping some of the younger, but I rather fear that the proposed remedy would never meet with acceptance from central authority, as it definitely breaks the accepted contract. Would there be any objection to an alternative scheme which has occurred to me—that is, that any doctor over 65 should be allowed to retire at will, receiving his compensation on retirement and also receiving his full pension at the end of ten years, provided that for each year intervening between retirement and pensionable qualification he should have paid to the Ministry of Health a sum equal to the superannuation paid in his last working year? The interval in question could in no case be more than three years, as the change could clearly not become operable before July, 1955, and might in many cases be two years or only one.

This plan would have the advantage of staggering the retirement of the older practitioners, many of whom would doubtless welcome retirement but are compelled to remain at work under existing conditions controlling pensions, and it would also facilitate the entry of younger practitioners

into settled practices and, so far as I can see, would in no respect lessen the obligation of the retired doctor to the Ministry of Health.

It might be argued that it would be difficult for some practitioners to find the money to pay the superannuation if they were no longer working, but to take the necessary amount from the capital received in compensation would surely be an advantageous investment in the long run.—I am, etc.,

Oxford.

ISABELLE M. LITTLE.

Facilities at Headquarters

SIR.—Suburban and provincial practitioners must find the B.M.A. quite useful as a rendezvous for lunch, etc., when in town; but many London G.P.s would welcome, I am sure, its use as a club one or two nights a week after the evening surgery. The talking of shop after dinner at home could be transferred to our, rather expensive, club, and an exchange of ideas is always useful. May I suggest an open common room from 8.30 to 10.30 p.m. on Wednesday and/or Thursday?—I am, etc.,

London, E.1.

N. D. WAYNE.

Doctors' Telephones

SIR.—Mr. H. K. Vernon (*Supplement*, February 26, p. 68) reiterates a common fallacy when he writes of a consultant using his car, and states that in certain circumstances "he is entitled to reclaim the cost of this journey from the regional board" (my italics). It is not the cost but the mileage allowance that one is entitled to claim; the former exceeds the latter by a considerable margin; the consultant pays the difference out of his own pocket. In the case of the whole-time consultant neither this personal contribution to the cost of the N.H.S. nor any part of the cost of a telephone is recognized for tax purposes as a necessary professional expense.—I am, etc.,

Ipswich.

R. MAYON-WHITE.

Doctors on the Dole

SIR.—From time to time letters appear in the *Journal* airing the grievances of various branches of the profession. Consultants complain about merit awards, S.H.M.O.s are dissatisfied with their status, G.P.s resent their exclusion from hospitals, and senior registrars and assistants in general practice express anxiety about their prospects of advancement and establishment. It is desirable that these grievances should be aired and that each section of the profession should be aware of the problems facing other sections and the profession as a whole.

I wish to draw attention to the plight of those at present seeking entry into general practice. Advertisers for assistants regularly receive upward of a hundred applications; one recently had over 200, and no view was offered. Admittedly some of these applicants will already be assistants seeking a change, but the majority have no steady employment in the meantime. It is obvious that under present conditions these persistent triers can have no reasonable expectation of a permanent post in the foreseeable future. Meanwhile, locum work is available in the summer, but the winter is fraught with unemployment and hardship, and the situation for most becomes financially impossible. A glance at the "Assistants Available" column shows that some of these doctors have been qualified for several years, most are widely experienced, and many are married with families to support.

My own experience is that in the past 10 months I have applied for 23 assistantships, and have had 12 replies, in eight cases getting as far as an interview. During these 10 months I have had 13 weeks of total unemployment and a further three weeks of part-time work only. I am not one of those who believe that the world owes them a living, but surely there is something far wrong when, nine years after the war and nearly seven years after the inception of the Health Service, so many young doctors should be denied a

means of livelihood and the security of a job with some degree of permanency in the largest single branch of medical practice.

The announcement by the Minister of Health of the appointment of a committee to look into future requirements of medical manpower shows official awareness of the problem, but offers little comfort to those affected in the present "surfeit" (?) of doctors. The figures given above apply to Scotland, but I understand that the position in England and Wales is comparable. It would be interesting if the members of the B.M.A. staff who undertook the recent analysis of the profession (*Supplement*, January 8, p. 9) could provide an indication of the number of doctors unemployed at that time.—I am, etc.,

Jeppa, Midlothian.

W. A. ELLIOTT.

H.M. Forces Appointments

ARMY

Brigadier W. L. Spencer-Cox, O.B.E., M.C., late R.A.M.C., has retired on retired pay.

Colonel (Temporary Brigadier) R. V. Franklin, O.B.E., late R.A.M.C., to be Brigadier.

Lieutenant-Colonel W. H. Hargreaves, O.B.E., from R.A.M.C., to be Colonel, remaining seconded.

HOUSEHOLD CAVALRY

Surgeon Major E. W. Hayward, O.B.E., to be Surgeon Lieutenant-Colonel.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel J. G. M. A. Brunet, O.B.E., has retired on retired pay, and has been granted the honorary rank of Colonel.

Lieutenant-Colonel S. G. M. Lynch, having attained the age for retirement, is retained on the Active List.

Majors A. Bennett, R. G. Davies, and J. B. M. Milne, O.B.E., to be Lieutenant-Colonels.

Short Service Commission (Specialist).—Major I. E. Harries has retired, receiving a gratuity.

Short Service Commission.—Major D. R. Hood, T.D., has retired, receiving a gratuity.

Captain S. H. Janikoun to be Major.

Branch and Division Meetings to be Held

ALDERSHOT AND FARNHAM DIVISION.—At Cambridge Hospital, Aldershot, Wednesday, March 16, 8.15 p.m., meeting.

BIRMINGHAM DIVISION.—At 154, Great Charles Street, Birmingham, Tuesday, March 15, 8.30 p.m., joint lecture by Dr. Hugh M. D. Shepherd and Mr. F. G. Allan: "Rheumatoid Arthritis."

CAMBERWELL DIVISION.—At St. Giles' Hospital, Camberwell, S.E., Tuesday, March 15, 8.45 p.m., meeting. Sir Zachary Cope: "Actinomycosis, a Frequently Misdiagnosed Condition."

DEWSBURY DIVISION.—At Batley General Hospital, Friday, March 18, 8.15 p.m., clinical meeting.

DORSET DIVISION.—At the Clinic, Glyde Path Road, Dorchester, Monday, March 14, 8.30 p.m., meeting. Lecture by Dr. A. S. Hall: "The Differential Diagnosis of Eruptions of the Extremities."

EAST NORFOLK DIVISION.—At the Green Lounge, Bell Hotel, Norwich, Wednesday, March 16, 8 p.m., meeting. Films: (1) "Clinical Uses of Hyaluronidase" (sound and colour). (2) Full colour silent picture: "Diseases of the Ear, Nose, and Throat in General Practice." A discussion will follow each film.

HALIFAX DIVISION.—(1) At Whitworth Hall, Royal Halifax Infirmary, Tuesday, March 15, 7.30 p.m., meeting. Film: "Separation of the Conjoined Twins of Kano." Admission by ticket only. (2) At Out-patient Department, Halifax General Hospital, Wednesday, March 16, 8.30 p.m., clinical meeting, followed by Mr. J. N. I. Emblin: "Trilene Anaesthesia in General Practice."

LINCOLN DIVISION.—At County Hospital, Lincoln, Saturday, March 19, 3.30 p.m., meeting. Paper by Dr. G. Armour: "Stress and its Relationship to Treatment in Rheumatoid Arthritis," followed by discussion; 5 p.m., paper by Dr. Trevor Wright: "Haemolytic Disease in the Newborn," followed by discussion; 7 for 7.30 p.m., dinner at Great Northern Hotel, Lincoln.

MID-ESSEX DIVISION.—At Out-patient Department, Chelmsford and Essex Hospital, London Road, Chelmsford, Wednesday, March 16, 8.15 p.m., meeting. Talk by Mr. J. Wentworth Day: "The Amazing Dr. Salter."

NORTH OF ENGLAND BRANCH.—At Royal Victoria Infirmary, Newcastle-upon-Tyne, Thursday, March 17, 7.15 p.m., film: "Conjoined Twins of Kano"; 8.45 p.m., address by Mr. J. L. Anderson, F.F.A., F.I.A.: "The Acceptance of Life Assurance Risks."

NOTTINGHAMSHIRE BRANCH.—At 64, St. James's Street, Nottingham, Wednesday, March 16, 8.30 p.m., meeting. B.M.A. Lecture by Dr. D. G. French: "Clinical Research in General Practice." The Nottingham Medico-Chirurgical Society has been invited.

ROCHDALE DIVISION.—At Birch Hill Hospital, Rochdale, Monday, March 14, 8.30 p.m., clinical meeting. Dr. M. C. G. Israels (Manchester): "Recent Advances in Treatment in Haematology."

SOUTH-EAST ESSEX DIVISION.—At Southend General Hospital, Friday, March 18, 8.30 p.m., meeting. B.M.A. Lecture by Dr. W. D. Wylie: "Anaesthesia and General Practice."

SOUTH SHIELDS DIVISION.—At Ingham Infirmary, South Shields, Wednesday, March 16, 8.30 p.m., meeting. Clinical Symposium by Consultant Staff of Ingham Infirmary.

SOUTH-WEST ESSEX DIVISION.—At New Out-patient Department, Connaught Hospital, Orford Road, Walthamstow, E., Wednesday, March 16, 8.30 p.m., general meeting.

STOCKPORT DIVISION.—At Stockport Infirmary, Tuesday, March 15, 8.30 p.m., Dr. J. D. Allan: "Modern Trends in Paediatrics."

SUNDERLAND DIVISION.—At Royal Infirmary, Sunderland, Friday, March 18, 8 p.m., address by Dr. W. N. Pickles: "Epidemiology in Country Practice."

TEES-SIDE BRANCH.—At Sparks Café Royal, Middlesbrough, Tuesday, March 15, 8.30 p.m., meeting. Lecture by Sir Daniel Davies: "The Doctor and To-day."

WEST LOTHIAN DIVISION.—At West Port Hotel, Linlithgow, Thursday, March 17, 8 p.m., meeting. Address by Mr. William Mair: "Legal Pitfalls of Medical Practice."

WEST SUSSEX DIVISION.—At Burlington Hotel, Worthing, Wednesday, March 16, 6.30 p.m., meeting. Papers by Dr. W. A. Bourne, Mr. N. C. Tanner, and Dr. J. Lipsey: "Peptic Ulcer," 8 p.m., dinner. After dinner, discussion of papers with Drs. Bourne, Tanner, and Lipsey.

WINCHESTER DIVISION.—At Nurses' Home, Royal Hampshire County Hospital, Thursday, March 17, 8.15 for 8.30 p.m., joint meeting with E.C.I. Club. B.M.A. Lecture by Dr. Raymond Greene: "Hormone Therapy and the General Practitioner."

Meetings of Branches and Divisions

SOUTH STAFFORDSHIRE DIVISION

Meetings of the Division were held at the Star and Garter Hotel, Wolverhampton, on November 24 and December 15, 1954, and January 25, 1955. Mr. Leslie Thomas took the chair at the first meeting, at which Dr. Robert Morrison delivered the B.M.A. lecture on "Radiotherapy in Malignant Disease." At the meeting on December 15 Dr. R. S. V. Marshall took the chair, and was presented with a chairman's badge of office by Mr. Leslie Thomas. Mr. A. L. d'Abreu gave a lecture on "The Indications for Cardiac Surgery." Dr. Marshall again took the chair on January 25, when Dr. F. H. Milner gave a lecture on "Allergy."

PRELIMINARY

Chairman of Council

1. Dr. E. A. Gregg has been appointed Chairman of Council for the sessions 1954-5 and 1955-6.

Council Dinner

2. On November 2 a Council Dinner was held in the Great Hall of B.M.A. House. The chief guest was H.R.H. The Duke of Edinburgh, K.G., K.T., who was presented by the Chairman of Council with a Certificate of Honorary Membership of the Association designed and executed by a distinguished artist, Miss Margaret Alexander, and enclosed in a red leather case made by Mr. G. W. Frewin, of the Central School of Arts and Crafts in London.

His Royal Highness proposed the traditional toast of the "Common Health," and the Minister of Health replied.

Dedication of War Memorial

3. The War Memorial in the Court of Honour of B.M.A. House in Tavistock Square was dedicated by the Archbishop of Canterbury on Tuesday afternoon, November 2, 1954. The service of dedication was simple but impressive. The singing was led by the choir of the Queen's

Chapel of the Savoy, and the music played by the band of the Royal Army Medical Corps. In addition to the Archbishop, the Moderator of the General Assembly of the Church of Scotland, a representative of the Free Church Federal Council, and the Vicar of St. Pancras took part in the service.

The President of the Association (Sir John McNeel), at the invitation of the Chairman of the War Memorial Committee (Dr. H. Guy Dain), unveiled the memorial plaque, which bears the following inscription:

"In Memoriam 1939-1945

In Honour of the Medical Men and Women of the British Empire and Commonwealth of Nations who gave their lives in the Second World War."

Wreaths were laid by the Chairman of Council (Dr. E. A. Gregg) and the President of the Medical Women's Federation (Dr. Annis Gillie).

A large number of relatives of the fallen, members of Council, and other members of the Association (in academic robes) and distinguished guests were seated in the courtyard for the ceremony.

The Memorial, which was designed by Mr. James Woodford, O.B.E., R.A., in collaboration with Mr. S. Rowland Pierce, F.R.I.B.A., takes the form of a central fountain.

with two symbolic heroic-size figures on the west and two on the east side, all in Portland stone. The design of the bronze fountain jet is based on the shape of the staff of Aesculapius. The four statues have as their themes Sacrifice, Cure, Prevention, and Aspiration.

The cost of the Memorial has been defrayed from voluntary donations totalling over £8,000 as a result of an appeal by the Chairman of Council, and, in accordance with the wishes of some of the donors, a proportion of the funds has been set aside for assisting in the education of the children of the fallen.

The Roll of Honour of members who fell in both World Wars—542 names having been added for the 1939–45 War—is available for inspection in the Hastings Room.

A twenty-page illustrated brochure containing photographs of the Memorial and the names of the fallen may be obtained, price 2s. 6d.

Joint Annual Meeting, Toronto, 1955

4. The Annual Meeting of the Association will be held this year in Toronto from June 20 to 24 as a Joint Meeting of the B.M.A. and the Canadian Medical Association. The Council is pleased to be able to report that upwards of 250 members from the United Kingdom will be taking part in the meeting. A full programme of plenary sessions, scientific sections, and other scientific meetings has been arranged. (See *British Medical Journal Supplement* of February 26.)

The President, 1955–6

5. Dr. T. C. Routley, who will be President of the Association next session, is resident in Canada. The Council therefore recommends:

Recommendation: That in the absence of the President during the session 1955–6, Sir John McNee, who will then be the Immediate Past-President, be invited to act for the President on all appropriate occasions.

Future Annual Meetings

6. As already announced, the Annual Meeting in 1956 will be held in Brighton from July 5 to 13.

The Council has accepted an invitation from the Newcastle-upon-Tyne Division to hold the Annual Meeting in Newcastle-upon-Tyne in 1957 (July 11–19), and an invitation from the East Kent Division to hold the Annual Meeting in Margate in 1958 (June 19–27).

The Annual Meeting in 1959 will take the form of a Joint Meeting of the B.M.A. and the Canadian Medical Association, and will be held in Edinburgh at the invitation of the City of Edinburgh Division from July 16 to 24.

Annual Representative Meeting, 1955

7. The Annual Representative Meeting will be held in London this year from June 1 to 4. The Council has accepted the kind offer of the Metropolitan Counties Branch to arrange a Cocktail Party for members of the Representative Body and their ladies on the eve of the A.R.M., and to make provision for a Ladies' Club. There will be a joint dinner for Representatives and their ladies at the Dorchester Hotel on the evening of June 1.

Representatives at Conferences of Other Bodies

8. The Council appointed the following to represent the Association at the Conferences named:

Third International Conference on Gerontology, London, July, 1954	Dr. H. D. Chalke
Danish Medical Association Annual Meeting, Aarhus, August, 1954	Dr. K. Cowan
Fifth International Congress on Mental Health, Toronto, August, 1954	Dr. J. T. McCutcheon
National Smoke Abatement Society Annual Conference, Scarborough, September, 1954	Dr. Doris Odium
	Dr. C. Metcalfe Brown

Sanitary Inspectors' Association Annual Conference, Southport, September, 1954

Columbia University Bicentennial, October, 1954

Royal Sanitary Institute Health Congress, Bournemouth, April, 1955

International Hospital Federation's Ninth International Congress, Lucerne, May, 1955

Annual Cremation Conference, Ayr, June, 1955

Commonwealth Health and Tuberculosis Conference, London, June, 1955

Australasian Medical Congress (B.M.A.), Sydney, August, 1955

Sanitary Inspectors' Association Annual Conference, Scarborough, September, 1955

Annual Meeting of Medical Association of South Africa, Pretoria, October, 1955.

Coat of Arms

9. In order to meet certain criticisms, it has been necessary to make some changes in the original design of the Association's armorial bearings. The lion in the design proved unacceptable to the Lord Lyon King of Arms and has been replaced by a blue lion passant. The crest has been improved and now takes the form of two torches of learning in saltire, with the rod and serpent of Aesculapius in a central position. A pomegranate has been substituted for the apple in the right hand of Hippocrates. It is hoped that the armorial bearings will be granted to the Association in the near future, and the Council proposes to incorporate them in a banner to be presented to the Canadian Medical Association at the Joint Annual Meeting in Toronto.

The Council again wishes to place on record its indebtedness to Dr. S. F. Logan Dahne, whose invaluable help and expert knowledge of heraldry have been placed so freely at the disposal of the Association.

Staff

10. Mr. P. M. Hubbard, M.A., has been appointed to the post of Senior Assistant to the Public Relations Officer.

Mr. A. W. Jarvie has been appointed to the post of part-time Press Officer to the Association in Scotland, which had been rendered vacant by the resignation of Mr. Alexander Bowman.

The Council records with deep regret the death of Dr. Alfred Cox, who gave distinguished service to the Association as Medical Secretary from 1912 to 1932.

Columbia University Bicentennial

11. In 1954 Columbia University, in the City of New York, celebrated the two hundredth anniversary of the grant of its original Charter by King George II. An Address, handwritten on parchment, signed by the officers of the Association, sealed with the seal of the Association, and enclosed in a leather case bearing the Association's crest, was presented by the Association's President-Elect (Dr. T. C. Routley) at the Anniversary Convocation last October.

Swedish Medical Association

12. The Swedish Medical Association celebrated its fiftieth anniversary in June, 1954, and to mark the occasion the Council presented a piece of silver on behalf of the British Medical Association.

The Medical Profession in the U.S.S.R.

13. Last August the Council repeated its invitation (which was declined two years ago) to the President of the Academy of Sciences of the Union of Socialist Soviet Republics to arrange for six Russian doctors to visit Great Britain as guests of the Association. No reply has yet been received.

In November last a party of 10 distinguished Russian doctors on a visit to Great Britain was entertained in B.M.A. House. The guests were received by the Chairman of Council, who was accompanied by the President of the Medical Women's Federation (Dr. Annis Gillie). They presented to the Association a number of books in the Russian language, and at their request various publications of the Association were sent to them.

Cricket

14. A return match was played at Hurlingham on May 30, 1954, between teams representing the Association and the Law Society, and was won by the Law Society team. A further match between teams representing the two organizations will be played in 1955.

The Council is again indebted to Dr. R. P. Liston (Tunbridge Wells) for kindly making the necessary arrangements on behalf of the Association.

Gift to the Association

15. The Council has pleasure in reporting that one of its members, Mr. D. S. Pracy, has kindly presented to the Association three pieces of cloisonné for the Hastings Room. These were formerly in the Bowes Collection and are first-class examples of Japanese work.

GENERAL MEDICAL SERVICES

Remuneration

Size of the Central Pool

16. Negotiations have continued on the application of the various factors which must be taken into account in order to assess the size of the Central Pool each year. The method of calculating the number of doctors in the Service has finally been agreed in detail, and the G.M.S. Committee is satisfied that the formula adopted should provide an accurate result. It has also been agreed that a practice expense ratio of 32.3%, which is slightly higher than the actual ratio which emerged from a new Inland Revenue inquiry into 1951–2 accounts, will be applied to the calculation of the 1952–3 Pool. The Pool for that year has now been finally determined and shows a small balance due to the profession.

A further inquiry by the Board of Inland Revenue into accounts for the year 1952–3 for application to the 1953–4 Pool is now under way, but the Board has indicated that it may not be possible to undertake similar inquiries every year.

The G.M.S. Committee rejected a suggestion by the Ministry that a Working Party of experts should be established for the purpose of keeping the expense ratio up to date in those years when the Board of Inland Revenue is unable to undertake a full inquiry, and this and other points will be settled by direct negotiation with the Ministry of Health, as has been the case in the past.

No satisfactory method of estimating the income received by general practitioners from private practice has been found apart from a full-scale inquiry, which the Board of Inland Revenue would not be able to undertake. The G.M.S. Committee has therefore informed the Ministry that it will be prepared to accept the figure of £2m. for the year 1953–4. It is hoped that the size of the Pool for 1953–4 will shortly be determined, and that the final settlement for that year will be substantially in excess of the amount for 1952–3.

The Danckwerts Award and the Small-list Practitioner

Last year the Conference of Local Medical Committees and the Representative Body approved the second report of the Working Party, and the Ministry, in consultation with the G.M.S. Committee, introduced the new scheme of Supplementary Annual Payments for small-list practitioners. The G.M.S. Committee insisted that the criteria laid down

for the purposes of the scheme should not be too rigidly applied, and particularly that borderline cases should not be rejected merely because they failed to conform with the criteria in some small respect. The Ministry readily agreed that the scheme should be as flexible as possible, and the Central Committee has been given specific power to vary the application of the criteria to meet borderline cases.

This Central Committee, consisting equally of representatives of the profession and the Ministry, has already reviewed a number of doubtful cases, and the Committee is glad to report that the new arrangements are working satisfactorily. More recently the Ministry has agreed that claims for Supplementary Annual Payments will also be considered from general practitioners who have retired since the new scheme came into operation on April 1, 1953, and also from the estates of those general practitioners who have died since that date.

Exchange of Practices

17. Discussions have taken place with the Medical Practices Committee on certain suggestions made by the special subcommittee which was established last year to examine ways and means by which established practitioners could more easily change the area of their practices. As a result of these discussions, the Medical Practices Committee has issued a circular letter to executive councils in which it is suggested that, when it is apparent that a further vacancy in another area may be created by the appointment of a particular doctor, executive councils may feel that this is one of the factors to which favourable consideration might be given.

Medical Practices Committee

18. The G.M.S. Committee is pleased to report that F. Lishman (Crook, Co. Durham) has been appointed a member of the Medical Practices Committee.

Group Practice

19. The Group Practice Loans Committee, composed equally of representatives of the G.M.S. Committee and the Ministry, has held several meetings and considered a number of applications submitted under the Group Practice Loans Scheme. An encouraging start has been made, and the Committee believes that the Fund has a valuable part to play in facilitating group practice.

Committee on General Practice of the Central Health Services Council

20. A detailed study has been made of the Report of the Committee on General Practice within the National Health Service which was set up by the Central Health Services Council. The G.M.S. Committee's detailed comments and criticisms were circulated to local medical committees, who were invited to express their own views on any part of the Cohen Committee's Report. A consolidated document setting out the views of the Committee and of local medical committees is now in course of preparation.

Drugs for Private Patients

21. It will be remembered that in the last Annual Report an account was given of the representations which had been made by the G.M.S. Committee in support of the Association's policy that private patients should be permitted to obtain their drugs and appliances under the National Health Service on Form E.C.10.

Following these discussions with officers of the Ministry, a deputation, representing the G.M.S. and Private Practice Committees, was received by the Minister. An account of the meeting is set out in Appendix II.

Prescribing of Proprietary Preparations

22. Following the Minister's announcement in the House of Commons that doctors would be asked not to prescribe

certain proprietary preparations in cases where it had not been possible to reach satisfactory price arrangements with the manufacturers, the G.M.S. Committee was asked for its comments on a draft circular letter which the Ministry proposed to send to all general practitioners, giving details of the proprietary preparations which were affected. The Committee obtained an assurance from the Ministry that the Minister's announcement in no way departed from the agreed policy that a general practitioner is quite free to prescribe whatever he decides to be necessary in the best interests of his patient, but it was pointed out that the phraseology in the draft circular by no means made this clear.

After further discussion, the Ministry agreed to amend its circular to meet the G.M.S. Committee's wishes, but the Ministry was left in no doubt as to the Committee's view that it was unfortunate that the Minister had opened his campaign by referring to a group of well-known proprietary anti-asthmatics which, though more costly, were frequently more efficacious and better tolerated than the equivalent standard preparation. The Committee has also secured more adequate representation of general practitioners on the new Standing Joint Committee on the Classification of Proprietary Preparations.

Economy in Prescribing

23. It has long been maintained by the G.M.S. Committee that one of the most effective methods of combating high prescribing costs would be a return to the system of areal averages which operated before the National Health Service. Although it has not been possible to resume this practice on a national scale, a start has now been made by circularizing comparative prescribing costs to doctors in certain areas. Similar information will be collated and distributed for other areas from time to time. The Committee intends to keep a careful watch on the way in which these figures are compiled.

Standard of Accommodation in Surgeries and Waiting-Rooms

24. Early in the new session statements in Parliament and in the Press again focused public attention on the standard of surgery and waiting-room accommodation provided by general practitioners. Although in October, 1953, a circular letter on the subject by the Chairman of the G.M.S. Committee was sent to every general practitioner in the Health Service, no precise information was available to either confirm or deny the allegations which had been made from time to time of inadequate or unsatisfactory practice accommodation. Furthermore, it was clear that a general survey under arrangements to be made by the Ministry and executive councils was both inevitable and imminent.

The G.M.S. Committee, feeling that this was a matter which was primarily of concern to the profession rather than one which called for official action under the regulations, discussed the problem with the Ministry of Health, and in consequence it was agreed to seek the co-operation of local medical committees in carrying out surveys of the practice accommodation in their own areas.

The vast majority of local medical committees in England and Wales have agreed to co-operate to the full, and it is hoped that within a reasonable time the G.M.S. Committee will have an accurate picture of the general situation throughout the country.

Provision of Diagnostic and Ancillary Facilities

25. The course of events at the Springfield Maternity Home at Blackburn has given rise to concern that proposals to withdraw or vary clinical facilities which have been granted to general practitioners—both the provision of general-practitioner beds and of diagnostic and similar ancillary services—can reach an advanced stage before they come to the notice of the G.M.S. Committee or the Ministry.

Proposals of this sort are generally initiated in a committee of the regional hospital board or in the hospital management committee, and, although there may be a general-practitioner member of the board or management committee itself, he may not necessarily be a member of its committees or subcommittees.

The Ministry's attention has therefore been brought to the desirability of instituting centrally early and full discussions on any proposals affecting facilities for general practitioners. The Ministry has undertaken to raise the matter with senior administrative medical officers of regional hospital boards. The opportunity will also be taken of reminding them of the desirability of including general-practitioner representation on hospital management committees.

Amendment of the Service Committees and Tribunal Regulations

26. Discussions are still proceeding with the Ministry on the proposals made by the G.M.S. Committee for amending the Service Committees and Tribunal Regulations. It is hoped that the few points outstanding will soon be resolved and that it will be possible to report the final outcome of these discussions in the Supplementary Annual Report.

Representation of General Practitioners on Boards of Governors of Teaching Hospitals

27. Whilst there is now at least one general practitioner on every regional hospital board, in the case of the teaching hospitals the situation is far from satisfactory, and, to quote the London area as an example, on only six of the boards of governors is a general practitioner included in the membership. Whilst in the case of regional hospital boards the Ministry is required to consult such organizations as may be recognized as representative of the medical profession in the area, no similar obligation exists in the case of boards of governors. It appeared, however, that there was no reason why the Association should not take advantage of section (d) of Part III of the Third Schedule to the Act, which requires the Minister to consult with such organizations as appear to him to be concerned, and through Branches and Divisions of the Association and the local medical committees in the area, or preferably a combination of these bodies, nominate general practitioners to serve on boards of governors.

It is therefore proposed that in future years Branches and Divisions will be invited to consult with local medical committees and put forward, through Headquarters, to the Ministry the names of general practitioners who are willing to serve on boards of governors. It is emphasized that this procedure will in no way modify the existing method of obtaining consultant representation on boards of governors of teaching hospitals.

General Practitioner Refresher Courses Grants for Locums

28. The Ministry has agreed with the G.M.S. Committee's view that the grant which is made towards the expenses of engaging a locum during the period that a general practitioner is attending a postgraduate course is inadequate having regard to present-day conditions. The Ministry has agreed to increase the grant to 16 guineas per week, and the new rate will be payable from September 1, 1954.

Assistants

The Ministry has agreed that, from September 1, 1954, assistants in general practice will be eligible to attend postgraduate courses, the cost of which will be borne from public funds. The G.M.S. Committee accepted a suggestion by the Ministry that, in order to be eligible for a grant, an assistant should have been qualified as a medical practitioner for at least three years.

Maternity Medical Services

General Practitioners and Institutional Midwifery

29. It will be remembered that the G.M.S. Committee, in association with the Blackburn and Lancashire Local Medical Committees, had made strong representations to the Ministry of Health against the closure of the Springfield Maternity Home at Blackburn. A deputation was received by the Permanent Secretary to the Ministry, who, although he held out little hope of reversing the decision of the regional board to close Springfield, gave an assurance that the board would be asked to consider carefully the provision of alternative accommodation which would be reasonably accessible to general practitioners in Blackburn. Later a meeting of the board took place at which representatives of the various interests concerned were invited to be present and were given an opportunity to state their views as to the provision of alternative accommodation. Subsequently, the Board announced that it had reached the conclusion that the provision of additional general-practitioner maternity beds in Blackburn to replace those no longer available at Springfield was impracticable.

The G.M.S. Committee then suggested that, in an attempt to meet the opposing views of both sides to the dispute, the situation should be investigated on the spot by representatives of the Ministry and the G.M.S. Committee. This proposal was rejected by the Ministry and, in consequence, a personal interview was sought with the Minister on the subject. The deputation emphasized not only the inaccessibility and unsuitability of the accommodation offered, but also the fact that general practitioners were clearly entitled to expect that adequate consultation should take place with local medical committees before decisions of this nature were taken by the hospital management committee.

During the course of the interview with the Minister it was clear that he was unwilling to intervene in a matter which he considered to be within the competence of the regional hospital board and the hospital management committee. Nevertheless, an assurance was received that the whole situation would be reviewed in the full light of the facts. Subsequently, however, the G.M.S. Committee was informed that the Minister did not feel justified in intervening in this particular case.

Whilst it is felt that there is little further action which can usefully be taken in this instance, on the general issue, much anxiety is felt that where proposals are afoot to vary the facilities available to general practitioners the local medical committees concerned are not always consulted at a sufficiently early stage. Possible methods of remedying the situation are being considered by the Liaison Committee which exists between the G.M.S., Central Consultants and Specialists, and Public Health Committees.

Use of Pethidine in Midwifery

It will be remembered that the Representative Body last year expressed some misgivings about a circular letter which had been submitted to the G.M.S. Committee drawing attention to the possible dangers of a midwife using a supply of pethidine which had been supplied by a general practitioner when she was already in a position to obtain a supply herself through the medical officer of health.

Following consultation between the Ministry of Health and the Home Office, the original draft was withdrawn and a circular issued in which it was stated that, whilst it was legally in order for a midwife working with a general practitioner to use a supply prescribed by the doctor or issued directly to him, nevertheless, to prevent confusion and waste it was desirable that the general practitioner should not himself prescribe but should rely upon the midwife's supply obtained through the medical officer of health. It was felt that the revised form of the circular met the objections which were raised to the original draft and it has since been issued.

Treatment of Services Personnel on Leave as Temporary Residents

30. Agreement has now been reached between the G.M.S. Committee, the Ministry of Health, and the Service departments on the arrangements whereby Services personnel on leave will in future be treated as temporary residents under the National Health Service. Adequate assurances have been received that the interests of private practitioners and special groups, such as Admiralty surgeons, will be protected. Similarly, an assurance has been given by the Ministry of Health that the arrangement will not in any way affect the size of the central pool.

Acceptance of Patients of a Vacant Practice

31. Both the G.M.S. and Central Ethical Committees have for some time been seeking a satisfactory solution of the problem of protecting the position of the appointed successor to a death or retirement vacancy. The need to find some practical method of overcoming the difficulty has been emphasized by several instances in recent months which have demonstrated the extent to which the practice of the successor can be adversely affected by the transfer of patients to the practitioner temporarily looking after the practice. The situation was complicated by the fact that any solution must be capable of dealing, not only with the full-time locum, but also with neighbouring practitioners already on the medical list who may have been looking after the practice temporarily pending the appointment of a successor. At the same time, the freedom of the patient to change his doctor at will must be borne in mind.

In view of these factors, a special subcommittee has been appointed to examine all aspects of this difficult problem.

Remuneration of Trainee General Practitioners

32. The G.M.S. Committee has asked the Ministry to increase the salaries of trainee general practitioners on the ground that there has been an upward trend in the salaries paid to assistants generally.

General Practitioner Representation on the Clinical Research Board

33. The G.M.S. Committee, in conjunction with the College of General Practitioners, has again made strong representations that general practitioners should be entitled to representation on the Clinical Research Board.

The Board is by no means unsympathetic, and the matter will be raised again when the term of office of the present members has expired.

General Dental Services

Dental Anaesthetics

34. On a number of occasions attention has been drawn to the inadequacy of the fee paid to general practitioners for providing dental anaesthetics. This matter has been discussed with the British Dental Association, which pointed out that the dentist can hardly be expected to pass on to the doctor a higher fee than he in fact receives from the Dental Estimates Board, and that the only remedy lies in a general upward revision of the scale of fees paid to dentists.

The Committee has therefore offered the B.D.A. its full support in any negotiations with the Ministry for an increase in the dental anaesthetic fees at present paid by the Dental Estimates Board.

Dental Haemorrhages

After long discussion with the Ministry the regulations have now been amended to enable a general practitioner to claim a fee for attending a case of haemorrhage following a dental extraction. Unfortunately there remain two circumstances in which a practitioner is unable to obtain a fee—namely, where the haemorrhage follows extraction in hospital and where the haemorrhage follows dental treatment given privately.

The G.M.S. Committee has been able to make little headway in the first set of circumstances, but, following discussions with the Ministry of Health, it is understood that the dental scale of fees now makes it possible for a dentist to make a claim when the arrest of haemorrhage follows an extraction carried out privately, provided that he is also taking part in the general dental services. When the dentist is in purely private practice no claim can be made on the National Health Service.

The Ministry is also looking into the possibility of paying more than one fee where more than one practitioner is called upon to arrest dental bleeding following the same extraction.

National Insurance Contributions

35. A motion referred to the Council by the Representative Body last year suggested that it was unfair to call upon an individual to pay a full week's National Insurance contribution when the contributor was unfit for work for only part of the contribution week in question. This matter has now been taken up with the Ministry of National Insurance, who maintain that any revision on these lines would completely upset the actuarial basis of the National Insurance scheme. The Ministry's arguments appear conclusive, and there seems little justification for pursuing the matter further.

Post-mortem Examinations

36. The Representative Body last year called for arrangements to be made which would enable a practitioner to have a post-mortem performed by a consultant pathologist on any case of particular clinical interest—the cost being borne by the National Health Service. Because of possible legal implications, the G.M.S. Committee sought advice on the situation generally, but, unfortunately, the various enactments on the subject are by no means clear and are possibly out of keeping with present-day conditions. The G.M.S. Committee believes that it would serve no useful purpose to raise this matter officially with the Government departments concerned, and is satisfied that from a practical point of view the position is adequately covered. In general, post-mortems can be divided into five main groups, namely:

- (1) Those undertaken at the request of the coroner, which represent the majority of cases, and where the coroner has an overriding interest over all other persons. Many cases of clinical interest come within this category.
- (2) Another fairly large group—those carried out in hospital, where many cases of clinical interest occur. Consent of the relatives is necessary in these instances, but in most cases it is readily forthcoming.
- (3) A group which can be described as ex-hospital cases. Here, if the general practitioner is in doubt he can ask the hospital authorities to conduct a post-mortem and the certificate will be given in the proper way without reference to the coroner.
- (4) Those where a general practitioner has attended the patient for some time. In these instances he can communicate with the coroner, who can order a post-mortem, where the cost is defrayed from public funds. Here again a certificate can be given without an inquest.
- (5) Lastly, there is a group where the relatives or executors wish for a post-mortem. In all these cases it is wise, as a matter of courtesy, to advise the coroner—the cost falls upon the relatives or executors making the request.

Within the limit of the instances which are cited above, any general practitioner who is in doubt over a case involving matters of clinical interest or public policy can achieve his objective through one or other of these channels. It is felt, therefore, that in view of the adequate arrangements which can already be made in the vast majority of cases no further action is called for at the present time.

Insulin Syringes

37. The G.M.S. Committee, in consultation with the Diabetic Association, is representing to the Ministry of Health that the recently introduced 1½-cm. type of insulin syringe is not suitable for the purpose for which it was designed. Not only is it an extremely clumsy instrument from the point of view of self-administration, but its capacity is too

small for the larger doses of insulin which are frequently ordered. The Ministry is being asked to provide a 2-cm. syringe of the same length as the present 1-cm. syringe, but with a wider barrel. There is no criticism of the 1-cm. syringe, which has proved most satisfactory in use.

At the same time, the G.M.S. Committee has pointed out that it would be of considerable advantage if a spirit container were provided with these two syringes in an endeavour to reduce the many breakages which occur and to facilitate sterilization.

COMPENSATION AND SUPERANNUATION

Compensation

38. The Council has reviewed the question of the advance payment of compensation in circumstances which do not qualify for payment on grounds of hardship arising out of a debt incurred in purchasing a practice before the appointed day. In the opinion of the Council, it is still not opportune to reopen this question with the Ministry of Health. There has been no change in the position since the matter was discussed with the Department recently.

Superannuation—Determination of Questions

39. During last session the Council contemplated an approach to the Ministry of Health with a view to amendment of regulation 60 of the N.H.S. Superannuation Regulations, 1950, which states that any question on the rights or liabilities of persons under the regulations shall be determined by the Minister, there being no appeal against the Minister's decision. Action was deferred, however, pending the outcome of an appeal to the High Court and subsequent recourse to the Appeal Court against a decision of the Minister under regulation 60. These appeals were lost, but comments made by Mr. Justice Cassels and also by Lord Justice Denning have given support to the Council's view that there should either be a statutory Appellate Tribunal to determine these questions, or at least a Tribunal which can hear evidence relevant to matters in dispute and advise the Minister before questions are finally determined. Appropriate representations have been made to the Ministry.

Amendment of N.H.S. Superannuation Regulations

40. The Ministry of Health has been informed that the Council has no comments to make on draft regulations to amend still further the N.H.S. Superannuation Regulations, 1950. In the main, the amending regulations deal with anomalies which have come to light during the past five years. The Ministry has been asked, however, to incorporate further amendments so as to reverse the present procedure for assessing the contributions paid by a partnership, and to allow the superannuation contributions relating to a hospital appointment held by one partner to be shared between the partnership in accordance with their shares, contributions being deducted by the executive council.

Assessment of Pension of Practitioners

41. The advice of the Actuary has been sought in an attempt to ascertain whether there is likely to be any disparity between a pension assessed on eightieths of average remuneration over the last three years of service and one assessed on the "practitioner" basis of 1½% of superannuable remuneration for all years of service. The Council is satisfied that no true comparison can be made until information is available on the effect of the new distribution scheme on the average remuneration curve of a practitioner, or until the result is available of the first actuarial investigation into the N.H.S. Superannuation Scheme, due in July, 1955. The Council proposes to reconsider this question at a later date in the light of the Government Actuary's report.

Short Service and Death Gratuities

42. The Ministry of Health suggested that, in the case of practitioners, short-service and death gratuities should be

assessed on total superannuable income instead of on the average remuneration over the last three years of service. This change would result in a reduced gratuity in some cases, particularly where a gratuity is paid in respect of a young practitioner. As a result of representations by the Council the Department will continue the present method, but the definition of average remuneration will be modified slightly in order to simplify the calculation.

Relief from Tax on Minister's 8% Contributions

43. Arising out of a decision of the High Court, tax is payable on the 8% contribution made by the Minister to those who exercised the option to continue life policies instead of joining the N.H.S. Superannuation Scheme. The Council has considered the reports of the Millard Tucker Committee, which deal *inter alia* with tax relief on superannuation provisions by self-employed persons, and regards efforts to obtain early implementation of the recommendations of the Millard Tucker Committee as the best means of removing this anomaly.

Local Government Superannuation

44. The Council has kept local government medical officers informed of the options available under the Local Government Superannuation (Benefits) Regulations which came into operation on October 1, 1954. It has also expressed its concern at the action taken by one authority in passing a general resolution which excludes doctors from the provision of added years under regulation 12. Representations have been made both to the authority concerned and to the Ministry of Housing and Local Government, and the situation is being closely watched.

HOSPITAL AND CONSULTANT SERVICES

Negotiating Machinery

45. The Council has considered the following resolutions of the Representative Body:

(a) **Resolved:** That the following motion be referred to the Council:

That this meeting recommends that a negotiating committee be elected (representative of all sections of the profession) to conduct all future negotiations on the subject of terms of service or remuneration of any section of the profession.

(b) **Resolved:** That the best actuarial and legal advice be given to the negotiators, all of whom should be members of the Central Consultants and Specialists Committee, either by election or *ex officio*.

(c) **Resolved:** That in view of the damaging restrictions which make it impossible to have present on the Staff Side at meetings of Whitley Committee "B" expert legal and actuarial advisers, in future it is essential that the Staff Side should have available all the facilities for special legal or other advice both prior to and during the conduct of negotiations.

With regard to the motion referred to it by the Representative Body, the Council is of the opinion that, provided there is adequate machinery for co-ordination and discussion between the three main sections of the profession, as indeed exists at present, it is much more effective for each section to have its own negotiating machinery than to establish a negotiating committee for the whole profession.

The Council has noted the view of the Representative Body regarding the need for the Staff Side of Committee "B" to have available expert legal advice. The Staff Side did in fact take legal advice during the negotiations on remuneration, and the course and policy of these negotiations was largely determined by the advice of the late Mr. F. Grant, Q.C. There is no reason to doubt that the Staff Side will seek legal or other expert advice in the future whenever it judges such advice to be helpful.

With regard to the composition of the negotiating body, it must be remembered that in the field of Whitley negotiations the "Staff Side" must be formed by agreement with all the interested professional bodies. It is the opinion of the Council that there would be serious disadvantages and diffi-

culties in disturbing the agreement entered into in 1948 between the Association and the Royal Colleges and Corporations for the preservation of the principle that consultants should speak with "one voice." The real issue is to secure improvement in the Whitley machinery, and this is a matter to which the Central Consultants and Specialists Committee is now giving serious consideration. In fact, the Staff Side of the General Whitley Council for the Health Services has set up a subcommittee to study the working of the Whitley machinery and to make recommendations for its improvement. The Staff Side of the Medical Whitley Council is represented on this subcommittee.

Remuneration of Hospital Medical Staff

46. The Council has not yet been able to complete its consideration of a number of resolutions of the A.R.M., 1954, concerning the remuneration of hospital medical staff, but will include a statement on this subject in its Supplementary Report.

Hospital Medical Staffing

47. During the past session further consideration has been given to the problem of hospital medical staffing.

The first report on this subject, prepared by a special subcommittee of the Central Consultants and Specialists Committee, contained far-reaching proposals for altering the structure of hospital staffing, a brief account of which was given to the Representative Body last year. This report has been circulated to Regional Consultants and Specialists Committees and has occasioned widespread interest and comment among members of the profession throughout the country. A revised report has now been prepared in the light of the views expressed by the Representative Body in 1954, and of the comments and criticism received from Regional Committees and other bodies. This second report has been referred to Regional Consultants and Specialists Committees, to the Scottish Central Consultants and Specialists Committee, and to the Joint Committee for their consideration.

If possible, a final report will be submitted to the Representative Body in the Supplementary Annual Report of Council.

The Joint Consultants Committee has already been asked by the Ministry of Health to discuss medical staffing problems with them.

Part-time Consultants and Income Tax

48. Prior to the introduction of the National Health Service it was customary for income-tax inspectors to assess practitioners engaged in private practice wholly under Schedule D, even where part of the professional income was derived from a paid appointment. This custom continued in the early years of the National Health Service, but recently there has been a move throughout the country for income-tax inspectors to assess the hospital income of part-time consultants under Schedule E where this income is the major part of the professional earnings.

At first sight there appeared to be little hope of contesting successfully this new policy, but the Association's solicitor suggested that there was sufficient doubt in the matter to justify seeking the opinion of an eminent tax counsel. This has been done, and in the light of the advice given by counsel steps are being taken to test the validity of this basis of assessment in the courts.

Senior Registrars and Additional Consultant Posts

49. The Council has given consideration to the following resolution of the Representative Body:

Resolved: That this meeting is of opinion that the Minister should increase the number of part-time consultant posts in general medicine and surgery and in psychiatry.

It is the policy of the Central Consultants and Specialists Committee that the consultant establishment should be expanded as and where it may be necessary in order to

provide an adequate consultant service in all specialties throughout the country. This policy has been borne in mind in the consideration given to the problem of hospital staffing, and will be dealt with in greater detail in the report on this subject. (See para. 47.) It is also the Committee's policy that where a new virtually full-time post is created the appointed candidate should have the option of accepting the post on a whole-time or maximum part-time basis.

There has been greater expansion in the consultant establishment in psychiatry than in general medicine and general surgery during the past few years, and it is understood that there is likely to be no dearth of consultant and S.H.M.O. vacancies for senior registrars in psychiatry now completing their training. Unfortunately the reverse is the case in general medicine and surgery, where there are considerably more senior registrars in their fourth or subsequent years than can hope to be absorbed into the consultant establishment in the near future. Discussions between the Joint Committee and the Ministry have revealed that there is a disturbing discrepancy between the number of expected consultant vacancies and the number of senior registrars in training in the various specialties. The Joint Committee is impressed with the need for overall planning in the development of the consultant services and is now discussing the matter with the Ministry. In the meantime, and pending the forthcoming discussions on hospital staffing, agreement has been reached with the Ministry that hospital boards should be allowed to extend the appointment of senior registrars who have completed their normal tenure, where they are satisfied that, given more time, the senior registrar is likely to obtain a higher post.

Medical Advisory Machinery

50. During the past year further opportunities have been sought to impress upon the Ministry the importance attached by the profession to the establishment of satisfactory medical advisory machinery at regional board level.

The subject was discussed at a meeting between the Joint Committee and the Minister of Health on December 1, when the Joint Committee drew attention to the defects in the methods adopted by some boards for obtaining professional advice. The Minister expressed his complete sympathy with the Committee in its desire for close co-operation between hospital boards and their consultant staffs, and his wish to secure improvement in the medical advisory machinery where this was found to be necessary. He asked the Committee to provide examples of what was wrong with the existing advisory machinery and of the kind of mistakes which the Committee thought could be avoided with more effective machinery. This information is now being sought from Regional Consultants and Specialists Committees, and the Joint Committee has asked the Ministry for an opportunity of discussing the problem directly with the chairmen of regional hospital boards.

S.H.M.O. Appointments

51. The Council has considered the following resolution of the Representative Body:

Resolved: That no further S.H.M.O. posts be established and that existing posts should be subject to biennial review with a view to upgrading.

The limited field in which S.H.M.O. posts may now be established was agreed between the Joint Committee and the Ministry in 1950. The question of the future use of this grade is bound up with the discussions now taking place on the subject of hospital medical staffing, and must therefore await the outcome of these discussions.

Grading of S.H.M.O.s

52. The Council has had before it the following resolution of the Representative Body:

Resolved: That this meeting draws attention to the complete lack of uniformity in different regions, and sometimes within the same region, in the use of the grade of S.H.M.O., particularly in

relation to, and to the detriment of, the tuberculosis service; and that Council be requested to treat the correction of this injustice as a matter of priority and to employ every means in the power of the British Medical Association to ensure the grading as consultants of those S.H.M.O.s who are at present inappropriately and unfairly graded.

As stated in the previous paragraph, the field in which posts in the S.H.M.O. grade can be established is limited by agreement between the Ministry and the Joint Committee, and defined in Circular R.H.B. 50/96 issued to hospital authorities in October, 1950. Advertisements for S.H.M.O. appointments submitted for publication in the *British Medical Journal* are carefully scrutinized with a view to detecting in advance any possible abuse of the grade.

With regard to the last part of the Representative Body's resolution, the Staff Side of Committee "B" of the Medical Whitley Council has recently proposed to the Management Side that S.H.M.O.s occupying consultant posts should be remunerated on the consultant salary scale.

Domiciliary Consultation Arrangements

53. The Council has had before it the following resolution of the Representative Body:

Resolved: That this meeting is of opinion that the diagnosis should not be disclosed on domiciliary consultation certificates.

The obligation of disclosing the diagnosis on the domiciliary consultation certificate falls upon the consultant, and an inquiry addressed to regional consultants and specialists committees some time ago revealed that there was considerable divergence of opinion among consultants on the question. Some took the view that the disclosure of the diagnosis amounted to a breach of confidence, and should be resisted, while others felt that it was not unreasonable that hospital boards should know for what purpose their consultant services were used. The matter has, however, been under discussion between the Joint Consultants Committee and the Ministry, the attitude of the Joint Committee being that there is no point in asking consultants to disclose the diagnosis unless it serves some useful purpose. The Ministry has therefore been asked for specific examples of the purposes for which the diagnosis has proved to be of value, but although the Ministry has stressed its importance no explanation acceptable to the Joint Committee has so far been produced. The matter is still being pursued with the Ministry.

The Council has also noted the following resolution of the Representative Body:

Resolved: That facilities for domiciliary visits under the National Health Service be made available to all patients in private nursing-homes.

The Joint Committee has urged upon the Ministry the desirability of extending the domiciliary consultation arrangements in this way, and the Ministry's attention has been drawn to the hardship inflicted upon patients of modest means who enter nursing-homes for domestic reasons or because of the lack of adequate hospital accommodation, and who are deprived of the benefit of consultant advice under the National Health Service.

The Ministry is considering the proposal, although its initial reaction is that the domiciliary scheme could not be extended as suggested without amending legislation, in view of the fact that the Minister's obligation to provide a domiciliary consultant service is specifically limited to the patient's home.

Internal Administration of Hospitals

54. The Committee appointed by the Central Health Services Council in 1950 under the chairmanship of Alderman A. F. Bradbeer to consider the internal administration of hospitals, issued its report in August, 1954.

The theme of the report is that hospital administration should be on a tripartite basis—medical, nursing, and lay—and that this conception of partnership should determine the lines of all future development in the hospital service.

As regards the medical administration of hospitals, the Bradbeer Committee has largely accepted the evidence submitted to it by the Central Consultants and Specialists Committee. It recommends that medical administration should be carried out through the committee system, the detailed day-to-day administration in general hospitals being undertaken by the chairman of the medical staff committee or, in the larger hospitals, by a consultant specially appointed for the purpose and selected from the existing consultant staff by the medical staff committee and the hospital management committee and regional board jointly. The Committee recommends that this appointment should be for a limited period, and that no reduction should be made in the consultant's salary for the time devoted to administrative work. In order to provide hospital junior staff with experience in medical administration, combined with reasonable prospects of promotion in the clinical field, the Committee suggests the creation of a new R.M.O./R.S.O. grade with clinical and administrative duties. The report recommends that medical administration in mental hospitals and institutions and sanatoria should continue to be carried out through the appointment of a medical superintendent.

An important recommendation of the Bradbeer Committee which will be welcomed by the profession is that regional boards should be encouraged to appoint up to one-fifth of the total membership of hospital management committees from names submitted by the senior medical and dental staffs of the hospitals concerned.

It is understood that the Ministry is now studying the report, and an assurance has been given to the Joint Consultants Committee that, before issuing any advice to hospital authorities on matters affecting the profession, the Department will consult the Joint Committee.

The Joint Consultants Committee has informed the Ministry of its broad approval of the Bradbeer Report, and of its hope that action will be taken upon its recommendations. It is to be noted that the Committee has clearly been influenced by evidence given before it by the Central Consultants and Specialists Committee.

Machinery for the Appointment of Consultants and Registrars

55. The Council has noted the following resolutions of the Representative Body:

Resolved: That this meeting considers that, at the appointment of registrars and consultants, both the hospital management committee and the assessors should have equal voting power, while the chairman should retain a casting vote.

Resolved: That the Representative Body considers that local group medical and lay committee members should have more say in the appointment of consultant staff.

The Central Consultants and Specialists Committee and Joint Consultants Committee have felt for some time that the machinery for the appointment of consultants is unsatisfactory and should be amended to give the senior medical staff at the hospital concerned a greater voice in the selection of their future colleagues. The matter is now under active discussion between the Joint Committee and the Ministry.

It is the view of the Central Consultants and Specialists and Joint Committees that registrars should be appointed locally by the hospital management committee, and representations have been made to the Ministry accordingly. It has been agreed, however, that any change in the existing procedure should be left in abeyance pending the discussions on hospital medical staffing.

Medical Representation on Regional Hospital Boards and Hospital Management Committees

56. Regional Consultants and Specialists Committees, Local Medical Committees, and Divisions and Branches of the Association have been invited to nominate practitioners to be recommended by the Council for the consideration of the Minister of Health in filling the vacancies arising on

regional boards in March, 1955, when the term of office of one-third of the members expires.

The Council has had before it the following resolution of the Representative Body:

Resolved: That this meeting is of the opinion that medical members of regional hospital boards and hospital management committees should be elected by their professional colleagues.

The view expressed by the Representative Body accords with the policy of the Central Consultants and Specialists and Joint Consultants Committees. At a recent meeting with the Minister of Health the Joint Committee urged that the constitution of regional boards should be amended to provide, as in the case of boards of governors, that up to one-fifth of the members should be appointed on the recommendation of the senior medical and dental staff of the board's hospitals. The Joint Committee also expressed the hope that the Minister would accept the same principle in the case of hospital management committees, as recommended by the Bradbeer Committee.

The Minister replied that he would take note of the Joint Committee's view, but reminded the Committee that the persons appointed to regional boards and hospital management committees were chosen as individuals and not as representatives of professional or other interests. He pointed out that the N.H.S. Act did not permit the nomination of members of regional boards and management committees, but added that he was always ready to consider candidates whose names were brought to his notice, from whatever source.

Whole-time or Part-time Service

57. The Council is fully in sympathy with the following resolutions of the Representative Body:

Resolved: That regional hospital boards should permit whole-time salaried consultants to become part-time when they so desire.

Resolved: That all consultants should be given the option of being on a part-time or whole-time basis after giving adequate notice.

At the outset of the Service the Ministry instructed hospital boards that when granting permanent contracts to consultant staff they should offer individual consultants an option of whole-time or part-time service, so far as this was consistent with the needs of the service. Since that time this has remained the policy of the Ministry in connexion with new appointments, and it has been faithfully observed by some regional boards.

The question of the preservation and, where necessary, extension of the principle that consultants should have an option for whole-time or part-time service has been under discussion between the Ministry and the Joint Committee for some time past. One result of these discussions has been the recent issue of a circular by the Ministry extending the offer of an option for whole-time or part-time service to chest physicians, whose employment hitherto has traditionally been on a whole-time basis.

More recently the Ministry has undertaken to consider the issue of an "agreed" statement of policy on the granting of an option for whole-time or part-time service, for the information of the profession, and this is now under discussion.

Remuneration of Medical Teachers

58. The Council has noted the following motion, referred to it by the Representative Body in July, 1954:

That this meeting considers it to be prejudicial to the best interests of medical teaching in this country that there should be such a large discrepancy, accentuated by the recent agreement on hospital staff remuneration, between the salaries of consultants paid by hospital boards and those employed full-time by universities, particularly since both may be carrying out similar duties in the same hospitals. It is urged that immediate steps be taken to improve the financial position of medical members of university teaching staffs.

At that time an approach had already been made to the University Grants Committee to ascertain what steps were

being taken to improve the remuneration of medical teachers following the increases of salary granted to hospital medical staff in April, 1954.

In November last the Chancellor of the Exchequer announced that he proposed to ask Parliament to provide additional funds amounting to some £2½m. to enable universities to bring into effect, as from October 1, improved rates of remuneration for full-time university teaching staffs, including both clinical and non-clinical medically qualified teachers. The position will be further reviewed when information is available regarding the new salary scales introduced by the different universities.

The Staff and Management Sides of Committee "B" have now agreed upon a revised basis for the payment of distinction awards to whole-time clinical teachers or research workers with honorary hospital contracts. This provides that where the teacher or research worker spends on the average 21 or more hours per week in clinical work he shall receive the whole of the award as at present. Where the time devoted to hospital work is less than 21 hours per week the following fractions of the award will be paid:

17½ hours or more but less than 21	16/20ths
14 " " " " " "	17½ 13/20ths
10½ " " " " " "	14 ½
7 " " " " " "	10½ 7/20ths
3½ " " " " " "	7 5/20ths
For an assessable amount of time below 3½ hours	3/20ths

Review of Consultant Organization

59. During the past session the Central Consultants and Specialists Committee has continued its review of the consultant organization, and in this connexion the following resolution of the Representative Body (1954) has been noted:

Resolved: That in subparagraph (3) of para. 206 of the Annual Report, the last words should be amended to read "who are graded as consultants, senior hospital medical officers, and G.P. 10(b)s."

[The subparagraph referred to is as follows:

"The electorate of regional committees should consist of those members of hospital medical staffs and all other specialist units in the region (for example, blood transfusion and mass radiography) who are graded as consultants and senior hospital medical officers."]

The Committee has not yet completed its deliberations on the subject.

Regional Hospital Board Administrative Medical Staff and Medical Superintendents

60. A claim has been lodged in Committee "B" of the Medical Whitley Council for an increase of salary for senior administrative medical officers and regional psychiatrists, parallel to that granted to consultants in April, 1954. Proportionate increases are being sought for junior grades of administrative medical staff.

A claim for an increase in the administrative scales applicable to medical superintendents has also been made.

Fees for Part-time Work for Local Authorities

61. In 1954 the Representative Body referred the following motion to the Council:

Resolved: That in the opinion of this meeting all scales of fees for special sessions—for example, dental anaesthetics, etc.—should be immediately revised.

After careful consideration the Council feels that it would be wiser to defer seeking any revision of the sessional fees payable by local authorities to consultants and general practitioners pending the outcome of the negotiations on the remuneration of public health medical officers.

Fees for Part-time Work for Government Departments

62. Following representations to the Treasury an improvement in the fees paid by Government departments

for part-time services undertaken by consultant members of the profession has been obtained, as set out below. It meets, in full, the claims of the Central Consultants and Specialists Committee. A scale of fees for work undertaken by S.H.M.O.s, introduced by the Treasury for the first time, is receiving consideration:

	Previous Scale	New Scale for Consultants	Proposed Scale for S.H.M.O.s
Medical boards:			
One case	£2 12 6	3 gns.	2 gns.
2 cases	£3 5 0	4 "	2½ "
Session (between 2½-3½ hours*)	£4 4 0	5 "	3½ "
Examination and advice on individual cases:			
One case	From 2-5 gns.	From 3-5 gns.	From 2-3½ gns.
Medical appeal tribunals Day or part of day ..			7 gns. (cons. 10 gns.)
Appeal boards:			
One case			3½ gns. (cons. 5 gns.)

* Previously 2½ hours.

Waiting Time in Hospital Out-patient Departments

63. In June, 1954, the Ministry issued a circular to hospital boards and committees drawing attention to widespread criticism regarding unnecessary waiting in out-patient departments, and calling upon hospital authorities to review their out-patient arrangements. This circular led to some criticism of the profession in the daily press. The Joint Committee protested to the Minister of Health at his action in issuing the circular without prior consultation with the profession, in view of the fact that the matter was one with which the profession was intimately concerned. The Minister apologized for not consulting the Joint Committee.

The Central Consultants and Specialists Committee, believing that the reasons for patients being kept waiting in out-patient departments are largely to be found in the deficiencies of existing hospital staff and facilities, coupled with an increased demand for out-patient treatment, is studying the problem with a view to making constructive suggestions.

The Ministry's circular advised hospital authorities that so far as possible each patient should be given an appointment for the time when he was expected to see the doctor, and that multiple or "block" bookings should be discontinued. It was pointed out to the Minister that with present staff and facilities this might well lead to a reduction in the number of patients seen at each out-patient session, and to a lengthening of waiting-lists. The Minister replied that he thought the Committee was interpreting the advice he had given too literally. Although he was certainly opposed to the block appointments system whereby all the patients were called for the beginning of the session, he had no objection to the practice of calling, say, two or three people at intervals throughout the session.

Consultants and Specialists Defence Fund

64. The Council has noted the following resolution of the Representative Body:

Resolved: That this Representative Body requests Council to take steps to ensure that an adequate Defence Fund is established by the consultants and specialists.

It is recognized that the Fund already in existence should be of larger dimensions than it is. It is proposed shortly to issue a strong and reasoned appeal signed by the leaders of the various consultant organizations, in order to interest all consultants and S.H.M.O.s in the Fund, so that it can be greatly enlarged by dint of a modest subscription from a high proportion of members of hospital senior medical staffs. It is hoped to broaden the purposes for which the Fund is to be enlarged.

Remuneration of Locums

65. Following the revision of the salary scales of hospital medical staff in April, 1954, increased rates of remuneration for hospital locums have been agreed between the Staff and Management Sides of Committee "B," as set out below:

	Old weekly rate	New weekly rate
Senior Registrars	£22	£24
Registrars and J.H.M.O.s ..	£16	£17 10s.
Senior House Officers	£13	£14 10s.
House Officers	£8	£9 10s.

The new rates are retrospective to April 1, 1954.

The Staff Side has also endeavoured to secure an increase in the remuneration of locums replacing consultants or S.H.M.O.s, but so far this has been resisted by the Management Side on the ground that the existing rates are generous even in relation to the new consultant and S.H.M.O. salary scales.

It has also been agreed in Committee "B" that locums employed continuously for periods of upwards of six months shall be given annual leave, and that employment as a locum (for not less than three months) shall count towards sick leave entitlement.

General-practitioner Maternity Beds in Hospital

66. The Council has considered the following resolution of the Representative Body:

Resolved: That this meeting urges that regional hospital boards be instructed to refrain from reducing the number of general-practitioner maternity beds in hospitals and to endeavour to provide more.

It has been decided to ask the Joint Consultants Committee to urge upon the Ministry that regional hospital boards should be instructed to consult local medical committees and local health authorities in connexion with the planning or review of maternity services.

Geriatric Units

67. The Council has had before it the following resolution of the Representative Body:

Resolved: That this meeting is alarmed at the absence of any organization in some areas for ensuring prompt admission to hospital of aged persons in need of full-time attention, and suggests that the early appointment of a doctor able to assess the needs of each and authorized to arrange admission is essential.

This resolution reiterates the concern expressed by the Representative Body in 1953 at the lack of a co-ordinated geriatric service. As reported to the Representative Body last year, a Geriatric Subcommittee was appointed by the Joint Liaison Subcommittee of the Central Consultants and Specialists, General Medical Services, and Public Health Committees to study the problem, and it is anticipated that its report will be ready for the information of the Representative Body in the Supplementary Report of Council. It was an instruction to the Geriatric Subcommittee to try to arrive at practical recommendations which could be later negotiated with the authorities.

Facilities for Hospital Medical Staffs to Attend Meetings of a Professional Body

68. The Council has considered the following resolution of the Representative Body:

Resolved: That this meeting requests the Council to urge regional hospital boards and boards of governors of hospitals to grant every facility to hospital medical staff for the purpose of attending the Annual Representative Meeting.

The Council is not aware that widespread difficulties have arisen in this matter. It suggests that any local difficulties which may arise should be brought before the Regional

Consultants and Specialists Committee, which, if necessary, will in its turn pass it on to the Central Consultants and Specialists Committee for appropriate action.

Accommodation of Medical Superintendents Outside the Hospital

69. The Council has considered the following resolution of the Representative Body:

Resolved: That the Council be asked to investigate the possibility of medical superintendents being given the opportunity to live outside the hospital if they so desire.

There is no central ruling that medical superintendents shall reside at their hospitals, and the Council feels that the matter is one which is best dealt with locally.

The Control of Hospital Management

70. The Council has noted the following resolution of the Representative Body, with which it is fully in sympathy:

Resolved: That this meeting would deprecate the return of hospital management from independent to municipal control.

Staffing of Radiological Departments

71. Increasing difficulties are reported in the staffing of hospital radiological departments, and the Council has authorized the Radiologists Group Committee to undertake a survey of the radiological services throughout England and Wales, with a view to making recommendations for improving the existing situation.

Hospital Medical Staff on Pre-Act Terms of Service

72. Following representations by the Staff Side of Committee "B," the Management Side have agreed that hospital medical staff who in 1949 opted to retain their old conditions of service should be given a further option of transferring to the standard terms and conditions of service as from April 1, 1954, when the revised salary scales were introduced.

REFORM OF THE NATIONAL HEALTH SERVICE

73. The Council has received from the Standing Committees concerned reports on the action taken to give effect to the decisions taken by the S.R.M. of December, 1951, in connexion with the recommendations made in the Interim Report of the Council on the Reform of the National Health Service. It is now studying these reports.

ARBITRATION MACHINERY

74. Last year the Representative Body, in confirmation of its previously established policy, resolved "that there should be the unilateral right to arbitration."

The Council regrets that it cannot at present report progress in this matter. It will include a statement on the subject in its Supplementary Report after further study of the problem.

OCCUPATIONAL HEALTH

Remuneration of Industrial Medical Officers

75. In accordance with the undertaking given to the Representative Body in 1954, the Council has reviewed the basis of the Association's recommendations for the remuneration of whole-time industrial medical officers, and in this connexion valuable assistance has been received from a number of industrial medical officers with experience in a variety of industries. It is considered that everything should be done to encourage the right kind of practitioner to make his career in industrial medicine.

There is an increasing tendency for firms, particularly in Scotland and Northern Ireland, to appoint part-time medical officers, on a temporary basis, who may spend up to half their time in postgraduate study, perhaps in other fields. No reference to this particular type of appointment has

been made in the revised recommendations because they are only temporary and do not necessarily lead to permanent appointments in occupational health.

The Council does not consider that any revision is necessary of the existing recommended scale for the remuneration of part-time industrial medical officers, as it appears to compare favourably with the suggested revised whole-time scale. It is considered, however, that certain explanatory notes should be appended to the part-time scale.

As there is no single organization with which the salaries of industrial medical officers can be negotiated, it is felt that the position can best be met by the preparation of a revised statement for the guidance of managements on the definitions, qualifications, and remuneration of industrial medical officers.

The needs of individual industries vary considerably by virtue of their peculiar hazards and requirements, and it has not been possible to prepare precise definitions covering all industries. It is therefore suggested that an Advisory Panel, composed of medical officers with wide experience of industry, be set up by the Association to give guidance to managements, where desired, regarding the type of medical service required in individual undertakings.

Recommendation: That the revised statement on the remuneration of industrial medical officers set out in Appendix III be approved.

Terms of Service for Industrial Medical Officers

76. The Council has revised the statement on the Terms of Service for Industrial Medical Officers which it published in its Annual Report for the year 1950-1. The revised statement is set out in Appendix IV to this Report.

Industrial Health Advisory Committee

77. The Minister of Labour and National Service announced in the House of Commons on November 11, 1954, the setting up of an Industrial Health Advisory Committee as a standing committee to advise him on measures to further the development of industrial health services in workplaces covered by the Factories Acts. The following organizations were invited to submit nominations for membership of the Committee:

British Employers' Confederation	..	..	..	3
Trades Union Congress	..	..	..	3
British Medical Association	..	..	..	2
Association of Industrial Medical Officers	..	..	..	1
Association of Certifying Factory Surgeons	..	..	..	1
Nationalized Industries	..	..	..	1
Royal College of Nursing	..	..	..	1
British Occupational Hygiene Society	..	..	..	1
Committee of Vice-Chancellors and Principals of the Universities of the United Kingdom	..	..	..	1

The attention of the Ministry was drawn to the difficulty which the Association would experience in covering all interests with only two nominees. However, as the Minister wishes the Committee to be an active working body, he has purposely limited its membership, and he was unable to agree to an increase in the number of the Association's nominees.

Regret was expressed to the Ministry that the Committee's terms of reference did not cover offices, shops, and other places of work mentioned in the Gowers Report, but in view of the fact that the Committee has been established by the Minister of Labour and National Service, it must confine its activities within the Ministry's statutory powers.

The Council nominated Dr. L. G. Norman and Dr. J. A. L. Vaughan Jones for membership of the Committee, and it suggested that members of the Committee should be appointed for three years. This suggestion was adopted by the Ministry of Labour and National Service.

Advisory Councils on Occupational Health

78. In its last Annual Report the Council referred to the first Conference of Advisory Councils on Occupational Health, which had been held in April, 1954. The Council

has agreed to sponsor the second Annual Conference, and it is to be held at B.M.A. House on April 20, 1955, under the chairmanship of Mr. C. F. Gothard, of the Burton and District Advisory Council. The subject for general discussion will be, "The Adolescent in Industry."

The 1954 Conference recommended that a central body should be established consisting of representatives of the British Medical Association, the British Employers' Confederation, and the Trades Union Congress, together with representatives from local advisory councils. The Council agreed that an approach should be made to the British Employers' Confederation and the Trades Union Congress concerning the possibility of establishing a tripartite central committee, but the British Employers' Confederation felt that developments in connexion with the setting up of the Industrial Health Advisory Committee should be awaited before reaching any final conclusions. The Confederation has not, however, ruled out the possibility of direct discussion with the British Medical Association on subjects of mutual interest should it prove desirable.

A Joint Committee of the British Medical Association and the Trades Union Congress is already in existence.

Future of Occupational Health Services

79. The Joint Committee of the B.M.A. and T.U.C. has discussed the Association's report on the future of occupational health services, and the major issue raised concerned preplacement medical examinations and examinations on return to work after absence from sickness or injury.

The Trades Union Congress maintains that, unless an employee is suffering from a disease which renders him a danger to his colleagues, he should not be prevented on medical grounds from taking up or retaining a post. Though the industrial medical officer might advise a man of the probable consequences should he continue in his occupation, the man himself must decide whether or not to accept the advice.

The Association's representatives on the Committee have stressed the importance of the doctor-patient relationship, which cannot be overlooked, and have suggested that adequate safeguards for the employee can be provided by a right of appeal. In view of the importance of this issue both sides have agreed to give further consideration to it.

The Council has decided that, in future discussions with the Trades Union Congress, the following policy should be adopted in regard to preplacement and subsequent examinations in the field of occupational health:

Preplacement Examinations:

(a) On medical grounds preplacement examinations are desirable and necessary.

Subsequent Examinations:

(b) An employer has a right to instruct an employee to be medically examined by the industrial medical officer, but the medical officer should not undertake this examination without the employee's consent.

(c) If consent is withheld, any decision as to the worker's future employment is the concern of the management.

(d) If consent is given, the industrial medical officer, on completion of the examination, should recommend that the employee is fit or unfit, but should not disclose any details without his consent.

All other issues are non-medical and should be dealt with between management and worker, or his union.

Administration of Morphine by Nurses in Industry

80. The Royal College of Nursing has expressed anxiety to the Council regarding the inability of State-registered nurses under present legislation to administer morphine in emergency in industry.

The whole problem of the legal position of a nurse who undertakes functions hitherto regarded as outside her professional scope has been the subject of joint discussion, but

it is felt that this particular aspect of the problem is of sufficient importance and urgency to be dealt with separately. Meetings between representatives of the Association and the Royal College of Nursing have been held and a joint statement is being prepared.

Toxic Chemicals in Agriculture

81. A request was received from the Association of British Insecticide Manufacturers for the assistance of the British Medical Association in preparing notes on first-aid and medical treatment in the event of poisoning, for circulation with containers of toxic chemical preparations used in agriculture. The comments of the Ministry of Agriculture were sought in view of the discussions which took place between the Ministry and the Association in 1951, resulting in the issue to the medical profession of notes on the clinical aspects of insecticide poisoning.

The Council has approved the suggestion that all containers of toxic chemical preparations should be labelled in this way, provided that the information is standardized and prepared by experts.

It has recommended that (i) medical officers of health should be provided with copies of the information set out on the labels, for their permanent records, so that reference could be made rapidly if inquiry were received about a case of poisoning; (ii) that suppliers and distributors of toxic preparations should be provided with copies of the same information for a similar purpose; (iii) that the Joint Formulary Committee should be asked to consider the inclusion of relevant information in the *National Formulary* for the use of general practitioners and hospital medical officers.

Occupational Dermatitis

82. The Council has appointed a deputation to approach the Ministry of Pensions and National Insurance with a view to discussing a number of points which have arisen in connexion with the work of examining medical practitioners and occupational dermatitis in its relation to the National Insurance (Industrial Injuries) Act.

Duties and Ethical Rules for Industrial Medical Officers

83. The Council has considered the following motion, which was referred to it by the Representative Body in 1954:

That this meeting urges Council to take further active steps to try to compile a comprehensive list of industrial medical officers, or, failing this, to circulate among all non-members of the Association a copy of "The Duties and Ethical Rules for Industrial Medical Officers," and also to publish them at periodic (say three yearly) intervals in the *Supplement*.

A list of whole-time industrial medical officers is already being maintained, and consideration has been given to possible methods of compiling a list of part-time industrial medical officers, including the question of a request for information from local medical committees. However, there appears to be no source from which constant and complete information can be obtained, particularly as some doctors are reluctant to disclose details of their part-time appointments.

During last session a notice was published in the *Supplement* to the *British Medical Journal* drawing attention to the duties and ethical rules for industrial medical officers, copies of which are available on request. Consideration has been given to the question of publishing the duties and ethical rules in the *Supplement* from time to time, but, apart from this, the Council is of the opinion that, for the present, no further action can be taken on this motion.

Medical Standards for Road, Rail, and Air Transport

84. Discussions have taken place between representatives of the Association and representatives of the Ministry of Transport on the recommendations contained in the Association's Report on Medical Standards for Road, Rail, and Air Transport.

Mule Spinning (Health) Special Regulations, 1953

85. In the last Annual Report of Council reference was made to the representations which had been submitted to the Ministry of Labour and National Service that the fee for examinations under the above regulations should be 12s. 6d. for the first examination and 5s. for subsequent examinations undertaken on the same occasion. The Ministry has not yet accepted the Association's views on the matter, and the position is being watched, but, as it appears that no final decisions have yet been made on the arrangements for and the scope of these examinations, no further action is proposed at this stage. The position will be reviewed during the next session.

International Committee on Occupational Health Services

86. Information regarding the occupational health services of this country has been sent to the World Medical Association on a questionnaire received from that association entitled "Council Investigation of Possibilities for W.M.A. Co-operation in International Occupational Health Services." Nominations were invited for one or more medical specialists in the field of occupational health to serve on the International Committee on Occupational Health Services. The Council nominated Dr. J. A. L. Vaughan Jones, the Chairman of the Occupational Health Committee.

PUBLIC HEALTH

Remuneration in the Public Health Service

87. A comprehensive review of the salary scales of all categories of medical officers in the Public Health Service has been undertaken by the Staff Side of Committee "C" of the Medical Whitley Council. The recommendations of the Staff Side for improving these scales and for bringing them into closer relationship with the remuneration of the rest of the profession were submitted to the Management Side, but it was not possible to reach agreement during the negotiations. The matter has been reported to the Ministry of Labour and National Service, which has referred the dispute to the Industrial Court for settlement.

When the award of the Court is known, consideration will be given to the possibility of revising the 1947 agreement on sessional fees payable by local authorities to general practitioners and consultants.

The fee for the annual medical examination of boarded-out children has been increased to 25s. in certain cases (see para. 119).

Superannuation

88. The attention of all medical officers in the Public Health Service has been drawn to the present position in regard to local government superannuation (see para. 44).

Appeals Machinery

89. The rulings given by Whitley Regional Appeals Committees have all been in favour of the medical officers concerned, and, with one exception, have been implemented by the employing authorities. Steps are being taken to have the case which is still outstanding referred to the Industrial Court, with the agreement of the employing authority concerned.

The Council continues to press the Northern Ireland Ministry of Health and Local Government to establish suitable machinery for dealing with appeals.

Constitution of the Public Health Committee

90. Careful consideration has been given by the Council to views expressed at the A.R.M., 1954 (Minute 153), regarding the representation of junior grades of the Public Health Service on the Public Health Committee.

The main responsibility for electing members of the Committee lies with the Representative Body and the Council, but the Committee, under its constitution, has power to co-opt three members "to secure representation of a

particular class of experience not otherwise represented on the Committee." When co-opting in the past and in the present session the Committee has borne in mind the need for adequate representation of all categories in the Public Health Service, including junior grades. The Council is of the opinion that there is adequate representation of these grades on the Committee.

To improve liaison, the Council has decided that the constitution of the Public Health Committee should be amended to provide for the inclusion of a representative of the Occupational Health Committee (see Appendix VI).

Rules for D.P.H. Courses

91. At the invitation of the General Medical Council, views have been formulated by the Council of the Association on the revision of the G.M.C.'s Rules as to Courses of Study and Examination for Diplomas and Degrees in Sanitary Science, Public Health, or State Medicine. These rules were last revised in 1945, and their possible amendment in the light of changing circumstances is now under consideration. Representatives of the Association have, in the course of discussions with the special committee of the General Medical Council, amplified written recommendations which had already been submitted (see Appendix V).

Infectious Diseases

92. After consultation with the Association, the Ministry of Health has issued the Puerperal Pyrexia (Amendment) Regulations, 1954, operative as from March 1, 1955, which amend the form of notification by adding the words "Cause, if known." This has been done as many notifications arise from pyrexia due to known causes which do not involve any epidemiological hazard.

The Council hopes to refer in its Supplementary Report to the outcome of discussions with the Ministry of Health on the follow-up of cases of venereal disease and the tracing of contacts, with particular reference to the importance of social work.

Bacterial Pesticides

93. The Working Party on Precautionary Measures against Toxic Chemicals used in Agriculture recommended, among other matters, that the firms and Government departments concerned should give consideration to the expert view that it is desirable to avoid the use of bacterial rodenticides. The Council has supported this recommendation of the Working Party with a view to the ultimate banning of bacterial rodenticides, and has taken this matter up with the Ministry of Agriculture and Fisheries.

School Health Service

94. Satisfactory arrangements have already been formulated and widely adopted to ensure (a) that the concurrence of the general practitioner is obtained before medical officers employed by local authorities refer schoolchildren for special investigation (other than an ophthalmic examination) or treatment, and (b) that copies of any special reports on the child received by the medical officer are sent to the child's own doctor. Consideration is now being given to the possibility of providing the medical officer with copies of reports sent to general practitioners in cases where the child was referred by his own doctor to a consultant, and where special treatment or other facilities provided by the local education authority or local health authority are advised.

Health Visitors

95. The Council's suggestions for improving co-operation between general practitioners and health visitors, which were formulated last year, have been the subject of discussion by Divisions and Branches, and numerous local meetings have been held at which medical officers of health and health visitors have been present. In some areas improved co-operation has already been reported, whilst in others the assessment of results is awaited. The local authority health

and welfare services have been made more widely known to general practitioners as a result of action by medical officers of health.

Food Hygiene

96. The Council has submitted to the Ministry of Food certain suggestions for improving the draft Food Hygiene Regulations and Codes of Practice to be made under the Food and Drugs (Amendment) Act. The appropriate Government departments have been informed that, in the Council's opinion, the functions of the Ministry of Food relating to food hygiene would now most appropriately be taken over by the Ministry of Health.

Milk

97. Detailed comments have been sent to the Ministry of Food as a result of discussions between representatives of the Association and the Society of Medical Officers of Health on the revision of the Milk and Dairies Regulations 1949-54, Milk (Special Designation) (Raw Milk) Regulations, 1949-54, and the Milk (Special Designation) (Pasteurized and Sterilized Milk) Regulations, 1949-53.

Industrial Health Advisory Committee

98. Support has been given by the Council to the application of the Society of Medical Officers of Health to be included in the list of nominating bodies, and thus ensure representation of the public health service on the Industrial Health Advisory Committee which is being set up to advise the Ministry of Labour and National Service on measures to further the development of industrial health services in workplaces covered by the Factory Acts.

Durham County Council—Health Consultative Joint Committee

99. The Council has decided against participating in the Durham County Council's proposed Consultative Joint Committee for the Health Services on the ground that negotiations on remuneration of medical officers in the public health service and the terms of service are the responsibility of Committee "C" of the Medical Whitley Council.

Aberdeen Corporation Order

100. The Council has petitioned against Clause 25 of the draft provisional Aberdeen Corporation Order, under which the medical officer of health would be precluded from exercising the right conferred by the Local Government (Scotland) Act, 1947, of appointing his own deputy.

Functions of the Medical Officer of Health

101. In accordance with the agreement between the Association and the Society of Medical Officers of Health, the Council has had the opportunity of examining a memorandum prepared by the Society on the functions of the medical officer of health. The Council has informed the Society that it does not wish to submit any comments on this memorandum, which does not contain any new medico-political principle which has not been previously discussed between the two bodies.

REMUNERATION POLICY

102. In accordance with the wishes expressed by the Representative Body last year, the Council has appointed an *ad hoc* Committee to examine the whole question of medical remuneration with the object of establishing a general Association policy on the remuneration of the profession in all its many branches.

The Committee has held a number of meetings and discussed the many complex problems which are associated with the Representative Body's decision.

The Committee felt that its first task should be to endeavour to collect factual information, showing not only the present rates of remuneration enjoyed by the various branches of the profession, but also the number of doctors

within the different remuneration scales inside the different branches. The collection of comprehensive data of this nature necessarily involves a considerable amount of research, and the Committee is seeking expert statistical advice on how best the data may be presented. The Council hopes to make a detailed report to the Representative Body in 1956.

MEDICAL ETHICS

Loan of Hospital Records to Government Departments

103. The Council has revised the statement approved by the A.R.M., 1954, on the Loan of Hospital Records to Government Departments. The original statement contained the following paragraph, which refers specifically to industrial accidents, whereas many of the claims which have to be considered do not relate to accidents of this nature:

(b) That the form of consent signed by or on behalf of the patient should include a statement that the patient agrees to his hospital records being made available to the medical board in order to assist them in determining the degree of disablement and whether it is related to his industrial accident.

This paragraph has been amended and is now in a form which is acceptable to the Government departments concerned. Paragraphs (a) and (c) of the statement remain unchanged.

Recommendation: That the following statement on the loan of hospital records to Government departments be approved:

(a) That medical records be lent to the medical officers employed by Government departments only when written consent has been given by or on behalf of the patient.

(b) That the form of consent signed by or on behalf of the patient should include a statement that the patient agrees to his hospital records being made available to the medical board in order to assist them to consider and assess claims.

(c) That, wherever practicable, and particularly where disclosure of information may have an adverse psychological effect upon the patient, the practitioner who compiled the record or, if he is not available, one nominated by the hospital authority for the purpose, should be consulted on the wisdom of disclosing to the patient all of the confidential information contained therein, and should take the opportunity of reviewing the notes before they leave the hospital.

Professional Secrecy

104. Problems relating to professional secrecy continue to arise, and advice has been given on matters such as disclosure of mass radiography records and registration schemes to assist cancer research. The accepted policy of the Association is that information obtained in the course of the professional relationship should not be disclosed without the consent of the patient or, if this is not practicable, the consent of the nearest competent relative or the legal representative of the patient. The Council is constantly concerned with minimizing the risk of leakage of information through the handling of records.

Publicity through Press, Radio, and Television

105. The Council has under review the question of the publicity arising when medical practitioners take part in radio and television programmes or contribute to the Press.

Ethical Inquiries

106. The local and central machinery for investigating complaints regarding professional conduct has operated on several occasions during the current session. Rules of procedure have been agreed with the British Dental Association by means of which inquiries could be held into complaints involving a doctor and a dentist.

International Code of Medical Ethics

107. The Council has considered a suggestion from the World Medical Association regarding the proposed inclusion in the International Code of Medical Ethics of a section relating to the "Duties of Doctors to Society." The Council has informed the World Medical Association that it con-

siders this unnecessary, as there is no evidence that doctors in this country fail to discharge their obligations to society.

Medical Attention Given by a Doctor to a Near Relative

108. In the opinion of the Council it is neither illegal nor unethical for a doctor to treat a near relative during a serious illness, and in certain circumstances this may be unavoidable. The Council considers, however, that a doctor acts imprudently in taking sole responsibility for the treatment of a serious illness of a near relative when it is unnecessary for him to do so.

PRIVATE PRACTICE

One-day Incapacity Certificates

109. The Council has given full and careful consideration to the following Minute 28 of the A.R.M., 1954:

Resolved: That this meeting demands the abolition of the one-day certificate for absence from employment.

Although this resolution is of a general nature the attention of the Council was directed more particularly to the special problem of the one-day incapacity certificate required by miners in order that they may qualify for a proportionate bonus when absence from the pits is due to illness. The A.R.M., 1953, disapproved of the issuing of bonus-shift certificates to a miner unless he had actually been attended by the doctor during illness, but nevertheless many doctors continue to give, and the National Coal Board to accept, as evidence that the man considers he has a claim to proportionate bonus, a certificate which merely repeats the man's statement: "... states he was unable to attend work because of ...".

To implement the above resolution in the case of the mining industry (a) there must be a decision on the part of the industry as a whole not to require or to accept such medical certificates or (b) the National Coal Board and the National Union of Mineworkers must agree between themselves to a change in the bonus-shift scheme. In the opinion of the Council an essential prerequisite to any attempt to persuade the interested parties to carry out (a) or (b) is that the profession itself must agree to withhold these one-day certificates. In order to gauge the support for this, Divisions in colliery areas were asked what proportion of colliery practitioners would refuse any one-day certificates at all (apart from those required for N.H.S. purposes) if so requested by the Association.

The replies were in complete contrast with the spirit of the resolution of the Representative Body: according to the information provided, only 10% of these Divisions would be prepared to follow the lead of the Association in this matter. In view of this lack of support from a large section of the profession it is the view of the Council that it would be inappropriate to attempt to implement the resolution at this stage.

The Council has no reason to believe that in the case of other one-day certificates the response from the profession would be any more encouraging.

Life Assurance: Fees for Medical Reports

110. As recorded in Minute 33, the A.R.M., 1954, resolved that the standard fee for medical examination and report for life assurance should be increased from £1 11s. 6d. to a minimum of £2 2s. and that the fee for reports without examination should be £1 1s. Representations were accordingly made to the Life Offices' Association, and agreement was reached that the fee for the ordinary form of life assurance would be increased to £2 2s. for examinations undertaken on or after March 15, 1955. As in the previous agreement of 1947, it was accepted that should it be necessary for a Life Office to ask for supplementary information in elucidation of, or to remedy omissions in, the original report, no further fee should be forthcoming when information additional to that sought in the original report is required.

The Life Offices' Association would not accept the suggestion that the fee for medical attendance reports (reports on

the medical history of the proposer without a medical examination) should be a minimum of £1 1s. The position is thus unchanged; a fee for these reports is offered by the Life Office and the practitioner is free to seek a higher fee if he wishes. In the opinion of the Council a suitable minimum fee for a report without examination for purposes of life assurance is £1 1s.

Medical Witnesses in Law Courts

111. The Lord Chancellor's Department has agreed to receive a deputation from the Council for discussions on ways of removing the delay which so often occurs in the hearing of court cases involving medical evidence, and which was the subject of Minute 41 of the A.R.M., 1954.

Fees for Services to the Police

112. Minute 42 of the A.R.M., 1954, called upon the Council to take action with the Association of Local Authorities in support of local claims where adequate remuneration is not paid for services rendered to the police. The Council is seeking information on the present position in a number of Divisions where the recommended scale of fees has not been adopted by the police authorities. Whenever it is requested by the local Division the appropriate action will be taken by the Council.

Remuneration of Members of Medical Boards

113. The A.R.M., 1954, expressed the opinion that the time had come for an increase in the remuneration of members of Governmental medical boards (Minute 43). Representations have accordingly been made to the Treasury that the fees for chairmen and members of medical boards should be increased to £4 4s. and £3 3s. per session respectively. Corresponding increases have been requested in the fees for the examination of one case by an individual chairman or member, and also in other cases where Government Departments require medical reports.

Supply of Medicines to Private Patients

114. In Minute 208, the Representative Body, 1954, instructed the Council to continue to press the Minister to take immediate steps to allow the issue of medicine on Form E.C.10 to private patients. The Minister has since met representatives of the Council and he was fully informed of the views of the Association on this matter.

A report of the discussion at the meeting is contained in Appendix II. The Council has reconsidered the matter at some length in the light of this report and has concluded that, although this question must be kept under constant review, no further action can usefully be taken at the present time.

Parking of Doctors' Cars

115. A satisfactory solution of the problem of parking doctors' cars in "yellow band" areas of London (to which reference was made in Minute 238 of the A.R.M., 1954) has followed a meeting with the Assistant Commissioner of Police for the Metropolis. The police were concerned at the impairment of essential services, including those of doctors and midwives, caused by this and other aspects of the London traffic problem, but they did not consider it desirable to have special legislation for a particular class of driver. They agreed, however, to issue a general order to all Metropolitan police reminding them that the no-waiting and unilateral parking regulations provide for exemption for anything done with permission of a police officer in uniform, and stating that doctors are to be given assistance if they seek the advice of the police on this problem. Publicity for this agreement was given in the *Supplement* of December 4, 1954.

National Insurance Medical Boards

116. During part of 1954 the Ministry of Pensions and National Insurance arranged in a number of areas to call six cases instead of five to National Insurance medical

boards. This experiment showed that in all these areas the average duration of sessions remained at less than two and a half hours. In fact, in only one area were there reports of boards taking longer than two and a half hours, and then only in 11% of the sessions did this occur. The terms of appointment to the medical board panel state that boards should ordinarily occupy about two and a half hours and should not, save in exceptional circumstances, necessitate a member's attendance for more than three or less than two hours. The Council is satisfied that there is no reason to suppose that these conditions will not be fulfilled if six cases are called to all sessions in future, provided that the Ministry exercises care not to call more than a proportion of the more difficult cases to any one session. An assurance to this effect has been received and the Department has also stated that where, owing to local difficulties, six cases are too many for medical boards, the number of cases called will be limited to five.

Occasional Treatment of Service Personnel

117. In conjunction with the agreement with the Ministry of Health on the treatment of Service personnel on leave as temporary residents (see para. 30) agreement has also been reached with the Service departments on the fees to be paid to private practitioners who give occasional treatment of this kind. Previously the fees of 5s., 7s. 6d., and 15s. for a surgery attendance, day visit, and night visit, respectively, have included the provision of all except specially expensive drugs and dressings necessary for treatment. As from April 1, 1955, however, the actual cost of drugs and dressings will be claimed from the Service Department by the private practitioner concerned, and for the treatment itself the fees will be:

	s.	d.
For attendance at the surgery	6	0
For a day visit	10	0
For a night visit	15	0

In addition, the private practitioner will be able to claim mileage at 1s. per mile each way in excess of two miles and a fee of 1s. for a certificate. The claim forms used by the Services are being amended accordingly.

Naval personnel will continue to be instructed to report sick when on leave to the nearest Admiralty surgeon and agent, if at all possible, and in all cases the appropriate mileage allowance will be paid by the Admiralty if the agent visits men who are resident more than two miles from his surgery and no payment for mileage has been received from any other source.

The Council regards these arrangements as satisfactory.

Treatment of Merchant Seamen under the National Health Service

118. It has come to the notice of the Council that in some areas practitioners treating merchant seamen under the National Health Service are paid the full temporary resident fee for only the first, second, or third seaman examined on one day and that for all others seen on the same day a fee of only 5s. is paid. It was the intention of the Council that the lower rate of payment should be restricted to those cases in which a practitioner examines a number of seamen on one ship at the time of his visit to the ship. The practitioners concerned have therefore been advised to raise this matter through the local medical committee.

Boarded-out Children: Fees for Medical Examinations

119. Both the County Councils Association and the Association of Municipal Corporations have now agreed that the full fee of 25s. will be paid for the "subsequent" examination of a boarded-out child in a case where the doctor did not carry out the initial examination, provided he is not a partner of, an assistant to, or a locum tenens employed by the doctor who made the original examination. In other cases the fee for the subsequent examination remains at 12s. 6d.

National Society for the Prevention of Cruelty to Children

120. Following a request made by the Council, the National Society for the Prevention of Cruelty to Children has agreed to increase by 100% the fees paid for medical reports on children and for attending at court to give evidence on behalf of the Society. At the same time the Society has recorded its very warm appreciation of the services which have been and are being rendered by many doctors without charge.

Allowances at Criminal Courts

121. The Council has continued to press the Home Office to increase the allowances payable to professional witnesses at criminal courts. A meeting has been held with the Department to discuss proposals made by the Home Office and counter-proposals made by the Council. It is understood that increased allowances will not now be long delayed.

Memorandum on Dangerous Drugs

122. A draft of a revised memorandum by the Home Office on the duties of doctors under the Dangerous Drugs Act and Regulations has been studied and the Department has agreed to amend the memorandum to meet objections raised by the Council.

Election of Direct Representatives to the General Medical Council

123. The next election of direct representatives of the profession to the General Medical Council is due in April, 1956. In accordance with the approved procedure the selection of the eight members who will receive the support of the Association in England and Wales will be dealt with in the following manner.

One nominee will be selected by the Welsh Committee. One woman practitioner will be selected by women members of the Association resident in England and Wales.

The remaining six will be selected by the Representatives at the Annual Representative Meeting in June, 1955. Divisions in England and Wales are being asked to submit nominations for this purpose.

Remuneration of Admiralty Surgeons and Agents

124. The Council has made representations to the Admiralty for an increase in the fees paid for many of the services performed by Admiralty surgeons and agents.

Examination for Fitness for Borstal: Fees

125. The present fee for the medical examination of boys for fitness for Borstal training is 15s. for each examination, subject to a maximum of £3 15s. when more than five boys are examined on one day. The Council has asked the Treasury to increase the fee to £1 1s. and to remove the daily maximum.

Alcohol and Road Accidents

126. The report on the publication "The Recognition of Intoxication" contained recommendations on the appointment and remuneration of doctors to undertake the examination of intoxicated motorists, on the facilities available at police stations, and on the procedure for the determination of alcohol in urine. These recommendations were referred, in the first place, to the local authority associations concerned. Both the Association of Municipal Corporations and the County Councils Association have now expressed the opinion that each police authority should decide whether, and to what extent, to apply the recommendations in its own area. The Council is therefore requesting the Branch or Division, as appropriate, to take up the matter with the police authority locally.

Coroners Act, 1954

127. The Council is in correspondence with the Home Office on the fees and allowances payable to witnesses at coroners courts, and to medical practitioners who perform post-mortem examinations at the request of the coroner, which are to be included in the regulations to be issued under the Coroners Act, 1954.

"BRITISH MEDICAL JOURNAL"

128. It is satisfactory to record an increase in the circulations of the specialist periodicals published by the Association, with a consequent improvement in their financial position. There has, too, been a steady increase in the circulation of the *British Medical Journal* in other countries, where it would appear to be read more than ever before. A recent contributor was so impressed by the requests he received from workers abroad for reprints that he sent them to the Journal office for inspection. This foreign circulation not only enhances the prestige of British medicine, and so of the Association, but also helps to counteract a financial situation which in other respects is less favourable, owing to a rise in the cost of production and a decline of revenue from classified advertisements (those relating to appointments). Since 1943, with the exception of one or two years, the revenue from the *British Medical Journal* has exceeded the cost of production, but present trends are less favourable than they have been.

The number of papers submitted for publication continues at a high level, and on grounds of space alone some two-thirds of these have to be rejected. The sale of the books containing a selection of questions and answers from the "Any Questions?" section of the *Journal* and of the "Refresher Course" books shows that these parts of the *Journal* are widely appreciated.

For the past three years the Editor has been responsible for organizing the medical editors' conference held during the general assembly of the World Medical Association, and has thus had the opportunity of becoming acquainted with medical editors in other countries. Members of the editorial and publishing staff of the *Journal* undertook the responsibility of editing and producing the *Proceedings of the First World Conference on Medical Education*, now published by the Oxford University Press—another instance of active support of the work of the W.M.A. from the member association principally responsible for its establishment.

"FAMILY DOCTOR"

129. In the Report of Council last year it was stated that the intention of the Family Doctor Committee was to conduct *Family Doctor* during 1954 at no cost to the Association, and this aim has been achieved. In fact, there has been a small surplus which is sufficient to cover the net loss to the Association in the 1953 trading year. In effect, therefore, *Family Doctor* has been run at no cost to the Association during the past two years.

In the first quarter of 1955, the advertisement revenue shows an increase of approximately £6,000 over the corresponding period in 1954. The total advertisement revenue for 1954 was £10,000 higher than the advertisement revenue for 1953. Advance bookings for advertisements in 1955 already exceed the value of the entire advertisement revenue for 1954.

All advertisements in *Family Doctor* continue to be subject to the closest scrutiny, and during the whole of 1954 a policy of the most careful selection has been exercised. The advertisement pages now reflect the growing confidence in the magazine of leading firms in the country.

The distribution of the magazine on a national scale presents a variety of problems, but *Family Doctor* is now on sale in newsagents' shops and bookstalls in most parts of the United Kingdom, and in many centres overseas. The magazine is also sold in many clinics and maternity and child welfare centres. Distribution has been brought about in this way in clinics controlled by over 100 different local

authorities, and the number of local authorities co-operating in this type of distribution is increasing. This is an especially satisfactory development, as it gets *Family Doctor* into the hands of young mothers, a section of the population of first importance from the point of view of health education.

A total of 15 *Family Doctor* pamphlets have been published, and these are being sold in increasing numbers to the public in single copies and to local authorities in bulk quantities. Increasingly often an individual reader is told by his or her own doctor that a particular pamphlet may help. The prices of these pamphlets have been kept down to a level which it is hoped will keep them within the reach of almost everyone. Nevertheless, they are distributed at no cost to the Association and, indeed, make a small surplus. There is a further small surplus each year on the sale of *Family Doctor* binders and indexes.

In March, 1955, *Family Doctor* arranged one of the largest feature stands ever to have appeared at the *Daily Mail* Ideal Home Exhibition. This had the dual function of drawing the public's attention to *Family Doctor* and making copies available to them there, as well as carrying a health education message translated into popular terms and directed specifically at housewives.

This exhibit was supported by press advertising in both national and provincial newspapers, and, of course, the entire cost of all this promotional activity is borne by *Family Doctor's* revenue from sales and advertisements.

Family Doctor has become the most widely quoted magazine in Great Britain. Every month national and provincial newspapers quote from *Family Doctor* articles. It is fair to say that this reflects a growing appreciation by the Press of the accuracy, authority, and reliability of the articles and features which are published in *Family Doctor* and over the imprint of the British Medical Association.

The B.B.C., both in its home and overseas broadcasts, from time to time makes use of *Family Doctor* material, and publications throughout the world regularly purchase material from *Family Doctor* for reproduction in their own local press. Arrangements for the regular reproduction of *Family Doctor* articles exist in particular in South Africa, Australia, and most European and Scandinavian countries.

The influence of *Family Doctor* and its acceptance by the Press of this country is further reflected in the growing number of press inquiries made on the interpretation of medical material. Advice is sought regularly by editors, journalists, and publishers on medical and para-medical subjects, on articles on medicine which appear in other publications, and on a variety of related topics in the field of popular medical writing.

During 1954 the magazine has become more firmly established and is now widely accepted by the public and advertisers. It is the intention of the *Family Doctor* Committee during 1955 further to develop the influence of the magazine by increasing its circulation and by enlarging the facilities which it now offers in the field of health education.

It is intended that, once again, the magazine and all its other activities shall be conducted at no cost to the Association.

FINANCE

(As the auditing of the Association's accounts has not yet been completed, the Annual Financial Statement will be published in the Council's Supplementary Report.)

130. Throughout the past year the Council has exercised a close control of Association expenditure, with the object of achieving a stabilization of the financial position. From the frequent scrutiny of the budgets of the departments and "spending" committees by the Finance Committee and the Financial Advisory Committee, the Council has ensured that the estimates for the year have been closely followed and every economy exercised.

Income

131. The income from membership subscriptions reached the anticipated level of £250,000 after providing for losses arising from resignations and deaths.

Rents from the accommodation let to medical and other organizations produced a net revenue of £15,650, after charging the establishment charges attributable to the tenants' accommodation.

With an additional income of £5,000 from investments and bank interest the total revenue for the year was £270,800.

Expenditure

132. In the budget for 1954 provision was made for a total expenditure under all headings—with the exclusion of the Publications Account—of £230,222. It is satisfactory to note that the completed accounts for the year show that there was an actual expenditure by the departments and "spending" committees of £226,400. The Association recovered a part of the cost of the Central Medical Recruitment Committee, which is included in this figure.

Direct expenditure on the periphery amounted to over £41,000, represented by the cost of the Regional and Scottish Offices and the capitation grants to Divisions and Branches during the year. The library facilities were operated at a cost of approximately £11,000.

There is evidence that the service given by the Medical Practices Advisory Bureau, which is available to both members and non-members, has become more widely known and appreciated. The cost of this department in 1954 was £10,800, which was only a small increase on that of the previous year. Expenditure by the Empire Medical Advisory Bureau and the International Medical Visitors Bureau was kept within the amount set aside in the budget.

Approximately £20,000 was expended on Central Meetings, including Council Meetings and the Representative Meeting. This was an increase on the previous year, as it included the cost of new committees. The Trustees of the National Insurance Defence Trust again undertook responsibility for all but £1,000 of the expenses of the General Medical Services Committee, and the Council gratefully acknowledges this help.

Publications Account

133. There was an improvement on budget expectation in the case of the publications of the Association, although the surplus for the year, to which *Family Doctor* contributed for the first time, was smaller than that for the previous year.

Whilst the results achieved during the past year can be regarded as satisfactory, the Council, when preparing the Budget for the coming year, has taken note of the fact that there may be little, if any, surplus on the Publications Account. It has been necessary to make this forecast in view of the increasing costs of production.

Trust Funds and Medical Charities

134. During the year the Office Staff Superannuation Fund was revalued by an independent actuary, and the Council is pleased to report that the financial position of the Fund is considered to be quite satisfactory. There was a marked improvement in the market value of the investments held by the Trust Funds, and there has been sufficient income to pay the customary prizes. With the help of additional bequests the Charities Trust Fund collected and distributed the sum of over £12,500 during the past year, which exceeded the previous year's distribution by £600.

Revenue Budget for Twelve Months Ending December 31, 1955

135. Based on estimates submitted by the "spending" committees and departments, the Council has approved a master budget of income and expenditure for the twelve months ending December 31, 1955.

It is estimated that the total income from membership subscriptions, rents, and investments will be £278,900.

Out of this sum it will be necessary to meet expenditure under the various budgets amounting in all to £234,600. Provision has been made also for loan redemption and for

contingencies, including the Association's probable contribution towards the cost of the legal actions which are to be instituted in connexion with assessing the income of part-time consultants under Schedule E.

After making these provisions it is anticipated that the net surplus for the year will be £16,300, which the Council has earmarked for a General Reserve Fund.

Membership Subscription

136. The Council has carefully considered the following resolution of the Annual Representative Meeting, 1954:

That this meeting notes with satisfaction the greatly improved financial position of the Association which has resulted in part from the increase in subscription from four to six guineas in 1952, and instructs the Council to consider the desirability of reducing the subscription to five guineas within two years.

It should be remembered that the increase in the subscription rates became necessary because of increased costs generally and not solely as a result of the phenomenal rise in the price of paper which led to a heavy deficit on the Association's publications in 1951. While it is satisfactory that the Association is now out of debt and that the publications, for the time being, are self-supporting, the Council considers it important that the Association should not be content merely to confine its expenditure within its income, but should aim at building up ample reserves so that it may never again be faced, as a result of unforeseen and unforeseeable contingencies, with a critical financial situation. This policy, which ordinary prudence would dictate, was strongly recommended by the expert management consultants who investigated the Association's affairs some years ago.

So far as can be judged at present, only a moderate annual surplus is to be expected, even if the annual subscription remains at the present rate. Therefore, while the Council will keep the matter continually under review, it regrets that in present circumstances it cannot advise the Representative Body that it would be wise to contemplate a reduction in the standard rate of subscription in the immediate future.

ESTATES

Maintenance of Headquarters Building

137. The first stage of the schedule approved by the Council with the object of ensuring that the interior and exterior structure of the Headquarters building is maintained in a good state of repair was carried out during the past year. Prior to the unveiling of the war memorial, the whole of the exterior facing the Court of Honour was decorated, and the memorial gates were overhauled and repainted. The appearance of the courtyard was greatly improved by the use of a coloured tarmac surround to the memorial.

In the Garden Court Wing, the rooms occupied by the library were redecorated during the holiday period, and at the same time the opportunity was taken to replace a number of the interior doors and fittings of an "austerity" pattern, installed during the war by the Ministry of Works.

Scottish House

138. The reconstruction of the interior of the Scottish House in Edinburgh was begun in August of last year, and considerable progress has been made in the necessary preliminary work. It is anticipated that the final stage of the alterations will be carried out early in 1956.

The Library Accommodation

139. The claims advanced on behalf of the library for adequate and appropriate accommodation are regarded by the Council as of the highest priority, as there is evidence from the growing use of the library services that they are greatly appreciated by members of the Association. The Council is examining the position with a view to deciding on a policy in regard to the immediate and long-term planning of the library accommodation.

Burton Street Site

140. In the early months of 1954 negotiations with the Bedford Estate on the acquisition of the Burton Street site were resumed on the basis of the terms originally proposed in 1952. Subsequently, in August of last year, the agreement with the estate was completed, under the terms of which the Association will be granted a lease of 169 years when it has obtained vacant possession of adjacent houses and can clear the site and erect a building which will be linked with B.M.A. House.

Meantime the Council is considering the development of the site. It is recognized that when the new building is completed it will be possible to ensure that all departments of the Association are properly housed. At the same time the financial position is being carefully watched, as it is the intention of the Council to ensure as far as possible that the rental income from office accommodation will give the Association an adequate return for the capital sums invested in the new building.

SCIENCE

Functions of the Science Committee

141. The Council has reviewed the existing scope, functions, and constitution of the Science Committee, whose main responsibility is to advise and, when so directed, to act for the Council "in all such matters as are not specially referred to other committees and concern the work of the Association for the promotion of the medical and allied sciences." The Council is anxious that the Association should be recognized by the profession and the public as having a vital concern for the nation's health, and it considers that from time to time, through the Science Committee, inquiries might be initiated into, and reports made on, medico-scientific matters which would not only be of great value in themselves but would also redound to the credit of the Association and enhance its reputation.

In order to strengthen the Science Committee and to make available to it the fullest information on scientific developments and national needs in relation to medicine and health, the Council proposes that the Committee should have power to co-opt up to three additional members, thus enabling persons recognized as authorities in special fields to serve upon it and raising its status and increasing its prestige.

The suggested amendment of the Schedule to the By-laws is contained in Appendix VI.

With a view to maintaining a closer liaison between the Science Committee and *ad hoc* committees set up to consider particular subjects with a scientific bearing, the Council has decided to provide for the appointment of at least one member of the Science Committee to all such *ad hoc* committees.

The Council wishes to stimulate local scientific activities in Branches and Divisions. It may appear that, in some areas where there are very active medical societies, it is difficult for the local unit of the Association to arrange well-attended lectures or scientific meetings, but it is suggested that in such areas Branches and Divisions should offer to co-operate with the medical societies, with a view to extending the local scientific activities.

Other suggestions relating to the scientific activities of the Association are under consideration.

Crash Helmets

142. In view of the very large number of fatal and serious accidents in which motor-cyclists and their passengers receive head injury, the Council has been exploring means of promoting a much wider adoption of the practice of wearing crash helmets. It made representations to the Commissioners of Customs and Excise for the removal of the purchase tax on crash helmets, and it appointed a deputation to meet the Commissioners.

The Commissioners have accepted all the evidence given relating to the advantages of the wearing of crash helmets

by motor-cyclists, and to the dangers of not wearing them, but they have not agreed that the extra cost which purchase tax involves is a real deterrent to their more general use.

It is estimated that at present only about 20% of civilian motor-cyclists normally wear crash helmets. There is no purchase tax on helmets used by miners and quarrymen, but all other forms of protective clothing (including firemen's and policemen's helmets) are subject to tax.

Decisions with regard to the abolition of purchase tax must be made by the Government, and the Commissioners have undertaken to acquaint the Chancellor of the Exchequer with the views expressed by the Association.

The Council proposes to take all possible further steps to promote the more general wearing of crash helmets by motor-cyclists and their pillion and side-car riders.

Coal-gas Poisoning

143. In view of the numerous reports of accidental death and ill-health from coal-gas poisoning, the Council considers that the extent of the problem should be investigated and also possible methods of rendering the escape of coal gas more easily detectable. A special subcommittee is being appointed to inquire into the matter and to make recommendations.

The Library

144. In 1954 there was an increase in the recorded number of members using the Library and in the number of books borrowed, as compared with 1953.

During last year over 150 books and journals were presented to the Library, and the Council is most grateful to the donors.

The mutual borrowing arrangements with other medical libraries throughout the country have continued to work satisfactorily.

In 1951, as an economy measure, the Council agreed that, until further notice, members borrowing books from the library by post should be required to pay the cost of the outward postage as well as the cost of the return postage. It has decided that, as from January 1, 1956, it will revert to the practice of bearing from Association funds the outward postage on books borrowed, except in London postal areas adjacent to B.M.A. House—namely, N.1, N.W.1, W.C.1, W.C.2, E.C.1, E.C.4, and W.1.

The Library is still expanding, and the Council has agreed that increased accommodation should be made available for it as soon as possible in the Garden Court Wing of B.M.A. House.

Consideration is being given to possible methods of restricting the amount of storage space which will ultimately be required by the Library.

Association Prizes

Sir Charles Hastings and Charles Oliver Hawthorne Clinical Prizes

145. The Sir Charles Hastings Clinical Prize, established to stimulate systematic observation, research, and record in general practice, has been awarded for 1955 to C. A. H. Watts, of Ibstock, Leicestershire, for his essay on "Some Observations on Depression in General Practice." The award consists of a certificate and a cheque for £75.

The Charles Oliver Hawthorne Prize of a certificate and a cheque for £50, which is given to the author of the second best essay in this competition, has been awarded to D. S. McLaren, of London, for his work entitled "A Study of the Factors Underlying the Special Incidence of Keratomalacia in Oriya Children in the Phulbani and Ganjam Districts of Orissa, India."

Katherine Bishop Harman Prize

The Katherine Bishop Harman Prize, established for the encouragement of study and research directed to the diminution and avoidance of the risks to health and life that are apt to arise in pregnancy and child-bearing, has for 1955 been awarded jointly to A. F. Rogers, of Bristol, for his

essay on "The Physiology of the Umbilical Arteries," and to J. K. Wilson, of Liverpool, for his essay on "The Investigation of the Placental Stage of Labour by Cord Injection Placentography" (prepared in conjunction with John MacPherson). Each prize consists of a certificate and a cheque for £37 10s.

The Council wishes to express its appreciation of the services given by the examiners in these competitions.

B.M.A. Lectures

146. Experts in various fields of medicine have continued to give B.M.A. Lectures to Branches and Divisions at the invitation of the Council. The number of Lectures arranged so far for the session 1954-5 is 98.

The Council wishes to record its thanks to the following, who have kindly consented to give Lectures during the current session:

Mr. A. Lawrence Abel
Professor Ian Aird
Mr. H. J. B. Atkins
Dr. C. G. Baker, O.B.E.
Dr. Roger Bannister
Mr. N. R. Barrett
Dr. D. Evan Bedford
Lord Boyd-Orr of Brechin
Mearns, D.S.O., M.C.
Dr. F. Camps
Dr. R. G. Cochrane
Dr. F. S. Cooksey, O.B.E.
Sir Zachary Cope
Dr. Macdonald Critchley
Sir Daniel Davies, K.V.C.O.
Mr. W. W. Davey
Mr. H. Dodd
Dr. W. R. S. Doll
Professor J. B. Duguid
Professor D. M. Dunlop
Mr. Harold Edwards, C.B.E.
Mr. R. Charles Evans
Dr. R. Forbes
Dr. T. F. Fox
Dr. A. W. Frankland
Dr. A. R. French
Dr. D. G. French
Professor J. Glaister
Dr. J. D. Allan Gray, T.D.
Dr. R. Greene
Sir David Henderson
Dr. E. A. Johnston
Dr. A. Trevor Jones
Dr. F. Avery Jones
Dr. J. A. L. Vaughan Jones
Professor R. J. Kellar, M.B.E.
Mr. Geoffrey Knight
Sir William MacArthur,
K.C.B., D.S.O., O.B.E.

Dr. J. A. W. McCluskie
Dr. Melville D. Mackenzie,
C.M.G.
Professor W. A. Mackay
Sir Geoffrey Marshall,
K.C.V.O., C.B.E.
Dr. G. B. Mitchell-Heggs,
O.B.E., T.D.
Professor J. Chassar Moir
Mr. A. M. A. Moore
Mr. Robert Morrison
Professor Ian Murray
Sir W. Heneage Ogilvie, K.B.E.
Dr. W. N. Pickles
Sir Arthur Porritt, K.C.M.G.,
C.B.E.
Dr. L. G. C. E. Pugh
Mr. E. W. Riches, M.C.
Dr. F. F. Roberts
Professor M. L. Rosenheim
Dr. B. Schlesinger, O.B.E.
Mr. T. Holmes Sellors
Dr. C. Keith Simpson
Dr. Eliot Slater
Dr. J. Smart
Dr. G. Stewart Smith
Dr. K. Shirley Smith
Professor C. H. Stuart-Harris
Mr. N. Leigh Taylor, M.B.E.
Professor R. E. Tunbridge,
O.B.E.
Sir Cecil Wakeley, Bt., K.B.E.,
C.B.
Dr. S. Wand
Dr. M. Ward
Professor L. J. Witts
Dr. Paul Wood, O.B.E.
Dr. W. D. Wylie

Mackenzie Industrial Health Lecture

147. Dr. R. S. F. Schilling has accepted an invitation to deliver the 1956 Mackenzie Industrial Health Lecture. At the invitation of the Association of Industrial Medical Officers, the Lecture will be given in conjunction with next year's Annual Meeting of that Association, which will be held in London from September 24 to 29. The Lecture will be given at B.M.A. House on Tuesday, September 25, 1956.

PUBLIC RELATIONS

Broadcasting and Television

148. Following a meeting between the Chairman of the Public Relations Committee and the Postmaster-General certain safeguards against improper advertising of medical goods and services were included in the Television Act, 1954, which set up the Independent Television Authority. Subsequently, the Association was invited to nominate a representative to serve on the expert Advisory Committee on Advertising established by the Authority, and the Chairman of the Public Relations Committee (Dr. H. Guy Dain) was appointed. The Advisory Committee has held several meetings during the session.

Public Relations Activities in Divisions

149. Out of 221 Divisions, only 10 have now no provision for Public Relations work. In 83 Divisions a separate Honorary Public Relations Secretary has been appointed. In 128 Divisions the post is combined with that of Honorary Secretary.

A successful Conference of Honorary Public Relations Secretaries was held, at which the morning session was devoted to a general survey of the Public Relations position, while during the afternoon a number of distinguished journalists answered questions submitted by Divisions on the subject of "Doctors and the Press." In future a Conference of Honorary Public Relations Secretaries will be held biennially, the next Conference taking place in 1956.

A statement has been prepared giving an outline of the functions of an Honorary Public Relations Secretary. The statement suggests ways in which the Honorary Public Relations Secretary can act as a liaison between the profession and the public (including the Press) on behalf both of the Division and of Headquarters. A copy will be sent to every Honorary Public Relations Secretary.

The Public Relations Officer has made many visits to the periphery during the year and has addressed meetings of Divisions, consultants committees, and other groups in the profession on various aspects of public relations. It is planned to expand this side of the Department's work with a view to strengthening the relations locally between the profession and the organs of public opinion, including the Press.

Advance Copies of "British Medical Journal" to Local Division Officers

150. Local Division Officers are often approached by local press reporters with a request for a comment on or explanation of items of public interest which are to be published in the *British Medical Journal*. These officers were frequently in a difficult position owing to the fact that they themselves had not received their *Journals* when the reporter telephoned. In order to assist them in their public relations duties, arrangements have been made by the Journal Committee for a strictly limited number of membership copies of the *Journal* to be posted to Honorary Division Secretaries and Honorary Public Relations Secretaries in advance of general publication.

Press Arrangements

151. The Public Relations Department's close and friendly relations with the Press have been maintained and strengthened during the past year. A record number of press representatives attended the Glasgow A.R.M.; part of the proceedings were televised. The number of inquiries by telephone and correspondence from the Press, professional organizations, and members of the public continues to increase.

A number of Press Conferences in connexion with the publication of Association Reports and decisions on policy have been held during the year. These included one to introduce the Report on "The Recognition of Intoxication," when arrangements were made for a recorded interview between the Chairman (Professor Wayne) and a B.B.C. reporter, which was broadcast in "Radio Newsreel" the same evening. When the proposed scheme of inspection of doctors' surgery and waiting-room accommodation was announced, it was considered essential that the public should be aware that the inspection was being undertaken on the initiative of the profession itself. A Press Conference was accordingly held at which the Chairman of the General Medical Services Committee (Dr. A. Talbot Rogers) explained the scheme. The Conference was well reported and many laudatory editorials and other comments appeared in the Press congratulating the profession on having taken the initiative in this matter. A Press Conference was also

arranged in connexion with the publication of the Report of the Committee on "The Rehabilitation and Resettlement of Disabled Persons."

World-wide publicity was obtained for the dedication by the Archbishop of Canterbury of the B.M.A. War Memorial. The ceremony was reported, in word and picture, through the Press, the newsfilms, the radio and television, and, through the news agencies and the B.B.C.'s services overseas, to Branches and Divisions abroad.

Register of Medical Conferences

152. The Register of Medical Conferences maintained in the Department continues to expand, and there is evidence to show that, by preventing overlapping of dates and in other ways, it is of much value to professional organizations when they are arranging their annual conferences. In addition to the Register, a selected list of conferences, giving on an average particulars of about 150 meetings, is issued quarterly to professional organizations.

ARMED FORCES

B.M.A. Lectures for Large Service Establishments in the United Kingdom

153. The Council has approved a suggestion that the Association's lecture scheme for home Branches and Divisions should be extended to enable groups of Service medical officers in large establishments in the United Kingdom to apply for one lecture annually.

Principally for financial reasons the medical societies formed by these groups, which are often isolated, are unable to invite distinguished members of the profession to visit them, and it is hoped that the extension of the Association's lecture scheme will overcome this difficulty.

Specialist Training in the R.A.M.C.

154. The Council is pleased to report that arrangements are now being made by the War Office under which, each year, five Army medical officers will be permitted to attend full-time courses, without cost to themselves, enabling them to take the appropriate postgraduate examinations and ultimately to be classified as senior specialist officers, serving at home or abroad may apply, and those selected will be expected to remain in the Service for five years after completing the course.

ORGANIZATION

Association Membership

155. The Council sends the following report upon the membership of the Association for 1954:

New members	3,477	
Resignations withdrawn		
Reinstated		3,607
Removed in arrears	2,902	
Less paid arrears	1,324	1,578
Deaths		592
Resignations		1,404
		3,574
		Increase 33
Membership, December 31, 1953	67,506	
Membership, December 31, 1954	67,539	

The membership of the Association in the United Kingdom represents 71% of the total profession and 80% of the working profession. The membership on March 8, 1955, was 66,647.

Despite the increase in subscription, the Association's membership has not only remained stable but is again showing an upward trend. The Council, however, has no intention of relaxing its efforts, and, with the co-operation of Honorary Secretaries of Divisions, a special drive is being made to recruit non-members to the Association and to secure the return of ex-members.

Honorary Secretaries

156. The Council, on behalf of the general body of members of the Association, desires again to express its grateful thanks to the Honorary Secretaries of Divisions and Branches, upon whose loyal co-operation the effective local organization of the Association so largely depends. The general increase in activity, particularly on the clinical and social sides, has been maintained.

Annual Conference of Honorary Secretaries

157. The Annual Conference of Honorary Secretaries in 1955 will be held at B.M.A. House on March 31. Dr. J. E. Morrison, Honorary Secretary of the Stirling Branch, will be in the chair.

The Newly Qualified Practitioner

158. The position of the newly qualified practitioner and the problems with which he is faced as a result of the introduction of the Medical Act, 1950, have continued to receive attention. Every effort is being made to bring the young practitioner into closer contact with the Association during his pre-registration year, and the part which the Divisions might play in promoting this contact was fully discussed at the 1954 Conference of Honorary Secretaries of Divisions and Branches. A pamphlet giving details of the Library facilities has been prepared for distribution to newly qualified and other members of the Association.

Certain grievances of house officers, such as difficulty in obtaining pre-registration posts, off-duty periods, and married quarters, have been freely ventilated, and the co-operation of the Licensing Bodies has been sought in avoiding any unnecessary delay in the issue of the certificates essential for the purpose of full registration.

Areas of Branches and Divisions

159. Approval has been given, after due notice in the *Supplement*, to the reconstitution of the Borneo Branch into one of three Divisions, and the transfer of the Salisbury Division from the Wiltshire Branch to the Southern Branch. Other changes in home Division areas are under consideration.

Autonomous Bodies

160. Pending the report of the Constitution Committee and any changes in procedure which may result therefrom, Minute 27 of the A.R.M., 1950, remains operative. This Minute requires that the autonomous powers of the General Medical Services and Central Consultants and Specialists Committees "in so far as they derive from the Representative Body" shall be specifically renewed by successive Annual Representative Meetings. The Council recommends:

Recommendation: That the autonomous powers of the General Medical Services Committee and the Central Consultants and Specialists Committee be renewed in respect of the year 1955-6.

That the Representative Body looks to these Committees to ensure (1) that no action be taken by either which may prejudice the interests of another part of the profession without full prior consultation with the appropriate interests, and (2) that their autonomous powers will be used so as to expedite and not delay the work of the Association.

Membership of Divisions and Branches

161. In accordance with the decision recorded in Minute 143 of the A.R.M., 1954, the Council has taken steps to implement the proposal made in Minute 255 of the A.R.M., 1953, namely:

That members of the Association shall ordinarily be allocated, as hitherto, to the various Divisions (and Branches) purely on an address basis, but where by reason of ease of access, professional association, or for any other reason, a member finds it more convenient to attend the meetings of some other Division (or Branch), that member may, on application to Head Office, be transferred to the Division (or Branch) of his choice.

The necessary alterations of the Articles and By-laws are contained in Appendix VI.

Associates

162. In 1936, at the instigation of certain overseas Branches, the constitution of the Association was altered to permit Branches of the Association overseas to elect as Associates persons legally recognized as members of the medical profession in the country in which they were resident but not eligible for ordinary membership under the Rules of the particular Branch. Since 1948, after consultation with the solicitor on the interpretation of the relevant by-laws, the privilege of Associateship has been extended to practitioners from overseas temporarily resident in this country and not eligible for ordinary membership. The number of these "home" Associates is limited, but the extension of what was originally intended to be a local arrangement overseas has resulted in anomalies. Difficulties arise, particularly when an Associate elected by a Branch in this country changes his address and goes to an area overseas where the Branch has made no provision under its Rules for the election of Associates, or where the practitioner goes to an area abroad where there is no Branch of the Association. In the opinion of the Council, the regulations of the Association should be amended to restrict the election of Associates to Branches overseas, as was the original intention. The position in the United Kingdom is already covered by the provisions of By-law 12, which gives to Divisions and Branches the power to elect as Complimentary Members qualified medical practitioners resident within their area who are not eligible for Ordinary Membership of the Association. The Council recommends:

Recommendation: That in view of the provision under By-law 12 for the election of Complimentary Members of Divisions and Branches, the election of Associates be restricted to overseas Branches.

The necessary amendments of the Articles and By-laws to give effect to this recommendation are contained in Appendix VI.

Installation of President of Association

163. The Annual Meeting of the Association this year will be held in Toronto some weeks later than the Annual Representative Meeting in London. Under By-law 68 as now worded, the President is elected annually at the Annual Representative Meeting and enters upon the duties of his office on his installation at the next Annual Representative Meeting. This means that in 1955 the President would have to be installed at the Annual Representative Meeting in London at the beginning of June instead of, as is desirable, at the Adjourned Annual General Meeting in Toronto. The Council recommends the amendment of By-law 68 contained in Appendix VI.

Subscription for Newly Qualified Members of the Association

164. In the course of its discussions on methods of securing and maintaining the interest of newly qualified practitioners in the Association, the Council has considered the subscription rate paid by such members during the first five years after qualification. Under By-law 16 (1) B this is two guineas for the first two years and three guineas for the next three years. In the normal course, newly qualified practitioners, after full registration, proceed on National Service for a period of two years, and during this period they may be expected to have little contact with the Association. They may therefore defer joining the Association until the period of National Service has been completed or allow membership to lapse during that period. To meet the situation, the Council proposes that the subscription of the newly qualified practitioner should be two guineas for the first three years and three guineas for the following two years, and, as a further attraction to young practitioners to take up and retain membership of the Association, that they should have the option of paying the subscriptions for the first five years, which would normally amount to twelve guineas, in one sum of ten guineas, thus saving two guineas over the period.

It also proposes that the requirement that the newly qualified practitioner, to be eligible for the reduced subscription, must be admitted to membership before the expiration of two years from qualification, should be discontinued. Examination of the proposed amendments to give effect to these suggestions has disclosed confusion in the wording of By-law 16 in respect of some categories of members eligible for reduced subscription, and it is proposed to take the opportunity of clarifying the position.

The recommendations for amendment of the Articles and By-laws to meet the above proposals are contained in Appendix VI.

Extraordinary Members

165. By-law 12, which lays down the procedure for the election of Extraordinary Members, has given rise to misunderstanding. Extraordinary members may not receive notices of "General Meetings," but no indication is given as to whether these are General Meetings of the Association or of the Division or Branch. The general meetings referred to are those of the Association. In order to remove doubt the necessary recommendation for amendment of the By-law is contained in Appendix VI.

Election of Officers of the Services

166. By-law 7, which governs the election of officers of the Services to membership of the Association, refers *inter alia* to the "Colonial Medical Service." This Service is now known as "H.M. Oversea Civil Service," and a recommendation for amendment of the By-law is contained in Appendix VI.

Amendments of Articles and By-laws

167. Proposals are made in various paragraphs of this Report which necessitate alterations of the Articles and By-laws. Amendments of the Schedule to the By-laws in respect of certain Standing Committees are also necessary to give effect to decisions of the Council relating to the constitution of these committees. The Council recommends:

Recommendation: That the Articles and By-laws of the Association be altered in the manner shown in Appendix VI, and that the Council be instructed to submit the amendments of the Articles concerned to an Extraordinary General Meeting of the Association.

The B.M.S.A. and the B.M.A.

168. The Association continues to maintain its close connexion with the British Medical Students Association. At its annual general meeting in November, 1954, the B.M.S.A. acknowledged its "continued indebtedness to the B.M.A. for all its help, both in the administration of B.M.S.A. affairs and discussion and advice on student problems." It also expressed its thanks for the enlarged office accommodation made available in B.M.A. House and the clerical assistance placed at its disposal.

Association Groups

169. *Senior Hospital Medical Officers.*—The Council has approved the formation within the Association of a Group of Senior Hospital Medical Officers. This Group will be organized on the lines of the Registrars Group formed in 1949.

Spa Practitioners.—This Group, which has been inactive for some years, has now been dissolved and its members transferred to the Physical Medicine Group.

CONSTITUTION OF THE ASSOCIATION

170. The Committee appointed by the Council on the instructions of the Annual Representative Meeting, 1953, "to examine and report on the present structure and constitution of the Association with special reference to the re-organization of the Representative Body" is engaged in a review of the constituent parts of the Association's administration and the changes necessary to bring them into accord with present-day circumstances and needs. The Committee first turned its attention to the peripheral organization of

the Association. Certain provisional conclusions have been circulated to the Divisions and Branches with a request for their comments and any additional suggestions they may care to make. After studying the views expressed, the Committee will formulate definite proposals. It is now reviewing the structure and functions of the Representative Body and of the Council and committees of the Association, including the autonomous bodies and the special groups and group committees. Later it will study the Annual General Meeting procedure, the scientific activities of the Association, and the relationship of the Association with other professional bodies.

SCOTLAND**Chairman and Deputy Chairman of Scottish Committee**

171. Dr. J. G. M. Hamilton and Dr. W. M. Knox were appointed Chairman and Deputy Chairman respectively of the Scottish Committee for the session 1954-5.

Reconstruction of Scottish House

172. Good progress is being made with the alterations to Scottish House. It is anticipated that the new accommodation for the staff and the caretaker's flat will be completed during the summer, and the common room, reading room, and snack restaurant by early next year.

Visit to Scotland by Danish Doctors in 1955

173. Following two very successful visits paid to Denmark by parties of Scottish doctors it has been decided to arrange, through the Danish Medical Association, a reciprocal visit to Scotland by Danish doctors during September, 1955. The Hospitality Subcommittee of the Scottish Committee has therefore drawn up a programme for the visitors which includes visits to the main medical centres and also sight-seeing tours. As Association funds cannot be used for the purpose, local medical committees in Scotland have been invited to contribute to a fund to defray the expenses of the visit, either by direct contribution or by guarantee, and several have already undertaken to do so. The Central Consultants and Specialists Committee (Scotland) has agreed to assist with the expenses of the tour by guaranteeing a sum of £300 from its Central Fund.

Conference of Honorary and Public Relations Secretaries of Branches and Divisions in Scotland

174. Twenty-nine honorary secretaries and public relations secretaries of Branches and Divisions in Scotland attended a most successful conference held in Scottish House on October 13, 1954. The following also attended by invitation: Chairman of the Scottish Committee; Chairman, General Medical Services Subcommittee (Scotland); Chairman, Public Health Subcommittee, Scottish Committee; Chairman and Secretary of the Central Organization Committee; the Secretary of the Association; the Scottish and Assistant Scottish Secretaries; and the Association's Public Relations Officer. The main items discussed at the conference included "B.M.A. Organization in Scotland," "The Relationship of Local Medical Committees to the Divisions of the Association," and "The Association and the Young Doctor." The Public Relations Officer also gave a survey of the work of his department.

The honorary secretaries passed a resolution recommending to the Scottish Committee that a similar conference should be held in the autumn of 1955 and that further conferences should be held at regular intervals thereafter. This recommendation has been approved by the Scottish Committee and referred to the Organization Committee. A full report of the conference appeared in the *Supplement* of November 13, 1954.

Building Legislation Committee

175. The Scottish Committee was invited to submit evidence to a committee set up by the Secretary of State for

Scotland to examine the existing law for the general regulation of building in Scotland in so far as it relates to the control of building standards, and to make recommendations. The Public Health Subcommittee, to whom the matter was remitted, has, in conjunction with the Scottish Branch of the Society of Medical Officers of Health, submitted written evidence and answered a questionnaire from the Committee.

Maternity Services Subcommittee

176. The Maternity Services Subcommittee has considered a number of matters in connexion with the organization and administration of the Maternity Services under the National Health Service (Scotland) Act, 1947. It has, with the approval of the Scottish Committee, issued a circular to local medical committees suggesting that they should consider drawing attention to the facilities which are available locally to general practitioners for the blood-testing of their maternity cases.

Public Health Subcommittee

177. The Public Health Subcommittee has had under consideration the National Health Service (Scotland) (Superannuation) Amendment Regulations, 1954, as they affect doctors employed by local health authorities.

Adoption of Children

178. The Chairman's Subcommittee has for some time had under consideration certain problems relating to the preservation of anonymity in adoption cases, particularly the difficulty that may arise where it is desired that the identity of the mother should not be disclosed. It is felt that this point is not fully dealt with in the Hurst Committee's Report. It is thought that discussions with the Scottish Home Department might be helpful, and action of this kind is under consideration.

Auditor and Financial Adviser

179. The Treasurer of the Association has authorized that the Association's auditor in Scotland shall receive an additional fee for the services which he is rendering as financial adviser to the Scottish office.

Scottish Health Services Conference

180. The Committee indicated to the Royal Institute of Public Administration that it welcomed the holding of a conference on the Scottish Health Services and was prepared to commend it to members of the Association. The Scottish Secretary is attending the Conference, which is to be held at Peebles on March 31 and April 1 and 2, 1955, as the Association's representative.

Committees which Report to the Scottish Committee

(a) General Medical Services Subcommittee (Scotland)

181. Dr. C. J. Swanson and Dr. Kate Harrower have been appointed respectively chairman and deputy chairman of the Subcommittee.

In view of the various difficulties experienced by practitioners in certain remote areas of the Highlands and Islands it has been decided to set up a special subcommittee of the General Medical Services Subcommittee (Scotland) "to consider and to report to the G.M.S. Subcommittee (Scotland) on matters pertaining specially to the medical service in more sparsely populated areas of the Highlands and Islands." Amongst the subjects considered by this subcommittee are inducement payments, practitioners' houses, mileage, and ambulance service.

The Subcommittee has revised the memorandum on "Medical Partnerships under the National Health Service (Scotland)."

Considerable attention has been given to a proposal by the Department of Health for a survey of the standard of

surgery and waiting-room accommodation, and the Subcommittee has now agreed that a general survey should be carried out in areas where this has not already been undertaken. The Subcommittee is of the opinion that the review should be the responsibility of executive councils, who would in practice act in close consultation with local medical committees.

(b) Central Consultants and Specialists Committee (Scotland)

Dr. J. G. M. Hamilton was reappointed chairman of the Committee for the session 1954-5 and Dr. A. Smith was appointed deputy chairman.

Sufficient copies of the Report on Hospital Junior Staffing prepared by the special subcommittee of the Central Consultants and Specialists Committee were issued to Scottish Regional Consultants and Specialists Committees for distribution to members of their constituent bodies. The contents of the report, together with comments received from the regions, were discussed at meetings of the Central Committee, when it was agreed that further consideration of the report was required before any definite decision could be given regarding the suitability of its proposals for adoption in Scotland. The Committee's own Medical Establishments Subcommittee is also giving active consideration to the whole problem of hospital medical staffing in Scotland.

The Committee is obtaining information regarding the interpretation by the regional hospital boards of the discretionary clause in the terms and conditions of service relating to the placing on the salary scale of newly appointed consultants.

It has been remitted to the Chairman's Subcommittee to examine and report on the present structure and organization of hospital medical staff representation in Scotland. The Chairman's Subcommittee, in its consideration of this matter, is seeking the views of the Scottish members of the Joint Consultants Committee.

In addition to issuing its annual report, the Committee is circulating to members of hospital medical staffs in Scotland the bulletins issued from time to time by the Central Consultants and Specialists Committee, to which, when necessary, is attached a statement of the position in Scotland relative to the items contained in the bulletin, together with other information of current interest to the hospital medical staffs in Scotland.

The Committee has asked the Joint Consultants Committee (Scotland) to discuss with the Department of Health the question of maintaining an adequate representation from hospital medical staff committees on hospital boards.

The Joint Consultants Committee (Scotland) has also been asked to discuss with the Department of Health the policy to be adopted when establishing new S.H.M.O. posts in Scotland.

The specialist subcommittees of the Committee have under consideration various administrative problems connected with their own particular fields, and the Tuberculosis and Diseases of the Chest Subcommittee is co-operating with the Public Health Subcommittee of the Scottish Committee in an investigation into the resettlement schemes for the tuberculous.

WALES

182. The Welsh Committee, which includes representatives of all the Divisions and Branches in Wales and Monmouthshire, has met in Shrewsbury under the chairmanship of Dr. Leslie W. Jones. It provides opportunities for discussion of all matters affecting Welsh members.

The Annual Welsh Dinner is to be held in London on Friday, June 3.

OVERSEAS

Reorganization of the Colonial Service

183. The Council has welcomed the creation, as from October 1, 1954, of Her Majesty's Overseas Civil Service, and hopes that the measures taken by the Government in this direction will go some way to allay the feeling of

insecurity which has recently existed among expatriate members of the Service, particularly those posted to territories which are already far advanced towards self-government.

The United Kingdom Government, in acknowledging the continued need for officers from Great Britain and the Commonwealth countries to fill many posts in the professional, technical, and higher administrative branches, has recognized that it has a special obligation towards such officers. It has accordingly made known its intention, if and when a Colony attains self-government, to secure by formal agreement with the government of that territory the observance of the following conditions *inter alia*: terms of employment no less favourable than those upon which an officer is already serving; the safeguarding of pension rights and similar benefits; eligibility for transfer; and compensation from the government of the territory in which an officer is serving in the event of premature retirement resulting from constitutional changes. The agreement would also cover the continued payment of pensions already awarded to officers and their dependants.

East Africa

184. The Council has considered the report of the Commission appointed to examine Civil Service salaries and conditions of service in East Africa, and the new salary scales subsequently adopted by the East African Governments. Negotiations on various detailed aspects of the proposals have been carried on locally by the Kenya, Tanganyika, and Uganda Branches, and discussions have also taken place centrally with representatives of the Colonial Office. Attention has been drawn to certain points which were not *prima facie* considered to be wholly satisfactory, and, in particular, the Council has stressed the need for remuneration to be adequate to attract sufficient recruits of the right calibre, bearing in mind that it is necessary to maintain a high standard, and that there are a number of factors, over which the Colonial Office has no control, which act as deterrents to recruitment.

Cyprus

185. The Council has considered the report of the Commissioner appointed to examine the salary structure of the Civil Service of Cyprus and also the memorandum issued by the Government of Cyprus setting out new salary scales which have been introduced with effect from July 1, 1954. The new scales are a considerable improvement on those previously in force, but there are still a number of points upon which the Council is not satisfied. Until these have been further considered, the Council has felt unable to remove the Government of Cyprus from the "Important Notice."

Medical Appointments Overseas

186. Misunderstandings have arisen in the past due to accurate information not always being available to candidates in this country applying for medical posts in certain areas overseas, particularly those areas where there is no local Branch of the Association. The Council has decided therefore that advertisements for certain posts shall be accepted for publication in the *British Medical Journal* only if the advertiser agrees to the inclusion of the following footnote:

Information about conditions of medical practice in may be obtained from the Secretary of the British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

EMPIRE MEDICAL ADVISORY BUREAU

187. The Empire Medical Advisory Bureau, on behalf of the Association, welcomes and provides a personal advisory service to medical practitioners from the Dominions and Colonies visiting the United Kingdom.

The Committee of Management has met three times during 1954, and the Advisory Committee held its seventh Annual Meeting on May 28, 1954. The attendance of members at

meetings and their help throughout the year with the problems of individual visitors is much appreciated.

The use made of the Bureau by overseas inquirers and visitors continues at the same high level as in previous years. The numbers of visitors remain about the same, but there has been a marked increase in new correspondents seeking advice. Nearly 2,000 visits were paid to the Bureau during the year by old and new visitors.

The various aspects of postgraduate medical education are of main concern to the majority of new inquirers, and information is given on higher qualifications, courses of instruction, hospital appointments, examinations, and medical registration and defence.

The "Summary of Regulations for Postgraduate Diplomas and Courses of Instruction in Postgraduate Medicine," compiled and produced by the Bureau, has been revised and reprinted, as is usual each year. The "Summary" has been dispatched overseas to all Branches of the Association, affiliated Associations, deans of medical faculties of Commonwealth universities, postgraduate committees, and editors of medical journals. These copies are intended for reference by overseas inquirers, and many tributes to their usefulness have been received.

Between three and four hundred doctors inquired about junior hospital appointments, and advice was given on the types, grades, and availability of these.

Some of the more senior visitors wish to see methods and developments in the particular field of medicine in which they are interested. Visits to hospitals, clinics, and special centres have been arranged through the co-operation of consultants and hospital authorities.

Many visitors have been met personally by the port health medical officers on arrival, and a letter of welcome from the Bureau is sent to every visitor whose place and date of arrival are known. There is no doubt that these attentions are much appreciated by the newly arrived visitor. Through the kindly co-operation of authorities arranging courses of instruction, the Bureau is enabled to contact those overseas visitors, already arrived in the country, who do not know of the Bureau's facilities; liaison letters are sent to all these visitors and in many cases result in the Bureau being able to be of service and to invite the visitors to social functions.

All requests by visitors for accommodation to be arranged in readiness for their arrival in the country have been met. In addition, the Bureau has helped visitors, after their arrival, to secure furnished houses and flats. It is known that nearly 300 doctors and families have been successfully assisted with the problem of accommodation.

The majority of visitors have inquiries which fall into the wide field of "General Information," and every endeavour is made to answer these or to assist the inquirer to find the answer.

Overseas visitors have been enabled to meet their fellow practitioners from all parts of the Commonwealth, including senior members of the profession in the United Kingdom, at social functions arranged by the Bureau. "At homes" were held in London, Edinburgh, Liverpool, and Glasgow, and a total of nearly 1,200 overseas doctors and wives were able to attend these. Many expressions of appreciation from guests have been received, especially of the opportunities to make contacts which the "at homes" afford.

Many expressions of appreciation for the Bureau's services have been received, and the Council is glad to report that our medical colleagues from the other parts of the British Commonwealth are made welcome in the United Kingdom and receive the assistance they require to make the most of their visit.

INTERNATIONAL MEDICAL VISITORS BUREAU

188. The International Medical Visitors Bureau, established in 1950, provides a personal advisory service for medical practitioners desiring to visit the United Kingdom from countries other than those of the British Commonwealth.

New inquirers making use of the Bureau during the year totalled more than 300 and came from 36 countries.

In addition, requests were received from approximately 250 United Kingdom and Continental doctors or their families for "holiday exchanges" or *au pair* visits.

Many of the overseas inquirers wanted information concerning postgraduate courses of instruction and diplomas. Others sought information about hospital appointments in order to obtain experience of British medicine, and it is known that several have been successful in obtaining hospital appointments and temporary registration.

Visits to hospitals, clinics, and other institutions were desired by some of the more senior visitors. The Bureau is much indebted for the co-operation of heads of departments, consultants, and other authorities in arranging these visits.

Suitable accommodation has been found in London and the provinces for all visitors requesting this.

Many inquiries in the field of "General Information" have been received and dealt with, and visitors are encouraged to make requests with a view to making their visits successful.

Inquiries about "holiday exchanges" for themselves or their families or children and about *au pair* visits were received from many doctors in Europe and in the United Kingdom. With the co-operation of national medical associations, the Bureau endeavoured to put the inquirers in touch with suitable professional contacts, and it is known that more than forty "exchanges" were arranged.

Inquirers have much appreciated the help received from the Bureau, and the Council is glad that visiting colleagues can obtain assistance to make their visits pleasant and useful.

MEDICAL FILMS

189. The Council is glad to report that increasing use has been made of the Association's Film Library during the past year. Twenty films have been added to the Library, and a third addendum to the Film Catalogue has been issued. Information on a large number of recent medical films has been received as a result of a questionnaire sent to medical photographers.

Appraisal panels have met from time to time to view medical films which have been brought to the notice of the Association, and the Council wishes to express its thanks to the members of the profession who have served on these panels.

The Council is greatly indebted to the following, who have kindly presented films to the Association in the past year or have placed copies of their films in the Library on indefinite loan: Davis and Geck Inc., Imperial Chemical Industries Ltd., Kleenex and Kotex Ltd., G. D. Searle and Co. Ltd., and T. J. Smith and Nephew Ltd.

Consideration has been given to the possibility of lending films to the Overseas Branches, and it is hoped to introduce overseas hirings on a small scale during the coming year. This project would be separate from the home library service.

The Council is exploring the possibility of making a general film on rehabilitation for showing to lay audiences, followed by a series of films on special aspects of rehabilitation.

INTERNATIONAL RELATIONS

Anglo-American and Anglo-Canadian Exchange Scheme

190. The scheme which enables a small number of British doctors to visit the U.S.A. and Canada in exchange for visits to this country by American and Canadian doctors has been continued. Five British doctors have visited the U.S.A. and Canada during the year, and their reports show that the existence of the scheme is much appreciated.

The World Medical Association

191. Dr. J. A. Pridham, who had been a member of the W.M.A. Council since the foundation of the W.M.A. in 1947, has retired from that office. The Councils of the W.M.A.

and the B.M.A. have expressed their appreciation of his services. The Council of the W.M.A. has appointed Sir Lionel Whitby to fill the vacancy.

The Association was represented at the Eighth General Assembly of the W.M.A., which was held in Rome in October, 1954. The Council has considered a report of the proceedings of the General Assembly, and a number of matters referred to member-associations. The latter included a series of resolutions adopted by the International Social Security Association concerning the relations between the medical profession and social security institutions, a proposal to form an International Occupational Health Committee, a resolution on human experimentation, and inquiries on the allowance of professional expenses for purposes of income tax, the proposed abolition of the use of heroin, and the establishment of national standards for identification of ampoules, solutions, and packages of dangerous drugs. As is stated in paragraph 203, the W.M.A. has invited member-associations to appoint groups to study the *Proceedings of the First World Conference on Medical Education*, and to make recommendations concerning the Second Conference to be held in 1959.

The next General Assembly will be held in Vienna from September 20 to 26, 1955. The Association will be represented by the Chairman of Council and Dr. T. Rowland Hill as Delegates, with Dr. J. A. Pridham and the Secretary as Alternate Delegates. Dr. Mary Esslemont will attend as an observer.

Financial Position of the W.M.A.

192. The council of the W.M.A. has reported to member-associations that the association is in serious financial difficulties, and it has proposed a substantial increase in the rate of subscription. The difficulties are mainly due to the widening scope and increasing cost of W.M.A. activities, and to the fact that many national associations do not pay their full membership subscription. The B.M.A. Council has carefully considered how it can best help the W.M.A. It is convinced that the W.M.A. serves a useful and necessary purpose in presenting the views of the medical profession to international governmental bodies such as the World Health Organization and the International Labour Office, and moreover, as the B.M.A. was largely responsible for the creation of the W.M.A., the Council feels that it must do all in its power to ensure the W.M.A.'s continuance.

The Council has accordingly made an unconditional gift of £1,000 to the W.M.A. to help it over its immediate difficulties. It has also studied the W.M.A.'s financial statements with a view to offering constructive advice. It has suggested to the W.M.A. council that the crisis is serious enough to justify an immediate and thorough examination of the finances, organization, and activities of the W.M.A., and that, after effecting such economies as are practicable, the council of the W.M.A. should work out a programme of activity within the revenue that it can reasonably expect to receive. It has recommended that the proposed increased rate of subscription should be reconsidered, partly because, if certain member-associations do not pay their full subscriptions even at the present rate, it is unlikely that they will pay any substantially higher rate.

OTHER ASSOCIATION ACTIVITIES

Medical Practices Advisory Bureau

193. The volume of work in both the Advisory and the Agency Departments of the Bureau has been fully maintained during 1954. Approximately 600 partners, assistants, and trainees have been introduced, and the number of appointments and practices overseas with which the Bureau has been asked to deal has shown a marked increase. Very close liaison is maintained between the headquarters of the Bureau in London and the branch offices in Manchester, Edinburgh, and Glasgow.

In the field of exchange of practices the results of much work and the dissemination of a great amount of information have been very disappointing, but the facilities for

arranging exchanges are considered adequate and will continue to be available to members.

The number of requests for advice on partnership problems, including the drawing up of partnership agreements, is very much greater than the number of openings for assistants "with a view" on the books of the Bureau. This confirms the inference from the statistics available that while a partnership does not always follow as a matter of course the offer of a view, the fact that no view is offered does not exclude the possibility of a partnership where circumstances permit.

During 1954 nearly 2,500 locums were introduced. Every effort is made to satisfy the demand, but during certain periods of the year this is not always possible.

"National Formulary"

194. The Formulary Committee, which was appointed jointly by the Association and the Pharmaceutical Society, has completed the revision of the *National Formulary* issued in 1952. Copies of the new issue, published on January 1, 1955, are being distributed to hospitals and general practitioners under arrangements made by the Ministry of Health after sufficient time has elapsed to allow wholesale and retail pharmacists to adjust their stocks. The new edition will replace the 1952 *National Formulary* on April 1.

British Commonwealth Medical Conference

195. The Fourth British Commonwealth Medical Conference will be held in Toronto in June, 1955, immediately before the Joint Annual Meeting of the British Medical Association and the Canadian Medical Association. Delegates will be coming from Australia, Canada, Ceylon, India, Ireland, New Zealand, South Africa, Southern Rhodesia, and the United Kingdom. (The Pakistan Medical Association has not yet stated whether it will be sending a delegate.) The United Kingdom delegation will be composed of the Chairman of Council, the Chairman of the Representative Body, and the Editor of the *British Medical Journal*. The Secretary will also attend in his capacity as Honorary Secretary and Treasurer of the Conference.

The purpose of the Conference is to afford an opportunity for informal discussion of problems of common interest to the National Medical Associations in the British Commonwealth. The subjects to be discussed in Toronto will include: Lessons from the First World Conference on Medical Education, Medical Licensure and Registration, Rehabilitation—the Third Phase of Medicine, the Medical Care of Native Populations, the Public Relations of the Medical Profession, and Medical Journalism. The programme will also include a visit to the School of Hygiene of the University of Toronto and the Connaught Medical Research Laboratory.

Control of Medical Manpower

196. As in the past, the Council has provided secretarial and clerical assistance and other facilities for the two Central Medical Recruitment Committees, and will recover three-quarters of the cost from the Government.

The new regional medical recruitment committee for the Western Area of the South-west Metropolitan Hospital Region, the establishment of which was proposed by the Council last year, has been brought into existence by the Ministry of Health.

A summary of the detailed analysis (as at December 31, 1953) of the emergency register of the medical profession, which is maintained by the Association on behalf of the Central Medical Recruitment Committees, was published in the *Supplement to the British Medical Journal* of January 8.

Catering

197. Throughout the past year the Council has exercised a close scrutiny of the catering services provided in the Members' common room and the staff dining-room. It is satisfied that, as a result of the measures taken in regard to staffing and equipment, there has been a marked improvement in these services. Furthermore, it has become possible

for the catering department to undertake catering for large receptions and meetings held in the building.

The particular problem which the Council is meeting in common with all catering establishments is the increasing cost of labour and foodstuffs. As it is necessary to ensure that, so far as the Members' service is concerned, the catering does not become a financial liability, the charges for lunches and teas may have to be moderately increased.

Admission of Students to Medical Schools

198. In its last Annual Report the Council described at some length the difficulties encountered in an endeavour to estimate the number of students entering medical schools, the number qualifying from the schools, and the number of newly qualified practitioners likely to be absorbed into the various branches of the profession. In view of these difficulties the Council asked the Minister of Health to set up a working party to review the whole problem.

In a letter from the Permanent Secretary of the Ministry to the Secretary of the Association, published in the *British Medical Journal Supplement* of February 26, 1955 (page 67), it was explained that the Minister and the Secretary of State for Scotland, whilst in full agreement as to the need for a detailed inquiry, did not consider that a representative working party of the kind suggested by the Council would be the best method of undertaking such an inquiry. The Ministers decided that it would be preferable for them to appoint a small committee to which all interested bodies could present their views. The terms of reference and the members of the Committee appointed by the Ministers are as follows:

Terms of Reference: To estimate, on a long-term basis and with due regard to all relevant considerations, the number of medical practitioners likely to be engaged in all branches of the profession in the future, and the consequential intake of medical students required.

Members: Mr. Henry Willink, Q.C. (Chairman), Dr. J. T. Baldwin, Sir Harold Boldero, Sir John Charles, Sir Henry Cohen, Sir Andrew Davidson, Dr. A. B. Davies, Mr. J. P. Dodds, Sir Geoffrey Jefferson, Mr. L. G. K. Starke, Mr. A. B. Taylor.

Civil Service Medical Officers

199. In its last Annual Report the Council announced that the long dispute with the Treasury regarding the salaries paid to medical officers in the Civil Service had concluded in a satisfactory interim agreement between the Treasury and the Civil Service Medical Officers' Joint Committee. The agreement reached provided for increases in pay in certain grades of the medical officer class in the Civil Service, both sides remaining free to ask the Royal Commission to consider any representations they might see fit to make regarding the remuneration of any of the medical grades. The scales resulting from this interim agreement are set out below:

Grade	Age	Salary Scales (Basic plus Pay Additions)			
		Old scale		New scale	
		£	s. d.	£	
Basic	35	1,331	5 0	1,500	
	36	1,382	10 0	1,575	
	37	1,433	15 0	1,650	
	38	1,485	0 0	1,725	
	39	1,536	5 0	1,800	
	40	1,600	0 0	1,900	
Senior Medical Officer		1,675	0 0	2,000	
		1,750	0 0	2,100	
		1,825	0 0		
Principal Medical Officer		£1,900 × £100 to			
		£2,100		2,200	
		£2,250		2,300	

Following this agreement the Civil Service Medical Officers' Joint Committee, consisting of representatives of the Association and the Institution of Professional Civil Servants, prepared a memorandum of evidence for submission to the Royal Commission on the Civil Service. Representatives from the Joint Committee subsequently gave oral evidence to the Commission, and details of the claim made on behalf of medical officers in the Civil Service

were reported in the *Supplement* to the *British Medical Journal* of January 22. The salaries sought for the various medical posts in the Civil Service, together with the present scales, are set out below:

Grade	Present Salary £	Claim £
Chief Medical Officer, Ministry of Health	4,000	6,000
Chief Medical Officer, Department of Health for Scotland	3,000	At a point immediately below Chief Medical Officer, Ministry of Health
Chief Medical Officers, Colonial Office, Ministry of Pensions and National Insurance, Treasury Medical Adviser	2,850	
Deputy Chief Medical Officers, Ministry of Health	3,000	4,500
Deputy Chief Medical Officers, Ministry of Pensions and National Insurance, Department of Health for Scotland, Senior Medical Senior Commissioner of Board of Control	2,600	Not less than £500 above principal medical officers
Principal medical officers	2,300	3,500
Senior Medical officers	2,200	3,100
Medical officers	1,500 (age 35) > 75—1,800 > 100—2,100 (Scale is age-pointed to age 40)	1,600 (age 35) x 120—2,800

Joint Committee of the B.M.A. and the Magistrates' Association

200. This Committee has continued its study of the problem of cruelty to, and neglect of, children, and has received both written and oral evidence from a number of bodies and individuals. The report of the Committee is now in preparation, and it is expected that it will be completed during the autumn of this year.

Air Pollution—The Beaver Committee

201. The Association was invited by the chairman (Sir Hugh Beaver) of the Air Pollution Committee, set up by the Minister of Housing and Local Government, the Secretary of State for Scotland, and the Minister of Fuel and Power, to give evidence to that committee on the many forms in which danger to health arises from, or is thought to arise from, pollution of the air, and on the evaluation of such danger. Time did not permit of the production of a formal memorandum of evidence, but a subcommittee, under the chairmanship of Mr. J. R. Nicholson-Lailley (chairman of the Science Committee), considered the matter and gave oral evidence to the Beaver Committee in September, 1954. Sixteen points were specifically brought to the committee's notice and the whole subject was discussed at great length. The committee expressed its gratitude for the opportunity of discussing the matter with the Association's representatives.

Ministry of Healing

202. The Archbishop's Commission on Divine Healing and Co-operation with the Clergy having sought the assistance of the Association, a special Committee was established by the Council to prepare evidence for the Commission. A questionnaire was published in the *Supplement* to the *British Medical Journal*, and copies were sent to honorary secretaries of Branches and Divisions with a request that they should bring the matter to the notice of doctors interested in the subject. A number of replies have been received and have been considered by the Committee, which has also received oral and written evidence and memoranda. The Committee has confined its inquiries entirely to the medical field.

The Archbishop's Commission is hoping to complete its report by the autumn of next year, and it is anticipated that the Association's memorandum of evidence will be submitted to the Commission by the Council towards the end of 1955.

Medical Education

203. The *Proceedings of the First World Conference on Medical Education*, which was held in London in August, 1953, were published in October, 1954. The World Medical Association is now making arrangements for a Second World Conference on the same subject to be held in the United

States in 1959, and it has invited member-associations to appoint study groups to study the *Proceedings* of the First Conference and to make recommendations concerning the structure and content of the Second Conference. The Council has accordingly appointed a special Committee for this purpose under the Chairmanship of Sir Lionel Whitby.

The General Assembly of the W.M.A., on the recommendation of the council of that body, has expressed warm thanks to the Editor of the *British Medical Journal* and his staff for their invaluable services in connexion with the publication of the *Proceedings* of the first Conference.

Homosexuality and Prostitution

204. The Council has been invited to submit evidence to the Departmental Committee set up "to consider

(a) the law and practice relating to homosexual offences and the treatment of persons convicted of such offences by the courts; and

(b) the law and practice relating to offences against the criminal law in connexion with prostitution and solicitations for immoral purposes;

and to report what changes, if any, are in their opinion desirable."

The Council has appointed a special Committee to prepare evidence on the medical aspects of the subject. The Chairman of the Committee is Dr. R. G. Gibson, of Winchester.

The Law on Mental Illness and Mental Deficiency

205. Following the appointment of the Royal Commission on the Law relating to Mental Illness and Mental Deficiency, the Council requested the Psychological Medicine Group Committee to prepare a memorandum of evidence for submission to this body. The Committee was augmented for the purpose by the co-option of representatives of the Central Consultants and Specialists, General Medical Services, and Public Health Committees, a nominee of the Royal Medico-Psychological Association, and an eminent legal expert on mental law and procedure.

Throughout the preparation of evidence a close liaison was maintained with the Royal Medico-Psychological Association, which was itself preparing a memorandum for submission to the Royal Commission, and there has been a very large measure of agreement with that association.

The Council has recently considered and given its approval to the memorandum of evidence which has been drawn up, and this has now been submitted to the Royal Commission.

Hypnotism

206. The Council included in its Supplementary Annual Report for 1952 (para. 235) a statement of the views of the Psychological Medicine Group Committee on hypnotism. This had been prepared because of the frequent inquiries received by the Association on the subject, which at that time was receiving wide publicity and which had received no consideration by the Association since the report published in 1892.

The 1952 statement, however, dealt only briefly with the subject, and on further consideration it was felt desirable to undertake a fuller investigation.

The Psychological Medicine Group Committee therefore appointed a special subcommittee, which included a representative of the Science Committee, with the following terms of reference:

To consider the uses of hypnotism, its relation to medical practice in the present day, the advisability of giving encouragement to research into its nature and application, and the line upon which such research might be organized.

A report is now nearing completion and will shortly be submitted for the Council's consideration.

Control of Meat Inspection

207. The British Veterinary Association has submitted to the Council a revised memorandum on meat production and control. The original memorandum outlined a plan which

would have had the effect of removing the responsibility for meat inspection from the local authority and would have excluded entirely any supervision by the medical officer of health. The revised memorandum sought to make it clear that this is not the intention of the British Veterinary Association, but further joint discussions with the B.V.A. were considered necessary to clarify other points on which the policy of the Associations appeared to differ. Some measure of agreement has already been reached and discussions are continuing.

E. A. GREGG,
Chairman of Council.

APPENDIX I

RETURN OF ATTENDANCES OF COUNCIL

Name	Attendances	
	Actual	Possible
E. A. Gregg, London (Chairman of Council)	5	5
Sir John McNee, London (President)	2	5
I. D. Grant, Glasgow (Chairman of the Representative Body)	5	5
L. Douglas Callander, Doncaster (Treasurer)	5	5
J. W. Tudor Thomas, Cardiff (Immediate Past-President)	5	5

APPENDIX II

NOTE OF A DISCUSSION WITH THE MINISTER OF HEALTH ON DECEMBER 9, 1954, ON THE PROVISION OF DRUGS FOR PRIVATE PATIENTS

Present: A. Brown, A. Talbot Rogers, D. P. Stevenson, and W. Hedgcock.

1. Dr. Rogers said that, in pursuing this question, the Committee did so with the full knowledge that its implementation would require an amendment of the Act and that this might not be possible at the present time. Dr. Rogers referred to the very considerable amount of feeling in the profession that the present state of affairs was inequitable. It seemed quite unnecessary to regard prescribing as an inseparable part of general medical services, and the profession had always been led to believe that patients would be free to use separately any part of the services which were provided under the Act. It was believed that it would not be difficult to devise satisfactory machinery which would prevent any abuse, and, in the opinion of the Association, the fear that it might lead to two standards in general practice was quite unfounded. Whilst appreciating the present difficulties, the Committee would like to know what the Government's policy would be at a time when amending legislation became a practical proposition.

2. Dr. Brown amplified Dr. Rogers's statement, and said that when the Act was introduced the impression gained ground that patients would be able to take advantage of the Service either in part or in whole. Now it was found that the supply of drugs was tied up with treatment and that an amendment to the Act would be necessary to give effect to this part of the Association's policy. Dr. Brown said that he appreciated to the full the difficulties in the political field and the lack of time available for legislation at the moment. What his Committee, the Private Practice Committee, would like to know was whether the Government accepted the view that a private patient was entitled to drugs under the Service. Once that principle had been decided any administrative difficulties could be examined.

3. The Deputy Secretary said that there were four particular points which he would like to make. Two arose out of the recently published Report of the Cohen Committee on General Practice. Firstly, the suggestion that the proposal would introduce two standards in general practice had given rise to considerable resentment in the profession and, in his view, such a situation might well exist in reverse to-day when many private patients were unable to afford the drugs necessary for their treatment. Secondly, it had been stated that many doctors in private practice would be unwilling to accept the imposition of any necessary safeguards. The Association, which represented the whole of the profession, would be only too willing to discuss the introduction of measures to prevent abuse, and, indeed, some form of contract and some ultimate sanction, such as the removal of a licence to prescribe on Form E.C.10, had always been envisaged. The Association was not, of course, aware of the source of this statement, but, for its part, it recognized that if its point was met the Association would be only too glad to devise adequate safeguards.

4. The third point concerned finance. Although time alone would show the cost of allowing private patients their drugs on Form E.C.10, it was quite possible that any increase in the drug bill which resulted would be offset, at any rate to some extent, by an increase in the amount of private practice, with a consequent reduction in the amount of public funds which went into the Central Pool.

5. There remained the political aspect, and it was here that it was hoped that the Minister would explain the Government's policy.

6. Mr. Macleod said that there had been no change either in the situation generally or in his own views on the subject. It had been suggested that there was a breach of faith on the part of the Government in not giving effect to a promise which was contained in an election manifesto.

7. This was not so. The pamphlet issued by the Conservative Party which had advocated this right for private patients had appeared in July, 1949. This pamphlet was in no way a form of election manifesto, and, indeed, the proposal had been dropped completely from the Party's electioneering programme which appeared some six months later. Again, in the 1951 election no mention of it had been made at all. The Conservative Party's reason for withdrawing from its original position was that it realized the impracticability of making any concession on the lines suggested when the full and mounting cost of the Health Service became apparent. As far as the Cohen Committee was concerned, the Parliamentary Secretary's reply in the House of Commons to the effect that the Cohen Committee was unanimous on this particular point was made in perfectly good faith. No minority report or anything of a similar nature had appeared when the report was published, and, if any members of the Cohen Committee had had any reservations, it would have been proper for them to have stated this when they were considering their report in its draft form.

8. From the Government's point of view the question raised three difficulties, those of legislation, finance, and administration. The door was by no means shut. The proposal which was made in the 1949 leaflet was withdrawn purely because of the financial position of the National Health Service, and it had never been restored. He found himself in no position to give any undertaking of any sort that the Government would commit itself to allowing private patients to be supplied with drugs under the Service either at present or at any future time. As far as the administrative difficulties were concerned, they were formidable but not insurmountable. He did not necessarily agree with the views of the Cohen Committee on this particular point, and, if the Government agreed to give private patients this right, then there was little doubt that any proposals would be discussed with the profession in advance.

9. In brief, Mr. Macleod said that the situation could be summarized—that the proposal was not repugnant to Conservative principles and that the door was by no means shut. He could, however, give no undertaking that the change either could or would take place.

10. The Minister agreed that his officials, in consultation with Dr. Stevenson, should formulate and agree a statement for publication which would set out the Government's view on the question.

APPENDIX III

DEFINITIONS, QUALIFICATIONS, AND REMUNERATION OF WHOLE-TIME INDUSTRIAL MEDICAL OFFICERS

1. In the view of the Association whole-time industrial medical officers should be graded in the following four categories:

Assistant Medical Officer.—A practitioner training for a career in occupational health and under the control of a more senior medical officer.

Medical Officer.—A practitioner in charge of the medical services of a small firm, or a constituent unit of a larger firm, working either single-handed or with an assistant.

Senior Medical Officer.—A practitioner in charge of the medical services of a medium-sized firm or, in the case of a large organization, of one of its constituent groups. A senior medical officer would usually have one or more medical officers, whole-time or part-time, under his control, but industrial medical officers who carry special responsibility by virtue of the hazards peculiar to the industries concerned, even when working single-handed, should be included in this grade.

Chief Medical Officer or Director of Medical Services.—A practitioner responsible for, or in charge of, the medical services of a large industrial undertaking.

2. Medical officers, senior medical officers, chief medical officers, and directors of medical services should be responsible to the highest level of management, locally or centrally, as may be appropriate.

3. As requirements for occupational health services vary widely from industry to industry, it is not possible for the Association to lay down precise definitions of the type of industrial medical officer required in all industries. The Association has, however, established an advisory panel of practitioners experienced in occupational health services which is available to give guidance to individual managements, if required. Requests for the assistance of the Advisory Panel should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

Qualifications

4. The qualifications required for entry into each of the above grades should be:

Assistant Medical Officers

One year in pre-registration house appointments, preferably one house-surgeon and one house-physician appointment; two years' military service; and a further two years engaged in general practice, in public health, or in additional hospital work. Applicants for such appointments will usually be about 30 years of age. Attention should be paid to any specialist appointments which the practitioner may have held—for example, in chest medicine, dermatology, ophthalmology, etc.—which have a bearing on the problems of the particular industry concerned.

Medical Officers

Applicants should have held an appointment for a minimum of two years in the assistant medical officer grade, or have postgraduate experience in a branch of medicine likely to be of value to industry additional to that required for assistant medical officers.

The following higher qualifications would be regarded as an additional recommendation:

Membership of one of the Royal Colleges of Physicians.
Fellowship of one of the Royal Colleges of Surgeons.
Doctorate of Medicine.
Diploma in Industrial Health.
Diploma in Public Health.

Senior Medical Officers

Applicants for appointment in this grade would normally be practitioners who had distinguished themselves in the medical officer grade or had special experience in addition to that required for the medical officer grade of the industry concerned. Particular regard should also be paid to administrative ability.

Chief Medical Officers or Directors of Medical Services

These medical officers would normally be appointed from practitioners who had distinguished themselves in the senior medical officer grade, except where a special requirement of the industry made it necessary to appoint an experienced medical practitioner from outside the industry.

Remuneration

	Range
Assistant Medical Officers	£1,200 to £1,500
Medical Officers	£1,400 to £2,300
(A practitioner in this grade who gave satisfactory service would be expected to reach his maximum in his early 40's, but the practitioner giving outstanding service would be expected to receive more rapid advancement.)	
Senior Medical Officers	£2,000 to £3,000
Chief Medical Officers or Directors of Medical Services	From £3,000, according to the size of the undertaking and the responsibilities involved.

5. The salary in each grade should be reviewed at intervals not exceeding two years.

6. The Association regards these salary ranges as suitable for pensionable appointments. Where no pension scheme is in operation the salary should be adjusted accordingly.

REMUNERATION OF PART-TIME INDUSTRIAL MEDICAL OFFICERS

1. In the view of the Association, part-time industrial medical officers should be paid an annual salary, in preference to sessional fees, based on the average number of hours work per week at rates not lower than those set out in the

table below. The medical practitioner so appointed will have a recognized position in the industrial undertaking and thus should be able to maintain a continuing interest in it:

Hours per week	Minimum Annual Salary
Up to 1 hour	75
1 " 2 hours	150
2 " 3 "	225
3 " 4 "	300
4 " 5 "	350
5 " 6 "	400
6 " 7 "	450
7 " 8 "	500
8 " 9 "	550
9 " 10 "	600
10 " 11 "	650
11 " 12 "	700
12 " 13 "	750
13 " 14 "	800
14 " 15 "	850
15 " 16 "	900
16 " 18 "	950
18 " 20 "	1,000

2. It is pointed out that this scale constitutes minimum salaries, and in individual cases the value of the medical service given to firms will be such that managements may consider higher remuneration justifiable and appropriate.

3. Where a part-time industrial medical officer is required to travel beyond a radius of two miles in the course of his duties, a mileage rate of 1s. a mile each way is recommended.

4. A number of practitioners are fully occupied in occupational health by virtue of holding several part-time appointments. The aggregate salary of such a practitioner should be comparable with that of a whole-time industrial medical officer of similar standing.

5. The remuneration of a consultant in occupational health, or in any other appropriate specialty, called in by a firm to advise as an expert in some particular occupational health problem or problems, should be a matter for private negotiation, as in similar situations in other fields.

6. As requirements for occupational health services vary widely from industry to industry in regard to part-time appointments in the same way that they vary for whole-time industrial medical officers, it is not possible for the Association to lay down precise definitions on the type of industrial medical officers required in all industries. The Association has established an Advisory Panel of practitioners experienced in occupational health services which is available to give guidance to individual managements, if required. Requests for the assistance of the Advisory Panel should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

APPENDIX IV

TERMS OF SERVICE FOR INDUSTRIAL MEDICAL OFFICERS

This memorandum is presented for the guidance of medical practitioners who are offered, or who apply for, appointments as medical officers in industrial or commercial undertakings, both private and nationalized.

The Duties and Ethical Rules for Industrial Medical Officers have been published and form the basis of the work of the medical practitioner in an occupational health service. The needs of occupational groups vary very considerably from group to group, and it is not possible to lay down hard and fast rules to cover all groups, but it is possible to enumerate certain fundamentals.

The medical officer should, whether his work is full-time or part-time, be directly responsible for the organization, administration, and staffing of the service to which he is appointed. In those organizations in which more than one

medical officer is employed he would obviously be responsible to the principal medical officer. With this exception the medical officer should be responsible only to the highest level of management.

The questions of salary, hours of work, holidays, study leave, research, and the publication of medical papers are matters which can best be discussed on a mutual basis to the satisfaction of both parties. It is, however, considered desirable that an industrial medical officer should be given leave of absence after six or seven years' satisfactory service, in order to undertake postgraduate training.

In some industries it is necessary to provide a service to cover all emergencies within the 24 hours. This would be a matter which would require special arrangements, for while a doctor would not expect to cease work at the end of the "working day" he could not be expected to cover the whole day.

Practitioners applying for part-time occupational health appointments should satisfy themselves that their other professional commitments would allow them time to carry out to the full the duties of the occupational health appointment.

It is suggested that practitioners accepting appointments as industrial medical officers should seek a contract of appointment. In any agreement entered into between a doctor and an employer it would be desirable to have an arrangement whereby either may terminate the agreement within a specified and reasonable time.

The practice of medicine in industry or commerce necessitates the closest co-operation with other professional and non-professional men and women, and the success or failure of a doctor in such an appointment will depend very largely on his ability to work with these colleagues.

APPENDIX V

RULES FOR D.P.H. COURSES

Recommendations in regard to the proposed revision of the General Medical Council's rules as to courses of study and examinations for diplomas and degrees in sanitary science, public health, and State medicine.

Recommendation (a): That the Certificate in Public Health as it now exists be discontinued and that a course leading to the Diploma in Public Health be arranged as a continuous whole.

Recommendation (b): That the authorities of teaching bodies be recommended to adopt a general requirement that a period of not less than two years after permanent registration should elapse before a practitioner becomes eligible to sit for the D.P.H. examination.

If the General Medical Council sees fit to adopt these recommendations certain consequential amendments would become necessary in the existing rules. It is suggested that paragraph 4 of the introduction might be amended on the following lines:

The only public health officers who are required by law to hold diplomas or degrees registered under the section are medical officers of health (and supervisors of midwives who are registered medical practitioners). It has been widely recognized that the possession of the D.P.H. is of value to all engaged in the practice of preventive medicine.

The discontinuance of the C.P.H. as it now exists would mean that paragraphs 5-13 would no longer be applicable and would require redrafting to make it clear that there should be a continuous course of instruction for the complete diploma. In these circumstances it would be necessary to make provision for existing holders of the C.P.H. to complete the course for the diploma.

The Council of the British Medical Association is of the opinion that there should be reasonable flexibility regarding the time of entry for the course. Adoption of Recommendation (b) would enable one year to be devoted to the course and one year to other professional activities, which in the case of male candidates could include their National Service.

After considering the content of the course of instruction, the Council of the British Medical Association wishes to recommend:

Recommendation (c): That the existing Rules 1 (3)-10 be redrafted and extended to cover systematic instruction in the undermentioned subjects:

1. Public Health History, Law, and Administration

The history of public health, public assistance, and social services. The evolution of central and local authorities. The law relating to public health and social security. The existing functions of central and local authorities and voluntary organizations, including committee work; the nature and objects of the public health and medical services they administer. The operation of international health organizations. The principles of administration of medical departments and institutions. Social security and the agencies for the relief of poverty and the promotion of social welfare.

2. Health and Welfare Services

Antenatal care, maternal and child welfare, school health service, care of the aged, child guidance, and problem families.

3. Epidemiology

The principles of the epidemiology of infection. The causal agents of infection, their sources and control. Administrative measures in relation to communicable disease, including personal hygiene. The epidemiology of non-infectious diseases. The administrative measures in relation to their control. Vulnerable groups. Social aspects of disease.

4. Influence of Heredity on Health

5. Medical and Population Statistics

The nature and sources of information bearing on the health of the people, and its numerical presentation; the preparation of memoranda and scientific articles containing statistical data, and exercises in their preparation. The principles of medical statistics and the statistical method and their use in social research.

6. Environmental Hygiene

The influences of environment on physical and mental health. The principles of public health engineering, including sanitation, water supplies, housing, town and country planning.

7. Health Education

The principles of education, with particular reference to the methods of educating the public as to the promotion and maintenance of health, including the study of nutrition, dietetics, and physical education.

8. Mental Health

The principles of psychology and mental health. The study of human behaviour and the significance of custom and habit on a group. Laws relating to mental deficiency and mental illness. The principles of mental assessment and the development of the normal child. The ascertainment of mental subnormality.

9. Occupational Health

The principles of occupational health. The evolution of industrial health services. Epidemiological and social aspects of occupational disease. The prevention and rehabilitation of industrial injuries and the legal aspects.

The duration of the course of instruction should remain at 850 hours.

Recommendation (d): That the existing Rule 12 be redrafted to ensure that candidates must produce:

(a) Evidence of having attended satisfactorily theoretical and practical instruction in the subjects listed above.

(b) Certificates of having (i) received adequate clinical instruction in infectious diseases; (ii) personally studied the work of health departments.

(c) A day-book in which regular entries have been made relating to subjects in which practical instruction is given during the course and brief observations on the objects of such instruction and the conclusions to be drawn therefrom.

(d) A dissertation on an approved subject.

Rules 13-18 would not require any alterations other than those arising from changes in the preceding rules.

APPENDIX VI

AMENDMENT OF ARTICLES AND BY-LAWS

Amendments of Articles

1. By altering Article 5 as follows: After "Each Branch" add "of the Association not in Great Britain or Ireland".

2. By altering Article 6 as follows: After "1st January, 1938," delete "but so that this proviso" and add "Provided Further that the Regulations and By-laws may provide that any Member admitted to membership before the 31st December next occurring after the date of the grant to him of a qualifying diploma within the meaning of the Medical Acts may compound his subscriptions for such period as may be prescribed by the payment of a lump sum but so that each of the foregoing provisos".

3. By altering Article 10(c) as follows: After "or (vi)" add "in the case of an Associate on the 31st day of December next following after he shall have ceased to reside within the area of the Branch by which he was elected or (vii) . . .".

4. By altering Article 18 as follows: At the beginning insert "Subject as hereinafter provided". After the words "Corporate Group and of no other" insert "Provided Always that any Member whose address as registered for the time being in the Register of Members of the Association is within Great Britain or Northern Ireland who has become a member of a Division other than that in which he resides in manner provided by the By-laws shall be an Ordinary Member of such first mentioned Division and of no other".

Amendments of By-laws

1. By altering By-law 5 as follows: (i) By deleting in para. (1) "each Branch and Division concerned" and inserting "the Branch and Division in whose area the candidate resides".

(ii) By inserting following new By-law 5(a):

"Change of Division

"5(a). (1) Any Member whose address as registered for the time being in the Register of Members of the Association is within Great Britain or Northern Ireland may apply to become an Ordinary Member of a Division other than that in whose area he resides on one of the grounds hereinafter mentioned. Every such application shall be forwarded to Head Office accompanied by a statement of the reason or reasons therefor and shall (together with such reason or reasons) forthwith be notified by Head Office to the Secretaries of the Divisions concerned. If within one month from the receipt of such notification either such Division shall send to Head Office any objection to such proposed change of Division or if there be doubt whether adequate reasons exist for such proposed change the matter shall be decided by the Council but subject as aforesaid such proposed change shall become effective at the expiration of the said period.

"(2) The grounds on which any such application may be made are:

"(a) that for any reason the member concerned can attend meetings of the Division of which membership is sought with greater convenience than meetings of the Division in which he resides, or

"(b) that the member concerned has a greater community of professional interest with other members of the Division of which membership is sought than with Members of the Division in which he resides.

"(3) The result of any such application shall be notified forthwith by Head Office to the Secretary of each of the Divisions concerned and (where appropriate) the necessary entries shall forthwith be made in the Register of Members of the Association."

2. By substituting in By-law 7 for the words "Colonial Medical Service" the words "H.M. Oversea Civil Service".

3. By altering By-law 12 as follows: (i) In line 12 of the By-law, insert after "General Meetings" the words "of the Association" and in line 15 the word "such" after the words "notices of".

(ii) At the end of the By-law add the following words: "Provided that a Division or Branch may either generally or in any special case authorize Extraordinary Members to receive notice to attend and speak (but not to vote) at meetings of such Division or Branch and to receive the Journal."

4. By inserting in the first paragraph of By-law 13 after the words "in which he is" the words "for the time being".

5. By inserting at the beginning of paragraph 1 of By-law 14 the words "subject as hereinafter provided" and at the end the words "Provided Always that any Member who has become a member of a Division other than that in which he resides in manner provided in By-law 5(a) hereof shall be a member of such first-mentioned Division and shall not be a member of the Division in which he resides."

(i) 6. By altering By-law 16(1) as follows:

In the table: Under the column 1 at the end of the matter after A add "who does not fall within classes B or C below described".

Under the column 1 at the end of the matter after B before "(i)" delete "class A above described" and substitute "classes A above or C below described".

Under the column 1 at the end of the matter after "B(vi)" add "whose joint subscriptions would but for this provision be greater than 7 guineas".

In both columns delete "B(vii)" and all matters appearing against it.

Under the column 1 alter "B(viii)" to "B(vii)".

Under the column 1 after "within the group" add a new paragraph:

"C. Any member admitted to membership before the expiration of five years from the date of the grant to him of a qualifying diploma within the meaning of the Medical Acts."

Under the column 2 against the foregoing entry in the column 1 add:

"Two guineas until the 31st December next occurring after the expiration of three years from the date of such qualification and three guineas for the following two years thereafter."

Under the column 1 alter the existing letter "C" to "D".

(ii) After the proviso following the table ending with the words "subscription for that year" add the words "Provided Always that any member admitted to membership before the 31st December next occurring after the date of the grant to him of a qualifying diploma within the meaning of the Medical Acts may by one further payment of ten guineas made during the calendar year in which he is admitted to membership compound all subscriptions due from him to the Association in respect of the five calendar years next occurring after the calendar year in which he is admitted to membership but so that no part of such sum shall in any event become payable to such member . . .".

(iii) In the next paragraph of the By-law delete from "but so that this proviso" down to and including "to his obligations" and insert in its place "Provided Always that nothing in this By-law before contained shall in the case of a Member who is a Member of a Corporate Branch or of a Corporate Group prejudice his obligations . . .".

By-law 16(B) would then read as follows:

1 Members Entitled to Reduction of Subscription	2 Reduced Subscription Payable
A. Any Officer on the Active List of any of the medical branches of the armed Forces wherever resident, who does not fall within classes B or C below described	Three guineas
B. Members of the following descriptions resident in Great Britain or Northern Ireland and not falling within classes A above or C below described:	
(i) Any Member of not less than 40 years' standing as such	Two guineas
(ii) Any Member of not less than 10 years' standing as such who has definitely and permanently retired from the active practice of the medical profession and has signed and transmitted to the Treasurer a declaration to that effect	Two guineas
(iii) Any Member who is not engaged in medical practice whether as consultant or otherwise and is a whole-time non-professional member of the teaching staff of a university or medical school and has signed and transmitted to the Treasurer a declaration to the foregoing effect in relation to the year for which the subscription is due	Three guineas

1 Members Entitled to Reduction of Subscription	2 Reduced Subscription Payable
(iv) Any Member who is not engaged in medical practice whether as a consultant or otherwise and occupies a chair at a University or Medical School as a non-clinical professor and has signed and transmitted to the Treasurer a declaration to the foregoing effect in relation to the year for which the subscription is due	Three guineas
(v) Any Member who is not engaged in medical practice whether as consultant or otherwise and whose whole time is occupied in the investigation of scientific problems as distinguished from routine laboratory work and has signed and transmitted to the Treasurer a declaration to the foregoing effect in relation to the year for which the subscription is due	Three guineas
(vi) Two Members jointly being a husband and his wife residing together, whose joint subscriptions would but for this provision be greater than 7 guineas	Seven guineas
(vii) Any Member who is engaged in full-time salaried employment the salary of which is not more than £1,500 per annum (or such other sum as the Council may from time to time determine) and who has signed and transmitted to the Treasurer a declaration in specified form that he comes within this group in relation to the year for which the subscription is due. (The Council have the power to decide in case of doubt whether the Member comes within the group.)	Four guineas
C. Any Member admitted to membership before the expiration of five years from the date of the grant to him of a qualifying diploma within the meaning of the Medical Acts	Two guineas until the 31st December next occurring after the expiration of three years from the date of such qualification, and three guineas for the following two years thereafter
D. Any Member resident outside Great Britain and Northern Ireland and not falling within Class A above described	Two guineas

"Provided also that any Member, wherever resident, who is admitted on or after the 1st July in any year, shall pay only half his current subscription for that year. Provided Always that any member admitted to membership before the 31st December next occurring after the date of the grant to him of a qualifying diploma within the meaning of the Medical Acts may by one further payment of ten guineas made during the calendar year in which he is admitted to membership compound all subscriptions due from him to the Association in respect of the five calendar years next occurring after the calendar year in which he is admitted to membership but so that no part of such sum shall in any event become payable to such Member.

"A person who shall have been a Member of the Association for a period of 50 years shall not be required to pay any annual subscription as from the 1st January next succeeding the expiration of such period or in the case of existing Members who have been Members for more than 50 years then as from the 1st January, 1938. Provided Always that nothing in this By-law before contained shall in the case of a Member who is a Member of a Corporate Branch or of a Corporate Group prejudice his obligations, as such Member of the Corporate Branch or of the Corporate Group."

7. By deleting in By-law 68 the words "on his installation at the next Annual Representative Meeting" and inserting the words "at his installation at the Annual General Meeting in the year following that of his election".

Amendment of Schedule to By-laws

1. In the Schedule to the By-laws relating to the Public Health Committee, add in the fifth column ("Otherwise Appointed") the words "I to be appointed by the Occupational Health Committee".

2. In the Schedule to the By-laws relating to the Science Committee, insert at the end of the existing entry in the sixth column ("Duties, Powers, etc.") the words "The Committee shall have power to co-opt up to three additional members to secure representation of a particular class of experience not otherwise represented on the Committee".

WELSH DINNER

The Annual Welsh Dinner will be held at the Royal College of Surgeons, Lincoln's Inn Fields, London, W.C.2, on Friday, June 3. All Welsh representatives, Welsh graduates, and others with Welsh associations, accompanied by their ladies, will be welcome at this Dinner.

Tickets will be 30s. per head (exclusive of wines), and those wishing to attend are asked to apply, with remittance, to Dr. S. J. Hadfield, B.M.A. House, Tavistock Square, London, W.C.1.

LOCAL GOVERNMENT SUPERANNUATION

EXERCISE OF OPTIONS

Two of the options granted to local government officers under the Local Government Superannuation Act, 1953, and the Benefits Regulations (1954) made under it, expire on March 31, 1955. An officer who previously elected to retain the benefits provided under the 1937 Act, or a local Act, and who still wishes to retain those benefits must notify his employing authority in writing before April 1, 1955. Similarly, local government medical officers who were contributory employees of a local authority on October 1, 1954, have until March 31, 1955, to apply for added years under Regulation 12 of the 1954 Regulations.

Further details of these options appeared in the *Supplement of the British Medical Journal*, December 11, 1954, page 221.

MEDICAL PRACTICES COMMITTEE

AMENDMENT OF CLASSIFICATION OF AREAS

The following areas have been reclassified by the Medical Practices Committee (January 2 to March 7, 1955) as "designated":

Essex.—Urban District of Hornchurch.
London.—Borough of Lambeth: Prince's and Oval Wards.
Birmingham.—Stockland Green.

The following areas as "intermediate":

Cheshire.—Crewe and Haslington.
Lancashire.—Worsley.
London.—Borough of Hackney: Chatham Ward.
Middlesex.—Borough of Twickenham; Borough of Willesden: Stonebridge Ward.
Wiltshire.—Downton.
Kingston-upon-Hull.—West District.
Leeds.—North-west Area.
Glamorganshire.—Urban District of Caerphilly.

The following areas as "restricted":

Lancashire.—Carnforth.
Sussex (East).—Winchelsea, Guestling and Pett (remainder of Battle Rural District and Rye Borough to remain classified as "intermediate").
Sussex (West).—Pulborough.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.
Urban District Councils.—Houghton-le-Spring.

Dangerous Drugs Act: Withdrawal of Authority

The Home Office announces that Dr. George Norman Reed (Grimsby, Lincs) is no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations apply.

HOSPITAL PRESCRIBING COSTS

From information available to the Ministry of Health, most general hospitals need to purchase about 3,000 different drugs, but of these the first 30 in order of total cost may well account for some 80% or 90% of the bill; the expenditure on antibiotics alone may comprise between 35% and 50% of the total. The Ministry has therefore written to hospital authorities suggesting that every committee and board should prepare its own list of the 30 or so most expensive items, and that the medical committees of the hospitals concerned should be invited to examine their prescribing of these items to see whether economies can be made without prejudice to the treatment of patients. It suggests that medical staff might also be informed of the relative costs of antibiotics so that if there is a choice they may know which is the more economical. For example, intramuscular penicillin for three days at 1,000,000 units daily costs about 4s. 6d. With aureomycin or oxytetracycline the cost is about six times as much, and with erythromycin slightly less than 10 times as much, if these antibiotics are given in a daily dose of 1.5 g. Treatment with 2 g. chloramphenicol daily costs about five times as much as with penicillin.

Another field in which the Ministry suggests that investigation might be profitable is expenditure on vitamins. In one hospital enough 50-mg. tablets of vitamin C were issued to the wards daily to provide three tablets for each of 550 occupied beds, but it was found that after the medical staff had been informed by circular of the quantities being used consumption fell by 25%. It is believed that economies could be made in surgical dressings also.

The Ministry suggests that medical and pharmaceutical staffs in each hospital or group of hospitals be asked to devise means of preventing excessive prescribing and of making economies. Hospital medical staffs, it says, might also usefully be asked to bear in mind the likely consequences of their prescribing methods on the further treatment of patients after their discharge from hospital to the care of the general practitioner.

Questions Answered

Cost of Added Years

Q.—I am a whole-time medical officer of health nearly 61 years of age. I have been granted 10 added years under the Local Government Superannuation (Benefits) Regulations, 1954, but I have to find a lump sum of £2,415 as my share of the cost of these added years. I am told that I cannot obtain any tax relief on this amount whether this is paid in a lump sum or by instalments of a lump sum. Is this correct?

A.—Yes. The answer given on page 32 of the *Supplement* of January 29, 1955, dealt with the position where additional contributions for added years are paid as a percentage of remuneration over future service, as will usually be the case. It now seems clear, however, that in the case of officers over 60 years of age the Government Actuary is insisting that payments should be made in a lump sum, or by instalments of a lump sum. Such payments do not qualify for tax relief.

Notes and News

Several German medical families would like to arrange holiday exchanges for their children with British children during the summer. Would any British families interested please communicate with Brigadier H. A. Sandiford, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Correspondence

Shortage of Hospitals

SIR.—The programme of new hospital building which was outlined in the House of Commons (*Journal*, February 19, p. 486) must have shocked family doctors and all who read the articles published by the *Manchester Guardian* about a year ago showing the dreadful suffering caused by the shortage of hospitals and nurses. May I suggest that it is the duty of the medical profession to educate the public in this matter and that the best course would be for the B.M.A. to appoint a small committee to make recommendations?

The first step for such a committee would be to find out how many beds are required. They would get estimates from the consultants in all the different kinds of hospitals—for example, they would ask the psychiatrists how many more beds were required in the mental hospitals. They would then get into touch with family doctors, health visitors, and district nurses and find out from them how many beds were required for different classes of patients, such as infirm old people, defective children, convalescents. Another form of inquiry would be to take a decade before and after the last war and compare the expenditure in various localities on housing estates, schools, and hospitals; it would probably be found that the number of new schools is out of all proportion to the number of new hospitals.

The second stage would deal with the improvements that are required in the hospitals. Probably the best course would be to compare hospitals and factories—the buildings, accommodation, lighting, ventilation, amenities, and so on. The committee would note whether the equipment, apparatus, and appliances were all the latest and best obtainable. The next step would be to arrange for some of the engineers and instrument-makers who have built and fitted out the latest factories and commercial laboratories to inspect some of the older hospitals and report on the improvements that could be made.

No doubt it will be said that the primary need is not for more hospital beds but for more hospital nurses. It will be argued that a great many beds are empty because there are not enough nurses to staff them. And there is the further point that if there were more district nurses a great many patients who are sent to hospital could be nursed at home, to the great advantage of everybody concerned. All that is perfectly true, but that is not to say that we must wait until we have more nurses before we build any more hospitals. The shortage of nurses and the shortage of hospitals are parts of one problem; they are signs of some obscure social disorder. The root of the trouble goes very deep, and some day it will have to be dealt with. Looking ahead, it seems very doubtful whether the problem can be solved without a comprehensive national nursing service and perhaps some form of conscription. But that is a long story, and the need for more and better hospitals is urgent: my point is that we can hardly expect to get them until we can show how many new ones are required and to what extent the old ones need reconditioning.—I am, etc.,

Wetherby, Yorkshire.

R. L. KITCHING.

Doctors' Cars and Telephones

SIR.—Mr. H. K. Vernon's letter (*Supplement*, February 26, p. 68) shows a complete misconception of the basis of the whole-timer's claim for car expenses. Mr. William Gissane (*Supplement*, February 12, p. 48) must have a car at hand wherever he goes so that he can respond to an emergency call without delay—that is why he travels to work in it. If it is necessary for him to take his car to hospital because of his work, surely he should be given a travelling allowance for the journey? It is quite irrelevant to drag in (as Mr. Vernon does by implication) the case of the clerk who sits on an office stool all day. He has no need to travel to work by car and no need to use it during the course of his day's work.

When Mr. Vernon mentions the part-time consultant who lives at a distance from his consulting-room, and gets no travelling allowance for journeys between it and his home, he forgets that the part-timer visits his consulting-room to see private patients and gets income-tax relief on his travelling expenses. He surely does not expect a travelling allowance from the N.H.S. as well. Part-timers with a "consulting-room" in their own homes need not see one private patient a year in it to be able to claim a travelling allowance of up to £190 a year for routine visits to hospital. What is the logic in that? Mr. Vernon's flights of fancy about consultants travelling to work in aeroplanes fall rather flat. Surely he knows that payment for routine journeys to one's headquarters is limited to 10 miles in either direction.

Why should a whole-time consultant who uses his car to attend special clinics, medical meetings, and conferences for the benefit of his hospital patients be denied income-tax relief on his expenses, while a part-timer can set them off against his receipts from private practice?

If Mr. Vernon wants a legal viewpoint let me quote Mr. A. A. H. Marlowe, M.P. (*Journal*, April 17, 1954, p. 938), who asked the Chancellor of the Exchequer "whether he was aware that consultants incurred many expenses for which they could make no income-tax rebate claim on Schedule E assessments; and whether he would introduce legislation to remedy this hardship." Mr. Marlowe also said there was a conflict of opinion between the appointing authorities, who would not appoint a consultant unless he had a motor-car, telephone, and secretary, and the Revenue authorities, who did not allow these expenses. Why does the B.M.A. not refuse all advertisements for whole-time consultant posts until this matter is put right?

Unfortunately, as Dr. K. W. Beetham has said (*Supplement*, July 31, 1954, p. 83), "The profession is making it too obvious that the paramount consideration is the preservation of private practice, and such a policy can only adversely affect our terms and conditions of service in the end." How prophetic were his words. A couple of months later the Labour Party announced its intention of abolishing pay beds, and then came Sir Henry Cohen's indictment of the two standards of treatment in general practice.—I am, etc.,

Orpington, Kent.

LEO GILCHRIST.

SIR.—My friend, Mr. Henry K. Vernon, states (*Supplement*, February 26, p. 68) that if a motor-car is considered essential to the work of any doctor then "every single worker in Britain should be allowed to claim his fares for travelling from home to work." I have heard this argument before and failed to appreciate its logic. It is known that many full-time employees in industry and in many professions are either provided with motor-cars by their firms or have a clause in their contracts stating that a car is essential to their work. Therefore it is accepted that a car is essential to certain forms of non-medical full-time employment. Why then is it denied to any form of full-time medical practice?

I am particularly interested in the development of hospital accident treatment services. During the last decade a great volume of evidence has been published from clinical and research departments¹⁻⁸ proving that life can often be saved after serious injuries by very early and often massive blood transfusions, but only if surgery follows quickly and at the right time. Since serious accidents occur at any time of the day or night, this means that telephones and cars are as essential to the efficiency of the treatment services as they are to the quick ambulance transport of the seriously injured from the accident site. At the moment the Ministry of Health does not take this view. Yet, if a long view is to be taken, the Ministry must, on the evidence, consider not only the detailed planning and strategic siting of large accident departments but also the terms of service of personnel, at all levels, needed to staff such departments over the 24 hours of each day.

Our annual mortality toll from accidents is a large one. Accidents in 1953 accounted for 23% of all deaths among boys aged 1 to 4 years, 37% of all deaths among boys aged 5 to 14 years, and 42% of all deaths among boys aged 15 to 19 years. The vast majority of these deaths occurred in hospitals, days, weeks, even months after the accident. The published clinical and research evidence is that if the right quality and tempo of treatment are provided immediately after the accident, not only could our present mortality figures be appreciably lessened, but the long "illness of trauma" could often be prevented. Surely it is not illogical to consider that telephones and cars are quite essential to some forms of full-time medical practice. In a long-term view efficiency and overall economy are generally inseparable.—I am, etc.,

Birmingham.

Branch and Division Meetings to be Held

BOLTON DIVISION.—At Victoria Hotel, Hotel Street, Bolton, Tuesday, March 22, 8.30 p.m., annual general meeting.
BOURNEMOUTH DIVISION.—At Royal Victoria Hospital, Boscombe, Friday, March 25, 8 p.m., annual meeting, followed by ordinary meeting. Address by Dr. J. A. L. Vaughan Jones: "Rehabilitation of the Handicapped Patient."
BRADFORD DIVISION.—At Medical Society's Room, Bradford Royal Infirmary, Wednesday, March 23, 8.15 p.m., meeting. Address by Mr. A. Lawrence Abel: "Common Diseases of the Rectum and Anal Canal."
CHELSEA AND FULHAM DIVISION.—At Centre for Spastic Children, 61, Cheyne Walk, Chelsea, S.W., Friday, March 25, 8.30 p.m., meeting. Address by Dr. W. F. Dunham and another speaker from the Centre for Spastic Children. Members of the Kensington and Hammersmith Division are invited.

CHESTERFIELD DIVISION.—At Ophthalmic Department, Chesterfield Royal Hospital, Friday, March 18, 8.45 p.m., meeting. Clinical demonstration by Mr. H. C. Muirhead and Mr. Lumsden.
DARTFORD DIVISION.—At Nurses' Home, West Hill Hospital, Dartford, Thursday, March 24, 8.45 p.m., meeting. Dr. C. G. Baker: "Home Treatment of Coronary Thrombosis."

DONCASTER DIVISION.—At Parkinsons' Café, Friday, March 25, annual general meeting: (1) 8.30 p.m., Doncaster Medical Society; (2) 9 p.m., Doncaster Division, B.M.A.
EAST HERTS DIVISION.—At Haymeads Hospital, Bishop's Stortford, Thursday, March 24, 8.30 p.m., meeting. Address by Mr. V. J. F. Lack: "Menorrhagia."

EAST SOMERSET DIVISION.—At Bath Arms Hotel, Cheddar, Wednesday, March 23, 8.30 p.m., general meeting.
EASTBOURNE DIVISION.—(1) At the George Hotel, Hailsham, Wednesday, March 23, 7 for 7.15 p.m., dinner; 8.30 p.m., discussion to be opened by Dr. F. Gray: "The Difficulties of the Country Practitioner." (2) At the Gildredge Hotel, Friday, March 25, 8.30 p.m., combined meeting with Eastbourne Branch of the Pharmaceutical Society. Talk by Sir Hugh Linstead, M.P.: "Credits and Debits of the National Health Service."

GLASGOW DIVISION.—At Glasgow Regional Office, 234, St. Vincent Street, Glasgow, Wednesday, March 23, 8.30 p.m., annual meeting.
HALIFAX DIVISION.—At Royal Halifax Infirmary, Tuesday, March 22, 8.30 p.m., general meeting.

KENSINGTON AND HAMMERSMITH DIVISION.—At St. Charles's Hospital, Ladbroke Grove, London, W., Friday, March 25, 3.30 for 4 p.m., clinical meeting.
KESTEVEN DIVISION.—At George Hotel, Grantham, Thursday, March 24, 7.15 for 7.45 p.m., dinner. Address by the Lord Bishop of Lincoln, the Rt. Rev. Maurice Harland, on Spiritual Healing: "Doctor and Parson." Representatives of other denominations and non-members of the B.M.A. are invited.

MANCHESTER DIVISION.—At Fallowfield Hotel, Wilbraham Road, Manchester, Tuesday, March 22, 8.30 p.m., "Medical Forum." Subject: "The Future of the Profession." To be opened by Dr. S. Almond.
MIDLAND BRANCH.—At Birmingham Accident Hospital, Friday, March 25, 8.15 p.m., clinical meeting.

MONMOUTHSHIRE DIVISION.—At 20, Stow Hill, Newport, Thursday, March 24, 8 p.m., extraordinary general meeting.
NORTH MIDDLESEX DIVISION.—At Coroner's Court, North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, March 22, 8.45 p.m., annual general meeting.

OLDHAM DIVISION.—At Albion Club, Queen Street, Oldham, Monday, March 21, 9 p.m., meeting. Lecture by Dr. J. M. Greenwood: "Care of the Aged and Chronic Sick."

OXFORD DIVISION.—At Maternity Department Lecture Theatre, Radcliffe Infirmary, Oxford, Wednesday, March 23, 8.15 p.m., meeting. Talk by Mr. A. Dickson Wright: "Famous Operations in History."

SCARBOROUGH DIVISION.—At Scarborough Hospital, Thursday, March 24, 8.30 p.m., annual general meeting.

SHROPSHIRE AND MID-WALES BRANCH.—At Royal Salop Infirmary, Shrewsbury, Wednesday, March 23, 8 p.m., general meeting; 8.30 p.m., meeting of Clinical and Pathological Section. Talk by Dr. E. J. Richardson: "Radiotherapy of Certain Conditions." Illustrated by colour films and x-rays.

SOUTH ESSEX DIVISION.—At Cinema, Oldchurch Hospital, Romford, Friday, March 25, 9 p.m., film show. (1) "Gait." (2) "Trichomonal and Monilial Vaginitis" (colour and sound film).

SOUTH MIDDLESEX DIVISION.—At Anchor Hotel, Shepperton, Wednesday, March 23, 9 p.m., meeting. Address by Dr. Robert Forbes: "Recent Developments in Medical Litigation."

SOUTHAMPTON DIVISION.—At Polygon Hotel, Friday, March 25, 7.30 for 8 p.m., annual dinner dance.

SWANSEA DIVISION.—At Osborne Hotel, Swansea, Thursday, March 24, 7.30 for 8 p.m., informal supper. Lecture by Sir Arthur Porritt.

TOWER HAMLETS DIVISION.—At Mile End Hospital, Bancroft Road, E., Friday, March 25, 3 p.m., clinical meeting.

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tunbridge Wells, Tuesday, March 22, 8.30 p.m., meeting.

WANDSWORTH DIVISION.—At St. James' Hospital, Sarsfield Road, Balham, S.W., Tuesday, March 22, 8.30 p.m., A.G.M.

WEMBLEY DIVISION.—At Century Hotel, Wembley, Wednesday, March 23, 7.30 for 8 p.m., third annual dinner and dance.

WIGAN DIVISION.—At Lewis's Restaurant, Wallgate, Wigan, Thursday, March 24, 8.15 p.m., general meeting. 9.15 p.m., clinical meeting. Professor T. N. A. Jeffcoate: "Forceps Delivery."

WILLESDEN DIVISION.—At Willesden General Hospital (in the Rehabilitation Department), Harlesden Road, London, N.W., Tuesday, March 22, 9 p.m., meeting. Annual B.M.A. Lecture by Professor Ian Aird: "The Conjoined Twins of Kano." Members of the Wembley, Hampstead, and Paddington Divisions, members of the Willesden General Hospital Medical Society, the nursing staff of the Willesden General Hospital, the district nurses, and the local authority midwives are invited.

WOOLWICH DIVISION.—(1) At Woolwich Memorial Hospital, Shooters Hill, London, S.E., Friday, March 18, 3 p.m., meeting. Seminar on Paediatrics: Children with Feeding Disorders. (2) At Woolwich Memorial Hospital, Shooters Hill, London, S.E., Tuesday, March 22, 8.30 p.m., meeting. Annual B.M.A. Lecture by Dr. W. R. S. Doll: "Cancer of the Lung and Smoking." Members from local Divisions are invited.

ANNUAL MEETING: TORONTO, JUNE 20-24

REFORM OF THE ASSOCIATION'S
CONSTITUTION

BY

N. ROSS SMITH, M.B., Ch.M., F.R.C.S.

Reform of the Constitution of the Association is now being considered by a special committee set up by the Annual Representative Meeting in 1953 and by Divisions and Branches, to which a questionnaire has been sent with a request for suggestions. It might be helpful also for individual opinions on this subject to be expressed. The following are the personal views of one who has been a member of the Association for 35 years, Secretary of a large Division for six years and a representative for some 10 years, and was a founder member of the consultants and specialists organization.

The Need for Reform

The document (*Supplement*, October 23, 1954, p. 147) prepared by the Constitution Committee which accompanied the questionnaire is concerned only with the peripheral organization of the Association and proposes in effect that that should be left much as it is. Although recognizing that "there have been revolutionary changes in most fields of medical practice" in the half-century since the present constitution was established, there does not seem to be in this document sufficient appreciation of the need to alter the organization of the Association both at the periphery and the centre—for consideration of these cannot really be made separately—to meet the effects of those changes.

The decline in attendance at local meetings—a more sure index than the mere numbers of membership—since 1948 has, however, shown a loss of confidence of members that their interests can be maintained by the Association as at present constituted and that there can be effective action through their Divisions or Branches and the Representative Body. In reality, the changes which, with the coming of the National Health Service, have occurred in the employment and representation of the majority of the profession in Great Britain have already in the realm of medical politics and negotiation on terms of service brought about the side-tracking of the Divisions and Branches, the Representative Body, and the Council itself. Inevitably machinery has had to be set up for the representation of those engaged in each

of the three sections of the profession concerned in the N.H.S., so that the many special and detailed points affecting each section may be dealt with expeditiously.

The Autonomous Bodies

The old machinery of the Association was and is too slow, unspecialized, and inflexible to deal with the affairs of these great groups, which felt obliged to claim and obtain autonomy in determining policy and action for themselves, though using the Association's administration and remaining financially dependent on the Association. Indeed, the process of taking away from the Association responsibility for representation of a section of its members has gone even further in the case of hospital medical staffs, control of whose affairs has passed to a body, the Joint Consultants Committee, responsible to neither the Association nor the members of hospital staffs themselves, except in a minor and indirect way through the Central Consultants and Specialists Committee.

With this change of representation of those employed in the N.H.S. the proceedings of Divisions and Branches in any matters to do with the N.H.S. have been conducted in an atmosphere of unreality, as have those also of the Representative Body. It has been largely waste of time and effort for Divisions to formulate motions in this sphere for the Representative Body and for representatives to attend the meetings of that body to debate such motions. Although, according to the constitution, the Representative Body has remained responsible for the making of policy, its resolutions upon subjects concerning the N.H.S. are in fact passed to the appropriate autonomous committee for general practitioners, hospital staff, or public health officers, where they may or may not be endorsed. Further, the Council, as the executive of the Association, cannot seek to implement such resolutions nor do more than receive and discuss the reports of the autonomous committees and give or withhold its support for any action which may have been decided.

Bringing in the Autonomous Bodies

For practical reasons the autonomous organizations are essential. It is suggested, however, that what is needed in reform is to bring these bodies more closely within the Association both at the centre and the periphery, and thus to arrange the means whereby the Association may act more

effectively in the interests of the profession as a whole or of any section. For this, certain radical reforms both of structure and of function would be needed.

The Council

The geographical basis upon which the majority of the Council are elected can have nowadays little importance, the problems of the profession being mainly national. On the other hand, the autonomous General Medical Services and Consultants and Specialists Committees are represented in the Council by their chairmen alone and the public health service by two members. It is suggested that the geographical basis of representation should go and that the Council should be formed on a sectional basis by representation from the autonomous committees, the members in the Armed Forces, and of the Overseas Branches, together with members elected by the Representative Body whereby private practice and various other interests could be safeguarded and the corporate views of the Divisions represented.

In addition to its executive function, the Council should logically be given also authority to determine policy on all matters affecting the profession as a whole, replacing the Representative Body in this respect and strengthening its effectiveness as a medico-political machine. It should elect its own chairman and also the treasurer, and appoint the standing committees.

The Representative Body

The Representative Body has in reality already largely ceased to be the maker of policy it was designed to be under the present constitution. It has lost power in this respect to the autonomous committees. But apart from this the R.B. has become too large to be a sound deliberative assembly, at any rate on points of detail. Meeting only annually, or by special calling and at great expense, it is unsuited to the pace of modern affairs. In the course of three or four days of an annual meeting it considers hundreds of motions, all potentially points of policy, as well as reports of standing committees, official and financial statements, and observes certain formalities.

It is suggested that the need nowadays is for an Annual Conference of delegates from Divisions and Branches. This would receive and discuss the reports of Council and the autonomous and other standing committees, and consider resolutions for reference to the Council upon any subject of professional interest. The Conference would elect its chairman and deputy chairman, the president and vice-presidents of the Association, and a certain number of its members drawn from England, Scotland, Wales, and Northern Ireland to be members of the Council, and would make nominations also to the standing committees.

Like the present Representative Meeting, the Annual Conference should be held at the same place and time of year as the Scientific Meeting, preferably indeed on the same days at morning and afternoon times respectively. The Scientific Meeting, though providing through the publication of some of its proceedings in the *Journal* the best medium for reviews of current medical knowledge, has no longer, for specialists at least, its former importance. There are now associations in every specialty and it is easier and more valuable for the specialist to attend the meetings of his own association than the section of the Scientific Meeting. It is suggested that the Scientific Meeting should be reduced to three or four sessions for discussions upon subjects of general interest. The Annual Conference and Scientific Meeting, with the official and social events which accompany them, might thus be held within a period of three or four days instead of the nine they now occupy.

Local Reorganization

Integration of the organizations for general practitioners, hospital staffs, and public health officers should be made also locally in the executive committees of Divisions. The

main function of the Division must be, as the Constitution Committee states, "to foster and maintain personal contact between the members and to provide a forum for the discussion of their problems." It can "co-ordinate professional opinion in all fields of medical practice."

For these purposes the area of a Division should be determined primarily by the convenience of members to attend meetings. A secondary consideration is that the area should be coterminous with that of the local N.H.S. executive council, so that the general-practitioner membership of the local medical committee and of the Division would correspond. Size is a third consideration which need apply only in densely populated areas.

To co-ordinate professional opinion in medical politics, the committee of Divisions should be reconstituted in the same way as for the Council. It should contain members drawn from the local medical committees, from the local consultants and specialists group, and from the public health officers of the area, as well as members elected directly by the Division. The local consultants and specialists group could well be constituted within the Division. The local medical committee presumably could not be brought in this way into the Division, because it is a statutory body within the N.H.S., but it could nevertheless be represented in the committee of the Division.

The Second Tier

There appears to be no real need for a second-tier unit such as a Branch to exist between the Division and the Council, except perhaps in the great cities where there are many Divisions which may have need for co-ordination of their policies and actions. Elsewhere, some Branches at least have long ceased to be of value and to be active. Of the stated work of Branches there appears to be none which could not be done by the Divisions or from the headquarters or regional offices of the Association. Nor should there be a need for a permanent constitutional structure to enable neighbouring Divisions to meet in functional groups when they want to, and it is difficult to imagine the circumstances in which such a need would arise.

For hospital staffs there is the need, due to the regional administrative structure for hospital services, for a second tier between the periphery and the centre, which has already been met by formation of regional consultants and specialists committees. Unfortunately, hospital staffs suffer from too many tiers of committees dealing with their affairs—four, including the Joint Consultants Committee, or five if the Whitley Council Committee B is counted. Other sections of the profession should be warned of the delaying and stultifying effect of such a multiplicity of committees. Generally, the more tiers there are in an organization the more difficult it is to get anything done.

It is suggested that Branches are no longer needed in Great Britain, that their functions should be taken over by the Divisions. Any temporary need for co-ordination of neighbouring Divisions could be met, if need be, by arrangement through the headquarters and regional offices of the Association.

At present non-members of the Association are represented by the autonomous organizations, and may take part in their committees as much as subscribing members. It is hard to see why there should be this curious provision or that it really strengthens the negotiating power of the committees, as is claimed. One does not hear of it in the associations which protect the interests of other professions and of those in other occupations. If continued, this provision might make more difficult the closer integration of the autonomous organizations into the structure of the Association which has been suggested.

It is hoped that the views which have been expressed in this memorandum may be helpful and of interest to all those who are concerned to see that the Association shall be the integrated and strong body which it should be in the conditions of to-day.

Summary

1. Certain radical reforms of structure and function of the committees and assemblies of the Association are needed to integrate the autonomous organization for general practitioners, hospital staffs, and public health officers more closely into the Association, whereby it may act more effectively in the interests of the profession.

2. The Council should be constituted on a sectional basis, representative of the autonomous organizations, the Armed Services, the Overseas Branches, and the Representative Body.

3. The Council, like the committees of the autonomous organizations, should have authority to determine policy as well as action.

4. The Annual Representative Meeting should be replaced by a conference of delegates from Divisions and Branches, which would receive and discuss the reports of the Council and standing committees, elect certain officers, and consider as recommendations to the Council resolutions upon any subject of professional interest.

5. The Scientific Meeting should be held within the same period as the Annual Conference and should be abbreviated to three or four sessions of general interest.

6. The autonomous organizations should be integrated closely into the Association locally as well as centrally. The committees of Divisions should contain effective representation of the local sections of the autonomous bodies as well as members elected directly by the Division.

7. There is no need for a second-tier unit between the Division and the Council. The functions of Branches in Great Britain could be taken over by the Divisions. Any temporary need for co-ordination of neighbouring Divisions could be dealt with by the Headquarters or regional administrative officers.

ISLE OF MAN HEALTH SERVICES

A Commission appointed by the Lieutenant-Governor (Sir A. Flux Dundas) in August last to inquire into the working of the Isle of Man Health Services recommends that they should be retained in the present pattern. The Commission reports: "We are satisfied that the only method by which a substantial reduction in the expenditure of the health services could be effected would be by remodelling the entire service by eliminating some parts of it. We are satisfied that there is no desire whatever on the part of any responsible person or body of persons in the Isle of Man that this should be done."

The Commission recommends that a maintenance charge of 3s. 6d. a day should be made to patients in a general hospital if they stay longer than 28 days, but not to patients in a tuberculosis sanatorium. The charges should be capable of being remitted upon a certificate from the Social Services Board.

It is also recommended that the Legislature consider altering the law so as to ensure that, if a person is in a hospital through an injury caused by the use of a motor vehicle in such way that the patient recovers damages, the hospital may recover a reasonable sum for the cost of the services it has given.

The Commission considers that the doctors in the Isle of Man occupy a position which is in all respects comparable to the position of doctors in the United Kingdom, and therefore it is in the public interest that their remuneration and conditions should be similar.

The Secretary of State for Scotland has reappointed Dr. A. Lamont, Foyers, and Dr. T. Scott, Inverness, to the standing Advisory Committee on Health Services in the Highlands and Islands. Dr. R. Scott, director of the general practice teaching unit, Edinburgh University, has been appointed to the standing Advisory Committee on Local Authority Services.

INVESTIGATION OF EXCESSIVE PRESCRIBING

BY

D. F. HUTCHINSON, O.B.E., M.R.C.S., L.R.C.P.

Secretary of the Middlesex Local Medical Committee

Under paragraph 7 (10) of the Terms of Service for General Medical Practitioners, "A practitioner is required to order on a form provided by the Council for the purpose, such drugs and appliances as are requisite for the treatment of any patient." This applies, of course, only to prescribing doctors. Later in the Terms of Service, in paragraph 7 (14, d), it says, "A practitioner is required to answer any inquiries of the medical officer with regard to any prescription or certificate issued by the practitioner or to any statement made in any report under these terms of service." All general practitioners in contract with an executive council to provide general medical services under the N.H.S. are bound by these requirements.

The Central Investigation Unit

For examining prescribing costs the Ministry has set up what is known as the "Central Investigation Unit." To this unit goes information from the various pricing bureaux on the prescribing statistics of individual doctors in an executive council area, together with the areal average of the prescribing of all the doctors in that area. From these figures the Central Investigation Unit (staffed by employees of the Joint Pricing Committee) examine individual doctors' prescribing costs. Under actuarial advice, and in agreement with the General Medical Services Committee of the B.M.A., the Ministry normally refers cases for further investigation only where the practitioner's average exceeds by a substantial amount the average for his executive council area. The areal average includes the doctor's own high figures, and is therefore likely to be higher than an average which excludes his figures.

The Procedure for Investigation

For those cases where it is decided that further investigation of a doctor's prescribing is necessary, the Ministry, in agreement with the profession, has devised a procedure for use in England and Wales, and the following account of this procedure may be helpful to those unfamiliar with it.

R.M.O.'s Visit

As a first step, the doctor is sent a copy of the details of his prescribing for the month under review, and an appointment is made for a visit by the regional medical officer.

This visit is for a friendly and helpful discussion of the doctor's prescribing and for suggesting ways of reducing his costs towards the areal average, yet without detriment to the patients' treatment. Explanations given may, of course, make it clear that the prescribing has been entirely reasonable. There might, for instance, be some special peculiarity of the practice.

Where the regional medical officer's report shows that there is a likelihood of bringing a doctor's prescribing costs to normal no further action is taken. And it must be emphasized that in the past these cases may have arisen from prescriptions written as much as eight months previously; but this period of time is now in the region of three months.

The most recent year for which published figures are available is that which ended December 31, 1953, and the report of the Ministry of Health for that year stated that, as a result of information given by the Central Investigation Unit, regional medical officers visited some 328 general practitioners to discuss with them their prescribing costs. The report goes on to say, "In the majority of cases the

doctor has found, after discussion with the regional medical officer, that he can effect economies in his prescribing without prejudice to the treatment of his patients." It was necessary in only four cases to refer the matter to the appropriate local medical committee, and in all these cases the committee found there had been excessive prescribing.

Second Visit

The doctor's prescribing figures are reviewed three to six months after the regional medical officer's visit, and, if necessary, he is asked to make a further visit. In this case the statement of prescribing particulars sent to the doctor with a request for an appointment will always relate to a recent month. This second visit may be of a more formal nature, and, if so, the regional medical officer informs the doctor that he may, if he wishes, invite a representative of the local medical committee to be present. The regional medical officer asks the doctor to explain his figures and discusses with him a number of his prescriptions. A copy of the explanations he has given is subsequently sent to the doctor, and he is asked to alter this in any way he wishes and sign it.

Subsequent procedure depends on whether it is thought that the doctor's costs are likely to be further reduced satisfactorily; in which case he is sent a suitable letter, and his figures are checked again by the Central Investigation Unit after a period of about three months.

Where a doctor's prescribing remains unduly high, and there appears no likelihood of a reasonable reduction, the case is referred to the local medical committee under the National Health Service (Services Committees and Tribunal) Regulations, 1948, 12 (1). This reference is made only after careful consideration of the case by senior medical officers at the Ministry of Health and never at divisional level.

The Local Medical Committee

Regulation 12 (1) states:

"Where it appears to the Minister after an investigation of the orders for drugs and appliances given by a medical practitioner to persons on his list and of the accounts furnished by the practitioner for drugs and appliances supplied to these persons that there is a *prima facie* case for considering that by reason of the character or quantity of the drugs or appliances so ordered or supplied the cost is in excess of what was reasonably necessary for the proper treatment of those persons, the Minister may refer the matter to the local medical committee for their consideration."

The local medical committee's duty is to decide whether the cost of what was prescribed was in excess of what was reasonably necessary for the proper treatment of the patients referred to.

The local medical committee must first of all send the practitioner a notice indicating the matters on which a statement from him is required, and he must be given a reasonable opportunity of appearing before the committee or of submitting a statement. The Minister is also entitled to send a representative to any such hearing.

The local medical committee has to decide not only whether any cost has been incurred in excess of what was reasonably necessary but also, if there was excess, what was the amount of the excess. It must then inform the executive council, the practitioner, and the Minister of its findings, and may add a statement of any considerations to which, in its opinion, the council and the Minister should have regard in making any recommendation or decision on the withholding of money from the practitioner.

Appeal

The practitioner may appeal against the decision of the local medical committee by sending notice to the Minister within one month. The Minister is then required to appoint a person or persons (not exceeding three in number, and not being officers of the Ministry of Health), of whom at least one should be a medical practitioner, to hear the appeal. The Minister also has the right, if he is dissatisfied with the decision of the local medical committee, to set up a similar tribunal to re-hear the case.

The tribunal consists usually of a lay chairman and two practitioners, one of whom at least is a general practitioner in active practice and appointed from a panel nominated by the General Medical Services Committee of the B.M.A.

The Executive Council

When the executive council receives the findings of the local medical committee (or if an appeal has been made, the result of the appeal) the council is required, if the decision is that excessive cost has been incurred, to make a recommendation to the Minister on the amount of money that it thinks should be withheld from the practitioner's remuneration as a penalty. The Minister considers the recommendation of the executive council and directs the council to withhold such sum as he thinks fit.

The practitioner has the right to make oral or written representations to the Minister with regard to the sum which the Minister proposes to withhold. If oral representations are made the Minister must appoint the persons to hear them; he usually appoints a general practitioner from the panel mentioned above, with a regional medical officer and a lay officer from the Ministry.

MEDICAL PRACTICES ADVISORY BUREAU

ENTRY INTO PRACTICE

Some of the problems of entry into general practice are discussed in the annual report of the Medical Practices Advisory Bureau of the B.M.A. for the year ending 1954. Dr. L. S. Potter, the Medical Director, says that it is impossible to give exact figures of how many doctors are trying to get into practice. But an analysis of those registered with the Bureau gives a fairly reliable indication of the present position. Of those seeking openings, a proportion cannot hope to compete on fair terms owing to age and other factors, and quite a number are merely wishing to improve their permanent prospects, and are particular as to the kind of opening for which they will apply. Nevertheless, the report states, the number of young practitioners in "blind alley occupations" is much too great. The number of men of all ages on the books of the London office of the Bureau seeking to be partners, assistants, or trainees is about 850. Just under half (414) are only seeking posts offering the status of principal, and of these only 30% are prepared to go anywhere or to any type of practice. Of the remainder, all but an insignificant number will only consider an opening in the South (Severn-Wash line), and 50% will only consider country or country town practices.

Restrictions imposed by principals, such as nationality and religion, are not nearly so important as age as factors making entry into practice difficult. The Bureau reports that after 35, and certainly after 40, difficulties become greater every year. Seventy per cent. of principals stipulate that introductions should be limited to those not over 35. Experience and qualifications are not so important, though where a view is offered the prospective candidate must have some G.P. experience to compete with others. A previous appointment in midwifery is of value. Higher qualifications are no handicap, but on the other hand they do not confer any advantage (except in a very few cases).

Assistantships

The following table shows the number of assistants and trainees successfully introduced by the Bureau.

	1953	1954
Prospective partnerships (Assistants with view)	175	139
Assistants and Trainees	483	449

The proportion of trainees was about 40% of the total of assistants and trainees.

All the figures obtainable by the Bureau suggest that the number of so-called permanent assistants is falling. There is, however, an apparent anomaly in that the records of

Bureau over the past four years, which cover the period before and after the impact of "notional lists," show that number of offers with a view to partnership has gradually declined whereas the number of openings for assistants out view has steadily increased. Experience during the year, the report says, confirms the view held in the previous report that there is an increasing tendency among principals seeking partners to withhold the firm offer of a partnership. The reason for this, Dr. Potter thinks, is that it is difficult to give notice to an assistant who proves unacceptable, who is unwilling to accept the terms of a provisional partnership, when no view has been offered. If no promise has been made, the motives of the principal are unlikely to be questioned. The Bureau considers that this practice is unsatisfactory and even potentially dangerous to the assistant, for to attain the status of a principal is at present difficult that an assistant may feel bound to accept terms of partnership which he does not regard as satisfactory rather than risk a fresh start. It is a great advantage for an assistant to know the main terms of the prospective partnership before entering on the probationary period.

Unemployment

Unemployment is frequently stated, says the report, that there are large numbers who cannot obtain appointments or openings in general practice and that this has been taken as implying there is widespread unemployment among doctors. The fact that the Bureau does not support this. It would appear that there is very little actual unemployment, including those "resting" between appointments and those who, because of age, physical handicap, or other disability, must perforce rely on casual or temporary appointments, it is estimated that the number out of work involuntarily is rather less than 5% and that this percentage is not rising.

In January, 1954, the Bureau was asked to introduce an assistant (without view) to a partnership in an industrial area on the outskirts of Birmingham. The salary offered £1,100 per annum (including car allowance), and accommodation for a single man was stated to be available. During the year 140 introductions have been made, but the post remains vacant for lack of applicants.

A doctor in an industrial area in East London asked the Bureau to introduce an assistant. The minimum salary offered was £750 plus £150 car allowance, together with a house and garage rent and rates free. These particulars have been sent to nearly 200 applicants, but after a fortnight the principal has only received two inquiries.

The Medical Director of the Bureau thinks that these figures, although admittedly of vacancies in less attractive areas, are a convincing answer to the statement that doctors cannot get posts in general practice.

ADVANCE PAYMENT TO DOCTORS

Under the scheme for the distribution of general practitioners' remuneration it is possible, in certain circumstances, for payments to be made to doctors in advance. A doctor applying to be paid in advance is required to satisfy the executive council that he would be in difficulty or hardship if he had to wait until the normal time of payment at the end of the quarter.

After consultation with the G.M.S. Committee of the B.M.A., the Minister has agreed that it should be open to executive councils to accept as satisfactory evidence a doctor's statement of the nature of his hardship or difficulty without insisting on detailed proof. The doctor may also state at the same time the number of quarters during which he expects his difficulty or hardship to continue, and suggest to executive councils that normally they should accept the doctor's application as being effective for the number of quarters indicated.

Ministry circular (E.C.L. 13/55) has been sent to all executive councils advising them of this new agreement.

Scottish News

CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE (SCOTLAND)

A meeting of the Central Consultants and Specialists Committee (Scotland) was held at the B.M.A. Scottish Office, Edinburgh, on March 7, with Dr. J. G. M. HAMILTON in the chair.

It was reported that the Joint Consultants Committee (Scotland) had agreed to discuss with the Department of Health the difficulties to which the Tuberculosis and Diseases of the Chest Subcommittee had drawn attention in connexion with the secondment to special hospitals of nurses in training.

Dr. HAMILTON reported that the Joint Consultants Committee (Scotland) had decided that in view of the probable reorganization of hospital medical staffing no useful purpose would be served meantime by further approaches to the Department of Health in connexion with future reviews of S.H.M.O.s; the Committee agreed.

The Committee considered and approved the report and recommendations of the Chairman's Subcommittee on the Structure and Organization of Medical Staff Representation in Scotland. The recommendations were:

- (1) That no change be proposed in the present structure of hospital medical staff representation in Scotland.
- (2) That it be recommended to the Joint Consultants Committee (Scotland) that the number of members elected to the Committee by the Central Consultants and Specialists Committee (Scotland) be increased from four to six.
- (3) That the above recommendations be referred to the regional committees for consideration before further steps are taken.

It was agreed that the report of the Chairman's Subcommittee be sent to all regional committees for consideration and comment.

Structure of Hospital Medical Staffing

The Committee had before it for comment the revised report of the Medical Staffing Subcommittee of the Central Consultants and Specialists Committee (Strachan Report), along with its own Medical Establishments Subcommittee's commentary on hospital staffing and the remuneration of hospital doctors. The latter criticized certain features of the Strachan proposals and set out the Subcommittee's own recommendations. Of these recommendations, the one which differed most from those of the Strachan Report was that the description of salary grades by title should be abandoned and replaced by a system of numbered salary scales or grades within the total range, from which would be selected, by a procedure approved by the profession, the one appropriate to a particular appointment. A number of advantages were claimed for this arrangement.

Among the Subcommittee's recommendations are the following:

- (1) There should be a comprehensive review of the present consultant establishment.
- (2) There should be a ratio of appointments in the two "grades" below consultant appointments, so designed that their holders all have the opportunity of successful application for senior appointments when they have acquired the necessary skill and experience.
- (3) Appointments in the higher of these two grades should be of indefinite tenure and those in the lower of limited tenure, perhaps five years, and renewable where the circumstances of the hospital make this appropriate.
- (4) The full appointments procedure, applicable to consultants, should apply to appointments in those two grades.
- (5) It should be emphasized that the young doctor must accept full responsibility for planning his own training and career.

After a long debate the Committee adopted the commentary of the Medical Establishments Subcommittee and agreed to forward it, together with a summary of the proposals, to the Central Consultants and Specialists Committee.

Dr. HAMILTON gave a brief summary of the meetings of the Joint Consultants Committee (Scotland).

The Committee agreed to ask the Joint Consultants Committee (Scotland) to propose to the Department of Health that regional consultants and specialists committees should be amongst the organizations consulted in connexion with nominations for membership of boards of management.

The Committee welcomed the memorandum prepared by Dr. MACARTHUR on the relation of the general practitioner to the hospital service, and in particular the proposal that the trainee general practitioner scheme should be extended to include a period of training in the hospital service.

GENERAL MEDICAL SERVICES SUBCOMMITTEE (SCOTLAND)

A meeting of the General Medical Services Subcommittee (Scotland) was held on March 8, 1955, with Dr. C. J. SWANSON in the chair.

It was reported that the representations made on the allocation of the mileage fund to practitioners in the Highlands and Islands area had been successful, and that the General Medical Services Committee had now agreed that the total amount should be increased by the sum of £20,000.

The General Practitioner and the Hospital Service

The Joint Subcommittee of the General Medical Services Subcommittee (Scotland) and the Central Consultants and Specialists Committee (Scotland) is still considering practical means of implementing some of the recommendations contained in the Scottish Health Services Council's Report on the General Practitioner and the Hospital Service. Consideration is being given to the possibility of extending the trainee general practitioner scheme to include some training in the hospital service. In connexion with the latter proposal, a memorandum was prepared by Dr. J. C. MACARTHUR, and a draft scheme was received by the G.M.S. Subcommittee (Scotland) from Aberdeen Local Medical Committee.

Notification of Change of Name

With reference to the suggestion that registrars of marriage should notify executive councils of change of name on marriage, a reply has been received from the Department of Health that the Registrar General's office is not prepared to accept this additional obligation. As the Subcommittee, however, is anxious to reduce inflation as much as possible and is not prepared to accept the decision of the Registrar General's office, it was decided to ask the Department to approach the Registrar again with a request that further consideration be given to the proposal.

Form E.C.10A

The Subcommittee has agreed to the Department's proposal that in cases where drugs governed by the D.D.A. Regulations are ordered on Form E.C.10A, either the order form should be completed in duplicate by means of a carbon copy or the practitioner should sign the chemist's register.

Scottish Medical Practices Committee

The Subcommittee has been informed that the Secretary of State has appointed Dr. BENJAMIN HUTCHISON, of Cambuslang, a member of the Scottish Medical Practices Committee in place of Dr. W. JOPE, Blantyre, whose term of office expires on March 31. The Secretary of State has also appointed Mr. STEWART E. BELL, Advocate, Edinburgh, as the legal member of the Committee in place of Mr. SHEWAN, Q.C., who has resigned.

The Subcommittee recorded its appreciation of the services rendered by Dr. Jope as a member of the Scottish Medical Practices Committee since its inception.

Other Business

Negotiations are still proceeding with the Department of Health on the amendment of Form R.M.2(A) dealing with reference of cases to regional medical officers. The Subcommittee is also negotiating with the National Union of Mineworkers regarding modification of the certificate used by their members in connexion with claims for benefit in respect of pneumoconiosis.

OCCUPATIONAL HEALTH

A short meeting of the Occupational Health Committee was held at B.M.A. House on March 16, with Dr. J. A. L. VAUGHAN JONES presiding. A discussion took place on the procedure to be followed at the forthcoming conference of Advisory Councils on Occupational Health, to be held on April 20, and the construction of the agenda.

On the report that the Council of the Association had appointed a Committee on Medical Education to consider the proceedings of the First World Conference and the programme for the Second, Dr. VAUGHAN JONES suggested that some specific representation of occupational health would be desirable, also that the Association of Industrial Medical Officers should be asked to nominate a representative.

It was pointed out that Dr. H. Alexander, a member of the Occupational Health Committee, had been appointed to the new committee by the Council and that there were other appointees such as Dr. Charles Fletcher, who had considerable occupational health interests. It was agreed, however, on the motion of the CHAIRMAN, seconded by Dr. J. B. WRATHALL ROWE, to suggest to the Council that the A.I.M.O. be invited to nominate.

Industrial Health and the Medical Curriculum

It was also agreed that representations should be made to the Council on the announced intention of the General Medical Council to consider the revision of the recommendations for the medical curriculum which were adopted in 1947. The Association's views on this revision had been invited by the General Medical Council, and the Chairman felt that the place of industrial health in educational facilities should receive its proper emphasis in such discussions.

Dr. ROWE said that he regarded industrial health as a branch of general practice. It was dealt with by the general practitioner to a greater extent than by any other branch of the profession, and the proposed new curriculum should be viewed from that aspect as well as others.

It was agreed to set about framing proposals, and the question was placed in the hands of the existing D.I.H./D.P.H. subcommittee reinforced for the purpose.

Information was placed before the Committee on the various regulations and courses for the diploma in industrial health of the Royal Faculty of Physicians and Surgeons of Glasgow, the English Conjoint Board, and the Society of Apothecaries of London.

The Committee considered a private Member's Bill, the Non-Industrial Employment Bill, which proposes to extend the statutory minimum standards of conditions of employment which now apply to miners, factory workers, and quarrymen to categories of employment outside the scope of these Acts. These include agricultural workers, office and shop workers, transport workers, employees in the catering trades, and many others. The Committee agreed that no exception could be taken to what was proposed in the Bill.

On the question of administration of morphine by nurses in industry, which had been before the Committee on previous occasions, it was stated that a further meeting was being arranged with the Royal College of Nursing.

It was announced that Dr. R. S. F. Schilling had accepted the invitation to give the 1956 Mackenzie Industrial Health Lecture.

WELFARE IN LONDON

A new book published by the London County Council, *Welfare in London*,¹ tells the story of the L.C.C.'s welfare service as it is to-day. New ideas are being developed for the replacement of the old institution by smaller and more homely places where old people can be cared for in pleasant, comfortable surroundings. The latest development is an experiment to be made in Hackney to combine specially designed flats for old people with a small welfare home. Of interest, too, are the arrangements to help unmarried mothers and their children to find security and happiness.

The booklet says that a great problem facing Londoners since the war has been homelessness, and reports that 11,000 families have been helped through temporary accommodation in homes and half-way houses. Also described is the pioneer scheme for helping and training difficult families whose way of life is such that no landlord will accept them.

Other new services are those provided for the physically handicapped in their own homes. For many years a great deal has been done for blind people, and now similar help, including the provision of clubs, is being given to those with other handicaps such as spastics, haemophiliacs, and poliomyelitis cases.

The book is illustrated by selected photographs, and detailed facts and figures for the whole welfare service are given in several appendices.

INDUSTRIAL HEALTH ADVISORY COMMITTEE

The first meeting of the Industrial Health Advisory Committee appointed by the Minister of Labour and National Service (*Supplement*, December 11, 1954, p. 223) took place on March 18. The Committee is to advise the Minister on measures to further the development of industrial health in work-places covered by the Factories Acts. Among the practical tasks before the Committee are the determination of priorities for action in the field of industrial hazard, including dust and fumes, dermatitis, and radioactivity; the method of conducting surveys; advice on problems of research and investigation; and methods of organizing group health services for small factories.

The Minister of Labour is chairman of the Committee, and Sir Guildhaume Myrddin-Evans, deputy secretary of the Ministry of Labour, vice-chairman. The medical members are Professor R. E. LANE (Royal College of Physicians, in agreement with the Royal Colleges of Surgeons and Obstetricians and Gynaecologists and the Society of Apothecaries); Dr. J. A. L. VAUGHAN JONES and Dr. L. G. NORMAN (British Medical Association); Dr. R. S. F. SCHILLING (Association of Industrial Medical Officers); Dr. R. NIGHTINGALE (Association of Certifying Factory Surgeons); Dr. R. S. AITKEN (Committee of Vice-chancellors and Principals of the Universities of the United Kingdom); Dr. T. BEDFORD represents the British Occupational Hygiene Society, and Mrs. I. G. DOHERTY the Royal College of Nursing. The eight lay members are representative of the British Employers' Confederation, the T.U.C., nationalized industries, and local authorities.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

GENERAL MEDICAL SERVICES COMMITTEE

FEES FOR TEMPORARY RESIDENTS

A meeting of the General Medical Services Committee was held on March 17, with Dr. A. TALBOT ROGERS in the chair.

A lengthy discussion took place on fees for temporary residents. The Ministry had referred to the Committee for its comments an explanatory draft E.C.L., which stated that some difficulty had apparently arisen over the phrase "in regular attendance." The Ministry suggested that these words applied generally to places where 10 or more people resided temporarily, at which the doctor had an arrangement to attend at a fixed time and place, irrespective of any request to treat any particular patients, and where the doctor had been provided with some surgery facilities. Dr. WAND suggested that the words "at a fixed time and place" be omitted; the "arrangement to attend" would govern all genuine cases. This proposed alteration was agreed to.

Another difficulty related to the wide difference between the full fee (17s.) and the fee at the lower rate (5s.). The Ministry stated that it was open to an executive council, in consultation with the local medical committee, to decide, when using their discretion, that, for example, the first patient be treated at the full rate and other patients seen on the same occasion at the lower rate. After some discussion, during which the DEPUTY SECRETARY suggested that all holiday camps should be regarded as qualifying for the lower fee, at a rate intermediate between the present 17s. and 5s., on the ground that a distinction should be drawn between such camps and patients who called in a doctor under the temporary-resident arrangement, it was agreed in principle—the phrasing to be worked out later—again on the suggestion of Dr. WAND, that the option should be left to the local medical committee of determining full payment for the first (the number to be decided later) patients treated at any one particular time, the remainder to be at the lower fee.

Holiday Camps

Before these decisions were actually taken Dr. A. D. F. MENZIES, of Skegness, chief medical adviser to Butlin's Ltd., attended by invitation and gave an account of the medical arrangements at Butlin's camps. He said that it remained with the executive council and the local medical committee to propose any desired alteration of the regulations, but after it had been decided in Lindsey that at the holiday camp in Skegness the higher fee should be paid, the Ministry turned down the proposal and the fee remained at 5s. At some camps in the country 17s. was paid and the lower fee at others. Another point was that no mileage was paid for temporary residents in the Lindsey area, and Butlin's camp was three or four miles from the town of Skegness, a town which had a population of 12,000, with eight doctors, who depended to a large extent on temporary residents. He gave the Committee a number of figures relating to Skegness and other camps. In August, 1954, the busiest month of the year, 327 campers and 230 members of the staff were seen by doctors at their surgeries (the staff was 90% local and most of them probably on permanent lists); the number of visits of doctors to the chalets was 41 for campers and 4 for staff, and there were 48 visits of doctors outside surgery hours. Twelve campers were admitted to hospital and nine to the sick bay. Dr. Menzies added that he felt that the seaside doctor had had a raw deal. It might mean three miles out and return to see a case for 5s.

After Dr. Menzies had withdrawn the Committee discussed whether the differentiation between the higher and lower fee could be justified, and, if so, whether the two figures (17s. and 5s.) should not be brought nearer together. It arrived at the conclusions stated above with regard to the proposed E.C.L., and agreed that the whole matter be discussed with the Ministry.

Sectional Representation in Representative Body

This question, at the request of the Constitution Committee, was discussed in some detail. The CHAIRMAN said that general practitioners had never felt the need for sectional representation but would not oppose such representation of other sections of the profession if the Constitution Committee so recommended, though in that event they would reserve the right to sectional representation for themselves also. Dr. D. F. WHITAKER said that the wheel had come full circle since the turn of the century, when general practitioners complained that they were not getting a fair deal in the Association; now it was the consultants who were saying that they were not getting their proper representation. Dr. O. C. CARTER said that the Representative Body was the mouthpiece of the Association, and he hoped its principle of democratic election would continue. Dr. J. A. PRIDHAM said that he thought it would be a pity for the Committee to make any decision; it should await the report of the Constitution Committee, while reserving its rights.

The Committee made no definite decision, on the understanding that, should sectional representation be accorded to other branches of the profession, the matter would be reconsidered.

Specially Expensive Drugs

Dr. C. F. R. KILLICK, chairman of the Rural Practices Subcommittee, brought forward a recommendation for a particular case to be taken up with the Ministry of Health. This turned upon the principle that where a doctor supplied a drug in combination with other drugs not included in the special list it should be permissible for him to make a claim for that portion of the preparation which was included in the special list for which he was entitled to payment over and above the dispensing capitation fee. One member in the North Riding, who had prescribed caps. epanutin and phenobarbitone and had claimed for that portion of the cost relating to the former, had had his claim rejected. The CHAIRMAN considered it a good case for taking up with the Ministry.

It was reported that negotiations were continuing with the Association of the British Pharmaceutical Industry and the National Pharmaceutical Union on the question of discount on drugs.

Care of the Aged

Dr. H. D. CHALKE presented a report of the Geriatrics Committee, a report prepared by a committee of the Council in which members of the G.M.S. Committee had collaborated.

Dr. K. S. MAURICE-SMITH said that he was glad to note the emphasis on the desirability of keeping old people in their own homes as long as possible. In East Anglia the only service which appeared to be functioning smoothly so far as old people were concerned was district nursing; elsewhere the Welfare State was largely a paper matter, at least in rural areas. He suggested that old people might get meals through the school health service. Dr. MAX SORSBY drew attention to what he considered to be one serious omission from the report—namely, the question of ophthalmic services. Many old people were suffering from long-standing glaucoma and cataract, and their partial or entire blindness was not discovered. Dr. CHALKE said that there should be a nation-wide survey to find out exactly the dimensions of the problem of the aged.

It was agreed that the report, with a proposal for a slight verbal alteration, should go to the Council with the Committee's approval.

Service Committee and Tribunal Regulations

Dr. H. G. DAIN presented the report of a subcommittee which has been working for a very long time on a review of the constitution and procedure of medical service committees. Dr. Dain said that he was very satisfied with this report, whereby he thought both service committees and the

doctors concerned would get a fair and reasonable showing. If this procedure was carried out properly there would be no complaint that injustice was likely to happen in these inquiries. This new machinery should last for ten years or longer without need for further revision. He paid a tribute to the work of the Deputy Secretary (Dr. Stevenson), and also to Mr. Scrivener and Mr. Currer, past and present clerks of the Committee.

The report contained as many as 23 recommendations, but so well had the subcommittee done its work that they were now all agreed by the parties concerned. The CHAIRMAN expressed the great gratitude they all felt to Dr. Dain for the work he had done in this connexion, and also commended the help received from the representatives of the dentists and the pharmacists on the subcommittee. The report was approved for submission to the Annual Conference in May.

Assistants in General Practice

Dr. BRUCE CARDEW presented the revised report of the subcommittee on assistants in general practice. The report had its "first reading" at the previous meeting, when it was referred for comment to the Assistants and Young Practitioners Subcommittee, which had welcomed the recommendations as a first step in the solution of a problem which it proposed to continue to study (*Supplement*, March 5, p. 69). Dr. Cardew said that he was very glad to have this decision. He fully agreed that the report did not represent complete finality or close the door to subsequent proposals. But it was, in his view, a practical solution to the problem. The action of local medical committees would determine to a very large extent the effectiveness of the proposals.

Dr. FRANK GRAY, chairman of the Assistants and Young Practitioners Subcommittee, said that the report was examined with great care, and the four recommendations were considered separately. It would be wrong to suppose that they were satisfied that this was a final solution of the problem. Certain doubts were expressed, but it was appreciated that something had been done towards a solution.

Dr. L. RUSSELL, representative of the young practitioners on the parent committee, was invited to speak but did not do so, and the report was approved as a document to go to the Conference.

Other Business

For the subcommittee which had been set up to consider the report of the Central Health Services Council's Committee on general practice within the health service (Cohen Committee), Dr. WAND reported that comments from local medical committees had been very carefully considered, and such action as was necessary would be taken at the proper time.

Referring to the Minister of Health's decision (*Supplement*, February 26) to appoint a small committee to report on the future intake of medical students, the CHAIRMAN said that the personnel of the committee appointed by the Minister and the Secretary of State for Scotland was, he thought, satisfactory from the general practice point of view. Two of its members, Dr. J. T. BALDWIN and Dr. A. B. DAVIES, were members of the former Working Party. It was hoped that the precedent of the Guillebaud Committee would be followed and that each principal committee of the Association would draw up a memorandum, and thus through a steering committee and the Council an authoritative presentation of the views of the Association could be made.

A compendious document was laid before the Committee showing the result of the sample inquiry undertaken by the Inland Revenue into doctors' expenses. The figures had been worked out in 16 groups according to size and type of practice. The Committee remitted the study of these figures to its expert advisers and to a special subcommittee appointed for the purpose.

Correspondence**Springfield Maternity Home, Blackburn**

SIR,—The letter from Blackburn general practitioners (*Supplement*, March 5, p. 71) might be interpreted as indicating that Mr. Dewhurst, Secretary to the Blackburn and District Hospital Management Committee, acted arbitrarily and on his own initiative in the closing of Springfield Maternity Home. The letter warns against the "tendency to subordinate the doctor's clinical judgment to the irresponsible dictates of the lay administrator."

In justice to Mr. Dewhurst, and without further comment on the accuracy or comprehensiveness of the account as given in the letter referred to, we wish to make it perfectly clear that in visiting Springfield Maternity Home on January 7, 1954, and in interviewing patients, Mr. Dewhurst was in the process of carrying out the decision of the Regional Hospital Board to close the home; a decision which followed the H.M.C.'s recommendation to the same effect. His visit on the day in question was at the request of the first two signatories to this letter and with the concurrence, from a medical point of view, of the third signatory.

Mr. Dewhurst is a most responsible and capable officer, with a lifetime's experience of hospital administration, and enjoys the complete confidence of his Committee.—We are, etc.,

WILLIAM E. WOOLLEY,
Chairman, Blackburn and District
Hospital Management Committee.
W. BRIGGS,
Member, Blackburn and District
Hospital Management Committee.
H. S. WATERS,
Senior Consultant Obstetrician
to the Hospital Management Committee

Blackburn.

Practice in the Highlands and Islands

SIR,—As Chairman of the Highlands and Islands Practitioners Subcommittee of the General Medical Services Subcommittee (Scotland), I read with considerable surprise the statement by Dr. Alasdair McL. Smith in the *Supplement* of March 5 (p. 71) that "no compensation was paid to the Highlands and Islands practitioners." Dr. Smith's letter was discussed at a meeting of the Highlands and Islands Practitioners Subcommittee on March 15, when I was asked to write to you expressing the Subcommittee's dissociation from the views expressed by Dr. Smith. The Subcommittee wish it to be made quite clear that Dr. Smith was writing as an individual and had no authority whatsoever to create any impression that he was representing the views of the Subcommittee. The Medical Practices Compensation Committee took great care to deal fairly with practitioners from the Highlands and Islands. The Scottish member of that Committee, a senior practitioner with wide knowledge of practice in Scotland, undertook the major part of the work of investigation on behalf of the Committee.

Practices in the Highlands and Islands fell into two main categories. First, those in which the doctor was not under agreement with the Secretary of State but received a payment from the Highlands and Islands Medical Service Fund in respect of mileage for insured persons. These doctors were not restricted in the scale of fees which might be charged to non-insured patients, and their practices, being saleable, were assessed for compensation in the ordinary way. Secondly, those under agreement with the Secretary of State to provide medical services for all persons in their areas (both insured and non-insured). A limit was imposed in these areas on the fees which might be charged to crofters, cottars, and persons in similar economic circumstances. These practices, being virtually appointments, created more difficulty, but each case was considered individually and on its merits.

There was a right of appeal from the decisions of the Medical Practices Compensation Committee, and some of

THE PRICE OF STANDARD DRUGS

Following the Ministry of Health's investigation into the margin of profit, turnover, and capital employed of a sample of 19 pharmaceutical manufacturing companies with an annual turnover of about £24m. (see *Supplement*, February 12, p. 46, and February 26, p. 66), the Association of British Pharmaceutical Industry has received a letter from the Ministry saying that the investigation does not suggest "that the general level of prices which manufacturers receive for unbranded drugs and preparations is excessive." The letter goes on to say that the Ministry is satisfied "that there is at present no occasion for the Health Departments to seek to influence the level of prices received by manufacturers for unbranded standard drugs and preparations, or the earnings which are being obtained in wholesale distribution."

Notes and News**HOSPITALITY**

A French doctor's daughter, aged 18, would like to stay *au pair* with a medical family in Kent or Surrey for three months from August to October in return for helping to look after children.

A Portuguese doctor would like to arrange an exchange for his son, aged 11, with a British boy during July and August.

A German doctor and his wife, living in a small town in Southern Germany, would like to arrange exchange hospitality with a Scottish doctor and his wife for a few weeks. The German doctor would like to visit Scotland in 1956, preferably at the time of the Edinburgh Festival, and the Scottish doctor could visit Germany in 1955.

There are a few other outstanding requests which have been received from France, Austria, and Germany regarding hospitality exchanges.

Would anyone interested please communicate with Brigadier H. A. SANDIFORD, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

The new increased pension and benefit rates will shortly be payable (*Supplement*, January 29, p. 31). From May 16 the maternity and home confinement grants will be raised to £10 and £4 respectively and the maternity allowance to 40s. weekly; from May 19 sickness and unemployment benefits are to be increased from 32s. 6d. to 40s., and the industrial injury benefit from 55s. to 67s. 6d.

those practitioners not eligible for compensation received the privilege of having their services in the Highlands and Islands regarded as qualifying service for a pension under the National Health Service Act. Dr. Smith in his letter implies that the Department of Health have not been as co-operative as they might have been, and I feel that this impression should not be allowed to go unchallenged. It is fair to say that, when we have approached the Department in connexion with any difficulties that may have arisen in the Highlands and Islands areas since the inception of the National Health Service Act, we have always been met with understanding and a readiness to co-operate.—I am, etc.,

Aberfeldy, Perthshire.

C. J. SWANSON,
Chairman, General Medical Services
Subcommittee (Scotland).

Separate Prescriptions

SIR,—I doubt the wisdom of the present strict enforcement of Clause 10 of our Terms of Service, by which each patient must have a separate Form E.C.10, if it is applied to several young members of a family suffering from an epidemic complaint. The reasons are as follows: (1) It is certain that "other members of a family" will receive doses out of the sick person's bottle if they produce the same symptoms. In the seasons of coughs and colds they nearly always do. Therefore it is immaterial what names are written on Form E.C.10. (2) If members of a family who cough once to the patient's thrice demand and receive separate bottles of medicine there will be a 200% to 300% increase in the legion of half-empty bottles of medicine lying around in family cupboards. One acid commentator in the press has noted already that there is enough unused medicine in this country to float a battle fleet. Why, then, should we be encouraged to prescribe four bottles of mist tuss. nig. when one communal bottle will suffice? Why must we add waste to waste and scrape the very bottom of an empty public purse? Cannot Clause 10 be amended? —I am, etc.,

Plymouth.

LESLIE DEXTER.

Prescribing Averages

SIR,—The figures for my prescribing average for November sent to me by the executive council and based on a report from the Joint Pricing Committee for England may be of some interest, particularly to anyone "in danger."

Owing to illness, I was not doing full work in November, but even so I was astonished to find I had only issued 12 scrips in the month, and simply staggered that they were priced at 28s. each. It seemed that I deserved a gold medal for economy of numbers and a heavy fine for extravagance per scrip. A protest brought an amendment that the 12 scrips should have been 120 and the 28s. should have been 3s. But investigation showed that I had paid 150 visits and done most of my usual surgeries.

It hardly sounds convincing that about 30 of these 150 visits and four weeks' surgeries produced no scrips. But when the revised figures stated that my average number of scrips per patient on list are over three times those of a partner whose list is nearly identical, and just three times those of the third partner, it begins to appear that statistics can prove anything.—I am, etc.,

Kington, Herefordshire.

G. W. DRYLAND.

Furthering Professional Interests

SIR,—In the *Supplement* of March 5 (p. 70) there appeared a few paragraphs under the heading "Furthering Professional Interests."

I would like to comment on the first of the three resolutions affecting dentistry which came before the last Annual Conference of the Management Committee of the Executive Councils Association (England). This proposed to increase the contributions payable by many patients towards the cost of dental treatment. I do not know what type of treatment the Committee had in mind. If it was relating to the cost of some types of prosthesis I have some sympathy for it,

but if it was an increased charge for conservative treatment and relief of pain I consider it very wrong. To draw an analogy, if a patient is suffering pain from a fishhook in a finger most would think it outrageous if his N.H.S. doctor should have to demand a fee in his surgery before he could treat the condition. What of an acute alveolar abscess? Does this not require urgent treatment and should the individual be required to pay? (It is only fair to state that certain classes are exempt from a charge. This concession was due to good work put in by B.D.A. officials.)

Regarding conservative treatment most dental practitioners in the National Health Scheme will have patients who should be attending 6-monthly for inspections who do not do so now under 18 months or 2 years. By that time certain teeth are often difficult to save (if at all) but, what is more important, are more expensive to save (a crown or gold inlay costs the taxpayer more than an amalgam restoration).

I submit that the £1 charge is a deterrent, and to think of increasing this charge is, in my view, the absolute end. I would like to feel that any delegates to councils debating future policies consider very carefully whose interest is being served best. It is surely in the interest of all that good regular treatment be provided, but above all that pain should be relieved promptly.—I am, etc.,

London, S.E.9.

N. P. BRONSDON.

Assistants in General Practice

SIR,—The plight of assistants in general practice and the shortage of hospital staff have produced a flood of correspondence in the *Journal*. The impression gained from all these letters is a pathetic one. The cry goes up from the unemployed pre-registered doctor, from the disillusioned assistant, is carried on by the disgruntled registrar, and finished off by the disappointed consultant who has not got his merit award. These pressing problems have received the widest publicity in the *Journal*, many recommendations have been made, but little or no action has been taken.

In a letter in the *Supplement* (August 14, 1954, p. 94) I suggested the establishment of rotating appointments, similar to the American intern system. Such a scheme has now been introduced by the Oxford Regional Board (*Supplement*, January 29, p. 30) and deserves earnest consideration. These posts are tenable for from two to four years and the holder will serve for approximately six months in each of the major departments (medicine, surgery, paediatrics, and obstetrics). The salary scale (equivalent to that of an assistant in general practice) and the provision of married accommodation (where possible) will be a great inducement for the married man to remain longer in hospital. The regional committee of the executive councils has expressed its interest in the project, and is willing to facilitate entry of doctors, trained under the scheme, into general practice.

I feel that this lead given by the Oxford Regional Board should be quickly followed by other areas. The scheme provides for greater hospital experience without financial loss or social disharmony, and this experience will not be an adverse factor when entering general practice. As an interim measure it will also help to absorb a number of excess assistants.—I am, etc.,

Leicester.

G. F. STONE.

SIR,—We, members of the executive committee of the General Practice Reform Association, consider the report of the special subcommittee on the employment of assistants, introduced in the General Medical Services Committee recently by Dr. B. Cardew (*Supplement*, February 26, p. 64), to be quite inadequate. In our opinion, the proposals (*Supplement*, March 5, p. 69) would fail to help solve the difficulties of thousands of present and future doctors with regard to salary, conditions of employment, and prospects. We see no reason to believe that the proposed reviews and possible actions by executive councils, in consultation with local medical committees, could significantly further the careers of the vast majority of assistant practitioners. Moreover, the recommendation on "the right to claim

COUNCIL OF THE B.M.A.

Election of 40 Members by Grouped Branches in the British Isles, of 2 Public Health Service Members, and of 1 Woman Member

The following have been elected unopposed for the session 1955-6:

North of England and Tees-side Branches:	J. C. Arthur, Gateshead. Weldon P. T. Watts, Newcastle-upon-Tyne.
East Yorkshire and Yorkshire Branches:	W. E. Dornan, Sheffield. Ian G. Innes, Hull. J. A. L. Vaughan Jones, Leeds. F. M. Rose, Preston.
North Lancashire and Westmorland Branch:	D. R. Owen, Chester.
Divisions in Cheshire—Birkenhead and Wirral; Chester; Crewe; Hyde; Macclesfield and East Cheshire; Mid-Cheshire; Stockport; Wallasey:	David Brown, Liverpool.
Lancashire Divisions of Merseyside Branch—Liverpool; St. Helens; Southport; Warrington. Isle of Man Branch:	J. I. Milne, Manchester.
Lancashire Divisions of South Lancashire and East Cheshire Branch—Ashton-under-Lyne; Bolton; Bury; Leigh; Manchester; Oldham; Rochdale; Salford; Wigan:	J. Cottrell, Grimsby. E. C. Dawson, Derby.
Derbyshire, Leicester and Rutland, Lincolnshire, and Nottinghamshire Branches:	D. S. Pracy, Atherstone, Warwickshire. A. V. Russell, Wolverhampton.
Midland Branch:	S. F. Logan Dahne, Caversham, Reading. Alexander Brown, Linton, Cambs. R. Hale-White, London, N.W.1. J. A. Moody, Ilford.
Staffordshire, and Worcester and Hereford Branches:	H. H. D. Sutherland, London, W.10.
Berks, Bucks and Oxford and Northamptonshire Branches:	H. Alexander, London, S.W.18.
Cambs and Hunts, Norfolk, and Suffolk Branches:	A. Staveley Gough, Watford.
Marylebone Division:	L. A. Gibbons, Reigate. J. O. M. Rees, Guildford. A. Barker, Whitstable. W. B. Heywood-Waddington, Littlehampton. R. G. Gibson, Winchester.
City, South-west Essex, Stratford, and Tower Hamlets Divisions:	J. R. Nicholson-Lailey, Taunton.
Chelsea and Fulham, Kensington and Hammersmith, and Paddington Divisions:	W. Woolley, Bristol. S. Noy Scott, Plympton, Devon.
Camberwell, Greenwich and Deptford, Lambeth and Southwark, Lewisham, Wandsworth, and Woolwich Divisions:	Leslie W. Jones, Anglesey.
Bedfordshire, Essex, and Hertfordshire Branches:	J. W. Tudor Thomas, Cardiff.
Surrey Branch:	Mary Esslemont, Aberdeen.
Kent Branch:	J. G. M. Hamilton, Edinburgh.
Sussex Branch:	W. M. Knox, Glasgow.
Dorset and West Hants and Southern Branches:	
Bath, Bristol and Somerset, Gloucestershire, and Wiltshire Branches:	
South-western Branch:	
North Wales and Shropshire and Mid-Wales Branches:	
South Wales and Monmouthshire Branch:	
Aberdeen, Dundee, Northern Counties of Scotland, and Perth Branches:	
Edinburgh and South-east of Scotland and Fife Branches:	
Glasgow and West of Scotland Branch (Glasgow Division):	

retrospective payment on the basis of notional lists" could actually cause a delay in the materialization of a partnership and cannot be easily justified on logical grounds. We are also unable to agree that the first recommendation is uncontroversial, since many doctors, including ourselves, consider that the present model assistantship agreements are outdated and one-sided. The absence of any assistant practitioners on the special subcommittee is noteworthy.

The General Practice Reform Association is opposed to the maintenance of the assistantship system in N.H.S. general practice, and consequently we believe the view held by the special subcommittee that there is "nothing improper in a principal enjoying a monetary reward in respect of the indefinite employment of an assistant" is fundamentally incorrect, irrespective of any provisos, and contrary to the real and long-term interests of the profession as a whole, and of the health services. Our approach to the assistantship question and related problems follows quite different lines from those proposed in the report of the special subcommittee, and may be summarized as follows: (1) the abolition (by stages, if necessary) of the extra list at present permitted for employing an assistant practitioner; (2) the introduction of a comprehensive training scheme for doctors new to N.H.S. general practice, the trainee to be employed by an appropriate authority instead of privately by another doctor; (3) the reduction, by stages, of the permitted maximum number of N.H.S. patients per practitioner, eventually to 2,000 or 2,500; and (4) equal opportunity for entry into health centre practice for established and unestablished practitioners.—We are, etc.,

H. P. HILDITCH. A. C. J. SAUDEK.

Glasgow and West of Scotland Branch (County Divisions), Border Counties, and Stirling Branches:
Northern Ireland Branch:

N. Douglas, Hamilton.
Alexander Scott, Ayr.

N. S. Dickson, Templepatrick.
Ian Fraser, Belfast.

The following candidates have been nominated for the Groups in which there are contests:

Divisions of Metropolitan Counties Branch in Middlesex (two seats):

D. F. Hutchinson, London, W.C.1.
J. B. Wrathall Rowe, Harrow.
Angus Weston, Greenford.

Hampstead, St. Pancras, and Westminster and Holborn Divisions (one seat):

F. Gray, London, W.C.1.
J. L. McCallum, London, W.C.1.

Voting papers will be issued to the members of these Groups on March 30, 1955.

Public Health Service

The following candidates have been nominated for the two seats:

C. O. S. Blyth Brooke (London, E.C.1).
H. D. Chalke (London, N.W.4).
J. B. Tilley (Newcastle-upon-Tyne).

Voting papers will be issued to all public health service members on March 30, 1955.

Woman Member

Annis Gillie, London, W.2, has been elected unopposed.

A. MACRAE,
Secretary.

ELECTION OF MEMBER OF COUNCIL BY FAR EASTERN GROUP OF BRANCHES

No nomination having been received for the election of a member of Council to represent the Far Eastern Group of Branches for the period 1955-8, the Council has decided, in the exercise of its power under By-law 62, again to invite the Branches in the Group, named below, to submit nominations:

Assam	Malaya
Baluchistan	North-west Frontier
Borneo	Punjab
Ceylon	Sind
Hong Kong and China	

Nominations must be forwarded so as to reach the Secretary not later than May 14, 1955, and must be in the following form, or one to the like effect:

We, the undersigned, hereby nominate.....
of..... (full name and address to be given) for election
by the..... (state the names of the Branches
in the Group) Branch as a member of the Council of the Association for the three years 1955-8.

Signatures and addresses of three nominators.....

Branches.....

Date.....

In the event of a contest, voting papers will be issued from the Head Office, British Medical Association, Tavistock Square, London, W.C.1, to each member in the Group.

By Order,
A. MACRAE,
Secretary.

Diary of Central Meetings

MARCH

29 Tues.	Amending Acts Committee, 2 p.m.
30 Wed.	Evidence Committee on Divine Healing, 10 a.m.
30 Wed.	Committee re Remuneration Policy, 2 p.m.
31 Thurs.	Conference of Honorary Secretaries of Divisions and Branches, 10.30 a.m.
31 Thurs.	Ethical Review Subcommittee, Central Ethical Committee, 2 p.m. (Date changed from March 17.)
31 Thurs.	Committee on Homosexuality and Prostitution, 2.15 p.m.

APRIL

1 Fri. Scholarships Subcommittee, Science Committee, 11.30 a.m.
1 Fri. Science Committee, 2 p.m.

Branch and Division Meetings to be Held

BROMLEY DIVISION.—At Bell Hotel, Monday, April 4, 8 p.m., joint meeting with Pharmaceutical Society of Great Britain, West Kent Branch. Lecture by Dr. F. E. Camps: "Dangerous Drugs from a Medico-Legal Aspect."

CITY DIVISION.—(1) In Committee Room A, B.M.A. House, Tavistock Square, London, W.C., Tuesday, March 29, 8.30 p.m., annual general meeting. (2) At Hackney Hospital (G5 Ward), Homerton High Street, London, E., Wednesday, March 30, 2 p.m., films: (1) "Early Diagnosis of Anterior Poliomyelitis"; (2) "Development of Locomotion"; (3) "Development of Movements of the Hand."

COVENTRY DIVISION.—At Sibree Hall, Monday, March 28, 8 p.m., meeting. Miss Vera Pitman, S.R.N., Sister Tutor from the Christian Medical College, Vellore, S. India, will talk about the work of the College. This will be illustrated by slides.

DONCASTER DIVISION.—At Parkinson's Café, Doncaster, Tuesday, March 29, 7.30 for 7.50 p.m., joint meeting with Doncaster Medical Society. Dr. John Hunt: "Future of General Practice and its Relationship to Other Branches of Medicine." Members of Rotherham and Wakefield, Pontefract and Castleford Divisions are invited.

DUNDEE DIVISION.—At Queen's Hotel, Dundee, Friday, April 1, 8.30 p.m., business meeting.

GRIMSBY DIVISION.—At Scartho Road Infirmary, Grimsby, Friday, April 1, 9 p.m., meeting. Dr. James Cyriax: "Lumbar Disk Lesions." All medical practitioners in the area of the Division are invited.

HALIFAX DIVISION.—At Royal Halifax Infirmary, Thursday, March 31, 8.30 p.m., meeting. Annual B.M.A. Lecture by Professor M. L. Rosenheim: "The Treatment of Nephritis."

HASTINGS DIVISION.—At Bexhill Hospital (Out-patient Department), Tuesday, April 5, 8.15 p.m., clinical meeting.

LEICESTERSHIRE AND RUTLAND BRANCH.—At Leicester Royal Infirmary, Wednesday, March 30, 8.45 p.m., meeting.

LEWISHAM DIVISION.—At Lewisham General Hospital, High Street, Lewisham, S.E., Friday, April 1, 8.30 p.m., meeting.

NORFOLK BRANCH.—At Assembly House, Theatre Street, Norwich, Saturday, April 2, 8 p.m., meeting. B.M.A. Lecture by Mr. T. Bourdillon, M.A.: "The Ascent of Mount Everest, and the Problems of Life at High Altitudes," with a demonstration of equipment. Members' wives are invited.

NORTH WALES BRANCH.—At Ruthin Castle, Thursday, March 31, 3 p.m., spring meeting. Short papers by Dr. Philip Evans: "The Medical Treatment of Peptic Ulcer"; Dr. Dorothy Lancaster: "Some Dermatoses of the Perineum"; Mr. V. Kent Drennan: "Some Problems of the Foot."

REIGATE DIVISION.—At Reigate Hill Hotel, Reigate, Tuesday, March 29, 8.30 p.m., meeting.

RUGBY DIVISION.—At Grand Hotel, Rugby, Friday, April 1, 8 for 8.30 p.m., informal supper; 9.30 p.m., B.M.A. Lecture by Dr. C. G. Baker: "Mitral Valvotomy (with a six-year follow-up)."

SCUNTHORPE DIVISION.—At Crosby Hotel, Scunthorpe, Wednesday, March 30, 8.15 p.m., meeting. Dr. F. J. S. Esher: "An Approach to the Problem of Delinquency." Members of the legal and clerical professions are invited.

SHEFFIELD DIVISION.—At University Medical Library, Sheffield, Friday, April 1, 8.30 p.m., annual general meeting.

SOUTH ESSEX DIVISION.—At Railway Hotel, Hornchurch, Tuesday, March 29, 9 p.m., meeting.

SOUTH-WEST ESSEX DIVISION.—At Board Room, Whipps Cross Hospital, Leytonstone, E., Wednesday, March 30, 8.30 p.m., meeting. Lecture by Sir Russell Brock: "Cardiac Surgery."

SOUTH-WEST WALES DIVISION.—(1) At Cliff Hotel, Gwbert-on-Sea, Cardigan, Saturday, April 2, 7.15 for 7.45 p.m., dinner-meeting. Mr. Rainsford Mowlem: "Burns." Members' wives are invited. (2) At St. David's Hospital, Carmarthen, Sunday, April 3, 2.30 p.m., meeting.

SUSSEX BRANCH.—At Hotel Metropole, Brighton, Sunday, April 3, 12.30 for 1 p.m., luncheon; 2.15 p.m., B.M.A. Lecture by Dr. T. F. Fox (Editor, *The Lancet*): "Medicine in Soviet Russia." A discussion will follow. Members' wives and other guests are invited.

WEMBLEY DIVISION.—At Wembley Hospital, Tuesday, March 29, 9 p.m., meeting. Lantern lecture by Dr. S. M. Rivlin: "Bad Legs."

WEST HERTS DIVISION.—At Shrodells Hospital, Vicarage Road, Watford, Friday, April 1, 8.30 p.m., joint meeting with Watford and West Herts Medical Society.

WEST MIDDLESEX DIVISION.—At Paul's Restaurant, New Broadway, Ealing, London, W., Tuesday, March 29, 8.30 p.m., annual general meeting. Members' wives are invited.

S.H.M.O. Meeting

There will be a meeting of Senior Hospital Medical Officers in the Newcastle Region on Tuesday, March 29, at 8 p.m. at B.M.A. House, 7, Windsor Terrace, Newcastle-upon-Tyne.

GENERAL MEDICAL SERVICES COMMITTEE

REPORT OF THE GENERAL MEDICAL SERVICES COMMITTEE TO THE ANNUAL CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL COMMITTEES, 1955

PERSONNEL OF GENERAL MEDICAL SERVICES COMMITTEE, 1954-5

Ex-officio: Sir John McNee, London (President); I. D. Grant, Glasgow (Chairman of Representative Body); E. A. Gregg, London (Chairman of Council); L. Dougal Callander, Doncaster (Treasurer); A. Beauchamp, Solihull, Warwicks (Chairman of Conference of Local Medical Committees).

Elected by A.R.M. of B.M.A. (1954): England and Wales: A. Brown, Linton, Cambs; J. A. Brown, Birmingham; H. Guy Dain, Birmingham; F. Gray, London. *Scotland*: J. T. Baldwin, Milton Bridge, Midlothian. *Northern Ireland*: J. Bleakley, Belfast (*Deputy*: H. J. Cronhelm).

Direct Representatives of Local Medical Committees: W. Neil Darling, Edinburgh (Group A.1); C. J. Swanson, Aberfeldy, Perthshire (Group A.2); W. M. Knox, Glasgow (Group A.3); R. C. Hamilton, Kilmarnock (Group A.4); F. Lishman, Crook, Co. Durham, and D. T. McDonald, Belford, Northumberland (Group B); H. F. Hollis, Leeds, and H. Thorp, Todmorden, Yorks (Group C); A. Campbell, Accrington, Lancs, F. S. Catto, Manchester, and P. J. Gibbons, Liverpool (Group D); Miles Parkes, Crewe, Cheshire (Group E); T. J. Hargest, Swansea, and G. P. Williams, Anglesey (Group F); E. W. Goodwin, Leicester, and A. S. Wilson, Gosberton, Lincs (Group G); A. B. Davies, Walsall (Group H); F. A. Smorffitt, Southam, Warwickshire (Group I); C. F. R. Killick, Williton, Somerset (Group J); R. W. McConnel, Wendover, Bucks (Group K); J. D. R. Murray, Exmouth, Devon (Group L); K. S. Maurice-Smith, Ely, Cambs (Group M); H. S. Howie, Wood, Shanklin, Isle of Wight (Group N); D. F. Whitaker, Guildford, Surrey (Group O); R. Green, Hurstpierpoint, Sussex (Group P); A. Talbot Rogers, Bromley, Kent (Group Q); D. F. Hutchinson, Middlesex, and A. N. Mathias, London (Group R); C. M. Scott, Barnet, Herts, and H. N. Rose, Ilford, Essex (Group S); H. H. D. Sutherland, London, and Max Sorsby, London (Group T); J. B. Young, Belfast (Group U).

Elected by Annual Conference of Local Medical Committees, 1954: J. C. Arthur, Gateshead; I. G. Innes, Hull; J. A. Pridham, Weymouth; F. M. Rose, Preston; S. Noy Scott, Plympton, Devon (in place of W. Woolley, who resigned in November, 1954); S. Wand, Birmingham.

Nominees of Other Bodies: T. Rowland Hill, London, and J. R. Nicholson-Lalley, Taunton (Central Consultants and Specialists Committee); Kate Harrower, Glasgow (Medical Women's Federation); H. D. Chalke, London (Public Health Committee and Society of Medical Officers of Health); B. Cardew, London, and H. C. Faukner, London (Medical Practitioners' Union).

Co-opted Members: O. C. Carter, Bournemouth; H. P. Hilditch and L. Russell (Assistants and Young Practitioners Subcommittee); D. C. Bowie, London.

Observer from the British Dental Association: L. Everest, London (in place of G. M. Hickley, who resigned in October, 1954).

Observer from the Registrars Group: F. T. Page, London.

CHAIRMAN

1. A. Talbot Rogers was appointed Chairman for the session 1954-5.

OBITUARY

2. The Committee regrets to report the deaths during the past session of Dr. Mabel Ramsay, the first representative of the Medical Women's Federation on the Insurance Acts Committee, who served in that capacity for some 15 years; Dr. Alfred Cox, former Medical Secretary of the Association; and Dr. J. B. Miller, a Vice-President of the Association and former chairman of the Representative Body.

THE WORK OF THE COMMITTEE

3. Although the past session has been necessarily shorter than usual, the Committee has met monthly, and in addition much detailed work has been undertaken by special sub-

committees appointed to consider a number of important matters which have arisen during the course of the year.

4. Negotiations with the Ministry of Health on the application of the principles established by the Danckwerts award to the calculation of the size of the Pool have continued, and the final settlement for the financial year 1952-3 agreed. Discussions on the final settlement for the year 1953-4 are at an advanced stage.

5. A start has been made upon a re-examination of the Trainee General Practitioner Scheme, and another special subcommittee is investigating the difficulties experienced by general practitioners in securing practice accommodation. It is hoped that detailed reports on both these subjects will be available before the Annual Conference in 1956.

6. Another major task has been an examination of the report of the Committee on General Practice within the National Health Service, which was established by the Central Health Services Council in 1951, and the Committee wishes to acknowledge the great help it has had from local medical committees, who themselves made a detailed study of the report.

7. Proposals for the revision of the disciplinary machinery have also been discussed with the Ministry of Health in the light of the decisions taken by the Conference in 1953 arising out of the Committee's earlier recommendations on the subject.

8. The Committee has also kept in close touch with the Medical Practices Committee, the College of General Practitioners, and the British Dental Association. Through its liaison with these bodies, and with representatives of other branches of the profession, it has been possible to discuss with advantage many matters of mutual interest. The Committee is also pleased to report that the Registrars Group has appointed an observer to the Committee, and this arrangement has facilitated discussions on many problems which are common to young practitioners both in general practice and in the hospital field.

9. Representatives of the Committee have played a full part in the deliberations of a Joint Subcommittee with the Central Consultants and Specialists and Public Health Committees which has been studying the question of the establishment of an integrated service for the treatment and rehabilitation of chronic disablement arising from age or illness.

10. As is its normal custom representatives of the Committee have met officers of the Ministry at regular intervals throughout the session to discuss the many detailed points of administration of the Service which continue to arise. These regular meetings are of the greatest value in solving the problems appearing in the day-to-day working of the Service, and the Committee wishes to record its appreciation of the ready help it at all times received from the Ministry.

11. The Assistants and Young Practitioners Subcommittee has continued to study a number of problems which face assistants and those newly established in practice. The opportunity which the Committee thus has of hearing the views of these two sections of the profession has again proved of considerable value during the past session.

12. The attendances of members of the Committee and the subcommittees appointed during the past session are recorded in Appendix A. It should be noted that this record covers only the period from the commencement of the present session—June—to the March meeting of the Committee, and that it does not include attendances of members at meetings of other Association committees upon which they serve as representatives of the G.M.S. Committee.

REPRESENTATION ON B.M.A. COMMITTEES

13. The G.M.S. Committee is represented on the following B.M.A. committees: Private Practice (A. N. Mathias; Deputy—C. M. Scott); Public Health (C. M. Scott; Deputy—K. S. Maurice-Smith); Central Consultants and Specialists (A. Talbot Rogers and D. F. Hutchinson; Deputies—F. A. Smoritt and J. D. R. Murray); Ophthalmic

Group (M. Sorsby); Occupational Health (F. Lishman; Deputy—A. Brown); Public Relations (A. Talbot Rogers, D. F. Hutchinson, F. M. Rose, and W. Woolley; Deputies—P. J. Gibbons, R. W. McConnel, and H. H. D. Sutherland); Compensation and Superannuation (A. B. Davies, A. N. Mathias, and S. Wand); Joint Committee of B.M.A. and Pharmaceutical Society (A. Talbot Rogers, F. Gray, and E. W. Goodwin); Consultants, General Practitioners, and Public Health Liaison Committee (A. Talbot Rogers, A. Beauchamp, A. B. Davies, D. F. Hutchinson, A. N. Mathias, J. D. R. Murray, and S. Wand); Joint Formulary Committee of B.M.A. and Pharmaceutical Society (H. Guy Dain, A. B. Davies, M. Sorsby, and D. F. Whitaker); Arrangements Committee (A. Talbot Rogers, I. G. Innes, and F. M. Rose; Deputy—A. Beauchamp); Pharmacopoeia Subcommittee of Science Committee (A. B. Davies); Committee on the Relation of Drunkenness and Alcohol to Road Accidents (A. B. Davies).

NOMINEES ON MINISTRY OF HEALTH DISTRIBUTION COMMITTEES

14. The following nominees were accepted by the Ministry for appointment on Central Distribution Committees for 1954-5:

International Distribution Committee: F. Gray (London), E. R. C. Walker (Scottish Secretary), G. P. Williams (Holyhead), and D. P. Stevenson (Deputy Secretary).

Distribution Committee for England and Wales: A. Talbot Rogers (Bromley, Kent), F. Gray (London), S. Wand (Birmingham), G. P. Williams (Holyhead), and D. P. Stevenson (Deputy Secretary); together with A. Brown (Linton, Cambs), J. D. Wells (Billericay, Essex), and C. F. R. Killick (Williton, Somerset) when questions concerning mileage are under consideration.

BRITISH DENTAL ASSOCIATION'S GENERAL DENTAL SERVICES COMMITTEE

15. Close liaison with the General Dental Services Committee of the British Dental Association has been maintained during the past year.

16. G. M. Hickley, who has attended meetings of the Committee since 1952 as an observer from the B.D.A., resigned in October, 1954, and his place has been taken by L. Everest (London).

17. F. Gray (London) has continued to attend meetings of the General Dental Services Committee of the B.D.A.

OBSERVER FROM THE REGISTRARS GROUP COMMITTEE

18. The Committee felt it would be helpful to promote a closer liaison with the Registrars Group Committee of the Association. This was felt to be particularly desirable in view of the number of hospital registrars who were seeking openings in general practice, and because of the many problems common to both fields.

19. At the invitation of the Committee the Registrars Group Committee appointed Dr. F. T. Page (London) as an observer. An observer from the Registrars Group (A. Poteliakhoff) has also been invited to attend meetings of the Assistants and Young Practitioners Subcommittee.

LIAISON BETWEEN THE GENERAL MEDICAL SERVICES, CENTRAL CONSULTANTS AND SPECIALISTS, AND PUBLIC HEALTH COMMITTEES

20. It will be remembered that last year the Committee reported that it had been decided to invite the Public Health Committee of the Association to appoint representatives to the Liaison Committee which then existed between the G.M.S. and Central Consultants and Specialists Committees of the Association.

21. This arrangement came into operation during the present session, and the Committee is pleased to report that it has proved a successful means of furthering co-operation in the three main branches of the National Health Service.

22. A number of meetings have been held during the year. The Chairman is appointed from each of the three constituent bodies in rotation.

MEDICAL PRACTICES COMMITTEE

23. The Committee has learnt with considerable pleasure of the appointment of one of its members, Dr. F. Lishman, to the Medical Practices Committee.

24. It would also like to place on record its appreciation of the valuable services given by Dr. J. C. Pearce (Diss, Norfolk), who was Dr. Lishman's predecessor on the Medical Practices Committee.

25. Through its Liaison Committee, and by close contact at officer level, many points of mutual interest to the two committees have been satisfactorily dealt with during the past year.

REMUNERATION

Size of the Central Pool

26. In its report to the last Conference the Committee dealt at some length with the various steps which must be taken each year in order to reach agreement with the Ministry on the detailed application of the variable factors which are involved in calculating the size of the Central Pool, namely:

- (1) the number of doctors in the Service;
- (2) the level of practice expenses;
- (3) the earnings of general practitioners from Government sources, apart from general medical services;
- (4) receipts from private practice.

27. The Pool is calculated on a provisional basis at the beginning of every financial year, and its size cannot be finally determined until detailed information in respect of all these factors has been obtained. Indeed, until agreement is reached with the Ministry on every one of these points, no calculation of the final settlement can be made. Because of the complexity of the various inquiries which must be made it is inevitably some time before any balance can be announced and distributed.

28. During the past session agreement has been reached on the size of the Central Pool for the financial year 1952-3, but, as the Committee anticipated, the balance due to the profession by way of a final settlement for that year was extremely small.

29. The Committee is now negotiating on the final settlement for the financial year 1953-4, and it is hoped to reach early agreement. Although the final position has not yet emerged, present indications are that in this, the first year of the new distribution scheme, a substantial amount will be due to the profession. The Committee will do all it can to ensure that these sums are distributed as quickly as possible.

30. As far as the variable factors are concerned, the following paragraphs set out in detail the action which has been taken by the Committee in each case:

Number of Doctors in the Service

31. It will be remembered that last year the Committee reported that general agreement had been reached on an equitable method of calculating the precise number of doctors in the Service so as to ensure that not only would account be taken of those whose names appeared on the medical lists at the dates upon which the actual count took place, but that due regard should be paid to applications for admission to the list which are then under consideration. There were, however, four small groups of practitioners—whose names appear in the medical lists—whose

position the Ministry felt should be specially considered before they were included in the calculation, namely:

- (1) those practitioners with no patients at all;
- (2) doctors with very few N.H.S. patients;
- (3) salaried partners; and
- (4) partners whose share in the practice is less than one-third of the share of any other partner.

32. The Committee is pleased to report that agreement over these questions has now been reached, and it is satisfied that the general principles upon which the number of doctors in the Service is calculated each financial year are equitable from the point of view of both parties.

Practice Expenses

33. Although Mr. Justice Danckwerts accepted an expense ratio of 38.7% and this percentage was used for the purpose of calculating the size of the Pool up to and including the financial year 1951-2, it was clearly desirable that the ratio should be brought up to date. Consequently, arrangements were made for a further review of the level of practice expenses, and an inquiry was undertaken by the Board of Inland Revenue based upon doctors' accounts for the financial year ended during the March quarter of 1952. The results of this inquiry have now been discussed with the Ministry of Health and agreement has been reached that for the financial year 1952-3 an expense ratio of 32.3%, which is slightly higher than the actual ratio which emerged from the inquiry, should apply.

34. The apparent "reduction" in the ratio is, of course, due to the fact that as a result of the Award the overall Pool is substantially larger than the original sum of money on which the old expense ratio of 38.7% was calculated.

35. A further inquiry undertaken by the Board of Inland Revenue on accounts ending in the March quarter of 1953 for use in connexion with the 1953-4 calculation of the Pool has now been completed. The results are being discussed with the Committee's expert advisers.

36. The Board of Inland Revenue has now decided that it will not be possible for it to undertake similar inquiries in every subsequent year, and the Committee, in consultation with the Ministry, is looking into ways and means of keeping the practice expense ratio up to date in those years when it is not possible for a factual inquiry to be carried out. The Ministry's first thoughts on this difficult problem are now under consideration by the Committee.

37. The Committee has felt unable to accept a suggestion by the Ministry that a small Working Party of experts should be established specifically for this purpose, and the matter will continue to be dealt with, as formerly, by direct negotiation.

Earnings from other Government Sources

38. In order to determine the amounts received by general practitioners in the National Health Service from other Government sources, the Ministry obtains returns from the various authorities concerned. Thus, the sums so disclosed are factual. Inquiries in respect of the 1952-3 Pool were completed during the past year and a similar investigation for use in the 1953-4 calculation is now proceeding.

Receipts from Private Practice

39. In its last report the Committee referred to the Ministry's suggestion that the Inland Revenue inquiry into practice expenses should be used to obtain an estimate of the receipts of general practitioners from private practice. This proposal was rejected by the Committee as it was advised that the actual method which the Ministry proposed to adopt could not result in any accurate assessment of private practice receipts.

40. After very careful consideration, and in the light of views expressed by its expert advisers, the Committee has concluded that nothing short of a full-scale inquiry based on the tax returns of all practitioners could reveal what general practitioners are earning from this source. The

Ministry feels, with some justification, that an inquiry of this magnitude would be quite impracticable at the present time. This view is endorsed by the Board of Inland Revenue.

41. In consequence, both sides have agreed that the figure of £2m. accepted by Mr. Justice Danckwerts should continue to be used for the purpose of calculating the Pool for the financial year 1952-3. So far as future years are concerned, the Committee sees no alternative than to stand firm on its assertion that the figure of £2m. should remain unless and until a full-scale inquiry on the lines indicated above proves this figure to be wrong.

THE DISTRIBUTION SCHEME

Supplementary Annual Payments

Implementation of the Working Party's Second Report

42. Following the acceptance by the Conference of the Second Report of the Working Party, which set out the proposals for dealing with the problem of the small-list practitioner, the Ministry has issued instructions to executive councils to implement the new scheme. The Committee has every reason to hope that the new arrangements will eliminate any cases of hardship arising from the operation of the distribution scheme, which came into effect in April, 1953.

Central Appeals Committee

43. Although certain criteria were laid down to assist executive councils in administering the new scheme, the Committee was anxious to ensure that no small-list practitioner who could justifiably claim that his position had been prejudiced as a result of the new distribution arrangements should be debarred from enjoying the benefits of the Supplementary Annual Payments scheme merely because he failed in some small respect to conform with the established criteria. To this end a practitioner has a right of appeal to a Central Appeals Committee, consisting equally of representatives of the Committee and the Ministry. This Central Committee has now been established, and has discretion to allow appeals in borderline cases. The Committee has every reason to believe that this machinery is working well.

44. The Committee subsequently agreed with the Ministry that this Central Appeals Committee should also be used for a number of other purposes under the distribution scheme—namely, to determine appeals against:

- (1) the refusal of an Initial Practice Allowance;
- (2) the refusal of payment on the basis of notional lists; and
- (3) the refusal of a hardship payment under the old arrangements.

Eligibility for Supplementary Annual Payments

45. Since the original E.C.L. on the subject was issued some doubt has arisen as to the circumstances in which a doctor will be automatically eligible for a supplementary annual payment. A new circular on this subject has made it clear that a doctor over 60 years of age will not be automatically eligible unless he has been conducting single-handed for the last 10 years the particular practice in respect of which his application was submitted. Similarly, the position of a doctor with a fluctuating list has been clarified. Whilst under the scheme a practitioner may lose his supplementary annual payment because his list falls below 300 or decreases by more than 10% over four consecutive quarters, executive councils have now been told that where this happens but the practitioner subsequently builds up his list again he is eligible to reapply for a supplementary annual payment. Payment may then be granted if the list has remained over 300 for four consecutive quarters and, in the case of doctors under 60 years of age, has increased by at least 10% over those four quarters. The opportunity was also taken of clarifying a number of other minor points about the scheme, and the Committee hopes that, as a result,

no small-list practitioner will be in any doubt as to his position under these arrangements.

46. The Committee was unable to accept a suggestion put forward by the Ministry that, in the case of applications for supplementary annual payments from general practitioners over the age of 75, the regional medical officer should visit the doctor concerned in order to be sure that the practitioner is, in fact, providing full general medical services. The Committee feels that this is a matter which can best be judged by the local medical committee in consultation with the practitioner's own local colleagues, but it has been agreed that, in cases of doubt, it would be appropriate for a medical member of the Central Appeals Committee to interview the doctor, in consultation with a member of the local medical committee or a near-by colleague. A circular letter setting out the arrangements which the Committee feels should be made in these circumstances has been sent to local medical committees.

Supplementary Annual Payments for Doctors No Longer on the Medical List

47. Following representations made by the Committee, the Ministry has informed executive councils that, if under the new scheme a doctor satisfied the criteria for a supplementary payment on April 1, 1953, but had since resigned from the list or died, application could be accepted for a supplementary payment for the period from April 1, 1953, up to the date when he ceased to be on the list.

Initial Practice Allowances

48. In its report to the Conference last year the Committee drew attention to an anomaly in the method of assessing income in connexion with claims for initial practice allowances, and pointed out that, in the case of doctors filling vacancies in small single-handed practices, executive councils were required to take all payments for dispensing into account. The Committee felt that some allowance should be made for the fact that in the case of dispensing doctors the amounts involved included a substantial element in respect of the actual cost of the drugs supplied, and, following consultation with the Ministry, it was suggested that the total sums paid for dispensing should be disregarded.

49. The Ministry, though at first sympathetic to the proposal, felt on further reflection that it would be fairer to regard as remuneration for this purpose the same proportion of dispensing payments as is used for superannuation purposes—namely, 50%. The Committee felt that the arguments put forward by the Ministry had force. It believed that the proposal was equitable and has agreed to it.

50. Similar arrangements will be adopted in connexion with hardship payments.

Back Debits and Back Credits

51. It will be remembered that last year, having considered the views of the Committee on the subject of back debits and back credits, the Conference decided not to seek their abolition but rather to accept the Ministry's suggestion than an overall time limit of two years should be imposed. Since then the Scottish Subcommittee has again raised the question and drawn the Committee's attention to the comparative ease with which back debits may be made and the difficulty of obtaining back credits. This frequently means that the individual doctor is penalized.

52. The Committee has a good deal of sympathy with the Scottish view that the most equitable method of dealing with the situation would be to secure the total abolition of both back debits and back credits, and without commitment is seeking the Ministry's comments on the subject.

53. The Committee itself has an open mind on the subject, but, remembering the decision taken by the Conference last year, and the views since expressed by the Scottish Subcommittee, it feels that it should report what has transpired and give local medical committees an opportunity of second thoughts on a most difficult problem.

Monthly Payments

54. The Committee has discussed with the Ministry the views expressed by the last Conference that general practitioners should be paid monthly should they so wish without any specific plea of hardship. Whilst the Ministry feels unable to go as far as the Conference wishes, it has agreed that a doctor having once established a case for receiving monthly payments should not be required to make a similar request each succeeding quarter. It has therefore, by means of a circular letter to executive councils, suggested that monthly advance payments to a doctor once granted might continue to be made without the need for further application each quarter, and that a doctor should not be asked to supply actual details of hardship in support of his original application.

55. The Committee is satisfied that this action, by and large, gives effect to the Conference's wishes on this matter.

Limited Lists

56. As local medical committees will be aware, the terms of the distribution scheme debar practitioners with limited lists from receiving loaded capitation fees. The Committee has considered how this condition should operate in cases where a practitioner has a limited list in the area of one executive council and an unlimited list in the area of another.

57. The Committee feels that in these circumstances the practitioner should not be held to be providing full general medical services in those areas where he has a closed list only, and that his open list alone should rank for loaded capitation fees.

58. The matter is to be discussed with the Ministry on these lines.

Partnership Lists

59. It will be remembered that the Conference last year expressed the view that practitioners in partnership should be allowed a fixed period of nine months to bring their individual lists within the prescribed maxima, and that any extension of this period should be permitted only with the Minister's consent. It was suggested that, during this period of grace, a partner should be paid for the actual number of patients on his individual list.

60. This problem was particularly pertinent where a new partnership was formed and it would otherwise have been necessary for block transfers to be effected.

61. The Ministry has agreed to advise executive councils that, on the formation of a new partnership, the partnership will be allowed up to nine months to bring their lists within the maxima permitted by the allocation scheme. If, however, at the end of this period one particular partner's list is still excessive, executive councils will insist upon the immediate transfer of the excess patients.

TEMPORARY RESIDENT FEES

62. In its report to the last Conference the Committee referred to the difficulties which had arisen over the application of the criteria laid down for the purpose of deciding which cases should attract the lower temporary resident fee of 5s. It will be remembered that executive councils, in consultation with local medical committees, are required to classify holiday camps and institutions into those in which it would be appropriate to pay the higher temporary resident fee of 17s. and those where the lower fee of 5s. should be paid. The decision as to whether an institution is to be classified for the purposes of payment at the lower rate depends largely upon whether the doctor is in regular attendance and has facilities for seeing a number of patients at a fixed time and place.

63. The matter has been discussed at some length with the Ministry of Health and, before making any radical alteration to the present scheme, the Committee decided to seek further information as to the size of the problem and the extent to which the lower rate of payment was being

applied. Having considered the matter again in the light of the further information supplied by the Ministry, the Committee feels that a case does exist for giving local medical committees discretion to pay a fee for temporary residents which would modify the present somewhat rigid rates of payment. The matter is to be discussed with the Ministry on this basis.

TREATMENT OF SERVICES PERSONNEL ON LEAVE

64. It will be remembered that the Conference last year expressed its general agreement with the proposal made by the Service departments that Services personnel on leave should be treated as temporary residents under the National Health Service. Before these arrangements could be put into effect it was necessary for the Committee to seek certain assurances about the position of private practitioners who undertook this work. The Private Practice Committee of the Association is quite satisfied with the assurances which have been given, and the Committee has itself received an undertaking that the new arrangements will in no way affect the size of the Central Pool.

65. Now that these difficulties have been overcome the Committee has agreed to the publication of details of the new scheme, which will come into operation at the beginning of the next financial year—that is, April, 1955.

MILEAGE—SCOTLAND

66. Pending an early investigation into the present method of allocating the total Mileage Fund between England and Wales and Scotland, the Committee has agreed to an increase of £20,000 in the present mileage allocation of £140,000 for the Highlands and Islands. The increase in the Highlands and Islands mileage allocation will be met as a first charge on the total Mileage Fund for the two countries.

GROUP PRACTICE

67. In its report to the last Conference the Committee gave a very full account of the discussions which had taken place on ways of allocating the sum of £100,000 which the Working Party recommended be set aside from the Pool each year to encourage group practice. It will be remembered that the proposals were to provide financial assistance by way of an interest-free loan recoverable by quarterly deductions from the remuneration payable by executive councils to individual members of the group.

68. The Group Practice Loans Committee, consisting of four members of the Committee and four officers of the Ministry of Health, together with legal advisers, has since been established and has considered and approved a number of applications for interest-free loans under the scheme.

69. Applications for loans to the Group Practice Loans Committee necessarily involve its members in a considerable amount of time and travel both in attending meetings of the Committee and in investigating the circumstances and practice premises of the groups concerned. Although the Ministry of Health pays a modest subsistence allowance, the Committee felt that a good case existed for its own representatives on the Group Practice Loans Committee to be compensated for a heavy burden of work undertaken on behalf of the profession. On its recommendation, the Trustees of the National Insurance Defence Trust decided to pay an honorarium of 7 guineas per day to the Committee's representatives.

ADMISSION OF STUDENTS TO MEDICAL SCHOOLS

70. As the Conference will remember, on the recommendation of the Committee the Council of the Association invited the Ministry of Health to set up a Working Party to examine on a long-term basis, and with the widest possible terms of reference, the future number of medical practitioners likely to be required in all branches of the profession and to correlate the intake of students to the teaching schools to these estimated needs.

71. After a considerable lapse of time the Minister has announced in Parliament the establishment of a small Committee with the following composition and terms of reference.

Terms of Reference: To estimate on a long-term basis, and with due regard to all relevant considerations, the number of medical practitioners likely to be engaged in all branches of the profession in the future, and the consequential intake of medical students required.

Personnel: The Right Hon. Henry Willink, M.C., Q.C. (Chairman); J. T. Baldwin, Esq., M.B., Ch.B.; Sir Harold Boldero, D.M., F.R.C.P.; Sir John Charles, M.D., F.R.C.P., D.P.H.; Professor Sir Henry Cohen, M.D., F.R.C.P., J.P.; Sir Andrew Davidson, M.D., F.R.C.P.Ed., D.P.H.; A. B. Davies, Esq., M.B., Ch.B.; J. P. Dodds, Esq., C.B.; Professor Sir Geoffrey Jefferson, C.B.E., M.S., F.R.C.P., F.R.C.S., F.R.S.; L. G. K. Starke, Esq., C.B.E., F.I.A.; and A. B. Taylor, Esq.

72. The Ministry has sent the following letter to the Association explaining why the Minister had not felt able to agree to the suggestion of a Working Party.

"Since you wrote to me on 20th January, 1954, the Minister and Secretary of State for Scotland have given careful consideration to the suggestion, made by the Council of the Association, that the Association and various other bodies concerned should appoint representatives to a working party to make a detailed enquiry into the future number of medical practitioners and students.

"So far as the need for a detailed enquiry is concerned, the Ministers are in full agreement with the view expressed by the Council. They do not, however, consider that a representative working party of the kind suggested in your letter would be the best method of undertaking such an enquiry. Your letter mentioned by name an appreciable number of bodies that have an interest in this matter, but you made it clear that the list you gave was not intended to be exhaustive, and in the Ministers' view it would be quite impracticable, on the basis of full representation for all interests, to secure a body sufficiently compact for an efficient detailed study of a problem of this nature. The Ministers have therefore come to the conclusion that it would be preferable for them to appoint a small committee, before whom all the interested bodies can be given full opportunity of laying their views.

"As you will recollect, this method of proceeding was informally discussed with officers of the Association before a final decision was taken, and following a suggestion that was then made, the Ministers agreed that the committee—although small—should include two general medical practitioners. As, however, it was felt to be proper that in accordance with the usual practice the first announcement of the Ministers' intentions should be made to the House of Commons, prior consultation with the Association could not take place in any more formal manner.

"For the same reason and because of the large number of bodies that could claim an interest in future medical manpower, it was not practicable to have formal consultations about the membership of the committee. The Ministers are, however, confident that those invited to serve will bring a wide and comprehensive background of knowledge and experience to the work of the committee, and that they will command the full confidence of all branches of the profession.

"The House of Commons has today been informed of the conclusions the Ministers have reached in this matter, and I am enclosing a copy of the statement that has been made. You will see that it sets out all the details of the membership and terms of reference of the new committee."

73. Whilst the Committee naturally regrets that the Minister felt unable to accept its original suggestion that an inquiry of this nature should be conducted by means of a Working Party, it nevertheless welcomes the decision to make a thorough investigation of this most important problem.

74. Early consideration is to be given by the Committee to the question of preparing evidence to be given to the Willink Committee.

PRE-REGISTRATION PERIOD

75. The Committee has been concerned to hear that there have been numerous complaints about the difficulties and delays which provisionally registered practitioners experience in obtaining pre-registration posts in approved hospitals required under the Medical Act of 1950. It was therefore gratified to learn that it was proposed to convene a conference between the Association, the Licensing Bodies, and the Ministry of Health on the general question of pre-registration appointments.

76. The Committee will be represented at this Conference.

CLASSIFICATION OF AREAS

77. At the last Annual Conference some concern was expressed that the Medical Practices Committee did not always pay due regard to the full circumstances prevailing in a particular area when undertaking the task of classification. Indeed, during the course of the debate it was suggested that, for the purpose of classifying an area as "closed," the minimum figure should be higher than the 1,500 which is the datum line now used by the Medical Practices Committee.

78. The Committee has discussed this matter with the Medical Practices Committee and has received an assurance that the greatest regard is paid both to the recommendations of the local bodies concerned and to the overall position in each individual area. The minimum figure of 1,500 is by no means rigidly applied, and the Medical Practices Committee pointed out that its action is already in accordance with the spirit of the motion which was proposed by Surrey at the last Conference. Where a difference of opinion exists between the Medical Practices Committee and the local medical committee as to whether or not an area should be closed, representatives of the local medical committee are, if they so wish, afforded an opportunity of placing their problems personally before the Medical Practices Committee.

79. In view of this fact, the Committee feels that the situation is adequately safeguarded and calls for no further action on its part.

MACHINERY FOR FILLING PRACTICE VACANCIES

80. One of the major questions upon which the Committee was awaiting the views of the Committee on General Practice concerns the machinery for filling practice vacancies. It will be remembered that the Conference last year once more urged that all necessary steps should be taken to secure that, in respect of appointments to vacancies in general practice, the actual appointment should be made by executive councils in consultation with local medical committees; and that any appeal should lie with the Medical Practices Committee. The Committee noted with regret that in its recently published report the Cohen Committee has failed to support this view. The wishes of the Conference must now be pressed in further discussion with the Ministry.

81. The Committee's attention has been drawn to a decision of the Medical Practices Committee that, before making further appointments from applicants in respect of advertised vacancies, the Medical Practices Committee expects local executive councils to take up the references of the short-listed applicants. The Committee understands that the reasons for this step are twofold. Firstly, the Medical Practices Committee prefers to rely upon confidential references taken up in accordance with the wording of Form E.C.16A, which specifically invites all applicants for a vacancy to furnish the names of referees, and, secondly, it hoped to avoid delay between the period of short-listing and the interview with the Medical Practices Committee.

82. The Committee, believing these considerations to be valid, feels that this procedure is not unreasonable.

EXCHANGE OF PRACTICES

83. The Conference last year approved the report of a special subcommittee set up to examine ways and means by which established practitioners could more easily change the area of their practices. The Committee has discussed the implementation of the report with the Medical Practices Committee, and as a result a circular letter has been sent to executive councils suggesting that, when it is apparent that a further vacancy in another area may be created by the appointment of a particular doctor, executive councils may feel that this is one of the factors to which favourable consideration should be given when making their recommendations, and certainly the fact that the candidate is already established in another area should not be counted against him. The Committee hopes these same considerations will be borne in mind by local medical committees when consulted by executive councils about the names of applicants suitable for short-listing.

84. The Committee hopes that, with such assistance from executive councils and local medical committees, changes between one area and another will be facilitated.

ACCEPTANCE OF PATIENTS OF A VACANT PRACTICE

85. In its last Annual Report the Committee referred to the discussions which had taken place with the Central Ethical Committee of the Association on the problems which arise when the patients of a vacant practice seek acceptance by other doctors in the vicinity who have been temporarily looking after the practice.

86. The Committee, in seeking a solution to this difficult problem, found considerable difficulty in reconciling the right of the patient to select his own doctor with the obligation of the acting practitioner to hold the practice together for the appointed successor.

87. During the year the problem has been accentuated by a number of instances in which a full-time locum has, in fact, secured admission to the medical list of the area to the detriment of the appointed successor. In the event of the area being classified as "open," the Medical Practices Committee has no option but to grant the application. The attention of the Committee also has been drawn to occasions when, following the appointment of a successor, an inordinate number of patients have been found to have transferred to the list or lists of local doctors who have been appointed to take care of the practice pending the appointment of the successor.

88. The Committee has therefore established a special subcommittee which, with the aid of legal advice, is studying all aspects of the problem, and will report its recommendations to the Conference next year.

ALLOCATION OF PATIENTS TO GENERAL PRACTITIONERS

89. At the last Annual Conference it was recommended that, when a patient was being attended by a registered practitioner other than his or her N.H.S. practitioner and without the latter's consent, the N.H.S. practitioner should be permitted, if he so desired, to have the patient removed from his list immediately.

90. The Committee has considered this matter in consultation with the Private Practice Committee of the Association. The conclusion has been reached that the present arrangements for the removal of a patient from a doctor's list are quite adequate for their purpose and that no change is called for.

REMOVAL OF NAMES FROM DOCTORS' LISTS

91. The Committee has now discussed with the Ministry a proposal put forward by the Conference last year that the executive council should be responsible for tracing

patients on the list of a practice in those cases where a death or retirement vacancy had recently been filled. It was felt that in these circumstances the executive council should satisfy itself that every possible method of inquiry had been made before removing the patients from the practice list.

92. The Committee has been assured that executive councils do, in fact, make every effort to trace missing patients, and the Ministry maintains that so far as this aspect of their work is concerned it is not practicable to place any additional responsibilities on executive councils. The Committee therefore suggested that where a vacancy is filled, in the absence of any direct proof to the contrary, the list should not be purged for two years. The Ministry has undertaken to look at this suggestion, but has pointed out that it might well increase the dangers of inflation and might therefore prove inadvisable.

REINSTATEMENT OF EX-SERVICE MEN ON DOCTORS' LISTS

93. The Committee has once again asked the Ministry to arrange for the automatic reinstatement of Services personnel on doctors' lists on discharge from the Forces, and the views of the Conference on this subject have been represented in the strongest possible terms. The Ministry felt, however, that the proposal had to be resisted on two grounds—firstly, that its administration would be both costly and complex, and, secondly, that the practice would inevitably increase the already substantial degree of inflation of doctors' lists. It pointed out that a sample check carried out in the area of one large executive council had revealed that some 31.3% of ex-Service men registered within one week of release, 73% within one month of release, and 88% within three months of release.

94. The Committee, whilst impressed by these figures, felt that they were insufficient to enable it to reach any conclusion on the situation generally and asked for further inquiries to be carried out in other sample areas. This further check showed the following results in the areas named:

Executive Council Area	Registration within:		
	1 month	3 months	6 months
Birmingham	70%	87%	96%
Essex	55%	86%	96%
London	50%	75%	Not known
Reading	80%	90%	100%

95. In addition, an independent inquiry carried out at the Central Registry showed that 56% registered within one month, 78% within three months, and 92% within six months. The figures are of particular significance in this instance because they represent an average for the whole country.

96. The Committee feels that, in view of the situation as it is now shown to exist, it would not be justified in pursuing the suggestion that special machinery should be established for the purpose of automatic reinstatement.

ELIMINATION OF INFLATION

97. The Committee has long regarded the establishment of an alphabetical index as essential to the efficiency of the Central Registry, and is convinced this step is necessary to check the present inflation of lists and to safeguard the provisions of the distribution scheme. This view was emphasized by the Conference last year and the Ministry was asked to take immediate steps to establish an alphabetical index. Unfortunately the Committee is not able to report any satisfactory progress and it is hoped that the Conference will again reaffirm its views on this subject.

98. A resolution passed by the Conference last year suggested that instructions should be printed on the medical card requesting the patient to notify the executive council of any change of address. The Ministry has undertaken to

consider this matter in consultation with the Committee when other amendments to the medical card are under consideration.

COMMITTEE ON GENERAL PRACTICE OF THE CENTRAL HEALTH SERVICES COUNCIL

99. The Committee has made a detailed study of the Report of the Committee on General Practice within the National Health Service, which was set up by the Central Health Services Council.

100. The Committee's detailed comments and criticisms were circulated to local medical committees, who were themselves invited to express their own views on any part of the Cohen Committee's report. Many local medical committees took advantage of this opportunity, and the task of collating the views of local medical committees with those already expressed by the G.M.S. Committee has now been completed with a view to any necessary action being taken.

TRAINEE GENERAL PRACTITIONER SCHEME

Review of the Scheme

101. In response to the views expressed by the Conference last year the Committee has set up a special subcommittee to re-examine the Trainee General Practitioner scheme. This subcommittee has now completed its general review of the scheme and an interim report setting out the conclusions and recommendations reached will be sent to local medical committees later this year. At the same time, local medical committees will be asked to submit their own views on the subject, particularly from the point of view of how the present scheme has worked out in their own areas. A final report will be submitted to the 1956 Conference.

Remuneration of Trainee General Practitioners

102. The Committee has sought an increase in the maximum salary which the Ministry of Health pays, through the principal, to the trainee general practitioner. It has been pointed out that the present rate is inadequate having regard to present-day circumstances, and the Ministry has undertaken to give the matter careful consideration.

103. The Committee is also to discuss with the Ministry the possibility of making monthly payments to the trainer in respect of the trainee's salary.

ASSISTANTS AND YOUNG PRACTITIONERS SUBCOMMITTEE

104. The Assistants and Young Practitioners Subcommittee has continued to examine a number of problems which face assistants and unestablished principals.

105. One matter which has received the most careful consideration during the past session has been the whole question of the employment of "permanent" assistants in general practice. A report of a special subcommittee which was set up to examine the matter was submitted to the Subcommittee and its views are referred to later in this report.

PRESCRIBING AND DISPENSING

Joint Committee on Prescribing

106. In its last report the Committee referred to the decision of the Central and Scottish Health Services Councils to appoint a Joint Standing Committee on the Classification of Proprietary Preparations under the chairmanship of Sir Henry Cohen. This Joint Committee would undertake the classification of new proprietary preparations as they were introduced and would take the place of the original Joint Committee on Prescribing on Form E.C.10.

107. The Association was invited to nominate a general practitioner to serve on this Committee, but, before doing so, further inquiries were made as to its constitution and precise terms of reference. As a result, the Committee is satisfied that the new Joint Committee has not the power—

given to its predecessor—"to consider the desirability of placing any restriction on prescribing by general practitioners." Nevertheless, the Committee felt that the proposed constitution did not allow sufficient representation of general practitioners. This view was accepted by the Central Health Services Council, and, at the suggestion of the Committee, the Council of the Association nominated three general practitioners to serve on the Joint Committee. The Committee is pleased to report that these nominees were accepted and have now been appointed to the Joint Committee.

Prescribing of Proprietary Preparations

108. Following the Minister's announcement in Parliament that doctors would be asked not to prescribe certain proprietary preparations in cases where it had not been possible to reach satisfactory price arrangements with the manufacturers, the Committee was shown a draft circular letter to doctors in which the Ministry set out details of the proprietary preparations which were affected. An immediate assurance was sought from the Ministry that the Minister's announcement in no way departed from the agreed policy that the general practitioner would be free to prescribe whatever he thought necessary in the best interests of his patient. This assurance was readily forthcoming, but the Committee pointed out that the phraseology in the draft circular by no means made this clear.

109. After further discussion the Ministry agreed to amend its circular to meet the Committee's wishes, but the Ministry was left in no doubt as to the Committee's view that it was unfortunate that the Minister had opened his campaign by referring to a group of well-known proprietary anti-asthmatics which, though more costly, were frequently ones which individual patients had found from experience were best tolerated and most efficacious in their particular case. A change of drug in such a case might have a bad psychological effect.

Prescribing of Preparations Which are not Drugs or Medicines

110. The Committee agreed with the Ministry that there was no longer any need for the Ministry to be informed of cases in which executive councils decided to take no action where a prescription was referred to them by Pricing Bureaux. Similarly, it was agreed that, where the practitioner did not wish to exercise his right to appear before the local medical committee, the Minister on his part would not submit representations and that, in consequence, the arrangement whereby local medical committees were asked to give the Ministry 14 days' notice of any cases of this nature could be discontinued.

111. To avoid misunderstanding, however, the Committee would like to emphasize that the Regulations themselves are unaltered and that the results of these cases must be notified to the Ministry.

Remuneration of Medical Practitioners for the Supply of Drugs and Appliances

112. Now that Pricing Bureaux are more up to date with their work, the Ministry felt that the arrangements whereby advance payments on account were made in respect of drugs and appliances supplied were no longer necessary and that the normal system of settlement in arrear could be resumed.

113. The Committee raised no objection to this proposal, but experience has shown that there is still considerable delay before dispensing doctors paid on the basis of the Drug Tariff receive the moneys due to them each quarter. In consequence, the Committee has represented to the Ministry that, as the practitioner is usually expected to settle his account with his supplier monthly, he should, in order to avoid hardship, still be able to obtain on application advance payments from the executive council.

List of Appliances

114. The Committee is seeking the addition of the following articles to the list of appliances prescribable by general practitioners in the National Health Service:

- (1) Pessaries (Simpson's shelf, celluloid ring, india-rubber ball).
- (2) Tubular gauze.
- (3) "Algetyn" nonad tulle.
- (4) Finger cots.
- (5) "Cellanband" bandages.
- (6) Two-way-stretch knee-caps.

List of Specially Expensive Drugs

115. At the request of the Committee the Ministry has added the following substances to the special list of expensive drugs:

- "Mysoline."
- Piperazide preparations.
- Streptomycin.

Prescriptions for Items on the Specially Expensive List

116. It will be remembered that the Committee accepted the Ministry's proposal that a Form E.C.10 printed on coloured paper might be introduced for use by dispensing doctors who wished to issue prescriptions for items on the special list for which payment was made over and above the dispensing capitation fee. The Ministry has now suggested that the use of these coloured forms should be extended to all dispensing doctors whether paid by drug capitation fee or on the basis of the Drug Tariff. In this way the Ministry hoped that all prescriptions issued to patients on dispensing lists would be readily identifiable.

117. The Committee sees no objection to this proposal and the Ministry has been so informed.

Form E.C.10

118. Although the Committee had recommended to the Ministry that there should be an early return to the practice of making up pads of Form E.C.10 by means of staples, it was suggested at the Conference that the present type of pad which is secured by means of an adhesive material had a number of advantages which made its retention advisable.

119. The Committee therefore asked the Ministry to arrange, as soon as practicable, for the issue of pads of both types so that practitioners might choose whichever type of pad they found most convenient. The Ministry maintains that, to do as the Committee wishes, might well lead to supply difficulties, but the matter is still under consideration.

Methylpentynol

120. The Committee's attention has been drawn to the fact that methylpentynol (marketed under the name of "oblivon"), because it was not a scheduled poison, was freely available to members of the general public. In view of the dangers inherent in the free sale of oblivon, the Committee felt that some restriction should be placed upon it. The Committee was informed that the Pharmaceutical Society was then in process of circulating its members to the effect that, in view of the dangers of indiscriminate use or use in excessive quantities, the Council of that Society felt that the drug should be available only on medical or dental prescription.

121. The Committee feels that, in the absence of the inclusion of methylpentynol in the scheduled poisons, this is the most effective method of controlling its free sale. It wishes to record its appreciation of the prompt action taken by the Pharmaceutical Society.

"Casilan"

122. The Committee has discussed with the Ministry of Health the suggestion made by the Annual Conference last year that high protein substances such as "casilan" should be regarded in all cases as foods.

123. The Ministry, whilst willing to offer general guidance on the subject, felt, as did the Committee itself, that it would be undesirable to depart from the principle that the

general practitioner must remain free to prescribe such substances in individual cases where he felt it to be justified. The Department did not think it practicable to single out any particular product nor to go beyond what the Definition of Drugs Joint Subcommittee had felt able to say.

124. In consequence, it was agreed that the best method of meeting the situation was the insertion of an explanatory statement in *Prescribers' Notes* based on those cases where the decisions of referees on appeal had given a clear lead.

Cod-Liver Oil and Malt

125. As a result of a suggestion that there was an increasing number of references of prescriptions for cod-liver oil and malt, the Committee has discussed a proposal made by the Representative Body of the Association that prescriptions for this substance should not be questioned unless they exceed 4 lb. The Committee is given to understand that in no case is a prescription under 4 lb. challenged by Pricing Bureaux, and that, even so, where it subsequently transpires that a patient is suffering from tuberculosis, no further action is taken. The Committee feels that these arrangements are not unreasonable.

Insulin Syringes

126. The Committee, in consultation with the Diabetic Association, is representing to the Ministry of Health that the recently introduced 1½ c.c. type of insulin syringe is not suitable for the purpose for which it was designed. Not only is it an extremely clumsy instrument from the point of view of self-administration, but its capacity is too small for the larger doses of insulin which are frequently ordered. The Ministry is being asked to provide a 2 c.c. syringe of the same length as the present 1 c.c. syringe, but with a wider barrel. There is no criticism of the 1 c.c. syringe, which has proved most satisfactory in use.

127. At the same time, the Committee has pointed out that it would be of considerable advantage if a spirit container were provided with these two syringes in an endeavour to reduce the many breakages which occur and to facilitate sterilization.

ECONOMY IN PRESCRIBING

Areal Averages

128. The Committee reaffirmed its view that the only effective method of combating excessive prescribing would be an early return to the system of full pricing and areal averages whereby the individual doctor is notified of his own prescribing costs, together with the area and national averages.

129. Although the arrears of work which faced Pricing Bureaux made it impossible for the system to be introduced at once on a national basis, the Ministry agreed that, as an interim measure, in those areas where pricing averages could be computed, a system of areal averages would be re-instituted in the first place for groups of counties selected in rotation. The first of these statistics have now been compiled and circulated to general practitioners in the areas selected.

130. The Committee hopes that the availability of figures which will enable the doctor to compare his prescribing costs with those of his colleagues in the area will do something to reduce the cost of prescribing. The Committee has now had an opportunity to examine the actual statistics which the Ministry has been able to produce, and they are clearly open to criticism in one or two respects. The Committee intends to discuss these points of criticism with the Ministry to ensure that future figures are compiled on a completely realistic basis.

Stock Orders

131. It will be remembered that the Conference last year expressed its full support of the Committee's view that the immediate introduction of stock orders for doctors' immediate prescribing needs would result in substantial savings in the pharmaceutical service. Unfortunately, it had not then proved possible to secure the co-operation of the chemists, without whose participation the scheme could not

be operated, and the Conference expressed the wish that further efforts should be made to overcome the difficulties which were preventing the implementation of the stock orders arrangements.

132. The Committee is pleased to record that the need for finding a solution to this problem was also stressed in the recently published report of the Committee on General Practice. The matter is to be discussed again with the Ministry of Health, and the Committee will do all it can to give effect to the Conference's wishes in this matter.

SUPPLY OF MEDICINES TO PRIVATE PATIENTS

133. The Chairman of the Committee, accompanied by the Chairman of the Private Practice Committee, met the Minister of Health to press the Association's claim that private patients should be entitled to drugs and appliances under the National Health Service. A very full discussion took place and a report of this meeting is set out in Appendix B.

DISCOUNT ON DRUGS

134. Further discussions have taken place with the National Pharmaceutical Union and the Association of British Pharmaceutical Industry in an effort to secure an equitable rate of discount for dispensing doctors. The Committee has, for some considerable time, protested against a situation which in some instances results in the doctor suffering actual financial loss when supplying certain items to his patients. The chemists were made very well aware of the very considerable feeling in the profession on this issue.

135. Subsequently, the Committee was informed that the Association of British Pharmaceutical Industry would be prepared to recommend to its constituent members that manufacturers and wholesalers should increase to a material extent the professional discount allowed to N.H.S. dispensing doctors on ethical proprietary preparations.

136. This offer is to be considered by the Rural Practices Subcommittee, whose views will be reported to the Conference by the Chairman of that Subcommittee.

CHARGES FOR PRESCRIPTIONS

137. The Committee and its Rural Practices Subcommittee have given careful consideration to the view expressed at the last Conference that dispensing doctors should be placed in the same position as chemists in the matter of collecting prescription charges. The Committee has however reached the conclusion that it would be unwise to disturb the present position. Briefly, the chemist has deducted from his remuneration a number of "shilling charges" equivalent to the number of prescriptions which he submitted to the Pricing Bureau less 4d. (4d. in the case of rural pharmacists) in respect of each Form E.C.10 to cover any losses he may sustain through being unable to collect the charges. Taking the rural chemist, who is in the most advantageous position from this point of view, the tolerance allowed is in the region of 3%—a comparatively small margin. The dispensing doctor, on the other hand, is not fettered by any hard or fast limits and suffers no arbitrary deduction from his remuneration—a position which was established only after lengthy and difficult negotiations with the Ministry when prescription charges were first imposed. Moreover, should the executive council consider that a doctor is collecting insufficient charges he has the right to justify himself before his own colleagues on the local medical committee.

138. Again, the instructions to executive councils stress that charges of this nature should not be brought unless they have good reason to believe that a substantial breach of the regulations is involved. Even when the local medical committee finds against the doctor, he still has the right of appeal to a body upon which dispensing doctors are represented. The Committee feels that in view of all these facts the position of the dispensing doctor is far better than that of the chemist, and it can see no grounds for believing that to place the dispensing doctor in the same position as the chemist would be to the former's advantage in any way.

139. During the course of the past session the Committee has been asked to give some guidance to local medical committees on the margin which the dispensing doctor should be allowed before any conclusion was reached that he had not complied with the regulations. The Committee feels that in this, as in many other instances, each case must be judged on its individual merits and in the full light of the circumstances of the practice concerned. It feels that this is a matter which is best left to the discretion of local medical committees.

POSTGRADUATE COURSES

Grants for Locums

140. Following representation to the Ministry the Committee is pleased to report that it has been agreed that the grant which is made towards the expenses of engaging a locum during the period that a general practitioner is attending a postgraduate course should be increased to 16 guineas per week.

141. The new rate is payable from September 1, 1954.

Assistants

142. The Ministry has also agreed that, from the same date, assistants in general practice will be eligible to apply for a grant under the refresher course arrangements. The Committee accepted a suggestion by the Ministry that in order to be eligible for a grant an assistant should have been qualified as a medical practitioner for at least three years.

Courses in Specific Subjects

143. The Committee has received several requests that courses in specific subjects should be available under the scheme—notably, obstetrics. The matter has been discussed with the Ministry, who have assured the Committee that, providing the course in question is recognized by the university concerned, there will be no difficulty about it ranking for a grant under the scheme. In consequence, if any local medical committee feels that there is a call for any course in a particular subject in its own locality, they should approach the university authorities. Similarly, difficulties arose in one area over the recognition of a refresher course consisting of evening sessions. Here again the Committee understands that, provided the university authorities give prior recognition to such a course, the grant will be payable.

Subsistence Allowance

144. The Committee has concluded that the rates of subsistence allowance granted to general practitioners attending refresher courses are inadequate. It intends to ask the Ministry to bring the allowances more into line with present-day circumstances.

CERTIFICATION

Certification for Surgical Corsets

145. Following the decision of the Conference last year to seek the abolition of medical certificates to secure exemption of surgical corsets from purchase tax, the Committee has discussed the matter once again with the Board of Customs and Excise. After a frank discussion the following letter was received from the Board of Customs and Excise:

"In your letter of 25th October you made further representations about the abolition of medical certification to secure exemption of corsets from Purchase Tax; and on 6th December a deputation from the General Medical Services Committee came to see me to discuss this question.

"We have given careful consideration to the points which you and your colleagues made at the meeting and I am now writing to put our views on record.

"In the first place I should like to make it clear that there is no tax exemption for corsets as such. The general position is that tax is not chargeable on surgical appliances; and there are of course many articles which by reason of their physical characteristics are clearly identifiable as surgical appliances. In the field of clothing, however, there is

a range of articles, chiefly abdominal and other belts, which are not so readily identifiable. Here the crux of the matter is how to give the benefit of the exemption to those articles which are genuinely surgical appliances and at the same time to exclude those which are no more than ordinary made-to-measure garments. It is difficult to see how this distinction can be made except by the method we now adopt, but equally I am sure you would agree that it would be extremely difficult to justify withdrawing the tax exemption for all surgical appliances merely because of some minor difficulties of identification in the case of corsets.

"Had the exemption from Purchase Tax for surgical appliances become completely redundant as a result of the National Health Scheme we might agree that the time had come to consider its withdrawal, but experience shows that this is in fact not so. There are apparently still many people who are prepared to buy their appliances without going to hospital and there are good reasons why it would be undesirable to upset this state of affairs. These people save the country expense and considerably ease the burden on the hospitals. As you will appreciate, the political difficulties of getting an exemption of this kind withdrawn would indeed be formidable.

"At the moment, therefore, I think we must take it that removal by legislation of the tax exemption on surgical appliances is a non-starter. This being so, we in this Department have to recognize that we have neither the power nor the right to refuse the benefit of the exemption to any individual who is entitled to it. Nor can we insist on his attending hospital where it is not his wish to do so. But it is certainly not our wish that the administrative side of the exemption should place any undue burden on the doctors. It was for this reason that we removed severe enteroptosis, gastropnoxis, etc., from the list of conditions for which certificates would be accepted. It was fully appreciated that those conditions had given rise to abuse and were leading to unnecessary calls on the doctors. We think you would agree that since these steps were taken the position has much improved and demands on doctors had dropped considerably this last year or two. But we should like to assure you and your members that we are fully conscious of their views on the question of certificates and we are anxious to do all we can to ease the situation. With this in view we now propose to discontinue the need for further medical certificates when replacement appliances are required. We are notifying the suppliers concerned accordingly. This additional measure should reduce still further the demands made on the doctors and I trust that it will go a good way to meeting your members' complaints."

146. Thus although the Board has not been able to agree to the total abolition of certificates it has offered to discontinue the need for further medical certificates when replacements are required.

147. The Committee feels that with the implementation of this proposal the steady decline already noticed in the number of certificates required will continue and this will substantially reduce the burden which has fallen on general practitioners in the past.

Hospital In-patient Certificate

148. A suggestion was made by the Northampton Local Medical Committee at the last Conference that the hospital in-patient certificate (Form Med.10) should be redrafted to state the fitness or unfitness for work of the patient. In view of the fact that these hospital intermediate certificates are normally issued by lay personnel, the Committee feels unable to support the proposal. It has, however, suggested to the Ministry of Pensions and National Insurance that the footnote now printed on this certificate form should be amended so as to remind the patient that an intermediate certificate issued by the hospital is valid for eight days after discharge. This step should reduce the calls made upon general practitioners.

149. The amended footnote will read as follows:

"If a final certificate is not issued on discharge from hospital you (the claimant) should obtain a further certi-

ficate from your doctor within a week of discharge. You should obtain a final certificate before resuming work."

STANDARD OF ACCOMMODATION IN SURGERIES AND WAITING-ROOMS

150. Early in the new session, statements in Parliament and in the press again focused public attention on the standard of surgery and waiting-room accommodation provided by general practitioners. Although in October, 1953, a circular letter on the subject by the Chairman of the Committee was sent to every general practitioner in the National Health Service, no precise information was available either to confirm or deny the allegations which had been made from time to time of inadequate or unsatisfactory practice accommodation. Furthermore, it was clear that a general survey under arrangements to be made by the Ministry and executive councils was both inevitable and imminent.

151. The Committee, feeling that this was a matter which was primarily of concern to the profession rather than one which called for official action under the regulations, discussed the problem with the Ministry of Health, and, in consequence, it was agreed to seek the co-operation of local medical committees in carrying out surveys of the practice accommodation in their own areas.

152. The vast majority of local medical committees in England and Wales have agreed to co-operate to the full and it is hoped that within a reasonable time the Committee will have an accurate picture of the general situation throughout the country.

PRACTICE ACCOMMODATION

153. A special Subcommittee has been set up to look at the general question of practice accommodation. Cases have arisen from time to time when general practitioners succeeding to death or retirement vacancies have been faced with considerable difficulty in obtaining suitable accommodation, whilst the establishment of new housing estates, the clearance of slum areas, and redevelopment schemes generally have added to the problems which doctors face in acquiring suitable new or alternative surgery premises. The conditions under which local authorities should rent premises to general practitioners calls for particular examination in present-day circumstances, and this and a number of associated problems are under active consideration. In view of the many complicated factors involved it is unlikely that the Subcommittee's full report on these matters will be available until the 1956 Annual Conference.

SERVICE COMMITTEES AND TRIBUNAL REGULATIONS

154. Negotiations have continued with the Ministry of Health on the recommendations made by the special subcommittee which has been reviewing the Service Committees and Tribunal Regulations. The Committee is pleased to report that agreement has now been reached on the various matters under discussion, and the Subcommittee's report of these negotiations appears in Appendix C. The Committee recommends:

Recommendation A: That the Report of the Subcommittee on Service Committees and Tribunal Regulations be approved.

MATERNITY MEDICAL SERVICES

Ante- and Post-natal Care

155. In the last report the Committee referred to the difficulties which had arisen in a number of areas over the payment of fees to general practitioners undertaking the ante- or post-natal care of patients who had elected to be confined in hospital. Special arrangements had been agreed with the Ministry whereby, although the confinement was to take place in hospital, in exceptional cases where, in the opinion of the general practitioner, it was inconvenient for the patient to attend hospital for her antenatal or post-natal care, or where at the hospital's request the general practitioner undertook these services, the latter should be entitled to claim appropriate fees from the executive council.

156. It was clear that these arrangements were not working smoothly in all areas, and the Committee has therefore discussed the whole problem with the Ministry of Health, who have agreed to circulate a further memorandum to hospital authorities on the subject. The Committee has had an opportunity of examining a draft of the memorandum and has informed the Ministry that in its view the guidance given does not adequately emphasize the general practitioner's role in the maternity services. Discussions are continuing.

Maternity Record Card

157. The Conference last year suggested that practitioners should be provided with maternity record cards of a size suitable to fit inside the medical record envelope. The Committee fully supports this proposal and appropriate representations have been made to the Ministry of Health.

Use of Pethidine in Midwifery

158. A draft circular was submitted to the Committee early last year drawing attention to the possible dangers of a midwife using a supply of pethidine which had been obtained by a general practitioner by prescription on Form E.C.10 when she was already in a position to supply herself through the medical officer of health.

159. Following consultation between the Ministry of Health and the Home Office, the original draft has since been withdrawn and a circular has been issued in which it is stated that, whilst it is legally in order for a midwife working with a general practitioner to use a supply prescribed by the doctor or issued directly to him, nevertheless, to prevent confusion and waste, it is desirable that the general practitioner should not himself prescribe but should rely on the midwife's supply obtained through the medical officer of health.

160. The Committee considers that the revised form of the circular meets the criticisms which were made of the original draft.

Submission of Claims

161. The Committee is suggesting to the Ministry that, in the case of claims for services given following an emergency aid call from a midwife, the present period for submitting claims should be extended to six months. It is not always possible for the general practitioner to give the final post-natal examination within the three months now allowed, and it is important that more tolerance should be given in the submission of claims.

The Obstetric List

162. The Committee is grateful for the support given to it by the Conference last year for its contention that the Obstetric List served no useful purpose and should be abolished. This matter is being pressed with the Ministry of Health.

General Practitioners and Institutional Midwifery

Springfield Maternity Home, Blackburn

163. The Committee has made a strong protest to the Ministry about the decision by the hospital management committee to close the Springfield Maternity Home at Blackburn. Not only was the decision to close Springfield taken without adequate consultation with the local general practitioners, but the actual evacuation of the patients was carried out with complete disregard for their responsibility for the patients then in the home. The alternative accommodation offered was neither convenient nor practicable as far as the doctors in Blackburn itself were concerned, and representatives of the Blackburn and Lancashire Local Medical Committees were invited to accompany a deputation to the Ministry on the subject.

164. This deputation was received by the Permanent Secretary to the Ministry, who, whilst holding out little hope of reversing the decision of the regional hospital board to close Springfield, gave an assurance that the Board would be asked to consider carefully the provision of alternative accommodation which would be reasonably accessible to general practitioners in Blackburn. Later, a meeting of the

Board took place at which representatives of the various interests concerned were invited to be present to state their views as to the provision of alternative accommodation. The Board subsequently announced that it had reached the conclusion that the provision of additional general-practitioner maternity beds within the boundaries of the County Borough of Blackburn to replace those no longer available at Springfield was impracticable.

165. In view of the very strong feeling in the area, the Committee suggested that, in an attempt to meet the opposing views of both sides to the dispute, the situation should be investigated on the spot by representatives of the Ministry and the G.M.S. Committee. This proposal was not accepted by the Ministry, and in consequence a personal interview was sought with the Minister on the subject. It is, however, apparent that the Minister is unwilling to intervene in a matter which he considers to be within the competence of the regional hospital board and the hospital management committee. The Committee feels that it has taken every step open to it, but is both disappointed and disturbed that so little has been achieved as a result of its efforts.

Portway Maternity Hospital, Dorset

166. The Committee has similarly made representations in support of the provision of general-practitioner maternity beds at the Portway Maternity Hospital, Dorset. Efforts by the local medical committee have proved unavailing and the Committee, in consultation with the local bodies, is making a direct approach to the regional hospital board.

PROVISION OF DIAGNOSTIC AND ANCILLARY FACILITIES

167. In view of the unfortunate experience at the Springfield Maternity Home, Blackburn, and in other parts of the country, it is not surprising that a good deal of concern has been expressed that proposals to withdraw or vary clinical facilities which have been granted to general practitioners can reach an advanced stage before they come to the notice of the Committee. Such variations concern the provision of both general-practitioner beds and of diagnostic and other ancillary services. Proposals of this sort are generally initiated in a committee of the regional hospital board or in the hospital management committee, and, although there may be a general-practitioner member on the board or management committee itself, he may not necessarily be a member of the particular committee or sub-committee concerned. The Committee therefore drew the Ministry's attention to the desirability of instituting centrally early and full discussions on any proposals affecting facilities for general practitioners.

168. The Ministry expressed its full agreement that local medical committees should be informed and consulted at an early stage when any proposal was made on the hospital side affecting facilities available to general practitioners. It has undertaken to raise the matter with both senior administrative medical officers and secretaries of regional hospital boards. It will, at the same time, remind them of the desirability of including general-practitioner representation in all hospital management committees. The Ministry has also undertaken to take similar action so far as boards of governors of teaching hospitals are concerned.

REPRESENTATION OF GENERAL PRACTITIONERS IN HOSPITAL ADMINISTRATION

169. The Committee has continued its efforts to secure adequate representation of general practitioners in all spheres of hospital administration.

170. In the case of regional hospital boards, the Committee is pleased to report that there is now at least one general practitioner on every Board. In the teaching hospitals, however, the situation is far from satisfactory and, to quote the London area as an example, on only six of the Boards is general-practitioner representation at present included in the membership.

171. In appointing the members of regional hospital boards, the Ministry is required by the Act to consult such

organizations as may be recognized as representative of the medical profession in the area. Unfortunately, no similar obligation exists in the case of boards of governors of teaching hospitals. The Committee felt, however, that there was no reason why the Association should not seek to submit nominations under the provisions in the Act which require the Minister to consult with such other organizations as appear to him to be concerned, and, through Branches and Divisions of the Association and the local medical committees in the area, or preferably a combination of these bodies, nominate general practitioners to serve on boards of governors of teaching hospitals. This procedure would in no way modify the arrangements under which nominations are sought from the regional hospital board and medical staff of the hospital concerned.

172. The Committee therefore recommended to the Council that, in future years, Branches and Divisions of the Association, in consultation with local medical committees, should be invited to forward to Headquarters for transmission to the Minister the names of suitable general practitioners who were willing to serve on boards of governors of teaching hospitals. The Council has accepted this recommendation and the new arrangements will be put into effect next year.

EMPLOYMENT OF GENERAL PRACTITIONERS IN HOSPITAL

173. In its report to the last Annual Conference the Committee gave a detailed account of the negotiations which had then been taking place between the Joint Committee for Consultants and the Ministry of Health on the terms upon which general practitioners should be employed in N.H.S. hospitals. The G.M.S. Committee maintained that no practitioner working as a clinical assistant under supervision should be paid less than the rate laid down under paragraph 10(b) of the terms and conditions of service for hospital staff—that is, £175 per annum per weekly half-day. Subsequently, the Ministry put forward a proposal that a rate of pay of £125 per annum per weekly session would be appropriate. At that time negotiations were proceeding in Committee "B" of the Medical Whitley Council for a review of the remuneration of hospital medical staffs, and it was agreed between the Staff and Management Sides that the actual rate of payment for practitioners working as clinical assistants should be left in abeyance until the major question was resolved.

174. Nevertheless, although the remuneration of hospital medical staffs has since been revised no final decision has been reached on the rate laid down in para. 10(b) of the terms of service. The Committee is keeping in close touch with the Central Consultants and Specialists Committee of the Association on this issue, and it has been agreed that it would be advisable to defer any final decision until agreement has been reached on the future pattern of junior hospital staffing.

175. In the meantime the Ministry has agreed that general practitioners undertaking these duties should continue to be paid at the rate laid down in paragraph 10(b)—that is, £175 per annum per weekly half-day.

176. The Committee has been led to understand that, in some circumstances, there has been reluctance on the part of general practitioners in sending their patients to a hospital staffed by specialists who are also practising in the same area as general practitioners. The Committee is not unappreciative of this point of view and of difficulties which might arise, but hopes that every endeavour will be made at local level to overcome any obstacles which might militate against securing for the general practitioner his proper place in the hospital service.

APPOINTMENT OF CASUALTY OFFICERS IN HOSPITALS

177. The Committee's attention has been drawn to the difficulty which is being experienced by many hospitals in obtaining the services of casualty officers. During the course

of discussions with the College of General Practitioners it was suggested that consideration might be given to making it a requirement of entry into general practice that the practitioner should previously have held a casualty post. The Committee did not feel able to support this requirement. Whilst sympathetic with the position of the hospital authorities, the Committee feels that, to a large extent, the shortage of casualty officers is bound up with the reluctance of hospital authorities to admit general practitioners on a sessional basis. The Committee feels that the position would be eased and the hospital assisted if general practitioners were invited to undertake hospital sessions in rotation under arrangements which could be made locally. In this way general practitioners could gain useful experience within the limits of time which their respective practice commitments might allow.

178. These views have been placed before the Ministry.

ASSISTANTS IN GENERAL PRACTICE

179. Early in 1953 the Assistants and Young Practitioners Subcommittee drew the Committee's attention to the difficulties which were being experienced by assistants in attaining principal status in the National Health Service. A number of suggestions for solving the problem have been put forward by the Subcommittee—directed in the main to a reduction of the additional list of patients allowed by virtue of the employment of an assistant.

180. In the view of the parent Committee, none of the suggestions advanced would have successfully solved the main problem—that of the principal who advertises successive posts "with a view" and then has a series of assistants, none of whom is taken into partnership. The Committee, therefore, established a special subcommittee to examine the problem and to see what action could most usefully be taken to meet the views advanced by the Assistants and Young Practitioners Subcommittee. Its report is set out in Appendix D.

181. Before reaching any final conclusion on the recommendations made by the Subcommittee, the Committee remitted the whole report to its Assistants and Young Practitioners Subcommittee for its comments. After a very full discussion, the Assistants and Young Practitioners Subcommittee passed the following resolution:

"That the Subcommittee welcomes the recommendations contained in the report as a first step in the solution of the problem, which it will continue to study."

182. The G.M.S. Committee feels that the recommendations contained in the report would do much to solve the problems now facing assistants in general practice. It therefore recommends:

Recommendation B: That further efforts should be made, through the deans of medical schools, and through honorary secretaries of local medical committees, to ensure that final-year students and newly qualified practitioners are fully informed of the importance of entering into a formal agreement when accepting a post as an assistant, either with or without a view.

Recommendation C: That the Ministry of Health should be asked:

(i) To insert an additional section in paragraph 8 of the Terms of Service of General Practitioners so as to make it clear that local executive councils shall, in consultation with local medical committees, periodically review all cases in which consent has been given to the employment of an assistant;

(ii) By means of a circular letter to executive councils to point out that, whereas under the regulations the normal maximum additional list of patients permitted by virtue of the employment of an assistant is 2,000, local executive councils have power, where after consultation with local medical committees they are satisfied that a reasonable case exists for so doing, either after due notice to withdraw their original consent to the employment of an assistant or modify the number of additional patients otherwise permitted under their allocation schemes.

Recommendation D: That an appropriate letter be sent to local medical committees, drawing their attention to the proposed arrangements, and offering general guidance upon the principles they should adopt when advising their local executive

councils that in a particular instance it would be appropriate to withdraw the consent already given to the employment of an assistant, or to modify the size of list.

Recommendation E: That a principal implementing a "view" registered with the executive council should have the right to claim retrospective payment on the basis of notional lists for a period up to a maximum of one year.

GENERAL-PRACTITIONER REPRESENTATION ON THE CLINICAL RESEARCH BOARD

183. The Committee, in conjunction with the College of General Practitioners, has again made strong representations that general practitioners should be entitled to representation on the Clinical Research Board.

184. The Board is by no means unsympathetic, and the matter will be raised again when the term of office of the present members has expired.

GENERAL DENTAL SERVICES

Dental Anaesthetics

185. On a number of occasions the Committee's attention has been drawn to the inadequacy of the fee paid to general practitioners for providing dental anaesthetics. This matter has been discussed with the British Dental Association, who pointed out that the dentist can hardly be expected to pass on to the doctor a higher fee than he in fact receives from the Dental Estimates Board, and that the only remedy lies in a general upward revision of the scale of fees paid to dentists.

186. The Committee has therefore offered the British Dental Association its full support in any negotiations with the Ministry for an increase in the dental anaesthetic fees at present paid by the Dental Estimates Board.

Dental Haemorrhages

187. After long discussion with the Ministry the regulations have now been amended to enable a general practitioner to claim a fee for attending a case of haemorrhage following a dental extraction. Unfortunately there remain two circumstances in which a practitioner is unable to obtain a fee—namely, where the haemorrhage follows extraction in hospital and where the haemorrhage follows dental treatment given privately.

188. The Committee has been able to make little headway in the first set of circumstances, but, following discussions with the Ministry of Health, it is understood that the dental scale of fees now makes it possible for a dentist to make a claim when the arrest of haemorrhage follows an extraction carried out privately, provided that he is also taking part in the general dental services. When the dentist is in purely private practice no claim can be made on the National Health Service.

189. The Ministry is also looking into the possibility of paying more than one fee where more than one practitioner is called upon to arrest dental bleeding following the same extraction.

POST-MORTEM EXAMINATIONS

190. It has been suggested that arrangements should be made which would enable a practitioner to have a post-mortem performed by a consultant pathologist on any case of particular clinical interest—the cost being borne by the National Health Service. Because of possible legal implications, the Committee sought advice on the situation generally, but, unfortunately, the various enactments on the subject are by no means clear and are possibly out of keeping with present-day conditions. The Committee believes that it would serve no useful purpose to raise this matter officially with the Government departments concerned and is satisfied that, from a practical point of view, the position is adequately covered. In general, post-mortems can be divided into five main groups, namely:

(1) Those undertaken at the request of the coroner, which represent the majority of cases. Here the coroner

has an overriding interest over all other persons. Many cases of clinical interest come within this category.

(2) Another fairly large group—those carried out in hospital—covers many cases of clinical interest. Consent of the relatives is necessary in these instances, but in most cases is readily forthcoming.

(3) A group which can be described as ex-hospital cases. Here, if the general practitioner is in doubt, he can ask the hospital authorities to conduct a post-mortem and the certificate will be given in the proper way without reference to the coroner.

(4) Those where a general practitioner has attended the patient for some time. In these instances, he can communicate with the coroner, who can order a post-mortem, where the cost is defrayed from public funds. Here, again, a certificate can be given without an inquest.

(5) Lastly, there is a group where the relatives or executors wish for a post-mortem. In all these cases it is wise, as a matter of courtesy, to advise the coroner—the cost falls upon the relatives or executors making the request.

191. Within the limit of the instances which are cited above, any general practitioner who is in doubt over a case involving matters of clinical interest or public policy can achieve his objective through one or other of these channels. It is felt, therefore, that in view of the adequate arrangements which can already be made in the vast majority of cases no further action is called for at the present time.

NOTIFICATION OF PUERPERAL PYREXIA

192. The Committee has agreed to a suggestion by the Ministry of Health that the form of notification of puerperal pyrexia should be amended by adding the words "cause if known." The change was suggested because many notifications arose from pyrexia due to some known cause and not involving any epidemiological hazard.

REPORTS OF ACCIDENTS TREATED AT HOSPITAL CASUALTY DEPARTMENTS

193. The Committee's attention has been drawn to difficulties which are experienced by doctors in cases where patients present themselves for treatment stating that they have been involved in an accident and received treatment at a hospital casualty department. In the absence of any information about the nature of the injuries sustained and the treatment which has been afforded by the casualty officers, considerable inconvenience is caused to both patient and doctor.

194. The Committee, in consultation with the Central Consultants and Specialists and Public Health Committees of the Association, is investigating the possibility of asking hospital casualty departments to send short reports of these cases to the family doctor.

MEDICAL BOARDS

195. The Committee has been examining the possibility of facilitating the exchange of information between National Service medical boards and general practitioners where a patient is rejected as unfit for National Service.

196. The question of automatic notification has previously been discussed but found to be impracticable. The Ministry of Health suggested that it would be helpful if the patient was informed that the reasons for his particular grading were available to his general practitioner on request and that the address to which inquiries should be sent was notified at the same time.

197. The forms in question will be suitably amended and the Committee hopes that the action taken will prove to some degree a solution to this problem.

REPORTS FROM GENERAL PRACTITIONERS

198. The Committee has been asked for its views on the desirability of a general practitioner charging a fee for a report called for by a patient's employer. The Committee

takes the view that a distinction should be made between those cases where the report is required in the patient's own interests (for example, where a firm is prepared to make an *ex gratia* payment of salary if they can have some assurance that the employee is likely to return to work "within a reasonable time") and those where reports are required by an employer for administrative convenience in organizing the work of his firm or undertaking. In the former case, where only a brief statement as to the patient's fitness or unfitness for work is all that is required and it is in the patient's own interests that it should be given, it is the view of the Committee that no fee should be charged. In other circumstances the Committee feels that the general practitioner is fully justified in charging a fee.

APPOINTMENT OF AN ADVISER IN GENERAL PRACTICE TO THE MINISTRY OF HEALTH

199. The Committee, having learned of the appointment of an adviser in general practice to the Ministry of Health, sought an undertaking from the Ministry that such an appointment would in no way affect its own position as the source to which the Ministry looked for advice on all questions affecting general medical services.

200. The Ministry has assured the Committee that the new appointment should in no way be interpreted as implying any reflection on the arrangements for consultation on general practice problems which have developed so successfully since the Service began, nor will it in any way diminish such consultation in the future.

"HANDBOOK FOR GENERAL MEDICAL PRACTITIONERS"

201. Following the publication of the consolidated N.H.S. (General Medical and Pharmaceutical Services) Regulations, 1954, the Ministry has revised its *Handbook for General Medical Practitioners*. The Committee was given an opportunity of examining the *Handbook* in draft and it should be issued within the next few months.

202. The Ministry has been asked to consider whether the new edition of the *Handbook* cannot be published in loose-leaf form as is the case in Scotland, since there have been suggestions that, by so doing, it will facilitate any future revisions which may prove necessary should the regulations again need amendment.

CHILDREN'S COMMITTEES

203. At the last Annual Conference the Committee was asked to take such steps as were open to it to persuade local authorities, firstly, to co-opt general-practitioner representatives to Children's Committees, and, secondly, to encourage the attendance of a local authority medical officer at the meetings of these committees. The Committee understands that it is already within the powers of the local authority to arrange for the attendance of a medical officer of health or one of the authority's medical advisers at meetings of Children's Committees, and that in many instances full advantage is taken of this arrangement.

204. As far as general-practitioner representation is concerned, the Committee, through the Ministry of Health, has been in touch with the Home Office. The Home Office feels that it would not be proper for it to put any pressure on local committees to use their powers of co-option, but rather that in any particular areas where difficulty was being experienced the matter should be taken up on a local basis.

205. The Committee accepts this suggestion as the most practical way of dealing with the situation.

LOCAL MEDICAL COMMITTEES AND PRIVATE PRACTICE APPOINTMENTS

206. The Committee's advice has been sought on the propriety of local medical committees selecting practitioners for private appointments. In a particular case in point, the

Admiralty asked the executive council to submit the name of a practitioner suitable for appointment as an Admiralty surgeon and the executive council, in turn, referred the request to the local medical committee.

207. After careful consideration, the Committee has concluded that, whilst it would be quite proper for a local medical committee to circularize all doctors eligible for appointment when such a course is more satisfactory than advertising on a national basis, it feels that, once the local medical committee has obtained the names of those practitioners who wished to apply for the post, then all should be forwarded to the employer, with whom the final selection must rest. The Committee does not feel it desirable for any preliminary selection to be made by the local medical committee when posts outside the National Health Service are involved.

GENERAL PRACTITIONERS AND LOCAL AUTHORITY SERVICES

208. The Committee, together with the Public Health Committee of the Association, has under consideration a draft circular letter which the Ministry is proposing to circulate to local authorities on the subject of the facilities made available to the general practitioner by local authorities.

VACCINATION AND IMMUNIZATION

209. In its last report the Committee referred to the Ministry's proposal that a further circular letter should be issued setting out its policy on vaccination. It will be remembered that this action was suggested because the Committee had been disturbed to learn that a number of local authorities were proposing to discontinue the payment of fees for records of successful vaccination in the case of adults. The Ministry's circular, which the Committee had an opportunity of examining in draft, has now been issued and the Committee hopes that it will prevent similar difficulties arising in the future.

Vaccination Pad

210. Following representations by the Committee that the existing vaccination pad had proved to be unsatisfactory, the Ministry has introduced a new type of pad. The small square pad in which a piece of "cellophane" prevents contamination of the dressing when the tabs are removed is an improvement upon the old type, and the Committee decided not to press its original request for a type of single-strip dressing.

LEGAL POSITION OF THE NURSE

211. The Committee has been consulted by the Royal College of Nursing on the preparation of a memorandum on the legal position of the nurse who undertakes procedures outside her professional scope.

ACCIDENTAL POISONING OF CHILDREN

212. Discussions have continued with the Pharmaceutical Society about the protection of children against accidental poisoning by medicinal preparations. It is felt that no absolute safeguards can be provided by legislation, and the main duty of protection must always rest with the parent or guardian of the child. The Committee proposes to issue a joint memorandum on the subject at an early date and to initiate as much publicity as possible for it.

THE DEFENCE TRUSTS

213. The balance sheets and statements of income and expenditure of the National Insurance Defence Trust and the General Medical Services Defence Trust for the year ended December 31, 1954, are appended (Appendices E and F).

214. A statement showing the contributions so far received from each area is being sent to local medical committees.

A. TALBOT ROGERS,

Chairman,

General Medical Services Committee.

**GENERAL MEDICAL SERVICES SUBCOMMITTEE
(SCOTLAND)****Chairman and Vice-Chairman**

215. C. J. Swanson, Aberfeldy, and Catherine Harrower, Glasgow, were appointed Chairman and Vice-Chairman respectively for the Session 1954-5.

Subcommittees

216. The following Subcommittees were appointed for the session: Chairman's, Rural Practitioners', Colliery Practitioners', Dispensing Capitation Fee, Joint Subcommittee with the Central Consultants and Specialists Committee (Scotland) on Relation of General Practitioners to Hospitals, Special Subcommittee to consider the effect of the Working Party's Proposals on General Practitioner Remuneration in Scotland, Subcommittee to consider Medical Service Committees and Tribunal Procedure, and the Highlands and Islands Practitioners' Subcommittee.

Representation

217. Representatives of the Subcommittee were appointed to the following committees: Central Consultants and Specialists Committee (Scotland), and their Anaesthetic Services, Ophthalmic Services, and Radiological Services Subcommittees; Maternity Services, Public Health, Partnership Advisory, and N.H.S. (Scotland) Review Subcommittee of Scottish Committee; Assistants and Young Practitioners' Subcommittee of G.M.S. Committee; Staff Side of Medical Subcommittee of Scottish Advisory Committee (Whitley); Liaison Committee with Scottish Association of Executive Councils; International and Scottish Advisory Distribution Committees; Editorial Committee of *Prescribers' Bulletin*; Scottish Central Medical Recruitment Committee; Group Practice Loans Committee; Medical Advisory Committee under Regulation II of the Medical and Pharmaceutical Committees and Tribunal Regulations; Scottish General Dental Services Committee of the British Dental Association.

Partnership Practice

218. The Special Subcommittee which was set up to revise and redraft the Partnership Memorandum has now completed its task, and the Memorandum has been reprinted. The Subcommittee is glad to report that its publication has been well received. Copies may be obtained on application to the Scottish Office, British Medical Association, 7, Drumsheugh Gardens, Edinburgh, 3, or the Glasgow Regional Office, British Medical Association, 234, St. Vincent Street, Glasgow, C.2.

Remuneration

219. (a) *Distribution Scheme*. The Subcommittee which has under consideration the effects of the Working Party's Proposals on remuneration of general practitioners in Scotland has submitted a report to the G.M.S. Subcommittee to the effect that the new Distribution Scheme is working satisfactorily. The position will be reviewed in a year's time.

220. (b) *Supplementary Annual Payments*. The Central Supplementary Annual Payments Committee, which is composed of representatives of the Department and the General Medical Services Subcommittee (Scotland), has already met to consider certain applications for payments. The representatives of the Subcommittee on this Committee are C. J. Swanson, Catherine Harrower, and J. T. Baldwin, with J. T. McCutcheon in attendance as an observer.

Group Practice Loans

221. The Scottish Group Practice Loans Committee first met on April 5, 1954, and has now held four meetings and considered 21 applications. The Scottish share of the sum available for granting interest-free loans to doctors setting up group practices is £12,000. As no loans were approved in the financial year 1953-4, £24,000 was available for distribution in 1954-5. Loans totalling £21,250 have been

approved to 14 groups of applicants. Three applications were refused, three withdrawn, and one held over for further consideration.

Mileage

222. The Subcommittee is pleased to report a satisfactory outcome of the negotiations regarding a reallocation of the mileage fund in so far as the Highlands and Islands area is concerned. It is anticipated that this will now result in practitioners in this area receiving mileage payments at the same rate as their colleagues elsewhere. This matter is referred to in the General Medical Services Committee's Report, paragraph 66.

Laboratory Service

223. Proposals have been submitted to the Subcommittee by the Pharmaceutical Society for the setting up of a laboratory service for general practitioners. Local medical committees have been consulted with regard to the facilities at present available in their particular area. The matter has been referred to a Joint Subcommittee of the General Medical Services Subcommittee (Scotland) and the Central Consultants and Specialists Committee (Scotland), who are examining the proposals further in consultation with representatives of the Pharmaceutical Society.

**Medical Service Committees and Tribunal Procedure—
Regulations**

224. A preliminary discussion was held with the Department regarding certain proposed amendments to the above Regulations. The Subcommittee is, however, awaiting the Report of the General Medical Services Committee on this subject before considering further proposals.

Standard of Surgery and Waiting-room Accommodation

225. Proposals from the Department of Health in connexion with a survey of surgery and waiting-room accommodation have been considered, and the matter has been discussed fully in the Subcommittee and with representatives of the Department. It has now been agreed that the survey should be the responsibility of the executive councils, acting in consultation with local medical committees, provision being made for any local medical committee to undertake the review themselves should they so desire.

Admission of Assistants to Medical List

226. The Subcommittee has had discussions with the Scottish Association of Executive Councils on the desirability of adopting the English procedure whereby only a part-time assistant building a list of his own may be admitted to the list of an executive council. The matter is still under discussion.

Inducement Payments

227. The Subcommittee has been considering, in consultation with the Department of Health, the general question of inducement payments, with particular reference to a "target" net income below which practitioners in the great majority of cases would qualify for inducement grants, and also the possibility of fixing an inducement payment to a particular practice so that when a vacancy is advertised it should be possible to include in the advertisement the amount of inducement grant payable.

Form E.C.10A

228. Discussions are being held with the Department regarding the method to be adopted to ensure that prescriptions, which include drugs covered by the Dangerous Drugs Regulations, on stock order forms comply with these Regulations. It is probable that the discussions will result in Forms E.C.10A having to be completed in duplicate by means of a carbon so that a copy may be retained by the chemist.

Superannuation Regulations

229. The Subcommittee has been represented at a meeting in London between representatives of the General Medical Services Committee and the Ministry of Health, and in Scotland with representatives of the Central Consultants and Specialists Committee (Scotland) and the Department of

MEDICAL SERVICES COMMITTEE AND ITS
SUBCOMMITTEES (TO MARCH 17, 1955)**

Health, regarding certain proposed amendments to the Superannuation Regulations. The three main points under consideration are: superannuation deductions in partnership practice, part-time hospital appointments held by general practitioners, and short service and death gratuities.

Ambulance Service

230. The Subcommittee has agreed with the Department of Health's proposals which resulted in the setting up of regional ambulance committees—which include representatives of local medical committees—in an effort to ensure the smooth and economical working of the ambulance service.

Form R.M.2(A)

231. Representations have been made to the Department of Health regarding the possible re-drafting of this form, and a meeting was held recently at which the various suggestions of the Subcommittee were considered. The Department's observations on the proposals are awaited.

Back-debits and Back-credits

232. Discussions have been held with the Department regarding the possibility of abolishing both back-debits and back-credits, and both sides appeared to favour such an arrangement. Representations were duly made to the G.M.S. Committee, but, while that Committee received the proposals favourably, it could not agree to support our suggestion for the abolition of back-debits and back-credits on a U.K. basis, since the Annual Conference of Local Medical Committees in 1954 had resolved in favour of the continuance of this system. This matter is referred to in the Report of the G.M.S. Committee, paragraphs 51-3.

The General Practitioner and Hospital Service

233. After much discussion by the Joint Subcommittee of the General Medical Services Subcommittee (Scotland) and the Central Consultants and Specialists Committee (Scotland), the Subcommittee has now received and endorsed recommendations by the Joint Subcommittee designed to accelerate the introduction of some of the recommendations contained in the report of the Scottish Health Services Council on this subject. It has been suggested to the Department that they should advise the setting up of joint committees between executive councils and hospital boards to examine the situation.

Change of Name and/or Address

234. A suggestion was made to the Department of Health for an amendment of the medical card whereby a space could be provided to enable patients to notify direct to executive councils a change of name and/or address. In addition, it was suggested that tear-off pads might be provided for the use of practitioners in notifying such changes. The Department has now agreed to the proposals.

Small Practice Vacancies

235. In connexion with this matter, which was mentioned in last year's Report, very little progress has been made. The question has again been discussed by the Liaison Committee with the Scottish Association of Executive Councils and the Department, but so far nothing definite has materialized. The matter is still under discussion.

Maternity Services

236. The Maternity Services Subcommittee of the Scottish Committee has again suggested to the Department some amendment of the maternity record card and the claim forms. In addition, the attention of the Department has been drawn to the difficulties which exist in some cases because of the requirement for practitioners to carry out antenatal examinations at the 36th and 38th week of pregnancy. As a result of the representations it is hoped that any difficulties which may have been experienced will no longer exist.

CHARLES J. SWANSON,
Chairman,

General Medical Services Subcommittee (Scotland).
